In his speech at the annual general meeting of the Deccan Sugar Factories Association in Bombay last week, Mr. F. Edwards, president, emphasised the need for cutting down costs of the sugar industry in order to dispose of the mounting surplus through exports and by stimulating domestic consumption. With production during the current season estimated around 3 million tons and a carry-over of 550,000 tons, the supply will exceed the domestic demand by about 1,450,000 tons as the internal offtake is unlikely to be more than 2.1 million tons. Allowing for a normal carry-over of 500,000 tons, there remains a "glut" of 950,000 tons. The position could worsen next year when new mills would start production. But considering the high cost of production of Indian sugar and the low prices prevailing abroad, the total loss in exporting sugar would be colossal. Production costs will continue to remain high unless efforts are made to increase the sugarcane yield an acre and produce better quality of cane with a high sucrose content. Mr. Edwards said that the joint-stock sugar factories in Maharashtra had produced quality sugar at a much lower price than factories elsewhere in the country, which did not grow their own sugarcane. The impressive results of the Deccan sugar factories would not have been possible but for their effective control over the sugarcane growing farms. If these farms were to be taken away, it would do irretrievable harm to the sugar industry as well as to the economy as a whole. Mr Edwards reiterated his plea for exempting sugar factories from the scope of the land ceiling legislation. He hoped that the President would withhold his assent from the Maharashtra Agricultural Land (Ceilings on Holdings) Act, unless it is modified to exclude sugarcane farms of joint-stock sugar factories from its purview. Referring to the report of the Central Wage Board for the Sugar Industry awarding a higher scale of wages to workers in the Deccan sugar factories, Mr Edwards said that the situation had radically changed since the report was published because of the land ceiling legislation. The paying capacity of sugar factories in Maharashtra would be no better than that of sugar factories in the northern and central regions once they were deprived of their extensive sugarcane farms. However, since the land legislation of the Maharashtra Government has not yet received the President's assent and in deference to the appeal made by the Food Minister, the Association has decided to ask the member-factories to implement the Wage Board's recommendations.

Baroda Electric Meters Issue Soon

Baroda Electric Meters Ltd, which proposes to undertake the manufacture of electric meters of all types as well as electrical instruments is expected to enter the market by about the middle of July to raise Rs. 30 lakhs through public subscription. The Company has an authorised capital of Rs. 1 crore, made up of 75,000 equity shares of Rs. 100 each and 25,000 unclassified shares of Rs. 100 each. The issued capital is Rs. 40 lakhs in equity shares, of which the promoters and their friends have subscribed 10,000 shares. The balance is to be offered to the public. The entire issue has been underwritten by the Industrial Credit and Investment Corporation of India, the Life Insurance Corporation and the Bank of Baroda and certain other investment institutions. The factory will be located in Vallabh Vidyanagar in Anand. The plant will have an annual production capacity of 60,000 single-phase and 24,000 poly-phase meters. A.C. Messrs Deutsche Zahler Gesellschaft, Hamburg, is collaborating in the venture. The West German firm will set up the plant and supply the technical know-how and training. Baroda Electric intends to set up an up-to-date research laboratory at an estimated cost of Rs. 7½ lakhs.

T. Maneklal to Expand

Last week the shares of T. Maneklal Manufacturing Co. Ltd spurted from Rs. 415 to Rs. 475. The shares shot into the limelight at a time when the rest of the market—particularly cash shares—was rather subdued by heavy corrective profit-taking. That the Company is doing well has been common knowledge. Production and sales during the year ended May 1961 are expected to show substantial improvement over the previous year's performance. But keen enquiry for the Company's shares last week was prompted mainly by the expansion plans which the Company has on hand. The firm has received a licence for manufacturing large-sized diesel engines ranging from 150 horsepower to 800 horse-power in collaboration with Messrs Swiss Locomotive and Machine Works of Switzerland. The production capacity will be 45 engines a year rising up to 75 engines. The factory will be located in Ahmedabad, and the project is estimated to cost about Rs. 50 lakhs. The Company also proposes to undertake the manufacture of water-ring pumps and Roots blowers. The licensed capacity is 30 pumps and 30 blowers a year initially, rising up to 100 units each ultimately. The Company has also obtained a licence for manufacturing high-pressure laminated sheets used for industrial and decorative purposes. The plant will be located in Bombay and will have an annual production capacity of 9 million square feet on a single-shift basis. This project is estimated to cost Rs. 25 lakhs to Rs. 30 lakhs. The Company has secured the technical collaboration of a leading U.S. firm. In addition to manufacturing texitle machinery—including automatic looms—the Company has recently started the production of rotary air compressors and hot air stenters.

New Permanent Magnets Project

Reliable reports indicate that the Government of India has approved the scheme submitted by the East Coast Enterprisers Ltd of Calcutta for setting up an undertaking in 24-Parganas near Calcutta for manufacturing permanent magnets. The firm does not propose to have any foreign technical collaboration. It has already made some experiments and samples of permanent magnets manufactured by it have been tested at the

Defence Metallurgical Research Laboratory in Ichapur. East Coast Enterprisers is negotiating with the Research and Development Organisation of the Defence Ministry for getting testing facilities and technical advice from the Director of Ichapur Laboratory. The proposed plant will have an annual production capacity of 75 tons of cast permanent magnets in alloys of alnice and alcemax types. The value of plant and equipment to be imported is estimated at Rs. 11.20 lakhs, and machinery worth Rs. 3.77 lakhs is to be obtained from indigenous sources. The firm has indicated to the Government that it is trying hard to obtain capital goods from east European countries by paying non-convertible rupees or on a long-term loan basis. Efforts are also being made to obtain part of the capital goods requirements through established importers. The foreign exchange requirement for importing raw materials is estimated around Rs. 10 lakhs a year. Nickel and cobalt are the main raw materials. When the plant goes into production, it will help save about Rs. 26 lakhs a year by way of foreign exchange now being spent on imports.

East Coast Enterprisers is the sixth firm to receive the Government's sanction for manufacturing permanent magnets. The other five firms, which have already been licensed to make magnets, are: Hindustan Magnets of Calcutta (capacity 600,000 magnets a year), Deepak Industries of Calcutta (capacity Rs. 42 lakhs worth of magnets), International General Electric Co. (India) Private Ltd, Bombay (capacity 120,000 kilograms valued around Rs. 20 lakhs), Jaipur Metals and Electricals Ltd, Jaipur (capacity 120,000 magnets), and Messrs Permanent Magnets, Bombay (capacity 180,000 kilograms). Hindustan Magnets is trying to secure Japanese collaboration but the terms have not yet been finalised. No progress has been made concerning the import of plant and equipment. Deepak Industries is negotiating with Philips of Holland for technical collaboration and it has yet to apply for the import of capital goods. International General Electric Co. (India) will be collaborating with the International General Electric Company of the U.S.A. but the terms have not yet been finalised and no progress has, therefore, been made in importing plant and equipment. Fuji Electric Company of Japan is collaborating with Jaipur Metals and Electricals, and the firm's application for importing capital goods is being considered by the Government. Permanent Magnets of Bombay has made considerable progress. The name of its foreign collaborator is Centre Magneti Permanenti of Italy. The present demand for permanent magnets is estimated around 2 million or 2.5 million finished magnets a year valued around Rs. 25 lakhs or Rs. 30 lakhs. The demand, however, is expected to increase appreciably during the third plan in view of the large-scale expansion of the radio industry, the house-service meter industry, etcetera. It is estimated that the total demand may be three to four times the present demand during the next quinquennium. If all the schemes, which have already been licensed, materialise, then there may not be scope for licensing additional units. Furthermore, licensing will become necessary only if the schemes already sanctioned fail to make satisfactory progress.

Policy on New Pulp and Paper Mills

As many as 42 applications for setting up new undertakings for the manufacture of pulp and paper of different qualities came up for consideration before the recent meeting of the Licensing Committee. Of these proposals, eight were for establishing factories in Maharashtra, seven for Uttar Pradesh, six for Gujarat, five for West Bengal, four each for Assam and Andhra, two each for Madras and Punjab and one each for Madhya Pradesh, Mysore and Kerala. The Committee has rejected 37 applications and recommended the granting of licences to only five firms, namely, Messrs Bansilal H. Shah, Ahmedabad, Messrs Sohanlal of New Delhi, Jaydeep Paper Industries, Kalyan (Bombay), Tribeni Tissues Private Ltd, Calcutta and Gujarat Paper Mills Ltd of Ahmedabad. The first three firms will set up new undertakings and the last two will be expanding their existing units. Messrs Bansilal H. Shah propose to set up a factory in Ahmedabad to manufacture 4,800 tons of body paper waxing, laminating and sensitising boards a year. Messrs Sohanlal want to establish a factory in Rahuri or Sangli or Kohlapur in Maharashtra State with an annual production capacity of 42,000 tons of printing, writing, bank and bond paper and cards. Jaydeep Industries proposes to manufacture 7,500 tons of solid container boards a year. The Tribeni Tissues has been licensed to effect substantial expansion in its existing undertaking in Chandrahati (West Bengal) for manufacturing 2,400 tons of cigarette tissues and commercial and other tissue paper. Gujarat Paper Mills will also expand its production capacity in Barejodi in Gujarat in order to achieve an annual output of 3,600 tons of printing and writing paper. None of these firms will be allowed to import raw materials. The Licensing Committee rejected 37 applications due to the scarcity of requisite raw material in the country and the likely heavy foreign exchange expenditure on the import of plant and raw material. The Committee has recommended that further licensing of pulp and paper mills hereafter may be deferred for a year and that, in the meantime, only schemes which satisfy certain specific conditions may be considered individually on merit. The conditions are that the firms concerned should undertake to obtain the plants and raw materials from within the country and that the State Governments concerned should give the firms the necessary clearance concerning the supplies of raw materials (after providing for existing and licensed units), location, power, water supply, etcetera.

New Scrap Committee Criticised

Estimates of ferrous scrap arisings in India vary widely. Against the industry's estimate of 1 million tons, the Government's figure is substantially lower around 400,000 tons. The industry contends that official estimates based on the report of the Scrap Investigation Committee are a gross underestimate, since they were based on faulty and inadequate data. With varying estimates of scrap arisings, the industry has always been dissatisfied with the Government's price and distribution policies. Restrictive official policy is said to have retarded the industry's growth, by preventing the maximum use of scrap arisings. It has, therefore, long been pleading for the appointment of a committee to conduct a thorough study of the issues connected with iron and steel scrap. This has now been done, as the Central Government has appointed a Scrap Committee. The constitution of the Committee fulfills a long-standing demand of the industry and is a first step towards achieving the maximum use of ferrous scrap arisings. But its composition and the terms of reference have been criticised. The industry is aggrieved because it has not been represented on the Committee. Speaking to Press men in Bombay last week, Mr. Sultan A. Nathani, president of Scrap Traders and Exporters Association, said that unless scrap interests were properly represented on the Committee, it would not be able to come to any correct judgment on scrap arisings and other related issues. This is the first time that a full-fledged Committee would be undertaking a thorough enquiry into iron and steel scrap in the country and in order to ensure that it enjoys the confidence of all interests, it should be broad-based so that its investigations would be exhaustive and the findings conclusive. To deny direct representation to scrap interests on the Committee, Mr. Nathani said, was a departure from the sound practice of associating the representatives of any trade or industry on an inquiry committee appointed for the purpose of investigating and recommending appropriate measures for it. The appointment of a committee exclusively composed of Government personnel may have some virtues, but it has too many drawbacks. As the administrative officials constituting the Committee will not be divorced of their administrative functions, there will be reluctance to express freely by interests concerned before such a Committee. Consequently, many will presumably think it discreet to refrain from expressing their views to it. Mr. Nathani said that the Committee's terms of reference also left much to be desired. It has been asked to study the "existing system of distribution and suggest improvements that could be made to it." This, according to the industry, implies the continuation of distribution control which is derogatory to an unbiased approach and a healthy investigation expected of the Committee. So Mr. Nathani urged that its terms of reference be suitably modified so that the whole question of price and distribution control concerning scrap can be considered de novo.

Insurance in Pakistan

The recently published *Pakistan Insurance Year Book 1959*, provides, as usual, a belated review of the insurance business of that country; this one, for instance, relates to 1958. As on 30th April, 1960, Pakistan had 79 insurers, of which 25 were Pakistani companies. Life insurance is still in the private sector. The new life business in the year was about Rs. 20 crores, which is less by about Rs. 2 crores than that of 1957. No explanation has been offered for this, but it could well be an index of the present economic conditions in the country.

The total of life insurance business in force was Rs. 84,89,78,000 at the end of 1958, compared with Rs. 68,84,83,000 at the end of 1957. From a review of the total income and outgo during 1958 of the local and foreign insurers in their life business, the balances of income and outgo, namely, Rs. 1,15,07,000 and Rs. 1,42,95,000, represent the increases during the year in the life funds of the Pakistani and foreign insurers, which now stand at Rs. 6,41,17,000 and Rs. 6,74,90,000, respectively. The net rate of interest realised by the Pakistani insurers on their total life funds and by the foreign insurers on their mean life funds in 1958 was 2.95 percent and 1.53 percent, respectively, compared with 3.02 percent and 2.20 percent in 1957. The total management expenses of the Pakistani insurers in their life business and of the foreign insurers in their Pakistani business in 1958 was, expressed as a percentage of the premium income, 37.8 percent for Pakistani insurers and 27.3 percent for foreign insurers, compared with 44.1 percent and 26.5 percent, respectively, in 1957. The total gross permium written direct in Pakistan by the local and foreign insurers during 1958 including premiums for non-life insurance amounted to Rs. 10,59,17,000, representing an increase of Rs. 69,10,000 over that of 1957. The gross direct premium of the general insurance business was Rs. 5,85,12,000, compared with 5,81,01,000 in 1957, and Rs. 5,63,62,000 in 1956. The rise is slow, and not marked by any exceptional features. The net premiums amounted to Rs. 2,55,40,000 in 1958, compared with Rs. 2,47,70,000 in 1957 and Rs. 2,36,58,000 in 1956. The claims ratio in fire, marine and miscellaneous insurance business was 28 percent, 44 percent and 43 percent, respectively, for 1958, against 22 percent, 42 percent and 47 percent for 1957. The Pakistani insurers alone had a claims ratio of 34 percent in fire, 43 percent in marine and 43 percent in miscellaneous insurance, compared with 23 percent, 54 percent and 36 percent, respectively, last year. In marine, there is a welcome fall in the claims ratio, while in fire and miscellaneous insurance, there is an increase.

U.P. Demands More Looms

The U.P. Government has represented to the Centre that at least 25 percent of the additional production capacity of 800 million yards of mill cloth during the third plan period should be allocated to the State. The various chambers of commerce in Kanpur have also made similar representations. The State Government's contention is that although 17 percent of the total population of India reside in Uttar Pradesh, the textile industry of the State could produce only about one-fifth of its cloth requirements calculated on the basis of 17.8 yards of cloth a head a year. On this basis, there is scope here for the location of 500,000 spindles and 10,000 looms in addition to the existing facilities. At present, Uttar Pradesh has 17 composite cotton textile mills, ten cotton spinning mills and three cotton weaving mills with an installed capacity of about 875,064 spindles and 13,278 looms. Of this installed capacity, about 214,000 spindles and 1,800 looms represented by nine units are reported to be idle. The employment potential, which should normally be 80,000 if the installed capacity is used in full, is thus considerably reduced. Compared with the all-India figures, while the installed capacity in spindlage and loomage in U.P. works out to 5.56 percent, only 4.87 percent of spindles and 5.73 percent of looms are actually in operation. The rehabilitation of the uneconomic units and the reopening of the closed units would require at least Rs. 16 crores, although this would seem to be more important than the allocation of additional production capacity which the State Government wants.

Industrial Progress in U.P.

The annual review of industrial development of Uttar Pradesh released by the Director of Industries says that there has been a steady increase in factory employment in the State in 1960 and that there has also been a rise in the value of production over the previous year by Rs. 81.22 crores. The value of production in 1960 has been put at Rs. 293.52 crores. The increase in production was mainly noticeable in cotton and woollen textiles, iron rolling and foundries, non-ferrous metals, bicycle and bicycle parts, hydrogenated oils, *khandsari*, leather and leather goods, distilleries and breweries, paper and strawboard, etcetera. To some extent, the increase in the value of production is accounted for by the rise in prices, but some new units have also come into being. In 1960, 133 industrial undertakings were licensed in the State bringing the total number of licensed units under the Industries (Development and Regulation) Act since the inception of the first five year plan to 633. Most of the new units are consumer goods industries like sugar, alcohol, general glassware and vegetable oils.

On average, the value of production a unit increased from Rs. 11.10 lakhs in 1959 to Rs. 13.36 lakhs in 1960, and the production a worker rose from Rs. 9,000 in 1959 to Rs. 11,200 in 1960. The productivity a worker is about Rs. 90,000 in hydrogenated oils, Rs. 16,000 in sugar, Rs. 14,000 in paints and varnishes, Rs. 13,000 in non-ferrous metals, Rs. 11,700 in industrial gases, Rs. 10,400 in woollen textiles, Rs. 5,000 in cotton textiles and

Rs. 8,000 in miscellaneous industries. It is rather low in fountain pens, plastic goods, ceramics, printing press, glass bangles and sports goods.

Loans amounting to Rs. 19.61 lakhs and grants totalling Rs. 39 lakhs were advanced to 331 and 153 units under the loans and grants scheme for small industries. Assistance in securing transport and power was also rendered to such units. The allotment of coal to these units amounted to 30,044 wagons. Besides iron and steel and coal dust, they were also allotted 1,400 tons of copper, 125 tons of copper scrap, 350 tons of brass scrap, 160 tons of German silver, etcetera. Essentiality certificates of the c.i.f. value of Rs. 2.75 crores for importing raw materials and components were also issued. Quantity contracts worth Rs. 2.19 crores and rate contracts worth Rs. 1.28 crores were given to these units. Under the hire-purchase scheme, 180 applications for machinery worth Rs. 57.28 lakhs was accepted by the National Small Industries Corporation, New Delhi. The loans sanctioned by the State Bank of India amounted to Rs. 1.59 crores in favour of 416 parties. Preliminaries concerning the establishment of a co-operative spinning mill of 12,000 spindles—eventually to be expanded to 24,000 spindles—have been completed. The mill has raised a paid-up share capital of Rs. 41.50 lakhs, which includes a sum of Rs. 20.25 lakhs contributed by the State Government. A licence for importing machinery has also been obtained.

U.P. Committee to Probe Sugar Bonus

The granting of bonus to sugar workers in U.P. for the 1960-61 season has been referred to a committee by the tripartite conference which met in Naini Tal recently. Representatives of sugar mills were initially opposed to the appointment of the committee, since they wanted to stick to the decision of the Sugar Wages Board in this matter. Representatives of labour were, however, equally determined to have a committee, as they felt that otherwise due to the longer crushing season and consequent lowering of the recovery percentage, the size of the bonus would be adversely affected. The Chief Minister, Mr. C. B. Gupta, while appealing for a compromise said that although the Wage Board's formula for fixing bonus was there, it did not rule out regional variations provided they were mutually agreed upon. For the past 12 years, bonus to sugar workers in U.P. had been paid on an agreed basis. The bonus for the last season was Rs. 1.04 crores. Although the State's sugar production during the present crushing season is expected to be about 6 million maunds more than last year, the mills have pleaded their inability to pay bonus on account of the accumulation of stocks and also because wages in the industry had been raised as a result of the Wage Board's recommendations. In accordance with the Wage Board's formula, bonus will be 20 percent or 22 percent of the profits—the difference between the cost of production of sugar calculated in the manner suggested by the Tariff Board and the income earned by sales. As far as U.P. is concerned, the practice in the past has been to base bonus on the quantity of sugarcane crushed by a factory—eight annas a maund for factories which have crushed more than 500,000 maunds of sugarcane, and 2 annas to 6 annas for factories which have crushed less.

Memorandum on U.P. Textile Wages

Criticising the proposed legislation for implementing the Textile Wage Board's recommendations, the U.P. Merchants Chamber, Kanpur, has suggested that Clause 6 of the Bill should be so amended as to make it clear that no claim for the revision of wages shall be entertained for another five years, whether or not the dear food allowance is merged with wages and irrespective of the proportion and the amount of such merger. The Chamber has also demanded that Clause 6 should provide for the merger of 75 percent of the dear food allowance with the basic wage as recommended by the Textile Wage Board. Furthermore, it is of the view that Clause 7 should provide that the Act shall not apply to such textile establishments as are managed by a committee of directors appointed by the High Court or such other judicial authority or statutory body "consequent upon disputes between shareholders." In a memorandum urging the abandonment of the proposed legislation altogether, the Chamber points out: "When it is realised that 376 out of a total of 478 cotton mills in India have already implemented the decisions of the Wage Board and that as many as 17 mills are closed and they are not thus affected by the decisions and also that there may be about 30 mills in India which, on account of their financial position, will have to be exempted by the Central Government from having to implement the recommendations, the industry as a whole can certainly claim to have honoured the decisions of the Wage Board. The Merchants Chamber of U.P., therefore, feels that both in principle and on facts, the proposed legislation is not only uncalled for but also undesirable. It sets a bad example to other wage boards now functioning and in prospect in as much as it robs them both of the desirability and possibility of reaching unanimous conclusions as a sort of agreed tripartite solution. It will be difficult to expect any implementation of the recommendation of these wage boards without any friction in future if legislation is the only course adopted to coerce everybody concerned into adopting these recommendationns." The Chamber has also pointed out that whereas the Textile Wage Board had stipulated that its recommendations should be taken as a whole, including those on rationalisation, "the Bill in the form it has been introduced in the Rajya Sabha seeks to secure the wages and other emoluments of workers only, completely ignoring its recommendations on rationalisation and modernisation of the cotton textile industry."

Peninsular Plantations Pays Same

The working of the Peninsular Plantations Ltd for the year ended February 1961, has yielded a net profit of Rs. 2,61,699.18 after taxation, compared with Rs. 1,65,243.63 for the previous year. With the amount of Rs. 1,09,470.50 brought in, the amount available is Rs. 3,71,169.68. The directors have recommended a dividend of 20 percent free of agricultural income tax (same as in the previous year). This dividend will absorb Rs. 1,20,000. The balance of Rs. 2,51 169.68 is carried forward to the next year. The total rubber crop for the year amounted to 138,842.14 kilograms, against 173,847.64 kilograms in the previous year. The average price realised was 148.71 cents a lb against 150.08 cents in the previous year.

A SURVEY OF INDIAN INDUSTRIES

With the issue of CAPITAL dated 29th June, 1961, will be published an 88-page "Survey of Indian Industries". It will contain authoritative articles on the problems and prospects of many of India's leading industries such as oil, lignite, fertilisers, shipbuilding, rubber production, iron ore, industrial gases and heavy chemicals. There will be surveys of the progress of lighter industries such as footwear, refractories, tyres, diesel-engine manufacture, watches, lamps, paper machinery manufacture, motor vehicles, food canning and sewing machines. There will also be articles on such subjects as the Calcutta power crisis, the output of ordnance factories and the economics of small-scale industries. The leading article on foreign investment prospects in Indian industry, has been contributed by Sir Percival Griffiths. The supplement will be supplied free to registered subscribers and will be available to others at Rs. 5 a copy (postage extra). Enquiries may be addressed to the Manager, CAPITAL, 5 Mission Row, Calcutta 1.

Pudukotah Textiles Loses

The working of the Pudukotah Textiles Ltd for the year ended December 1960 has resulted in a loss of Rs. 56,506, after writing off depreciation of Rs. 1,78,422, and after adjusting a loss of Rs. 1,00,832 incurred on account of machinery purchased in 1947, which was in dispute for a long time in the Calcutta High Court. The dispute has been compromised out of court by paying a compensation of Rs. 22,500. This together with an advance of Rs. 90,000 against the supply of machinery as reduced by recovery for damages for defective supply, has been written off in the year, since the machinery purchased being defective and incomplete, was not and could not be, put to efficient use from its inception. The directors' report says that as the result of a compromise for the non-fulfilment of a contract for the supply of staple fibre, the company received during the year a sum of Rs. 1,05,000 by way of compensation in full settlement of its claim. The Company's shares, which are Rs. 100 paid up, are now quoted at Rs. 55.

Same from Twyford Tea

For the year ended December 1960, the Twyford Tea Co. Ltd has earned a net profit of Rs. 1,99,128, after providing Rs. 43,967 for depreciation and Rs. 1,80,000 for income tax and agricultural income tax. The previous year's net profit was Rs. 1,13,805, after providing Rs. 100,000 for taxation and Rs. 42,126 for depreciation. With the amount of Rs. 565 brought in, the total comes to Rs. 1,99,693. The directors have recommended a dividend of 10 percent subject to tax (same as in the previous year). This dividend will absorb Rs. 1,57,500, leaving a balance of Rs. 42,193, which is carried forward to the next year. The total tea crop for the year amounted to 1,078,797 lbs, compared with 963,293 lbs for the previous year. The cost of production was lower at 158.85 cents a lb, against 179.20 cents in 1959. The net average price realised was 206.17 cents, against 216.83 cents a lb in 1959. The estimated crop for 1961 is placed at 1,125,000 lbs.

CORRECTION

On page 923 of the issue of *Capital* dated 15th June in the paragraph entitled "Rajgarh Tea Bonus and Rights". it was incorrectly stated that the ordinary taxable dividend of 40 percent represented a yield of 78 percent at the current price of the share. This figure should, of course, have been 7.8 percent.

Haileyburia Tea Raises Dividend

The working of the Haileyburia Tea Estates for the year ended December 1960, has resulted in a net profit of Rs. 4,64,502, after providing Rs. 4,30,000 for taxation, and Rs. 1,33,894 for depreciation. The previous year's net profit was Rs. 2,13,414, after providing Rs. 200,000 for taxation and Rs. 94,192 for depreciation. With the amount of Rs. 1,633 brought in, the total comes to Rs. 4,66,135. The preference dividend accounts for Rs. 14,000. The proposed dividend of 15 percent on the ordinary shares (against 12½ percent for the previous year), subject to tax, will absorb Rs. 3,75,000. The balance of Rs. 77,135 is carried forward. The total crop for the year amounted to 1,828,493 lbs, against 1,721,550 lbs for the previous year. The average cost of production was 137.74 cents a lb, against 163.54 cents a lb in 1959. The net average sale price realised was 208.77 cents a lb against 204.02 cents a lb in 1959. The estimated crop for 1961 is put at 1,950,000 lbs.

Radio and Electricals Expanding

For the year ended 31st December, Radio and Electricals Ltd, Madras, has earned a net profit of Rs. 21,897.56, after providing Rs. 51,253.42 for depreciation and Rs. 10,000 for bonus to employees, compared with the previous year's net profit of Rs. 1,38,058 after providing Rs. 55,925 for depreciation. With the amount brought in, the total comes to Rs. 24,554.19. Out of this, the directors have provided Rs. 10,768.12 for taxation (which includes a sum of Rs. 768.12, being short provision for income tax in the earlier year). The balance of Rs. 13,786.07 is carried forward to next year. Although there has been a slight increase in sales, the results have been rather unsatisfactory, due to the decline in the price of transformers and an increase in the price of raw materials. The report says that competition in the transformer line is also on the increase. The directors have been negotiating for foreign collaboration for undertaking manufacture of new items of electrical equipment. The Company has now secured technical collaboration of Messrs Merlin and Gerin, a well known French company, for the manufacture of railway switchgear and power transformers. The sanction of the Government has also been received and steps are being taken for implementing these schemes. The Company is also opening a branch factory in Hyderabad.

THE HOME MARKET FOR TEA

THE question of selling tea in Calcutta and its environs seems to be attracting some attention, but there are several points in connection with it which do not appear to have been clearly brought out. First and foremost, we noticed in a contemporary that tea was being given at 4 annas per lb to be retailed. Had the tea been a common dust even, then the price is too low. What is wanted is to get rid of a quantity of common tea but the price netted to the estate should not be less than 4 annas per lb; else, no relief will be given. There are very few estates that can turn out their teas at 4 annas per lb, and it is no use putting a price upon the tea to be disposed of unless it gives some benefit to both parties. Another thing is, that even if the natives take to drinking tea they will later on be averse to paying more for it, than they did at first. It would surely be a far wiser policy to start at a price that can be reduced, and, we hope that those most interested will endeavour to start at something not less than 8 annas per lb for our best pekoes, down to 5 annas for souchong, and 4 annas for dusts. Even at these figures enormous profits can be made if tea was retailed by the cup even at a pice a drink. The native of India is like Hodge at home, he does not value a thing unless he has to pay well for it, we do not mean an exorbitant price but one that will leave a fair margin of profit to the grower, middleman and retailer.

FROM

CAPITAL,

20th June, 1901

A Ditcher's Diary

INDIA SEEMS AS UNENTHUSIASTIC ABOUT JOINING A neutralists' summit as Britain is to join the Common Market; but there is a tide in such affairs which it is not easy to swim against. The awful fact is that the pace is set by others, not because reason is on their side but because they have ganged up and one hates the feeling of being left out. Like individuals, nations can feel lonely too; and so Mr. Nehru will go to Bled in the full knowledge that, apart from a holiday for the participants, nothing much will come of the conference. Precious little comes of most conferences; but when a medley of countries with next to nothing in common get together for a huddle on nothing in particular, even meaningless verbiage can do harm. India, for instance, will sit together with countries whose neutrality is, to say the least, dubious in the extreme. Or, to put it differently, their neutrality consists almost wholly in being firmly anti-western. Mr. Khrushchev has laid it down with some finality that although countries may be—just may be and no more—there is no such thing as a neutral individual. That is why he will have nothing to do with Mr. Hammarskjoeld. It is thus easy to see that he will take little notice of the September song from Yugoslavia. The West can be sure in advance that there will be long resolutions against its many sins, real and imagined. Will there be anything said against the Soviet Union? I doubt it. Anything against China? Even that I doubt. Mr. Nehru is the kind of man who would hate to enlist other countries' support in his unfortunate row with Peking. First, he worked harder than anyone else (save Mr. Krishna Menon) to make the communist régime in Peking respectable to the world outside. Secondly, he thinks he can yet "fix" Mr. Chou En-lai all on his own with his sweet reasonableness. I will not comment on either of these rather touchy subjects; but I simply do not see what India expects to gain from a neutralists' "summit". As a matter of fact, her efforts to restrain the more irresponsible "neutralists" have already earned her not a little misunderstanding.

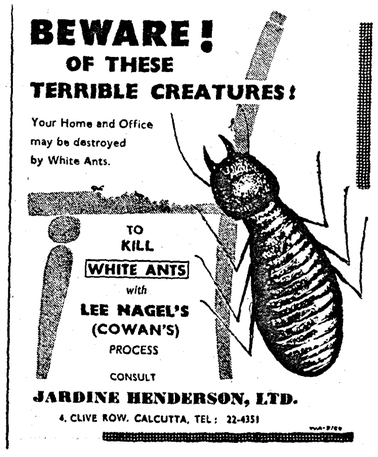
IT WAS NOT VERY WISE OF INDIAN MUSLIMS TO hold a convention of their own at a time when the move was so easily capable of being misunderstood. In his message, Mr. Nehru shrewdly stressed the overriding importance of national unity as against any community's sectional interests, which was perhaps the reason the organisers were at such pains to justify themselves by passing resolutions such as the one on the need to eschew all kinds of communalism. Yet some fiery speeches were made, and some speakers went so far as to allege, and with considerable bitterness, that muslims are being deliberately kept out of government service. What exactly can be done in the matter was not suggested; neither the Constitution nor the rules of recruitment discriminate against any community. Only the scheduled castes are treated as a special case, and that is entirely justifiable. In Madras, I understand, a certain caste ratio is maintained in government service, but this is the only State I know of which does this kind of thing. If the principle were to be extended to the country as a whole and communal proportions were fixed for recruitment to the civil services, how then could efficiency and integrity be maintained? What struck me as the oddest of demands was the one made for a more adequate representation of muslims in trade and industry. How this can be assured by an external authority such as a government, I cannot imagine. So much depends on skill, aptitudes and willingness to work, and, of course, requirements. No, this is a matter in which communities can only help themselves. There are other minorities, Parsis for example, and even the muslims' co-religionists, the *Bohras* of western India, who have achieved prosperity in trade and industry. They do not get any special help from government. The remedy is to be more enterprising; the field of small-scale industries and industrial co-operatives, for example, is wide open.

THE SHOCK I RECEIVED ON OPENING MY LAST month's bill from the chemist's called for a hurried resort to the aspirin bottle. Was it possible, I asked myself, to pour so much medicine and so many pills into a single small family in the remarkably short time of 31 days? Apparently it was, because whoever had totalled the bill seemed to have mastered his arithmetic. But on closer inspection I discovered the reason its total was so large; it was not so much the quantities as their prices. The bill was, in fact, the first evidence I had noticed of the Government's persistent efforts to price drugs and medicines, along with Scotch whisky and other necessities, completely out of the market. Now I am wondering what will happen to Calcutta's much-cherished hypochondria if this trend continues. In a city where, apart from cocktail parties, the most likely place to meet one's friends is in the doctor's waiting rooms, the inflation of such prices can be a major disaster. No doubt the sterner souls will point out how much better we shall be when we cease to absorb such inordinate quantities of physic into our neurotic systems. I could not disagree more. This may no longer be the aspirin age, but it is certainly the era of the tranquilliser, the pep-pill, and the patented and widely-advertised cure-for-what-ails-you, and the psychological consolation derived, if not the strictly medical benefit attained, should not be under-rated. There are greater dangers to society and the individual than the harmless dosing of oneself with pills, potions and preparations. I could suggest the heartless pricing of essential medicines out of reach of the sick poor, for one. Seriously, what is a minor irritation for the richer hypochondriac can be a matter of life and death for the poverty-stricken sufferer. Personally, I cannot understand how any government professing to have the poor man's interests at heart can contemplate anything of the kind, whether by excise duty or import restriction. It simply does not make sense. But then, neither does the acceptance or even encouragement of price inflation—the most fruitful source of social injustice known to economic science—by a government which excuses a host of crippling burdens on the grounds that it is trying to build a society based on justice for all.

THE COMMONWEALTH PRESS UNION, I FIND, WILL meet in India and Pakistan in October. I think I know why Ceylon is not another venue too, for by the time October comes along there may not be many newspapers left in that country of which to be proud. The other day I had a look at the draft Press Control Bill; and I could hardly believe that a country included in the Commonwealth could conceive of such absurd restraints on one of the most fundamental freedoms of democracy. There is much to be said for licensing doctors, for quacks cannot be permitted in any society to play with people's lives. Journalists can do harm too; but for authority to presume to prevent anyone from owning or editing newspapers without a licence is to proclaim that it is afraid of its own people. No government really enjoys criticism, except when it is "constructive" (which means support of everything done by it); but most governments profit from criticism. Oscar Wilde once said that there is no tyranny like the tyranny of the weak. I am not suggesting that Mrs. Bandaranaike is weak; it takes a bit of doing to be the world's first woman prime minister, especially in the turgid politics of Ceylon; but I put it to Mrs. Bandaranaike that, by gagging the Press, she will be robbing herself of one of her best instruments of power. Ministers hate to acknowledge it; but it is true that they often know of the misdeeds—sometimes conspiracies against Ministers themselves—of their officials from reports in the newspapers. When Mrs. Bandaranaike has abolished a free Press she will find that she lacks the information she needs to run the Government; she will also have to do without the benefit of alternative opinions. She will have only the official advice to go by; and this does not always coincide with the public weal. It is this practical aspect of the functions of the Press that I stress because I do not think anybody in the Ceylon Government believes any more in freedom in the abstract. More when she may be in the opposition, but even when in charge of the Government, Mrs. Bandaranaike needs a free Press as much as the country and its people need it.

THE POLICE SERGEANT WHO STROLLED OVER TO MY car the other day and explained to my driver that he should have carried on when the lights changed suddenly instead of stopping well past the white line and reversing to the head of queue, was cheerful, polite and thoroughly helpful. It was a pity that his good work was wasted at the very next set of traffic lights when the same thing occurred and the constable on duty waved us back into line. If the police are really serious about improving Calcutta's traffic chaos I suggest they start by agreeing among themselves what to do about it. The other evening I was stopped by a constable at a crossing and beckoned on by another one who was in the middle controlling it. When I drove away after putting my head out of the window and giving them a piece of my mind I was followed by what sounded suspiciously like a rude noise. The trouble is that one never knows what Calcutta's traffic policemen intend, their signs being generally ambiguous and indecisive. And this, I suspect is deliberate, because I have often witnessed the situation where a vehicle has done the opposite to what has been signalled to it in a half-hearted fashion, and the policeman has shrugged his shoulders obviously glad to have had his mind made up for him. It must be difficult to stand in the middle of a crossing, defenceless in one's isolation, and have to make decisions requiring the compliance of so many different people all at once. But there is at least the consolation of knowing that one's word is law, that one is there for that sole purpose, and that most drivers will respond quite gratefully to a clear signal decisively given.

THE DITCHER



ASHOK LEYLAND LIMITED

MADRAS

CHAIRMAN, SIR A. R. MUDALIAR'S REVIEW

Speech delivered by Sir A. Ramaswami Mudaliar, K.C.S.I., D.C.L.(Oxon), Chairman, Ashok Leyland Limited, to the Shareholders at the Twelfth Annual General Meeting of the Company held on 15th June, 1961 at Ennore, Madras.

Gentlemen,

I have great pleasure in extending to you a cordial welcome to the 12th Annual General Meeting of your Company.

The Directors' Report, Audited Balance Sheet and Profit and Loss Account for the year ended 31st December 1960 have been circulated to you, and with your permission, I shall take them as read.

As the Balance Sheet and Profit & Loss Account have disclosed to you, 1960 may be considered to have been a reasonably satisfactory year. The output of Comet chassis for the year was 43% in excess of that for 1959 and it has, therefore, been possible for your Directors to recommend the same dividend as previously. That is, the increased capital has been as profitably employed as has been the case for some years.

Manufacturing Programme

It is probable that in retrospect 1960 will have proved to be a memorable year. Not only has the Factory maintained progress with the Manufacturing Programme while increasing production and sales by an appreciable percentage, but also the foundations have been laid for the expansion of output to which I referred in speeches at the last Annual General Meeting and at subsequent Extraordinary General Meetings. It will be appropriate for me to give a brief history of the steps which have been taken during the year to ensure that our output will keep pace with the sales demand. In February, Messrs. S. Markland and D. G. Stokes, Directors of Leyland Motors Ltd., visited the Factory and had discussions with your Directors regarding the proposed expansion programme; and arising from these discussions, decisions were taken in the same month to ask your approval to an increase in the Authorised Capital to Rupees Ten Crores. In February also, following representations made at an earlier date to it, the Government of India approved Leyland Motors' share of the Company's capital being increased to 60%. In April, you approved at an Extraordinary General Meeting the proposal to increase the Company's Authorised Capital to Rupees Ten Crores as a preliminary step towards the ultimate financing of the proposed expansion programme. In this month, your Directors also decided to apply to the Government of India for their approval of a programme to increase the production of Comet chassis to 5,000 per annum and in addition to tool up for an annual production of 1,000 '600' type engines which are used in chassis heavier than the Comet. It was also proposed to add 20% extra productive capacity to provide for the manufacture of spare parts required for the maintenance of vehicles in service. In July, an application was made to the Controller of Capital Issues for consent to the issue of Rs. 172.25 lakhs capital for the provision of buildings and plant and equipment to cover the first phase of the expansion scheme Following a resolution taken at a Board Meeting held in October and the receipt of a Consent Order regarding the proposed new capital issue early in November, you approved at an Extraordinary General Meeting held at the end of November, the issue of Rs. 172.25 lakhs capital of which Rs. 139.10 lakhs was offered to Leyland Motors to bring their shareholding to 60% of the total issued capital of Rs. 497.25 lakhs. Messrs. Leyland Motors took up this offer and this decision will provide the necessary foreign exchange for the purchase of plant and equipment.

Design and Layout

Coincident with the successive steps taken to provide the necessary capital for your Company's expansion, planning commenced in regard to the design and layout of buildings and of machine tools and other equipment to be accommodated in them. A contract was let in April for the steel work for the main building extension which will add 125,000 sq. ft. floor area for additional machine shops, assembly shops, etc. This addition with other building works, including the extension to the Canteen, a new Training Centre and improvements to office accommodation will bring the total covered area to 12.65 acres. A contract for the builder's work for all these new buildings was let in August. The precaution of placing early orders for steel work and other building construction resulted in erection of the new buildings commencing before the year end. I am pleased to be able to report to you today that such good progress has been made that it will be possible for the installation of plant and machinery in the new shops to commence in the second half of 1961. This fits in with the promised deliveries for machine tools and other equipment which will be shipped progressively from July 1961 onwards.

At your last Annual General Meeting, I reported to you that the establishment of a Foundry in collaboration with Messrs. Leyland Motors Ltd., in which this Company would have 25% of the capital and Leyland Motors 75%, had been approved by Government and at that time I anticipated full scale production of castings might commence in the first half of 1961. Certain unavoidable delays occurred and actual delivery dates of major items of equipment have been later than was originally promised. I am pleased to be able to inform you, however, that by the end of this year, Ennore Foundries Ltd. will be in a position to meet all your Company's requirements of iron castings; and progressively from that time onwards, surplus capacity will become available which will be utilised for the production of castings for the other manufacturers. Mr. West, Vice-Chairman of Leyland Motors and Chairman of West Yorkshire Foundries Ltd., accompanied by Mr. F. Grimshaw, Leyland Motors Ltd.'s General Works Engineer, visited your Factory in November, the principal object of their visit being to acquaint themselves at first hand with the progress being made with the erection of the Foundry. I am sure you will agree with me that we are fortunate to be able to depend on the advice of Mr. West who is acknowledged to be one of the leading authorities on Foundry Practice.

Excise Levy

In my speech at the last Annual General Meeting, I referred to a levy of excise duties which occurred on the 1st March 1960; and I expressed the hope that the incidence of such duties on the development of road transport would be carefully studied and that such a study might lead to the abolition or at least the lowering of these duties. It can only, therefore, be considered most unfortunate that far from lowering excise duties, they have since been increased. The 1961 Finance Bill provided for additional import duties and excise duties which will still further increase the price of materials used in the manufacture of motor vehicles; and will probably necessitate a corresponding increase in the retail price of the Comet chassis. The Finance Minister met a deputation from the Association of Indian Automobile Manufacturers when the latter represented to the Minister the seriousness from the point of view of the Industry's welfare of the latest levies. The Minister could not give hope of any reduction in duties.

During 1960, the Company commenced the marketing of industrial engines. To enter the market for industrial engines entails producing Comet engines additional to those required for use in the Comet chassis. With tooling available, it was not practicable to achieve a very high output and the total sales of industrial engines amounted to 162. Our incursion into this market, however, has demonstrated that there is a good demand for industrial engines with the performance characteristics of the Comet, and that there will be a similar demand for the heavier engines which are about to come into production. It is possible, therefore, to anticipate that as soon as it is practicable to increase the output of engines additional to those required for the Company's own chassis, there will be considerable revenue from the sale of industrial engines.

Export Business

For some time now, your Directors have had in mind the importance of export and attempts have been made to secure an entry into overseas markets. These efforts have been to some degree successful and your Company's export business commenced with the sale of 24 Comet chassis to the Ceylon Transport Board during the 1960 year. Efforts to secure export business will be continued because it is not only advantageous from the country's point of view but also from the Company's, as the Government of India provides additional foreign exchange to manufacturers who secure overseas business which can be utilised for the import of materials which are not available from indigenous sources.

It is my custom at your Annual General Meetings to attempt to give some idea of what the future holds as well as to review the results of the previous year. I do not think that apart from one particular issue to which I will refer a little later, 1961 will be very different to previous years. It will undoubtedly be a difficult year because there will be a high level of expenditure on new buildings and new plant which will not immediately give rise to a corresponding increase in output. Nevertheless, it is hoped that production will again show a substantial increase on the previous year. In addition, I can anticipate with confidence that further progress will be made in the deletion of imported components and materials and, as I have already stated earlier in this speech, castings will be eliminated from materials to be imported. Towards the end of the year, new machine tools and equipment will be received in increasing volume and buildings being ready for its immediate installation, it will come into use without delay. Production, therefore, will be on a rising curve as the 1961 year approaches its end, but the new plant and machinery will not have any really appreciable impact on the output of chassis until 1962. 1961, therefore, is likely to be a period of transition from low level production with the exclusive use of standard machine tools to higher volume production with an increasing use of special purpose machine tools; and the installation of the latter will commence during the current year.

I have referred to one difference which will distinguish 1961 from other years This is the change in the financial year end from 31st December to 30th September. This decision was made by your Directors in order that the Company might fall in line with our Associates, Messrs. Leyland Motors Ltd., whose financial year is from 1st October to 30th September. The current year, therefore, will be of nine months duration from 1st January to 30th September when a Balance Sheet and Profit & Loss Account will be prepared for the year ended 30th September 1961. Thereafter, the financial years will run from 1st October to 30th September inclusive.

I have already referred to visits from Directors of Leyland Motors and I must once again place on record the invaluable advice both with regard to the work of the Factory and its expansion which we receive from them. I am sure you will desire me to convey to them and above all to Sir Henry Spurrier our thanks for all the help and guidance received.

I must also take this opportunity to recognise the enthusiastic help and co-operation that has been extended to your Directors by the Officers, staff and workpeople both on the factory side and on the administrative office side. I should like to convey our thanks to all of them.

Note: This does not purport to be a record of the proceedings of the Annual General Meeting.

Money

THE CALCUTTA MONEY MARKET

SLIGHT FALL IN ADVANCES

Wednesday, 21st June.

ADVANCES declined slightly in the Calcutta money market during the past week. There was a sharp fall in the requirements of the jute industry and the engineering and iron and steel industries. Demand from the cotton mills was slightly less, but call for accommodation against grains and seeds storage increased fractionally. The needs of the sugar mills showed a slight increase. In the interbank market, conditions became tighter and the call rate increased to 4½ percent, but fell to 4½ percent at the close today in the face of slightly easier conditions.

There has been a further improvement in the supply of exchange bills during the past week, chiefly on account of gunny shipments. Remittance demand has been moderate to poor. In the London money market, the pound showed a firm tendency at the beginning but gave way to renewed weakness later following reports of a deterioration in the British balance of payments during May. Towards the close, however, some of the lost ground was regained, although closing quotations showed fractional losses against all important currencies with the exception of the Canadian dollar.

BULLION WAS STEADY IN THE PAST WEEK. SILVER was quoted at Rs. 236 a 100 tolas for ready delivery and the rate for forward delivery was quoted at Rs. 201.50. The London and New York prices were 79¾d and 91.375 cents.

Gold was steady in sympathy with silver. The price advanced from Rs. 143 to Rs. 143.50. Sovereign at Rs. 96.25 showed a gain of 50nP.

DURING THE WEEK ENDED 16TH JUNE, GOVERNMENT of India Treasury bills for Rs. 1,16,31,50,000 were sold in favour of the Reserve Bank.

TENDERS FOR RS.2 CRORES OF 91-DAY GOVERNMENT of India Treasury bills were opened on 20th June. The total amount offered was Rs. 2 crores. Tenders at Rs. 99.335 percent and above were accepted in full. The total amount accepted was Rs. 2 crores, the average rate of acceptance being Rs. 2.650 percent a year. Tenders for Rs. 2 crores of 91-day Government of India Treasury bills will be received at all centres up to the close of business on 26th June.

IT IS STATED THAT 91-DAY INTERMEDIATE TREASURY bills will be sold from 21st June to 23rd June at Rs. 99.356 percent, subject to the conditions previously announced that sales can be stopped at any time without notice if the Government thinks it necessary. These bills sold from 14th June to 17th June, amounted to Rs. 30 lakhs only.

A DECLINE OF Rs. 14.31 CRORES TO Rs. 1,968.99 crores in active notes was a notable feature of the return of the Rserve Bank of India during the week ended 16th June, 1961, but the total note issue rose by Rs. 1.25 crores to Rs. 1,995.62 crores. Notes held in the Banking Department consequently increased by Rs. 15.56 crores to Rs. 26.63 crores. Deposits of the Government rose by Rs. 30.64 crores to Rs. 80.73 crores due to good tax collections, but other Government accounts declined by Rs 5.63 crores to Rs. 5.44 crores. Balances of commercial banks at Rs. 86.25 crores showed a rise of Rs. 2.92 crores. Balances held abroad again fell by Rs. 1.69 crores to Rs. 15.78 crores. Investments increased by Rs. 10.81 crores to Rs. 214.66 crores. Other loans and advances declined from Rs. 118.50 crores to Rs. 118.24 crores, of which advances to scheduled banks against usance bills amounted to Rs. 13.78 crores (Rs. 14.03 crores). Ways and means advances stood at Rs. 83.02 crores, against Rs. 77.01 crores.

THE RETURN OF THE STATE BANK OF INDIA FOR THE week ended 9th June, 1961, shows a fall of Rs. 72 lakhs to Rs. 531.95 crores in total deposits. Investments in Government securities are down by Rs. 13.82 crores to Rs. 212 52 crores, while other authorised investments remain unchanged at Rs. 9.29 crores. Advances, including loans, cash credits, overdrafts, and bills discounted and purchased have increased by Rs. 3.04 crores to Rs. 270.69 crores. Cash and balances are, in consequence, shown at Rs. 24.83 crores or Rs. 4.42 crores higher.

THE STATEMENT OF THE POSITION OF SCHEDULED banks for the week ended 9th June, 1961, shows Demand and Time liabilities at Rs. 822.88 crores (Rs. 25.82 crores on account of borrowings from banks) and Rs. 1,127.70 crores (Rs. 14.50 crores), compared with Rs. 827.09 crores (Rs. 26.22 crores) and Rs. 1,120.61 crores (Rs. 15.55 crores), respectively, in the previous week. Cash has decreased by Rs. 23 lakhs to Rs. 46.37 crores and balances with the Reserve Bank have also fallen by Rs. 2.20 crores to Rs. 76.76 crores. There is a drop of Rs 3.34 crores to Rs. 537.11 crores in investments. Advances and bills discounted at Rs. 1,288.49 crores show a fall of Rs. 7 lakhs. The ratios to total liabilities of cash and balances, and of advances and discounts are, in consequence, shown at 6.3 percent and 66.1 percent, against 6.4 percent and 66.2 percent.

TREASURY BILL MATURITIES

Details of 91 days' bills outstanding with the public on 23-6-61.

Issue Date	Maturity Date	Amount (000's Rs.)	Average Acceptance Rate

Stocks and Shares

SPECULATIVE SHARE PRICES FLUCTUATE WIDELY

OPERATORS FEAR OFFICIAL RESTRICTIONS

Wednesday Evening.

THERE have been wide fluctuations in speculative shares in the Calcutta stock market in the past week. Rumours concerning further restrictions on trading largely governed sentiment. Lyons Range was inspired by advices from Dalal Street where share prices moved up and down on talk of changes in the margin system. At the close, confidence seems to have returned on the view that the Bombay stock market may maintain the *status quo* in the margin system, at least for the time being. As far as Lyons Range is concerned, operators appear to have been unduly disturbed on this account because there is little sign that speculation has been excessive in this centre since the announcement of the last Central Budget. So the authorities of the Calcutta stock market are unlikely to make any change at present. It is believed that the existing rules and regulations are adequate to restrain speculation.

As a result of the heavy shake-out, the technical position is believed to have improved, which is evident from the recovery which has taken place at the close. At today's settlement, the price of Indian Iron shares has closed at Rs. 27.95. The moderate carry-forward charges are considered helpful. Steel shares have been fancied on the view that they now carry the dividend for the year ended March 1961, which is likely to be announced in the near future. Talk of an early increase in the retention price of steel has also promoted steadiness.

The stock market is worried about the recent move to regulate underwriting commission. The Company Law Department is reported to have represented to New Delhi that the commission is at present excessive. Although all underwriting commissions have been paid within the statutory limit of 5 percent, the Department seems to think that they are still rather high, specially in the case of those underwriters who also take up a portion of shares themselves. This concern for shareholders is difficult to understand considering what they have suffered in various other ways due to the activities of the Department. This besides, there is little justification for making a fuss about the underwriting commission. Not only is it moderate, but underwriting business has just begun to be developed on a large scale; and it would be a great mistake to discourage it at the present stage. If investment habits are to be promoted, the institution of underwriting is an essential prerequisite. Good underwriters provide not only safeguards for investors by sifting share issues in the light of their expert knowledge, but they also help companies obtain their capital requirements more easily. Instead of wasting time fighting out the battle over commission, the Company Law Department would do well in concentrating on other more important matters.

Investment buying is running at a low level, but it is expected to improve in the coming weeks when money conditions become easier. It is possible there will be a bigger flow of funds into the banking system when the pressure of demand declines. This does not imply that the stock market will also benefit from the increased banking resources. Under the circumstances, the fear that the Reserve Bank may tighten up its control on the flow of banking credit into stocks and shares further appears to have been exaggerated. In any case, the existing restrictions on advances against stocks and shares are sufficiently stiff.

Judging from the trend, there is little ground for thinking that share prices have increased unduly. During the past year or so, the index of variable dividend industrial securities has increased only from 174.8 to 184.2 (1952-53 equals 100). The modest rise is justified by the economic growth which has taken place meanwhile. There is no denying that the prices of some blue chips have increased remarkably, but this is due more to the shortage of floating scrip than to speculation. As long as an institutional investor, such as the Life Insurance Corporation, holds a substantial portion of good shares, the trend cannot but be upwards.

The recent ordinary share issue of Dr. Paul Lohmann (India) Ltd is reported to have been oversubscribed three-and-a half times. The directors have allotted shares to every applicant. Apolicants for 100 shares will receive 35 shares, 200 shares 50 shares, 300 shares 75 shares and so on. Allotment letters and refund pay orders will be sent from 15th July, 1961.

In the market, engineering shares have not been fancied due to shortages of electric power and raw materials. Texmaco have fluctuated on speculative manipulation. J. K. Steel and Jay Engineering have met with interested support. Jessops are neglected, but Guest, Keen, Williams have recovered on replacement buying. Braithwaite and Indian Standard Wagon have gained on good corporate news.

Selected coal shares have been steady, but turnover has fallen. Investors are inclined to watch further developments concerning the World Bank's loan for expansion. The coal industry has sent a representative team to Washington for finalising the terms and conditions of the proposed loan. But it looks as if collieries having adequate financial resources will be better placed in taking advantage of the foreign loan. Bengal, Burrakur, New Beerbhoom, East Indian and Amalgamated have been in demand.

Prices of speculative miscellaneous shares recovered at the close on replacement buying. Indian Cables, Dunlop Rubber and Hindustan Motors were prominent. Indian Aluminium closed below the best level touched earlier. Orissa Minerals improved on good working reports. Britannia Biscuits were firm on hopes of a bonus share issue. British Paints rallied, as did Metal Box, on producing a good report. Interested support has been forthcoming for Electric Construction and National Insulated Cable. Duncan Brothers have met with interest on the prospects of a rights share issue. Alkali Chemicals, Union Carbide and Rallis have been maintained. Paper shares are quiet on the fear that the profitability of the industry has been hampered by price cuts in the commodity. Orient and Titaghur have lost further ground.

Cotton mill shares have been boosted on hopes of higher production and greater modernisation. Bharat Commerce, Dunbar and Kesoram improved. J. K. Rayon fluctuated narrowly.

There are more sellers than buyers in jute shares on the apprehension that the current working of mills may show considerable deterioration. Birla, New Central and Anglo-India have met with scattered support.

Sugar shares were neglected because export prospects are considered uncertain. Carew, S. K. G. and Ramnugger Cane have met with some buying.

Selected Assam and Dooars gardens have been picked up by bargain-hunters. Bishnauth, Hantapara, Huldibari and Tezpore have improved. Jay

Shree are being bought by knowledgeable quarters on the decision to issue bonus shares.

Government securities are dull. Prices of long-dated loans have reacted further and the 3 per-cent Conversion loan 1986 has declined to Rs. 72. In spite of a fair demand for short-dated stocks, business has been small due to the shortage of offers.

Engo Tea

A dividend of 6 percent, subject to tax (against nil) has been declared by Engo Tea Co. Ltd for the year ended December 1960. The profit has risen from Rs. 41,335 to Rs. 1,04,620, after allocating Rs. 26,405 for depreciation (against Rs. 15,560). Taxation absorbs Rs. 5,000 and development rebate reserve gets Rs. 19,779. Bringing in the debit balance of Rs. 710 and making other adjustments, there remains a balance of Rs. 7,131 to be carried forward. The crop amounted to 134 440 kilograms (against 132,574 kilograms). The average sale price was Rs. 4.20 (against Rs. 4.58) a kilogram. Estimates for the current season provide for a crop of 150,000 kilograms, to cost Rs. 5.25 lakhs.

Pathemara Tea

The profit of the Pathemara Tea Co. Ltd has declined from Rs. 94,143 to Rs. 11,129 for the year ended December 1960, after providing Rs. 36,304, (against Rs. 31,493) for depreciation. The ordinary dividend has been passed again. After making other adjustments, there is a debit balance of Rs. 1,07,282 to be carried forward. A crop of 194,141 kilograms (against 240,114 kilograms) was manufactured and the average sale price of Rs. 4.63 (against Rs. 4.34) a kilogram was realised. Estimates for the current season have been framed for a crop of 217,724 kilograms at a cost of Rs. 7.92 lakhs.

Burma Lime and Chemical

Providing Rs. 57,100 (against Rs. 58,000) for taxation, the profit of the Burma Lime and Chemical Co. Ltd has increased from Rs. 48,894 to Rs. 69,757 for the year ended September 1960. A taxable dividend of 10 percent has been declared, absorbing Rs. 26,403. Allocations include Rs. 25,000 for reserve fund (against same) and Rs. 15,000 for dividend equalisation fund (against Rs. 10,000). With other adjustments, there is a carry-forward of Rs. 9,780, against Rs. 3,276.

Bombay Market

MARKET CLOSES ON STEADIER NOTE

CHANGE IN MARGIN SYSTEM PROSPECTS WELCOMED

Wednesday Noon.

THE Bombay stock market closed the past week in a steady mood after heavy fluctuations. Prices of some shares moved up and down on alternate waves of buying and selling inspired by conflicting rumours concerning the margin system. At the close, sentiment improved in the belief that there would be no change in the existing margin and *hawala* systems. The sub-committee of the stock market, which has submitted its report, is believed to have recommended the maintenance of the *status quo* in this matter. The decision of the Ahmedabad Stock Exchange not to introduce any change at present is considered as a pointer.

The improvement at the close was due to hectic replacement buying induced by some favourable developments. There were shortages of floating stocks due to heavier deliveries. The stock market expects there will be a bigger flow of funds into stocks and shares in the coming weeks in view of the return of funds into the banking system following a decline in the pressure of the busy season demands. Corporate news is good and some companies are expected to issue further shares in the near future.

Steel shares were boosted on talk of an early rise in the retention price of steel. Operators also thought that the Tata Iron and Steel Company might pay higher dividends for the year ended March 1961. Tata Steel closed at Rs. 163.75 and Indian Iron at Rs. 28.10. Engineering shares showed mixed trends. Tata Locomotive improved further to Rs. 386 on investment support and Mukand Iron gained at Rs. 31.50. Alcock Ashdown lost at Rs. 301, as did Premier Construction at Rs. 203. In motor shares, Hindustan Motors reacted to Rs. 23.12 on pressure, but Premier Automobiles were maintained at Rs. 174.

Cotton mill shares fluctuated widely, but closing levels showed appreciable gains. Century were done at Rs. 717 and Bombay Dyeing came to hand at Rs. 70.30. Standard recovered to Rs. 1,480 on replacement buying and Morarji met with support up to Rs. 440 on prospects of a further share [illegible] were transacted at Rs. 317 and Svadeshi were taken at Rs. 283. Khatau were steady at Rs. 603.75 and Finlay changed hands at Rs. 320. Simplex were placed at Rs. 216 and India United Ordinaries came to hand at Rs. 15.08. Apollo were offered freely down to Rs. 1.48.

Miscellaneous shares moved in line with the general trend. Sugar shares turned soft, and Belapur were sold at Rs. 275. Phalton declined to Rs. 134, as did Walchandnagar Industries to Rs. 164. Cement shares were steady, and support was forthcoming for Associated Cement at Rs. 164. But Digvijay reacted to Rs. 157 on profit-taking. Mining shares were steady, and Shivrajpur Syndicate were dealt in at Rs. 71. Steamship company shares were easier, and Scindia Steam were sold down to Rs. 14.36. Great Eastern Shipping were freely offered at Rs. 14.12. National Rayon recovered to Rs. 572 on short-covering due to expansion prospects. Bombay Burmah rallied to Rs. 642 on hopes of a higher dividend. Baroda Rayon were steady at Rs. 126, but Gwalior Rayon lost at Rs. 53.70 on profit-taking. Voltas were steady at Rs. 300, as were Tata Mills at Rs. 66.50. Chemical Shares were quiet, and Tata Chemical were available at Rs. 20.64. Colour-Chem were steady at Rs. 375 on the decision to issue rights shares but Indian Dyestuff lost at Rs. 527.50. Ceat Tyre were quiet at Rs. 210, but Synthetics and Chemicals were maintained at Rs. 173. Magnets met with support up to Rs. 97.

Turnover was small in banking shares, but prices showed little variation. Central Bank came to hand at Rs. 57.30 and Bank of India were done at Rs. 123.50. Insurance shares were quiet, and New India Assurance lost at Rs. 61.70. British India General were sold down to Rs. 12.15.

Scattered interest was taken in electric company shares, and Ahmedabad were transacted at Rs. 85. Bombay Suburban were placed at Rs. 89 and Tata Power were indicated at Rs. 1,075.

Madras Market

PRICES RULE STEADY DESPITE DOUBTS ELSEWHERE

GOOD CORPORATE NEWS HELPED SENTIMENT

Tuesday Evening.

THE Madras stock market has been steady during the past week and prices of selected shares were maintained. Rapid movements in Dalal Street and Lyons Range had little effect. Good corporate news, combined with hopes of a larger flow of funds for investment in stocks and shares, helped promote steadiness. Business was small in Government securities, but demand was forthcoming for selected State loans. Selected sugar shares were bought on reports of higher production. Cotton mill shares were fancied on prospects of bigger cotton supplies. Reports of strike notices in many Coimbatore mills were ignored. In the planting group, tea shares were fancied on reports of good offtake. Selected coffee shares were bought on crop reports and investors were not disturbed by talk of excessive production. Selected miscellaneous shares were supported on good corporate news.

In the banking group, Canara came to hand at Rs. 85 and Indian were done at Rs. 172. Business passed in Indian Overseas at Rs. 178 and Punjab National came to hand at Rs. 22.30. Public utilities were neglected and routine business was transacted. Negapatam were done at Rs. 8.75 and South Madras at Rs. 9.87.

Among sugar shares, Deccan were steady at Rs. 14.05, as were E.I.D. at Rs. 43.40. India reacted to Rs. 13.75 and K.C.P. were sold down to Rs. 23.57. Mysore were steady at Rs. 57.75, but United Breweries lost at Rs. 108.

In the planting group, Blue Mountain were steady at Rs. 3.30, but Cochin Malabar lost at Rs. 7.83. Consolidated Coffee met with support up to Rs. 22.08, but Ouchterlony were easier at Rs. 3.78. Business was done in Periakaramalai at Rs. 3.83 and Kil Kotagiri came to hand at Rs. 4.80. Coffee Lands were sold down to Rs. 18.75, but Nilgiri were steady at Rs 8.45. Peermade were bought up to Rs. 22.38 and Swinton were transacted at Rs. 3.12. Thirumbadi were offered at Rs. 1.60 and Twyford were sold down to Rs. 13. United Nilgiri were in demand up to Rs. 24.75, but Woodland reacted to Rs. 8.

Among textile shares, Anglo-French improved to Rs. 135 on paying a taxable ordinary dividend of 15 percent. Buckingham hardened to Rs. 224 on hopes of a bonus share issue, but Bangalore Woollen were maintained at Rs. 202. Travancore Rayon reacted to Rs. 40.40 on profit-taking, but South India Viscose were steady at Rs. 173.50. Lakshmi were done at Rs. 172, as were Madura at Rs. 39.70. Mettur were steady at Rs. 400 and Kothari were done at Rs. 12.60. Sarada were taken at Rs 67 and Vasanta changed hands at Rs. 250. Radhakrishna were bought up to Rs. 33.87 and Rajalakshmi were in demand at Rs. 90.

In the miscellaneous group, Aluminium Industries lost at Rs. 23.60, as did Ashok Leyland at Rs. 9.28. India Cement were steady at Rs. 6.40 on paying an ordinary taxable dividend of 6 percent on old shares. The dividend on the new ordinary shares was paid at the rate of 3 percent, taxable. Mysore Electric Industries were steady at Rs. 219 on paying taxable ordinary dividends of 20 percent on old shares and 10 percent on new shares. The Company has increased the authorised capital from Rs. 20 lakhs to Rs. 50 lakhs. Binny came to hand at Rs. 213 and Tube Investment were bought up to Rs. 265. Textool were steady at Rs. 181 and Spencer were done at Rs. 22.60. Standard Motors were dealt in up to Rs. 16.75 and Parry's Confectionery were placed at Rs. 4.95. Seshasayee Paper declined to Rs. 6.25, but Seshasayee Industries improved to Rs. 11. Mandya National Paper reacted to Rs. 8.40, but United Electrical were in demand up to Rs. 9.50. Kirloskar Electric were quietly steady at Rs. 13.50 and Madras Aluminium were supported up to Rs. 23.50.

THE WEEK'S TRANSACTIONS

NAMES AND DATES

The Consumers Association of India will hold a seminar in Delhi on consumer problems some time in October this year, in order to create consumer-consciousness and focuss public attention on the need for producing quality goods.

London Market

FURTHER HEAVY FALLS IN STOCK MARKET

UNDERTONE REMAINS SENSITIVE

London, 21st June.

THE fall in the stock market which started towards the end of last month, gathered momentum in the past week following the disappointing May trade figures and further widespread and even more substantial losses were recorded. With the exception of tin, and to a lesser extent, tea shares, the whole market fell away sharply and falls are measured in shillings rather than in pence. Gold shares suffered the biggest falls following news of further South African restrictions on the flow of capital out of the Republic. Domestic sections were very far behind however. The trade figures were the biggest influence here, but there were many other contributory factors. These included the decline in steel output, the stream of price increases and the consequent rise in the cost of living, the pressure on profit margins and the weakness of sterling, the last a reflection of the trade figures, and the general uncertain economic situation. Government measures to reduce the overload on the economy are now widely expected and these expectations were another adverse factor. Selling was not heavy, but it was persistent, while buyers were few and far between. Steadier conditions developed on Tuesday, but the market remained very sensitive. Renewed weakness in the gilt-edged market brought many prices down to new all-time lows and Consols 2½ percent fell sharply. Greeks were firm in a quiet foreign market, but dollar stocks receded in the wake of Wall Street. Banking, finance and insurance shares sustained heavy falls. Property shares joined in the general fall. Losses ranged to several shillings in industrials and leading issues in most cases were 2s or 3s, or even more, lower. Leading share indices are now over 10 percent below their peaks reached in mid-May. Falls in gold and diamond shares extended to nearly 20s. Coppers also fell back, but losses here were considerably smaller. Tins moved against the trend in response to the buoyancy of the metal. Oils and rubbers receded quite sharply, but tea shares were steady to firm.

SHEET ALUMINIUM IN JUTE INDUSTRY

Aluminium in its pure form is a rather soft metal; but some of its alloys are known to be stronger than iron, over which it has some advantages. It is rust-proof and light; it reflects heat, and it can be given a variety of finishes. The metal is put to versatile uses in many lines of industry including jute textiles. It is used in the form of jute textile machinery components. Most of these, however, are alloy components, machined castings of aluminium of specified composition. Recently, sheet aluminium of a suitable alloy composition has been used in the manufacture of sliver cans.

THE RECURRING PROBLEM OF BONUS

By Mary Sur

THE "bonus season", with all its recurring problems for industry, is just round the corner. Although the Labour Minister announced the intention to set up a Bonus Commission at the end of last year, the personnel and terms of reference of the Commission are still under discussion. The names originally suggested for membership drew a storm of protest because they did not include representatives of employers and labour. Now it has been agreed in principle to make the Commission representative, but the personnel is not yet finally agreed. There is, therefore, no hope of receiving any guidance from the Commission this year.

According to the draft terms of reference, the Bonus Commission will be asked to consider the question of payment of bonus in all its aspects, including the extent to which bonus should be influenced by the wage level in an industry; whether it should be considered industry-cum-region-wise or merely industry-wise; how prior charges should be determined; whether bonus should be paid in cash or partly in National Savings Certificates; and what is the appropriate machinery for settlement of bonus claims. Somewhat surprisingly there is no reference in these terms to bonus in relation to production, despite the current emphasis on productivity.

Whatever the final terms of reference, the members of the Bonus Commission are not going to have an easy task. They have to consider one of the thorniest questions in present-day industrial relations—a question on which many different solutions have been offered, and on which the Supreme Court has already expended a disproportionate amount of its time.

What people tend to overlook when they heatedly uphold this or that view on bonus is that we have built such barriers around the subject that it can no longer be treated merely as an economic question—as it would be in any other country. It is not just a matter of relative strength at the bargaining table or the capacity of an industry to pay. The whole problem of bonus has to be related to the social background, to the changing concepts of a period of political readjustment and rapid industrialisation.

The psychological origins of the claim for bonus are mixed, and the industrial courts, by taking a "social justice" rather than a strictly judicial attitude to bonus cases, have introduced further overtones. The famous Full Bench Formula is misleading, because it is not a formula at all in the scientific sense. And this so-called formula has been so many times elaborated and interpreted that a whole volume can be written on case law in relation to bonus alone.

Sociological Aspects

Originally, bonus was a gift gratuitously given by the employer (who in the old days was usually both owner and manager of the business) to his employees when trade was flourishing. Normally it was given at the time of the principal annual festival because it was then most appreciated. The paternalism which prompted such a gift is now decried as old-fashioned, but—although the organised worker would vigorously deny it—there is still much of the old "Ma-Baap" attitude about the demand for bonus. It is not uncommon (within the writer's experience) for trade union representatives, when they have exhausted arguments on the amount of the profits and the workers' due share in them, to fall back on the familiar prayer: "We are only poor men. Look at the hardships we are suffering from rising prices. You are our father and mother—you must do something further to help us". And there is nothing insincere about this change of front. The hardship is there. A survey made by the Central Statistical Organisation of the Central Secretariat for the year 1958-59 showed that deficit budgets were a common feature of lower middle-class families, and indebtedness among industrial workers is too well known to require further comment. The need is such that all types of argument must be produced by the unions in order to try and alleviate it.

Employers themselves have in many cases recognised the need by giving a bonus when the profits have not warranted it, or by giving more than the Full Bench formula required. Bonus, it is clear, cannot be regarded merely as a bargaining question, and the worker himself does not see it in this way. The force of social convention cannot be overlooked. In all communities the principal annual festival requires additional expenditure on religious rites, on food, on new clothes and gifts. Apart from their religious significance, which in urban areas is waning, these festivities provide a much-needed relief from the monotony of daily life. They are as necessary in the humdrum life of an industrial community as in the hard life of the agricultural worker, but there is this difference. In the country the festivals are celebrated after the harvest has been gathered and sold, when there is generally a little extra money in hand. In industry earnings may be much higher than in agriculture, but the industrial worker has also more expenses in the town—rent, transport, etcetera—and his wages, while he is in employment, normally remain fairly constant week after week. Where is he to find the extra to pay out at festival time? Perhaps in his village the local zamindar used to provide a feast for the villagers during the festival. To the industrial worker fresh from the village it is not unreasonable to expect that the employer (a vague figure, who to some extent takes over the attributes of the zamindar) should at least provide the wherewithal for some small festivity.

Political Aspects

On the simple outlook of the peasant who has become an industrial worker is imposed the more "political" outlook of the urbanised and organised worker, who argues that he has a legitimate claim on a share of the profits to which he has, through his work, contributed. It is a good arguing point, but trade unions have never faced up to the logical corollary that a share in profits during prosperity must be balanced by a sharing of losses in lean years. The industrial courts, aware of this weakness in the argument for profit-sharing, and unwilling to force it to its logical conclusion, have introduced a rationalisation of their own. Annual bonus, they declare, is neither profit-sharing nor deferred wages. The Constitution of India provides that the State shall endeavour to secure to all workers a living wage, and though no one can give a satisfactory definition of the living wage—which has been aptly described as a "receding horizon"—everyone is clear that the living wage has not yet been reached in industry. Bonus should, therefore, according to the Labour Appellate Tribunal theory, be regarded as a means of reducing the gap between the actual wage and the living wage, wherever on the past year's trading results there is a sufficient "available surplus" of profits, after meeting certain prior charges.

This theory has been accepted by the Supreme Court and represents the "social justice" view of bonus, but in one respect it has not been followed to its logical conclusion. The oil companies challenged their employees' claim for large bonuses with a counter claim that, since they were paying higher wages than any other industry, their employees were already receiving a living wage. Refusing to be drawn into an attempt to define the living wage, the courts fell back on the unconvincing argument that where the goal of living wages had been reached, bonus, like profit-sharing, would represent a cash incentive to greater efficiency.

The formula evolved for calculating the "available surplus" from profits, out of which bonus can be paid, has undergone frequent modification, as the courts have endeavoured to plug first one loophole and then another in its fabric. At the same time insistence on the application of the formula has become more emphatic. In early cases alternative schemes for bonus were sometimes endorsed by the courts, but in a recent case* the Supreme Court ruled that an industrial court did not have jurisdiction to enforce an agreement on bonus which departed from the formula in important details.

Industrial Relations Aspect

Despite the Supreme Court's emphasis on standardisation, many industries and companies are not convinced of the universal application of the Full Bench Formula, and have arrived by agreement at other solutions of the bonus problem. Unions, too, are not unanimous in their support of the Formula. In one industry, for instance, the trade union calculated that on account of the special circumstances of the trade, no bonus could ever become payable according to the Formula. There are, moreover, certain features of the Formula which make it unsatisfactory from the industrial relations point of view. Wide variations in profits between one industry and another lead to wide differences in the bonus paid in neighbouring companies and become a natural source of irritation and grievance. Uncertainty as to how much of the "available surplus" should be distributed as bonus makes negotiation on the basis of the Formula difficult.

The tea industry has taken an independent line on bonus, applying different solutions in different areas. In the south, the tea garden bonus is negotiated State-wise each year as a percentage of the actual wages earned. In north-east India tea gardens have agreed to make bonus a first charge on net profits, and have linked it with attendance. Textile companies in Bombay and Ahmedabad have made agreements to pay a minimum bonus of 15 days' pay even in a year of loss. Hindustan Lever and Bata agreements give a fixed percentage of basic earnings as bonus, subject to certain conditions. Agreements in the aluminium industry relate bonus to production; the Joint Steamer Companies link it to annual turnover in their steamer services.

Another criticism of the bonus formula is that it encourages an annual struggle by the trade unions to prove a higher "available surplus", introduces an element of uncertainty into labour relations, and does not give the employee any assurance of financial relief. Professor J. H. Richardson in his report to the Government of India two years ago recommended that to reduce disputes and remove the element of uncertainty, efforts should be made to stabilise bonus over a period of from three to five years, and that reserves should be set aside in good years for payment of bonus when trading results were less favourable. He also suggested that the surplus above a ceiling of three months' basic pay might be allocated by agreement to welfare purposes instead of increasing cash payments.

The problem that the Bonus Commission will have to consider, therefore, is not purely an economic one. Its economic aspects are important to industry and relevant to planning, but its sociological implications are not only important from the workers' point of view, but are linked with the political objective of the Government, namely, a socialistic pattern of society, and the theory of "social justice" evolved by the courts in consonance with it. But the newer concepts of industrial relations based on negotiated settlement rather than compulsory adjudication, although they also are derived from the idea of a socialistic pattern of society, are at variance with the theories of the courts.

There appears to be no single, universal solution. We can neither throw over the carefully built system of the Full Bench Formula which has been the basis for bonus awards in so many companies in recent years, nor can we reject the many voluntarily agreed settlements. Indeed we need to give more encouragement to such agreements if we are to get away from the present over-legalistic approach to labour problems. We want to do something to discourage the annual bickering over bonus, and to meet the social need which makes the annual struggle so bitter. Perhaps we could separate the latter aspect by a fixed annual bonus to be paid at the time of the employees' main festival to all those with a given length of service. If the amount were to be one month's basic pay, then industry could budget on a 13-month year for basic pay—as is done by one or two companies in the U.K.—and the worker could be assured of at least a minimum extra amount for his festival.

As to the "available surplus" formula, let us, at least, have some guidance as to what proportion of it should go back into the business and how much can be paid out in bonus; what the ceiling on bonus should be; and whether a reserve fund can be built up for less favourable times; and finally whether encouragement should not be given to linking bonus, or part of it, with production rather than profits.

U.S. INTEREST SHOWN IN FINANCING BOKARO STEEL PLANT PROJECT

GOVERNMENT TO SET UP NEW AGENCY FOR FERTILISER DISTRIBUTION

(FROM OUR NEW DELHI CORRESPONDENT)

THAT the U.S. Ambassador, Professor J. K. Galbraith, is taking active interest in the financing of the fourth State steel plant in Bokaro has been known here at least for a month. It was at the Ambassador's own personal request that news correspondents who attended his off-the-record Press conference kept out the news from their papers. This embargo should no longer hold good, as the U.S. Embassy has published the news through a certain agency. On the eve of his departure for the United States, Professor Galbraith told journalists that he had been arranging loans from the Export-Import Bank and the Development Loan Fund to finance the one-million ton steel plant in Bokaro. Under his scheme, India will only be committed to buy U.S plant and equipment for the steel works. India has already got a project report prepared and will shortly be appointing Messrs Dastur and Company as the consulting engineers. While the chairman of Hindustan Steel has gone to West Germany to recruit technicians for the operation of the Rourkela plant, and British and Russian technicians are already engaged in not inconsiderable numbers in operating the Durgapur and Bhilai steel works, India claims that she has ample trained talent to set up a new plant in Bokaro.

Since then, the Washington meeting of the creditors' consortium has committed itself to over $2,000 million of aid to India during the first two years of the third plan. This aid is based on the projects constituting the plan, which includes the expenditure of Rs. 223.5 crores on the one-million ton integrated Bokaro steel plant including Rs. 100 crores in foreign exchange. The consortium in promising the aid to finance the plan has, in fact, accepted the obligation to finance the Bokaro project. To put it more concretely, in accepting the plan as a whole, the U.S.A. has also accepted in principle the obligation to finance the Bokaro steel works. Following the Washington meeting of the consortium, there will be bilateral negotiations between India and the aid-giving countries to select the projects and allocate finances for them. Indo-U.S. negotiations will, among other things, allocate finances for the Bokaro project and determine the manner and method of its being commissioned. On one end, India has put forward a proposal to buy equipment from the U.S.A. and to have it assembled by her own technical experts. On the other, the U.S.A. demands to have the plant commissioned by one of her steel-making companies, and then have it managed by the company in the initial period. Bilateral talks may discover a middle course or a compromise between the two.

The U.S. steel industry, apparently, has still to change its attitude. It is unwilling to come out to India to participate in setting up a steel plant in the public sector. But the U.S.A. also has conflicting interests. Her machine manufacturers are facing export difficulties, largely due to high prices. The U.S. strategy now aims at an export drive in general and of steel-making machinery in particular. If communist Russia can join hands with a private sector unit to set up a tractor plant, there can be no comparable sacrifice of "the basic principles" if U.S. manufacturers decide to sell steel-making machinery to a public-sector unit. They have sold machinery even to communist countries.

Project Report

Messrs M. N. Dastur and Company, in their preliminary report on an integrated steel plant in Bokaro, say: "The installation of new steel capacity is a time-consuming process as the ancillary facilities for a steel plant, such as railways, water and power supplies, new mines and washeries take time to construct. The planning of steel development should, therefore, be done on a long-term basis. Accordingly, an assessment beyond the fourth plan has been attempted which indicates that steel requirements should continue to rise rapidly. It is estimated that the existing plants could be expanded to produce about 8 million ingot tons by 1965, which would still leave a shortfall of 3 to 4 million tons. It is thus vital that the construction of the Bokaro plant be started in 1961 so that it could begin production by 1965.

"The Bokaro plant would have a strong raw materials base, good road-rail connections and adequate water and power resources. And, in view of large future requirements, Bokaro should be designed for expansion to the maximum economic size. Accordingly, large modern blast furnaces, steel-making units and rolling mills have been selected to produce 2 million ingot tons initially, with provision for future expansion to 8 to 10 million tons. If desired, the initial Bokaro construction can be phased so that 1 million tons capacity would be in operation by 1965, the larger capacity becoming available in the following year.

"The 1965 steel requirements of 12 million ingot tons (i.e., 9 million tons of finished steel) has been analysed by main product categories, which shows that the demand for flat products would be 3.3 million tons, merchant sections 2.8 million tons, structurals 1.5 million tons and railway materials and miscellaneous products 1.4 million tons. An estimate of the production in 1965 indicates that even after the possible expansion of existing plants, there would still be a shortfall of about 1.7 million tons in flat products and about 600,000 tons in merchant sections, whereas the requirements of structurals and railway materials would be met. Due to the large shortfall in flat products, it is proposed that India's second strip mill should be installed in Bokaro which, like Rourkela, should initially produce sheets and plates exclusively. A further analysis has been made of the shortfall in flat products by categories from which the product-mix for Bokaro has been assessed as shown below:

(In thousand tons)

	Consumption 1957	Estimated demand 1965	Shortfall 1965	Proposed Bokaro product-mix
Hot-rolled sheets	240	1,000	530	470
Cold-rolled sheets	150	700	350	300
Galvanised sheets	280	500	300	150
Tinplate	113	400	170	150
Plates	112	700	330	300
Total	895	3,300	1,680	1,370

Alternative Product-mix

"An alternative product-mix has also been considered, consisting of about 800,000 tons of flat products and about 700,000 tons of billets for re-rollers to enable them to make better use of existing facilities. A survey of iron and steelmaking raw materials indicates that the position concerning iron ore reserves and quality may be considered very satisfactory. The known reserves of good metallurgical coking coal are comparatively low and the ash content of the coal is high, necessitating washing. Limestone with low insolubles in the proximity of steel plants, is also limited. The manganese ore reserves are not too plentiful and, therefore, high grade ores need to be used judiciously and low grade ores beneficiated. A comparative estimate of deposits of principal raw materials is given below, which shows that limestone and coking coal are likely to be restricting factors to future steel expansion, unless action is taken to conserve known reserves and to locate new deposits:

Raw materials	Reserves (million tons) (approx.)	Total steel production possible from available resources (million tons) (approx.)
Iron ore	20,000	10,000
Manganese ore (marketable grade)	60	3.000
Coking coal (washed)	1,600	1,200
Flux limestone (up to 6 percent insolubles)	100	200

"The Bokaro plant is located on the Bihar coalfields and within 240 kilometres of the Singhbhum-Bonai-Keonjhar iron ore range. It is proposed that the Sasangda deposits of this range be developed for the supply of about 3.3 million tons of ore for the initial 2 million tons of production. The annual requirement of about 3.12 million tons of coking coal would consist of a blend of high, medium and low volatile coals. These coals have ash contents ranging from 18 to 25 percent and cannot be used without washing due to the adverse effects of high ash content on blast furnace operations. Additional washery capacity would be required to reduce the ash content of the coals to give a blend with about 16 percent ash. New coal mines may take six to eight years before attaining full production. Therefore, if the present acute shortage of good metallurgical coal is to be avoided in the third plan, steps to open up new mines need to be initiated immediately. Further, the investigations required for the design of washeries, coal blending and carbonising plants also take a long time and should be undertaken as soon as possible.

Supply of Refractories and Steel Scrap

"Available data indicate that there will be a shortfall in the production of refractories in the country by the end of the second plan itself—which would be greatly accentuated in the third plan by the country's growing requirements—unless steps are taken to install new capacity. At the same time, the quality of Indian refractories needs to be progressively improved in order to reduce the consumption in India from the current 100 kilograms an ingot ton to a figure of 50 to 70 kilograms. Constructional requirements of the Bokaro plant are estimated at 145,000 tons and the operational requirements at 120,000 tons a year. A survey of the steel scrap position in India in 1936 indicates that about 1.7 million tons of 'prompt industrial' and 'obsolete' scrap will be generated (excluding plant scrap of about 2.5 million tons from the integrated steel works). The low scrap availability in a partially industrialised country like India tends to favour the production of steel by pneumatic processes, such as the L.-D. process, using high hot metal and low scrap charge. It is estimated that about 400,000 tons of scrap would be generated at the Bokaro plant, which would be fully used at the works itself.

"It is proposed that the Bokaro coke requirements be met from four batteries of 82 ovens each. Run-of-oven coke production will be 2.1 million tons and a surplus of about 200,000 tons will be available for sale. In order to conserve the limited low-volatile coking coal resources, the use of high volatile coal in the blend is proposed. For producing metallurgical coke of adequate strength from such a blend, a system of petrographic preparation is recommended whereby the coal is selectively crushed and then blended. Also in the interest of coal conservation it is proposed that the minimum size of coke for the blast furnaces be lowered to 20 millimetres.

"A Robins-Messiter system together with a stockyard is proposed for stocking, bedding and reclaiming ore. In addition, arrangement has been made for drying of ore prior to screening of the fines for sintering as this is considered essential under Indian monsoon conditions. It is proposed that the requirement of iron for steel-making in Bokaro (1.82 million tons a year) be met by three blast furnaces of 1,600 cubic metre volume each. These furnaces will be equipped for operation at pressures of up to 1.5 atmos at the top, blast temperatures of 900-950°C and controlled blast humidification. For the purpose of this study, a production of 2,000 tons a day from each furnace has been assumed, although the furnaces could produce up to 3,000 tons each with 100 percent self-fluxing sinter. A surplus of about 250,000 tons of saleable iron is expected.

Two Alternatives

"From a study of various steel-making processes, two alternatives emerge for adoption in Bokaro—basic top-blown oxygen converters (L.-D. process) or basic open-hearth with ladle desiliconising. The installation and operating costs of the L.-D. process are appreciably lower than the open-hearth and the type of steel products visualised for Bokaro—flat products—are very well suited for L.-D. The quality of fluxes and dolomite for brickmaking, although not as good as desired, are considered adequate. Accordingly, three L.-D. converters of 120 tons capacity each (two operating) are recommended to produce 2 million ingot tons of steel annually, on the basis of about 30 heats a day a convertor. The convertors can be charged to about 150 tons each in future to produce about 2.5 million tons. Further, space has been provided for a fourth convertor in the same shop. Initially, two 350 tons a day tonnage oxygen plants are proposed. One 1,150 millimetre universal slabbing mill has been provided to roll 2 million tons of ingots annually. Twenty soaking pits (capacity 100 to 125 tons each) are provided. One 2,000 millimetre continuous hot strip mill and 4,000 millimetre plate mill are recommended, together with suitable cold mills and finishing equipment for plates, hot and cold-rolled sheets, tinplate and galvanised sheets. With minor modifications, the mills would be capable of rolling 3 million tons of ingots. Two alternative layouts have been proposed. Adequate provision has been made for additional coke ovens, blast furnaces, steelmelting shops and rolling mills to enable the plant to expand to a size of 8 to 10 million tons. The total capital cost of the plant is estimated at about Rs. 215 crores based on current international equipment prices and Indian construction costs. Customs duty, engineering and spares have been excluded in order to make this estimate comparable to the published figures of capital costs of the other new steel works. These items would add another about 10 percent to the cost. Also not included are expenses connected with the development on off-site facilities, such as the township, new mines and quarries, washeries, etcetera.

Capital Cost

"The above capital cost includes a number of special features such as extensive materials preparation including selective coal preparation, ore bedding and drying and sinter plant. The rolling mills in Bokaro include a fully continuous hot strip mill and tandem cold mills for finishing flat products; these facilities are more expensive than mills rolling other sections such as rails and structurals. The finishing lines (such as electrolytic cleaning, tinning, galvanising, annealing) are also continuous, producing a better quality product at lower operating costs. In preparing this project, cognisance has been taken of the Government's desire to make the Bokaro steel plant as nearly Indian engineered and constructed as possible. The bulk of fabricated structurals and refactories could be obtained in India by augmenting existing capacity. However, it is estimated that only about 25 to 30 percent of the equipment could be supplied from indigenous sources, as the Ranchi heavy equipment plant may not be in full

production before 1964-65. The total indigenous contribution including equipment of local supply, civil and erection work represents 60 percent of the total plant cost, the balance 40 percent being the foreign exchange requirement for imported equipment. The low proportion of indigenous manufacture emphasises the importance of augmenting the existing forge-foundry and equipment manufacturing activities and initiating new facilities including an additional heavy equipment building plant.

"Tentative construction schedule and quantities of construction work have been indicated. It is considered possible to install a capacity of about 1 million tons within a period of four years after the final authorisation to proceed is given. The target capacity of 2 million tons can then be reached a year later. The five-year period mentioned above required to complete the entire 2-million-ton Bokaro plant could be appreciably reduced with proper scheduling and organisation of work on the project. For the purpose of determining the labour component of the operating costs, estimates of labour force requirements have been prepared. A total force of about 12,000 is estimated, comprising 120 senior engineers, 620 engineers, 5,540 operators and skilled workers and 5,900 semi-and unskilled workers."

Competition for Industrial Projects

State Government representatives are unanimous in the view that any tendency on the part of applicants to create conditions of competition among State Governments for attracting their industrial projects should be discouraged, it is disclosed here. Following detailed discussions, the Central Government has decided that: (a) any tendency on the part of the applicants seeking change of location, to create conditions of unhealthy competition among different States in the matter should be discouraged. (b) In genuine cases, where a change of location is desired on technical grounds or for reasons of economy, the change of location should be considered sympathetically. (c) Where location has been a necessary ingredient in making a decision to grant industrial licence, the application for change should ordinarily be turned down and the applicant should be asked to submit a fresh application for the consideration of the Licensing Committee. (d) Application of change of location (in cases where one of the State Governments concerned does not agree to the change) should ordinarily be submitted for advice to the Licensing Committee together with the views of the State Governments concerned.

Expansion to Polyethylene Capacity

It was reported in these columns in April this year that a licence for the domestic manufacture of high density polyethylene has been issued by the Government. This licence, according to enquiries, has been issued to Alkali and Chemical Corporation of Calcutta for the manufacture of 8,500 tons of polyethylene in Rishra in West Bengal. This is in addition to two other licences issued earlier, one to Union Carbide India Ltd for expanding its existing capacity to 20 million lbs at its Trombay factory in Bombay State and the other to Duncan Brothers of Calcutta to manufacture 4,000 tons of polyethylene in a new factory in Assam, the exact location of which has not yet been decided by the Company.

Fertiliser Distribution

The Central Ministry of Food and Agriculture, it is understood, has accepted the Fertiliser Distribution Enquiry Committee's recommendation that a central fertiliser marketing corporation be set up to take over the duties now performed by the Central Fertiliser Pool. This will be in addition to the Fertiliser Corporation of India, which is a purely production organisation. The marketing corporation, with generally the same aims as the Fertiliser Pool, namely, the welfare of cultivators and increased agricultural production, will be an autonomous body. In its report, submitted last year, the Fertiliser Distribution Enquiry Committee pointed out that the high targets of foodgrain production in the third plan called for a determined effort to popularise fertilisers, to improve their distribution system and to streamline the machinery connected with the indenting, allocation and distribution of fertilisers. The Committee also stressed that the prices of fertilisers and those of agricultural produce should be so related as to make it profitable to the farmer to use fertilisers.

Industrial Committee on Plantations

The Industrial Committee on Plantation, which will meet in New Delhi on 4th July, will, among other things, discuss the housing for plantation workers, fixing of wages on the basis of eight hours a day or 48 hours a week, difficulties in the enforcement of the Plantation Labour Act, abolition of the contract system, payment of sick leave, education of workers' children, leave with wage of temporary workers and wage-fixing in minor plantations.

Deep-shaft Mine Project

An agreement between the National Coal Development Corporation and the Polish firm, Cekop, for the development of the deep-shaft mine project in Sudamdih in Jharia, Bihar, was signed last week. Under the agreement, the Polish firm will prepare a project report for a colliery in Jharia consisting of two mines—a deep-shaft mine and an incline—with a common surface plant. The surface equipment will include a coal washing plant besides workshop, coal bunkers, etcetera. The planned output of raw coal from the mines is 7,500 tons a day. The underground mine is situated 12 miles from the Dhanbad railway station, and nearly three miles from Patherdih railway station with an area of 1.75 miles along the strike and nearly one mile along the dip. The area consists of 14 coal seams of varying thickness of four to 60 feet with a total reserve of nearly 250 million tons and with an ash content of 10 to 28 percent.

Equipment for Barauni Refinery

Russia has signed an agreement with India to supply equipment and machinery for the Barauni refinery and to provide technical assistance for its erection and commissioning. Under the agreement, Russia has reduced the cost of equipment by Rs. 80 lakhs. She has also agreed that equipment and materials worth Rs. 12 crores will be substituted by Indian manufacturers. Foreign exchange worth Rs. 2 crores has thus been saved. Another important change made in the project report is that lubricating oil will be produced at the refinery and not jute batching oil as proposed by Russia earlier. The estimated value of the contract—the last in the series—is about Rs. 14.5 crores, besides the rupee expenditure to be borne by the Indian side. The Russian Government has given a credit of Rs. 17.8 crores for the Barauni refinery. According to the contract signed, the refinery is to be completed in three stages. The first million-ton capacity is expected to be completed by December 1962. In the second stage, a further 1.5 million-ton capacity will be created by April 1963, and in the final stage, which involves the manufacture of lubricants, by the end of 1963.

Coal Supplies to Consumers

The Government of India has recently adopted several measures to improve supplies of coal to areas distantly situated from the Bengal-Bihar coalfields, which produce about 80 percent of the total output of coal. The movement of coal by coastal shipping is also to be stepped up. At present, about 1 million tons of coal move annually from the Calcutta port to the coastal States in the south. This movement is being augmented and will be stepped up progressively to about 2 million tons a year and coal will now be carried by coastal shipping to the ports on the western coast such as Cochin, Bombay and those in Saurashtra. Some of the consumers in Gujarat State are obtaining their supplies by the rail route through Mughalsarai and the proposed movement to these consumers by the sea route would supplement the movement taking place through Mughalsarai. The movement of coal by the sea route is comparatively costly and in order that the consumer may get his supplies at almost the same cost at which he would have got these if the movement had been by the all-rail route, a system of subsidising the movement of coal by sea has been introduced. To meet the expenditure on this account, a cess of 80nP a ton has been levied on all coal despatched from collieries with effect from 8th June, 1961, so that, including the existing cess of 88nP a ton, the total cess will now be Rs. 1.68 a ton.

Hitherto, the movement of coal by coastal shipping was only to the extent of about 12 to 14 ships a month. With the introduction of the above measures and as more and more ships become available, the Government proposes to increase the above to 30 sailings a month. Besides the above measures, stress will be laid on greater movement of coal from the outlying fields such as Madhya Pradesh, Orissa and Andhra Pradesh. This would further reduce the pressure on movement from the Bengal and Bihar coalfields. Some explanation is called for. The Government has assured the consumer that it will subsidise the movement of coal by sea. Side by side, a cess on coal of 80nP a ton has been levied on all coal despatched from the collieries. In the nature of things, the cess will be passed on to the consumer, who will be called on to pay 80nP a ton, not only on carriage of coal by sea but also by rail.

Allocating Yen Credit

Seven firms have already applied for the Japanese yen credit which will be available during the third plan period. They relate to the following industries:

Industry	Amount (in lakhs of rupees)
H. T. Wires	23.40
Viscose Rayon	60.00
Textile auxiliaries	2.48
Wire ropes	45.40
Papers	10.00
Total	141.28

Allocations against Swiss Credit

The allocations made so far for various purposes against the Swiss credit offer are as follows:

	(Rs. lakhs)
Textile machinery	80
Printing machinery	40
Turbo-alternators for the sugar industry	60
Capital goods for private industry including machine tools	200

The Swiss credit is available only to finance 90 percent of the value, ex-factory, in Switzerland.

Petroleum Prices

In anticipation of the Petroleum Products Prices Committee's report, the Indian Government has given notice to the three western oil companies, terminating the existing *ad hoc* price agreements with them, with effect from 31st August, 1961. The Government has also called off its demand for rupee payment for deficit petroleum products, and will allocate an additional $42 million for imports of such products during the quarter ended September.

Secretaries Change Places

Mr. S. Bhoothalingam is joining the Ministry of Finance as Secretary in charge of the Expenditure Department by the middle of July, replacing Mr. M. N. Wancho, who in his turn is taking the place of Mr. Bhoothalingam as the Secretary to the Steel Ministry. In this changeover, Mr. Bhoothalingam will be giving up his association with the steel industry lasting almost over ten years. It was he who was originally deputed to appraise the requirements of pig iron in India, and if necessary, recommend the expansion of its production. His report revived interest in the steel plants. The C. C. Desai mission of which Mr. Boothalingam was a member was sent to the U.K. and the U.S.A. to mobilise interest in India's 500,000-ton steel plant. This mission failed. Ultimately, Messrs Krupps-Demag were persuaded to build a 500,000-ton steel plant in Rourkela. Later, the Russians offered to build the one-million-ton steel plant in Bhilai and the British to build the Durgapur steel works. At this stage, a separate Ministry for Steel with Mr. Bhoothalingam as its secretary was created. This was nearly six years ago. Next Monday, Mr. Bhoothalingam will leave on a tour of the three steel plants in the public sector. The project report for the fourth steel plant in Bokaro has been received, and finances for it have been assured. Expansion of the Bhadravati steel plant in Mysore is under way, and a firm decision has been taken on setting up an alloy steels plant in Durgapur. A decision has also been taken to expand pig iron manufacturing capacity. These are some of the highlights of Mr. Bhoothalingam's tenure of office as Secretary to the Steel Ministry.

London

MR. MACMILLAN DISCUSSES BRITISH PARTICIPATION IN EUROPEAN COMMON MARKET

SENIOR MINISTERS TO TOUR COMMONWEALTH CAPITALS FOR FURTHER DISCUSSIONS

(FROM OUR LONDON CORRESPONDENT)

IN a statement in the House of Commons on the European Common Market, the U.K. Prime Minister said that the Government was in touch with other Commonwealth Governments for some time in the normal way about the problems of the relationship between the United Kingdom and the European Economic Community, and the possible arrangements which might meet the needs of Britain, the Commonwealth countries, and the United Kingdom's partners in the European Free Trade Association. The Government has not yet, however, reached decisions on this important question. "Before doing so," Mr. Macmillan said, "we regard it as essential for there to be further discussions with all the Commonwealth countries." He added: "For this purpose, I have proposed to the Prime Ministers of the Commonwealth countries that I should arrange for the Secretary of State for Commonwealth Relations (Mr. Duncan Sandys) and two other senior Ministers between them to visit Commonwealth capitals in the near future. In the light of these consultations and of the discussions which we shall be having with the European Free Trade Association Ministers, the Government will further consider their policy. Arrangements for these visits are in hand and an announcement about the dates will be made as soon as possible. I hope it will be possible for a start to be made towards the end of this month."

A long exchange of questions and answers followed Mr. Macmillan's statement and in the course of these he emphasised that his proposals were "generally welcomed" by the Commonwealth countries, and also that at no stage had the Government agreed even in principle to seek "unity with Europe." Indeed, he said at one point, "we may decide the opposite." Both sides of the House appeared to be satisfied that the Prime Minister had gone far towards clearing the air about the European Common Market, but it is evident that this question is exercising the minds of a wide circle of people to the exclusion of almost all other matters. Quite a substantial body of Labour members of the House have tabled a resolution objecting to the U.K.'s participation in the European Common Market.

Sterling: Ups and Downs

Meantime, sterling has had an uneasy week, with weakness earlier on following withdrawals of hot money. This was subsequently followed in turn by a welcome recovery of strength as a result of a rush of buying by Continental operators which finally also extended to New York. The rather surprising *volte-face* was due to the public declaration made the other day by Dr. Per Jacobsson, Managing Director of the International Monetary Fund. He stated that rumours of any further devaluation were entirely baseless; what is more, he pledged the formidable backing of the Fund for the maintenance of existing exchange parities and for the recent agreement among European central banks to support each other's currencies.

For the moment, this one-man demonstration, which took place after the annual meeting of the Bank for International Settlements, attended by all central bank chiefs of western Europe, seems to have scotched the rumours of a pending devaluation of the pound which have been spreading rapidly through the Continental and American markets. Dr. Jacobsson's voice is powerful, as the Fund he manages is ready to advance Britain up to £900 million under "drawing rights" to ward off temporary difficulties. If that help is not to be needed, it is essential that Britain expands her export trade so as to overcome her balance of payments difficulties. The May trade figures do not make very encouraging reading. The trade gap has widened to £82.1 million, compared with £24 million in April. The provisional figures show that exports last month totalled £290.9 million, re-exports £13.6 million, and imports £394.6 million. The trade gap is the widest since October, when it was £110 million. The figures will be considered in greater detail next week.

B.I.S. on British Problems

Ever since the agreement was concluded in Basle in March for central banking co-operation in the foreign exchange market, the Bank for International Settlements has been regaining some of its former prestige. In its latest annual report, the B.I.S. takes a hopeful view of the economic and financial outlook. Developments in the spring of this year, it maintains, have brought "a definite improvement." Most important, the Bank sees an up-turn in the United States, with more determined policy measures to foster it. In western Europe, it considers that the prospects are for continued growth, with perhaps less intensive demand pressure.

The report recognises, however, that the United Kingdom is faced with special problems, most of them in the external payments field. It points out that between 1953 and 1960, the volume of British exports rose by only 28 percent. In West Germany, the rise was 156 percent, in Italy 180 percent, in the Netherlands 92 percent and in Switzerland 67 percent. Excluding the communist bloc countries, world exports increased by over 50 percent. The trouble, as the B.I.S. sees it, lies mainly in the almost continuous tendency in Britain for wage increases to exceed gains in productivity, with consequent rises in costs and prices. It sees the solution in methods of wage negotiation which will lead to some sort of price stability.

Retail Sales Level Off

Retail sales fell back a little in May after the brisk expansion of the two previous months. The U.K. Board of Trade has estimated that the sales index dropped a full point to 114, compared with 115 in both April and March. These comparisons make allowance for seasonal factors. But the May level of shop sales was still slightly above that for the first quarter (113) and it was between 3 and 4 percent above that of a year ago, of which over a half was probably accounted for by increased prices. The trend of personal spending will be keenly watched—not least by the U.K. Chancellor—in the next few months. There is plenty of money about. There was quite enough money about last year, for that matter, to cause a boom in the shops; but due to the restrictions on hire-purchase and other credit, a substantial portion of spending money did not get spent last year. As a result, the makers of motor-cars and household appliances had to build up stocks, lay off men, and close factories; and the financial counterpart was a spectacular rise in personal savings.

This reluctance to spend cannot be expected to go on for very long, and there are signs that it is coming to an end. Perhaps the change will show up most clearly in a rise in sales of motor-cars and appliances, which has indeed begun. Last year the slump in these goods brought more demand to the "soft" goods and services; this year the shift is likely to be reversed, although aggregate spending may well go up strongly enough to bring more demand to all trades. The wage and salary rates are now rising at an accelerated pace and as production expands total earnings should also rise fast. This is splendid for trade but is also pushing up prices and bringing Government restrictions nearer the day.

Steel Production

Steel production in May was at an average rate of 466,100 tons a week, compared with 471,600 tons a week in April and 475,400 tons a week in May 1960. Allowing for the different timing of Whitsun, the steel output last month was at about the same level as a year ago, the U.K. Steel Board says. Since then, the industry's capacity has been rising so that the May output represents only 87 percent of capacity, against 95 percent of the smaller capacity available at this time last year.

This rate is still profitable for most of the companies, but the Board indicates that it may well decline further. "For several months the orders received by the steel producers from the home users have been running below the rate of deliveries. Order-books have shortened and most products are now available with early delivery." Demand is active for building, industrial plant, and general engineering, with some revival in the motor-car industry. But the statistics do not yet show much evidence that steel is being taken out of stocks (with exception of sheet). Up to the end of March, the latest date for which figures are given, stocks were still increasing on balance.

Low-cost Competition from Overseas

The managing director of English Sewing Cotton, Mr. C. F. Harrison, in his first speech as president of the Federation of British Industries, said at Cambridge that the "immense damage" which has already been done to British textile producers by low-cost Asiatic and other producers is "merely a forerunner of the blows" to come. As underdeveloped countries become more and more industrialised, their products represent an increasing threat to British industries. The range of products affected is widening and British makers of consumer goods are in "the most vulnerable" position. Assistance to underdeveloped countries is not, however, confined to financial aid, technical help and education, it also means the acceptance of their products.

Mr. Harrison said that the rapid growth of nationalism which associates a high standard of living with a high degree of industrialisation has made it vitally important that those who "have" should assist those who "have not." This urgent need has laid a strong moral obligation on the more prosperous countries. Assistance has to be given to the point of "sacrifice of some of our comfort," which is an issue the people of Britain have not yet faced. "It is difficult to believe that we can avoid a major world conflict if we fail to satisfy, in part at least, the demands of those whose needs are so urgent. The luxuries of yesterday are the necessities of today, and it is unrealistic to believe that these demands will not increase and that they can be met without adding to the demands made on our income and resources by the authorities responsible for their provision," Mr. Harrison said. He added that these demands could only be met by ever increasing efficiency in the use of labour and resources. "If they are to be met by taking a larger share of the wealth produced, a rapid decline in power and effectiveness is inevitable. It is the function of industry to produce wealth and we as industrial leaders have to meet this challenge of ever increasing demand."

Mr. Harrison considered Britain's position in relation to the European Economic Community. He said: "I believe that there is a general desire at home and in Europe for a settlement which will avoid the division of Europe into two trading groups. On the other hand, we must have regard to our Commonwealth commitments and relations and we cannot lightly loosen the economic ties which bind us. We have also our duty to our E.F.T.A. partners and the need to ensure that our agriculture continues prosperous and healthy."

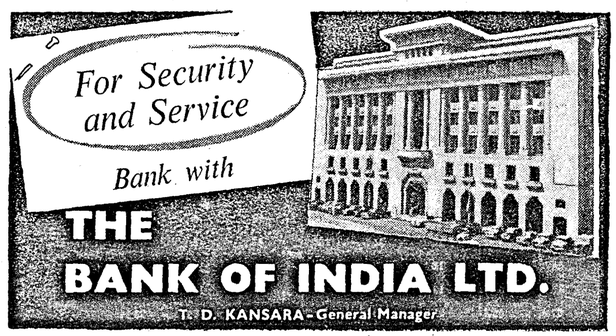
Funds for the Banks

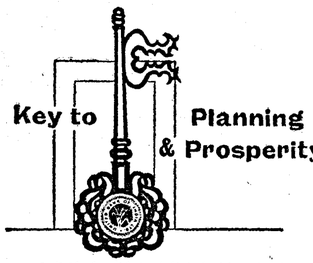
Where can the banks find funds to sustain the volume of lending needed by a growing economy? This was the question posed by Mr. David Alexander, general manager of the National Commercial Bank of Scotland, in his presidential speech to the Institute of Bankers in Scotland. With the Chancellor budgeting for a surplus, there is no reason to expect a rise in bank deposits, which are more likely to feel the impact of funding operations by the U.K. Treasury. Between 1951 and 1959, combined deposits of the English and Scottish banks fell from 51 percent to 35 percent of national income.

Meanwhile, businesses have found more profitable homes for short-term funds elsewhere. The answer, in Mr. Alexander's view, is in encouraging wage-earners who control about 40 percent of national personal income, to make greater use of the banks. It is understandable, but regrettable that he regards the wish of the Trustee Savings Banks to operate current accounts "with grave apprehension." To counter such potential competition, he advocates lower or, at least, more flexible bank charges and evening the opening of branches, giving an interesting hint on how bankers are thinking.

Computer Service Bureau

Stock brokers and other businesses in the City will soon be able to use a computer service bureau dealing exclusively with their type of work. It will be the first to offer such a specialised service and will be opened in September by N.C.R. Electronics. Among the tasks it will perform are the evaluation and analysis of portfolios and statistics for investment analysts.





Individual well-being is linked with national prosperity and only planned efforts can ensure both in the shortest possible time. And planning, for its success, largely depends on savings, individual as well as national.
Saving in the form of Bank Deposits provides resources for the National Plan.

United Bank of India Ltd.

GUNNY PRICES IMPROVE AS FUTURES MARKET REOPENS

FIBRE RISES ON PUBLICATION OF MAY ARRIVAL FIGURES

INTEREST in the Calcutta jute and jute goods circles during the past week centred on the reopening of the futures market, which is run by the East India Jute and Hessian Exchange Ltd. Trading in futures was banned locally in October last year, when, with the concurrence of the Forward Markets Commission, the futures market was closed to try and prevent undue speculative activity which was mainly responsible for the high prices ruling at that time. When trading was resumed on 15th June, prices opened considerably lower than anticipated, but after an initial pause while operators took stock of the position, rates showed a gradual rise. The opening was conducted smoothly and satisfactorily, and as confidence gradually improved, business has been put through on an increasing scale. To ensure that speculative trading does not get out of hand and bring about a crisis similar to that which caused forward trading to be banned, the East India Jute and Hessian Exchange, at the suggestion of the Forward Markets Commission, is taking steps to limit the volume of business to the capacity of individual members. Talks on this have taken place both in Calcutta and New Delhi, and representatives of the jute industry have placed their proposals before the Ministers of Food and Agriculture, and of Commerce and Industry. Trading in the futures market is now very nearly back to normal as margin deposits, which were introduced in November 1960, were withdrawn with effect from 13th June, and the restrictions imposed on the number of transfers of pucca delivery orders against T.S.D. contracts in certain standard constructions have been withdrawn. Registration of contracts and submission of trading returns will continue to remain in force.

U.S. Stocks and Offtake Fall

The reasons for the improvement in the general outlook in the Calcutta markets noticed at several times during the past week, are difficult to explain—except in the context of the reopening of the futures market. Apart from showing limited interest, overseas buyers in general were not active. Local covering against previous commitments helped, but this was on a much smaller scale than during the preceding weeks. The steadiness is all the more surprising in view of the heavy fall in U.S. burlap consumption during May, although this was probably counteracted by an even greater fall in stocks, which normally tends to be a bullish factor. U.S. consumption slumped to 57 million yards, which was 2 million yards less than the previous month, but 17 million yards less than during the corresponding month of last year. This is the lowest consumption figure since July 1953, and brings the total consumption figure so far this year to 332 million yards, and shows a low-level average of 66 million yards. The U.S. stock figure dropped by 10 million yards, of which 133 million yards were spot, and 85 million yards afloat. It remains to be seen how long the U.S.A. can hold out before being forced into the market. Although her stocks are lower than for several years, her consumption has been reduced to a commensurate figure, and the position is really no worse than it was a year ago. At last year's average rate of consumption for the first five months (74.6 million yards), the U.S.A.'s total stocks, both spot and afloat, would last 3.5 months. At the current average rate of consumption (66 million yards), stocks will last a little longer. It is disconcerting, however, to see one of the major consumers of hessian reducing offtake to such an extent with no apparent dislocation in her economic set-up. Bulk-handling and substitutes are obviously responsible for this, and constitute the main reason why stocks have been allowed to drop so low. As pointed out previously, at the present rate of consumption, the U.S.A. can afford to wait and pick an opportune moment for replenishing her stocks.

If would seem that the hand of nature, which last year was instrumental in bringing about the current jute crisis and which so far this season has played the part in bringing the trade back to normalcy, has once again relented. The law of supply and demand has been stimulated by climatic conditions, over which neither governments nor propagandists can exercise any effective control. The somewhat unusual weather conditions of an early monsoon which were experienced both in Calcutta and the mofussil brought with it excellent crop reports. Heavy, continuous rainfall in many districts, withcut the essential bright intervals of sunshine, has, however, caused a setback. There is no reason to believe that there will be any great damage as a result of this, but in many cases, the growth will be affected, and in others, immature jute may have to be cut.

What does matter at this stage is that hopes of getting some early deliveries, particularly as far as Pakistan is concerned, are becoming remote. As a result of this, old crop jute, which a week ago showed signs of falling to still lower levels, has had a revival of about Rs. 3 a maund over the past week, and at the time of writing, is back to about Rs. 8 below the maximum prices, having at one time fallen to Rs. 13 below it. The I.J.M.A. is still issuing quotas, but on a much reduced scale, and mills are showing very little interest, particularly as there will be a saving of jute next week when the industry closes its doors. Offers of new crop jute are few and far between, and sellers' ideas on prices differ widely. Some are asking the same price for new and old crop, while others are prepared to sell new crop at a discount. The current new crop situation cannot be viewed in the light of experience, as normally at this time of year, mills have bought a fair quantity of new crop jute. The volume of business so far in new season jute is negligible. For this reason, many believe that new crop prices, at least in the first three months of the coming season, will not show much of a discount. All mills have still to buy even their early requirements, and the demand, when buying does start, is liable to be far greater than the supply. Mills will thus be still working on a hand-to-mouth basis, which is not conducive to lower prices.

Although the new crop prospects continue to be good certain areas have received setbacks. In Bihar, heavy rain has caused floods, and the situation is uncertain and some damage is expected. All Assam areas, however, report favourable conditions with alternate rain and sunshine. The long rainy spell experienced last week does not appear to have had very much effect, and small imports are finding their way into the local markets. In parts of northern Bengal, more sunshine is required, but on the whole, conditions are favourable. The Daissee crop is very healthy and much further advanced than at the same stage last year. All reports indicate that there has been a drop in mesta sowings, and as a result, the area under Daissee is estimated to be about 25 to 30 percent larger than last year.

Raw Jute Arrivals

The publication of the raw jute arrival figures for May caused Calcutta markets to firm up towards the close. This was due to the fact that operators, estimating June arrivals, decided that the current Indian crop would not be much more than 4.5 million bales. This was a decidedly bullish factor and the markets reacted accordingly. Total arrivals during May into Calcutta and mill stations amounted to 242,100 bales, of which only 8,000 came from Pakistan, and 234,100 from India. This was 13,600 bales less from Pakistan than during the previous month, and 60,900 less from Indian stations, making an overall drop of 74,500 bales. The total arrivals so far this season, from June 1960-May 1961, amount to 4,724,050 bales of which 401,200 bales came from Pakistan, and 4,322,850 bales from India. The estimated consumption of raw jute by the industry during the same period amounted to 5,445,000 bales. Thus there is a deficit of 720,950 bales.

THE JUTE MARKETS

Manufactured Goods: The goods market opened quietly last Thursday, the main interest being centred round the futures market, which opened for trading for the first time after nearly eight months. There was a certain amount of buying interest at the beginning as prices were lower than anticipated. November B Twills opened at Rs. 126.50, and real goods prices were based on Rs. 147 for June and Rs. 129.50 for October-December, 40in. 10oz. hessian started the day at Rs. 46.90 for the near deliveries, and Rs. 44.25 for forward shipment. Prices began to move up rapidly on the strength of buying interest and B Twills reached Rs. 152, which was the opening price on Friday morning. Hessians also moved up, but there was little interest in the section. Covering business helped to keep the market steady, but when profit-takers began to unload at the higher levels, prices began to ease. Overseas buyers showed no interest, but a renewal of local buying interest forced sacking rates up to Rs. 154.50 for June shipment. At this stage, November *fatka* stood at Rs. 132.50 for B Twills, which was Rs. 6 up on the opening rates, and hessian *fatka* was called over at Rs. 45.80. Again selling pressure caused prices to ease, and over the week-end, real goods prices dropped, and on Monday, began to show a definite downward tendency in the absence of business. Prices fluctuated within narrow limits after this until near the close, when the publication of the raw jute arrival figures for May created a bullish sentiment, and prices began to rise once more.

On Wednesday morning, opening quotations were as follows:

	June	July	July-Sept.	Oct.-Dec.
40in. 7½oz.	38.00	37.75	37.50	35.25
46in. 8oz.	41.25	41.00	40.50	38.00
40in. 10oz.	48.50	48.60	48.60	46.50
B Twills	154.50	153.00	151.00	137.25
Heavy Cees (Plain)	154.50	153.00	151.00	137.25
A Twills	184.50	184.50	182.00	167.50
Liverpools	172.50	172.00	170.00	157.00
Cornsacks	158.00	157.00	155.00	141.00

Raw Jute: As in the goods section, fibre prices were slightly lower at the opening last Thursday, but buying interest in the jute futures for December developed after the market opened at Rs. 32.64. Over the next few days, raw jute was very steady, mainly due to covering business and buying interest in *fatka*. Mill interest in raw jute was small, as most of them indicated discount rates, but only a few sellers were willing to do business. Assam jute rose to Rs. 47 by Saturday which was Rs. 2 above the opening rates. Prices continued to rise and small business was reported at Rs. 48. Sellers looked for higher rates and prices were increased accordingly, and several ready bills of lading changed hands at the higher rates. Towards the close, the market became very steady, mainly as a result of the publication of the raw jute arrivals for the month of May. These were very low—nearly 100,000 bales less than during May last year—and a fresh wave of short crop stories created a bullish tendency. Some minor reports of flooding also caused a steadier tendency, but on the whole, the new crop outlook was very satisfactory.

Opening quotations on Wednesday morning were as follows:

	Landed at Mills (Basis Bottoms) Rs a 100 kilos	Rs. a md.	Shipment
Assam	130.00	48.50	June-July
Northern	127.25	47.50	,,
Purnea Desal	124.50	46.50	,,
Assam Tossa	131.25	49.00	,,
Mesta:			
Assam-Northern	123.25	46.00	,,
Desal	123.25	46.00	,,
Daissee	122.00	45.50	,,
Pakistani Cuttings	200.00 a bale		

THE FOREIGN JUTE MARKETS

FALL IN FIBRE PRICES HALTED

(FROM OUR DUNDEE CORRESPONDENT)

THE situation in the Dundee jute industry is becoming more difficult again. Not many offers of raw jute are being made at the moment, and it looks as if the steady decline in fibre prices during the past month or so has now been halted. It might do some good to the market if a steadier spell came along to bring out some of the many potential orders which are being held up in the hope of cheaper prices. Most people are, however, of the opinion that the prices will come back to much more reasonable levels, say, around £100 a ton for Mill Lightnings, the grade which is usually regarded as the barometer of the Dundee jute market. Today's prices for July-August shipment are £134, c.i.f. U.K.-Continent, and £129 for Mill Hearts. For August-September, sellers are quoting £125 for Mill Lightnings, and £120 for Mill Hearts, and £120 and £115 for September-October, with Grade Tossa-2/3 at £127 and fours at £122 for October-November shipment, c.i.f. A month ago, prices were £160 for Mill Lightnings and £155 for Mill Hearts, July-August, and £5 less for August-September and £5 less for September-October, c.i.f., on 15th May. Little business is being done in Dundee in new crop fibre. As far as old crop fibre is concerned, there is absolutely no interest in it whatsoever.

Calcutta goods are firmer now. It is reported that there are enquiries for large quantities of bags for Cuba for July-December shipment, which may be the reason for the prevailing firmer tendency. Hessians are up to 72s for 40in 10oz. and 55s 9d for 7½oz. June, 72s and 54s 6d July-September and 68s 3d and 51s October-November, with B Twills at 227s, 218s 9d and 198s 9d for the respective positions of shipment, all f.o.b., Calcutta.

Spinners in Dundee are moderately busy, but there is a good deal of machinery standing idle, and the same applies to cloth and bags. Meanwhile, no further change has been made in the official prices. But there has been more enquiry for business, indicating that there are fresh orders to be placed. The industry will be glad to see that the prices are reasonable once again, and spinners and manufacturers believe that good business will be forthcoming then.

U.S. BURLAP CONSUMPTION AND STOCKS

U.S. burlap consumption last month continued to decline, being 2 million yards below April this year and 17 million yards below May last year. Bag cut-up fell by 8 million yards, with piecegoods deliveries down by 9 million yards compared with a year ago. For the first five months of the current year, the total estimated consumption fell by 41 million yards, or 11 percent last year. U.S. burlap

HIGH FIBRE PRICES AFFECT EUROPEAN MILLS

GROWTH OF PAKISTANI CROP REMAINS HEALTHY

(FROM OUR EAST PAKISTAN CORRESPONDENT)

DURING the last six weeks this correspondent has been on tour in Europe where he has met jute buyers in most countries. In almost every country, the position was the same, namely, that the buyers have been shocked by the excessively high prices for the fibre. A lot of their business has been lost to competitive fibres, especially to Indian jute goods. They all are very short of raw jute, especially for the July position, but cannot consider buying at the current prices. Earlier the position was that the quotations of Export Firsts for July shipment stood at about £175 and at that time, the European jute mills could only sell very small quantities of goods at a parity of £150 for Export Firsts. Now that the market is easier, the parities at which they can sell are correspondingly lower, and it is still impossible, therefore, for them to buy jute and sell the goods competitively.

At first, it would appear that the main trouble has been the very high price of raw jute. Investigation shows, however, that there is more to it than this. It would appear that what has really created a very uncomfortable position for the European jute industry is the fact that Indian goods have been freely available at higher competitive prices. It is even alleged that the Indian mills have reduced their prices much below their production cost. At such a level, there is no question of European mills competing and it is for this reason that many of the mills have suffered heavy losses during the recent months. In some cases, they have been able to lay off workers and reduce their working hours in order to keep going with their current stocks until cheaper Pakistani jute is available. Quite apart from the fact that this is not always economic, one must also remember that in some countries such as West Germany, where there is full employment, a worker who has been laid off is permanently lost.

Siamese Jute

Siamese jute has undoubtedly found a very strong position in Europe, and it is only because of the very small crop in Siam that this fibre is not yet a serious competitor for the Pakistani fibre. Fortunately for Pakistan, reports indicate that conditions are such in Siam that the crop cannot be increased very much more. When the difference between Pakistani jute and that from Siam is smaller than it is at present, there is no doubt that the preference will go to the Pakistani fibre, because of the irregularity of standards and deliveries from Siam.

Synthetic fibres have obviously come into their own a good deal more this season than ever before. Some mills have been able successfully to mix raw jute with synthetic fibres. Even flax has been cheaper than jute and this has mixed in extremely well for some constructions. This correspondent also saw a tubulur sack knitted rather than woven from 100 percent cellulose fibre. This, of course, is restricted in its uses, but is considerably cheaper than raw jute. Despite the fact that all buyers went out of their way to explain that Pakistani jute has lost a lot of markets which cannot be regained due to high prices, this correspondent feels that the actual loss which cannot be regained is very small, provided the present downward trend of prices continues, and provided no further heavy rises occur. Another result of this unfortunate season is a determination among almost all buyers to insist in the near future on some kind of moisture clause. They have all lost very heavily through excessive moisture in Pakistani fibre, and they do not intend to continue paying high prices for water instead of jute.

Pakistani Crop

Reports from Pakistan indicate that the crop is still growing very healthily in spite of rather heavy and early rains. In fact, these rains are required because there is a shortage of steeping water, and a lot of jute in the Dacca and Northern districts has not yet been harvested for want of steeping water. The recent rains should result in large imports of raw jute very shortly. Since prices are already comparatively low, this should result in even lower prices, and perhaps more interest from overseas buyers. It is unfortunate that there is such a difference in price between July, August, and September shipments. Since the difference is more than the 2 percent late shipment penalty for one month, there will be a tendency among unscrupulous balers to sell for July, ship August, and even after paying the 2 percent late shipment penalty, such balers will show a profit of about £7 a ton. As is always, it is up to the buyer to consider the reputation of his seller and not merely the price. Some buyers try to cover themselves by buying for guaranteed shipment. One wonders what protection this is, since if the market goes down, the baler is almost certain to ship in time, and if the market goes up, and the baler does not ship, the buyer has no recourse except to cancel since there is no provision in guaranteed contracts for late shipment penalty or for default charges.

BAISAKHI LAC CROP BELOW AVERAGE

According to the revised estimates of the Baisakhi lac crop 1961 issued by the Indian Lac Cess Committee, a total quantity of 605,000 maunds is expected to have been produced this year, compared with the preliminary estimate of 670,000 maunds and an estimated production of 895,000 maunds last year, 650,000 maunds in 1959 and a normal production of 736,000 maunds based on the average of 10 years preceding 1960. The crop this year is below average, as there were no rains in April and May and the crop suffered due to extreme summer heat. The arrivals are also poor as the prices of sticklac are low. The total production of 605,000 maunds is made up of Bihar, 300,000 maunds, West Bengal 88,000 maunds, Madhya Pradesh 162,000 maunds and 55,000 maunds from other States.

Commodity Markets

WORLD TRADE IN COTTON TEXTILES

FUTURE PROSPECTS NOT ENCOURAGING

A REPORT has now been circulated of some of the proceedings at the annual meeting in Osaka last month of the International Federation of Cotton and Allied Textile Industries. These are especially important in view of the recent developments in Government quarters affecting international trade in cotton textiles. A survey was made of the industries in certain areas, including south-east Asia, Hongkong, Africa, Latin America, and the communist countries, with special reference to the extensions of capacity which are contemplated. The prospect is not very encouraging. In the light of the survey, the I.F.C.A.T.I. considered it desirable to point to the danger of an excessive concentration, expansion, or reliance on the textile industry in any one area, which, in the long run, must be to the detriment of the economies of those areas themselves. It stressed the need for a continuance and intensification of technical research into new yarn and textile processing methods, the development of new end-uses, market expansion, and the promotion of textile consumption as a counter-balance to the many other demands made on the purchasing power of the public. It noted that a large variety of commercial practices and manipulations are currently in use which tend to distort normal conditions of competition in the international textile market. It expressed the view that it is essential to eliminate such practices as may lead to a distortion of competition in the international textile trade. While recognising fully the aspirations of developing countries, the I.F.C.A.T.I. is of the opinion that the disruption of established textile industries and possible further threats to their existence must be brought under control. It stresses that the established cotton and allied textile industries should continue to produce mass manufactured goods in order to ensure their continued viability.

Note was taken of the declaration made by President Kennedy on the textile industry. The I.F.C.A.T.I. noted with satisfaction that the existence of a special problem of international textile trade had been officially recognised at the highest level, and that it was also officially admitted that special solutions must be found to this problem. Great interest was shown in President Kennedy's proposal "to call an international conference of all the principal textile exporting and importing countries, for the purpose of seeking an international understanding which will provide a basis for trade that will avoid undue disruption of established industries." It was recommended that this proposal be given the most serious consideration by all the Governments concerned, in consultation with representative national textile industry associations.

RISE IN MAN-MADE FIBRE PRODUCTION FORECAST

In their annual reports, the directors of Snia Viscosa, the Italian man-made fibre producing group, give a great deal of information about trade in man-made and other fibres throughout the world, and their report for 1960, besides reviewing recent events, gives some indications of possible future trends. They suggest, in particular, that 1960 will be found to have marked the beginning of a new phase of man-made fibre production and trade. Postwar reconstruction, they say, has now been completed, and there should be acceleration both in technological progress and in the rise in standards of living in all countries. Under the circumstances, supply and demand should be continually stimulating each other, thereby causing both increases in the volume of production and improvements in the quality of the products. Estimates are given of last year's production, and an increase of 4.3 percent—compared with 1959—is shown in the world's output of rayon filament yarn, with a rise of 4.5 percent in rayon staple. The U.S. output fell in 1960, and its production of rayon yarn was a little more than twice that of Japan's whereas in 1959 it had been nearly three times as large. Japan easily maintained its place as the largest producer of rayon staple, but the U.S.A. lost second place to West Germany.

World production of non-cellulose fibres is estimated to have increased by 19 percent in 1960. There were marked increases in virtually all the producing countries except the United States, where there was a slowing down in the rate of expansion. Synthetic fibres formed 20.6 percent of the total output of man-made fibres in 1960, compared with 18.6 percent in 1959. The production of rayon yarn and staple and of synthetic fibres together increased by 7.1 percent, compared with 1959. In Italy, total production of man-made fibres of all kinds was 8.1 percent greater last year than the year before. Viscose yarn production showed a rise of 11.1 percent but viscose staple, somewhat surprisingly, fell by 1.3 percent. Total production of acetate and cuprammonium fibres was 5.3 percent lower than in 1959. Among the other fibres, there was an increase of 42.7 percent in protein types, one of 31 percent in the polyamides, and one of 18.2 percent in the polyomyls. The most remarkable expansion in the Italian industry last year, however, was in polyester fibre, where the output increased by 69.5 percent. The commercial production of acrylic fibres began last year.

PROBABLE INCREASE IN TANKER SURPLUS

More than 12 million tons deadweight of tankers are scheduled for completion during 1961 and 1962, according to a report just issued by W. G. Weston, the London firm of shipping consultants. Assuming that the rate of scrapping increases slightly—2,875,000 tons deadweight was broken up during 1960—this still leaves about 6 million tons of new vessels to swell the tanker surplus and help keep rates at their present unsatisfactory levels. The report state that current rates barely cover operating costs. The figure of 6 million tons increase may prove an exaggeration, not only because more than 3 million tons a year could be scrapped, but because future cancellations and deferments may well outkeigh new orders which can be completed before the end of 1692. The report, nevertheless, sees no likelihood of an early improvement in the tanker market situation. On the other hand, a cautious optimism does seem to have asserted itself in orders for ships to be delivered from 1963 onward. Independent Scandinavian owners have been particularly active in recent months. An analysis of orders as a whole shows that the trend towards larger tankers continues.

NEW JETLINER ORDER FOR B.O.A.C.

Revised plans for B.O.A.C.'s future jet fleet have been made as a result of developments in the design of the new Vickers *VC.10* jetliner. The airline's existing order for 35 Vickers *VC.10s* and 10 *Super VC.10s* has been modified as a result of improvements in the aircraft's planned performances. B.O.A.C. will now receive 15 stardard model *VC.10s* instead of 35, and 30 modified *Super VC.10s*, instead of 10. The total number of aircraft in both versions will remain at 45. The stardard *VC.10*, with four Rolls-Royce Conway jet engines, will carry 135 passengers. The Super *VC.10*, with a longer fuselage, greater range and more powerful engines, will carry 163 passengers. All 45 aircraft are due for delivery between 1963 and 1966. The first *VC.10* for B.O.A.C. is now nearing completion and is expected to make its first flight early in 1962. The 45 new jetliners will eventually replace 60 aircraft of B.O.A.C.'s present fleet—*Comet 4s*, *Britannias* and *DC.7Cs*. The airline's existing fleet of 15 Rolls-Royce powered *Boeing 707s* will continue to fly in conjunction with the *VC.10s* in the later 1960s.

LINSEED FIRM

A very firm tendency prevailed during the past week. The main reason was the shortage of supplies, and the firmness of mustard and groundnut markets. Movements of new crop seeds were very slow in the centres, and local offerings were small. Ready supplies were negligible. The oil market also advanced in sympathy with seeds, but business was negligible as millers were reluctant to do any forward business at current rates. Local ready stocks were very small. The oilcake market was steady. There was a good local demand, but the turnover was small as stocks were low in the mills. The latest quotation is as follows: ready, June delivery Rs. 29.50 a maund.

HIDES AND SKINS STEADY

The market was steady. Stocks of hides were higher, but those of skins were less than in the previous week.

Bazaar Sales

(Between 13th and 19th June, 1961)

Cowhides: Wet salted (Slaughtered) 18,500 pcs. on the basis of Rs. 10 to Rs. 16 and Rs. 19 to Rs. 28.

Goatskins: Wet salted (Patna, Daissee, Kustia) 62,700 pcs. on the basis of Rs. 240 to Rs. 275, Rs. 300 to Rs. 320 and Rs. 340 to Rs. 360; Wet salted (he-killed) on the basis of Rs. 4.25 and (she-killed) on the basis of Rs. 4.00 a piece; Assam-Dinajpur 46,300 pcs. on the basis of Rs. 250 to Rs. 290 and Rs. 310 to Rs. 325; Kissenganj 600 pcs. on the basis of Rs. 320; Muzufferpore 4,000 pcs. on the basis of Rs. 325.

Bazaar Stocks

(19th June, 1961)

Cowhides: Wet salted 141,000 pcs.

Goatskins: Wet salted (Patna, Daissee, Kustia, Killed) 45,000 pcs.; Assam-Dinajpur 43,000 pcs.; Muzufferpore-Patna-Pakur-Kissenganj 346,000 pcs.

CALCUTTA TEA AUCTIONS IN MAY

IRREGULAR TREND IN PRICES

TWO sales were held in May. Departing from the procedure of recent years, it was decided that no Darjeeling supplement sales would be held but that the season would commence with Sale No. 1 in which teas from any district which had arrived would be offered. Offerings during the month amounted to some 52,000 packages, say Messrs Harrittt Moran and Co. Private Ltd in their monthly tea market review. There was a good demand in the first sale but prices for Darjeelings, which comprised the majority of the offerings, were somewhat irregular with some withdrawals in this category. Orthodox manufactures met with good support and sold readily at about valuations; Legg-cut Dooars were, however, a weak feature. Assam C.T.C.s were also a little difficult to sell and were generally easier. In the second sale there was only a fair demand, and Darjeelings, which in this sale comprised about half the offerings, tended easier except for a few flavoury invoices which sold well. The main interest in this category was centred on the plainer Darjeeling brokens, with similar leaf grades often difficult to sell. Although the remaining orthodox descriptions were irregular and generally easier, they met with a good enquiry except for the fanning grades, which were a weak feature. A few better liquoring Dooars sold above valuation. Legg-cut Dooars met with more enquiry and were firm, while C.T.C. grades—although irregular—were generally firm to dearer, particularly B.P.S.

Leaf appearance of Darjeeling teas was of a satisfactory standard for first-flush manufacture. Liquors of the early invoices were fully average in quality but due to unfavourable weather conditions, the later first-flush invoices deteriorated in quality and were below the normal average standard. Leaf appearance of both orthodox and C.T.C. manufacture from Assam were satisfactory while liquors were generally of an average first-flush description. Leaf appearance of Dooars and Terai teas was about average, although some invoices contained stalk and fibre. Liquors were about average in quality. Teas from Cachar and Tripura were of an average quality for the time of year both in leaf and liquor.

Sale No. 2 " "	4.70	(2.14)	4.40 "	(2.00)

(Inclusive of zonal excise duty.)

Five sales were held in May, and the 1,715 chests of leaf tea on offer met with a good demand at irregular rates. In the five sales, dust offerings amounted to 115,047 packages. Demand in the first four auctions was good and general; in the last sale, however, an appreciable weakening was evident. Clear medium C.T.C.s opened at slightly lower rates, but came to a good market in the subsequent auctions. In the last sale, the prices declined by as much as 60nP, and the closing rates were far below those ruling at the beginning of the month. Good C.T.C.s followed a similar trend. The fibrous teas were virtually neglected and sometimes proved difficult to sell. Orthodox dusts registered a steady decline in all the five auctions, but the few small and bright lines realised satisfactory prices. Legg-cut Dooars dusts were irregular but generally easier with the bright liquoring ones selling well.

(Inclusive of zonal excise duty.)

Export sales up to and including Sale No. 2 totalled 42,174 chests at an average price of Rs. 5.95, compared with 19,379 chests at an average price of Rs. 7.19 for the same period of the previous season. Internal sales at 27,057 chests of leaf and 919,228 chests of dust (average prices Rs. 4.30 and Rs. 5.13) go against 44,811 chests and 938,762 chests, respectively (against Rs. 3.97 and Rs. 4.67) of the corresponding period of the previous season.

The estimated north Indian crop up to the end of April 1961 was 8.65 million kilograms (19.08 million), compared with 7.51 million kilograms (16.57 million lbs) up to the same date of last year. The average figure at this date for the three years 1958-60 was 7.99 million kilograms (17.62 million lbs).

The special export licence for the 1960-61 season continued to be quoted at ½nP except at the close of the month when just a little business was done at ¼nP. There were, however, few buyers, and the market remained quiet. The last day valid for business in the special export licence was 31st May. Export quota for the new season was quoted at 3nP by sellers, at which rate only a little business was transacted.

Arrivals (in chests) in Calcutta warehouses during the period 1st May to 31st May, 1961, with the corresponding figures of the previous year in parentheses were by steamer 24,668 (9,867), by rail 16,083 (22,069), by road 32,106 (17,076) and by air 6,637 (4,279) chests. From the beginning of the season 1st April, 1961 to 31st May, 1961, arrivals have been: by steamer 28,207 (10,959), by rail 18,817 (38,511), by road 40,124 (32,140) and by air 9,620 (8,367), making a total of 96,768 (89,977) chests.

U.S. TEA IMPORTS REACH RECORD LEVELS

AIMS OF PROMOTIONAL CAMPAIGN DISCUSSED

In his preface to the annual report of the U.S. Tea Council for 1960, Mr. R. B. Smallwood, chairman, says that tea imports at 116,077,418 lbs reached a new high in 43 years. Imports showed an increase of 7,668,582 lbs or 7 percent over 1959. Sales of tea through grocery stores, which rose to an all-time high in 1959, remained at that level, being 85.6 million lbs, against 85.9 million lbs. It is estimated, the Council says, that the total tea promotional expenditure in the U.S.A. was somewhere between $14 million or $18 million. In the face of powerful competition, the U.S. tea industry's ability to consolidate its gains and maintain its competitive position is a striking testimony to the overall effectiveness of the campaign, the Council says.

Advertising Expenditure

The total consumer media expenditure for 1960 was $1,205,817. Of this, about 40 percent was spent during six weeks in February and March. "Twenty second television spots were used in evening time periods in the 18 basic markets which account for over 57 percent of retail food store sales." The iced tea campaign used radio exclusively, and 31 percent of the year's expenditure was allocated to iced tea radio spots in the 29 markets. Keeping in step with the warm weather cycle, the schedules were staggered, starting on 1st June in the deep south and on 15th June in the north. They ran for four weeks, were off during two, resumed for four more weeks, giving eight weeks of advertising pressure over a ten-week period.

The final phase of 1960 advertising, the fall-winter-hot-tea campaign, was marked by the first major shift in media strategy in many years. The money available for this phase was $270,000. The economics of television raised serious doubt whether or not for that amount of money any message could be projected via TV with sufficient frequency over a long enough period to make an important impact on the consumer. At the same time, it was agreed that a new and dramatic approach to advertising hot tea should be devised, and that the results of this creative search should be the final determining factor as to what media might be used. Knowing full well that rarely is there anything to be gained from advertising which is different just for the sake of being different, the creative search started on the premise that a primary function of new advertising for hot tea must be to attract attention and arouse interest among consumers.

Rationale for the Campaign

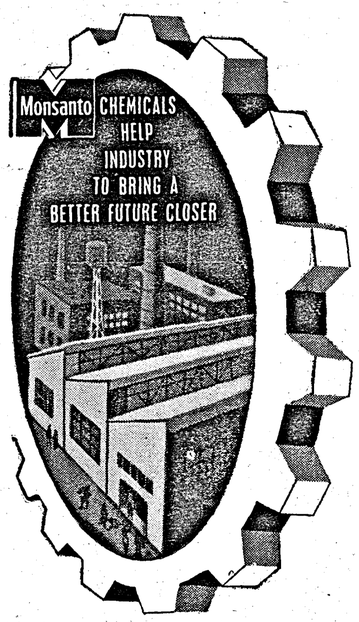
The approach developed was a very bold one but it was felt that nothing short of boldness could hope to penetrate the consciousness of the American public in today's highly saturated climate, particularly on a product which people generally take for granted and think they know all about. The rationale for the campaign was along the following lines. More people than ever seem to be suffering from an outraged sense of justice, a feeling of inadequacy, a delusion that the world is down on them and that they are trapped by their jobs, their marriage problems, their financial situation, etcetera. These emotional conflicts and frustrations are leading to both a conscious and an unconscious search for peace of mind. That is one side of the climate in which tea must be sold. The list of such frustrations in the vernacular of everyday American living is practically inexhaustible. Most people can and do readily identify themselves with these day-to-day feelings of tension when it is presented to them in a humorous vein. "These conditions lend themselves ideally to simple cartoon treatment, which, in combination with very brief display copy was translated into a completely fresh and dramatic advertising form. This creative rationale and the advertising that grew from it led to the decision to use the print media in place of television for the fall-winter-hot-tea campaign," the Council says.

Attitude Survey

The Tea Council used research in 1960 as a basic tool to guide the direction of its advertising programme. Early in the year, an "attitude survey" for four cities was completed which measured the ideas of consumers about tea in two cities where hot tea television spots had been run for a number of years, *versus* two cities which were not shown Tea Council T.V. advertising. "The results indicated that television had implanted the ideas contained in the spots, but the relative degree of positive feelings raised the first serious question about whether the level of impact it would be possible to sustain on T.V. in the future was sufficient to justify a continuing use of the medium."

The Tea Centre

During the first five months of 1960, work proceeded on the small five-storeyed building of the Tea Centre. On 7th June, 1960, the Centre opened its doors for a private preview attended by over 250 members of the tea trade and representatives from India, Ceylon and Indonesia.



Monsanto works constantly both to develop new, better chemicals—and to improve those chemicals already used in every major industry.

PHARMACEUTICALS
acetylsalicylic acid, phenacetin, benzoic acid, phenol, phenolphthalein, germicides are but a few of the many Monsanto products in this field.

RUBBER
Monsanto's accelerators help speed vulcanisation, add quality. Anti-oxidants improve resistance, prevent early cracking, give increased flexibility.

TEXTILES
Monsanto Syton is widely used in spinning cottons and woollens, increases yarn strength, allows for reduction in twist.

PRESERVATIVES
Monsanto's pentachlorophenol chemicals help to preserve a wide range of products. Monsanto sodium benzoate helps prevent corrosion.

PAINT
Monsanto's chemicals are used extensively in the manufacture of high-quality paints, varnishes and lacquers.

SYTON is a Registered Trade Mark

Monsanto
chemicals for every industry.

MONSANTO CHEMICALS OF INDIA PRIVATE LTD.

COMPANY AND PUBLIC NOTICES

THE MANDYA NATIONAL PAPER MILLS LIMITED

NOTICE

NOTICE is hereby given that an Extraordinary General Meeting of The Mandya National Paper Mills Limited, will be held at the Registered Office of the Company at 14, Palace Road, Bangalore-1, on Friday the 28th July 1961, at 3 p.m. to consider, and if thought fit, to pass the following resolutions with or without modifications:

I. As Special Resolution: RESOLVED that the Resolution passed by the Members at the Second Annual General Meeting of the Company held on the 4th November 1960, authorising the Board to issue 5 lakhs New Equity Shares of Rs. 10/- each and 10,000—6½ per cent Redeemable Cumulative Preference shares of Rs. 100/- each, be and is hereby withdrawn and the following Resolution is substituted therefor:—

"RESOLVED that the Company hereby authorise the Board to issue 8 lakh new Equity Shares of Rs. 10/- each and offer them for subscription on the following terms and conditions:—

(i) The new Equity Shares shall be offered for subscription at par to the existing holders of equity shares of the Company whose names appear in the Company's Register of Members on the 28th July 1961, in the proportion of 8 New Equity Shares for every 14 Equity shares held by each such member on the said date, the shares to be allotted to be suitably adjusted to the nearest multiple of five.

(ii) The Board of Directors may offer shares to the existing Members in excess of above mentioned proportion after taking into consideration renunciations which may be advised to the Company before the date of offer.

(iii) The holders of Equity Shares may also apply for a larger number of Equity shares than they are offered by the Board but their applications for additional shares will be considered by the Board after the shares have been allotted in the proportions as determined by the Board.

(iv) The Board of Directors may also entertain applications from the public and the holders of Preference Shares, but the allotment to the public and the holders of Preference Shares will be considered by the Board after the existing holders of Equity shares have been allotted the shares applied for.

(v) The New Equity Shares shall rank *'Pari Passu'* with the existing Equity Shares of the Company in all respects.

(vi) The offer aforesaid shall be made by the Board by a Notice specifying the number of shares offered and limiting the time not being less than one month from the date of the offer within which the offer if not accepted will be deemed to have been declined.

(vii) The offer aforesaid shall include a right exercisable by the Members concerned to renounce the shares offered to him or any of them in favour of any other person.

(viii) After the expiry of the time specified in the Notice aforesaid or on receipt of earlier intimation from the person to whom such notice is given that he declines to accept the shares offered, the Board of Directors may dispose of them in such manner as they think fit.

(ix) The issue, offer and allotment of the New Equity Shares shall be made in such manner and on such terms consistent with this resolution as the Board may in its absolute discretion determine and without prejudice to the generality of its powers given in this resolution, the Board is hereby explicitly authorised to decide and settle all questions relating to the issue and allotment to non-resident members of the Company.

(x) A sum of Rs. 5/- per share shall be payable along with the application and the balance of Rs. 5/- per share shall be payable in such calls as may be determined by the Board of Directors.

(xi) The Certificates in respect of new Equity Shares shall be completed and ready for delivery within 6 months after the date of last allotment thereof.

(xii) The Underwriting arrangement for the new issue may be made by the Directors as they think fit, but the underwriting commission shall not exceed 2½% of the nominal value of the shares which the Board may decide to have underwritten.

(xiii) Aforesaid issue shall be made by the Directors subject to the sanction of The Controller of Capital Issues and on such terms and conditions as the Controller of Capital Issues may prescribe.

II. As Ordinary Resolution: "RESOLVED that the Board of Directors be and are hereby authorised to borrow moneys up to a limit of Rs. 4 crores (inclusive of borrowings already made) not withstanding that the moneys to be borrowed together with the moneys already borrowed by the Company (apart from temporary loans obtained from the Company's Bankers in the ordinary course of business) may exceed the aggregate of paid up capital of the Company and its free reserves, that is to say reserves not set apart for any specific purpose".

III. As a Special Resolution: "RESOLVED that the Contract between the Company and the Neturia Coal Company Private Limited, an associate (As defined by Section 2(3)(c) of the Companies Act 1956) of Bedi & Company Management Limited, the Company's Managing Agents, a draft whereof has for the purpose of identification been subscribed by the Chairman of this Meeting, for the sale of coal by the Neturia Coal Company Private Limited, to the Company up to 80,000 tons annually at the Government Controlled Rate plus incidental charges not exceeding Re. 1/- per ton for a period of 10 years, commencing from 1st July 1961, be and is hereby approved."

The share transfer Registers of the Company will be closed from the 12th July to the 28th July, 1961, both days inclusive.

By Order of the Board,

BEDI & CO. MANAGEMENT LIMITED,
Managing Agents,
ANUP SINGH BEDI,
Managing Director.

Bangalore-1,
9th June, 1961.

NOTE: (1) A member entitled to attend and vote at the Meeting is entitled to appoint a proxy to attend and vote instead of himself and such proxy need not be a member of the Company.

(2) Explanatory Statement has been annexed to the copies of this notice posted to the members.

A TIGHT YEAR FOR INDIAN BANKING

THE strains imposed on the Indian banking system during 1960 were perhaps the most severe in its history. This year and in subsequent years, they may well be greater because demand for credit continues to increase rapidly whereas the circumstances which have restricted a corresponding expansion in the banks' capital and deposits, still persist. The extent of the problem is revealed in the Reserve Bank's routine report, *Trend and Progress of Banking in India during 1960*, recently published. Some suggestions for improving the position are also given. The statement that "Such weaknesses as have been shown are dimensionally of little significance" is reassuring, although on the basis of the facts given, not altogether convincing: while the prediction that "The banking system can confidently look forward successfully to meet the challenge thrown up by the third plan" is as questionable factually as it is grammatically. It may be true that there are no serious structural weaknesses revealed by this report, but it is clear enough that the difficulties encountered are not of the kind which might be expected to disappear of their own accord in the natural process of banking evolution. The least they call for is careful investigation before adequate remedies can be prescribed. Those put forward by the report are interesting enough, but it is doubtful whether, in practice, they will be adequate to solve the banking system's entire range of problems. It is possible that this can only be done in the context of wider economic policy changes.

On the basis of the report's figures, the strain on the banking system is revealed in the increase of the credit-deposit ratio from 52.2 percent in 1959 to 62.5 percent in 1960, and the growth of borrowings from the Reserve Bank from Rs. 1 crore in 1959 to Rs. 50 crores in 1960. Deposits increased by only Rs. 39 crores in 1960, compared with Rs 253 crores and Rs. 216 crores in the two previous years. Advances, on the other hand, were up by Rs. 208 crores as against Rs. 91 crores and Rs. 11 crores in 1959 and 1958, respectively. These comparisons, the report points out, are to some extent vitiated by the transfer of P.L. 480 funds from the State Bank of India to the Reserve Bank. But this is not the whole story; briefly, the figures reveal that the banks have been unable to meet the calls upon them without a radical change in their customary ratios and an increasing resort to the Reserve Bank. Whatever the report may say, this is *not* a satisfactory position from which to meet the rapidly expanding requirements of the third plan. Something fairly drastic will have to be done, if the banks are not to be faced with annually recurring crises, to increase the resources at the system's disposal.

Apart from the loss of P.L. 480 funds, the report puts forward a number of reasons for the unsatisfactory growth in deposits. In 1960 there was less deficit financing; the import surplus was larger, the failure of a few small south Indian banks caused a general loss of confidence; and the incidence of credit curbs forced some borrowers to go outside the banking system to satisfy their needs. All these reasons are relevant. There was probably less created money entering the banking system last year than during any other year of the second plan. It is also possible that the general rise in prices increased liquidity preference throughout the economy, and this may be one of the reasons for the surprising fall in time deposits —a decline of Rs. 12 crores, compared with increases of Rs. 234 crores and Rs. 226 crores for the two previous years. Demand deposits improved by Rs. 51 crores, however, compared with a rise of Rs. 19 crores in 1959 and a decline of Rs. 10 crores in 1958. Clearly, the previous preference for the less liquid form of deposit has been reversed, although there may be other explanations for this phenomenon. The failure of the Palai Central Bank and the subsequent moratoria undoubtedly damaged confidence in the banking system as a whole in a way which may take some years to repair, although the ultimate solutions are simple enough. But the growth of "direct financing" is in another category of seriousness and calls for a specialised study of its own.

The report outlines a number of remedies. Amalgamations are to be encouraged in order to strengthen banking units. This is undoubtedly a sound development. Modern banking is increasingly of the branch variety and there is no reason why the trend should not grow in India. The next few years should see an increasing crop of amalgamations, both forced and voluntary, and this is a welcome development. So is the Government's decision to introduce deposit insurance, although from the start the amount covered—a mere Rs. 1,000 for any one depositor—should be increased to cover the entire deposit whatever its size. It is possible to suggest other steps. For example, after the Palai Central fiasco there is obviously room for more careful Reserve Bank supervision. Less official prying into bank accounts by tax inspectors might popularise interest-earning deposits among some sections of the community in preference to the holding of non-yielding and risky hoards of gold and currency notes. Deposits will be encouraged by better facilities; the report enlarges on this point, although its suggestion for introducing a system of credit transfers, as has just been done in the U.K., seems slightly unrealistic under Indian conditions today. A more rapid expansion of branches, better trained staff, more attractive premises and the growth of the savings-deposits scheme would all help to draw in more resources, while greater specialisation, more mechanisation and a higher degree of decentralised decision taking, would cut costs. Finally, an increase in banks' reserve funds and issued capital would be a powerful aid to improving and strengthening the banking system. This, however, is dependent on an increase in bank profits. These increased in 1960, or at least they did for those banks included in the report's analysis of Profit and Loss Accounts; but it is doubtful whether they have yet reached the level which would permit the banks to approach the capital markets for their requirements. An increase in the banking system's capital base is urgently needed at this stage in development and every facility should be provided for earning the profits which would make this possible.

A point which the report fails to make with sufficient force is that so much of the banks' failure to attract deposits must be attributed to the inadequacy of the attraction offered. Why so little attention should be given to the rate of interest as an inducement to deposit money with banks can only be explained in terms of wishful thinking. But for those who are interested in the facts, the recent fall in time deposits and increase in direct financing might both be taken as indications that current bank borrowing rates are too low. It has often been stated in these columns, when commenting on the inter-bank agreement, that competition between the banks for deposits might at least ensure that the borrowing rate would find its proper market level. Without contradicting anything said above about the banks' profits, there seems no reason for changing this point of view. What the inter-bank agreement appears to have accomplished —along with ruling out competition between the banks themselves—is to put the whole banking system into competition with direct financing of various kinds. And the inadequate growth of bank deposits during 1960 is partly an indication of how the banks are faring against this threat. It follows, of course, from any suggestion of the inter-bank agreement being abandoned, that the banks be allowed to increase their rates to lenders. This, in turn, means that industry and commerce should be permitted to earn and retain the profits necessary for paying the higher rates.

All this adds up to a change in economic policy, as was hinted at in the last sentence of the first paragraph of this article. High interest rates would be contrary to the current official policy of cheap money, but there is no reason to suspect that they would in any way hamper development provided profits were permitted to rise accordingly. Other nations have developed more rapidly than India is doing at present with rates of interest at considerably higher levels; West Germany is a case in point. At the moment there is too little incentive for saving in this country; only speculative activities appear able to afford the true market rate for resources. An increase in rates of interest would, of course, involve the Government in more costly borrowing, and this might not be possible without a cut in plan expenditure. Thus the true facts of the situation are revealed; the current predicament of the banking system is due to the high proportion of Government economic activity financed out of swingeing taxation and borrowing at artificially low rates of interest. As, under the third plan, this proportion of official economic activity is to rise, without any contemplated change in the method by which it is to be financed, then there is every reason to believe that the banking system's resources problems will increase along with it.

A GROWING STOCK EXCHANGE

INDIAN stock markets have turned cautious during the past week or so mainly due to uncertainties about further restrictions on trading. Debates on the margin and *havala* systems seem to have ended in Dalal Street because the Stock Exchange authorities have decided to maintain the *status quo*, at least for the time being. But operators are getting worried about a report that the Stock Exchanges Directorate of the Finance Ministry is pressing the markets to abolish free margin limits and fix minimum brokerages. There is no doubt that the Stock Exchange authorities have carefully considered the views of the Directorate, but they are probably right in thinking that the present time is not an appropriate one for fresh restrictions. As far as the Calcutta stock market is concerned, the question of restraining speculation by extraordinary measures appears irrelevant under present circumstances. A careful study of the indices for ordinary shares made by the Reserve Bank for the Calcutta, Bombay and Madras stock markets establishes the fact that speculation has been restrained in Lyons Range. The index for the ordinary shares has increased from 179.3 to 193.8 (1952-53 equals 100) in Dalal Street during the past year, while it has improved from 161.2 to only 167.4 in Lyons Range. The index has risen from 189.6 to 195.5 in the Madras stock market and has moved up from 229.0 to 249.6 in the Delhi stock market.

It is evident, therefore, that trading has been maintained at a normal level in the Calcutta market. In a survey of its activities during 1960-61, just published, the Calcutta Stock Exchange authorities point out how business in cleared securities—speculation is mainly concentrated on these scrip, which now total 12—has had a clear passage. There has been no occasion to adopt any emergency measure such as interim clearing or the imposition of fresh margins on trading. At the same time, activities have broadened in an appreciable way. Not only has the sub-division of the capital structure of the Calcutta stock market succeeded in drawing many more persons to the avocation of stock-broking, but there has been a notable expansion in the investment habit, which is evident from the warm response accorded to new share issues in recent

months. During the period under report, 29 companies applied for initial enlistment of their securities. Out of these 21 were granted enlistment and now account for a total number of 29 securities—21 ordinary shares and 8 preference shares. The paid-up capital of the ordinary shares amounts to Rs. 18.05 crores, and the preference capital to Rs. 1.92 crores. A further 21 issues of the existing listed companies were also granted enlistment. As a result, the official list of the stock market now shows a total number of 584 companies having 948 issues. In addition, the list contains 26 securities of the Central Government, 56 of the State Governments, two of the Industrial Finance Corporation, two of the Madras State Electricity Board, two of the U.P. Zamindary Abolition Scheme, three of the Calcutta Port Trust, nine of the Calcutta Improvement Trust and 13 of the Calcutta Municipal Corporation. Thus, the total number of securities quoted on the Calcutta stock market was 1,088 at the end of May 1961.

An important factor is that the listing regulations have been codified under the direction of the Government of India in line with other stock markets. The uniformity in regulating the listing of shares in different stock markets is considered a step in the right direction. Another important reform is that the Calcutta stock market, along with others, has formulated regular procedures, under the direction of the Government of India in order to ensure fairness in the matter of allotting shares. It is now a settled principle that the stock market does not permit any official quotation for a share until the Company's auditors certify that allotments have been made under the rules of the Stock Exchange and that all allotment letters have been despatched. Although these improvements have been of some help in safeguarding the interests of shareholders to the extent that interested persons are prevented from exploiting unduly the gains of new share issues there is still a great deal to do before it can be claimed that shareholders have been protected to the maximum extent circumstances permit. A discouraging fact is that in many share issues, quite a large number of small applicants are disappointed when their applications produce no result. The company managements protect themselves by claiming that fairness has been maintained through the alloting of shares by ballot. If greater spread of share ownership is desired, it is time steps were taken to ensure compulsory allotments at least for all small applicants.

In spite of the evidence that interest has broadened in investment during recent months, some reforms are urgently called for if the growing confidence is not to receive a setback. One of the new share issues recently over-subscribed and listed in the Calcutta stock market has now been removed from the official list until further notice. A large parcel of these shares has had to be sold by public auction at much below the par value. These examples are not likely to inspire confidence. It is pointless to apportion the blame to any particular institution—whether it is the Controller of Capital Issues, the Company Law Department or the Stock Exchange. What is needed is to devise ways so that doubtful issues are not permitted to exploit the hard-earned money of the unsophisticated public. The broking fraternity of the stock market can be of much greater service in this matter. It is the duty of brokers to examine new share issues carefully and ventilate their opinions in a forthright manner. To earn brokerage by buying and selling is not the end of a broker's job. His main duty is to protect the interests of his clients. A broker can do his work well provided he has the necessary technical knowledge and is paid his due remuneration for the service rendered. Although the stock market brochure mentions the introduction of an educational programme, it does not say how and for whom education is being imparted. The authorities might do well to insist on a minimum educational qualification before enlisting a broker. It is also relevant to stress the point that more harm than good might be done if time were wasted in enforcing minimum brokerage under present conditions. It should be remebered that brokerage by itself neither promotes nor discourages speculation. On the other hand, unless fair remuneration is ensured, stock-broking as a career will not attract the right type of people.

THE WEAKNESS OF STERLING

THE statement in Basle by Dr. Per Jacobsson, Managing Director of the International Monetary Fund, that he "happened to know" that the authorities in all the major financial centres intended to maintain the present exchange-parities, strengthened the pound in a period of alarming weakness. The "categorical" reiteration in London a few days later by Mr. Anthony Barber, Economic Secretary to the U.K. Treasury, of statements made previously by the Chancellor of the Exchequer that sterling would not be devalued, was ignored. Any statement on a currency by the authorities responsible for that currency is nowadays suspect apparently. Nevertheless, Mr. Barber's assurance that the U.K.'s resources—he meant, principally, the reserves and the drawing rights with the I.M.F. —were "fully adequate to meet any speculative attack on sterling" would have supplemented the favourable effect of Dr. Jacobsson's statement if confidence in sterling had not been weakened in the meantime by figures that seemed to show deterioration in the trading position and by persistent evidence of rising costs and prices. It was recognised that the temporary supports for sterling would not be adequate to maintain its value if its underlying position remained weak.

The external deficit—probably, at a yearly rate, smaller than last year's—is not in itself alarming, if it is temporary. But the competitive power of British industry is rather deteriorating than improving. Answers to the latest questionnaire of the Federation of British Industries showed that many firms were experiencing not less but more difficulty in securing orders from abroad. Although they are reducing their profit-margins, they cannot completely insulate their prices from the upward trend of their costs; and some of them cannot fulfil their orders within a reasonable time because they cannot get enough labour to increase their output. The main difficulties in the British trading position now are rising costs and scarcity of labour. Production is not fully efficient because, despite the pressure of demand in most sectors, much capacity is under-employed. Prices, after some three years of approximate stability, are rising at an alarming rate.

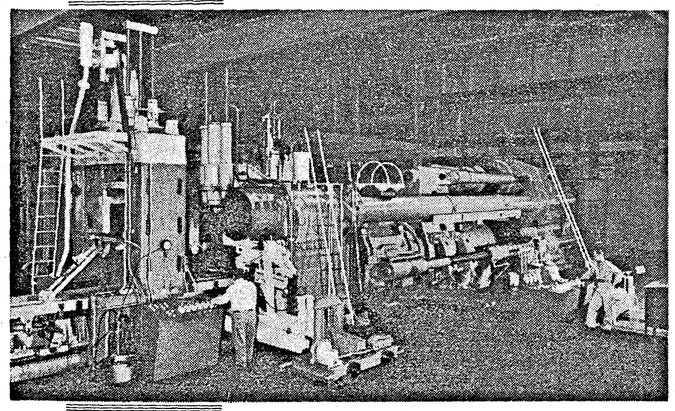
It is almost incredible, but it is true, that nearly every official action in the economic field, in this dangerous situation, tends to raise the cost of production and the cost of living. A glaring example of the cost-raising policy is the tax on fuel-oil imposed in the Budget last April: many firms have mentioned this impost as a factor in their present difficulties. A glaring example of the increase in the cost of living is the raising of fares on publicly-owned transport. (Probably the most unpopular man in Britain today is Dr. Richard Beeching, an industrialist who claims no special knowledge of transport but has been put in charge of the railways at a salary much higher than that of any other executive in public service. His pathetic solution of the railways' problem is the same solution as his lower-paid predecessors', to raise fares. The only visible effect of this policy in the past has been loss of traffic, and consequent under-employment of capacity). The Chancellor of the Exchequer provided for his future use, in his Budget this year, new "economic regulators" which are technically interesting, even refreshingly imaginative, but which are cursed with the same defect: applied to relieve strain, they would raise costs and prices. There is the tax on labour, a direct addition to industry's costs; and there are the flexible duties on consumer goods, directly increasing the cost of living.

It can be said in defence of these measures that the orthodox alternatives, such as high interest rates and restraint of credit, have failed. And it can be plausibly argued that when the economy is demonstrably overloaded it must be relieved, either by restraints on demand or by withdrawal of purchasing power. But it can be more convincingly argued that the one policy that would be effective is the one that no British Government seems competent to adopt: relief of pressure by reducing the amount of public money injected into the economy or spent abroad—in other words, by reducing public spending. If expenditure on defence on the present scale is disrupting the economy it cannot achieve the essential purpose of defence. It has been repeatedly revealed by the Auditor General and other investigators—and millions of Britons know from their personal experience—that much of the money spent on the defence services is wasted. This waste must be ruthlessly eliminated. If the resulting savings are not enough, commitments must be reduced to a scale commensurate with available resources.

However, the faults of official policy do not exonerate industry. If labour is scarce and increasingly costly, why are so many firms so slow in applying labour-saving techniques? The alleged deficiencies in Britain's industrial technology are not so much in the processes and equipment as in the use of them. By some means, production must be increased within a framework of stable prices. Selective restraints on demand at home may be necessary, but a general policy of restraint, as applied in the past, has been proved ineffective. In any case, no policy of restraint is long-term; and what is needed above all to restore confidence in sterling is a coherent long-term policy of national development. If the Government presists in its present policy, devaluation of the pound will be inevitable. (Even the short-term expedient, the "Basle Agreement" that informally restricts conversion of weak currencies, will collapse if the central banks lose confidence in a currency that they are required to hold in abnormal quantities.) But the value of sterling must be maintained. Therefore, the Government's policy must be changed.

SCHLOEMANN

14,000-ton Extrusion Press



It pays to know more about SCHLOEMANN

Sales targets are difficult to achieve when production is hampered by absolescent equipment. SCHLOEMANN is prepared to modernize your plant with highly efficient machinery, for either light or heavy work.

The two 14,000-ton extrusion presses installed at Alcoa's Lafayette Works – the largest units of their kind in the States – are fine examples of SCHLOEMANN skill. Capable of extruding profiles up to 40" wide and seamless pipes up to 20" o. d. from aluminum billets weighing 5,000 lbs., these presses provide cost-conscious designers with new possibilities in many branches of engineering.

If you are concerned with the plastic forming of non-ferrous metals and steel, it will pay you to consult our engineers.

Current News and Comment

Burmah-Shell Refineries' Offer

The striking rise in Indian oil consumption during the past few years shows how important energy is in the economic growth of a country. The consumption of oil is expected to increase to 7.8 million tons in 1961 from 4.9 million tons in 1956. Although the percentage rise in consumption varies from product to product, it is estimated that the general demand will increase at a rate of 12 percent a year during the third plan, compared with 10 percent in the second plan. The Oil Advisory Committee estimates the total demand for petroleum products at 14.14 million tons, representing a crude oil equivalent of 15.27 million tons, in 1966. In order to bring supplies in line with rising requirements, a substantial amount of capital investment will be necessary. It is believed that an investment of Rs. 60 crores is required to find, produce, refine and distribute to consumers 1 million tons of oil. It is, therefore, clear that an investment of Rs. 400 crores may be necessary in order to meet the increased demand to the extent of nearly 7 million tons.

The financial implications apart, there are many other problems concerning the organisation for producing adequate supplies in time. On a longer view the supplies will be provided by both the public and private sectors. The two Government refineries—one in Gauhati and the other in Barauni —are expected to begin production in the near future. There is no denying the fact that efforts will be made to increase production in the public sector as quickly as possible. But the question is whether this expansion can be achieved rapidly enough to meet all requirements in time. Judging by current trends, it looks as though considerable time will be required before the public sector refineries can produce in substantial quantities. Meanwhile, the demand has increased to a considerable extent, so production needs to be stepped up quickly in order to avoid shortages. Under the circumstances, the existing refineries in the private sector should be permitted to increase their capacities. Not only are they in a position to raise their production quickly, but the increased supplies can be made available at cheaper costs.

In the light of these considerations, the proposals of the Burmah-Shell Refineries Ltd to increase its refining capacity by a further million tons and to manufacture lubricating oil to the extent of 100,000 tons a year, should receive careful consideration from the Government. In his chairman's statement at the annual general meeting of the Burmah-Shell Refineries Ltd held on Monday, Mr. L. D. Mudie (a full text of his statement is printed elsewhere in this issue of *Capital*) pointed out that the total cost of the two projects has been reduced further by Rs. 2.28 crores. The expansion of the refinery capacity will cost Rs. 2.83 crores and the project to manufacture lubricating oil Rs. 6.47 crores. The necessary foreign exchange for the two projects will be provided by the Company itself out of its own resources.

The report of the Burmah-Shell Refineries Ltd for the year ended December 1960, shows good results. Not only has production increased, but there has been a sustained rise in the output of middle distillates and a reduction in the yield of motor spirit. Mr. Mudie thinks that the over-production of motor spirit will be relieved to a great extent by the development of chemical and fertiliser industries based on light petroleum feedstock. The marketing associates of Burmah-Shell Refineries have contracted with F.A.C.T. for the supply of naptha to the fertiliser plants of the latter situated at Alwaye. Arrangements have also been made with the Fertiliser Corporation of India for the supply of 50,000 tons of refinery gas to the latter's Trombay plant. Burmah-Shell Refineries has started producing quality jute batching oil. The profit of Burmah-Shell Refineries has amounted to Rs 2.59 crores in 1960 against Rs. 3.51 crores in 1959, after providing Rs. 1.72 crores (against the same) for depreciation, Rs. 4.12 lakhs (against Rs. 9.12 lakhs) for development rebate and Rs. 2.61 crores (against Rs. 1.90 crores) for taxation. The higher taxation provision is due to the fact that the Company has ceased to benefit from the relief provided under the Income Tax Act. General reserve receives Rs. 1 crore. A taxable ordinary interim dividend of 15nP a rupee has already been paid and a final ordinary dividend of 5nP a rupee, taxable, has now been declared. The dividends absorb Rs. 2.76 crores (against Rs. 2.49 crores).

Universal Cables Prospectus

Universal Cables Ltd, formed out of the former Hindustan Woollen Mills Ltd, is offering 700,000 ordinary shares of Rs. 10 each for subscription at par. As the paid-up capital is already Rs. 34.97 lakhs in ordinary shares of Rs. 10 each, the existing shareholders have been offered the privilege of subscribing for new shares worth Rs. 34.97 lakhs. The remaining 350,275 ordinary shares are being offered for public subscription. The entire issue has been underwritten. (The announcement is published elsewhere in this issue of *Capital.)* The proceeds of the new shares will be used for building a cable factory in Satna, Madhya Pradesh. The installed capacity is for 624 miles of paper-insulated lead-covered power cables a year. The cost of the project is estimated at Rs. 2.50 crores, to which a foreign exchange loan of Rs. 80 lakhs is likely to be contributed by the Industrial Credit and Investment Corporation and the Commonwealth Development Finance Company. Technical collaboration has been arranged with British Insulated Callender's Cables Ltd of the U.K.

The directors consider the prospect optimistically in view of the rising demand for paper-insulated cables. The demand is expected to rise to 4,000 miles a year during the third plan due to progress in electric development. At present, the domestic output is no more than 570 miles a year, so Universal Cables may not find any difficulty in selling all its products. Production is expected to begin at the end of 1962 and the directors hope to pay reasonable dividends on the new shares within a short period. The Company has declared a taxable ordinary dividend of 50nP a share for the year ended March 1961. The subscription list opens next Monday.

New Issue from Star Paper

The Star Paper Mills Ltd proposes to issue new ordinary shares of Rs. 50 lakhs to the existing ordinary and preference shareholders at par in proportion to the capital paid-up on the shares held by them. The proceeds of the issue will be used to meet the increased costs of the expansion scheme. The Industrial Finance Corporation has sanctioned a further loan of Rs. 37 lakhs to the Company. The expansion scheme is making progress, but production from the new plant is not expected to begin until after some time. The directors state that the working during the year ended September 1960, has been adversely affected by rising production costs. The reduction in the prices of the commodity since the beginning of 1960 has also proved unremunerative. The profit has amounted to Rs 7.03 lakhs in 1959-60, compared with Rs. 7.91 lakhs in 1958-59, after transferring Rs. 2.95 lakhs (against Rs. 3.26 lakhs) to depreciation. Taxation is allocated Rs. 3 lakhs (against the same) and a balance of Rs. 3,97,323 has been carried forward, against Rs. 6,122 brought in. The dividends have been passed.

A Good Year for Metal Box

There has been a substantial improvement to Rs. 51 in the price of the ordinary shares of the Metal Box Company of India Ltd due to the excellent results achieved during the year ended March 1961. The Company has taken steps to extend its activities and diversify its products. As Metal Box produces quality goods, there is sustained demand for all it turns out. In his chairman's review (a full text of which is printed elsewhere in this week's *Capital)* circulated to shareholders along with the report and accounts, Mr. K. C. Mahindra points to the importance of a good container-making industry in order to prevent the widespread use of adulterated and spurious products. It is rather unfortunate that high prices of containers following increased excise duties on raw materials such as tinplate, aluminium and polyethylene used largely by the container-making industry, have promoted bulk packings. As a result, consumer goods are sold loose from such packings and adulteration and substitution are being encouraged. Mr. Mahindra claims that the industry should be given priority in the matter of imported raw materials because a healthy container-making industry is essential for building the domestic and export markets on a sound basis. Unless goods are well packed, they are difficult to sell in foreign markets. Mr. Mahindra takes a cautious view about the supplies of raw materials during the current year. As far as tinplate is concerned, the proposal of Tatas' to shut down their billet mill for overhaul is viewed with some concern. This apart, he thinks that the demand for tinplate will exceed supplies unless steps are taken now to improve domestic production. Every possible effort is being made to ensure supplies of mild steel either from D.L.F., rupee payment or barter sources.

Pointing to the improved results for 1960-61, Mr. Mahindra mentioned the rise in exports of Metal Box products. There has been a substantial increase in the production of the Calcutta factory No. 2 which is engaged in producing industrial components and machinery and plastics. In the plastics works, the range of products has been extended. The expansion of machinery building facilities is continuing. The range of plant for customers' use has increased. The new factory in Faridabad started production last October, but its efficiency has been hampered by power shortages. It is proposed to increase the range of machines produced in the Calcutta factory. The profit of Metal Box has increased from Rs. 1.08 crores in 1959-60 to Rs. 1.23 crores in 1960-61, after increasing depreciation from Rs. 14.78 lakhs to Rs. 16.10 lakhs.

Sales also rose from Rs. 8.30 croras to Rs. 9.70 crores. The ordinary taxable dividend has been maintained at 25 percent. It is covered more than two-and-a half times and offers a yield of 4.9 percent at the present price. Taxation is allocated Rs. 60 lakhs (against Rs. 51 lakhs), development rebate reserve Rs. 3 lakhs (against Rs. 3.25 lakhs) and general reserve Rs. 15 lakhs (against the same). The carry-forward is Rs. 28,85,973, against Rs. 23,96,994 brought in.

New Great Insurance Prospects

In the absence of Mr. Tulsidas Kilachand, chairman of the New Great Insurance Co. of India Ltd, Mr. Ambalal Kilachand presided over the Company's annual general meeting held last week. In his speech, Mr. Kilachand appealed to the Executive Committee to recommend to the Government that it review the Insurance Act, remove the provisions such as the restriction on commission, etcetera, and enact new insurance legislation in a simplified form based more or less on the laws prevailing in the United Kingdom. (A fuller version of the speech appears elsewhere in this week's issue of *Capital.)* The existing restrictive regulations, Mr. Kilachand said, are hampering the smooth working of the general insurance industry in India. The authorities should re-examine the provisions of Section 40C of the Insurance Act and Rule 17E of the Insurance Rules relating to the amount of expenses which were fixed over ten years ago at a time when the cost of living and the prices of commodities were much lower. Mr. Kilachand urged the Government to effect changes in the formula by making it more flexible so that the industry could conduct its business smoothly under present-day conditions. Through the Insurance (Amendment) Act, the Government has made it compulsory for all insurers in India to reinsure a certain percentage of their business with the Indian Guarantee and General Insurance Co. Ltd, in addition to the reinsurance already being placed with the India Reinsurance Corporation. Insurance companies are spreading out their liabilities to as wide a geographical area as possible and are getting reciprocity to the fullest extent—particularly in the fire department—which has enabled them to build up a profitable reciprocal portfolio. On the other hand, they will be receiving only 50 percent reciprocity from the India Reinsurance and the Indian Guarantee. Mr. Kilachand said that both these Companies should concentrate on bringing to the Indian market an increasing volume of profitable business from abroad.

The gross direct premium of New Great Insurance for 1960 was Rs. 48.15 lakhs in fire, Rs. 37.25 lakhs in miscellaneous insurance and Rs. 38.21 lakhs in marine, while the net premiums were Rs. 42.24 lakhs, Rs. 31.99 lakhs and Rs. 19.51 lakhs, respectively. After providing for losses, expenses and reserves at 50 percent for fire and miscellaneous insurance and 100 percent for marine, and after adding the balance brought forward from the previous year, the net amount to the credit of the profit and loss appropriation account is Rs. 3.21 lakhs. The directors have transferred Rs. 40,000 to the staff gratuity account and have recommended an ordinary dividend of Rs. 2.50 a share, subject to deduction of tax, which will absorb Rs. 2.50 lakhs.

Larsen and Toubro Repeats

The shares of Larsen and Toubro, which touched a high of Rs. 48 early in June, declined to Rs. 40.75 last week, and the latest quotation is only slightly better around Rs. 41.50. The sharp decline was caused by the disappointment over the bare maintenance of the dividend at 18 percent, less tax. But the maintenance of the dividend has cost the Company an additional Rs. 1.70 lakhs, for while the new shares issued in August 1959 were entitled to the dividend for only six months of 1959-60, they are now entitled for a full year's dividend. Besides, during the year ended March 1961, Larsen and Toubro issued a further 300,000 equity shares of Rs. 10 each at par and these shares will be entitled to dividend from the current year onwards. The maintenance of the dividend should, therefore, scarcely be any cause for disappointment. The working results show that the Company has done fairly well during the year ended March 1961. Sales are up from Rs. 3.21 crores to Rs. 3.51 crores and the income from commissions, engineering fees and other sources amounted to Rs. 19.48 lakhs, against Rs. 17.18 lakhs in the previous year. The gross profit shows a rise of Rs. 6.49 lakhs at Rs. 55.53 lakhs. After providing Rs. 11.52 lakhs (against Rs. 7.09 lakhs) for depreciation and Rs. 17.48 lakhs (against Rs. 16 lakhs) for taxation, the net profit amounts to Rs. 22.84 lakhs, compared with Rs. 21.78 lakhs in 1959-60. After transferring Rs. 1.27 lakhs (against Rs. 1.02 lakhs) from taxation provision, the directors have allocated Rs. 4.82 lakhs (against Rs. 4.57 lakhs) to development rebate reserve. Allocations to general reserve and dividend equalisation reserve have been maintained at Rs. 2.50 lakhs and Rs. 1 lakh, respectively. The dividends, both ordinary and preference, absorb Rs. 15.37 lakhs, against Rs. 13.67 lakhs in 1959-60, leaving Rs. 99,000 to be carried forward, against Rs. 56,000 brought in.

During the year, there has been a net addition of Rs. 43.60 lakhs to fixed assets, bringing its total cost to Rs. 1.22 crores which has been written down to Rs. 84.18 lakhs. The directors state that during the year, the Company acquired at par 312,500 shares of Rs. 10 each (Rs. 8 paid) of Utkal Machinery Ltd and 2,550 shares of Rs. 100 each of Christensen Longyer (India) Ltd, raising total investments of the Company to Rs. 56.68 lakhs. Larsen and Toubro's manufacturing activities have made considerable progress. The Powai workshop produced a larger volume of high quality engineering goods. The production of equipment for dairies, refrigeration plant, food processing plant and chemical plant "was further developed." Negotiations have been completed for the production of equipment for sulphuric acid and superphosphate plant, of drilling equipment and diamond bits and of lubricated taper plug valves in collaboration with leading foreign firms. The Company has completed a number of major contracts for the erection of factory structures, machinery and equipment, and further new valuable contracts have been secured.

Prospects for Alcock Ashdown

Although the shares of Alcock Ashdown Co. Ltd have suffered a substantial setback from the highest level of Rs. 332 recorded in the last week of April, the current quotation of Rs. 307 shows an impressive improvement over the January low of Rs. 234. Mr. K. D. Ryall, chairman, said at the annual general meeting in Bombay last week that shareholders can look to the future with optimism. "It is confidently anticipated that overall results should be better than for 1960 which were themselves better than 1959," provided there were no unforeseen developments. Mr. Ryall pointed to the shortage of wagons for the supply of materials and despatch of fabricated goods and to the difficulties of securing steel. But he added that these difficulties would not unduly affect the Company's production. Giving an account of the progress made at the works, the chairman said that productivity of the Bombay works continued to increase. The transmission line tower manufacturing shop has been completed, and the order-books are full up to next year for both transmission line towers and boat manufacture. With the machinery and plants overhauled, Alcock Ashdown is in a position to compete with foreign firms and build craft for export markets. The chairman is optimistic of getting foreign orders to build craft, although foreign competition in this line of business is very severe. No immediate improvement is, however, expected in the immediate future for ship repair works. The expansion scheme of the Bhavnagar works is making satisfactory progress. The transmission line tower shop and the galvanising plant are expected to be in operation early in October this year. The light and heavy structural shops with assembly areas will be ready for production by the end of the current year. The Company has already obtained initial orders for the tower shop in Bhavnagar. The chairman does not anticipate any difficulty in securing orders to help the structural shops to go into production as soon as they are ready. The boat-building yard in Bhavnagar is said to be in full production and is fully booked until early next year with good prospects of further orders for craft.

Svadeshi Mills Pay More

The working of the Svadeshi Mills for 1960 more than justifies the increase in the dividend from 14 percent to 17 percent, both taxable. Net realisation from the sale of cloth, yarn and waste is up from Rs. 4.28 crores to Rs. 4.42 crores and stocks from Rs 63.64 lakhs to Rs. 87.37 lakhs. The gross profit has risen from Rs. 44.32 lakhs to Rs. 67.65 lakhs. The ratio of the gross profit to sales works out to 15.3 percent, against 10.4 percent in 1959. The improved financial results are largely due to the full use of the Company's productive capacity, better demand for cloth and higher realisation because of the diversification of production. The directors state that production during the year was somewhat less than in 1959 because the Company produced better finished and finer type of goods. It installed new plant and machinery of the value of Rs. 31 lakhs during the year. At the end of the year, additional machinery of the value of Rs. 4 lakhs was awaiting installation. Since then, orders have been placed for machinery worth Rs. 6 lakhs. Most of the expenditure on the renovation of plant, machinery, equipment and buildings is being met from Svadeshi Mills' internal resources. This has been possible due to the management's policy of ploughing back into reserves a large part of the profits. Besides, this has greatly strengthened the intrinsic worth of the equity. The paid-up capital of Rs. 1.15 crores, of which the preference capital is Rs. 15 lakhs, is supplemented by reserves and surplus amounting to Rs. 1.06 crores. The book value of the share works out to around Rs. 206. The gross block stands at Rs. 3.51 crores, and this has been written down to Rs. 1.58 crores. Loans and current liabilities amount to Rs. 1.68 crores against which investments and current assets stand at Rs. 2.21 crores. From the year's gross profit, the directors have provided Rs. 18.49 lakhs (against Rs. 15.32 lakhs) for depreciation, Rs. 6 lakhs (against Rs. 2.75 lakhs) for development reserve and Rs. 17.50 lakhs (against Rs. 10.50 lakhs) for taxation. The net profit amounts to Rs. 21.05 lakhs, against Rs. 13.10 lakhs. A sum of Rs. 2.84 lakhs has been transferred to general reserve No. 2 while the directors had to draw Rs. 1.75 lakhs from general reserve No. 1 for paying dividend in 1959. The proposed dividends absorb about Rs. 17.98 lakhs, against Rs. 15.07 lakhs paid in the previous year. After making these appropriations, there remains Rs. 24,523 to be carried forward, against Rs. 1,506 brought in.

The directors state that the mills are unable to run the third shift to full capacity as the Government has not granted permission to install the 25,000 additional spindles. The Company has been allotted 48 automatic looms against its application for 240 looms. In addition, 96 looms were allotted against Svadeshi Mills' supplementary application for 200 looms. The import licence for 48 looms is being considered while the application for importing 96 looms has been turned down for the present. The Company purchased the ginning and pressing unit in Yeotmal for Rs. 2.61 lakhs. The shares of the Company have risen from Rs. 218.50 to Rs. 287.50 since the turn of the year and at its latest quotations of Rs. 281, it offers a tax-free yield of 4.4 percent.

Ahmedabad Advance Fares Well

Ahmedabad Advance has reported satisfactory results for the half-year ended December 1960. It has earned a gross profit of Rs. 14.92 lakhs which compares with Rs. 29.11 lakhs for the year ended June 1960. The Company has made up its accounts for six months following the change in its year-end accounting from June to December. Net sales of cloth, yarn and waste during the half-year totalled Rs. 1.35 crores, against Rs. 2.88 crores during the year ended June 1960. The directors state that production during the period was well maintained and that trading conditions on the whole were favourable in June and July 1960 which kept the Company's cloth stocks moving at an appreciable rate. Ahmedabad Advance installed new plant and machinery of the value of Rs. 5 lakhs, and at the end of the period additional machinery worth Rs. 5 lakhs was awaiting installation. Allocations from the half-year's profits include depreciation Rs. 2.82 lakhs, development reserve Rs. 1 lakh and general reserve Rs. 6.74 lakhs. The directors have proposed a dividend of Rs. 6 a share, less tax, for the half-year ended December, against Rs. 10 in the previous full year. A distribution of 3.25 percent, subject to tax, has been recommended on the 5 percent tax-free preference shares. The ordinary shares have improved gradually from Rs. 164 to Rs. 190 since the beginning of the current year. The book value of the share works out to around Rs. 195. Ahmedabad Advance has a paid-up capital of Rs. 50 lakhs, of which equity capital accounts for Rs. 40 lakhs and its reserves and surplus Rs. 36.97 lakhs. The gross block of Rs. 2.14 crores has been written down to Rs. 1.20 crores.

Premier Automobiles to Expand

In spite of the marked strength in other motor-car shares, those of Premier Automobiles have continued to be subdued, although the Company is known to be doing well and it has quite an ambitious expansion programme. This is presumably due to the marked increase in the floating stock of this scrip as a result of substantial selling by a prominent institutional investor in recent months. But the outlook for Premier Automobiles seems fairly promising. The Company proposes to erect a new factory in Kalyan—40 miles from Bombay—which will be an independent unit in addition to the existing plant in Kurla. Premier Automobiles has selected a large piece of land measuring 300 acres, and the Government of Maharashtra has notified in the *Gazette* about the acquisition of land. The preliminaries such as contouring and surveying

have already been completed. The construction work will be undertaken immediately after the monsoon. After the establishment of the Kalyan factory, the Company's production capacity will be raised to 15,000 to 20,000 Fiat cars and 15,000 to 18,000 Dodge and Fargo lorries a year, which is almost three times the present annual production of the Kurla plant. Premier Automobiles' Kurla plant employs about 6,000 workers. The Rs. 100-paid shares of the Company are currently quoted around Rs. 174.50.

Cotton Floor Prices Raised

The Government of India has decided to increase the floor price of Jarilla cotton 25/32 inch from Rs. 139 to Rs. 168.57 a quintal (100 kilograms), corresponding to an increase from Rs. 495 to Rs. 600 a candy (784 lbs) of the old rate for the 1961-62 season. The floor prices of other varieties will be increased correspondingly. The ceiling prices of all varieties of cotton have been kept unchanged at the existing levels. The Press note announcing the change in prices says that floor prices have been increased because of the necessity to increase cotton production. While the Government has done well in announcing the floor and ceiling prices fairly early in the season, although sowings have been nearly completed in Punjab and are in progress at some other places, it is difficult to appreciate how the increase in floor prices will help raise cotton production which has continued to lag behing the plan targets. Variations in the cotton output from year to year indicate that production depends mainly on the unpredictable weather. This apart, the problems with Indian cotton has never been one of revising merely the floor prices; the demand, on the country, has always been for raising the ceiling rates. Although much has recently been heard about the "crisis" of accumulating cotton stocks in Gujarat and the consequent fall in prices, even at their lowest, cotton prices never came anywhere near the floor levels which have now been fixed for the new season. In fact, cotton prices in the past have generally been nearer the ceiling than the floor prices. Since 1952—in spite of the predominantly bearish character of the hedge contract—cotton futures have fallen only twice, in 1953 and 1955, below the Rs. 600 level which has now been fixed as the floor for the new season. Cotton growers have long been clamouring for higher ceiling prices on the ground that production cannot be raised appreciably as long as other cash crops continue to fetch better prices than cotton. The wisdom of controlling raw cotton prices when no such control exists on the finished product, that is, cloth, has often been questioned. The force of this argument is, however, greatly reduced now that cloth prices are voluntarily controlled. Whether or not cotton prices should be decontrolled in the interest of achieving higher production is a moot point. But if cotton production is not to suffer, growers need to be assured of a minimum price which will fully cover the cost of the marginal producer.

Tata Mills Profit Doubled

The ordinary shares of Tata Mills (Rs. 25 paid), which could be bought around Rs. 38.50 about the beginning of the current year, are now quoted around Rs. 67. The highest price realised by the shares in 1960 was Rs. 53. The impressive rise reflects the Company's excellent performance in 1960 and the prospects of still better results in the current year. The Company did well in 1960 as a result of the successful implementation of various schemes for the reorganisation and renovation of production facilities and the introduction of new lines of manufacture. Net realisation from the sale of cloth, yarn and waste amounted to Rs. 4 crores, against Rs. 3.81 crores in 1959. Stocks held by Tata Mills rose from Rs. 57.39 lakhs to Rs. 80.59 lakhs. While sales increased by a mere 5 percent, the gross profit rose by over 100 percent from Rs. 20.62 lakhs to Rs. 44.22 lakhs. The ratio of the gross profit to sales increased from 5.4 percent to 11 percent. The improved results have enabled the directors to raise the dividend from Rs. 2.50 a share to Rs. 5 a share, both taxable. After providing Rs. 10 lakhs (against Rs. 12.62 lakhs) for depreciation and Rs. 7.25 lakhs (against Rs. 6.50 lakhs) for development reserve, the net profit amounts to Rs. 24.49 lakhs, against Rs. 1.01 lakhs in 1959. Adding Rs. 1.22 lakhs, being the provision no longer required, and after transferring Rs. 9.13 lakhs from general reserve No. 1 for part payment of the proposed dividend for 1960 together with a sum of Rs. 17,925 brought forward from the previous year, the total amount available for disposal is Rs. 35.03 lakhs. From this, the directors have allocated Rs. 21.65 lakhs to general reserve No. 2. The proposed dividend absorbs Rs. 13.12 lakhs (against Rs. 6.57 lakhs), leaving Rs. 26,322 to be carried forward.

The directors state that new plant and machinery of the value of about Rs. 38 lakhs was installed during the year. At the end of the year, additional machinery of the value of about Rs. 7 lakhs was awaiting installation. Since then, orders have been placed for machinery worth Rs. 10 lakhs. The Company has applied to the Government for its permission to install 20,000 additional spindles to enable the mills to balance production facilities. Due to the imbalance between spinning and weaving sections, the mills are unable to operate all the looms in the third shift. The Government has not so far accepted the Company's request. Against the paid-up capital of Rs. 65.58 lakhs, reserves and surplus amount to Rs. 62.02 lakhs. The gross block of about Rs. 3 crores has been written down to Rs. 1.74 crores. The arrears of depreciation under the Companies Act, 1960, amounted to Rs. 11.25 lakhs which have now been provided by transferring an equal sum from general reserve No. 2. At the current quotation of Rs. 67, the shares offer a tax-free yield of about 5.5 percent.

No Rights from Atul Products

Last week, the shares of Atul Products Ltd dropped sharply from Rs. 607 to Rs. 534. The heavy selling which brought about this fall was provoked mainly by the disappointment over the chairman's hint at the annual general meeting last week that the dividend was unlikely to be increased in the coming years and that there was also no prospect of any rights issue. In view of the huge capital outlay on the expansion plans, the prospects of a rights issue had been widely talked about. Uncertainty concerning this has now been almost set at rest. Mr. Kasturbhai Lalbhai told the shareholders that the Company has still to draw a substantial amount from the Rs. 3-crore loan sanctioned by the Government and that with the loan carrying an interest of only 4½ percent, it would be unwise to finance the new schemes by raising fresh capital. Atul Products has undertaken a number of expansion schemes which will be completed only in 1964. The chairman attributed the delay in implementing the expansion schemes to factors over which the management had no control. The shortage of foreign exchange is said to be the main obstacle. However, the sulphuric acid plant was commissioned in July 1960, and a plant for manufacturing individual intermediates is also nearly ready. A large part of the Bon acid plant is on the site awaiting installation, and it is likely to be commissioned in the first quarter of 1962. The caustic soda plant is also likely to be commissioned by June next year. The combined scheme for intermediates and fast colour bases had been delayed longer than it was anticipated. But almost all the problems relating to these schemes have now been settled but they are unlikely to be completed before the end of 1963. All these projects are estimated to cost about Rs. 7 crores. The next three years will be a difficult period because the Company will have to face a shortage of raw materials and fuel. Besides, there will be no immediate return on the large investments made by the Company. However, by the time the plants are commissioned, Atul Products will be manufacturing most of the raw materials it requires. It will become broad-based to manufacture products other than dyes. Referring to the new venture, Cibatul Ltd, the chairman said that the Company was floated with an authorised capital of Rs. 5 crores, of which Rs. 1 crore was issued. Atul Products holds 65 percent of the shares in the new Company and the remaining 35 percent is held by Ciba Ltd, Basle, and Ciba of India Ltd. The Company will manufacture some urea formaldehyde plastic products and intermediates for sulpha drugs. The plant will be ready for operation before the end of June 1963. The value of the Company's import licences had been cut by about 20 percent due to the foreign exchange scarcity, but it is trying to secure raw materials from rupee payment areas.

Worries of Oilseed Crushers

In his presidential address at the annual general meeting of the Bombay Oilseed Crushers Association, Mr. C. V. Mariwala reiterated the industry's demand for a suitable modification of the compounded levy for excise duty on vegetable oils. While the Association fully appreciates that reasonable relief should be given to small units, it is necessary, said Mr. Mariwala, that the levy should be fixed on a judicious and rational basis. The present policy is hardly in conformity with the Government's declared objective of reducing excise formalities to the barest minimum for small crushers. He hoped that the newly-appointed Central Excise Reorganisation Committee would tackle this problem effectively. The president suggested a compulsory compounded levy for all power-driven oil mills and commended it for the Committee's consideration. Referring to copra imports, he criticised the import allocation to the State Trading Corporation during the current licensing period. There is no justification for giving quotas to the S.T.C. when other established trade channels are already starved of their essential supplies.

As for the cut in copra allocation voluntarily agreed to by the crushing mills with a view to increasing *vanaspati* exports, Mr. Mariwala said that the burden of financing exports should be broad-based and carried by the entire industry which is importing a large quantity of raw materials, so a cut in imports should be equitably distributed among all industries. But the copra crushing industry has now been made the main victim as everybody wants to import copra against other exports. Mr. Mariwala hoped that the distribution of copra by the S.T.C. would be made on an equitable basis. He stressed the need for increasing oilseeds production in order to meet the growing internal demand and for creating a large exportable surplus to earn foreign exchange. Mr. Mariwala described the third plan target of 9.7 million tons as more bold than realistic, for if the performance in the second plan is any guide, it is extremely doubtful whether the target of 9.7 million tons could be realised by 1966. Against the second plan target of 7.6 million tons, actual production of oilseeds in 1960-61 is estimated around 6 million tons only. The increase in oilseeds production has not kept pace with the growing internal demand. This has pushed up their prices above world parity. High prices of vegetable oils have, however, greatly encouraged cottonseed crushing. Mr. Mariwala praised the Indian Central Oilseeds Committee for its efforts to popularise cottonseed cake as cattlefeed. He welcomed the formation of a separate oil panel as a sub-division of the Development Council for Oil and expressed the hope that the panel would consider ways and means for rationalising the oilseeds crushing industry which had grown in a haphazard manner.

McDowell Maintains

For the year ended 31st December, McDowell and Company Ltd has earned a profit of Rs. 1,83,028, after providing Rs. 12,000 for taxation (against Rs. 85,000) and Rs. 84,704 for depreciation (against Rs. 33,823). The previous year's profit was Rs. 1,56,021. After adding to last year's profit a sum of Rs. 6,961 which was the excess provision for doubtful debts in the previous years, Rs. 1,938 being unclaimed dividends forfeited, Rs. 16,000 drawn from general reserve and the sum of Rs. 1,49,226 brought forward from the previous year, the surplus available for appropriation comes to Rs. 3,57,153. Out of this, the directors have transferred a sum of Rs. 1,31,000 to development rebate reserve (against Rs. 17,000). The preference dividend has absorbed Rs. 31,200. The interim dividend on the ordinary shares at Rs. 1.50 a share, subject to tax, has absorbed Rs. 90,000. The proposed final ordinary dividend of Rs. 1.50 a share, subject to tax, will absorb Rs. 90,000. The balance of Rs. 14,953 is carried forward. In order to maintain the dividend at 30 percent (same as in the previous year) and in order to make the statutory transfer to development rebate reserve, it has been necessary for the Company to use the unappropriated amount brought forward from the previous year as well as a small amount from general reserve. As income from investments was received after the close of the year, the same has not been included in last year's accounts. A sum of Rs. 3,25,000, being the surplus on revaluation of the Company's lands, has been transferred to capital reserve. The subscribed capital was increased to Rs. 2,000,000 during the year, with the allotment of 100,000 equity shares of Rs. 10 each.

The Company's sales were appreciably higher than in the previous year. While the distillation unit began operating from October 1960, teething troubles restricted production. Output during the current year has steadily increased. The Company is taking steps to increase the installed capacity from 3,000 litres a day to 8,000 litres a day. It is reported that steps are also being taken to install a plant for the collection and bottling of carbon dioxide, a by-product going to waste at present.

Dividend from Janardana Mills

For the year ended December 1960, Janardana Mills Ltd has earned a net profit of Rs. 4,43,260, after deducting all expenses and interest and after providing Rs. 94,450 for depreciation, compared with one of Rs. 73,103 in the previous year, when depreciation was Rs. 94,227. Out of the profit, a sum of Rs. 12,987 was adjusted towards expenses pertaining to the raising of a loan, and bonus for 1959 has absorbed Rs. 32,885. After making other adjustments, there is a balance of Rs. 3,97,534 out of the net profit, which has been adjusted against the loss of Rs. 5,61,231 brought forward from the

previous year. Therefore, the net loss carried forward amounts to Rs. 1,63,697. In spite of the carried-forward loss, the directors have recommended a dividend of 9 percent, subject to tax, (against nil for the previous two years), and for the payment of this dividend, they have transferred a sum of Rs. 80,100 from the dividend equalisation reserve. The shares of this Company are now quoted at Rs. 75.25 cum-dividend (Rs. 50 paid up).

Same from Balasubramania Mills

The working of Sri Balasubramania Mills Ltd for the year ended December 1960 has yielded a net profit of Rs. 4,37,253.87, after providing Rs. 2,27,432 for depreciation (against Rs. 1,93,568), Rs. 61,922.21 for managing agents' remuneration (against Rs. 68,193) and Rs. 1,20,046 for development rebate reserve (against Rs. 71,453). The net profit for the previous year was Rs. 4,90,044. With the amount of Rs. 18,462.60 brought forward, the total available surplus for appropriation comes to Rs. 4,55,716.47. Out of this, the provision for taxation is Rs. 2,05,000 (against Rs. 2,22,750), and a sum of Rs. 50,000 is transferred to general reserve (against nil). The proposed dividend at 15 percent subject to tax (against same) will absorb Rs. 1,91,820.75. The balance of Rs. 3,895.72 is carried forward. During the year, the mills worked for 304 days in double shifts. The installed capacity was raised from 25,712 spindles at the beginning of the year to 90,976 spindles at the close. The old spindles were reconditioned, renewed and modernised. The recommendation of the Central Wage Board for Textile Industries has been implemented with retrospective effect from the beginning of the financial year.

Travancore Ogale Glass Maintains

The Travancore Ogale Glass Manufacturing Co. Ltd has earned a net profit of Rs. 88,809 for the year ended December 1960, against Rs. 70,086 for the previous year. With the amount of Rs. 12,479 brought in, a sum of Rs. 1,01,288 is available for disposal, compared with Rs. 80,418 in the previous year. Out of this amount, provision for taxation comes to Rs. 38,000 (against Rs. 8,003.) A dividend of 6 percent is declared, subject to tax (against the same in the previous year). This dividend will absorb Rs. 60,000. The balance of Rs. 3,288 is carried forward. Although production was higher by 30 percent and the profit by 27 percent, the amount available for the payment of dividend is just about the same as last year, since income tax has to be paid in full from this year onwards on the profits earned. During the year, the automatic bottle plant went into production and one machine was worked practically for the full year. The initial difficulties of working on an oil-fired furnace are now practically over and the directors feel confident of getting better and higher production during 1961. The Company is now planning to switch on to oil firing for its other furnace.

Nilambur Rubber Pays Same

For the year ended December 1960, the Nilambur Rubber Co. Ltd. has earned a net profit of Rs. 51,188 after providing for depreciation, debenture interest, the Company's contribution to provident fund and managing agents' commission. This profit of Rs. 51,188 is lower than the previous year's profit of Rs. 58,118. With the amount of Rs. 3,026 brought forward from the previous year and with an amount of Rs. 5,000 transferred from the dividend equalisation fund, the total available for appropriation comes to Rs. 59,214. Out of this amount, the directors have provided Rs. 14,000 for taxation. The 6 percent grossed (taxable) dividend on preference shares absorbs Rs. 12,900. The directors have recommended a dividend of 15 percent taxable on equity shares (same). This equity dividend will absorb Rs. 30,000, leaving a balance of Rs. 2,314 which is carried forward. The total crop for the year amounted to 132,826 lbs, compared with 1,47,816 lbs for 1959. The cost of production a lb works out to 74.49 cents, against 80 cents a lb in the previous year. The net sale price realised amounts to 150.18 cents a lb, compared with 148 cents a lb in 1959. The estimated crop for 1961 is 160,000 lbs.

A SURVEY OF INDIAN INDUSTRIES

With this issue of CAPITAL is published an 88-page "Survey of Indian Industries". It contains authoritative articles on the problems and prospects of many of India's leading industries such as oil, lignite, fertilisers, shipbuilding, rubber production, iron ore, industrial gases and heavy chemicals. There are surveys of the progress of lighter industries such as footwear, refractories, tyres, diesel-engine manufacture, watches, lamps, paper machinery manufacture, motor vehicles, food canning and sewing machines. There are also articles on such subjects as the Calcutta power crisis, the output of ordnance factories and the economics of small-scale industries. The leading article on foreign investment prospects in Indian industry, has been contributed by Sir Percival Griffiths. The supplement will be supplied free to registered subscribers and will be available to others at Rs. 5 a copy (postage extra). Enquiries may be addressed to the Manager, CAPITAL, 5 Mission Row, Calcutta 1.

Same Again from Karikode Rubbers

The working of the Karikode Rubbers (1945) Ltd for the year ended December 1960 has resulted in a net profit of Rs. 15,764.55, after meeting all charges including depreciation and interest on debentures and provision for taxation. This profit of Rs. 15,764.65 compares with the previous year's Rs. 16,977. With the amount of Rs. 2,359.50 brought forward, there is available for disposal a total sum of Rs. 18,124.15. Out of this amount, the preference dividend (at 6 percent, subject to deduction of tax) amounted to Rs. 9,000. The directors propose to maintain the dividend at 4 percent on ordinary shares, taxable, which will absorb Rs. 8,000, leaving a balance of Rs. 1,124.15 to be carried forward. The shares of this Company are quoted at Rs. 8.50 c.d. each of Rs. 10 paid-up. The total crop obtained during the year amounted to 62,559.13 kilos, against 60,146.06 kilos in the previous year. The average price of rubber obtained was Rs. 160.38 a 50 kilos, compared with Rs. 162.04 for 50 kilos in 1959.

The Pace of U.S. Recovery

The marked increase in industrial activity during April and May has erased any lingering doubts that the U.S. economy is in a very encouraging rebound from recession lows. Improvement in business sentiment—stimulated by better sales and by some improvement in earnings—has been most noticeable in the stepped-up tempo of ordering, particularly for durable goods, and in a moderate increase in plans for capital investment later this year, says the latest monthly letter of the First National City Bank. Inventory liquidation by manufacturers was largely completed by the end of April. However, some stock cutting continues where shipments of finished goods have picked up more rapidly than output, or where production is using up materials faster than they are being delivered. When rebuilding of stocks begins, a further stimulus will be given to recovery. The most dramatic upswing in business activity during April was in the industrial sector. Not only did new orders, production, and shipments rise, but, on a seasonally adjusted basis, more workers were employed in manufacturing and the factory work week was lengthened. The rise in industrial production, as measured by the Federal Reserve Index, amounted to 2.5 percent in April with a further rise indicated for May. The recovery is on a broad base, encompassing all major industrial sectors. Rising output of steel and motor-vehicles has attracted most widespread attention, but gains have extended into textiles, furniture, television, and industrial and farm equipment. It seems reasonable to figure that by now half the decline in industrial production has been made up. With this auspicious start, the natural question is how far and how fast the recovery will go. The fact that the recession was mild does not necessarily point to either a mild or a strong recovery, since history affords examples of both.

As often happens in the initial stages of recovery, some types of activity which spurted upwards early this year have found it difficult to maintain the pace. Housing starts, which had drifted lower throughout 1960 to an annual rate below one million units in December, rebounded to 1,317,000 in March, but fell back 6 percent in April to a rate of 1,233,000. After a two-month rise, retail sales figures, seasonally adjusted, sagged in April, perhaps because the data do not make adequate allowance for the early Easter. However, new passenger car sales continued to improve in April and May, as they have done since mid-February. In the first 20 days of May, deliveries trailed 1960 by 13 percent, compared with a year-to-year decline of 19 percent in the first four months. Total employment rose by one million in May, about as much as usual at this time of year. The number of unemployed declined by 194,000 to 4,768,000, but the seasonally adjusted rate of unemployment, at 6.9 percent of the civilian labour force, remained around the same level recorded in the preceding five months. Further confirmation of the improvement in business sentiment already developing in March and early April was provided by a McGraw-Hill survey of 1961 plant and equipment expenditure plans. Such outlays are expected to total $3.5400 million; while this is 1 percent below the 1960 level, it is a measurable improvement over earlier surveys which had indicated a 3 percent decline. About 70 percent of the expenditures—a larger share than usual—will be for modernisation rather than expansion of capacity. Of course, these plans are subject to change, depending on the strength of business recovery and also on the outcome of the Administration's efforts to stimulate capital investment.

Oilseeds Output and Exports

Speaking at the annual general meeting of the East India Oil Millers Association in Calcutta recently, Mr. M. Nopany, president, stressed the need for increasing oilseeds production. Against the target of 7,550,000 tons of oilseeds by the end of the second plan, one of 9.2 million or 9.5 million tons has been fixed for the third plan. Out of this, 1.5 million tons have been earmarked for exports, leaving the rest to meet the rising internal consumption at the rate of 0.47oz. a head, compared with 0.36oz. a head in 1955-56. Mr. Nopany urged the State Governments to give topmost priority to the intensive cultivation of oilseeds with a view to achieving the third plan target. Because of the increasing demand for vegetable oils in India and the wide gap between supply and demand, oil resources have to be augmented not only by raising the production of traditional seeds but also by exploiting new sources, such as by crushing cottonseeds. While the ginning industry in India yields annually about 2 million tons of cottonseed, only 6 percent of it is being crushed, and the rest is used as cattlefeed. Mr. Nopany said that the cottonseed industry in the U.S.A. provides useful lessons on the commercial exploitation of this new material. No cottonseed is wasted in that country. About 20 percent of the material is used on the farm—for planting and as fertiliser and animal food—and the rest is processed for edible oils, protein meal feeds and industrial cellulose. Along with the increase in production, Mr. Nopany said, stress should be laid on increasing exports. Although exports of oilseeds, oil nuts and oil kernel rose from Rs. 34 lakhs in 1958 to Rs. 2.62 crores in 1959 and Rs. 3.09 crores in 1960, there was a sharp fall in exports of major oils from India, except castor oil, which increased to Rs. 8.85 crores in 1960, against Rs. 4.92 crores in 1959 and Rs. 3.05 crores in 1958. Referring to oil mills in West Bengal, Mr Nopany said that they are now passing through a crisis. More than 60 percent of their installed capacity is idle due to the inadequate supply of oilseeds.

Reference Book on British Industry

One of the most ambitious works of reference for industry and commerce ever produced in Britain has recently been launched in London. The publication is entitled "Kompass Register" and is the first authoritative and comprehensive register to combine in one work a detailed list of the products of all sections of British industry. It should fill a long-felt want, for in foreign countries and even in the Commonwealth, there is surprising ignorance of the range of manufactures offered by Britain. "Kompass" provides in a compact form a salesman, a marketing expert, and a public relations officer for British industries. The new work is multi-lingual and is to be publicised as the buyer's complete book of reference. Every British product, industry and company is clearly identified from one index. The first British edition will contain information on some 25,000 firms employing 50 people or more and will consist probably of three volumes. It will be revised and reprinted annually.

Textile Machinery Exports

British textile machinery manufacturers, whose exports jumped in value to £51,805,000 last year from £41,129,000 in 1959 and £39 560,000 in 1958, have begun this year's overseas trade in a promising style. Exports of textile machinery in the first quarter of the year reached a total value of £ 16.55 million, compared with £12.1 million in the first quarter of last year, and the expansion seems to have been spread widely both over the different markets and over the different types of machines. In the first quarter, as in 1960 as a whole, Russia was the largest overseas customer, taking £2,802,000, compared with £1,488,000 in the first quarter of last year. India again took second place, with £1,104,000, against £1,175,000, but West Germany, which was third last year and took £972,000, against £757,000 in the first quarter, was overtaken by Australia—fifth last year—whose trade jumped to £993,000 in the first quarter, against £595,000. The U.S.A. moved from the fourth to fifth place, its takings being £831,000 against £813,000. There were larger exports to most Continental countries, Italy being prominent with an increase to £796,000, compared with £357,000, and exports to France were £675,000, compared with £473,000. Other sharp increases included Japan (£674,000, against £436,000), Brazil (£411,000, against £65,000) and Israel (£412,000, against £82,000). Exports to Pakistan fell to £381,000 from £552,000 in the first quarter of 1960, and those to the Philippine Islands fell to £106,000 from £357,000.

One striking aspect of the export returns is an increase to 29,975 cwts in machinery for extruding man-made fibres, compared with only 165 cwts a year previously; this no doubt represents orders placed for communist countries some months ago. There are sharp increases in machinery for spinning and the processes preparatory to it, while automatic looms and finishing machinery of all kinds also reached higher figures. Exports of used machinery for cotton and staple fibre were only 1,640 cwts, compared with 6,029 cwts in the first quarter of last year.

Education for Underwriting

The insurance industry has given a great deal of thought to the problems of insurance education. This was one of the main subjects of discussion at the annual conference of the Chartered Insurance Institute, and approval was given to some changes recommended by its Educational Policy Committee. The changes are designed to meet criticisms—particularly from outside the industry—that its training is too technical, and without an adequate basis of general commercial knowledge. The Institute is the main source of education within the industry. Membership is open to everybody engaged or employed in insurance, and it conducts annual examinations, notably for associateship and fellowship. Last year, more than 16,000 candidates sat for the examinations, including 2,000 from overseas. The four main groups of insurance students have been defined by Mr. G. K. Greening, a past-president of the Institute, as follows: (1) Boys entering the industry from school in the 16-18 age-groups, with or without G.C.E. or equivalent certificates at ordinary or advanced levels. (2) University graduates in the 21-25 age-groups. The degrees they hold have no direct bearing on insurance, but include in some cases a knowledge of subjects indirectly connected with insurance—perhaps law, commerce, or economics. (3) Diploma-holders of other professional bodies, such as chartered accountants, secretaries, or engineers. These men bring to insurance technical knowledge required for specialised work, but have little or no knowledge of the insurance industry to which this technical knowledge is to be applied. (4) Older men, without specific qualifications, who enter insurance at a later stage, principally on the sales side. For those planning to take its examinations, the Institute provides both oral and postal tuition. The associateship examination is normally spread over three years, and the fellowship requires another two years. There is also a College of Insurance, which provides full-time training courses of four to eight weeks; these are designed to give a general introductory training, and are financed by fees paid by insurance companies and broking firms which use the courses as part of their own training programmes.

The Educational Policy Committee of the Institute was formed some three years ago to review the future basis of training. A new syllabus, which will start in 1963, will require all candidates to take the following six subjects: (1) elements of insurance; (2) general principles of law (with alternative papers in English and Scots law); (3) commercial practice; (4) insurance on the person—a general introduction to life assurance, and general accident and sickness insurance; (5) insurances on property—a general introduction to the insurance of property, whether on land or sea or in the air, against risks of all kinds; and (6) insurances against liability—a general introduction to liability insurance, whether accident, marine, or aviation. The associateship will be completed by three further subjects from one of the three groups—fire and accident, life, or marine.

THE JUTE FORECAST

THE preliminary statement of the first forecast of the Jute crop was issued on Monday forenoon. It states that the area under cultivation this season is 2,216,500 acres, and that the outturn on this area is estimated as 94 percent. The gross outturn of the past season is now estimated at 64 lakhs of bales and that of the present season at 62¼ lakhs, or 15½ annas of a normal crop. We wait the fuller particulars which the more detailed statement will furnish, but in the meantime, we cannot help thinking that if, during the past season, the yield per acre was 3 1/7 bales, we may safely assume that it will not be less during the present season. Calculated on this basis, the outturn of the crop will be, not 62¼ lakhs, but nearer 70 lakhs of bales. The whole Jute trade believes in a good crop, and as a natural consequence, the market is easier all round, and prices tending in favour of buyers. Since writing the above, the detailed statement has been published, and will be found in another column. There is nothing to modify in the opinion already expressed.

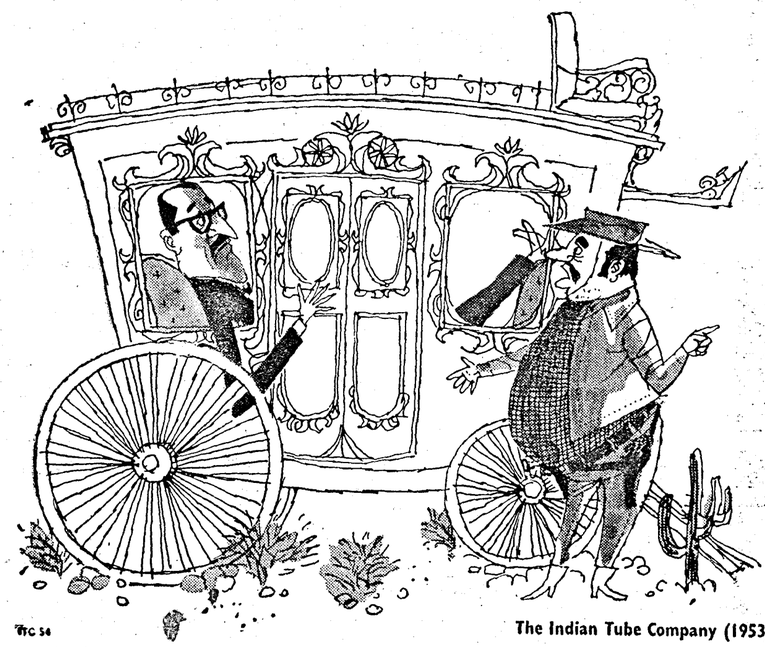
TRAVEL TALK IN TUBELESS TIMES



'A tube, a tube, my kingdom for a tube', quoted Time-Master Tubophile getting his Shakespeare all mixed up.

'Listen', said the coachman. 'You ain't got a kingdom to give and we ain't got a 'tube' to travel in...so now we walk, see!'

'Zounds, Sir', thundered Time-Master Tubophile, still Shakespearean, 'you don't have to remind me that this is a tubeless land in tubeless times. Full well do I, Chairman, Tube Time Inc., know it. Not a car, train or plane for conveyance...not even a bicycle to take the ache out of travelling. Nothing to take you from here to there save a horse...and that too run away. Such is tubeless travelling. Comforting, though, to think, there is my tubular time machine to take me back to my own well-tubed time. And back I'll go after I have seen more of these tubeless times.'

'Coachman! forward—Ho!'

RESERVES AND USE OF NATURAL GAS IN INDIA

By S. N. Varma

THE term "natural gas" is used to differentiate it from "refinery gases", which are produced during the refining of petroleum. In composition, both are more or less similar, but natural gases are lighter. More volatile components of petroleum constitute natural gas, which is composed of gaseous hydrocarbons. The chief constituent is methane (CH_4) with other volatile hydrocarbons in varying proportions, along with a little of nitrogen. Besides methane, other hydrocarbons present are ethane (C_2H_6), propane (C_3H_8), butane (C_4H_{10}), pentane (C_5H_{12}), hexane (C_6H_{14}) and heptane (C_7H_{16}). Some natural gases contain hydrogen sulphide and are known as "sour", and those devoid of it, are called "sweet". Varying amounts of gasoline vapours present in natural gases classify them as "dry", "lean", or "wet" gases. Removal of all the gasoline vapours from natural gas renders it as "residue gas". Other gaseous impurities are carbon dioxide, hydrogen, oxygen, carbon monoxide and helium. Argon and other inert gases may sometimes be present and are included with nitrogen.

Besides hydrocarbons, nitrogen is the commonest constituent of natural gas. "Dry gases" may contain 90 percent to 99 percent methane, the remainder being almost nitrogen. In exceptional cases, nitrogen may account for 85 percent to 95 percent, and such nitrogen-rich natural gases do not burn and are useless as fuel. Carbon dioxide is generally absent, and if present, does not exceed normally 2 percent. However, rare cases containing carbon dioxide up to 98 percent are known and such natural gases have been used for the manufacture of carbon dioxide in the U.S.A. and Mexico. Hydrogen sulphide must be removed before the gas can be used as it is poisonous and corrosive and forms a very undesirable constituent of natural gas. All the same, "sour" natural gases are important sources of sulphur in the U.S.A. and Canada. Helium, in very small amounts (rarely exceeding 0.5 percent) is present in many natural gases. Helium content around 2 percent forms an important source of helium and its production is controlled by governments for defence purposes. Natural gas is classified as "associated" where it occurs with oil, and "non-associated", if it occurs alone. Every oilfield has some associated gas, but workable reserves of natural gas are only a few, in countries fortunate enough to possess them.

Using Natural Gas

Natural gas forms comparatively inexpensive fuel and the financial requirements to tap natural gas reserves are not very large. Initially, natural gas was used for domestic and industrial purposes, but now its uses have increased to internal combustion engines and as a feedstock for rapidly growing petrochemical and allied industries. Natural gas is extensively used for driving turbines for the generation of power. During periods of emergency it provides a source of "synthetic petroleum". It easily competes with coal and petroleum and its increasing use helps towards the conservation of coal and oil supplies.

Besides the above uses, natural gas is of great importance in oil production technology and recovery methods. The volatile liquids, associated with the natural gas rising from the well along with crude oil, are extracted and removed in pure form in natural gasoline plants. After processing, the natural gas is compressed and returned, *via* injection wells, to the underground reservoir rocks where it helps in driving out more crude oil and absorbs more volatiles which are further processed. The productiveness of an oilfield is enormously raised by such repressuring and as much as 80 percent of oil can be recovered. Recovery by ordinary pumping hardly accounts for 20 percent to 30 percent.

Some Important Petrochemicals

Natural gas alone, or in combination with liquefied petroleum gases (LPG), crude oil, benzene, butane, propane, cyclohexane, butadiene, adiponitrile, refinery gases, refinery gas streams, liquid fractions, methyl alcohol, ethyl alcohol, sulphur, olefines, ethane, formaldehyde, petroleum base stocks, and propylene, produce many important petrochemicals, such as methyl chloride, methylene chloride, carbon tetrachloride, chloroform, hydrocyanic acid, acrylonitrile, acetylene, carbon disulphide, hydrogen sulphide, glycols, propylene oxide, acetone, methanol, formaldehyde, acetic acid, acetaldehyde, propanols, butanols, acetic anhydride, vinyl acetate, propyl acetate, butyl acetate, ethylene, propylene, polyethylene, polypropylene, kelones, esters, etcetera.

Other important products from natural gas include butadiene (for synthetic rubber), adiponitrile (for nylon), aromatic distillates and solvents, petroleum resins, hydrogen, mercaptan's benzene, toulene, amines, urea, ammonia, carbon monoxide, carbon dioxide, xylenes, hydrogen chloride, phenols, ethanols, alcohols, polyethylene (for plastics), vinyl resins and vinyl plastic meterials, nitrogen solutions, ammonium nitrate, ammonium sulphate (fertilisers,) nitric acid, anhydrous ammonia, dry ice, liquid Co.,, ammonium phosphate, nylon intermediates and acrylics sulphur and a host of other products. A world survey of the petrochemical plants in 1959, conducted by the *Oil and Gas Journal*, shows that about 70 plants are operating alone in the U.S.A. using natural gas, for the manufacture of the above-mentioned petrochemicals, besides 24 plants which are producing sulphur from "sour" natural gas.

Natural Gas Reserves

It is encouraging to note that a committee has been set up by the Government of India for the utilisation of natural gas and a few plants, both in the public and private sectors, have been projected in the third five year plan to use the natural gas from the Nahorkatiya-Moran-Hugrijan oilfields in Assam. The manufacture of fertilisers, plastics, carbon black and synthetic rubber will be taken up in the first instance. For more efficient working of the Committee, the Government of India would do well to co-opt enthusiastic members from the general public.

The latest estimates given by Messrs De-Goyler and MacNaughton of associated gas from Nahorkatiya-Moran-Hugrijan oilfields in Assam place the reserve at about 719,000 million cubic feet. For industrial and domestic uses, about 38 million cubic feet of gas will be available daily. Accordingly, Nahorkatiya is going to be a nerve-centre of gas-based industries and a pioneer in petrochemicals. Some of the important projects coming up in the third five year plan, involving an investment of about Rs. 45 crores, are mentioned below.

Public Sector Projects

Nahorkatiya thermal power plant: The power plant, using natural gas to run its four turbines, each with a capacity of about 16,000 kW, will be constructed near Namrup, about 10 miles from Zaloni—the Oil India township near Nahorkatiya. The installed capacity of the plant will be 50,400 kW and the transmission system will cover 416 miles. The power demands of the whole of upper Assam are expected to be met with by this project, which is likely to cost about Rs. 10 crores. The exhaust gases from the turbines will be fed up in waste heat boilers for the production of steam to be used in a fertiliser project. Besides the above thermal plant, Oil India has already set up a gas-turbine power plant, the first of its kind in India, in Zaloni with an installed capacity of 5,370 kW. This plant will supply power to the oilfields and installations and will consume about 1.5 million cubic feet of gas a day.

Fertiliser plant: The plant will require 7.2 million cubic feet of gas a day and cost about Rs. 15 crores. About 50,000 tons of urea and 50,000 tons of ammonium sulphate will be produced a year, sufficient to meet the requirements of not only tea gardens but also of other agricultural occupations. The Fertiliser Corporation of India, a Government of India undertaking, will set up and run the plant and the foreign exchange component of the project, about Rs. 5 crores, will be met from the British credit available in India. This public sector project, it is expected, will be commissioned by the end of 1964.

Gas transmission and distribution project: About 7.2 million cubic feet of gas a day, it is proposed, will be distributed for domestic and industrial fuel in Tinsukia-Namrup-Dibrugarh area. The distribution is expected to start from 1962-63.

Private Sector Industries

Synthetic rubber plant: Messrs Duncan Brothers, in collaboration with Phillips, will manufacture 20,000 tons of C.I.S. 1-4 polybutadiene (synthetic rubber) and the plant is estimated to cost Rs. 15 crores.

Synthetic plastics plant: About 4,000 tons of polyethylene and other plastics will be produced annually and the plant will cost about Rs. 4 crores.

Carbon black plant: Messrs P.J.B. Industries have entered into collaboration with Messrs Continental Carbon Company, Houston, Texas, to produce furnace black from natural gas. The annual production will be about 10,000 tons, and the estimated cost of the plant is Rs. 1.5 crores. The plant is expected to go into production in 1962-63 and will use about 5 million cubic feet of gas a day.

Brick-making plant: Gas-based brick-making plant, fully automatic, having a capacity of 40,000 bricks a day is under construction near Zaloni.

Cement manufacturing plant: A plant using natural gas for the manufacture of cement has also been proposed.

The Sector Controversy

The Industrial Policy Resolution of 1956 puts "petroleum and natural gas" in the public sector and this is responsible for the ideological approach of those in authority at the Centre to treat the exploitation of oil and gas potential of the country to be a public sector monopoly. In its zeal, the Government forgets about the country's limitations of financial resources, paucity of technical know-how, foreign exchange position, and the tremendous expenditure incurred in a planned economy. It was the same psychology that was responsible for the delay of quite a few months in allowing the private sector to start industries using natural gas from the Nahorkatiya-Moran-Hugrijan oilfields. In the interest of economic progress, this delay could have been conveniently avoided.

Recently, Mr. K. D. Malaviya, Central Minister for Mines and Oil, has appealed to both the sectors to co-operate in the exploitation of the country's mineral resources. It is hoped he will maintain the same attitude for the development and utilisation of the oil and gas potential of the country, and no undue preference will be given to the public sector over private enterprise. It is only then both the sectors can co-operate unreservedly towards a common goal.

A Ditcher's Diary

WERE CALCUTTA EYES MOIST WHEN SOME BUSYBODY arbitrarily pronounced Surat the dirtiest city in India? That this rather obvious crack should have occurred to so many directly the item appeared in the papers bespeaks a degree of cynicism which I suggest is dangerous. It is not true that there is nothing anyone can do about Calcutta. Both the causes and the remedies are known; and the latter in particular will receive expert attention shortly from the Ford Foundation and others. There are several things I do not understand about the proposed Calcutta Metropolitan Planning Organisation. Dr. Roy, I read, is going to be in sole charge of the set-up. The choice could easily have been worse. But I take it that it is as Chief Minister that he will preside, and this gentleman has to seek a renewal of his mandate in less than a year. He will perhaps get it; or let us assume he will. But the C.M.P.O.'s work is unlikely to be completed in a year or two or even five; and Dr. Roy is not a young man. Are we right in assuming too that his successor will be as keen on Calcutta's improvement on the lines suggested by its American benefactors? The reports do not say so yet: but as I understand it the Americans will insist on setting aside all political pressures while they are getting on with the job. Thirty-two municipalities are not superseded without considerable political difficulties; and there are obvious advantages for the Congress in keeping these useless bodies alive. Suppose, then, that half way through the scheme somebody in power in Writers' Buildings wants no more of Calcutta's improvement: and the Americans—World Bank, I.D.A. and Ford Foundation—find they have sunk millions of dollars into a project which can no more be carried out. I do not actually believe that a squad of U.S. marines will then land in Calcutta to recover the outlay: but I can foresee some tearing of hair in Washington and elsewhere.

MR. BIJOYANANDA PATNAIK IS NOT THE FIRST CHIEF Minister I have seen dancing in a public restaurant; I well remember Mr. H. S. Suhrawardy's dextrous waltzing on various dance floors in Calcutta. But on Monday week at Firpo's Mr. Patnaik presented a very unfamiliar image of a Congressman; and I hope he keeps it up. Thanks to his Party's stupidity in the matter, he permitted himself nothing headier than what I took to be tomato juice; but this made his performance the more remarkable, for to dance with only a soft drink for sustenance can be tough. The somewhat flamboyant personality of Mr. Patnaik has already impressed most people who have met him; a foreign journalist in Delhi, I find, called him a Texan Indian. He has certainly put life into the aging body of the Congress. Whether he will be able to transmit some verve into the Orissa administration I would rather wait and see before predicting success—or failure. The administration certainly needs *jaldi* putting into it; but Mr. Patnaik will do permanent harm to the Government machinery if he tries to introduce business methods. There are very good reasons why governments do not function as business corporations do; and if Mr. Patnaik excessively "personalises" the administration he will soon be asked some very uncomfortable questions in the Assembly. Now that I come to think of it, perhaps there is more in common between Mr. Patnaik and Mr Suhrawardy than their dancing: they are both vigorous men; and I do not have to remind anyone in Calcutta that the latter brought disaster to Bengal with his unorthodox methods. There was also a great deal of corruption in Mr. Suhrawardy's administration; and much of it came about because he thought he could do "deals" at the now defunct 300 Club in the small hours of the morning and thus expedite governmental action. Nor do I like Mr. Patnaik's repeated remark that the Party is supreme and the Government comes next. In India we have enough experience of the Government subserving the ruling Party in many devious ways: one of the communists' errors in Kerala was that they followed the Congress in this. Mr. Patnaik has proved that he is a good Party organiser. He has yet to show that he can rise above Party interests and run a Government in the interests of the entire people of Orissa and not just for the benefit of Congressmen.

DISEASE AND PESTILENCE STILL TAKE FAR TOO LARGE a toll of life in India each year, and that is precisely why I welcome the Government's firm determination to eradicate malaria once and for all by the end of the third plan. It was, I think, Professor P. T. Bauer, of the London School of Economics, who pointed to the futility of increasing investment in public sector steel plants when ordinary human beings in this country are often forced to live a life worse than animal. The eradication of malaria has restored life to many a deserted village, whose cultivators now enjoy the blessings of health and vigour which their malaria-ridden ancestors never dreamed of. But eradication has not been an unmixed blessing; I am told that the medical profession has in some cases suffered severely. A high police official told me only the other day of the plight which has befallen one medical practitioner in the Murshidabad district of West Bengal, where the disease has been almost completely wiped out. It seems he once made a prosperous living by doing nothing more useful than selling quinine mixture to the villagers and charging them fat fees for the privilege. Now, it seems, he is out of business. Another doctor the official told me about used to do his rounds on a horse wearing smart European dress. Nowadays, a mere shadow of his former opulence, he has to walk long distances to visit his patients; a horse is something he can no longer afford. There are numerous quacks in the villages, too, who carry on their multi-purpose activities as moneylenders, grocers and storekeepers, village school teachers and part-time doctors. The eradication programme will make a difference to them. Another major loser, I daresay, will be the West Bengal Government, which has been doing a roaring trade selling quinine through village post offices. But nobody need shed a tear for the demise of a scourge which as recently as 1935 was causing an annual economic loss to the nation of around Rs. 1,000 crores. The figure now, I believe, is a little over Rs. 34 crores.

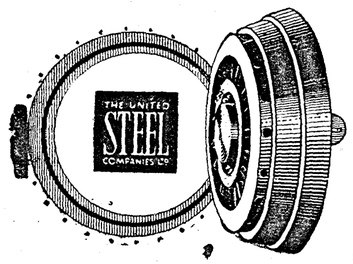
THAT NOTHING WORSE THAN FREEDOM (WHICH HAS its hazards) has befallen Mr. Tshombe of Katanga is perhaps a measure of the improvement recently claimed for the Congo by Mr. Hammarskjoeld. I am not very sure yet that the improvement will endure; but it is quite possible that things in the Congo, deplorable as they were and are, were never quite as bad as some people made out. A friend who saw a thing or two for himself in the Congo some months ago tells me that when the world was hearing about a famine in Leopoldville he found that there was indeed a severe shortage of cornflakes. He adds with bitter irony, "And as it happens, the Congolese very sensibly do not eat cornflakes." I hate to say anything against the United Nations, which has done much useful work in spite of Mr. Khrushchev and General de Gaulle; but I am beginning to wonder whether the world organisation has not come to develop a sort of vested interest in crises. I will come back to the Congo; but let us take Laos for the moment. How serious, ever, was the crisis there? How many killed? I have been told that in Diem's South Vietnam more people are bumped off by one side or the other in a day than are killed in the war in Laos in six months. Some silly men in the Pentagon or the C.I.A. may have contemplated American military involvement in Laos, but I refuse to believe that the Kremlin ever thought of wasting Russian lives in those steaming jungles. Mr. Khrushchev did once threaten to intervene in the Congo for the Gizenga Government. Need anybody have taken him seriously? Consider the logistics of the thing; and you will see that when China threatened to send "volunteers" to the Middle East at the time Britain and the U.S.A. sent troops to Jordan and the Lebanon, nobody had any reason to pass a sleepless night. Mankind is capable of almost unlimited stupidity, I know; but there are things that simply cannot be done. When Mr. Hammarskjoeld claims that the U.N. kept war out of the Congo he is claiming to have averted an eventuality that probably never was. As for Laos, well, Mr Krishna Menon likes the climate of Geneva; so why not let the crisis continue?

A STORY TOLD BY CHARON, THE *New Statesman*'s London Diarist, should settle once and for all the controversy between zips and buttons for men's trouser fronts. It was told to him by his tailor, who may not exactly have been disinterested in the effect produced: 'A man and a friend went to the theatre. They sat down in their seats in the stalls. Suddenly the friend said: 'I say, you've left your trousers undone'. The next moment the lights were dimmed and the curtain began to go up. Under cover of darkness the man started to remedy the omission. At that moment a woman wearing a gauzy flowering evening dress passed in front of him, late coming to her seat. As he jumped to his feet to let her by, he self-consciously zipped up the zip. It caught in a billowing fold of her dress and, lo!, they were inextricably locked. No effort could extricate them on the spot. They had to waddle self-consciously up the aisle, spotlighted by usherettes' torches, to the box office. There, a semi-surgical operation with a pair of scissors had to be performed." Charon goes on: "I only wish this story had a happy ending—the development of a new friendship: but my tailor tells me each was so overcome with embarrassment that neither wishes to set eye on the other ever again". Scarcely surprising under the circumstances. And there are probably other morals to be drawn from this tragic little story, such as do not come late to the theatre, or always carry a pair of scissors with you.

THE DITCHER

Bank vaults are always made of steel...
because steel is so dependable!

symbol of security!



Through the years Steel has come to be considered the symbol of security... not merely physical security, but economic security as well! The larger the amount of steel a country produces, the higher the rung she occupies on the ladder of economically stable countries... the greater her credit in the international market. And that is why India today is striving so hard to raise her output of steel — Steel that will endorse her claim to economic stability... Steel that she can hold up to the world as a symbol of her security.

THIS IS ONLY AN ANNOUNCEMENT AND NOT A PROSPECTUS.

No subscriptions are invited on the basis of this announcement. Intending subscribers should obtain from the Registered Office or any of the Bankers or Brokers referred to hereunder, copies of the Prospectus, and the Forms of Application.

Consent of the Central Government has been obtained to this issue by an *Order* of which a complete copy is open to public inspection at the Registered Office of the Company. It must be distinctly understood that in giving this consent the Central Government do not take any responsibility for the financial soundness of any scheme or for the correctness of any of the statements made or opinions expressed with regard to them.

A Licence was obtained from the Central Government for the establishment of this new industrial undertaking at Bombay, a copy of which is also open to public inspection at the Head Office of the Company. Subsequently, a fresh Licence has been obtained from the Central Government for the change of location to Satna, a copy of which is open to public inspection at the Head Office of the Company. It must be distinctly understood that in granting this licence the Government of India do not take any responsibility for the financial soundness of this undertaking or for the correctness of any of the statements or opinions expressed in regard to it.

A copy of the Prospectus, along with documents attached thereto, has been delivered to the Registrar of Companies, W. Bengal, as required, by Section 60 of the Companies Act, 1956.

The shares of the Company are already quoted on the Delhi Stock Exchange. Applications have been made to the Calcutta and Bombay Stock Exchanges for permission to deal in and for official quotations of the shares of the Company.

THE SUBSCRIPTION LIST WILL OPEN AT THE COMMENCEMENT OF BANKING HOURS ON MONDAY THE 3RD JULY, 1961 AND WILL CLOSE AT THE CLOSE OF BANKING HOURS ON SATURDAY THE 8TH JULY, 1961 OR EARLIER AT THE DISCRETION OF THE DIRECTORS, IF THE ISSUE IS FULLY SUBSCRIBED, BUT NOT BEFORE THE CLOSE OF THE BANKING HOURS ON WEDNESDAY THE 5TH JULY, 1961.

UNIVERSAL CABLES LIMITED

(Incorporated on 6th March, 1945 at Calcutta under the Indian Companies Act, 1913.)

SHARE CAPITAL AUTHORISED

Rs. 5,00,00,000 divided into 30,00,000 Equity Shares of Rs. 10/- each and 2,00,000 Preference Shares of Rs. 100/- each	Rs. 5,00,00,000

SUBSCRIBED AND PAID UP CAPITAL

3,49,725 Equity Shares of Rs. 10/- each. These Shares are fully paid up, payment having been received in cash	Rs. 34,97,250

PRESENT ISSUE

7,00,000 Equity Shares of Rs. 10/- each at par	Rs. 70,00,000

Out of the present issue:—

(a) Offered to the existing members of the Company pursuant to Section 81(1) of the Companies Act, 1956, 3,49,725 Equity shares of Rs. 10/- each for cash	Rs. 34,97,250
(b) Offered to the Public under the Prospectus for subscription in cash 3,50,275 Equity Shares of Rs. 10/- each	Rs. 35,02,750
	Rs. 70,00,000

Such of the shares offered to the existing members of the company as are not taken up by them and/or their nominees will also be available for subscription to the public.

(The aforesaid new Equity Shares shall rank in all respects *pari passu* with the existing ordinary shares of the company except that they shall not be entitled to share in any dividend in respect of the year ending 31st March, 1961 or any previous period. The dividend payable in any year would be in proportion to the amount paid on the shares from time to time.)

APPLICATIONS AND SUBSCRIPTIONS

Applications for shares by members of public must be for a minimum of 25 shares or multiples of 25 shares.

TERMS OF PAYMENT OF ABOVE SHARES

On application .. Rs. 5/- per share.
Balance .. Rs 5/- per share on call to be made not earlier than 6 months after allotment.

Rs. 10/- PER SHARE.

BORROWING POWERS

The Directors may borrow and secure the payment of money for the purposes of the Company within the limitation imposed by Section 293 of the Companies Act, 1956 in such manner and upon such terms and conditions in all respects as they think fit.

OBJECTS AND PROFITABILITY OF THE COMPANY

The particular immediate object is to manufacture Paper Insulated Lead Covered Power Cables with an annual capacity of 624 Miles.

India's dynamic growth under the First and Second Five-Year Plans and the progressively increasing tempo under the Third Plan is associated with the rapid expansion of electricity in the country in which cables play a vital role. If power is not available in ample sufficiency to meet demand, a very serious restriction on the proper growth of all industries will occur and its effect will be even more seriously felt in the processing industries which offer the greatest scope for increasing employment. Equally if agricultural improvement and rural development take place as they should, there will be a vast and important demand for increasing quantities of power for villages and agricultural development. Therefore, a concern such as this, should do well in a country which has huge electrical programmes in hand. The phenomenal progress of electricity has led to a corresponding demand for cables.

Power development has been given top priority in the 3rd Five-Year Plan. It is proposed to increase the total generating capacity of power from 5.8 million KW at the end of the 2nd Plan to 13.4 million KW at the end of the 3rd Plan. It is expected that 25,000 additional towns and villages will be electrified during the 3rd Plan period bringing the total to 44,000.

POTENTIAL DEMAND

Distribution of this power load to consumers—industrial and domestic—would involve heavy requirements of Paper Insulated Cables. The production target of these cables at the end of the 3rd Five-Year Plan has been laid down at 4,000 miles per annum. Indigenous production in 1960 was only 570 miles and there is, therefore, a considerable gap between supply and demand. Hitherto, a major requirement of these cables was being met by imports from foreign countries, which have had to be curtailed owing to the shortage of foreign exchange. Therefore, there should be no difficulty in selling the company's total output.

The industrial advancement of a country is measured in terms of per capita consumption of electric energy and from this point of view, our present consumption of electricity is awfully low. Both in the 'take-off' stage as also in subsequent plan periods, rapid industrialisation would mean a substantial increase in the production of PILC Cables to bring the energy to the consumers and, as such prospects for future expansion of this industry are excellent.

The Company has also been investigating the prospects of production of other electrical items used for the dissemination of electric energy and on the basis of such investigations application for the required Industrial Licence under the I. D. R. Act has already been made.

Production in the normal course is expected to commence by December 1962. The Directors hope that barring unforeseen factors they will be in a position to pay a reasonable dividend on the equity capital.

TECHNICAL COLLABORATION

British Insulated Callender's Cables Ltd. of U.K. are the foreign technical collaborators in this project. They are specialists in this line and as is well known, are the largest manufacturers of cables in the world. The U.K. collaborators will assist in setting up the Factory and shall provide technical assistance, know-how, use of patents and processes to ensure that the Company's products are of the highest quality. British Insulated Callender's Cables will send technicians from U.K. to the Company's Works to train Indian personnel and also to assist in the production. B.I.C.C. will keep the Company in the fore-front technically and would permit employees of the Company to be trained in their U.K. factories and laboratories.

The Central Government's approval has been obtained for their appointment.

TERMS OF APPOINTMENT OF PROPOSED MANAGING AGENTS

Subject to the approval of the Central Government and of the Company in General Meeting, it is proposed to appoint Messrs. Birla Gwalior Private Limited as the Managing Agents of the Company for a period of 10 years with effect from 1st April, 1961 on the following terms as to remuneration:

A commission at the sliding scale ranging from 10% of the net profits of the company on the first Rs. 10 lakhs down to 4% or any sum over one crore of rupees in any financial year or part thereof computed in the manner provided under Sections 349 and 350 of the Act.

In the case of absence or inadequacy of the profits in any financial year, a minimum remuneration of Rs. 50,000/- to be paid in eleven monthly instalments of Rs. 4,000/- and the balance sum of Rs. 6,000/- to be paid at the end of the last month of each financial year

LOCATION

The plant shall be located at Satna in the State of Madhya Pradesh. Satna is geographically well situated and enjoys all the facilities of rail and road transport. The site has excellent facilities in regard to power and water and sufficient land is available to provide for the present needs and also for future expansion. A Railway Siding already exists near the site which shall be extended to our Works at a small cost.

INTEREST OF DIRECTORS

All the Directors will be interested to the extent of any shares subscribed by and allotted to them in the Company.

Shri M. P. Birla is a member and Director of M/s. Birla Gwalior Private Ltd., the proposed Managing Agents of the Company.

Shri H. P. Barat is a partner of M/s. G. M. Pyne, one of the Underwriters and Brokers named in the Prospectus.

Shri S. K. Birla is a member of M/s Birla Gwalior Private Ltd., the proposed Managing Agents of the Company.

None of the Directors has any interest in any property acquired by the Company within 2 years of the date of this Prospectus or proposed to be acquired by it.

UNDERWRITING

The entire issue of Rupees Seventy Lacs has been fully underwritten the names of the Underwriters and the amount of the shares underwritten by them being as stated below:—

Names	Amount Underwritten (Rupees in Lacs)
(1) M/s Investment Corporation of India Limited .. 'Ewart House', Bruce Street, Bombay 1.	22.00
(2) " G. M. Pyne .. 14, India Exchange Place, Calcutta-1.	8.00
(3) " Navalchand T. Shah & Co. .. 102, Stock Exchange New Bldg., Dalal St., Bombay-1.	8.00
(4) M/s. Chimanlal J. Dalal & Co. .. Stock Exchange New Bldg., Dalal St. Bombay-1.	8.00
(5) " Devkaran Nanjee & Co., .. Horniman Circle Bombay-1.	8.00
(6) " Batlivala & Karani, .. Union Bank Building. Dalal Street Bombay-1.	8.00
(7) " A. B Pandit & Co., .. 32, Apollo Street, Bombay-1.	8.00

In the opinion of the Directors, the resources of the said Underwriters are sufficient to discharge their underwriting obligations

UNDERWRITING COMMISSION

A Commission at the rate of 2.5% shall be paid to the underwriters in the case of 3,50,275 Equity Shares offered to the Public and also a commission at the same rate shall be paid on such Equity Shares which are not taken up by the existing shareholders or their nominees and are allotted to the Public.

BROKERAGE

Brokerage will be paid by the Company to members of the recognised Stock Exchanges and to Banks at the rate of 1% on the nominal value of the aforesaid Equity Shares offered to the Public in respect of the shares allotted against applications bearing their stamps No brokerage is payable in respect of the shares which may be allotted to the existing shareholders and/or their nominees as right shares.

Brokerage on the same basis will be payable to the Underwriters who are also brokers to this issue in respect of the shares, allotted against applications made or procured by them provided that the relative forms of application bear their respective stamps, and in such case no brokerage will be payable to any other party in respect of the shares so allotted.

CAPITAL REQUIREMENT

Capital out-lay for the project is given below:—

	Rs. (in lacs)
Land	3.00
Buildings	28.50
Plant and Machinery	135.97
Preliminary Expenses	2.53
Working Capital	80.00
	250.00

The above sum will be met in the following manner:—

From Equity Share Capital ..	105.00
" Foreign Exchange Loans ICICI and CDFC (under negotiation)	80.00
" Borrowings from Banks ..	65.00
	250.00

The minimum subscription in respect of the present issue on which the Directors will proceed to allot is Rs 70/-lacs which is the total amount of the present issue offered to the existing members and to the public.

IMPORT LICENCE AND FOREIGN EXCHANGE

The Company has made an application for import licence for the requisite plant and machinery

Applications have been made to Messrs ICICI Bombay and Messrs CDFC London for foreign exchange loan to the value of Rs 80 lacs, and the same are under their consideration.

INSPECTION OF DOCUMENTS

The following agreements and documents can be inspected at any time during the usual business hours at the Registered Office of the Company until seven days after the opening of the subscription list:

1. Copy of the Memorandum and Articles of Association.
2. Licence No. L/5(6)/-17/EEI/61 dated 31st January, 1961 issued by the Government of India under the Industries (Development & Regulation) Act & Rules in favour of the Company.
3. Licence No. L/5/(6)-30/EEI/61 dated 24th May, 1961 issued by the Government of India for Change of location.
4. Consent Order No. R.42-CCI/61 dated 9th May, 1961 and an amendment letter No. R.42-CCI/61 dt. 14th June, 1961 issued by the Controller of Capital issues in favour of the Company.
5. Correspondence exchanged between the Underwriters and the Company containing the terms of the Underwriting Agreement.
6. Draft Managing Agency Agreement with M/s. Birla Gwalior Pvt. Ltd.
7. Technical Collaboration Agreement to be executed by the Company with B. I. C. C.
8. Balance Sheet and Profit & Loss Accounts for the last five years.

APPLICATIONS AND ALLOTMENT

Applications must be for 25 shares or multiples of 25 shares. All applications must be made on the form accompanying this Prospectus which can be had from the Company's Bankers and Brokers. All application forms properly completed must be lodged together with the amount payable on application with any of the following Banks or at their branches mentioned below:—

BANKS IN BOMBAY

1. **The State Bank of India.**
2. **The United Commercial Bank Ltd.**
3. **The Central Bank of India Ltd.**
4. **The Bank of Baroda Ltd.**
5. **The Bank of India Ltd.**

BANK'S MAIN OFFICES AT:

Calcutta. Bombay. Delhi, Madras Ahmedabad, Rajkot Poona Bangalore & Bhopal.

The remittance should be made by cheque or draft drawn on any Bank in the aforesaid towns (i.e. Calcutta Bombay, Delhi. Madras, Ahmedabad, Rajkot, Poona Bangalore and Bhopal) only and deposited with the above Banks or their above Branches.

Cheques or drafts should be drawn in favour of any of the above banks. A/c. The Universal Cables Ltd. For the applicant's protection, cheques or drafts should be crossed 'Account Payee only'. A separate cheque or draft must accompany each application.

Allotment will be notified by the despatch of an allotment letter, but the Directors reserve the full uncontrolled right of accepting or rejecting any application in whole or in part in either case without assigning any reason. Where an application is rejected or not accepted in full the whole or any balance of the application money received will be refunded within two months from the date of the closing of the Subscription list, to the applicant, in which event Bank commission if any, will be payable by the applicant

ISSUE OF SHARE CERTIFICATES

Certificates for shares allotted in terms of this offer will be ready for delivery in exchange for the letters of allotment within nine months after the date of allotment:

THE NEW GREAT INSURANCE CO. OF INDIA LTD.

MR. AMBALAL KILACHAND'S SPEECH

Mr. Ambalal Kilachand presided over the Eighteenth Annual General Meeting of the Shareholders of the Company held at Baroda on the 23rd June 1961, in the unavoidable absence of the Chairman, Mr. Tulsidas Kilachand.

In his speech, Mr. Ambalal referred to some of the problems facing the Insurance Industry.

Removal of Restrictive Regulations

He appealed to the Executive Committee to recommend to the Government to review the Insurance Act as a whole, remove all the provisions such as restriction on commission etc. and to enact new Insurance legislation in a simplified form based more or less on the laws prevailing in a highly developed country like the United Kingdom as, in his views, it was the existing restrictive regulations which hampered the smooth working of the Insurance Industry.

Quantum of Expenses Limit

Mr. Ambalal also appealed to the authorities to re-examine the provisions of Section 40C of the Insurance Act and Rule 17E of the Insurance Rules pertaining to the quantum of expenses which were fixed over ten years ago at a time when the cost of living and the prices of commodities were very much lower, and to effect the necessary changes in the formula by making it more flexible, so that the Industry could conduct the business smoothly under the present-day conditions.

Compulsory Cessions to Approved Reinsurers

Mr. Ambalal then referred to the passing of the Insurance (Amendment) Act whereby Government have made it compulsory for all Insurers in India to reinsure a certain percentage of their business with the Indian Guarantee & General Insurance Co., Ltd., in addition to the reinsurance already being placed with the India Reinsurance Corporation which had been formed a few years ago at the instance of the Government by Companies working in India who subscribed to the Corporation's capital and also undertook to reinsure with it a certain agreed percentage of business. He mentioned that Companies were spreading out their liability in as wide a geographical area as possible and were getting reciprocity to the fullest extent, particularly in the Fire Department, which had enabled them to build up a profitable reciprocal portfolio. On the other hand, they would be receiving only 50% reciprocity from the India Re and the Indian Guarantee. As the main object for which the Amendment Act was passed was to conserve and earn foreign exchange, and with a view to making good to the companies the reduction in reciprocity, Mr. Ambalal felt that the India Re. and the Indian Guarantee should concentrate on bringing to the Indian Market an increasing volume of profitable business from abroad.

Company's Building

Mr. Ambalal took the opportunity to mention that there had been certain unavoidable delay and difficulties in starting the construction of the Company's Building but once we surmounted these initial handicaps, the building would be completed as quickly as possible.

Company's Accounts

Dealing last with the departmental accounts, Mr. Ambalal stated that the gross direct premium for the year 1960 was Rs. 48,14,879 in Fire, Rs. 37,24,835 in Miscellaneous Insurance, and Rs. 39,20,963 in Marine whilst the net premiums were Rs. 42,24,023 and Rs. 31,99,405 and Rs. 19,50,504, respectively. After providing for losses and expenses and reserves at 50% in respect of Fire and Miscellaneous Insurance and 100% for Marine, and after adding the balance brought forward from the previous year, the net amount to the credit of the Profit and Loss Appropriation Account in all was Rs. 3,20,736. The Directors had transferred Rs. 40,000 to the Staff Gratuity Account and had proposed to pay Twelfth Dividend on Ordinary Shares at Rs. 2-50 per share less deduction of tax, amounting to Rs. 2,50,000.

N.B. This does not purport to be a record of the proceedings of the Annual General Meeting of the Company.

UNIVERSAL CABLES LIMITED—*Cont'd.*

BURMAH-SHELL REFINERIES LIMITED

CHAIRMAN, MR. L. D. MUDIE'S STATEMENT

Statement by Mr. L. D. Mudie, Chairman, Burmah-Shell Refineries Ltd. at the Eighth Annual General Meeting held on 26th June, 1961.

Gentlemen,

The Directors' Report and Statement of Accounts for the year are before you. The crude oil intake of the Refinery was 366,035 metric tons more in 1960 than in 1959, with income from refining increasing from Rs. 10.91 crores in 1959 to Rs. 12.33 crores in 1960. As from 1st January, 1960, your Company ceased to benefit from the relief provided under Section 15(c) of the Income Tax Act and in consequence, has had to set aside Rs. 2.61 crores for taxation on 1960 profits as compared with Rs. 1.90 crores charged in the 1959 accounts.

An interim dividend of 15 nP. per rupee was declared and paid in November, 1960 on the paid-up ordinary share capital absorbing Rs. 207.3 lakhs and the Board now recommend a final dividend of 5 nP. per rupee which will absorb a further Rs. 69.10 lakhs; Income Tax at 20% will be payable on these dividends.

I do not think further comments are required in respect of the details of our 1960 Statement of Accounts which are set out fully in the documents already circulated to you. I would now like to take this opportunity to give a few figures regarding the growth of Oil demand during the last five years under the dynamism of the Second Plan period and also project this picture into the Third Plan to see what contribution your Company has to make in this context.

Rise in Consumption

In the process of the many-sided development through which the Indian economy has been passing, Oil has effectively played its parts. Total inland oil consumption will have risen to about 7.8 million metric tons in 1961 from 4.9 million in 1956, a 59% increase during this period. The percentage rise in consumption has varied from product to product; thus, demand for High Speed Diesel Oil will have risen by 162%, while the demand for Furnace Oil will have gone up by 57%, that for Light Diesel Oil by 48%, Lubricants by 47% and Kerosine by 36%.

There appears to be much support for the view that we should provide for an annual compound growth rate of about 12% during the Third Plan period, as compared to the rate of 10% experienced in the Second Plan. These projections will naturally require revision at regular intervals, but it is generally recognised that energy is an essential overhead of economic growth and the growing importance of oil in the Indian pattern of energy consumption has been well demonstrated during the last decade.

At the meeting of the Oil Advisory Committee held in May this year, a figure of 13.55 m. metric tons was agreed as the likely inland demand in 1966. Including the provision for international bunkers, total demand for refined petroleum products will be about 14.14 m. metric tons representing a crude oil equivalent of about 15.27 million metric tons. The Oil Advisory Committee will review their forecasts at regular intervals and experience may well show an upward revision is necessary. Your Company attaches much weight to these figures, for with such targets before us, the exchange of ideas and plans between the public and private sectors is greatly facilitated, thus leading, it is hoped, to an understanding that a full contribution from both sectors is essential, if the task ahead is to be completed in time.

Large-scale Investment

While opinions may differ in regard to priorities, one incontrovertible fact emerges, namely that to meet a demand of the order of 15 m. metric tons of crude equivalent by the end of the Third Plan, investment on a large scale in all phases of the business is required not only now but as a recurring need into the long term future. The Oil Industry is highly capital intensive and experience has proved that to find, produce, refine and distribute to the consumer 1 million tons of Oil calls for a capital investment of approximately Rs. 60 crores. It is apparent, therefore, that an increase in consumption by about 7 million tons over the Third Plan period calls for a capital investment of some Rs. 400 crores if this increase alone is to be assured.

Investment is only one aspect of the problem. Equally important is the time factor; here, there are no short-cuts. There is no way of finding oil without drilling; the risk of failure is great and even successful ventures take many years and consume much money before the fruits of success in the form of commercial production of crude oil are ready to reach the consuming market.

From the moment of inspiration, to engineer, construct, staff, and bring on full stream a new refinery, is the work of years.

The distribution of oil presents its own special problems in a country the size of India; here is a railway system doing a magnificent job but nevertheless unable always to cater for the full traffic. The road system is still in the development stage. An oil distribution network must therefore provide innumerable upcountry storage points to ensure the smooth flow of supplies through out the country.

I am convinced that for prompt, effective action to meet these challenges there is need for a massive efforts, attacking the problem from as broad a front as possible, and enlisting help from all who are willing to contribute, on terms which are reasonable and still in keeping with the avowed objectives of Indian economic development.

Refinery Agreement

In his speech at this meeting last year the Chairman said that provided we were permitted to go ahead with our expansion proposal there might be room for further modification in the terms of the 1951 Refinery Agreement in addition to the Duty Protection which we had agreed to forego.

Arising from the above statement the Ministry of Steel, Mines & Fuel informed the Company that the question of revising the Refinery Agreement and a proposal to expand the capacity of the Refinery would have to be treated quite separately and that it would not be desirable to link them together. This letter was dated 14th September, 1960.

In February this year the Company received an official reply to its original proposal for the expansion but in this instance Government stated that they were unable to consider any proposal for the expansion of the refinery in terms of the 1951 Agreement. The letter went on to state that, as the total refinery capacity likely to be available by the end of the Third Five Year Plan period would be about 10.75 m. metric tons and product demands at that date had been variously indicated as 10 to 14 m. metric tons per annum, Government had decided, subject to reconsideration in the light of a more accurate forecast of product demand by the Oil Advisory Committee, that further increase in refining capacity in the Private Sector was not considered necessary. As mentioned earlier, the Oil Advisory Committee has now estimated product demand in 1966, including international bunkers, at about 14.14 m. metric tons.

Revised Cost Estimates

Revised cost estimates, which have more recently been communicated to Government, show that the additional million tons of refining capacity will cost only Rs. 2.83 crores, a fraction of the cost of constructing a new refinery of comparable capacity, and that the project to manufacture Lubricating Oil, now stepped up from 60,000 to 100,000 metric tons capacity per annum, will cost Rs. 6.47 crores. The total cost of the two projects has therefore been reduced by Rs. 2.28 crores and I would remind you that there will be no request to Government for foreign exchange, which will be provided from our own resources.

Despite the cool reception which these proposals have received so far I feel they are so sound and their acceptance is so much in the country's interest that we should be optimistic about the final outcome.

It will perhaps be useful again to refer to the sustained increase in Middle Distillate production and reduction in yield of Motor Spirit achieved by your Company between its commencement of operations and the year under review.

	1955	1960
Motor Spirit (% production on crude intake on weight basis) ...	22	14.9
Middle Distillates (% production on crude intake on weight basis)	33.5	45.1

Continued improvements in manufacturing techniques increased Crude throughput, as already stated, by 366,035 metric tons to a total of 2,843,010 metric tons in 1960 producing an additional 295,000 tons of essential Middle Distillates and only a marginal extra quantity of Motor Spirit. This represents a substantial contribution towards minimising the import of deficit products. Today your Refinery is operating at a rate equivalent to an annual Crude intake of 3 million metric tons and this further achievement is in logical conformity with the concept of utilising the country's capital assets to the maximum—a cardinal principle in a capital hungry world.

Product Imbalance

While there will be a critical period of product imbalance with a considerable surplus of Motor Spirit following the commissioning of the Gauhati and Barauni Refineries, there are encouraging indications in the longer term. One favourable factor is the development of chemical and fertiliser industries based on a light petroleum feedstock and in this connection a contract has been concluded by our Marketing Associates with F.A.C.T. for the supply of naphtha to their Fertiliser Plant at Alwaye. Also of interest is a contract recently signed by our Marketing Associates with the Fertiliser Corporation of India for the supply of 50,000 metric tons of refinery gas annually to their Trombay Plant.

Before I close, I would like to refer to four further points of interest.

During last year, negotiations were undertaken with Government for permission to manufacture Jute Batching Oil and I am happy to report that the necessary licence has now been received and the Refinery has already commenced production of a high quality which conforms to the very special requirements of the Jute Industry.

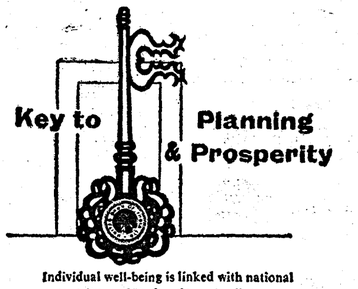
Our Marketing Associates are in negotiation with the Oil and Natural Gas Commission for processing at our Refinery indigenous crude from the Ankleshwar oilfields. Many important details have yet to be settled, but the Railway Authorities have in hand the laying of sidings at the refinery site to handle this crude oil traffic in tankwagons.

Your Company offered to train 18 operators for the Gauhati Refinery and also to accept two of their senior staff for study visits. These offers have been accepted and training will commence shortly.

Your Managing Director, Mr. G. B. Stanger, was honoured to accept the invitation extended to him last year by the Council of Scientific and Industrial Research to serve as a member of the Governing Council of the Indian Institute of Petroleum. I have no doubt that he will bring to bear on the deliberations of the Council his wide experience in the Oil Industry acquired over many years in different countries.

It remains for me to thank the Managing Director and those who worked for him for the considerable achievements of the year under review. The encouraging financial and technical results referred to earlier are the result of their hard work and ingenuity and in the full expectation that these qualities will be with us in the years to come, we look to the future with confidence.

N.B. This does not purport to be a record of the proceedings of the Annual General Meeting of the Company.



Individual well-being is linked with national prosperity and only planned efforts can ensure both in the shortest possible time. And planning, for its success, largely depends on savings, individual as well as national.
Saving in the form of Bank Deposits provides resources for the National Plan.

THE METAL BOX COMPANY OF INDIA LIMITED

REVIEW BY THE CHAIRMAN, MR. K. C. MAHINDRA

The Twenty-eighth Annual General Meeting of The Metal Box Company of India Limited will be held on Wednesday, the 19th July, 1961 at 59C, Chowringhee Road, Calcutta.

The following is a copy of the Review by the Chairman, Mr. K. C. Mahindra, which has already been circulated to members.

Sales

We have concluded another satisfactory year, with a rise in sales from Rs. 830 lakhs to Rs. 970 lakhs, 17% over the last year, but of this increase some Rs. 52 lakhs or 6% represents an increase in the price of raw materials, largely due to the substantial excise duties imposed last year on two of our basic materials —tinplate and aluminium. The Company's sales emphasis during the year has been on earning or saving foreign exchange. A substantial expansion in exports was achieved following vigorous promotional efforts. Calcutta No. 2, a factory devoted to foreign exchange saving products, viz. industrial components and machinery (previously imported) and plastics (made from local materials) achieved an 85% increase in turnover. For the rest of the business the net increase was 8%, reflecting the steadily growing demand for packaged goods.

The Company has maintained its position despite increasing competition due to its continued ability to offer high quality products and service. Production resources, however, were extended in the latter half of the last calendar year, as a consequence of a temporary deterioration in the flow of tinplate supplies which was beyond our control. We are aware and sincerely sorry that our customers in certain areas were seriously inconvenienced during this period. However towards the end of the financial year the position improved and customer goodwill has, by and large, been regained.

I feel constrained to repeat the emphasis I laid in my review last year on the question of pilferproofing. Newspapers report almost every day the widespread extent of adulterated and spurious products in the country, possibly affecting the health of the nation. The consumer package of which we offer such a large variety is perhaps the only sure means of beating the traffic in spurious goods. Typically its brand name is indelibly marked by lithography applied direct on to the metal; once factory-sealed it is tamperproof. The extension and improvement in the range of these packages is constantly engaging the engineering and research resources of your Company, but the high price, inflated by indirect taxation, of such essential packing materials as tinplate, aluminium and polyethylene favours the use of bulk packings. Since the product is dispensed loose from these, they constitute a standing invitation to adulteration and substitution.

The change-over to the metric system during the year provided some challenges to our production and marketing departments, but with the assistance of the Indian Standards Institution to the industry and the enlightened co-operation of our customers, our tasks have so far proved simpler than we anticipated.

Production Capacity

It is necessary for me to reflect here on the factors governing the operation and growth of a Company like ours, at a time when there appears to be an insufficient appreciation, by the planning authorities, of the role an efficient container-making industry can and needs to play in India's developing economy. Owing to lack of foreign exchange and insufficiency of home production of tinplate, your Company is unable to expand and diversify its production of containers using this metal as base. It is not realised that the production of apparently simple cans and closures, to the absolutely consistent quality standards essential for modern packaging systems, necessitates a complex industry employing engineering and technological skills of a high order. How complexity is rendered simple is told in the short illustrated story of a prawn can published with this review.

This impression of insufficient appreciation is reinforced by a list issued earlier this year by the Ministry of Commerce & Industry which includes, amongst the manufacturing licence applications which may ordinarily be rejected without reference to the Licensing Committee, those concerning tin containers, collapsible and rigid tubes, excepting where the fabrication is to be done by the packer himself. This policy decision is misconceived. It is vain to expect a packer to install the highly complicated and automated machinery required for producing Open Top food cans or lithographed General Line tin-containers and tubes to modern quality standards, for he will not have the requisite volume over which to spread the costs of expensive installation and overheads. Except in the case of plain unlithographed cans, usually large ones where freight considerations are overriding, packers almost invariably find it to be in their own interest to buy their containers from specialists who through larger scale operation and continuous technological improvements can offer a better and more efficient product which will satisfy the requirements of the home demand as well as the highly competitive export markets.

This has undoubtedly been the experience in such countries as Britain, the United States, Japan, Canada, France, Germany, Holland, Australia and Malaya. To quote but one instance, over the last seven years Japan has developed her annual canning of processed foodstuffs from 700 million labelled cans, mostly unlacquered and undecorated, to 2,000 million cans, most of which now are either internally coated with protective lacquer or decorated outside with process-resistant lithography. This spectacular advance both technological and quantitative, could not have taken place but for the existence of a progressive, responsive, and highly organised can-making industry. I suggest that Indian packers, and food-packers in particular, need behind them a well-equipped and equally capable can-making industry, as an essential pre-condition to their playing their proper part in conserving food which at present goes to waste. Your Company aims at providing this service of supply backed by its Research Laboratories and can-closing machinery building operation in Calcutta. It is rational that packers of food—or, for that matter, of pharmaceuticals and other packs—should devote their energies and talents to developing the quality and volume of their production, rather than diverting them to the specialised business of can- or tube-making.

Nor should the package-makers' rôle in developing the country's export markets be underestimated. It is a simple fact that Indian manufacturers will only succeed in selling their products abroad if they are packaged to international standards. In this contex it is necessary to stress the important point that high quality in the can-making industry is achieved by complex mechanised methods, justified only by a large volume. High quality in these markets is essential for competition there is fierce and we are up against foreign manufacturers who have all the advantages stemming from a massive volume of domestic production. For these reasons it is not possible to produce a utility standard for the domestic market and a higher standard for export. The quality standards in an exporting nation must be such that its products in the domestic market are increasingly worthy of exporting. Only if they are well packaged can consumer goods exports grow as they should; approximately Rs 4 crores per annum of such exports are made possible today by your Company's packages and there is room for massive growth if we analyse the factors favouring exports correctly and act accordingly.

I, therefore, hope that the authorities, in the interest of superior and more economical supplies in the home market and the more vigorous development of exports, will take a realistic view in their licensing policy for India's container-manufacturing industry.

Raw Materials

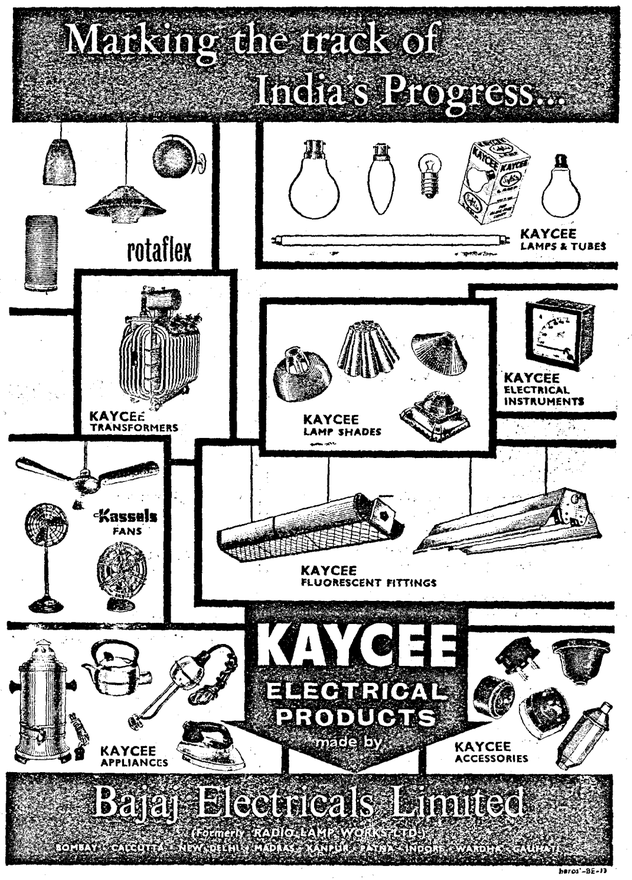
The overall availability of tinplate throughout most of the year was maintained at a satisfactory level. The crisis that developed at mid-year in Bombay was due to the delayed shipment of plate procured from overseas under DLF arrangements. Although every effort was made to achieve maximum production from the resources available, the operational efficiency of our Bombay factory was thereby adversely affected for several months.

Although the year opens with a satisfactory stock level, the outlook for the current year cannot be without anxiety. If Tatas proceed with the planned closure for overhaul of their billet mill, The Tinplate Company of India will be required to obtain their tinbar from unfamiliar sources. It is not difficult to visualise the manufacturing problems that could ensue. Rourkela is not expected to commence tinplate production until the end of the year and the continuing gap between indigenous supply and current demand can only be met by imports. This is not a situation which allows complacency in the face of the critical foreign exchange position.

Looking beyond the current year Rourkela will provide only short-term relief, as the demand for tinplate is rising at a rapid rate. The National Council of Applied Economic Research have estimated that by the end of the Third Plan tinplate demand will have reached 250,000 tons and we have no reason to disagree with this estimate. It is believed that to meet this the Government of India contemplate licensing production capacity of 320,000 tons. Until a really substantial expansion of production capacity is put into effect, the import bill for tinplate will be heavy, notwithstanding the considerable efforts being made to utilise alternative packaging materials. Meanwhile, if the means of providing adequate imports are not found, the effect on the many industries dependent on tinplate containers for their packaging will be far-reaching with corresponding repercussion on the economy as a whole.

The Company's consumption of aluminium, although to an extent limited by availability, again increased. Arrangements have since been made to procure a somewhat larger tonnage during the present year. Compared with the prices ruling elsewhere, the cost of Indian aluminium is very high. As the additional sources of supply now planned come into production this is a factor which will require the industry's consideration if the use of aluminium as a packaging material is to be properly developed.

Supplies of deep drawn mild steel were obtained during the second half of the year in sufficient quantity to allow increased production of industrial components. The outlook for the current year is at present uncertain but every possible effort is being made to ensure availability either from DLF, rupee payment or barter sources. It is to be hoped that the Company's representations on this score will not be ignored as the range of components now produced for the automotive, electrical and other industries



represent in most cases direct saving of foreign exchange.

Co-operation between the Company's Research Laboratories and the suppliers of ancillary materials continued fruitfully during the year. As a result the Company's usage of wholly indigenous materials has broadened satisfactorily as quality has been brought up to the required standards.

Development

The Company's Technical Development Section contributed significantly during the year to the improvement of manufacturing methods and the design and introduction of new products.

Calcutta No. 2 at which the Company's development projects are concentrated had a satisfactory year of consolidation. In the Plastics Works the range of products has been extended.

The expansion of machinery building facilities was continued. The range of plant for customers' use was increased and a start has been made on the building of replacement equipment for internal use. Foreign exchange savings are directly proportionate to the output of this section.

A small expansion of the Bombay factory building was completed and occupied while construction of an additional floor to the Bombay administrative block was started. These additions will facilitate improved plant layout and develop to the full the existing Worli site.

The transfer of plant to Faridabad was largely completed during the year; only a small reforming operation now remains at Azadpur. The availability of power did not improve as anticipated and in order to work a day shift generating equipment had to be installed.

Board Changes

In April 1961, Mr. R. W. Westbrook retired to return to an appointment in the United Kingdom. A member of the Board for fifteen years and Managing Director for the last three, he had served your Company with great loyalty, enthusiasm and skill for over twenty-five years. It was with regret that we said farewell to him.

The Board have appointed Mr H. K. S. Lindsay as Managing Director and Mr. J N. de N. Cochrane-Barnett as Deputy Managing Director. Both have wide knowledge and experience of the Company's affairs. Mr. Lindsay has been a Director since 1951 and Mr. Cochrane-Barnett since 1957.

Employee Relations

Good relations between management and employees have continued: it is gratifying that the latter and their representatives have as much faith in bipartite negotiations as the former. In pursuance of the Company's policy of keeping well abreast of area practices, agreements were concluded on the reclassification of occupations, wages and salary, dearness allowance, and other conditions of service. Regrettably the daily rated employees in Madras constitute a solitary exception to this pleasant picture: for the third consecutive year no bipartite negotiations have been possible notwithstanding the settlement of a five-year agreement covering the revision of salaries and grades with the Madras monthly rated employees.

Training remains an important feature of personnel policy. During the year the Company strengthened its own training arrangements and took every available opportunity for its staff to participate in suitable outside seminars, productivity teams and courses calculated to improve job knowledge, performance and potential for promotion. The scope of this activity has covered literally every category of personnel from the Daily Rated Worker to the Managing Director. The latter, for example, attended the ILO/NPC Conference of Industrial Leaders convened for "heads of organisations of national importance" in the public and private sectors. Other participants in outside courses were two members of top management in the NPC's Three Day Seminar on Top Management; one manager at The Administrative Staff College in Hyderabad; three in advanced management courses; sixteen in courses for middle and junior management and salesmen. Nineteen of our Indian managers and technologists went abroad; three to programmes sponsored by the NPC and sixteen under training, one holding a short term appointment, with our U.K. associates. Arrangements have been concluded under which the Company's training staff were able to commence regular residential courses of two to three weeks' duration for managers, management trainees, salesmen and foremen. So far thirty-four have undergone residential courses, twenty-eight men other training courses. The Company has continued to support the Workers' Education Scheme: Calcutta No. 1 has been the most active, their Unit Level Centre has now trained its third batch of workers.

It is gratifying for me to record the valuable co-operation of the Company's employees in our growing activities and I thank them and management for a year of hard and constructive work.

N.B. This does not purport to be a record of the proceedings of the Annual General Meeting of the Company.

INDUSTRIAL **IBCON** CONSULTANTS

The industrial consultancy services offered by the group fall under the following headings:-

IN THE PLANT—

PLANT CAPACITY AND LAY-OUTS • PRODUCTION PLANNING AND CONTROL
STORES ORGANISATION • CONSUMABLE STORES CONTROL
RAW MATERIALS CONTROL • FUEL AND STEAM UTILISATION
TRANSPORTATION METHODS • MECHANICAL HANDLING
PRODUCT QUALITY CONTROL • OPERATIONAL RESEARCH
WORK STUDY • BUDGETARY CONTROLS
VALUATION OF PLANT & BUILDINGS
DESIGN AND ESTIMATES OF EXTENSIONS

ON LABOUR—

METHOD AND WORK STUDY • PRODUCTIVITY INDICES
TIMEKEEPING SYSTEMS • WAGE PAYMENT SYSTEMS
JOB EVALUATION • WAGE STRUCTURES
PERSONNEL RECORDS • LABOUR POLICIES
HUMAN RELATIONS • COMMUNICATION
REORIENTATION LECTURES • FOR LABOUR AND SUPERVISION

IN OFFICES—

MANAGEMENT ORGANISATION • EXECUTIVE LEVEL WORK
CLERICAL PROCEDURE • MANAGEMENT CONTROLS
WORK MEASUREMENT • BUDGET FORECASTS
LAYOUT, COMMUNICATIONS AND EQUIPMENT

AND

Money

THE CALCUTTA MONEY MARKET

INTERBANK RATE FALLS

Wednesday, 28th June.

A FURTHER moderate decline has been recorded in the advances outstanding in the Calcutta money market during the past week. There has been a sharp fall in the requirements of the jute mills and more moderate ones in demand from the engineering and iron and steel industries and against foodgrains and seeds storage. Other sources of demand, notably the sugar and cotton industries, showed little change. In the interbank market, conditions have become extremely easy. The call rate has fallen to between 3⅜ and 3½ percent and money is reported to be unlendable.

Good activity has once again been reported from the exchange market during the past week. Both tea and gunny bills have been in good supply. Remittance demand has again been moderate to poor. In the London money market, the pound has shown nominal gains against the U.S. dollar and most other important currencies. The substantial gains of the pound against the Canadian dollar were the result of last week's announcement of a lower value for that currency.

BULLION WAS QUIET ON LACK OF SUPPORT DURING the past week. Silver declined from the previous week's level of Rs. 236 to Rs. 235.50, quoted today for ready delivery and the rate for forward delivery was quoted at Rs. 201. The London and New York prices were 79⅜d and 91.375 cents.

Gold was quiet in sympathy with silver and the price declined from Rs. 143.50 to Rs. 141.50. The sovereign at Rs. 96.25 showed little variation.

DURING THE WEEK ENDED 23RD JUNE, GOVERNMENT of India Treasury bills for Rs. 72,40,00,000 were sold in favour of the Reserve Bank.

TENDERS FOR RS. 2 CRORES OF 91-DAY GOVERNMENT of India Treasury bills were opened on 27th June. The total amount offered was Rs. 2 crores. Tenders at Rs. 99.335 percent and above were accepted in full. The total amount accepted was Rs. 2 crores, the average rate of acceptance being Rs. 2.650 percent a year. Tenders for Rs. 2 crores of 91-day Government of India Treasury bills will be received at all centres up to the close of business on 3rd July.

IT IS STATED THAT 91-DAY INTERMEDIATE TREASURY bills will be sold from 28th June to 1st July at Rs. 99.356 percent, subject to the conditions previously announced that sales can be stopped at any time without notice if the Government thinks it necessary. These bills, sold from 21st June to 23rd June, amounted to Rs. 80 lakhs only.

DECLINES OF RS. 23.24 CRORES TO RS. 1,945.75 crores in active notes and of Rs. 8.47 crores to Rs. 1,987.15 crores in the total note issue were notable features of the return of the Reserve Bank of India for the week ended 23rd June, 1961. The currency contraction was adjusted by reducing rupee securities by Rs. 10.01 crores to Rs. 1,641.91 crores and by increasing rupee coin from Rs. 117.94 crores to Rs. 119.47 crores in the paper currency reserve. Deposits of the Government of India rose by Rs. 1.32 crores to Rs. 82.05 crores, as did other Government accounts by Rs. 9.19 crores to Rs. 14.63 crores. Balances of commercial banks at Rs. 80.37 crores showed a decline of Rs. 5.48 crores. Balances held abroad again fell by Rs. 3.13 crores to Rs. 12.65 crores. Investments increased by Rs. 8.43 crores to Rs. 223.09 crores. Other loans and advances declined from Rs. 118.24 crores to Rs. 115.71 crores, of which advances to scheduled banks against usance bills amounted to Rs. 8.48 crores (Rs. 13.78 crores). Ways and means advances stood at Rs. 77.43 crores, against Rs. 83.02 crores.

THE RETURN OF THE STATE BANK OF INDIA FOR THE week ended 16th June, shows a drop of Rs. 11.77 crores to Rs. 520.17 crores in total deposits. Investments in Government securities are down by Rs. 9.90 crores to Rs. 202.62 crores, while other authorised investments remain unchanged at Rs. 9.30 crores. Advances, including loans, cash credits, overdrafts, bills discounted and purchased have dropped by Rs. 3.54 crores to Rs. 267.15 crores. Cash and balances are, in consequence, shown at Rs. 32.47 crores, or Rs. 7.64 crores higher.

THE STATEMENT OF THE POSITION OF SCHEDULED banks for the week ended 16th June, shows Demand and Time liabilities at Rs. 835.15 crores (Rs. 31.55 crores on account of borrowings from banks) and Rs. 1,114.11 crores (Rs. 17.41 crores), compared with Rs. 822.88 crores (Rs. 25.82 crores) and Rs. 1,127.71 crores (Rs. 14.50 crores), respectively. Cash and balances with the Reserve Bank have increased by Rs. 77 lakhs and Rs. 4.88 crores to Rs. 47.14 crores and Rs. 81.64 crores. There is a drop of Rs. 8.20 crores to Rs. 528.91 crores in investments. Advances and bills discounted at Rs. 1,284.29 crores show a fall of Rs. 4.20 crores. The ratios to total liabilities of cash and balances and of advances and discounts are, in consequence, shown at 6.6 percent and 65.9 percent, against 6.3 percent and 66.1 percent.

THE FOLLOWING IS A STATEMENT OF THE CASH balances of the Central Government on the last day of February 1961:

		Rs.
(1)	At the Reserve Bank of India in India	50,97,92,000
(2)	At treasuries in India ...	34,18,000
(3)	In England (sterling converted at 18d the rupee)	1,02,47,000
	Total ...	52,34,57,000

TREASURY BILL MATURITIES

Details of 91 days' bills outstanding with the public on 29-6-61.

Issue Date	Maturity Date	Amount (000's Rs.)	Average Acceptance Rate

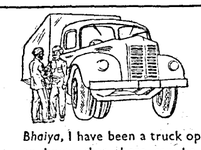
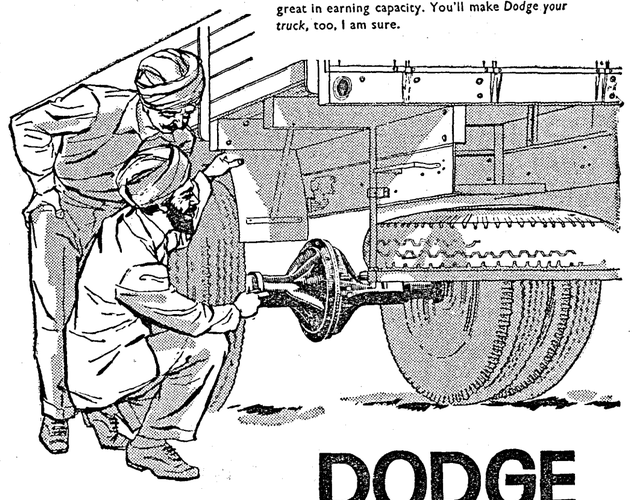
My choice of a truck? DODGE of course



Bhaiya, I have been a truck operator long enough to know that there can be no two opinions about the superiority of *Dodge trucks*. For instance take Axles. A Dodge vehicle is fitted with Timken axles now known as Rockwell-Standard which have a world-wide reputation. These axles have great load carrying capacity and are absolutely dependable-which means a great deal to us truck operators.

There are several other superior features besides. Taken together they lead to only one conclusion, namely, that the *Dodge is a great truck*. It is great in hauling power, great in endurance, great in earning capacity. You'll make *Dodge your truck*, too, I am sure.



DODGE
DIESEL TRUCK

"CAPITAL" STOCKS AND SHARES INDEX*

The *Capital* Stocks and Shares Index (Base: 1939) has now been brought up to May 1961. As compared with April, the May indices for preference shares and Government securities show declines of 1.0 point and 0.1 point, respectively.

There were decreases in banks 0.8 points, jutes 9.6 points, teas 3.8 points, papers 102.0 points, sugars 3.4 points and miscellaneous 28.9 points, while increases occurred in cottons 6.2 points, coals 12.8 points, minings and oils 1.2 points, cements 2.4 points and engineerings 6.4 points.

Combining all the factors, the *Capital* variable yield securities index declined by 5.1 points during May 1961.

Stocks and Shares

PRICES FALL ON RUMOURS OF CONTROLS ON TRADING

GOOD DEMAND FOR MISCELLANEOUS SHARES

Wednesday Evening.

THE stock market has closed the week in a hesitant mood. Business has been largely concentrated on speculative shares, but turnover has declined appreciably. Fluctuations have been governed by conflicting rumours about further controls on trading. It is reported that the Stock Exchange Division of the Finance Ministry has asked the Bombay market to consider the possibility of removing free margin limits and fixing minimum brokerage with a view to restraining speculation. Considering that the Directorate has now opened its Office in Calcutta, Lyons Range wonders whether the Calcutta stock market will also be asked to enforce similar restrictions on trading. The new Office has been started here in order to administer the Securities Contracts (Regulation) Act, 1956, in so far as it relates to Calcutta and Madras.

Judging from the trends during the past few months, it appears that trading has been maintained at a normal level in Lyons Range. In the circumstances, there is little need for adopting any special measure to regulate trading at the present stage.

Business has been done on a cautious scale because operators are unable to take a definite view about the future outlook. The corporate working is likely to improve in the coming months under the stimulus of the third plan outlays. As India has been assured of the necessary foreign exchange during the first two years of the plan, it is thought that economic development will proceed at a satisfactory level. An encouraging factor is that a portion of the foreign loans may be used for financing maintenance imports. If existing industries are assured of the necessary foreign equipment, spare parts and raw materials, production will be promoted. A report that the World Bank has agreed to give a loan of about Rs. 30 crores to the coal industry for expansion, has helped broaden support for shares. From the scrappy details which are available, it looks as if the loan will be channelled through the Government of India. Under the circumstances, collieries having adequate resources of their own are likely to benefit greatly. A representative team of the industry is expected to go to Washington soon in order to finalise the terms and conditions of the proposed loans.

A striking feature is that the prices of selected miscellaneous shares have improved considerably. It looks as if these scrip are in short supply. Holders are generally disinclined to sell in view of the promising outlook for these industries. As a result of import restrictions, the domestic requirements have to be satisfied largely by indigenous supplies. Many miscellaneous industries have increased their output capacities and diversified their products in order to meet the rising requirements. The latest reports of some companies show how turnover has increased, but the profitability has improved relatively less due to higher production costs. Attention, therefore, has been concentrated on companies which can offset a portion of their increased production costs by rising turnover.

At the same time, the difficulties facing these industries must not be ignored. Apart from the usual lack of transport facilities, shortage of electric power has affected the working of many concerns in several parts of the country. The supplies of proper grades of coal have fallen short of requirements. There is growing evidence that the supplies of steel are also inadequate. An important factor contributing to the steadiness is the hope that the prices of some commodities may soon be increased in order to compensate producers for rising production costs. The recommendations of the Tariff Commission concerning the new prices of steel and cement are likely to be announced in the near future. The latest reports of paper companies show how profitability has been adversely affected by cuts in the prices of the commodity since the beginning of 1960. It is, therefore, hoped that the Government will consider revising paper prices upwards.

The price of Indian Iron shares has closed at Rs. 27.63 after wide fluctuations. In the engineering section, influential support has lifted J. K. Steel. Scattered interest has been shown in Guest, Keen, Williams, Burn and Britannia Engineering. Texmaco have fluctuated on speculative manipulation. Indian Oxygen are steady on expansion prospects. Binani Metal Works have been newly listed and are attracting support. The Calcutta stock market authorities have suspended trading in William Powell shares until further notice.

In the miscellaneous section, Indian Coppers have improved on favourable corporate rumours. Metal Box are firm on producing a good report. Britannia Biscuits are in demand on expectations of a bonus share. Orissa Minerals are steady on good working reports. Indian Aluminium have recovered, as have Indian Cables, on replacement buying. Rohtas are quiet, as are Hindustan Motors, on long liquidation. Dunlop Rubbers are steady on hopes of a further share issue. Union Carbide and Rallis have been steady. Interest has been shown in British Paints. National Insulated Cable have recovered on talk of a higher dividend. Electric Construction have been bought by knowledgeable quarters. Isaac Holdens and Hindusthan Twyfords have been maintained on good working reports. Alkali Chemicals are fancied on expansion prospects. Shaw Wallace, Duncan Brothers Martin Burn and Balmer Lawrie have been supported. Paper shares are quiet and Orient have lost further ground. Titaghur are steady on talk of expansion of the Orissa factory. Seshasayee Paper appear to have settled down at the current level on a report that the equipment of the factory will arrive soon and production may begin early in 1961.

Coal shares have been selectively bought. Prominent scrip are Bengal, Burrakur, New Beerbhoom, East indian and Amalgamated. Western Bengal have attracted scattered interest on prospects of expansion.

Interest has broadened in selected jute shares on the view that the working of mills may improve when the new crop begins to arrive in large quantities. But it is feared that results during the current year are likely to be far from encouraging. Business has been done in Birla, New Central, Howrah, Megna, Anglo-India, India and Union.

Cotton mill shares are steady on hopes of higher production. Bharat Commerce, Dunbar, Kesoram

Guaranteed for one year
MADE IN INDIA
anglo-swiss watch co.
6 & 7, DALHOUSIE SQUARE EAST, CALCUTTA-1

and J. K. Rayon have been transacted in fair quantities.

Sugar shares have become sluggish because investors wonder how the factories will be compensated for export losses. Scattered business has been done in Carew, Belsund, S. K. G. and Ramnugger.

Support has been maintained for selected Assam and Dooars gardens due to good dividends. Improved prices realised at the Calcutta auctions held this week have helped to stimulate interest. Basmatia, Tezpore, Rajgarh, Jay Shree, Bishnauth and Hasimara are in demand.

Government securities are dull. The 3 percent conversion loan 1986 has declined further to Rs. 72.62. In spite of interest in short-dated loans, business has been difficult to negotiate in the absence of declared sellers.

Basmatia Tea

The profit earned by Basmatia Tea Co. Ltd has risen from Rs. 3.86 lakhs to Rs. 4.21 lakhs for the year ended December 1960, after allocating Rs. 74,810 (against Rs. 55,300) for depreciation. The ordinary dividend has been raised from 30 percent to 35 percent, subject to tax. Taxation is allocated Rs 1.63 lakhs (against Rs. 1.48 lakhs) and general reserve gets Rs. 70,000 (against same). After making other adjustments and bringing in Rs. 43,644, there remains a balance of Rs. 44,554 to be carried forward. A crop of 2,647 quintals was secured (against 2,762 quintals) and the average sale price was Rs. 7.21 (against Rs. 6.659) a kilogram. Estimates for the current season have been framed for a crop of 2,900 quintals.

Ledo Tea

The working of Ledo Tea Co. Ltd has resulted in a profit of Rs. 86,551 for the year ended December 1960, against a loss of Rs. 2 lakhs in the previous year. Dividend has again been passed. Revenue reserve absorbs Rs. 70,000. After making other adjustments, and bringing in Rs. 22.109, a sum of Rs. 14,035 is carried forward. A crop of 229,767 kilograms (against 188,700 kilograms) was produced. The average sale price realised was Rs. 5.53 (against Rs. 4.70) a kilogram. Estimates for 1961 provide for a crop of 220,000 kilograms at an outlay of Rs. 12.64 lakhs, including freight and sales charges.

Bombay Market

OPERATORS TURN CAUTIOUS ON CONTROL FEARS

T.E.L.C.O. ISSUE TAKEN BEARISHLY

Wednesday Noon.

THERE was a decline in turnover in the Bombay stock market during the past week and fluctuations were narrow. Operators turned cautious on the fear that the Government might press the stock market authorities to tighten controls further in order to restrain speculation. Corporate news was mixed. Selected cotton mill shares met with support on the expectation of further share issues, but the news that Tata Locomotive has been permitted to issue debentures worth Rs. 5 crores to finance expansion has been interpreted bearishly. The stock market thinks that the Company may not issue rights shares for the time being.

Tata Steel closed at Rs. 162.50; operators are hoping that the Company might pay a higher dividend for the year ended March 1961. Indian Iron closed lower at Rs. 27.80 on selling from Lyons Range. Engineering shares were generally subdued. Tata Locomotives came to hand at Rs. 375 and Larsen and Toubro declined to Rs. 41.75. Premier Construction were sold down to Rs. 197 and Alcock Ashdown were offered at Rs. 304. Mukand Iron were an exception and improved to Rs. 32.75 on prospects of expansion. Motor shares were quiet, and Hindustan Motors lost at Rs. 22.40. Premier Automobiles were available at Rs. 171.50.

Cotton mill shares showed losses on balance. Century reacted to Rs. 705 on profit-taking and Standard declined to Rs. 1,448. Bombay Dyeing were quoted lower at Rs. 69.20 and India United ordinaries were offered freely down to Rs. 15.16. Scattered interest was taken in Morarji at Rs. 434 on prospects of a further capital issue. Kohinoor met with support up to Rs. 317 and Simplex improved to Rs. 213.50. Finlay were bought at Rs. 328 and Gokak were in demand up to Rs. 186.50. Khatau rose to Rs. 591.25, as did Svadeshi to Rs. 280. Apollo were sold freely down to Rs. 1.60.

In the miscellaneous section, sugar shares were quiet because the Maharashtra Land Bill has received the assent of the President of India. Belapur lost at Rs. 270, as did Phalton at Rs. 130.75. Business passed in Walchandnagar Industries at Rs. 167.50. Mining shares were steady, and Shivrajpur Syndicate improved to Rs. 71 on fresh support. Steamship company shares showed divergent trends, and Scindia Steam improved to Rs. 14.72 on professional support. But Great Eastern Shipping declined to Rs. 14.08 on the fear that the working during the current year might show further deterioration. Cement shares were steady, and Associated Cement were bought up to Rs. 167 on prospects of a bonus share issue. Digvijay came to hand at Rs. 160. Bombay Burmah reacted to Rs. 623 because the interim dividend of Rs. 12 a share, taxable, against Rs. 11 a share, taxable, fell below market expectations. National Rayon reacted to Rs. 568 on profit-taking. Gwalior Rayon declined to Rs. 52.70 and Baroda Rayon were sold down to Rs. 130.50. Chemical shares were quietly steady, and Tata Chemical were done at Rs. 20.36. Colour-Chem were dealt in at Rs. 265 and Polychem came to hand at Rs. 247.50. Indian Dyestuff declined to Rs. 520. Voltas met with support up to Rs. 291 and business was done in Tata Oil at Rs. 75. Ceat Tyre recovered to Rs. 212.50 on replacement buying and Synthetics and Chemicals were steady at Rs. 173.

Bank shares were steady and fractional gains were scored. Bank of India were done at Rs. 124 and Central Bank came to hand at Rs. 58.30. Insurance shares were quiet, and New India Assurance were transacted at Rs. 61.50.

Sellers predominated in electric company shares and prices declined on balance. Ahmedabad lost at Rs. 85 and Tata Hydro were placed at Rs. 106.25. Bombay Suburban declined to Rs. 89.50.

Madras Market

MARKET HESITATES AFTER EARLY BUOYANCY

COFFEE SHARES ATTRACT SUPPORT

Tuesday Evening.

THE Madras stock market has been steady during the past week and fair business was transacted in both clearing and cash scrip. Good corporate news, combined with prospects of easier money conditions, helped broaden interest. Towards the close, operators turned cautious and turnover declined due to lower advices from the Calcutta and Bombay stock markets.

Turnover was restricted in Government securities and attention was mainly concentrated on selected State loans. Bank shares were selectively bought, but sugar shares were transacted cautiously in view of excessive stocks. Among planting shares, selected coffee shares attracted support on reports of good crop progress, but tea shares were hesitant due to uncertainties concerning the marketing outlook for the commodity. Rubber shares were quietly steady. Reports of satisfactory working induced support for textile shares and selected miscellaneous scrip improved on good dividends.

In the banking group, Andhra were bought up to Rs. 100 and Canara were done at Rs. 85. Indian came to hand at Rs. 172 and Indian Overseas were transacted up to Rs. 181. Punjab National were steady at Rs. 22.25. Among public utilities, interest was taken in Ellore at Rs. 16.55 and in Negapatam at Rs. 8.90. South Madras were steady at Rs. 10 and Vellore were done at Rs. 13.35.

In the sugar section, Andhra were dealt in at Rs. 26.85 and Cauvery changed hands at Rs. 130.50 E.I.D. lost at Rs. 42.87, as did Deccan at Rs. 13.95. Mysore were done at Rs. 57.75 and United Breweries declined to Rs. 103.50 on profit-taking.

Among planting shares, Blue Mountain were steady at Rs. 3.20 and Consolidated Coffee improved to Rs. 22. Cochin Malabar were supported up to Rs. 7.80 and Ouchterlony were in demand at Rs. 3.74. Periakaramalai were transacted at Rs. 3.85 and Balanoor realised Rs. 16.30 on paying a taxable ordinary dividend of 12 percent. Interest was taken in Devon up to Rs. 14.37 on the payment of a taxable ordinary dividend of 12 percent. Kil Kotagiri were done at Rs. 4.86 and Malankarai changed hands up to Rs. 18.75. Mysore Coffee were in demand up to Rs. 5.45 and Nilgiri were transacted at Rs. 8.55. Business passed in Ossoor at Rs. 2.65 and Peermade were steady at Rs. 22.48. United Nilgiri were quoted at Rs. 24.75 and Twyford came to hand at Rs. 12.12. Thirumbadi were quiet at Rs. 1.60 and Travancore Rubber were available at Rs. 10.09.

Among textile shares, Adoni improved to Rs. 12 and Anglo-French to Rs. 141. Buckingham hardened to Rs. 225 on talk of buying by the Life Insurance Corporation, but Bangalore Woollen were sluggish at Rs. 202.50. Lakshmi were transacted at Rs. 168.50 and Madura were supported up to Rs. 39.15. Travancore Rayon reacted to Rs. 40 on profit-taking, but South India Viscose were steady at Rs. 176. Kothari came to hand at Rs. 12.55 and Rajapalayam were steady at Rs. 141. Mettur were in demand up to Rs. 400 and Ramakrishna were done at Rs. 224. Rajalakshmi were quoted at Rs. 88 and Trichinopoly were steady at Rs. 12.25. Vijayakumar were done at Rs. 111 and Coimbatore Spinning were sold at Rs. 51.

In the miscellaneous section, India Cement hardened to Rs. 6.55 on paying a taxable ordinary dividend of 12 percent, including an interim of 6 percent, compared with 11 percent, taxable, in the previous year. Aluminium Industries were quoted at Rs. 23.60 and Ashok Leyland were steady up to Rs. 9.37. Mysore Paper met with support up to Rs. 21.25 on paying a taxable ordinary dividend of 15 percent, but United Electrical were sold down to Rs. 9.50 on passing a dividend. Enfield were steady at Rs. 13.25, but F.A.C.T. were quiet at Rs. 10.48. Kirloskar Electric changed hands at Rs. 13.50 and Madras Aluminium were in demand up to Rs. 23.50. Mandya National Paper declined to Rs. 8.40 on pressure and Seshasayee Paper lost at Rs. 6.15. Tube Investment attracted support up to Rs. 265 and Textool were steady at Rs. 181.50. Standard Motors were steady at Rs. 16.75, as were Spencer at Rs. 22.65. Premier Fertiliser were neglected at Rs. 9 and Travancore Ogale were sold down to Rs. 7.20.

THE WEEK'S TRANSACTIONS

[In the following list of stocks and shares in which transactions have taken place during the past week, the figures indicate Opening Quotations. Highest for the week. Lowest for the week. Closing Quotations and Quotations for the corresponding Closing Date a Year Ago. The last-named is shown in parentheses and will not be given where such a quotation is not available.]

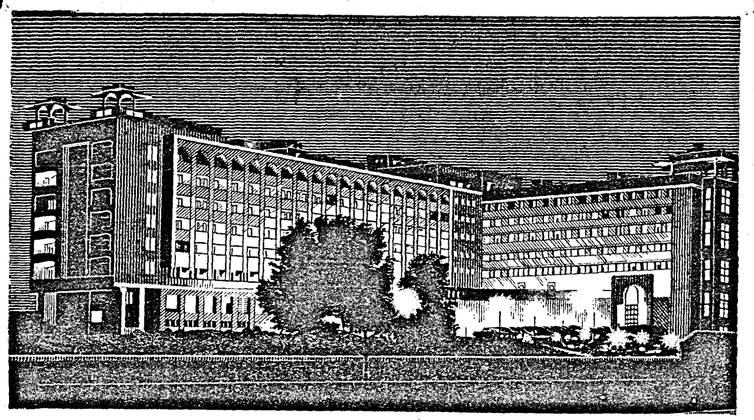
The Ashoka Hotel AT NEW DELHI


LIGHTING BY **PHILIPS**

Occupying an area of 20 acres, the Ashoka Hotel—the largest project of its kind in India—stands out as another shining example of Philips' specialised lighting.

The lighting is so essentially a part of the whole conception that it presents an architectural masterpiece which belies the fact that it is achieved by artificial means.

Philips exclusive lighting consisting of lamps, fittings and accessories ensures ultimate economy through maximum illumination level at lowest running cost and gives longer, trouble-free performance. Philips' scientifically designed equipment is the result of experience, research and development to meet the ever-growing demands of better lighting. And hand-in-hand with Philips' unrivalled quality goes the invisible *plus* of Philips' international experience and know-how.

FREE: *For planned lighting, designed economically to suit your specific need—whether it is industrial, commercial or any other specialised application—consult Philips Lighting Service Bureau.*

PHILIPS **PHILIPS** *quality lighting for ultimate economy*

MR. AL FOIL MINDS HIS MANNERS

"Party manners?" queried Mr. Al Foil with a broad grin, "Whoever heard of a polite fellow like me standing on a Tea Table? But every perfect hostess knows I should be there because all food, biscuits, cheese, butter, tea, cream and milk must be protected by foil.

"Foil packaging guarantees quality from the manufacturer to the consumer, and you, my charming Hostess," continued Al, "maintain that quality by keeping your food protected by household foil both in the refrigerator and on your shelf."

Fifty seven years' experience as Manufacturers of Aluminium Foils for packaging goods in the Cigarette, Pharmaceutical, Confectionary, Tea and many other industries.

London Market

MARKET FALLS HEAVILY AFTER BRIEF RALLY

GILT-EDGED SHARPLY DOWN

London, 28th June.

A HALF-HEARTED and short-lived rally in the past week followed the previous week's fall in the stock market, but prices soon resumed their downward path to record further widespread losses on the week. There is a complete lack of incentive in the market at present, but plenty of adverse factors. The most important of these is the uncertainty concerning the Government's intentions in the economic field. Measures to reduce the strain on the economy are considered inevitable, and the market is unlikely to regain confidence at least until these measures are made known. Disappointing company news, labour troubles, the unsettled performance of Wall Street and Iraq's claim to Kuwait all contributed to the malaise in the market. The main feature of the week was the pronounced and continuous weakness of the gilt-edged market. There were virtually no buyers around for gilt-edged and prices fell back heavily on persistent small selling. In undated stocks, losses extended to over a point and many prices established new all-time lows. Canadians moved up in immediate response to the move to devalue the Canadian dollar, but subsequently moved irregularly. Banking, hire-purchase finance and insurance shares lost ground. Property shares were depressed. Industrial equities rallied at one time, but soon turned downwards again and fresh losses ranging to 2s or more were recorded. Gold shares advanced in response to the Canadian dollar devaluation, which raised hopes of a rise in the price of gold, but the flurry did not last long and prices subsequently receded in idle conditions. There are now very substantial differences between London and Johannesburg prices due to the South African exchange restrictions. Coppers also lost ground. Despite some profit-taking, tin shares showed substantial gains following the news that the buffer pool's stock of tin had been exhausted. Oils fell back on the Kuwait development. Rubbers were dull, but teas were fairly well maintained.

SHELLAC STEADY

During the week ended 27th June, the market was steady. The range of quotations was as follows:

Superior Lemon	Rs. 168, 170 sellers.
Light Pure Buttonlac	Rs. 168, 170 sellers.
Standard Pure Buttonlac	Rs. 156, 158 sellers.
Lemon No. 1 Shellac	Rs. 156, 158 sellers.
Lemon No. 2 Shellac	Rs. 146, 148 sellers.
F.O. Superfine Shellac	*Rs. 132, 134 sellers.*
Standard One Shellac	Rs. 128, 130 sellers.
TN Pure Shellac	Rs. 110, 112 sellers.
ITN 3% Shellac	Rs. 98, 100 sellers.
ITN 4% Shellac	Rs. 88, 90 sellers.
Golden Kusmi Seedlac	Rs. 146, 148 sellers.
Kusmi Seedlac No. 1	Rs. 136, 138 sellers.
Kusmi Seedlac No. 2	*Rs. 126, 128 sellers.*
Golden Bysacky Seedlac	Rs. 120, 122 sellers.
One B Seedlac	Rs. 116, 118 sellers.
Two B Seedlac	Rs. 100, 102 sellers.
Manbhum Fine Seedlac	Rs. 108, 110 sellers.
Fine Bysacky Seedlac	Rs. 102, 104 sellers.
Genuine Bysacky Seedlac	Rs. 92, 94 sellers.

Shipments during June until the 21st were 14,996 packages.

NAMES AND DATES

The Committee of the Calcutta Stock Exchange Association Ltd has been reconstituted for 1961-62 and Mr. C. L. Jhunjhunwalla has been elected *president and Mr. C. L. Khendelwal vice-president* The members are: Messrs B. C. Seal, M. D. Khaitan, S. K. Bagla, P. D. Jalan, C. L. Hazidas, S. Haralalka, G. R. Chiripal, S. R. Dutt, B. Murarka, M. L. Pyne, B. C. Roy, Eric Gregory, J. L. Esplen, N. D. Bangur, P. S. Nadkarni and D. R. Pendse. Mr. Nadkarni and Mr. Pendse have been nominated by the Government.

New Delhi

U.S. AID TO BE PARTLY AVAILABLE FOR MAINTENANCE IMPORTS

CONSORTIUM OPPOSED TO USE OF PROMISED FUNDS ON NON-PLAN PROJECTS

(FROM OUR NEW DELHI CORRESPONDENT)

IN confirmation of what has been reported in these columns last week, the U.S. Ambassador, Professor John Kenneth Galbraith, has stated at a Press conference here that the United States is contemplating financial assistance for the proposed steel plant in Bokaro. In the discussions which he had held in Washington during his recent trip, the Ambassador said, he found there was a "good deal of sympathy both for the need and for the plant itself." Subject, of course, to the priorities of the Indian Government, to the passage of the new aid Bill by the U.S. Congress and to negotiations with appropriate contractors, the prospect is "favourable". Professor Galbraith also indicated that a considerable part of the U.S. contribution in the first year of the third plan will go towards maintenance imports. The Ambassador dedared: "The basic decision to have the Bokaro steel plant in the public sector, is of course, accepted."

Professor Galbraith also had discussions in Washington on the subject of development of the Calcutta region as well as the work the Ford Foundation is contemplating. "This is a matter of very much interest to me personally and something on which we hope to do something useful." Commenting on the Aid-India Club decision, the Ambassador said: "It does indicate that a substantial measure of the resources for the first year will be available and the prospect of a good start for the second year. This is not something which we can look upon with unqualified approval. Some considerable part of the funds made available are for relatively short times and on relatively high rates of interest. This means that in the period immediately ahead there will be a substantial increase in the claims upon India's foreign exchange earnings for debt service. This, it would seem to me, would mean two or three things: first, there must be a great emphasis on export earnings. Second, through the third plan, there will have to be continued attention given to two terms. One should not confuse aid with purely commercial credits and, if the aid to India were to limit itself to purely commercial credits on purely commercial rates of interest, the burden of debt service would soon become intolerably high. This is something which, in my view, would have to be watched in the future." It is the U.S. view, the Ambassador added, that in the initial period of development, India requires long-term loans, the rates of interest being low or zero. Replying to a news man's question, Ambassador Galbraith said $200 million out of the $545 million which the United States contemplated for the first year of India's third five year plan would be available to India for non-project aid—as balance of payments support. "This type of aid is just as important and as useful as that which goes into the building of concerte, brick and mortar structures and indeed in certain stages of development, provision of working capital is more important than fixed structures." The U.S. aid "will be available for the import of raw materials and components, for working capital as distinguished from physical investment. The presumption is that it is related to the growth and expansion of the Indian economy."

U.S. Import of Indian Sugar

Professor Galbraith said that the possibility of the United States entering into a long-term agreement with India for the import of sugar was "certainly not ruled out." "We have allocated a very substantial quota for the coming year," he stated, "and I hope if India continues to be an exporter and if the sugar crop continues to be good, we will continue to buy some of it."

The Ambassador also announced the signing of an agreement with the Government of India by which the United States would provide the services of eight American engineers to help increase coal production in this country. By another agreement, also announced by him, the United States would make available the services of four training advisers to Hindustan Steel Ltd, to set up a comprehensive training programme within India for steel engineers. Five of the American coal experts will work with the National Coal Development Corporation on its plans to develop new mines in the Ramgarh Coalfield, Bihar State, to obtain an annual production of 1.5 million tons of washed coal. The project includes the construction and operation of a coal washery. Three other American experts will be associated with *the Neyveli Lignite Corporation*, Madras State. The Corporation plans to extract 3.5 million tons of lignite yearly by 1964 and later to step up production to 6 million tons. Assistance to the two projects involves an expenditure of nearly Rs. 20 lakhs, of which $300,000 will be in dollars and the rest in rupees.

The agreement concerning Hindustan Steel Ltd continues an existing training programme under which 295 Indian engineers have been trained in the United States under the auspices of the U.S. Technical Co-operation Mission. Three hundred other engineers have also been trained in the U.S.A. under a Ford Foundation programme. With the Government of India's decision to double the present capacity of steel plants from 3.3 million tons to 6.6 million tons, and to add another steel plant, it is now estimated that an additional 1,400 personnel will have to be trained. Hindustan Steel is setting up a training programme within the country. The U.S. Technical Co-operation Mission will make available a chief training adviser and also three training advisers. The latter will be assigned to the Rourkela steel plant. The project involves a total rupee and dollar expenditure of $176,000 (Rs. 8 lakhs).

Finance for Non-ferrous Metal Imports

Professor Galbraith also announced that the U.S. Government has approved a loan of $20 million (Rs. 9.5 crores) to India for the import of non-ferrous metals, which are at present in short supply in this country. The loan will be channelled through the U.S. Development Loan Fund. Like all other credits given by the Fund to India, it is repayable in rupees. The Ambassador stated that the loan is further evidence of the U.S. Government's policy of helping India make full use of the additional industrial capacities created in recent years. A number of loans given to India have been tied to specific projects. He noted that while such loans are necessary, it is equally important that industrial production should not be hampered by lack of raw materials and industrial components, which cannot be imported on account of the foreign exchange shortage. The loan will be used in the United States for the procurement of aluminium, copper and zinc. It is expected that much of the metal will be processed into final form at plants in India. Resulting products will be used mainly for projects in the fields of power, transport and communication. The non-ferrous metals to be procured are needed to meet the objectives in the first year of India's third five year plan. Some part of the imports will be used in the fabrication of electrical equipment such as transformers, motors, generators, switchgear and overhead railway lines. The manufacture of machinery components for chemical, sugar, tea, paper, motor-vehicle and storage battery industries will also be helped by the imports. Some of the zinc imported will be used for galvanising.

More Details of Consortium Meeting

Some details of the Washington meeting of "Aid-India" Club are also now available. The first meeting on 25th and 26th April had before it a memorandum by the World Bank presenting the Government of India's estimates of India's foreign exchange requirements both for the third five year plan as a whole and for each of the first two years. Concerning the financing of the plan as a whole, the chairman in his opening statement suggested that India should be given sufficient assurances of support to enable her to proceed in an orderly manner with the placing of overseas orders for projects in the plan. There was also the immediate problem of devising ways and means of helping India to cover her overseas payments in 1961-62 and 1962-63. The U.S. delegate proposed on 25th April that the meeting should consider how much additional aid might be committed by members of the consortium during the first two years of the plan, both to finance a substantial proportion of the new orders to be placed overseas for projects in the plan and, as far as possible, to cover the prospective balance of payments deficits. He indicated that subject to the necessary Congressional action, his Government would commit $1,000 million of additional aid to India over the first two years of the third plan, if over the same period (a) the World Bank and the International Development Association would commit $400 million; and (b) the other members of the consortium would commit $1,100 million. The total proposed commitment of $2,500 million was related to an estimate of $3,245 million, which represented the total additional external financing required for orders and payments in the first two years of the third plan. The commitment proposed by the United States was not intended to include (a) five loans recently made by the U.S. Export-Import Bank and the Development Loan Fund, totalling about $46 million and (b) that part of the German refinancing of the Rourkela credits in 1961-62—also about $46 million—which the Indians had already allowed for in calculating the payments deficit for the year. It was agreed that these items should be included in the "two-year commitment." The figures for the proposed aid were accordingly revised as follows:

($ million)

	1961-62	1962-63	Two-year total
United States	545	500	1,045
World Bank and the I.D.A.	200	200	400
Other consortium members	620	525	1,145
Total consortium	1,365	1,225	2,590

The President of the World Bank stated that, within the context of the U.S. proposal, he was prepared to recommend to his executive directors that the Bank and the I.D.A. should between them commit a total of $400 million, equally divided between the two institutions. Other delegates were not at that time in a position to offer commitments on the scale suggested by the United States, and the meeting was accordingly adjourned to allow the Governments more time to consider the U.S. proposal. When the meeting was resumed on 31st May, the following commitments were indicated:

($ million)

Year of commitment: Indian fiscal years	1961-62	1962-63	Two-year total	1963-64 1964-65	Total commitment
Canada	28	28	56	—	55
France	15	15	30	—	30
Germany	225	139	364	61	425
Japan	50	30	80	—	80
U.K.	182	68	250	—	250
U.S.A.	545	500	1,045	—	1,045
World Bank and the I.D.A.	250	150	400	—	400
Total	1,295	930	2,225	61	2,286

Individual Commitments

It was understood that the commitment indicated for the United States in 1962-63 was related to the prospects for additional aid commitments by other countries which are already members—or might subsequently become members—of the consortium, in amounts which would raise the total contributions of these countries in that year to a level comparable with the proposed United States' contribution. The above commitments were made on the understanding that the Indian Government would carry out the third five year plan as at present visualised, subject to such changes as might be necessitated from time to time by changing circumstances. The commitments are described in more detail below:

Canada: Canada indicated commitments of $18 million in each of the two years as grants under the Colombo Plan. This is in addition to the wheat grants which India is receiving from Canada. Further, the Canadian Government is prepared to extend to India export credits of $20 million in the two-year period to finance purchases of capital equipment in Canada. The maturities for each credit will be negotiated as the credits are made available and will probably be in the range of 15 to 20 years. No decision has yet been taken concerning the rates of interest or grace periods.

France: France is ready to make available to India credits equivalent to $30 million to finance the import of capital equipment from France. The period of repayment will be ten years from the time of delivery of the equipment. The rate of interest will be negotiated in the case of each individual order.

West Germany: West Germany indicated commitments as follows: (a) 230 million deutschemarks ($57.5 million) for refinancing Rourkela credits falling due in 1961-62, repayment to be spread over 12 years, including a four-year grace period; rate of interest 5½ percent. (b) 85 million deutschemarks ($21.25 million) for refinancing Rourkela credits falling due in 1962-63—terms still to be negotiated. (c) 245 million deutschemarks ($61.25 million) for refinancing Rourkela credits falling due in the three years 1963-64 to 1965-66; terms still to be negotiated. (d) 100 million deutschemarks ($25 million) credit for disbursement in 1961-62; repayment to be spread over 20 years, including a six-year grace period; rate of interest 5½ percent. (e) 170 million deutschemarks ($42.5 million) credit for disbursement in 1961-62; terms still to be negotiated. (f) 415 million deutschemarks ($103.75 million) credit for disbursement in 1962-63; terms still to be negotiated. (g) 176 million deutschemarks ($44 million) for commitment in 1962-63 and disbursement in subsequent years; terms still to be negotiated. (h) 280 million deutschemarks ($70 million) for financing the extension of the Rourkela steel plant in 1963-64 and the following years; terms still to be negotiated. As for 330 million deutschemarks ($82.5 million), that is, one-third of the credits for disbursement in 1961-62 and 1962-63, the West German Government is ready to reduce the rate of interest to 3 percent and to extend the grace period from five years to seven years. The total period of repayment cannot, however, be extended beyond the present limit of 20 years.

Japan: Japan indicated a commitment of $80 million over the two years, of which: (a) $40 million credits are to be extended to the public sector in India—repayments to be spread over 15 years, including a five-year grace period; rate of

interest to be related to the prevailing rate of interest on World Bank loans, and at present assumed by the Japanese Government to be around 6 percent; (b) $40 million credits are to be extended to the private sector in India—repayment to be spread over 15 years, including a five-year grace period; rate of interest as under (a) in the previous page. The Japanese delegate said that the above commitment might be broken down into $50 million in the first year and $30 million in the second year, so long as there is actual placement of orders by India for such amounts.

United Kingdom: The commitments indicated by the U.K. were as follows: (a) the £30 million ($84 million) loan signed in May 1961—repayment to be spread over 25 years, including a seven-year grace period; rate of interest to be the rate at which the U.K. Government can borrow for comparable periods at the time the drawings are made, plus a service charge of ¼ percent. (b) The £10 million ($28 million) loan signed in May 1961; repayment to be spread over 25 years, including a five-year grace period; rate of interest as under (a); (c) The £20 million ($56 million) loan for financing extension of the Durgapur steel plant—repayment to be spread over 25 years; rate of interest as under (a). (This loan may include private participation to the extent of £5 to 6 million, and the grace period will be decided when the position concerning such participation becomes clear.) (d) Additional loans of £13 million ($36.4 million), of which £5 million ($14 million) will be committed in 1961-62 and £8 million ($22.4 million) in 1962-63, to be disbursed in the years in which the commitments are made—terms not yet negotiated, but assumed to be the same as under (a) above. (e) Loans totalling £16.4 million ($46 million) to be committed in 1962-63 for disbursement in subsequent years; terms not yet negotiated, but assumed to be the same as under (a) above.

United States: The United States indicated commitments of $545 million in 1961-62 and $500 million in 1962-63. *It is contemplated that much* the larger part of these commitments would be in the form of loans extended on terms comparable with those proposed for the International Development Association. Part of the remainder would consist of loans from the Export-Import Bank, whose two most recent loans to the Government of India have been for periods of 16 years, including a six-year grace period, with interest in one case at 5¼ percent and in the other case at 5¾ percent. U.S. loans would be related to the purchase of U.S. goods and services with provision for review in hardship cases. In addition to the commitments mentioned above, the United States has already undertaken to assist India's third plan by making available surplus commodities in the amount of about $1,300 million.

World Bank and I.D.A.: The World Bank and the I.D.A. indicated commitments of $250 million in 1961-62 and $250 million in 1962-63. The terms of the World Bank loans will vary according to the date at which each loan is made and the nature of the project. Maturities on loans made to India in the past three years have ranged from 10 to 25 years, including grace periods of three to six years. The present rate of interest on World Bank loans is 5¾ percent. Repayment of I.D.A. credits will be spread over 50 years, including a ten-year grace period; credits to be interest-free with an administrative charge of ¾ percent.

The representatives of Austria, Denmark, Norway and Sweden said that their Governments were unable at this stage to enter into any definite commitment concerning aid to India. The Austrian delegate indicated, however, that his country was considering a contribution to the third plan.

The commitments indicated at the meeting were tentatively estimated to result in the following disbursements:

($ million)

Total commitments, of which to be disbursed in:	1961-62	1962-63	1963-64	1963-64 1965-66
Canada	56	13	27	16
France	30	1	4	25
West Germany	425	125	125	175
Japan	80	17	27	36
United Kingdom	250	70	70	110
United States	1,045	225	350	470
World Bank and I.D.A.	400	75	140	185
Total	2,286	526	743	1,017

In addition to the disbursements set out above, the Japanese delegate said that his Government had indicated to the Indian Government in December 1960 that it would be prepared to make credits of $21 million available for financing Japanese exports of capital goods to India in addition to the Japanese assistance already allowed for in the Indian balance of payments forecasts presented to the consortium. Disbursements of these credits were assumed by the Japanese delegation to be as follows:

($ million)

1961-62	1962-63	1963-64—1965-66
6	10	5

On the assumption that in the first two years of the third plan new overseas orders for projects would amount to above $3,000 million, the Government of India had estimated the overall balance of payments deficits at the equivalent of $684 million in 1961-62 and $884 million in 1962-63, after allowing for all aid committed up to 15th January, 1961. The meeting noted that, if disbursements of additional aid from the consortium were in line with the estimates set out above, the deficit still to be covered would be about $150 million in 1961-62 and $130 million in 1962-63.

Assistance from I.M.F.

The representative of the International Monetary Fund described the Fund's relationship with India in recent years and pointed out that India's quota now amounted to $600 million. Financial assistance to India from the Fund had totalled $300 million. Of this amount, $127.5 million was still outstanding. This sum was due to be repaid to the Fund in February and March 1962. In view of the reservation in the U.S. commitment for 1962-63, it was agreed that another meeting should be held in the autumn of 1961 to review the position and to consider what further resources might be made available to meet India's requirements in the first two years of the plan. The meeting recognised that while the commitments proposed for the first two years of the plan would go a long way towards covering the orders which India stated she would need to place overseas for development imports during this period, a proportion would still remain uncovered. The meeting agreed that, in addition to the present members of the consortium, the World Bank should invite to the next meeting on India representatives of other countries which in the Bank's view are in a position to extend aid to India in association with the consortium. It was further agreed that the invitation need not specify in what rôle, whether as member or observer, other countries might be associated with the consortium.

Financing of the third plan as a whole: The meeting reaffirmed the continuing interest of the consortium in India's economic development and agreed that, in addition to another meeting this year, a further meeting would be necessary at a later date to review the progress of the third plan and to consider the steps that might be taken towards meeting India's financial requirements during the last three years of the plan. Stress was laid on the need for aid to be extended in a form which added as little as possible to India's foreign exchange repayment obligations, and the members of the consortium undertook to give due consideration to this point in deciding the terms on which aid would be made available. The estimates of India's external financial requirements were based on certain assumptions about the total size of the third plan, and about the projects to be included in it. The importance was accordingly recognised of ensuring that the aid committed by members of the consortium was not used to finance projects outside the plan.

Trade measures: The chairman reminded members of the consortium of the significance of their trade policies in relation to the long-term expansion of Indian exports. The meeting took note of the fact that over half of India's exports go to countries represented at the meeting and recognised that the benefits of aid could easily be negated by restrictive import policies, or by any contraction in demand for India's exports whether resulting from governmental action or not. At the same time, the main responsibility for the promotion of these exports rests with India herself, and there is considerable scope for the adoption of more vigorous action in this field.

T.E.L.C.O. Debentures

The Tata Engineering and Locomotive Company Ltd has been granted consent to the issue of 50,000 5 percent a year debentures of Rs. 1,000 each, repayable on six months' notice on or after 1st October, 1970, at the option of the Company, but not later than 30th September, 1975. The consent is valid for 12 months. The Company has a paid-up capital of Rs. 9,99,91,200. It will use the new issue for financing the schemes of expansion in the existing lines of manufactures.

Collaboration Offer in Aluminium

The demand for aluminium in India is growing, especially as this country is in short supplies of copper and tin. There are offers pending for collaboration from, at least, three well-known American firms; Reynolds, Keiser and Alcova. There are similar offers from French and German firms. Meetings were held to discuss the problem of expanding aluminium production for which raw material is available. They were adjourned without reaching a decision. India's demand in 1966 is placed at 1.5 million tons.

Coalmining Machinery

The coalmining machinery project which is being set up in Durgapur in technical collaboration with Prommashexport of Russia, and which was initially conceived for a capacity of 30,000 tons of coalmining machinery items a year valued approximately at Rs. 15 crores, will now be developed for a capacity of 45,000 tons valued at Rs. 24 crores. The production programme of the plant includes majority items like coal cutters (1,715 tons), loaders (1,371 tons), conveyors (22,500 tons), haulages (3,816 tons), electrical winders (1,167 tons), besides capacity for booster fans, pumps, automatic cage keeps, safety hooks and oil drilling rigs and other equipment for oil exploration and boring of wells. This plant is scheduled to be completed during the latter half of the third plan. In addition to the above, manufacture of haulages and conveyors required by the coal mines has also been developed in the private sector. At present, there are four sizable units in the private sector, licensed to manufacture coal cutters, haulages, conveyors and winders. These four units are expected to produce coalmining machinery valued at about Rs. 1.5 crores by 1965-66. Besides the four sizable units in the private sector, there are a few more units which produce conveyors not only for mines, but also for other purposes and their production during 1960 has been Rs. 30 lakhs and here again it is expected that their production will also be steadily increased during the third plan period.

As for the manufacture of coal washery plants, although there is no specific target indicated for this item in the third plan, it is well known that a number of washeries will be set up to meet the needs of washed coal required by the steel industry, railways and power generating undertakings. It has been estimated that to meet the needs of the new washeries as well as replacement requirements of the existing washeries, there will be a demand for coal washery equipment valued at Rs. 5 crores approximately a year. Accordingly, steps have been taken to create capacity for the manufacture of coal washery equipment. Already one unit in the private sector, which has large workshops, has been licensed for the manufacture of complete coal washery plants. They have proposed a tie-up with a U.K. firm for designs and drawings as well as assistance for executing the civil engineering work, erection, etcetera. It will, therefore, be possible for this unit to manufacture, erect and guarantee the performance of a complete coal washery plant. It is expected that by 1965-66, this unit in the private sector would be capable of producing coal washery equipment to the tune of Rs. 1.75 crores. It is also proposed to license at least one unit, if not more, to achieve additional capacity both for ensuring healthy competition as well as to reach self-sufficiency in the requirements of coal washery equipment by 1965-66. A scheme from Messrs Bird and Company (Private) Ltd, Calcutta, in collaboration with McNally Pisburg of the U.S.A., for setting up a new manufacturing unit in India for the manufacture and supply of complete coal washery plant, is being considered. Thus, the total mining production under this head of coalmining, oil and other mining equipment in 1965-66, could be estimated at Rs. 15 crores.

Manufacture of Tractors

A committee was appointed by the Ministry of Commerce and Industry to assess the scope for the manufacture of agricultural tractors in the country. This committee assessed the demand, and for purposes of indigenous development, classified the tractors as falling in three distinct ranges as below:

12/18 D.B.H.P. (draw-bar horse-power)	1,500 numbers
20/30 D.B.H.P. (draw-bar horse-power)	3,000 numbers
35 D.B.H.P. (draw-bar horse-power)	500 numbers

The committee further stated that the types of tractors to be developed should be of the four-wheeled type and powered by diesel prime movers. Referring to the demand for tractor-drawn implements, it stated that it would not be possible to estimate the requirement of the various types of implements, but mentioned the following to be taken up for indigenous manufacture: mould-board ploughs, disc ploughs, disc harrows, harrow ploughs, cultivator, middle-breakers or listers, tractor-drawn seed drills, tractor-drawn moving machine, tractor-drawn harvesting machines or reapers, power-driven threshing machines (above 5 h.p.).

In 1959, on the basis of the above report, two firms in Bombay and the other in Faridabad were licensed for the manufacture of tractors in the 12 to 18 D.B.H.P. range for a capacity of 1,250 numbers each, and in view of the fact that a firm in Madras had already been licensed for making tractors in the range of 20 to 30 d.b.h.p., no further proposals were approved. The committee further said that the demand for tractors of over 35 D.B.H.P. being very small, it would not lend itself to economic production.

In view of the great stress that is being laid for the development of the agricultural sector in the third plan, it was felt that the demand for the various categories of tractors might be somewhat higher than what was estimated before. A working group was appointed by the Ministry of Food and Agriculture which assessed the requirements of agricultural tractors as 10,000 numbers a year by the end of the third plan and the break-up of the different ranges as:

12 to 18 D.B.H.P.	3,000 numbers a year
20 to 30 D.B.H.P.	5,500 numbers a year
35 D.B.H.P. and above	1,500 numbers a year
	10,000 numbers a year

In 1959, it became known that the firm licensed for the manufacture of tractors in Madras was not in a position to implement its programme because of certain developments in the organisation of their foreign collaborators. Later a study group appointed by the Central Ministry of Commerce and Industry endorsed the estimates of the working group on the estimated requirements of tractors by 1956. On the basis of these estimates, the proposals that had been received were considered and the following firms have been licensed for capacities indicated against each:

1. Messrs Goodearth and Company, New Delhi	2,000 numbers (for tractors in the 12 to 18 and 20 to 30 D.B.H.P. range)
2. Messrs Tractors and Bulldozers (P) Ltd, Baroda ...	1,000 numbers (for tractors in the 35 D.B.H.P. range)
3. Messrs India Tractors and Implements Company Private Ltd, Madras ...	3,500 numbers (for tractors in the 20 to 30 D.B.H.P. and 35 D.B.H.P. and above range)
4. Messrs Mahindra and Mahindra Ltd, Bombay	3,500 numbers (for all three ranges)
Total ...	10,000 numbers

As it was desirable that the tractor-drawn agricultural implements which were to be manufactured should be matched with the types of tractors proposed for the manufacture, and with this in view, all the firms licensed for tractors were also approved for the manufacture of the matched agricultural implements of the respective tractors.

Of the above, one of the units, namely, Goodearth, has very recently gone into production (since September 1960) at the rate of about 50 tractors a month (in the 26 to 27 D.B.H.P. range). They have also started producing agricultural implements to go with the tractors manufactured by them. Messrs Tractors and Bulldozers are expected to go into production by the middle of this year. Messrs India Tractors and Implement Company are taking steps to import their plant and machinery at an early date. In the case of Messrs Mahindra and Mahindra, the firm's scheme of collaboration with Messrs David Brown of the U.K. has fallen through, and the party has finalised its negotiations with Czechoslovakia. In principle, the change of collaboration has been agreed to. It is expected that by 1965-66, all these firms would be operating their factories to full capacities and would have achieved the maximum indigenous content of very nearly 100 percent. Besides the above, one independent unit is also licensed for the manufacture of tractor-drawn agricultural implements, namely, Messrs Marshall and Sons Co. (India) Ltd, Calcutta, for a capacity of 200 numbers and 400 numbers of ploughs and cultivators, respectively. They have gone into production and the production is as follows:

	(Nos.) 1959	(Nos. estimated) 1960
Ploughs	40	60
Harrows	54	100
Cultivators	112	72

It was also considered necessary to encourage the manufacture of tillers which are also sometimes called as walking tractors. Proposals from the following three firms have been approved for the capacities indicated against each:

	Annual capacity
Messrs East Asiatic Co. (I) Ltd, Bombay	24,000
Messrs Testeels Ltd, Bombay	1,200 to 6,000
Messrs Engineering Developments (P) Ltd, Calcutta	1,200

It will, therefore, be seen that steps have been taken for establishing the agricultural tractor and implements industry to meet the requirements of the country during the third plan. Each of the firms licensed for manufacture are expected to achieve an indigenous content of 50 percent of the value of the tractor equipment during the very first year of their operation. The production of agricultural tractors and implements in 1960 was worth Rs. 16 lakhs, and production in 1965-66, it is estimated, will be Rs. 20 crores.

Diesel Engines and Dairy Machinery

In the diesel engine industry, the number of firms now stands at 30 with a total capacity of 60,000 a year. Until 1955, the firms confined their activity to the manufacture of slow-speed horizontal engines, excepting in one case where a firm had already established capacity for a single cylinder high-speed engine. Since then the firms engaged in the field have not only taken up the expansion of their capacity but also are introducing new sizes and types of engines. The range and type of engines which have been undertaken now for production may broadly be classified as under:

	Capacity Nos.
Single cylinder horizontal engines (for 3½ to 50 h.p.)	23,500
Single cylinder vertical engines (3 to 12 h.p.)	30,000
Multicylinder vertical engines (from 16 to 650 h.p. at varying speed ranges) ...	6,500
	60,000

The actual production figures of diesel engines from 1954 exclusive of automotive engines, is as follows:

	Nos.
1954	8,654
1955	10,220
1956	11,015
1957	16,921
1958	27,165
1959	30,335
1960	42,000

The target of capacity for dairy machinery during the third plan period has been fixed at Rs. 2.5 crores a year. Four firms, namely, Messrs Larsen and Toubro Ltd, Bombay, Messrs Alfa-Laval (India) Private Limited, Bombay, Messrs Vulcan Trading Company Ltd, Bombay and Messrs A.P.V. Engineering Company Ltd, Calcutta, have been recently licensed to manufacture a wide range of dairy machinery. The total installed capacity of these firms would be of the order of Rs. 2.25 crores. More schemes are coming in. The production of dairy machinery during 1960 was worth Rs. 18 lakhs. The expected production by 1965-66 would be worth Rs. 2.25 crores.

Wagon-manufacturing Firms

At present, there are 13 firms manufacturing wagons of all types with an annual installed capacity of 187,900 tons (namely, 23,500 tons in terms of four-wheelers, wagons for broad-gauge, meter-gauge and narrow-gauge). Three more firms namely, Messrs Britannia Engineering Company Ltd, Mokaba, Messrs Modern Industries, Sahibabad and Messrs Britannia Building and Iron Company, Calcutta, are expected to come into production. The production of wagons during the last three years and in 1965-66 (estimated) are given below:

Year	Tonnage	Value
		Rs. lakhs
1958	118,400	1,540
1959	93,950	1,220
1960	62,000	810
1965-66	200,000	2,600

Broad-gauge underframes are manufactured by the Tata Locomotive Engineering Company Ltd, which are sent to Hindustan Aircraft, Bangalore, for building the shells to meet the requirements. Jessop and Company Ltd, Calcutta, is manufacturing meter-gauge underframes and also is building shells on the top. Indigenous content in all these is to the extent of 95 percent to 98 percent. Broadly, the estimated minimum production of all types of wagons in 1965-66 could be placed at Rs. 20 crores.

Heavy Machine-building Project

The heavy machine-building project being set up in Hatia, Ranchi, will have a capacity of 80,000 tons of machinery a year in two stages, with 45,000 tons at the first stage. This plant is being planned to produce machinery and equipment primarily for the iron and steel industry, besides possessing adequate capacity also to meet the requirements of the mineral oil industry and the manufacture of general engineering items like heavy cranes, excavators, oil drilling rigs, crushing and grinding equipment, press and forge equipment, etcetera.

The following is the approximate typical break-up of machinery items which it is proposed to produce in this plant as required from time to time:

Description of items	Figures in tons First stage	Second stage
Rolling mill equipment	20,000	34,500
Blast furnace equipment	4,000	5,500
Steel making equipment	5,000	7,000
Crushing and grinding equipment ...	2,100	3,100
Coke ovens and by-product equipment ...	6,000	7,700
Crane equipment	4,400	6,570
Spare parts for metallurgical equipment ...	1,500	1,080
Mining equipment	—	880
Excavators	—	5,000
Press forging equipment	—	1,360
Heavy oil drilling rigs	—	5,500
Miscellaneous heavy machine parts and assemblies	—	1,810
Total	45,000	80,000

The first seven items are mainly meant for steel plants. This plant is expected to be completed by December 1964, and its saleable output is likely to be as follows:

Year	Estimated minimum value in Rs. crores
1965	5
1966	10
1967	16
1968	24
1969	34
1970	42

(The ratio of output between steel plant machinery and equipment to other plant machinery and equipment can be roughly taken at 3:1). The above is the minimum production. As a matter of fact, the actual production, when all the details and programmes are worked out, will be far larger than the above estimates. Continuous efforts are being made to enlarge the production schedules. Once the requirements and specifications of the existing steel works for replacement, rehabilitation and modernisation of their plants are known and the actual requirements and specifications of the expansion programmes of the existing steel plants and the requirements and specifications of the new steel plants are fully worked out and ascertained, production will be organised to supply as much of indigenously manufactured plant and equipment as possible.

CAPITAL

Founded in 1888, is India's oldest and most widely read financial newspaper. It gives its readers in all parts of the world the most up-to-date service in Indian economic intelligence and information of any newspaper in the daily or weekly field, and includes a complete list of all shares and securities dealt in on the Calcutta Stock Exchange, together with full details of latest balance sheets.

The Research & Statistical Department undertakes research into industrial and financial problems and numbers among its clients, Government departments, railway administrations, chambers of commerce and industrial associations.

U.K. MINISTERS TOUR COMMONWEALTH COUNTRIES TO DISCUSS THE COMMON MARKET

NO DEVALUATION OF THE POUND NOW, SAYS BRITISH CHANCELLOR

(FROM OUR LONDON CORRESPONDENT)

THE U.K. Minister of Labour, Mr. Hare, and the Minister of Aviation, Mr. Thorneycroft, who are both members of the Cabinet, have been chosen to assist Mr. Duncan Sandys, Secretary for Commonwealth Relations, in the task of exchanging views with other Commonwealth Governments on the question of Britain's entry into the European Common Market. Mr. Sandys is to be responsible for visiting New Zealand, Australia, and Canada; Mr. Hare for Sierra Leone, Ghana, Nigeria, and the Federation of Rhodesia and Nyasaland; and Mr. Thorneycroft for India, Pakistan, Ceylon, and Malaya. The length of their visits cannot be fixed precisely, but they may all be away for as long as three weeks. Even if the Ministers are all home by the middle of next month, the U.K. Government is allowing for a further period of consultation both within the Commonwealth and with the other members of the European Free Trade Association. The Commonwealth Finance Ministers will meet in September when they will assemble for the annual meeting of the International Monetary Fund. Mr. Macmillan regards this occasion as a useful opportunity for more talks on the European Common Market. Each of the three travelling Ministers will be accompanied by a small staff. They hope to have talks with the Prime Ministers of all the countries they visit, and will be prepared to discuss the political as well as the economic aspects of the Common Market membership.

Overseas Trade Setback

British overseas trade showed a disappointing setback in May after the better trend of recent months. The gap between exports and imports widened sharply from £24¼ million in April to £82 million—the largest figure since the £108 million recorded in last October. Special influences arising from the London dock strike probably made the figures worse than they would otherwise have been, but the latest picture cannot be encouraging, for there is little sign of the much-needed upward turn in exports. Allowing for seasonal adjustments —although not fully for the dock strike—the May gap was £71 million, against £36 million in April, again the highest since October 1960. On this basis, last month's exports and re-exports totalled £295 million while imports were £366 million.

Taking the average of the past three months, exports are seen to be 4½ percent less than in the preceding December-February period. This is where the chief disappointment of the new figures lies. During the first five months of 1961, however, the export rate was 2½ percent more, and the rate of imports 1 percent less, than the average for 1960 as a whole.

It would be useless to pretend that the trade figures are anything but a shocking disappointment. That is how the stock market took them, and sterling promptly dropped part of the gain it had made since the reassurance from Dr. Jacobsson. The total absence of any evidence of rising exports and declining imports wipes out all hope that the situation might somehow right itself without active intervention. This becomes all the more imperative in view of recent developments in prices. Apart from the recently sanctioned increase in railway fares, the cost-of-living index rose to 114 in May, compared with 113 in April, and it is now announced that steel prices are to go up by 1 percent this week.

Prices Worry Exporters

Output increased in a wide cross-section of British industry in the four months to the beginning of June. This is stated in the latest survey of the Federation of British Industries. As many as 38 percent of firms covered by the survey reported higher production, compared with only 13 percent reporting a fall. On balance, the 701 firms covered experienced a revival in new orders, longer order-books and an increased labour force. Stocks of raw materials and finished products have continued to rise. Even so, 45 percent of the firms were working below capacity, although a precise measurement of "capacity" is notoriously difficult to obtain. Of the factors likely to limit production in the next few months, 34 percent of the firms gave first place to the shortage of skilled labour. Another 28 percent thought too low a level of sales or orders would be the main limiting factor.

Cost increases were widely spread in the last four months. Fully 50 percent of the firms reported higher average unit costs, while only 6 percent had lower costs. The higher fuel oil tax probably explains much of the increase. Taken with a much more restricted increase in selling prices, higher costs led to a fall in profit margins among 45 percent of the companies. For the first time, the Federation has conducted a supplementary detailed survey of exports by 500 firms. Its findings show that exporters believe that price "is by far the most serious short-term problem." In spite of some fall in export prices recently and the tightening of profit margins, 49 percent of the firms forecast that price changes relative to those of foreign competitors would make export orders more difficult to secure in the next few months. On balance, 28 percent of the firms are more optimistic about export prospects for the next year while 21 percent are less optimistic. Behind this confidence is what the Federation calls "a significant improvement" in exports during the last four months.

Industrial Production Rising

Industrial production is at last beginning to rise. The official index for the first three months of the year has been revised upwards so that it now lies a fraction above the level of the first quarter of 1960. The index for April, which after seasonal adjustment is 122, is one point or rather less than 1 percent above the figures of a year ago. The rise is still slight, but it does introduce a change after the 12 months' stagnation.

The question now is whether output will rise smoothly by absorbing some of the idle production capacity which still exists, and using labour more fully in the places where it is employed. There is some hope that this may happen because the industries which have been working well below capacity are, in the main, the ones that have hoarded labour. The alternative is quickly rising pressure at points where it is already strong, with the usual result of the growing labour shortage, higher pay, and lengthening deliveries. In such an inflationary climate, prices would rise further and exports tend to be neglected. Obviously, the Government could not allow this to happen.

Balance of Payments

The balance of payment figures for the first quarter of this year are moderately comforting. They confirm that the huge deficit of 1960 was to some extent exceptional. The deficit on trade, at £58 million, is much smaller than in any of the three previous quarters, although still higher than the £46 million a year ago. The improvement is due to exports increasing and imports levelling off—a trend that was clear from the monthly Customs returns. A pleasant surprise is the rise in net invisible earnings to £87 million, which offsets net Government payments abroad with just £2 million to spare. In the second half of 1960, invisibles had been in deficit and the deterioration of this account has been particularly worrying.

One quarter's figures do not prove anything but at least there is an improvement. The current account balance is still £56 million in the red, against £37 million in the first quarter of 1961, but much larger dificits in the third and fourth quarters of last year. Britain has had an unusual surplus of £58 million on private long-term capital account, but that reflects the Ford money: without that windfall, the U.K. Treasury says that "the net outflow of private investment is estimated to have been at a rather higher rate than in 1960." Taking current and long-term capital transactions together, the upshot was a deficit of £21 million, compared with a quarterly average of £138 million in 1960. What is more relevant, the overall monetary position has been improved by £29 million through the reduction of liabilities showing the outflow of "hot" money. In short, if it had not been for the May trade figures casting a doubt on the continued export improvement, one might have thought that the worst was over.

No Devaluation

"There is one precedent of Sir Stafford which I am certainly not going to follow.' In these words, the U.K. Chancellor of the Exchequer reinforced his determination that the pound should not be devalued. He was answering questions in the House of Commons from Mr. Cyril Osborne, the outspoken Conservative member for Louth, who had suggested that it was time for the Chancellor to get both sides of industry together and urge restraint on both. The Chancellor rejected the idea of a formal conference between both sides of industry. He was perfectly certain that both sides of industry were well aware of the situation. It is not the immediate situation which is causing anxiety, but the long-term trend. That is what Britain has to get right, and it is vital that she keeps her costs on a competitive basis.

In answering Mr. Osborne's point about the need for Government economies, the Chancellor explained that the long-term review of which he spoke in his Budget speech was now well advanced. In the shorter term, too, he would be making the maximum administrative economies possible. As for incomes and prices, the responsibility does not rest exclusively with the Government, he said, but is shared by both sides of industry, and, in general, "I propose to advance on the lines laid down in the Budget speech." Recent events have borne out the anxiety the Chancellor expressed in his Budget speech about the rising pressure of costs and prices. "My Budget proposals as a whole were designed to restrain this pressure."

On an earlier question, the Chancellor admitted that the serious decline in net invisible earnings was a matter for concern. So he is reviewing ways of reducing Government expenditure overseas. He does not anticipate a substantial increase in earnings by "invisibles" this year, and on the question of what used to be called support costs in Germany, he said that the matter is under constant discussion and consideration.

Rise in Bankruptcy Orders

Figures published by the U.K. Board of Trade show that the annual number of bankruptcies has gone up by more than 50 percent during the past decade. Receiving and administration orders made in 1960 totalled 2,801, compared with 1,816 in 1951. Although the rate has fluctuated a good deal over the ten years, there was a sharp increase of 500 last year over the figure for 1959. As in the past, builders, shopkeepers, and farmers are among those most affected last year, but bankruptcies among hardware and electrical retailers were exceptionally high at 225, against 114, reflecting the impact of hire-purchase controls. Results of the trend towards multiple firms in the food trade are also shown in the rise from 155 to 183 in orders concerning grocery and provision dealers.

New Ten-shilling Notes

Ten-shilling notes of the new series will be issued by about the beginning of October. They will be ½-inch narrower than the present ones, but of similar colour, and will bear the same portrait of the Queen as £1 notes. Except for the method of printing and the change of colour in 1948, and the introduction of the metal thread in 1940, the design of Bank of England 10s notes has remained unaltered since 1928. There are 205 million in circulation, just under 5 percent of the total note issue. The artist responsible for the design of the new 10s notes is Mr. Robert Austin who also designed the £1 notes. The Bank of England says that it is unlikely the £5 and £10 notes will bear the Queen's portrait until 1963 at the earliest.

Brevities

The P. & O. liner *Strathaird*, 22,568 tons, arrived in Tilbury last week from Australia with nearly 1,200 passengers at the end of her last voyage. The 29-year-old liner has been sold for scrap.

An increase in freight rates from British and Continental ports to all ports served by the Far Eastern Conference was announced last week. The increases, generally 10 percent, are due to higher costs. A similar increase is being made by the Japan Outward Conference and the Philippines-Europe Conference.

The appointment of Lord Douglas of Kirtleside, chairman of British European Airways, due to expire on 14th March next year, has been extended until 23rd December, 1963, his seventieth birthday.

Manufacturing industry's capital expenditure is estimated by the U.K. Board of Trade at about 5 percent higher than in the fourth quarter of 1960, seasonally adjusted. Expenditure by "other industries and services" was 1 percent up.

Eastern Tea Holdings announces that its offer for the preference and ordinary stock of Darjeeling Consolidated Tea has been accepted by the holders of more than 75 percent of the capital. It has been declared unconditional. The offer will remain open for acceptance for the time being.

INSTRUCTION COURSE ON INSTALLATION OF INDUSTRIAL INSTRUMENTS

Messrs Air Conditioning Corporation Ltd has organised a three-week course of instruction to train engineers and scientists on the various aspects concerning engineering, application, installation, maintenance and service of industrial instruments. Automatic control, feed back or automation are vital factors in industrialisation and the increase in *per capita* productivity. By a precise control of intricate and complicated processes, even the under-developed countries, such as India, can adopt the latest techniques in production technology for a variety of products. The growth in demand of the industrial instruments in India and the estimated requirements on the completion of the third five year plan, of approximately Rs. 15 to Rs. 20 crores every year, clearly shows India's vital interest in the progress and development of the industrial instruments industry. As the availability of trained personnel is often a fore-runner to any organised effort in development, the idea of this three-week course was conceived. Over 50 engineers and scientists representing some of the major industrial organisations in the public and private sectors are attending this course, which covers such wide spectrum of industries as atomic energy, antibiotics, breweries, heavy chemicals and fertilisers, rayon, pharmaceuticals, airconditioning and refrigeration, defence engineering, metallurgical industries including iron, steel and aluminium, rubber, leather, shoes, oil refining, etcetera. The course was inaugurated by the general manager of the Corporation and is being conducted by Mr. J. S. Detwiler, one of the senior executives of the Taylor Instrument Companies, U.S.A., who has specially come to India for this purpose.

Jute

GUNNY MARKETS UNAFFECTED BY BLOCK CLOSURE OF MILLS

SUBSTANTIAL NEW CROP FIBRE OFFERS AT PREVAILING RATES

THE Calcutta mills are closed this week under a block closure scheme, devised by the I.J.M.A. and sanctioned by the Government. This is designed to conserve raw jute stocks, and a further closure is scheduled for one week starting from 23rd July. The market reaction to this was negligible as the effect had already been discounted. There has not been much business in manufactured goods. Mills have been holding out for full prices, and brokers have found difficulty in placing the small orders which have come forward. Rumours that the mills were contemplating a similar closure for August was a little disconcerting to market circles, but throughout the week, the main price movements, which on occasions were erratic, were governed by speculative activity.

There is still a great deal of controversy over the fact whether the mills are justified in cutting production because raw jute supplies are short. At one stage last week, it looked as if the situation might have been misjudged, for when the rates advanced to Rs. 50 a maund for Assam jute, hidden stocks came out, and business, which is now considered substantial but in normal conditions would not evoke much comment, was concluded with one or two large houses. It was reported that some individual sellers sold lots of up to 10,000 maunds, and there was also reports of some inter-mill business on a fairly large scale. After this however, the general lack of old crop offers, even from the larger stockists, caused a fresh wave of shortage reports. The main problem seems to be one of assortment. Most sellers can offer high grade jute, but the mills' requirements are for low grade assortments, mainly Bottoms. In many cases, stocks are adequate, but uneven distribution in quality causes production difficulties.

The continued favourable weather conditions in nearly all areas brought out some substantial new crop offers. Jute was offered for July shipment, but generally at the same price as old crop jute, there being no discount. The attitude of new crop sellers is one of reserve. This is because the mills have still to buy the bulk of even their initial requirements of new crop jute, and until such time as this demand is satisfied, there seems to be little chance of any large reduction or discount in new crop rates. Estimates of the size of the crop, both in India and in Pakistan, indicate a record high level, but an increase in acreage does not always indicate a correspondingly high outturn. When the area under jute is large, the yield from each acre and the yield of green fibre a plant, are very often forgotten, and do not gain the importance they would if the area sown was small.

Enhancing Fibre Quality

There never was a time when it was more important for the mills to be sure of adequate supplies of fibre. So the ultimate aim of more green fibre a plant, which in turn will automatically give a greater yield to each acre, must never be lost sight of. It is self-evident that at the present moment, there exists a sellers' market. Raw jute dealers can hold the jute manufacturer to ransom which cannot always in turn be passed on by the latter to the consumer. The education of the farmer in the correct methods of cultivation should be the principal aim of the Government and research bodies if this problem is to be overcome. A year in which the acreage has increased by such an extent must mean that there are many new farmers, or farmers who have reverted to growing jute and are not conversant with modern methods. The immensity of this task is acknowledged, but unless the yield is increased, the same problems will periodically confront the industry when acreage is reduced for any reason.

The future of the jute industry is still very undecided. Overseas buyers continue to keep out of the market, and there is an increasing tendency to delay purchases of forward requirements. There is no scarcity of jute goods as confirmed by the gradual rise in mill stocks over the past four months, but what would the position be if consumers all decided simultaneously that it was time to buy? In that case, they may perhaps run the risk of not being able to purchase when they most require it, or of having to pay a higher price due to the natural laws of supply and demand. Jute goods prices are now 25 percent to 30 percent lower than they were four months ago, but consumers, particularly in the U.S.A., continue to throw out hints that they are becoming tired of paying higher prices, and this is confirmed by their stock and consumption figures and their reluctance to operate in the forward shipment positions. They cannot forget that a bumper crop of jute is expected in the coming season, from which they anticipate a reduction in the values of fibre which, theoretically, should show a corresponding fall in jute goods prices. But the production costs of yarns and cloth have considerably increased recently, irrespective of the raw material, and employers will experience great difficulty in bringing about any reduction in these. The workers' wages have increased, and the payment of involuntary unemployment benefit during the period of closure will considerably add to their future costs. The trade generally is anxious to see a return to cheaper prices, but not at the expense of incurring continuous manufacturing losses.

Relaxation of Credit Restrictions

There was an improvement in the financial arrangements for the mills, and market operators during the week, as a result of the withdrawal by the Reserve Bank of the credit restrictions on advances against jute goods. According to the Press *communiqué* issued by the Bank, this has been made possible by the decline in the price of hessian and sacking in recent months and the slackening of foreign demand. In view of this, it is no longer considered necessary for banks to continue to subject advances against jute goods to a minimum margin of 40 percent which has been in operation since 12th December, 1960. This will considerably aid shippers, the mills and market operators. It is indeed unfortunate that the Reserve Bank has not seen fit to withdraw similar restrictions on advances against raw jute. It was made quite clear in the *communiqué* that scheduled banks should continue to retain a margin of 25 percent on advances to jute mills, and 40 percent on advances to other parties against jute stocks or documents. This has already caused considerable hardship, particularly to brokers who advance large sums of money—normally between 80 percent and 90 percent of the value of the goods—to sellers, only a portion of which is now covered by advances against the documents from the banks. Over the past few months, fibre prices have dropped up to 30 percent, and currently are lower than when the credit restrictions were imposed on 12th December, 1960. Credit restrictions will not prevent the price of jute from rising, as was proved after its introduction when rates soared to the high 60's, nor will it prevent speculation now that this is again officially allowed under the East India Jute and Hessian Exchange. What useful purpose then does it now serve? These restrictions should be withdrawn to ensure a free flow of raw jute to the mills.

Indian trade circles, it is reported, are highly concerned about the possibility of the U.K. joining the Common Market. Fears have been expressed that once Britain falls out of the Commonwealth economic alliance, she may regulate the flow of Indian jute goods under a quota system which is favoured by some existing members of the Common Market. To do this she would have to increase her own production considerably in order to satisfy even her own requirements. European members of the Common Market are not in a position to be self-supporting in jute goods, therefore, they will still have to depend on Indian goods for a large portion of their requirements provided these are supplied at competitive rates. The offtake of the Indian goods is expected to diminish, however. This and other matters likely to affect India economically should Britain join the Common Market, are likely to form the basis of the discussion when Mr. Peter Thorneycroft, an ex-President of the Board of Trade and ex-Chancellor of the Exchequer, visits New Delhi.

THE JUTE MARKETS

Manufactured Goods: There was very little interest in the market at the opening last Thursday, and prices showed little alteration from last week's closing rates. There was a certain amount of buying interest in the futures market which induced a steadier undertone, but on the whole, the market was dull. Mills were keen to sell, but in general, looked for higher prices. As the week progressed, some real goods interest developed, and business was concluded in B Twills, which along with speculative covering succeeded in pushing B Twill prices up to Rs. 159 for June shipment from Rs. 154.50 which was the opening rate. There was less interest in hessians, but 40in. 10oz. moved up Re. 1 in sympathy, to Rs. 48.75 for June shipment. Speculative selling pressure at the higher levels saw prices go into a gradual decline. Saturday was a holiday when all markets were closed, and on Monday, sentiment was weak with B Twills opening at Rs. 157 with October-December shipment at a Rs. 19 discount, the largest for some time. Prices fluctuated narrowly over the next two days. Prices improved temporarily on Tuesday on rumours of the mills closing for another week in August, but the tendency soon weakened.

Opening quotations on Wednesday morning were as follows:

	June	July	July-Sept.	Oct.-Dec.
40in. 7½oz.	37.50	37.25	37.00	34.75
40in. 8oz.	42.25	40.75	40.00	37.25
40in. 10oz.	48.00	48.35	48.50	46.15
B Twills	154.50	153.50	151.00	136.50
Heavy Cees (Plain)	154.50	153.50	151.00	136.50
A Twills	183.00	183.50	181.00	167.00
Liverpools	175.00	175.00	172.00	156.00
Cornsacks	159.00	157.50	155.00	139.50

Raw Jute: The fibre markets were quiet at the opening last week, with rates remaining unchanged. There were rapid developments, however, after the market opened, and with several mills reported interested in substantial quantities, prices moved up rapidly to Rs. 51, which was a jump of Rs. 2.50. Interest flagged at the higher rates, but as prices fell back, some covering business helped to steady the market, as in many cases it was reported as fresh business. Some inter-mill transactions were reported at high prices, and again, the market became excited, but this was only temporary. After the week-end and the intervening holidays, the market opened on Monday at lower levels and by Tuesday morning, Assam Bottoms were quoted at Rs. 49. Small business was conducted against the I.J.M.A. quota, which was reported to be slightly larger than of late, but the main business was conducted in Cossipore by mill agents. Arrivals in Cossipore were at typical off-season levels, and only 170 wagons were reported. Many sellers were prepared to discount prices to clear off godown stocks at this stage, but they were asking full market prices for new crop jute which was offered in quantity. Opening quotations on Wednesday morning were as follows:

	Landed at Mills (Basis Bottoms) Rs. per 100 kilos	Rs. a md.	Shipment
Assam	128.75	48.00	June-July
Northern	126.00	47.00	,,
Purnea Desal	123.25	46.00	,,
Daissee Selected	134.00	50.00	,,
Assam Tossa	130.00	48.50	,,
Mesta:			
Assam Northern	122.00	45.50	,,
Desal	122.00	45.50	,,
Daissee	120.50	45.00	,,
Pakistani Cuttings	195.00 a bale		

THE FOREIGN JUTE MARKETS

FIBRE PRICES RISE

(FROM OUR DUNDEE CORRESPONDENT)

THE Dundee jute market is again uncertain, and buyers and sellers have had all their ideas upset by the dearer trend in fibre and goods prices during the past week. As far as raw jute is concerned, several factors have led to the dearer tendency. Some European countries—including Poland —have entered the raw jute market, having been compelled to purchase the material. Poland bought 2,000 tons, which is not a great deal, but when it is added to what other countries have bought in small lots, the quantity becomes substantial, so it has led to a rise in prices. Spinners in Dundee still consider the rates quoted as too dear, and no business has been reported.

Another factor which has affected the market is the state of the roads in upcountry areas. This has prevented the arrivals from coming forward and has aggravated the shortage of jute, either old or new. Sellers do not require much of an incentive to put up their prices, but they may have to bring them down again soon, as already an improvement in the condition of roads has been reported.

Raw jute prices are £150 for Mill Lightnings and £145 for Mill Hearts for June-July shipment, £140 and £135 July-August, £134 and £129 August-September and £127 and £122 September-October, with Continental Tossa-2/3 at £122, September-October, all c.i.f. U.K.-Continent. Jute brokers in Dundee are transacting little business. Some say that they have done little or nothing for the past six months. Spinners—like all other buyers of jute commodities—must be scraping the bottom of the barrel waiting for lower prices, which they believe will come before long.

The prices of Calcutta goods are firm, no doubt due to the block closure of mills. Hessians are at 74s for 40in. 10oz. and 56s 9d for 7½oz., June, 74s 3d and 56s 6d July-September and 71s 6d and 53s 9d October-December, with B Twills at 240s 6d, 235s and 213s for the respective positions of shipment, all f.o.b., Calcutta. Dundee yarn prices were reduced by £10 a ton with effect from 16th June. Cops are down to 20.02d for 8 lbs C.H.W and spools to 21.16d for 8 lbs J.C.H., with 40in. 10oz. at 16.77d and 8oz. at 14.12d a yard.

PAKISTANI PLAN TO RAISE JUTE PRODUCTION

BUFFER STOCK SCHEME RECOMMENDED

(FROM A CORRESPONDENT IN EAST PAKISTAN)

THE recent Governors' conference under the chairmanship of the President of Pakistan, also attended by the Ministers and high officers of the Central and Provincial Governments, took up the report of the Jute Commission which was set up by the Government in June 1959 under the chairmanship of Mr. Zakir Hussain, the then Governor of East Pakistan. The terms of reference of the Commission were to enquire into the production, prices, market and export of jute and jute goods and recommend measures for improvement at every stage. Although the detailed report of the Commission and the decisions of the Government

have not been released, but from what all has been made available to the Press, it appears that the Government has decided to expand the Jute Board with a chairman of the status of a Secretary to the Central Government and two other members —one of whom to be from the Ministry of Finance and the other representing the Government of East Pakistan. The new Board when formed will regulate and advise on all aspects of jute trade and industry including farming, warehousing, marketing and industrial production. The Board will work in very close collaboration with the Agricultural Development Corporation so that all duplication of work is avoided.

PROSPECTS OF BUMPER CROP NOT AFFECTED BY RAINS

(FROM OUR EAST PAKISTAN CORRESPONDENT)

A RECENT quick tour of some of the jute growing areas showed that Press reports to the effect that there has been some damage to the crop through pest, rains and cyclone, are incorrect. The north Bengal crop is astonishingly large, and is growing exceedingly well. In some areas, however, heavy rains have discouraged harvesting. The rainy weather which has been persistent is accompanied by an overcast sky, so there has been no sunshine for several days. This, of course, has slightly affected the growth of the plants. The north Bengal crop invariably arrives some time after the district and jut crop, so at the moment this is not a very serious matter. In fact for the last three or four days, there has been bright sunny weather and this could make up for the delay. In the Mymensing area once again, there have been heavy rains. This area grows an early crop and it was almost ready for harvesting, but the weather has held up the operations. The recent sunny weather will mean that harvesting has started in full swing, and heavy arrivals by the first week of July may be expected.

In the Tipperah district, an amount of the crop was flattened by the cyclone and has not completely recovered. The early crop which has been coming in for a week or so, may, therefore, be rather short, say 4 feet to 5 feet after cutting. The midland and highland crops, however, should have recovered completely by the time they are ready for harvesting. Press reports also indicate that the heavy rains will spoil the tossa crop. It is hard to understand their basis since it is well known that tossa jute can stand water ever better than white jute.

In spite of the heavy rains which flooded the fields, it is interesting to note that in some areas, growers say that they wish to harvest some of their crop, but are afraid to do so for lack of steeping water. These apparently contradictory reports are due to the fact that heavy rains do not lie on the ground for long and only fill the steeping tanks temporarily because the river levels are still rather low as may be expected at this time of year. As soon as it stopped raining, the rain water in the lowlying field was drained away into the rivers. Fortunately not only has the sun made its appearance, but the river levels are rising at a normal and reasonable speed. It is also fair to state that no evidence of the pest has been seen except for a very few isolated places, which is quite normal. In general, there is every indication of a bumper crop which should begin to arrive in substantial quantities by the middle of July. Earlier than usual, but not as early as expected.

Despite the small arrivals, the market locally is, if anything, below overseas parity. There has been no rush to buy. In isolated places, balers, who have sold for early delivery, have shown eagerness to buy fearing that they will not be able to get as much jute as they expected for early delivery. This has caused occasional price rises, but that does not indicate the actual state of the market. As long as the overseas buyers hold out, the market is not likely to be steady. On the other hand, there is no doubt that eventually the buyers must come in. If they do so before the full weight of the crop is felt, then steadier prices will prevail. But if they can hold out until the middle of July, their entry into the market is likely to be offset by heavy arrivals, and the effect on the price should be negligible. The Narayanganj market has reacted upwards on reports of interests being shown by Pakistani mills and by a certain amount of short-covering for early delivery by balers. Altogether however, the market remains rather erratic and uncertain and one gets the impression that in spite of the fact that an early crop and great overseas demand are expected, there has not been very much business done in the new crop.

The main recommendations of the Commission are for a number of measures mainly directed towards reducing the cost of production, provide adequate supply of good quality seeds to cultivators and adequate facilities both for internal and external marketing of raw jute and jute goods. The Government announcement also states that there will be no restriction on the cultivation of jute except in certain border areas.

In response to one of the recommendations of the Commission, efforts will also be made to create operational buffer stocks in order to regulate the supplies of jute and thus to stabilise prices. In case the jute price went down, the Government would be in a position to enter the field and buy stocks at reasonable rates, and in case the prices shot up, the Government could release the stocks held and thus bring the rates down. A comprehensive soil survey has been strongly recommended in order to increase the yield from each acre. The Minister for Commerce disclosed that by the end of second five year plan, raw jute production in the country would be 8 million bales, that is, an average jute growth of 5 percent in each year. Lack of adequate worehousing facilities has been emphasised by the Jute Commission and the Government will take steps in this direction. The Government will also undertake surveys of the world requirements of jute so that production does not fall short of world needs.

THE NEW STEEL TARGET AND CONSUMPTION PROSPECTS

(BY A SPECIAL CORRESPONDENT)

STEEL, the showpiece of Indian planning, has been given the central place in the third five year plan as in the previous quinquennium. The capacity target for the second plan has not been achieved exactly according to schedule, but the delay eventually was very much less than what had at one time been feared. The position now, however, is that the capacity target of 6 million ingot tons has been fully set up (for details see Table A), although it will naturally take some more time to achieve full production from the new Government plants. It needs to be said that of the "hard core" projects of the second plan, the Government has achieved relatively better success in steel than in other things, and this has encouraged the authorities to plan for further expansion more confidently. And their confidence has been reinforced by the offer of credit aid by the countries concerned, namely, Russia, Britain and West Germany. The latest development should be more encouraging. The American Ambassador, Professor Galbraith, has announced that the United States is interested in financing the Bokaro steel plant project provided certain conditions are met. And the conditions which he is reported to have stipulated are rather reasonable.

The target for the third five year plan is 10.2 million ingot tons; that is, an extra 4.2 million ingot tons above the second plan target, which has already been achieved. This extra capacity of 4.2 million tons is made up of 1.5 million tons at Bhilai, 800,000 tons at Rourkela, and 600,000 tons at Durgapur, one million tons from the new plant projected in Bokaro and the balance of 300,000 tons from electric furnaces operating with scrap, as well as from the Mysore Iron and Steel Works. The cost of expanding the Bhilai, Rourkela and Durgapur steel plants, according to the estimates furnished to the Lok Sabha by the Central Minister for Steel, Mines and Fuel during the last session, is Rs. 138 crores, Rs. 90 crores and Rs. 58 crores, respectively. The foreign exchange portion of the expenditure in each of these estimates is, respectively, Rs. 56 crores, Rs. 50 crores and Rs. 27 crores. A tentative allocation of Rs. 200 crores has been made for the Bokaro project.

The outlook for steel expansion has also become more certain with the announcement of aid offer for the third plan from the consortium of leading creditor countries, as well as the World Bank and its affiliates, at their resumed Washington meeting held on 31st May, 1961. This will ensure a fairly rapid rate of economic growth, which in turn will govern the level of steel production and consumption in the economy. But this does not dispose of all the questions which need to be raised against the steel expansion programme. The first objection is the economic one of allocating such a large proportion of the country's scarce resources to steel when there are other competing claimants, such as fertilisers, which are more deserving, and when it is by no means certain that the economy will be able to absorb this considerably increased production. The wisdom of the political decision not to allow the existing private producers a certain margin of further expansion, for which they had submitted schemes and which could obviously have been accomplished at very much less cost than, say, by setting up one more entirely new steel plant requiring large social overheads, is also questionable.

Secondary Industries not Encouraged

The second objection is that while the Government is concentrating so much on installing basic steel capacity it is not doing nearly enough to encourage the development of secondary or finishing industries, which after all are going to process or use the steel, and finally, the basic steel-making capacity which is to be set up in such feverish haste, is not supported by the necessary facilities for moving the raw materials to the steel plants in proper quantities and the finished goods from them to consuming centres. It has also to be remembered that there are not enough trained and experienced steel technical men to run these gigantic undertakings. Three new blast furnaces at Bhilai, Durgapur and Rourkela had to remain idle for a long time last year because the plants did not have enough high-grade coal to commission them, as the railways could not carry the fuel in time. The strangest thing of all was that even the steel works of the Iron and Steel Company in Burnpur had to suffer from a lack of suitable coal, although as the chairman said at the latest annual general meeting of the Company, the plant is virtually "sitting on coal mines." It was disclosed by a visiting foreign expert as late as last year that some 40 to 50 percent of the higher grade supervisory jobs still remained unfilled, as the necessary trained talent is not available in this country, and no steps had been taken to recruit it from abroad. The position concerning the technical personnel would have remained very much the same but for the West German help in providing a fairly large number of technicians for the Rourkela works. It is not known what steps are being taken to recruit them for the Bhilai and Durgapur plants (Bhilai incidentally, is going to be the largest single plant after it is expanded to 2.5 million tons capacity.) The chairman of Hindustan Steel, who recently went on a visit abroad, may have taken up the matter with the authorities concerned. India has received generous assistance from other countries, namely, the U.K., West Germany and Russia and the United States in the matter of training her young engineers, but they are still not experienced enough to take on the difficult and responsible supervisory jobs at steel plants, as it takes many years for a technician to become a competent steel man.

Perspective Planning

The Government, however, is not unduly perturbed by these practical aspects of its enterprise. It is obsessed by what is called "perspective planning", and naturally, lets Professor Mahalanobis's outfit in the Planning Commission do most of the thinking for it. This set-up is called the Perspective Planning Division, and it has urged the case for maximum expansion of steel. Its case would appear to be as follows: (1) India enjoys cost advantages which can even help her become an important exporter; (2) the steel industry should play an active, rather than passive part in industrialisation. Experience elsewhere shows that the machine-building industries grow most vigorously when the steel industry is one step ahead of them and (3) that installed capacity should be somewhat in excess of the required production, for it takes a new plant two or three years to reach the rated capacity. The facts, however, are not completely on its side. In the first place, India has already lost the distinction of being one of the cheapest producers of steel; in fact, she is already on the way to becoming a high-cost producer herself. For example, the landed cost of some categories of foreign steel are cheaper for the Indian consumer than the price at which the domestic commodity sells in India. Secondly, it is not yet known what exactly is the cost of making steel at the Government plants, but if their affairs continue to be what one sees them to be from the report of the Lok Sabha Estimates Committee, then India may soon be earning the distinction of being the world's highest cost-producer. In any case, the world is tending towards over-production of steel, and this country does not stand any reasonable chance of competing with its well-established rivals.

Steel Exports

The export "success" which Hindustan Steel has had may have created the misleading impression in the country that India too can do what her betters in the field are doing. But these exports, it may be recalled, were those of certain quantities of pig iron and semi-manufactures which had to be sold abroad because the finishing mills in the respective plants had not been set up. Now that the latter are there, the Hindustan Steel authorities can resume their exports either by keeping the finishing capacities idle or starving such important domestic industries as re-rolling, foundries and other engineering concerns of their much-needed raw materials. The question whether it would be wise to do this, especially when the engineering industries are themselves increasing their exports, is too obvious to be laboured. As for the point that it is desirable to aim for a capacity well in excess of the required production, since it takes one or two years for capacity to come into full production, the theoretical validity cannot be questioned. But when a target of steel production is meant to be achieved within a given period of time, it is necessary to examine whether the economy has the requisite strength and resources to stand up to the strain, and whether grave dislocation is not to be caused in its other sectors by this over-concentration on projects which take long in maturing. For example, India's production and known reserves of metallurgical coal are inadequate to support the steel expansion programme; if all or most of it is to be given to the steel plants alone, then other consumers including the railways will suffer. The prospect of a sufficient number of washeries being set up in time remains as uncertain as ever. If the washeries cannot be completed quickly, which looks most likely, then the experience of the second plan in this particular matter is bound to be repeated.

It is, of course, true that machine-building industries grow more vigorously when there is the prospect of an assured supply of steel, but this happens when the supply is available in the right balance. The pattern of production in India is still far from this stage. For example, India's production of alloy, tool and special steels, which are most essential for machine building industries, is

ECONOMIC RESEARCH

- is an essential part of modern commerce. But it is
- not always easy to obtain. The ordinary business
- house does not usually possess the records, statistics
- and archives which are the raw material of research.
- CAPITAL'S RESEARCH & STATISTICAL DEPARTMENT
- has a long record of service to Chambers of Commerce,
- Industrial Associations and private business concerns.
- It does not undertake trade inquiries, but its facilities
- and advice are available for all kinds of research
- proper into the problems of Indian commerce
- and industry.
- CAPITAL'S RESEARCH & STATISTICAL DEPARTMENT
- has constructed and maintains a number of cost of living
- indices for various classes and communities in India
- and Pakistan. It offers the industrialist and business
- house its experience in

P.O. Box 14, Calcutta, or 5, Mission Row, Calcutta, India.

at present too small, and such plans as she has for stepping up their production may not materialise fully before the third plan itself. Some experts have been known to complain that India has not been careful from the beginning about production planning in the steel plants, with the result that while some categories are in excess supply today, there are serious shortages in others. This, it is thought, was avoidable.

Actual Consumption

Had the Perspective Planning Division, istead of looking so far into its own private vision of economic growth over a long period of time, done some real research work into the actual consumption of steel in the economy at present, it might have done some useful work. Nobody really knows what the economy consumes at the moment. The Government's claim that it is around 4 million tons is no better than guesswork. For example, steel supply last year was not more than 4 million tons, including the increased production from the Government plants. Yet towards the end of the year some categories were freely available in the open market at prices which were even a shade lower than the Government-fixed selling price.

It strikes one as extraordinary that the Ministry of Steel which is concerned with planning the increase in steel production and distribution should have no machinery to publish full co-ordinated information or data concerning steel consumption in the various sectors of the economy. While the National Council of Applied Economic Research undertook a study of the steel demand with a view to forecasting consumption trends over the next decade, it was greatly handicapped by the fact that there was a comparative lack of data concerning the technical and other factors operative in different industries. No information was directly available on the consumption of steel in the economy's various sectors. The distribution of imported steel to various sectors was also not precisely known, except in a very general way that most of the imported steel is consumed by the railways. It, therefore, felt obliged to suggest: "Lack of relevant data leads the research worker in this field, as in many other aspects of the Indian economy, to feel an urgent need for better organisation in the compilation of all data on consumption of steel by end-users. Looking ahead, we may perhaps hope that in future all information on steel will be co-ordinated at a central place, and published periodically, as is currently done by the U.K. Iron and Steel Board, the British Iron and Steel Federation, or the American Iron and Steel Institute." Consequently, the demand trends forecast by the Council are on the basis of the five year plans and the physical targets corresponding to them. But it makes clear that the Indian economy is likely to consume the forecast quantities of steel only if the projects concerned are carried out in full. Table B at the end of this article gives the figures for steel demand at the end of the second, third and fourth five five year plans. Expressed in terms of per capita consumption, this gives roughly 19 lbs in 1960-61, 35 lbs in 1965-66 and 56 lbs in 1970-71. These figures compare poorly with the 1952 per capita consumption figures of such countries as Turkey, Ireland, Portugal and Argentina (95 lbs, 80 lbs, 64 lbs and 133 lbs, respectively), and even with the 1928 figure of Russia which was 64 lbs. Except that this is a measure of the level of industrial or economic progress, this need cause no undue worry, since India can achieve within a given period of time what her resources permit, and the sound economics of balanced economic development should not be sacrificed to political showmanship and disastrous inflation.

Artificial Prices

It is indeed strange that a Government which is anxious to increase steel making capacity does so little to stimulate consumption. The old system of selling steel at a price which includes a large surcharge for supplying imported steel to the consumer at a subsidised price continues to be in force, and the Government has made it clear that it has no intention of removing or reducing the surcharge even if the justification for it has largely disappeared as imports have dwindled steadily. On the other hand, it now performs the contrary function of keeping the steel prices high, and in that sense has become a tax on the consumption of steel. Part of it is, of course, required for subsidising freight and for selling billets to re-rollers at lower prices, but why should the surcharge be continued at the old rate when it is directly contributing to the inflationary process which is daily gathering momentum?

These are some of the relevant questions which ought to have been considered carefully in connection with the steel expansion programme, but which, apparently, have been characteristically brushed aside. The expansion of the steel industry is important, but it must be subject to a proper order of priorities, and at all stages, a balanced development of the economy needs to be attempted. For example, instead of deciding to set up immediately a fourth steel plant in Bokaro, it would perhaps have been wiser to encourage the growth and development of secondary industries by allowing an adequate import of steel. Under the present circumstances, it would have been a better economic proposition too, for foreign steel can be had cheaply and the engineering industries are already doing well in the export field. Besides, there is a large unsatisfied demand for their products at home, and an increased supply would have assuredly combated inflation. This is not the only better alternative either. The fertiliser projects at Neyveli. Rourkela and Nangal have had to be put off because sufficient foreign exchange could not be found. Since a big proportion of the national income is still derived from agriculture, the rapid pace of industrialisation notwithstanding, do not fertilisers deserve a better priority than steel?

MIDDLE CLASS COST OF LIVING INDEX NUMBER FOR CALCUTTA

(Base: August 1939)

THE Middle Class Cost of Living Indices, by groups, have now been brought up to May 1961. As compared with April, the May Index for Food shows a rises of 1 point, while those for Fuel and Lighting, Clothing and Miscellaneous remain unchanged at 287, 581 and 308 points.

Combining all the factors, the Middle Class Cost of Living Index for Calcutta shows that the cost of living remained unchanged at 461 points during May 1961.

BUSINESS CYCLES: A NEW RESEARCH STUDY

Business Cycle Indicators, Volumes I and II. Edited by Geoffrey H. Moore. (Published by Princeton University Press, Princeton. Review copies received from the Oxford University Press, Mercantile Buildings, Calcutta 1. Prices: Vol. I $12.50; Vol. II $4.50; set $15, pages 757 and 179.)

Virtually since its beginning in 1920, the National Bureau of Economic Research—now an internationally reputed U.S. research body—has been engaged in studying business cycles. It was mainly concerned with the basic problems of how they come about, and what circumstances and policies make for their variations. Scholars of the eminence of Wesley Mitchell, Arthur Burns, Geoffrey Moore (the editor of the present work) and Solomon Fabricant have been engaged in this work. The Bureau's first work on business cycle indicators was in 1938—by Mitchell and Burns. The present volumes carry this line of research further. Many earlier findings are tested against subsequent experience, their rationale is explained and a new list of indicators drawing on recent work presented. Besides, some recently developed methods of forecasting the cyclical behaviour are described, especially by Moore and Shiskin.

The book also contains the reprints of some previously published reports of the Bureau, which are now landmarks in this line of work, and some are now out of print. Volume II of the work contains many historical data on which the Bureau's studies were based and which other research workers may use with a view to checking the validity of the conclusions reached by previous workers as well as to interpret current trends. The study assesses the value and limitations of a large number of indicators, and develops a short list of those to be found most useful as a guide to the overall trend of business in the U.S.A. A vast amount of research was necessary to arrive at the list of series of 26 indicators—12 classified as leading, nine as roughly coincident, and five as lagging.

It is interesting to note—more as an indication of the revolutionary changes in the past two decades in the kinds of current statistics at the disposal of the U.S. economists than anything else—that of the 21 indicators selected by Mitchell and Burns in 1937, only three still figure in the new list. These are: business failure liabilities, the industrial production index and the average workweek in manufacture. Among the 12 leading indicators are: the value of new orders in durable goods industries, corporate profits after taxes, the common stock price index and the change in business inventories: the coincident group includes employment in non-agricultural establishments, industrial production, personal incomes, etcetera; the lagging group includes plant and equipment expenditure, wage and salary cost a unit of output and the book value of manufacturers' inventories, etcetera. The text explains why some indicators "lead" while others "lag" and describes techniques for extracting useful information from the raw data.

The present work is primarily a valuable reference book rather than a continuous report. For business cycle theorists, it furnishes a vast mass of reliable statistical data, useful for theoretical analysis and for searching the "causes" of changes in the level of business activity. Here in India the analysis of business cycles is still in its infancy but as the industrial sector expands—both absolutely as well as relative to the agricultural sector—the need for initiating such analyses will grow. The Bureau's work will provide an excellent source of inspiration for all such studies in future.

BANKING ANNUAL

The Banker, 1961 Annual Number. Edited by Raj Sri Ram. (Published by S. R. Suneja from 24/90 Connaught Circus, New Delhi. Price Rs. 3, pages 107.)

The latest annual number of the *Banker* contains some interesting articles on such subjects as the reorganisation of Indian banking, profits of scheduled banks and the insurance of bank deposits. Those who are interested in banking theory will find the articles on interest rates and monetary theory and policy particularly informative. But the publishers should have omitted the articles which have no relevance to Indian banking.

Plantation Topics

NORTH INDIAN TEA OUTPUT RISES SLOWLY

SIGNIFICANCE OF THIRD PLAN TARGET EXAMINED

(BY A SPECIAL CORRESPONDENT)

THE third plan tea target of 900 million lbs is undoubtedly high. so it is doubtful if the gardens in north-east India will be able to contribute much to the expansion. South India, meanwhile, is forging ahead. While in the past ten years, the north Indian tea crop has increased from 513.5 million lbs to 536.1 million lbs, the south Indian crop has risen from 93.8 million lbs to 109.1 million lbs. As is well known, the output of Assam and Cachar gardens in 1960 was severely affected by drought, so it will be more appropriate to take the 1959 production for comparison. The output in that year was 564 million lbs, showing an increase of 51 million lbs or about 10 percent. But it fell far short of the rate of increase in south India or for that matter any other major tea producing country, except Pakistan, where the increase was 10 percent for the year ended 1959, followed by a loss of about 20 percent in the drought year of 1960.

Average Yield

In 1950, Pakistan produced 52 million lbs, Ceylon 306.2 million lbs, Indonesia 78 million lbs and east Africa 43.9 million lbs. In 1960, Pakistan's output declined to 41.8 million lbs while that of Ceylon, Indonesia and east Africa rose to 434.8 million lbs, 100.2 million lbs, 94.9 million lbs, respectively. Compared with the production of these countries, the output of north Indian tea gardens shows a smaller increase. But this is not due to a falling yield an acre as is revealed from an analysis of statistics. The average yield an acre in north India was 842 lbs in 1950, which increased to 894 lbs in 1959. That of south India increased from 561 lbs in 1950 to 847 lbs in 1959. The average Indian yield has risen from 781 lbs to 884 lbs during this period. On the other hand, the average yield of Pakistan has increased from 711 lbs to 744 lbs. of Ceylon from 540 lbs to 713 lbs, of Indonesia from 253 lbs to 481 lbs and of east Africa from 527 lbs to 654 lbs.

Good Management

These figures are reassuring, for they show that the north Indian gardens have a very productive acreage, and although they now include much old tea, they still lead in output an acre. This is certainly a proof of good management. However, the world tea output has risen from 1,357.7 million lbs to 1,986.6 million lbs between 1950 and 1959 or by 46 percent. A production target for an annual crop, such as jute or rice, has some meaning because apart from the vagaries of the monsoon, man can regulate the planted area with a view to restricting or increasing production. A tea bush is, however, generally non-paying before, say, its fifth year. Replanting will not yield quicker results but with modern methods of fertilising by green crops, etcetera, it will probably be a sound scheme to experiment with some old abandoned areas which have been lying waste for 20 or 30 years. They will be easier to clear of tree growths than virgin forest areas, and so will be less wasteful. Besides, natural weeds and jungles will have refreshed the land and green crops can render nitrogen to the soil.

Chinese Output Rises

Through improved production techniques, the Chinese have recently increased their output from 138 million lbs to 337 million lbs or by 144 percent. This looks dangerous but China is determined to earn more foreign exchange. She will undoubtedly try to raise her exports as far as possible. But the chief threat to Indian common tea producers seems to be east Africa, Nyasaland and Mozambique. In 25 years, shipments from east Africa have jumped from 21 million lbs to about 76 million lbs.

Without sufficient details, it would only be a guesswork to calculate how the Indian crop can be increased by 28 percent in five years, that is, from 700 million lbs to 900 million lbs, because the largest tea producing area, that is, north India appears to be almost completely dependent on old tea. If an overdose of fertilisers is applied to the soil, the quality will inevitably deteriorate.

COCHIN TEA SALES

At Dust Sale 25, 277,000 kilograms of tea were on offer. There was a strong general demand for all descriptions, and prices were 10nP to 15nP dearer.

NAMES AND DATES

Mr. K. M. Wilcox, deputy managing director of the British India Corporation Ltd, Kanpur, has been elected president of the Upper India Chamber of Commerce, Kanpur, for 1961.

The second annual general meeting of the West Bengal Hosiery Association will be held on Thursday, 6th July, at Prince's, Grand Hotel, Calcutta.

The twelfth annual general meeting of the Indian Non-ferrous Metals Manufacturers Association will be held on Friday, 7th July, at "India Exchange", India Exchange Place, Calcutta.

Calcutta Market

GOOD GENERAL DEMAND AT TEA EXPORT SALE

PRICES OF QUALITY DUSTS RISE

AT Sale No. 4, held on 26th and 28th June, there was a good general demand at the Export Sale for the 23,605 chests on offer. Darjeelings with good quality sold well at dearer rates, but the more ordinary kinds were very irregular and generally easier with some withdrawals. The plainer orthodox teas were generally firm to dearer, while better descriptions met with good support at about valuations, interest being centred mainly on brokens. Tippy teas were well supported and prices were generally dearer. Whole leaf grades were well supported at dearer rates, while stylish B.P.'s were strong. The better liquoring C.T.C.'s sold well and prices were dearer with quality. The medium and poorer kinds also sold quite readily with the B.P.'s generally realising prices above their Fannings. Legg-cut descriptions met with a good enquiry and were firm to dearer.

Quotations

	1961 Rs. a kilo	1960 Rs. a kilo
Clean Plain Pekoe	5.10 to 5.20	5.00 to 5.25
Plain B.P.	4.70 to 4.80	4.30 to 4.50
Plain Fannings	4.60 to 4.65	4.20 to 4.40

(Quotations are inclusive of excise duty.)

At the Internal Sale, there were 13,444 chests of Dusts on offer, of which 12,395 packages were of new season's manufacture. There was a good general demand. C.T.C. descriptions were keenly competed for; the exportable and better liquoring types showed an advance, but the green and thin liquoring teas were a little easier. At the opening of the sale, prices for orthodox teas were slightly easier but strengthened as the sale progressed and were fully firm to dearer at the close with the brighter lines receiving better support. Legg-cut teas, although a little irregular, were readily absorbed, and the bright kinds sold at firm to dearer rates. The more ordinary descriptions were, however, sometimes up to 10nP easier. Darjeelings were well supported, and the more flavoury types sold at dearer rates.

Quotations

	1961 Rs. a Kilo	
Plain Orthodox Dust	4.20 to 4.35	
Medium Assam Dust	4.50 to 5.00	(Nominal)
Legg-cut Dust	4.45 to 4.60	
Medium Assam C.T.C. Dust	5.70 to 6.20	
Good Assam C.T.C. Dust	6.30 to 7.00	

(Quotations are inclusive of excise duty.)

A total of 152 chests of Leaf was on offer, of which 93 chests were of new season's manufacture. There was a good general demand, and the teas were readily absorbed.

FREIGHT RATES FALL

THE last week in the freight markets has seen a reduction in rates and in the number of fixtures made. Even scrap loading to Japan which has provided a lot of business lately has fallen off considerably. Among the latest fixtures are three cargoes from Geelong to east coast India with bulk wheat at 52s for second-half July loading. Two vessels were fixed from Durban-Lourenco Marques to Rangoon with coal for August-September loading at 50s which is 3s lower than similar fixtures made last week. Heroya and Bremerhaven to one port west coast India was fixed for 5,000 tons of bagged urea, completing with 4,600 tons of sulphate of ammonia on the basis of 75s Heroya and 65s Bremerhaven with 25th July-15th August laydays. In the time charter market, a German 11,000 d.w.t. motor vessel of 13 knots was taken at 22s with delivery at Gdynia for a round trip, India, Pakistan and Burma.

LINSEED FIRM

The market was firm in the past week. In sympathy with the advancing trends in other oilseeds markets, linseed prices rose further and sellers were reserved. Crushers showed a keen interest and small quantities changed hands daily for ready goods with buyers over. The oil market was firm in sympathy with seeds. Prices advanced and stocks were low; small business was done for local requirements. Sellers for forward delivery were reserved. There was little activity in the oilcake market. Latest advices from foreign markets show that price are firm for forward deliveries and some business may be expected in the near future. The latest quotation is as follows: Ready July delivery, Rs. 30 a maund.

COMPANY AND PUBLIC NOTICES

SHAW WALLACE & COMPANY LIMITED

NOTICE is hereby given that the Fifteenth Annual General Meeting of the Members will be held at the Registered Office of the Company, 4, Bankshall Street, Calcutta, on 26th July, 1961, at 3 p.m. for the following purposes :—

1. To consider the Profit & Loss Account for the year ended 31st December, 1960, the Balance Sheet as at that date and the Reports of the Directors and the Auditors.
2. To declare a Dividend on the Ordinary Shares.
3. To appoint Auditors and to fix their remuneration.
4. To elect Directors in the places of two Directors retiring.
5. **AS SPECIAL BUSINESS** to consider and if thought fit to pass with or without modification the following two Resolutions, of which two Notices have been received by the Company from a Member under Section 257 of the Companies Act, 1956, which will be proposed as ordinary resolutions :

   (1) "That Mr. C. M. A. Bathurst be and is hereby appointed a Director of the Company".

   (2) "That Mr. J. L. Capper be and is hereby appointed a Director of the Company".

Explanatory Statement

With regard to Item No. 5 above it is pointed out that Messrs. C. M. A. Bathurst and J. L. Capper were appointed as additional Directors. In terms of Section 260 of the Companies Act, 1956, they now vacate their offices and in view of their vast experience of the affairs of the Company, your Directors recommend the adoption of the resolutions in the best interest of the Company.

The Share Transfer Register of the Company's Ordinary Shares will be closed from 17th July to 26th July, 1961, both days inclusive.

N.B. A Member entitled to attend and vote at the Meeting is entitled to appoint a proxy to attend and vote instead of himself and the Proxy need not be a Member of the Company.

By Order of the Board,
D. A. HOUGHTON,
Calcutta Director and
Secretary.

4, Bankshall Street, Calcutta.
Dated 26th June, 1961.

BALLY JUTE COMPANY LIMITED

NOTICE is hereby given that the Annual General Meeting of the Shareholders will be held at the Registered Office of the Company at 8, India Exchange Place, Calcutta, on Wednesday, the 16th August 1961 at 3 p.m. for the following purposes :

(1) To receive and consider the Report of the Directors and to pass the audited accounts of the Company for the year ended 31st March, 1961.

(2) To declare dividends on Preference and Ordinary Shares.

(3) To elect Directors in place of Mr. H. J. Silverston and Shri R. N. Bangur, who retire by rotation, but being eligible, offer themselves for re-election.

(4) To appoint Auditors and to fix their remuneration.

(5) As special business to consider and if thought fit to pass with or without modification the following resolutions :

(i) As Ordinary Resolution :

"RESOLVED that Shri Chinubhai C. Dalal, a Director of the Company, who retires under Article 111 of the Articles of Association, be and is hereby reappointed a Director of the Company."

(ii) As Ordinary Resolution :

"RESOLVED that the consent of the Company be and is hereby given to the Board of Directors to contribute and/or subscribe from time to time to any national, political, charitable, benevolent, public or general and other funds not directly relating to the business of the Company or the welfare of its employees, upto a total sum of Rs. 5 lacs in any financial year as may be considered proper by the Board notwithstanding that such amounts in any financial year may exceed Rs. 25,000/- or 5% of the Company's average net profits, as determined in accordance with the provisions of the Companies Act, 1956, during the three financial years immediately proceeding whichever is greater. Provided, however, that contributions to any political party or for any political purpose to any individual or body, will be subject to the restrictions contained in Section 293A of the Companies Act, 1956."

(iii) As Special Resolution :

"RESOLVED that the Company do hereby approve of the contract with Messrs. Birla Brothers Private Ltd., the Secretaries & Treasurers of the Company, for supply of money by the said Secretaries & Treasurers to the Company by way of short-term credits with or without security, made or to be made over a period of five years with effect from the 1st of April 1960, bearing interest at the rate mutually agreed upon from time to time. Provided, however, that any interest received by Messrs. Birla Brothers Private Limited from the Company on or in respect of money lent pursuant to this Resolution shall not be deemed to be remuneration paid by the Company to them as Secretaries & Treasurers of the Company within the meaning of Sections 198 and 381 of the Companies Act, 1956, and that Messrs Birla Brothers Private Ltd. shall not be accountable therefor under the provisions of Sections 363 & 379 of the Act."

The Register of members and Share Transfer Books of the Company will remain closed from the 1st of August 1961 to 16th August 1961, both days inclusive.

By Order of the Board,
Per Pro BIRLA BROTHERS PRIVATE LIMITED,
G. MAKHARIA,
Secretaries & Treasurers.

Calcutta,
Dated, the 22nd June 1961.

N.B. (i) The Directors have recommended the payment of the following dividends free of income tax payable by the Company but subject to deduction of tax under Section 18(3D) of the Income-tax Act :

On Preference Shares @ 10% per annum.

On Ordinary Shares @ Rs. 25/- per share.

If the dividends on shares as recommended by the Directors are approved at the meeting, THE DIVIDENDS WILL BE PAYABLE ONLY TO THE REGISTERED SHAREHOLDERS, whose names are on the Company's Register on the 16th of August 1961 or to their order or to their Bankers. No application need be sent for dividends as relative Dividend Warrants will be posted to such shareholders by the 7th of September 1961.

(ii) A member entitled to attend and vote at the above meeting is entitled to appoint a proxy to attend and vote instead of himself and a proxy need not be a member.

(iii) **An explanatory statement in respect of the above items of special business has been forwarded to the members of the Company.**

RESERVE BANK OF INDIA

Applications are invited for the following posts in the Bank :

(A) POSTS AND SCALES OF PAY

(i) **Banking Officers :** Rs. 375-55-815 E.B. 55-925-60-1045

(ii) **Probationary Assistants :** Rs. 250-25-450 E.B. 25-650

Note : Candidates possessing exceptionally good qualifications and experience of value to the Bank may be given a higher starting pay in the prescribed scales.

In addition to pay, the selected candidates will be eligible to draw local pay, house allowance and dearness allowance at the rates prescribed by the Bank from time to time.

(B) QUALIFICATIONS :

(i) **Banking Officers :**

(a) Applicants should have a minimum of five years' commercial banking experience out of which not less than three years should be in a responsible position. Preference will be given to applicants with high academic qualifications who have made a special study of Economics, Banking, Commerce or Accountancy, or

(b) They should be Chartered Accountants with a minimum standing of 5 years.

Preference will be given to those who have passed the examinations of the English or Indiah Institute of Bankers.

(ii) **Probationary Assistants :** Applicants should have a good academic record and a first or high second class Master's degree of a recognised Indian or foreign University with Economics, Banking, Commerce or Accountancy as a special subject and should also have some proficiency in drafting. Educational qualifications may be slightly relaxed in the case of candidates who have passed the Institute of Bankers' examinations and/or possess practical banking experience in a supervisory capacity in a commercial bank.

Candidates who have applied for these posts in response to previous advertisements issued in 1960 need not apply again.

THE SELECTION BOARD WILL INSIST ON A VERY HIGH STANDARD OF SUITABILITY IN MAKING SELECTIONS FOR THE ABOVE POSTS AND ONLY THOSE CANDIDATES WHO POSSESS HIGH ACADEMIC QUALIFICATIONS AND ADEQUATE EXPERIENCE OF THE TYPE SPECIFIED ARE ADVISED TO APPLY.

(C) AGE LIMITS AS ON 1ST JULY, 1961 :

(i) **Banking Officers :** Candidates should not ordinarily be over 35 years of age but the age limit may be slightly relaxed in the case of candidates with exceptionally good experience of value to the Bank.

(ii) **Probationary Assistants :** Between 21 and 25 years.

In the case of (ii) the maximum age limit is relaxable but not beyond 30 years in the case of :

(i) candidates possessing special qualifications and experience of value to the Bank ;

(ii) ex-employees of banking institutions whose services had to be terminated for reasons of economy or as a result of the banks going into liquidation ;

(iii) personnel retrenched from Government offices after at least one year's service applying through Employment Exchanges ; and

(iv) candidates belonging to the Scheduled Castes or Scheduled Tribes.

2. Candidates who wish to apply for more than one category of posts must submit *separate* applications accompanied by separate application fees and *should clearly indicate the post for which they have applied.*

3. Applicants for the posts of Banking Officers and Probationary Assistants must remit with their applications a fee of Rs. 7.50 for each post by cheque or bank draft on a *Scheduled Bank* payable at Bombay or by Postal Order. *The application fee is in no case refundable.* Bonafide refugee candidates *not in employment* applying through Employment Exchanges are exempted from payment of application fees while in the case of candidates belonging to Scheduled Castes/Tribes, the fee will be reduced to one-fourth.

4. Applications in the candidate's own handwriting in the prescribed forms obtainable from the Reserve Bank's offices at Bombay, Calcutta, Kanpur, New Delhi, Nagpur, Madras, Bangalore, Lucknow, Trivandrum and Patna accompanied by copies *(originals should not be sent) of certificates regarding age and educational qualifications, statements of marks secured in the Graduate and Post Graduate degree examinations and two testimonials* should be forwarded to the Secretary, Central Recruitment Board, Reserve Bank of India, Central Office, Post Box No. 406, Bombay No. 1 so as to reach him on or before *22nd July 1961.*

5. *Candidates should also indicate in their applications whether they had applied previously for a similar post in the Reserve Bank and if so with what result.*

6. Candidates already in service will be required to produce a proper discharge certificate from their employers in the event of their being selected, at the time of their appointment in the Bank's service.

7. Candidates belonging to Scheduled Castes/Scheduled Tribes should mention this fact prominently in their applications and also enclose a copy of a certificate to that effect from a competent authority.

8. Selected candidates must be prepared to serve in any office of the Bank in India and to undertake tours when required.

9. Appointments will be subject to candidates being found medically fit for service in the Bank by the Bank's Medical Officer.

10. If any candidate desires to have his application acknowledged, he should send it by "Registered Post—Acknowledgement Due". Apart from those who may be specially called, interviews will not be granted to candidates nor will the Bank enter into correspondence with them.

11. Canvassing will be regarded as a disqualification.

THE BISRA STONE LIME COMPANY LIMITED

Notice of Interim Dividend

THE Board of Directors has sanctioned payment of an Interim Dividend on the Ordinary Shares @ Rs. 1.25nP per share in respect of the year ending 31st March 1961, subject to deduction of tax at source.

This dividend will be paid on or after 28th July, 1961, to those Shareholders (or their mandatees) whose names appear in the Company's books on the 24th July 1961, as the registered holders of the above shares.

The Share Transfer Register of the Company will be closed from 11th July 1961 to 24th July 1961 both days inclusive.

By Order of the Board,
BIRD & CO. (PRIVATE) LIMITED,
Managing Agents.

Chartered Bank Buildings,
Calcutta, 19th June, 1961.

DHELAKHAT TEA COMPANY LIMITED

NOTICE is hereby given that the Forty third Annual General Meeting of the Shareholders of Dhelakhat Tea Company Limited, will be held at the Registered Office of the Company, No. 31, Chowringhee Road, Calcutta, on Thursday, the 27th day of July, 1961, at 9-15 a.m., for the following purposes :—

1. To receive the Directors' Report for season 1960.
2. To pass the Accounts for the year ended 31st December, 1960.
3. To declare a Dividend for the year 1960.
4. To elect Directors.
5. To elect Auditors for the current year and to fix their remuneration.
6. To transact any other ordinary business brought before the Meeting.

The Share Transfer Books of the Company will remain closed from 13th July, 1961 to 27th July, 1961, both days inclusive.

As dividend warrants are sent only to registered shareholders or to their mandatees, shares on blank transfer should be submitted with completed deeds for transfer registration before the transfer books are closed.

By Order of the Board,
JAMES WARREN & COMPANY, LIMITED,
Managing Agents.

31, Chowringhee Road,
Calcutta, 22nd June, 1961.

The Dividend when sanctioned will be payable on and after 27th July, 1961 to those Shareholders whose names stand on the Register on 12th July, 1961.

Note :—A member entitled to attend and vote at this Meeting is entitled to appoint a proxy to attend and vote in his stead. Such proxy need not be a member of the Company.

INDIA PAPER PULP CO. LTD.

THE Board of Directors have today decided to recommend to the forthcoming Annual General Meeting of members a final dividend in respect of the year ended 31st March, 1961 of 80 naye paise per share. Tax will be deducted from this dividend before payment in accordance with the provisions of the Finance Act currently in force, and the warrants for the dividend, if declared, will be despatched to shareholders on the date on which the Annual General Meeting is held.

By Order of the Board,
INDIA PAPER PULP CO. LTD.,
ANDREW YULE & CO. LTD.,
A. S. MacLaren,
Secretary,
Managing Agents.

Calcutta.

BANKS

H. indicates that Share capital is half paid. O. C. and Dd. indicate Ordinary, Contributory and Deferred Shares respectively. P. next to the name of the company indicates that the company also has Preference Shares. Figures in 'accounts closed' column indicate the months of the calendar year in which accounts are closed. For Managing Agents refer to the Key (last page) under the numbers indicated.

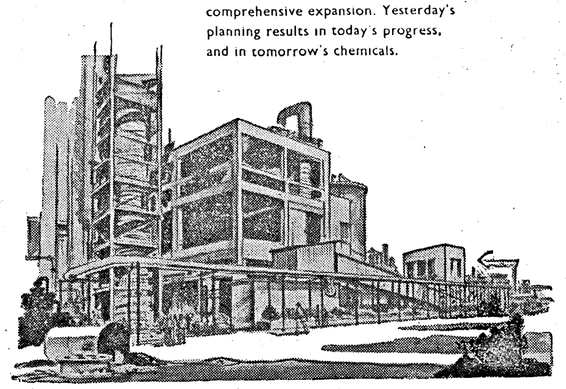
Another step forward

With the inauguration of their new Steam Tube Drier, the largest of its kind in India and designed to handle 300 tons of Soda Ash per day, Tata Chemicals have taken another major step forward in their plans to expand the production of Soda Ash.

The entire task of erecting and commissioning this equipment, as well as of the design, engineering and putting into operation of other important new units of the plant like the Brine Refinery and the Ammonia Still, has been entrusted to Tata technicians who are turning blueprints into reality.

As India's Five Year Plans strive to raise our standard of living, Tata Chemicals make their contribution through comprehensive expansion. Yesterday's planning results in today's progress, and in tomorrow's chemicals.



TATA CHEMICALS LIMITED
Bombay House, Fort, Bombay.

PARSONS POWERGAS LONDON

COMPLETE ENGINEERING AND CONSTRUCTION SERVICES TO THE PETROLEUM AND PETROCHEMICAL INDUSTRIES

ENGINEERING SERVICES

PARSONS POWERGAS, in addition to accepting responsibility for processes offered, are ready to engineer and supply units or complete plants directly from clients' flow sheets under the clients general supervision and control. The organisation will undertake all responsibilities for providing the following services: economic studies, site selection, field engineering, process engineering, mechanical engineering, procurement of materials, erection, operation, personnel training, pilot plant studies, and research and development. These integrated services will furnish the client with a single source of responsibility for every detail.

HIND CYCLES LTD. 250 WORLI BOMBAY-18

Hind Frames and Forks have earned all India fame for sturdiness. As such 80% of Rickshaws use 'Hind' Cycle Frames and Forks since they are more durable and sturdier. The reason: they are brazed by brazing solder manufactured by Indian Smelting & Refining Company Limited.

Carrier are a hidden asset
at the Bank of India Limited, Bombay

We may not be entered in the books. But we are a hidden asset in many of India's leading banks. We're air conditioning people. Operate behind the scenes. Balancing, not the books, but temperature and humidity. This adds up to cool, dust-free working conditions. Increased staff efficiency and goodwill.

"A sound investment," people say. "You can always bank on dependable Carrier equipment, Voltas' design, installation and service." Not customary for us to indulge in grandiose claims. Leave it to bankers (among others) to say: "Carrier and Voltas are the people who know air conditioning best".

Some other banks air conditioned by us:
Bombay Mercantile Co-operative Bank Ltd., Bombay
National City Bank of New York, Calcutta and Bombay
Netherlands Trading Society Ltd., Calcutta
Reserve Bank of India, Bombay, Madras, Nagpur and New Delhi
State Bank of Mysore Ltd., Madras
United Bank of India Ltd., Bombay.

FOREIGN INVESTMENT PROSPECTS IN INDIAN INDUSTRY

By

SIR PERCIVAL GRIFFITHS, C.I.E., I.C.S. (Retd.)

IN the second half of the nineteenth century Britain provided a good example of an affluent society in a sense quite different from that attached to the term today. Large sections of her people were poor and overworked, but the community as a whole was immensely prosperous. The enterprising industrialists who had made Britain the most important manufacturing country in the world were constantly on the watch for fresh opportunities of making profits overseas. The outward pressure of funds for investment was therefore very great, and at the same time Britain's military and political supremacy rendered almost the whole world a safe field for British investment. Today, wholly different conditions prevail. The funds available for investment abroad are strictly limited; the British flag no longer offers protection to British interests over half the world; and the growth of economic nationalism in some countries excludes the United Kingdom investor from fields previously open to him.

He has, therefore, to be considerably more discriminating than formerly in his choice of a field of operation and it is important, therefore, that British business men should from time to time review the comparative attractions and deterrents to investment in particular countries. In the present article it is proposed to assess those factors in the case of India.

In the course of such a study of any country under modern conditions, four main questions must be answered. Is it politically stable and well governed? Is its economy firmly based and progressive? What is the attitude of the Government and the public to private enterprise? Does foreign business receive fair treatment? Other factors such as cost of production, market potential and the like will need to be examined by each industrialist in relation to his own particular field, but the four questions just enumerated will determine the general investment climate.

Political Conditions

In the case of India, the first of these questions is perhaps the most easily answered. Anybody who is doubtful as to the quality of the Indian administration can easily resolve his doubts by a visit to Indonesia or Burma or some of the other countries of south-east Asia. When he returns to India he will feel that he has come back to a land of sanity and will appreciate what it means to live in a country where even a woman can travel from north to south or east to west in reasonable safety.

In the early days of Independence, some foreign observers were apt to say "After Nehru, the deluge". Few would take so pessimistic a view today. Nehru has set India on the right course and there is no lack of potential successors capable of holding her to it, backed as they will be by what is undoubtedly the most efficient civil service in Asia. Pessimistic views as to the future of India have sometimes resulted from an exaggerated idea of the threat from communism. There are indeed volatile areas such as Calcutta where subversive movements always have the odds in their favour, while elsewhere in India there are places where the communists have shown great skill in exploiting local or temporary grievances. Over the country as a whole, however, the communists have relatively little influence—a fact attested by the general public approval of the intervention of the Government of India in Kerala last year. The China episode has given the communist cause a further setback. The various sections of the Party have been unable to agree as to the line to be taken, and the general public has awakened to the danger from a Party which owes allegiance to a body outside India.

The only ace in the hand of the communists is their superiority to the Congress and other Parties in the efficient organisation of labour, and it is much to be regretted that except in one or two areas the Congress Party has never applied itself seriously to the development of a strong and healthy Congress trade union movement. In spite of this cause of anxiety, the business man seeking fields of investment cannot help coming to the conclusion that India offers him as good a government and as much stability as most countries in the modern world.

Economic Conditions

The potential investor's second question relates to the economic soundness of the country, and here he will have to balance the encouraging against the discouraging features. The good features can scarcely fail to be observed. The abundance of coal and iron and some other raw materials; the existence of ample water power; the important export trades in tea, jute goods, cotton textiles, leather, manganese ore and tobacco; all these provide the foundation on which industry can be built. To them must be added the fact that there are a very large number of highly educated and intelligent Indians with managerial capacity, and the aptitude of many classes of Indians for skilled mechanical work. Apart from these theoretically hopeful features, there is the solid fact of India's industrial progress in the last decade. It is not necessary to quote figures to show that progress has exceeded the expectations even of congenital optimists. Nobody can travel round India with his eyes open without realising the great strides which have been made.

On the other hand, causes of anxiety are as obvious as the bull points. Population continues to grow so fast that, in spite of rapid economic development, the standard of living rises but slowly—and although the Government of India has inaugurated and financed a family planning campaign, the results in the country as a whole are so meagre that no slowing down of the rate of increase of population seems likely in the next decade or so.

Linked with this ground of anxiety is the problem of increasing the production of food. India's achievement in this direction since Independence has been remarkable, and it is a pity that some Indian economic writers have failed to recognise it. Nevertheless, food production does not keep pace with the combined effects of population growth and the rising standard of living. In the towns as well as the country, people eat better than they once did—except perhaps for the unfortunate middle classes—and India's continuing food shortage is thus in a sense a measure of her progress.

Less comfort can be offered in regard to India's other major problem—that of unemployment in general and middle-class unemployment in particular. The second plan has made no impact on this situation and there is no reason to expect better results in the period of the third plan. This difficulty at times forces the Government of India to adopt policies which must in the long run be economically unsound, such as the restriction of production of mill-made cloth.

Another anxiety is inherent in the concept of planning. Once a government undertakes to regulate the economy, it is bound to be in a hurry. It cannot turn round to the poor man and say: "You must wait patiently—we cannot do much for you now, but things will be better for your children". A government which undertakes economic planning is compelled to go faster than its resources justify, and so India finds herself constantly overspending her foreign exchange. Crisis after crisis arises and these crises naturally make the foreign business man nervous. India's record with regard

to remittances of profits and repatriation of capital is, he gladly acknowledges, first class—even at her most difficult times she has played more than fair—but he cannot help wondering if she will overstrain herself, with disastrous results for him. Fortunately, the world is in the mood to help. India may or may not get 100 percent of the foreign aid which she needs for the third five year plan, but she will get enough to make that plan a reality. The consortium of lending nations has already shown its determination to help and British friends of India will continue to press for the maximum possible assistance.

What does all this add up to in the mind of the foreign business man? Perhaps the answer is this—there is a tremendous economic future ahead of India and there is a vast amount of business to be done on the basis of an economy which is generally sound. Unemployment, food production, and the foreign exchange shortage will continue, to bedevil the situation, but they will not alter the fact that in the economic sphere India is on the march. No business man can ignore her.

Private Investment

Having satisfied himself that India is politically and economically worth while, the business man wants to know what she thinks about private investment. He knows that the Congress Party has accepted the socialist pattern as its ultimate aim, but he does not quite know what this means.

One of his difficulties in elucidating its meaning is the lack of balance in the Congress Party. The back-benchers are fairly solidly left-wing, with a strong prejudice in favour of the public sector. The Cabinet are ideologically divided along fairly obvious lines, but the hands of the realists are continuously strengthened as India gains practical experience of the running of industry. Wholesale nationalisation, which seemed an obvious panacea soon after the transfer of power, is now seen to be full of perils and even the most intransigent nationaliser recognises today how India's progress has been retarded by the doctrinaire insistence some years ago that the expansion of the coal industry must be confined to the public sector. Whatever the backwoodsman may think, those in authority recognise the value of a mixed economy. From time to time individual Ministers make speeches suggesting that private enterprise is only tolerated as a temporary measure and those speeches do a great deal of harm. They are nevertheless belied by the sensible policy pursued by the Government as a whole.

Nationalisation for its own sake is not in fact round the corner and nobody expects to see, for example, the tea and jute industries taken over by the State. It is true that the public sector occupies what some of us regard as an unduly prominent place in the expansion of some industries. Even here, however, there is a great deal of realism. In the development of the new steel plants, while the Indian share is State-owned, private enterprise has been warmly welcomed in the foreign element. In the judgment of the present writer, new foreign investors in many important fields of industry need not be more apprehensive of nationalisation than they would be in Britain.

The position with regard to trade, as distinct from industry is quite different. The State Trading Corporation, set up primarily for the limited transactions with the iron curtain countries, is steadily encroaching on many fields which would be better left to private enterprise. There is a curious belief in Government circles that whereas industry requires specialised knowledge for its conduct, anybody—even a government official—can operate in commerce. The tradition is perhaps a relic of the days when the "heaven-born"—including the present writer—were supposed to be able to do anything that came to hand. The sooner it is dropped in the sphere of commerce the better it will be for India. There is no doubt that the operations of the State Trading Corporation have done much to build up in the outside world the belief that private enterprise is doomed. The writer does not share that view and believes that a participant in one of the modern, highly technical industries in India need not be unduly worried about the public sector.

Foreign Capital

The fourth main question is as to the attitude of the Government and the public towards the foreign capitalist. This attitude has fluctuated so much from time to time that it is not easy to generalise about it. When India began to govern herself there was a widespread belief that British investment in India had been tantamount to exploitation, and there was some talk in the Legislative Assembly of the compulsory buying out of foreign interests in India. The Government moved rapidly away from this crude belief, but there have been phases when some sections of Indian business men have resented the existence of British business. We do not appear to be in one of those phases at the moment. It seems to be recognised that the industrial development of India in the next few years will require all the resources that can be brought to it, at home or from abroad. Whatever the theoretical approach may be, in general the foreign business man gets a fair deal. Once he is allowed to operate, he is not treated as a stranger, except to some extent in the matter of taxation. India is perhaps too civilised to indulge in extravagant xenophobia.

In general, therefore, the natural fears of the foreign investor do not appear to be applicable to India. There are, nevertheless, some deterrents and it is important to state them quite frankly.

Deterrents

The most important of them is undoubtedly the high incidence of taxation. The spokesmen of the Government often seek to rebut this statement by comparison with taxation in certain other countries. These comparisons are as a rule irrelevant to the case of a developing country which needs to provide positive attraction to capital from overseas. The truth is that the Government of India is faced with a dilemma. If taxation is not kept at a high level, the immediate needs of the third five year plan cannot be met, while if it remains too high the foreign capitalist will think twice before investing. Fortunately, the Government seems to have recognised that the time has come to put more emphasis on indirect taxation. This at least spreads the burden and to that extent gives the industrialist some relief.

The second factor which makes potential investors hesitate is the complicated network of controls and sanctions which surround the company which wishes to embark on a new enterprise. It is true that the concept of planning necessarily involves fairly detailed control, but simplification is both possible and necessary. At present only a very resolute man will face all the obstacles which confront him at the outset of his undertaking and he is apt to be left with the impression that the Government of India feels that it is doing him a favour by allowing him to operate.

A third deterrent is the labour policy pursued by some of the governments concerned. It often looks to the outsider as though the various Labour Ministers, who should regard themselves as umpires between employers and employees, are in fact far too ready to align themselves with labour even in support of unreasonable claims. Wage scales are fixed without regard to the economic condition of the industry concerned, and if this policy is not changed, India may price herself out of the import-export market. A more realistic labour policy would go far towards encouraging investments, either by Indian nationals or by foreigners.

One other point must be made. The foreign investor will always expect to be able to employ a limited number of the nationals of his own country. It is comforting to know that the Government of India recognises the reasonableness of this desire, but from time to time Ministers make speeches on this subject which create doubts in the minds of those concerned.

Conclusion

These discouraging factors have not been set down in a spirit of captious criticism, but in the belief that their removal would help the economic progress of India. They do not alter the fact that India's achievements since Independence are remarkable and that the political and economic foundations of the country are such as to make India worth while from the point of view of a foreign company in search of fields for investment.

RATIONALE OF STATE PARTICIPATION IN INDIAN OIL INDUSTRY

AMBITIOUS EXPLORATION PROGRAMME DURING THIRD FIVE YEAR PLAN

By

K. K. SAHNI

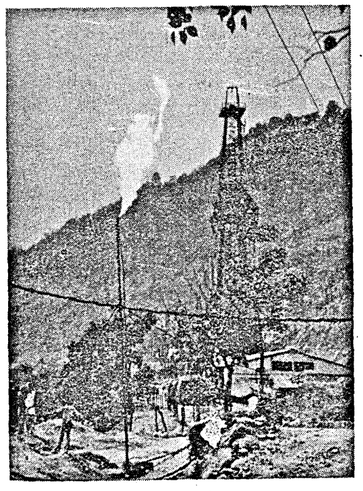
Joint Secretary, Department of Mines and Fuel (Central Ministry of Steel, Mines and Fuel)

THE oil industry has grown more rapidly and more regularly in this century than almost any other major industry. Its growth continues unchecked, but lately, a growing world surplus of oil has become noticeable. This is not a new problem. Since the early 'thirties, oil output has been regulated by administrative decisions in Texas, Louisiana and many other main producing States; but exploration, especially development drilling, has been stimulated by the prices which result from this control, by the method by which production quotas are established, and by certain tax advantages. Hence the policy has been to restrict output, but at the same time, to expand capacity.

The world market for oil can no longer be considered as a single market. There are three separate spheres to consider—the United States, Russia and the remaining countries of the world. Both the United States and Russia are potentially self-sufficient, being at the same time major producers and consumers. Their foreign trade in oil is sizable but not vital—the former being now a net importer, the latter a net exporter; whereas the impact of Russian oil on the world could become significant, the opposite is not true. The characteristic feature of the oil market in the remaining areas of the world is the polarisation of supply and demand; the main producers, namely, Venezuela, the Middle East and north Africa have no sizable demands for oil whereas the biggest consuming group notably, western Europe, has little or no domestic oil production. World oil consumption has doubled every ten years during the period 1880 and the present day; more particularly, the average annual rate of increase between 1880 and 1900 was 8.3 percent, while from 1900 to 1920, it was 8 percent, from 1920 to 1940 6 percent and from 1940 to 1950 6.5 percent.

Rise in World Reserves

Since 1950, world oil reserves have risen more than three-fold, and much faster than consumption. They stood at 40,000 million tons at the close of 1959. These figures are for proven reserves, recoverable by applying today's techniques. If semi-proven reserves are taken into account and allowances made for future improvements in techniques, the ultimately recoverable reserves of oil in the world will undoubtedly be higher. Most of the new reserves have been found in the Middle East; and in the United States, the increase has been not so prominent. Consequently, there has been a shift in the location of reserves away from the western hemisphere. The United States's share in the world total has dropped from 25 percent in 1950 to about 10 percent now; and Venezuela's share has fallen too. On the other hand, in the Middle East, oil reserves increased almost five-fold and now account for 60 percent of the world's total and Russia's reserves rose about four-fold. In the Sahara, Libya and West Africa, where oil has only recently been discovered, proven reserves are at present relatively small, but show promise of becoming much bigger in the near future. These discoveries, coupled with the discoveries of gas in Pakistan and oil and gas in different parts of India, have shown that deposits of commercially recoverable oil are more widespread in the world than it was thought previously.



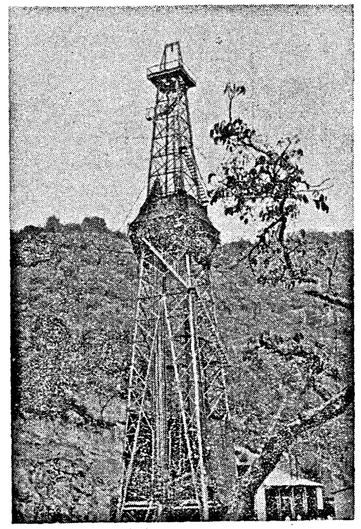
Burning gas at the drilling site in Jawalamukhi

Apart from political considerations, the reserve position and production cost of each area together with technical and quality considerations, largely determine how the rising demand for oil in the 1960's will be divided between the different producing areas. The production-reserve ratio gives some indication of the reserve strength of a producing region and the average production a well gives a rough idea of the relative production cost. At present, the proved world oil reserves are equal to about 40 years' production at the 1959 rate, but this world average includes a production reserve-ratio of 12 years in the United States, 108 years in the Middle East, 18 years in Venezuela, 70 years in Indonesia and 30 years in Russia. Similarly, the annual average production of each producing well is 600 tons in the United States, 3,300 tons in Russia, 7,600 tons in Indonesia, 15,500 tons in Venezuela and 184,500 tons in the Middle East as a whole, rising to almost 500,000 tons a well in Iran and Iraq. The Middle East has both the highest production-reserve ratio and the greatest output a well and, additionally, the oil there is located close to deep water, whereas in the United States, more and more costly drilling is required for technical and other reasons and the wells are often in comparatively inaccessible places.

Oil Prices

Although the proportion of reserves in the hands of the eight biggest international oil companies is still formidable today, it was greater ten years ago when they controlled 100 percent of the oil in the Middle East and about 95 percent in Venezuela. This explains why, until recently, the companies were in a position to limit the development of reserves to a rate which would not upset the market as there were few of them and most of them had much to lose if they expanded too fast. The pattern tended to be determined by the respective market share of each of the companies in the consuming countries. In the aggregate, these shares tended to remain reasonably constant. Thus there emerged, although it was never explicitly established, the pattern of supplies from producing countries which was considered generally acceptable. Secondly, these conditions permitted a price policy which made crude oil production in Venezuela and in the Middle East exceedingly profitable. The world market prices to which newer oil regions were geared, were those set by the United States, a high cost area with Government-sponsored price maintenance. Although the companies did compete—essentially, they did not compete on price—their prices were geared to the level of high cost crude oils without direct reference to their own lower cost.

The fact that international oil was, for a long stretch of its history, almost a U.S. and British preserve, was a historical accident. The Americans were the first to have a persistent oil surplus, the British had no oil, but were the first to obtain command of oil abroad. A change was bound to come. The two countries could not hope that they should for ever be purveyors to the world of oil which they find and develop in countries which are not their own. The rapid increase in the volume of business together with the high margins to which the oil companies, the Governments of producer countries and shareholders had grown accustomed, could not have continued indefinitely. The very magnitude of margins earned in Venezuela and the Middle East gave rise to claims by producer Governments for bigger, and yet bigger share, in them, and it has encouraged other enterprises, private or Government-backed, to enter the field. The French Government promoted with considerable success the search for oil in the Sahara through a complex mixture of public, private and mixed companies combined with various forms of financial aid. Mexico, where the oil industry was nationalised before the second World War, also made spectacular strides. In Italy, the State-owned E.N.I. has become an international oil enterprise. In Venezuela and Libya medium-sized (mostly American) companies have found a good deal of oil which is expected to have low cost. The advent of newcomers, who are inevitably in more of a hurry than are well established companies, and the desire of the purely consuming countries to reduce their foreign exchange expenditure by finding their own oil, has introduced more intense competition. The policy of the international oil companies which tended to maximise unitary profits rather than the global net profits, has ended by recoiling on the group because it has attracted a large number of new operators on to the market.



The drilling site in Jawalamukhi

State and Oil Enterprise

During recent decades of the present century, State interest in the oil industry has also been taking shape and developing. What is important is to appreciate the gradual change which has taken place in the relationship between the State and the oil industry. Before the second World War, there was no difference to speak of between State oil policy and that of the major oil companies. At any rate, as far as the great powers are concerned, they unreservedly backed up the endeavours of the companies with the weight of their diplomatic and military forces. The major companies assumed all the risks and responsibilities and as a result, all the power deriving from the control of the market. They were the only ones to bring in capital and the technical know-how. The concession system was set up under which the company explored and developed the

An industry as basic to the public welfare as electric supply is now compelled by circumstances to switch quickly away from a material which has to be imported from abroad (frittering away scarce foreign exchange) and which costs a pretty penny...

DIRECTOR OF PUBLICITY, GOVERNMENT OF MAHARASHTRA, BOMBAY.

On towards progress...

India Steamship Co., Ltd., has a steady record of progress... Since Independence, its tonnage has increased from about 85,000 D.W. tons to over 200,000 D.W. tons—more tonnage being still on order.

Its services are also extending to various trade routes. After initial consolidation in the India-U.K.-Continent trade—the Company entered the Indo-Soviet service to the Russian Black Sea ports in 1956 and later to Rumanian ports. In 1959 the Company forged still another link in the overseas with South America, and in 1960 it extended its service to Poland.

Their experience and reputation for fast, efficient and dependable service built on the personal care given by their experienced officers and crew to the cargo entrusted to them, have earned them the goodwill of their customers.

fields with the minimum of obligations and controls imposed by legislation which generally was inadequate to look after the country's economic and social interest. In consideration for exploiting these reserves, the grantor country received a bare lump sum, and only later, a fixed royalty in each unit produced. The case of Iran is an apt example to quote. During the second World War and since the principle that the State is entitled to a share in the concessionaires' profits has asserted itself first in Venezuela and then in the Middle East with the adoption of the 50:50 system, the grantor countries became interested in and affected by the level of production and the level of prices as well. Of late, many arrangements have been arrived at where profit-split has been even more than 50 percent in the case of grantor countries and substantial bonuses have been paid for the grant of concessions in many parts of the world. In view of the growing importance of energy, in general, and of petroleum in particular, the next stage is going to be one of growing national interests in the oil industry and State entry into the business of oil. There is already evidence of this process of evolution, and it would be in the interest of every party if the historical and economic forces working behind this evolution are recognised and understood.

State Venture in India

India is no exception to the processes of history and economic forces. In fact, some of the economic forces operating here are such as are apt to accelerate the process of this evolution. At present, India spends about Rs. 100 crores a year which is equally divided between the imports of crude oil and refined products. On the basis of the anticipated demand in 1966 which may be of the order of 14 million tons a year, the amount of foreign exchange expenditure may well double itself. In addition, such imports would mean continued dependence of the country on certain foreign oil companies or foreign countries and, to that extent, the planned development of the country will not be possible without, in some measure, tying it to such countries or companies. Immediate concerted actions are, therefore, necessary to prove and use domestic sources. The problem is simply to find more and more oil. There are some who are prone to argue that, in view of the foreign exchange burdens, curbs should be applied on the growth of demand in order to save foreign exchange. This argument is fallacious; it would be unwise not to allow demand to grow naturally, but instead to apply artificial curbs. This will be a self-defeating measure: by stifling growth one would only stifle the creation of sources of industrial wealth and consequently, of earning foreign exchange.

Indigenous production of crude oil in India is hardly 500,000 tons at present, and with exploration of the new oilfield in Assam jointly owned by the Government and Burmah Oil Company, the reserves already established are expected to yield about 3 million tons a year. Therefore, new reserves have to be established quickly enough to sustain by 1965 a production of crude oil of the order of about 15 million tons, and 35 to 40 million tons by 1975. Oil and gas reserves had been known in India for many decades and the first well was drilled some 70 years ago. India has great known natural wealth, but as the country has by no means yet been properly surveyed, her natural wealth may be considered larger than already known. This gives confidence in the future, but is of little avail in the immediate period unless, of course, circumstances are created in which both external and internal help may be obtained to assist future development.

Growth of Public Sector

The growth of the public sector in oil in India, therefore, stems from purely economic and strategic considerations. Since the close of the second World War, the upsurge of nationalism brought about within its fold an ever increasing tendency to develop resources, local industrial skills with a view to undertaking economic activities themselves. In 1956, a mission was sent abroad to Italy, France, the U.S.A., Mexico, Britain and Russia to study the growth of the oil industry in the State sector as well as under the aegis of the oil companies. The first thing which impressed the mission were the words of the founder of an international American oil company, Mr. W. L. Mellon, who observed that the way to compete was to develop an integrated business which would first of all produce oil, and that production had to be the foundation of such a business. Such developments, apart from the growth of oil technology and business in the communist countries of eastern Europe, have been evident in countries like France, Italy, Argentina, Mexico and Egypt. In some countries, an attempt to supervise the operations by the Governments by means of legislative and administrative measures is noticed. In others, there is an attempt to get hold of the sources of supply through setting up public enterprises and also to ensure that thus there is an effective instrument through which an oil policy, more in keeping with national interests, can be carried out. This, for instance, is the case in Italy where a big public undertaking has been formed capable of operating in every phase of the oil industry. E.N.I. has offered countries, starting with Iran, better contractual terms than usually offered by the international oil companies; it has also given them the opportunity of sharing, on terms of full equality, in the exploitation of their resources and sales in the development of their own economies. This Company has, therefore, created a new set-up based on direct co-operation between producer and consumer States. In setting up this precedent, E.N.I.'s president, Mr. Enrico Mattei, said as follows: "The sharing of the countries possessing the oil reserves in the exploitation of the fields discovered meets the indisputable economic needs of these countries, recognising them as fully mature nations. A wider application of similar principles, accompanied by a due regard for the interests of the consumers, would bring the oil industry more up-to-date and in keeping with the spirit of the times, making it an effective instrument towards a safe and prosperous future."

The question which arises and which has been asked many times and answered in different ways by different people is: should an under-developed country make investments in oil exploration programmes, thus dissipating a portion of its resources which could be used for more secure industrial enterprises? There are some whose advice to developing countries would be not to dissipate their scarce resources in oil exploration, but to leave the search for oil to the skills and abundant resources of private international oil companies. According to their argument, the problems inherent in oil exploration and development are (i) the risk element involved in a search for oil, (ii) the technology, skill and experience and diversity of judgment which together increase the chances of success, (iii) the heavy initial investment which must be incurred, (iv) where exploration is successful and development proceeds, the continuing financial requirements to develop, maintain and expand production is likely to absorb the large part of funds generated in the course of operation even after production is well established. The entry of the private capital of the international companies is advocated on the ground that they are used to taking risks, their financial resources are substantial, they have the advantage of having developed technical skills and trained personnel and their technical competence is drawn from wide experience.

Advancement of Technical Skills

This judgment, as it is found from the experience in India, suffers from some basic fallacies. Advancement of technical skills during the last

decade—particularly in the field of geophysical investigations—has considerably reduced the element of risk. At any rate, the risk element is not such as may not be susceptible to calculation in a reasonably precise measure. On the contrary, it is found to be amenable to calculation. It has been this country's experience that the quantum of infructuous expenditure, which may have to be incurred till the possibility of finding hydrocarbons in a sizable area is exhausted may—according to the estimates of some of the private oil companies themselves—be of the order of about Rs. 2 crores. This is an investment which a country of the size and resources of India can and should afford in all its promising areas, if the goal of self-sufficiency is to be achieved. The bulk of the investment is made to develop and exploit the fields; this investment is apparently a secure one and must not be taken into reckoning as far as the risk element is concerned. Hence the argument about the alleged colossal uncertainties of oil exploration and of heavy investments after the stage of discovery is not tenable in the context of Indian conditions.

In a recent study made for the World Bank it has been estimated by an expert that the cost of producing one barrel a day of oil averages out to $1,800. This appears to be a very high figure and is not supported by Indian experience even in an area like Assam which is difficult and expensive to operate. The argument about the technical skills and diversification of experience and judgment, too, has been over-emphasised. It has been found that within the space of half a dozen years, it has been possible for India to build up a fairly sizable technical personnel and train this geological and geophysical teams and drilling crews. An idea of their accomplishments, in physical terms, will be given in a subsequent paragraph. A significant factor in examining the need for the entry of the private capital of international oil companies to the exclusion—or partial exclusion—of indigenous effort has to be the peculiar economic and industrial potentialities of a country, as also its economic policy. It can be argued in the case of an utterly under-developed country but having reasonable prospects of possessing oil-bearing areas that since local skills are non-existent, a lot of effort will need to be made and a lot of time will have to be expended to establish natural agencies for oil in exploration ventures. But in a country like India where technological advances in various industrial and engineering fields are taking place day after day and where the peculiar consumption pattern assures a ready-made market, there is no reason why national efforts should be lacking.

Oil and Natural Gas Commission

It was as a result of the foregoing consideration that the Oil and Natural Gas Commission was established in August 1956 (later converted into a statutory body by an Act of Parliament in October 1959). Many people doubted the wisdom of the Government in taking up oil exploration at taxpayers' expense and entertained serious doubts about the ability of the newly-formed Commission to get the man-power requirements for such a venture, especially as there was no background of experience at that time. However, the Commission was able to go ahead with the recruitment of the technical and other staff. It was understood that the proposed programme of oil exploration could be fulfilled only with the help of a large number of specially trained personnel. It was decided to recruit a number of graduates and post-graduates in geology, geophysics, mathematics, physics and engineering and to give them intensive training in the various methods and techniques of oil exploration. Steps were also taken to impart training to Indian officers by attaching them as understudies to foreign experts in India and also by training in other organisations in India and abroad. The geologists and geophysicists who were given intensive theoretical and practical training in 1956-57, were grouped into seven geological parties, seven gravity-magnetic parties and five seismic parties. These parties were increased to 20 geological, eight gravity-magnetic and nine seismic parties during 1959-60. Initially, the Commission had three deep rigs; at the end of the year, there were ten deep rigs in operation.

In the Cambay, Jawalamukhi and Hoshiarpur areas, where, for the first time, deep exploratory drilling was undertaken, abnormal and unexpected conditions, like high pressures, high temperatures, frequently alternating hard and soft formations, heavy shales, blow-outs, etcetera, were encountered. Although the Commission's drillers were mostly new to the job, these difficulties were tackled satisfactorily with the assistance of the Russian and Rumanian technicians. In Cambay and Ankleshwar, the Commission has so far met with more success than most of the oil exploration activity in the world.

Exploration Successes

The first well in Lunej near Cambay struck oil and gas under high pressure between 5,000 feet and 6,000 feet of depth in September 1958 and oil was also struck in May 1960 in the first test well drilled in Ankleshwar, and again in December 1960, oil was struck in the second well in Rudrasagar (Assam). This is likely to constitute a record as it is not uncommon that in virgin areas, several wells have to be drilled before striking oil or natural gas in commercial quantities. It is interesting to note that recent tests of the few other deep wells in Cambay and Ankleshwar have given very encouraging results. Some gas and oil were also found at a depth of about 500 feet in a shallow well drilled in Versad near Baroda.

The discovery of oil in Cambay and Ankleshwar has made it necessary greatly to intensify the drilling operations in those two fields in order to obtain production as quickly as possible. Also, it is considered necessary to intensify the exploratory drilling activity in the other parts of the Cambay region, in order to discover more fields if possible. The discovery of oil in Rudrasagar has, likewise, made it necessary to increase the tempo of drilling work in the Brahmaputra Valley considerably. Although the activities of the Oil and Natural Gas Commission have not yet reached the production stage, the Commission has been able to establish the existence of oil and gas in Gujarat, in Cambay and Ankleshwar. It proposes to start trial production of crude oil at the rate of approximately 1,500 tons a day from Cambay and Ankleshwar oilfields during the last quarter of 1961. After the trial production for some time and with the drilling of more production wells, it will be possible for the Commission to work out in detail the total extent of the two oilfields and possible reserves in them. A large volume of surface and sub-surface geological data have been collected by the Commission in the various parts of the country. During the past years in which the Commission has been carrying on the exploration, three oilfields have been discovered—the Lunej, the Ankleshwar and the Rudrasagar fields. Efforts are being made to produce oil from these fields as early as possible. In the Ganga Valley, a considerable volume of geophysical work has been carried out. A structural hole for geological information in Ujhani near Badaun in U.P. was drilled. A seismic party from West Germany, under an aid programme, is also working along with the Commission's personnel in the eastern parts of U.P. and Bihar.

Elaborate Exploration Plans

The progress of exploration by the Oil and Natural Gas Commission has been gaining an increased tempo. Elaborate plans for intensifying the activities of the Commission for exploration, development and production have been formulated for the third five year plan. The oil exploration work involves the expenditure of a large sum of money and unless the exploratory efforts are distributed over a considerable area, the chances of striking oil and recouping the loss will be meagre. The Government of India has proposed a sum of Rs. 115 crores for the oil exploration work in the public sector for the third plan. The Oil and Natural Gas Commission will naturally enlarge its activities in the coming years and it is hoped that by the end of the third five year plan, India will be able to find enough reserves of oil to produce at least a major part of her requirements.

During the past years, the Commission faced many difficulties, particularly due to the inadequacy of technical and administrative personnel, procedural delays in the undertaking of projects, and the late arrival of some urgently needed equipment. With the ever-increasing tempo of oil exploration which visualises putting into operation, during the third plan, something like 25 geological parties, 18 gravity-magnetic parties, 30 seismic parties and 50 drilling rigs, the training and research have assumed greater importance and steps for the immediate establishment of a separate Research Wing in the Oil and Natural Gas Commission for looking after these aspects as a prime necessity have already been taken. The Oil and Natural Gas Commission has already set up laboratories in Dehra Dun headquarters and also at the various drill sites for day-to-day operations. Time has now come for undertaking research of an applied nature for the correlation and interpretation of various technical and scientific data on a comprehensive scale.

The policy of the Oil and Natural Gas Commission is to attain self-sufficiency in terms of geological, geophysics, seismic electrologging and drilling work. For this purpose, on-the-job training is given by foreign experts who are employed for suitable periods. Departmental schools were started at drill sites in Jawalamukhi and Cambay to impart theoretical and practical training in oil well drilling, etcetera. A number of officers have been and are being sent from time to time for training under the various aid programmes to foreign countries and recently the Commission has sent 62 officers for specialised training in various fields of oil technology in Russia.

Seeking Foreign Collaboration

In spite of the ambitious programme which the public sector has set for itself in the field of oil exploration, it is clear that, in view of the largeness of the sedimentary areas in the country and the growing demand, there is a gap between what can be achieved through the public sector and what the country may need in the form of petroleum products. It is, therefore, the Government's avowed policy to seek collaboration of international oil explorers. This is not a new policy nor does it constitute a shift from the earlier policy. The Industrial Policy Resolution of 1956 contemplates association of private capital in oil ventures if national interests so warrant. It was after 1956 that negotiations with the Burmah Oil Company resulted in the signing of an agreement which promoted the incorporation of a joint company in partnership with the Government. It must, however, be understood that any collaboration with private companies has to be related to the national objectives and policies. This brings one to the consideration of a vital issue which needs to be resolved in any scheme of collaboration—namely, participation. The international companies had for long been accustomed to working in isolation, because more often than not, the only interest of the producing countries was merely to collect revenues from the operating companies. Times have changed and the producing countries are becoming more and more convinced of the need for their own participation in oil ventures. How else are these countries going to develop their skills, learn to manage oil affairs and also to be convinced that the operations are really compatible with the national objectives and policies? Some of the producing countries have even had the unfortunate experience of mortgage licences, which enabled the private companies to keep substantial acreage with them, but in an undeveloped state, for strictly commercial reasons, which were surely incompatible with national objectives. During the past few years, there have been witnessed some arrangements which contemplate sharing of control and responsibility by the operating company with the Government of the producing country. These arrangements have worked to the satisfaction of both parties, and there is no reason why more and more such arrangements should not be arrived at. These arrangements will generate goodwill and both parties will benefit from this.

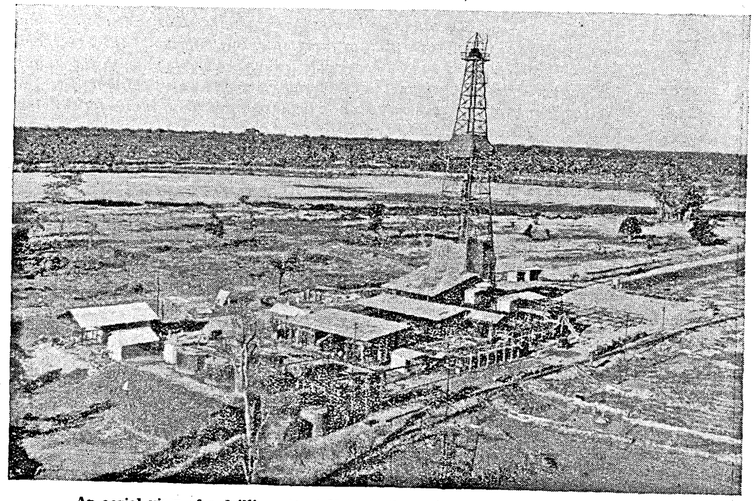
Progress in Pipeline Construction to Transport Nahorkatiya Crude

Latest Equipment Being Installed

THE ordinary pipeline provides a highly specialised transport facility. It is fixed after a consideration of geographic location, for oil cannot be moved from one area to another with shifts in traffic pattern as a tanker or a lorry can; it is entirely dependent on either crude or products and is not multipurpose as a railway system; it serves a few customers and as such the heavy investment involved demands a high utilisation of capacity. But when large quantities of crude or products have to be moved over a long distance, trunk pipelines offer one of the cheapest modes of transport. All other types of carriers—whether they are tankers, tank wagons or lorries—involve the "breaking" of the crude or product into "lots", so the per unit costs are higher than in pipeline transportation. Figures quoted by Messrs J. G. Maclean and R. W. Haigh in their study entitled *The Growth of Integrated Oil Companies* show that to transport crude by pipeline from Scurry County Texas to Bayway New Jersey—*just over 1,600 miles*—the cost a barrel by pipeline was in 1951 Rs. 3.74 (78 cents) and by railroad Rs. 13.58 ($2.83). Further economies, that is, lower unit costs can be obtained by an increase in the diameter of the pipe, which means raising the capacity.

With this basic background in the economics of pipeline operations, it is easy to appreciate the



An aerial view of a drilling rig at Nahorkatiya on the banks of the Burhi Dhing

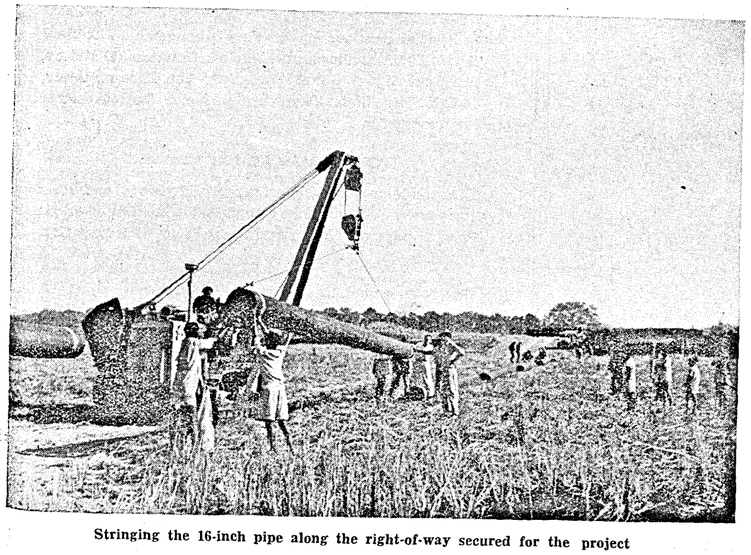
By

A SPECIAL CORRESPONDENT

advantages of using pipelines. The first crude oil pipeline was laid by Samuel Van Syckel in 1865 which moved 1,800 barrels a day at a cost of $1 a barrel; by 1900, there were 18,000 miles of crude pipelines in the U.S.A. Sixty years later, this figure rose to 160,000 miles for crude and 45,000 miles for products. For the world as a whole (excluding the Russian bloc), trunk pipelines in 1956 amounted to 302,000 miles which include crude, product and natural gas lines.

Oil India Pipeline Project

While deciding to construct a pipeline, the experts have to consider the reserves of the oilfield; the viscosity of the oil; the change in its flow characteristics with alterations of temperature and the maximum and minimum temperatures which the crude will encounter in its journey. This type of basic analysis was undertaken when Oil India Private Ltd decided to build its 720-mile pipeline from Nahorkatiya to Barauni. B.O.C. (Pipe Lines) Ltd has been delegated the responsibility to design and construct the pipeline and also to operate it for a period of one year after completion. Messrs Mannesmann A.G. of Dusseldorf and Saipem of the E.N.I. Group of Italy, have formed the Manesmann-Saipem Pipeline Contractors to lay the pipeline under the supervision of the B.O.C. (Pipe Lines) Ltd. Assam's trunk pipeline is being built in two sections: the Nahorkatiya-Nunmati section, which is about 255 miles, has 16-inch pipes, supplied by Stewarts and Lloyds of England; the Nunmati-Barauni section has a length of 465 miles and will use 14-inch pipes which are partly being supplied by Hindustan Steel. The terrain over which the pipe is being laid presents a number of hazards such as 78 river crossings, including major crossings such as the Brahmaputra in Gauhati.



Stringing the 16-inch pipe along the right-of-way secured for the project

Three Spreads

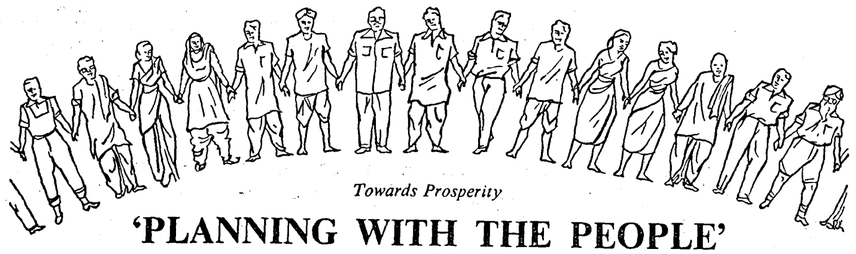
A right of way of 60 feet width has been obtained to move heavy equipment. The cost of land may vary from Rs. 5 lakhs a mile for tea garden areas to Rs. 15,000 a mile for agricultural land. The first section of the pipeline is being laid in three spreads, A, B and C. Spread "A" is working down from Nahorkatiya to Badulipar, spread "B" from Nunmati to Sekoni and spread "C" from Badulipar to Sekoni. A spread is a self-contained unit in machinery, manpower and transport and everything is geared for speed and mobility. Spread "B", for instance, has 16 side-boom tractors; 35 welding machines; 12 Mercedes lorries; 11 International lorries; five bulldozers, two wrapping machines; two pruning machines and two Cleveland ditchers, apart from numerous other smaller machines. The main camp of the spread which may have about 60 foreigners and over a thousand Indians and covers housing facilities, workshop, up-to-date cooking arrangements, can be moved in 15 days from one point to another.

The pipe corresponds to the A.P.I. grade of 5LX-46 which has a wall thickness of 0.312 in. and for sections which are subjected to higher external stresses, the pipe's thickness is 0.469 in. or 0.375 in. Careful check is made of welding jobs by a specialist team from Solus Schall, London, which uses a radio isotope to detect faults. Roughly 10 percent of the welded joints are checked but all the river crossing joints are examined.

Cathodic Protection

An important part in pipeline operations is to prevent external corrosion which is associated with the flow of electric currents. Corrosion control is effected by insulating the pipe by coating it with bituminous material and by ensuring that the pipe is always at a slight negative potential compared with the surrounding soil. The latter technique is known as Cathodic protection. These methods are being used for corrosion control of the Nahorkatiya pipeline.

An important feature of the pipeline is the degree of automatisation by which its operations will be conducted. The pipeline will be one of the



Towards Prosperity

'PLANNING WITH THE PEOPLE'

Planning like Democracy is a joint enterprise : Government of the people, by the people and for the people. But that is not all. Togetherness in ambitions and endeavours can be best achieved by Government with the people. West Bengal has been reconstructing herself out of the economic ruins of the past, with slender resources but plenty of will to bring about a higher standard of living for all the people in all the places. This welfare State within a short span of eleven years has achieved a good deal, which we can be proud of, and a lot more remains to be done, which we are striving for. Let us all dedicate ourselves to the task of building a New India and a New Bengal. The dream will soon be fulfilled when we are together—a Government with the people—

to build a

A "CRC" coating and wrapping machine at work

world's largest remotely controlled crude pipeline working in a difficult terrain and with a highly viscous crude. It will have the most up-to-date telecommunication, telemetering and telecontrol equipment. At each of the eight pumping stations located at an average distance of 90 miles, precise instruments will measure all important data such as pressures, temperatures, flow rates and engine speeds, and indicators will show the various states of equipment or other quantities (*e.g.*, high-low and on-off). These instruments and indicators will provide signals which will be transmitted from each pump-station to the despatcher's office in Nunmati. The speed of this process can be gauged by the fact that in about 12 seconds, the despatcher can observe instrumentally and accurately the whole operational state of the pipeline. The Oil India Pipeline project has chosen radio communication because of the climatic hazards in the region. The system includes a V.H.F. trunk radio network, which will have 17 repeater stations and up to 36 speech channels ; a H.F. standby system ; and a V.H.F. mobile maintenance radio.

Characteristics of Nahorkatiya Crude

Another difficult part of the study has been the characteristics of the Nahorkatiya crude. It has an A.P.I. gravity within the range of 34° or 34.9° (specific gravity 0.85) ; a pour point (the lowest temperature at which the oil will flow) of between 85° Farenheit and 90° Farenheit and a wax content of about 14 percent. It has been found that haphazard cooling gives rise to waxy gels which may be quite solid at 72° Farenheit and since the soil temperature can go below the pour point, the crude will become difficult to pump. Hence a special conditioning plant is being manufactured by Whessoe Ltd of Darlington, England, the object of which will be to heat the crude, then control the rate of cooling whereby the wax crystals will be held in suspension and the crude will remain pumpable down to a temperature of 65° Farenheit.

The cost of the pipeline is expected to be about Rs. 5.76 lakhs a mile, while the overall cost is put at Rs. 44 crores, of which the foreign exchange component is about 43 percent. A substantial saving is anticipated by using the Brahmaputra railway bridge to carry the 14-in. crude line. The 14-in. line will be covered by a 16-in. casing pipe and the annulus will be pressurised which will control valves at either end. In the event of an accident, the pressure will fall and the valves will close automatically. The major heads of expenditure are : pipe 22.8 percent ; mainline construction and demarcation 19.0 percent ; the pumping-generating plant, valves, fittings and conditioning plant 17 percent ; river crossings 3.2 percent and telecommunication-telemeterin[illegible] and cathodic protection 4.3 percent.

Drilling Time Reduced

The pipeline contractors have completed a major portion of their job. But the men have also to meet their target of having enough production wells to produce the required quantity of oil. In the second week of May, Oil India had spudded in its hundredth well. Figures show that the average drilling time to the depth of between 9,500 feet and 10,500 feet has been reduced to about 11 days a well which gives an average penetration rate of 900 feet a day. Out of 85 wells completed in Nahorkatiya as on 13th May, 1961, 61 wells contained oil ; seven gave gas ; seven were dry and ten were to be tested. In Moran, out of 13 wells, seven produced oil ; one gas and five were dry. With the present number of wells, Oil India can produce about 2 million metric tons of crude a year and its production capabilities will increase to between 2.75 million and 3.0 million metric tons by the time the Nunmati and Barauni refineries go on stream. These development wells alone do not solve the production problem, for the crude in its raw state has a large amount of gas associated with it. For this, special and intricate equipment is being installed in seven or eight oil-collecting stations which will, on average, handle 18 wells and have a capacity up to 11,000 barrels a day. The horizontal gas separators used at these stations are designed to reduce the oil pressure from up to 1,500 lbs a square inch to about 30 lbs a square inch with less than 2 percent gas. The handling techniques of the O.C.S. are unique in that the crude will be collected by the station and pumped direct into the trunk line.

The story of Assam oil is steeped in history ; shallow wells were drilled in 1866. Well No. 1 was completed in November 1890 and in 1899 the Digboi refinery was projected. Since then, 998 wells were drilled in the Digboi field producing about 9 million tons of oil. The refinery—the oldest in the Indian union—had an initial capacity of 500 barrels a day, and it has been expanded to 8,500 barrels a day. The oilfield and the refinery have provided job opportunities for the local inhabitants and have increased the wealth of the State. With the Nahorkatiya find in 1953, a fresh spurt has been given to Assam's oil industry, for more wells are being drilled and a highly automatised pipeline is being laid. Besides, a second refinery will be on stream by the end of the year and a new industrial complex will be built around the natural gas which is associated with the crude produced. Some of the industries to come up include a fertiliser plant ; a thermal plant near Namrup ; a synthetic rubber plant ; a carbon black factory ; a cement factory and a proposal to use the gas as fuel for industrial and domestic purposes. The Zaloni power-station is already at work producing electricity by means of three English Electric gas turbines. With these developments, Assam's prosperity will be further enhanced.

Ships' main turbines can be repaired at

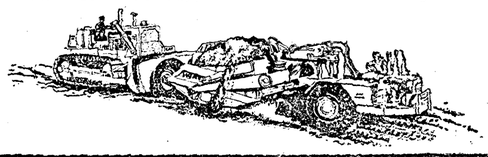
DAIRY & REFRIGERATION

Pioneers in dairy engineering, L & T have helped to plan, and install 44 modern dairies all over India. Today, L & T also manufacture various items of dairy and refrigeration plant and equipment

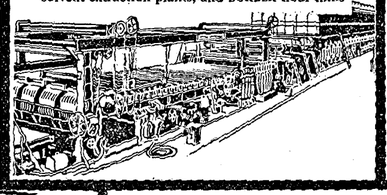
EARTHMOVING & AGRICULTURAL EQUIPMENT

L & T have supplied to various projects earthmoving, land-clearing, excavation, logging and dredging machinery—CATERPILLAR Tractors, Bulldozers, Dumpers, Scrapers and Motor Graders; JOHN DEERE Wheeltype Tractors; HENSCHEL Locomotives; COLES Cranes; HYSTER Fork Lift Trucks; and PRIESTMAN excavators and dredgers



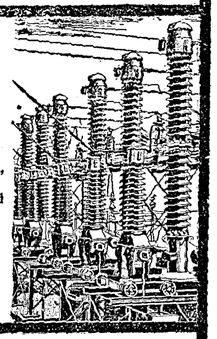
HEAVY PLANT

Paper machines manufactured by J. M. VOITH have been supplied to a number of Indian paper mills. Among other heavy plants supplied by L & T are NIRO Atomizer plants; CHEMIBAU sulphuric acid plants; ROSE, DOWNS & THOMPSON solvent extraction plants; and BUHLER flour mills



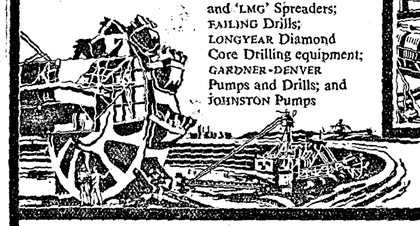
ELECTRICAL EQUIPMENT & SWITCHGEAR

L & T supply for hydro-electric and thermal power stations, substations and distribution installations, high quality electrical equipment manufactured by ESCHER WYSS, OERLIKON, HAEFELY and NORDEN; and LK Switchgear now manufactured by L & T at Powai



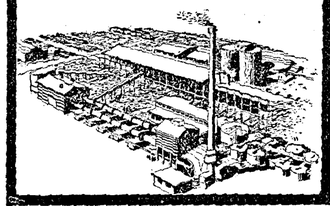
DRILLING & MINING

To the Neyveli Lignite Project, and other mining schemes, L & T have supplied 'LMG' Bucket Wheel Excavators and 'LMG' Spreaders; FAILING Drills; LONGYEAR Diamond Core Drilling equipment; GARDNER-DENVER Pumps and Drills; and JOHNSTON Pumps



CIVIL ENGINEERING

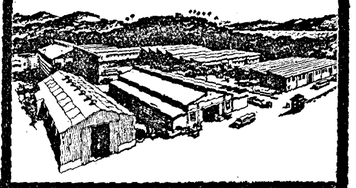
Engineering Construction Corporation Private Limited, a fully owned subsidiary of L & T, has constructed a number of cement factories, notably the cement factory of India Cements Limited at Tinnevelly. L & T, together with ECC, undertakes to do "turn-key" jobs, including all design work, civil engineering and the supply and erection of equipment

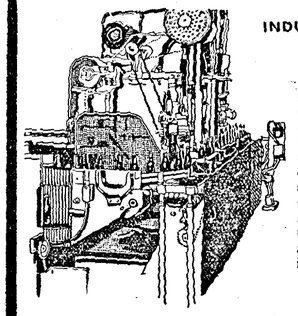


MANUFACTURE

Products manufactured at L & T Powai Works

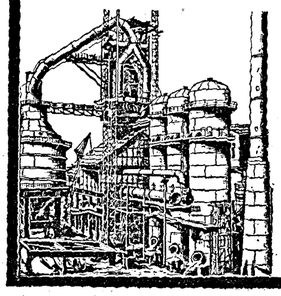
Dairy machinery and refrigeration equipment; solvent extraction plant; switchgear and motor starters; induced draught cooling towers; petrol dispensing and metering pumps; sheepfoot rollers and belt conveyors; stainless steel, copper and aluminium equipment for the chemical and dyestuff, drug, pharmaceutical and food-processing industries; and distilleries and breweries





INDUSTRIAL APPLIANCES

Numerous industrial appliances are supplied by L & T. These include DIAF pharmaceutical machinery; MORGAN FAIREST labelling and tablet strip-packing machinery; DANFOSS automatic refrigeration controls; ELLIOTT, BRISTOL and GORDON process control instruments; DE WALT power saws; EUTECTIC welding alloys; and up-to-date bottling installations



ERECTION

At the Rourkela steel works, L & T have erected 3 Blast Furnaces, a 'Pig' Casting machine, and the Rolling Mill Buildings, involving a total of 63,000 tons of steel work. These are only the more recent of the erection contracts executed by L & T

SERVICING

IN SERVICE L&T LIES SUCCESS

When we coined this slogan, we intended to sum up in a few words our outlook upon the function we perform. We believe that in the world of commerce lasting success comes only to those who are willing and competent to give service, as well as goods, to their customers. By service we mean advice and assistance to those who have engineering problems. We maintain a staff of experts in all our Divisions. Every installation, every piece of equipment we supply is backed by a service organisation designed to keep it working at highest efficiency. Only thus have we a right to hold the position we have always striven to occupy.

Background to the Power Crisis in Calcutta

Policy of West Bengal Government has Much to Answer for

By

A SPECIAL CORRESPONDENT

CALCUTTA has recently experienced a sudden curtailment of power supply. Factories have been asked to draw less power, and to abolish at least one shift or to keep the workshop closed on one of the week days besides Sunday. As a result of this, earnings of the labourers have been reduced. A cut in power supply means loss of productivity, loss of national earning and may ultimately lead to labour unrest. Even the new industries will be scared away out of the State. The situation is really alarming. The shortage of power supply came so suddenly that the general public have been left wondering about the causes for the same. They have a right to know (1) the immediate causes leading to the power crisis in West Bengal; (2) how long the situation is likely to last and whether there is any guarantee that it will not be repeated in future and (3) what steps the West Bengal Government has taken or contemplated to take to prevent its repetition.

It is, therefore, incumbent on all, specially on the leaders of industry and public opinion, to probe the causes which have ultimately led to this crisis so that the circumstances responsible for it may be traced and the State can be saved from the recurrence of similar crises in future. Since this is a matter which vitally concerns the future of West Bengal and her people, the failure of three generating units of the Calcutta Electric Supply Corporation within a period of one and a half months is something rather unusual, especially as the turbo-generating sets concerned are not too old and have been working satisfactorily for several years. It is not known what steps the Corporation took to put back into commission the first unit which went off by the middle of February. The agreement between the C.E.S.C. and the D.V.C. was for the supply of 105 mVA of electricity by the latter, but the C.E.S.C. used to draw about 95 mW only. Even after the D.V.C.'s first unit was put out of commission, it could maintain a supply of about 85 mW. With the fall of the second unit, the D.V.C. could continue to maintain supply up to 75 mW which is about 20 mW less than the normal drawal by the C.E.S.C. Surely, a cut of 20 mW cannot be responsible for the recent cuts in power supply by the C.E.S.C. The immediate reason is that the Corporation's own generating sets totalling about 110 mW went out of order one after another. A probe has to be made to ascertain how a shortage of 20 mW from the D.V.C. grid caused over-running of the sets and the ultimate breakdown of all the generating units of the new Cossipore station.

Less Supply by D.V.C.

A large measure of responsibility for the recent power crisis, it is felt, should be borne by the D.V.C. as it could not keep up the maximum supply agreed to. The West Bengal Government's Durgapur thermal power station also cannot be exonerated of the responsibility either. It is responsible because it too failed to run its powerhouse at full load. If the Durgapur thermal power station had been in service, it could supply enough power to the C.E.S.C. through the D.V.C. grid to overcome the temporary difficulty.

The power generation and supply position in general may now be examined. The C.E.S.C. can claim long experience in administration, generation and distribution of electricity from large thermal power stations. On the other hand, the experience of the newly-formed Durgapur Industries Board in planning, installation and maintenance of a large modern power station is very little indeed. The C.E.S.C. should have been given permission to install additional units of at least 150 mW in total. The power stations were there, and the administrative and operating personnel were ready at hand. Installation of new sets by the C.E.S.C. would have been quicker and it would have saved a good deal of valuable foreign exchange. In fact, the foreign exchange question would have been easily solved, for the shareholders of the C.E.S.C. are mostly in the U.K. and the Corporation could easily have issued new shares there. It is, therefore, felt that the West Bengal Government, by denying permission to the C.E.S.C. to increase the generation of power, has not only ignored the Company's right of generation, its experience and administrative ability, but has probably wasted foreign exchange also.

Broadly speaking, there does not seem to be enough justification for the West Bengal Government's Durgapur Industries Board to install its own power stations in Durgapur or elsewhere. The D.V.C. which has been created as a joint venture of West Bengal, Bihar and the Central Government, solely for the purpose of flood control, irrigation and power generation, could have been entrusted with the generation of further power in Durgapur and elsewhere nearer to Calcutta. It is an obvious fact that two separate power systems are much more expensive and uneconomic than one large power system. Besides, a great deal of energy and finance of the West Bengal Government could have been saved for developing other industries where more people could find employment.

Bandel Power-station Project

From the above points of view, it is doubtful whether the decision of the West Bengal Government to start another super-thermal power station in Bandel is justified. The West Bengal Government opposed the D.V.C.'s proposal for extension in Chandrapura and Durgapur, but at the same time sanctioned Rs. 30 crores for starting a new power station in Bandel. The Durgapur Industries Board, which had as its primary objective the establishment of an extensive chemical industry in Durgapur, ought to have concentrated its energy on starting large chemical plants in that area. It is understood that the West Bengal Government has promised to commission the new Bandel power-station by the end of 1964 consisting of four 75 mW units. The work at site has not been started. It is extremely doubtful whether that station would be ready by 1964, and whether the State Government would at all be able to supplement power demand in Calcutta and the industrial area around it. The real power crisis will come at that time. It is whispered that the West Bengal Government is contemplating to establish two more power stations situated hundreds of miles away from Calcutta. Justification for the latter ventures, if true, is hard to understand, as transmission over long lines will mean tremendous expenditure resulting in increased price for energy.

The case of the Durgapur thermal power station may again be considered. This scheme does not seem to be properly planned and was unduly delayed perhaps due to the inexperience of the administrative body. The officials concerned were over-confident. A certain West German firm was called for unofficial consultation and was entrusted with drawing up the estimate and detailed specifications. Tenders were invited on that basis for the thermal power station. The Durgapur Industries Board placed a turn-key order with that firm and probably thought that it was no longer necessary to obtain any more expert advice. For reasons best known to it, the Board was in great haste to make a package deal with a West German firm and to make the necessary advance payment; it did not even appoint a competent power station engineer before issuing the formal order, and did not obtain formal sanction of the Central Government. As a result of these incompetent and careless actions, it is believed, the supply and installation of the 60 mW thermal power plant in Durgapur was delayed by more than a year. For many months, manufacturers did not even get final technical data and the approval of the Durgapur Industries Board to enable them to proceed with the manufacture of the plant. The original scope of the order had to be altered and prices enhanced. A superintending engineer was appointed in the Board only in 1956. He was entrusted with the entire work of the thermal power station, the formal agreement, technical scrutiny, etcetera. The formal agreement was finally drawn up several months after the order had been placed by the West Bengal Government! The plant was delayed by over one year.

Failure of Durgapur Power Station

What is the position now? The West Bengal thermal power station in Durgapur is even now incapable of generating power to its capacity. On 7th September, 1960, the Chief Electrical Engineer and Electrical Adviser to the Government took over the plants, power station buildings, etcetera, "on completion of trial run for satisfactory commercial operation and satisfactory performance of guarantee tests". One of the turbo sets, however, has been, to the best information available to this writer, damaged and has been lying idle for several months, while the second set is probably running on 30 percent to 40 percent of the load. News of failures at some part or other of the plant has been leaking out, although in reply to verbal queries, responsible

EBSC-45

officers of the Board maintain that the plant is absolutely in perfect order. There is a general hush-hush attitude in the Board itself. No statement has been published until now either from the Durgapur Industries Board or from the Government of West Bengal as to the exact position of power generation in the thermal power station in Durgapur. The various reasons why the whole plant is still incapable of delivering full power have not yet been made public. What is the last date by which the defects will be removed? What steps have been taken to bring pressure on the suppliers of machinery for rectifying the defects in the quickest possible time? Both the main suppliers of the power station are reputed manufacturers in the world and that the firms are quite capable of removing the causes of failure provided the administration is capable of handling the situation. The situation, obviously, cannot be allowed to drift indefinitely.

When the first stage of the thermal plant is not properly working as yet, it is surprising, or rather beyond comprehension, why orders for the extension of two more units, of 75 mW each, which are more than double the size of the first two units, have been placed with foreign suppliers. It is understood that the supplying firms have refused to rectify the defects in the units free of charge. They ought to have been compelled to put the first two smaller units in perfect running condition before being given another order for two more units of double the sizes. The contract amounts to about Rs. 8 crores and it is said that the order was placed without the knowledge of the Board. An impartial commission should be set up to probe the affairs of the Durgapur Industries Board. It should be thoroughly enquired into why the Government of West Bengal has been advised to spend crores of rupees, even by taking loans, to install its own power houses first in Durgapur, then its enormous expansion, again another super-power station in Bandel, and then in Purulia (which is already connected with the D.V.C. grid), Farakka and Gouripore.

The Government of West Bengal is going to link up its Durgapur power station with the proposed Bandel power station and create a separate grid of its own, instead of using the existing D.V.C. grid. It is surprising how and why the State Government started a grid for itself by the side of the D.V.C. grid, throwing all questions of economy to the winds. The West Bengal Government holds a one-third share in the D.V.C.—a national organisation—both in expenses and profit and, therefore, this separation may be a waste of national wealth.

Need for Capable Administrator

Criticisms and apportioning of the blame will not really put the power plant in order. Some immediate energetic action is required. It is suggested that a capable administrator-*cum*-chief engineer should be appointed immediately for the thermal power station. He should be given quite wide powers to execute things. Secondly, the C.E.S.C. should be given permission to install an additional unit of at least of 150 mW capacity. Thirdly, a co-ordinating committee should be immediately constituted, consisting of members from the D.V.C., West Bengal State Electricity Board, Durgapur Industries Board, the C.E.S.C. and the Bihar State Electricity Board to study the availability of power from different sources, load curves of different stations and load requirements month by month in different areas for pooling resources during the emergency period. It should also be ascertained how soon and to what extent power may be available from the Hirakud grid which is going to be inter-connected with the D.V.C. grid and, lastly, an enquiry should be made into the manner in which the orders are being placed by the West Bengal Government with suppliers and why it is so anxious to install new power plants of its own.

Summary

In conclusion, the facts discussed in the article may be summarised as follows:

The maximum demand on the C.E.S.C. at present is about 410 mW, with an annual rate of increase of about 25 mW to 30 mW. The C.E.S.C. has the following generating stations:

Southern station 4×7.5 mW, 4×20 mW, 1×1.25 mW, total 111.25 mW.

Mulajore station 5×30 mW, 1×1 mW, total 151 mW.

Old Cossipore station 2×15 mW, 3×12.5 mW, 1×2.5 mW, 1×2.6 mW, total 82 mW.

New Cossipore station 1×50 mW, 2×30 mW, 1×2.5 mW, total 112.5 mW.

Total installation of the C.E.S.C. 456.75 mW, derated at 438 mW.

Firm capacity is 310 mW; expected supply from the D.V.C., 100 mW.

Recent outages in Cossipore station: one 30 mW unit shut down in the middle of March 1961; one 30 mW or 50 mW shut down in early April 1961; and one 50 mW or 30 mW shut down in middle of February 1961.

The causes of the C.E.S.C.'s troubles are not known; it may be that blades in some set were damaged. One unit is expected to be ready in May 1961. The break-down of the transformer of D.V.C. Bokaro fourth unit occurred on 12th March, 1961. The D.V.C. Durgapur thermal power station broke down several times from January onwards due to troubles in generators, boilers and ancillary equipment. They are still giving trouble.

The agreement between the C.E.S.C. and the D.V.C. is for the supply of maximum bulk energy of 105 mVA or 99mW. The maximum drawal is about 90 to 95 mW at present. When one unit of the D.V.C. was out of order, it supplied to the C.E.S.C. about 85mW. When the second unit of the D.V.C. Durgapur unit went off, the D.V.C. continued to supply the C.E.S.C. about 75 mW.

The West Bengal Government first agreed to supply the D.V.C. about 45 mW. Later on, it reserved about 50mW for other industries and only 7.5 mW was promised to D.V.C. on a permanent basis. The State Government's Durgapur generating station has been connected to the D.V.C. for the supply of an ultimate load of 7.5 mW. The main purpose of the West Bengal Government is to have a reserve on the D.V.C. so that it can sell the total generated power.

Order for the West Bengal Durgapur unit 2×30 mW was placed in 1955 September-October, but the manufacture of the same could not be started before the end of 1956 or beginning of 1957. The power house was commissioned in the middle of 1960.

The West Bengal Durgapur station is, until now, incapable of full generation and supply of the promised load. One set has suffered a break-down and is lying ineffective for several months, probably five to six months. The blades have been broken. One set is giving about 20 mW and the other only 10mW. There are boiler troubles also. It is understood that the suppliers have refused to rectify the defects free of charge and on their own responsibility, on the plea that the troubles have been caused by bad operation.

Some time in 1953, the C.E.S.C. wanted to install a generating station with 2×30 mW sets. Permission was refused by the West Bengal Government on the plea that power would be available from the Bokaro station of the D.V.C. Later on, the C.E.S.C. wanted to install one set 1×50 mW, some time in 1958. This was refused again by the West Bengal Government. The C.E.S.C. again asked for a 1×40 mW set. That request also was turned down by the State Government on the plea that power would be available from the proposed Bandel station. Very recently, probably during the visit of the C.E.S.C.'s chairman to Calcutta, the Corporation requested the Government for sanctioning a 1×40 mW unit which could have been made ready before the middle of 1963. The request was turned down on the ground that power would be available from the expansion scheme of the Durgapur Industries Board even before power supply started from Bandel.

The Bandel power station consisting of 4×75 mW has been sanctioned. Consulting engineers are the Kuljion Corporation. The West Bengal Government hopes to commission the plant by the end of 1964.

The railways wanted about 125 mW for electrification. For this purpose, 1×125 mW was sanctioned by the authorities at a new power station in Chandrapura in April 1958, instead of expanding the D.V.C.'s Durgapur station. The West Bengal Government refused to agree to further extensions of the D.V.C. Durgapur and Chandrapura power stations for supplying power to Calcutta and Asansol areas.

The West Bengal Government has agreed to supply the C.E.S.C., out of Bandel, 125 mW, and 40 mW to the railways when Bandel and Durgapur expansion schemes materialise. The Government contemplates to install two more power stations, one in Purulia and the second in Farakka.

The West Bengal Government contemplates to purchase the Gouripore Electric Supply Company and install another generating unit there.

USHA

EXPORTS CROSS ONE CRORE MARK !

Pioneers in the export of Light Engineering products of India, Jay Engineering Works have once again created history! During 1960, for the first time more than rupees one crore worth of USHA sewing machines and fans have been sold to over 40 countries.

This has been achieved by following a vigorous export policy with the nation's best interest at heart.

USHA Sewing Machines and Fans have been welcomed into foreign homes because they are designed right, built and priced right for any budget.

Durgapur Thermal Power Station

Prestressed Concrete Plank Roofing was adopted for the Durgapur Thermal Power Station because of its lightness thus reducing the cost of the foundation and superstructure. It also made rapid construction possible.

A conventional cast-in-situ roof was ruled out because of the unusual height between roof and floor.

The roof area covered was 50,000 sq. ft. The job was completed in about twelve months.

An additional feature is thermal insulation with foam concrete blocks.

RAISING FERTILISER PRODUCTION IN THE THIRD PLAN

MARKETING AND DISTRIBUTION POSE CRUCIAL PROBLEMS

IT is expected that the third five year plan will fix the fertiliser targets at 1 million tons of N, 400,000 to 500,000 tons of P_2O_5 and 200,000 tons of K_2O. The draft plan indicated these targets for N and P_2O_5 but curiously omitted all mention of potash. This will no doubt be corrected in the final plan. Much thought and discussion have gone into the fixing of the targets. They represent the minimum quantities of plant nutrients which, in the opinion of agronomists, should be fed to India's soils in the shape of chemical fertilisers, in order to achieve the agricultural production targets in the final year of the third plan. The targets are based on the projected repuirements of an increasing population and an expanding economy and on the achievement of self-sufficiency in agricultural production, particularly in foodgrains. It is not to be supposed that the application of fertilisers on however large a scale will by itself solve India's agricultural problems. An assured and adequate water supply is no less important. Investments in irrigation and fertilisers need to be safeguarded by the use of good seed and the adoption of suitable plant protection measures and cultivation techniques. Experience in India and abroad shows that the systematic use of fertilisers is the starting point of scientific crop husbandry and leads to a series of technical improvements in agricultural practices. Given adequate encouragement in the shape of credit and marketing facilities and stable prices, the improvements effected by the use of fertilisers can transform subsistence

By

C. R. Ranganathan,

Executive Director, The Fertiliser Association of India

farming to profitable commercial farming and play a major part in rural regeneration.

Under-fertilised Land

Mr. Jonathan Garst pointed out that the land in India is not over-populated but under-fertilised. He wrote about this before the staggering increase in population was shown by the recent census, but the proposition is still true. India cultivates a larger proportion of her land surface than any other country, but her yield an acre is the lowest in the world. Her soils have been impoverished by continuous cropping over long periods without any adequate restoration of plant foods. Their productivity cannot be raised except by adding through chemical fertilisers.

The word "fertiliser" is a generic term which includes a large variety of chemical substances, each of which conveys one or more plant nutrients to the soil and through it to the crop. Of these nitrogen, phosphorus and potassium are classed as major nutrients, because they are the elements which are removed from the soil in the largest quantities through cropping. If agricultural yields are to be maintained, they must be restored to the soil in an adequate quantity to make good the drain. If yields are to be raised—and this is the crux of the problem in India—the nutrient elements must be applied to the soil in larger quantities, the limit being set by the capacity of the crop to absorb them. When adequate water supply is assured, new varieties of cereal and other crops can be produced, which can stand high fertilisation and offer high yields. Fertilisers and water are thus the basic requirements for raising agricultural production.

Solid Substances

It is convenient and technically meaningful, but uninformative and sometimes misleading, to talk of 1 million tons of N, 400,000 tons of P_2O_5 and 200,000 tons of K_2O being applied to India's soils by the end of the third plan. This is merely a symbolic language, and not very accurate at that, because it is not possible to add either nitrogen or the oxides of phosphorus or potassium as such to the soil. These nutrients have all got to be applied in the form of solid substances—usually salts—either individually or in combination or in the form of mixtures. Liquid fertilisers are

being used to some extent in the United States, but it will probably be many years before they are used in India.

The kind of nitrogenous or phosphatic substances which should be produced to fulfil the fertiliser targets assumes importance from the agronomic and economic points of view. It is obviously necessary that the fertilisers produced should be convenient to store and handle, be cheap to produce and transport, have no harmful effects on the soil and at the same time help increase the yields. Besides, the dependence on imported raw materials should be reduced to the minimum. It is not easy to balance all these considerations. A compromise has often to be made and in the present situation, the decision is naturally influenced by the pressing need to economise on the expenditure of foreign exchange. In effect, this means avoiding the use of sulphur to the extent possible. There is at present no escape from the need to import rock phosphate because no indigenous phosphatic mineral has yet been discovered which can replace it economically. Similarly, India must continue to import muriate and sulphate of potash for the lack of adequate indigenous potash resources.

Advantage of Nitrophosphates

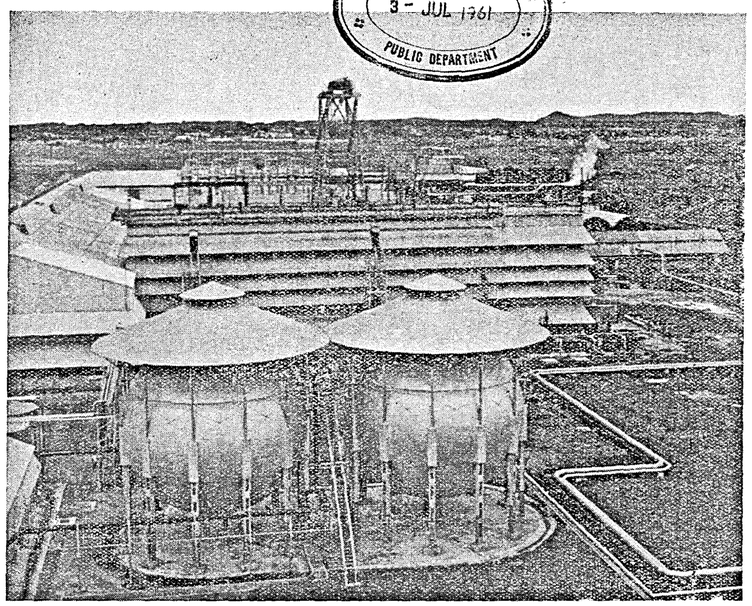
Arising out of the need for reducing the use of sulphur, a class of fertilisers known as nitrophosphates has been developed in Europe and America, based on dissolving rock phosphate in nitric acid, instead of in sulphuric acid. The advantage of nitrophosphates is that they are complex fertilisers delivering both nitrogen and phosphorus and that they can be made without using sulphuric acid. Their main disadvantage is that the phosphate present in them is either partly or wholly insoluble in water. Another type of complex fertilisers, namely, mono-and di-ammonium phosphates, has the merit of being completely water soluble but requires the use of sulphuric acid. In recent years, the nitrogenous fertiliser urea has gained in popularity as its synthesis requires no extraneous raw material and its agronomic value has been found to be satisfactory.

The discovery of natural gas in Assam and the development of large refineries in Trombay, Visakhapatnam, Barauni and Ankleshwar have provided new and economic raw materials in the shape of natural gas, refinery gases, and naphtha for producing hydrogen for ammonia synthesis. It will perhaps be too much to say that these new raw materials have made coal obsolete as a source of hydrogen at present, but they have certainly introduced new criteria in the selection of sites for future nitrogen factories and in the economics of ammonia synthesis. Coastal sites drawing their supplies of naphtha from the coastal refineries and sites, which are in the vicinity of the refineries, are advantageously placed. But this is only a part of the picture. It is equally important that the sites selected should be near the areas of fertiliser consumption and should be served well with lines of communication to them.

TABLE II

END-PRODUCT PATTERN FOR THE THIRD FIVE YEAR PLAN

Product	N	P_2O_5
	('000 tons)	
Urea	422.5	—
Ammonium sulphate	203.0	—
Ammonium chloride	26.0	—
Ammonium sulphate nitrate	36.0	—
Calcium ammonium nitrate	160.0	—
Anhydrous ammonia and nitrogen solutions	21.0	—
Complex fertilisers (20-20-0) and co-product of calcium ammonium nitrate, if any	111.0	111.0
Ammonium phosphate 16-20-0, 16-46-0	93.0	115.0
Superphosphate and dicalcium phosphate	—	220.0
	1,072.5	446.0



The Ammonia synthesis plant with the hortons spheres for storing ammonia in the foreground

Consumption Targets

The end-products tentatively listed in the draft outline of the third plan will probably undergo considerable revision. Tables I and II give a picture of the location of the existing and proposed factories and of the likely end-products. There is little point in building up capacity for producing the targeted quantities of fertilisers if they do not reach their destinations regularly and punctually in millions of India's fields. To ensure the consumption of the fertilisers produced is not merely a problem of commercial marketing. It is a national problem, because the fulfilment of the third plan's agricultural production targets is bound up with the realisation of the fertiliser consumption targets. The problem is, logistically speaking, one of moving some 7 million tons of fertilisers from a small number of factories and ports to several hundred thousand villages. There is the further problem that while production is and must be continuous, consumption is markedly seasonal; this entails storage and other costs at various points along the line.

In recent years, nitrogenous fertilisers have been in short supply and a sellers' market appropriate to conditions of scarcity has prevailed. The Central Fertiliser Pool in the Ministry of Food and Agriculture has been functioning as a central rationing agency, using the State Governments and their departments as similar rationing agents in their respective jurisdictions. The belief has consequently gained ground that the distribution of fertilisers is essentially a Government function. It is also taken for granted that the final stages in the distribution process must—in accordance with the policy decisions—be exclusively entrusted to co-operative marketing societies.

Marketing and Distribution

There are unmistakable signs that with the improvement in the supply position of nitrogenous fertilisers in the current year, the sellers' market is on its way out. For phosphatic fertilisers, it disappeared over a year ago and manufacturers of superphosphates have had to pay more attention to their promotional activities. As new factories go into production, the problems of marketing and distribution will become more and more difficult. The changeover from a situation of strong consumer demand to one of consumer resistance often comes with surprising suddenness. Recent experience with sugar illustrates this. In the case of fertilisers, there is the added complication of consumer preference for a particular type of fertilisers. It will be prudent to view these problems realistically and seek solutions unbiased by ideological considerations. Some of the questions which will need careful consideration are: (1) should the Central Fertiliser Pool be continued after indigenous production exceeds the current demand? If it is to be continued, what will its functions be? If not, what distribution arrangements should be envisaged? (2) Should State Governments continue to play a direct rôle in fertiliser distribution? If not, what alternative arrangements should be made? (3) Should the present system of delivering nitrogenous fertilisers at uniform prices at railhead all over the country continue? (4) Should not public sector nitrogenous fertiliser factories undertake the responsibility of marketing their products?

Work the VISADEX way to get the best out of your men, machines and materials.

VISADEX can tell what you need to know at a glance. VISADEX offers you a fluent indexing system by which records are kept on cards, while colour signals spotlight what things are in stock or needed, whether production is ahead of or behind schedule, sales are increasing or decreasing, where to intensify advertising, which department requires more personnel, who owes you and how much...VISADEX, in short, affords greater control at less cost, besides keeping records secure.

Our VISADEX Representative will be happy to show you, without obligation, how simple VISADEX is to operate — either with Card Pockets or Brass Card-holders — and how easily it can meet your specific requirements.

GAP IN NATURAL RUBBER PRODUCTION AND CONSUMPTION WIDENING

MORE USE OF SYNTHETICS URGED

BY
D. M. TRIVEDI

RUBBER is a key material in modern age, and like steel, aluminium, cement and glass is indispensable to modern civilisation. Not only it plays an important part in the peace economy of any country but is also a strategic material in the event of war. Almost 70 percent of all rubber used today—both natural and synthetic—goes in transportation in one form or another. This explains the great importance rubber enjoys in a country's economy. Rubber cultivation on a modest scale was started in India at the beginning of the twentieth century and by 1910, only 80 tons of natural rubber was produced. By 1960, production of natural rubber exceeded 24,000 tons. More intensive efforts are now being made to increase output to meet the rising consumption. If these efforts prove successful—which is rather doubtful—by 1965-66 production is expected to go up to about 40,000 tons. If the proposed high subsidy scheme for replanting the large acreage with high yielding rubber trees proves successful, the natural rubber output may further rise to 50,000 tons in 1970 and about 63,000 tons in 1975.

India's rubber consumption is going up very rapidly. Till the development of the moulding industry in India during and after 1935, the bulk of rubber production right up to 1939 was exported and it competed with other large producing countries, such as Malaya, Indonesia and Ceylon. Since the second World War, natural rubber consumption is rising rapidly : while the consumption in 1950 was 17,735 tons, in 1960 it was as high as about 45,400 tons. The consumption is expected to exceed 55,000 tons by 1965-66 *excluding* synthetic and reclaimed rubbers which are also used in substantial quantities in addition to natural rubber. The following table shows the production and consumption of raw rubber in India during the period 1955-60 :

Table I

RAW RUBBER CONSUMPTION

(All in tons)

Year	Production of natural rubber	Consumption of natural rubber	Synthetic rubber (Cons.)	Reclaimed rubber (Cons.)	Total consumption of rubber
1955	22,481	27,543	106	2,502	30,151
1956	23,444	28,996	2,409	3,261	34,666
1957	23,767	31,765	3,032	3,837	38,634
1958	24,327	34,756	3,252	4,057	92,059
1959	23,396	38,663	4,340	4,454	47,457
1960	24,794	45,215	6,457	6,000 (estimated)	57,667

With the progress in industrial development, the consumption of all forms of rubber is expected to go up sharply, and the present estimates are :

Table II

Year	Consumption estimates	Production estimates for natural rubber	Ratio of production of natural rubber to total consumption of rubber
	(In tons)	(In tons)	(Percent)
1965	100,000	40,000	40
1970	175,000	50,000	28
1975	300,000	63,000	21

Widening Gap

It will be clear from the above figures that even with best efforts to increase rubber production by raising the acreage as well as by applying more scientific methods and better rubber-yielding varieties of trees, the gap between the production of natural rubber in India and the consumption of all rubbers will grow wider. While in 1960, the shortfall was about 30,000 tons, it will grow to about 237,000 tons by 1975, that is, about eight times as much. In spite of the foreign exchange shortage, the Government of India has to import about 30,000 tons a year, which involves an expenditure of Rs. 6 crores or Rs. 8 crores a year. This expenditure must increase year by year in view of the mounting consumption. How can this widening gap be bridged ? Is it at all possible to do so ? Can India ever be self-sufficient in this important commodity in the foreseeable future ? These questions are very vital to India's economy. The answers to these must be found early enough, for on this will depend the steps which must be taken from now on if the country is at all to achieve any measure of self-sufficiency in the future.

The study of the present stage of rubber production in India will convince even the sceptic that if the country is to achieve self-sufficiency in the commodity, there is absolutely no way out but develop synthetic rubbers as soon as possible. This will be clear from the fact that even today, the total area planted with rubber trees is of the order of 305,450 acres, of which as much as 290,000 acres are situated in Kerala State. Out of this planted area, only about 25,000 tons of rubber is raised today. If the shortfall in natural rubber requirements is to be met, then there will be a need to plant additionally between 350,000 acres and 500,000 acres of land with high-yielding rubber trees during the next five or six years. There is, however, not that much land available today. Again, almost 80 percent of the planted acreage under natural rubber is planted with old low-rubber yielding trees with the average yield of only 304 lbs an acre, compared with over 350 lbs in Ceylon, 550 lbs or 600 lbs in Indonesia and over 700 lbs or 750 lbs in Malaya. In view of this state of affairs, the Rubber Board—in consultation with the Government of India—has evolved a scheme of replanting considerable acreage with high-yielding rubber trees and as an incentive to planters offers to pay a subsidy ranging from Rs. 325 to Rs. 400 an acre for small acres and between Rs. 250 and Rs. 300 an acre to estates above 50 acres. These subsidies have been now increased to a flat rate of Rs. 1,000 an acre recently. The following replanting targets are proposed :

Table III

	(In acres)
1960	7,500
1961	8,000
1962	8,500
1963	9,000
1964	9,500
1965	10,000
	52,500

Replanting Scheme

It is assumed that if this replanting scheme is fully implemented, the production of natural rubber will rise to 50,000 tons in 1970 and 63,000 tons in 1975. The latest reports from Kerala, however, indicate that the Government is facing serious difficulties in clearing these areas and replanting in 1960 was not even 50 percent of the target as indicated above. With the present confused political situation in Kerala, it will be highly optimistic to believe that even the above modest target for replanting will be realised, so the result will be a bigger shortfall in rubber production and, therefore, in supply. It is obvious, therefore, that the only way to achieve measurable self-sufficiency in the commodity is by way of synthetic rubber. It is to the credit of the Government of India that it has appreciated this need and is trying to promote the synthetic rubber industry. At present, two proposals for synthetic rubber production have been approved. They are: the S.B.R. plant in Bareilly, U.P., with a production capacity of 30,000 tons a year and the poly butadiene rubber plant in Assam with a production capacity of 20,000 tons a year.

The Bareilly plant is based on styrene-butadiene copolymer system, commonly known as S.B.R. rubbers, and is expected to go into production in the later part of 1962. By 1965, the plant may be able to achieve a production capacity of up to 40,000 tons a year, including latices, oil extended rubbers and alloys subject to the availability of alcohol—the basic raw material for the industry—as a by-product of the sugar industry. It must be added that this is a step in the right direction, since the output will absorb about 25 million gallons of the alcohol produced from by-product molasses of the sugar industry. The second plant licensed for Assam is to be based on natural gas, unlike the Bareilly plant which is based on alcohol. Besides, the Assam plant is reported to be planned for the production of poly-cis-butadiene rubber. This is a new type of rubber and its production will help increase rubber supplies. But reports say that this plant is not expected to go into production before 1964-65. However, it must be stated that while S.B.R. rubbers have been increasingly used in all western countries and accepted as a basic partial substitute for natural rubber, the Indian experience so far has somewhat been limited. In order that the output from the Bareilly plant is acceptable to industry, it should be prudent to ask the Indian rubber industry to use increasing quantities of S.B.R. rubbers in their formulations and mixes so as to build up necessary techniques in the use of these raw rubbers. Since S.B.R. rubbers have been in use for over 15 years or so, adequate field experience is available, so the Indian industry can readily use these rubbers without any great difficulty. As for poly-cis-butadiene rubber, however, since it is quite new even to American industry, its ready acceptance by Indian industry may pose some problems.

Newer Synthetics

An important question in connection with the planning for rubber in coming years is how far the newer synthtics could replace natural rubber. The answer to this question can be given by referring to the world picture of rubber consumption with a special mention of natural *versus* synthetic rubber as the following table will show :

Table IV

NATURAL AND SYNTHETIC RUBBER CONSUMPTION RATIOS FOR DIFFERENT COUNTRIES (1960)

	Natural	Synthetic
U.S.A.	31	69
U.K.	61.2	38.8
France	59.0	41.0
West Germany	57.4	42.5
Netherlands	64.7	35.3
Italy	55.0	45.0
Japan	75.0	25.0
Russia	65.0	35.0

From the above it will be seen that while in the U.S.A. the substitution of natural rubber by synthetic rubber (S.B.R.) has very much advanced and is about 70 percent of total rubber consumed, the European countries, excluding Russia, considerably increased their rate of consumption of synthetic rubber after the synthetic rubber plants were established in those countries. In fact, present trends indicate that the ratio of synthetic rubber consumption will increase still further from an average of 40 percent or 45 percent to 55 percent or 60 percent during the next three years or so. Even in Japan, the consumption of synthetic rubber is expected to rise faster now that the S.B.R. plant has been established and expanded. It is also felt certain that the newer types of

rubber, namely, poly-cis-butadiene and polyisoprene rubber, that is, natural synthetic rubber, when produced in quantity, will further reduce the demand for natural rubber in the future. It is estimated that as a result of the large-scale production of poly-cis-butadiene and polyisoprene rubber now planned in the U.S.A. and Europe, the consumption of plantation natural rubber will go down still further by about 5 percent or 10 percent during the next five or seven years.

Compared with the consumption of synthetic rubbers in the U.S.A. and the Continent, the Indian consumption ratio of raw rubber is 82.6 percent of natural rubber, 7.7 percent of synthetic rubber and 9.6 percent of reclaimed rubber. When it is realised that of the 4,340 tons of synthetic rubber consumed in India in 1959, a very substantial part was used by only one tyre plant and a significant balance of the same constituted speciality rubbers such as Neoprene, Nitrile rubbers, etcetera, it will be obvious that the Indian rubber industry has not taken kindly to synthetic rubber. There is, however, no doubt that as a result of the establishment of the Bareilly plant for producing synthetic rubber and the assured possibilities of its availability next year, the Indian industry is gradually becoming conscious of the need to use more synthetic rubber. This is evident from the 1960 figure of the estimated consumption of synthetic rubber. But this is far below what the industry can use even today, as can be seen from the following table where an attempt is made to work out the potential consumption of synthetic rubber in the different items of manufacture:

Table V

POTENTIAL CONSUMPTION OF SYNTHETIC RUBBER IN DIFFERENT ITEMS OF RUBBER MANUFACTURE

Product	Approx. tons of raw rubber consumed in India (period June '59 to June '60) (Tons)	Approx. quantities of S.B.R. which can be used for natural rubber (Tons)	Percentage of synthetic rubber
Passenger tyres	1,520	1,064	70
Giant tyres	27,630	11,052	40
Tractor aero-tyres and all types of tyres	4.500	Nil	
Cycle tyres	4,498	2,249	50
Cycle tubes	1,476	—	
Rubber footwears	5,000	2,000	40
Waterproofing	798	399	50
Latex foam	856	428	50
Ebonites	262	131	50
Camel back	1,710	855	50
Cables	N.A.	N.A.	N.A.
Other mechanical goods and fabricated articles and moulded and extruded goods	1,500	600	40
Total	48,274	18,778	

In the present context of India's foreign exchange shortage, the increased use of synthetic rubber by the industry assumes added significance. Firstly, the price of imported synthetic rubber is lower by at least 3 cents or 4 cents a lb, compared with that of imported natural rubber. As the Indian natural rubber price is higher by at least 6 cents or 8 cents a lb over the imported synthetic rubber price, the tremendous savings in foreign exchange requirements a unit of import of rubber on the one hand and to the industry in terms of a larger volume of supply of rubber for a given unit of available import licence or higher profitability due to lower price for rubber on the other hand are easy to calculate. It is, therefore, necessary that efforts be made to ensure an increasing use of synthetic rubber in all Indian rubber manufactures to the maximum possible extent. Since between 60 percent or 70 percent of rubber is expected to be consumed in tyre manufacture and the tyre plants have at their disposal the "know-how" from their foreign collaborators, the increased use of synthetic rubber to the maximum extent possible by these plants should pose no problem at all. Besides, since these plants are well organised and have also fully-equipped laboratories with trained technical personnel, the problem of changing over from natural rubber compounding techniques to the mixtures of natural rubber with synthetic rubbers is a relatively simple matter. However, as the large number of smaller rubber plants do not have this advantage, the necessity for technical assistance to these units to fecilitate the change-over will assume some significance.

Technical Personnel

Secondly, the need for using technically trained personnel and technologists for the industry is great. At present there is no institute or university in India which gives special or general courses in rubber technology, although the industry is very large and is growing rapidly. The acute need of the industry to find qualified technical personnel, who can competently handle these new raw rubbers, must be recognised, and steps should be taken to start rubber technology courses in at least two or three important centres in India, both at the university level for technologists and at the polytechnic level for training technicians for the industry. Unless this is done with speed and imagination, the development of the industry will be seriously handicapped. Thirdly, the introduction of synthetic rubber demands changes in the techniques of compounding as well as the use of specially tested and processed ingredients to realise full advantage of properties of the newer rubbers. For instance, the increasing use of synthetic rubbers will necessitate a larger use of activated fillers and carbon blacks. It will, therefore, be logical to assure the rubber industry increased quotas of these specific ingredients, if necessary by imports, wherever they are not available indigenously. Even if these increases in quotas are permitted, the net increase in foreign exchange component will be more than adequately compensated by savings due to the import of lower-priced synthetic rubbers in place of imported natural rubber.

Finally, it may be pertinent to mention about the need to redefine the I.S.I. and other accepted standards for rubber articles in a manner as will enable synthetic rubbers to be used in place of natural rubber. This work ought to be taken up almost simultaneously. To cite an example, in the cable industry the use of synthetic rubber as an insulating material is not recognised and only natural rubber is specified except for the top covering. Such restrictions will need to be removed.

Perspective Planning

These are some of the important problems which should be resolved to facilitate the change-over to synthetic rubber. Nevertheless, it is clear that these are not any difficult problems. Since the serious limitations of growing more natural rubber in India are recognised, it is obvious that the future growth of the industry will necessarily depend on increasing production and consumption of factory-made synthetic rubbers, including synthetic natural rubbers. The perspective planning for rubber for the next 15 years or so is being attempted in view of the importance of the industry to the national economy. The preliminary pattern of the future development is summarised in table VI in page 32.

Table VI shows that on the basis of the present replanting programme, not more than 60,000 tons or 65,000 tons of natural rubber will be available indigenously from the plantations by 1975. So if one has to plan for self-sufficiency in rubber, one has got to plan for factory-made synthetic rubbers in a big way. Apart from the synthetic S.B.R. rubbers and reclaimed rubbers, the lion's share in meeting the rubber requirements will have to be distributed between the poly-butadiene rubber and the polyisoprene rubber—the commonly known synthetic natural rubber. Both these rubbers will need petroleum C_4 and/or C_4 feedstocks, and both will be available in view of the significant planning for the oil-refining capacity in India. The geophysical and geopolitical considerations will compel India to decide whether self-sufficiency in rubber should be India's economic objective. These considerations are compelling because south-east Asia produces today about 80 percent of the total world production of natural rubber. On the other hand, equally compelling lessons of history which India learnt not so long ago concerning natural indigo and madder cultivation in the face of synthetic products must not also be overlooked in India's natural desire to extend the scope of natural rubber plantations within the country, particularly

*—No imports of natural rubber but all natural synthetics to be produced in India.

†—Part of these may be speciality rubbers.

‡—Does not include above 10,000 tons of S.B.R. likely to be available as high styrene alloys, latex, etcetera.

§—If fully available, less imports of natural rubbers will do.

when it will be possible technically to meet her total needs of rubber through synthetic rubbers. Finally the big question, whether in her craze for planning, India is not planning for rubber too ambitiously, can be answered by a look at the following table of the *per capita* consumption of rubber in different countries of the world:

Table VII

Per capita consumption in lbs in 1959

World average	2.89	
U.S.A.	20.55	
Rest of the world	1.72	
Canada	13.03	
Australia	12.70	
U.K.	11.25

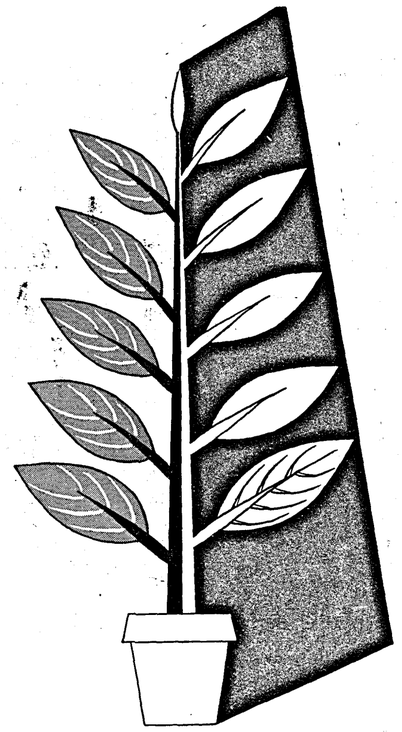
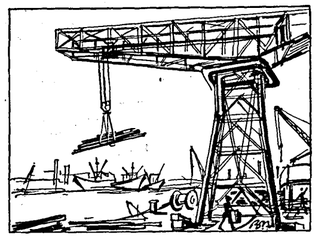
	1.15	Fifth plan end

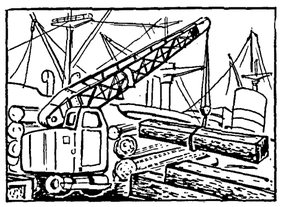




Planning TOWARDS
A BETTER PORT

As the life-line of Eastern India's trade and commerce, the Calcutta Port faces recurring problems every year. The emphasis on industrial progress in the Second Five-Year Plan period has considerably changed the type of cargo to be handled. Steel and mechanical equipment, heavy machinery and huge plant form a considerable bulk of the import. On the export front it is coal or ore.

To-day's well-equipped Port needs be made into a better Port to-morrow. But this is possible not by more equipments alone. The Calcutta Port needs most the whole-hearted co-operaton from all fronts,—from those who use and also from those who serve it.



MEN & MACHINES MAKE
A BETTER PORT

TYRE PRODUCTION RISES STEADILY

BUT SHORTAGE OF NATURAL RUBBER HINDERS EXPANSION

By
A SPECIAL CORRESPONDENT

THE tyre industry in India is a major strategic industry. It is the largest constituent of the rubber manufacturing industry, consuming about 68 percent of the total rubber consumption. The industry's rapid progress during the last few years will be evident from the following table of the index of industrial production:

INDEX OF INDUSTRIAL PRODUCTION
(Base: 1951=100)

Period	General index	Index of tyre manufacture
1956	132.6	161.4
1957	137.3	170.1
1958	139.7	193.0
1959	151.9	221.9
1960 (Jan.-Sept.)	167.2	252.8

Source: Monthly Statistics of Production of Selected Industries of India.

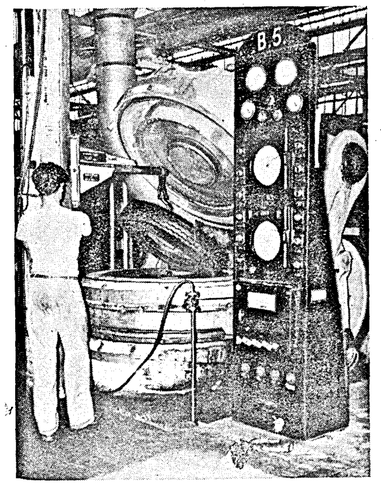
The above table shows that while the overall output in the organised industrial sector rose by 67.2 percent during 1951-60 (January-September), the index for tyre manufacture has risen by 152.8 percent during the same period. In other words, the production of tyres has gone up by more than one and a half times in the past ten years. In assessing the progress and prospects of the industry, it is necessary to take into account the developments in the fields of roads and road transport. The growth of road mileage in the country is given below:

Year	Surfaced roads	Unsurfaced roads	Total
1951	97,546	150,963	248,509
1956	121,617	195,051	316,668
1961 (estimated)	144,000	250,000	394,000

The chief engineers of the Central and State Governments have formulated a 20-year road development programme beginning from 1961. The broad objective of the plan is that no village in a developed and agricultural area should remain more than four miles from any metalled road and more than one and a half miles from any type of road. Under this plan, it is proposed that by 1981, the total mileage of surfaced roads should reach 252,000 and of unsurfaced roads 405,000. It is estimated that the entire plan can be "self-supporting" as the revenue from motor-vehicle taxation during the 20-year period will amount to about Rs. 6,150 crores, against the expected total expenditure of Rs. 5,200 crores. The chief engineers recommended an investment of Rs. 590 crores on roads during the third plan.

Third Plan Allocation

Against this, the third plan allocation for road development is Rs. 250 crores, which happens to be the same as that provided under the second plan. As a percentage of the total investment of the third plan, it is only 2.45, against 4 in the second plan and 5 in the first. With this allotment, it may not be possible to add more than 20,000 miles of surfaced roads. Taking the area of the country into consideration and the increased economic activity anticipated under the third plan, the allocation for roads is admittedly far short of the country's requirements. The present road mileage a square mile of territory in India is about 0.25, compared with 3.24 in the U.K., 3.03 in France, 1 in the U.S.A. and 0.38 in Ceylon. Even her national highways—suitable for inter-State long distance traffic—are only about 15,000 miles. Moreover, the existing network is deficient in certain aspects, such as unbridged river crossings, sub-standard surface, narrow carriageways, etcetera. The situation is further aggravated by the fact that only about one-third of the total road mileage is motorable throughout the year. As a result, road transport operation suffers from several disadvantages: waste of fuel, waste of money in repair bills for vehicles, excessive wear and tear of tyres, etcetera.



A car tyre being taken out of a mould

In this connection, the experiments conducted by the Indian Roads Congress to determine the cost of operation of motor-vehicles on different classes of roads and the economy resulting from road improvement will be of interest. The studies, which were conducted in collaboration with the U.P. Roadways and the Bombay State Road Transport Corporation, proved that the wear and tear of tyres was less with the improvement of the road surface. The Bombay experiments showed that the life of tyres used on concrete "good" roads was three times more than those used on water-bound macadam "good" roads. The following table shows the life of tyres on different road surfaces as shown by the Bombay experiments:

Life of tyres in miles

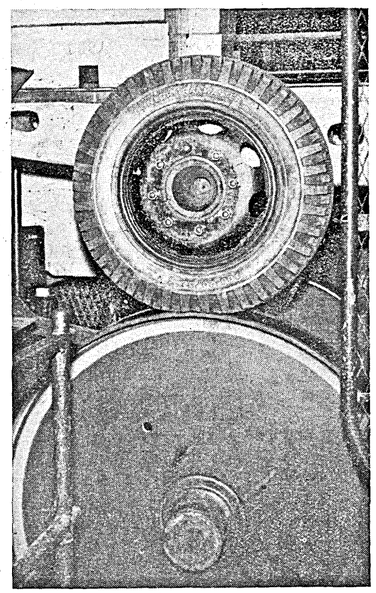
Cement concrete "good"	Black-topped "good"	Water-bound macadam "good"
47,340.85	22,169.5	15,776.9
49,090.15	22,169.5	15,776.9
49,090.15	25,432.5	15,776.9
49,090.15	25,432.5	9,613.5
49,090.15	25,432.5	16,513.9
49,090.15	25,432.5	19,832.3
	22,169.5	13,694
		20,089.5
		10,700.6
Average life of a tyre (in miles) 48,798.60	24,034.1	15,308.3
Cost in pies a tyre-mile 1.77	3.59	5.64
Cost in pies a vehicle-mile 10.62	21.54	33.84

Source: *Journal of The Indian Roads Congress*, Vol. XXIV-3 December 1959.

At present, there is a gap between the demand and supply of motor-car tyres in India which is met by imports. In the first 11 months of 1960, about 1.16 million tyres were manufactured and 95,594 tyres were imported. It is estimated that if important sections of India's road system are upgraded and modernised, it will reduce tyre wear and cut consumption of tyres by about 10 percent. In view of the critical foreign exchange situation, this aspect of tyre conservation deserves serious consideration.

Expansion of Road Transport

Road transport is now recognised as an integral part of the transport system of the country and the experience of the past few years has underlined its importance in economic planning. The preliminary report of the Neogi Committee on rail-road co-ordination states that the expansion of transport has been at a substantially faster rate than the increase in national income or the growth of production in any sector of the economy. The report adds that this trend will continue for the next ten or 15 years. According to a report of the Indian Institute of Public Opinion, the share of commercial road transport in total passenger traffic has risen from about 23 percent in 1948-49 to about 41 percent by the end of the second plan. In terms of passenger-miles, road transport has moved up from 14,490 million at the beginning of the first plan to 30,000 million by the end of the second plan, which is more than a 100-percent increase in the relatively short span of one decade. In the sphere of freight traffic, the road sector has increased its traffic from 4,000 million ton-miles in 1950-51 to 106,000 million ton-miles in 1960-61. On the basis of the number of lorries which are likely to be on the road by the end of the third and fourth plans, it is estimated that there will be more than a doubling of freight loads carried by road by 1965-66 and a 300-percent increase by the end of 1970-71.



A giant tyre is being tested for quality

Long-distance Goods Transport

By the end of the third plan, the output of commodities requiring long-distance goods transport is expected to be about 300 million tons, against 182 million tons in 1960-61. At the end of the second plan, the railways are estimated to have a carrying capacity of about 162 million tons, leaving a gap of about 20 million tons mainly to be carried by road transport. During the third plan period, this gap is expected to increase further requiring road transport to shoulder a greater burden. At present, 10 percent of the goods involving long-distance haulage is carried by road transport and according to the 20-year projection made by the chief engineers, about 246 million tons out of 800 million tons of goods will be transported by road in 1981. This will mean a ten-fold increase in 20 years.

During the ten-year period, from 1950-51 to 1960-61, the number of commercial vehicles in the country is estimated to have nearly doubled from 116,300 to about 204,000. In the third plan, it is roughly estimated that another 100,000 vehicles will be added to the existing number. The present annual production capacity of India's motor-car industry, other than motor-cycles, scooters and three-wheelers, is about 20,000 passenger cars, 5,500 jeeps and 28,000 commercial vehicles. By 1965-66, this is expected to increase to 30,000 passenger cars, 60,000 commercial vehicles, 10,000 jeeps and station-wagons and 48,000 motor-cycles, scooters and three-wheelers. In other words,

An important feature of the educational facilities at Jamshedpur is the leisure-time training of employees. Instruction provided, after hours, helps steelmen like J. P. Pathak to acquire wider knowledge and new skills.

opportunity for those that take it

Pathak, who started his career in Tata Steel as an office boy in 1929, passed his matriculation examination from the Company night school in 1944. Pathak next took up an evening course in basic mechanical drawing at the Jamshedpur Technical Institute. In 1957, he was selected for overseas training, and went to Canada, the U.S.A., West Germany and Holland, to learn techniques of operating a sinter plant. Today, Pathak is operator-in-charge of the sinter plant added under the two million ton expansion programme.

Notwithstanding initial handicaps, enterprising men like Pathak have the opportunity to better their prospects through further education and training at Jamshedpur, where industry is not merely a source of livelihood but a way of life.

a Challenge...

Prior to 1942 India had no electrical Wire and Cable Industry truly of her own. That was a challenge before us. The time was not at all propitious, but NICCO surged forward to establish a major, integral electrical Wire and Cable Industry. In course of these twenty long years NICCO have gained an incomparable wealth of experience and technical 'know-how' which is reflected in the high quality of all their products.

NICCO Produce every type of Copper and Aluminium Conductors, Rubber, P. V. C. and V. C. Insulated Cables, Enamelled, Paper and Cotton Covered Winding Wires, Strips, etc., etc.

NICCO products are manufactured strictly according to appropriate ISI specifications.

there will be a two-fold increase in the production capacity of the motor-car industry by the end of the third plan. This estimate does not include the production of the people's car proposed to be manufactured in the public sector from 1963.

Tyre Requirements

The above trends indicate that the requirements of road transport for tyres and tubes as original equipment and for replacement will be very high in the future. The production of motor-car tyres in 1960-61 is estimated at 1.5 million and by 1965-66, it is expected to rise to about 3 million. At present, there are four tyre factories in the country—two of Dunlop, one each of Firestone and Ceat. In order to meet the anticipated demand for tyres during the third plan, the Government has sanctioned a few more schemes for setting up new tyre factories, besides large-scale expansion of the existing units. Four new tyre factories are now being constructed and are expected to commence production shortly. It is expected that by the end of the third plan there will be about ten factories in the country manufacturing motor-car tyres. It is anticipated that they will be able to meet the entire internal demand for various kinds of tyres and will also have a surplus for export. The demand for tyres for bicycles, tractors, earth-moving machines, etcetera, is also expanding. The tentative production target fixed for these vehicles under the third plan is as follows:

	Target for 1965-66
Bicycles	2.5 million
Agricultural tractors	10,000
Dumpers and scrapers	500
Motor-car ancillaries including trailers	2,500

In 1959, the number of bicycles for each 100,000 of population was 238. By 1965-66, their number is expected to increase to 484 and by 1970-71 to 677. The production of bicycle tyres in 1960-61 is estimated at 14 million and in 1965-66 it is expected to rise to some 31 million. Co-ordination of the various modes of transport has become an urgent need in the interest of the Indian economy. In this, the bullock carts also deserve consideration. There are some 10 million of them in India serving mostly the feeder traffic generated by the farms, factories and commercial establishments. But their usefulness is restricted by two disadvantages. First, they have a low payload capacity. Secondly, their iron-tyred wheels damage road surfaces. The change-over to pneumatic tyres will at once increase their carrying capacity and also reduce the damage to road surfaces.

Inadequate Supply of Raw Materials

The principal problem confronting the tyre industry in its plans of expansion is the inadequate supply of raw materials. Of them, the indigenous supply of natural rubber is a source of perpetual concern. The indigenous output of natural rubber in 1960 was 24,975 tons, whereas the tyre industry alone in that year was estimated to have consumed some 31,000 tons of rubber, both natural and synthetic. In spite of the Government's efforts and the rubber manufacturing industry's contribution of large sums of money in the form of cess for improving the yield of rubber for several years now, the natural rubber output has shown only a marginal increase. As a result, the manufacturing industry has to rely more on imports every year. By 1961, India's natural rubber imports are likely to exceed 20,000 tons, against 1,000 tons in 1950 and about 15,000 tons in 1959.

The inadequate supply of indigenous rubber and the fluctuation in the price of imported natural rubber is compelling the tyre industry to rely more on synthetic rubber. In 1959, India imported 4,673 tons of synthetic rubber, which was about 9 percent of her total rubber consumption. During the current year, this proportion is expected to rise to about 12 percent. Recently, the Government sanctioned a scheme for setting up a synthetic rubber plant in Bareilly. The plant which will manufacture annually 20,000 tons of synthetic rubber is expected to commence production by 1962. It is reported that negotiations are being carried on for setting up another synthetic rubber plant in Nahorkatiya during the third plan period.

Other important raw materials like carbon black, sulphur, rubber chemicals, etcetera, are now mostly imported. The Government recently announced that a big smelter to produce sulphur from the pyrites discovered in the Amjore area of Bihar State would be set up in the public sector. A plant for manufacturing carbon black has already been sanctioned and another plant is proposed to be set up in Nahorkatiya. Schemes for manufacturing rubber chemicals and tyre cord have also been sanctioned. It is expected that by the end of the third plan, the rubber manufacturing industry will be nearly self-sufficient in her requirements of most raw materials.

Intimately connected with the progress of the industry is the training of technical personnel and facilities for research, both basic and applied. Although the industry in India is able to avail itself of the progress made in rubber technology all over the world by its association with well-known international organisations, it has yet to have the necessary facilities for organised research and training within the country. As a result, the utilisation and development of indigenous raw materials, new skills, new designs and new techniques have not received sufficient attention. A beginning has now been made, and the industry—in collaboration with various State Governments—has instituted a series of apprentice training schemes. A few universities and technical institutions have also introduced graduate and post-graduate courses in rubber technology. The Council of Scientific and Industrial Research has established an Indian Rubber Manufacturers Research Association in conjunction with the Association of Rubber Manufacturers in India and the Indian Rubber Industries Association. The C.S.I.R. announced recently that it would organise a research-station to undertake co-operative research and provide testing facilities, on the lines of the Motor Industry Research Association of the U.K. The National Chemical Laboratory, Poona, has also made a promising beginning in rubber research. There is no doubt that the results of its research will benefit the industry.

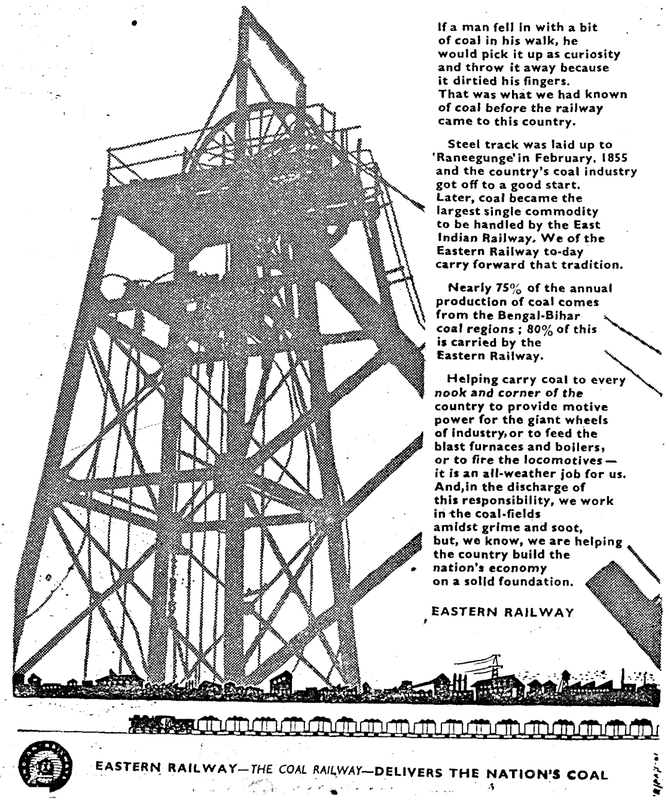
moving the country's coal



If a man fell in with a bit of coal in his walk, he would pick it up as curiosity and throw it away because it dirtied his fingers. That was what we had known of coal before the railway came to this country.

Steel track was laid up to 'Raneegunge' in February, 1855 and the country's coal industry got off to a good start. Later, coal became the largest single commodity to be handled by the East Indian Railway. We of the Eastern Railway to-day carry forward that tradition.

Nearly 75% of the annual production of coal comes from the Bengal-Bihar coal regions; 80% of this is carried by the Eastern Railway.

Helping carry coal to every nook and corner of the country to provide motive power for the giant wheels of industry, or to feed the blast furnaces and boilers, or to fire the locomotives — it is an all-weather job for us. And, in the discharge of this responsibility, we work in the coal-fields amidst grime and soot, but, we know, we are helping the country build the nation's economy on a solid foundation.

Economics of Small-scale Industries

More Credit Required: Raw Material Shortage Hampers Expansion

By

A. K. GANGULY

THE basic economic policy in an underdeveloped economy should be to accelerate growth consistent with what economists call minimum "social costs". This is as it should be. But the crucial problem is what ought to be the techniques of production. In a developing economy, there may be various alternative techniques which may mean the use of more of labour or less of capital or *vice versa*. The choice of the right type of production technique is probably the most difficult problem facing an underdeveloped economy. This is mainly because the number of available alternatives is quite large: production may be undertaken on the lines of primitive methods relying too much on hand-production or on fully automatic mechanical manufacture. But for a country whose population is large and increasing—such as India—there is considerable force in the argument that labour-intensive methods of production will help provide more employment opportunities than capital-intensive ones. It is necessary to be careful, however, that overemphasis on the former does not create conditions of disguised unemployment or underemployment. As it is, this problem has not apparently received much attention from the planners who, in their zeal to provide more employment opportunities for the people, have persistently feather-bedded small industries even at the expense of large ones.

But this does not mean that less attention should be paid to the development of small-scale industries or that official assistance for their rapid growth should be reduced. The official policy on the development of small-scale industries, if anything, has not always clearly appreciated the problems involved, nor has it been able to prepare the foundation for the simultaneous growth of the two sectors—each helping the other and creating the least hindrance in each other's growth. The two sectors, in fact, should be complementary, rather than competitive in character. The scope for developing feeder industries is particularly great in India, and many large industries are gradually appreciating their need since they can provide many components and parts required in large-scale manufacture. There is scope for considerable controversy over whether or not it will be expedient to develop the labour-intensive small-scale industries.

Capital Intensity

To begin with, it should be appreciated that not all small industries are necessarily labour-intensive in character. The degree of capital intensity varies from one concern to another. Light engineering industries, for example, may be organised as small-scale enterprises—as many of them in Howrah have been—although their capital intensity may be high. It is presumably because of Mahatma Gandhi's thinking that the revival of small industries would provide increasing employment opportunities for the masses that planners have paid more attention to developing the labour-intensive small-scale industries. The development of the handloom industry has, therefore, been the logical corollary. But there is no denying that there was a certain amount of political consideration in this policy. The planners adopted ambitious employment targets for the last two five year plans, but they knew well enough that it would be difficult to reach anywhere near these targets without the rapid development of small-scale industries. These must be rapidly developed, they thought, no matter whether they provided only meagre earnings for small-scale entrepreneurs insufficient even for bare survival, let alone for living decently, as is the aim of planners in India.

These incongruities in official policy notwithstanding, the need for developing small-scale industries has always been appreciated. The final report of the National Income Committee pointed out that next to agriculture and trade, small enterprises constitute the most important sector concerning income generated. It adds that from the standpoint of the number of persons employed, this sector comes next only to agriculture. As for employment, small enterprises provide jobs for 11,210,000 persons (8 percent of the total working force in 1950-51), against 2,971,000 employed by factory establishments (2.1 percent). Besides, the value of the net output of factory establishments and that of small enterprises was estimated for 1950-51 at Rs. 550 crores (5.8 percent of the net national output at factor cost) and Rs. 910 crores (9.6 percent), respectively. It is only common knowledge that the importance of small industries has further increased during the last few years, so the net output from this sector must have been substantially augmented The following table shows the national income by industrial origin, and the contribution to it of small-scale enterprises:

TABLE I

* Preliminary

Capital-output Ratio

It has been argued that the capital-output ratio of small-scale units using power is not always larger than the non-power using enterprises, although empirically one might have thought that this would have been so. But the capital-output ratio may be large or small depending on the techniques of production, so any generalisation on the effects of the use of power may not be correct. Besides, it has been pointed out that the surplus generated by small-scale enterprises in the rural sector is small, because, due to their meagre earnings, the consumption propensity among rural entrepreneurs is large. So the surplus cannot be used for accelerating the tempo of economic growth. These contentions, admittedly, are partially true. But a decentralised scheme for rural industries creates investment incentives, apart from providing subsidiary occupations for the rural peasantry.

Decentralised Base

Programmes for village and small-scale industries were given an important place in the first and second plans because, besides providing employment, they lay the foundation for a broad and decentralised base to the economy. The draft outline of the third plan states that the objectives which the programmes are intended to serve are broadly the same as in the second, namely, to provide employment, to meet a substantial part of the increased demand for common consumer goods and simple producers' goods and to provide "the basis for a progressive and efficient decentralised sector closely integrated with agriculture as well as with large-scale industries." It is stated that the scale and effort in the third plan will

be broadened further and the emphasis will be on the promotion of small-scale industries in rural areas and small towns. The Planning Commission has stated that the programmes will continue to be guided by the following three objectives. First, the relative contributions of small and large units in meeting the growing requirements of the community will be defined as part of the common production programmes for various industries. Secondly, small units will be assisted to improve their organisational and technical efficiency. Thirdly, artisans and craftsmen will be helped to organise on co-operative lines, especially in the rural areas.

Shortage of Raw Materials

The draft outline of the third plan says that in spite of the shortage of some basic raw materials—such as pig iron, steel and non-ferrous metals—the growth of small-scale industries has been quite impressive. In a number of industries, there have been increases in production varying from 25 percent to 50 percent, and in some cases even higher. But it is surprising that it does not say categorically that the assistance to small-scale industries has been meagre so far. It merely recounts what financial assistance has been provided for different branches of small-scale industries. It is stated, for example, that machines valued at about Rs. 2 crores have been supplied by the National Small Industries Corporation under the hire-purchase scheme introduced in 1956. As part of the industrial extension service, it is further stated, the Small Industries Service Institutes have been set up in all States and 42 extension centres established. Courses in business management for imparting training to small industrialists have been organised.

The draft outline also says that Government purchases of different kinds of stores from small industries increased from Rs. 75 lakhs in 1953-54 to about Rs. 4·5 crores in 1958-59. This increase is no doubt in accordance with the recommendation of the Stores Purchase Committee which urged that the Government increase its buying from small-scale industries to facilitate their development. The draft outline of the third plan says that 60 industrial estates were to be established by the end of the second plan. For one thing, they will contain about 700 factories or workshops. For another, they will provide employment to about 10,000 persons. After recounting a long list of official assistance, the Planning Commission frankly says that no significant progress has been made in developing small-scale units as ancillaries to large-scale ones, in bringing about the dispersal of industries and what is probably more important, in working out common production programmes.

Outdated Technology

But the frankest statement of all has been concerning the development of village industries. Their development, it is stated, has been hampered by the present low level of technology and by the shortage of trained and experienced supervisory personnel. "While these industries have helped to provide partial relief to village artisans and under-employed women workers in the villages, *they have not been able to provide fully remunerative work* (italics mine) or to attract young men with some measure of training and education." Besides, in the first three years, actual use of funds was slow and only a small impact could be made by way of extension of more efficient techniques. Out of complete despair, the Commission then says that greater progress was expected in the last two years of the second plan.

TABLE II

PROPOSED TARGETS FOR THE THIRD PLAN

	Unit (Million yds)	1960-61 (Anticipated)	1965-66 (Target)
Handlooms and powerlooms		2,125	
(a) In the handloom sector	,,	405	3,500
(b) Others	,,		
Khadi			
(a) Traditional	,,	48	
(b) Ambar	,,	32	
		2,610	
Raw silk	Million lbs		
Industrial estates	,, no.	3.7	5
Powerlooms to be installed in the handloom sector	no.	60	360
		3,500	13,000

A total outlay of Rs. 250 crores in the public sector has been provisionally suggested for the development of village and small industries under the third plan. The tentative break-up of the outlay between different industries is indicated in the following table along with the corresponding anticipated expenditure during the second plan:

TABLE III

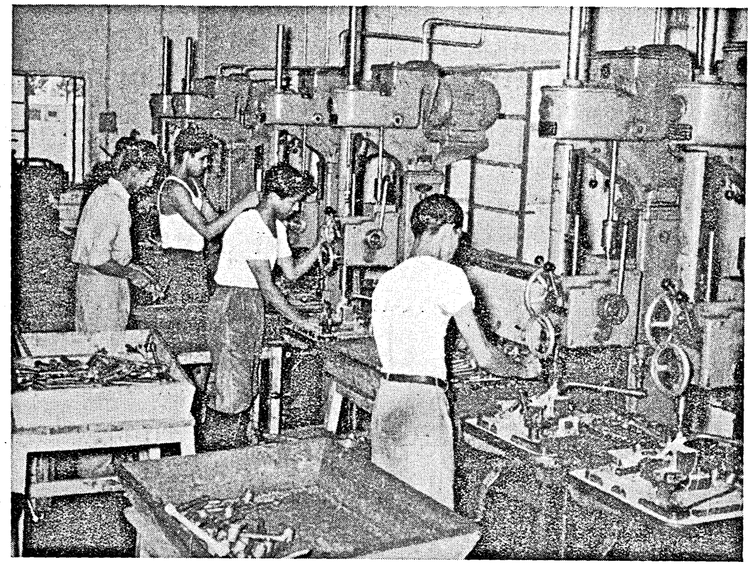
TENTATIVE ALLOCATIONS

Small-scale industries	Second plan (anticipated expenditure)	Third plan (tentative allocations)
Handlooms and powerlooms in the handloom sector	32.1	36.0
Khadi, Ambar *khadi*, and village industries	80.5	89.0
Small-scale industries in industrial estates	56.3	107.0
Handicrafts	5.3	8.0
Sericulture	3.8	7.0
Coir industry	2.0	3.0
Total	180.0	250.0

Ford Foundation Team

There is no denying that the Government has spent large sums for developing the small-scale industries. But the progress has been slow all the same. The remarks of the Ford Foundation team, which pointed out the defects, hold good even today. The team said that "efforts have been largely sporadic and have dealt chiefly with isolated segments of the problem. Lacking a systematic approach, they fall far short of making any appreciable impact towards the overall advancement of industrial development and no satisfactory overall solution or appreciable progress can be expected from them. It would be a false illusion to think otherwise." There is a need to increase the number of Small Industries Service Institutes and extension centres. Besides, the assistance to small industries by the former in providing technical know-how and management skill has been limited because of their meagre resources. The Industries Departments of the State Governments have not yet played a major rôle in developing these industries. The Ford Foundation team attributed the slow growth to the following factors: too little initiative on the part of the private sector; too great reliance on the Government to take action; outdated production and marketing methods; the lack of credit facilities and a systematic approach towards improvement.

The crucial need is to provide cheap credit facilities for small-scale industries. The Ford Foundation team recommended that commercial banks delegate greater authority to branch offices to decide questions concerning loans to small business. Local boards of directors or local advisory boards in other countries, it says, have proved useful in establishing better contacts between banks and local industry and trade, so the team believed that similar boards should be established in India. If advisory boards are used and disagreement on loan applications develops between the local management and the advisory board, final authority to decide should be referred to a higher level. It is in the interest of both banks and customers, the team said, that better contacts should be established and that the former should have a thorough knowledge of persons and enterprises within the sector of small industries.



A section of a bicycle parts manufacturing concern in an industrial estate in West Bengal

Lack of Acceptable Securities

It is arguable, however, that banks are unable to provide loans due to the lack of acceptable securities. But they should be less conservative in this matter with a view to providing liberal credit facilities to small industries. The State Aid to Industries Act has been of practically no benefit to the latter. So the Ford Foundation team urged the State Governments to simplify conditions and procedures so that loan applications might be processed more rapidly. As for the pilot scheme undertaken by the State Bank of India in 1955-56—in consultation with the Reserve Bank of India—results are reported to have been favourable. The former is now trying to help small industries by offering loans. But there is a clear case for providing cheaper credit facilities, especially by increasing the resources of the State Finance Corporations.

By adopting the most up-to-date techniques of production, Japan has been able to compete with many advanced countries with her products of small-scale industries. Switzerland is another example. With modern technology and cheap power, she has been able to make a remarkable progress in developing small-scale industries. With rationalisation of production techniques, the same can be done in India provided the Government does not adhere to its ideological approach. In developing the handloom industry, for example, it has penalised the mill sector, although production costs in the former are higher than in the latter. If the growth of small industries has been slow so far and the results have not come up to expectations, the reason is that the Government has been unable to visualise the simultaneous progress of both sectors. There is hardly any logic, after all, in penalising Paul to pay Peter if the Government genuinely wants progress in all sectors of the economy.

Need for Market Surveys

Besides, there is a need for improved marketing facilities for small-scale industries. The Ford Foundation team recommended the creation of a Marketing Service Corporation which the Government has not apparently accepted. There is a good demand for handloom cloth in overseas markets. But tastes are changing constantly, so there should be more market surveys as well as advertising to stimulate consumer demand. Although "bleeding Madras" has made some inroads in foreign markets, the gains could have been greater if the quality of products were better and the campaign for sales promotion more vigorous. But as is true for other products, Indian handicrafts will gain more popularity abroad only if they are cheap, their quality is better and a sales promotion agency constantly keeps watch on the markets already acquired and those to be explored in the face of competition from abroad.

The Calcutta Electric Supply Corporation wishes to thank all Industrial, Commercial and Domestic consumers for the assistance rendered during the period of the April/May emergency by voluntary reductions in demand.

The Corporation also wishes to express its regret for the inconvenience and hardship unavoidably imposed during the period.

STEADY PROGRESS IN PAPER MACHINERY MANUFACTURE

Indigenous Production Being Encouraged

By
A SPECIAL CORRESPONDENT

THE paper industry in India has been in existence for nearly 100 years, and it has suffered many fluctuations of fortune during this period. Nevertheless, its growth has been steady and production has increased by more than ten times during the last 40 years, and by three times since independence, and now stands at about 300,000 tons a year, excluding newsprint. The production target to be achieved by the end of the third five year plan is 700,000 tons. To achieve this production, it is anticipated that a capacity of 900,000 tons a year will be required, although, in fact, industrial licences have been issued considerably in excess of this figure, as shown below :

	(In tons a year)
Paper mills in production (28)	410,000
Expansion of large mills	130,300
Expansion of small mills	12,580
New large mills licensed (18)	368,960
New small mills licensed (83)	223,612
Total	1,145,452

The cost of increasing the capacity of the industry will amount to about Rs. 200 crores, of which machinery and plant will cost about Rs. 130 crores, all of which will normally be imported. The shortage of foreign exchange and the necessity for its conservation by all possible means has led the Government to encourage foreign machinery manufacturers to establish their own works in India with the object of manufacturing paper mill plants indigenously with the minimum use of imported components. The traditional suppliers of this type of plant have been the United Kingdom, Germany and Sweden. It was to manufacturers in these countries that India turned for help in providing the technical knowledge and, to some extent, the capital to build up the infant industry. Manufacturers in the United States and France have also recently evinced greater interest in the Indian market and have been competing actively and successfully with the older established producers.

Third Plan Targets

The draft outline of the third five year plan laid down the target for 1965-66 at four paper mill plants of 50 tons a day, and four small plants of 10 tons a day valued at Rs. 6.5 to Rs. 7 crores and containing indigenous manufacture to the extent of 70 percent. To achieve this target, ten schemes for the manufacture of paper-making machinery have been sanctioned, of which six cater for large plants of 50 tons or 100 tons a day, and four for small plants of 5 tons or 10 tons a day. Foreign collaboration for the larger projects has come from the U.K., Sweden, West Germany, France and the United States, and for the smaller plants from the U.K. and Japan. The pattern of collaboration has taken the form of an association between an established engineering works or paper mill and a foreign manufacturer or group of manufacturers through a new company in which each holds shares. Some of these companies have provided for some measure of diversification by making arrangements for the manufacture of other heavy engineering lines, while others rely solely on the sale of paper-making and allied plants.

The principal raw material for paper making in India is bamboo but bagasse—the waste product from sugarcane—is becoming increasingly important and will be the main raw material for a number of new mills situated at a distance from bamboo-producing areas. Of lesser importance is sabai grass. An appreciable quantity of waste paper and some rags for superior qualities are also used. Briefly, and in a simplified form, the following are the processes required to convert the raw material into paper. These processes are designed to felt uniformly cellulose fibres together into a continuous and even sheet.

(1) *Crushing, chipping, cutting and dusting:* the reduction of the raw material to a size to handle easily in the next process.

(2) *Digesting:* the treatment of the raw material with chemicals under steam pressure to remove pectins, lignins, etcetera, leaving the pure cellulose fibre in a loose pulpy condition.

(3) *Washing and bleaching:* washing of the pulp in filters to remove the residue of the chemical liquor, uncooked material and foreign bodies and bleaching to attain the required shade of whiteness.

(4) *Straining:* a further process to remove any remaining undigested fibre and grit.

(5) *Stock preparation:* the breaking up of the fibres in beaters or refiners in order to split them, thus increasing the surface tension and the area of bonding between the fibres to form a uniform sheet. At this stage, china clay or talc is added to the pulp to give opacity and smoothness together with size to induce further the bonding properties of the fibres and to render the paper inkproof. Alum to precipitate the size is added at this stage, also dyes if required.

(6) *The paper machine:* the pulp in a predetermined concentration, depending on the paper to be produced, travels over a wire cloth which is given a slight sideways shake to reduce the tendency of the fibres to settle parallel to the direction of travel and which drains off the bulk of the water. A suction roll or couch roll squeezes out enough water to enable the web to support itself as a damp sheet which is then carried forward as a woollen blanket to the press rolls and then to a series of steam-heated cylinders which dry the paper. A burnishing effect is given by a series of steam-heated polished calendar rolls, and the paper is finally wound on a reel.

(7) *Finishing:* the paper is slit and reeled in the required widths or cut into sheets of various sizes prior to inspection, wrapping and baling.

(8) *Chemical recovery:* the chemicals used in the process of digestion are treated with the object of recovering as high a percentage as is economically possible for reuse.

Cost of Plant and Machinery

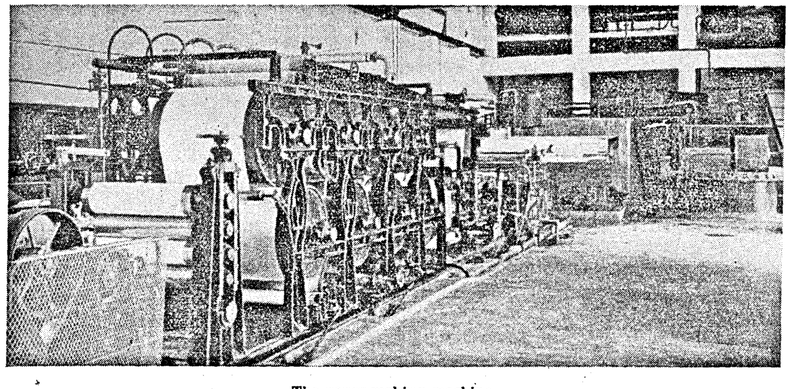
The cost of machinery and plant for a paper mill unit of 50 tons a day will be about Rs. 4 crores, inclusive of services such as water, power and steam. Three of the indigenous manufacturing companies expect to be in a position to supply such units by the end of 1962 provided orders are forthcoming. Initially, a fairly high proportion of the components will have to be imported, decreasing as the industry develops. As the indigenous capacity for the production of certain specific items of plant increases, licences for imported plant will not be granted and paper mills will be obliged to obtain their requirements from indigenous sources. The paper industry is, therefore, greatly concerned with the speedy fulfilment of manufacturers' plans and watches their efforts with interest and some anxiety.

The Government is trying to ensure that each manufacturing project is geared to produce the plant for a complete unit so that the whole plant may be offered as a package deal together with the services of the manufacturer in erecting and commissioning. This is not the traditional way in which paper machinery manufacture has developed and, generally speaking, machinery makers tend to specialise in certain lines with all the attendant advantages of such specialisation. It is customary and prudent for an entrepreneur starting a new mill or expanding an existing one to engage the services of an independent firm of consultants which makes a preliminary survey, draws out a specification of the plant required taking into account the special circumstances of the mill and advises on the best equipment to order after competitive quotations have been received, taking into account the known performance, delivery and price of the plant quoted. If required, the consultant also produces flow-sheets and site plans, supervises construction, provides staff to run the plant in its initial stages and trains other staff to take over. From the inception of the project, the millowner has, therefore, the guidance and support of a reputed firm with expert knowledge, and will be able to select the best possible equipment from a large number of different sources.

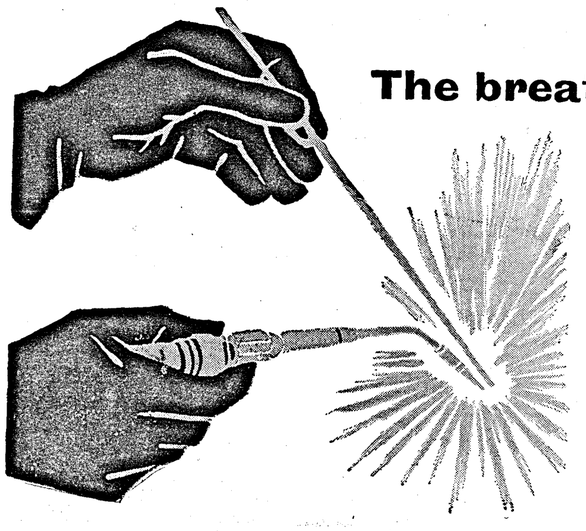
Consultancy Organisation

The Indian manufacturing industry seems, however, to be developing on rather different lines. Here the millowner will have to obtain quotations from a limited number of manufacturers for a complete plant and will then have to select the quotation he considers most favourable, thereafter relying wholly on the manufacturer to produce a "turnkey" job. This cannot be said to be entirely satisfactory from the point of view of either the machinery maker or his customer. The manufacturer must create a consultancy organisation or endeavour to use his technical staff for this purpose and the customer lacks independent advice and may have to wait longer for the completion of his mill since the plant will be emanating from a more restricted source. The millowner loses to a large extent his freedom of choice and the manufacturer—in undertaking the responsibility for complete erection and initial running of the plant—has to bear considerable financial risk.

India's main need now is to conserve foreign exchange, so indigenous manufacture is a step in the right direction. The paper industry in India will constantly expand for many years to come, and assuming that expansion will continue, there should be ample scope for the profitable development of paper-machinery manufacture. The industry is still in its infancy. Undoubtedly, there will be difficulties and frustrations ahead, but there is no reason why these should not be overcome in time. The stage has perhaps been reached when indigenous paper machinery manufacturers should consider forming an association on the lines of similar bodies already established for other industries. The peculiar problems of the industry can be more easily resolved in a common meeting ground, so the idea seems well worth consideration.



The paper-making machine



The breath of industry

Oxygen—feeding the flame that knifes through steel, welding enormous broken castings and bubbling through molten metal to make pure steel—the flow of Oxygen in modern industry never ceases. From tiny workshops to the great steel plants and shipyards, wherever there is metal to be worked, Oxygen is on the job.

FOREIGN EXCHANGE SHORTAGES HAMPER PROGRESS OF MOTOR-CAR INDUSTRY

Growing Plan Traffic Requires Further Development of Road Transport

BY

SIR L. P. MISRA

MOTOR-VEHICLE manufacture is a key industry for the general development of a country. It strengthens considerably the defence potential, its employment potential is high, offers a powerful incentive to the development of a large number of ancillary industries, and brings large revenues to the Government in the form of taxes. Naturally, all countries striving for industrial or economic expansion aspire to establish their own motor-vehicle industry. Its successful establishment in India has, however, been greatly handicapped on account of its being a highly specialised industry requiring for its success large capital investment and technical know-how which can only be imported at great expense from other advanced countries. Out of the "elements" known to science 58 are used in some form or the other for the manufacture of motor-vehicles. Each unit requires 4,000 to 5,000 parts made to a technical specification of a high order, and the finest tolerances in vogue in the engineering industry. It is for these reasons that about 18 countries in the world have so far succeeded in putting on their markets motor-vehicles of indigenous manufacture. India has only recently gate-crashed into this exclusive club. It is still a novice, but aspiring soon to become an important member.

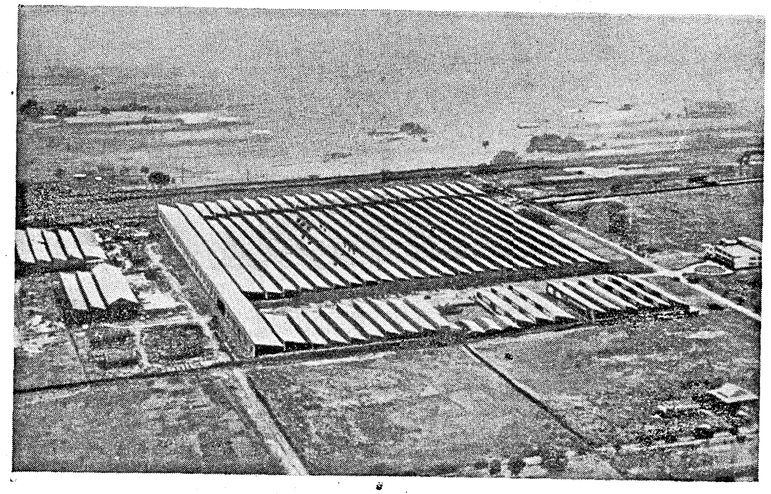
It is needless to emphasise that the motor-vehicle industry and road transport are inter-dependent. They rise or fall together, for the industry cannot develop without its products being fully used on the road, nor can roads become fully remunerative without using the motor-vehicles produced. It would, therefore, help a clearer appreciation of the problems of the industry if some of the difficulties of road transport in India are discussed first.

The motor-car was imported into India first in 1898 but until the beginning of the first World War, annual imports were confined to only small numbers. As a result, however, of the technical developments which the military needs of the first World War necessitated, the motor-car not only established its utility for war purposes of offence and defence, but also as a carrier for the public. As in other countries, there was naturally a rapid development of road transport in India, but the Indian market soon became static for two reasons. Motor-vehicles in India came to be looked upon as the privilege of the rich. The part which road transport can play in the economic development of a country was not adequately appreciated by the public or the Government of the day, with the result that roads remained neglected and taxes on motor-transport started rising. To add to these handicaps, there was a serious economic depression in 1930-31.

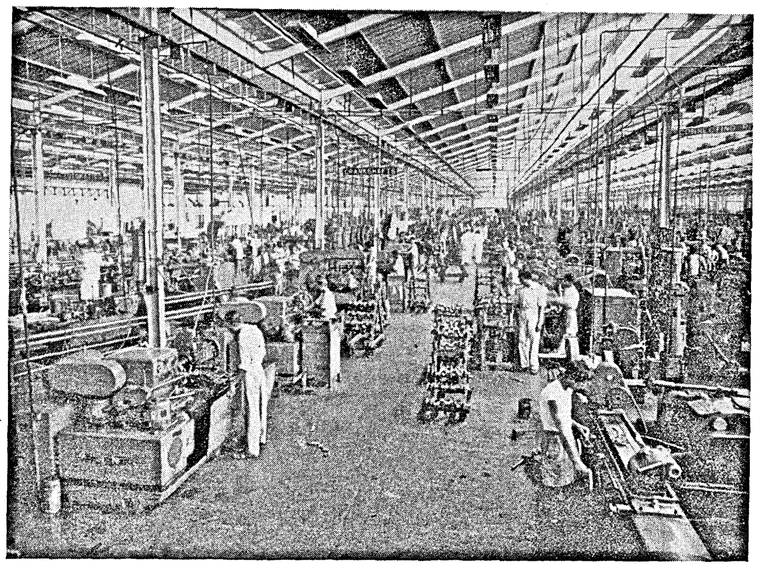
Railways and Road Transport

Since their inception, the railways had provided the quickest and cheapest transport all the world over. India being a land of long distances, its Government had also to concentrate on the development of railway facilities as much as its financial resources allowed with the result that the financial soundness of the railways became a vital national concern. Railway receipts at one time came down to the incredibly low figure of about Rs. 86 crores which could not meet even the interest and depreciation charges. In spite of the two handicaps of high taxes and bad roads, road transport started taking away the traffic for which there was ample capacity on the railways. This diversion of traffic to roads became, therefore, a matter of serious concern to the Government for, they could not in that emergency let motor transport carry away traffic for which there was ample capacity on the railways. A special committee (the Mitchell-Kirkness Committee) was appointed to investigate the problem. It advocated a strong control over road transport in the country and also recommended that its function should be restricted to that of a feeder to the railways. A similar view was supported by the Wedgwood Committee a few years after; but the Government of India took action on these reports only in 1939, or about eight years later, by enacting the Motor Vehicles Act which contained very drastic measures not only for regulating motor transport on roads but for restricting its function in practice to that of a feeder to the railways. Licences of commercial vehicles issued under the Act allowed public carriers a maximum distance of only 70 miles for operation. Further, under the Act, the licensee had to get special permission—not easily obtained—from the officer-in-charge of the administration of the Act, for going outside the route prescribed even after mentioning the details of what traffic was likely to be carried.

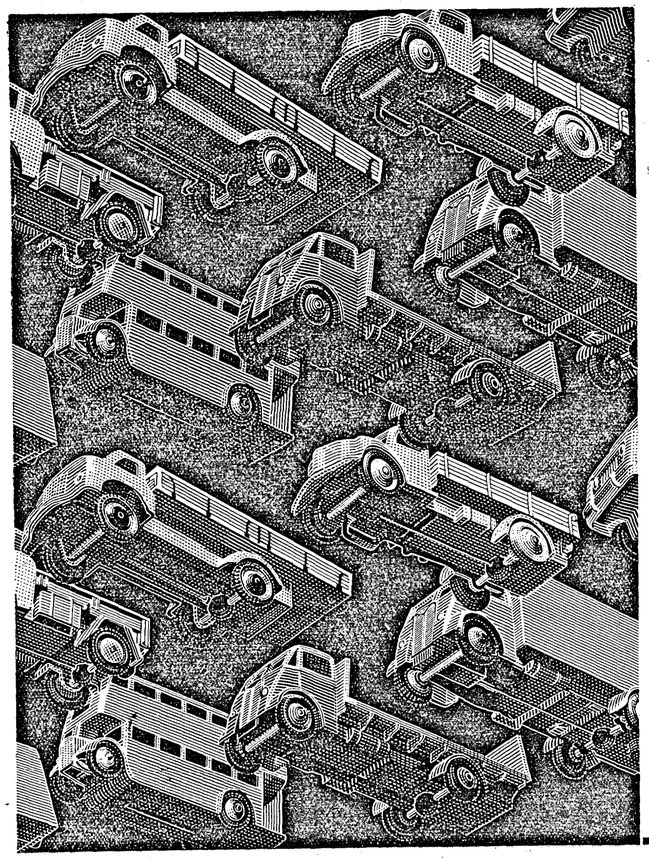
By 1939, conditions had become normal. Rigours of the depression had practically vanished. Railway revenues had steadily increased. Whatever the justification in 1931 or 1932 for restricting the road traffic, it had practically vanished in 1939. In fact, there was ample scope then for the development for both kinds of traffic. The second World War also started immediately after the enactment of the Motor Vehicles Act. The demand for traffic in general became so heavy that the officers-in-charge, instead of restricting road transport, had in the interest of war efforts to encourage it to



An aerial view of a motor-car factory



A sectional view of the machine shop of a motor-car factory



New avenues of progress

The rapid development of India's road transport has opened up new avenues of progress. Diesel trucks, lorries and buses now link every part of the country...carry goods and people to once-remote areas. With the growth of road transport has grown demand for High Speed Diesel Oil. Today over 1 million tons are consumed.

By the end of the Third Plan the country's needs will increase by 117.2%. There can be no question that the first priority should be the exploration and production of indigenous crude oil; the second priority must be to expand refining capacity in India. Oil is essential to economic growth, and Burmah-Shell believes that

for tomorrow's needs we must act today

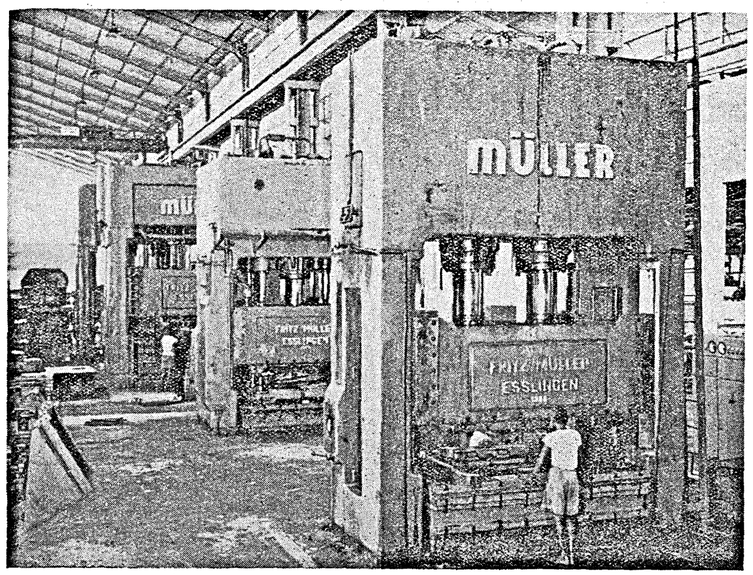
WESTERN RAILWAY



A general view of the press shop of a motor-car factory

carry as much as possible of the surplus traffic left over from the railways. By the time the second World War ended, transport requirements of the country had increased to such an extent that neither the railways nor the roads were in a position to meet the demand of the traffic offering. The economy of the country suffered a serious setback for lack of transport facilities for the traffic offering both on roads and on the railways. There was considerable agitation from the public for reduction of the heavy taxes levied on road transport and for the amendment of the Motor Vehicles Act so that the latter could meet the needs of the situation better. The Central Government appreciated the necessity of providing an earlier relief for transport and appointed a Motor Vehicles Taxation Enquiry Committee in 1950 to review the load of taxes, and find a solution. It also undertook a departmental review by the official Study Group of Transport Planning in 1953. Very practical and reasonable suggestions were put up by both the committees, but on account of the clash of vested interests and differences between the Central and State Governments, there was further delay in giving effect to their recommendations. Finally, the original Act of 1939 was amended. The new Act was on the whole a great improvement, but had to retain some of the restrictive clauses of the old Act just to accommodate the State Governments who under the Constitution controlled not only the operations of the motor-vehicles on roads in their jurisdiction, but taxed them as they liked. The maximum limit for the operation of motor-vehicles under the old Act was removed. An Inter-State Transport Commission was also set up by the Central Government to deal with inter-State controversies and complaints of the operators against the State. The idea was a very good one. Much was expected of this Commission, but it has not so far functioned according to expectations.

Third Plan Traffic

The position now is that the third plan will involve a traffic of not less than 300 million tons a year, out of which the railways have planned to lift only 232 million tons. The balance of 70 million tons will have to be carried either by inland waterways or road. There are about 5,700 miles of navigable waterways in the country, out of which 1,500 miles are available for small steamers and another 1,500 miles for large country crafts. The rest of the 2,700 miles can be used only by small country crafts. No effective measures have so far been taken to improve this vital method of transport. Even the suggestions made by the Gokhale Committee about three years ago remain to be implemented. There is, however, no doubt that the difficulties of improving inland waterways have on account of the long neglect become formidable. Not much relief can, therefore, be expected from this source in the current plan. It is, therefore, obvious in the circumstances that if the railways carry only 232 million tons and the economy of the country is not to be crippled, road transport will have to be developed to carry at least 60 million tons of the remaining traffic. It is generally not appreciated that traffic in many cases is a perishable commodity. What is offered for transport cannot remain available for transport for ever. Arrears of transport cannot be cleared, when convenient. The need for transport disappears for a number of consignments if transport is not available when required. Also, transport facilities for the traffic offering have to be provided in advance and not after the demand has occurred.

In these circumstances, an adequate number of motor-vehicles have to be put on the road to deal with the traffic offering in the third plan. On account of a serious shortage of foreign exchange, imports of these vehicles ready-made for road transport is out of the question. The Government and the country look up to the industry to provide the vehicles needed, and as cheaply as possible. A review of the progress of the motor-vehicle industry over a period of the past seven years will show that the industry has been growing from strength to strength. The annual production of vehicles has increased from 14,000 in 1954 to 52,115 in 1960. Capital investment in the industry has increased eight-fold during this period. The number of workers in motor-car factories has increased from about 5,000 to 35,000. Payments made to them have increased eight-fold. In 1960, about Rs. 8 crores were paid as wages and salaries. About 1,300 apprentices are undergoing training every year in the factories of motor-car manufacturers, who are purchasing components and materials worth Rs. 15 crores a year.

Progress of Indigenous Manufacture

Some idea of the progress made in domestic motor-car manufacture will be obtained from the following statement which gives the indigenous content of each model now being marketed in India.

Type of vehicle	Indigenous content (percent) (October 1958-March 1960)
Hindusthan Ambassador	70.5
Fiat 1100	77.0
Dodge Diesel with Perkins engine	78.0
Standard 10	32.0
Tata Mercedes Benz lorry	64.0
Tata Mercedes Bus chassis	77.0
Leyland Comet	38.5
Jeep	65.0
Meadows engine	50.0
Perkins P.6V Bare Exh. diesel engine	64.0
Bedford diesel with Perkins engine	46.0

UNDER SECRETARY TO GOVERNMENT
3 JUL 1961
PUBLIC DEPARTMENT

The above statement does not fully bring out the actual state of affairs, that is, in the case of the Hindusthan Ambassador car, the ex-factory price of Rs. 12,554 has a foreign content of only Rs. 2,000 or only 15.93 percent of the total price. The rest of the price paid (84 percent) by a purchaser represents expenditure incurred in India.

The total production of motor-vehicles in 1959 was 36,368. It rose to 52,115 in 1960. It is significant that the increase in production has been achieved with little or no increase in the allotment of foreign exchange, as it has been brought about by greater utilisation of local materials. The number of motor-vehicles in commission in India on 30th September, 1960, is as shown in the statement below:

Motor-cycles	61,599
Auto-rickshaws	4,130
Jeeps	23,822
Private motor-cars	225,381
Motor cabs	16,869
Other public service vehicles	47,905
Goods vehicles	145,387
Miscellaneous vehicles	30,879
	555,972

It is significant that although India has one-seventh of the world population, the total number of motor-vehicles on the road exclusive of motor-cycles and auto-rickshaws which are generally not recognised as motor-vehicles, comes to 490,063, compared with a total world figure of 112,724,300 and 697,200 of New Zealand which has a population of hardly four million. Yet out of a comparatively small number of 555,972 vehicles in commission, the Centre is realising a revenue of Rs. 142 crores as shown below:

(In Rs. crores)

	Revenue to State Governments	Revenue to the Centre	Total
1950-51	12.55	34.82	47.37
1960-61	41.00	101.00	142.00

Taxation of Motor Transport

This gives an average of Rs. 2,509 a vehicle on the road including motor-cycles and auto-rickshaws. It has been calculated that the annual taxes which a public carrier has to pay varies in different States in India between Rs. 5,400 and Rs. 6,000 a lorry. There have been additional levies in the latest Budget, and the taxes, in future, will, therefore, be much more than what has been recorded above. The total traffic involved in the third plan demands not only a much bigger output from motor-vehicle factories, but the better use of the vehicles already in commission or to be put on the road. The following practical steps have, therefore, to be taken to achieve this object: (a) construction of more roads to open up new and neglected tracts; (b) improvement of existing roads by better surfacing and

ridging the gaps which are preventing the full se of roads by the vehicles running on them; (c) uick disposal of applications for new registraions leading to a quick use of the commercial ehicles produced by the industry; (d) increase n the use of trailers for cheapening the freight harged; and (e) increasing the outturn of the xisting factories to what is needed to meet the ountry's requirements.

Construction of more roads—As in other fields f activity, India is far behind in the mileage of er road construction. It is at present very inadeuate for an area of about 1.25 million square iles and 550,000 villages. On an average, there re only 26 miles for an area of 100 square miles f the territory, compared with 100 to 300 square iles in other advanced countries. It has been uly said that in the present state of progress in he world, every country pays for its roads whether it builds them or not. The countries which do not build them lose much more indirectly. During the past 12 years, there has been a teady improvement in this direction in India. The Nagpur Plan of Road Development drawn p by chief engineers in 1943 was considered uite ambitious at the time. It has since been ompleted in the second plan. India now has 44,000 miles of surfaced roads and 225,000 miles f non-surfaced roads. This is a little more than what was visualised in the original plan of 1943. t has, however, to be borne in mind that conditions have materially changed since 1943, and hat no one could ever imagine then the vast evelopments which have taken place in the ountry now. The position had, therefore, to be eviewed again in all its bearings about three ears ago. It was found that the target of 1943 as become hopelessly inadequate and that if the are needs of rural India with 80 percent of the otal population are to be met, the road mileage n India will have to be increased by 80 percent n the next 20 years involving an expenditure of Rs. 590 crores in each plan period. It has been urther estimated that the cost in this target will n a liberal estimate not be even three-quarters of he revenue which the motor transport on roads will be contributing in taxes to the Government n each plan period. In spite of these facts, the llotment for roads in the third plan has been ept down to Rs. 250 crores. Taking into consideration the rise in wages and in the cost of the naterials, it will mean less mileage of new roads n the third plan than what has been achieved n the second. In view of the fact that the mount spent on roads is now earning a handsome dividend after providing for maintenance nd repairs and that each crore spent annually on oad construction finds employment for 10,000 nen a year, a revision of the allotment for roads n the third plan deserves to be reconsidered eriously.

Need for Road Development

Improvement of existing roads—This is a pressng necessity at present, for even the small mileage f trunk roads are not continuous. Rivers crossng the highways remain unbridged in many ases. Some rivers have weak bridges thereby educing considerably the full use of the commercial vehicles going over them. Surfaced oads in many cases have a thin metal surface which get cut up and remain unrepaired for want f funds, causing great damage to vehicles plying ver them. Much could be said for this state of oads when they were non-paying; but the evenue from motor traffic on roads has increased o such an extent that the capital sunk over the oads has begun to pay handsome dividends far n excess of the rates at which the Government oans are raised. It cannot be over-emphasised hat this lack of improvement in the maintenance f existing roads, also gaps in important roads, re seriously preventing the normal use of the ehicles plying over them.

To illustrate the point, India has only 1.2 motor-vehicles a mile of her roads, compared with 17.6 in Britain and 16 in the U.S.A. Even countries like Ceylon, Malaya and the Philippines have a much larger number of vehicles a mile. As against India's 1.2, Malaya has 13, Ceylon eight and the Philippines six.

As for quicker disposal of pending applications from new operators of commercial vehicles, it would be noticed from the previous paragraph that the number of vehicles on roads is much less than what can be safely operated on them in spite of the fact that there is a large traffic to carry and the manufacturers have increased the tempo of their production. It cannot be denied that if applications for new permits are withheld for long periods, all suffer equally—dealers for locking up their capital in commercial vehicles, operators for the loss of profits they would have earned and the Governments—Central and State—of the taxes which they would have realised on new vehicles coming into transport service. If these disabilities are to be remedied and the commercial vehicles manufactured are to be used in the best way possible, permits for commercial carriers should not be unduly delayed.

Supplementing Carrying Capacity

Use of trailers in India—In India, motor transport is generally very expensive. It has been calculated that the total cost—(in old currency)—of carrying one ton a mile on the railways used to be between 11 and 12 pies, while the taxes on public carriers work out to about double this amount. In all countries, trailers have become a common feature of motor transport on road. It has been found that the payload a vehicle increases by 50 percent with the use of trailers. The position in India is rather anomalous at present. Some commodities are carried on certain roads in India in trailers, while in others trailers are prohibited. Time has come for a general review of this problem as it will effect a very considerable reduction in the freight charged by commercial vehicle operators.

The need to increase the outturn of the existing factories to the maximum capacity is obvious. There is a serious shortage of foreign exchange. The Jha Committee's recommendation is that priority should be given for the import of capital goods just to decrease steadily the foreign content of each model now being marketed in India. The Government is also of the same view, but has given no sanction so far. It is very desirable that exchange requirements of the capital programme of each concern already submitted to the Government should be sanctioned as early as possible so that motor-vehicle factories may be able further to reduce the foreign content of their models and import more units out of the present licences. It is also to be remembered that the motor-vehicle industry can develop only through mass production. The greater the number of vehicles produced, the greater the scope of price reduction and the consequent increase in sales. Top priority should, therefore, be given to the sanction of the capital goods requirements of the factories. It is the only method by which more units can be got out of the exchange now available.

Complementary Rôles

It will be noticed from the problems explained above that both on account of the traffic involved in the third plan and also of the general development resulting from the first two plans, the traffic will in the coming years be far in excess of 232 million tons which the railways are planning to carry and this excess will have to be carried by road if the economy of the country is not to suffer setbacks. Agricultural, industrial and economic development in general is gathering a fast momentum, creating the need for transport facilities far beyond what could have been visualised four or five years ago. There will be plenty of traffic for the railways, roads and waterways, even more than what each can carry. The present is, therefore, not the time to emphasise the merits or demerits of alternative methods of transport and to waste time on unproductive controversies. The aim should be to ensure that the traffic offering does not remain uncarried. The railways have rendered a signal service to the country in the past. Their contribution, in future, will be still more, but with the development of internal combustion engines, other forms of transport are also in a position to take over the excess, with high efficiency in some cases. Alternative methods of transport are no longer competitive, but complementary to one another, for each has its own type of traffic, which it could carry with greater efficiency and greater satisfaction to the consumer. No method of transport can now become a substitute for another for all types of traffic, for the transport needs of the nation have grown both in extent and variety and have to be catered for in the most economical and convenient manner to the consumer. Advocates of any one method of transport cannot, therefore, rightly claim preference for their own over others and will, in the best interest of the country, have to leave to the user to select what he considers most economical and convenient for him. Unless the transport problem in India is tackled in this spirit, it cannot but retard economic development which the five year plans are generating so rapidly in the country.

Glass makes a distinct difference

Any home can be modernised—with glass. And not in appearance alone. Glass seals out moisture, noise and irritating dust and, fitted cleverly, filters through healthy, natural light. Glass is easily cleaned, too!

Versatile—glass has numerous other uses in the office, factory, school, hospital and store.

The finest and most durable in India, HPG sheet glass is tested for unvarying quality at every stage of manufacture.

Available in a wide variety of sizes and thicknesses

IRON ORE OUTPUT AND EXPORTS INCREASE

MECHANISATION OF MINES AFFECTED BY MACHINERY AND POWER SHORTAGES

By
A SPECIAL CORRESPONDENT

A NATION'S economic and industrial progress has often been measured in terms of its steel production. India is committed to a policy of industrialisation and has, as a result, stressed the importance of steel output. This has necessitated a large-scale increase in the production of iron ore, one of the basic raw materials for the steel industry. Apart from the requirements for indigenous consumption, the demand for iron ore for export is also rising at a very high rate every year. In the first five year plan, the main emphasis was on agriculture. The rapid development of iron and steel production held a central place in the second five year plan. The target for iron ore production in the last plan was set at 12.5 million tons, which the industry has achieved. The requirements for the third five year plan are estimated at about 32 million tons, of which 20 million tons is for consumption by domestic steel plants, and about 10 million tons is for exports. The balance of 2 million tons has been allocated against shortfalls, if any.

Planning to meet the steel requirements of the country in the next 50 years is one of the most important tasks facing the Government, and requires a far-sighted development programme to provide for the ever increasing demand. It is estimated that by the fourth five year plan, the requirements of steel in the country will be somewhere in the region of 18 to 20 million tons. This will mean that about 40 million tons of iron ore will be required each year. The exports will also be increased during the fourth five year plan, and it is thought that the figure for exports will be about 15 to 20 million tons. Thus it will be seen that the total requirements of iron ore at the end of the next decade will be about 60 million tons.

Quantity and Quality of Reserves

Before going into the details of the problems facing the iron ore industry, it will be of interest to make a survey of the country's ore reserves, which are outstanding in quality and quantity. The estimated proved reserves of different types of iron ore in India are 6,500 million tons, but the actual reserves are thought to be 21,000 million tons, of which the hematite ores alone make up nearly 5,400 million tons and 17,600 million tons, respectively. Some of the world's richest iron ore deposits exist in the Singhbhum belt in Bihar where the average iron content of the ore is between 60 percent and 69 percent, compared with 50 percent in the U.S.A. and 40 percent in Europe. It is evident that as far as the reserves are concerned, there is no difficulty at all in meeting the country's requirements for the steel plants as well as for exports. Thus the iron ore industry holds a very bright future as far as the prospects for the expansion of the entire industry is concerned.

The iron ore producers have planned their production programme to meet the future requirements of the steel works both in the private and public sectors. Of the public sector plants, Bhilai will be expanded to 2.5 million ingot tons during the third five year plan, which will need about 5 million tons of iron ore a year. The entire iron ore requirements of Bhilai are being met by its own mine in the Rajhara Pahar deposits in Durg district of Madhya Pradesh. When the iron ore reserves in the Rajhara Pahar deposits are exhausted in the course of years, the Bhilai plant will have to fall back on the adjacent deposits, the main adjacent ones being Dalli-Rowghat and Baladalli. The development of these two deposits depends upon the construction of railway communication which will join them to the Bhilai steel plant. It should not be difficult to plan the output of the neighbouring mines to meet the future requirements of Bhilai, if adequate railway communications are provided.

Richest Iron Ore Mine in World

The mines which will meet the needs of the Rourkela steel plant are in Barsua. The Barsua ore handling plant has recently been commissioned. The size of the ore deposit and the high iron content make the Barsua mine one of the richest in the world. The project will from now on be able to meet the requirements of the Rourkela steel plant with its present capacity as well as when production is expanded to 1.8 million tons by the end of the third five year plan. In the case of the Durgapur steel plant, the Bolani iron ore mines which lie on the Bonai iron ore range will continue to supply its major requirements. It is planned that the requirements of the new steel plant in Bokaro, which will be constructed during the third five year plan, will be supplied from a new mine to be developed in the Sasangda area in the Bonai range. In the private sector, the requirements of the Tata steel plant in Jamshedpur are principally met by the Company's own mines at Noamundi and Joda. Small tonnages are also supplied by the mines in Banspani and Bara Jamda areas. The Indian Iron and Steel Company has its own mines in Gua and Manoharpur, and some part of the needs of its works are met by the mines in the Bara Jamda area.

Coming to the exports of iron ore, it is notable that iron ore has become one of the valuable commodities for earning foreign exchange for the country. Iron ore exports are rising every year, especially to Japan. Recently, the Japanese steel mills and the State Trading Corporation of India reached an agreement on the price of Indian iron ore to be exported to Japan during 1961. Japan is expected to import nearly 2 million tons of Indian iron ore during the current year.

Until recently, most of the mines were producing the ore by hand. Manual mining operations consist of drilling, blasting, breaking and grading the ore to specified sizes. Drilling operations are carried out along the benches with Jack hammer drills operated by compressed air. After the holes are drilled, they are charged with explosives and blasted. When the blasting has been done, the workers have to dress the benches removing the loose ore and make the mining face ready for further drilling. The ore which is collected after blasting is in the form of big boulders and has to be broken by hammer to smaller pieces to meet the requirements of the steel plants. The broken ore is screened manually to reject fine material. The heavy increase in the demand for iron ore has resulted in the modernisation and mechanisa-

GUARDIAN OF THE REPUBLIC

Of the thousands of poems and songs, sculptures and paintings, architectural splendours and forts of India's glorious past, none is more eloquent than the relics of armour made with iron and steel. Steel was, then, the visible guardian of kingdoms—swords flashing in the sun, glinting spear points, arrows flying in the air. Steel saved and won kingdoms.

Today, steel plays a wider and more complex role in India's progress in every facet of industry, in every walk of life.

Millions of tons of iron ore and other raw materials are being smelted in the roaring furnaces of Rourkela, Bhilai and Durgapur. Products from these plants are already giving a fillip to industries all over the country and setting the pace for a rapidly growing economy.

The measure of steel production is the measure of a nation's economic strength and the fourfold increase of steel production in the second five year Plan and further expansion proposed in the third Plan mark India's steady stride towards greater strength, security and prosperity.

tion of most of the mines which supply to the steel industry.

Problems of Mechanisation

The immediate problem for the mechanisation of the mines is that of importing mining machinery, such as drilling equipment, shovels, heavy dumpers and crushing and screening plants. These are in very short supply due to foreign exchange difficulties and the industry as a whole is hard put to it in finding the necessary plant and spare parts which are essential to meet its future commitments. Some companies in India have started manufacturing the types of mining plant required to operate an iron ore mine, but considering the expansion programme they cannot at present meet the whole requirements. The ability of the iron ore industry to face its future commitments depends to a large extent on the Government being able to provide the necessary foreign exchange and purchase essential production plant and machinery.

The main mines which supply the steel plants are in the hilly country of southern Bihar and northern Orissa. Deposits occurring at higher levels involve more capital expenditure for hauling the ores down to the railhead than the deposits occurring at lower altitudes. One thing that has stood out over the recent years is the inability of small mines to reach out to new opportunities. To meet today's requirements, especially those of the steel mills, modern equipment and techniques are required for increasing the output from the mines and also speed up the process of loading railway wagons. The large capital expenditure involved in mechanisation cannot be met by small mine owners. It is a serious problem for them, which is even threatening their existence.

The mechanisation of our iron ore mines has created many problems and a particular one facing the industry is the production of fine ore. This ore is an unavoidable product of mechanised mining and is too small in size to be handled by the steel plants in this country in its present form. At the moment, all fines which are being produced are being stockpiled at the mines. As the steel plants are not able to handle this fine ore, serious consideration must be given to the introduction of either the sintering, agglomeration or the pelletisation process. Sintering consists of mixing the fine ore with a small percentage of coke breeze, this mixture is heated on a travelling hearth, which ignites the coke and fuses the particles of fine ore and dust together into a porous mass called sinter. The sinter is then broken into suitably sized lumps. In view of the large quantity of fine ore which is being produced and will be produced in the future, a sintering plant for each of the steel works in the country is essential. In the U.K. in 1962, the output of sinter is expected to amount to about 40 percent of the total ore consumed in Britain. The sintering of fines has to be tackled on a large scale in future which will not only utilise the large reserves of fine ore that are accumulating at the mines, but also provide a great economic relief to the iron ore industry.

Electric Power Shortage

Another problem facing this industry in connection with the modernisation and mechanisation of its production methods is the shortage of electric power, which is mainly used in the crushing and screening plants. Also due to the power shortage mines are unable to introduce electric shovels which are far more efficient than diesel shovels. Unless adequate energy is provided, it is impossible to commission the modern plant which is necessary to meet the Government's production targets. The iron ore industry has lately experienced a shortage of conventional explosives for blasting, and it is expected that due to general developments in the country, the demand for explosives will increase which will result in possible further shortages. Some of the mines are already experimenting with new explosives such as liquid oxygen for blasting. The Government should help set up new factories for the manufacture of explosives which will bridge the existing gap between supply and demand.

Another problem facing the iron ore producers is the shortage of skilled and unskilled labour. In the mining areas, there is a considerable shortage of local skilled labour due to the industrial development of the area, especially in the iron ore belt. This shortage of labour is at present being met by importing labour from adjacent districts of the mining areas. The mining worker is progressively receiving more privileges to which he is entitled under Government labour legislation such as the Mines Act and the Indian Metalliferous Mines Regulations. Other advanced countries during the process of their development did not have elaborate labour legislation in favour of their workers. What they developed after trial and error has become part of the conventions accepted under the International Labour Organisation to which India is a party. The producers are, therefore, trying to develop the industry under more difficult conditions in as much as the cost of labour is relatively high for the above reasons. Whereas the mining worker in the West got his privileges by hard work and by demonstrating his productivity in practice, India has given to the mining worker in India modern privileges before he has deserved it by his productivity.

Insufficient Wagons

So much for the problems for the actual mining in the iron ore industry. Once the ore has been mined, and screened to the required size, it is stockpiled near the railhead for being transported. For transporting ore from the mines to steel works or docks, the railway system plays a very important rôle. In order to speed up the movement, the railway authorities have embarked upon the programme of electrification in the iron belt. A considerable progress has already been made in this direction. The introduction of the so-called crack specials for despatching iron ore from the mines to the various steel works has been a successful experiment. New railway lines are being constructed to connect the iron ore mines to the steel works which they feed, and also to new docks being developed in the south for exports. Although the railways are trying their best to comply with the increased traffic, sufficient wagons are not being made available at the railhead of the mines. There appears to be a general shortage of railway wagons in the country and this is a great handicap to the iron ore industry. Sometimes mines have to reduce their production because of the mounting stocks of ore at the railhead due to the non-availability of wagons. It is hoped that the wagon placement is not going to be a bottleneck during the third five year plan and delay the planned development in the steel plants. Another difficulty in transporting iron ore to the steel works is that each steel plant has been provided with different mechanical unloading facilities, and as a result, they cannot all take the same type of wagons.

Competition from Manganese Ore

For iron ore exports, the wagon situation presents an additional problem. This is because of the stiff competition from the manganese ore industry, which is due to the fact that some of the manganese mines exist in the iron ore belt. The manganese ore industry rightly claims that foreign exchange earnings from the manganese ore a ton exported is, on average, double that of iron ore and, therefore, manganese ore exports should be given priority as far as the wagon allotment is concerned. Due to the above reasons, wagons which could have been allotted for iron ore are being allotted for moving manganese ore to the docks. It is quite clear from the foregoing that the problem of rail transport facing the iron ore industry is common both to iron ore used for home consumption and also for exports. An integrated outlook by the railways for overall planning is necessary in assessing the wagon requirements so that the growth of the industry is not hampered because of the shortage of rolling stock.

The main problems facing the iron ore industry are as follows. First, an inadequate supply of railway wagons for moving ore from the various mines to the steel works and to the docks. Secondly, the difficulty in obtaining import licences for obtaining the machines and plant needed for the mechanisation of the mines due to the shortage of foreign exchange in the country. Thirdly, the shortage of skilled technicians to man the new and developing mining installations, and finally, the shortage of electric power. All these problems must be tackled on a national basis, if the steel output targets for the next few years are to be achieved.

DEMAND FOR INDUSTRIAL GASES RISING RAPIDLY

PRODUCTION BEING DIVERSIFIED TO REDUCE IMPORTS

TWENTY-SEVEN years is not a long period as time is reckoned in the life of an industry, still less in the growth of a nation, but in this period are concentrated some of the most rapid and fateful changes in the history of the industrial gases industry. In 1935, its scale of operation was modest and its future seemed limited. Today, its contours are being radically transformed and it has emerged as one of the important industries of the economy. A few figures will give some idea of the progress of, and the prospects for, the industry.

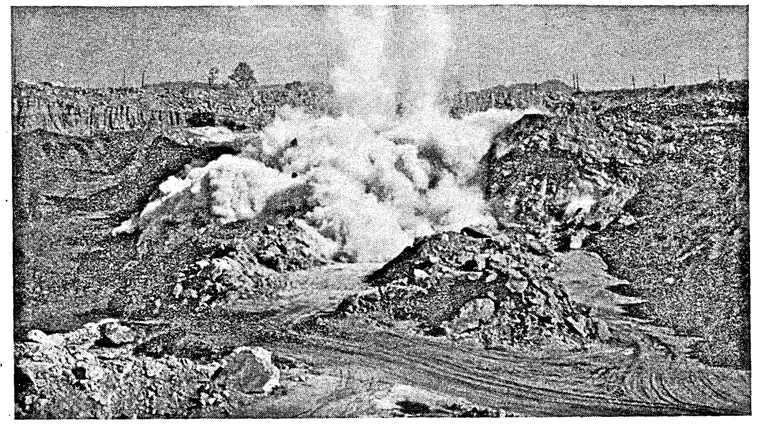
In 1960-61, the demand for oxygen is placed at about 1,000 million cubic feet. By 1965-66, it is estimated that the demand will expand to some 10,250 million cubic feet, and a further rise to about 24,950 million cubic feet is anticipated by 1970-71—a 24-fold increase in ten years. To appreciate this index of growth properly, however, one must place it in the perspective of the vast and strenuous efforts the country is making for

By
A SPECIAL CORRESPONDENT

rapid industrialisation and economic self-sufficiency. The figures for oxygen given above are based on the assumption that the indigenous steel output will rise from the current level of 2.5 million ingot tons to 17 million ingot tons by 1970-71 and the consumption of finished steel from 3 million tons to 15 million tons during the same period.

Oxygen in Steel Manufacture

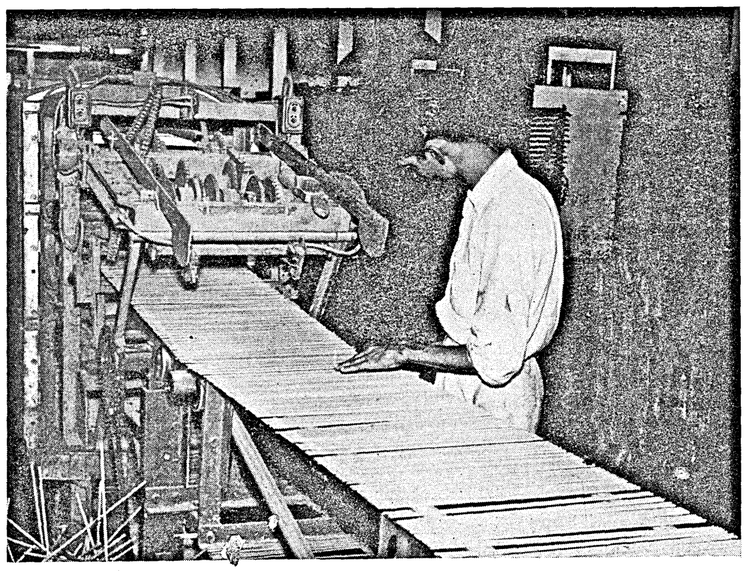
So intimately is steelmaking connected with oxygen that its augmented production has had an impact not only on the volume of oxygen produced, but on the pattern of production and distribution as well. As the steelmaking and fabricating industries expanded, it became more economic to increase the size of the oxygen plant and to locate it as near the consuming centre as possible, from where the gas could be conveyed through a network of pipelines, instead of in the traditional compressed cylinders, to the required point of consumption. T.I.S.C.O., I.I.S.C.O., T.E.L.C.O. and the Indian Tube Company receive their oxygen requirements through direct pipelines and the cost of supplying this piped oxygen has proved to be one-third that of the compressed cylinder variety. Liquid oxygen, produced by 400-cubic-metre-capacity plants and delivered in specially designed tankers to factory establishments, has been responsible for reducing supply costs by as much as 50 percent. This has enabled the industry to extend its use to processes other than welding, cutting, deseaming, tapping and lancing. Today, it is increasingly employed in foundries engaged in making machine castings and other special work, in steel-melting shops in the flame enrichment process to accelerate heating and melting and for the oxidation of steel by direct injection through roof lances into open-hearth furnaces. The use of oxygen in these last two fields has assisted in raising productivity by some 50 percent. Another recent application of oxygen is in the L.-D. process which has a productivity four or five times greater than the traditional open-hearth process. Here oxygen of 99.5 percent purity is blown vertically through a water-cooled lance on to the surface of the liquid iron in a closed bottom converter.



Liquid oxygen explosives are now extensively used in open-cast mining

These diversified uses have necessitated the installation of "tonnage" oxygen plants (that is, plants producing on the vast scale of tons rather than cubic feet) such as the ones in the public sector steel plants in Bhilai, Durgapur and Rourkela. Tatas have entered into a contract for the erection of one such plant at their Jamshedpur works, which, when completed, will be the first of its kind in the private sector. These "tonnage" plants have effected considerable savings in the supply cost of bulk oxygen; and these economies have, in turn, prompted still further applications of oxygen in steelmaking.

The object of this brief survey of the developing uses of oxygen in the steel industry has been to indicate how the growth of the industry has widened enormously the range of processes where oxygen may be employed, thus radically altering the structure of the industrial gases industry itself. In 1951, when the tempo of industrialisation had yet to quicken to anything like its present rate, liquid oxygen comprised only 2 percent of the total oxygen production. Today, this proportion has jumped to as high as 55 percent. The increase indicates the rapid development of the engineering industry over the last decade.



Welding electrodes, a variety of which are now manufactured in India

Liquid Oxygen Explosives

Steel does not, however, wholly account for this switch-over of the industrial gases industry from its traditional compressed gases business to its present emphasis on liquid oxygen. Another important area where liquid oxygen has been recently employed is in the field of explosives. Although liquid oxygen explosives were known in India at least as far back as 1935, it was only with the invention of the Loxite cartridge in 1955 that a really efficient and economic method of using liquid oxygen in this field was evolved. Only 45 tons of liquid oxygen explosives were consumed in 1955; by 1960-61, the figure has increased to 2,000 tons, and it is expected to rise still further, to some 16,000 tons by 1965-66. At present, it accounts for a third of the total output of industrial explosives in India. In the coal mines of the National Coal Development Corporation and in iron ore and limestone quarries, it has largely replaced the conventional high explosives. India may take legitimate pride in Loxite, for it is an indigenous discovery, processed from domestic agricultural waste. Not the least of its attractions is the considerable

Regulators to be used for cylinders now produced by the industry

foreign exchange saving that the use of liquid oxygen explosive has entailed, and it is interesting to note how the industry, as a whole, has branched out into various lines of production in accordance with the declared objective of India's five year plans.

The first argon and high purity nitrogen producing plant in India went on stream in Burnpur in December 1960. Argon is used for the welding and fabricating of stainless and heat-resistant steels, aluminium, copper, nickel and their alloys, silver, Everdur, and reactive metals such as titanium. In India, the industry's main customers are the aircraft and aluminium manufacturing industries, the railways, the chemical and brewery industries, and the lamp industry, where argon and argon-nitrogen mixtures are employed for the filling of bulbs. The alloy steels plant to be set up in Durgapur will also have large requirements of this gas. These industries are now in a position to obtain their total requirements from an indigenous source, instead of depending on imports, as hitherto they had been doing. As argon is present in the air in very minute quantities—approximately 0.93 percent by volume—it can only be produced in specially large plants with a minimum capacity of 400 cubic metres an hour, like the one in Burnpur. It is planned to set up similar plants in Bombay and other important port towns, with a view to exporting the gas eventually.

Welding Electrodes

While industrial gases constitute the major part of the industry's business, they are not the whole of it. The manufacture of electrode is another field with which the industry has been traditionally associated and where it has been able to save large foreign exchange by indigenous production. It was in 1947 that indigenously manufactured welding electrodes were first put on the market, but inadequate supplies of core wire and other raw materials restricted production and in 1952 only 36 million feet of general-purpose mild steel electrodes were produced. At the industry's request the Government placed import restrictions on electrodes in the middle of 1953 and this—coupled with the growing demand generated by industrialisation—led to an extension in both the volume and the range of electrode manufacture, till by 1960-61 production had risen to 350 million feet. This figure includes not only general-purpose mild steel electrodes but a number of special-purpose electrodes used for hard-facing, and bronze welding and high quality steel welding. Plans are being considered to enlarge the range of indigenously manufactured special-purpose electrodes, with a view to cutting down imports still further. Besides, the possibilities of exporting these electrodes to south-east Asia, where a good market exists, are also being considered.

The industry's core wire requirements have still to be largely imported, and this is one reason why its electrode manufacturing programme has not been fully implemented. The setting up of a projected wire drawing mill should go a long way towards making it self-sufficient in this important raw material and the high quality of the wire will undoubtedly open up export possibilities in neighbouring markets.

In addition to electrodes, the industry undertook in 1958 a phased programme for manufacturing gas welding and cutting blowpipes. By the middle of last year, it achieved a 100-percent local manufacture of all the components involved, with the exception of certain rubber items whose value is only 1 percent of the total production cost. The range of manufacture is now being extended to cutting machines.

Substantial progress has also been achieved in the manufacture of acetylene plant. Apart from certain high-pressure compressors and flame-proof electrical equipment, the major items are all produced locally. Oxygen plants present a more formidable problem. Here the main hindrance to the development of indigenous manufacture has been the inability of India's metal industry to reach the requisite standard in the metallurgy of non-ferrous and special metals. As a result, local production only accounts for a few items like high-pressure valves and cylinder fittings. But the rapid technological progress which is being made makes one optimistic that there will be significant improvement in this sphere before the end of the third plan.

Medical Oxygen

From the medical profession as well, the industrial gases industry has a significant contribution to make. Medical oxygen is manufactured at a large number of works and a 24-hour supply service maintained. Oxygen and carbon dioxide mixtures, required in pediatrics and psychotherapy, are also produced in India. Nitrous oxide—widely used as an anæsthetic—is being increasingly exported from Calcutta; Ceylon, Malaya and Burma obtain their full requirements from India, and with the establishment of a new plant early next year, a greatly increased quantity will be available for export.

In addition to these medical gases, the industry is engaged in the production of a whole range of medical equipment. Today, a large variety of oxygen therapy equipment and accessories—including fine adjustment valves, inhalers of different types, tubings, cylinder fittings and oxygen tents—are locally manufactured; quite soon the first indigenously produced Boyle anæsthetic apparatus will be put on the market. Here, as elsewhere, the progress has been rapid, so the scope for local manufacture is being continuously broadened.

IMPROVING OUTLOOK FOR THE FOOD CANNING INDUSTRY

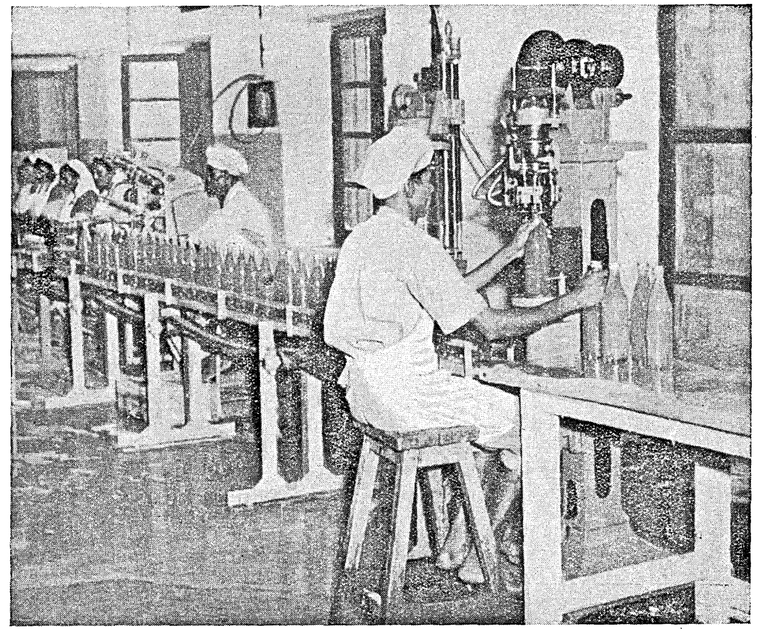
HIGH COSTS PREVENT QUICK EXPANSION

THE need for food preservation is almost as old as mankind. Although it is difficult to state with certainty which of the methods of preserving food developed first, it is likely that man first learnt that food could be kept for long periods of time when it had dried in the sun. The preservation of fish in the extreme northern regions of Scandinavia by freezing may also have developed as a natural phenomenon. Salting and fermentation may have followed next. Methods of food preservation, such as pickling, preparation of chutney and *murabba*, as well as the addition of spices, have been practised in India and some other countries of the East from time immemorial. With the advance of civilisation, however, man has been continuously searching for methods of preserving food in a form as close to fresh as possible. With increasing scientific knowledge and technological developments, it has recently been possible to produce preserved foods which can hardly be distinguished from the fresh. Research and development work go on ceaselessly and modern science is continuously striving to provide better and better preserved foods.

One of the most important steps in the field of food preservation was the introduction of canning. In order to overcome the dietary deficiencies of his armed forces, Napoleon offered a prize to anyone who could develop new and better methods of preserving food. In response to this, Nicholas Appert, a Parisian baker, came forth with a process of preserving foods in sealed metal containers and was awarded a prize of 12,000 francs in 1809. Although earlier attempts had been made to develop such a process by Spallanzani

By

A SPECIAL CORRESPONDENT



Sealing of squash bottles with pilfer-proof closures

and others, they did not achieve the degree of success attained by Appert. At the time of Appert's work, the causes of food being spoiled were not known; in fact, they were first discovered half a century later as a result of the research work of Louis Pasteur. This was the first step in the slow but sure conversion of canning from an art into a science.

Developing Improved Containers

Simultaneously with the development of food canning techniques, progress was made in developing improved containers. The first patent on the coating of iron with tin was obtained in Britain in 1810. This led at first to the development of the "hand-soldered" open top can and later to the "hole and cap" tin. The first "sanitary" type can was introduced in 1900. Today a complex industry employing engineering and technological skill of a very high order is employed in the manufacture of the apparently simple cans for preserved foods. Simultaneously with the development of cans, glass containers came into use and a large variety of glass jars and bottles, which can be hermetically sealed, are now available.

In present-day commercial canning, carefully selected and prepared food is placed in a container, which is permanently sealed and then subjected to an elevated temperature for a definite period of time, following which it is cooled. Heating produces an unfavourable temperature condition for spoilage micro-organisms which may be present in the food. Consequently, any such micro-organisms are destroyed or their growth is inhibited. After cooling, the permanent seal of the container prevents recontamination by spoilage organisms. Some products like jams and sauces, which are cooked during the process of manufacture, are filled hot into jars or bottles, which are then hermetically sealed. Others, like squashes, are protected from the action of spoilage organisms by the addition of very small amounts of chemical preservatives. Although the process of food preservation by canning originated in France, today the largest quantities of food are canned in the United States, Britain, Canada and Australia followed by the countries of western Europe. The total production of canned food in these countries is estimated at over 10 million tons a year. Out of this, the United States alone accounts for over 6 million tons. These figures assume much greater significance when it is considered that in these countries, large quantities of food are also preserved by freezing and other methods. Compared with this, the Indian food preservation industry produced a total quantity of 30,000 tons, including chutneys, *murabbas* and pickles, in the last year of the second five year plan. This total quantity was produced by approximately 1,000 factories holding manufacturing licences under the Fruit Products Order of the Government of India. Out of these thousand or so factories, only about 20 had a manufacturing capacity of over five tons of finished products a day.

Beginning in India

After over a century of its discovery, food canning started in India. However, even prior to this, canned foods had been introduced to the Indian consumer by importing them from abroad, and the food canning industry was started in the country with a view to catering to consumers, who were already used to imported preserved foods. While every effort was made to manufacture products which could compare favourably with their imported counterparts, new indigenous products were also developed gradually. Kissan Products were the first in the field having started 41 years ago, under the name of the Indian Mildura Fruit Farms Limited, in Renala—now in Pakistan. Other pioneers were the Oriental Canning Company and the Madhu Canning Company. The first few years were indeed very difficult ones for the industry as everything except the fruits and vegetables had to be imported. The Oriental Canning Company was a victim of these difficult circumstances and closed down after a short period. In the absence of tariff protection, the industry just about managed to keep its head above water until the start of the second World War, when the shortage of imported products coupled with large demands from the Army, gave it its first major impetus. Soon after the end of the war, the industry received a major setback because large quantities of processed foods declared surplus by the Army were released on the market at almost throw-away prices. The industry suffered heavily but just about managed to survive, until tariff protection was finally granted after independence and the Defence Services, who are large purchasers of canned foods, reduced their imports to a minimum and began purchasing indigenous products. This was followed by a complete ban on imports of canned foods due to the acute shortage of foreign exchange, which enabled the food processing industry to make rapid progress, in spite of the very high cost of sugar, containers, transport and even agricultural produce, in the country.

Dearer Sugar

Sugar is one of the major ingredients of canned and bottled foods, forming as much as 50 percent or more in the case of jams and squashes. The price of sugar in India is almost three times the world market price. It is, therefore, evident that for the proper development of this industry, sugar should be made available to it at a reasonable price, by a subsidy or any other means. Recently, on the recommendation of the Development Council for Food Processing Industries, the State Trading Corporation has agreed to bear a small trading loss on exports of canned or bottled foods to compensate for the high price of sugar to some extent, but this has not been enough. Much more will have to be done for promoting exports, apart from which the interests of the consumer in India should not be entirely ignored. Although there is at present a glut of sugar in India, due to Government control over its distribution, food processing factories often find themselves without any stock of sugar. Not only does this lead to a stoppage of production, but quite often the fresh fruit supplied to a factory, which has to be processed on the same day as it is received, is wasted due to the non-availability of sugar for processing. Another great disadvantage of Government control over distribution is that food processing factories are compelled to obtain their requirements of sugar from sources nominated by the controlling authority. The majority of sugar mills in India use the double sulphitation process and there is occasionally a residue of sulphur in the sugar. Although this is very small indeed, it sometimes leads to the darkening of the end-product or to the finding of an excess of pre-

Machines to produce wealth. But more important, men who can design and make machines and run factories. The production of skill. Dunlop have been doing this ever since they took on a batch of Calcutta University science graduates for their factory at Sahaganj, West Bengal, in 1936. At that time technicians from Birmingham supervised all operations. A different story in 1959, however, when Dunlop opened their second factory at Ambattur, near Madras. Skilled men from Sahaganj played the major part in getting Ambattur under way; in charge of production there is a man who began life as an operative at Sahaganj.

Throwing aside the deadweight of habit. Striking out along new paths with confidence in the future. This is the substance behind the new Dunlop symbol.

servative on analysis, in the case of squashes. Instances have also been known where some of the newly started co-operative sugar mills have supplied sugar of a dark colour totally unfit for use in food processing factories, and often containing as much as 10 percent of extraneous matter for which the price of sugar has been paid! The food processing industry is a large consumer of sugar and the unhampered development of this industry can go a long way towards solving the problem of excess production of sugar in the country. As such, the Government of India should seriously consider permitting food processing factories to purchase their requirements of sugar directly from any sugar mill of its choice at the controlled price.

High Cost of Containers

Another major difficulty of the food processing industry is the high cost and somewhat unsatisfactory quality of containers. One of the most helpful steps taken by the Central Government was to grant a subsidy of Rs. 500 a ton of tinplate used in the manufacture of containers for processed fruit and vegetable products. This brought down the price of cans in India to the same level as in the U.K., but recently a part of this concession was lost with the introduction of an excise duty of Rs. 200 a ton on tinplate. Although container manufacturers have recently used imported tinplate for the manufacture of cans, even then there have been a number of complaints as the quality of the tinplate was not satisfactory. Some products require lacquered cans, but the lacquers used in India are not entirely satisfactory. Due to the shortage of foreign exchange, it has not been possible to import the raw material used in these lacquers, and although some progress has already been made in developing substitutes from raw materials available in India, much remains to be done in this direction. The cost of glass containers is also almost twice as high as in other countries, besides which the quality of the containers continues to be a problem. For the manufacture of containers of uniform shape and capacity, automatic machines are necessary. With the rapid industrialisation of the country, the demand for good glass containers has increased considerably and the few manufacturers of glass containers, who have automatic machines, are unable to meet the full requirements of the food processing industry. The quality of the glass itself is often unsatisfactory—being excessively alkaline—even in the case of containers manufactured with automatic machines. This alkalinity reacts with the normal acidity of the processed food filled in the glass containers, leading to discolouration and spoilage. It is, therefore, evident that the progress of the food processing industry depends to a great extent on the progress of the container industry.

Due to long distances involved, transport charges form a high proportion of the final cost of processed foods to the consumer. But this is not the only drawback. The service rendered by the State-owned railways is extremely poor indeed. Apart from a very high incidence of breakage and pilferage in transit, it often happens that the railways refuse to accept goods for transport to certain destinations for long periods. Where there is such a restriction on the movement of materials to a food processing factory, it disrupts production. Where the restriction applies to the despatch of finished products from a factory to a consuming centre, it hampers proper distribution and the continuous availability of the factory's products to consumers. It often happens that consignments take months to reach their destination. It is sometimes necessary to transport fruit and vegetables to food processing factories located several hundred miles away. For this purpose, the railways do not provide proper facilities, such as ventilated or refrigerated wagons. The incidence of spoilage is, therefore, very large and whatever reaches its destination is by no means in the best condition. The railway staff is not trained in the proper handling of perishables and sometimes these are left lying for days at transhipment points. In spite of repeated representations to the railway authorities, little or nothing has been done to improve matters. It is, therefore, not at all surprising that the food processing industry is relying increasingly on road transport, but the raising of the excise duty on diesel oil every year during the last few years, coupled with other imposts on road transport, has made its cost prohibitive except for relatively short distances. Some progress has been made in the development of roads in formerly inaccessible fruit growing areas of Uttar Pradesh, which has brought considerable economic benefits to growers, but there is need for much greater development in this direction all over the country.

There is a great deal of misunderstanding among the public as well as in certain quarters of the Government that only surplus or inferior fruit and vegetables need to be canned. This is only partially correct. It is not possible to obtain from a can anything better than what has been put into it. As such, in most countries in which the food preservation industry has made considerable progress, high quality fruit and vegetables, which will retain their flavour and texture after canning and also have a long shelf-life, are specially grown for exclusive supply to processing factories. Similar steps to grow the right type of fruit and vegetables for canning should be taken in India, when the complaint of the consumer that the indigenous product is not as good as the imported one will disappear. Similarly, the meat processing industry requires the right type of livestock. The problem of the fish canning industry is slightly different. Whereas the quality of the raw material is satisfactory at the time it is caught, it deteriorates rapidly by the time it reaches the processing factory. It is, therefore, necessary to store the catch at a low temperature on board the fishing vessel with the help of chipped ice or by refrigeration so that it may reach the processing factory in good condition and free from contamination.

Supply of Machinery

The modern techniques of food processing are well known to the industry in India, but their effective use depends on the availability of suitable equipment. So far most of the machinery and equipment for the industry had to be imported, but considerable progress has already been made towards manufacturing most of the items in India. The Central Food Technological Research Institute in Mysore and other institutions continuously carry on research to solve problems of the industry peculiar to this country, although contacts between these research institutions and industry could be much closer. With the increase in the number of food processing factories, there is a shortage of technologists, and the existing training programmes are inadequate to meet the requirements of the industry. This problem needs to be tackled immediately if the industry is to make rapid progress.

The industry is regulated by the Fruit Products Order, which was first introduced in 1948 and later revised in 1955. Under this order, minimum specifications are laid down for each kind of product and there are regulations providing for the observance of proper hygienic conditions in factories. It is a particular feature of the Fruit Products Order that it provides for the regular inspection of factories and for the drawing of samples both at the factories as well as at retail outlets, the samples being analysed at the Central Food Technological Research Institute in Mysore. Where products are found to be defective, the Agricultural Marketing Adviser to the Government of India, who is responsible for the enforcement of the Fruit Products Order, takes steps to have the goods destroyed. A few years ago, the Prevention of Food Adulteration Act was passed by Parliament. Although the specifications for processed foods under this Act are the same as those prescribed by the Fruit Products Order, the enforcement of the Prevention of Food Adulteration Act is in the hands of the Health Departments of local municipalities, who have no technologists or other trained personnel with knowledge of the food processing industry. This has led to the unnecessary harassment of many manufacturers, so the Government of India should take steps to exempt the products of the food processing industry from the scope of the Prevention of Food Adulteration Act, as the Agricultural Marketing Adviser, who has a staff of technologists, is capable of enforcing the law more effectively.

Buying a Convenience

The food preservation industry flourishes in the United States and other countries of western Europe primarily because the people of these countries have come to believe that convenience is an essential corollary to their improving standard of living. The housewife, in most cases, holds a job for a living. Doing her dual job of working in a factory or in an office and also keeping a home, she has to buy as much "convenience" as possible. Preserved foods provide convenience and have, therefore, become a necessity. The indications are that the market for preserved foods will grow in India also somewhat on the lines obtaining in other countries, although it will naturally be at a slower rate for the present and may catch up progressively in the years ahead. It is seen from a study of the 1951 census that nearly 80 percent of the urban families in India consist of only father, mother and no more than their four children. The trend towards such natural families, as opposed to the traditionally large joint families, suggests a progressive adoption of apartment living as in the United States, which must lead to the adoption of "conveniences" as an inevitable routine in these families. Some 42 percent of India's population was in the age-group five to 24 in 1941. This segment of the population has today grown up to be in the ages of 25 to 44, constituting a large portion of the current market. This represents a new generation which has grown up during a period of economic growth through planning. It is, therefore, likely that this generation will be different from the last, being less austere in its outlook and habits of consumption. People are also meeting and mixing more freely. This factor together with the growing tendency towards natural families and an emerging new outlook in the growing generation should lead to the progressive introduction of preserved foods in a large way in the homes, primarily for entertainment purposes, but eventually to stay there as a routine habit. There is, of course, a greater need for consumer education in the use of processed foods.

Development Council for Industry

The formation of the Development Council for Food Processing Industries in 1958 provided for the first time a common platform for the industry to study the processors' problems and present them to the Government in a consolidated manner. This has led to a new awareness of the industry's problems by the Government and these problems are now securing the attention they have deserved for a long time. It can, therefore, be hoped that the barriers in the way of the development of the industry will be removed and assistance provided for its speedy expansion to meet the growing consumer demand in the country and also to build up an export market. The development of this industry will not only lead to the development of horticulture on the one hand, and a reduction in the waste of good protective foods on the other, but it can also provide employment to thousands of people both directly and indirectly.

DEMAND FOR HEAVY CHEMICALS RISING RAPIDLY

NEED FOR ACHIEVING THIRD PLAN PRODUCTION TARGETS

By
A CORRESPONDENT

THE exact scope of the heavy chemical industry is difficult to define on account of its complexity. The classification of heavy chemicals adopted in the U.S.A., the U.K. and India differs substantially from one another and no single standard classification is available. In the U.S.A. and the U.K., organic chemicals produced in large tonnage such as aliphatic alcohols, aliphatic and aromatic hydrocarbons, phenol, phthalic anhydride, glycol, synthetic detergents and styrene, are also listed under the classification of heavy chemicals. The Heavy Chemicals Directorate of the Government of India includes fertilisers and salt also under this category. For the present review, heavy chemicals will be defined as those basic inorganic chemicals which are produced primarily for use in the manufacture of other chemicals and allied products. The heavy chemical industry is essentially a source of intermediate products or raw material as distinct from consumer goods. Accordingly, the following chemicals may be listed under the category of heavy chemicals: *acids*—sulphuric acid and salts, hydrochloric acid and salts, nitric acid and salts. *Alkalis*—soda ash, sodium bicarbonate, caustic soda, chlorine, bleaching powder, hypochlorite, ammonia, potassium hydroxide, potassium carbonate, etcetera. *Miscellaneous*—calcium carbide, sodium hydrosulphite, hydrogen peroxide, industrial gases like oxygen, acetylene, carbon dioxide, etcetera.

As the above list, although not fully comprehensive, includes a very large number of chemicals, it is not possible here to deal in detail with all of them, and only the three key chemicals—sulphuric acid, soda ash and caustic soda—have been selected for the review. Although this is far from an ideal method of studying so important a sector of the chemical industry, it does allow significant trends to be brought into focus in the heavy chemical industry. The acid industry, represented by sulphuric acid, and the alkali industry, represented by soda ash and caustic soda, form the two great pillars of the entire structure of the modern chemical industry. Almost every chemical product is born from the complicated reactions of these principal substances. It is in view of this that the rise and fall of consumption of these heavy chemicals is said to be the barometer of economic advancement and the industrial development of a country. Various goods of daily use are produced either directly or indirectly from these chemicals. The development of innumerable products such as glass, soap, textiles, paper, rayon, fertilisers, explosives, steel, aluminium, petroleum, dyes, drugs, insecticides and plastics are all dependent on these key chemicals.

Production of Sulphuric Acid

Sulphuric acid is an important industrial raw material for the production of fertilisers, textiles, rayon yarn and staple fibre, explosives, dyes, paints, plastics, iron and steel, petroleum refining and a large number of industrial chemicals. Judged by the standard of consumption and production of sulphuric acid, India ranks low in comparison with the industrially advanced countries of the world. Here *per capita* annual consumption of the acid is about 2 lbs, compared with 75 lbs in the U.K. and 275 lbs in the U.S.A.

The expansion of the sulphuric acid industry during the first five year plan was mainly in the form of completion of schemes under implementation at the beginning of 1951. At the end of the plan, the actual installed capacity was of the order of 240,000 tons a year, against the target of 221,000 tons. The following table shows the actual production during the period of the first plan:

Year	Tons
1951-52	129,000
1952-53	96,000
1953-54	120,000
1954-55	160,000
1955-56	164,000

Production of the acid was low in the earlier years of the plan due to the difficulties connected with the supply of sulphur and in subsequent years due to low demand. Against a consumption of 200,000 tons of acid anticipated for 1955-56, the actual offtake was about 160,000 tons. This was primarily due to lower demand for superphosphate. During the second plan, however, developments have been more favourable, since with a greater stress on the production of fertilisers, rayon, steel and other items, the demand has sharply increased necessitating a big rise in the output, as is evident from the following figures:

Year	Installed capacity in tons	Production in tons	Production as percentage of installed capacity
1956	245,000	165,000	68
1957	274,000	196,000	72
1958	290,000	227,000	78
1959	375,000	275,000	74
1960	475,000	350,000	74

Although increase in production has been quite substantial, especially in the last two years of the plan, production of about 360,000 tons in 1960-61 was only 75 percent of the target output of 470,000 tons. Because of the small consumption of acid in the early stages of development of the sulphuric acid industry, the unit size of the plant was small—some were, in fact, as small as two tons a day. During the second plan period, stress has been laid on building large capacity units and today 50 to 75 tons a day units are in operation.

Demand in Third Plan Period

The Planning Commission has estimated the demand for sulphuric acid by 1965-66 as follows:

Consuming industry	The estimated demand in tons
Superphosphate and ammonium phosphate	740,000
Ammonium sulphate	148,000
Rayon and staple fibre	110,000
Pickling of finished steel	30,000
Aluminium sulphate	40,000
Petroleum refining	16,000
Titanium dioxide	22,000
Miscellaneous	170,000
Total	1,276,000

In view of the increased capacity to be installed to meet the increasing demand for the acid by the end of the third five year plan, the Government has made this item freely licensable under the Industries (Development and Regulations) Act, 1951. Applications, it is said, may be granted even without the prior approval of the Licensing Committee. Against the third plan target of 1.5 million tons a year, about 1.4 million tons of capacity a year has already been licensed so far.

The greatest weakness of India's sulphuric acid industry is that it is based on the use of imported sulphur, since there are no known deposits in India. The demand for sulphur as an industrial raw material by 1965-66 has been estimated by the Planning Commission as follows:

Consuming industry	Requirement of sulphur in tons
For sulphuric acid	437,500
For other uses, such as carbon disulphide, hydrosulphate of soda, sugar, paper and explosives	87,000
Total	524,500

The import of 524,500 tons of sulphur will require about Rs. 9 crores or Rs. 10 crores in foreign exchange. In case of emergency, the supply of sulphur from abroad may be cut off or drastically reduced resulting in lower production of sulphuric acid, so it will retard the whole industrial growth of the country. It is, therefore, a matter of national importance to develop alternative indigenous raw materials for the production of sulphuric acid.

There are several raw materials which can be used for manufacturing sulphuric acid. There are some plants in Europe for the manufacture of sulphuric acid from gypsum. Several plants abroad are also using smelter gases as raw material for producing sulphuric acid. The most important source of sulphur in India appears to be the vast deposit of pyrites which have been located in the Amjor area in Bihar. Eighty million tons of pyrites ores have already been proved, and there are definite indications of larger reserves. A scheme for the production of sulphur from pyrites, with an annual capacity of 30,000 tons, has been included in the public sector under the third plan. It is suggested that the production target for sulphur from pyrites be increased considerably so that this important industry is at least partially freed from complete dependence on imported raw materials.

Production of Soda Ash

Soda ash is an essential material for the production of glass, textiles, paper, bichromates, silicates, and is used for washing laundry. As in the case of sulphuric acid, the current level of consumption of alkalis in India is much less than in other industrially developed countries. During the first five year plan, only two plants—one of Tata Chemicals Ltd and another one of Dhrangadhra Chemical Works—were in existence. The first plan proposed the expansion of both these units as a result of which the installed capacity was to increase from 54,000 tons in 1950-51 to 86,000 tons by 1955-56. The target for actual production was 78,000 tons in the last year of the plan. The capacity of Tata Chemicals Ltd was raised to 120 tons a day by the end of 1953 and to 140 tons a day in the following year. The expansion programme of Dhrangadhra Chemical Works was completed before the end of 1954 and a capacity of 120 tons a day was achieved. At the end of 1955-56, the installed capacity was thus 90,000 tons a year. The actual production and imports of soda ash during the first plan period were as follows:

Year	Installed capacity in tons	Production in tons	Imports in tons	Total in tons	Production as percentage of installed capacity
1951	54,000	47,500	52,100	99,600	88
1952	54,000	43,400	112,100	155,500	81
1953	61,200	56,800	35,500	92,300	93
1954	61,200	48,300	94,500	142,800	79
1955	90,000	77,300	66,000	143,300	86

It will be seen that indigenous production did not materially increase during the first four years of the plan. Labour troubles at Mithapur affected the production of Tata Chemicals in 1952, and the closure of Dhrangadhra plant for five months in 1954 for additions and alterations reduced the output during the year. Also heavy imports allowed during the first two years of the plan caused some temporary difficulties to indigenous producers due to accumulated stocks. But production showed a substantial rise in 1955 and the output at the end of the first plan was 81,000 tons, against a target production of 78,000 tons a year. During the second plan, Tata Chemicals expanded its plant capacity from 200 tons to 400 tons a day and also made arrangements to convert part of its light soda ash into dense variety to meet the requirements of the glass industry. The Dhrangadhra Chemical Works expanded its 100 tons a day capacity to 150 tons a day. Messrs Saurashtra Chemicals installed a plant of 200 tons a day capacity in Porbandar. Messrs Sahu Jain installed a plant in Varanasi to produce 120 tons a day of dense soda ash and along with it ammonium chloride as a fertiliser, adopting the modified Solvay process. The installed capacities of these plants are as follows:

Plant	Installed capacity in tons a year
Tata Chemicals Ltd	144,000
Dhrangadhra Chemical Works	54,000
Saurashtra Chemicals	66,000
Sahu Jain	40,000
Total	304,000

Thus, at the end of the second plan, the installed capacity of 304,000 tons a year was achieved against the target capacity of 253,000 tons. The

COOPER MACHINE TOOLS

**FOR BETTER AND GREATER JOBS—
FASTER INDUSTRIAL DEVELOPMENT**

COOPER ENGINEERING LIMITED—one of the pioneers in the country's machine tool industry—now offer COOPER-LOUDON, 3 and 4 feet wide PLANING MACHINES of up to 20' stroke with Ward Leonard Drive.

The Machine Tool Industry is the springboard of industrialisation, and Cooper's are striving to equate the supply and demand of *better* Machine Tools for rapid industrial development.

Cooper's Machine Tool Division builds Grade I SHAPING, SLOTTING and PLANING MACHINES.

actual production and imports of soda ash during the second plan period were as follows:

Year	Installed capacity in tons	Production in tons	Imports in tons	Total in tons	Production as percentage of installed capacity
1956	90,000	84,200	91,000	175,200	94
1957	108,000	92,800	84,700	177,500	86
1958	110,000	89,400	50,900	140,300	81
1959	110,000	95,300	63,700	159,000	86
1960	217,000*	105,000*	71,300*	176,300*	

* Figures refer to the period January-September 1960 only

Although there has been a steady expansion in the production of soda ash during the second plan, yet the rate of growth was rather slow and the production during 1960-61 was only 150,000 tons, against the production target of 230,000 tons. This means that the actual production was only 65 percent of the target.

The demand for soda ash by 1965-66 has been estimated by the Planning Commission as follows:

Consuming industries	Demand in tons by 1965-66
Caustic soda ..	50,000
Sodium bicarbonate ..	15,000
Glass and bangles ..	149,000
Sodium silicate ..	36,000
Textiles ..	15,000
Paper ..	14,000
Bichromates ..	14,600
Dhobies and laundries ..	140,000
Miscellaneous ..	17,400
Total ..	451,000

The capacity for the production of this quantity has been estimated at 530,000 tons. During the third plan, Saurashtra Chemicals will be expanding its plant from 200 tons to 400 tons a day. Besides, Messrs Sahu Jain will increase their production capacity from 120 tons to 250 tons a day. A new factory of 200 tons a day is proposed to be located in Bombay, which is very close to the salt works in Uran. It is proposed that in the later part of the third plan period, a soda ash factory will be located below the Vindhyas to feed the regional requirements of south India.

Tariff Protection

So far, the industry has been enjoying tariff protection since the local cost of production has been higher than in other parts of the world. Self-sufficiency in this important chemical is being aimed to be achieved by the end of the third plan. However, judging by the results of production during the second plan, it is doubtful if the production target for the third plan could be achieved. In order to fulfil the third plan production target and also to make this basic industrial raw material available to consumers at cheap prices, attention will have to be paid to the following problems confronted by the industry:

1. For the last few years, the industry has not been able to get good metallurgical coke but had to use alternative varieties of coke such as beehive coke, Sindri coke (softer than metallurgical coke) and nut coke. This is reported to have affected efficient working of lime kilns. The Government should take necessary steps so that superior high-grade coke is made available to the industry.

2. About 2 to 2.2 tons of salt are required to produce each ton of soda ash. At present, salt has to be shipped in bags, and the railways do not accept bulk loading of salt. In order to reduce the cost of transporting salt, the railway administration should examine the question relating to the open wagon movement of salt after taking into account steps adopted in other countries for the purpose. The railways should also examine the question of providing wagons with sliding roofs for the bulk movement of soda ash so that large consumers can get their supplies without the incidence of packing charges and can further save handling costs at their factories by installing mechanical equipment for this purpose.

3. Soda ash manufactured by the Solvay process consumes for every ton of finished product nearly 4 to 4.5 tons of raw materials and fuels, consisting of 2 to 2.2 tons of salt, 1.4 to 1.6 tons of limestone, 0.5 to 0.7 tons of coal and coke. In the location of a Solvay soda ash factory, transport considerations are, therefore, of great importance.

All the three Solvay soda ash plants in India are located in Kathiawar, since the principal raw materials—salt and limestone—are available there at lower costs than elsewhere. However, the product has to be distributed all over the country and this puts a considerable strain on the transport facilities. The Sahu Jain plant at Varanasi is based on the modified Solvay process and soda ash and ammonium chloride are produced by using salt, ammonia and carbon dioxide. This process does not require limestone and, consequently, does not also have the problem of disposal of large quantities of calcium chloride effluent. The plant is facing teething troubles and production has not yet reached the design figure. If this process proves successful, soda ash can be manufactured at the locations where ammonia and carbon dioxide can be produced economically. This process is, therefore, of great interest to India so that the industry can be well dispersed.

Caustic Soda

The major consumers for caustic soda are the rayon, paper, textile and soap industries. The co-product chlorine which is produced along with caustic soda in the electrolytic process is the source for the manufacture of a large variety of organic and inorganic chemicals, plastics, insecticides and solvents. The caustic soda industry has been making considerable progress in the first and second plan periods as is indicated in the following table:

Year	Installed capacity in tons	Production in tons	Imports in tons	Total in tons	Production as percentage of installed capacity
1950	21,200	13,500	22,000	35,500	64
1951	27,600	16,000	62,700	78,700	58
1952	28,300	16,700	25,600	42,300	59
1953	37,000	22,800	46,500	69,300	62
1954	41,700	29,300	52,600	81,900	70
1955	44,300	34,300	54,900	89,200	77
1956	44,300	39,400	93,600	133,000	89
1857	45,300	42,600	66,000	108,600	94
1958	67,200	57,200	61,700	118,900	85
1959	98,900	69,900	147,200	217,100	71
1960	119,200*	74,200*	52,900*	127,100*	

* Figures refer to the period January-September 1960 only

At the end of the first plan, the actual installed capacity was 44,300 tons of caustic soda a year, against the target of 37,100 tons. The actual production was 35,000 tons, against the target of 33,000 tons a year. Although the actual production and the installed capacity exceeded the target, the average annual production during the entire plan period was hardly two-thirds of the available capacity in spite of the heavy demand for caustic soda. The main factor responsible for this was the difficulty in finding profitable outlets for the chlorine simultaneously produced in the electrolytic process. During the second plan period, a great impetus was given to the development of the chlorine-based chemicals and, consequently, the production of caustic soda rose sharply. However, in 1960-61, the actual production of 100,000 tons could be achieved, against the target production of 135,000 tons, i.e., only 75 percent of the target, although the installed capacity of 165,000 tons was attained against the target capacity of 150,400 tons. During the first and second plans, the indigenous industry could not satisfy the demand and consequently heavy imports had to be maintained. As the price of imported material is much cheaper, the indigenous industry has been offered tariff protection.

At present, there are two factories which produce caustic soda by the soda ash causticisation process and 18 by the electrolytic process. Of the latter 18, six are attached to paper mills and one to rayon mill. Eleven units use diaphragm cells and seven mercury amalgam cells. The average capacity of the units which produce caustic soda and chlorine for sale has been gradually raised to a level of about 30 tons to 50 tons a day. The other significant trends in the industry are: (i) the use of high amperage mercury amalgam cells is gaining ground. Mercury cells are preferred because of the production of high purity caustic soda of 50 percent concentration directly from the cells. Starting from 10,000 ampere cells in the initial stages, some factories are now already operating 60,000 ampere cells and would soon be installing 100,000 ampere cells. (ii) The continuous brine purification system is being adopted resulting in saving in capital investment and better control. (iii) Sale of caustic soda lye has been increasing, eliminating fuel charges for processing to solid and also packing charges. (iv) Continuous fusion method for the manufacture of solid caustic soda is replacing the old batch type cast iron pots. (v) The semi-conductor type of rectifiers are being preferred to other types of power rectification equipment because of their high operating efficiency and lower operating and maintenance costs.

The demand for caustic soda by the end of the third plan will be about 350,000 tons as the following table shows:

Consuming industry	Demand in tons by 1965-66
Rayon ..	80,000
Textiles ..	60,000
Paper ..	80,000
Soap ..	60,000
Miscellaneous ..	70,000
Total ..	350,000

The installed capacity which will be necessary to produce this quantity is estimated at 400,000 tons. Of the two processes available for the production of caustic soda, the causticisation process is not likely to play a major rôle in the expansion of production in view of the very high price of soda ash and its short supply. Therefore, the increase in caustic soda production will be by the electrolytic process in future.

Colossal Task

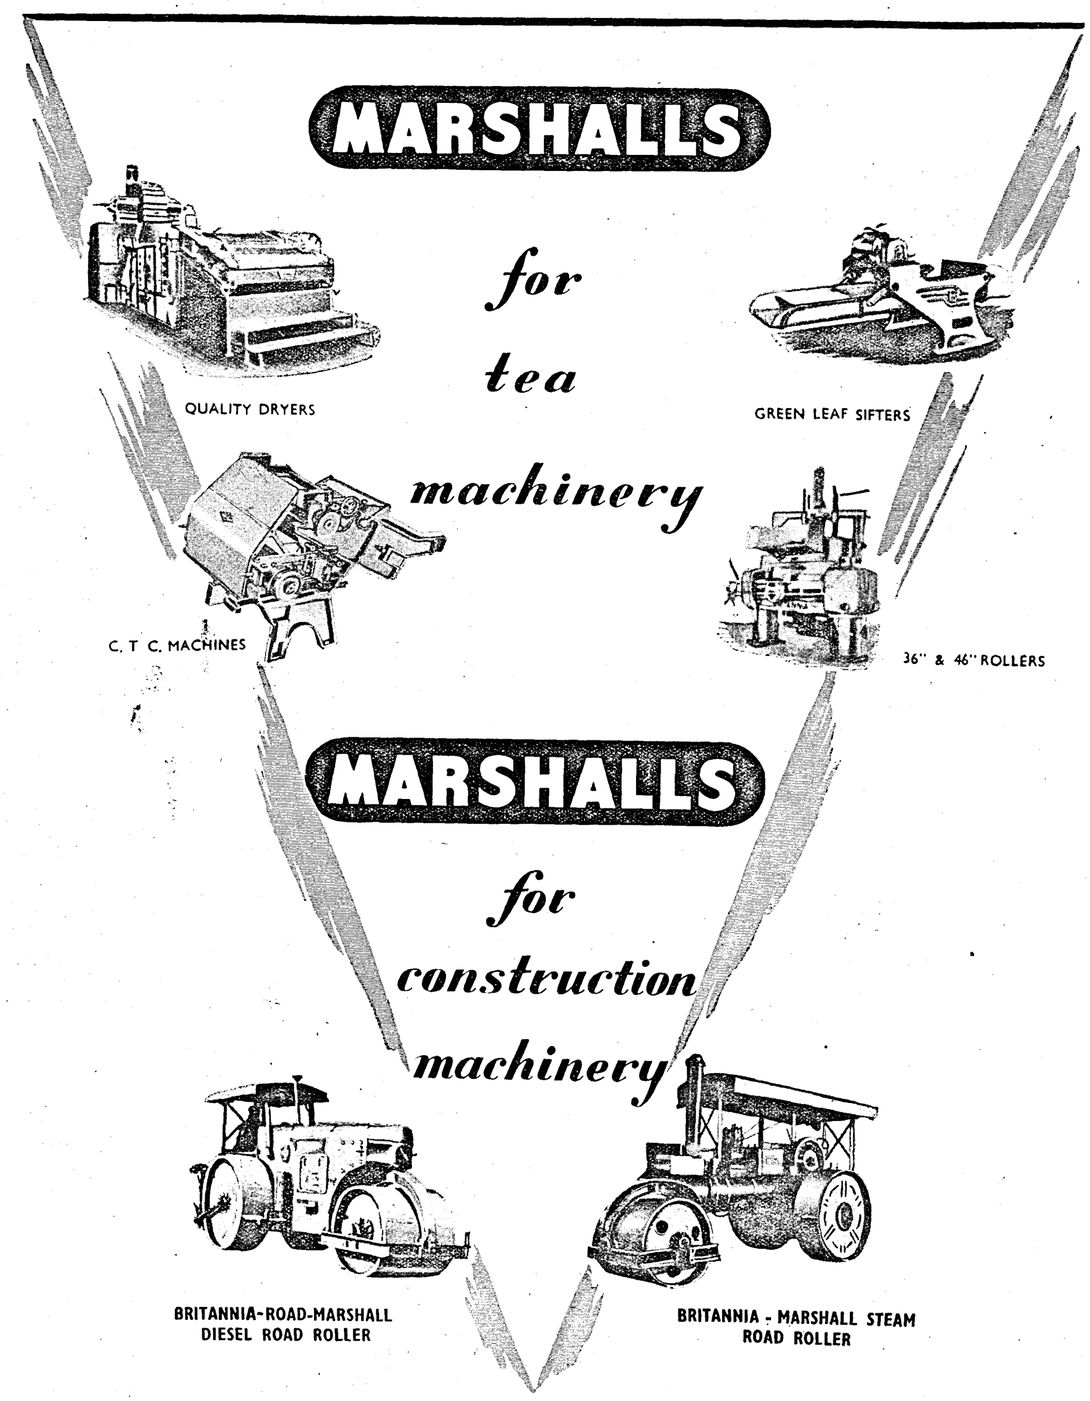
As mentioned earlier, the present output of caustic soda is about 100,000 tons annually and it is planned to increase it to 350,000 tons in 1965-66. This means that production in the next five years has to be more than trebled. To achieve this target is a colossal task, but it can be accomplished if vigorous steps are taken in the following directions:

1. So far, the development of the caustic soda industry in India has been, to a large extent, dependent upon the profitable use of the co-product chlorine. During the third plan period and possibly for a considerable length of time even after that, the demand for caustic soda will be far greater than that for chlorine. Therefore, if the country wants to attain self-sufficiency in caustic soda, it may be necessary to view the question of using chlorine from a different perspective. During the second plan period, about 750,000 tons of caustic soda were imported at a cost of about Rs. 40 crores in foreign exchange. On the other hand, the cost of caustic chlorine plant is about Rs. 1,400 a ton a year of caustic and out of this about Rs. 500 is the foreign exchange requirement. Thus, it takes about the same amount of foreign exchange in importing one ton of caustic soda as for importing equipment for setting up a caustic chlorine plant to give caustic production of one ton a year, and whereas in the former case, the expenditure is recurring, in the latter it is spent only once. Therefore, during the third plan period, the emphasis should be shifted to importing equipment for setting up caustic chlorine plants instead of importing caustic soda so that self-sufficiency is achieved. Under the present conditions, an adequate return on capital can be obtained in large plants even after throwing away the surplus chlorine. Meantime, efforts should be continued in finding profitable outlets for the surplus chlorine. In this connection, manufacture of ammonium chloride as a fertiliser appears to be an attractive proposition. Ammonium chloride is a satisfactory fertiliser containing 26 percent of nitrogen, compared with 21 percent of nitrogen in ammonium sulphate; 0.33 ton of ammonia and 0.67 ton of chlorine as hydrochloric acid are required for a ton of ammonium chloride. The capital investment and cost of nitrogen fixation are both comparatively favourable. The manufacture of ammonium chloride on a large scale will, however, necessitate proper arrangement for the regular supply of ammonia at reasonable prices to such manufacturers of electrolytic caustic soda as might desire to develop along these lines. It is suggested that the Government and the industry should give serious consideration to this problem.

2. For each ton of caustic soda produced, about two tons of salt is used, so the price at which this main raw material is available has a considerable bearing on the cost of production of the product. At present, most of the salt production is concentrated on the west coast necessitating long haulage, since the caustic soda industry is dispersed throughout the country. Steps should be taken to increase salt production in other regions so that the haulage of salt over long distances is avoided, thereby making savings in freight charges. The quality of the salt especially with reference to calcium, magnesium and sulphates should be improved. India's salt production techniques need also to be modernised and mechanised so that the cost of production could be reduced, as already the prices of caustic soda are high, compared with those in other parts of the world.

3. The electrolytic process of producing caustic soda involves large consumption of electrical energy. It is essential that electrical energy should be available at as low a rate as possible because of its high incidence on the cost of production. On the basis of an average requirement of about 3,600 kWH for one ton of caustic soda, an increase of a single naya paisa a kWH will result in raising the cost of production a ton by Rs. 36. Therefore, energy should be supplied at special concessional rates for proper and rapid development of the caustic soda industry.

From the above review, it is evident that the increase in production of these key chemicals has been phenomenal during the second plan period. However, the fact that the actual production of each of these chemicals has fallen far short of the target production must be emphasised. The targets for capacity and for production of the heavy chemicals proposed for the third plan can be and must be achieved if the overall industrial development programme is to succeed. This can only be done by paying attention to the problems confronting these basic industries.



EXPORTS OF SEWING MACHINES RISE STEADILY

SOME FOREIGN COUNTRIES WANT INDIAN TECHNICAL COLLABORATION

By

B. S. AGARWAL

EARLY attempts at manufacturing sewing machines in India were made in the late 'thirties just before the outbreak of the second World War. During the war, major manufacturing units were seized by the Government for the production of munitions. As a result, the industry's growth was retarded till the end of the war. Thereafter, it made quick recovery. Its performance is creditable not only because of the short period of growth available to it, but also because in its growth no foreign assistance was needed. The industry has been able not only to feed the home market, but has also captured a very substantial export market.

Broadly speaking, there are two types of sewing machines—domestic and industrial. The production of the latter began only a few years ago. In between, there are many varieties to suit consumers' needs and preferences. For example, in the domestic type some are suitable for stitching and some for embroidery work. The three main categories of domestic machines are hand, treadle and electrically-driven sewing machines. The industry has developed a special model to suit the American market, which is the largest single market for sewing machines, where about 2 million machines are sold annually. With concerted effort, it may be possible to increase exports to Rs. 2 crores by the end of the third plan from Rs. 53 lakhs a year at present. The production of the organised units is now mainly localised in Calcutta. There are, however, several other units as well which are manufacturing sewing machines on a cottage industry basis. Total production of sewing machines in India is now a little over 300,000 a year. In recent years, manufacturing licences have been given to four new units in Delhi and Calcutta with a combined annual production capacity of 43,700 sewing machines a year. The third plan target has been fixed at 600,000 machines, and at the present rate of growth, it is likely to be achieved. The largest unit in Calcutta, the Jay Engineering Works Ltd, is the most important unit in the industry. It has considerably improved production, both quantitatively and qualitatively, over the past seven years or so. The following production figures of the industry show its rapid growth:

	Production (Numbers)
1954	80,196
1955	101,472
1956	130,392
1957	167,484
1958	205,212
1959	252,612
1960 (Up to November)	266,618

It may, however, be noted that about 80 percent of this production has all through been accounted for by the output of a prominent Calcutta factory.

Quality Control

One of the largest manufacturers of sewing machines in the country has installed most modern equipment and accessories at the factory and has introduced a three-stage system of inspection and quality control. The preliminary inspection and laboratory testing is followed by process inspection to ensure quality control of components at every stage of production. Finally, the sewing machines are fully checked by the Inspection Department. So the machines produced at the factory are first-grade ones comparable in quality to the best foreign brands. In fact, the sewing machines manufactured in India have been so successful in competing with foreign established brands that imports of these machines into the country are now practically nil. The manufacture of sewing machine needles has also been started in India by the same large unit.

Sewing machines made in India are being exported to a number of countries including, among others, the U.S.A. and the U.K. The following table shows the exports during the last four years:

	Exports (In Rs. lakhs)
1957	8.36
1958	15.95
1959	35.11
1960	50.52

The principal importers of Indian sewing machines are Afghanistan, Ceylon, Egypt, France, Germany, Holland, Pakistan, Sudan, Thailand, the U.K., the U.S.A. and Yugoslavia. The popularity of India-made sewing machines is increasing in these countries, and they hold the pride of place as far as exportable Indian engineering goods are concerned. In the U.K. alone, over 30,000 British housewives are using India-made sewing machines exported by a Calcutta factory. The latter has received proposals from several countries for technical collaboration during the last few years. One such agreement has already been signed with South Vietnam, as a result of which progressive manufacture of sewing machines will be started shortly in Saigon under the supervision of Indian engineers. Work on some more foreign collaboration of a similar nature is likely to start in the course of next one or two years. This only goes to show that not only do the Indian sewing machines enjoy popularity abroad, but also foreigners have much faith in India's technical skill in this field, so some of them are keen on obtaining technical know-how from India for producing sewing machines in their countries.

Rapid Progress

In addition to exporting sewing machines, India has made appreciable progress in exporting other engineering goods as well. When India became independent, the Government declared its Industrial Policy and a lot of new industries have come up during the period of the two five year plans. The third five year plan opens a new era of expanding industrial activity. During the past ten years, India not only became self-sufficient in many items of production, but also could think of exports and has actually started exporting. The fact that her products could also find a considerable market in highly industrialised countries brought a new awakening among Indian industrialists. Till recently, it was a common belief among the highly industrialised countries that the underdeveloped countries had nothing to offer to highly developed ones except raw materials, circus monkeys, trinkets and tea leaves. But the rapid industrial progress and the rising tide of exports of engineering goods have exploded this myth. No doubt, traditional items like cotton, jute, and tea will continue to play a vital rôle in India's export trade. But engineering goods now offer a vast and diversified field for the expansion of India's export trade. It is encouraging that the existing industries are expanding their production capacity to increase exports. Besides, many new industries are also being set up.

The value of exports of engineering goods during the first two months of the current year has been Rs. 1.26 crores, compared with Rs. 1.05 crores during the corresponding period of last year. This shows an increase of 20 percent, which is no doubt encouraging. A country's exports depend largely on the policy pursued by its Government. Two prominent examples are West Germany and Japan, who sell a large percentage of their production of engineering goods in the world markets. According to available figures, India's engineering exports were hardly 3 percent of last year's total production. Yet exports can be raised substantially with the increased steel production in India. The latter has another advantage in that most of its industries are equipped with modern machine tools. It will, therefore, be profitable for this country to think of exporting the cast-iron products, semi-processed and finished components of steel, instead of exporting pig iron and steel. India can become a feeder to big industries in Europe, America and Canada by supplying them the castings according to the needs of their industries. But a thorough market research and contacts with manufacturers abroad are essential for this purpose. This will also help in using the idle capacity in many engineering industries in India and will give work to the unemployed.

Revised Export Target

In the third five year plan, imports are estimated to be of Rs. 1,100 crores a year and exports Rs. 690 crores, which have now been raised to Rs. 750 crores a year. No doubt, this increase of Rs. 60 crores a year is an admission of the urgent need of increasing exports, but even with this increased target, there will be a deficit of Rs. 350 crores a year which will have to be made up by loans. This gap can be narrowed by a bold and vigorous export drive. But even to reach the revised export figures, the Government will have to encourage exports by giving incentives as was done by Japan and Germany after the second World War. India's engineering industries alone can contribute Rs. 10 crores to Rs. 15 crores a year more. There are various ways by which the export of engineering goods could be boosted up. Some of them are the following:

1. The use of idle capacity available in the various industries by supplying sufficient raw materials with an understanding that they will export 15 percent to 20 percent out of the additional quota provided.

2. New industries, which are being licensed, should have export targets fixed and the supply of raw materials to them should be on the basis of fulfilment of their export targets.

3. All facilities should be provided to the manufacturer-exporter which are available to their counterparts in other countries. Today, the exporter in India has to start with a handicap in prices ranging from 5 percent to 10 percent, which can be reduced if some of the following facilities are available to them: (a) an increase in the import entitlement to exporters; (b) the supply of raw materials used in the manufacture of goods meant for export at a concessional rate; (c) the supply of pig iron, steel and tinplates at cheaper rates to reduce the cost of production further; (d) income-tax relief as available to the exporter in Japan; (e) long-term credit facilities at a concessional rate of interest; (f) concessional shipping freight rates for engineering goods; (g) further simplification of the rules and regulations for drawback on duties, so that the exporter is able to take advantage of the same; and (h) foreign exchange should be provided for the purpose of carrying out market surveys to suit the requirements of individual exporters.

Besides, the Government should study the various difficulties faced by the Indian exporter and should not hesitate to give them facilities for at least the next quinquennium. Once the markets have been built up, these facilities can be examined and withdrawn if considered necessary after the third plan period.

Need for Greater Co-ordination

The recent statement of the Prime Minister that "the export is to be built up even at the cost of consumption in the country" is heartening, but to give shape to his ideas it is essential that a wider outlook and co-ordination should develop in the various Ministries which are concerned with the export trade. The problems of the latter should not be tackled piece-meal. The Export Promotion Councils should be asked to prepare a list of all the difficulties experienced by them. These difficulties should be studied by a high-power committee consisting of members from each of the Councils and the secretaries of the various Ministries concerned, and their recommendations should be implemented by the Director of Export Promotion.

ECONOMIC RESEARCH is an essential part of modern commerce. But it is not always easy to obtain. The ordinary business house does not usually possess the records, statistics and archives which are the raw material of research. CAPITAL'S RESEARCH & STATISTICAL DEPARTMENT has a long record of service to Chambers of Commerce, Industrial Associations and private business concerns. It does not undertake trade inquiries, but its facilities and advice are available for all kinds of research proper into the problems of Indian commerce and industry.

CAPITAL'S RESEARCH & STATISTICAL DEPARTMENT has constructed and maintains a number of cost of living indices for various classes and communities in India and Pakistan. It offers the industrialist and business house its experience in consumer market surveys—industrial prospecting—readership analysis—economic indices—business research.

PROSPECTS FOR HINDUSTAN SHIPYARD IN THIRD PLAN

HIGH OVERHEAD CHARGES: SHORTAGE OF INDIGENOUS MATERIALS PERSISTS

THE shipbuilding industry is now in the doldrums throughout the world. This is the logical consummation of a steady decline in tonnage under construction in world shipyards during the past three years. The only redeeming feature is, however, that during 1960 the fall in the tonnage under construction was less steep than was apprehended some time ago and, by and large, most of the shipyards have still orders on hand to sustain them for about two years. The following table extracted from the statistics compiled by the Shipbuilders Council of America shows the gravity of the situation:

As on 1st July	Tonnage under construction or on order	Annual decrease
1957	35,062,000	...
1958	31,234,000	3,838,000
1959	24,856,000	6,378,000
1960	20,774,000	4,082,000

Considering the enormity of the world shipbuilding output during the past three years which, according to the *Lloyd's Register of Shipping*, has averaged about 8.75 million gross tons, it is indeed surprising that the situation is not really worse than what it is. However, this affords the comforting inference that there has been some expansion in world trade and also perhaps an increase in the scrapping of old ships.

The "State of Rajasthan", a 9,599-ton diesel cargo vessel, sailing out after completion

Depression in Freight Markets

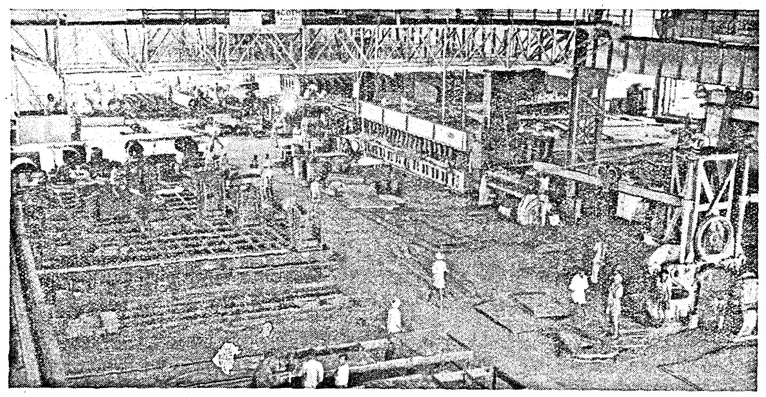
The freight market, on which depends the prosperity of both the shipping and shipbuilding industries, has not yet fully recovered from the impact of the depression, although there has recently been some rise in the freight rates. The depression has mainly been due to the excessive availability of ships over trade requirements. During 1960, there was a substantial improvement in the position of laid-up tonnage which was about 8 percent of the world tonnage in November 1959, and which dwindled to about 4 percent in November 1960. Even so, the volume of laid-up tonnage continues to be large and no substantial recovery can be expected in the immediate future.

In Britain, which is still a dependable barometer for assessing the fortunes of the shipbuilding industry, the proportion of cancellation to new orders during the 12 months ended 30th September, 1960, registered a distinct improvement over the position obtaining in the corresponding period of 1959. But it is debatable whether the present trend will continue. A turn in the fortunes of the shipping and shipbuilding industries, which are closely inter-linked, will necessarily have to await the scrapping of ships on a considerably increased scale and a substantial expansion in world trade. In a recent review of the prospects of the shipping industry for 1961, Mr. Hugh Hogarth, president of the U.K. Chamber of Shipping, commented that "if a backward glance in shipping is not exactly inspiring, then a forward look is hardly more reassuring." The statement sums up well the present state of the shipbuilding industry.

Paradoxical Phenomenon

One is witnessing today the paradoxical phenomenon of low prices being quoted by many foreign shipyards in spite of increasing costs. This has gone to such an extent that many orders booked in 1960 must leave the shipyards with no profits and often little towards overhead charges; in fact, all the benefits accruing from the vast expenditure recently incurred by the shipbuilding industry on modernisation schemes are being passed on to customers. Shipbuilding has, therefore, become a highly competitive business, with too many shipyards trying to grab the too few orders. If this situation continues for some length of time, it will lead to widespread under-employment and, in the long run, the closing down of many marginal units.

It is in this context that one has to examine how far India has progressed in putting the shipbuilding industry on a sound footing. Although there are a few shipyards on the Hooghly and the west coast of India engaged in the construction of smaller vessels, the building of modern ships is being carried on in Hindustan Shipyard in Visakhapatnam.



An inside view of the new prefabrication shop in Hindustan Shipyard

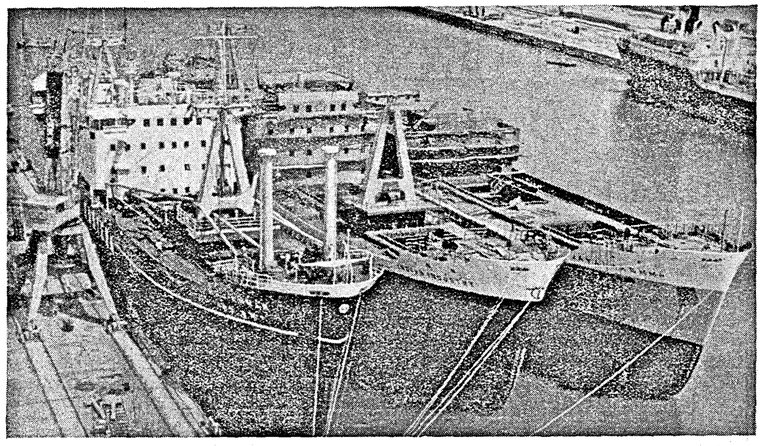
Lay-out and Design

In spite of the chequered history of the shipyard, it has generally been accepted that its original lay-out and design made by Sir Alexander Gibb and Partners was basically well conceived, except perhaps that it was on somewhat orthodox lines. The scheme recommended by the firm proposed the contsruction of eight slipways of varying sizes with attendant workshops, the lay-out being such as to permit the flow of production in the proper sequence of operations, conforming to recognised principles of planning. On the other hand, the reorganisation scheme recommended by the French consultants in 1953 after the shipyard was taken over by the Government from the Scindia Steam Navigation Co. Ltd (who originally pioneered this venture), proposed to remedy some factors which, due to modern innovations, had become somewhat obsolete in shipbuilding techniques. The stationary monotower cranes installed for serving the slipways were replaced by heavy-lift travelling ones to facilitate the adoption of prefabrication methods (which, incidentally, helped reduce the number of slipways from eight to five) and the orthodox method providing for the flow of steel fabrication and erection at right angles from the hullshop to the berths was converted into the more modern straightline method by the installation of a new prefabrication shop and steelyards.

The emphasis was, generally speaking, on the adoption of more travelling cranes in accordance with the modern trend and the provision of more up-to-date tools and machines in the shops. As a result, the production capacity of the shipyard, which was just about 15,000 d.w.t. to 20,000 d.w.t. (about two ships on average) of the old type of steamships when it was taken over by the Government in 1952, has now increased to about 35,000 d.w.t. to 40,000 d.w.t. (about four ships on average) of modern diesel ships a year. With the addition of one more berth, further extensions of the outfit jetty to permit the simultaneous fitting out of at least three ships and a few more improvements in the production arrangements during the third plan period, it is expected that the shipyard may be able to produce about 50,000 d.w.t. to 60,000 d.w.t. (five to six modern diesel ships on average) a year. Its present lay-out, the arrangements for storage and handling of materials, and the organisation of the various auxiliary units and shops have in them all the elements of modernity, and are comparable to any modern shipyard of average size abroad.

Technical Personnel

In the matter of manpower, a fairly adequate nucleus of personnel has been gathered and



Three ships treble-banked at the outfit jetty which is being extended

trained. The shipyard has undoubtedly been facing difficulties in getting shipbuilding draughtsmen and supervisory personnel, apart from skilled labour in categories which are special to shipbuilding, but this is an inevitable factor. In order, however, to make up the deficiency, a self-contained scheme with a scientific orientation, providing for an integrated programme of training technical personnel at various levels, has been organised on a permanent basis. As far as the training of technical personnel is concerned, the foundations of a sound and long-term scheme have been well and truly laid.

Although the staff organisation is still in the process of being streamlined to cope with the stupendous problems of planning and co-ordination required for the successful operation of a complex industry like shipbuilding, it is significant that the shipyard is now manned entirely by Indian engineers and supervisory staff.

Imported Materials

As far as raw materials are concerned, the shipbuilding industry in India is in a peculiarly difficult situation. The materials used in shipbuilding can be broadly classified into four categories, namely, machinery and equipment, steel, timber and general stores. At present, in terms of value, about 80 percent of the materials used are being imported. The imported element includes not only the main engines and auxiliaries, electrical installations and various other items of equipment necessary for the operation of a ship, but also the bulk of steel, which in fact is the principal raw material. As far as steel is concerned, the problem is not so much the lack of indigenous capacity for manufacture as its being uneconomic in nature, particularly as the demand for shipbuilding steel is for small quantities and in an amazing variety of sizes. So the bulk of steel required for shipbuilding has hitherto been imported—since it is obviously more profitable to do so—instead of dissipating the limited steel manufacturing capacity in uneconomic production of shipbuilding steel. But arrangements have now been practically completed in the Rourkela and Bhilai steel works for the production, respectively, of shipbuilding plates and sections according to Lloyd's specifications. This in itself will help reduce the foreign exchange element in the cost of a ship, say, by about 10 percent.

Besides steel, the single largest item of import is the main engine and its auxiliaries, accounting for about 20 percent to 24 percent of the cost of a ship. A project to set up a factory in the public sector for manufacturing marine engines has been under the consideration of the Government for some time, but this has not become an accomplished fact, perhaps due to considerations of economic viability. Nevertheless, as the shipbuilding industry has an inherent strategic importance, it is essential to make it increasingly self-reliant by reducing the dependence on imports. One way in which the engine-building project could perhaps be made less uneconomic would be to adapt and expand an existing factory which is producing smaller engines required for agricultural and industrial purposes and thus equip it to handle also the manufacture of larger marine engines for shipbuilding purposes.

Meantime, constant efforts are being made to establish indigenous substitutes for various items of imported equipment and fittings, although the results achieved have not been spectacular. One of the important steps taken in this connection is the setting up of a permanent exhibition in the premises of the shipyard. In it are displayed a large number of materials and equipment which are now being imported but for which indigenous capacity could be developed, with the object of creating an interest in the development of such capacity among the visiting representatives of manufacturers and suppliers. The Government of India has also set up recently a Standing Advisory Committee on the development of ancillary industries related to shipbuilding and ship repairs.

Until a few months ago, one of the most important problems confronting the shipyard was the paucity of orders for new construction, which is being experienced by shipyards all over the world. But as a result of various measures adopted by the Government to induce shipowners to place orders for their requirement in India, the order-book of the shipyard is now partially full and will see it through the first half of the third plan period. It will, however, be necessary to make further efforts for securing adequate orders to provide work for the rest of the plan period in good time.

Subsidy and Pricing

The economics of shipbuilding in India is at present somewhat complex, since Hindustan Shipyard does not receive from the shipping companies, to whom the ships are made available, its full cost. The price of a ship is fixed by negotiation between the owners and the shipyard on the basis of what is called the "U.K. parity price"; the object being that shipowners should not be made to pay much more than what they would pay to a U.K. shipyard for an identical ship. The difference between the cost incurred by Hindustan Shipyard and the price so fixed is reimbursed by the Government as subsidy. Although in theory this arrangement appears to be satisfactory, in practice it is beset with difficulties since it is well-nigh impossible to ascertain an incontrovertible U.K. parity price for a ship. Lately, the owners have voiced a demand that the shipbuilding prices obtaining in the U.K. are no longer the cheapest as they used to be at one time and that, therefore, they should be called upon to pay only the cheapest world price for a similar ship, as they have to compete in the international shipping market. Apart from the merits or otherwise of this demand, the experience of Hindustan Shipyard on the fixing of the U.K. parity price makes it abundantly clear that the adoption of the concept of the "world parity price" is not at all a feasible proposition.

Any formula of pricing and subsidy based on parity prices obtaining in foreign countries can work only if the determination of the parity price concerned is done by an outside independent agency, acceptable both to the builders and the owners, on the lines of the practice obtaining in Australia. The Australian Shipbuilding Board is a statutory body set up by the Government and is the agency through which trading vessels are constructed in Australia. The prospective shipowner approaches the Board with a proposal for the construction of a ship of certain broad specifications. Thereupon, the Board prepares plans and specifications and invites tenders from the Australian shipyards. According to the policy of the Government of Australia, subsidy is paid on trading vessels constructed in Australia to the extent necessary to equate the price of the local vessel with the estimated cost of acquiring the vessel from the U.K., subject to a maximum of 33 1/3 percent of the cost incurred by the Australian shipyard. The estimated cost of getting a vessel built in the United Kingdom is determined by the Board. The most competitive price quoted by an Australian shipyard, less the amount of Commonwealth subsidy payable by the Government, is submitted to the prospective shipowner, the choice of acceptance being left to the latter. If this quotation is accepted by the prospective owner, the Board prepares the complete working drawings required for constructing the vessel, places a firm order in its own name with the shipyard and, in most cases, also arranges for the supply of the main and auxiliary machinery and other equipment to the builders. The construction and trials of the vessels are supervised by the Board which purchases the vessel on completion from the builder and sells to the owner at the agreed price, namely, cost less subsidy. This arrangement has helped the Australian shipyards earn, on average, a small profit up to about 5 percent of their cost.

Intractable Problem

Obviously, the setting up of a machinery similar to the Australian Shipbuilding Board will be the only answer to the difficult, and almost intractable, problem of relating subsidy to parity prices, although it is bound to be expensive. Till this is done, the subsidy may have to be paid on the basis of a fixed percentage of the cost incurred by the shipyard, the balance representing the price payable by shipowners, although this may not perhaps be the best or the most rational arrangement. In any case, a percentage arrangement for pricing and subsidy is worth giving a fair trial, in preference to the existing arrangement based on the so-called "U.K. parity price."

The question is why is the cost of shipbuilding high in India. This is often asked by a layman, and is no doubt a pertinent question. It is necessary to know that the cost of shipbuilding in India is high only in a relative sense. The costs are higher than those in the U.K., West Germany, Japan and the Scandinavian countries. But they are almost on par with the costs prevailing in Italy and France. On the other hand, if one looks at the costs obtaining in countries like Australia and the United States, one finds that the costs in India compare very favourably, since her costs are substantially less than those obtaining in these two countries. It is as well to remember that practically in every country, shipbuilding is being subsidised in one form or another, either directly or indirectly. The principal reasons which account for the high costs in India are (i) the low *per capita* productivity (which is perhaps a common factor in all industries), (ii) higher cost incurred on the import of machinery and equipment (forming the bulk of the materials consumed), (iii) additional cost incurred in holding large stocks of steel in standard sizes and last, but not least important, (iv) the high overhead charges.

Optimum Production

The problem of productivity will perhaps continue to be a matter of concern almost eternally in an underdeveloped country like India which is still far from the "take-off" stage in industrial development, although the great impetus which the productivity movement has received recently in India is undoubtedly encouraging. Similarly, a solution to the problem of dependence on imports must await the development of ancillary industries catering to the needs of shipbuilding, although supplies of the required steel is expected to improve in the near future. The crux of the matter, will, however, continue to be the high overhead charges, the answer to which could only be found in increasing production to an optimum level practically with the same equipment and personnel. This will largely mean the perfection of planning and organisation which will eliminate bottlenecks which retard the progress of production at every stage. While these matters are receiving the constant attention of both the Government and Hindustan Shipyard, it would be idle to pretend that it could do without subsidy in the foreseeable future.

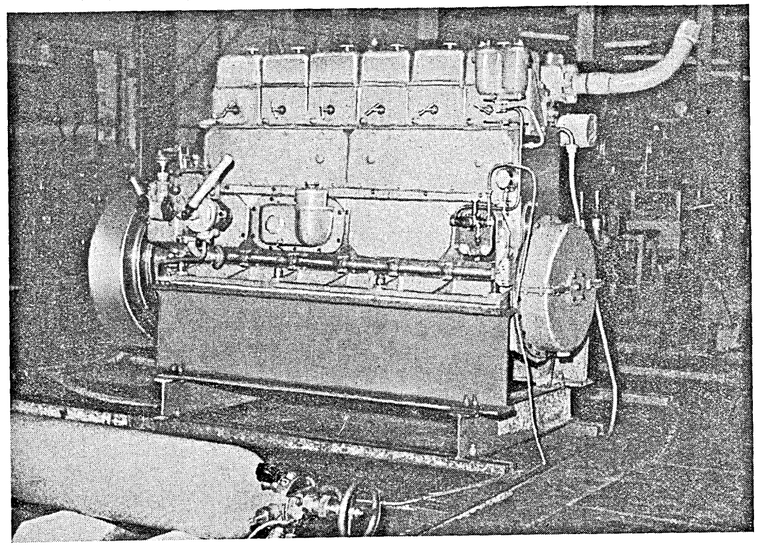
At present, the ships built at the Visakhapatnam yard have to go to Calcutta for drydocking before delivery to the owners for the examination of the hull. A project for the construction of a "graving dock" was sanctioned in 1955, but was postponed due to the shortage of foreign exchange. But the revival of the project is now being actively considered by the Government. It is hoped that the project will be included for execution during the third plan. The establishment of a graving dock in Visakhapatnam will greatly assist in improving the economic viability of the shipyard, since it will not only contribute to direct savings in the cost of ships constructed, but also facilitate the development of a virile and profitable ship-repairing unit as an adjunct to the yard.

Progress of the Diesel Engine Industry in Post-war Years

Prospects for Future Considered Good

A DIESEL engine was practically an unknown machine in India 25 to 30 years ago. It has become an important industry in the country. The industry's phenomenal growth, after its modest beginning and initial teething troubles, has attracted attention from all quarters. Therefore, an attempt has been made here to assess the achievements and future of the industry. The Indian diesel engine industry is a post-war development. Not much activity was seen in this field in the immediate pre-war years. The infancy of the industry could be traced as far back as 1926 when the first diesel engine was manufactured by Messrs Kirloskar Brothers Ltd. In 1933, Cooper Engineering Ltd first took up the manufacture of engines on a commercial scale to be followed by Messrs Kirloskar Brothers Ltd, who brought into the market three sizes of indigenous vertical engines—5 and 8 horse-power single-cylinder and 16 horse-power

By
M. B. Dhavale
and
M. V. Nevrekar



Kirloskar licensed M.A.N. engine with 6 cylinders, 1,000 R.P.M., 210 horse-power

twin-cylinder engines. It was in 1939 that another Company, Messrs Ruston and Hornby, Bombay, joined the manufacturers' ranks by producing Ruston engines in Bombay. During the war years, production was severely affected and the industry, as a whole, could not make any headway.

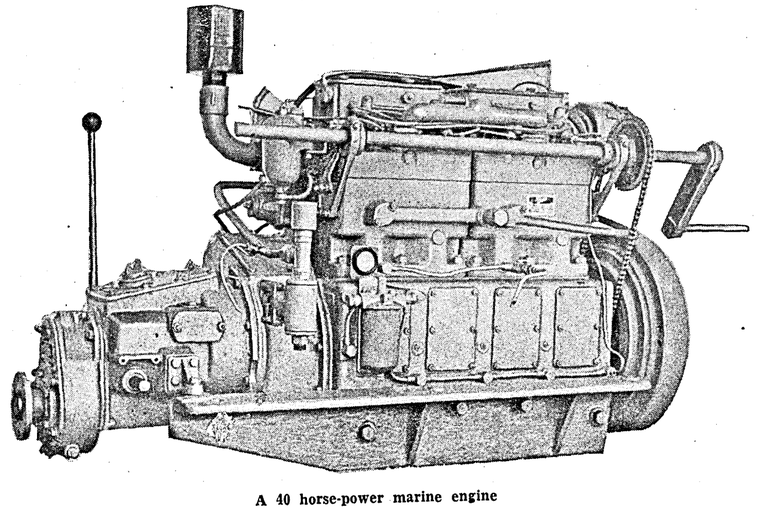
The real beginning in the field, therefore, was made immediately after the war. By 1949, there were five firms, who took up its manufacture. They, however, concentrated mostly on producing slow-speed engines. These were mostly used for flour mills, large-scale irrigation purposes, small workshops and generation of power. It was in 1949 that Messrs Kirloskar Oil Engines Ltd, Kirkee, Poona, introduced in the market the first high-speed, vertical diesel engine.

The post-independence period saw further progress. This can be seen from the following data giving the number of licensed manufacturers and the number of engines manufactured by these units:

Year	Licensed manufacturers	Production of engines
1953	6 units	7,200 nos.
1956	—	12,015 ,,
1959	18 ,,	30,375 ,,
1960	23 ,,	42,000 ,,
	28 ,, (in 1961)	
1966		100,000 ,, (target)

(All the engines referred to above are stationary, industrial type diesel engines.)

Besides the licensed manufacturers, there are about 150 small units, who are engaged in the production of diesel engines in different parts of India. Reliable statistical figures of their production are not available. However, sources close to them place the annual output at about 20,000 units. Most of these are copies of Kirloskar, Ruston and Lister engines. It will be seen that taking this production into account, the target for diesel engines at the end of the third five year plan (in 1966) of 66,000 units has already been achieved.



A 40 horse-power marine engine

Progress of Industry

Demand for diesel engines in the country was fairly good during the period 1947-51 and was met by imports as well as by the small number of indigenous production. The average annual demand for the engines during these years was of the order of 2,500 to 3,000 only. In the first five year plan, stress was laid on attaining self-sufficiency in food. To achieve the object, small-scale lift irrigation by small electric and engine-driven pumping sets was indicated. Funds were allotted to the States to grant loans for *taccavi*, hire-purchase and such other schemes with the sole object of helping the farmers to own and use mechanical equipment to increase the food production. Cultivators were immensely benefited by these schemes. The idea of using mechanised equipment for irrigated farming caught their imagination. Demand for engines, naturally, increased beyond expectations. This factor, coupled with the decision of the Government to stop the imports of 5 to 30 horse-power engines into the country, greatly helped the indigenous manufacturers. The period after 1955, therefore, showed signs of an expanding market, so much so that the manufacturers had to launch expansion schemes to meet the ever increasing demand for their products.

Development Council

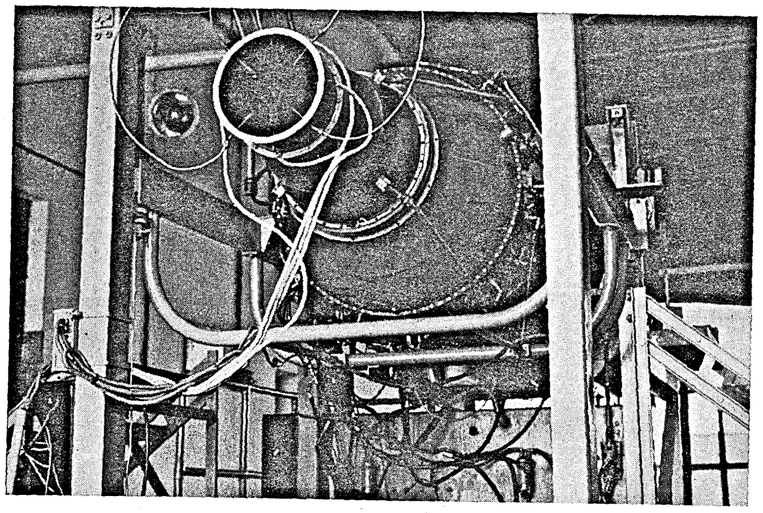
Apart from helping the industry through banning imports, the Government took another important step in 1953 by constituting a development council for internal combustion engines and power-driven pumps. The aim of the Council is to advise both the Government and the industry on measures to be undertaken to develop the engine and pump industry. Subsequently, the Council was enlarged to include air compressors, industrial fans and blowers within its scope. During the ten years of its working, it has guided the industry ably. It concerned itself with solving the manufacturers' problems, removing bottlenecks in supplies, etcetera. The achievement of the industry, especially after 1956, speaks volumes about the Council's constructive approach in putting the industry on a sound foundation. The Development Council realised that the demand for diesel engines is growing at a very fast pace. Therefore, it has revised its estimates and the target for 1966 of 1 million engines has already been indicated elsewhere in this article. It is expected that about

ammunition. In small arms, she has done well always. The Artillery, Air Force and Naval guns and various ammunition for them are products of the first-rate quality. The ordnance factories today produce heavy mortars, recoil systems of guns, mountings, carriages and buffers for heavy and medium-calibre guns, light-machine guns and high-explosure mines. An elaborate system of inspection has been built up in recent years. The inspectorate staff is independent of the factory authorities; this ensures high standard of performance. A repair organisation and the corps of electrical and mechanical engineers of the Army, also function effectively.

The production of these factories has a special significance in another way also. India has been faced with an acute foreign exchange shortage since 1956-57, so the limited resources at her disposal have to be used carefully. In the matter of defence equipment, utmost care is, therefore, taken to see that only *absolutely* essential items, not available internally, are indented for imports. It is not possible to indicate the saving of foreign exchange due to the pursuit of this policy, but there is no denying that it has saved a substantial amount of foreign exchange.

Manufacture of Lorries

An important step towards self-sufficiency has been the rolling out from the assembly line of the first ordnance-made lorry in record time. At present, 35 percent of the components of "Shaktiman" are domestically manufactured. "Shaktiman" has additional advantages over lorries imported hitherto, like the increased payload by 30 percent, multi-fuel engine and other features which have made it a suitable vehicle for military purposes. Eight hundred and thirty-eight lorries were produced by ordnance factories during the first year of production (July 1959 to June 1960), against a target of 1,200. The total number assembled up to 31st December, 1960, was 1,264. The production target for the second year (July 1960 to June 1961) is 1,200 lorries with an indigenous content of 50 percent. It is expected that the target will be reached or even exceeded. Proposals for further increasing the indigenous content in the shortest period possible are being finalised in consultation with Messrs. M. A. N. of West Germany. Sanction was accorded for progressive manufacture of Nissan one-ton lorries in ordnance factories in collaboration with Messrs Nissan Motor Company of Japan during February 1960. The total number of one-ton lorries assembled up to 31st December, 1960, is 230. Work on this project is progressing satisfactorily.



The first India-built gas turbine jet engine produced at the I.A.F. factory in Kanpur

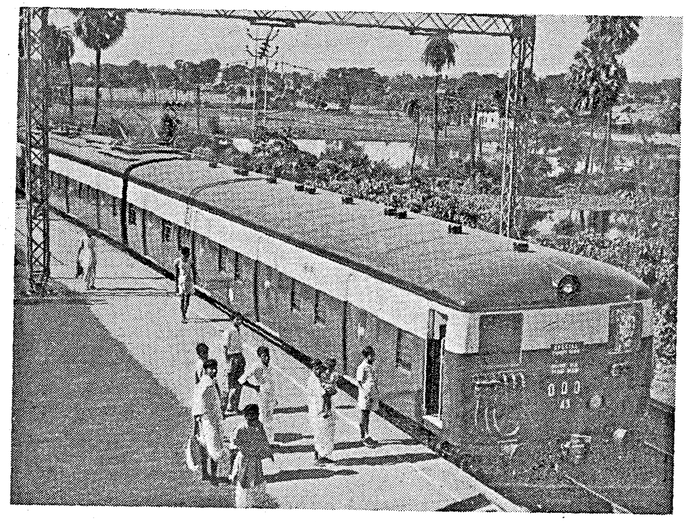
A Wide Range of Articles

The defence production also covers a wide range of articles for other Government departments as well as for civil use. Among these are tractors, mountaineering equipment, axle-boxes for the railways, water-current meters, wheel trucks, etcetera. An outstanding example of the ordnance factories helping to meet civilian requirement is the manufacture of sluice-gate tracks for the Rihand hydro-electric project in Uttar Pradesh. Considerable delay would have occurred in commencing work on the project if the ordnance factories had not supplied the equipment in the record time of less than three months. The ordnance factories also supplement the work of public undertakings. In Jabbalpur, they forge spares connecting rods of locomotives for the railways. For the first time, the production of the instrument for measuring the flow of water in rivers has also been undertaken at the request of the Central Water and Power Commission. Another recent venture is the assembly-cum-manufacture of tractors. Up to the end of last year, 278 tractors had been delivered, among others, to the Dandakaranya project and the Rajasthan Canal Board.

Manufacture of Aircraft

Apart from the ordnance factories, the Hindustan Aircraft and the Bharat Electronics also undertake defence production. In the sphere of aircraft manufacture, a project to build the *Avro-748* transport aircraft has been taken up since last year and the first prototype has been successfully flown. A major step in Indian aeronautics was taken recently when the first India-built gas-turbine jet engine, designed and developed by I.A.F. technicians, was switched on by Mr. Krishna Menon. Aviation in India has made considerable progress due to the efforts of the Air Force technicians, and a word of tribute is due to them for the successful manufacture of *H.T.-2, Kanpur I* (trainer aircraft), *Kanpur II* and *Krishak* (for spraying). Besides, an efficient team of young and enthusiastic aeronautical engineers has been built up. In the next few years, this will strengthen the air-arm of India's defence system. In the naval side, dependence on foreign countries for training has virtually been done away with. The Mazagaon docks in Bombay and the Garden Reach Workshop in Calcutta have been acquired for enlarging the fleet repair facilities. With suitable re-equipping, these two docks can eventually build naval vessels. With the completion of the Bombay Naval Dockyard expansion scheme, the Navy's defence capacity will rise further. Defence production has successfully completed its first phase—that of modernising and expanding its manufacturing base. At the same time, a vigorous research wing has been set up.

AEI POWER FOR 55 TRAINS



In the last five years, India has entrusted AEI with the manufacture of electrical equipment for 55 three car trains. They have been designed to cope with exceptional working conditions of high temperature, humidity and rain, and on the Bombay suburban electric railway they sometimes have to run over flooded track during the monsoon season. The trains were ordered for Bombay and Calcutta, following the outstanding performance of the trains supplied both before and after the war. Much of the equipment was made in India by Associated Electrical Industries Manufacturing Company Private Ltd., and in the latest orders some of the sets of equipment will be supplied from the Heavy Electricals factory at Bhopal.

Demand for Refractories Increasing

The Need to Improve Quality of the Indigenous Products

By

A SPECIAL CORRESPONDENT

IN times past, refractories were used merely to prevent fire from melting or damaging the furnace, but as modern industries grew up, refractories were subjected not only to high temperature, but also to severe abrasion, spalling and such other chemical and physical reactions creating problems for the industry. To overcome these problems, intensive research to produce suitable types of refractories assuring better performance and long life was undertaken. The economic salvation of a country stems from industrialisation. India also is striving for self-sufficiency through her five year plans, industrialisation, of course, being the chief aim. The iron and steel industry plays a pivotal part in helping to attain that aim. According to the set target, the output of steel should be about 10 million tons by the end of the third five year plan. To achieve this target, the consumption of refractories by the steel plants should go up to about 70 percent of the total production in India. The rest will be used by small industries such as, glass, paper, cement and non-ferrous metals, etcetera.

The complaint of the Indian steel industry is that its consumption of refractories is about 207 lbs to each ton of steel ingots, whereas in other countries it is about 120 lbs to each ton of steel ingots only. It is, therefore, natural that the steel manufacturer should be interested in reducing the cost a ton of steel produced. This could be done only if there is co-operation among consumers, manufacturers and the research institutes in finding out ways and means of improving quality and also reducing refractory consumption. Such co-operation appears to be lacking. There is still much room for improvement in the quality of refractories now made in India to meet the particular requirements of different industries. The manufacturers should try to make quality bricks to give better life to the furnace; only then the cost of production of steel can be lowered. In this connection, it is interesting to note that a slight improvement in the quality of silica roof bricks could help the steel industry to increase its output in open-hearth furnace. If the alumina content is kept to a minimum, the working temperature of the open-hearth furnace could be increased and more would be the driving rate, and more the production. If the furnace temperature could be raised by at least 10°C, then a proportionate increase also could be obtained in production. The following figures would give an idea as to how by decreasing the alumina content of a silica brick, the underload value increases giving a better life to the roof.

Silica brick A1203	Ta	Refractories underload Te
1.2-1 percent	1637°C	1670°C
0.7-0.5 percent	1634°C	1673°C
0.5-0.1 percent	1645°C	1683°C

Demand for Quality Refractories

From this statement, it will be noted that there is a justification for consumers demanding quality refractories. Refractory manufacturers should try to supply products according to the specifications stipulated by the users. According to the Development Wing, Government of India, the requirements of refractories during the third five year plan period would come to 1.6 million tons of all types, of which 350,000 tons of silica and 180,000 tons of basic bricks would be required if the use of silica bricks in the roof is to be continued. But lately it seems that the trend is towards the use of basic bricks for the open-hearth roofs. The Bhilai steel plant has already started using basic bricks for some of its open-hearth furnaces, and it is expected that the other steel plants will emulate its example, in which case, the requirements would be reduced to 1.3 million tons of all refractories, out of which 301,000 tons will be basic and 168,000 tons silica.

The estimated production of refractories in 1960-61, it was expected, would be 590,000 tons, but, unfortunately, this figure has not been reached due to various reasons. Thus the demand is much more than the supply, and there seems little prospect of improvements in the foreseeable future. In order to facilitate the country's industrial progress, the refractory industry should be expanded in the right direction if it is to serve the consuming industry in an efficient manner. The requirement of different types of refractories depends on the consumer industries as also the different processes adopted and the supply of the correct quality of refractories for the specific conditions for which they are intended. Since the major consumer of refractories is the iron and steel industry, if one follows up closely the changes in the processes taking place, it could give a pointer to the trend of refractory requirement of different types. Taking the following furnaces in the steel plant, it would be interesting to see how the changes are likely to take place in the use of refractories.

Blast furnace: The refractories in the blast furnace are subjected to various service conditions at different levels. The bricks used at the bottom must be capable of withstanding heavy loads at high temperature. The hearth walls and bosh are also subjected to heavy loads, high temperature at the tuyeres level and must also resist the action of blast furnace slag. For this, hard-fired dense high duty firebricks are at present being used to give excellent life. In the stack of the furnace also, the refractories have to resist some slag attack near the mantle and also resist the physical abrasion due to the charging of materials from the top. The bricks are also exposed to reducing atmosphere due to the formation of carbon monoxide. It has been found that if the iron content of the brick is not very low, the iron oxide acts as a catalyst which increases the conversion of Co to Co_2 and C, and this carbon gets deposited around the iron oxide and helps in the disintegration of the brick. So the hard-fired dense high-duty fireclay bricks with low iron content is being used at present. In the Durgapur steel plant, carbon bricks are being used for one ring in the hearth, and the rest with high heat duty firebricks. Nowadays carbon bricks are used in a large number in blast furnaces as they have the advantage of avoiding hearth breakouts, carbon disintegration, etcetera. In England, the Appleby Fordingham steel plant lately relined one blast furnace with sillimanite bricks, and it is reported to be giving very satisfactory service.

High Heat Duty Bricks

According to Mr. W. S. Debenham of the United States Steel Company, in his article on "Rôle of Refractories in Steel Furute—An American View Point", it is not to be expected that any major changes will be made in the use of high heat duty bricks for the present. The only possibility is that the refractories in the stack may be eliminated at a later date in favour of a water cooled shell, with a thin monolithic lining. The use of carbon bricks in hearth walls, bottom, and increasingly in bosh, is also expected. These changes would be at the expense of the high heat duty bricks now being used. The function of the blast furnace stove is to preheat the air supplied to the blast furnace. The service conditions which the refractories are expected to withstand are high temperature and high load at the lower section of the checker work. The use of high duty fireclay bricks are being used in most of the sections, but super duty bricks find a place where high temperatures are prevalent. The main consideration steel manufacturers will look for in bricks for their stove is that they should withstand high temperature, heavy load, etcetera. The bricks should also give maximum surface for heating through increased height of checkers, settings and decreased checker-walls thickness. The use of high alumina or super-duty bricks or expensive basic refractories in the hotter zones is being recommended for durability.

Open Hearth: The open-hearth furnace is one of the major users of refractories in the steel industry. The severe conditions refractory bricks are subjected to in the open-hearth furnace have engaged the attention of steel manufacturers in studying the behaviour of the refractories in different parts of the furnace with a view to achieving better service conditions from the bricks, thereby increasing the steel output. High temperature chemical attacks by slag containing iron oxide and other fluxes, temperature fluctuations, abrasion and heavy loads are some of the conditions detrimental to the life of the bricks. To combat these conditions, several types of refractories are used in different sections of the furnace to give the maximum life to the furnace. The hearth of the furnace is subjected to high temperature, attacks by slag and abrasion by the molten metal. The present practice is to use calcined magnesite grains for fettling and ramming. Repairs are usually effected with granular dolomite. Beneath the hearth, refractory brickwork is usually employed and basic bricks are used. The front wall regions are under high temperature, slag attack, temperature fluctuations, and mechanical abrasions; here basic bricks are also used. The life of the roof of an open-hearth furnace is the main anxiety of the steel manufacturers. The high temperature prevailing in the region, chemical attack by iron oxide vapour and furnace dust, are some of the detrimental factors affecting the life of the roof. Silica bricks are generally used for the purpose. These bricks should have a high silica content and as low as possible the alumina content. It was shown earlier in this article that by lowering the A1203 content, the furnace temperature could be raised proportionately and greater would be the driving rate. Recently, the use of basic bricks has been advocated since it was found to give a much better performance in the furnace. In India also, the bent is towards using basic bricks and it may be expected that the changeover would be coming soon. The Bhilai steel plant is already using these bricks. This improvement would enhance the requirement of the basic bricks at the expense of silica bricks which hitherto has been shouldering the task. The use of basic bricks in other countries has given us a picture of the state of things to come. According to the figures supplied by Mr. W. S. Debenham in West Germany, the consumption of basic bricks and silica bricks from 1948 to 1955 was as follows:

	1948	1950	1955
Silica bricks lbs to each ton of steel	36.74	28.44	19.84
Basic bricks lbs to each ton of steel	6.88	6.76	13.60

Implications of L.-D. Process

Another change that may affect the refractory industry is the adoption of the well-known L.-D. process. The Rourkela steel plant is equipped with this furnace. It is reported that the constructional and operational costs are much less than that of the conventional open-hearth furnace. The Mysore Iron and Steel Company, Bhadravathi, is also contemplating the use of this type of furnace. The tar-bonded dolomite bricks which are cheaper and more durable than other basic bricks, could be used in these furnaces. Hence it may be expected that at the expense of other basic bricks, dolomite bricks would find a market in the steel industry. In the case of electric furnaces for making steel, silica bricks are being used in the roof and it has been found that the use of high alumina bricks would also be advantageous.

Soaking Pit Refractories: In the soaking pits, suspended arch bricks are used in the construction of the roof which in the course of time would be gradually replaced by castables. This construction would be preferred, because repairs and patch-work could be done without much loss of time and without disturbing the main construction. Semi-silica bricks are used for the side walls as these bricks are best suited to withstand scale attack. In the bottom of the soaking pit which is covered with coke-breeze scale, attack does not arise, and as such, high alumina bricks could be satisfactorily used.

Ladles: The quality of bricks used in the ladle is directly proportional to the number of heats that can be obtained with one-relining and is, therefore, an important factor in the steel industry.

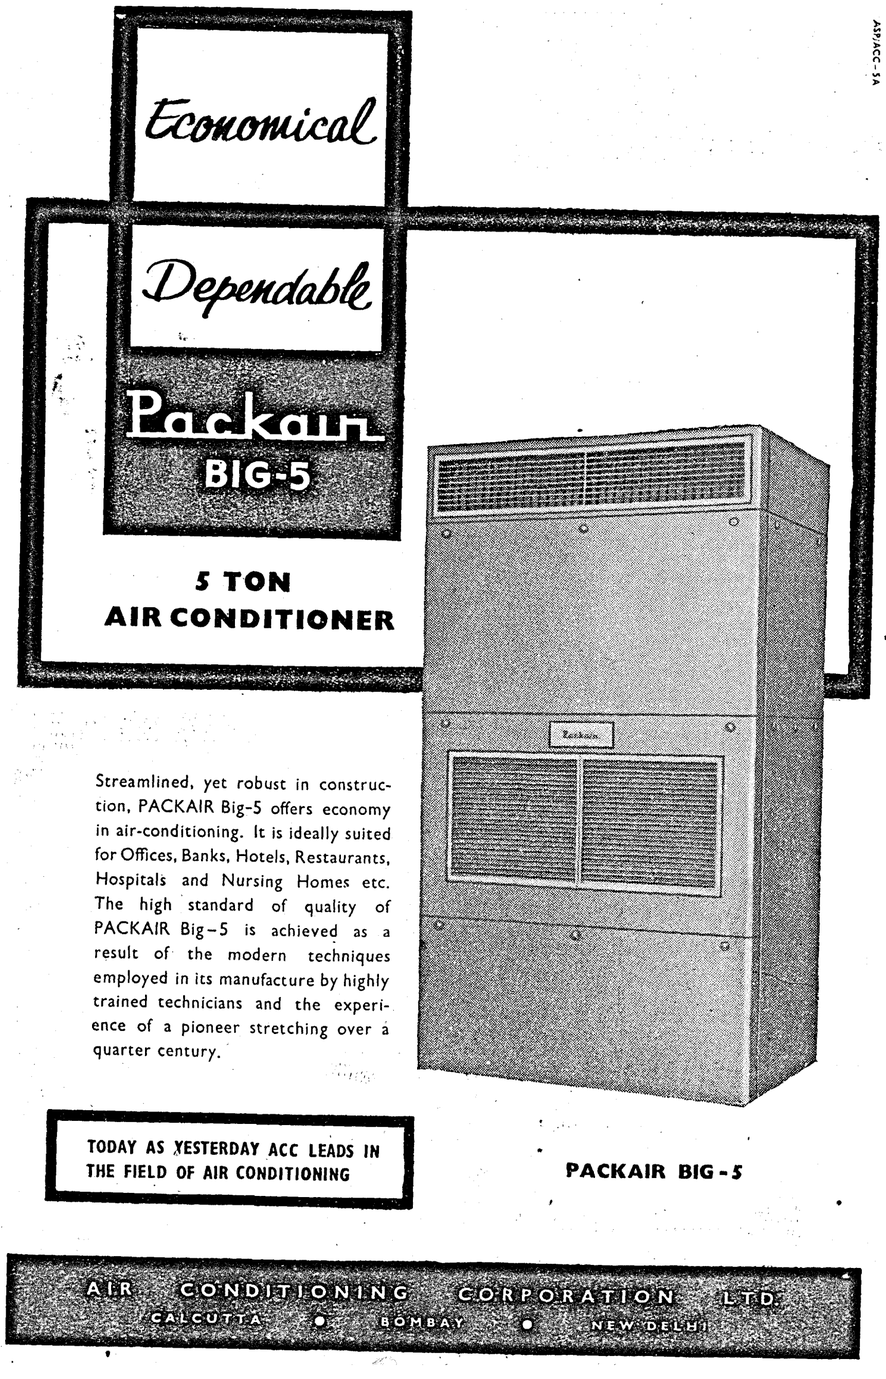
Any attempt to increase the life of the bricks would ultimately result in the reduction of steel-making costs.

In most of the advanced countries, refractory manufacturers are able to produce ladle bricks which can withstand up to 20 to 25 heats. In India this is not so, where less than half the number of heats are presently obtained with indigenous bricks and, therefore, steel manufacturers are still relying on imports. With the setting up of modern refractory plants, this situation, however, is now improving and the trend is towards making high grog ladle bricks with very low porosity. Ladle bricks made from bloating clays are also being used successfully in Australia and in western countries. Another consumer of refractories worth mentioning here is the glass industry. With import restrictions on cohart, mullite, and electro-cast glass tank blocks, the glass manufacturers were faced with a tremendous problem in obtaining suitable indigenous products to replace the imported ones.

Natural Khasi Sillimanite Blocks

After long trials it was found that by cutting sillimanite blocks of suitable sizes from natural Khasi sillimanite boulders obtained from the Khasi and Jaintia hills in Assam, a refractory material much superior to other types of refractories imported or manufactured here, has been evolved. In this field, the only firm in this country manufacturing such blocks—Assam Sillimanite Ltd—is doing a yeoman's service to the glass industry. These "natural Khasi sillimanite" blocks have absolutely "nil" porosity and can withstand the corrosive action of the glass for periods extending beyond three years, thus ensuring a longer life of the tank furnace, than any other known tank blocks.

From what has been said, it is apparent that the quality of refractories depends entirely on the changes in the process of production of iron and steel and such other consuming industries to meet their specific requirements. To that end, constant research and quality control in individual plants is imperative in order to meet the stringent requirements of the consuming industries with an improved product. The research in this field being conducted by such institutes as the National Metallurgical Laboratory and the Central Glass and Ceramic Research Institute, is praiseworthy, and the refractory industry in India could look forward to a bright future.



THE FOOTWEAR INDUSTRY MAKES RAPID PROGRESS

DEMAND EXPECTED TO RISE WITH IMPROVEMENT IN LIVING STANDARDS

ALTHOUGH still carried on largely as a cottage industry, the footwear industry of India has made remarkable progress ever since the manufacture of footwear on a mass scale by modern methods was started as an organised industry some 30 years ago. Within this short period, and entirely due to private initiative and effort, the manufacture of leather and rubber footwear on a large scale has—in spite of initial handicaps and difficulties—been rapidly developed and has succeeded in establishing itself as one of the most progressive and best organised of India's national industries. The large-scale manufacturing sector of the footwear industry plays an important rôle in India's economy. It provides fruitful employment to thousands of people of different classes and communities, gives direct and indirect support to other allied and ancillary industries and contributes substantially to the Exchequer by way of different taxes and excise duty. Furthermore, it earns valuable foreign exchange by exporting its products.

Of the 5 million pairs of footwear exported by India in 1960, the share of the large-scale manufacturing sector was almost 100 percent. Today, Indian leather and rubber footwear have a world-wide market. They are exported to such countries as the United Arab Republic, the Sudan, north, east and west Africa, Cyprus, Jordan, Saudi Arabia in the Middle and Near East; Malaya, Thailand, Viet Nam, Ceylon in the Far East; the United Kingdom, France, West Germany and several other countries of Europe; the West Indies and other islands in the Pacific; and even to Canada and the U.S.A.

Annual Output

Of the present annual output of about 146 million pairs of footwear by the industry as a whole, the large-scale manufacturing sector produces over 53 million pairs of leather and rubber footwear in several modern plants established in different parts of the country. Highly organised and run on the most up-to-date lines, some of the plants are comparable to similar plants in the most advanced countries of the world. The plant in Batanagar in West Bengal is the biggest and most modern of its kind in the whole of Asia. It has several large factories for manufacturing leather and rubber footwear, a fully equipped modern tannery and many auxiliary departments which include sections engaged in lace-making, manufacture of shoemaking machinery and research. In this plant, footwear of innumerable types and designs are manufactured on a vast scale on the latest assembly-line system. The larger plants keep themselves constantly abreast of the latest manufacturing techniques and other development in the shoe industries of Europe and the U.S.A. and avail themselves of these to the maximum extent possible in order to keep their own production methods and manufacturing processes thoroughly up-to-date. Special stress is also laid on research to enable them to meet the demand for new and better products at competitive prices, and scientific quality control at every stage of production is carried out to maintain and improve the workmanship and the standard of quality of the wide variety of footwear of many types and designs which are manufactured in these plants.

In the large-scale manufacturing sector of the industry, many highly qualified Indian experts and technicians and several thousands of trained workers are employed. They are skilled in the operation of the various modern equipment and machines used in the fabrication and manufacture of leather and rubber footwear. Great importance is attached and efforts are made in this sector to promote the legitimate interests and the welfare of workers and to earn their loyalty and goodwill. Congenial working conditions, adequate opportunities for advancement, fair and adequate rates of pay, bonus, provident fund and retiring benefits, paid holidays and other leave facilities, housing and medical facilities, educational and recreational facilities, encouragement and support of social and cultural activities are some of the many features of the enlightened and progressive labour welfare policy pursued by employers in this sector.

Joint Consultative Bodies

Through recognised employees' unions, workers are provided with the fullest opportunities for collective bargaining and direct negotiations with the management for settling industrial disputes. Moreover, there are joint consultative bodies such as works committees and production advisory committees made up of an equal number of representatives of employees and management to deal with day-to-day matters of common interest and concern. The code of behaviour and the rights and privileges of workers are embodied in a collective

By
J. VYORAL
Managing Director, Bata Shoe Co. Private Ltd

agreement between employees and management, and the standing order and rules of the different plants define working conditions, leave and holidays, scales of salaries and wages, complaints and remedies, grievance procedure, etcetera.

The progress achieved by the large-scale sector has not been confined exclusively to improving and enlarging its productive capacity and resources. On the distribution side, too, a highly efficient and elaborately planned selling and distribution system has been built up within the country. The wide network of retail stores established by one leading manufacturing concern selling directly to the public are now a familiar sight in every city and town in India. These stores are operated and staffed by men trained in the latest methods and techniques of merchandising and selling. Moreover, with its wholesale and agency outlets the distribution system of this concern covers every part of the country, making its products readily and regularly available everywhere.

The Age-old Stigma

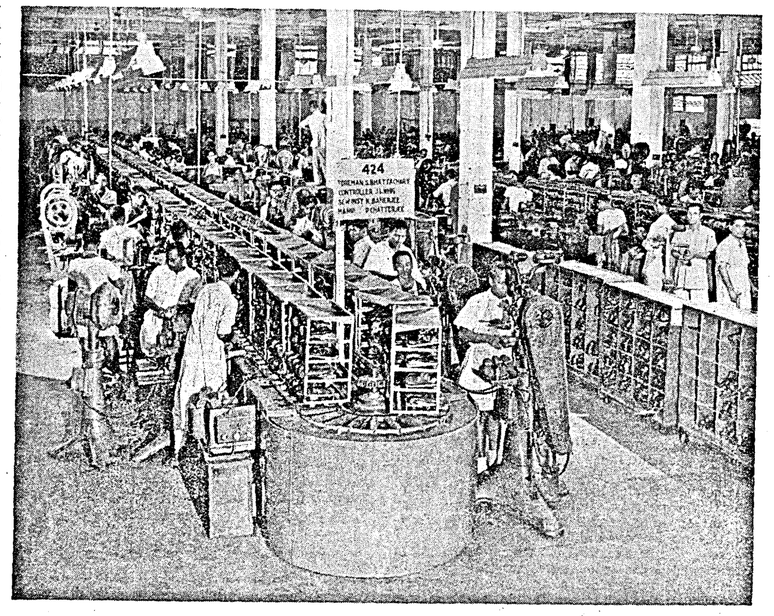
This then is a brief survey of the progress made so far by the large-scale manufacturing sector of the footwear industry of India. Shoemaking in a modern factory in India is now a calling as decent, congenial, remunerative and honourable as that in any other industry. There is no denying that the establishment of modern shoe factories in this country has helped to remove the age-old stigma attached to shoemaking and raise it from a much despised craft to a dignified profession. It is attracting educated young men from the best of families and from all communities who are coming forward in increasing numbers to take up a career in shoemaking. Again, it is largely due to the efforts and activities of the large-scale sector that the common people have been made increasingly conscious of the benefits to be derived from wearing shoes and have been systematically encouraged to develop the habit of wearing shoes.

At a time when the Central and State Governments are directing their efforts towards developing the nation's industrial capacity and raising the economic conditions and living standards of the people through the five year plans, one may be curious to know the future prospects for the footwear manufacturing industry in India and the part it will play to contribute to her future economic progress.

With her vast area and teeming population, India is potentially one of the largest markets for footwear in the world. When one considers the fact that even today barely 15 percent of India's population of over 400 million people wear any kind of footwear at all, compared with the average of three pairs worn annually by each person in Britain and the U.S.A., it is easy to imagine the tremendous task which lies ahead of the industry in India as more and more of the barefooted millions take to wearing shoes. This they must inevitably do as their purchasing power increases and material prosperity and social progress change their outlook, ideas and habits. Already there are unmistakable signs of the awakened desire of even the simplest villagers in the remotest corners to live a better and healthier life and to enjoy more material comforts. In the not-too-distant future, this desire is sure to develop into an insistent demand which will have to be adequately met.

Developing the Cottage Sector

The large rise in production which will be needed in the future even to meet the minimum



The manufacture of leather shoes on the assembly-line system

Rubber and textile shoes are being fabricated from components on a semi-automatic conveyor

requirement of one pair of shoes a year a head of the entire population will not only provide an extensive and widening scope to the small-scale and cottage industry in footwear to develop and prosper, but will also necessitate the setting up of many more large and modern manufacturing plants and lead to a considerable expansion of those already in existence. As far as the cottage footwear industry is concerned, it is still largely primitive and unorganised. It is, therefore, understandable that the Central and State Governments should be anxious to render all possible help to improve the industry in order to provide maximum employment to people traditionally engaged in it. It is in itself a tremendous task demanding elaborate and meticulous planning and organisation and the expenditure of huge sums of money to cover the traditional leather workers all over the country who will have to be weaned away from their out-of-date and crude methods of production and progressively be induced to take to more modern methods and techniques in keeping with modern requirements if they are effectively to play their part in meeting the growing and more exacting demands for footwear in the future. Great stress has been laid by the Government of India on the development of the small-scale and cottage industry sector in its five year plans. During the second five year plan period, which has just ended, a number of technical training institutes have been set up in different States to give specialised training to local shoemakers in the production of footwear by modern methods. Better credit, purchasing and marketing facilities on co-operative lines have been made available to this sector through Government channels. Moreover, the export of footwear made by the cottage industry sector is also being undertaken by the Government through the State Trading Corporation.

Problems and Difficulties

The development of the cottage industry sector is one of the main items in the programme of work of the Development Council for the Leather and Leather Goods and Pickers Industries set up by the Government of India. The Council is at present engaged—among other things—in studying the problems and difficulties of the small and cottage industry units and in recommending to the Government suitable measures for the standardisation and improvement of the quality of their products, making raw materials and suitable equipment and machine available to them and to render them technical and other assistance to enable them to develop on modern and organised lines. This process of organised and practical assistance to the cottage industry will continue on a wider and more ambitious scale under the third five year plan. While one fully appreciates and wholly welcomes this concern, the determination and effort on the part of the Government to do everything possible for the progress of the small-scale and cottage industry sector of the footwear industry of this country, one cannot but cherish the earnest expectation and hope that it will continue to be equally concerned and provide adequate facilities for the development of the large-scale manufacturing sector, in view of the significant contribution that the latter is making towards the development of the footwear industry as a whole and in the interests of the country's advancement.

Growing Collaboration

A heartening feature in recent years has been the growing collaboration within the industry between the larger manufacturing concerns and cottage industry units. Apart from giving direct and practical support to small units by regularly purchasing large quantities of footwear made by these units to supplement its own production, the manufacturing sector has voluntarily rendered aid to these units in the form of technical and other assistance so that they might produce goods according to acceptable standards of quality and has offered practical advice on new developments in footwear styles and designs. The two sectors of the industry are thus becoming more and more inter-dependent. It is clear that one sector cannot be allowed to thrive at the expense of the other without doing damage to the industry as a whole. The balanced development of both is essential for the future progress of the industry. Any undue restriction on the legitimate activities and continued development of the large-scale sector—if this were to be imposed in pursuance of too doctrinaire a policy for the development of the cottage industry sector—will surely result in stagnation and grave setbacks for the industry.

The large-scale sector has its own difficulties and problems. The rising costs of labour and of raw materials and the scarcity of some items, particularly of suitable leathers for the manufacture of leather footwear, the difficulty of importing essential machinery and equipment due to restricted foreign exchange, rising distribution costs, etcetera, are some of the main problems which this sector is now having to contend with. It is unlikely that these difficulties will be easily solved in the near future. As for the urgent need to earn as much foreign exchange as possible by increasing the volume of exports, the large-scale sector of the footwear industry is making serious efforts to sell more of its products abroad including the hard currency countries. This could well be more effective and yield the desired results if a policy of more practical and liberal aid to the industry were to be formulated and pursued by the Government of India and the industry provided with such incentives as would help offset the factors acting as curbs on exports under the changing and difficult conditions. Given the needed encouragement and facilities, there is no reason why exports of Indian footwear could not be substantially increased and brought up to the level of exports of such leading shoe exporting countries as Britain and Italy.

Far-reaching Developments

Recent trends in the footwear industry in the west European countries and in Canada and the U.S.A. point to the far-reaching developments which are taking place in those countries in the manufacturing processes and techniques and in the use of synthetic materials for manufacturing shoes. Threads, tacks, nails and pegs which have carried mass-production methods so far are now giving ground to the application of adhesives, pressing, vulcanising and injection moulding. A constant search is also in progress for new materials which will make the manufacture of footwear easier and help reduce manufacturing costs. Already there is a remarkable increase in the use of synthetic rubber in the manufacture of soles and heels, and millions of pairs of shoes are now being produced with uppers made from plastic materials. All-plastic shoes made by a simple and efficient process and leather shoes with plastic injected soles are other new features which are proving commercially successful and are being readily accepted in the world markets. In the overseas markets, footwear made with new synthetic materials are seriously competing with shoes exported from India. This competition is likely to become more acute as the quality of the synthetic materials is further improved and their manufacturing costs are lowered.

Synthetic Materials

The revolution in materials for shoes has thus begun and is sure to gain momentum in the future. While leather will perhaps never go out of demand as a natural material for shoe-making, eventually the industry is likely to have various synthetic materials with all the good qualities of leather and few of its disadvantages. These materials will come from the textile, chemical and plastic industries and will be developed by scientists, research workers and chemists who will be playing a decisive rôle in shaping the future course of the shoe-making industry all over the world. The manufacturing sector of the footwear industry in India is fully aware of the importance of these new developments and realise the urgent need to prepare and equip itself to enter the new era which is opening up as a result of the developments in the sphere of mass production of shoes. It is necessary, therefore, that the Indian industry should be encouraged by the Government to keep pace with these developments and take full advantage of them in order that it can march forward to further progress and face the future with confidence. It should also strengthen its ability and resources to maintain and improve its competitive position in the world markets.

FOOTWEAR EXPORTS FROM INDIA

Year	Total pairs
1955	4,029
1956	4,446
1957	4,717

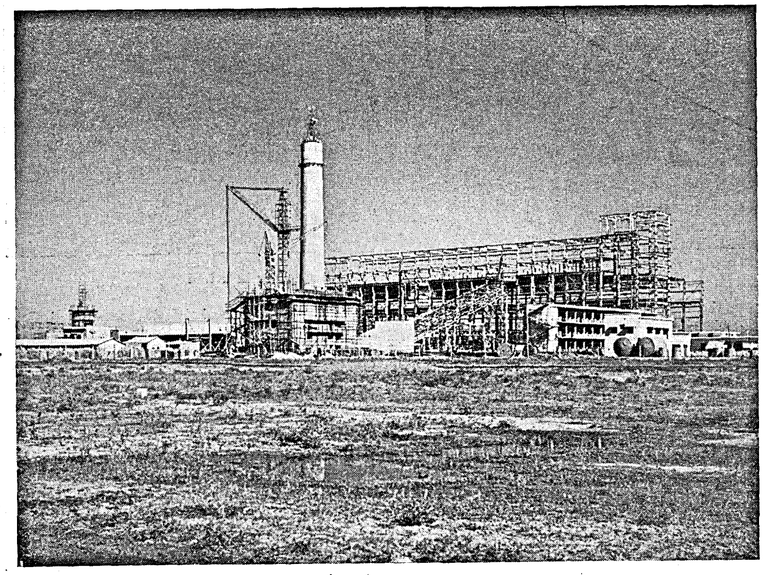
Economics of the Neyveli Integrated Lignite Project

Essential for the Development of South India

By

A SPECIAL CORRESPONDENT

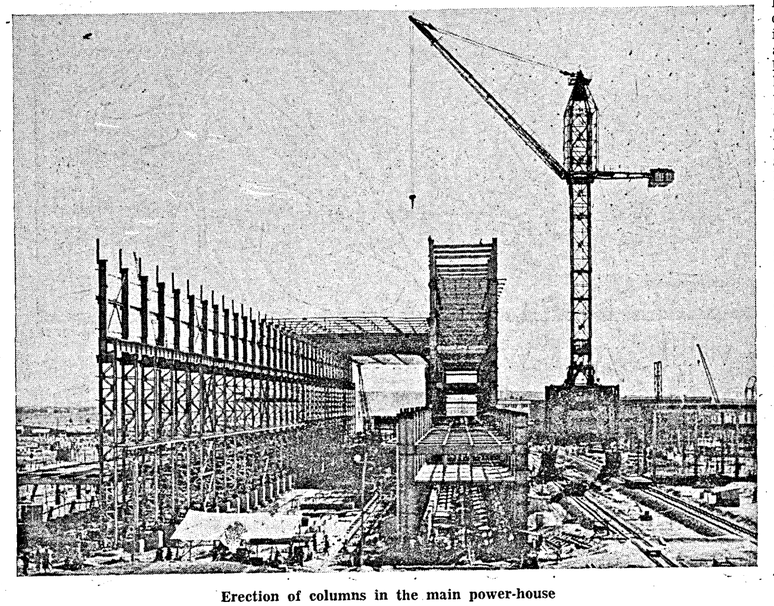
LIGNITE, which is formed from vegetable matter, is an inferior type of coal, friable, tan-brown in colour and light to the feel. Its occurrence in and around Neyveli in the South Arcot district of Madras State, although previously known, actually came to prominent notice in the later 'thirties of this century while drilling wells for water supply purposes. As far as is known, the lignite seam in South Arcot district is nowhere less than about 160 feet below the surface. Except for one shaft sunk into it, its extent, disposition, thickness and quality are known only from the data collected from bore holes drilled. The area north of the Cuddalore-Vriddhachalam Railway in Neyveli has been chosen as most suitable for initial mining operations. The favourable features of this site in comparison with the other areas are: (i) thinner overburden and generally greater thickness of lignite, with a consequent superior ratio of lignite to overburden; (ii) greater height of the lignite horizon above the sea level which may be expected to lessen the difficulty of controlling ground water.



A general view of the main power-house

Geological Investigations

The Geological Survey of India carried out investigations and put down a number of bore holes during 1943-46, which revealed the existence of lignite over an area of 23 square miles. In view of the shortage of power and fuel in Madras State and the difficulties and cost involved in transporting coal from north India, the Government of Madras turned its attention to the development of lignite, as a source of supply of power, fuel and raw material for industries in the post-war years, and arranged for further investigations from 1946. A series of bore holes were drilled during 1948-51, and these proved the existence of lignite reserves, estimated at 2,000 million tons, over a total area of 100 square miles. The most favourable overburden-lignite ratio and the more easily workable deposits, amounting to 200 million tons, occur in an area of about 5½ square miles, at more or less the centre, the mining scheme of which was inaugurated by the Prime Minister of India on 20th May, 1957. The thickness of the seam in this area, which is to be worked first by the Neyveli Lignite Corporation, varies up to 89 feet with an average of 55 feet, and occurs at a depth of about 180 feet below the ground level.

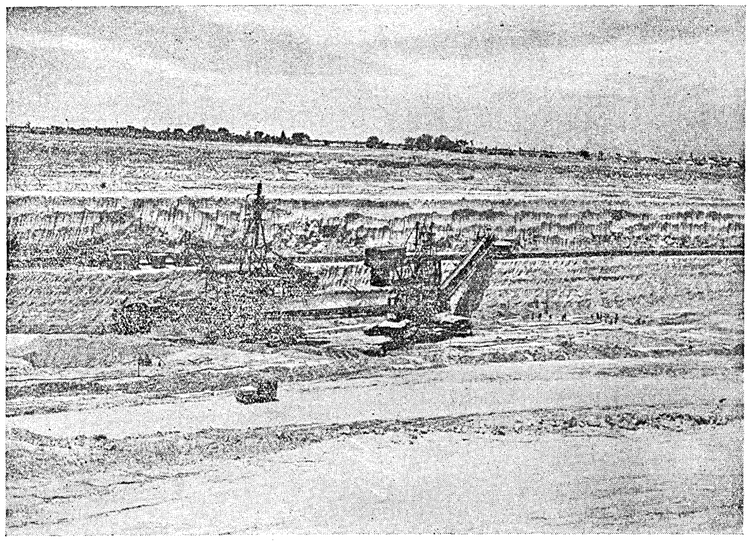


Erection of columns in the main power-house

The artesian water below the lignite exerts an upward thrust of about six to eight tons a square foot (93 lbs to 124 lbs a square inch or 6.6 kilograms to 8.8 kilograms a square centimeter). In the areas which are higher than the sea level, like the area taken up to be worked first, as soon as a hole is bored from the surface down to the base of the lignite at about a depth of 235 feet, the artesian water rushes up in the hole to its static level of about 100 feet above the mean sea level or about 60 feet below the ground level. Where the level of the ground surface is nearly equal to or a little less than the static level, the water will flow out of such a bore hole. There are a number of flowing artesian wells put down for irrigation in the area south of the Cuddalore-Neyveli-Vriddhachalam railway line. There being no impermeable barrier of sufficient thickness below the lignite bed to withstand the pressure that would be exerted on the base of the lignite on the removal of the overburden, there is a risk of the artesian water heaving upwards, bursting through the lignite seam and flooding the mine, unless its pressure is kept continuously under control from the appropriate stage of the mining operations.

Pilot Quarry

Further investigations were conducted and it became clear that underground working of the mine would be quite out of the question. The Madras Government, therefore, undertook the excavation of a pilot quarry, with aid from the Technical Co-operation Mission of the United States arranged through the Government of India, to determine the engineering feasibility and economic practicability of open-cut mining. The excavations in the pilot quarry were taken down to about 145 feet below the ground level by December 1954, and indicated that open-cast mining would be practicable, but further work had to be stopped, pending a detailed study of the groundwater problem. The investigations did not also contemplate any specific project as such, for mining any specific quantity of lignite, and for its use. The India Government, therefore, in the meantime arranged under the Colombo Plan, for the services of Messrs Powell Duffryn Technical Services Ltd, a firm of consulting engineers, well experienced in the mining of coal, to prepare a definite project report on the economic mining, processing and utilisation



The bucket wheel excavator and spreader in action

of the lignite. The firm presented a report in November 1954, in which it proposed a number of specific alternative schemes and suggested further investigations to check the thickness of the lignite seam and also to evolve an efficient and thoroughly dependable system of groundwater control. Tests and analyses abroad, in well-known laboratories, of bulk samples of the Neyveli lignite, were also suggested. After a detailed examination of the proposals submitted by the above firm and discussions between the State and Central Governments, it was decided to adopt a project for mining 3½ million tons of lignite a year and its processing and use for the generation of 250 mW of electric power, the production of nitrogenous fertilisers with a nitrogen content of 70,000 tons a year, and the manufacture of 720,000 tons of raw lignite briquettes which on carbonisation would produce 380,000 tons of carbonised briquettes —a smokeless domestic fuel—and a number of valuable by-products, and to investigate this specific project further.

Artesian Water Pressure

Before the tax-payer's money could be spent on a venture attendant with the risk of flooding of the mine, it was essential to prove that the artesian water pressure could be effectively controlled and the risk made negligible, if not eliminated altogether. The drilling of large-diameter pump wells, hitherto not known in this part of the country, was undertaken, 29 pumps of a capacity of 1,000 gallons a minute each were fitted, and a large-scale pumping test was conducted. The test was successfully completed at the end of June 1956 and proved that the pressure surface of the artesian water could be reduced to a safe level below the lignite, by pumping from a carefully designed pattern of wells, most of them around the mine and some within it. It was only after the expert consultants and the Government of India's own experts had studied the results of the tests and fully assured the Government that it would be feasible to control the artesian pressure and eliminate risk, that the Government approved the project as a whole, and shortly thereafter, sanctioned the execution of the mining scheme, which is the basic scheme in this integrated project.

The test also confirmed the theoretical calculations that 48,000 gallons of artesian water a minute will have to be pumped out round the clock to control the groundwater for mining 3½ million tons of lignite a year. It must be remembered here that it is neither possible nor desirable to empty the groundwater. Only that much of the quantity of the artesian water to prevent a heave-up and admit of safe mining will be necessary. Groundwater control arrangements would be a continuous process, beginning when the first mine cut reaches the crucial stage of excavation and is coterminus with the life of the mine. Before the lignite available in one cut is fully exploited, the next cut should be ready for exploitation and for this purpose, new groundwater control wells to the extent necessary will have to be drilled and pumps fitted at appropriate places. The drilling of wells will be a continuing process, and to determine the best method of drilling, casing and the size of well screens and gravel packing to be adopted to prevent or minimise the entry of sand into the wells which will affect the submersible pumps, further tests were conducted. On the basis of the results obtained from these tests, the Corporation has taken a decision on the method of drilling, size of the hole, size of the casing pipes, etcetera.

Water Problem

The water which is a problem for mining, is an essential requirement for the other schemes of the integrated project. There is no perennial river or other source of water supply near Neyveli, and as a matter of fact, the project, and particularly the large thermal power-station, could not have been thought of without abundant supplies of water. Large quantities of water will be required for the thermal station, the fertiliser factory, the briquetting and carbonising plant, the clay washing plant, the workshops, the township and for the mine itself for allaying dust nuisance and as fire protection. The water pumped out to control the artesian pressure will be used for the above purpose and the surplus water, if any, made available for irrigation. At the same time, there is no guarantee that supplies from the artesian aquifer would be continuous and lasting. An emergency scheme for bringing water to Neyveli from the Cauvery irrigation system, between 35 to 40 miles away is, therefore, being drawn up.

Tests of bulk samples of Neyveli lignite conducted in West German laboratories have confirmed that the lignite, as mined, has a moisture content of about 50 percent, volatiles amounting to 25 percent, 22 percent of fixed carbon and an ash content of only 3 percent. The heating value of lignite is 5,500 b.th.u. a lb. The quality of lignite is better than that of even German lignite. For winning 3½ million tons of lignite a year, about 27 million cubic yards of overburden will have to be removed. About 17.22 million cubic yards of overburden have been removed until 31st March, 1961, and the mine has gone to a depth of 140 feet at places. The pattern of working the mine will be that followed in West Germany and Australia. The lignite required for the first unit of the thermal power-station, which is expected to be commissioned in the last quarter of this year, will be made available in time.

About 2½ tons of raw lignite will be equivalent in thermal value to a ton of good coal. The annual target of production of 3½ million tons will, therefore, be equivalent to about 1.4 million tons of good coal. But raw lignite is bulky and liable to spontaneous combustion. To be transported, it must be briquetted, after bringing the moisture content down to about 15 percent. Raw lignite briquetted will have a heating value of about 9,000 b.th.u. a lb, and the price of the quantity equivalent to one ton of Singareni coal in thermal value will be under Rs. 40. With the rate of production of 3½ million tons a year, the comparatively easily minable lignite would last for about 57 years. But, with the experience gained in working this part of the lignite reserves, it should not be difficult to win the rest of the deposits also economically.

Regional Development

A comment is made on occasions in certain quarters that the same amount of money invested in a coal mine in Bihar or Bengal would yield much larger quantities of coal a year. But this ignores the need for regional development and the wasteful use of transport involved in the carriage of coal from the north to Madras, for power generation to firm up the very unreliable hydel-power available to the Madras grid. Without electric power, the development of the southern region will be very unbalanced and the people condemned to subsistence farming.

As industrial development in the State was retarded largely due to shortage of electric power, and power is needed for the development of agriculture as well—for example, for lifting water from wells—and as the most economic use of lignite is to use it as fuel in boilers close to the mine itself, the generation of electric power is the most important constituent scheme in the integrated project. The installed capacity of the thermal power station will be 250,000 kW and, in addition, there will be a back pressure turbine plant in conjunction with other production units. The thermal station will require 1½ million tons of lignite a year. It has been decided that the fertiliser plant in the project should produce 152,000 tons of urea, using lignite (about ½ million tons) as the raw material. The urea plant will probably be one of the largest in the world.

Provision for Other Fuels

The need for providing other fuels has not been overlooked. The briquetting and carbonising of the balance of 1½ million tons of lignite produced would yield 380,000 tons of carbonised briquettes—a smokeless fuel, ideal for domestic consumption in the place of charcoal, and also for industrial purposes, 43,000 tons of char dust, 6,400 tons of motor spirit, 51,300 tons of tar and 1,032 tons of phenol. A scheme for washing the excellent china clay available close to the lignite and which will be removed during the mining operations, has been worked out and is being implemented. The constituent units of the project will thus utilise the entire quantity of raw lignite won annually, and convert it into various important products.

The integrated lignite project will help remedy to some extent the shortage of electric power, fuels and fertilisers and hold out promise for further industrial progress in the State and also in the neighbouring ones. A part of the power which will be generated in Neyveli will be used in the component schemes of the integrated project and the balance will be fed into the Madras grid.

Use in Low-shaft Furnaces

Tests and experiments in Germany on bulk samples of Neyveli lignite indicated that the production of a suitable coke for use in low-shaft furnaces seemed possible. The possibility of using this coke for the reduction of the iron ores in Salem is being examined by a committee appointed by the Government of India. Subsidiary industries can make use of the tar products for hydrogeneration purposes to produce various insecticides and other chemicals, and also synthetic liquid fuels. The by-products of the briquetting and carbonising plant are carbolic acid, cresols, xylenols, fuel oils and char dust. The carbolic acid and the phenols can be used for making plastics and coal chemicals. The char dust resulting from carbonisation can be used in the calcium carbide industry and for the production of activated carbon, carbon electrodes, carbon bricks, heat exchangers, etcetera. The tar also can be used for making carbon for electrodes. These products in conjunction with the increased quantities of power in the State would assist materially in the development of electro-chemical industries.

Experiments in Karaikudi have indicated that carbide can be used for the manufacture of plastics, card boards, and also in the plywood industry. The employment of the Fischer-Tropsch process for the production of synthetic fuels is also a possibility. The montan wax that can be extracted as a by-product can be used in explosives and for insulation in electrical equipment and in conjunction with the production of ceramics, the manufacture of various electrical fittings involving the use of ceramic ware can be set up. A cement factory can also be set up to use some of the by-products.

LEONARD SYMBOLISES PERPETUAL SPRING TIME

A Rapid Rise in Lamp Production

Not Enough Attention Being Paid to Quality Standards

LIGHT consciousness provides the barometer of progress in any society. The various kinds of light sources and their specialised application in the different departments of human activity confirm, without any shadow of doubt, the important rôle which light plays today. The modern housewife is no longer prepared to suffer from insufficient light even in the kitchen. Equally conscious are our modern industrial employers. Provision must be made for proper lighting in their plants to help workers maintain their efficiency and a high rate of productivity. The shopkeepers are fast switching over to better lighting in their shops to attract more customers. And in the field of art and culture, light is given much better attention than in the past.

This light-consciousness to spread, there must be more generation of electricity in the country. The Planning Commission is of the opinion that power production in India should be doubled every five years in order to sustain the present rate of economic growth. The installed capacity in India registered a rise from 2.3 million kW in 1950-51 to 3.4 million kW in 1955-56. As against the second plan target of 6.9 million kW, the third plan stipulates a target of 13.4 million kW

By

P. C. VINK,

Chairman and Managing Director, Philips India Ltd

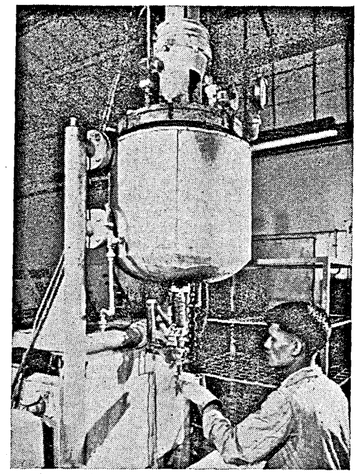
of installed capacity. The actual output by 1966 will be about 12.7 million kW. Due to foreign exchange difficulties, the actual capacity at the end of the second plan is expected to be 5.8 million kW. Rural electrification schemes are, however, being so geared as to bring 15,000 more villages under electricity during the third plan period. By the end of the second plan period, some 17,000 villages have been electrified. No longer is electricity an exclusive prerogative of urban areas. Electricity is being brought within the easy reach of villages, and villagers are taking more to electricity instead of burning kerosene lamps. This progressive rise in the distribution of electricity on a national basis has been contributing to a corresponding rise in the use of light sources all over the country, which explains the increasing popularity of lamps.

General Lighting Service Lamps

A beginning was made in 1932 when a manufacturing unit in the neighbourhood of Calcutta commenced the production of general lighting service lamps, popularly known as G.L.S. lamps. A number of other units came into existence during the next 15 years. But the industry did not see real progress until after the years following the second World War. With the policy of rapid industrialisation adopted after independence, economic independence in as many branches of production as possible became the goal, and a programme of local manufacture was launched. A phased programme for the generation and distribution of electric energy was also initiated.

Against the background of this economic activity in the country, the Indian lamp industry reached the "take-off" stage and showed symptoms of genuine prosperity. In 1946, as many as nine manufacturing units produced 8 million lamps including candle, pigmy, reinforced construction and coloured lamps against an aggregate annual capacity of 13 million lamps. During the following four years, this capacity registered a rise to 23 million numbers and the actual production rose to 14.4 million numbers in 1950. The progress of the Indian lamp industry is well reflected in the figures given in the following table, covering the period 1951-1960 :

Year	Actual number produced (in million)
1951	15.51



Filling the ballasts with polyester compound

Year	Actual number produced (in million)
1953	19.66
1954	22.86
1955	23.59
1956	29.84
1957	32.03
1958	29.44
1959	33.67
1960	39.79

Demand Estimates

The Planning Commission estimated a market demand for 16 million numbers of G.L.S. and other special lamps in the country in 1950-51. Production of these lamps went up to 25 million in 1955-56. By the end of the first plan period, there were ten manufacturing units and the total re-assessed capacity stood at 43.13 million numbers. The Development Council for Light Electrical Industries stipulated an estimated demand for 45 million G.L.S. lamps at the end of the second plan period. This included 5 million of coloured and other decorative lamps. The Planning Commission revised this estimated demand and put it at 50 million, all inclusive. Taking into consideration the trends of production during recent years, the demand for general lighting service lamps will be rather difficult for the Indian lamp industry to meet. The shortage of lamps is already acute. This has resulted in an interaction of the normal economic laws of demand and supply leading to a rather undesirable phenomenon : rise in prices, even rackets.

The increasing tempo in the industrial activity in India will be further stimulated under the impact of third plan projects and the extension of electrification schemes. The annual *per capita* consumption of electric energy which stood at 14 kWH in 1950-51, rose to 25 kWH at the end of the first plan and it is expected to rise to 50 kWH and 84 kWH by the end of second and third plan periods, respectively. The Development Council has recommended a production target for G.L.S. and other lamps at 68 million by the end of the third plan. In addition to this, another 10 percent extra has been stipulated for export purpose. In the event of the realisation of the target for the generation of electricity towards the end of the third plan, it will not be unreasonable to say that the demand level of 75 million G.L.S. lamps stipulated by the Development Council during the corresponding period will be exceeded by at least 10 percent. This estimated rise in the demand for G.L.S. lamps will be borne out by other factors as well. The general rise in the national as well as the *per capita* income, in India's population, in the general standard of living of the people and many other factors are definitely going to reflect on the market demand for this most common utility consumer good. All these factors will raise the demand for G.L.S. lamps further by 1965-66. It may be argued here that a rise in the production of fluorescent lamps would tend to reduce the demand for G.L.S. lamps. But experience in Europe and other advanced countries has shown that in a developing economy, the production of one is complementary to that of the other.

Fluorescent Lamps

Fluorescent lighting marks the beginning of a new chapter in the history of development of light sources. Belonging to the family of gas-discharge lamps, this new light source made its *debût* in the U.S. market in 1938. Comparatively a newcomer in the field of lighting techniques, fluorescent lamps did not find any place in the first five year plan. In 1952, a Calcutta firm commenced their production for the first time in this country. Starting with a capacity of 400,000 tubes a year, this manufacturing unit increased its production capacity to 800,000 tubes a year in 1955 on a single-shift basis in line with the rising demand for fluorescent lamps. The aesthetic as well as utilitarian value in lighting seems to have been combined in this new light source. These "beautility" goods have won their way into practically all spheres of human activity—homes, offices, factories, roads, shipyards, railway platforms, etcetera. Long stretches of roads in Calcutta, Bombay, Madras and Delhi wear a fascinating look at nightfall. Experiments are now going on to introduce this form of lighting in newer fields. In Calcutta, a number of tram cars are already equipped with fluorescent lighting.

Increase in Sales

The demand for these lamps rose steadily during 1955-56 to 1 million numbers, representing approximately 4 percent of the demand for G.L.S. incandescent lamps in the corresponding period. The Planning Commission estimated a demand for 2 million numbers of fluorescent lamps for 1960-61. During the latter half of 1957, a total ban was imposed on the import of fluorescent lamps. Local production amounted to 1 million by 1957-58. As the situation stands today, the country's overall demand for fluorescent lamps has already outpaced the rate of production. In view of the popularity already enjoyed by fluorescent lamps, the Development Council has estimated a demand for 6 million pieces towards the end of the third plan period. A number of auxiliary articles like ballast, glow starters, lamp and starter holders, louvres and fittings are now being made in the country, but it is a pity that even though their output has tended to cut out imports almost completely, the quality factor is not paid the attention it deserves. There is a glut of sub-standard material in the market. Time is ripe now for these industries to realise the importance of quality and adhere to the standards laid down by the Indian Standards Institution, in their process of manufacture. Special mention must be made of polyester ballast, the use of which marks an important step forward in the field of fluorescent lighting. These are being made for the first time in India by a Calcutta firm. With this new method, it has become possible to reduce the size of the ballast and thus have a far-reaching effect on the design of fluorescent fittings. As far as the manufacture of these accessories and fittings is concerned, the industry has reached the stage of self-sufficiency which has created a corresponding increase in employment opportunities.

Until 1953, there was hardly any manufacturing unit which produced miniature lamps on an organised scale. The manufacture of motor-vehicle and torch lamps was undertaken in that year. Radio panel lamps were also gradually taken up. The installed capacity of the six manufacturing units for the production of miniature lamps towards the end of 1955 was put at 11.2 million numbers. The actual production during that period was only 1.72 million numbers. The country's annual requirement of miniature lamps by the end of the first plan stood at 24 million pieces. The total demand by the end of 1960-61 was estimated by the Planning Commission at 30 million numbers. In spite of a tremendous progress made by the industry in the meanwhile, the demand cannot, however, be met in full. A certain amount of imports is, therefore, called for. It is expected that by the end of the third plan period, the total demand for miniature lamps will reach the level of 45 million numbers.

Raw Materials

The Indian lamp industry at the beginning of the first plan was completely dependent upon imports for its raw materials and components. The situation improved rapidly over the past few years, and today, a number of items like brass caps, glass tubes and shells are being made in the country. Other items of manufacture which will be taken up shortly are glow switches for starters for fluorescent lamps, burners for gaseous discharge lamps. It will be interesting to note that the production of molybdenum wire and tungsten wire for electric lamps, hitherto imported, will also be undertaken in a new factory in Maharashtra State with the technical collaboration of N. V. Philips Gloeilampenfabrieken, Holland. With this factory going into production, the Indian lamp industry will achieve near self-sufficiency in indigenous contents.

It must, however, be borne in mind that the Indian lamp industry must continue to maintain and, if possible, to improve quality standards. The lure for a compromise on the question of quality, particularly in a sellers' market, is difficult to resist. But it is dangerous to slacken the grip over quality control, particularly at a time when the Indian lamp industry is called upon to set aside a quota for the export market. Here is an opportunity to show that the Indian lamps are as good as those from other countries. Some years ago, it was impossible to convince a customer that lamps made in the country were in no way inferior to those imported. This outlook has since changed due to the attention which the organised sector of the Indian lamp industry in particular has been paying to the question of quality. This quality-consciousness must be maintained at all costs if the industry has to make further progress. Let the industry, however, not take the blame which at times is levelled against lamps for their shorter life. It should be known by the consumers that the reasons for shorter life are not so much the lack of quality-consciousness on the part of the manufacturing units as factors like erratic voltage fluctuations in power supplies in some areas of the country.

New Light Sources

The Indian lamp industry, to be able to retain its progressive outlook, must include in its regular production programme, the manufacture of various lamps in the gas-discharge family. In street and various kinds of outdoor lighting, these lamps have proved their merit and must, therefore, be made locally. Other items like photoflux lamps should also be taken up for local manufacture.

Notwithstanding the above progress, the following statistics showing the *per capita* consumption of electric lamps, will prove that the Indian lamp industry has a tremendous potential in the years to come :

Europe ...	...	2.3 pieces
U.S.A. ...	...	6.0 „
U.K. ...	...	4.0 „
Scandinavian countries		3.5 „
India ...	...	0.09 pieces (i.e., one lamp for every 12 persons)

Vast areas are still to be brought under electricity coverage. Users by and large are yet to realise the importance of higher wattage of lamps, different kinds of specialised lamps and fittings. With more and more knowledge of the various aspects of lighting and light sources, a better understanding will prevail with the users in general.

WATCHES FROM THE H.M.T. PROJECT EXPECTED SOON

Phased Programme Prepared for Maximum Indigenous Contents

By
A SPECIAL CORRESPONDENT

INDIA'S first ever watch project came into being early this year in Bangalore. It is heartening to note that it is being set up as a subsidiary to the State-owned Hindustan Machine Tools factory there, which on account of its excellent progress, has come to be known as "the jewel in the public sector of India". The association of the watch project with Hindustan Machine Tools heralds, therefore, the success that will be achieved in the not-too-distant future.

India has been importing watches and other time gadgets like wall-clocks, table-clocks, etcetera. As far as watches are concerned, her imports have been about 2 million units a year. One cannot ignore the other source of acquiring these items. Besides the smugglers' market, there is what can be termed as the "friends' courtesies". It can safely be said that quite a large number of watches find their way into this country through visiting foreigners or friends. The total amount of foreign exchange which would be spent on this particular item could, therefore, be placed easily at an astounding figure of about Rs. 10 crores or Rs. 15 crores.

Mr. Manubhai Shah laying the foundation-stone of India's first watch project

Japanese Collaboration

After a careful study of market conditions and India's requirements, the Government of India entered into a technical collaboration agreement with the leading Japanese firm of Messrs Citizen Watch Company of Tokyo for manufacturing wrist watches here. The task of implementing the project was assigned to Hindustan Machine Tools. The main reason for associating the country's first watch plant with Hindustan Machine Tools is the largest concentration of skilled manpower and management that the Bangalore factory has in comparison with other industries in the country. Tool-room facilities and skilled workmanship with a high degree of precision which Hindustan Machine Tools has, will further enable the watch project to have a quick start. According to a recent announcement by the Central Industries Minister, the first series of watches are expected to be in the market by July-August this year.

During August last year, an Indian delegation led by the managing director of the Hindustan Machine Tools, Mr. M. K. Mathulla, visited Japan to finalise details concerning the implementation of the project. The former made a first-hand study of the watch industry in Japan and fixed up details about the implementation of the project in consultation with the Japanese firm.

Watch Making in Japan

Although the art of watch making was known to the Japanese as early as the seventeenth century, it was towards the end of the nineteenth century that watch making actually became a modern industry. Production of pendulum wall-clocks began 90 years ago, and Japan took to wrist watch manufacture in 1895. In 1937, the industry was able to produce over 5 million watches and clocks, about one-third of which were exported. During the war as well as the postwar period (mainly as a result of wartime devastations), the Japanese watch industry had to suffer a setback, so production declined considerably. With concerted efforts, the industry saw its way through with other industries, and Japan regained its level of production in watches in 1954. In 1959 alone, the output of the Japanese watch industry rose to an all-time peak of more than 9 million units—5 million wrist watches; 50,000 pocket watches; 2.5 million alarm clocks; more than 500,000 million table-clocks; 1 million wall-clocks; and 3,000 electric clocks, timers and time switches.

Today, there are more than 40 watch and clock manufacturing companies in Japan. Of them, four are watch makers, namely, Citizens, Seiko and Orient of Tokyo, and Tacano of Jagoya. The rest are clock makers located in the Tokyo and Nagoya areas. Production of wrist watches and pocket watches came to 5 million units last year. In the production of wrist watches, priority was given to five-jewelled watches for ladies and ten or 15-jewelled watches for gents. The movements have been tropicalised and are, therefore, best suited to Indian conditions of manufacture. Seventeen jewels are usually being used for watches. But the recent trend is for more jewels—21 to 23. These watches are shock-proof and resistant, rust-proof, and are equipped with unbreakable mainspring and steel escapement. New and popular devices such as calendar, automatic, and alarm watches are also being manufactured. Not as popular, but highly accurate, pocket watches are available in the 19-jewelled category.

The H.M.T. Watch Project

The Hindustan Machine Tools, which has now entered into a technical collaboration agreement with Messrs Citizen Watch Company of Tokyo, proposes to set up a unit with a production capacity of 360,000 watches a year. Watches to be produced in the first instance will be (1) of gents and (2) ladies—both models incorporating the latest improvements and fashions in watch manufacture. The selling price, although not finally fixed, is expected to be below Rs. 100 a piece.

Five Japanese experts, who have recently returned home, were in Bangalore to finalise details like the lay-out of the factory building, recruitment of suitable Indian personnel for training in Japan, etcetera. According to present plans, about 100 Indian technicians will be trained in Japan for a period of about one-and-a-half years. The construction of the factory building with power and water supply connections will take some time, and although actual production may start by the end of 1962, it is expected that the first series of watches assembled from imported components will be out in the market very soon.

Phased Programme

The programme for the H.M.T. watch project has been phased in such a way that the indigenous contents of watches manufactured in the Bangalore factory will rise from 54 percent in the first year to 60 percent in the second, 72 percent in the third, and 84 percent in the fourth. After the fourth year, it is presumed that India will have to import some parts from Japan. Besides the suitability of manufacturing conditions, the Japanese collaboration in building the watch industry is considered more advantageous in view of the unique nature of the Japanese watch plants. Unlike in European countries, where watch making is developed as a specialised cottage industry, Japan has adapted improved techniques for mass production. The Citizen Watch Company with which H.M.T. is collaborating, turns out about 8,000 watches a day.

Although the Bangalore factory is equipped to attain a production capacity of 360,000 watches a year, it is expected that with the traditions Hindustan Machine Tools has set up in the matter of progress in production, the Bangalore plant will go a long way in delivering the much-needed watches which were once regarded as luxury, but now considered a vital necessity.

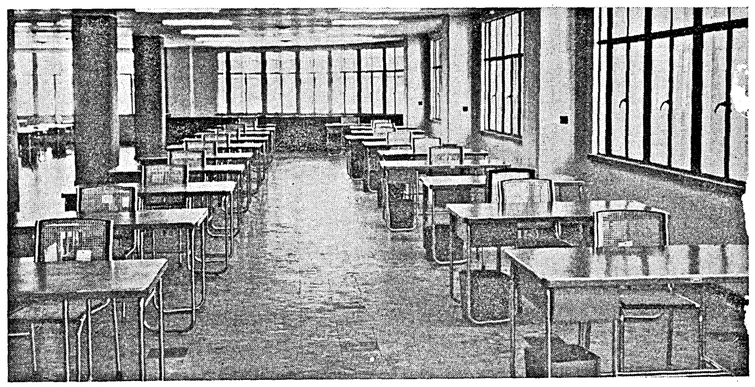
THE GROWING POPULARITY OF STEEL FURNITURE AS OFFICE EQUIPMENT

INDIAN INDUSTRY HAMPERED BY RAW MATERIAL SHORTAGE



An ultra-modern office equipped with stream-lined steel equipment

FROM A CORRESPONDENT

WITH the expansion in the uses of steel in India in recent years, new and new products made of this metal are being put on the market. In keeping with this trend, a wide and varied range of steel furniture for offices and institutions has been manufactured in this country. It is now a growing branch of the overall secondary processing industry. The future development of the steel furniture industry is likely to be helped considerably by the three new steel plants, which have now been commissioned. The immediate problem, however, is to ensure an adequate supply of steel to the existing steel furniture manufacturers to use their capacity fully so that the growing demand for their products can be met. The steel furniture fabricating industry was developed in India in the 'thirties. It has been steadily growing since then. There are over a score of factories engaged in furniture manufacture.

Increase in Office Efficiency

Steel furniture can be said to have improved working standards in offices. It has now been proved that a more comfortable posture while working, and arrangements to facilitate the prompt availability of everything needed even at an ordinary clerical level, result in a greater output of work in an eight-hour day. The modern steel furniture has been scientifically designed to give the busy office worker every facility he needs to make the most of his time and talent: chairs give exactly the right support and enable free movement at the desk with the minimum of fatigue; tables, made in different models for executives, subordinates and typists, have the writing and storage space so planned that everything is within easy reach and the moving parts slide at a touch.

Speed and accuracy are the two qualities of cardinal importance in business today. The present-day filing system with ingenious mechanical devices makes reference easy and quick, of letters, of large-scale maps and drawings. Filing cabinets with an automatic locking device provide the necessary protection for the preservation of records. A new easy method rationalises filing by radical improvement; files are no more just heaped in the drawer, but each file is suspended in its folder on a pair of horizontal bars. The titles of all the files are marshalled before one in a neat array of specially designed celluloid tabs. At a glance, one can pick out what one required. Special folders for easy filing are also now being designed and made in India by the manufacturers of steel equipment.

Aid to Business Management

One of the secrets of good business management lies in quickly reaching a particular set of facts and acting promptly on them. Each day an executive or a subordinate must have at his fingertips the facts which need attention. He should know which cases demand priority, require reminders, follow-ups, etcetera. To sort out these daily from the innumerable documents and records is a time and energy-consuming process. A time-pressed worker needs a record system which not only gives a graphic view of the facts, but also signals where and when attention is required. The best possible answer to these requirements, to date, is the visible-index cabinet, which offers a fluent indexing system by which records are kept on cards, while colour signals spotlight what things are in stock or needed, whether production is ahead of or behind schedule, sales are increasing or decreasing, where to intensify advertising, which department requires more personnel, who owes you and how much, and so on. That this refinement of efficiency is not neglected even in India where manpower is proverbially cheap has been demonstrated by a number of firms investing in modern filing equipment, and systems.

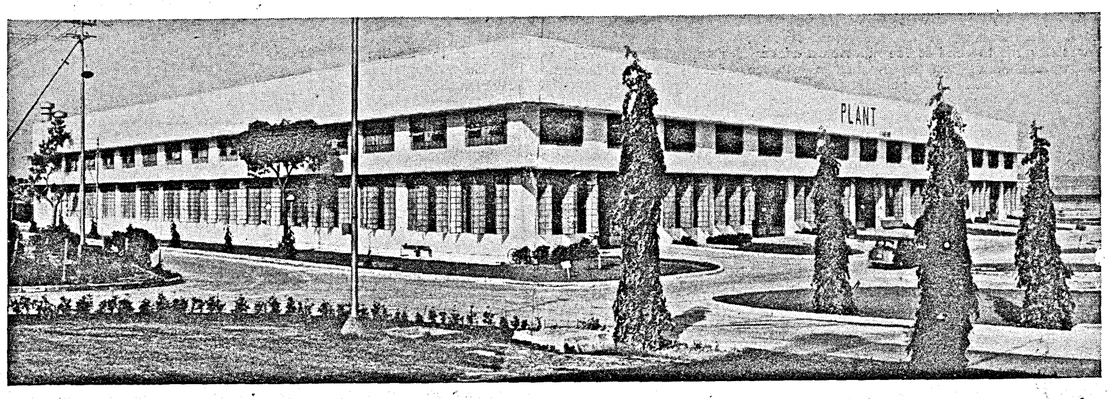
Typewriter Manufacture

Typewriter manufacture in India is an infant industry, and has made satisfactory progress. The manufacture of typewriter has been compared, for the precision required, with the making of telephones and watches. The latter are yet to be made in India. This need for precision has created certain peculiar manufacturing problems but with the fast developing know-how of the industry, these difficulties will not prove insurmountable. Not only are more and more technicians being trained for manufacture, but the indispensable and prompt service after sales is provided at very reasonable rates. The successful manufacture of typewriters in India has brought prices down to a level where they compare well with those of imported machines. This will no doubt cause demand to grow. This in turn will give greater support to a host of ancillary industries such as the manufacture of ribbons and carbon paper, erasers and ink eradicators, typists' chairs and tables.

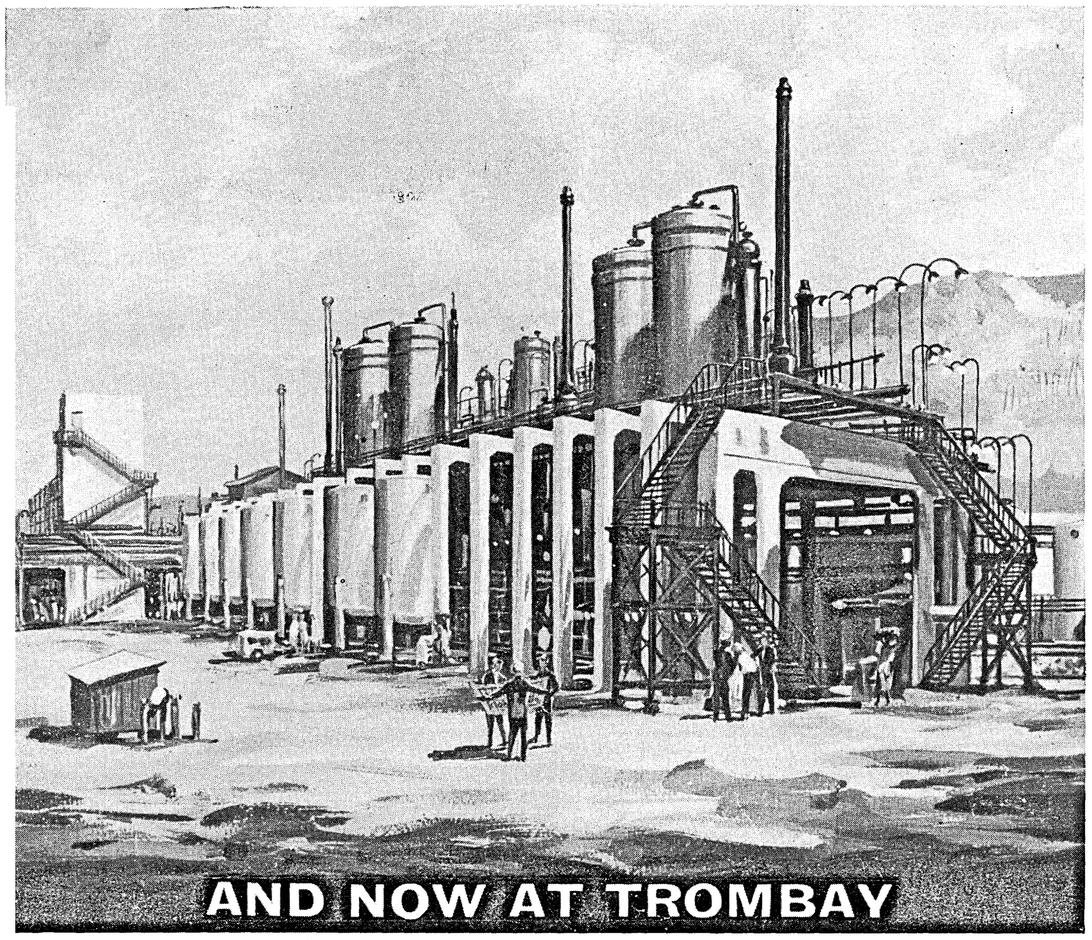
Steel has many advantages over wood; it withstands fire; wood feeds it. White ants, cockroaches and other insects are second to fire in their destructive operations. They thrive on wood: steel is anathema to them. Perishable possessions can be sealed against theft inside a steel cupboard or filing cabinet, fitted with good reliable locks. Wood; even the so-called seasoned wood, swells and contracts due to the fleeting changes of climate. Well-fitting steel doors and shutters work smoothly round the year. Mechanical devices like slides, ball-bearings and pivots cannot be incorporated in wood. Wood is subject to damage and decay; which steel is not.

Export Prospects

The steel furniture industry has a market not only at home, but also abroad. It has established a foothold in east and west Africa, Burma, Ceylon, Saudi Arabia and other countries. There are possibilities of exporting steel furniture in bigger quantities to these as well as to other countries. But a persistent shortage of steel has been impeding production.



An extensive, well laid-out factory, specially designed and equipped for typewriter manufacture



During the quarter century and more of Union Carbide India's operations, the Company's rapid progress has been stimulated by a spirit of enterprise which has constantly sought new fields of industry, new areas of endeavour.

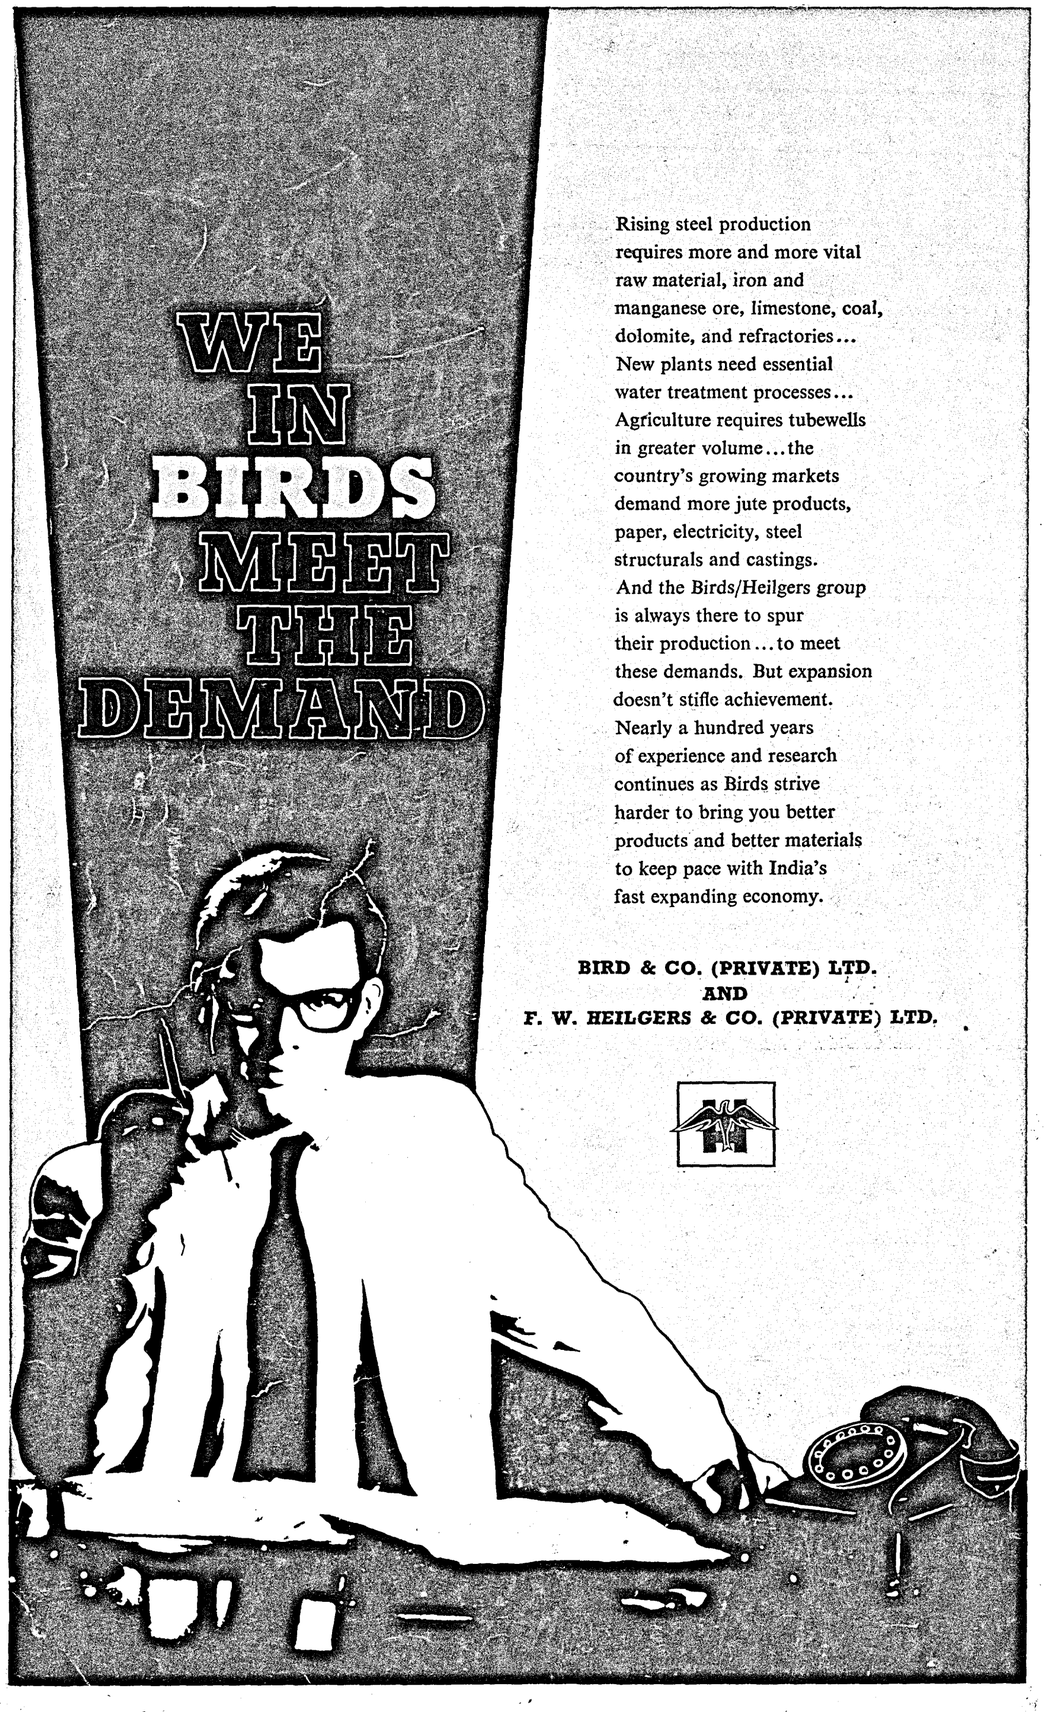
And now that spirit of enterprise finds its latest expression at Trombay Island, Bombay where Union Carbide India's new chemicals and polyethylene plant was recently inaugurated.

Built at a cost of Rs. 4.5 crores, the Trombay plant of Union Carbide India will produce nearly 15 million pounds of chemicals and polyethylene worth Rs. 2.5 crores annually. It will help save Rs. 2 crores in foreign exchange every year by manufacturing products which, until now, have been largely imported. The Trombay plant will be yet another contribution from Union Carbide towards the rapid industrialisation of India.

UNION CARBIDE

UNION CARBIDE INDIA LIMITED

JWTUC 210(A)R



Rising steel production requires more and more vital raw material, iron and manganese ore, limestone, coal, dolomite, and refractories... New plants need essential water treatment processes... Agriculture requires tubewells in greater volume... the country's growing markets demand more jute products, paper, electricity, steel structurals and castings. And the Birds/Heilgers group is always there to spur their production... to meet these demands. But expansion doesn't stifle achievement. Nearly a hundred years of experience and research continues as Birds strive harder to bring you better products and better materials to keep pace with India's fast expanding economy.
