(a) = Absolute figures, (b) = Proportionate figures

## NOTE:

- Minor groups which have a minimum of 1,000 workers of both sexes in the State have been given in the table.
- The Indian Standard Industrial Classification giving description of divisions, major groups and minor groups has been reproduced as Appendix X.1.

STATEMENT X.87-*contd.*

Proportions of workers of each sex to total of all workers (per 10,000 of all workers)  
in the industrial divisions, major groups and minor groups, 1961

| Branch of Industry<br>1 |     |  | Total workers |         | At Household Industry |         | In Non-household Industry, trade, business, etc. |         |

## NOTE:

- Occupational groups having less than 5 per cent of the workers of the respective division and 2.5 per cent in case of Division 7-8 have not been given in this table.
- The National Classification of Occupations giving description of divisions, groups and families has been reproduced as Appendix X.2

## STATEMENT X.93-contd.

Proportions of migrant workers of each sex to total of all migrant workers (per 10,000 of all migrant workers) in occupational divisions and groups in six cities, 1961

| Workers by Occupational Division and Group | Males      | Females | Workers by Occupational Division and Group | Males     | Females |

## CHAPTER XI

### THE NON-WORKING POPULATION

#### SECTION I

##### INTRODUCTORY

1. This Chapter is complementary to the one which it follows. While the preceding Chapter deals with the various aspects of the economic activity of the people of the State, the present Chapter deals with the types of activity of non-workers. As already referred to before, this is the first occasion when a natural basis of classification has been introduced, namely, the basis of work in preference to the classification by means of livelihood or by means of occupation in vogue at the preceding censuses. In any attempt to gauge the nature and extent of economic activity or otherwise of the people, it is not the means of livelihood which is important and significant, but work or non-work of a productive nature, which keeps a person gainfully employed and gives a correct picture of man-power resources and their utilisation so very essential for planning economic development and thereby estimate the reserves which are lying idle and need to be productively utilised. Commenting on this aspect of the census returns, L. J. Sedgwick remarked as under in 1921.

“While it is certainly desirable to know how many actual workers there are, and how many non-workers, out of the total population, the advantage of knowing which occupations support more and which less of the non-workers is dubious.”<sup>1</sup>

2. It is in the background of this concept of economic activity that the population of the country has been classified into workers and non-workers for the first time during the Census of 1961. It is also for the first time that the non-working population of the State and the country has been classified into 8 categories, which will help analyse the possibility of utilising the vast

man-power resources and the various measures to be taken to put an end to unemployment or underemployment, which is the aim of the successive Five Year Plans to remove. In order to properly appreciate the existing bulk of non-working population, it is very necessary to understand the census concept of work, which is the basis of the returns tabulated in the various tables comprising the economic series. Work does not mean full-time work as distinguished from part-time work, neither does it signify permanent employment in contrast with seasonal employment. For census purposes “the basis of work will be satisfied in the case of seasonal work like cultivation, livestock, dairying, household industry, etc., if the person has had some regular work of more than one hour a day throughout the greater part of the working season. In the case of regular employment in any trade, profession, service, business or commerce, the basis of work will be satisfied if the person was employed during any of the fifteen days preceding the day on which you visited the household”. It was further clarified that “work includes not only actual work but effective supervision and direction of work”. These instructions to the enumerator have been repeated in this Chapter to underline the fact that among the workers there will be many who are seasonally without work as also those who are unemployed for the greater part of the day or underemployed continuously by not having full-time work during the period of employment. It may not be possible to take account of all these varied aspects of underemployment. To that extent the relevant sections of the non-working population may not present a true picture of unemployment or

1. Census of India, 1921, Vol. VIII, Bombay Presidency, Part I, *General Report*, p.206

underemployment. There is another reservation which is also to be borne in mind, particularly in respect of children and women returned as non-workers. For, it is by no means certain that all full-time students or children attending schools, housewives or persons attending to household duties, dependents or any of the remaining five categories of non-working population, have been completely accounted for in Table B.IX because of the rather generous definition of what constitutes 'work' and the marginal cases such a definition creates. It is very likely that a number of them who are doing some productive work, even though part-time, or assisting in the family industry or cultivation, who are classified as workers, would not appear under some of the categories as non-workers.

#### QUESTIONS AND INSTRUCTIONS

3. The activity of non-working population has also been classified into 8 categories for the first time on the present occasion. The following were the questions and instructions to the enumerator for recording the status of various categories of non-workers.

#### "Q 12 Activity, if Not Working"

This question will apply to a person NOT working.

Write 'X' in this question for a person who is working, that is for whom you have recorded the work in any of the Qs. 8 to 11 above.

The following activities should be recorded in the case of persons NOT working:

- 1 For a full-time student or child attending school who does no other work, such as make articles at home for sale, nor even help part-time in his own family cultivation, industry, trade or business
- 2 For a person engaged in unpaid home duties (like housewife or other adult female) who does no other work, such as make articles at home for sale or wages, nor help regularly even part-time in family cultivation, industry, trade or business

- 3 For any dependent, including an infant or child not attending school, a person permanently disabled from work because of illness or old age **Write D**
- 4 For a retired person who is not employed again, rentier, person living on agricultural or non-agricultural royalty, rent or dividend or any other person of independent means for securing which he does not have to work and who does no other work **Write R**
- 5 For a beggar, vagrant or independent woman without indication of source of income and others of unspecified source of existence **Write B**
- 6 For a convict in jail (an under-trial prisoner will be shown as a worker if he used to work before he was apprehended) or an inmate of a penal, mental or charitable institution **Write I**
- 7 For a person who has not been employed before but is seeking employment for the first time **Write NE**
- 8 For a person employed before but now out of employment and seeking employment **Write UN**

**Explanation**—If a person, who does not work, cannot be readily classified in any of the above categories, put him in category 5 and write B in this question. A retired person who has taken up regular work again should not be entered in this question as he would have been entered for his new work in Qs. 8 to 11.

A person who is not working but has been offered work which he has not joined should be included in item 3 and 'D' should be written. He should not be included in items 7 or 8."

#### REFERENCE TO STATISTICS

4. The following are the tables concerned with the non-working population:

union Primary Census Abstract

Table B-I Workers and Non-workers Classified by Sex and Broad Age-groups

Table B-II Workers and Non-workers in Cities, Town-groups and Towns arranged Territorially Classified by Sex and Broad Age-groups

Table B-III Part-A Industrial Classification of Workers and Non-workers by Educational Levels in Urban Areas only

Table B-III Part-B Industrial Classification of Workers and Non-workers by Educational Levels in Rural Areas only

Table B-VIII Part-A Persons unemployed aged 15 and above by Sex, Broad Age-groups and Educational Levels in Urban Areas only

Table B-VIII Part-B Persons unemployed aged 15 and above by Sex and Educational Levels in Rural Areas only

Table B-IX Persons not at Work Classified by Sex, Broad Age-groups and Type of Activity

Table C-VIII Scheduled Castes and Scheduled Tribes:

Part-A Classification by Literacy and Industrial Category of Workers and Non-workers among Scheduled Castes

Part-B Classification by Literacy and Industrial Category of Workers and Non-workers among Scheduled Tribes

Table D-VI Distribution of Industrial Categories of Workers and Non-workers by Place of Birth

Table SCT-I Part-A Industrial Classification of Persons at Work and Non-workers by Sex for Scheduled Castes

Table SCT-I Part-B Industrial Classification of Persons at Work and Non-workers by Sex for Scheduled Tribes

Table SC-I Persons not at Work Classified by Sex, Type of Activity and Educational Levels for Scheduled Castes

Table ST-II Persons not at Work Classified by Sex and Type of Activity for Scheduled Tribes

The above statistical data have been further supplemented by the subsidiary tables listed below:

B-I.1 Distribution of 1,000 Persons by each Industrial Category of Worker and by Non-worker and by Sex

B-III Part-A.3 Distribution of 1,000 Persons not at Work by Educational Levels in Urban Areas only

B-III Part-B.2 Distribution of 1,000 Persons not at Work by Educational Levels in Rural Areas only

B-VIII Part-A.1 Distribution of 1,000 Males and Females who are Unemployed in each Age-group according to Educational Levels in Urban Areas only

B-VIII Part-B.1 Distribution of 1,000 Males and Females who are Unemployed by Educational Levels in Rural Areas only

B-IX.1 Number per 1,000 of Population aged 15+ and of Population of each Age-group 15-34, 35-59, 60+ and Age Not Stated who are Unemployed, separately for Persons, Males and Females

B-IX.2 Distribution of 1,000 Persons not at Work by Age-groups

B-IX.3 Distribution of 1,000 Persons not at Work by Sex and 1,000 Non-workers of each Sex by Type of Activity

C-VIII Part-A.2 Distribution of 1,000 Persons of All Scheduled Castes by Categories of Workers and Non-workers

C-VIII Part-B.2 Distribution of 1,000 Persons of All Scheduled Tribes by Categories of Workers and Non-workers

## SECTION 2

## NON-WORKERS

## DISTRIBUTION OF WORKERS AND NON-WORKERS

## India and States

5. Statement XI.1 at the end of this Chapter abstracted from Table B-I for India and

principal States, distributes 1,000 of total population of each sex in broad age-groups among workers and non-workers. The entries for all India and Gujarat are, however, reproduced below.

## STATEMENT XI.1

## Distribution of 1,000 of total population of each sex in each age-group among workers and non-workers, India and States, 1961

| India/States | Total Rural Urban | Age-group      | Total population |       | Total workers |     | Total non-workers |     |
|--------------|-------------------|----------------|------------------|-------|---------------|-----|-------------------|-----|
|              |                   |                | M                | F     | M             | F   | M                 | F   |
| 1            | 2                 | 3              | 4                | 5     | 6             | 7   | 8                 | 9   |
| INDIA        | Total             | All ages       | 1,000            | 1,000 | 571           | 280 | 429               | 720 |
|              |                   | 0-14           | 1,000            | 1,000 | 94            | 66  | 906               | 934 |
|              |                   | 15-34          | 1,000            | 1,000 | 881           | 436 | 119               | 564 |

812

The salient feature of the non-working population is a high proportion of female non-workers as compared to males. In every 1,000 of each sex there are in the country as a whole 429 male non-workers as against 720 females. In Gujarat the male ratio is a little higher (465) than the average for the country, the female ratio (721) being practically the same. Among the States, the highest proportion of male non-workers has been returned for Kerala (528) and the lowest for Andhra Pradesh (378) in case of males. But among female non-workers, the ratio is the lowest for Madhya Pradesh (560) and the highest for West Bengal (906). For other States, these ratios fluctuate from one region to another according to the difference in their economic and social conditions as encouraging or discouraging manual labour and the tendency to be employed in productive work on the part of women. Another significant feature of the proportions contained in the foregoing table is the relatively higher ratios of non-workers of both the sexes in towns as compared to villages, where the ratios of non-workers are below the general averages for rural and urban areas. These variations also go to show that the difference in the social life of the people of these two tracts, with diverse economic problems and social status, have a very marked influence on the proportions of workers and non-workers living in these areas. The comparatively higher proportion of female non-workers in towns results from certain distinguishing features of urban life and notions of social superiority, which act as a deterrent to the economic activities of women. These, however, are factors which usually do not operate in case of villages where women offer a helping hand without neglecting either their household work or their children. The most representative age-group where the proportion of non-workers is the least, both in the case of males and females, is 35 to 59 years. But the disparity between male and female ratios is great as revealed by the fact that as against 33 males who are non-workers in every 1,000 in these ages, there are as many as 524 among females. These proportions vary from one age-group to another and follow the same trend both in the total, rural and urban population of the States. The proportions of children non-workers

aged 0-14 are the highest 906 for males and 934 for females in the country as a whole, as against 927 for males and 934 for females in Gujarat. These proportions vary in different States according to the extent to which child labour is in demand. Such a demand is the least in States like Kerala and West Bengal but comparatively greater in Andhra Pradesh, Madhya Pradesh, Mysore, Orissa and Rajasthan.

6. This picture of the non-working population is highlighted still further when rural and urban ratios are compared for the children's age-group which shows very nearly the same variation from one State to another. The position of Kerala and Maharashtra, however, deserves special mention. In Kerala, there is no difference in the proportion of boy non-workers (978) both in the rural as well as urban areas; but that of girl non-workers is slightly higher in urban areas (982) than in rural (980). This also shows that the ratio of boy non-workers are practically the same as girl non-workers in both the areas. In short, the position obtaining in rural areas is the same as in urban areas.

7. The rural areas of Maharashtra are the only areas among all the States where female non-workers in age-group 0-14 are less than male non-workers (894), which also changes the proportion for all the areas of that State slightly. The age-group 15-34 shows a comparatively lesser proportion of non-workers than in the remaining age-groups excepting 35-59, where, as already noticed, the ratio of non-workers is the lowest. The ratio is particularly low for ages 15-34 for males in the rural areas of Madhya Pradesh. The ratios of Gujarat for age-groups 15-34 and 35-59 are significantly low for males of these ages living in rural areas and those for females much below the average of the country, a fact which shows the greater extent to which women in the countryside keep themselves employed in farming operations and field labour. The proportions of those aged 60 and over differ much for different parts of the country, and show the extent to which aged people are required to work for their maintenance. These proportions are, as usual, higher for the urban than for the rural. The strength

of non-workers in this age-group for the State of Gujarat is 291 for males in rural areas as against 491 for males in urban areas, corresponding proportions for females being 800 and 921 compared to 757 and 886 for the country in general. These proportions appear to be markedly low for Andhra Pradesh and other States where the general ratios of non-workers of both the sexes are also low. Thus, the proportions of non-workers in the general population of a State, though influenced by a variety of circumstances are materially affected by the pro-

portions of workers and non-workers among the children and the aged, the ratio being high where these proportions are high and low where these proportions are small.

#### REGIONAL DISTRIBUTION

8. The following table distributes 1,000 of total population of each sex in each age-group among workers and non-workers in the State for total, rural and urban areas. The entire table showing figures for the State and districts has been given at the end of this Chapter.

STATEMENT XI.2

Distribution of 1,000 of total population of each sex in each age-group among workers and non-workers, 1961

| State<br>1 | Total<br>Rural<br>Urban<br>2 | Age-group<br>3 | Total population |        | Total workers |        | Total non-workers |        |

|            | Urban                        | All ages       | 1,000            | 1,000  | 484           | 92     | 516               | 908    |
|            |                              | 0-14           | 1,000            | 1,000  | 21            | 9      | 979               | 991    |
|            |                              | 15-34          | 1,000            | 1,000  | 755           | 136    | 245               | 864    |
|            |                              | 35-59          | 1,000            | 1,000  | 927           | 195    | 73                | 805    |
|            |                              | 60+            | 1,000            | 1,000  | 509           | 79     | 491               | 921    |
|            |                              | Age not stated | 1,000            | 1,000  | 248           | 93     | 752               | 907    |

The main feature of distribution of workers and non-workers shows that there are 535 male workers as against 279 female workers among 1,000 of total population of each sex in the State. Corresponding figures for non-workers

are 465 males and 721 females. The proportions of workers in age-group 0-14 relating to school-going ages are lower for both the sexes than the corresponding proportions of non-workers. In age-groups 15-34, 35-59 and 60+, male

workers are much higher than female, unemployment among males in the age-group 35-59 being the least with only 37 non-workers in every 1,000 males. The extent of female non-participation is the highest (934) at ages 0-14 but reduced to 536 in each of the two next age-groups 15-34 and 35-59.

#### Rural Areas

9. Examination of non-workers in rural areas of the State and the districts discloses interesting results. The rural average for the State comes to 447 males against 659 females among 1,000 non-workers of each sex. The proportions of male non-workers higher than the State average are returned by the districts of Mehsana (476), Ahmedabad (463), Kaira (463), Surat (459), Kutch (455) and Jamnagar (450). The districts of Mehsana, Ahmedabad and Kaira are contiguous areas marked by certain common features as fertility of soil, prosperous peasantry, large size villages and similar social conditions which dis-favour greater participation of women in these areas. The remaining districts fall below the State average which is equalled by Surendranagar. The least number of non-workers, i.e., 412 is reported by the district of the Dangs which is mainly inhabited by tribals. Districts such as Banaskantha, the Panchmahals, Baroda, Broach and the Dangs which are having a sizable population of tribals have also reported non-workers less than the State average.

10. Against the State average of 659, the highest number of non-workers among females is returned by the district of Kaira (828) and the least by the Dangs (497). Among the remaining districts, these proportions exceed the State average in Ahmedabad (764), Baroda (742), Surendranagar (734), Jamnagar (721), Kutch (715), Bhavnagar (687) and Banaskantha (660). This shows that the tendency to avoid productive work by females generally goes with the social status and the economic prosperity enjoyed by certain districts.

#### Ages 0-14

11. In age-group 0-14, there are 910 boy non-workers and 916 girl non-workers. All the districts in Peninsular Gujarat and the backward districts of Banaskantha, the Panchmahals and

the Dangs in Mainland Gujarat have reported proportions of boy non-workers which are less than the rural average for the State. There is thus a distinct pattern of progressive and backward areas where the rate of literacy and the number of school-going children bring about variation in the proportions of boy non-workers. As regards females Kaira district enjoys the distinction of having the highest number of non-workers (972) and the least (865) in the backward district of the Dangs. The districts below the State average are Rajkot (886), Amreli (909), Junagadh (905), Banaskantha (894), Sabarkantha (893), the Panchmahals (833), Broach (905) and the Dangs (865). In the descending order of female non-participation Ahmedabad (953) comes second and Kutch (941) third.

#### Ages 15-34

12. In age-group 15-34 also the highest number of male non-workers is reported by Kaira (126) and the districts of Mehsana (123), Surat (121) and Ahmedabad (90) closely follow. These are all progressive districts. The least number of non-workers is reported by the tribal district of the Dangs (29). The proportion of male non-workers in all the districts of Peninsular Gujarat except Amreli and Kutch ranges between 52 and 57. Among females the State average in this age-group is 417. The highest number of female non-workers in this group is reported again by the district of Kaira (723) followed at a great distance by the districts of Ahmedabad (597) and Baroda (567). In Peninsular Gujarat, the highest proportion of non-workers among females of these ages is reported by the districts of Kutch (534), Surendranagar (511), Jamnagar (486) and Bhavnagar (427). The Panchmahals (182), Surat (298), Broach (335), Sabarkantha (348) and Mehsana (356) in Mainland Gujarat are having female non-workers less than the State average.

#### Ages 35-59

13. The main working age-group 35-59 has 24 male non-workers against 447 females per 1,000 of each sex in the villages of the State. All the districts of Mainland Gujarat except Banaskantha (30), Ahmedabad (28) and Mehsana (25) are having male non-workers below the

State average. But all the districts of Peninsular Gujarat have reported a contrary trend by returning a higher proportion of male non-workers above the State average. Peninsular Gujarat and Mainland Gujarat thus present different patterns of non-workers at ages 35-59. Among females, the districts of Kaira and the Dangs stand apart in having the highest and lowest proportions of female non-workers (700) and (138) respectively in this age-group. The districts that follow are Ahmedabad (613), Baroda (589), Surendranagar (578) and Jamnagar (577). This age-group as well as the preceding one constitutes the main period of active life when maximum number of both the sexes engage themselves in productive work. But the tendency on the part of females to remain unemployed and keep themselves engaged in home making still remains unaltered.

#### Ages 60+

14. The age-group 60+ shows an increasing number of non-workers both for males (291) and females (800). The range of non-workers among males in this age-group varies from 148 for the Dangs to 372 for Surendranagar and from 656 for Surat district to 891 for Jamnagar among females, going down as low as 527 in the district of the Dangs.

#### Urban Areas

15. The number of non-workers both among males and females resident in the towns of the State is higher than that in the rural areas in all the age-groups. This tendency which is general is already noticed earlier in case of States and the country. The least number of non-workers reported among males (73) and females (805) is in the working ages 35-59. The proportions of female non-workers are uniformly high, practically in towns of all the districts and all the age-groups. Thus the urban pattern of distribution of non-workers by sex and broad age-groups is uniform and shows little deviation from one district to another.

#### NON-WORKERS IN CITIES AND DIFFERENT SIZE CLASS OF TOWNS

16. The distribution of non-workers in the rural and urban areas of the State has been examined above. The proportions of non-workers in all the age-groups have been found to be uniformly higher in urban areas as compared to the rural, for both the sexes. We shall now examine the extent of non-workers in broad age-groups for each sex for the 6 cities, 2 town-groups and 6 categories of towns, as given in the subjoined table.

#### STATEMENT XI.3

##### Distribution of 1,000 of total population of each sex in each age-group among workers and non-workers in the State, 1961

| City/Town-group/<br>Class of Towns<br>1 | Age-group<br>2 | Total urban population |              | Total workers |              | Total non-workers |              |

*Males*

17. As is to be expected, females far outnumber males in the total non-working population of each city, town-group and class of towns. The average proportion of non-workers among males for Class I, which contains all the 6 cities, is 503 non-workers as against 497 returned as workers, the corresponding proportions for females being 936 and 64. These figures accentuate the marked difference among the workers and non-workers of both the sexes in the cities of Gujarat. The male average of non-workers in the total population of Class I cities is exceeded by all the cities and town-groups except Ahmedabad City, Ahmedabad town-group and Surat, the last named city having a comparatively smaller proportion of male non-workers (484). If the proportions of workers and non-workers are further examined for these urban areas by broad age-groups, it is noticed that the age-group 0-14 has over 98.6 per cent of its male population returned as non-working. This average is exceeded a little in the case of female non-workers, who account for more than 99 per cent of girls aged 0-14. These figures suggest that economic employment of children living in cities is insignificant and that the little employment that exists is confined to boys. This is what it should be particularly as this age-group relates to school age population. But the next higher group, ages 15-34, registers a sharp decline in the percentage of male non-workers who are reduced to 21.6 per cent for Surat, the highest being 30.6 per cent for Baroda. Veraval town-group has a still lesser percentage of non-workers in this age-group which has 185 male non-workers in every 1,000 aged 15-34. Among other cities, there are slight variations which are likely to result from the variation in the strength of those receiving secondary and higher education as in the cities of Baroda and Bhavnagar. The lower ratios, however, in Ahmedabad, Jamnagar and Surat may be attributed to the greater proportions of those employed in the manufacturing and household industries. The age-group 35-59 shows the least percentage of non-workers, as it is in this group that the major portion of the working population is concentrated. As against 70 non-workers

in every 1,000 persons aged 35-59 in Class I cities, Baroda has 93 and Ahmedabad 60. The slight difference in other cities may be ascribed to the varying extent of employment opportunities offered by each of them. The last age-group 60 and over shows that the average of non-workers of these ages in Class I (536) is exceeded by Jamnagar, Rajkot, Bhavnagar and Baroda, but the ratios are particularly low in Veraval town-group (358) and Surat City (491) revealing the extent of availability of work to much older section of the population as also the relative extent to which the males at these ages are required to keep themselves productively employed.

18. An analysis of non-working males in the various categories of towns shows that the extent of non-working population declines from one class to another in the lower category. Generally speaking, there is a gradual decline from the lower to higher age-groups except in the age-group 60+. This tendency is noticeable particularly in case of towns falling under Classes II and V as well as in respect of working age-groups 15-59. But on the whole the percentages show a downward trend from one age-group to another, and the proportion of workers rises as the extent of urbanisation decreases. As in the case of cities so in the case of various classes of towns, the most important group, where economic activity covers most of the working population is age-group 35-59, where the ratio of male non-workers ranges between 70 for Class I and 84 for Class II. The variation also for age-group 60 and over is noteworthy in that male non-workers of these ages account for 536 in Class I as against 360 in Class VI. This may as well suggest that highly industrialised and urbanised areas offer comparatively smaller scope for old age employment than in towns which are relatively less urbanised and, therefore, have lesser unemployed even among the older section of males.

*Females*

19. In the general population of cities, the proportion of female non-workers is the lowest in the total population as well as in the various age-groups for the city of Surat and the highest for Ahmedabad. Even amongst the females of

working ages, the proportion of non-workers does not fall below 81 per cent in any of the 6 cities though it comes down to 79.4 per cent for Veraval town-group in case of women aged 35-59 and is again the lowest for that town-group for females aged 60 and over. In much younger age-groups the proportion of non-workers in all the cities is over 99 per cent and varies between 92.8 and 94.9 for those aged 60 and over. The same pattern of distribution of female non-workers is also noticeable in case of different categories of towns, which have one uniformity that the ratios for all ages as well as for different age-groups register a continuous decline from higher to lower age-groups evidencing a relatively lower proportion of non-working females in towns less urbanised. Another point worthy of note in case of female non-workers is the influence of marital status. Most of the females over 15 and below 20 get married. The responsibilities that they have to shoulder after marriage in looking after the household prevent women from taking up any work outside their home. This tendency is relatively more marked in towns than in villages, where the occupation of cultivation favours the helping hand of the weaker sex of all ages to a varying extent.

*NON-WORKERS BY EDUCATIONAL LEVEL**Urban Areas*

20. The extent of literacy and illiteracy among non-workers can be gauged from Statement XI.4 at the end of this Chapter giving distribution of 1,000 non-workers of each sex among the different educational levels for each city of population 100,000 and above and for urban areas of districts.

Going through the above table it is noticed that illiteracy among female non-workers is greater than among males, but city areas show it to a much lesser extent in case of both males and females than other urban areas in the districts. Another feature of these statistics is that the extent of literacy or illiteracy among city and other urban non-workers of either sex varies according to their proportion in the total urban population of the district. Further, among non-workers those who have received secondary or higher education either technical or non-technical are comparatively as well as proportionately

much less than those who are literate without educational levels or those who have passed primary or junior basic.

Among the non-workers who are literate without educational levels, though females outnumber males, their distribution per 1,000 non-workers shows that the male proportion of this category is throughout higher than that of female except in Rajkot, Amreli and Surat districts. There is not any significant variation, however, between the proportions of both the sexes from one district to another, though the city ratios of non-workers who are literate without educational levels are higher than those in the non-city urban areas of Bhavnagar, Baroda and Surat districts. The proportions of non-workers in this category are, however, very low in the urban areas of Rajkot, Broach, and Surat, but noticeably high in those of Kutch, Banaskantha, Sabarkantha and Ahmedabad districts and Baroda City. Among non-workers who have passed the test of primary or junior basic, male proportions are again higher than female, though females are more in numbers than males of this category. City proportions of literate of this category are higher than non-city urban except in Baroda and Surat City, where they fall below those for non-city urban. Taken as a whole, female literacy among non-workers of this category is less in non-city urban areas than in the city. Among higher educational levels, university degree holders far outnumber non-workers having technical degrees. Broadly speaking, these figures indicate that the extent of literacy among non-workers of various educational levels varies according to the average level of literacy in the urban areas of the district, as already noticed in the Chapter on Literacy.

*Rural Areas*

21. Distribution of 1,000 of total population of each sex in each educational level among workers and non-workers in the rural areas of the State and districts is given in the Statement XI.5 at pages 820 and 821.

The total rural population of the State consists of 7,830,222 males and 7,486,504 females. Among males, 4,329,568 are workers and 3,500,654 non-workers. Among females, 2,556,524 are workers and 4,929,980 non-workers. In the

existing state of society where the sphere of activity of women is for the greater part confined to the household, females outnumber males as non-workers even in villages where for 2 males who are unemployed, there are 3 such females. Analysing these figures by literacy and educational levels, it is further noticed that there is greater literacy among male workers than among female. But among the latter, there are proportionately more non-workers who are illiterate than males. The gap between the two widens at each successive higher level of education. This is but natural as literacy and education are regarded as an essential qualification in finding profitable employment for men. Females, however, have comparatively higher proportions of non-workers among those who have passed some educational test or are matriculate. As housewife, their main responsibility being management of the household, the proportion of non-workers among them would naturally be higher. Another noteworthy feature of these statistics is that even in rural areas males who are matriculate enjoy a distinct advantage in the matter of employment, as out of 1,000 in this level of education, as many as 769 are workers and 231 non-workers.

#### Males

22. Examining these statistics by districts, State average of male non-workers in rural areas (447) is exceeded by Jamnagar, Kutch, Sabarkantha, Mehsana, Ahmedabad, Kaira and Surat, comparatively smaller proportions of male non-workers being returned by Banaskantha (418), the Panchmahals (416) and the Dangs (412). The general conclusion which emerges from these proportions is that the proportion of male workers is comparatively higher in the rural areas of backward districts, where the economic condition and the low level of literacy, favour greater employment of children and older people. In all the levels of education the proportion of male workers is found to be higher in every 1,000 of each educational level but comparatively lower (525) among illiterate. The State average of 475 non-workers in every 1,000 who are illiterates among rural males is exceeded by the districts of Rajkot, Surendranagar, Bhavnagar, Amreli, Mehsana, Ahmedabad, Kaira,

Baroda, Broach and Surat. Among literate and educated males, the proportions of non-workers vary from district to district, higher proportions being returned by those areas where potentialities of employment are less or where the greater extent of literacy raises the strength of non-workers by the addition of those attending school, who would otherwise swell the ranks of workers by helping either in the family cultivation or in tending cattle.

#### Females

23. The proportions of female non-workers in every 1,000 of different educational levels are higher than those of workers and do not decrease but increase with each higher level of literacy and education. The State proportion of female non-workers in every 1,000 living in the countryside is exceeded by Jamnagar, Surendranagar, Bhavnagar, Banaskantha and is particularly high in the districts of Kutch, Ahmedabad, Baroda and Kaira, but the proportions of non-workers are the least in the Dangs (497), the Panchmahals (504) and Surat (584), where Adivasi areas receive greater help from their womenfolk than any other areas. In the State as a whole, in every 1,000 female illiterates, 638 are non-workers. The districts which rise above this average are Jamnagar (708), Surendranagar (720), Bhavnagar (675), Kutch (701), Ahmedabad (743), Banaskantha (652), Kaira (809) and Baroda (713). The districts which fall below the State average are Junagadh (596), Sabarkantha (589), the Panchmahals (485), Broach (567), Surat (539) and the Dangs (484), all of which contain large areas inhabited by Scheduled Tribes, again revealing the fact that rural areas which are backward and underdeveloped have higher rate of illiteracy and, therefore, tend to return comparatively higher proportion of workers than those which are developed and economically better situated. Among the educated females who are matriculate and above, the ratio of workers to non-workers is found to be 27.6: 72.4. The varying extent to which educational qualification is availed of for getting employment is noticeable from the relatively lower extent of non-workers and higher extent of workers in Jamnagar, Bhavnagar, Amreli and Mehsana districts as compared to

#### NON-WORKERS BY EDUCATIONAL LEVEL

Rajkot, Surendranagar, Junagadh, Ahmedabad, Kaira and Surat, where education seems to have been received more for the sake of education and to a lesser extent as a means of employment.

24. The following table gives the distribution of 1,000 persons of each sex among workers and non-workers by different educational levels in the rural areas of the State.

#### STATEMENT XI.6

Distribution of 1,000 persons of each sex among workers and non-workers by different educational levels in the rural areas of the State, 1961

| State   | Educational level                    | Total population |         | Total workers |         | Total non-workers |         |
|---------|--------------------------------------|------------------|---------|---------------|---------|-------------------|---------|
|         |                                      | Males            | Females | Males         | Females | Males             | Females |
|         |                                      | 3                | 4       | 5             | 6       | 7                 | 8       |
| 1       | 2                                    | 1,000            | 1,000   | 1,000         | 1,000   | 1,000             | 1,000   |
| GUJARAT | Total                                | 655              | 868     | 621           | 921     | 696               | 840     |
|         | Illiterate                           | 130              | 51      | 146           | 31      | 111               | 61      |
|         | Literate (without educational level) | 208              | 80      | 223           | 47      | 189               | 98      |
|         | Primary or Junior Basic              | 7                | 1       | 10            | 1       | 4                 | 1       |
|         | Matriculation and above              |                  |         |               |         |                   |         |

The higher extent of male literacy and the comparatively greater degree of educational levels acquired by males are markedly evident from the proportions given in the foregoing table. In every 1,000 male workers living in rural areas, 621 are illiterate as against 921 who are so among females. This disparity is also reflected among literate and educated male workers who have 14.6 per cent literates without educational level, 22.3 per cent primary or junior basic and 1 per cent matriculate and above. Similar percentages for females are 3.1, 4.7 and 0.1. Among the literate and educated of both the sexes, the proportions of those who have passed primary or junior basic are comparatively

higher than those of literates with educational levels and matriculation and above as a result of the recent drive against illiteracy. So far as males are concerned, illiteracy is comparatively greater and literacy relatively much less among non-workers than among workers. As already seen, literacy is insignificant among female workers in rural areas who have only 7.9 per cent literate or educated. Higher female proportions of illiterate, literate and educated among non-workers than among workers, might as well mean that illiterate women in rural areas have greater tendency to get themselves occupied than those who have the benefit of education, who exclusively devote themselves to household work.

### SECTION 3 UNEMPLOYMENT

#### (i) URBAN UNEMPLOYMENT

25. The extent of unemployment in towns and

cities where it assumes real importance can be visualised from the following table.

STATEMENT XI.7

Distribution of a total of 1,000 unemployed persons by sex between those seeking employment for the first time and those employed before but now out of employment and seeking work in cities and districts for urban areas only, 1961

The total number of persons returned as unemployed aged 15 and above in the urban areas of the State as a whole is 45,532—44,612 males and 920 females. Among those who are unemployed, 16,011 males and 359 females are seeking employment for the first time, while 28,601 males and 561 females, who were employed before but are now out of employment, are seeking work for the second time. The real extent of urban unemployment can be better had by examining their absolute numbers which are so small and in some cases much less than 1,000. The proportionate figures will, therefore, be utilised for broad and general comparisons only. Of the two sexes, males who have to shoulder the burden of maintaining the family are in greater search of jobs than females. They are numerically as well as proportionately larger not only as seeking employment for the first time but also as seeking work again after they have lost their first employment. But among the two categories of unemployed, the second that is of persons employed before but now out of employment and seeking work, accounts for a far larger number of both the sexes than those seeking employment for the first time. While 35.9 per cent of unemployed males seek employment for the first time, 64.1 per cent of this sex do it for the second time, corresponding proportions for females being 39.0 and 61.0 per cent. The number of males unemployed are relatively higher in the urban areas of the districts of Jamnagar, Rajkot, Bhavnagar, Junagadh, Mehsana, Ahmedabad, Kaira, the Panchmahals, Baroda, Surat and all the 6 cities. Ahmedabad, however, heads the list with 15,373 unemployed, out of whom 14,069 are accounted for by the city of Ahmedabad alone, where also the extent of female unemployment is the highest. Among those seeking employment for the first time in urban areas, the male average for the State 359 is exceeded by the urban areas of Rajkot, Bhavnagar, Amreli, Junagadh, Sabarkantha, Kaira, the Panchmahals and Broach. But the urban males seeking employment after the termination of their former job exceed the State average of 64.1 per cent in Jamnagar City, Bhavnagar City, districts of Surendranagar, Kutch, Banaskantha, Mehsana, Ahmedabad district and city, Baroda district and city, Surat district and

city. These proportions are, however, reported to be the highest from Banaskantha (726) but the lowest in the urban areas of the Panchmahals (516). Among females, Jamnagar city and urban areas of Sabarkantha do not have a single woman seeking employment for the first time. The highest proportion of unemployed in this category is, however, returned by Kutch (821) and the lowest by Jamnagar (125). Females seeking job after being once employed are noteworthy only in the urban areas of Surat and Ahmedabad districts, which respectively account for 158 and 124 such women.

26. A very high disparity in the numbers and proportions of unemployed between males and females results from the social and economic conditions of the people in this country, where by tradition, customs and beliefs, there has been since time immemorial a well-defined division of work between the two sexes. Male has always been regarded an earning member whose duty it is to maintain the members of his family by getting himself employed in some productive pursuit, which would enable him to discharge this responsibility. The question of employment or unemployment was, therefore, important and material in his case only. In contrast, females did not work but looked after their children and household, which was considered to be their legitimate sphere of activity. Women, therefore, had no occasion to go out in search of employment. These age-old ideas are now gradually changing under the economic stress of present times when people of middle classes in particular increasingly find it difficult to make both ends meet. The former notions of their roles being distinct and separate are gradually being replaced by those of social and economic equality of the sexes, particularly among the educated living in towns, who are anxious to occupy a proper place not only in the social structure but also in matters that vitally affect the well-being of the family. There is thus a growing anxiety and desire on the part of women to be economically independent. But this desire has not yet developed to such an extent as to make them rivals of males in the matter of employment. Girls are being educated and given higher education in towns. Education over, they do not generally offer themselves as prospective

candidates for employment, though inwardly their parents desire to see them employed to relieve economic stringency from which the family suffers. In such circumstances, if any job comes their way, it is welcomed and accepted. Under these circumstances, the real extent of unemployment among females is not likely to be revealed by figures thrown out by the census. For, apart from the operation of these factors, a deep-rooted sense of social prestige would also come in the way of such prospective candidates

being returned either as unemployed or as seeking work.

*Educational Qualifications of Persons Seeking Employment for the First Time*

27. We shall now scrutinise the distribution of persons seeking employment for the first time between the various educational qualifications by sex and age, as revealed by the following table for the State. The entire table showing the figures for the State and districts is given at the end of this Chapter

STATEMENT XI.8

Distribution of 1,000 persons of each sex and age-group of persons seeking employment for the first time and between the various educational qualifications for urban areas only, 1961

| Educational level<br>1                                                          | Total |       | 15-19 |       | 20-24 |       | 25-29 |       | 30-34 |       | 35+   |       |

N=Negligible

Educated unemployment is more a problem for the urban areas than the rural, where under-employment is material and believed to be widespread. The table on the previous page, therefore, deals only with persons seeking employment for the first time in urban areas only, where 16,370 persons have been returned as seeking employment for the first time. Of these, 16,011 are males and 359 females. 80 per cent of these are aged 15-24. With the inclusion of the next higher age-group 25-29 the percentage rises to 90 for those below 30 years. The most numerous age-group, however, is 15-19, which accounts for 7,539 such males as against 135 females. These figures further bring out the fact, discussed in the preceding para, that unemployment is a matter of concern more for males than for females, whose number returned as seeking employment for the first time in the urban areas of the State is quite insignificant (359). Examining these figures by various educational levels, it is found that among males in search of employment for the first time, 21.1 per cent are illiterate, the problem of waiting to be employed being greater in case of literate and educated, who account for the rest of 78.9 per cent among males. The highest proportion of such persons is, however, returned by those who have passed primary or junior basic examination. Those who have passed matriculation or obtained university degree account for a little over 15 per cent of males seeking employment for the first time, the highest quota among these two levels being furnished by matriculation or higher secondary, which accounts for 135 in every 1,000 males unemployed. Among the rest, those who are technically qualified do not find it difficult to get themselves employed, there being not a single person seeking employment for the first time in case of those who have obtained technical degree or diploma equal to degree or post-graduate degree in agriculture, veterinary or dairy and teaching. The proportion of males unemployed in engineering and technology is negligible. It also is the case with those who hold non-technical diploma not equal to degree. Medicine and technical diploma not equal to degree have each returned 1 male in every 1,000 seeking employment for the first time. As is to be expected, the proportion of such qualified males unemployed is either nil or negligible for

those aged 15-19, in whose case the problem of unemployment arises after they attain the age of 20 and intensifies a little in the higher age-groups. It is significant to note that the strength of unemployed among holders of university degree or post-graduate degree other than technical degree in the ranks of higher education is proportionately greater than that of those possessing any other educational qualifications above higher secondary. Further, these proportions are comparatively higher in case of females than males, who find it easier to be employed owing to the preference given to qualified males, who fare better in competition against females. Females thus seem to be at a distinct disadvantage in the matter of employment. This is also apparent from there being proportionately more females seeking employment in the age-groups 15-19, 20-24 and 25-29. Comparatively lesser proportion of females seeking employment for the first time in primary or junior basic as well as among illiterates and literates without educational levels, results from the fact that these are qualifications which usually go with such type of employment as does not call for any educational standard. It mostly relates to manual labour which does not discriminate much between male and female owing perhaps to the disparity of wages given. This is the general picture of those who are unemployed and are seeking work for the first time in the State as a whole, which goes to show that unemployment is comparatively much less among the educated and the least among females. Further, ages for seeking employment differ with different levels of education, educated females being at a greater disadvantage than males. This general picture is also true in case of the various districts except in the case of cities where the extent of unemployment is relatively higher than in other urban areas.

*Unemployed and seeking Work for a Second Time*

28. The picture of unemployment in case of those who were employed before but now out of employment and seeking work does not differ much from those who seek employment for the first time, as will be seen from Statement XI.9 on the next page for the State. The detailed statement for districts has been given at the end of this Chapter.

## STATEMENT XI.9

Distribution of 1,000 persons of each sex and age-group of persons employed before but now out of employment and seeking work and between the various educational levels for urban areas only, 1961

| Educational level<br>1                                                | Total |       | Age-group |       |       |       |       |       |       |       |       |       |       |       |

N=Negligible

Here again, as in the preceding paragraph, absolute figures would give a more realistic picture of this category of urban unemployment, proportionate figures being discussed to study the relative extent of unemployment by different educational levels and age-groups. 28,601 males and 561 females are returned as unemployed in the second category of unemployment in towns. The three most numerous levels which throw out such unemployment are illiterate (M 8,428; F 382), literate without educational level (M 5,332; F 36), primary or junior basic (M 12,904; F 82) which account

for a total of 27,164 or 93 per cent of those employed before but now out of employment and seeking work. In case of different educational levels the trends which are noticeable in the total are also reflected in the different age-groups for both the sexes. The most important educational level for this category of unemployment among males is primary or junior basic, as against illiterate among females. Unemployment among persons employed before but now out of employment and seeking work is greater among illiterate than among literate without educational level for both the sexes as seen from the fact that the former

account for 8,810 as against 5,368 for the latter. Those whose educational level is primary or junior basic account for the largest number 12,986 or 44.53 per cent of the total unemployed for the second time and far outnumber those who have passed matriculation or higher secondary as also those who have acquired still higher levels of education. This type of unemployment among matriculates, though higher than that returned by subsequent educational levels, is comparatively much less than that among those who can only read and write or have passed primary or junior basic. The extent of unemployment for the second time is thus found to go on declining with each higher level of education. It also supports the general notion that education is a surer means of securing employment; that it is a means to an end and not an end in itself. Another important feature of these statistics is that there are proportionately more females unemployed among the illiterate than males who are numerically in a vast majority. Among the educated, simple university degrees are at a disadvantage as compared to technical degrees and diplomas, which have numerically as well as proportionately lesser number of persons of both the sexes as seeking employment for a second time. For, holders of non-technical degrees are far greater in number (127 among males) than technical degree or diploma equal to degree holders who number 58, corresponding proportions for females being 9 and 6. There is none among females seeking employment for the second time from the educational level matriculation and onwards, except that there were 9 females holding university degree or post-graduate degree other than technical degree and 6 holding technical degree or diploma equal to degree or post-graduate degree.

29. The age break up of the unemployed belonging to this category also shows that coupled with illiteracy, primary and junior basic is the most important group of unemployment at different ages for males, the variation in one affecting the proportion of the other. The distribution for the different districts follows the State pattern, the extent of unemployment showing slight variation in the cities according as the opportunities for second employment offered are greater or lesser.

## (ii) RURAL UNEMPLOYMENT

30. The Statement XI.10 at pages 830 and 831 is important as giving the distribution of workers and non-workers by sex and educational levels in the rural areas of districts and State.

In every 1,000 males living in villages of Gujarat, 655 are illiterate and 345 literate and educated. Among the latter, 130 in every 1,000 are literate without educational level, 208 have passed primary or junior basic and 7 matriculation and above. Among females, 868 are illiterate and 132 literate; and those who have reached primary or junior basic grade account for 81. Illiteracy is a little less among working males, but a little higher among non-workers, with *pro rata* increase and decrease respectively for workers and non-workers who are literate and educated. But among females, literacy is proportionately more among non-workers than among workers as revealed by the distribution of 1,000 of each sex in these two categories.

31. Among the different educational levels, in every 1,000 males the educated are more numerous in primary or junior basic standard in the general population of all the districts except Jamnagar, Kutch, Banaskantha, Sabarkantha and Ahmedabad. The same pattern of distribution persists among working and non-working males except in certain districts, where the proportion of literate workers and non-workers generally exceeds those of primary or junior basic both in case of males and females. Except for some variation here and there with regard to sex of non-workers, these are the districts of Jamnagar, Surendranagar, Kutch, Banaskantha, Sabarkantha, Mehsana, Ahmedabad and Baroda. Among females, literacy is greater among non-workers than among workers, for reasons already noted before. The converse is, however, true about males, who stand in greater need of educational qualifications for getting employment and for whom literacy is a distinct advantage in securing jobs. In rural areas in every 1,000 male workers in the State 621 are illiterate as against 921 among females. Rural occupations being mainly related to cultivation and traditional crafts do not require

## STATEMENT XI.10

Distribution of 1,000 persons of each sex among workers and non-workers by different educational levels in the rural areas of the State and districts, 1961

| State/District<br>1 | Educational level<br>2                   | Total population |         | Total workers |         | Total non-workers |         |

N=Negligible

much of literacy or education and do not count much in the matter of employment, though those who are educated would fare better in non-agricultural pursuits as being more efficient workers than those who are not.

32. Literacy among workers and non-workers of both the sexes varies from district to district. Among workers illiteracy is proportionately

greater among females than among males, with corresponding increase in the proportions of non-workers among females. Districts with higher rate of general literacy are found to have relatively lesser proportions of illiterates both among workers as well as non-workers. The proportion of illiterates among male workers varies between 503 for Kaira and 851 for the

Dangs, the similar proportions of male non-workers being 606 again for Kaira and 866 for the Dangs. Among females relatively higher proportions of illiterates are to be found among workers than among non-workers. The districts where illiterate female workers are proportionately large are the backward areas of the Dangs (987), Banaskantha (989), Sabarkantha (964), the Panchmahals (981), Ahmedabad (933), Kaira (910) and Baroda (925) and in all the districts of Saurashtra region except Amreli, which suggest that in case of females, illiteracy is higher among workers than among non-workers who claim relatively smaller proportions of illiterate women in districts like Surat, Broach, Baroda and Kaira, where the general level of female literacy

is comparatively higher.

#### UNEMPLOYMENT ACCORDING TO EMPLOYMENT EXCHANGES AND CENSUS RETURNS

33. It would be interesting to compare the figures of unemployment on the register of the Employment Exchange in the various districts of the State with those returned by the census. Both these sets of statistics which are reproduced below bear a striking resemblance, as seen from the fact that in the State as a whole there was a total number of 62,900 applicants on live register in 1961 as against 67,023 enumerated by the census either as seeking employment for the first time or employed before but now out of employment and seeking work.

#### STATEMENT XI.11

34. As for the figures furnished by the employment exchange, it must be borne in mind that all those who stand on the live register are not the prospective candidates for employment as there would be not a few amongst them who have been since employed and yet stand on the live register as they have not reported their employment after registration. Unemployment would, therefore, be much less than actually reported. These figures would, however, be counterbalanced by a further factor affecting the census returns, namely, that the census takes note of employment of all ages as against the employment

exchange, which takes note only of those who are unemployed at the age of 18 and above. With these reservations, the figures show great similarity as regards extent of unemployment as reported at the various employment exchanges in the State and those recorded by the Census, which give a comparatively higher number of unemployed than the former. It should also be noted that both these types of unemployment do not take account of those who do not prefer to declare themselves as unemployed and this number would not be insignificant.

# SECTION 4 ACTIVITY OF NON-WORKERS

35. The data which the following table yields are very interesting and illuminating indeed as showing the distribution of non-workers into 8 types of activity according to which they are classified.

While the entire table has been given at the end of this Chapter, the entries for the State are abstracted below.

**STATEMENT XL.12**  
Distribution of 1,000 persons of each sex and age-group among eight types of activity of non-workers, 1961

N=Negligible

The total non-working population in the State is distributed into the 8 types of activity of non-workers in the table given below for the State as a whole, as also for its rural and urban areas. The most important groups among them are those relating to (1) full-time students (20.41 per cent), (2) household duties (25.18

per cent) and (3) dependents, infants and disabled (52.16 per cent), which account for a total of 11,885,284 or 97.75 per cent of the non-working population. The rest of the 5 types of activity of non-workers account for 273,478 or only 2.25 per cent of the non-workers.

Types of activity of non-workers

|                                                                      | 40,224     | 886          | 10,809     | 312          | 29,415     | 574          |

37. The two most important activities of male non-workers are full-time students and dependents, infants and disabled, to which household duties are to be added for females. Of all the types of activity, dependency claims the highest number of non-workers among both the sexes. Distribution of 1,000 of each sex and broad age-groups in the different types of activity will now be examined for each of the 8 types of activity of non-workers.

#### FULL-TIME STUDENTS

38. School-going ages would claim the entire age-group 0-14 and a part of those aged 15-34, which are the periods wherein students receiving education at different levels would be naturally concentrated. In every 1,000 male students, 803 and 197 respectively are claimed by both these age-groups, corresponding proportions for females being 888 and 112, disclosing at the same time

the much lesser extent of those having secondary and higher education than those receiving primary education. The greater proportion of females as compared to males aged 0-14 brings out another important feature of education, which goes to show that the proportions receiving secondary and higher education are greater for boys than girls. These proportions are slightly higher for the age-group 0-14 in rural areas and for age-group 15-34 in urban areas for both the sexes, which again accentuate the greater extent of secondary and higher education among both the sexes living in towns. This pattern of distribution of full-time students in the different age-groups is very nearly the same for all the districts. The percentages for the different levels and age-groups vary according as female literacy area. As against 286 full-time male students in every 1,000 boys aged 0-14 in rural areas, there

are 409 in urban areas, similar female proportions being 134 and 304 respectively. The age-group 15-34, however, claims the greatest proportion of full-time male students but relatively smaller proportion of females, who after marriage go to swell the ranks of those whose main activity is household duties. As is to be expected, city proportions show still further variations owing to the greater facilities for education in these areas. In every district of the State, urban proportions are higher than the rural for both the sexes and city proportions are higher than other urban areas in both these age-groups, viz., 0-14 and 15-34.

#### HOUSEHOLD DUTIES

39. In the general population of the State there are only 13,944 male non-workers enumerated as doing household duties, as against 3,047,651 females. In other words, in every 1,000 of total non-workers of each sex 3 are males and 423 females doing household work. These figures mirror the fundamental constitution of our social structure and household, wherein household duties have come to be regarded as the sole responsibility of women, though there are a few of the backward classes among whom males also do some household work, but their number is, as already seen, quite insignificant. This feature is based on the division of spheres of activity among males and females. While men employ themselves in productive pursuits and shoulder the responsibility of maintaining the household, the female takes up the responsibility of running and managing the household by freeing the male absolutely from this worry and anxiety. The most important age for women, when they are called upon to assume this responsibility are the ages 15-34 and 35-59, which account for more than 91 per cent of the females of these ages returned as non-workers. But their proportion dwindles down to 37.5 per cent for women aged 60 and over, owing to the physical incapacity which sets in during later age periods, when they are reduced to the category of dependents whose ranks they reinforce. For boys and girls aged 0-14, dependency and study are the important types of non-working activities, though there are a few girls who start helping their mother early rather than attending school or whiling away their time doing nothing. Such a

proportion (79) is very small indeed. Proportions of females aged 35-59 doing household work are higher in urban than in rural areas where some of them also work on the field. They are likewise higher in cities than in other urban areas. For, the higher the extent of urbanisation the lesser is the degree to which females participate in productive activities. This difference in the pattern of household duties on the part of males and females and the variation between rural and urban areas noticed above hold equally good also for the several districts of the State. This inference is further corroborated by the distribution of 1,000 persons of each sex and type of activity. The proportion of males doing household duties is much higher in case of those aged 15-34 living in towns (628) and for those aged 0-14 living in villages (544). But in case of females the distribution is somewhat different, though it follows very nearly the same trend, the higher extent of female literacy reducing their proportion in younger ages in towns, where most of the school-age population receive primary education.

#### DEPENDENTS, INFANTS AND DISABLED

40. This is the most numerous of all the 8 types of activity which the non-workers pursue, distributed between rural and urban areas according to the proportions of population living in villages and towns. This characteristic persists even in the districts where also dependency is the most prominent feature of the non-working population living in the rural as well as in the urban areas of the State. While there is not much difference between the two sexes so far as every 1,000 aged 0-14 are concerned (M 679; F 744), the variations are particularly marked in the age-group 35-59, which has in the State 341 males returned as dependents as against 66 females. This difference is brought about by the greater proportion of females of these ages doing household duties, an activity which is disfavoured by male non-workers, who are distributed for the most part between dependents, retired persons and beggars, vagrants, etc., and jointly account for 79 per cent of non-workers of these ages. The female dependents are on the whole greater in number than male. Male dependency decreases at ages 35-59, but rises more than three times

for those aged 60 and over. Female dependency is less for age-group 15-34, but comparatively higher in the age-group 35-59 and still higher in the age-group 60 and over, when there is complete dependency owing to age and infirmity. But proportionately examined, the pattern is different for both the sexes at different age periods. Both men and women have the highest proportions of dependents aged 0-14 in every 1,000 of their sex as revealed by 94.6 per cent of males and 90 per cent of females in this category. The intermediate groups have insignificant proportions, which appear to be a little noteworthy, in case of those aged 60 and over, where dependency again reasserts itself. In every 1,000 at ages 15-34, dependency is the least (M93; F20) but again rises in the age-group 35-59 to 341 for males and 66 only for females, which rises very sharply at ages 60 and over to 580 for males and 495 for females. Thus, the two important periods so far as dependency is concerned are the younger (0-14) and the older age-groups (60 and over), which account for most of the non-workers of these two age periods. Dependency would obviously be less for the intervening age periods wherein household duties for females claim most of the non-workers of that sex. The general proportions rise in rural area but fall in the urban sector. In every 1,000 males aged 0-14 rural proportion of dependents is higher than the urban, where the student population would naturally tend to reduce the proportions in this type of non-working activity. Urban male proportions of those aged 35-59 are, however, much less (237) than the rural (458), due to rise in such type of activity as retired, pensioners, rentiers, etc., after 55 years of age. Female dependency is the least for ages 15-59 in all the areas, either total, rural or urban, but it is a little more in rural than in urban, where household duties claim higher proportions of females. This proportion again drops down in the city areas as compared to other urban areas. For those aged 60 and over, male dependency is greater than female in rural areas, but higher among urban females than males, who have relatively greater proportion of retired persons. Rural and urban male proportions of dependents aged 60 and over vary sharply, as seen from the fact that the rural ratio

is much higher than the urban, as those of the older ages in urban areas would be naturally classified as retired and rentiers, a concept which is in marked defect in villages.

#### RETIRED, RENTIER OR PERSONS OF INDEPENDENT MEANS

41. In this category the majority would include retired persons, and those who are either rentiers or persons of independent means would be insignificant. Retirement is a concept which is known more to those in Government service as well as to those where some sort of age restriction operates as a bar to continued employment after the age limit fixed for superannuation and withdrawal from work becomes necessary. Among the vast majority of others, people would work so long as they are physically capable of working and jobs are available. Retirement is also a concept, which is confined to males and not to females, in whose case it assumes significance only after the age of 60, when they become aged and infirm and cannot lend a helping hand either in the household or family cultivation. The only age-group which is, therefore, important in respect of this type of non-working activity is 35-59, rentiers, if any, would be more among males than among females and they would be proportionately more in urban areas than in rural areas. In the whole State there are 84,012 males as against 74,326 females returned in this entire category. Of these 59,175 males and 53,990 females are aged 60 and over. Thus, in every 1,000 of each sex 28 per cent of males aged 35-59 and 70.4 per cent aged 60 and over are retired as against 24.9 and 72.6 per cent respectively among females.

#### BEGGARS, VAGRANTS, ETC.

42. In the State as a whole, there are 29,364 males and 9,574 females returned as beggars, vagrants, etc. Thus, males outnumber females in this category, wherein the most important ages are 15 years and onwards, whereafter the male proportions dwindle, but those of females rise in rural areas and fall in urban areas. For, as age advances, females become destitute and more helpless than males. It is further noted that these proportions are comparatively less in

urban areas than in the rural as the former does not tolerate vagrancy to that extent to which it is done in the countryside. It is the least in the district and city of Ahmedabad, some of the other urban areas and the district of the Dangs. The age-group 15-34 shows relatively higher proportion in Banaskantha and all the districts of Saurashtra except Kutch, where these ages also show appreciable proportions which are no doubt less than those at ages 35-59 in the rural areas.

#### INMATES OF PENAL, MENTAL AND CHARITABLE INSTITUTIONS

43. In this category there are 7,456 males as against 1,723 females, revealing greater criminal propensities on the part of the stronger sex. Examining their proportions in 1,000 of each sex and for each age period, the male proportions are noteworthy only for the age period 35-59, which dwindle down in rural areas but rise in towns where they are also appreciable for ages 15-34 and 60 and over. This picture is reflected also in the proportions of different districts. Variations between villages and towns suggest the difference in the life of these two sectors of population and the relative tendency and opportunities for the people to resort to criminal activities in each of them.

#### UNEMPLOYED

44. The twofold aspect of unemployment, namely, (1) those seeking employment for the first time and (2) those employed before but now out of employment and seeking work has already been examined before. Briefly stated, female unemployment is negligible as seen from the fact that there are 1,448 unemployed amongst them as against 65,575 amongst males. Further, there are more of those seeking work for the second time than those who do it for the first time. Proportions of those seeking employment for the first time are relatively greater in the age period 15-34. But for those seeking it for a second time, ages 35-59 are relatively more important. There is, however, greater unemployment in towns than in villages, where underemployment is more general.

#### WORKERS AND NON-WORKERS AMONG MIGRANTS, SCHEDULED CASTES AND SCHEDULED TRIBES

45. The extent of non-workers among

migrants, Scheduled Castes and Scheduled Tribes, as compared to the general population of the State and different districts can be assessed from the Statement XI.14 given at pages 840 and 841.

#### (a) Migrants

46. Migrants in Gujarat account for 2,190,444 males and 4,623,569 females. The disparity in the numbers of both the sexes results from the inclusion in these figures of a large number of female migrants within the State, who leave their parental home after marriage. In view of this, these figures may not give a true and correct picture of working and non-working population among the migrants of both the sexes. They would, however, give a rough indication of the extent of non-working population among migrants, a factor which has already been taken into account in the Chapter on migration. General observations which emerge from these figures are that male proportions of workers in the State population are higher than females, in case of all the categories examined. The proportions of male workers among migrants are higher than the State average of 648, in Jamnagar (665), Banaskantha (692), Sabarkantha (677), Ahmedabad (691), the Panchmahals (671), Broach (659), Surat (661) and the Dangs (797). The proportion of non-workers among males is the least in the Dangs. The State average of workers among female migrants (402) is exceeded by Amreli (477), Junagadh (441), Banaskantha (468), Sabarkantha (532), Mehsana (509), the Panchmahals (437), Broach (523), Surat (492) and the Dangs (716). It is significantly low in Kutch (350), Ahmedabad (196) and Kaira (230), where female non-workers are proportionately much higher than in the rest of the districts. As observed elsewhere, large urban areas where migrants are concentrated do not favour economic activity to any appreciable extent on the part of their womenfolk, particularly among the middle and higher classes of the urban population.

#### (b) Scheduled Castes

47. In the State, in every 1,000 males of each sex belonging to Scheduled Castes 513 are workers and 487 non-workers. The State average of 513 male workers among the Scheduled

## STATEMENT XI.14

Distribution of 1,000 of total population of each sex between workers and non-workers in the (i) General population (ii) Migrants (iii) Scheduled Castes and (iv) Scheduled Tribes, 1961

Castes is lower than the similar average in the general population. The same tendency is also observable in case of various administrative units except Amreli, Junagadh, Kutch, Kaira, the Panchmahals and Broach, where the proportion of workers among Scheduled Castes exceeds the average for the district. The proportion of non-working males among Scheduled Castes is the highest in Surat, which has 549 male non-workers in every 1,000 of the Scheduled Castes living in that district. Female workers

among Scheduled Castes are proportionately higher (336) than those in the State as a whole (279) but lower than the average for the district in the Panchmahals (437), and the Dangs, where it falls down to 223. But the proportion of Scheduled Caste female workers is the highest in Broach as compared to other districts.

(c) *Scheduled Tribes*

48. The proportion (582) of male workers

among Scheduled Tribes is higher than the State average (535) of workers in general population. It is also much higher for females which have 491 workers among Scheduled Tribes as compared to 279 for the State. In districts, such as Banaskantha, Sabarkantha, the Panchmahals, Baroda, Broach, Surat and the Dangs, having preponderantly large population of tribals, proportions of workers of both the sexes are higher than the district average except in the case of the Dangs, where it is a trifle lower than the average for the district in case of males. There is no district in the tribal areas where male workers among Scheduled Tribes account for less than 55 per cent of the workers, a percentage which rises over 60 in Banaskantha, the Panchmahals and Junagadh. In case of tribal females, the percentage of workers is 49.1 for the State as a whole, which goes over 50 in the districts of Sabarkantha, the Panchmahals, Surat and the

Dangs. These figures amply go to show that the extent of workers of both the sexes is much higher among the Scheduled Tribes than in the general population, a feature which is particularly noteworthy in case of tribal females, who more actively participate in gainful employment than in any other area or community of the State. The backward and underdeveloped areas thus have proportionately larger numbers of male and female workers, as compared to other areas where education and social prestige effectively intervene to reduce this proportion.

#### EDUCATIONAL LEVELS AMONG NON-WORKERS IN SCHEDULED CASTES/SCHEDULED TRIBES

49. Further analysis of these figures by sex and educational level throws light on the extent of school-going population among Scheduled Castes and Scheduled Tribes as compared to general population, as also among those who are unemployed among them.

#### STATEMENT XL15

Distribution of 1,000 of total population of each sex and educational level among non-workers in (i) the general population (ii) Scheduled Castes and (iii) Scheduled Tribes in the State, 1961

| Type of population     | Educational level                              | Total non-working population |       | Full-time students and children attending school |     | Persons seeking employment for the first time |    | Persons employed before but now out of employment and seeking work |    | Others |     |

| (iii) Scheduled Tribes | ..                                             | 1,000                        | 1,000 | 196                                              | 50  | 1                                             | N  | 2                                                                  | N  | 801    | 950 |

N=Negligible

full-time students. The number of those who have passed matriculation or above is very poor in that this educational level has reported 1,568 males and 173 females only.

#### (b) Scheduled Tribes

51. The position of Scheduled Tribes is worse than that of Scheduled Castes, as seen from the fact that in every 1,000 non-workers of each sex in this community only 196 males and 50 females are full-time students and children attending school, the rest falling under the category of others—801 males and 950 females. As in the case of Scheduled Castes, the problem of unemployment as judged from the figures given in the foregoing table seems to be, much less than in the Scheduled Castes or in the general population of the State. These proportions, however, furnish no indication whatsoever of the extent of underemployment which is far worse than unemployment, a problem which is far more acute because of the absence of any alternative means of employment in these backward areas, where either cultivation in poor soil with very little yield and collection of some jungle produce are their only salvation.

#### (a) Scheduled Castes

50. Out of the Scheduled Caste non-working population of 338,042 males and 447,155 females, only 28.8 per cent of males and 7.6 per cent of females are full-time students and children attending schools, those unemployed accounting for 1.8 per cent of males and negligible proportion of females. The rest of the 5 categories of non-workers account for 69.4 per cent of males and 92.4 per cent of females. Thus, among non-workers of Scheduled Castes, schooling is comparatively much less than in the general population, and the proportions under other activities also do not differ much from those in the general population, though a little higher. In every 1,000 illiterate, 969 males and 994 females, who are non-workers are classified under other 5 types of non-workers, those returned as full-time students and unemployed being relatively insignificant. In every 1,000 of each sex literate without educational level, 851 are males and 538 are females returned as full-time students as against 117 males and 461 females under others. Among those who have passed primary or junior basic, 894 males and 631 females are
