PHYSIOGRAPHY

GEOGRAPHICALLY the mass of land today called India consists of the territories contained in the Union of India, the Portuguese possessions of Goa, Daman, Diu and the French possessions of Mahe, Karikal, Pondicherry and Yanam.

The Republic of India consists of the following 28 States: Assam, Bihar, Bombay, Madhya Pradesh (formerly called the C.P. and Berar), Madras, Orissa, Punjab (East Punjab), Uttar Pradesh (the U.P.), West Bengal, Hyderabad, Jammu and Kashmir, Madhya Bharat, Mysore, Patiala and East Punjab States Union, Rajasthan, Saurashtra, Travancore-Cochin, Vindhya Pradesh, Ajmer (Ajmer-Merwara), Bilaspur, Bhopal, Coorg, Delhi, Himachal Pradesh, Kutch, Manipur, Tripura and the Andaman and Nicobar Islands.

In shape India is like a triangle with its base resting on the Himalaya Mountains in the north and its apex running far into the ocean in the south. At the southern extremity the triangle tapers with a pear-shaped curve to a point called Cape Comorin.

India lies entirely to the north of the equator. From south to north including Kashmir, it stretches from 8° north latitude to 37° north latitude, with the Tropic of Cancer cutting it roughly into two halves. West to east it stretches from about 66° 20′ east longitude to 97° east longitude.

Broadly speaking India is shut off from the mainland of Asia by the Himalaya Mountains, the highest mountain range in the world. Going from west to east along the country's land frontier are Pakistan, Chinese Turkestan, Tibet, China, Burma and Pakistan. In the south, the country is surrounded on all sides by water—the Arabian Sea in the west, the Indian Ocean in the south and the Bay of Bengal in the east.

India is about 1,700 miles from east to west, and about 2,000 miles from north to south. Its land frontier is about 8,200 miles long and the sea frontier about 3,500 miles. The total area involved is 1,138,814 sq. miles. The total population is 356,891,624, which is a little less than one-sixth of the population of the whole world.

Ports.—Compared with the size of the country, the coast-line is short, as there are few bays or inlets. Hence there are also very few harbours. The fact is the west coast is rocky and the sea is deep near the coast, while in the east the sea is extremely shallow so that big ocean-going ships have to weigh anchor at some distance from the shore. The only so-called natural harbours are Bombay and Goa. While Madras, Vishakapatnam and Port Okha are examples of purely artificial harbours built by human enterprise.

The principal ports in India are (going from west to east along the coast), Bedi Bunder, Port Okha, Porbandar, Surat, Bombay, Marmagao, Mangalore, Kozhikode (Calicut), Cochin, Alleppey, Quilon, Tuticorin, Dhanushkodi, Nagapattinam, Karikal, Cuddalore, Pondicherry, Madras, Masulipatam, Coconada, Vishakapatnam and Calcutta. Of these, Karikal and Pondicherry belong to France, Marmugao belongs to Portugal, while the rest are in the Republic of India. It may also be mentioned that a new harbour is under construction at Kandla in Kutch.

MOUNTAIN WALL

India can be divided into three natural regions [illegible] the physical map—1. the mountain [illegible] the Plain of Hindustan, and 3. the [illegible]teau.

[illegible]s take the mountain wall first. From [illegible]mir Knot in the far north two mountain [illegible]s radiate one in the south-east and easterly direction called the Himalayas, and the other in a south-western direction reaching almost down to the sea, called the Sulaiman Range in the north and the Kirthar Range in the south. In the east the mountain wall between India and Burma is called by different names in different places. In the north, for instance, it is known as the Patkoi Hills, further south as the Naga Hills. In Assam it is called Jaintia, Khasi and Garo. Southward are the Lushai Hills, then lastly there are the Arakan Yoma which finally reach the sea at Cape Negrais and continue in the Andaman and Nicobar Islands.

Of the various ranges which constitute the mountain wall of India the Himalayas are the most note-worthy. Extending like a scimitar for a distance of 1,500 miles along the northern frontiers of the country they form the loftiest mountain range in the whole world, and contain many of the highest mountain peaks, Mount Everest 29,002 ft., Mount Godwin Austen 28,250 ft., and Kanchenjunga 28,146 ft.

Passes.—There are no easy ways in and out through the mountain wall which shuts off India from the rest of Asia, but there are a few difficult passes. In the very north are the Zojila Pass and the Shipki Pass which lead out of Kashmir and Punjab respectively. Then from Shipki right down to Darjeeling there is no route across the mountain wall. Across the Burma frontier again there are a few routes but they are of little use for purposes of communication.

The following is a more detailed description of the mountain region.

In the east on the border of Burma the mountain wall is much lower. Here it can more accurately be described as a range of hills rather than of mountains. This region is wet, forested and very thinly populated. The region round about Cherrapunji in Assam has the highest rainfall in the world.

Then from Darjeeling to Kashmir are the Himalayas proper, over 1,500 miles in length and 150 to 200 miles in breadth. The Himalayas are thus not a mountain chain in the proper sense of the word. They can be described as a series of parallel but converging ranges intersected by valleys and big plateaus. On the whole, the slopes of the mountains facing India are very steep, while those facing north are much more gentle. We say, on the whole, because though the eastern Himalayas (in West Bengal and Bihar) rise abruptly from the plains, in the west (western Uttar Pradesh and the Punjab) the rise from the plains is a little more gradual. Hence the Himalayas themselves can be further sub-divided into three parallel zones, the Great Himalayas with an average elevation of 20,000 ft., always covered with snow; the Lesser Himalayas, the middle range, with an average elevation of 15,000 feet; and finally the Outer Himalayas lying between the Lesser Himalayas and the plains with an average elevation of about 3,500 feet. The last are a sort of foot-hills to the Great Himalayas, and are usually described as forming the sub-Himalayan region, a region which extends from eastern Bihar to the Punjab all along the Plain of Hindustan.

In the north the altitude of the range is much lower: there are few peaks which exceed a height of 20,000 feet. The Punjab Himalayas are comparatively dry, and the snow-line is much higher than elsewhere. The northern slopes are bare while the southern slopes are forested.

Two of the longitudinal valleys which separate the mountain ranges are worth a note. They are the Vale of Kashmir and the valley of Khatmandu in Nepal. Both the valleys are fertile, extensive and from a tourist's point of view a dream of beauty.

Thus it is clear the whole region possesses great variety in climate and a range of vegetation stretching from the tropics to the poles.

The north mountain wall has a tremendous influence on the physiography of the country. On the one hand it keeps out the bitterly cold winds which blow from Central Asia and Tibet during the winter, and on the other it intercepts the moisture laden winds which blow from the sea in the south so that the northern plains of the country have rain during the monsoon. Second, the melting snow and rain falling on the mountains go to form the chief source for the water of the rivers which flow from the Himalayas. Hence the rivers of Hindustan never go completely dry in the summer. In short, if Egypt is a gift of the Nile, the Plain of Hindustan is no less a gift of the Himalayas.

PLAIN OF HINDUSTAN

Geologically, the Ganges plain can be considered as the fore-deep of the mountains to the north of it. This fore-deep extends thousands of feet below the sea-level, though since its formation it has been filled in by deposit. In the east this deposit consists of alluvial material from the mountains, in the west it consists of material blown by the wind. All through the deposit is fine grained made up chiefly of muds and sands.

The Plain of Hindustan extends from the Bay of Bengal in the east to the Pakistan frontier in the west; that is to say, it is about 1,500 miles long and from 150 to 200 miles broad. Throughout this vast tract of land not a hill can be seen. The slope from the mountains to the sea is so gradual that about 100 miles from the mouth of the River Ganges the surface is no more than 500 feet above sea-level.

The Plain of Hindustan is probably the most important part of the country. For one thing, it contains some of the richest soil in the world. Second, it is on the Plain of Hindustan that the whole drama of race conflict and race assimilation was played out, a drama which finally shaped the political and cultural destiny of both India and its neighbour Pakistan.

Going into more detail the Plain of Hindustan is formed by the basins of three distinct river systems. In the far west are the Beas and Sutlej, tributaries of the Indus draining into the Arabian Sea. Further east is the River Ganges with its tributaries the Jamuna, Gogra, Rapti and Gandak which flows south-eastwards into the Bay of Bengal. The capital of the Indian Republic Delhi stands on the water-shed between the Indus and the Ganges river basins. The third of the three river systems, the Brahmaputra rises beyond the Himalayas, turns east and enters India at its eastern extremity and joins the Ganges before reaching the Bay of Bengal. The Brahmaputra has no important tributaries.

On the Himalayas these rivers are rushing, roaring torrents, cutting their way through steep and rocky gorges. But when they reach the vast plains they broaden out and wander slowly till they get to the sea. The land is so flat that the rivers sometimes leave their old beds and cut out new channels flooding the surrounding area.

The rivers of Hindustan are notable in three respects, 1. They give a constant supply of water, 2. The land through which they flow is broad, flat and fertile and eminently suitable for irrigation, 3. Because water flows perennially they are navigable through the greater part of the year.

As we go from west to east in the plain rainfall increases and so does the fertility of the soil.

The whole plain can be sub-divided according to climate into a number of natural regions. There are first the plains of the north-west, comprising Punjab State, a dry area depending on the irrigation canals of the rivers Beas and Sutlej for its water. Second, there is the valley of the Upper Ganges covering the major part of Uttar Pradesh a comparatively dry region which depends for its cultivation on the irrigation canals of the Ganges and the Jamuna. Third, we have the valley

of the middle Ganges embracing the State of Bihar, which is an intermediate zone, with both wet and dry cultivation. As we go further east we have the lower valley of the Ganges, which includes the whole of West Bengal, a wet region with considerable rainfall growing rice and jute.

INDIAN PLATEAU

The third of the natural regions into which the country is divided is called the Indian Plateau because it comprises a three-sided table-land covering the whole of the country in the south except for two narrow coastal strips in the east and the west. The Indian Plateau is marked off from the Plain of Hindustan by a confused mass of hill ranges running with a general direction of east to west. Three of these ranges have been distinguished by the names of Vindhyas, Satpuras and Ajantas respectively. They stand from 1,500 feet to over 4,000 feet high and though pierced by road and railway at the present time were not easy to cross in the old days and thus formed a barrier of hill and jungle between the northern and the southern portions of the country.

The Indian Plateau is higher in the west and the south than in the east and north. Along the western and eastern edge of the plateau run the Western and Eastern Ghats. They start southward, from the extremities of the Vindhya mountain system and run along the western and eastern coasts of the country and unite to form a sort of upheaved angle towards their southern extremity. The Western Ghats run through the State of Bombay and ascend to an average height of about 3,000 feet while some of the peaks are anything between 5,000 feet and 9,000 feet high. The Eastern Ghats stretch down the State of Madras and have an average elevation of 1,500 feet. The inner triangular plateau which the Western and Eastern Ghats form far in the south is seamed with little ranges of hills exceeding 4,000 feet in height the best known among which are the Nilgiris. It is on the Nilgiris that Ootacamund the famous summer capital of Madras State stands.

Drainage Systems.—There are three systems of drainage in the Indian Plateau—one towards the north, the second towards the west and the third towards the east. The drainage from the northern or Vindhya edge of the plateau falls into the Ganges. Two rivers Narmada and Tapti carry the rainfall of the southern slopes of the Vindhya and Satpura mountains respectively in almost parallel lines into the Arabian Sea. Further south, as we have already stated, the plateau is much higher in the west than the east. So the drainage has to make its way across the whole breadth of the plateau eastwards until it falls into the Bay of Bengal. The most important rivers are the Mahanadi, the Godavari, the Krishna and the Cavery. These rivers differ from the rivers of the Plain of Hindustan in three ways: 1. They are fed only by the monsoon rains and therefore do not yield a constant supply of water, 2. Their valleys are less suitable for irrigation, 3. And finally, they are not navigable for certain seasons in the year when parts of the river dry up.

From a geological point of view the Indian Plateau consists mainly of very old crystalline rocks—much older than the Himalayan fold mountains. On some of the edges of the plateau in the north-east for instance, are areas of sedimentary rocks from which the country obtains most of its coal. About nine-tenths of the coal resources of India lie in Jharia in Bihar and Raniganj in West Bengal, though coal-bearing beds are also found in the valley of the Godavari and the northern slopes of the Vindhyas. The north-west of the plateau is covered by vast stretches of lava called the Deccan lavas. This region is one of the largest areas of lava in the world, covering as it does an area of 250,000 square miles with a total thickness of several thousand feet. In spite of the great extent of the lavas there are few or no signs of volcano. In the rest of the Plateau valuable minerals occur here and there among old crystalline rocks. Gold is obtained in Kolar, manganese in Vishakapatnam, Mysore and Madhya Pradesh, copper and iron in Bihar and Orissa, mica in Madras and the south-east. The point about diamonds is of some interest. They occur in sand-stones or conglomerate in Panna in Vindhya Pradesh or Kurnool in Madras, though no diamond bearing igneous rocks are found.

Natural Regions.—From the point of view of climate and vegetation the Indian Plateau can be divided into ten natural regions. There are first of all the coastal regions round the plateau. In the north covering part of the State of Bombay is the Gujarat region, moderately dry and hilly in places. Further south is the west coast region covering part of Bombay and part of Madras, narrow and wet. In the east is the Carnatic or Tamil region comprising part of Madras, moderately wet but wider than in the west. In the north is what is called the Northern Circars region covering part of Andhra and part of Orissa, also moderately wet. Then there are the dry regions lying to the north of the Vindhya mountains sloping downwards to the plains of the Ganges. There are the Thar or Great Indian Desert, the Rajasthan uplands dry and hilly, and the Central Indian Plateau comprising part of Madhya Pradesh. Finally there is a third group of regions which can be distinguished, all lying in the Indian Peninsula proper. These are first the southern part of the plateau covering the whole of Mysore and parts of Madras and Bombay, dry, somewhat barren and thinly populated; second, the Deccan lavas region in the north-west, containing parts of Bombay, Hyderabad and Madhya Pradesh dry but with fertile black soil suitable for cotton and moderately thickly populated; and lastly, the north-eastern Plateau covering parts of Bihar, Madhya Pradesh and Orissa. This last mentioned region has moderate rainfall, is thinly populated, but thickly forested. The inhabitants are mainly concentrated in two river valleys.

Ceylon is the only important island lying off the coast of India to which it is joined by a line of sand flats collectively called Adam's Bridge. But Ceylon is politically separate from the sub-continent. Two groups of very small islands in the Bay of Bengal, the Andamans and the Nicobars, and one group in the Arabian Sea the Laccadives are part of the Republic of India. So is the quasi-island of Kutch off the Kathiawar Peninsula in western India. Kutch is a dry, rocky, treeless country.

VEGETATION

India is thickly populated and so over a greater part of the country the natural vegetation has been removed. The country has no distinctive botanical features peculiar to itself. Where the rain-fall is more than 80 inches a year there are ever green forests on the hills. The wood from these forests is hard but the forests have not yet been commercially exploited. These evergreen forests are chiefly found on the slopes of the Western Ghats, the wetter eastern parts of the Himalayas up to a level of 5,000 feet, and in Assam.

Where the rain-fall is less than 80 inches but more than 40 we have what are called the monsoon forests, so-called because the trees in these forests lose their leaves in the dry season. The monsoon forests are very valuable, because they contain two of the most useful kinds of tree, the teak and the sal. The teak is found chiefly in the western parts of the country while the sal is obtained in the lower slopes of the Himalayas and the north-east of the Plateau. Where the rainfall is less than 40 inches, in the drier parts of the country we find small thorny trees, sometimes so small that they are more like bushes than like trees. In the driest parts where the land is desert or semi-desert even bushes cannot grow. There we find plants with thick fleshy stems and long roots. As we go up the mountains too the vegetation changes. In the higher reaches of the mountains, above 5,000 feet in the south, and 3,000 feet in the north the forests are similar to those found in temperate lands. Some of the trees have broad leaves and are like the oak while others are tall and have needle-shaped leaves like the pine.

On the highest parts of the mountains it is too cold and too dry for trees to grow and so we find only small bushes and short grass.

Along the sea-coasts and in the great river deltas where the land is flat and muddy grows a kind of tree, called mangrove. These trees are most frequent in the deltas of the River Ganges where they are called Sundarbans.

There is not much grass land in India though in the hills in the monsoon grass patches can be seen.

The main cultivated plants include rice, wheat, pulses and grains. Among the important seeds grown are castor, sesamum and ground-nut. The chief fruit trees include mango, coconut, areca-nut and certain citrus fruit. Apples, peaches, pears, apricots and walnuts are confined chiefly to the Himalaya valleys. There are tea plantations over large areas on the mountains in the north-east and south, while coffee, cardamom, pepper and rubber are extensively grown in the south. In some of the damper regions the cinchona is successfully cultivated. (For more detailed description see section on agriculture.)

ANIMALS

Just as natural vegetation has disappeared over the greater part of the land so have a great many wild animals. The lion, for instance, was not uncommon within historical times in the north. Today it is confined wholly, to the Gir forest in Junagadh in Saurashtra.

The most famous among the wild animals which survive are the tiger and the elephant. The leopard or panther is more common than the tiger and equally destructive of life and property. The cheetah or the hunting leopard is found only in the Deccan and is generally trained for hunting the antelope. Other wild Indian animals of the cat family are the marbled cat and the jungle cat.

In the open country-side wolves are plentiful and usually prey on sheep. The Indian fox is comparatively scarce but the jackal is very common. The wild dog is found in the denser jungles and generally hunts in packs. Among other dogs are the pariah common in the south, and the greyhound used for hunting.

The black bear is common wherever rocky hills and forests occur. It lives on ants, honey and fruit and may often prove dangerous. The Himalayan bear which is found only in the north, stays in the mountains during the summer but comes lower down during the winter.

The rhinoceros found in the country are of three different types, two have a single horn and one has double. The rhinoceros are commonest in the Brahmaputra valley and in the Sundarbans. With the rhinoceros might be mentioned the crocodile which can be very dangerous specially in the rivers of the north. The wild hog is also well-known in certain parts of the country and is very destructive of crops.

In the remote parts of the deserts of Kutch is found the wild ass but its contacts with man are few. Many wild varieties of sheep and goat are met with in the mountain ranges of the north.

The antelope proper is more widely distributed. On the coasts of Gujarat and Orissa, for instance, a herd of does accompanied by a single buck is a common sight. The gazelle can also be found almost everywhere. The sambar is confined to hill forests, while the spotted deer is considered to be the most beautiful animal of the Indian jungle.

In the Western Ghats, and in the hill jungles of Assam and Madhya Pradesh is found the bison. It is a fierce animal and almost as dangerous to hunt as the tiger. Akin to the bison is the wild buffalo very common in Assam.

The rat and the mouse are a perpetual nuisance. The bandicoots some of which can be as long as 2 feet burrow under stores and godowns and are often deadly to plants, fruit or grain.

The reptiles abound in garden and jungle and even intrude into dwelling places specially during the rains. Thousands of people die every year in the country-side of snake-bite. The most dreaded of the reptiles is the cobra. There is another variety called Russel's viper whose bite is equally fatal. Generally speaking the salt-water snakes are dangerous while the fresh-water ones are harmless. The bigger variety scorpion which abounds in parts of Madras is a domestic terror.

Of all the wild animals in the country the elephant is the most interesting as well as the most useful. It generally lives in the wilder parts of the monsoon forests and being an intelligent animal can be trained to do heavy work such as dragging great logs of wood, or arranging them in neat piles. The elephant is also excellent as a transport animal as it can push its way through the thickest jungle where roads cannot be built.

Domestic Animals.—So much for the wild animals. Among the domestic animals the most useful are the oxen. It is estimated that there are about 136·372 million cattle in India. Milk is not a staple article of food and the oxen are chiefly used for ploughing or drawing carts. The bullocks are more valuable than the cows though in certain parts like Uttar Pradesh dairy-farming is an important industry. One handicap is that in most areas fodder has to be specially grown for the cattle.

There are 40·618 million buffaloes in the country. The buffalo is stronger than the bullock and is chiefly used for ploughing. The she-buffalo is the typical dairy animal.

There are 37·734 million sheep in the country. But they are a very poor specimen and do not give good wool or meat. Sheep are most numerous in Madras and live chiefly on waste land which is not good enough for cattle. Goats (46·469 million) are found everywhere because it does not take much to keep them alive. They can feed on the poorest grass or shrub and so find enough to eat even in the driest parts of the country.

There are 3·236 million horses, ponies and donkeys, most of which are used as draught animals. Mules, donkeys and camels are also used for purposes of transport: mules and donkeys on the hilly parts, and camels in the sandy desert. The total number of live-stock in the country is 264·429 millions.

The birds of India though not as gorgeous as those of some other tropical lands deserve mention. The parrot is easily the most beautiful of the Indian birds. The peacock is another beautiful bird, while the maina like the parrot lives happily in a cage and talks well. Of the vulture there are four varieties which include the common scavenger. There are many types of eagle too and some of the falcons can be trained for hawking. A bird much sought after for its plumage is the kingfisher and among the birds which are hunted for their flesh are pigeons, ducks, partridges, plover, quail and snipe. The jungle fowl, however, is not considered good for eating.

There are many beautiful butterflies in India, while among the more useful insects are the bee, the silk-worm, the *coceus laca*, that is, the insect which gives lac. Certain varieties of Indian moth and ant are very destructive. Locust invasions are not frequent but when they appear they leave complete destruction behind them. Mosquitoes abound everywhere.

In India fish is eaten fresh as methods of fish preservation are either primitive or not practised. Among the edible Indian fishes are the carp family and the cat fishes. But the most delicious is the hilsa which is also a rich food. A fish which is found in all hill streams is the mahseer. (For a more detailed discussion see section on fisheries).

INDIA, PAKISTAN

The partition of what was formerly known as British India took place on August 15, 1947. Broadly speaking, the areas in the north-west and the north-east inhabited predominantly by people belonging to the Muslim religion were cut off and formed into a separate independent state. Only two provinces were primarily affected by the decision to partition the sub-continent, and a third to a smaller degree. The two which were primarily affected were the Punjab in the west and Bengal in the east. The old Punjab was divided into West Punjab (now called Punjab) which became a part of Pakistan and East Punjab (also called Punjab), which became a part of India. The old Bengal was divided into East Bengal which became a part of Pakistan and West Bengal which became a part of India.

The Province of Punjab (Pakistan) includes the whole of the old Multan and the Rawalpindi Divisions and the Districts of Gujranwala, Sheikhupura and Sialkot of the old Lahore Division. The State of Punjab (India) includes the whole of the old Jullundur and Ambala Divisions and the Amritsar District of the old Lahore Division. The Gurdaspur and Lahore districts of the old Lahore division were divided between the two new provinces.

In the east the Province of East Bengal includes the whole of the old Chittagong and the Dacca Divisions and the Districts of Rangpur, Bogra, Rajshahi, Pabna and Khulna. The State of West Bengal includes the whole of the old Burdwan Division and the Districts of Calcutta, the 24 Parganas, Murshidabad and Darjeeling. The old Districts of Nadia, Jessore, Dinajpur, Jalpaiguri and Malda were divided between the two provinces.

The old Province of Assam too was affected to a minor degree. Except four thanas the whole of the District of Sylhet was transferred to the newly created Province of East Bengal.

THE FRONTIERS

THE frontiers of India consist of Tibet, Nepal, Sikkim, Bhutan, and, of course, Pakistan, while Assam in India and Eastern Pakistan have a common frontier with Burma.

TIBET

Tibet has an area of about 470,000 square miles and a population of about 3 millions. The Government of Tibet consists of the minor Dalai Lama who is the temporal and spiritual head of the State with his seat at the capital Lhasa. He has an adviser who is assisted by a Council of Ministers. There is also a National Assembly consisting of monks and lay officials whose functions are advisory.

The relations between China and Tibet may be described as follows. From the conquest of Tibet by the Manchu dynasty of China in the 18th century the Chinese maintained officers at Lhasa (military escort limited to 300) though their authority decreased to a merely nominal suzerainty. Following the Chinese revolution of 1912 the Tibetans evicted all Chinese officials and troops. In 1914 a conference of representatives of Tibet, China and Britain met in Simla and agreed on a convention to govern the relations of the three parties. This convention divided Tibet into two parts Tibet proper (outer Tibet) which was to be autonomous under Chinese suzerainty and inner Tibet under Chinese authority subject to certain already existing Tibetan rights. The Chinese accepted all the terms of the convention except the one that related to the boundaries of inner and outer Tibet. Upon this convention all subsequent relations between Tibet and Britain were based. On the death of the 13th Dalai Lama in 1933 a Chinese condolence mission was admitted to Lhasa, and in 1934 a Chinese representative was appointed at the Tibetan Capital. Tibet also admitted a complimentary Chinese delegation on the installation of the 14th Dalai Lama in February 1950.

Towards the end of the civil war in China between the Kuomintang and the Communists the Tibetan authorities asked the Chinese mission in July 1949 to leave Tibet for fear of causing complications. On July 20 the mission left *via* India after all the formalities of leave taking had been observed. But the Chinese Government (then represented by the Kuomintang) were never reconciled to their departure and proceeded to instal a Panchen Lama (spiritual head) at Sining in the Chinese province of Tsinghai. The candidature was vigorously opposed by the Tibetan authorities in Lhasa.

India's relations with Tibet (mainly an inheritance from the British) is as already noted, governed by the Simla Convention of 1914. India recognizes Chinese suzerainty over inner Tibet (that part of Tibet which is nearest India) including Lhasa, Shigatse and Chamdo, the last of which apparently the Chinese had not recognized as falling within inner Tibet. India is allowed to maintain an agent in Lhasa and establish trade agencies at Gyantse and Yatung for the protection of which a military escort not exceeding 225 is authorized to be stationed along the Kalimpong (West Bengal) Lhasa trade route.

India's trade relations with Tibet are very close. Tibet's population is mainly concentrated along the southern wall of the mountain plateau especially round Lhasa and Gyantse. India is thus the nearest and the most convenient market place for Tibetan goods, the Indian terminals of the trade being Kalimpong, Almora and Leh. The value of the annual Tibetan trade is about 3 crores, two-thirds of which passes through India. The imports from Tibet include wool, borax, salt and musk and the exports woollen and cotton textiles, grain, glass, sugar and tobacco. It may be added that there is a proposal to build a motorable road to connect Tibet with China. If this materializes part of the trade may be directed to China.

After the victory of the Communists in China an attempt was made to regularize the relations between China and Tibet. The Chinese delegation had left, as already reported, in July 1949.

The whole history of the subsequent developments is a little confused although the main lines are fairly clear. These may be summarized as follows. By mutual agreement a delegation from Tibet tried to get into touch with the Peking Government *via* India and Hong Kong. The delegation which arrived in India in the middle of May 1950 was however held up owing to a number of difficulties such as visa. Early in October the Chinese Government took military action and Chinese troops entered the eastern parts of Tibet. The Government of India sent a note of protest to China on October 26 against military intervention and expressed amazement and regret at Chinese action. In

its answer the Chinese Government declared that Tibet was an internal question and that Chinese action sprang from a desire to liberate the people and safeguard Chinese frontiers. China also complained of foreign interference with the Tibetan delegation while in India. The Government of India regarded the Chinese answer as unsatisfactory and on November 3 advised the Tibetan delegation which had meanwhile got into touch with the Chinese Embassy in New Delhi not to proceed to Peking. Meanwhile the Chinese armies which had reached as far east as Chamdo turned south and after a time stopped military operations. It may be added that troop movements had probably taken place in a region the sovereignty of which had long been disputed between Tibet and China. On November 7 Tibet appealed to the U.N.O. The Tibetan note explained that Tibet never agreed to the Chinese claim to suzerainty. The nominal suzerainty conceded to China in 1914 was not enforceable as the Chinese Government had not ratified the treaty. The complaint was taken up by the South American republic El Salador who formally requested the General Assembly on November 15 that the question might be placed on the agenda. The Salvadorian resolution also asked the Assembly to condemn China's aggression and called for the appointment of a committee, to study what measures the U.N. could take. The U.N., however, decided on November 24 to postpone all discussion.

On November 17 changes of a drastic nature in the structure of the Government of Tibet took place in Lhasa when the minor Dalai Lama was installed with full powers as the temporal ruler of Tibet and the Regent retired. Negotiations with China were taken up from where they were interrupted. It was reported that Sawong Lama, the President of the Tibetan Assembly who was acting as adviser to the Dalai Lama was in favour of a peaceful solution through discussion. The Dalai Lama asked that the Chinese should withdraw their forces from the eastern provinces as a token of good faith and to facilitate settlement. The Chinese forces were consequently withdrawn. It was also reported that the Tibetan Government had dismissed a number of high ranking officials. The new mission which the Government appointed consisted of Kungang Sey (Commander-in-Chief), Thrunik Chempo Lantra, a Lama of the highest status, Yabsey Sey, Rinchen Sadhu Tsang, Naboo Samdo Photang and Rimsi Samdo Photang. The last two were to go to China via Chamdo, while the first two were to have a preliminary meeting with the Chinese Ambassador in New Delhi. It was expected that a settlement would be effected on the lines of an autonomous Tibet under Chinese suzerainty. China would look after defence and foreign affairs but would station only a token force in Lhasa. It was also learnt that Indian interests would not be affected.

On May 23, 1951 China and Tibet signed an agreement. The points of the agreement are as follows:

(1) The Tibetan people shall unite and drive out imperialist aggressive forces from Tibet so that the Tibetan people shall return to the big family of the motherland—the People's Republic of China.

(2) The local Government of Tibet shall actively assist the People's Liberation Army to enter Tibet and consolidate the natural defences.

(3) In accordance with the policy towards nationalities laid down in the common programme of the Chinese People's Political Consultative Conference, the Tibetan people have the right of exercising regional autonomy under the unified leadership of the Central People's Government.

(4) The Central authorities will not alter the existing political system in Tibet. The Central authorities will also not alter the established status, functions and powers of the Dalai Lama. Officials of various ranks shall hold office as usual.

(5) The established status, functions and powers of the Panchen Lama shall be maintained.

(6) By the established status, functions and powers of the Dalai Lama and of the Panchen Lama, are meant the status and powers of the 13th Dalai Lama and of the ninth Panchen Lama when they were in friendly and amicable relations with each other.

(7) The policy of freedom of religious belief laid down in the common programme of the Chinese People's Political Consultative Conference shall be carried out. The religious beliefs, customs, habits of the Tibetan people shall be respected and Lama monasteries shall be protected. The Central authorities will not effect a change in the income of the monasteries.

(8) Tibetan troops shall be reorganised, step by step, into the People's Liberation Army and become a part of the national defence forces of the People's Republic of China.

(9) The spoken and written language and school education, etc., of the Tibetan nationality shall be developed, step by step, in accordance with the actual conditions in Tibet.

(10) Tibetan agriculture, livestock raising, industry and commerce shall be developed step by step, and the people's livelihood shall be improved, step by step, in accordance with the actual conditions in Tibet.

(11) In matters related to various reforms in Tibet there will be no compulsion on the part of the Central authorities. The local Government of Tibet should carry out reforms of their own accord and when the people raise demands for reform they shall be solved by means of consultation with the leading people of Tibet.

(12) In so far as former pro-imperialist and pro-Kuomintang officials resolutely sever relations with imperialism and the Kuomintang and do not engage in sabotage or resistance they may continue to hold office irrespective of their past.

(13) The People's Liberation Army entering Tibet shall abide by all the above mentioned policies and shall also be fair in all buying and selling and shall not arbitrarily take a needle or thread from the people.

(14) The Central People's Government shall have the centralised handling of all external affairs of the area of Tibet and there will be peaceful co-existence with neighbouring countries and the establishment and development of fair commercial and trading relations with them on the basis of equality, mutual benefit and mutual respect for territory and sovereignty.

(15) To ensure implementation of this agreement the Central People's Government shall set up a military and administrative committee and a military headquarters in Tibet and apart from the personnel sent there by the Central People's Government, shall absorb as many local Tibetan personnel as possible to take part in the work.

Local Tibetan personnel taking part in the military and administrative committee may include patriotic elements from the local Government of Tibet, various districts and various principal monasteries; the name list shall be set forth after consultation between the representatives designated by the Central People's Government and various quarters concerned and shall be submitted to the Central People's Government for appointment.

(16) Funds needed by the military and administrative committee, the military area headquarters and the People's Liberation Army entering Tibet, shall be provided by the Central People's Government. The local Government of Tibet should assist the People's Liberation Army in the purchase and transport of food, fodder and other daily necessities.

(17) This agreement shall come into force immediately after the signatures and seals are affixed to it.

Chinese Representative, General Chang Ching-Wu.

THE NORTH-EASTERN FRONTIER

The position on the northern frontier has been considered as if the Indian frontier were contiguous with that of Tibet. This is not so. For on this frontier also lie the independent Kingdom of Nepal, the Sikkim State and Bhutan. From Gilgit, now the northern post of the Indian Government to Assam, with the exception of the small wedge between Kashmir and Nepal, where the Indian district of Kumaon is thrust right up to the confines of Tibet, for a distance of nearly fifteen hundred miles there is a narrow strip of territory between India and the true frontier.

The first of these frontier States is Kashmir which is almost the only important State which has acceded to India with frontier responsibilities. But these responsibilities have now virtually passed to the Government of India because of the recent invasion of Kashmir by forces from the west. As has already been noted one of the most important trade routes with Tibet passes through Kashmir—that through Ladakh.

Then comes the long narrow strip of land called Nepal. This Gurkha Kingdom stands in a special relation with the Indian Government. It is the main Indian outpost against Tibet or against foreign invasion through Tibet.

Beyond Nepal are Sikkim and Bhutan, whose rulers are Mongolian by extraction and Buddhist by religion. In view of Chinese connections with Tibet, the Government of India in 1910 strengthened their relations with Bhutan by increasing their subsidy from fifty thousand to a lakh of rupees a year, and by taking a guarantee in return that Bhutan would be guided by them in its foreign relations. Afterwards China was officially notified that the rights and interests of Sikkim and Bhutan would be protected.

NEPAL

The small hilly independent Kingdom of Nepal is a narrow tract of country extending for about 620 miles along the southern slope of the central axis of the Himalayas. It has an area of about 54,000, square miles, with a population of about 6,282,000, chiefly Hindu. The greater part of the country is mountainous, the lower slopes alone being cultivated. Above these is a ragged broken wall of rock leading up to the chain of snow-clad peaks which culminate in Mount Everest (29,002 feet) and others of slightly less altitude.

Rice, wheat and maize form the chief crops in the low-lands and in some parts of the hills too. Mineral wealth is supposed to exist but has not as yet been either prospected or developed.

The chief articles of export are cattle, hides and skins, opium and other drugs, gums, resins and dyes, jute, wheat, pulse, rice and other grains, butter, oil seeds, spices, tobacco, timber and salt-petre. The principal imports are cattle, sheep, goats, salt, sugar, drugs, petroleum, iron and copper ware, cotton, silk, textile goods.

New industries like jute, sugar, glass are being set up.

There is to be a Planning and Development Board, while Nepal also expects to get direct help from India, the Colombo Plan and the American Point Four Programme.

Nepal has railway links with India: Amlekganj to Raxaul in Bihar, from Jayanagar to Bijulpura. There are about 250 miles of motorable roads. There are telephone connections between Khatmandu and stations in Bihar.

Trade is mostly financed by the Nepal Bank Ltd.

The revenue of the country for 1952-53 was estimated at Rs. 3,05,16,000 and the expenditure at Rs. 5,25,21,000, thus leaving a deficit of Rs. 2,20,05,000.

The standing army is estimated at 45,000.

The State is of considerable archæological interest and many of the sites connected with scenes of Buddha's life have been identified in it by inscriptions on pillars.

The administrative structure of Nepal was reorganized in accordance with a proclamation made by King Tribhuvan (Maharaja Dhiraj Tribhuvan Bir Bikram Jang Bahadur Shah Bahadur Shamsher Jang) on February 18, 1951. The proclamation was made from the throne at Narainahiti Palace in Khatmandu. The introduction of these changes marked the end of the hereditary rule of the Ranas which was in existence from 1867.

There is now a Cabinet of twelve Ministers who are jointly responsible to the King and the Prime Minister keeps him informed from time to time of the progress of work in general administration. This is only an interim arrangement. For drawing up a permanent constitution a constituent assembly based on adult suffrage would be set up in 1952 or '53.

The Ministry is as follows:

Prime Minister, General Adm. and Foreign Affairs, M. P. Koirala.

Finance, Maj.-Gen. Subarna Shumsher.

Home, Information, Broadcasting, Food, Surya Prasad Upadhya.

Works, Communications, Transport, Bhadrakali Misra.

Agriculture, Animal Husbandry, Administration, Ganeshman Singh.

Industries, Commerce, Civil Supplies, Mahendra Bikram Shah.

Planning, Development, Maj.-Gen. Mahabir Shumsher.

Local Self-Govt., Naradmuni Thulung.

Parl. Affairs, Khadgman Singh.

Education, Maj.-Gen. Sharda Shumshere.

Defence, Gen. Kaishere Shumshere.

Law, Justice, Bhagwati Prasad Singh.

Minister of State for Health, Capt. Nar Bahadur Gurung.

Dy. Minister for Food, Dharma Ratna.

The Government survived a serious revolt of a section of the Home Guards on January 23, 1952. The rebellion in the course of which Dr. K. I. Singh a political prisoner escaped from jail, lasted only about a day.

SIKKIM

Sikkim (area 2,818 sq. miles) is an independent Himalayan State under the protectorate, in respect of foreign relations, defence, etc., of the Government of India. The population of about 1,22,000 is mixed, consisting of people partly of Tibetan origin, partly Lepcha tribesmen and partly of Nepalese immigrants. The ruling family is connected with leading Tibetan families and their origin and culture is also essentially Tibetan. It was created originally by the East India Company, partly to check the eastward expansion of Nepal, but mainly as a buffer between India and Tibet.

By the Treaty of 1861 between the Maharaja of Sikkim and the British Government, the latter acquired the right to ask for the delivery of offenders and also of following up fugitive criminals into Sikkim. It also provided for the freedom for British subjects to enter Tibet and to participate in trade in Sikkim. By the Anglo-Chinese Convention of 1890, the Tibeto-Sikkim boundary was fixed and the Chinese Government recognised Sikkim as a British protectorate.

As, till 1947, the British Government had affirmed direct and exclusive control over both the internal administration and foreign relations of that State, Sikkim was treated for all practical purposes as an Indian State. With the lapse of paramountcy in 1947, negotiations were started for a standstill agreement, which was signed early in 1948. In the middle of 1949, the Government of India lent the services of an officer to take charge of the administration of the State in response to a request from the Maharaja, when Sikkim was threatened with disorder. In December 1950, a Treaty was signed between the Government of India and Sikkim, of which the salient feature is that Sikkim should continue to be a protectorate of India, but should enjoy autonomy in regard to its internal affairs.

India has the right to station her troops anywhere in Sikkim. It may be mentioned here that there is already a small number of Indian troops in Sikkim. The Government of India has to pay Sikkim three lakhs of rupees every year starting with 1950.

An item of some interest was the resignation of three members of the Dewan's Advisory Council on November 19, 1950. They explained that they resigned on the ground that the Dewan denied the Council opportunity to discuss important administrative questions. There was one member of the Council the representative of the Sikkim Praja Sammelan who did not attend any meeting of the Council as he contended that the Maharaja must go and Sikkim should be converted into a Chief Commissioner's State.

At the same time there was a proposal to hold general elections early in 1952 to constitute a Legislative Council. But no elections had been held till March 1952.

Dewan, J. S. Lall.

BHUTAN

Bhutan (area 18,000 sq. miles) is an autonomous Himalayan State, under the protectorate, in respect of foreign relations, of the Government of India, possessing a fertile soil and temperate climate. The population, computed to number about 300,000, are sturdy folk of Tibetan affinities; in recent times there has been a considerable Nepalese immigration in the foot-hill region. The capital is Bumthang.

The chief products are rice, Indian corn, millet, lac, wax, cloth, musk, elephants, ponies, chowries. Extensive and valuable forests exist. Guns and swords of quality steel are manufactured.

Though politically independent of Tibet Bhutan is susceptible to Tibetan influence; for the Bhutanese share the religion and culture of Tibet, and look to the Dalai Lama as their spiritual head. In former times, China exchanged presents with Bhutan, but did not establish effective suzerainty.

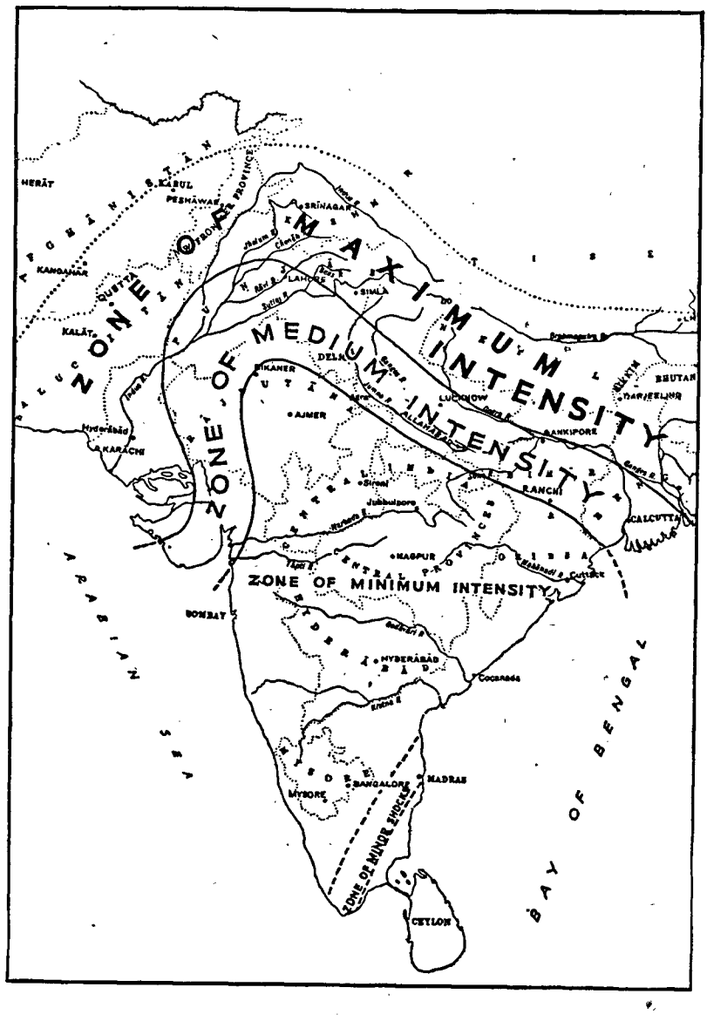
On the transfer of power in India in August 1947, the Bhutan Government entered into a standstill arrangement with the Government of India, pending the conclusion of negotiations.

Bhutan and India entered into a new treaty of friendship on 8th August 1949. Under the treaty, the Government of Bhutan continues to be guided by the Government of India in regard to its external relations. As a measure of goodwill, the Government of India have agreed to cede the territory known as Dewangiri to Bhutan and have raised their annual subsidy to Bhutan to Rs. 5 lakhs.

McMAHON LINE

There now remain the Assam border tribes—the Monbas, Lamai (Mijis), Nisu (Dafias), Abors and others—living between the administered border of Assam and the external frontier of India, in the region defined by agreement with Tibet in 1914 by Sir Henry McMahon and known as the McMahon line. Excepting the Abors, none of these tribe has given serious trouble.

In 1911 the murder of two Englishmen by the Minyong Abors made necessary an expedition to the Dihang valley of the Abor country; a force of 2,500 and about 400 military police was employed for six months in subduing the tribe. After two or three small actions the murderers were given up. At the same time friendly missions were sent to the Mishmi and Nisu countries. The border region is some of the most difficult country in the world and the maintenance of close contact with the tribes has always been far from easy.



In the hills between Assam and Burma various Naga tribes predominate from Manipur northwards, and tribes of the Chin-Lushei stock from Manipur southwards.

All these tribal areas are now an integral part of Assam with some sort of local autonomy for the tribes. There are provisions in the new constitution which make the welfare of the tribes a special responsibility of the Government. There is, for instance, an obligation on the State Governments to set up Tribal Advisory Councils.

In 1947, the Government of India approved a Five Year Development Plan for the tribal areas of the north-east frontier, a plan which contemplates the building of roads, schools and hospitals. Work on the plan commenced in the winter of 1947. Progress has been made in implementing schemes in relation to education agriculture, medical relief, etc.

MAP SHOWING THE EARTHQUAKE ZONES OF INDIA

By M. R. SAHNI,
Geological Survey of India. (After W. D. West.)

POPULATION*

MAJOR provisional figures about population obtained from the census carried out in February 1951 were placed before Parliament by the then Home Minister Mr. C. Rajagopalachari on April 14, 1951.

According to these figures the total population of India (exclusive of the State of Jammu and Kashmir and the tribal areas of Assam) is 356,891,624; males 183,384,807; and females 173,506,817. The population of Jammu and Kashmir is estimated at 4·37 millions (as on March 1, 1950) and that of the tribal areas of Assam 0·56 millions. The population of India including these two figures is thus 361·82 millions. The total number of displaced persons is given as 7,479,278. The increase in population during the period 1941–1951 is 42·06 millions that is to say 13·4 per cent.

The area of the country is 1,138,814 sq. miles, of Jammu and Kashmir 82,250 sq. miles.

These figures are, of course, subject to correction in the light of detailed scrutiny of census records. It is not, however, anticipated that any material variations will be found necessary. Detailed tables of population are given below. Final and complete results were to be published in the last quarter of 1952.

A comparative study of the population of the country with the rest of the world shows that India's population is 15·1 per cent. of the world population. India is second only to China whose population is 19·4 per cent. But while the land area in India is only 1,221,000 sq. miles that of China is more than three times as much. The total world population is estimated to be 2,386·81 millions.

Uttar Pradesh with 63 million people has the largest population. Next come Madras, Bihar, Bombay and West Bengal in that order. The Andaman and Nicobar Islands are at the bottom with a population of 30,963.

The population of the four biggest cities in India are as follows:—

Calcutta City—2,549,700
[Greater Calcutta—4,550,117]
Bombay—2,840,011
Delhi—1,743,992
Madras—1,429,985

Special attention may be drawn to some of the more outstanding features of the census records.

There are more men than women in India today. This masculine predominance is evident to a greater extent in the North than in the South.

The only exceptions are Madras, Travancore-Cochin; Orissa, Kutch and Manipur.

According to the 1951 census figures, the male population in Madras is about 28,400,000 compared with about 28,500,000 females. In Travancore-Cochin there are 1,007 women to every 1,000 men, while in Orissa, Kutch and Manipur, the female population exceeds the male respectively by 2·3, 7·7 and 3·4 per cent.

Physiologists believe that the predominance of the male population over the females is a trait peculiar to India, for mother nature has always been partial to the female.

A number of sociological reasons is adduced to account for the increased male population in India, and all of them centre on religion and superstition. For instance, sub-conscious neglect of the female child—or a conscious preference for the male—is given as one of the reasons. An average Indian family always prefers a male child to a female child.

Another theory advanced is heavy maternal mortality which is a direct consequence of child marriage or of the young age of those married.

Another interesting feature revealed by the census figures is that the percentage of increase in the total population in 1951—13·4 as against 14·3 registered in the 1941 census—is said to be a little less than the normal demographical stipulations.

The smaller percentage of the increase is attributed partly to prohibition of widow remarriage and partly to the purdah system in certain communities.

Delhi recorded the biggest increase in population, 90 per cent; Coorg is next with 35·5 per cent. Punjab is least with 0·4 per cent. though it must be remembered that this State today is less than half its original size in undivided India. The increase in West Bengal is recorded as 13·5 per cent which again on account of partition contains more people in a smaller area. The only area which registers a decrease is the Andaman and Nicobar Islands where the population has fallen from 33,768 in 1941 to 30,963 in 1951, a drop of 8·3 per cent.

The birth-rate for 1949 is 26·7 per mille, and the death-rate 16 per mille.

CENSUS OPERATIONS

A few particulars about the census itself may be useful. For the first time the census embraced the whole of India including the former Indian States, but excluding Jammu and Kashmir and the tribal areas of Assam. Jammu and Kashmir was omitted because of special conditions and the tribal areas of Assam because they had never been enumerated before.

The census began on February 9, 1951 and ended at sunrise on March 1, 1951. Persons who do not normally reside in houses such as members of wandering tribes, tramps, sadhus were enumerated wherever they were found during the night before March 1.

The operations were one of the biggest as well as the cheapest. About 600,000 enumerators took part and visited about 64 million houses. Except for the census superintendents and the staff engaged on tabulation everyone else was an honorary worker. These honorary workers included Government employees, employees of local bodies, teachers and boy scouts. There are about 55 tabulation offices and about 15,000 sorters and supervisors working for about a year or more until all the tables are complete. The operations which generally cost about a crore of rupees were expected to cost only about 20 lakhs, that is to say, about Rs. 43 per thousand of the population.

One vital difference between the 1951 census and all previous census is that caste and community distinctions would not figure as before except to the extent necessary for the purpose of Article 338 of the Constitution which provides safeguards to scheduled castes, scheduled tribes and Anglo-Indians, and of Article 340 which provides for the appointment of a Backward Classes Commission. The emphasis is laid on the economic aspects of the situation, such as the principal and subsidiary means of livelihood of the person, whether employer, employee or independent worker and so on. (A detailed analysis of the questionnaire is given below.) All this will combine to give a true picture of the living conditions of the people.

The census this time was important in two more respects. First it formed the basis for the delimitation of constituencies for the general elections at the end of 1951. It will also provide important data for the National Planning Commission in the preparation of their reports.

QUESTIONNAIRE

We may next pass to a general analysis of the questions that were asked during the enumeration.

The census questionnaire covered the entire International list drawn up by United Nations experts excepting a single item, namely, fertility data. Even this was covered by a local question included in the all-India questionnaire in two States (Bihar and Madhya Pradesh) with a total population of 70 millions. The twelve items of the International list, it may be mentioned are, (1) Total population; (2) Sex; (3) Age; (4) Marital Status; (5) Place of Birth; (6) Citizenship or Nationality; (7) Mother tongue; (8) Educational characteristics; (9) Fertility data; (10) Economic characteristics; (11) Urban and Rural population; and (12) Households (including relationship to Household Head).

In addition to the International list of 12 topics, the questionnaire asked three questions, of which the most important related to displaced persons. By this question Government hoped to find out how many displaced persons there were in the country, when they came, which districts of Pakistan they came from, where they were now living and what they were doing to earn their livelihood.

Two main and two subsidiary questions in the census questionnaire related to "economic status" and "means of livelihood". These questions were: Are you a self-supporting person or a non-earning dependent or an earning dependent? If you are a self-supporting person, are you an employer or an employee or an independent worker or none of these? What is the occupation or source of income which forms your principal means of livelihood? Have you a secondary means of livelihood? If so, what is it?

Whether one was a self-supporting person or an earning or a non-earning dependent would depend on whether the cost of one's maintenance was wholly or partly met by one's own income.

The census questionnaire did not contain any enquiry about either income or cost separately. What it attempted was to get data on the economic status of a person. If the total number of self-supporting persons was ascertained and the number of people who lived on unearned income were deducted from it, we would get the total of the economically active population. The census sought to obtain this figure as distinct from the figure for the economically passive and semi-active population. It also sought to determine the distribution of the economically active population in the different divisions and sub-divisions of the national economy, and also the actual number of other people who were dependent on each of those divisions and sub-divisions. Vague and general conceptions like "labour" or "service" were avoided, and specific answers were asked for.

The manner of recording agricultural livelihood, was different from that of non-agricultural livelihood. Instructions were given to classify agriculturists under four heads, *viz.*, (1) persons who cultivated land owned by themselves, (2) persons who cultivated land owned by another, (3) persons who were employed as labourers by another person who cultivated land and (4) persons who received rent in cash or kind in respect of land cultivated by another person.

These are general questions which were asked all over the country. There were also questions confined to particular States. For instance questions about unemployment were asked in the following twelve States:—U.P., Bombay, Punjab, Saurashtra, PEPSU, Mysore, Hyderabad, Delhi, Bilaspur, Himachal Pradesh, Kutch, and Vindhya Pradesh. Questions about previous occupation were asked in the 2 States of Madhya Bharat and Bhopal; about area of land owned and cultivated by each household in Orissa; about cultivation of land for which rent is paid in West Bengal; about land owned and rented by indigenous persons in the 3 States of Assam, Tripura and Manipur; about infirmities (incidence of diseases) in the 4 States of Madras, Coorg, Rajasthan and Ajmer; about fertility in the 2 States of Bihar and Madhya Pradesh. And about the duration of marriage and size of family in the State of Travancore-Cochin.

NATIONAL REGISTER

Simultaneously with the population census a census of small scale industries including cottage industries also took place. Only such undertakings as do not use mechanical power and employ less than 20 persons or those which use power but employ less than 10 fell within this category. The information collected included

*Provisional figures were published in 1951 April. Supplementary figures were not available at the time of going to press. We have, however, given a list of cities with a population of 100,000 and above. Where available figures for individual States have been given under each State.

EARTHQUAKES

THE sub-continent is divided geologically and therefore physiographically into three distinct and well-defined units. The northernmost unit consisting of sedimentary and crystalline rocks comprises the great mountain ranges of the Himalayas that were upraised, in comparatively recent times, geologically speaking, and are believed to be still undergoing elevation. They constitute the sub-continent's most unstable region and are therefore the seat of the most violent earthquakes. The north-south running mountains of Burma are components of the same mountain system, the Andaman and Nicobar Islands being their southern continuation, and Burma likewise pays the same penalty for their instability.

The southward push of these mountains caused a sinking of the Himalayan foreland—the region of the Indo-Gangetic basin, now filled with alluvium. This constitutes the second unit, and on account of its proximity to the restless mountains in the north, it shares, though in a lesser degree, the effects of the Himalayan earthquakes. But it also makes its own independent contribution of such catastrophies, as we know from the Bihar earthquake of January 1934.

The triangular portion of the Peninsula proper constitutes a stable landmass—a Horst—as the geologists call it—and is the third and most stable region in the sub continent, being comparatively free from any severe earthquakes. Only one earthquake which did any considerable damage has been recorded from this region (April 1843). From the apex of the Peninsula to Madras, however, runs a region of minor shocks, probably connected with some dislocation in the earth's crust, though there is no direct evidence of this.

These three units, then, constitute regions of decreasing intensity of earthquakes as we travel from north to south. They are indicated on the accompanying map, which is essentially the same as the one prepared by Dr. W. D. West of the Geological Survey of India.

During the year under review (1951) no earthquakes involving loss of life or damage to property were reported. However, fairly severe tremors lasting about one minute rocked Shillong on the 5th of August at 4-40 p.m. Similarly, shocks of moderate intensity were reported to have rocked Srinagar on the 13th September shortly after 2-15 p.m. and caused considerable panic. Shocks were felt also in the neighbouring territory of Pakistan. Dibrugarh and Tezpur experienced shocks of moderate intensity on 18th October, but no damage was done. A mild shock was recorded at Delhi on December 10 at 3-08 a.m. (I.S.T.) with its epicentre lying 90 miles away.

CAUSES

Nearly all the major earthquakes are almost invariably the result of movement along dislocations in the earth's crust—or "faults" as the geologists call them, and thrust planes.

A number of important faults run close to the southern edge of the Himalayas and the Himalayan foot is therefore a very unstable region. The most important of these is known as the Main Boundary Fault.

It may, however, be pointed out that it is only such 'faults' as are still active that give rise to earthquakes. Thus the faults in the Peninsular area appear to be now inert and therefore few earthquakes occur there. However some of these faults were probably active in remote geological times. Although the immediate cause of the shocks may be movement along a fault or faults (Kangra 1905) the ultimate cause is often the rapid denudation of steep ranges, which upsets the equilibrium of the earth in the readjustment of which these movements occur. The same result is achieved by the slipping of large alluvial masses in deltaic areas or their uplift owing to tectonic forces (Rangoon Dec. 1927). The regions where mountain ranges take sharp bends, being highly folded, are naturally areas of pent-up strains seeking relief and are therefore zones of great danger. The violent Quetta earthquake of 1935 and the earlier ones of Mach and Sharigh (1931) were of this nature, for these places lie near sharp bends in the Suleiman, Bugti or Kirthar ranges.

HISTORICAL REVIEW

Very little is known of the Indian earthquakes previous to the year 892 A.D. and accounts of the earlier of the recorded earthquakes are necessarily incomplete. T. Oldham has recorded the different sources of information of the earlier Indian earthquakes in his catalogue. Among the works in which records of Indian earthquakes later than 892 A.D. occur are the *Tárikhul Khulafá* (History of the Caliphs), the *Alkámil-fi-l Tárikh* by Ibnulathír—a historical work of the Arabians, the *Mir-át-ul-'Alam*, an unpublished work in the library of the Royal Asiatic Society of Bengal, *Baddoni* (Bibliotheca Indica), Bábar's memoirs, Khafi Khán's *Muntakhabullabáb*, etc.

Much information is also gleaned from the Journals of the Royal Asiatic Society of Bengal the *Philosophical Transactions*, etc. Accounts of the later earthquakes appear in detail in the records and memoirs of the Geological Survey of India, from which much of the information given here is drawn.

A chronological occurrence of the more important earthquakes may now be given.

The earliest earthquake authentically recorded in India took place about the close of the year 893 A.D. or early in 894 A.D., when Daibul or Daipul, an important town on the coast of the Indian Ocean was severely shaken and about 150,000 persons lost their lives. As noted by Oldham a record of this earthquake appears both in the *Tárikhul Khulafá* (History of the Caliphs) and in *Alkámil-fi-l Tárikh*.

The earthquake of July 6, 1505 affected Afghanistan and the northern part of the sub-continent. It is recorded that great fissures appeared in many parts and there were extensive landslips causing much damage and loss of life. In one day as many as 33 shocks were felt and continued for a whole month.

The State of Kashmir was shaken by an earthquake in 1552, but no details are available.

Several earthquakes of less intensity took place between the years 1618 and 1664. On the 26th of May, 1618, Bombay experienced an earthquake in which nearly two thousand lives were lost. The accompanying hurricane resulted in the destruction of several vessels. Lakhugar in Assam suffered an earthquake on February 7, 1663. Shocks were felt in certain parts of eastern Bengal for a period of 32 days during the year 1668.

The next earthquake of great intensity which affected the sub-continent occurred in May 1668, between the dates 2nd—11th. Its effect was so serious that Samáji or Samáwáni—a town of 30,000 inhabitants sank into the ground.

Following this terrible catastrophe there was a period of comparative quiescence for about 50 years. Upper India was however shaken by an earthquake on the '14 Muharam of Aurangzeb's 12th year' (*Mir-ut-ul-'Alam*, an unpublished work of Bakhtiwar Khan) that is, the 4th of June 1669. This earthquake was accompanied by a big shower of meteors, which, it is reported, fell into a lake and caused its waters to overflow.

Kashmir was affected by shocks on June 22, 1669 but not much damage appears to have been done.

Delhi Earthquakes.—A severe earthquake shook Delhi on Friday, July 17, 1720, at about midday and was accompanied by considerable damage to the fortress, Fatehpur Mosque and other property, as well as loss of life. It is reported that comparatively severe shocks continued for more than a month, so much so that the population of Delhi had to sleep out of doors during this period.

A violent earthquake accompanied by a hurricane of great intensity occurred in Calcutta and the delta of the Ganges in October 1737. It is reported that 20,000 craft plying in the Ganges were cast away, the steeple of a church sank completely into the ground, and 300,000 people lost their lives. It is further reported that 60 ton barques were blown two leagues up the river.

Bengal, Burma and the Arakan coast were affected on April 2, 1762. In fact it is reported that the emergence of the Arakan coast from the sea is due to this earthquake, but that is an obvious exaggeration, though partial elevation of the coastal strip probably occurred. It is stated that oysters were found attached to rocks forty feet above ground level.

Several shocks of varying intensity occurred in different parts of the sub-continent—Calcutta, Kashmir, Ongole and the upper reaches of the Ganges between July 13, 1762 and May 22, 1803, but they were not of much importance.

A violent earthquake took place on Sept. 1, 1803, affecting Mathura, Calcutta, Garhwal, Kumaon and Delhi. At Mathura the domes of several mosques erected by Ghazi Khan sank into the ground. Several villages were swallowed up in Garhwal.

This earthquake is noted for the fact that the upper portion of the famous Qutab Minar fell as a result of it, though it is also stated that the Minar was struck by lightning.

The earthquake of June 16, 1819 was one of the worst earthquakes experienced in the sub-continent. Its effect was the severest in Kutch, the chief town of which—Bhuj—was completely ruined and 2,000 persons perished. Ahmedabad, Broach, Surat and Poona were all affected.

In the western region of Kutch the town of Sindree and the neighbouring area was submerged as a result of tidal waves. A tract 51 miles wide was raised in front of a branch of the Indus and the river had to cut a fresh channel across it. This ridge is known to the local inhabitants as Allah Band, or God's Embankment.

One very severe shock followed by minor ones occurred on October 29, 1826 and resulted in several houses falling in Khatmandu and Patan, in Nepal.

Sometime in September 1827 the fort of Kolitaran, near Lahore, was destroyed and about 1,000 persons lost their lives. It is stated that a hill falling into the river Ravi resulted in extensive floods.

There is record of at least 80 earthquakes affecting the sub-continent between June 6, 1828 and the year 1839, but of these only two are worth mentioning, namely, the one that shook the vale of Kashmir on June 6, 1828 and the other that affected Nepal and the eastern and central region in the north. In Kashmir alone over a thousand persons lost their lives, and for at least two months following the earthquake the number of shocks was as high as one to two hundred per day.

The earthquake of August 26, 1833 was felt in Khatmandu (Nepal) and north Bihar. In Khatmandu alone 100 houses were levelled to the ground and a similar fate overtook other places. There was continuous agitation for full 24 hours.

The earthquake of February 19, 1842 lasted for about three minutes in Kabul and affected Peshawar, Jallalabad, etc. It was very destructive at Peshawar and one-third of the town of Jallalabad was destroyed. Hot springs at Sonah became cold and the amount of water also diminished. The area affected was about 216,000 square miles. The epicentral area was probably near Jallalabad.

Two earthquakes which affected the Deccan in March and April 1843 may be here recorded, for the Deccan, being a stable landmass, is rarely affected by earthquakes of any intensity. Sholapur, Maktal, Singrurgarh, Bellary, Kurnool, Belgaum were all affected and much damage was done. This is the only earthquake known in the Deccan which caused considerable damage. The epicentre was near Bellary.

An earthquake occurred on January 10, 1869 in Assam (Cachar). The total area where shocks were felt extended to 250,000 sq. miles.

A severe earthquake occurred in the Bay of Bengal on the morning of December 31, 1881. The radius of the area affected was about 800 miles, and the total area over which the shock was felt was in the neighbourhood of 2,000,000 square miles, most of it being sea. It was felt at Gaya, Hazaribagh, Agra, Ootacamund and Kozhikode (Calicut). The northernmost point affected was near Monghyr.

The earthquake of May 30, 1885 although comparatively mild, resulted in heavy loss of life and about 3,000 persons perished in Kashmir. The epicentre was a few miles west of Srinagar. The radius of felt area was 300–450 miles, the total area affected being about 110,000 square miles.

The epicentre of the earthquake of July 14, 1885 was north-west of Dacca. It was felt violently throughout East and West Bengal, but extended also into Chota Nagpur, Bihar, Sikkim, Bhutan and Assam. The area affected was approximately 230,400 square miles.

One of the worst earthquakes which has affected Assam and probably one of the greatest within historic times occurred on June 12, 1897. Stone buildings in Shillong, Goalpara, Gauhati, Nowgong and Sylhet were almost entirely destroyed everywhere and Calcutta was seriously affected. Over 1,600 lives were lost and the earthquake was felt in an area of 1,730,000 square miles. The earthquake was caused by a "movement along a thrust-plane or thrust-planes, and along secondary thrust and fault-planes, which had a maximum length of about 200 miles and a maximum width of about 50 miles." This movement was due to the relief of differential strains set up in the interior of the earth.

The district of Kangra in the Punjab suffered heavily on April 4, 1905, more particularly because the shocks occurred early in the morning when people were still asleep. There was heavy loss of life—20,000 persons having perished. The area affected was 1,625,000 square miles. Kangra and Dharamsala were completely destroyed. The main shock was from north to south, followed by an equally severe one from south to north. The earthquake is ascribed to movement along one of the reverse faults of the Himalayas.

A violent shock was felt on July 8, 1918 which affected East Bengal, Assam, Burma, and the north-west as far as Lahore. It was most strongly felt in Srimangal (Assam) where many tea estates were ruined. The total area over which it was felt was 800,000 square miles. This earthquake was due to subsidence along a fault. It was accompanied by pouring out of sand, mud and water from fissures created in the ground.

Assam was shaken by a severe earthquake on July 3, 1930, after about 12 years of comparative quiescence. The total area affected was about 350,000 square miles. The town of Dhubri suffered considerable damage, but fortunately no loss of life occurred. This was probably due to the fact that many houses were built of 'flexible superstructure supporting light, often galvanised iron roofs' and at that time of the year many persons were not sleeping in their houses.

The north Bihar earthquake of January 15, 1934 is still fresh in our minds. It was one of the most violent earthquakes that have affected the sub-continent. It is estimated that over 10,000 lives were lost and several crores worth of property was damaged. Sitamarhi, Madhubani, Monghyr, Patna, Jamalpur, Muzaffarpur, Darjeeling, etc., and the Nepal valley suffered heavily. The epicentre of this earthquake ran from near Motihari through Sitamarhi to Madhubani. The total area over which it was felt was 1,900,000 square miles. The earthquake is attributed to faults underlying the alluvium. It is fortunate that it occurred in the afternoon (about 2-15 p.m.), for had it occurred at night it would have been one of the worst of such disasters ever experienced by mankind.

Another severe earthquake to be experienced in the sub-continent occurred in the Hindu Kush on November 14, 1937, and was felt throughout the North-West Frontier Province, Kashmir, as well as largely over the two Punjabs, Uttar Pradesh, northern Sind and Baluchistan. Severe shocks were felt at Lahore, Rawalpindi, Peshawar, Kangra, Chitral and Drosh, and considerable damage was done. No loss of life was reported.

On May 3, 1938 two shocks were felt at intervals of about five seconds at Shillong in Assam, at 10-21 p.m. The shocks lasted for about 40 seconds. There was very little damage to property and no loss of life.

KASHMIR EARTHQUAKES

Mention must also be made of the earthquake of November 21, 1939, which was felt at Jammu, Mianwali, Dehra Ismail Khan, Peshawar, Rawalpindi, Srinagar, Dalhousie, Kabul, Gilgit, Skardu, etc. Its epicentre was in the Hindu Kush range being situated at 36° N. 75.5° E. Its focal depth was 200 kms.

The intensity of this earthquake at Srinagar and Gilgit was VII on the Mercali scale. At Srinagar three shocks were felt at intervals of 10 seconds each. Cracks developed in the walls of the Observatory and other buildings in the city. At Gilgit, which suffered three shocks at intervals of two seconds each, boulders slipped down from the surrounding mountains and dust spread all over the valley.

During 1940 earthquake shocks were felt at Gulmarg in Kashmir, at Barmer (Rajasthan) and at Bhuj and Radhanpur in western India.

At Gulmarg two shocks of moderate intensity were felt on August 3, at 14-45 (I.S.T.) and cracked walls of *kutcha* houses. Shocks of moderate intensity were also felt on August 8, and September 21, 1940, but apart from cracks in *kutcha* houses no damage was done. Barmer and Bhuj experienced a slight shock on October 31, while Bhuj had another shock on November 13, 1940.

There was no loss of life or serious damage to property during any of these earthquakes.

Another earthquake occurred on June 26, at 17-27 hours (I.S.T.). This earthquake whose epicentre lay in the neighbourhood of Nicobar Islands, was of very great intensity and was felt in Madras, Chittagong, Chandwadi, Colombo, etc. Extensive damage to buildings occurred in Port Blair where four persons were killed and four seriously injured. The duration of the shock was less than half a minute.

Three earthquakes of slight to moderate intensity were recorded during the year 1942. An earthquake of slight intensity with its epicentre in Assam was felt at 16-17 hours (I.S.T.) on February 22, in parts of old undivided Bengal and Assam. No loss of life or damage was reported. On March 22, a quake of moderate intensity was felt at 7-38 hours at Lahore and Rawalpindi in Pakistan and at Simla in India. The epicentre was in the Hindu Kush Mountains. A third earthquake of slight intensity was felt in parts of India on May 15, 1942 at 22-25 hours (I.S.T.). The epicentre lay in the Hindu Kush. There was no loss of life or damage to property.

Two shocks of slight intensity were felt at Srinagar in Kashmir and at Drosh in Chitral, on February 6, 1943, at intervals of 30 seconds. On February 9, an earthquake of slight intensity was felt in parts of Assam. Slight shocks were felt over a wide area—Rawalpindi, Muzaffarabad, D. I. Khan in Pakistan and Gauhati, Gulmarg and Srinagar in India on September 9, 1943, at 10-36 (I.S.T.). The epicentre of this earthquake was near the Hindu Kush Mountains. An earthquake of great intensity with epicentre in Assam was felt in parts of Assam and north Bengal, on October 23 at 23-54 (I.S.T.). Slight shocks were felt at D. I. Khan on November 27 at 15-15 (I.S.T.).

Although a large number of earthquakes have occurred during 1944-45, with the exception of one, they were all of comparatively small intensity. This latter had a higher intensity and was felt on December 25, 1944, at Silchar, Shillong and Calcutta, at about 9-25 p.m., (I.S.T.). At Silchar shocks were felt over a period of three minutes and several houses suffered damage. No damage was, however, reported from either Shillong or Calcutta.

On February 29, 1944, an earthquake of great intensity, with epicentre in the Maldive Islands was felt in the Ceylon region at 22-58 (I.S.T.). An earthquake of moderate intensity with epicentre near the Andaman Islands, was recorded on September 27, 1944. During 1944 further shocks were felt in different parts of India—Kashmir, Bihar, Assam—but none of them was of much importance.

Between January 1945 and March 1945 the reported shocks were all of small intensity and occurred in Nepal and Assam.

During 1946 also numerous earthquake shocks were experienced in various parts in the Republic of India but none of these appear to have caused any serious damage or loss of life. In India shocks of varying intensity were recorded at Digboi, in Assam (March 7, 1946), at Srinagar in Kashmir (February 25, 1946), at Jabalpur in Madhya Pradesh (January 19, 1946), at Dehra Dun in Uttar Pradesh (September 4, 1946), and at Faridpur (September 12, 1946) where the hitherto calm water of the river was agitated and rose to a height of 2 feet, the phenomenon being observable for 15 seconds.

No really severe earthquakes involving serious loss of life or property occurred in the Indian Republic during 1947 though shocks of varying intensity were recorded at Calcutta and other places.

ASSAM EARTHQUAKE

In 1950, however, a severe earthquake occurred, at 19 h. 39 m. 23 s. I.S.T. (14 h. 09 m. 23 s. G.M.T.) on August 15, in Assam. The seismological laboratory at Poona located the epicentre at Lat. 29° N and Long. - 97° E. From the extent of landslips it caused, it is presumed that the region extended further W.S.W. towards Abor Hills.

The main shock lasted for a period ranging from 4 to 8 minutes within the severely affected area. This was followed by a large number of aftershocks, those of August 16 to August 18, of September 13 and September 30, and of October 4 being fairly strong and recorded over wide areas. It is also presumed that the main shock created some dislocations along certain minor faults away from the epicentral zone and thus caused local earthquakes of minor intensity. In certain other areas the damage was found to be more severe in abandoned river beds, which are abundant in Assam and had often become populated.

Immediately after the earthquake several tributaries of the Brahmaputra were blocked by landslips, causing widespread floods. The most seriously affected river in this respect was the Subansiri. Landslips were widespread and a large area of the hill faces was rendered bare. Great damage was caused to railways, roads, bridges and brick buildings. Considering the severity of the earthquake, however, the loss of human life was comparatively small.

It is not possible to assess the total damage with any degree of accuracy but the following figures have been most often quoted:

extent—15,200 sq. miles.
number of persons affected—4,62,000.
loss of life—1,000.
dwelling houses damaged—100,000.
tea gardens damaged—6.
total estimated loss—rupees one crore.

The earthquake was regarded as one of the five worst in history with repercussions spreading over besides north and east Assam, south-east Tibet, north Burma and south-west China.

items like the name of the proprietor, nature of the business, number of owners of each establishment and whether the work is of a perennial or seasonal character.

The literates and illiterates will be categorized as follows: Those unable to read and write, those able to read but not able to write, those who can both read and write, and lastly those who have passed examinations and hold degrees. An item of some interest is that Sadhus and Sanyasis are to be classed under 'Religious and Charitable Service'. People without any permanent residence will fall under the category of vagrants.

There will in all be five kinds of tables, first general population tables, secondly economic tables showing among other things the people's means of livelihood and grouping them as employers, employees or independent workers, thirdly sample tables showing size of household, etc., fourthly social and cultural tables relating to language, religion, educational standards, scheduled castes and tribes, migrants, displaced persons and non-Indian nationals and fifthly tables giving summary figures for each district.

Of these only the population tables are ready and are given below.

At a later stage the Census Commission will prepare zonal population statistics based on people's food habits. There will be six zones, such as rice zone, wheat zone and so on. This will be done in order to help the Food Ministry in accurately assessing wheat, rice and other requirements of people in various areas.

All useful data collected during the census operations will be recorded in a national register. Relevant parts of this register will be kept in every tahsil or sub-division or ward as a permanent and confidential record of the inhabitants. It is also proposed to bring out a census handbook for every district which the State Governments have been requested to publish.

The State Governments have also been requested to include abstracts from these in school textbooks so that students could learn more about their region than they do at present.

GROWTH OF POPULATION.

Year.	Population (in millions).	Increase (in millions).	Percentage Increase.
1951 ..	356·89	42·06	+ 13·4
1941 ..	314·83	39·31	+ 14·3
1931 ..	275·52	27·34	+ 11·0
1921 ..	248·18	—0·87	— 0·3
1911 ..	249·05	13·55	+ 5·8
1901 ..	235·50	..	..

During the twenty years (1931-51), the number added to the population was three times as many as during the ten years (1921-31) and twice as many as during the thirty years (1901-31).

NOTE: The total number of displaced persons on March, 1951 in those areas covered by the 1951 census where no special census of Displaced Persons was taken in 1948 or 1949 is 74,838.

EARLIER CENSUS

Until the new tables of the 1951 census are ready one has still to depend on the findings of previous enquiries. It may be stated however that whatever changes the latest census may reveal will be of a marginal nature: the essential picture will be the same as presented below which is based on enquiries held before the 1951 census.

About 44 per cent. of the population was enumerated as workers in the census of 1931. Out of this about 67 per cent. was engaged in agriculture, 10·2 per cent. in mining and industry and the rest, 22·8 per cent. in trade, transport, etc.

Carrying the analysis of industry further, there are two types of industry, cottage industry and large-scale industry. About 90 per cent. of the total industrial population is engaged in small scale or cottage industry, and 10 per cent. in large-scale industry. The average monthly income varies from State to State. In Bombay the average income of a textile worker is about Rs. 1,210 a year.

Turning to agriculture, the amount of land available for cultivation is about 360 mlns. acres. The number of workers in agriculture which comprises cultivating owners, tenant cultivators, etc., was 66½ mlns. according to the census of 1931. Thus the amount of land per worker works out at 5½ acres. 70 per cent. of all farms are less than 5 acres each, and a good percentage are actually less than one acre each.

The following two tables show the average annual earnings of workers* in factories† in perennial industries:

Industry	1939	1945	1946¶	1947§
	Rs.	Rs.	Rs.	Rs.
Textiles (All)	293·5	613·7	624·5	773·7
Cotton	320·2	723·4	721·8	911·3

For fuller details see under 'Labour'.

PHYSICAL TYPES

There are six physical types in India. Indian manhood, in fact, varies considerably from place to place. No one, for instance, would confuse the main types, such as Gurkhas, Sikhs, Rajputs, Nagas, Tamils, etc., nor does it take long to carry the differentiation much farther. The typical inhabitants of India—the Dravidians—differ altogether from those of Northern Asia, and more nearly resemble the tribes of Malaya, Sumatra and Madagascar. Whatever may be their origin, it is certain that they have settled in India for countless ages and that their present physical characteristics have been evolved locally. In the north-west they have been displaced by successive hordes of invaders, including Aryans, Scythians, Pathans and Moghals, and in the north-east by Mongoloid tribes allied to those of Burma. Between these foreign elements and the pure Dravidians is a borderland where the contiguous races have intermingled.

The people of India are generally divided into six main physical types. There would be seven if the Andamanese were included, but this tiny group of Negritos may be disregarded.

The Indo-Aryan type is found in the Punjab, Rajasthan and Kashmir, and has as its characteristic members the Rajputs, Khattris, and Jats. This type approaches most closely the traditional Aryan type which colonised the sub-continent. The stature is mostly tall; complexion fair; eyes dark; hair on face plentiful, head long; nose narrow and prominent but not specially long.

The Scytho-Dravidian type comprises the Maratha Brahmans, the Kunbis, and the Coorgs of Western India. It is formed probably by a mixture of Scythian and Dravidian elements. This type is distinguished by a lower stature, a greater length of head, a higher nasal index, a shorter nose, and a lower orbito-nasal index than the Aryan. All of these characters, except perhaps the last, may be due to an intermixture of varying degree with the Dravidians. In the higher groups the amount of crossing seems to have been slight; in the lower Dravidian elements are more pronounced.

The Aryo-Dravidian or Hindustani type is found in Uttar Pradesh (U.P.) in parts of Rajasthan and in Bihar and is represented in its upper strata by the Hindustani Brahman and in its lower by the Chamar. This type is probably the result of the intermixture, in varying proportions of the Indo-Aryan and Dravidian types. The head-form is long with a tendency to medium. the complexion varies from lightish brown to black; the nose ranges from medium to broad, being always broader than among the Indo-Aryans; the stature is lower than in the latter group and usually below the average according to the scale. The higher representatives of this type approach the Indo-Aryans while the lower members are in many respects not very far removed from the Dravidians. The type is essentially a mixed one, yet its characteristics are readily definable, and no one would take even an upper class Hindustani for a pure Indo-Aryan or a Chamar for a genuine Dravidian. The distinctive feature of the type, the character which gives the real clue to its origin and stamps the Aryo-Dravidian as racially different from the Indo-Aryan is to be found in the proportion of the nose.

The Mongolo-Dravidian, or Bengali type of lower West Bengal and Orissa, comprising the Bengal Brahmins and Kyasthas and other groups is peculiar to this part of India. This type is a blend of Dravidian and Mongoloid elements, with a strain of Indo-Aryan blood in the higher groups. The head is broad; the complexion is dark; hair on face usually plentiful; stature medium; nose medium, with a tendency to broad. This is one of the most distinctive types in India, members may be recognised at a glance. Within its own habitat the type extends to the Himalayas on the north and to Assam on the east, and probably includes the bulk of the population of Orissa, the western limit coinciding approximately with the hilly country of Chota Nagpur and West Bengal.

The Mongoloid type of the Himalayas, Nepal and Assam is represented by the Kanets of Lahul and Kulu; the Lepchas of Darjeeling and Sikkim; the Limbus, Murmis and Gurungs of Nepal; and the Bodo of Assam. The head is broad; the complexion is dark, with a yellow tinge; hair on face scanty; stature short or below average; nose fine to broad; face characteristically flat; eyelids often oblique.

The Dravidian type extends from Ceylon to the valley of the Ganges and pervades Madras, Hyderabad, Madhya Pradesh (C.P.), most of central India and Chota Nagpur. Its most characteristic representatives are the Paniyans of Malabar and the Santals of Chota Nagpur.

Probably this was the original type of the population of India, now modified to a varying extent by the admixture of Aryan, Scythian, and Mongoloid elements. In typical specimens of this type the stature is short or below mean; the complexion very dark, approaching black; hair plentiful, with an occasional tendency to curl; eyes dark; head long; nose very broad, sometimes depressed at the root, but not so as to make the face appear flat. This race, the most primitive of the Indian types, occupies the oldest geological formation in India, the medley of forest clad ranges, terraced plateau, and undulating plains which stretch roughly speaking, from the Vindhyas to Cape Comorin. On the east and the west of the peninsular area the domain of the Dravidian is coterminous with the Ghats, while further north it reaches on one side to the Aravallis, and on the other to the Rajmahal Hills. Where the original characteristics have been unchanged by contact with Indo-Aryan or Mongoloid people, the type is remarkably uniform and distinctive. The Dravidian is a hard labourer and is found wherever there is demand for hard manual labour whether hoeing tea in Assam, the Duars, or Ceylon, or doing scavenger's work in the streets of Calcutta, Rangoon and Singapore; he is recognizable at a glance by his black skin, his squat figure, and the negro-like proportion of his nose. In the upper strata of the vast social deposit which is here treated as Dravidian these typical characteristics tend to thin and disappear, but even among them traces of the original stock survive in varying degrees.

RELIGION, COMMUNITY

The table below shows the distribution of population by community in the Indian Union according to the 1941 census:—

States	Total Population	Hindus	Muslims	Buddhists	Sikhs	Indian Christians	Parsis	Anglo-Indians	Jains	Tribes	Rest
	(*In thousands*)										
India	3,18,776	2,39,381	42,691		4,112	5,635			1,433	24,754	755
Assam	7,685	3,262	1,754		4	36			6	2,607	16
Bihar	36,546	26,607	4,719		13	25			5	5,165	11

LANGUAGES

A note on language will not be out of place here. According to a linguistic survey no fewer than 250 languages are spoken in India. But they all fall into four main groups, the Munda languages, the Dravidian languages, the Indo-Aryan languages and the Tibeto-Chinese languages.

The Munda languages are spoken by the pre-Dravidian inhabitants of India now confined chiefly to the hills and jungles of the Chota Nagpur plateau.

The principal Dravidian languages, Tamil, Telugu, Malayalam, Kanarese and Tulu have a much wider distribution. Once they were spoken over the whole of India. Now they are limited to peninsular India. The last-named language Tulu is indeed spoken in just one district in the whole country, *viz.*, South Canara in the Madras State.

The Indo-Aryan languages were introduced by the invaders coming from the north-west. But the languages have now spread over the whole of the north and have penetrated further south than the Vindhyas. Going east we find Pahari, Lahnda, Punjabi, Kashmiri, Hindi, Bihari, Oriya and Bengali. Going south we find Rajasthani, Gujarati and Marathi. Another language which is generally grouped with Hindi is Urdu. Urdu was born in the bazaars of the northern parts of the sub-continent when the Moghul soldiers came into touch with the local population. Urdu may be called Persianized Hindi and is widely spoken by the Muslims in the north and in certain areas by the Hindus as well.

The Tibeto-Chinese languages are not important as they are confined wholly to Himalayan hill tribes such as Lepchas.

The following figures (based on the 1941 census) are intended to give some idea of the distribution in the sub-continent of the various languages mentioned above:—

Hindi	79,000,000
Bengali	54,000,000
Telugu	26,000,000
Marathi	21,000,000
Tamil	20,000,000
Punjabi	16,000,000
Rajasthani	14,000,000
Kanarese	12,000,000
Oriya	11,000,000
Gujarati	11,000,000
Malayalam	10,000,000
Sindhi	4,000,000
Assamese	2,000,000
Kashmiri	1,500,000
Munda languages	4,000,000

Literacy according to the 1941 census was very low, being only about 12 per cent.

URBAN AND RURAL

Passing next to the question of the distribution of population between urban and rural areas we find from the 1941 census that the percentage of the urban population to the rural is about 15, which shows an increase of 3 per cent. over the 1931 census due partly to natural increase and partly to migration from rural areas.

The percentage of urban population ranges from 3 in Assam to 24.0 in Bombay which is the most urbanized of the major States. The absolute figures for the major States are given in a table further or while the table showing the percentage of urban population is given below:—

INDIAN REPUBLIC

	Percentage of urban population.
Madras	15·97
Bombay	23·92
Bengal, West	21·76
Uttar Pradesh (U.P.)	12·46
Punjab	15·09
Bihar	5·37
Madhya Pradesh	11·29
Assam	3·0
Orissa	2·99
Ajmer	36·68
Coorg	0·06
Andaman and Nicobar Islands	..
Bilaspur	2·6
Kutch	18·0
Delhi	75·78
Himachal Pradesh	3·4
Madhya Bharat	15·33
PEPSU	14·57
Saurashtra	25·6
Vindhya Pradesh	5·49
Bhopal	17·72
Hyderabad	13·4
Kashmir	10·3
Mysore	18·4

India is so often referred to as a land of villages that one is apt to overlook the real dimensions of the urban population. It is true that only about 15 per cent. of the population is urban; but then it is a 15 per cent. of 356 mlns. (1951 census) which works out to a total of about 53 mlns., that is to say, 3 mlns. more than the population of Britain which is always referred to as a highly urbanized country.

Here is a list of cities with a population of over 100,000 according to the 1951 census. The total number of such citie. is 73. And the total number of people living in them is 24,635,464.

City.	Population 1951.	Population 1941.	Population 1931.
Calcutta with Howrah ..	2,992,997	2,488,083	1,388,644

It is interesting to note how the urban element has gradually risen over a number of years from 1921. Here is a short table which makes the trend in the Indian Republic quite clear.

INDIAN REPUBLIC

Year	Rural	Urban
1921	88·7	11·3
1931	87·9	12·1
1941	86·1	13·9

On any showing India is in for urbanization on a big scale, which will affect more pronouncedly really large towns than the smaller ones. Much of this urbanization is attended by the usual evils of lack of control, squatters' freedom and general squalor. The approach to some of the fast growing towns like Delhi or Calcutta are hideously defaced by brick-fields, squatters' camps and general riff-raff. The matter of the spreading town cries aloud for a plan.

The rate of growth is much higher in the larger units than in the smaller ones. Reasons: First, industrialization which has for instance largely created Coimbatore as a modern phenomenon. The case of Coimbatore is interesting as it is the first striking instance of a large town based on electric and not steam power.

A contributory cause of the growth of large towns is the fact that city life has begun to appeal to the middle and lower middle classes in India. Accommodation which is within their means and to their taste is now available. There are the huge blocks of flats with such amenities as electric lights and running water which have altered the face of cities like Bombay and Calcutta. Other city features like trams, buses, cinemas also appeal. Education is not only better in the towns it is sometimes not available in the rural areas. Thus housing, transport, and the sheer conveniences of life in the city have led to a steady stream of migration into the larger towns of India. During the war owing to the enormous demand for manual and clerical work, the stream of migration became a flood which overwhelmed cities like Bombay, Calcutta and Delhi.

AGE GROUPING

Though the following analysis is based on the 1931 census it would be broadly true of the present situation as well.

Another way of grouping the population and one which is very important from an economic point of view, is by age. The table below shows the age distribution of 10,000 males and females of the population of the sub-continent by 10-yearly age-groups at the 1931 census.

Age-groups	1931		1921	
	Males	Females	Males	Females
10-20 ..	2,086	2,062	2,087	1,896
20-30 ..	1,768	1,856	1,640	1,766
30-40 ..	1,431	1,351	1,461	1,839
40-50 ..	968	891	1,013	967
50-60 ..	561	545	619	606
60-70 ..	269	281	347	377
70 and over ..	115	125	160	180
Mean age	23.2	22.8	24.8	24.7

If we were interpreting the same figures as a ratio we should set out the position as follows:

Age-Period	Male	Female
1-4 ..	14.7	15.9
5-9 ..	13.2	12.8
10-14 ..	12.0	11.9
15-19 ..	8.9	9.4
20-24 ..	9.1	9.8
25-29 ..	8.6	8.7
30-34 ..	7.9	7.6
35-39 ..	6.4	5.9
40-44 ..	5.5	5.0
45-49 ..	4 2	3.9
50-54 ..	3.3	3.2
55-59 ..	2.3	2.3
60-64 ..	1.8	1.9
65 ..	2.1	2.3

The table makes it quite clear that the population of the sub-continent is a very young population.

One reason for grouping the inhabitants of a country by age is to show the size of its working population, that is to say, that part of the population which is engaged in producing wealth. Other things being equal, the larger the size of the working population the bigger the national dividend.

Now if we assume the working age of the population in the sub-continent is 15 to 60 about 44% of the aggregate population could be classed as workers. 'Aggregate' because in India or Pakistan women in the lower classes at any rate usually join the men-folk in their work and so can be classed as workers. In the rural areas this practice whereby women join the men in their work is probably universal. At the 1931 census, for instance, it was found that for every 1,000 men there were as many as 465 women workers. But the percentage of the working population high as it is, is actually less than the percentage for England and Wales which is 47%. If we take males only the disparity is still higher—57% as against 63%. It becomes higher still, if we extend the working age of the English people to 64—68%. Thus in the race for production India and Pakistan are handicapped as against a European country because of the age composition of their population.

The national dividend is influenced not merely by the percentage of the working population but also by the working period. Consider the following facts, for instance. Out of every 1,000 males born in the sub-continent only 541 survive to enter the working period. Out of these 541 again only 14 survive to reach the age of 60. So out of a theoretical maximum of 45 years of working life a person of 15 in India or Pakistan can expect to get only 30, while a European can look forward to 40 years of working life. The whole argument, in short, leads to two conclusions; One, the sub-continent has a smaller proportion of people in the working age, and for every person, reaching the working age the working period which is available is also much shorter.

BIRTH-RATE

The following discussion is also based on reports previous to the 1951 census.

The size of the population depends upon a country's birth and death-rates, that is by the number of births and of deaths per thousand of its population. The following table shows the birth and mortality rates for the sub-continent from 1920 to 1946 and for India alone for 1947 and 1948:

Year	Birth-rate	Death-rate	Infant mortality
1920 ..	33	31	195
1921 ..	32	31	198
1922 ..	32	24	175
1923 ..	34	25	176
1924 ..	33	28	189
1925 ..	32	24	174
1926 ..	33	25	189
1927 ..	33	23	167
1928 ..	34	24	173
1929 ..	33	24	178
1930 ..	33	25	189
1931 ..	35	25	179
1932 ..	34	22	169
1933 ..	36	23	171
1934 ..	34	25	187
1935 ..	35	24	164
1936 ..	36	23	162
1937 ..	35	22	162
1938 ..	34	24	167
1939 ..	34	22	156
1940 ..	33	22	160
1941 ..	32·1	21·9	158
1942 ..	29·5	21·4	163
1943 ..	26·1	23·9	165
1944 ..	25·8	24·5	169
1945 ..	28·0	22·1	151
1946 ..	28·9	18·7	136
1947* ..	26·6	19·7	146
1948* ..	25·4	17·1	130·9

* Relates to India after partition.

Let us take the question of the birth-rate first. The officially recorded birth-rate for 1948 was 25·4, but this is known to be an underestimate for in a backward country like India about a third of the births are likely to go unregistered, so that we would not be far wrong if we assumed that the actual birth-rate was in the neighbourhood of 35 or 36 per thousand.

Now a birth-rate of 35 or 36 is one of the highest in the world and about 16 points less than the highest possible—52. There are a few countries including Palestine whose birth-rate is higher but they are all among the smaller countries. The birth-rate of the more important countries are far below 35 and in the most advanced of them the birth-rate is as low as 20 or even 15. If we restate the same position in absolute numbers, about 1,250,000 babies were born every year from 1920-1940 in the sub-continent. Of these only a third lived to be 30, while a fourth died before they were one year old.

Reproductive Capacity.—Now the birth-rate of a people depends among other things on three important factors: the number of women of child-bearing age in the community, the number of women of child-bearing age who are married, and the age at which the women generally marry, for fertility rate is higher in the first half of the child-bearing age than in the second half.

Let us consider the position statistically first. The following table gives the proportion of women in each group per 10,000 women according to the 1931 census:

Ages	1931 per 10,000	1921 per 10,000
5-9 ..	1,280	1,494
10-14 ..	1,124	1,081
15-19 ..	938	815
20-24 ..	985	881
25-29 ..	868	885
30-34 ..	756	833
35-39 ..	595	565
40-44 ..	505	621
45-49 ..	389	346

If we assume that the reproductive period of women in the sub-continent ranges from 15 to 45 we find that for every 10,000 women there are about 5,036 women of child-bearing age, 46.47%. Converting this into absolute numbers we find there were about 75.4 mlns. women in the sub-continent in 1931 in the age-group 15-45 compared with 79.9 mlns. men. Women fell short of men by about 4·5 mlns.

In a number of European countries, on the other hand, England for instance, women are always in excess of men. In this particular age-group in England the excess of women over men is about 1.7 mlns. At first sight therefore the sex ratio in the sub-continent, would appear to be unfavourable from the reproduction point of view. But actually the sex ratio has not affected reproductive capacity because the men in the sub-continent were (and still) in the habit of finding their wives from a much wider age-group than elsewhere and were not averse to marrying much below their age.

Again we have assumed the reproductive period of women in the sub-continent to be from 15-45. Actually, there is a great deal of evidence to show that the period starts at least two years earlier at the age of 13; but then as it also ends two years below 45 it is not necessary to make any adjustments: the variacase, we have no figures except for five year age periods on which to base any calculations.

Incidence of Marriage—A second factor which influences reproductive capacity is the number of women of child-bearing age who are married.

Here is a table which gives the proportion of married women per thousand women at the same ages:

Ages	1931 per thousand	1921 per thousand
15-20 ..	818	771
20-25 ..	886	877
25-30 ..	869	863
30-35 ..	824	797
35-40 ..	703	727
40-45 ..	627	599
45-50 ..	473	527

In 1931, that is to say, about 49.3% of women were recorded as married. The corresponding figure for England and Wales was 41.3. The reason for the disparity between the figures for the sub-continent and those for England is that there are more men than women in the sub-continent, and marriages are mostly arranged by parents so that it is rarely that a marriageable girl goes unmarried. Also in the sub-continent people marry very young. The following table gives the number of unmarried women for every 1,000 women in the different age-groups:

Age	Unmarried per 1000
0-4	969
5-9	802
10-14	609
15-19	148
20-29	44
30-39	17
40-60	11
60 and over	11

Only 1% of the women are unmarried by the time they reach 60 which compares favourably with 13.6% in England and Wales. Notice the fall from the age-group 15-19 to the age-group 20-20. By the time they are 29 almost all marriageable girls are married.

Fertility Rate—There is yet another point which has to be taken into account when calculating the reproductive capacity of a people. In the child-bearing period itself the frequency of child-bearing varies from age to age. The earlier years, and 15-25 particularly, are markedly more fertile than the later ones in the reproductive span, so that distribution by age of reproductive women is as important as the proportion which the women in the aggregate bear to the total population. When we look up the appropriate table we find that the first half of the reproductive period contains as many as 60% of women of child-bearing age. The corresponding figure for England is 53.5%.

To sum up, about 80% of the women in the age-group 15-45 are married and of these 64% are in the age-group 15-30 when the rate of fertility is very high.

That brings us to the last of the elements which go to make up reproductive capacity—the rate of fertility. Fertility rate is different from birth-rate. Birth-rate is the number of children born per thousand of a people. Fertility rate is the frequency of births among the women. The fertility rate only shows how prolific the women are.

The only data which we possess (we are writing at a time when the findings of the 1951 census are not yet public) for calculating fertility rate for the sub-continent relate to Cochin and Travancore but then these data can be taken as representative for the sub-continent as a whole. The following table gives the fertility rates for married women in Cochin and also for purposes of comparison those for married women in England and Wales:—

Age period	Cochin	England and Wales
15-19	224	372
20-24	249	267
25-29	253	187
30-34	246	127
35-39	182	81
40-44	120	33
Total Fertility	6,370	5,335

Thus we find that while the disparity between the birth-rates in the sub-continent and in England is very great the disparity between the fertility rates is very narrow. The average woman in India or Pakistan leaves about 6 children behind her while the average English woman leaves about 5. Contrary to general impression the Indian or Pakistani woman is not very much more fecund than the English woman. And if we consider certain national habits like the use of contraceptives, for instance, it may turn out that the Indian or Pakistani woman is actually less fecund than the English woman.

A second point which we notice is that the fertility rate among English women varies more sharply from age-group to age-group than the fertility rate among women in the sub-continent. The fertility rate among English women belonging to the first age-group, is more than ten times that among English women belonging to the last age-group, while the corresponding ratio for Indian or Pakistani women is only 2.

DEATH-RATE

So far we have been concerned with the question of birth-rate and allied problems. But the population of a country depends not only on its birth-rate but also on its death-rate. The death-rate indeed affects the aggregate population in a double sense. In the first place it reduces the number of people who are living, and secondly it reduces future accretion by killing off potential mothers. The effects of mortality must therefore be studied in both these aspects.

The death-rate and the infant mortality rate have already been given in a previous table. For purposes of comparison the death-rate for the sub-continent may be set out once again along with the death-rates for a number of other countries *.

	1911-13	1921-25	1926-30	1931-35	1936	1937	1938	1939
Sub-continent	29.0	26.0	23.5	24.3	22.6	22.4	24.3	21.1
Germany	14.8	13.3	11.2	11.8	11.8	11.7	11.6	12.3
France	19·7	17·2	15·7	16·8	15·3	15·0	15·4	15·3
U.K.	14.2	12.4	12.5	12.3	12.3	12.8	11.8	12.2
U.S.A.	14.1	11.8	10.9	11.8	11.6	11.3	10.6	10.6
Australia	10.9	9.5	9.0	9.3	9.5	9.4	9.6	9.9
Japan	20.7	21.7	17.8	19.3	17.6	19.1	17.6	17.6

* See also under 'Public Health'.

Even as it is the death-rate in the sub-continent is high. But these figures are really not comparable for while vital statistics are very accurate in every one of the countries cited above they are notoriously defective in India or Pakistan. It is difficult to say how faulty the figures are but according to one estimate an average death-rate of 33 for the sub-continent would be near enough. Assuming that is so we have a death-rate in India or Pakistan which is nearly double that of Japan, a little more than double that of France, and over three times that of Australia.

If instead of converting the figure into a ratio we simply put down the total number of deaths in India and Pakistan, we will get some idea of the enormous scale of Indian mortality. The average recorded deaths per year in the sub-continent from 1921-1938 were 6.40 mlns. But the total actual deaths were probably in excess of 8 mlns. Compare this with the scale of mortality in Europe. The total number of deaths per year in Europe minus Russia was 5.28 mlns. This means that in the years between 1921 and 1938 about 54 mlns. more people died in India and Pakistan than in Europe minus Russia. Or to put it differently about the same number of people died in the sub-continent between 1921 and 1938 as the population of Britain and Canada taken together.

Distribution of Death-Rate:—Not only is the death-rate in the sub-continent high but the distribution of death according to age and sex is not very favourable either. Consider the figures for deaths per 10,000 of either sex given in the table below:

Age group	Male	Female	Female as percentage of male
0–1 ..	1,844	1,671	95·5
1–4 ..	376	346	92.0
5–9 ..	100	99	99.0
10–14 ..	63	63	100.0
15–19 ..	89	106	119.0
20–29 ..	95	119	125.3
30–39 ..	126	113	105.6
40–49 ..	187	163	87.2
50–59 ..	318	283	89.0
All ages ..	236	119	..

As we have already said the death-rate in the sub-continent is high all along the scale. It is very high among first year infants—about 20% of them die every year, 60% of them in the first week after birth. In the second age-group the death-rate comes down but compared with European standards it is still very high. Then from 5 year onwards it continues to fall till the 10-14 age-group is reached when it starts rising again till it reaches the climax in the 50-59 and over group.

Now considering the same figures from the point of view of sex distribution we find that during infancy and childhood the female death-rate is lower than the male. In the 10-14 age-group it is about equal. Then the female death-rate begins to overtake the male. In the age-group 15-29 the female death-rate is higher. Then it begins to fall below that of the male, and thenceforth is always lower than the male.

Thus we find that the odds against women are specially high in the reproductive age which means that maternal mortality is abnormally high in the sub-continent. There are no records for maternity mortality for the sub-continent as a whole. But two enquiries, one made in 1933 and the other in 1936 reveal that the average mortality rate might be in the neighbourhood of 24 per thousand births. That is to say, the maternal death-rate in the sub-continent is about eight times as high as that in England and Wales.

Effect on Income—The incidence of mortality in the sub-continent specially the distribution by age greatly hampers economic advancement. The reason for this will be clear if we follow the progress of a group of 1,000 newly born babies and see what happens as they move from infancy to old age through youth and manhood. The following table shows how many of a group of 1,000 babies survive through successive stages to contribute to the country's economic wealth.

Age	Sub-continent		England	
	Males	Females	Males	Females
1 ..	751	768	928	945
5 ..	602	628	901	920
10 ..	565	593	890	911
15 ..	541	568	883	904
20 ..	512	528	872	894
25 ..	478	479	858	881
30 ..	439	427	844	868
35 ..	395	373	829	853
40 ..	346	318	809	837
45 ..	294	264	784	817
50 ..	243	215	750	790
60 ..	149	132	636	702
70 ..	70	66	434	531

Interpreting the figures we find that about 250 people have died before the first year is reached. By the age of 5 another 150 have dropped out. With the age of 20 when a person is mature enough to take a hand in the business of production only about half are left. And in the age-group 25-50 which period represents the major part of a man's working life there are on an average only about 360 people to shoulder the whole burden.

If we now turn to conditions in England we see how different the picture is. After the first five years are over, the loss is insignificant. And in the age group which is most crucial for the present purpose there are as many as 750 men out of the original 1,000 to enter into the business of production.

Applying the same analysis to the incidence of mortality among women about 450 die before they enter the reproduction stage, and of those who enter the reproduction stage only 346 live through the whole of it. Second, the heavy mortality among women in the child-bearing age leads to scarcity of partners for married life. One way in which this difficulty is circumvented is by forming unequal partnerships, unequal in the sense that the difference in age between a husband and wife is very great. Though this situation leaves little scope for spinsterhood among women it produces a great number of widows. In 1931 as many as 15.5% of all women in the sub-continent were recorded as widows while the corresponding percentage in England was only 8.7. The incidence of widowhood is particularly high in the reproductive stage—about 14%. Going up the scale we find that as the proportion of spinsters diminishes the proportion of widows increases.

Causes of Mortality—We can wind up this section with a short note on the chief causes of mortality in the sub-continent.

The overwhelming majority of deaths are caused by such typical tropical diseases as small-pox, typhoid, dysenteries, cholera and malaria. Tuberculosis which is one of the biggest killers in the larger cities continues to spread. Malnutrition and nutritional diseases are very common. This is no surprise considering the general poverty of the people. In fact, it would be no exaggeration to say that poverty and the consequent lack of vitality and resisting power are the root cause of the overwhelming majority of deaths from diseases in the sub-continent. Remedies for most of the diseases mentioned above exist but no medicine can be of any help where a patient has little or no reserves on which he can call in time of danger. This is the chief reason why in a general campaign against disease measures aimed at raising the average income of the citizen will bring in a quicker return than an extension of medical facilities. In other words, the most import single disease which has to be fought and overcome in the sub-continent is poverty.

The figures below are for the larger cities like Calcutta, Bombay or Madras because they are generally more accurate than figures for the smaller towns or rural areas. Here is a table which shows the specific death-rates per thousand for Calcutta, Bombay and Madras for 1949.

—	Calcutta	Bombay	Madras
Tuberculosis	120	113	69
Dysentery and Diarrhœa ..	156	79	301
Typhoid ..	58	53	10
Cholera ..	84	0.0	19

Turning to infant mortality figures in the larger towns we find that there has been on the whole some improvement as the following table shows:

City	1935	1936	1937	1938	1939	1940	1941	1942	1943	1944	1945	1946	1947
Bombay	248	250·2	246·3	267·9	212·2	201·5	211·4	95·1	197·4	203·0	190·4	195·4	166·6
Calcutta	239	241·6	252·7	218·6	205·4	212·5	..	166·8	427·7	429·8	288·6	243·4	269·3
Madras	227	218·3	223·8	222·1	241·6	205·7	208·9	196·8	247·3	284·3	213·8	183·0	196·0
Lucknow	224	224·4	223·5	226·4	212·2	214·4	134·3	210·0	189·0	174·7	204·7	165·4	188·5
Nagpur	261	283·5	234·6	264·2	226·2	294·6	218·8	275·5	201·9	228·0	275·1	194·0	286·8
Delhi	196	170·0	187·4	156·0	169·9	173·8	185·9	177·3	196·0	186·0	154·0	146·6	178·0
Ahmedabad	280	303·4	280·2	283·0	267·4	310·2	133·2	293·1	263·5	277·5	186·5	235·9	239·5

Special causes contribute to the high mortality of infants in the sub-continent.

Owing to the custom of early marriage, cohabitation and child birth commonly take place before the woman is physically mature and this, combined with the primitive and insanitary methods of midwifery, seriously affects the health and vitality of the mother and through her of the child. If the child survives the prenatal and natal chances of congenital debility and the risks of child birth, it is exposed to the dangers of death in the early months of life from diarrhœa or dysentery. According to the Executive Health Officer of Bombay City, by far the greater number of infantile deaths are due to infantile debility and malformation, including premature birth, with respiratory diseases coming next, then convulsions, then diarrhœa and enteritis.

There has been some reduction in the general rate of mortality due to specific diseases over the last three decades:

Year	Cholera	Small-pox	Plague
1920 ..	0.6	0.4	0.4
1925 ..	0.5	0.3	0.5
1930 ..	1.3	0.3	0.3
1931 ..	0.9	0.1	0.2
1932 ..	0.3	0.2	0.2
1933 ..	0.3	0.4	0.2
1934 ..	0.8	0.3	0.3
1935 ..	0.8	0.3	0.1
1936 ..	0·6	0·4	0·04
1937 ..	0.4	0.2	0.1
1938 ..	0.9	0.1	0.06
1939 ..	0.4	0.2	0.1
1940 ..	0.3	0.3	0.7
1941 ..	0·8	0·2	0·04
1942 ..	0·7	0·09	0·04
1943 ..	1·5	0·2	0·05
1944 ..	1·0	0·7	0·07
1945 ..	0·9	0·4	0·09
1946 ..	0·5	0·2	0·1
1947* ..	0·4	0·1	0·3

* After partition.

N.B.—Part of this section is based on D. Ghosh's *Pressure of Population and Economic Efficiency in India* which represents some of the latest work done in this field. The figures for languages were taken from Dudley Stamp's "Geography."

For more statistics on population see under States.

Manners and Customs

Next to the complexion of the people, which varies from fair to black, the tourist's attention in India is drawn to their dress and personal decoration. In its simplest form the dress of a Hindu consists of a piece of cloth round the loins. Many an ascetic, who regards dress as a luxury, wears nothing more, and he would dispense with even so much if the police allowed him to. The Muslim always covers his legs, generally with trousers, sometimes with a piece of cloth tied round the waist and reaching to the ankles. Men and women on the hills who at one time wore a few leaves before and behind and were totally innocent of clothing, do not appear [illegible] within the precincts of civilisation a... ill not meet the tourist's eye. Children, either absolutely nude or with a piece of metal hanging from the waist in front, may be seen in the streets in the most advanced cities, and in the homes of the rich. The child Krishna, with all the jewels on his person, is nude in pictures and images.

In parts of India the Hindu dress, the loin-cloth comes nearly down to the feet. On the Malabar coast, the ends are left loose in front. In the greater part of the country they are tucked up behind—a fashion which is supposed to befit the warrior, or one end is gathered up in folds before and the other tucked up behind. The simplest dress for the trunk is a scarf thrown over the left shoulder, or round both the shoulders like a Roman toga. Under this garment is often worn a coat or a shirt.

When an Indian appears in his full indigenous dress, he wears a long robe, reaching at least down to the calves: the sleeves may be wide, or long and sometimes puckered from the wrist to the elbow. Before the Europeans introduced buttons, a coat was fastened by ribbons, and the fashion is not obsolete. The Muslim prefers to button his coat to the left, the Hindu to the right. A shawl is tied round the waist over the long coat, and serves as a belt, in which one may carry money or a weapon, if allowed.

The greatest variety is shown in the head-dress. More than seventy shapes of caps, hats, and turbans, may be seen in the city of Bombay. In the Punjab and Uttar Pradesh, in West Bengal, and in Madras other varieties prevail. Cones and cylinders, domes and truncated pyramids, high and low, with sides at different angles, folded brims, projecting brims, long strips of cloth wound round the head or the cap in all possible ways, ingenuity culminating perhaps in the "parrot's beak" of the Maratha turban—all these fashions have been evolved by different communities and in different places, so that a trained eye can tell from the head-covering whether the wearer is a Hindu, Muslim or Parsi, and whether he hails from Poona or Dharwar, Ahmedabad or Bhavnagar.

Fashion Variations—Fashions often vary with climate and occupation. The Bombay fisherman may wear a short coat and a cap, and may carry a watch in his pocket: yet, as he must work for long hours in water, he does not cover his legs, but suspends only a coloured kerchief from his waist in front. The poorer people in West Bengal and Madras do not cover their heads, except when they work in the sun or must appear respectable.

Many well-to-do Indians notably Christians and Parsis wear European dress at the present day, or a compromise between the Indian and European costumes. Most Parsis however have retained their own head-dress, and many have not borrowed the European collar and cuffs with the European costume. The majority of the people do not use shoes: those who can afford them wear sandals, slippers and shoes, and a few cover their feet with stockings and boots after the European fashion in public.

On ceremonial or religious occasions indigenous dress is almost always preferred and with the recent change in the political landscape, it is possible that blind imitation will give place to intelligent selection.

There is also a certain tendency to economise in the use of cloth in times of scarcity, and fashions once introduced often remain. One way in which people in urban areas try to meet scarcity is to make, what they call, 'bush shirt' or 'bush coat' which is really a cross between a coat and a shirt and can be made to do duty for either.

Women's Costumes—The usual dress of a woman consists of a long piece of cloth tied round the waist, with folds in front, and one end brought over the shoulder or the head. The folds are sometimes drawn in and tucked up behind. In the greater part of the country women wear a bodice: on the Malabar coast many do not, but merely throw a piece of cloth over the breast. In some communities petticoats, or drawers, or both are worn. Many Muslim ladies wear gowns and scarfs over them. The vast majority of Muslim women are *gosha* and their dress and persons are hidden by a veil when they appear in public: a few of the converts from Hinduism have not, however, borrowed the custom. In the north, Hindu women have generally adopted the Muslim practice of seclusion. In the Deccan and Southern India they have not.

As a rule the hair is daily oiled, combed, parted in the middle of the head, plaited and rolled into a chignon, by most women. Among high caste Hindus, widows sometimes shave their heads in imitation of certain ascetics, or monks and nuns. Hindu men do not, as a rule, completely shave their heads, some Muslims, however, specially in Malabar, do. The orthodox remove the hair from a part of the head in front, over the temples, and near the neck and grow it in the centre, the quantity grown depending upon the fancy of the individual. Nowadays many have their hair combed in the European fashion which is also followed by Parsis and Christians. A great many Muslims grow beards. But most Hindus do not, except in places as in the north where Muslim influence was paramount in the past. Parsis and Christians follow their individual inclinations. Hindu ascetics, known as Sadhus or Bairagis as distinguished from Sanyasis, do not clip their hair, but coil it into a crest, in imitation of the God Shiva.

Hindu women wear more ornaments than women of any other community. Ornaments bedeck the head, the ears, the nose, the neck, the arms, wrists, fingers, the waist and the toes until motherhood is attained, and by some even later. Children wear anklets. Each community affects its peculiar ornaments, though imitation is not uncommon. Serpents with several heads and flowers, like the lotus, the rose and the champaks, are among the most popular objects of representation in gold or silver.

Caste Marks—Caste marks constitute a mode of personal decoration peculiar to Hindus, especially of the higher castes. The simplest mark is a round spot on the forehead. It represents prosperity or joy, and is omitted in mourning and on fast-days. Among certain communities absence of the mark might indicate that the person is a widow. The mark may be red, or yellowish as when it is made with ground sandalwood paste. The worshippers of Vishnu draw a vertical line across the spot to represent Lakshmi who is the goddess of prosperity. A more elaborate mark on the forehead has the shape of a U or a V, generally with a central line, sometimes without it, to represent Vishnu's foot. The worshippers of Shiva adopt horizontal lines, made with sandalwood paste or ashes. Some Vaishnavas stamp their temples, near the corners of the eyes, with figures of Vishnu's conch and disc. Other parts of the body are also similarly marked. The material used is a kind of yellowish clay.

To smear the arms and the chest with sandalwood paste is a favourite kind of toilet, especially in the hot season. Beads of Tulsi or sacred Basil, and berries of Rudraksha *eteocarpus ganitrus*, strung together are worn round their necks by Vaishnavas and Shaivas respectively. The Lingayats, a Shaiva sect suspend from their necks a metallic casket containing the Linga or phallus of their god. Bairagis, *i.e.*, ascetics, besides wearing Rudraksha rosaries round their necks and matted hair, smear their bodies with ashes. Religious mendicants suspend from their necks figures of the gods in whose name they beg. Strings of cowries may also be seen round their necks. Muslim dervishes sometimes carry peacock's feathers.

Hindu women mark their foreheads with a red spot or horizontal line. High caste widows, as is mentioned above, are forbidden to exhibit this sign of happiness, nor may they deck themselves with flowers or ornaments. Flowers are worn in the chignon. Hindu women smear their faces, arms and feet sometimes with a paste of turmeric, so that they may shine like gold. It is not always possible to say why a particular colour has been selected. The red liquid with which the evil eye is averted may recall the blood of the animal slaughtered for the purpose in former times. But in many other cases this particular colour has no such associations. The Muslim dervish affects green, the Sikh Akali is fond of blue, the Sanyasi adopts orange for his robe, and no reason can be assigned for the choice.

Festivals and Observances

Bara Wafat—(Death on the 12th) is called in Bengal Fatiha-i-Duwazdahum (Prayers of the 12th). In Turkey and Egypt the day is known as Mawludu-'n-Nabi (Birth of the Prophet). The date is 12, Rabi I.

It is a joint celebration of the birth and the death of the Muslim Prophet. In some parts of the country it is celebrated only as the birthday of the Prophet. (Jashn-i-Miiad-Sharif). It is believed that his birth and death took place on the same day, although there are differences of opinion on this question. It is a great day of feasting for Muslims (the Wahhabis, however, do not observe it; they regard it to be an innovation or *Bidat*). On this occasion the life story of the Prophet is recited and its points of excellence stressed. Prayers are offered for the benefit of his soul. Prayers are also read over cooked food which is then given to the poor. Some observe the feast on the second day of the month. As the date is disputed, the more devout read the prayers on all the days from the 1st to the 12th day of the month.

Dasara (DASHAMA = TEN DAYS).—This festival held on the 10th of Ashwin Shuddh (Oct.). is called *Durga Puja* or *Durgotsava*, and is posed to relate to the autumnal equinox. e festival commemorates the victory of Devi, e of Shiva, over the buffalo-headed demon hishasura. Her image is worshipped for e days and afterwards consigned to the river. is is also the day on which Rama marched inst Ravana, the demon king of Lanka dern Ceylon). Early in the morning Hindus form *puja* to their household gods or religious ks. Marathas and Kshatriyas, or those o consider themselves of the martial race, rship their weapons and ask protection for m throughout the year in the faith that, to propitiousness of the sword, they owe ry prosperity. In the afternoon they go to temple in procession.

he day is also considered most auspicious by Hindus to begin education of their children. e nine preceding days of Dasara are called *aratra*, a compound word for 'nine nights'. ring this period devotees of *Durga* engage a hman to read hymns before her image, olling her exploits and describing her rewards her votaries. On the ninth day, at every ple of *Durga*, the sacred fire is made and fed h rice and ghee to the chanting of *mantras*. is customary among Bania women to keep a dance called *garba* during these nine nights.

he celebration of Dasara is also said to owe origin to the Pandavas (the five sons of Pandu) o selected this day as an auspicious one for king preparations for their war with their ernal cousins, the Kauravas, which is narrated letail in the *Mahabharata*.

n modern times Dasara is observed with at pomp in Mysore State.

Dipavali—(Popularly termed Divali or vali).—Dipa means a lamp and Dipavali ns a row or collection of lamps. It is a ival of rejoicing at Lord Krishna's triumph r Narakasura, a demon. Rows of lamps at all es, sacred and secular, make a most beautiful ure on the occasion. Exhibitions of fire- ks, crackers, etc., add to its festive nature.

n the 14th day of the waning moon of Kartika t.-Oct.), known as Naraka or Bhuta Chatur- hi (Chaturdashi means 14th lunar day), shna destroyed Narakasura. The demon , however, a great devotee of Krishna had done severe penance to propitiate the d, but he had abducted 16,000 women for his em and had to be destroyed for his sins. In v of his piety, however, the death anniversary enjoined to be observed as a sacred day. he morning a bath is taken and certain rites h a lamp made of rice-dust, etc., are observed. w dresses are worn and sweets are served.

ahambars—These are traditional festivals of n (Persia) adopted by the Parsis, and mark six festivals of the six seasons of the year. first one commences on the 11th day of Ibehesht (Oct. 15), the second on the 11th of Tir (Dec. 14), the third on the 26th day Shehnever (Feb. 27), the fourth on the 16th Meher (March 29), the fifth on the 16th day Dai (June 17) and the 6th on the 1st day of ha at the end of the Parsi year (Aug. 31). y were mainly agricultural festivals and essarily formed formal seasonal celebrations. Parsis hold public feasts on the days of the ambars.

anesh Chaturthi—On this day was born pati, or Ganesh, who is regarded as the god wisdom and one to be propitiated for the oval of obstacles. As such he is invoked at commencement of all ceremonies and ertakings. There are varying versions of circumstances attending his birth. One tes that as the god Kartikavirya was ten by Shiva without connubial assistance, like manner Ganpati was formed by his ort Parvati from the turmeric and oil ped from her body while bathing. The of his human head and the substitution of of a female elephant with one tusk are also ously explained. By some his head is said to have been cut off by Shiva when he endeavoured to prevent the god from entering the chamber of Parvati when she was performing her ablutions. According to others, it was reduced to ashes by a glance from Shani (Saturn) who, with all the gods, went to look at the newborn child, and it was replaced by that of the animal first found, which happened to be an elephant.

The fourth of Bhadrapad Shuddh (Aug.) is the period appointed for the celebration of this festival in honour of Ganpati's birth. His image is installed in Hindu households and offered *puja*. Some people keep the image for a day and a half; some for five or ten days, according to the wealth and wish of the householder. On the final day, the image is taken in procession and eventually committed to the river, sea or tank.

There is a legend that one day Ganpati while riding his favourite mouse had a fall, at which the moon laughed. Enraged at the insult, Ganpati cursed the moon and all who should look at her, but afterwards restricted it to one day, *viz.*, his birthday. Thus, on the day of Ganesh Chaturthi, Hindus avoid the moon lest they should incur any calamity during the year. If by any chance they happen to see the moon, they try to provoke their neighbours into reviling them in the belief that its ill-effects will stop at such abuse.

Gokulashtami—(Also known as Janmashtami and Krishnashtami). The occasion marks the celebration of Krishna's birth on the 8th day of the dark moon in the month of *Shravana* (July-August) or *Bhadra* (Aug.-Sept.). In each case (*i.e.*, either in *Shravana* or *Bhadra*) different sects observe it on either of the two consecutive days of Ashtami. At the temple of Puri a Brahmin and a dancing girl play the roles of Vasudeva and Devaki, the parents of Krishna.

To the Vaishnavites, the devotees of Vishnu, and therefore also of Krishna (who was one of Vishnu's incarnations), the occasion is a great festival. It is also observed by non-Vaishnavites, and thus sets an example of the spirit of toleration. Janmashtami is a day of fasting. A large part of the day is spent in worshipping Krishna, Shri (the consort of Vishnu), and Devaki the mother of Krishna. *Kirtans* or religious songs (relating to Krishna) make a notable feature. Dacca (East Pakistan) brings out a great procession on this occasion.

Grahana—Grahana means an eclipse. Hindu astronomers were the first to declare that the earth is round and Hindu astronomy was the first to discover the scientific facts relating to eclipses. The popular tradition of earlier days, however, stuck in the popular mind. And the sight of an eclipse continues to suggest to the ignorant person that *rahu* (the ascending node), the trunkless demon, is devouring the sun or the moon as the case may be. Rahu in the guise of a god had attempted to share the nectar along with the gods. As soon as his tongue had tasted the nectar (a drink having the power of making those drinking it immortal), Vishnu detected the false god and struck off his head. Trunkless, up to the throat, as the nectar had passed, Rahu became immortal. Necessarily when he gulps the divine orbs they emerge out down his throat. Acceptance of the version therefore makes it an unholy sight and the defilement of the gods entails a defilement of the earth. Defilement requires a bath and a bath in holy water is held to be particularly efficacious on this occasion. As a matter of fact, two baths are required, one at the first contact of the eclipse and another when it terminates. People flock to the Ganges and other holy sites for baths are resorted to. The occasion, naturally, reminds one of death and oblations are offered to the dead. To ensure full merit of the bath, gifts must be offered after the bath. As a matter of fact gifts make an essential condition of all Hindu fasts and festivals. The inference is justified that gifts were to some extent ordained to ensure a spirit of charity. The period of the eclipse is a period of fasting. No food should be prepared during this period. Food prepared earlier cannot be used later.

Haj—It means "setting out" or "tending towards," and is the term used for the pilgrimage to Mecca. The performance of the *Haj* is to all good Muslims a most cherished ambition. It is one of the five pillars of the practices of Islam (Arkan), and there are the highest Quranic injunctions for its observance. The rites of the *Haj* may be divided into three groups; *Farz* or compulsory; *Wajib* or obligatory (in a lower degree than *farz*); and optional. *Farz* compulsions are three in number; wearing of Ihram (two seamless garments, one worn round the waist and another thrown loosely over the shoulder), standing in *Arafat* and doing the *Tawaf* (circumambulation of the Ka'bah). The Wajib rites are five in number in the case of those who do not belong to Mecca; to run between Mount As-safa and Mount Al-Marwah, to remain in Al-Muzdali-fah, to cast stones to the three pillars of Mina (Ramyu'r-rijam), to perform a second *tawaf* and shave the head as the final ceremony. The month of Zu'l-Hijjah (the 12th Muslim month) is the month of the Haj.

Idu'l-Azha (also called Iduz-Zuha).—It is the Muslim counterpart of the Passover. It is enjoined in the *Quran* (xxii 33-38) and falls on the 10th Zul-Hijjah. The words of the prophet are: Man cannot (by any act) on this day propitiate God better than by shedding blood.

Idul-Azha means the (great) sacrificial ceremony or festival. The festival commemorates Abraham's offer to sacrifice the object dearest to him, his son Ishmael (not Issac), on Mount Mina close to Mecca (the Bible gives the name of the land as Moriah). Its observance is one of the necessary acts in the performance of the Haj. All adult Muslims who can afford it are required to make a sacrifice of an animal. If the animal is a big one (*e.g.*, a camel or a cow), it is allowed to be the joint offering of seven, (according to some authorities as many as seventy). It is meritorious to sacrifice one animal for each member of the family, but on economic grounds the sacrifice of one animal for a whole family is allowed. A fully grown-up and sound camel, cow, goat or sheep is considered best. The sacrifice is offered with a short prayer absolutely surrendering the soul to Allah and acknowledging His greatness as the accepted creed. The meat is distributed equally among the poor, the relatives and friends and members of the household.

In India the cow was the usual beast of sacrifice. In other Muslim countries the camel takes its place. The cow being held most sacred by Hindus, the more popular Muslim monarchs of India (possibly a few of Afghanistan as well) had stopped its slaughter. There is a strong sentiment against cow sacrifice today.

'Id-ul-Fitr—"The festival of *breaking fast*," called also *Ramazan-ki-'Id*, and "the feast of alms," is celebrated on the 1st of Shavval. On this day Muslims bathe, put on new clothes, apply antimony to the eyes, and perfume themselves; then distribute the *fitr* or *sadkah*, which is 2½ seers of wheat, dates, or any grain used for food, to the poor or religious mendicants. All then proceed to the *Idgah*, repeating "God is great. There is no God but God." The Mulla ascends the *mimbar* or pulpit, and after a short thanksgiving reads the *Khutbah* or sermon. He then descends to the lowest step (which with the Shiahs is the third, but the fourth with the Sunnis) and recounts the virtues of the king, and prays for him. Then a general prayer is offered, and the congregation rise with a shout of *Din!*—"Faith!" and fire of muskets. The evening is spent in rejoicing and merriment.

Khordadsal—The birthday (the 6th day of the 1st Parsi month, Farvardin, 10th Sept.) of Zarathustra, the Prophet of the Parsis. He is the earliest known founder of a great religion of faith, courage and hope. The exact date and place of his birth have not yet been fully

ascertained. Probably he was born in the province of Media, Iran (Persia) about 3,000 years ago. His great sermons are preserved in the Gathas (Parsi Scriptures). He was held in great respect by the court of Gushtasp. He professed the doctrine of monotheism and held that Ahura Mazda is the Creator of the Universe. He preached the doctrine of *Asha* or piety, which would infuse in man the spirit to fight the force of evil and attain the beatific region of Ahura Mazda.

Muharram (Ar. Muharram, 'most sacred')—The mourning held annually in remembrance of the first martyrs of Muslims, Hasan and Husain, from whom the whole race of Sayads are descended. Abu Muhammad al Hasan and Husain were the two sons of 'Ali bin Abi Taleb, the cousin, and Fatimah, the daughter of Muhammad. The Muslims are divided into two distinct sects, called the Shiahs and the Sunnis; the former regard Ali and his descendants, Hasan, Husain, Zain-ul-Abidin, Muhammad Baugar, Jafar Sadik, and Ismail bin Jafar Sadik, as the lawful leaders after Muhammad; and the latter, the Caliphas, as Abubakar, Omar, Oosman and 'Ali—hence quarrels, animosities, and dislikes are hoarded up to be avenged during Muharram. Taziyas (a term signifying grief, applied to a representation of the mausoleum erected over the remains of Imam Husain at Karbala) made of ivory, ebony, sandalwood, cedar, and sometimes wrought in silver filigree—and indeed of every variety of material, from pure silver to bamboo and paper, according to the rank and wealth of the party—are exhibited and conveyed in procession through the streets.

Navroz, Nauroz—Jamshed of "the seven-ringed cup," who fixed the Parsi calendar, marked the day on which the Sun enters Aries (20th or 21st March) to be the New Year's Day. It is held that he chose to make the State entry on this day to the newly founded capital of Persepolis. The festival was given the name of Id of Jamshed and it has been celebrated with the greatest eclat in both Parsi and Muslim Iran (Persia). Shah Jalaluddin commenced his administrative year from this day. The Shiahs celebrate the day as Id-i-Khilafat or the festival in commemoration of 'Ali's formal succession on this day to the Caliphate. For the Parsis it is only next to Pateti as a festival of social merriment and they begin the Fasli (agricultural) year on this day. Navroz is one of the three celebrated Jashans of ancient Iran. Modern Iran celebrates the festival as a national event.

Paljusana—A great Svetambara Jain festival. Literally it means serving with a whole-hearted devotion. Formerly it was only observed by the ascetic order, but now the laity also observe it. The festival, as is common to all Jain festivals, is marked with rigorous fasting and penance.

Two schools, both of the Svetambara sect, observe the festival on slightly different dates, either from the 12th or the 13th day of the dark fortnight to the 9th or the 5th day of the bright fortnight of Bhadra (Aug.-Sept.). In either case it lasts for eight days. The more devout observe complete fasting during the whole period, while others fast on the last day only.

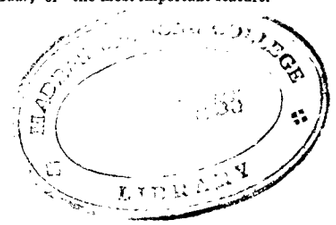
Pateti—The Parsi New Year, being the first day Hormazd of the first month Farvardin (Sept. 5). Firdausi associates many historical events of Zoroastrian Iran (Persia) with this day. It is the greatest social festival of the Parsis. In the great gatherings in their Fire Temples the cause of purity and chastity is preached.

Ram-Lila—An open-air amateur dramatic representation of selected episodes from Rama's life. The performance continues all through the Navaratra (the first nine days of the bright fortnight of Asvin) (Sept.-Oct.) and the Vijaya-Dashami (the tenth lunar day). Every day in the afternoon one act is played, the battle between Rama and Ravana being the most popular theme.

Ram-Lila is an important festival observed in the Hindi-speaking States.

Ram-Navami—It is the celebration of the birth of Rama, one of the incarnations of *Vishnu* of the Hindu Trinity, on the 9th lunar day (*navami*) of *Chaitra* (March-April). Besides Rama, his consort Sita, and brothers Lakshmana, Bharata and Shatrughna are also, worshipped. Prayers are offered to them at intervals of three hours. The day is one of strict fasting. The night is spent in worshipping. The learned give discourses upon Rama's life, stressing its excellent points as examples for man to follow. A legend (the *vrata-katha*) relating to the origin of this ceremony with pointers to the merits of observing it is recited. At Puri (*Jagannath*), an incarnation of Rama (*Vishnu*), in his representative figure *Madanamohana* is dressed as Rama and worshipped with great eclat. On this day oblations are offered to the departed ones.

In some cases, preparatory ceremonies commence from the first day of the waning moon. In the evenings sermons or discourses (kathas) are delivered in the temples of Rama. The birth is celebrated at 12 noon of the ninth day. This day is observed by a great many people as the New Year's day.



Ramzan—This Muslim fast commences from the morning after the new moon of Ramzan is first observed, and is kept each day throughout the month of this name from 4 a.m., or when the first streak of light borders the eastern horizon, till the stars are clearly discerned in the heavens. During the whole period not the slightest particle of food, or a single drop of water or any other liquid should pass the lips. The day is spent in occasional prayers, besides the usual *namaz*, and in reading the *Quran* or the life stories of the prophets. The fast is generally broken by a cooling draught, called *Dandhi*. On the 21st and 22nd the Shiahs celebrate the night of Ali, the nephew and adopted son of Muhammad, who is said to have died on one of these two nights. They perambulate the streets, carrying a *tabut* and beating their breasts. The odd ones of the last ten nights are called, *Lailat-ul-Kadr*, or 'night of power,' because it is said the *Quran* descended from heaven during one of those nights. It should be observed as a vigil.

Shiva-Ratri—The 14th night of the dark fortnight in Magha (Jan.-Feb.) is known as the night specially consecrated to Shiva. The 13th night of the waning moon of each month is held as the night of Shiva (Shiva-Ratri). The month of Shravana (July-August) is very sacred to Shiva. Hence, Shivaratri of Magha is generally called Mahashivaratri (maha meaning great).

In the *Mahabharata*, Bhishma, the great celibate, most scholarly and valorous prince, relates that King Chitrabhanu of the Ikshvaku dynasty popularised the festival. On this day when the King was fasting, a sage suggested to him that the human soul being one with God, indulgence in pleasure to the self and not infliction of pain to it by fasting would please God best. The King explained that the self of flesh and blood was not the real self and narrated the legend of a fast. In a previous life, the King was born a hunter. One dark night he lost his way in the forest and took shelter for the night on a *bilva* or bel (Indian wood apple) tree. The hunter had no food for the whole day and was ruminating on how his family would feel the double misery of starving and missing him. He wept bitter tears. To make himself comfortable and also to have a better view of the lie of the land and approaching game, he tore away and threw down the boughs and leaves obstructing his vision. It so happened that that night Shiva was under that *bilva* tree, and the tears and leaves fell on him. Shiva was propitiated by this act of the hunter, although unknowingly done, and declared that if anybody fasted on that day and worshipped him with offerings of water and *bilva* petals he would on death be accepted in Shiva's heaven.

Another account in later Puranic stories (*e.g.*, *Linga-Purana*) narrates that a hunter spending the day imprisoned in a Shaiva monastery or temple for having failed to pay his debt, was let out on parole. His way home lay through a forest and as night grew too dark to continue the journey, he took shelter on a *bilva* tree with his store of water. Hunger, anxiety and expectation of game kept him awake all through the night. Throughout the day in the monastery he had nothing to do but listen to the incessant recitation of Shiva's name, which had made an almost indelible impression upon his weakened brain. He filled his time mumbling the term in mock fashion, plucking the *bilva* leaves and throwing them down. Often his water pot was knocked about either by his movements or the wind and its contents trickled down. Shiva happened to be resting under the tree and was propitiated. The moral is that acts of devotion, even if not meant to be so, are accepted by the Lord.

Zarthost-No-Diso—The anniversary day of Zoroaster's death. The Parsi Prophet died a martyr's death, at the age of 77, while at prayer in a fire temple, at the hand of Turbratur. On this solemn occasion of mourning, discourses on the life and teachings of the Prophet form the most important feature.

INDIANS OVERSEAS

THE total Indian (includes Pakistani before 1948) population overseas, according to the latest available estimates, is as follows:—

Name of country	Indian population	Date of estimates
Commonwealth.		
Australia	2,480	..
Canada	1,465	1941
New Zealand	1,116	1946
South Africa	358,738	1951

Total for all countries	4,229,096	

* The last authoritative census were taken in 1932. According to an estimate made in 1947 the figure lies between 5,000 and 6,000.

ORIGIN

Emigration of Indians for purposes of labour dates from the beginning of the 19th century.

From 1800 A.D. onwards Indians crossed the Bay to the Straits Settlements to work on the sugar, spice, tapioca and cocoanut plantations of Penang, and this intercourse was allowed to continue for long without regulation. The first officially recorded instance of genuine recruitment for labour emigration occurred in 1830, when a French merchant, named Joseph Argand, carried some 150 artisans to Bourbon. The abolition of slavery in British colonies in 1834 gave the first great impetus to the movement. The sugar planters of Mauritius at once turned to India as their best recruiting ground, and between 1834 and 1837 obtained at least 7,000 recruits from Calcutta.

The Government of India at a very early stage realised the necessity of bringing such emigration under regulation. The Law Commission was asked to investigate the case and to make recommendations for securing the well-being of emigrants. They advised that no legislation was required except in order to prevent undue advantage being taken of the simplicity and ignorance of emigrants by providing that a magistrate should satisfy himself that all contracts were entered into freely and understood by them and in order to secure that sufficient provision was made for their accommodation and sustenance during the voyage. A copy of every engagement was also to be transmitted to the Government under which the emigrants were to live. These recommendations were embodied in the first Emigration Act (V of 1837), which also provided that contracts should be determinable after 5 years.

The labour laws of the several Colonies provide for the protection and welfare of resident Indian labourers. The Government of India also occasionally depute to the Colonies their officers to report on the condition of Indian labourers.

Act VII of 1922 prohibited indentured emigration and all unskilled emigration, except to countries specially approved by the Legislature. Emigration to Ceylon and Malaya was brought under control, and the definition of "Emigrant" was extended to cover all persons "assisted" to depart from India.

Safeguards.—It was found that the lack of power to regulate the total flow of emigration for unskilled work, whether assisted or voluntary and whether under contract or not, may operate to the detriment of Indian communities overseas, particularly in times of economic depression. The Indian Emigration Act was suitably amended in 1938 and the Government of India took power to prohibit, when necessary, even unassisted emigration for the purpose of unskilled work. This amendment was promulgated on December 14, 1939.

The Indian Emigration Act, 1922, also contains certain provisions to safeguard the interests of persons emigrating for the purpose of skilled work. It was found that illicit emigration in some volume was taking place particularly in Bombay with the connivance of some dishonest passage brokers and rules were promulgated under the Act on the 14th Dec. 1939, providing for the licensing of passage brokers and requiring that a passage broker should not be a party to any arrangement to recover from the emigrant the 'cost of recruitment.'

During 1939-40 two minor defects in the Indian Emigration Act, 1922, were remedied. Now the Protectors of Emigrants can exercise the powers of detention, search, etc., for the prevention of offences under the Act and by making the offence under Section 30 of the Act cognizable removes an anomaly between Sections 25 and 30A of the Act.

Indian emigration questions have recently taken on a wider aspect. The issues round which public interest at present centres are three:—

(*a*) Control of emigration.

(*b*) Rights of Indians to admission to other parts of the Commonwealth.

(*c*) Rights and disabilities of Indians domiciled overseas.

So far as unskilled labour is concerned, the Government of India have assumed absolute power of control in accordance with powers conferred on them by the Emigration Act of 1922. The functions of the Government of India were previously performed by State Governments by virtue of powers delegated to them under Section 124 (1) of the Government of India Act, 1935. With a view to dealing directly with all emigration problems in the post-war period on a uniform all-India basis, the Government of India resumed the administration of those functions with effect from 1st October, 1944, and appointed a Controller-General of Emigration in the Commonwealth Relations Department for that purpose.

A Controller of Emigration, Madras, has also been appointed to co-ordinate emigration control in Madras State.

AUSTRALIA, CANADA

The majority of Indians in Australia are engaged in retail trade or agricultural operations. The Commonwealth franchise was granted to Indians domiciled in Australia in 1925. The Constitution and Electoral Acts in Western Australia disqualify an aboriginal native of Australia, Asia or Africa from being registered as an elector for the Assembly; but he may be enrolled as a voter for the Legislative Council (which is the Upper House) in each province in which he holds freehold property of at least £50 capital value.

Indians in Australia still suffer from certain minor disabilities (administrative and legal) relating to Crown lands, mining, certain occupations and employment. Under the Mining Act of 1904, in Western Australia the grant of mining rights to Asians requires the approval of the Minister in charge of Mines. Under the South Australia Irrigation and Reclaimed Lands Act, 1914, Indians are not eligible to obtain leases of land. In Western Australia wherever licences are prescribed, for example, for cutting sandalwood, for employment under Government contractors and for employment in European factories, Indians find it difficult under the present administrative practice to get the authorities to exercise discretion in their favour.

Indians domiciled in New Zealand are generally not subject to any disability and enjoy equal citizenship rights including franchise with the other British subjects.

Indian residents of Canada are mostly farmers, gardeners, farm workers, managers of retail stores, hawkers, and unskilled labourers. With the passing of the Canadian Citizenship Bill of 1945 and the British Columbia Provincial Election Amendment Act of 1945 Indian residents enjoy all normal rights. On 25th January 1951 an Agreement was signed between India and Canada in Ottawa, providing for the admission into Canada, for permanent residence, of 150 citizens of India every year, beginning from January 1, 1951. The detailed procedure is now being worked out.

SOUTH AFRICA

In any discussion of the problem of Indians overseas South Africa takes a prominent place. The position upto 1927, that is to say, the time of the Cape Town Agreement may be summed up as follows:—

(*i*) 1885—All Asians in Transvaal were debarred from acquiring the rights of citizenship and from owning any property except in such areas as might be assigned to them.

(*ii*) 1896—Indians were deprived of parliamentary franchise in Natal.

(*iii*) 1907—In Transvaal all Asians were required to register themselves.

(*iv*) 1908—Under the Gold Law Asians could not reside in or occupy any land in any district or proclaimed land except in a bazar, etc. or such place as the Mining Commissioner might permit.

(*v*) 1913—Under the Immigrants Regulation Act, 1913, Asians have been declared as prohibited immigrants on economic grounds. Asians were also prohibited from moving from one province to another.

(*vi*) 1919—Asian companies were prohibited from holding any fixed property.

(*vii*) 1924—Indians in Natal were deprived of municipal franchise.

(*viii*) 1926—The Colour Bar Act excluded Indians from certain classes of skilled workers to whom certificates of competency could be given.

In 1927 December a Conference was held between the Governments of India and the Union of South Africa to settle the Indian question once and for all if possible. The two Governments specifically agreed as follows:—

(*i*) Both the Governments recognised the right of South Africa to maintain western standards of life and the Union Government would enable Indians in South Africa to conform to such standards;

(*ii*) Union Government would organise an assisted scheme of emigration to India or to other countries for those Indians in South Africa who may desire to avail themselves of it;

(*iii*) Union Government decided not to proceed further with the Areas Reservation Bill which provided for segregation;

(*iv*) The Government of India would appoint an Agent in South Africa; and

(*v*) The Union Government undertook to provide educational and other facilities for the upliftment of Indians permanently settled in South Africa.

This is the well-known Cape Town Agreement of 1927.

The number of Indians who took advantage of the Assisted Emigaration Scheme was, however, below expectations.

But the fact of the agreement did not prevent the Union Government from enacting anti-Indian laws in the years 1932-1939.

Interim Act

Then in 1939 the Union Government passed the Asiatic (Transvaal Land and Trading) Act in spite of repeated representations from the local Indian community and the Government of India. The Act restricted three important rights of the Indian community in the Transvaal: (*a*) the right to occupy land not subject to Gold Law restrictions; (*b*) the right to trade anywhere in the Transvaal; and (*c*) the right of Indians holding trading licences in May 1919 to transfer their business premises in the same township. This Act was later superseded by the Asiatic Land Tenure Act of 1946, which was in its turn amended later but maintained in substance the same position as before.

The international situation in September, 1939, and the consequent change of Ministry in the Union with Field Marshal Smuts coming into power altered the position slightly so far as the Indian community was concerned. The Government appointed a Commission presided over by Mr. Justice F. N. Broome in 1940. The two main findings were that in the Transvaal the extent of penetration since 1927 did not appear to be alarming or even surprising and in Natal the extent of penetration into European areas was little more than a trickle.

Towards the end of 1942, the Durban City Council represented to the Minister of the Interior that since October 1940 Indian penetration in predominantly European areas in Durban had been taking place on an accelerated scale. As a result of this representation, Mr. Justice F. N. Broome was once again appointed to enquire and report.

As a result of his finding and in order to check further acquisition of property by Indians, the Union Government passed in the teeth of opposition by the Indian community and Government of India, an Act called "the Trading and Occupation of Land (Transvaal and Natal) Restriction Act, 1943," generally called as the Pegging Act. This Act provided for the continuance in the Transvaal of the provisions of the Asiatic (Transvaal Land and Trading) Act, 1939 for a further period of 3 years and extended similar provisions prohibiting transfer of properties between Europeans and Indians in Natal for a period of 3 years, *i.e.*, up to March 31, 1946.

In 1944, as a result of an agreement, known as "Pretoria Agreement", between the Union Prime Minister and the Minister of the Interior on the one hand and a deputation from Natal including members of the Natal Indian Congress on the other, a decision was taken according to which the Pegging Act was to be replaced by an Ordinance to be passed by the Natal Provincial Council. The Ordinance was to provide for the creation of a licensing board with two Europeans and two Indian members and a third European with legal training as chairman. The Board was to control occupation of dwellings in Durban by licensing.

A draft Ordinance embodying major points of the Agreement was introduced in the Natal Provincial Council but when it finally emerged from the Provincial Council it departed from the Pretoria Agreement in many aspects.

The Government of India represented to the Union Government that the new measure was unwarranted and urged for its withdrawal and implementation of the Pretoria Agreement. As the representations met with failure, the Government of India enforced the Reciprocity Act against South Africa, and persons of South African domicile were declared prohibited immigrants in India.

The Ordinance was eventually declared *ultra vires* of the powers of the Provincial Council and therefore did not become operative.

In 1944 the Union Government appointed a Commission "To enquire into and report upon matters affecting the Indian community of the Province of Natal, with special reference to housing and health needs, civic amenities.... and as to all matters affecting the well-being and advancement of the permanent Indian population of Natal."

The main and only important recommendation of this Commission was that the Union Government should invite the Government of India to send to the Union a delegation, composed substantially of Indians for the purpose of discussing with the Union Government, all matters affecting Indians in South Africa.

Land Tenure Act

One of the most important events in the history of Indians in South Africa was the passing of the Asiatic Land Tenure and Indian Representation Act in June 1946.

The Act which replaced the Pegging Act of 1943, placed restrictions on the acquisition and occupation of land by Asians in Natal.

It also gave a limited franchise to all male Indians of or over 21 years of age with education and income or property qualifications.

Indians were to be represented by 2 European Senators, 3 European Members in the House of Assembly and 2 Members in the Natal Provincial Council.

Government of India's request for the postponement of this legislation and for a Round Table Conference to discuss the Indian question was rejected by the Union Government. Consequently they gave notice of the termination of Trade Agreement with the Union Government on the 25th March 1946 and banned all exports to and imports from South Africa with effect from the 17th July. The High Commissioner for India in the Union was recalled. In South Africa itself Indians started a passive resistance movement which took the form of defying the Asiatic Land Tenure Act by occupying land in the non-exempted areas. In the movement which continued till May 1948 about 200 persons including women, Africans and Europeans courted imprisonment.

Question Before U. N. O.

The Government of India was also urged by the Indian legislature to raise the Indian question in South Africa before the United Nations as the Union Government's treatment of Indians was a violation of the United Nations Charter. The Government of India lodged a complaint with the Secretary General, United Nations, requesting that the General Assembly should take up this question under Articles 10 and 14 of the Charter.

The question was discussed at the 1946 (October-December) session of the General Assembly. The South Africa delegation, led by F. M. Smuts, contended that this question was essentially a domestic question of South Africa and therefore under Article 2(7) of the Charter UNO had no right to discuss the matter.

The General Assembly adopted a resolution which after stating that because of the treatment of Indians in South Africa friendly relations between the two countries had been impaired, expressed the opinion of the General Assembly that such treatment "should be in conformity with the international obligations under the agreements concluded between the two Governments and the relevant provisions of the Charter". It requested the two Governments to report at the next session of the General Assembly the measures adopted to that effect. The South African Government, however, refused to accept the resolution as a basis for negotiations with the Government of India.

When the General Assembly met in 1947 the two Governments submitted their reports. The question was referred to the *Political* Committee which passed the Indian resolution as amended by Mexico. The resolution after reaffirming the last year's resolution requested the two Governments to enter into discussions at a Round Table Conference on the basis of that resolution, inviting the Government of Pakistan to such a Conference. But the resolution failed to secure a two-thirds majority in the General Assembly and hence was not effective. In July 1948 the Government of India again requested the United Nations to consider the South African Indian question. The item was again included in the Agenda for the Third Session of General Assembly held in Paris in May 1949, when it passed a resolution inviting "the Governments of India, Pakistan and Union of South Africa to enter into discussion at a Round Table Conference, taking into consideration the purposes and principles of the Charter of the United Nations and the Declaration of *Human Rights*". Consequently the Government of India initiated correspondence which resulted in the three Governments holding preliminary talks on February 6, 1950, at Cape Town to consider the possibility of a Round Table Conference. The three Governments accepted the recommendations of their delegations to these talks that a Round Table Conference be convened to explore all possible ways and means of settling the Indian question in South Africa. Before the Conference could be held the Union Government introduced in their Parliament and enacted an Act called the Group Areas Act (see details below) which vitally affects the existence of the Indian Community in South Africa. The Government of India requested the Union Govt. not to proceed with the Group Areas Bill pending the holding of the Conference. The Union Government however, did not accede to this request of the Government of India who therefore declined to participate in the proposed Conference and referred the matter to the U. N. General Assembly. The General Assembly thereupon adopted on December 2, 1950 a resolution, recommending that the Governments of India, Pakistan and Union of South Africa should meet at a Round Table Conference before April 1, 1951, and that if the Conference fails, a Commission of three members should be established to assist the three Governments in carrying through appropriate negotiations. The resolution further calls upon the Governments concerned to refrain from taking any steps which would prejudice the success of the negotiations, in particular the implementation or enforcement of the provision of 'The Group Areas Act,' pending the conclusion of such negotiations. The South African Government informed the Secretary-General of the United Nations that they were unable to accept the resolution since "the terms of the resolution constitute intervention in a matter which is essentially within the Union's domestic jurisdiction".

The General Assembly again discussed the matter in its 1951-52 session and passed a resolution on January 12, 1952. The resolution after re-affirming previous resolutions recommends the establishment of a 3-member commission, composed of one member to be nominated by South Africa and the other to be jointly nominated by India and Pakistan and the third to be nominated by the two nominees. In case the commission does not come into being within 60 days of the adoption of the resolution, the U.N. Secretary-General has been given discretion to render necessary assistance to the parties concerned or to nominate an individual to assist the parties in carrying through negotiations.

NATIONALIST PARTY POLICY

The party in power in South Africa today is the Nationalist Party. The policy of the Party may be described as follows: For Indians it suggested large-scale repatriation, repeal of Second Chapter of Asiatic Land Tenure and Indian Representation Act, segregation, curtailment of facilities to Indian traders outside their areas and prevention of penetration of Indians in Cape Colony.

And so far the Party has actually taken the following measures affecting Indians:—

(*i*) The second Chapter of the Asiatic Land Tenure and Indian Representation Act giving 'representation' to Indians was repealed in October 1948.

(*ii*) Family allowances admissible in South Africa on the basis of income and the number of dependants have been stopped for Indians with effect from December 31, 1948.

(*iii*) An Act has been passed to prohibit marriages between Europeans and Non-Europeans.

(*iv*) The bonus under the Assisted Emigration scheme has been doubled to induce Indians to accept repatriation to India.

(*v*) Indian traders in Reserves whose leases have run out are being refused renewals.

(*vi*) All Indians not born in South Africa are being deported on conviction for certain types of offences.

(*vii*) Segregation is being introduced in railway stations, post offices and in Cape Town buses and Suburban Railways.

(*viii*) The Asiatic Land Tenure Amendment Act of 1949, introduces segregation for purposes of trade also.

(*ix*) *Group Areas Act.*—This was enacted in 1950 and provides for the division and control of all land in the Union for ownership and occupation by the different racial groups. For this purpose, the entire population has been divided into three main groups, *viz.*, White, Native and Coloured, Indians being included in the last mentioned group. The Government can establish by Proclamation "Group Areas" for exclusive occupation or ownership or both, of any of the groups. Fresh acquisition or ownership by disqualified persons or company in any group area is prohibited; disqualified companies holding property at the commencement of notification cannot retain ownership after ten years. All the property in a group area held at the commencement of the notification by a disqualified individual will, after his death, have to be sold to a member of the group for which the area is set apart. No disqualified person can occupy land or premises in a group area without permit after one year of notification. No differentiation is made in the Act between occupation for residence and occupation for trade. The Act has roused consternation among the Indian community in South Africa who consider that the Act is mainly designed to liquidate them. The Act was put into operation by a proclamation on March 30, 1951.

(*x*) The Separate Representation of Voters Act by which Coloured voters were placed on a separate electoral roll was unanimously declared invalid by the Supreme Court. Dr. Malan has however declared that he will bring forward legislation to abolish the right of Courts to over-rule laws passed by Parliament.

EAST AFRICA

British East Africa includes Kenya, Uganda, Tanganyika and Zanzibar. Since 1948 January the first three are included in a sort of loose union designated East Africa High Commission with a common legislature and a common administrative service for certain specific purposes.

Indians in East Africa are mostly concentrated in urban centres. They are mainly engaged in 'Manufacture' and 'Commerce and Finance'. Their general economic condition, unlike in other British Colonies, is on the whole satisfactory. In Kenya and Tanganyika they constitute about 60 per cent of the total non-Native population of each Colony; in Uganda they constitute the single largest community among the non-Africans, being 75 per cent of the non-African population.

The questions affecting Indians in East Africa are much the same kind as those affecting them in South Africa and elsewhere, *viz.*, franchise, segregation, right to own land, and laws of immigration.

In the legislature of the East Africa High Commission, the Europeans, the Indians and the Africans were to have equality with 6 members for each group, according to the original proposals of December 1945. Because of strong opposition from the Europeans these proposals were later modified so that today instead of equality for race groups there is equality for territories with 5 members each for Kenya, Uganda and Tanganyika. In the legislature of Kenya Colony Europeans have 11 seats, Indians 5, Arabs 2, and there are 4 nominated Africans. The representation of Indians is partly based on communal grounds. Two of the 5 Indian seats are reserved for Muslims in two double member constituencies each voter having one vote only.

Recently the Kenya Legislative Council has passed a Bill which provides for an increase in the number of seats in the Council, the increase being Europeans from 11 to 14, Africans from 4 to 6 and Indians from 5 to 6. Another important provision in the Bill is that 6 Indian seats have been split up between Muslims (2) and other Indians (4). The electoral rolls have also been divided between the two groups. The East African Indian Congress is agitating against this separate electorate for Muslims and has petitioned to Her Majesty the Queen to disallow the Bill.

In Tanganyika and Uganda there is no electoral representation. In the Tanganyika Legislative Council out of 14 unofficial nominated members there are 3 Asians, and in Uganda Legislative Council out of 16 unofficial members 4 are Asians.

So far as allotment of land is concerned, broadly speaking, there is reservation of land for Europeans in the highlands, and for Indians in the lowlands, with regulations against alienation. Transactions in land are subject to two measures, the Land Control Ordinance, 1944 and the Crown Lands Amendment Ordinance 1944. There is a Land Control Board which has absolute control over all transactions in land in the highlands. The Governor has the power of veto by which he can disallow inter-racial transfers of shares in a landowning company as is done in the case of inter-racial transfers of land. Indian opinion is strongly opposed to the two Ordinances mentioned above.

Immigration is governed by Ordinances passed by the East Africa Legislature in 1948 as amended subsequently. The legislation specifies the kind of immigrant who is prohibited, and the class of person who can apply for Entry Permit or pass for entry. An immigrant intending to engage in agriculture, mining, trade has not only to have such sums of money as may be prescribed but he has to satisfy the authorities that such engagement in trade, etc., will not be to the prejudice of the inhabitants generally.

In Southern Rhodesia notice of all new townships proposed to be established has to be given under the provisions of the 'Town & Country Planning Act, 1945', which contain a clause forbidding occupation and ownership of any stands therein by persons other than those of European descent. None who is not a European can live in those townships except in the course of the discharge of his duties as a domestic servant.

FIJI

Indians have played an important part in the development of economic resources of the Fiji Islands in the Pacific. As estimated in 1949 the Indian population in this island was 133,941, *i.e.*, 47 per cent of the whole population. Indian residents here are the descendants of the indentured immigrants from India who started coming into the Colony in 1879. The economy of the Colony is based on agriculture and the sugar-cane production is mainly in the hands of Indians. Relations between Indians and Fijians are most friendly. Colour bar does not exist and Indians suffer from no 'political disabilities'. Literacy among Indians is confined to a small proportion of the population. On the whole the general economic position of Indians is not as good as it might be.

The Legislative Council consists of 31 members, with 16 officials and 15 non-officials. In the non-official group Europeans, Indians and Fijians have equal representation with 5 members for each group. Of the 5 Indian members 3 are elected on a communal franchise and 2 are nominated. One Indian nominated member was appointed member of the Executive Council in 1950.

The most important problem affecting the Indian community in Fiji is that of land tenure. A very large majority of the Indian population consists of agriculturists, but alienation of native-owned land is prohibited. More than 80 per cent of the land in the Colony is held by native owners as tribal land, and the rest is held as Crown grants or as freehold property mainly by the Colonial Sugar Refining Company, Ltd. Indians hold land as lessees from the native owners for the cultivation of rice, sugar-cane, etc., and from the Colonial Sugar Refining Co., for cultivation of sugar-cane.

Practically the whole problem is one of security of tenure and the encouragement given to Fijians to cultivate their own lands with the most stable and profitable crop, sugar-cane. The problem arose in this way.

In September, 1936, the Council of Chiefs of Fiji agreed that all lands (including leases) not required for the maintenance of the Fijian owners should be opened for settlement; that to further this end a Committee should be appointed to inquire into and to determine the amount of land needed for proper development by the Native owners; and that all land (including leases) not so required should be handed over to the Government to lease on behalf of the Fijians.

As a result of the examination of the question the Colonial Government came to the conclusion that the most satisfactory method of procedure would be for Government to take power to deal with *all* the native lands in the Colony, and then to appoint a Commission to determine the lands to be set aside for the exclusive use of the Fijians. A Commission has also reported on what lands are to be incorporated into Native Reserves. Where such lands are in Indian occupation, alternate lands are to be offered to the existing lessees. But the Commission has not recommended any compensation for improvements made in the land by Indians, and evicted lessees will be given only virgin land. It is feared that this will result in the displacement of some thousands of Indian agriculturists. The Governor in his speech at the budget-session in December 1949 reassured the Indian farmers that there was no cause for apprehension and that the Indians whose leases were not renewed would be helped to settle on land elsewhere.

The Indian cultivators have also had trouble with the Sugar Refining Company. In view of the rising cost of living due to war, the sugar-cane farmers in Fiji, who are mostly Indians, demanded, in June, 1943, a higher price for their cane. The Sugar Refining Company, which has the monopoly of sugar production in the Colony, refused any increase in the price of cane unless the price of sugar was increased by the Ministry of Food, United Kingdom, to whom the Company was bound to sell all its produce. The farmers thereupon decided not to harvest their crop. They stuck to their decision in spite of appeals made by the Governor of the Colony. As the crushing season advanced, the feelings among the Indians ran high. Some of them even ploughed in their crops. All attempts on the part of Indian leaders to reach a settlement having failed the major part of the cane crop in the Colony remained unharvested.

The Secretary of State for Colonies sent an expert C. Y. Shepherd to report on the situation. The report which Mr. Shepherd made is strongly criticized by Indian leaders.

A third problem which Indians in Fiji are facing is the residential tax. According to the Fiji Residential Tax Ordinance of 1923, all male persons between the ages of 18 and 60 other than Fijians and Rotuman residents in the Colony were liable to pay a tax not exceeding £1 per annum per person. The tax was imposed with the object of raising additional revenue for effecting improvements in the Colony.

During the last war a further tax of 10sh. per head per annum was imposed. An assurance was however, given by the Government of Fiji at the time that this additional war tax would be lifted as soon as the war ended. The promise was kept but simultaneously with the lifting of the war tax, the Residential Tax was increased from £1 to £2 per head. Those who pay income-tax are exempted from the tax, with the result that almost the entire European population is exempt from the tax, as a majority of them pay income-tax. In actual practice therefore the incidence of the tax has mainly fallen on the Indians whose economic condition has not shown improvement proportionate to the increase in the tax now demanded.

BRITISH GUIANA AND WEST INDIES

Indian emigration under 'indenture' system to British Guiana began in 1838. Today Indians constitute more than 40 per cent of the total population of the country. British Guiana is an agricultural country and about 30 per cent of Indians work in the sugar industry. Next to sugar, the rice industry employs a large number of Indian labourers. Indians have penetrated into all walks of life. A vast majority of them is illiterate. On the whole their general economic condition is not satisfactory.

Emigration of Indian labour to Trinidad began in 1845 and today Indians form about 35 per cent of the total population. A large number of them own small farms producing sugar-cane, cocoa and rice. Their general economic condition is about the same as in British Guiana.

As Indians in British Guiana and West Indies are mostly labourers on sugar estates, whatever grievances they have are of an economic nature. Nothing much was heard of them till 1935 when there was widespread trouble on sugar estates. The abolition of the indentured system though it marked an advance in their status actually deprived them of the safeguards that accrued from the Immigration Ordinance in regard to pay, hours of work, etc.

In 1942, a Labour Ordinance (No. 2 of 1942) was passed. This Ordinance provided for the appointment of a Commissioner of Labour for the regulation of the relations between employers and employees and for the settlement of disputes between them. This brought the labour laws of British Guiana in line with modern conceptions of labour legislation. The Government of India were given an opportunity to comment on the Ordinance at the Bill stage and certain modifications suggested by them were incorporated in it.

In 1945 a Royal Commission made a series of recommendations about the Colonies. Among others the Commission recommended that the possibility of the appointment of suitable East Indians to posts in the Government service should be carefully borne in mind by Colonial Governments. They expressed sympathy with the complaints regarding the arrangements for legitimisation and validation of East Indian marriages and recommended that these marriages should so far as the law was concerned be put on exactly the same footing as other marriages.

In effect the commission conceded practically all the demands to which Indians themselves attached importance. The general recommendations which related to matters of education, housing and labour administration appeared satisfactory and were likely to be of benefit to Indians.

In June 1948 Indian workers on sugar estates in British Guiana resorted to a strike owing to dissatisfaction with wages and conditions of work. The incident led to firing by the police in which five Indians were killed. The U.K. Government appointed a Royal Commission of Enquiry to investigate the whole problem of the sugar industry in British Guiana. This Commission in its report to the British Government recommended amenities such as housing, education and pensions, etc. to workers and mechanisation of the industry. Some of the recommendations are being carried out by the Colonial Government.

The British Guiana Legislative Council consists of 24 members out of whom 14 are elected, 7 unofficial nominated and 3 ex-officio. There are four Indian members, three of whom are elected and one nominated.

In Trinidad out of 18 elected members of the Legislative Council 7 are Indians. One Indian is in the Executive Council.

In Jamaica where Indians form only 1·7 per cent of the total population there is only one Indian member in the Lower House comprising 32 elected members.

CEYLON

Most Indians in Ceylon are workers on tea and rubber estates. Certain questions like wages affecting them were fixed by an agreement arrived at 1927. Because of depression in the two industries the wages were reduced in 1932 and again in 1933. Till about 1937 there was no fresh recruitment of labour. In 1937 there was an insistent demand for labour as general trade conditions improved. While permitting recruitment of Indian labour the Government of India tried to secure higher wages and village Committee franchise for Indians. In 1938 the Commission to investigate non-Ceylonese labour particularly with a view to control of immigration made a report. There has been a ban on emigration of Indian unskilled labourers to Ceylon since 1939. Exemption is made in deserving cases.

The rights of Indians to citizenship are governed by two Acts enacted in 1948 after a discussion between the Indian and Ceylonese Prime Ministers. These Acts are the Ceylon Citizenship Act and the Indian and Pakistani Residents (Citizenship) Act, which provide that the Indian residents in Ceylon would be entitled to obtain the citizenship of Ceylon by registration subject to the following conditions (*a*) an applicant must have a specified minimum period of uninterrupted residence in Ceylon, (*b*) he must have an adequate means of livelihood, and (*c*) he should be in a position to comply with the laws and customs of Ceylon. The procedure prescribed for the admission of Indian residents to the Ceylon citizenship is rather complicated, a fact that has created bitterness among the Indian community in Ceylon.

The Ceylon Government are also adopting a policy of Ceylonisation in trade and employment. Consequently Indians who have not acquired Ceylon Citizenship find it difficult to get employment there.

Other Acts which affect the rights of Indians are the Immigrants and Emigrants Act of 1948 and the Ceylon Parliamentary Elections (Amendment) Act of 1949. The former greatly restricts the rights of Indians to re-enter Ceylon, while the latter denies the rights of Indians to vote, and completely shuts them from the political life of Ceylon.

At the time of writing Indians were engaged in a non-violent civil disobedience movement to obtain voting rights in the Ceylon general elections.

Owing to the favourable balance of payments position, the restrictions imposed by the Government of Ceylon under the Ceylon Exchange Control Regulations, against remittances to India, were considerably relaxed towards the end of 1951. Consequently the difficulties of Indians on this score have been eased.

MALAYA

Malaya is divided into two administrative units, the Federation of Malaya and the Colony of Singapore.

The Federation of Malaya is under a High Commissioner assisted by a Federal Executive Council. There is a Legislative Council with 75 seats of which 50 are allotted to non-official members. One Indian has been nominated to the Executive Council and 4 Indians nominated to the Legislative Council. The Colony of Singapore is under a Governor. Out of a total of 22 members in the Singapore Legislative Council 4 are Indians, three of them elected and one nominated.

Soon after the collapse of Japan in 1945 the Indians found themselves faced with three problems for the solution of which the intervention of the Government of India was required, relief of the needy because of currency difficulties, the repatriation of Indians who wanted to return to India, and legal and political aid to those Indians who were accused of collaboration with the Japanese. The Government of India met the three problems with the help of various non-official bodies in India. Funds were made available to the needy and destitute, medical missions were sent and shipping space was found for those who wanted repatriation by the special chartering of a ship. For those accused of political crimes legal help was given, while many who were charged with mere collaboration were set free on the representation of the Government of India. (For details see 1949 edition.)

A great number of Indians work as labourers in the rubber and tin estates of Malaya. Owing to the steep rise in the cost of living (400 to 500 per cent) there is hardship. (There has been a considerable increase in the wages of labourers recently owing to a phenomenal rise in the price of rubber).

Shortage of rice was another factor that was causing great dissatisfaction. Strikes broke out as a result of all this discontent in the estates in Perak, Selangor, Malacca and Johore States. Some of these strikes were amicably settled by the intervention of the Representative of the Government of India, though wages continued to remain at a low level on account of a slump in the rubber market. Later when trouble of a political nature broke out in violence against the British Government in Malaya, Indians were inevitably caught up in it. A number of Indians were arrested and sentenced on charges of taking part in the insurgent movement or of helping the insurgents.

Lately legislation has been passed which hampers the Indian Agent in his welfare work for Indian labourers. He no longer enjoys the privilege of inspecting work places, etc., where Indian labourers are employed and of enquiring into their conditions. The Government of India made a protest against the withdrawal of a right long enjoyed by their Agent.

BURMA

Burma was a province of India till 1937 April when it was given a separate constitution. Though Indians were known to have gone to Burma from very early times, their immigration to that country was accelerated after the British connection with that country began. In 1931 the Indian population was reported to be more than one million. The Burman finding himself unable to compete with the industrious Indian began to nourish a grievance against him and the feeling became widespread as a result of Burmese propaganda by interested parties. This resulted in occasional riots and the biggest of them in the history of Burma, took place in 1938 and 1939 when more than 150 Indians lost their lives. A committee set up to enquire into those riots recommended an early examination of the problem of Indian immigration into Burma with a view to dispelling Burmese apprehension. Negotiations took place between the Governments of India and Burma and the Bajpai-U Saw Agreement was signed in June 1941.

As a result emigration of unskilled labour to Burma was prohibited. In other respects however the Agreement could not be implemented due to the Japanese occupation of Burma early in 1942. Consequent upon the Japanese occupation of Burma in 1942 about 4 lakhs of Indians left Burma for India. Here they were granted financial assistance and other facilities.

When the liberation of Burma was in sight the question of the future immigration of Indians into Burma as well as the return of evacuees was taken up. Evacuees were issued with identity certificates. The Government of Burma appointed their immigration officers at various ports in India and the evacuees could return after obtaining endorsement on their certificates from these officers. In the beginning the return of such evacuees was regulated and only such categories of evacuees who were useful for the reconstruction of the country were given priority. In 1947 an Immigration (Control) Agreement was passed by Burma. The legislation applied to Burmese as well as foreigners entering Burma. The Act has been amended from time to time and is applicable only to foreigners now. The Act provides for the entry of foreigners by passport duly visad by their officers. In view of the changed conditions in Burma and the difficulty of obtaining employment there many Indians who evacuated to India in 1942 did not return to that country. The present population of Indians in Burma is estimated to be about 8 lakhs.

Soon after the inauguration of the Burmese Republic on 4th January, 1948, the Government of Burma commenced serving notices of discharge on Indian employees who were either not eligible to become Burma citizens or unwilling to elect Burmese nationality. The Government of India felt a special responsibility towards such employees of the Government of Burma as were in that Government's service while Burma was still a part of India and sought (*a*) to secure adequate benefits for discharged personnel in the shape of leave, salary, pensions and (*b*) provided alternative employment to a considerable number of them in India.

Land Nationalisation

Certain measures of agrarian reform introduced by the Government of Burma during December 1947 and in the beginning of 1948 indicated that they had decided upon a policy of complete nationalisation of agricultural lands in Burma. The representatives of Indian interests in Burma considered that they could not take objection to the policy of nationalisation as such, provided adequate compensation for lands was paid to the land owners. Early in September 1948, the Government of Burma published their Land Nationalisation Bill, which *inter alia* fixed the maximum compensation at twelve times the land revenue. Provision was also made in the Bill for the appointment of a Land Commission to determine the basis of compensation. Representations were thereupon made to the Government of Burma, pointing out the inadequacy of the compensation proposed and suggesting that a multiple of 25 times the land revenue on a uniform basis should be adopted and adequate representation should be given to Indians on the Land Commission as well as on the Land Committees which would be responsible for the distribution of the resumed lands. The Government of Burma, however, passed the Bill on 11th October 1948, without any substantial modifications.

The ten man Land Commission provided under the Act, was appointed in August 1949. The Government of India then requested the Government of Burma to discuss the whole question with a delegation from India before the Commission took any decisions regarding the method of determining compensation for lands to be nationalised. The Government of Burma agreed. A delegation was sent by the Government of India to Burma in June 1950. It had discussions with the representatives of the Government of Burma who promised to convey the proposals of the Government of India to their Government.

The Burma Union Citizenship (Election) Act, 1948.—Passed in April 1948, provides for the conferment of citizenship on a person who was born in any of the territories which at the time of his birth was included within His Britannic Majesty's Dominions and who has resided in any of the territories included within the Union of Burma for a period of not less than eight years immediately preceding the 4th January 1948, or immediately preceding the 1st January 1942, and who intends to reside permanently therein and submits his application in accordance with the procedure laid down. The Government of Burma have also enacted a Burma Foreigners' Registration Act, whereby all persons, who were not citizens of Burma on the 4th January 1949, are required to register as aliens.

MAURITIUS

Mauritius in the Indian Ocean was the first British Colony to receive indentured labour from India in 1834. Nearly 63 per cent of the total population in the Colony is Indian. Agriculture forms the main occupation of the people of the Colony and the principal products of the place are sugar and copra. A large proportion of the Indians are farm-labourers on the sugar plantations. In Commerce their importance is second only to that of the Chinese. Indians are mostly illiterate. On the whole the general economic and social condition of Indians is extremely unsatisfactory. There is no colour bar against them.

Indians do not suffer from any political disability either. The new political constitution of the Colony consists of a Governor, an Executive Council of 3 ex-officio and 4 members chosen by the Legislative Council amongst its members and a Legislative Council of 3 ex-officio members, 12 nominated and 19 elected members. In the present Executive Council 2 more Indian members have been nominated. There are 11 Indian elected members of the Legislative Council, of which one is also a member of the Executive Council.

The condition of Indians in this Colony continued to remain satisfactory till 1937, when there were labour disturbances on certain sugar estates employing Indian labour. The Colonial Government appointed a Commission to enquire into and report on the disturbances. The commission reported during 1938 and the most important recommendations of the Commission related to the necessity for the formation of a Department of Labour and the enactment of suitable labour legislation in place of the Labour Ordinance of 1922 which mainly dealt with indentured labour.

Both recommendations were given effect to and the Labour Ordinance of 1938 which closely follows the Malayan Labour Code should prove of considerable benefit to the Indian labourers. The Industrial Associations Ordinance of 1938 provided for the regulation of conditions of employment, the establishment of machinery for the peaceful settlement of disputes and generally the formation of industrial Association. This Ordinance, it will be observed, provides for collective bargaining by industrial labourers.

In 1940 May, Mr. S. Ridley, then Secretary to the Agent General for India in the Union of South Africa, was deputed to visit Mauritius and make a report.

In his report, which was published at the end of 1943, he made a number of recommendations, the more important of which were (1) minimum wage for labourers in the sugar industry, (2) grant of war bonus, (3) Government control over housing of labourers of estates, (4) introduction of compulsory education in suitable stages, (5) extension of franchise by adding educational qualification as an alternative to property qualification, and (6) adequate representation of the Indian community in the Council of Government and the Executive Council, etc., etc.

Disturbances on Estates.—In 1943 disturbances occurred on 4 estates pending settlement of a demand for higher wages. The police were reported to have been assaulted and in the course of firing which followed 3 persons were killed and 3 wounded. A Commission of enquiry was appointed to investigate the cause of the outbreak and the Conciliation and Wages Boards examined the question of adjustment of wages. The report of the Commission was published in November, 1944.

The Commission observed that the main underlying causes of the disturbances were unsatisfactory economic conditions and low wages. It made far-reaching recommendations for the improvement of labour conditions, general welfare and health services and the general administrative machinery. The Government of Mauritius have taken action on certain recommendations in regard to the improvement of labour conditions and have set up a Central Statistical Bureau.

EDUCATION

SINCE August 15, Education at the Centre has been constituted into a separate Ministry of Education, the present Minister for Education being Maulana Abul Kalam Azad.* The State Governments are fully autonomous in regard to educational matters except in respect of educational development programme for which they receive grants-in-aid from the Central Government. Such programme has to be approved by the Central Government who have to examine whether it is in accord with the All-India approved educational policy.

The Central Ministry of Education consists of an Educational Adviser-cum-Secretary, a Joint Educational Adviser and *ex-officio* Joint Secretary, a Joint Educational Adviser and two Deputy Educational Advisers, one Deputy Secretary-cum-Deputy Educational Adviser and one Deputy Secretary who are in charge of the different Divisions in the Ministry. There are also two Deputy Educational Advisers who are in charge of educational work in London and Washington respectively. The names of the chief men in the Central Ministry of Education are given below :—

Educational Adviser-cum-Secretary, Humayun Kabir, M.A. (Oxon.), M.A. (Cal.).
Joint Educational Adviser and ex-officio Joint-Secretary, K. G. Saiyidain, M.Ed. (Leeds) (*Head of the Bureau and Development Division*).
Joint Educational Adviser, Ashfaque Husain, B.A. (Oxon.), Bar-at-Law.
Deputy Educational Advisers, M. S. Sundaram, M.A., B.Litt. (Oxon.) (*Educational Secretary, Embassy, Washington*); Dr. A. M. D. Rozario, M.Sc., Ph.D. (*Secretary, Education Department, High Commissioner's Office, London*).
Deputy Secretary, Mrs. P. Johari, M.A., L.T., T.D. (*Head of the Administrative and External Relations Division*).
Deputy Educational Adviser, L. R. Sethi, M.A. (Punjab) & (Toronto) (*Head of the General Education Division*).
Deputy Educational Adviser, A. S. Grewal, M.A., Bar-at-Law (*Head of the Scholarships Division*).
Deputy Educational Adviser, G. K. Chandiramani, B.E. (*Head of the Technical Division*).

STATE ORGANISATION

In the States also, the subject 'Education' is under the control of a Minister. The Secretary, Department of Education is the permanent head of the Department and the Director of Public Instruction (in some States he is called the Director of Education) acts as an expert Adviser to the Minister in charge of Education. The Director controls the inspecting staff and the teaching staff of the Government institutions. In some States (Coorg, Kutch, Bilaspur) the functions of Director are discharged by the Educational Officer, in others (Bhopal, Manipur, Tripura) by the Education Secretary.

The authority of Government in controlling the system of public instruction is in part shared with and in part delegated to Universities, and Boards of Secondary and Intermediate Education as regards secondary education and to local bodies as regards elementary education in some States.

Certain forms of Technical Education are under the technical departments concerned and come within the purview of the Minister in Charge of those Departments.

Madhya Pradesh, Madras, and Hyderabad (Deccan) have each a Board of Secondary Education, while Uttar Pradesh (for the whole State except the areas under the jurisdiction of Banaras and Aligarh Universities) has a Board which controls High School and Intermediate Education in the State. Ajmer, Bhopal and Vindhya Pradesh have a Board of High School and Intermediate Education at Ajmer and Madhya Bharat has one at Gwalior. Delhi and West Bengal have Boards of Higher Secondary Education, while Bombay has a Board of Secondary School Certificate Examination. After the Matriculation Examination for 1952 is completed by the Patna University, the Bihar School Education Board which has recently been set up will conduct the examination for the whole of the State.

Institutions under private management are controlled by Government and by local bodies by "recognition" and by the payment of grants-in-aid, with the assistance of the inspecting staffs employed by Government and by local bodies.

In India there are ten Boards of Intermediate and/or Secondary Education, and 30 Universities. The names of the Universities and of their Vice-Chancellors are given below :—

1. *Agra University.*—C. Mahajan, M.A.
2. *Aligarh University.*—Dr. Zakir Husain, M.A., Ph.D.
3. *Allahabad University.*—Dr. A. C. Banerjee, D.Sc.
4. *Andhra University.*—V. S. Krishna, M.A. (Oxon.), Ph.D. (Vienna).
5. *Annamalai University.*—Sir Shanmukham Chetty.
6. *Banaras University.*—Acharya Narendra Deva.
7. *Bombay University.*—N. J. Wadia.
8. *Calcutta University.*—Justice Sambhu Nath Banerjee, M.Sc., LL.B.
9. *Delhi University.*—Dr. S. N. Sen, M.A., Ph.D.
10. *Lucknow University.*—Acharya Jugal Kishore.
11. *Madras University.*—Lt.-Col. Diwan Bahadur Sir A. Lakshmanaswami Mudaliar, M.D., LL.D., D.Sc., F.R.C.O.G.
12. *Mysore University.*—Dr. B. L. Manjunath, B.A., M.Sc. (Lond.), D. Phil. (Oxon.).
13. *Nagpur University.*—Lt.-Col. Pandit K. L. Dubey, M.A., LL.B.
14. *Osmania University.*—Vacant.
15. *Patna University.*—Dr. K. N. Bahl.
16. *Travancore University.*—Sir A. Ramaswamy Mudaliar.
17. *Utkal University.*—Dr. Parasuram Misra.
18. *Sagar University.*—Dr. R. Tripathi, M.A., D.Sc. (Lond.).
19. *Rajputana University.*—Dr. G. S. Mahajani, M.A., Ph.D.
20. *Punjab University.*—Dewan Anand Kumar, M.Sc., M.A. (Cantab.), Bar-at-Law.
21. *Gauhati University.*—K. K. Handiqui, M.A. (Calcutta & Oxon.).
22. *Poona University.*—Dr. M. R. Jaykar, P.C., M.A. D.C.L., LL.D.
23. *Roorkee University.*—C. A. Hart, T.D., D.Sc. (Engg.), Ph.D., M.I.C.E., F.R.I.C.S., I.M.I. struct. E.
24. *Jammu & Kashmir University.*—Hon'ble Chief Justice Janki Nath Wazir, B.A., LL.B., Bar-at-Law.
25. *Baroda University.*—Mrs. Hansa Ben Mehta.
26. *Gujarat University.*—H. V. Divatia.
27. *Karnatak University.*—C. S. Hulkoti.
28. S. N. *D. T. Indian Women's University.*—D. B. K. M. Jhaveri, M.A., LL.B., J.P.
29. *Visva-Bharati University.*—Rathinder Nath Tagore.
30. *Bihar University.*—Shyamnandan Sahay.

THE NEW OUTLOOK

The whole structure of education in India is being remodelled. Old Primary Schools, which in some States comprised of four classes, in others of five and six, in still others of seven or eight are giving place to Junior and Senior Basic Schools; High Schools will be reorganised into Higher Secondary Schools to include the 1st Year of Intermediate Education, leading up to three-year degree course. The whole question of university education has been gone into by the Radhakrishnan commission. Technical Education is receiving increased attention and a definite vocational bias is being given to education in Basic Schools.

The new policy is based on a resolution passed by the Central Advisory Board of Education at a meeting held in December 1935. The resolution is worth quoting.

(1) The Board is of opinion that a radical readjustment of the present system of education in schools should be made in such a way as not only to prepare pupils for professional and university courses, but also to enable them at the completion of appropriate stages, to be diverted to occupations or to separate vocational institutions.

(2) These stages should be :—

(*a*) The primary stage, which should aim at providing at least a minimum of general education and training and still ensure permanent literacy.

(*b*) The lower secondary stage, which will provide a self-contained course of general education either for higher education or for specialised practical courses.

In rural areas, the courses at this stage should be attuned to rural requirements.

Some form of manual training at this stage should be provided which would aim at the development of practical aptitudes and be made compulsory.

(*c*) The higher secondary stage, in which would be included institutions with varying length of courses :—
(*i*) preparing students for admission to universities in arts and science ;
(*ii*) for the training of teachers in rural areas ;
(*iii*) for agricultural training ;
(*iv*) for clerical training ; and
(*v*) for training in selected technical subjects which should be chosen in consultation with employers.

Where separate institutions are not possible for the diversified courses, some of them might be incorporated in a higher secondary course of enlarged scope which would permit a choice of alternative groups of subjects and would end in leaving certificates.

(3) At the end of the lower secondary school course there should be the first public examination.

(4) Candidates desirous of joining the subordinate clerical service of Government and of local bodies should pass such qualifying examinations as might be prescribed by proper authority and should not be more than 19 years of age at the date of their examinations.

The certificate granted to pupils completing other specialised courses should receive Government recognition.

(5) Expert advice would be of value in organising the scheme of reconstruction outlined above; and also for suggesting methods of training masters who would assist pupils and selection, by the pupils, of courses of study with due regard to their aptitudes.

Educational Reports

As the Board had recommended that expert advice would be necessary for planning educational reorganisation, Messrs. A. Abbot, C.B.E., formerly Chief Inspector of Technical Schools, Board of Education, England, and S. H. Wood, M.C., Director of Intelligence, Board of Education, England, were invited to India for the purpose. Their visit resulted in the production of the famous report on educational reconstruction commonly known as "Wood-Abbot Report". The most important recommendations outlined in this report are:—

(*a*) Infant classes should, so far as possible, be entrusted to trained women teachers ; and for this and other reasons the development of educational provision for girls and women is of paramount importance.

(*b*) The education of children in the Primary Schools should be based more upon the natural interests and activities of young children and less upon book learning. Concentration on literacy as a narrow objective is unsound.

(*c*) The curriculum of the rural Middle (or Lower Secondary) Schools should be closely related to children's environment ; and if English is taught to any children of middle "school" age it should not be allowed to result in an excessive amount of time being devoted to linguistic studies.

(*d*) The Vernacular language should, so far as possible be the medium of instruction throughout the High (or Higher Secondary) Schools, but English should be a compulsory language for all pupils in these schools.

(*e*) The teaching of English should be made more domestic and less attention should be devoted by the average boy to the study of English "prose and poetry"—arrangements being made to meet the needs of those boys specially qualified to pursue more advanced English studies.

(*f*) More systematic attention should be paid to the teaching of Art; and steps should be taken to secure for the High (or Higher Secondary) Schools a supply of qualified teachers of Art.

(*g*) The pre-employment course of training for teachers of Primary and Middle (or Lower Secondary) Schools should be three-year course following without any gap, the completion of Middle (or Lower Secondary) School course.

In conjunction with the Wood-Abbot Report, the Board gave their considered thought to the scheme of educational reconstruction whose real author was Mahatma Gandhi, which had emerged in the shape of Dr. Zakir Husain Committee report. The Board accepted the Basic Education Scheme with certain essential modifications, and on this subject two very important reports known as Kher Committee reports were published.

In the expectation that sooner or later the problem of providing India with a system of education approximating to those available in other countries would have to be tackled, serious attention was devoted to the surveying of the main fields of educational activity so as to ascertain the minimum provisions required. Thus since the Board's revival in the year 1935, the various committees of the Board reported among others on the following subjects :—

(1) Basic Education (2 reports) ; (2) Adult Education ; (3) The Physical Welfare of Schoolchildren ; (4) School Buildings ; (5) Social Service ; (6) The Recruitment, Training and Conditions of Service of Teachers in Primary, Middle and High Schools ; (7) The Recruitment of Education Officers ; (8) Technical (including Commercial and Art) Education ; (9) Text-books ; (10) Examinations ; (11) Educational Administration ; (12) Agricultural Education; (13) Religious Education ; (14) Selection of Pupils for Higher Education.

THE PLAN

Two crucial meetings of the Board were those held in October, 1943 and January, 1944 when it reviewed the recommendations of their Committees with special reference to post-war needs and developments. The Board were satisfied that the Educational Adviser's Memorandum on Post-War Educational Development in India, subject to the modifications suggested by them, would provide the foundation upon which an efficient system of public instruction, suited to the needs and circumstances of the country could effectively be erected. Their final recommendations are contained in the published Report on Post-War Educational Development in India (popularly known as the Sargent Report). The main recommendations on which the whole post-war policy is based are given below :

(*a*) A system of universal, compulsory and free education for all boys and girls between the ages of six and fourteen should be introduced as speedily as possible though in view of the practical difficulty of recruiting the requisite supply of trained teachers it may not be possible to complete it in less than forty years (now reduced to 16).

(*b*) The character of the instruction to be provided should follow the general lines laid down in the reports of the Central Advisory Board's two Committees on Basic Education.

(*c*) The Senior Basic (Middle) School, being the finishing school for the great majority of future citizens, is of fundamental importance and should be generously staffed and equipped.

(*d*) All education depends on the teacher. The present status and remuneration of teachers and especially those in Primary Schools are deplorable. The standards in regard to the training, recruitment and conditions of service of teachers prescribed in the report of the Committee approved by the Central Advisory Board in 1943 represent the minimum compatible with success in a national system. These should be adopted and enforced everywhere.

(*e*) A vast increase in the number of trained women teachers will be required.

PRE-PRIMARY EDUCATION

(*a*) An adequate provision of pre-primary instruction in the form of Nursery Schools or classes is an essential adjunct to any national system of education. The provision in this respect at present is negligible

(*b*) In urban areas, where sufficient children are available within a reasonable radius, separate Nursery Schools or departments may be provided : elsewhere Nursery classes should be attached to Junior Basic (Primary) Schools.

(*c*) Nursery Schools and classes should invariably be staffed with women teachers who have received special training for this work.

(*d*) Pre-primary Education should in all cases be free. While it may not be feasible to make attendance compulsory, no efforts should be spared to persuade parents to send their children to school voluntarily, particularly in areas where housing conditions are unsatisfactory and/or mothers are accustomed to go out to work.

(*e*) The main object of education at this stage is to give young children social experience rather than formal instruction.

HIGH SCHOOL EDUCATION

(*a*) The High School course should cover six years and the normal age of admission should be about eleven.

(*b*) Entry to High Schools should be of a selective basis ; only those pupils should be admitted who show promise of taking full advantage of the education provided. Additional places may be provided for those not selected provided that no cost falls on public funds.

(*c*) In accordance with the general principle set out in (*b*) above, places in High Schools should be provided for at least one child in every five of the appropriate age-group.

(*d*) In order to secure the right children, the methods of selection to be employed will require the most careful consideration. Special arrangements will have to be made for the transfer from Senior Basic (Middle) Schools to High Schools of suitable children and particularly of those who show signs of late development.

(*e*) High Schools should be of two main types, (*A*) Academic, (*B*) Technical. The objective of both should be to provide a good all round education combined with some preparation in the later stages for the careers which pupils will enter on leaving school.

(*f*) The curriculum in all cases should be as varied as circumstances permit and should not be unduly restricted by the requirements of Universities or examining bodies. As long as English remains the medium of instruction at the Universities it should be compulsory throughout the secondary stage. Youth Movement, Scout Movement and similar extra-curricular activities should be encouraged.

(*g*) In order that no poor child of ability may be excluded, liberal assistance in the form of free places, scholarships and stipends should be available throughout the course.

(*h*) In order to secure teachers of the right type, the salaries paid in all recognised schools, whether maintained by the State or by private bodies, should not be less than those prescribed by the Central Advisory Board of Education.

UNIVERSITY EDUCATION

(*a*) Indian Universities, as they exist today, despite many admirable features do not fully satisfy the requirements of a national system of education.

(*b*) In order to raise standards all round, the conditions for admission must be revised with the object of ensuring that all students are capable of taking full advantage of a University Course. The proposed reorganisation of the High School system will facilitate this. Adequate financial assistance must be provided for poor students.

(*c*) The present Intermediate course should be abolished. Ultimately the whole of this course should be covered in the High School but as an immediate step the first year of the course should be transferred to High School and the second to Universities.

(*d*) The minimum length of a University degree course should be three years.

(*e*) The tutorial system should be widely extended and closer personal contacts established between teachers and students.

(*f*) The importance of establishing a high standard in post-graduate studies and particularly in pure and applied research should be emphasised.

(*g*) Steps should be taken to improve the conditions of service, including remuneration of University and College teachers where those now in operation are not attracting men and women of the requisite calibre.

(*h*) An Indian University Grants Committee should be constituted for the purpose.

TECHNICAL, COMMERCIAL & ART EDUCATION

(*a*) In view of the prospective needs of post-war industry and commerce for skilled technicians, and in order to cater for the aptitudes of those who will derive greater benefit from a practical course, the establishment of an efficient system of Technical Education at all stages on the lines set out in the report of the Technical Education Committee, is a matter of great urgency.

(*b*) Due regard should be had to the recommendations of the Wood-Abbot Report in respect of the scope and content of Technical Education.

(*c*) All technical education beyond the school stage other than that given in the technological departments of universities should be placed under a central controlling body (to be called All India Council of Technical Education) having representatives of all the interests concerned.

ADULT EDUCATION

(*a*) Comprehensive arrangements on the general lines set out in the Adult Education Committee's report should form an integral part of education. These are particularly important in India today in view of the very high percentage of illiterates.

(*b*) Literacy is a means and not an end in itself. The present plan of Adult (Social) Education aims at removing illiteracy as well as at teaching the people the fundamentals of citizenship in an independent country.

(*c*) It is estimated even with the introduction of a universal system of Basic education there will be over 9 crores of illiterates (age-group 10-40) to be dealt with. The Government of India have recently so planned the system of Adult (Social) Education, as to make possible the removal of 50 per cent illiteracy in ten years.

(*d*) In this as in all branches of education the quality of the teachers is of supreme importance. The difficulty of obtaining a sufficient number of teachers of the right type, particularly women, must on no account be underestimated.

(*e*) The responsibility for adult education must rest with the State but every effort should be made to enlist the aid of suitable voluntary organisations wherever available.

Literacy and general education are to proceed simultaneously but greater emphasis is to be laid on general education, in order to enable every Indian to fulfil his role of citizenship in the New Order. All possible resources of the country in men and money will be mobilized to attain these objectives and whole-time workers, part-time workers and volunteers will be employed to implement the programme. Owners of mills and factories will be asked to make arrangements for the education of their workers and workers' families, and the Government will make it compulsory for all its employees to attain literacy within a period of three years.

* Pre-General Election.

For this programme, modern media of mass education like radio, films, and open air theatres are suggested. In order to prevent backsliding, emphasis is also laid on further education of literates through clubs, discussion groups, summer schools and similar other agencies.

TRAINING OF TEACHERS

(a) The proposals for the recruitment and training of teachers as set out in the Report approved by the Central Advisory Board in January, 1943 should be generally adopted.

(b) The existing training institutions are barely sufficient to meet wastage among existing teachers to train those hitherto untrained.

(c) New Training Schools and Colleges (including University Education Department) must be provided to supply the additional teachers whom a national system will require. These will amount to over 2,000,000 non-graduates for schools of all types and 180,000 graduates for High Schools.

(d) Arrangements should be made to pick out suitable boys and girls towards the end of the High School course. This is particularly important in Girls' High Schools in view of the vast increase in the number of women teachers required.

(e) The courses provided should be essentially practical and should be specially related to the needs of the schools in which the trainees will subsequently serve.

(f) No fees should be charged either in Training Schools or Training Colleges; liberal assistance should be available for the maintenance of poor students.

(g) Refresher courses are of the utmost importance and should be provided for all types of teachers but particularly for those in remote rural areas. Facilities should be provided for research and selected teachers should be encouraged to study educational methods in foreign countries.

Provision for ensuring the physical welfare of all pupils and students should be made on the lines set out in the report of the Joint Committee.

EDUCATION OF THE HANDICAPPED

(a) Provision for the mentally or physically handicapped should form an essential part of a national system of education and should be administered by the Ministry of Education.

(b) While much of the work relating to the education of the handicapped has been done so far by voluntary effort, the Government of India are no less anxious to promote the cause of the education and welfare of the handicapped. The Ministry of Education have set up a special unit which deals with all matters relating to this branch of education. Plans for the establishment of a Braille Printing Press as well as a National Centre for the Blind are in hand.

(c) Wherever possible, handicapped children should not be segregated from normal children. Only when the nature and extent of their defect make it necessary, should they be sent to special schools or institutions. Partially handicapped children should receive special treatment at ordinary schools.

(d) The blind and deaf need special educational arrangements, including specially trained teachers. The Government of India have also proposed to modernize the existing Teachers Training Centres for the Deaf and Dumb.

(e) Particular care should be taken to train the handicapped, wherever possible for remunerative employment for them. After-care work is essential.

RECREATIVE & SOCIAL ACTIVITIES

(a) The provision of recreative and social activities on an adequate scale is an essential feature of any modern educational system.

(b) Apart from the needs of boys and girls in schools and colleges special attention should be paid to those in the 14-20 age-group who are no longer attending school. To serve these a Youth Movement on an All-India basis should be set up.

(c) A Youth Movement should aim at co-ordinating and supplementing rather than superseding the work of organisations already dealing with aspects of this problem.

(d) This main need of a Youth Movement will be for leaders, both men and women, who will have to be specially trained. The possibility of finding suitable recruits among demobilised Officers and N.C.Os. should be explored.

(e) The provision of social and recreative facilities for adults should form an important part of any Social Service Scheme. Reference is invited to the report of the Board's Committee on Social Service and Public Administration (1941).

Employment Bureaux form an essential part of educational administration: they are especially necessary in India in view of the restricted openings at the moment for progressive employment.

Employment Bureaux, if they are to fulfil successfully their legitimate functions must be staffed by trained experts with practical experience of teaching and of industrial conditions.

While contact should be maintained with Employment Exchanges, Labour Tribunals, etc. established by other Departments, Employment Bureaux which deal with the output of educational institutions should be under the control of the Education Department.

ADMINISTRATION

(a) The States should remain the main units for educational administration except in regard to University and Higher Technical Education, the activities of which could be co-ordinated on an All-India basis.

(b) The Director of Public Instruction should be directly responsible for the general administration of education, other than University and Higher Technical Education, throughout the State. He should also be Secretary for Education, should it be thought necessary to keep in existence a separate post of this kind.

(c) A national system of education will mean closer co-operation, financial and otherwise between the Central and State Governments.

(d) State Governments should be left to make such changes in their administrative arrangements as the carrying out of education developments on the scale contemplated may require. Experience, however, suggests that they would be well-advised to resume all educational powers from local bodies, except where these are functioning effectively.

(e) In order to enlist local interest in education, School Managing Bodies, School Board and District Education Committees may be constituted, if and when sufficient people of the right type are available to serve on them. An Educational Advisory Board for the whole State may be desirable.

(f) A strong Education Department will be required at the Centre and in this connection the scope and functions of the Central Advisory Board should be enlarged.

(g) Steps should be taken in accordance with the recommendations of the Board's Committee on the Recruitment of Education Officers (1943) to check the present deterioration in the status and calibre of the educational administrative service and to enable it to secure the services of the type of officer who will be capable of carrying a scheme of the kind contemplated into successful operation.

(h) Arrangements should be made for the exchange of officers between the Centre and the States and between one State and another. The desirability of establishing a senior educational administrative service on an All-India basis should receive consideration.

SOME OBJECTIONS

That is the basis on which Indian education is to be organized, with one difference. It was thought that forty years was much too long a period to wait for universal free education. A subsequent committee under B. G. Kher, ex-Chief Minister of Bombay shortened the term to 16 years divided into three periods two of five years and the last of six. The chief obstacle in the way of realization has been finance.

As a result of the general agreement which State Governments expressed with the policy outlined in the Board's report the Government of India generally accepted, subject to the limitation of finance, the principles and objects of the Board's scheme.

In 1944, the Government of India asked the State Governments to prepare their Five-Year Post-War Educational Development Plans on the general lines laid down in the report of the Central Advisory Board of Education. Early in 1946, the State Governments were asked to select a few important schemes like Training of Teachers, and Compulsory Primary Education from their plans, and start implementing them after their approval by the Government of India. All the schemes submitted by the State Governments to the Government of India were examined, and such of them as conformed to the recommendations contained in the Report were approved by the Government of India for immediate execution.

The comments of the Sub-committee of the National Planning Committee (old) may be reproduced here. The Sub-committee says that the system in the Wardha scheme of a child learning a craft by the end of the school career to start a vocational life, is spiritually harmful to the child, as the vocation becomes the principal object of education. This gives a narrow and shallow knowledge of the subjects taught.

While accepting the syllabus for the primary schools under the Wardha scheme as satisfactory, the committee suggests that algebra should be taught side by side with arithmetic, and British units of length, area, volume, weight and currency may be avoided and Indian units substituted.

The report is not in favour of what is known as the exchange motion under the Wardha scheme, according to which current expenditure of the school is expected to be met by the sale of the goods produced in the technical section by the students. The report emphasizes that these schools should be a direct burden on the State.

Primary education covering a period of seven years, according to the report, should be free and compulsory for all children and may be co-educational, the medium of instruction being the mother tongue.

After the primary course of seven years, secondary schools of general arts and sciences of three or four years' course should be established, and these three or four years should prepare students for admission to the university or higher technical or professional courses. Secondary schools, admission to which is not to be compulsory, should provide the study of Western languages, preferably English, the medium of instruction remaining the mother tongue.

A regular sifting of students is to be made after completion of the primary school course. Only those intellectually fitted will enter the secondary schools and the rest will enter what are called "continuation schools" for training in arts and crafts and industries such as drawing, artistic designs, general economics, civics, accounts and physical culture and gymnastics.

EDUCATION IN THE INDIAN ARMY

The section may be wound up with a note on education in the Army. Before the war the Indian Army had a system of education whereby all soldiers received instruction as an integral part of their training. Their school knowledge, if any, was revised and extended. Illiterate recruits were taught to read and write in Roman Urdu and further graded instruction was given upto roughly the Matriculation standard.

The outbreak of war and the consequent expansion of the army brought in large numbers of recruits, many of them illiterate, of different races, and speaking different languages. These had to be educated in a short time up to the standards required for the ranks they might hold and the parts they would have to play in a complicated mechanised army. And they had to be considered not merely as units of a machine but as individuals and prospective civilians of a developing State.

To deal with the problems that arose, the Army Educational Corps on whom the responsibility for their educational training devolved was expanded—largely by the intake of Indian Officers. And the educational training of the men was divided into two parts—normal and wartime.

Normal education is a development of the pre-war system, simplified and intensified. Wartime education, in spite of its title, dealt with war and peace. The technique adopted was that of the discussion group, within the unit, led by the platoon Commander under supervision of an officer of the unit.

The unit discussions and associated activities were based on handbooks and periodical pamphlets issued by the Directorate of Army Education at General Headquarters (India).

On the cessation of hostilities, an elaborate educational plan was put into operation by the Army—THE RELEASE PERIOD EDUCATION SCHEME (INDIAN TROOPS)—The object of the scheme was to use the time between the cessation of hostilities and the date fixed for the soldier's release from service to prepare him for return to civil life as a better, more useful citizen educationally, more capable of obtaining a better position in civil life. The scheme not only constituted a powerful drive against illiteracy, but also included graded instruction from the literacy stage in a man's own vernacular to the Matriculation stage in English. The I.A. SPECIAL certificate of Education, the highest certificate obtainable in the I.A. is now recognised by most universities in India as equivalent to their Matriculation standard. The scheme also provided for intensive instruction in the principles of citizenship and rural and urban development.

UNIVERSITY COMMISSION REPORT

The main conclusions of the University Commission report were made public on 25th August, 1949. The report itself covers over 600 pages and 100 pages of appendix and deals with various aspects of present-day Indian education including the medium of instruction, professional education, standards of teaching, post-graduate training and research, religious education, financing of universities and co-education.

The main object is to make education more Indian in character so that the product might be representative of Indian genius.

One of the serious complaints against the present educational system is that it is divorced from Indian life and thought. Today, Indian Universities discuss more of Shakespeare, Milton and others and not India's own writers. Universities in the United Kingdom and America give a historical background of the subjects which make up the genius of those countries while in India education has been more or less on an "un-Indian basis." One of the main objects is to make education more Indian in character so that the product may be representative of Indian genius.

Another recommendation of the Commission is to make professional education more relevant to India's needs. If one turned to agriculture, one would find that India's methods are archaic and primitive, while her problems are modern, requiring modern methods for their solution. Every system of education has its own objectives. The Soviet system aims at building up a particular class of society. The American system gives scholars the fundamentals of the American Constitution and makes them citizens of the American Republic.

Similarly our aim should be the objective of our Constitution, namely, a democratic society which has for its fundamental principles freedom, equality, and fraternity. They give us faith and a working philosophy of life.

On the question of religious instruction India being a secular State, could not identify itself with any one religion and so far as State institutions are concerned, there could be no denominational or sectarian religious considerations. The Commission recommends the starting of institutions for "silent meditation" where the lives of religious leaders like Bhudda, Jesus, Mohammed and Confucius may be studied in a reverent and dispassionate way.

Without any dogmatism, selections from the Scriptures of the world may be brought together and problems of philosophy and religion taught in a very general sense. This is in consonance with the general spirit of the country. It is to make people realise "that our destinies are ruled by an unseen power."

Religion might be studied academically even in State-maintained educational systems. There was a difference between the preaching of dogma and the study of religion.

In regard to co-education, the Commission's recommendation is that in the secondary stages there should be separation and in the basic and collegiate stages co-education.

Elections in the teaching profession must be avoided and important posts like those of Vice-Chancellor and Dean should not be thrown to academic log rolling. This often leads to friction in Universities and "mud-slinging." In U.K., Vice-Chancellors were appointed for life or by rotation.

The State should be liberal in the grant of scholarships. In Oxford between 50 and 60 per cent of the students was assisted by the State and poverty should be no bar to the prosecution of higher studies. In the U.K. £12,500,000 were paid by way of State grants to Universities and besides, Government spent over £8,000,000 by way of scholarships.

Again, in the U.K. and America, about 11 to 12 per cent of the country's Budget was spent on education while in India the amount spent was less than five per cent of the Budget including sums spent by Governments and local authorities.

Evening Colleges for workmen and other people should be started.

The maximum strength for any college should be 1,500. The Commission saw instances where there were 5,000 to 6,000 students on the rolls, while the actual accommodation provided was only for 1,500. Such institutions could be found in Bombay and Calcutta. Lack of individual attention led to frustration and exploitation of students by the politician, revolutionary or reactionary.

The Commission lays considerable stress on improving the standards of the teaching profession. The position today appears to be that anyone who was not fit for anything was made a teacher. The ablest type of men in the country are being driven to other services. Research and teaching should be regarded as the main concern of any civilised society. There could, however, be no improvement so long as the salaries paid to teachers remain what they are, and the best talent could not be attracted unless the salaries paid to them approximated with those in other services.

Technical, Professional Education

In regard to professional education, the Commission has recommended more adequate schemes to be undertaken. Seventy per cent of the population in India is engaged in agricultural occupations and yet the country is dependent for food on other countries, while in America only 13 per cent are engaged in agriculture and they produce 60 per cent of the world's export of food grains.

Similarly, with regard to industrial development there is a great paucity of technical and executive personnel.

The Commission has also made recommendations in respect of the legal and medical professions. Despite eminent lawyers in India, there has not been any outstanding contribution to the legal science as such. There is need today for a first class Medical Research Institute.

On the question of examinations, which has been "a great curse in this country" the Commission's view is that there is something radically wrong with the present system.

The great mathematician Ramanujam failed in the first Arts examination as he was not able to stand the "tests" but his contribution to mathematics was outstanding. Examinations fail to bring out the actual calibre of the students.

The Commission has therefore made "certain drastic recommendations in this regard." They have proposed the "objective test" which is in vogue in America. The U.S. Army and Navy held "objective tests" in recruiting officers and men during the war. Many big business firms and corporations are adopting this method which does not involve long, written examinations and students are not thrown just to trust luck. Hundreds of questions are put to students of which only one or two require an essay kind of reply. The test involves no gamble or luck.

On the question of language the Commission has recommended that the medium of instruction for higher education should be the regional language, with option to use the federal language either for some subjects or for all subjects.

The Commission has also recommended that where the mother tongue is not the same as the federal language, the federal language is to be studied from the first form. If the mother tongue and the federal language are identical, students would be required to take any other Indian classical or modern language. If Hindi happens to be the mother-tongue of a student, the student would be required to study some other Indian language.

There must be no attempt at hasty displacement of English as a medium of instruction for academic standards. Indian languages have to grow and must become proper media for communication. To displace English by a State or the federal language may result in deterioration of standards. Therefore, while State Governments should make their languages more potent as early as possible no time-limit should be prescribed. Languages will have to grow and there cannot be a time-limit. During the transition English will remain.

Besides the special connection which this country has with English it is becoming more popular in other countries as well. In Soviet Russia, University students are asked to learn one of the European languages and over 90 per cent of the pupils take English as their second language.

The Commission is of the opinion that English should be taught from the third form (three years before matric) for those who desire to enter the University.

In the inter-State border areas where the regional language may be different from that of the mother tongue of a student the medium of instruction must be the mother-tongue up to a particular stage and students would be asked to study the federal language as well.

It is recommended that State and Central Governments should establish bureaux of translation.

ADVISORY BOARD'S RECOMMENDATIONS

A special meeting of the Central Advisory Board was held at New Delhi on April 22 and 23, 1950 to consider the report of the University Education Commission. The Board accepted the recommendations regarding post-graduate teaching and research with special emphasis on the desirability of Ph.D. students being internal students of the university concerned. The examination for Ph.D. should include a thesis and a test of the candidate's general knowledge of the whole field of the subject.

In view of the acute shortage of scientific man-power, the Commission had emphasised the desirability of training a large number of scientists in order that the country might get a few men of outstanding calibre. They also recommended the institution of a large number of scholarships and free places for really good students at the M.Sc. and Ph.D. stage for this purpose. Fundamental research should be the primary concern of the universities and universities should not be precluded from taking up special applied problems concerning their own regions.

Regarding professional education, the Commission's recommendations about the teaching of agriculture, commerce, education, engineering and technology, law and medicine were accepted by the Board with very few modifications.

Regarding admission to law colleges, the Board decided that a 3-year degree course in pre-legal and general studies should be required for admission to the law course but the course for a degree in law would be of two years' duration only, to be followed by practical training such as may be prescribed by the High Courts concerned.

EDUCATIONAL STATISTICS

GRAND TOTAL	1,76,82,000	59,53,000	2,36,35,000

* Figures are provisional.

The Board also accepted the Commission's recommendations regarding new provisions including business administration, public administration and industrial relations with added provision for training in social service.

On the question of religious education, the Board decided that all educational institutions might provide a few minutes for silent meditation. Besides, lives of great religious leaders should be taught in the first year and the central problems of philosophy and religion should be considered in the third year. The Board also resolved that studies in religious philosophy might be provided for in universities.

Regarding the Commission's recommendations about objective examinations the Board adopted a resolution generally approving the recommendations and calling upon universities to implement these as far as possible.

The recommendations of the Commission regarding students, their activities and welfare as also women's education were generally approved by the Board.

Regarding the constitution and control of universities, the Board generally approved the recommendations of the Commission, subject to the provisions in the Constitution wherein university education had been placed on the Union list. Approving the recommendations of the Commission regarding university finance, the Board's resolution pointed out that the implementation of all the recommendations of the Commission accepted by the Board would depend upon the finances made available for this purpose.

About the recommendations made by the Commission regarding individual universities, Central and others, the Board decided that the Government of India should take up the case of each university in consultation with the university authorities and the State Government concerned.

The Commission's recommendations regarding new universities and asking for special attention to be paid to the development of higher education in rural areas were also approved.

The Board also adopted resolutions regarding the harm done by private coaching academies and the measures to regulate them and the question of private practice by Government medical officers.

Finally the Board discussed ways and means to be adopted to popularise Hindi specially in the non-Hindi States. In this connection it approved of the following suggestions:

(*i*) The most essential step in this connection would be to bring out cheap and attractive publications in Hindi on a variety of subjects which are of interest to the masses.

(*ii*) A set of gramophone records may be prepared with the help of which one could learn the language without a tutor.

(*iii*) Lessons in Hindi broadcast from schools may be repeated at great frequency.

(*iv*) Documentary and news films in Hindi should be produced increasingly. There should also be improvement of entertainment films in Hindi so that they may attract the cultured classes.

(*v*) Institution of proficiency tests in Hindi for Central Government servants with prizes for successful candidates.

(*vi*) Introduction of a test in Hindi in competitive examinations for Central Services without making this a handicap for candidates from non-Hindi States.

The Board asked the Central Education Ministry to examine these suggestions and implement them as soon as possible. It might be stated here that at the January meeting of the Board Maulana Azad had given it as his opinion that in the final analysis English should yield place to India's national language at the university stage. But it was a matter on which any hasty decision would be unwise.

THE YEAR IN REVIEW

The year saw the formal opening of the first of the four Higher Technical Institutes intended to provide facilities for Post-Graduate Training and Research in Engineering and Technology within the country. Legislation was also undertaken for giving effect to some of the recommendations of the Universities Commission in respect of the existing three Central universities and the institution of a fourth by incorporating Visva Bharati into a Central University.

A new university Bihar University was established, and an old university the Patna University was reconstituted.

The Planning Commission has recognised the importance of this subject and has recommended an expenditure of Rs. 20 crores for five years for the purpose. A provision of Rs. 1 crore has been made initially for the year 1952-53.

In Delhi the scheme of Social Education introduced in 1951-52 made further progress. Educational Melas were held to arouse the interest of the people and to give them some measure of social education through audio-visual means and to prepare the ground for a successful literacy drive. The Janata College was opened at Alipur in order to train selected villagers for local leadership so that, after a course of about 3 months in general education as well as training in agricultural and simple craft, they could go back to their villages and undertake social education work on a voluntary basis.

In pursuance of the recommendations made by the Central Advisory Board of Education it has been decided to set up a Secondary Education Commission to make a comprehensive survey of Secondary Education and make recommendations thereon.

Under the five-year plan of the Planning Commission schemes relating to Primary and Secondary Education have also been drawn up by the various States.

The Aligarh Muslim and Banaras Hindu Universities Acts were amended in order to reorganise the universities in some respects on the lines recommended by the University Education Commission. A Bill amending the Delhi University Act, 1922 on similar lines was also passed.

The Vishva Bharati, being an institution of national importance was incorporated as a Central University by an Act of Parliament in May, 1951.

Government of India have also decided to revive the University Grants Committee to deal in the first instance with the grants to Central Universities.

Under the five-year plan a sum of Rs. 4.2 crores has been allocated for Higher Education and Research during the quinquennium and it is expected that out of this a sum of Rs. 1.2 crores will be available for development schemes on the humanistic side, *i.e.* other than those relating to Technical Education and Scientific Research. A tentative provision of Rs. 34.2 lakhs has been made in the budget estimates for 1952-53.

Technical Education: The Indian Institute of Technology, Kharagpur, was formally declared open by the Hon'ble Minister of Education on the 18th August, 1951. Two hundred and ten students were admitted to the undergraduate courses for the session 1951-52. The total number of students to be admitted during 1952-53 would be about 600 including those taking courses in new subjects or doing research in certain specified fields.

The constitution of the four Regional Committees by the All-India Council for Technical Education and the demarcation of the Regions for each committee have been finalised. One of the main functions of the regional committees will be to bring about closer liaison between industry and educational institutions with a view to instituting training courses actually required by the industries and arranging facilities for practical training needed by the academic institutions.

The All-India Council for Technical Education has appointed a sub-committee under the chairmanship of Mr. G. L. Mehta to assess the country's requirements for technical manpower over the next five years as well as on a long-term basis.

Education of the Handicapped: One hundred and twenty-three blind adults from all parts of the country received training at the training centre for the adult blind at Dehra Dun. Two new trades, namely, plastics and poultry farming, were introduced at the centre.

Production of literature at the Central Braille Printing Press on a small scale has already commenced.

A common Braille code for Indian languages was framed in accordance with the recommendations made by the three International Conferences convened by UNESCO to study the possibility of evolving a single Braille script for the world. The new common Braille code to be known as Bharati Braille will replace the Braille codes at present in use in the country.

CENTRAL ADVISORY BOARD

Recommendations regarding the expansion of education at all levels were made by the Central Advisory Board of Education, which met in March 1952 in New Delhi. One of the most important issues discussed at this session related to the productive aspects of Basic Education. After detailed examination of the question in all its aspects the Board reaffirmed the value of craft work in an educational programme and recommended unanimously that even if no economic considerations were involved, the time had come to replace ordinary primary education by Basic Education. In carrying out such a programme, the Board drew the special attention of the State Governments to the fact that a system could not properly be designated as Basic Education unless it provided for the full course, including both the junior and senior stages, and placed adequate emphasis on craft work both in its educational and productive aspects.

Among other recommendations regarding pre-University education, are those dealing with the introduction of a minimum health service for school children, the necessity of increased paper quotas for schools and other educational purposes and the desirability of State Governments devoting attention to the development of aero-model clubs in schools.

With regard to social education, the Board expressed the opinion that Basic Education Centres should also be utilised for training social education workers. The Board recommended increased use of the machinery set up by the State Governments and official and non-official agencies for the production of social education literature in the national language and, in this connection, expressed the view that the social education pamphlets in Hindi, sponsored by the Central Ministry of Education and published through the Maktaba Jamia, should be given greater publicity. Greater use was also recommended of the village stage, dramas, kathak and ballad singers in the development of audio-visual education. The Board also emphasized the need for opening Annual Training Camps to train scout leaders, for starting Olympic organizations, opening youth hostels and providing facilities for inter-State travel for students.

Regarding the suggestion for forming an All-India Educational Service, the Board recommended that the Minister of Education, Government of India, may, in consultation with Ministers of Education in the States, examine again the desirability of forming such a Service.

On the recommendation of the Board, the Minister for Education has appointed a Committee on general education to act as an advisory panel to the Planning Commission.

The Committee consists of Shrimati Hannah Sen, Shrimati Zarina Currimbhoy, Dr. Amaranatha Jha, Dr. Zakir Husain, Dr. P. S. Deshmukh, Dr. Shyama Prasad Mukerjee, Shri J. C. Mathur, Secretary, Education Department, Bihar, Shri D. C. Pavate, D.P.I., Bombay, Dr. V. S. Jha, Education Secretary, Madhya Pradesh, Shri Unnithan, I.C.S., Secretary, Education Department, Madras, Shri C. L. Kapur, Secretary, Education Department, Punjab, Shri K. G. Saiyidain, Secretary, Central Advisory Board and Mr. Humayun Kabir, Educational Adviser to the Government of India.

BASIC EDUCATION CONFERENCE

The 7th All-India Basic Education Conference was held at Sevagram on March 3, 1951 with Mr. Badrinath Verma, Education Minister of Bihar presiding. There were 600 delegates and educational experts at the conference. Mr. Verma stated that, although the ideal of Basic education as enunciated by Mahatma Gandhi was accepted in principle by all educationists in the country, the necessary change in the outlook of the authorities of the States and other educational institutions had not come about even after independence. Old university degrees and curricula of studies still enjoyed the same official privileges, while the educated were still divorced from life in the villages.

He invited the attention of educationists to the organisation of rural universities, and said that he would prefer "ruralisation" of the existing institutions to starting new ones.

Inaugurating the conference, the Chief Minister of Madhya Pradesh, Pandit Ravi Shankar Shukla, said that educationists had to face two problems regarding Basic education—the raising of the standard of education and provision of free universal education.

Referring to the proposal for development of rural universities, Pandit Shukla said the planning of such universities would require most careful consideration, and the country would watch the development with great expectations. He asked basic education experts to consider the proposal and formulate concrete plans.

Mr. Jawaharlal Nehru, in a message to the conference said: "The approach to education should not be too rigid and should allow free play for experiment and the development of the individual and of the society we aim at."

The general principle of Basic education, he said, was accepted long ago by the Congress and a number of Provincial Governments tried to apply it in various ways.

"These Provincial Governments were criticised for deviating from the original idea. I am unable to say how far these deviations have been justified. But on general principles, it seems to me that in any such experiments it is desirable to have variety. There is always the danger of too much orthodoxy killing the spirit, and preventing the development of an inquisitive and experimental mind."

Dr. Rajendra Prasad, in a message, said the time had now come when Basic education, whose value had been proved by the work done at Sevagram and in Bihar, should be extended over a wider field and the principles of "Nai Talim" applied to all education up to the highest stage.

The Central Government filled a wide gap in the Basic scheme by producing a detailed syllabus for junior and senior schools. In a preface to the pamphlet that carried this syllabus the Joint Educational Adviser warned teachers that the handbook was to be used only for general guidance and need not be followed in every detail like a text-book or manual. It would greatly help the teacher in using the various crafts to carry out the ideals of Basic education.

A strongly-worded support for the Basic scheme of education also came from the Government of Bombay in a note issued in April 1950. The note set out once again the ideas underlying Basic Education and claimed that students who took the Basic Course had on the whole a better record than those who took other courses.

"Careful enquiries have revealed that the progress of these children in academic studies has not suffered in any way. On the contrary, it is on the whole considerably better than that in ordinary schools.

"The following figures of Primary School Certificate Examination results pertaining to the last three years are relevant in this connection.

Percentage of passes from all Basic schools 1947 47.1; 1948 50.0; 1949 58.0.

Percentage of passes from ordinary Primary Schools in these Districts (Satara, East Khandesh, Surat and Dharwar) 1947 40; 1948 38.4; 1949 41.4.

"The following activities have become a regular feature of almost every Basic school and through it children learn to carry out their social and civic responsibilities and get training in citizenship.

1. Cleanliness campaign in villages.
2. Celebration of religious and national festivals and jayantis.
3. Entertainment programmes and simple dramatisation of educative topics.
4. Manuscript magazines.
5. "Vastra Swavlambi" groups to produce cloth necessary for their own use.
6. Some kind of 'self-government' to train children in managing their own affairs.
7. Regular and systematic excursions and contact with nature.
8. 'Grow More Food' and 'Tree Planting' campaigns. Every 'agriculture-bias' school maintains compost pits and gives demonstrations in compost-making.
9. Children work as volunteers at the time of local fairs, festivals, functions, etc.
10. In all Basic schools in the State, emphasis is laid more on the educative value of the activity and the economic and productive aspects are not permitted to drive that consideration into the background. However, experience shows that self-sufficiency is possible with regard, at least, to the recurring cost on craft work."

One of the chief difficulties experienced by basic schools all over India has been the proper use and disposal of yarn spun by the children. The number of teachers who know khadi weaving is very small, and the yarn made by young children in the lower grades often cannot be woven on the ordinary looms. The Hindustani Talimi Sangh carried out an experiment in training teachers to use all this yarn for useful articles made by very simple processes on Assamese bamboo looms. Cloth of all kinds, up to 30" in width, durries, mats, etc., have been made and it has been shown that no yarn, however rough, need be wasted. The processes are quickly learned, and the cost of the looms is low—about Rs. 10 for a bamboo frame and about Rs. 25 for a wooden frame.

The carpentry and smithy departments have expanded and developed so as to provide and repair the tools and equipments needed in the weaving and other workshops and on the farm. The Dairy (Goshala) was also expanded and accommodation and organisation improved. A scheme for the development of 20 basic schools in a compact village area round Sevagram was inaugurated in collaboration with the Wardha Jahapad Sabha.

The basic schools organised by the Sangh in the rehabilitation centres at Faridabad and Rajpura developed up to the 5th grade, and plans for 6th grade were made. The Faridabad schools were housed in permanent buildings and the teachers' training scheme was completed.

The increasing interest in Basic Education at home and abroad was reflected in the increase in the number of correspondents writing from various countries to the central office. The demand for training for teachers was also very heavy.

A revised school syllabus for 8 grade basic schools and a booklet on adult education from the Basic point of view were published during the year. Material for a post-Basic Education hand-book was prepared on the basis of 4 years' experience of working. The illustrated album of work at Sevagram was re-edited and issued in French as well as in English, in connection with the visit of Sm. Ashadevi Aryanayakam to Paris at the invitation of *UNESCO*, as an expert on Basic Education on the Committee for Women's Education.

The States of Saurashtra, Hyderabad and Travancore-Cochin all opened their first Basic Training Schools during 1951 with staff trained at Sevagram. A private Basic Training School was opened in Travancore-Cochin. The Government of Bihar opened a post-graduate Basic Training College at Turki. The West Bengal Nai Talimi Sangh started a post-Basic School at Balrampur. In the Punjab, two important conferences were held, one for teachers of Training Schools and one for teachers of Christian institutions.

The Gandhi Smarak Nidhi formulated plans for the development of Basic Education and workers were trained at Sevagram for the States of Punjab, Uttar Pradesh and Madhya Bharat. The Ministry of Rehabilitation continued to send women teachers to the H.T.S. for training and subsequent employment in Basic Schools.

PROPAGATION OF HINDI

A five-year plan costing Rs. 17,080,000 has been drawn up by the Ministry of Education for the development and propagation of Hindi. The plan aims at making Hindi the official language of the Union, replacing English, within the stipulated period of 15 years as provided in the Constitution. A start has already been made and a new Hindi Section created in the Ministry. A Central Hindi organization, Hindi Siksha Samiti, has also been set up to advise the Ministry from time to time on matters relating to propagation and development of Hindi especially in the non-Hindi speaking areas.

During the year a Committee of Philologists and ten expert Sub-Committees were also set up and requisite technical staff appointed for the implementation of the recommendations of the Board of Scientific Terminology. Work has started for the preparation of lists of basic scientific, administrative and other technical terms in Hindi. For the time being, the work will be confined to the ten subjects mentioned below:—Mathematics, Physics, Chemistry, Medicine, Zoology, Botany, Agriculture, Social Sciences and Administrative subjects and Defence terms.

Each subject is to be in the charge of a Committee of three Experts with power to co-opt additional members, if necessary.

In March 1951 a Conference of 27 Hindi-organisations operating in Non-Hindi speaking areas was arranged. The Conference discussed various measures to be taken for the propagation of Hindi. These suggestions were examined and some of them have been incorporated in the five-year plan prepared by the Ministry. (Details of this plan are given below.)

Another conference of leading Hindi organisations was called in June 1951. It recommended the setting up of a Central Organisation (Hindi Shiksha Samiti) for the purpose of advising the Government of India from time to time on matters relating to propagation and development of Hindi.

The Hindi Shiksha Samiti met in January 1952 and made various recommendations which are under the consideration of Government. All State Governments have already been requested to introduce Hindi as a compulsory subject in the Secondary Schools.

The five-year plan prepared by the Ministry for the propagation and development of Hindi in non-Hindi speaking areas includes the following schemes:—1. Preparation of dictionaries of scientific and technical terms in Hindi. 2. Setting up of a Central Hindi Organisation. 3. Giving grants to approved Hindi Organisations engaged in spreading Hindi in the non-Hindi areas. 4. Opening of a new Hindi Section in the Ministry. 5. Establishment of a Library of Hindi books at the centre. 6. Preparation of dictionaries of Hindi to/from Regional languages. 7. Translation of selected books from other languages into Hindi. 8. Translation of text-books of other languages into Hindi. 9. Award of prizes for original works in Hindi. 10. Starting Hindi classes for Central Government employees. 11 Holding of exhibitions of Hindi books, charts, etc. 12. Preparation of bilingual series of books. 13. Preparation of a dictionary of Basic Hindi words. 14. Preparation of a dictionary of words common to Hindi and other Regional languages.

Action has already been initiated on items 1 to 10 of the above scheme.

SCALES OF PAY

Here are tables of scales of pay sanctioned in Government Schools by the Central Government:

PRIMARY SCHOOLS

Post.	Prescribed Scale.	Minimum Qualifications.	Remarks.
Headmaster.	Grade pay plus S. P. Rs. 15.	Matric Trained. *	Minimum from 1st April 1950.
Teachers.	68-4-120-E.B.-5-170.	Matric Trained.	
	68-4-120-E.B.-5-170.	Middle S. V. & V.T.C. if in Ajmer.	Temporary relaxation for existing employees.
	55-3-85-E.B.-4-125-5-130.	Untrained Matric Middle J. Vs.	
	50-2-60-3-90.	Lower than Middle J. Vs.	
	35-1-40-2-60.	Non-Matric Untrained.	Minimum from 1st April 1950.

MIDDLE SCHOOLS

Post.	Proposed Scale.	Minimum Qualifications.	Remarks.
1	2	3	4
Non-Language teachers and English teachers.	100-5-150-E.B.-8-190-10-250.	Trained (J.A.V., S.A.V., or B.T.) graduate teachers.	Minimum from 1st April 1950.
		Untrained graduate teachers with 5 years' experience.	
		Intermediate plus S.A.V.	
	80-5-120-E.B.-8-200-10/2-220.	Untrained graduate teachers with less than 5 years' experience.	Temporary relaxation for existing employees.
	68-4-120-E.B.-5-170.	Matric plus S. V. or J.A.V. or V.T.C. of Ajmer	
	68-4-120-E.B.-5-170.	Middle S.V. (or V.T.C. in Ajmer).	
Headmaster.	Grade pay plus S. P. Rs. 40/- for classes 1-8 Grade pay plus S. P. Rs. 25/- for classes 6-8	Trained graduate.	Minimum from 1st April 1950.

*Non-Matric J. V. H. Ms. who held their posts as Headmasters substantively on the date of election of the revised scales will also as a special case be given the scale of pay of Rs. 68-4-120-E.B.-5-170 as personal to them.

HISTORICAL SKETCH

Having surveyed the present position we can next pass on to a brief sketch of the history of Indian education.

Indian education is in fact unintelligible except through its history. The structure is top heavy. The lower classes are largely illiterate while the middle classes who constitute the bulk of the *intelligentsia* are in point of number at least educated to a pitch equal to that of countries whose economic conditions are more highly developed. As might be expected from this abnormal distribution of education, the form which it has eventually assumed contains corresponding defects. In recent years, however, strenuous efforts have been made to remedy these defects. Primary Education Acts have been passed in several States in favour of the expansion of primary education among the masses. On the other hand, the numbers of students in colleges and universities have grown apace. The volume of educated unemployment at one time reached alarming proportions, and is still serious.

WESTERN LEARNING

In the early days of its dominion in India, the East India Company had little inclination for the doubtful experiment of introducing western learning into India. Warren Hastings, the dominating figure of the time, was a genuine admirer of the laws and literature of the East. His policy was to enable the ancient learning to revive and flourish under the protection of a stable government, and to interfere as little as possible with the habits and customs of the people; he did not touch mass education.

Sources other than Government played an important part in encouraging the desire for western knowledge in India. In 1816, David Hare, an English watchmaker in Calcutta, joined hands with the great Indian reformer, Raja Ram Mohan Roy, to institute the Hindu College for the promotion of western secular learning. Fifteen years later, the Committee of Public Instruction in Bengal reported that a taste for English had been widely disseminated and that independent schools, conducted by young men reared in the Hindu College, were springing up in every direction. A still more remarkable innovation was made in 1835 by the establishment of the Calcutta Medical College, whose object was to teach "the principles and practice of medical science in strict accordance with the mode adopted in Europe." Many pronounced the failure of the undertaking to be inevitable; for, under the Hindu custom the higher castes were forbidden to touch the dead. This obstacle was surmounted by Madhusudan Gupta who, with a few courageous pupils, began the dissection of the human body.

The Missionaries.—Another impetus to the introduction of western learning was the devotion of Christian missionaries. Carey, Marshman and Ward opened the first missionary College at Serampore in 1818; and twelve years later, Alexander Duff reversed the whole trend of missionary policy in India by his insistence on teaching rather than preaching and by founding his school and College in Calcutta.

Lord William Bentinck's minute of 1835 (based upon Macaulay's famous minute) marks a somewhat tardy acceptance by Government of the new policy. Government then determined while observing neutrality in religious matters to devote its available funds to the maintenance of secondary schools and colleges of Western learning, to be taught through the medium of English. But this decision did not entail that Oriental learning should be neglected; still less that the development of the vernacular should be discouraged. Other changes powerfully contributed to the success of the new system. The freedom of the Press was established in 1835; English was substituted for Persian as the language of the Courts in 1837; and in 1844 Sir Henry Hardinge ordained that preference in Government appointments should be given to those who had received western education. In the following decade the new learning took firm root in India; and, though the Muslims still held aloof, the demand for English schools outstripped the means of Government for providing them. Later there was also a marked appreciation among Muslim leaders of the need for improving the instructional level of their co-religionists; in many of the States of India a great impulse towards educational advance among the Muslim community became noticeable. The Muslim University at Aligarh and the Osmania University of Hyderabad, Deccan, were the final fruit of the urge for higher education felt by the leaders of the Muslim community.

To Missionary Societies is due the initiative in the modern education of women, strongly supported by Hare and Ram Mohan Roy. The establishment of a Girls' school in Calcutta in 1849, by Drinkwater Bethune is a landmark in the history of female education in India.

WOOD'S DESPATCH

An epoch in Indian educational history is marked by Sir Charles Wood's despatch in 1854. Perhaps its most notable feature was the emphasis which it laid on the importance of primary education. The old idea that the education imparted to the higher classes of society would filter down to the lower classes was discarded. The new policy was boldly "to combat the ignorance of the people which may be considered the greatest curse of the country." For this purpose Departments of Public Instruction were created on lines which do not differ very materially from the Departments of the present day. The despatch also broke away from the practice followed since 1835, whereby most of the available public funds had been expended upon a few Government schools and colleges, and instituted a policy of grants-in-aid to private institutions. It emphasised the importance of encouraging the study of the vernaculars as the only possible media for mass education.

Another feature of the despatch was an outline of a university system which resulted in the foundation of the Universities of Calcutta, and of Madras and Bombay three years later. The affiliating type of university then became the pivot of the Indian education system. It has undoubtedly been of value in several ways. It enabled Government to select recruits for its service on an impartial basis; it did much, through the agency of its colleges to develop backward places; it accelerated the conversion of Indians to a zeal for western education; and it cost little at a time when money was scarce. On the other hand, the new universities were not corporations of scholars, but corporations of administrators; they did not deal directly with the training of men, but with the examination of candidates; they were not concerned with learning, except in so far as learning can be tested by examination. The colleges were fettered by examination requirements and by uniform courses; their teachers were denied that freedom which teachers should enjoy and their students were encouraged not to value training for its own sake but as a means for obtaining marketable qualifications.

In certain important respects the recommendation in the despatch were not followed. It did not intend that university tests, as such should become the sole tests qualifying for public posts; it also recommended the institution of civil service examinations. It did not desire the universities to be deprived of all teaching functions; it recommended the establishment of university chairs for advanced study. It showed awareness of the dangers of a purely literary course of instruction; it hoped that the system of education would rouse the people of India to develop the vast resources of their country.

The encouragement of the grants-in-aid system was advocated to an even greater extent by the Education Commission of 1882, which favoured the policy of withdrawing higher education from the control of Government within certain limits and of stimulating private effort. In theory the decision was correct, but in practice it was irretrievably wrong. In its fatal desire to save money, Government deliberately accepted the mistaken belief that schools and colleges could be maintained on the low fees which the Indian parent could be expected to pay. And, in course of time, an unworkable system of dual control grew up, whereby the Universities with no funds at their disposal were entrusted with the duty of granting recognition to schools and the Departments of Public Instruction were encouraged to cast a blind eye on the private institutions and to be content with the development of a few favoured Government institutions.

1902 UNIVERSITIES COMMISSION

In 1902, a Universities Commission was appointed by Lord Curzon's Government, and its investigation was followed by the Universities Act of 1904. The main object of the Act was to tighten up control, on the part of Government over the universities, and on the part of the universities over the schools and colleges. The Government retained the power of cancelling any appointment and all university resolutions and proposals for the affiliation or disaffiliation of colleges were to be subject to Government sanction. The universities were given the responsibility of granting recognition to schools and of inspecting all schools and colleges, the inspection of schools being ordinarily conducted by the officers of the Department of Public Instruction. Permission was also given to the universities to undertake direct teaching functions and to make appointments, subject to Government sanction, for these objects, but their scope was in practice limited to post-graduate work and research. The territorial limits of each university were defined, so that universities were precluded from any connection with institutions lying outside those boundaries.

Neither the Commission nor the Government discussed the fundamental problems of university organisation, but dealt only with the immediate difficulties of the Indian system.

1913 Resolution—The Indian Universities Act of 1904 was followed by two important resolutions of the Government of India on Indian educational policy—one in 1904 and the other in 1913. The resolution of 1904 was comprehensive in character and reviewed the state of education in all its departments. The following passage from it summarises the intentions of Government:—"The progressive devolution of primary, secondary and collegiate education upon private enterprise and the continuous withdrawal of Government from competition therewith was recommended by the Education Commission in 1883 and the advice has generally been acted upon. But while accepting this policy, the Government of India at the same time recognise the extreme importance of the principle that in each branch of education Government should maintain a limited number of institutions, both as models for private enterprise to follow and in order to uphold a high standard of education. In withdrawing from direct management it is further essential that Government should retain a general control, by means of efficient inspection, over all public educational institutions." The comprehensive instructions contained in this resolution were followed in the next few years by the assignment to the States of large imperial grants, mainly for University, technical and elementary education.

The resolution of 1913 advocated, *inter alia*, the establishment of additional but smaller Universities of the teaching type; it reaffirmed the policy of reliance on private effort in secondary education; it recommended an increase in the salaries of teachers and an improvement in the amounts of grants-in-aid; and it insisted on proper attention being paid to the formation of character in the education given to scholars of all grades. It further discussed the desirability of imparting manual instruction and instruction in hygiene; the necessity for medical inspection; the provision of facilities for research; the need for the staffing of the girls' schools by women teachers and the expansion of facilities for the training of teachers. The policy outlined in 1913 materially accelerated progress in the States, but the educational developments foreshadowed were in many cases delayed owing to the effects of the First World War.

The Reforms Act.—The Reforms Act of 1919 altered the conditions of educational administration in India. Education became a provincial 'transferred' subject in the Governors' States under the charge of a Minister, but the education of Europeans was made a provincial 'reserved' subject, *i.e.*, it was not within the charge of the Minister of Education. The introduction of provincial autonomy under the Government of India Act, 1935, brought education in these States under the full control of their Ministers of Education.

Broadly speaking, an educational policy for India as a whole no longer existed, but in order that States may co-ordinate educational activities and follow a uniform policy of development, the Central Advisory Board of Education was reconstituted in 1935. This Board in which all the State governments are represented now meets annually to discuss all matters of education, and devise an all-India educational policy. Its function is, however, purely advisory.

At the time of handing over the administration of education to the States, the Government of India retained under their immediate control all education in the Centrally Administered Areas. They still deal with matters relating to Universities like Aligarh, Benares and Delhi.

The Central Advisory Board of Education advised the revival of the Bureau of Education, which was done in 1937. With the revival of these two Central Agencies, and especially with the enlargement in the membership, function and scope of the Central Advisory Board of Education, public opinion was once again focussed on vital educational problems and policies of an all-India character. The Board soon became a source of inspiration for systematic and co-ordinated educational development in the country as a whole; one of the most important contributions of the Board is its report on Post-War Educational Development in India, published in 1944.

The Board meets once a year generally in January. Since the advent of independence it has held five meetings.

Following a recommendation of the Central Advisory Board, the Government of India also constituted a separate Department of Education from 1st September, 1945, consisting of several technical officers, besides Secretariat Officers. On the 15th of August 1947 the Education Department became a full-fledged Ministry of Education. With the attainment of freedom it was realised, as never before, that one of the basic steps towards national reconstruction was to improve and, if necessary, remodel the existing educational system of the country.

ART

Sculpture & Painting

INDIAN art is predominantly religious. Secular art was known, especially in the Gupta period and during the last few centuries, but it occupied a subordinate position, and most of its remnants are lost. As the chief aim of art was spiritual and contemplative, the representation of appearances was of secondary interest. In times of decadence the artists were content with ritualistic and iconographic correctness; in others they used religious imagery as a pretext for a lively description of elegant court life; in the best of times they filled it with a profound symbolic meaning and emotional appeal. In these latter periods the artists were well acquainted with the human anatomy and also had some notions of perspective; but such knowledge was subordinated to the decorative pattern, the evocation of ideal beauty, the suggestion of cosmic forces and spiritual experiences, and devotional responses. Indian art possesses an exceptional sensitiveness to the pulsating life of nature and the forces behind it. Its essential qualities are an inherent rhythm and vitality and a plastic power which, in painting and sculpture alike, reaches a perfection hardly ever matched elsewhere.

Indian art is almost anonymous, *i.e.* only the names of a few prominent artists have been preserved, but their role is not clear. The names of many architects, sculptors and painters have come down to us, but their individual achievements are not known. For the arts of ancient and mediæval India sprung mainly from the co-operative effort of craftsmen guilds which worked in the employ of rulers or religious institutions. In course of time a collection of scriptures came into being, the *silpa sastra*, which laid down certain rules to be followed in the creation of religious images, buildings, etc. These manuals, embodying much theoretical thinking and practical experience were originally meant to guide design without interference in the creative work of the artist, but when later generations misinterpreted their teachings as the very essence and not merely as the framework of art they became the source of an ossified traditionalism.

Art in India has always had a certain unity regardless of the religious or dynastic powers. Racial and provincial peculiarities can be traced in all Indian styles, but "what separates the provinces of Indian art is subsidiary to what they have in common" (S. Kramrisch). The inherent strength of this art enabled it to absorb and overcome numerous foreign influences (such as Greek, Persian, Scythian) without altering its main direction. Even Muslim art became Indianized after a few centuries, and mixed styles flourished only at the frontiers (Afghanistan, Kashmir, Turkistan, Nepal, Assam).

The chronology of Indian art is a difficult problem. The classification of periods given here tries to do justice to the development of styles and is based on a broad dynastic framework.

EARLY ART

The excavations of Sir John Marshall and others in the Indus valley at Mohenjo Daro and Harappa discovered an ancient civilisation on which in about 3,000-2,000 B.C. had already reached a considerable degree of refinement. In many forms and symbols Mohenjo Daro heralds the beginning of Indian art with a strong Dravidian flavour. Outstanding are animal engravings on seals, and little statuettes in terracotta, stone or bronze, amongst which a bronze girl in a dancing post anticipates later qualities of Indian plastic art.

From Mohenjo Daro to about 300 B.C. hardly any traces of artistic activities survive. This period saw the arrival of the Aryans in India and the coming into being of the three great Indian religions, Brahmanism, Buddhism and Jainism. From the religious scriptures and the great epics we know that painting, image-making and minor arts existed, though executed mainly in perishable material.

Under the Maurya emperors stone sculpture was introduced under Achaemenian influence. Though in the official monuments Persian inspirations and in some terracottas Greek techniques are evident, the main sculpture of the time was indigenous, going back to the folk cult of local dejties, yakshas and yakshis. These archaic works, immobile, angular and flat, still reveal the planes of the wooden stone block. Under the Sungas in the north, the Andhras in the south (2nd and 1st centuries B.C.) they become alive and assume a pliability and elasticity penetrated by a flowing rhythm. Boorish-heavy, they possess a remarkable sensitiveness to the life pulsating through the human, animal and vegetable organism, a voluptuousness ever characteristic of Indian art.

The art of the period is almost exclusively Buddhist though with a strong undercurrent of primitive folk cults. Its best known centres are Bharhut, Besnagar, Sanchi, Bodh Gaya, Mathura and Pataliputra (Patna), Khandagiri (Orissa), Bhaja, Bedsa, Junnar, Karle, Kondane, Kanheri, Ajanta, in and near the Western Ghats, and Vengi in south India. Sculpture and relief were used to illustrate religious teaching on the rails, gates and walls of *stupas* (relic mounds which had become the centres of worship) and in the monasteries and chapels attached to them. In the reliefs depicting Buddha's life or that of his previous incarnations (Jatakas) Buddha is never presented in human form, but his presence is shown by symbols such as the tree of enlightenment, his footprints, the throne on which he sat or the platform on which he used to walk.

Belonging to the first century B.C. or 1st century A.D. the fresco paintings in cave 9 and 10 in Ajanta (Hyderabad State) are the earliest of well-preserved paintings, though still earlier work survives in several other localities. Its competent naturalism points towards a previous history.

Already the famous sculptures of the Sanchi *stupas* achieve a certain ease and elegance. The later monuments (1st to 3rd centuries A.D.) under the western Kshatrapas (Nasik, Junnar) and the Satavahanas of the south (Manmad, Ajanta, Nagarjunikonda, Jaggayyapata, Bhattiprolu, and especially Amaravati) drive this elegance of over slim figures, in most composite and decorative scenes, to a high pitch. The same period saw the power of the Kushan Empire establishing itself in the north-west and north. Here the centre of artistic creation was Mathura. Its sculpture lacked the slim elegance of the south, but it evolved an intensified plastic penetration, experimented with views, movements and poses, and developed a new iconography. Buddhism was still the predominant theme. Mathura created the Indian Buddha image in direct continuation of the old yaksha figures; and later the first Bodhisattvas and other deities of the Mahayana. It created the first Jain Tirthankar images and the earlier types of Hindu gods. Frankly sensuous, but in a different way from the nudes of the Greek schools, are the

female figures of Mathura and other centres. Probably these graceful if voluminous nymphs originated from aboriginal symbols of fertility, and later became the prototypes of the Hindu goddesses and ultimately fixed, for centuries to come, the round-breasted, narrow-waisted, full-hipped ideal of female beauty for the Indian artist.

About the same time a hybrid art developed in eastern Afghanistan, the Gandhara country. Through direct contact with Graeco-Scythian and Parthian neighbours, Hellenistic forms were applied to Indian Buddhist themes. The Gandhara school has left behind an enormous output, most of which is of barbarian clumsiness. But individual early works (2nd century A.D.) under direct Hellenistic, or late ones (4th to 5th centuries A.D.) under Gupta influence or in a local style are of great beauty. It has exercised *via* central Asia considerable influence on the Buddhist art of eastern Asia.

THE GUPTA AGE

In 320 A.D. Chandragupta founded the Gupta dynasty in Patna, which was to be the dominant power in India for about 250 years. Puranic Hinduism came to the forefront during this period and a very powerful Brahmanical art was produced all over the sub-continent, especially in Deogarh (C.I.), Aihole (Deccan), Ajanta (Hyderabad State), Udaygiri (near Sanchi), Gwalior and many other places. The art of the Gupta period can be best characterised by the word spiritual. The latent naturalism of earlier periods is now overcome or harnessed to the spiritual representations of superhuman, elementary or cosmic powers. The human figure is only a vehicle of transcendental forces. The artist masters every mood from the lyrical to the awe-inspiring. The Buddha images of Mathura and Sarnath are in their classic simplification and perfection of modelling, in their serene spirituality and dignity amongst the world's supreme religious images. The boar incarnation of Vishnu in Udaygiri is of impressive power which changes primitive terror to a deep experience of divine force. The development of the iconography of the Mahayana-Buddhist and Hindu pantheons is almost completed during this age.

During the late sixth, seventh and early eighth centuries the Gupta spirit survived in Indian art; but with the decline and fall of the Gupta Empire it underwent a characteristic change. Canon and typology were increasingly fixed. In the late 6th century the natural ease of the 5th yielded to a decorative formalism while in the 7th it turned to a sweet elegance and in the early 8th to an involved, but not unpleasing mannerism (Sarnath, Mathura, Ajanta, Aihole, Badami). The art of fresco painting had then reached its zenith. Ajanta, Bagh Pitalkhora, Bhaja (Buddhist), Aihole and Badami (Brahmanical) are the chief centres of this art as it survives today, but the Jain paintings of Sittanavasal (south India), the Brahmanical paintings of Tirumalaipuram and the Singhalese rock pictures of Sigiriya (Ceylon) testify to its distribution over the whole sub-continent.

All these paintings are mostly narrative in character. The painters depict religious legends in easily understandable form, making use of the costume, scenery and manners of their own period. The colours, made from minerals, are bright green, red, brown, yellow, black and blue (Ajanta). The greatest artistic merit of these paintings lies in their rhythmical, flowing outline which indicates the plastic volume of a body. Light and shade are unknown, but forms are modelled with colour shading. Perspective in the Western sense was not known but compositions achieve a surprising degree of depth.

The victory of Brahmanism (mainly Saivism) inspired art with a new enthusiasm, bringing forth a sculpture of remarkable virility. It detached itself in the northern Deccan from Gupta sculpture under the Chalukyas of Aihole and Badami (5th to 8th centuries A.D.), in the south from the Amaravati-Andhra tradition under the Pallavas of Kanchi (7th to 9th centuries A.D.) and reached its highwater mark under the Rashtrakutas of Malkhed (8th to 10th centuries A.D.). Sweeping movement becomes an expression of force; the swelling, rounded forms of human or animal bodies become signs of pent-up energies. The sculptures of the temples of Aihole, Badami, Pattadakal, or Kanchi, the rock-cut shrines of Mamallapuram ("Seven Pagodas" near Madras), and of the caves of Elephanta (near Bombay), Ellora and Aurangabad (Deccan) are representatives of this period. Its masterpieces are the sculptures at Ellora (Das Avatara, Ravana-ka Khai and Rameswara caves, and some chapels in the enormous Kailasa), and the Maheswaramurti of Elephanta popularly but erroneously called the Trimurti.

MEDIÆVAL ART

The early mediæval north was dominated by two schools, that of the Palas and Senas in Bihar and Bengal, and that of the Pratiharas of Kanauj in the west. Both developed from late Gupta art, the first evolving an over-refined and rather mannered Tantric-Buddhist sculpture, the latter a Hindu style, related to the Rashtrakuta style, but without its grandeur. Whereas the Pala style survived in Greater India and central Asia, Pratihara sculpture became the starting point of a series of local schools, Chahamana, Paramara, Solanki, Vaghela and Oriya which, though elegant in detail excelled mainly in the symphonic composition of numerous figures. Since the 12th century this sculpture degenerated into a mass production of icons of merely ritualistic interest, representing an innumerable panthon solely distinguishable by means of its symbols. At last it was extinguished by the Muslim invasions. Revived in the 15th and 16th centuries, its tradition is still alive, though utterly ossified.

In the Deccan the Rashtrakuta style was taken over by the western Chalukyas, Hoysalas, Kakatiyas and several minor dynasties, and underwent the same transformation into an elaborate, overstressed decoration.

In the south the Pallava tradition was handed over to the Cholas, the Pandyas, the emperors of Vijayanagar and the minor dynasties of Tanjore, Madura and Kerala. Under the Cholas it reached its classic phase; the south Indian bronzes, mostly Natarajas and other Saiva and Vaishnava subjects, have become world famous. Thereafter the decline set in, but the tradition never sank so low as in the north. The tradition continues however though often in a grotesquely degenerated form.

A very recent discovery of a hoard of metal images near Baroda tends to indicate from their style, the existence of a flourishing school of metal sculpture in Rajasthan and north Gujarat during the post-Gupta and early mediæval periods.

In mediæval painting the trend towards a merely decorative interpretation was even more pronounced than in sculpture. Though vigorous, accepted forms tend to harden and are often overburdened with decorative details.

This trend was least pronounced in the south and east. The oldest wall paintings at Ellora still belong to Rashtrakuta times (8th to 9th centuries). In the south today we recognize Chola murals in the great Brihadesvara temple at Tanjore (11th century), in Pudukkottai and Tirumalaipuram, of the Pandya dynasty at Sittanavasal, of the Vijayanagar period at Tiruparuttikunram, Lepakshi, Anegundi, Somapalayam and Pillalmari. Later murals at Tiruparuttikunram bear a certain resemblance to the early Rajput miniatures of the north. In Kerala a local style flourished at Tirunandikara (9th century), Suchindrum (11th to 12th centuries) and at Ettumanur. Its last and most characteristic phase can be seen in the Padmanabha Temple at Trivandrum and the Mattancheri Palace at Cochin. There was a parallel late school at Tanjore and Madura. Offshoots of the South Indian style have been found in Ceylon, especially at Polonnaruva.

Because of wholesale destruction during the Muslim invasion and later neglect we know much less of northern India. Beautifully illustrated Buddhist palm leaf manuscripts were executed in Bengal and Bihar under the Pala and Varma kings. After the Muslim conquest the style was continued in Nepal, Burma and Greater India. In contrast to this "Eastern School" stood a "Western School", of a less ornate character. Only fragments of it have survived. The Paramara and Jain murals at Ellora the ceilings of Madanpur (C.I.) and some Jain manuscripts and bookcovers of Solanki and Vaghela times (12th to 13th centuries) are representative examples. Some Buddhist palm leaf manuscripts and frescoes in Ladakh and Spiti may be attributed to an intermediate school in Kashmir.

MUSLIM PERIOD

As in architecture, the Muslim invasion introduced a foreign style of sculpture and painting which, however, was completely absorbed after some centuries. Muslim orthodoxy disapproved of figural art, but in practice heraldic and symbolic sculpture, and book illustrations were cultivated, and wall painting was tolerated by many princes and nobles at least in their private rooms. Except for a few seals and portrait coins, Muslim sculpture was limited to horse, elephant and lion statues or coats-of-arms, and bird or other animal and flower motifs in decoration. It is not possible to predict the existence of any schools of miniature painting during Muslim rule prior to about 1510 A.D., save that the Gujarati illustrated MSS of Jain and Vaishnava works continued to be produced in abundance. A certain amount of fresco decoration of a purely formal geometric character appears however to have been practised.

When Muslim oppression relaxed, a conscious renaissance of mediæval art set in. In the south, in Bengal, Orissa, Gujarat and Rajasthan the old art had survived though often ossified. Sculpture was applied to the stelæ of local Hindu chieftains and painting to the illustration of religious manuscripts (especially the Jain Kalpa Sutra and Kalakacharya Katha). By the middle of the 15th century the renaissance in Gujarat and Rajasthan brought forth a new temple sculpture and book illustration to Vaishnava and Saiva subjects. Though conventional and often clumsy it was lively and decorative. In the course of the last decade of the 16th and first three decades of the 17th century it blossomed into early Rajput art. Early Rajasthani painting flourished in the early 17th century. It was used for the illustration of the *Bhagavata Purana, Chandi Mahatmya*, the old epics, Hindi lyrics and music (*Ragmala*), and for portraits and historical scene. Its archaic, formalized style with simple, flowing outlines and brilliant colour contrasts, without modelling or depth, against a yellow or red background, continued the Jain tradition on which was superimposed a strong Moghul influence. But its typology came from many sources including the old warrior stelæ. It has vitality, intensity of expression and suggestive power and it flourished during most of the 17th and 18th centuries with a Mughal technique, yet retaining its own ideals and æsthetic concepts. Towards the end of the 17th century a vital school of painting grew up in the hills of the Punjab at Basohli, and spread from there over the whole Punjab Himalaya (Pahari schools). In the 18th century it was superseded by the "Kangra" style proper, a derivative from Mughal technique in a Rajput spirit. This charming, sweet and romantic art, one of the highlights of the Indian tradition, flourished mainly under Sansar Chand of Tira-Sujanpur. The art was taken over by Sikhs and Kashmiris.

Derived from the Timurid School of miniature painting in Persia and beginning under strong Safavi-Persian influence in the middle of the 16th century, Moghul painting soon developed into a genuine Indian art. Even in early Moghul times Akbar employed indigenous artists who under the guidance of Persian masters were put to the task of illustrating manuscripts. Under Jehangir the last Persian traces disappeared. Under Jehangir and Shahjahan Moghul Painting reached its climax.

Moghul art was essentially a court art, limited in its scope, and overshadowed by the demand for extreme technical perfection. It was individualistic with a clear development of the personal style of different artists who are known by name (a thing rarely heard of in popular Indian art). It is illustrative, and is mainly concerned with the representation of court scenes, portraits, historical events, or the skilful rendering of flowers or animals. But Indian painters did not only introduce Hindu themes into Moghul art, but gradually flavoured it with the Hindu spirit. In technical excellence, accurate and delicate drawing, and in observance and taste Moghul art is unsurpassed.

Parallel schools of painting flourished in the Muslim kingdoms of the Deccan, Ahmednagar, Bijapur and Golconda. Their style was a mixture of Persian, Turkish Gujarati and Vijanagar-Hindu elements; later it came under Moghul influence, and was at last partly taken over by the painters of Hyderabad under the Nizams.

MODERN ART

With the eclipse of the mediæval powers and the introduction of European civilisation, the indigenous arts lost patronage and declined rapidly. In order to save them from oblivion art schools were started on the British model and attached to the country's educational system. Drawing, painting and modelling and certain arts and crafts were taught in accordance with Western academic tradition. On the whole, this Western tradition proved uncongenial and sterile. Raja Ravivarman's attempt to use it for the expression of Hindu religious concepts and mythological scenes was a complete artistic failure, though his cheap oil prints found much favour with the public. The art schools produced some well known artists, such as the sculptors Mhatre and V. P. Karmarkar (Bombay), and the painters Haldankar, Parendekar, Lalkaka, V. R. Rao, V. A. Mali, G. D. Deuskar in Bombay, J. P. Gangooly, H. Majumdar and Atul Bose in Calcutta.

At the beginning of this century, therefore, E. B. Havell, principal of the Calcutta Art School and Abanindranath Tagore advocated a return to the traditional indigenous techniques and styles. This so-called Bengal School soon became most influential and was looked on as the representative of a modern national art. It did a great service in restoring the continuity of a national tradition, but the efforts ended in failure because the approach was much too timid. Ignoring many vital aspects of the national art, it soon lost contact with modern trends in the country, and lapsed into an archaistic academic imitation of the Ajanta murals, and of the Moghul and Rajput miniatures. It also cultivated a "spiritual" sentimentality inspired by Preraphaelite and other neo-Romantic Western pictures. Its leading masters, besides Abanindranath Tagore, are Nandalal Bose, the late Suren Ganguly, Asit Kumar Haldar, Kshitindranath Mazumdar, Bireswar Sen and Ishwar Dass. The chief centre of the school outside Bengal is Lucknow. A minor parallel school was started at Ahmedabad by Ravishankar Raval, the best known artist of which was Kanu Desai. Kanu Desai's decorative designs and prints became very popular particularly through the medium of the film. A representative of the same school in Lahore is R. Chughtai many of whose pictures interpret Muslim attitudes.

During the last two decades the revivalist school has been more and more challenged by a modern art movement. Modern art, being international, freely experimental, and open to all types of inspiration offered a possible approach to an expression of the actual moods and thoughts of contemporary India. Naturally it reflects all the extreme tensions inherent in a time of rapid political, social and cultural change, from new interpretations of traditional Indian art and adaptations of modern Western art fashions to a genuine synthesis, in a modern yet thoroughly Indian idiom. Abanindranath Tagore was the first to experiment with new techniques, mainly Chinese and Japanese. Nandalal Bose took up the modern Bengali folk style in which he found a famous follower in Jamini Roy. Gogonendranath Tagore experimented with Cubism.

Amrita Sher Gil who died prematurely in 1941, was the first representative of a great modern Indian art of international reputation. Since then Bombay has had the lead in modern art, and next to it Delhi. With an art movement so experimental it is difficult to classify the workers. S. B. Paliskar, Abani Sen, Makan Dutta Gupta, L. M. Sen, Madan Lal Nagar, D. J. and Manohar Joshi, R. C. S. Paniker, and S. H. Raza represent an Impressionist approach. Manishi Dey might be described as a sort of expressionists interpreter of the ancient Indian mural style. Extreme modernists are George Keyt (Ceylon), Rathin Moitra (Calcutta), and M. F. Hussain and Francis Newton-Souza (Bombay). A more synthetic style in modern technique, based on Indian tradition is found in the paintings of N. S. Bendre, S. Chavda, K. K. Hebbar, K. H. Ara all from Bombay, B. Sanyal (Delhi), S. R. Khastgir (Dehra Dun), S. N. Butt (Srinagar), Kalyan Sen and Sailoz Mookerjea (Calcutta). A national Christian art is cultivated by A. D. Thomas, A. Trindade and A. de Fonseca. Sculpture is still neglected. However, D. P. Roy Chowdhury, S. R. Khastgir, S. K. Bakre, and especially Prodosh Das Gupta deserve mention among the Impressionists, and Sankho Chaudhuri, Dhanrak Bhagat and S. K. Bakre among expressionists and extreme modernists. Graphic artists are Mukul Dey, Haren Das, Makhan Dutta Gupta, L. M. Sen and Y. K. Shukla.

The Government School of Art, Calcutta, teaches Fine Art, Indian Painting, Commercial Art, Modelling, Lithography, Word-Engraving and Draftsmanship and has a Teachership Department for post-graduate studies.

The Sir J. J. School of Arts in Bombay has grown into a large and many-sided institution. It teaches a variety of crafts and industrial arts, such as stone carving, metal work, leather work, textile design, etc. It has also a large commercial art and photographic section. Many art schools flourish in India in different centres such as Indore, Delhi, Lucknow, Banaras, Shantiniketan, Madras, Mysore, Travancore-Cochin, Patna, under State Governments or as private institution.

Art exhibitions have increased in number while the quality of the exhibits has also risen during the last few years. The leading art societies in India are the Bombay Art Society, the All-India Fine Arts and Crafts Society (Delhi), The Indian Academy of Fine Arts (Calcutta), the Society of South Indian Painters (Madras), the Delhi Silpa Chakra, Kala Darshan (Ahmedabad), the Simla Art Society and the Progressive Artists Association (Kashmir). Various Art Conferences have tried to organize a central body in an All-India Association of Fine Arts. The Central and State Governments, as well as the various foreign Embassies have encouraged art activities, and modern Indian painters have exhibited with success in other countries, especially the U.S.A., Great Britain, France, Switzerland and Italy.

ARTS AND CRAFTS

IT is in the arts and crafts of a people that its heritage of artistic feeling, design and religious belief remain alive over many hundreds, if not thousands, of years. The Indian subcontinent absorbed throughout its long history innumerable foreign influences into its arts. Beginning with the fusion of Aryan and Dravidian art during the first millennium B.C., over the influx of Greek, Persian, Hellenistic, central or Asiatic Far-Eastern elements in pre-Gupta and Gupta times, to the blending of Islamic with Hindu forms of design after the Muslim conquest and even to the absorption of European features, the arts and crafts of the Indian sub-continent have adopted new designs, fused them with old ones and infused them with the spirit and the sensitiveness of this country. Two main elements can be discerned; on the one hand we have the geometrical element of the Northern nomads in which all natural forms are reduced to decorative patterns. This element came into the country in successive waves with the Aryans, the Scythians, the White Huns, the Mongols and the Muslims. The other element, which might be taken as belonging to the indigenous South Indian is more exuberant and uses natural forms such as human or animal figures with greater freedom. The desire to decorate, even the humblest articles of daily use and to introduce beauty into every feature of life has been inherent in the Indian sub-continent from time immemorial and has even survived, sadly weakened, the industrial revolution of our age. The gay and tasteful dresses of the village folk of today testify to the indestructible artistic sense of this ancient race.

Pottery—In the excavations of Mohenjo-daro and other Indus valley sites pottery of the 4th and 3rd millennium B.C. has been found, of pleasing shape and with very decorative paintings in black or red in which animal forms feature prominently. Up to the present time, the potter's wares have usually been of good functional design and quite often they have been painted. Well known is the glazed ware from Agra, Muradabad, Jaipur, Multan and Hala. Terra-cotta work has found manifold adaptations throughout the ages, a particularly beautiful one in the Gupta reliefs from Ahichhatra, Suratgarh, Paharpur, Nandangarh and terra-cotta reliefs on 16th to 18th century temples in Bengal. Glazed tiles were used by the Muslims for architectural decoration especially in Sind, the Punjab, Kashmir and the Deccan. The many coloured tile mosaics of Lahore Fort are famous.

Stone Work—Carved stone work is the principal form of decoration on Hindu or Muslim buildings. Ranging from fully sculptured figure friezes to the finest trellis work it is found on buildings of every epoch. Well known for the skill and the imagination displayed, are the Jain marble temples of Dilwara in Mount Abu and the Hoysala temples of Mysore. Muslim buildings are soberer in their ornamentation. The stone carvers of Ahmedabad excelled in delicate "*jali*" (stone tracery) work for windows (Sidi Sayyid's mosque). On buildings of the Pathan dynasty of Delhi wonderful decorative use has been made of carved Persian or Arabic lettering (Qutb Minar). The use of marble inlay and mosaic work became fashionable under the Moghuls and led to mastership in the costly art of "pietra dura" in which precious stones are inlaid in marble in most delicate and delightful flower patterns. The stone masons of modern Jaipur are highly skilled in architectural carving.

Wood Work—Wood carving was, as elsewhere, the mother of the art of stone carving. With a fine range of precious timbers suitable for the purpose, wood has always played an important part in building and decoration. The earliest extant Indian monuments (Bharhut, Sanchi) are imitations of wooden prototypes, the beautifully carved house fronts in Ahmedabad and other Gujarat cities, Maharashtra, the Punjab, Nepal, and the western Himalayas, the 16th to 19th century Jain temples in Ahmedabad are all carved in wood and painted right up to their domes, teeming with multitudes of figures. They are imitations of the stone carved temple ceilings of Mount Abu and Kumbaria. Richly carved furniture is made today in Kashmir (walnut) and in South India (rosewood and blackwood). Decorative carving in sandalwood for domestic or religious purposes is at home in South India.

Ivory—An inscription in Sanchi (1st century B.C.) says that part of the stone relief work of the Southgate was done by the ivory carvers of Besnagar. This alone proves the close interrelation of all the arts and crafts in the Indian sub-continent. Most important ivory reliefs of the Kushan period have lately been excavated at Begram (Afghanistan) and Pompeii (Italy). Of the Muslim period we have fine ivory boxes from Bijapur, Golconda, Bengal, Orissa and Goa, doors panelled with ivory from Jaipur, Bikaner and Udaipur. The doorleaves of the Amba Vilas Palace, Mysore, are covered with excellent reliefs. In Delhi ivory carving and painting was reintroduced early in the 19th century. Still a flourishing art in South India (Mysore, Travancore) and in Delhi, ivory articles find a ready market inland and overseas. Though of perfect finish, modern work lacks the sensitive sculpturing of earlier work.

Metal Work—With the exception of weaving the metal industry employed and still employs the greatest number of craftsmen and the greatest variety of methods and techniques. There is hardly a place where metal objects are not made in one form or other. Iron and steel, known from early times, were mainly used in weapons. The best damascened blades come from South India and Rajputana. Brass and copper go to make the plain but beautiful utensils of domestic use (*lota*, *huqqa*, etc.) and ceremonial lamps, images, vessels, etc., for religious worship. These articles are cast, hammered, chased, inlaid, encrusted or otherwise worked. The South Indian image maker's (*sthapati*) bronze or brass castings are a marvel. Well known is *bidri* ware (from Bidar in Hyderabad) in which silver is inlaid in a dark metal alloy or *koftgari* ware, the best specimens of which come from Muradabad and the Punjab, in which gold and silver are inlaid in steel. Gold and silver in repoussé or filigree, are worked into fine articles in Kashmir, Lucknow and other places.

Jewellery—From time immemorial jewellery of rich design was made in the Indian sub-continent, and worn by both sexes. Simple beads of polished precious stones have been found in many pre-historic and early historic sites. Classic and medieval sculptures and paintings tell us about the endless variety of jewellery, to describe which would require a large treatise. Flowers being the most primitive form of adornment, many forms of jewellery, up to the present day, derive their name and shape from floral prototypes. Perhaps the finest jewellery work is done in gold enamelling, Lahore and Jaipur giving the choicest pieces. Typical is the incrustration of gold and silver with gems which are always *cabochon* cut (never facetted as modern European jewellery) for a fuller colour effect. Another very ancient technique is gold and silver filigree applied to ornaments. Nothing can compare with the exuberant splendour of the country's jewellery, though the skill in stonecutting and also in setting has not always reached the level of Western craftsmen.

Lacquer Work and Papier Maché—Lac being an indigenous product, laquer work in various techniques has assumed industrial proportions in parts of the sub-continent. Best known perhaps are the products of the Kashmiri craftsmen, especially in connection with papier mâché painting. Lac turnery for furniture, toys and other objects is a widespread art in western India, especially in Kathiawar and Gujerat. In Sawantwadi (Konkan Coast) a small lacquer industry produces artificial fruit, playing cards, toys, etc.

Textiles—No other country, East or West, has ever excelled the Indian sub-continent in the weaving of cotton and silken fabrics. Since ancient times, Indian textiles were in great demand in all world markets. There is hardly a technique or art in fabric making that was or is not known in some part of India or Pakistan. A very short enumeration must suffice *Patola* silks of Gujerat, in which the threads are variously dyed before weaving; fine silks and brocades from Banaras, Murshidabad, Hyderabad, Madras, Tanjore and other places; finely woven woollen Kashmir shawls; delicate muslins from Dacca; tie-dyed fabrics from Rajputana; various forms of dye-painting on cotton (*qalmdar*, similar to Javanese batik) from South India; printed silks and cottons from all parts north or south with some of the finest cotton prints coming from Sanganir near Jaipur. As there is no limit to the styles of embroidery, mention may be made only of the *phulkari* work of the Punjab, the colourful embroideries of Kathiawar and the world-famous Kashmir shawls. Carpet making is at home in the North. Especially under Akbar in the 16th century, gorgeous rugs and carpets were made, exquisite in colour and fabric, though the finest work from Persia was never equalled.

It has been estimated that there are still 2½ million handlooms in India and Pakistan and the industry though depressed by the competition of the power loom, survives with part of its old artistic sense and skill.

Rangolis—Worth mentioning are the artistic designs made by the women with coloured powders on the floor or on the doorsteps of their houses as festival decoration. Preserving the age-old designs of religious symbolism, they are known in all parts of India in a great variety of patterns (*rangoli* in Gujerat, *alpona* in West Bengal, *kolam* in South India, etc.).

There can be no doubt that the skill and artistic sense of the craftsman is still alive, perhaps slumbering. As Mr. Fred H. Andrews said "deterioration is not the fault of the craftsman but of his employer." However, all the indigenous crafts have badly suffered from the industrialization of the country. Government and private efforts to save them have been successful only in preserving the technical tradition. Industrial competition and new fashions have deprived the craftsman of most of his customers for quality products. He has also lost his aristocratic and rich middle class employers and now has to cater chiefly for less well-to-do people for whom his traditional designs and techniques are too expensive. In consequence the old designs are deteriorating quickly, whereas new designs often suffer from a lack of taste. However, certain old industries have maintained their high quality, especially Banaras Saris. Other industries particularly in Kashmir, Bihar and Central India are successfully adapting themselves to modern needs. Industrial production where it simply accepts the tastes of a disorientated public, has lost contact with the national tradition. Where it tries to shape them, it is beginning to bring out very satisfactory creations. The "Art in Industry Institute" at Calcutta is doing most valuable work for the improvement of public taste. The future of the national arts and crafts depends not on a revival of dying traditions, but on an intelligent adaptation to changing conditions combining the best of the past with the technical opportunities of the present.

ARCHÆOLOGY

ALTHOUGH India is one of the most ancient countries in the world and the cradle of an ancient civilization, it has long remained in the background owing to the absence of written histories going back to the earliest recorded period as in the case of other ancient lands such as Egypt or Mesopotamia. Over a hundred years ago the foundation of Indian archæology was laid by Prinsep, who first deciphered the ancient Brahmi script and thus opened the way to a knowledge of the edicts of the Emperor Asoka and other ancient documents, which till then were a sealed book to the people of India or Pakistan. Since then a large number of scholars Indian, Pakistani and European have helped in building up the edifice of Indian and Pakistani archæology which though fairly comprehensive is still incomplete in several respects.

The story commences with the beginnings of human existence in the vast sub-continent. The roughly chipped stone implements discovered in various parts of the sub-continent, particularly in the eastern districts of Madras State, and the valleys of the Sabarmati, Narmada and Godavari show the first attempts made by man to work his tools with which to master his surroundings. Two of these palæolithic implements were found in association with the bones of extinct animals, one at Bhutra in Narsingpur district, Madhya Pradesh, on the banks of the Narmada and the other at Mungi on the upper Godavari. The age of the palæoliths determined mostly by geological considerations may be anywhere from 50,000 to 200,000 years, and the great interval of time between the microlithic and the palæolithic periods is shown by nearly a hundred feet of alluvial and wind-blown loam deposits in the valley of the Sabarmati river.

STONE AGE

The whole field of pre-history is receiving increasing attention, which is expected to systematise our knowledge of the earliest inhabitants of the sub-continent and systematic work has been recently attempted at several sites in Madras, Mayurbhanj, Rajpipla, Baroda, Andhra and Karnatak.

Neolithic man, who used a large variety of polished stone implements, was more widely distributed throughout the continent, particularly in the Peninsula and the Vindhyan regions and his skeletal remains have for the first time been unearthed in Gujarat. On the other hand the megalithic tombs which occur in a great variety of forms in the central and southern parts of the Peninsula, belong to the iron age and some even persist to our own age. The knowledge of metals developed differentially in the North and the South. Thus in the North the copper implements of the Gangetic Valley and the copper and bronze antiquities of the Indus culture exclude any knowledge of iron. In the South, however, though certain recent finds in Raichur district do not exclude the knowledge of copper smelting in the Peninsula, the neolithic settlements of the Bellary district seem to have been immediately followed by the knowledge of the smelting of iron, as evidenced by the large-scale furnaces which stand in the shape of cinder mounds notably at Kudatini (Bellary Dt.). It is clear that while copper and bronze were known in the North in the third millennium B.C. the South may have been generally content with the use of stone implements right down to the first millennium B.C. until stone was supplanted by iron. It is remarkable that in some of the localities in the ancient Deccan, comprising the Bombay Karnatak, the Ceded Districts of Madras, South Hyderabad and North Mysore, stone implements and painted pottery are followed by antiquities of the regular historic period. This gives the hope that a regular sequence can be established and links forged between the history and the pre-history of the Deccan.

AGRICULTURAL SETTLEMENTS

The earliest agricultural settlements yet known in India have been located in the desert and hilly regions of Sind and Baluchistan going at least to the beginning of the third millennium B.C. There is ample evidence to show that the climatic conditions of Sind and Baluchistan were more favourable in those days than today: abundant rainfall supported small agricultural communities. The existence of *gabarbands* or artificial stone built dams and terraces of unknown date in Baluchistan also support this view. The earliest phase of the prehistoric culture of Baluchistan is Quetta culture. Its pottery belongs to the Buff-ware group painted in purplish-brown and the designs are wholly geometric. The Nal-Amri culture can be divided into three phases—Amri, Nundara and Nal. The settlements of the Amri—Nal phase were under two acres. Some of the settlements were fortified. Stone was employed for the foundation of the houses but the walls were of mud-brick or pisé; stone was also used but only rarely for this purpose. The burial rite at Nal was inhumation or fractional burial. A large number of potteries and copper implements were also found. The vast majority of the Nal and Amri vessels have a buff or pinkish paste with a white slip for painting the designs. Designs representing animal or plant forms are absent on Amri ware, but are typical of Nal pots. Geometrical motifs are more common. There is also evidence of metal working in Amri-Nal culture. Copper ore was used for forging weapons. Beads were extensively used for making ornaments.

The Kulli culture (south Baluchistan) is distinguished by a characteristic painted pottery style. It is distinguished from Amri-Nal culture by a distinct burial site and abundance of clay figurines of women and animals. The normal building material employed by the culture was stone and sometimes the stone wall was plastered from inside. An important group of vessels carved out of soft stone has been discovered. The ornament on the pottery consists of naturalistic representations of plants and animals. The geometric ornaments are of varied shape and size. The Mehi cemetery was surprisingly rich in copper and bronze objects. There is evidence to show that Kulli culture was influenced by Harappa. There also seems to have been trade connections between south Baluchistan and Mesopotamia in Early Dynastic Sumer.

In North Baluchistan particularly in the valley of Zhob there existed a group of cultures known to archæologists as *Zhob cultures*. Ross's work at Ran and Ghundai revealed five strata. In the earliest stratum (R.G.I) the site was probably occupied by a semi-nomadic people living in impermanent huts and camps. Their pottery was unpainted and hand-made. The domesticated horse was known to them. In the second phase (R.G.II) the new comers built houses and made superb wheel-turned painted pottery. The pottery decoration consists of stylized figures of humped bulls and black buck. This new occupation does not seem to have lasted long. The third phase (R.G.III), the rise and decline of which could be seen in the stylistic sequences of its pottery, lasted for a considerable time. The culture had a violent end.

In common with Kulli culture the Zhob valley sites have yielded a considerable number of clay figurines of cattle and women. The female figures are characterised by staring circular eyeholes, an owl-beak nose and a grim slit mouth. Perhaps they represent the great mother goddess presiding over the destiny of the dead.

INDUS VALLEY

The most interesting and significant phase of the pre-historic civilization of the sub-continent is, that represented by the excavations at Harappa in Punjab (Pakistan) and Mohenjo-daro in Sind. These have completely revolutionized ideas on this subject and proved that as far back as the 3rd millennium B.C. the sub-continent was in possession of a highly developed civilization with well-planned and populous cities, well built houses and public buildings of brick, carefully constructed wells and a system of drains and many other amenities not always enjoyed at that period by the peoples of Mesopotamia and Egypt. Both at Mohenjo-daro and Harappa there are the remains of some 5 or 6 cities super-imposed one upon the ruins of another.

MOHENJO-DARO AND HARAPPA

In the matter of actual plan and lay-out the two cities of Harappa and Mohenjo-daro are strikingly similar, and Dr. Wheeler's recent work at Harappa has thrown much light on the significance of this planning. The mounds on the west of both the cities represent citadels roughly parallelogram in plan and measuring about 400 yards north-south and 200 yards east-west. Within the citadels, on a mud-brick platform, stood structures defended by a battened wall of baked brick facing the mud-brick core with rectangular towers and great gateways.

Adjacent to the citadel site at Mohenjo-daro is the 'Great Bath' with steps leading down from each end. The bath is built of fine brickwork and provision is made to drain the bath when needed. Around it is a cloister and a set of changing rooms and some other buildings whose exact nature has not been determined, but one of them might have served as a college. All these structures remind us of a Hindu temple. The citadel at Harappa also shows the remains of ceremonial terraces and a processional way leading up to gateways and these might have been connected with some religious ceremony.

Below the citadel lies the remainder of the streets, shops and dwelling houses. The basic lay-out of the city of Mohenjo-daro consists of main streets running north-south and east-west dividing the area into blocks. One could imagine from whatever details have come down to us that the city was a square and consisted of twelve major building blocks. The main blocks were provided with side lanes and alleys, thus dividing the blocks into individual houses. These houses, specially those of the well-to-do were built of burnt bricks. The outside walls overlooking the streets were provided with doorways. There are no traces of windows which were very high up in the walls. The house consisted of a courtyard with rooms and baths grouped round it. Buildings have also upper stories. The roofs were made of bamboo and rush matting covered with mud. The water supply came from the wells lined with bricks. Quarters for working men have been discovered at both cities. Beyond the working men's quarters at Harappa stood grain pounding devices behind which was a great granary.

There seems to have been some kind of municipal authority to look after the drainage of the city.

The remarkable conservatism of the Indus Valley culture in the field of arts and even the details of every day life presuppose a theocratic authority which insisted on the rigid observance of the traditions of the temple. The way the whole plan was laid out with the citadel, the defensive walls carrying on their fortified summit a group of buildings indicates the existence of a priest king wielding autocratic power from the two main seats of government.

The evidence from the skulls found in Mohenjo-daro and Harappa shows that ethnically the people of the Indus Valley culture consisted of (1) the aboriginal Proto-Australoid type, (2) the predominant Mediterranean and (3) an occasional hilly type from the north-east—the hill country of Nepal or of Assam. The sculptural evidence also supports this view. The famous statuette of the dancing girl perhaps represents a Proto-Australoid type with full lips and wiry limbs; the head of the bearded man would fit well enough with the Mediterranean facial type.

The large number of provincial sites interspersed in Sind and the Punjab formed a necessary corollary to the highly urbanised Indus Valley culture. Some of the sites must have been those of trading centres. An analysis of the objects found from Mohenjo-daro and Harappa shows that the people got their bitumen, alabaster and steatite from Baluchistan; silver from Afghanistan or Persia; silver, tin, lead and semi-precious stones such as lapis, lazuli and turquoise from Persia or Afghanistan, and the hæmatite from the islands of the Persian Gulf. Kathiawar and Gujarat provided chankshell, agates and carnelian. From Rajasthan came copper; the Deccan provided amethyst and the Nilagiri provided amozonite. Jadite came from Central Asia or Burma.

All the goods must have been transported by means on pack animals or carts. There must have been considerable river traffic too, and perhaps very primitive ships sailed from the sea ports of Sind to the Persian Gulf. In keeping with this highly developed trade, the Indus Valley culture had a well-developed system of pictographic writing found mostly on stamp seals. The script was written from right to left, though when there is a second line the boustrophedon practice prevailed. The writing has not been deciphered so far. Perhaps the inscriptions on the seals represent personal names.

A large number of weights have also been found and so also a scale measuring 13.2 inches.

INDUS VALLEY CULTURE

The Indus Valley seals are distinguished for their brilliant representations of animals, both mythical and actual, shown in profile. In addition to this glyptic art the Indus Valley culture introduced some remarkable sculptures in the round a few of which had inlaid decoration. The little bronze figure of the Dancing Girl from Mohenjo-daro is remarkable for its sensitive modelling. The sculpture in general shows that men had short beards and embroidered robes while the women had elaborate head-dresses and an abundance of ornaments consisting of parures, collars, girdles and necklaces. Some of these ornaments have actually been dug up at Harappa and Mohenjo-daro. Ornaments such as earrings and nose-studs were made of gold and semi-precious stones. Beads were extensively used and were made with great skill. Kohl was applied with little rods and razors were used for shaving. The pottery is for the most part quite plain. The decorated variety is a black-on-red ware, the designs being geometrical in shape. Irregular mass of foliage and tendrils, and birds and animals were also used for purposes of design. In some Harappa sherds there are human figures. Polychrome pottery also exists. The use of faience was also known. There were metal-smiths who manufactured tools such as axes, chisels, knives, etc. in copper and bronze by casting and forging.

The inhabitants of the Indus Valley were mostly cultivators. It is interesting that the wheat found at Mohenjo-daro and Harappa resembles the common variety grown in Pakistan today. Barley, sesamum and field peas were also grown. The food of the people appears to have included, bread, beef, mutton, and pork, the flesh of tortoise, turtles and gharial, fresh fish from the Indus and dried fish from the sea coast.

Religion also seems to have played an important part in the Indus Valley culture. As we have already shown there is a hint of priest-rule in the citadel architecture of Harappa. The numerous clay figurines of women establish the existence of the worship of a Mother—Goddess, the *gramadevatas* of contemporary Hinduism. Then there is the representation of a horned male god, with three faces, seated in the posture of a *yogi* surrounded by an elephant, a tiger, a rhinoceros and a buffalo and a couple of deer near his feet. In him one may recognise the prototype of the great God Siva, the Lord of Animals. There is also evidence of some form of phallic worship while the worship of animals and trees formed a separate feature of the Indus Valley religion.

JHUKAR CIVILIZATION

The simpler peasant civilizations of Baluchistan and the great urban civilization of the Indus Valley came to an end sometime in the middle of the 2nd millennium B.C. The story of this could be read at Rana Ghundai (R.G. III-c) which shows clear signs of conflagration. This phase is followed by stratum IV and V the painted pottery of which shows a rapidly changing population. The same evidence of pillage and burning is present in the last phase of the Nal culture. In south Baluchistan no comparable signs are apparent, but two cemeteries at Shahi Tump datable to C.2000 B.C. display features similar to those of the Indus Valley culture. Grave goods in most instances consisted of groups of pots, copper and bronze tools and ornaments, stone beads and alabaster cups. The outside ornaments on the vessels consist of *swastikas* and the interior ornaments besides *swastikas* of, spirals, chevrons, lozenges and triangles. The copper shaft-hole battle-axe has its nearest parallel in the battle axes found in the graves of chieftans of barbarous tribes in south Russia.

It is surmised from such relics as these that the men who finally destroyed the Indus Valley civilization were invaders who swept down into the sub-continent through the Bolan pass. They belonged to the Shahi Tump culture, the copper stamp seals from which speak of a Persian or Central Asian relationship.

This new intrusive culture is known as Jhukar culture to archæologists. The largest body of evidence of this culture occurs at Chanhu-daro. In Stratum II of the site the people who occupied the earlier site probably lived in thatched huts or tents, with fire places built in door-ways or niches. They used a characteristic type of pottery, stamp seals, amulets, beads, metal tools and pins, bone awls and a pottery head-rest. The pottery is buff ware with ornaments painted on it in black and red and comprising geometrical and stylised plant forms drawn probably from the Harappa and Kulli motifs. The seals are altogether different in their ornamental motifs from the Indus Valley seals, though they bear close affinity to the stamp seals of the great Western Asiatic family. The beads also point in the same direction.

The actual arrival of the invaders cannot be traced at Mohenjo-daro but the disturbed conditions of the time are reflected in the hurry with which the people buried their jewellery; the buildings show a falling off in standard, and municipal regulations in general are lower to the extent that pottery kilns appear in the city boundaries. The bigger houses were also being partitioned into smaller flats for security reasons. That the threat to the city was real is shown by a number of skeletons of people fleeing for their lives.

At Harappa the arrival of the new people is marked by a distinctive type of pottery found in the 'Cemetery H' and coeval with the final phase of the construction of the West Gateway of the citadel. The construction of this period is poor and certain charred remnants suggest barbarians' huts. The burial pottery of the second phase of the 'Cemetery H' which is made of a hard red fabric with red slip and black ornaments of stars, stylised forms, ring and dot patterns, zigzag, etc. or of cattle, goats, peacocks and fishes are fairly common. The figures are treated not realistically but symbollically. There is no analogy to the older kind of pottery and the only thing that could be said about it is that it betrays an ancient Iranian or North Mesopotamian strain.

The arrival of a new people in India about this time is also proved by other evidence not directly connected with the Indus Valley Civilization, the presence of the flat axe from Kurram, for instance, common in Europe, but rare in Asia. There are other finds of copper implements, one group in the Doab in U.P. and the other centered round the Ranchi upland. The simple flat axe could not be affiliated with its prototype at Harappa, but the prototype of the elongated variety exists at Chanhu-daro. The copper harpoons found from the Gangetic Valley are perhaps of local development among the riverside people whose economy centred round fish-spearing. In these elongated axes which probably owe their origin to the Indus Valley or an allied culture we may see evidence of the expansion into and colonisation of the Gangetic Valley from the west. Thus from all available evidence from the Punjab, Sind and the Gangetic Valley it is possible to say that near about 1,500 B.C. a new people from the west gave a rude shock to the long-established civilization of North-West India. This general movement of the barbarians was not confined to this country alone. They (the barbarians) also appeared in Babylonia, Syria, North Persia and in Russian Turkistan. Before their onslaught the ancient Western Asiatic civilization broke down resulting in the introduction of new ideas and new techniques such as the use of horse-drawn chariots in warfare. Civilization was taking a new turn.

ARYANS

The people who burst into the Western Asiatic civilization were probably the Aryans whose original homes were in the South Russian steppes and in the lands eastwards to the Caspian Sea. They domesticated the sheep and the cattle and reared the horse in the latter phase of the culture. The battle axes found in their graves emphasise their warlike character. The metal weapons and the wrought silver and gold found from certain great tombs bear resemblance to Akkadian weapons of a similar nature. The first signs of the dispersal of these Indo-European people are seen about 1600 B.C. In Mesopotamia a new dynasty was set up under the Kassites whose monarchs bear Indo-European names. The Mittanis who occupied the district round the head-waters of the Khabur river in the 14th and the 15th centuries B.C. mention the Vedic gods Indra and Varuna, Mitra and the Nasatyas in their diplomatic correspondence. Among the Boghaz Kemi documents is a fragmentary book on chariot racing which uses certain Sanskrit technical terms. Unfortunately archæological evidence about the presence of the Aryans in Persia and India is lacking and we have to depend on literary sources to get an idea of their culture. The Rig Veda datable to C. 1500 B.C. gives a good picture of the Indo-Aryan culture which could be corroborated with archæological evidences from other regions of the early Indo-European colonization. The Veda throws much light on the culture of the time which was confined to the north-west and the Punjab to the west of Ambala. For instance, it speaks of snow-capped mountains and of a great land of rivers, which can only be the Punjab. The society was divided into warriors (Kshatriyas), priests (Brahmanas), agriculturists and tradesmen (Vaisyas), but the concept of caste was unknown. In several of the Indo-Aryan gods more especially in Indra we get a magnified view of the Indo-Aryan chiefs, strong, tawny-bearded, hard fighters and drinkers, using bow and arrow from the chariot and consuming great quantities of beef, porridge and cakes. The Asujan is a cattle raider and above all a destroyer of the enemy's strong-holds —the enemy represented by wealthy, black *dasas* or robbers with an alien culture worshipping the phallus and contemptuous of Aryan practices. The description of the *dasas* perfectly accords with the black proto-Austroloid people of the Indus Valley culture who lived in strongly fortified citadels. From the Vedic evidence it is clear that these forts were built of stone and unbaked bricks, which the Aryans burned or destroyed.

These early Indo-Aryans had an agriculture economy with emphasis on live-stock specially cows and bulls which they kept for milk and beef or farm transport. Barley was grown and fields were tilled by ox-drawn plough. The ripe corn was cut with a knife or a sickle, was bundled into sheaves, thrashed and winnowed and then probably stored. Hunting was also practised. The flocks included both sheep and goats; and the wool which came from the sheep was spun and woven by the women. The horses were used to draw chariots in war or sport. The thatched

wooden houses were rectangular in shape and probably divided into several compartments. The central hearth was the focus of household rites. The house was provided with roasting spits and bronze cauldrons, flesh forks, saddle squerns, pestles and mortars and pottery. The drinks included mead and beer. The clothes were embroidered. The women wore ear-rings, neck ornaments, anklets and rings. Specialised crafts included smithery and carpentry while copper and bronze implements were extensively used. The community held periodic assemblies in halls which often became a gamblers' paradise with very high stakes. Musical instruments such as cymbals, drums, reed flutes, lute and a seven stringed lyre were well known. The people also enjoyed dancing.

It is possible to trace the extension of Aryan culture beyond the Punjab in later Vedic texts, but unfortunately archaeological evidence of Aryan settlement and expansion till the rise of the Mauryas hardly exists. Recently attempts have been made to study the pottery sequences between the Indus Valley culture and the Maurya period. Some painted grey ware of the Gangetic basin decorated with simple bands, criss-cross, concentric circles, dots, etc. has been discovered in Ahichhatra in Bareilly District and Hastinapura (both in Uttar Pradesh) underlying the typical monochrome black polished ware of the Maurya period. This grey ware has been tentatively assigned to C. 500 B.C.

Recent excavations at Hastinapur have yielded grey ware in lower levels. The excavations have also proved that a part of this city was flooded before the 5th century B.C. This new archæological discovery gives credence to the Pauranic legend that after the destruction of Hastinapur a migration took place to Kausambi.

Mr. A. Ghosh, Deputy Director General of Archæology, has explored archæological sites on the dried bed of the river Saraswati in the Punjab and Bikaner. His explorations have revealed the existence of various cultural phases in that part of the country. Some of the painted pot-sherds connect this cultural complex with the Indus Valley culture.

BUDDHIST MONUMENTS

From the time of the Mauryas, i.e., 4th century B.C., the history of architecture and of the formative arts is clear and can be traced with relative precision.

The earliest monuments of the historical period that have come down to us relate to the Mauryan period from which time onwards the main currents are pretty clear. The Mauryan monuments include certain caves in the Barabar hills near Gaya, the remains of a pillared hall and wooden palisade near Patna (ancient Pataliputra), a number of stupas at different places, built of large sized bricks traditionally attributed to Asoka, and a wealth of minor antiquities such as sculptures, terracottas, beads, etc., recovered in the excavations at Patna, Taxila (Bhir Mound), and Sarnath and in course of the sewage operations at Patna. Special mention must be made here of the stupa at Pirahwa opened by Peppé in 1898, which yielded a large stone box containing an inscribed steatite or soap-stone reliquary with a number of relics and beautiful precious stones now preserved at the Indian Museum, Calcutta. The inscription written in characters of the 4th-3rd century B.C., speaks of the relics being of the Buddha himself and enshrined by his kinsmen, the Sakyas.

Asoka's edicts—The rock and pillar edicts of Asoka (*circa* 272-232 B.C.), deserve special mention. His major rock edicts are engraved in seven places, ranging from Shahbazgarhi in the Peshawar District in Pakistan to Yerragudi in the Kurnool District in Madras. Among the thirteen pillars of Asoka (besides the Elephant capital of a 14th at Sankisa and a fragment of a 15th at Banares) ten bear his inscriptions. Of these the Lauriya-Nandangarh column in the Champaran District, Bihar, is practically uninjured.

The Mauryas were followed in the second century B.C. by the Sungas in the east, while in north-west Græco-Bactrian rulers were gradually extending their sway. The Buddhist stupa at Bharhut (Nagaud in central India) is the most typical and remarkable monument of this period illustrating the simple but expressive character of the art. Besides dedicatory inscriptions, the labels inscribed on the Bharhut panels are of unique importance. Antiquities of this period particularly terracotta figurines with exquisite ornamentation have been found in the excavations of city sites all over the north, notably Kosam and Bhita near Allahabad, Ahichhatra near Bareilly, and at Banares and Patna.

Sanchi—The best preserved in the series of early Buddhist monuments are the magnificent Buddhist remains at Sanchi in Bhopal State. Here the main stupa of which the core probably belongs to the time of Asoka, was later faced with stone and surrounded by a stone railing with four great gateways, one at each cardinal point, sometime about the first century B.C. Besides the stupas, a number of other buildings, temples, apsidal halls and monasteries of different periods form a splendid galaxy, illustrating the principal phases of the religion of the Buddha, from its early days to its decline.

Taxila—The extensive remains of the ancient city of Taxila, near Rawalpindi in Pakistan, are among the most important in the land, constituting three different cities that flourished in adjacent sites in successive epochs and a number of monastic establishments centered around stupas, situated in the suburbs or perched on the tops of hillocks in the vicinity. For over a quarter of century, Sir John Marshall's labours here have served to elucidate the splendid history and culture of this centre, the meeting-place of the three great civilizations of Greece, Persia, and of India and Pakistan.

The most prosperous of the cities was an Indo-Scythian city, now known as Sirkap, dating from a century on either side of the Christian era with regularly planned streets, houses and palaces, the antiquities from which including exquisite jewellery, beads, coins, all kinds of household objects and pottery, etc., form the bulk of the exhibits of the fine museum on the spot.

Mathura—Mathura, one of the most important religious and art centres in the north from ancient times was galvanised into activity perhaps from the beginning of the Christian era, if not earlier. Here the abundance of red sandstone in the neighbourhood was availed of by the followers of all religions and some of the earliest Brahmanical and Jain images were manufactured here in a peculiarly attractive and playful though sensuous art. From Mathura the Buddha image and some of the Hellenistic motifs travelled further to the east and south and even to the distant Buddhist school of the lower Krishna valley as at Amaravati, Nagarjunikonda and other places. By the fourth century A.D. the Hellenistic element in native art was, however, completely absorbed when under the stimulus of the Gupta Empire it reached its golden age.

GUPTA AGE

The rise of the Gupta dynasty early in the fourth century was a signal for the high water mark of Hindu achievement in literature, art and sculpture.

The best sculpture of this period has been found at Sarnath, Mathura, Deogarh and Garhwa in Uttar Pradesh, while examples of terracotta and minor arts have been found in all the excavations in the north. Sarnath, where Buddhism first saw the light of day, was the most prosperous centre of Buddhism at this time and, significantly enough, is the centre of a Buddhist revival in India, the Mulagandhakuti vihara founded here by the Mahabodhi Society, having received from the Government of India three Buddhist relics recovered from excavations at Nagarjunikonda in Madras, Mirpurkhas in Sind and Taxila in Punjab (Pakistan).

In the field of religion the Brahmanical fait was steadily in the ascendency while Buddhism still held its own, the intellectualism of the age finding expression in a broad spirit of tolerance. Simplicity of conception and restrained ornament is the keynote of the architecture of this period, examples of which are found at Sanchi, Bhumara, and Deogarh in stone and Bhitargaon, Ahichhatra and other places in brick. A well known monument of the Gupta period is the iron pillar standing in the middle of the open court of the mosque at the Qutb near Delhi, which has an inscription referring to King Chandra (identified with Chandragupta II *circa* A.D. 379-413). It is surprising to find that a bar of wrought iron of such dimension should have been made at this early period and still more surprising that not a speck of rust appears anywhere on it in spite of the weather action of 15 centuries. Other interesting examples of wrought iron are the beams from Konarak, 12th century, and the iron pillar at Dhar in Central India, dating back to the time of the Paramara King Bhoja early 11th century.

RECENT EXCAVATIONS

The ancient site of Pataliputra is being excavated at present under the auspices of Patna University. The excavations so far have revealed that the city was not destroyed by the flood as was generally supposed but by the invasion of the Huns who apparently had penetrated as far as Pataliputra.

The ancient site of Kausambi is being excavated under the auspices of Allahabad University. Excavations have yielded some interesting results. An inscription mentioning Ghoshitaram the ancient monastery which existed in the time of the Buddha, is the first definite archaeological proof of the existence of that monastery. A large number of beautiful terracotta figurines and sculptures ranging in dates from Sunga to the Gupta period have laso been found.

Excavations of great significance were also carried out in Baroda. It was found that Baroda was inhabited by primitive Stone Age people 3,000 years ago and that it was a flourishing township having commercial contacts with Rome in the first and second centuries of the Christian era.

Dr. B. Subbarao, head of the Department of Archaeology of Baroda University, who was in charge of the excavations, said that evidence relative to the evolution of Baroda in the last 3,000 years had been dug out from a site on the banks of the Vishwamitri River, known as Akota, near Baroda.

The Stone Age implements found during the excavations suggested that the early settlers of what is now known as Baroda were primitive people and that in the next 1,200 years, or so, they had marched towards a fairly flourishing civilisation.

The excavations had thrown up a brick building of very large dimensions suggestive of the fact that it might have been a public building. The relics of Roman pottery and clay seals, containing insignia of two horses and a star typical of Greco-Roman art, showed that the people of Baroda had trade contacts with Rome 800 years ago.

The expedition was organised after the chance discovery of a large number of Jain bronzes on the same site by people engaged in quarrying for bricks. Among the finds were Roman pottery, belonging to the first and second centuries, and Roman bronze handles with the figure of Eros.

The earlier name for Baroda was "Vadpadraka," which was a suburb of the ancient town of Ankottaka.

INSCRIPTIONS

We now come to inscriptions, of which vast numbers have been brought to light and which are particularly numerous in south India. They have been engraved on varieties of materials, but principally on stone and copper. The former are mostly associated with temples, of which they record the construction or

Avalokiteshwara of Padmapani—height 22½ ins., in the Calcutta Art Gallery (4th century A.D.): Nepal.

Asoka Pillar—height 38 ft., Lion Capital 7 ft. (240 B.C.): Lauriyanandangarh.

Lion Capital of Asoka Pillar, in Sarnath Museum (240 B.C.): Sarnath.

Buddha, in Sarnath Museum (5th century A.D.): Sarnath.

Temples and Ghat (dating earlier than 1000 B.C.): Banaras.

Mausoleum of Sher Shah (1540 A.D.): Sasaram.

Buddha Temple—height 180 ft. (Seen by Huien Tsang in 635 A.D.): Buddha-Gaya.

Bronze Buddha, in Nalanda Museum (6th to 8th century A.D.): Nalanda.

Yakshi or Women attendant—height 160 cm. (c. 200 B.C.): Patna.

Head of a boy, in Patna Museum (3rd to 1st century B.C.): Patna.

Buddha (c. 12th century A.D.): Rajgir.

Statue of Surya (Sun)—height 5½ ft. in Victoria and Albert Museum, London (12th century A.D.): Raj Mahal Hills.

Hindu Temple (1643 A.D.): Vishnupur.

Yakshi Chulakoka—from Stupa railing at Bharhut, height 214 cm., in Indian Museum, Calcutta (2nd century B.C.): Calcutta.

Apsaras in Heaven—Bharhut sculptures, in Indian Museum, Calcutta (200 B.C.): Calcutta.

Bronze Kali's Dance, in Indian Museum, Calcutta (10th to 11th century A.D.): Calcutta.

Statue of Indrani (10th century A.D.): Jajpur.

Skirted female figure—height 89 cm. (6th or 7th century A.D.): Bhubaneshwar.

Woman writing with a stylus—height 69 cm. (11th century A.D.): Bhubaneshwar.

Markandaya Temple (10th century A.D.): Bhubaneshwar.

Mother fondling child—height 92 cm. (11th century A.D.): Bhubaneshwar.

Colossal horse with attendant (c. 1200 A.D.): Konarak.

Colossal Elephant (c. 1200 A.D.): Konarak.

Sun Temple (c. 1200 A.D.): Konarak.

Temples (11th century A.D. onwards): Puri.

Durga slaying the Demon Mahesha (11th century A.D.): Puri.

Pillar in Temple on Ramappa Lake (c. 12th century A.D.): Palampet.

Pillar in Hindu Temple (1162 A.D.): Hanamkonda.

Kirti Stambha (c. 12th century A.D.): Warangal.

Descent of Buddha into the womb of Maya, in Indian Museum, Calcutta (170 A.D.): Amravati.

Court scene on a Medallion, in British Museum, London (2nd century A.D.): Amravati.

Slab from base of Stupa, in Madras Museum (2nd century A.D.): Amravati.

Monastery (6th century A.D.): Undavali.

Sculpture in Rameshwarswami Temple (1485 A.D.): Tadpatri.

Vishnu as Narsinh (lion) Avtar (1528 A.D.): Vijayanagar.

Chariot—height 26 ft. (1521 A.D.): Vijayanagar.

Sculpture on outer wall of Sinhasan Hall in Palace (16th century A.D.): Vijayanagar.

Vishnu sitting on serpent Ananta—ceiling slab in Temple (634 A.D.): Aihole.

Char Minar Mosque—height 186 ft. (1591 A.D.): Hyderabad.

Gateway of Banda Nawaz (1640 A.D.): Gulbarga.

Gol Gumbaz or Mausoleum of Mohammed Adil Shah—dome: 124 ft. wide (1659 A.D.): Bijapur.

Temple (8th century A.D.): Pattadakal.

Vishnu in Cave Temple (c. 600 A.D.): Badami.

Pillar in Kashi Viswanath Temple (earlier than 11th century A.D.): Lakhandi.

Temple of Chenna Kesava (12th century (A.D.): Belur.

Dancing figure in Chenna Kesava Temple (12th century A.D.): Belur.

Hoysaleswara Temple (13th century A.D.): Halebid.

Lord Krishna raising Mount Govardhan (13th century A.D.): Halebid.

Bronze—Shiva from Hindu Temple (17th century A.D.): Vellore; Kalyana Mandapam of Hindu Temple (14th century A.D.): Vellore.

Brass Images of Krishnaraya and his two Queens in Vijayanagar Tirumalai Hill Temple (16th century A.D.): Tirupati.

Temple of Vardaraja Swami (earlier than 13th century A.D.): Conjeevaram.

Bronze—Uma, in Boston Museum (12 century A.D.): Madras.

Bronze—Parvati, in Madras Museum (16th or 17th century A.D.): Madras.

Bronze—Krishna, in collection of K. J. Khandalawalla, Bombay (14th or 15th century A.D.): Madras.

Rock-cut Ganesh Rath (680 A.D.): Mamlapuram.

Bas-relief: "Penance of Arjuna" (7th century A.D.): Mamlapuram.

Temples of Shiva and Parvati (from 500 to 1700 A.D.): Chidambaram.

Sarangpani Vishnu Temple (10th to 14th century A.D.): Kumbhakonam.

Temple Cart: Sri Rangam.

Vishnu Temple of Raghunatha Swami (16th century A.D.): Sri Rangam.

Jambukesavara Shiva Temple (17th century A.D.): Trichinopoly.

Prasanna Chenna Kesava Temple (1270 A.D.): Somnathpur.

Jinanathpur (12th century A.D.): Basti.

Goma teshvara, Jain Saint—carved out of single rock—height 70 ft. 3 ins. (980 A.D.): Sravanabelagola.

Huntress—height 136 cm. (12th century A.D.), Mysore.

Ratha (17th to 18th century A.D.): Mysore.

Nandi—height 16 ft. (1659 A.D.): Mysore.

Audience Hall—Tirumala Nayak Palace (17th century A.D.): Madura.

Menakshi Temple (17th century A.D.): Madura.

Dancing Shiva in the Great Temple (17th century A.D.): Madura.

Dancing Shiva in a ring of flames, in Madras.

Museum (10th to 11th century A.D.): Tanjore.

Temple (18th century A.D.): Rameshwaram.

Monolithic Temple (10th century A.D.): Kalugumalai.

Padmanabha Temple (5th century A.D.): Trivandrum.

ARCHITECTURE

THE first comprehensive work, accessible to lay readers, to give a history of styles in architecture in the Indian sub-continent is Mr. Percy Brown's *Indian Architecture* in two volumes which marks a definite advance in the treatment of the subject over Fergusson's *Indian and Eastern Architecture* which, for many years, was considered to be the standard work.

The chief characteristics of our architecture, especially in its later stone phase, are (*a*) its use of heavy masses; (*b*) construction based on vertical not lateral pressure, *i.e.* without true arches or true domes; (*c*) its plastic treatment and close relationship with sculpture, (*d*) its undeveloped treatment of space and (*e*) its spiritual significance and symbolism.

HINDU STYLES

In Harappa and Mohenjodaro and other sites of the Indus valley extensive cities have been discovered. These cities dominated by mighty fortresses were built from C. 3000—2000 B.C. by a people whose chief occupation was trading. The buildings, of a type closely related to Sumerian, are executed in brick in "English bond", and are plain, functional and without great artistic merit. They are mainly houses, store houses, baths and wells and no certain traces of temples have yet been found. The city drainage system was perfect. The corbelled arch was used, the true arch being unknown.

With the invasion of the Aryan tribes who destroyed these *purs* a new architecture came into existence which, originating from the village, developed into the town and palace architecture of the epic period. Wood and clay being the only building materials, hardly any visible traces of this period exist. The main forms were the long house with a vaulted roof constructed with bamboo or reed and with horse-shoe shaped "sun windows" on either end; circular village huts (and perhaps shrines) and the wooden fence with wooden "cowgates". In the south are found "dolmens" covered with a single slab of stone. In Buddha's time towns flourished and in Rajgriha, the ancient capital of Maghada, cyclopean fortifications in stone were carried to a height of 12 feet.

With the establishment of a larger political power under the Mauryas the use of a more permanent stone architecture was gradually introduced. Monuments of this period include (*a*) 13 monolithic edict pillars of Asoka, some with beautifully carved animal figures on bell shaped capitals (Persian Influence); (*b*) remains of a large, three storied wooden palace near Patna supported on stone pillars; (*c*) several *stupas* or Buddhist relic mounds built largely in brick and (*d*) a group of rock-cut caves in the Barabar Hills in Bihar.

BUDDHIST STYLES

During almost four centuries, from 200 B.C. to 200 A.D., under two great dynasties, the Sungas of the north and the Andhras of the south, Buddhist zeal gave India some of her most remarkable monuments. In this period the hemispherical *stupas* are stonefaced, with a stone casket and umbrella on top, surrounded by stone railings in which are set four doorways or *toranas*. All forms though carried out in stone, betray their wooden origin. Sculpture and relief are used profusely to decorate the sacred shrines. The most famous *stupas* are those of Sauchi (Bhopal State), Barhut (C.I.), Mathura, Budh Gaya, Sarnath and Amaravati in Madras State which is the latest and most elaborate one.

To serve priests, monks and lay worshippers, temples and monasteries were built, mainly in brick and wood. Little of these has survived but their exact replicas have come to us, carved from solid rock in the shape of cave temples and monasteries; the largest caves (Karle, 124 ft. long, 46½ ft. wide and 45 ft. high) reach considerable proportions.

Buddhist caves are generally of two types—*chaityas* or chapels, and *viharas* or monasteries. The *chaityas* are long apsidal buildings with a vaulted roof and a horse-shoe window over the entrance. The interior is divided into a nave for the priests and aisles for the lay worshippers by means of a double row of pillars. At the apsidal end is a *stupa*. *Viharas* are rectangular halls surrounded by cells and having (in a later development) a sanctum in the centre of the backwall containing a Buddha image. The most important groups of caves of this period are those of Bhaja, Kondane, Pitalkhora, Bedsa, Nasik, Ajanta, Ellora, Junnar and Kanheri, all in Western India on or near the ancient trade route from Kalyan (near Bombay) and to the West.

BRAHMANICAL ARCHITECTURE

Since the Kushana dynasty (1st—3rd century A.D.) a cultural revolution had set in which in northern India reached its apogee under the Imperial Guptas and their successors (ca. A.D. 350—750), in the south under the Pallavas (7th—9th centuries A.D.). Buddhism and Jainism were slowly ousted by Saivism and Vaishnavism, and a new Brahmanical temple architecture developed. Wood architecture was gradually replaced by stone masonry. Builders used a simple construction of massive pillars and brackets supporting heavy beams and slabs. Genuine arches were not used, corbelled arches rarely. Pillars and beams were, preferably, monolithic, *i.e.* made from single large slabs of stone. Masonry consisted of large, very well worked stones bonded without mortar. The new architecture was evolved from the preceding Buddhist types by means of a process of adaptation, reduction and reduplication. In Indo-Greek and Kushana times simple chapel rooms had been known.

Typical of the Gupta age are temples consisting of a square sanctum with a pillared porch and a flat or slightly sloping roof. They are found in Udaigiri (Bhopal), Sanchi, Tigowa, Bhumara and Nachna Kuthara (C.I.), in Aihole (Kontgudi and other temples), Bhubaneshwar (Parasuramesvar), and Kumaon (Jageswar). Under the successors of the Guptas a small cellar was added on the roof (Lad Khan and Meguti at Aihole) and a closed hall in front. From this developed a step tower of successive simple or decorated storeys, or of successive roofs with dormer windows, first low, later of increasing height (Bhitargaon, Kanpur, Bodh Gaya, Kathiawad, especially Gop, Lakroda, Aihole, Pattadakal, Mamallapuram, also Nepal). The shrine was surrounded by a circumambulation passage, the hall was raised on a high plinth and enlarged by a pillared porch (Deogarh, Aihole, Badami, Pallava temples of Kanchi, as a cave *temple*—without plinth and tower—at Badami, Ellora, Elephanta, Jogeshwari, etc., mainly under the Chalukyas, Rashtrakutas and Silaharas).

HINDU TEMPLES

The South Indian Temple type was taken over in Greater India. Also in the south it set the model for all later evolutions. At Mamallapuram (Seven Pagodas near Madras) the prototypes of house, village, shrine, Buddhist Chaitya and monastery are still discernible, though often reduced to sculptured decoration; at Kanchipuram (Conjeeveram) the southern temple type is fully developed, enclosed by a court of subsidiary chapels, and rising in two, three or more clearly distinguished storeys of genuine or merely sculptured shrines. In the Chola temple at Tanjore this central tower rises to gigantic dimensions. Under the Pandya dynasty the entrance (Gopura) becomes the most conspicuous building, towering high above the temple and its various enclosures. Under the Vijayanagar and Madura dynasties immense halls supported by figural pilasters were the fashion (Hampi, Trichinopoly, Srirangam, Madura, Ramesvaram, etc.). The Kailasa of Conjeeveram was imitated by the Chalukyas of Badami (Pattadakal) and the Rashtrakutas (the famous Kailasa of Ellora, and the Dhamnar Caves in Malwa).

In the Ganges valley and Bengal the temple was raised on a step-pyramid ascended by four flights of steps (Paharpur, Ahichhattra, Nandangarh, Greater India also Nepal). This type was inspired by the late Buddhist Stupas, in which the original hemispherical dome was placed on the top of a high drum supported by a step pyramid and crowned by a multiple set of stone umbrellas (Pagoda).

Finally, in Kashmir a special style sprang from a combination of Gupta, Gandhara, Byzantine and local elements in the reign of Lalitaditya-Muktapida (8th century A.D.).

Under the Pratihara dynasty of Kanauj (8th—10th centuries A.D.) at last the classic "Aryan" temple type emerged. The storeys and step roofs of the temple tower, reduced to mere ledges, were fused into one, beehive-shaped tower (Sikhara) crowned by a mighty wheel shaped stone (Amalaka). This spire, again reduplicated and vertically sub-divided, is the main distinguishing mark of the style, in all its many varieties from the Punjab to Bengal, from the Himalayas to Orissa and Maharashtra.

The typical temple consists of a cell which houses the image (*Garbha Graha*—womb-house), and its spire, and a pillared hall (*Mandapa*). Originally not connected, these two parts were joined by an intermediate chamber (*Antarala*). Leading into the main hall are one or several porches (*Ardha-mandapa*). The whole temple may be raised on a platform and surrounded by an enclosure through which leads a gateway (*Gopura*). The 8th—10th centuries show this temple type growing in elaboration, wealth of decoration and symbolic significance, the 11th-12th centuries represent its Golden Age, the 12th-14th its decadence. Later temples are no more than imitations. The best known examples of the early mediæval north-Indian style are the Kalika at Chitorgarh (Mewar), the temples of Osia (Marwar) and Bhubaneshwar (Orissa) of the classic phase Khajuraho and Udayesvar (C.I.), Modhera (Gujarat) and Somnath-Patan (Saurashtra), and Sinnar and Ambarnath (Deccan); of the late phase Dilwara (Mount Abu) and Konarka (Orissa).

DRAVIDIAN TEMPLES

The southern (Dravidian) temples have already been mentioned. In the Deccan an intermediate style flourished under the Chalukyas of Kalyani, Yadavas, Rattas, Kakatiyas and Hoysalas. Most famous are the Hoysala temples in Mysore, at Belur, Somnathpur, etc. Its last phase is the so-called Hemadpanthi style.

Pillars developed from rectangular posts to columns with 8, 16, 32 sides, or combinations of these latter; in Gupta times they were often fluted. Brackets, which were at first plain, were then rounded off, indented, set crosswise, decorated with flying godlings, transformed into supporting dwarfs (Kichakas). Capitals imitate either cushions (mainly Deccan and south), or "pot and foliage" (north). Southern columns generally are very slim, with a very broad abacus. Later northern columns dissolve into storeys of arched niches and chapels in relief, enclosing dancing nymphs and gods. Brackets and merely decorative arches are treated as dryads, dancing nymphs or flower garlands carried by dwarfs or emerging from the mouths or tails of dragons. Walls are organized by a system of vertical projections and recesses, horizontal mouldings, and niches enclosed by columns and pentroofs. Pediments are decorated with semi-circular windows. The roof rises, on the top of a rounded or sloping pentroof, in a system of chapels and miniature Sikharas.

The best book on this subject is *The Hindu Temple* by Stella Kramrisch.

donations, while the copper plate records are usually grants of land made by kings on special occasions. In either case, the mention of the exploits of the donor and his ancestors and the dates (where specified) give the student of history, valuable contemporary material.

The earliest of these are found incised in two distinct kinds of alphabet, known as Brahmi and Kharoshthi, the latter being confined to the north-west of the sub-continent. Brahmi was read from left to right, and from it have been evolved all the modern scripts of India. The Kharoshthi script was written from right to left, and was a modified form of the ancient Aramaic alphabet introduced into the north-west of the sub-continent during the period of the Persian domination in the 5th century B.C. It was prevalent up to the 4th century A.D., and was supplanted by the Brahmi.

The earliest datable inscriptions are the celebrated edicts of Asoka to which a reference has been made above. One group of this has been engraved on rocks, and another on pillars. They have been found from Shahbazgarhi 40 miles north-east of Peshawar in Pakistan to Nigliva in the Nepal Tarai, from Girnar in Saurashtra to Dhauli in Orissa, from Kalsi in the Lower Himalayas to Yerragudi in the Kurnool District of Madras showing by the way the vast extent of territory held by Asoka.

The reference in his Rock Edicts to the five contemporary Greek Princes, Antiochus II of Syria, Ptolemy Philadelphus, and so forth is exceedingly interesting, and fixes B.C. 269 as the date of his coronation. His Rummindei pillar inscription, again, discovered in Nepal Tarai, now settles beyond all doubt, the birth-place of Buddha which was for long disputed. Another noteworthy record is the inscription of the Besnagar Pillar, at Besnagar, near Bhilsa in Central India, which records the erection of this column, a Garuda Pillar, in honour of Vasudeva by Heliodoros, son of Dion, an envoy of King Antialkidas of Taxila. Heliodoros is herein called a *Bhagavata* which shows that though a Greek he had become a Hindu and a Vaishnava. Another inscription worth noticing in this connection is that of Cave No. 10 at Nasik, in which Ushavadata, who calls himself a Saka or an Indo-Scythian, granted three hundred thousand kine and sixteen villages to gods and Brahmans and annually fed one hundred thousand Brahmans. Here is another instance of a foreigner having embraced Hinduism.

For the last fifteen years Indian epigraphy has received even greater attention, though unfortunately, owing to the exigencies of World War II the publication and interpretation of Indian epigraphs had practically stopped. Discoveries include copper plate inscriptions of the Salankayana dynasty of the 4th century A.D.; the epigraph of the Pandava of Mekala establishing the presence of a new dynasty; the Banaras plate of Hariraja (5th century) of Sura dynasty; the inscribed plates of the Nala dynasty of southern Madhya Pradesh and a large number of Pallava, Chola and Chalukyan plates which throw much light on the history of India from the 7th to the 11th century.

Among the stone inscriptions discovered during this period mention may be made of the Bandhogarh cave inscriptions of Bhimasena, Pothasiri, Bhattadeva, Sivamagha and Vaisravana which provide a great deal of information about the history of central India in the second century A.D. An interesting stone inscription from Ghantasala in the Krishna District, dating to C. 300 A.D. records the name of a sea captain thereby establishing the fact that the village was an important port in ancient times. A large number of stone inscriptions from south India dating from the 7th to the 11th century also materially add to our knowledge of Indian history and culture.

The part played by numismatics in reconstructing the continent's ancient history may also be mentioned here. The earliest coins are those of the silver punch-marked series, going back at least to the 4th century B.C., and found all over the land often in large hoards, which are still being systematically studied. Next come the cast coins issued by the various tribes and rulers in the north of the sub-continent. For the Indo-Greek, Indo-Scythian and Indo-Parthian periods, coins are our almost exclusive source of information, having revealed the names of scores of rulers, otherwise unknown. The entire genealogy, succession and regnal years of the kings of Saurashtra and surrounding territories, known as the Western Kshatrapas (2nd to 4th centuries A.D.) has been built up on the numerous coins issued by them.

Within the last ten years striking progress has been made in the study of ancient Indian numismatics which has greatly increased our knowledge of Indian history during those periods which were comparatively obscure hitherto. The Magha coins found from eastern Uttara Pradesh, Kausambi, and of the Satavahana kings have been closely studied and interpreted by various scholars. The Mahishaka coins from Hyderabad State reveal that the Sakas had penetrated into the Deccan and support the Pauranic allusions to Mahishaka dynasty. The most important numismatic discovery of recent years is the hoard of Gupta coins found from Bayana in Rajasthan. It contains several types of Gupta coin the most interesting being a coin of Chandragupta II receiving gifts from Vishnu, the tutelary deity of the Guptas.

ARCHÆOLOGICAL DEPARTMENT

A note on the function and organization of the Archæological Departments in the country will not be out of place here.

The work of the Archæological Department is primarily two-fold, conservation, and research and exploration. None but spasmodic efforts appear to have been made by Government in these directions till 1870 when they established the Archæological Survey of India and entrusted it to General (afterwards Sir) Alexander Cunningham, who was also the first Director-General of Archæology. The first systematic step towards recognising official responsibility in conservation matters was taken by Lord Curzon's Government who established most of the Archæological Circles that now obtain, placed them on a permanent footing and united them together under the control of a Director-General, provision being also made for subsidising local Governments out of imperial funds, when necessary. The Ancient Monuments Preservation Act was passed for the protection of historic monuments and relics especially in private possession and also for State control over the excavation of ancient sites and traffic in antiquities.

Under the direction of Sir John Marshall, first Director-General of Archæology under Lord Curzon's scheme, a comprehensive and systematic campaign of repair and excavation was prosecuted and at present the Central Government bears all expenditure in connection with the preservation and maintenance of monuments, as well as with excavation and research. Under later Directors-General it was continued with equal vigour and the result of it is manifest in the present altered conditions of many old and historic buildings and in the scientific excavation of buried sites such as Taxila (in Pakistan), Pataliputra, Sanchi in Bhopal, Sarnath near Banares, Nalanda in Bihar, Paharpur, and Nagarjunikonda in Madras, in the Indus Valley at Harappa in Punjab (Pakistan) and Mohenjo-daro in Sind and at Ramnagar (ancient Ahichchhatra) in Bareilly District, where an extensive walled town inhabited from before the fourth century B.C. to the ninth century A.D. has been unearthed stratum by stratum with far-reaching results for the study of archæology throughout the sub-continent's age-long history. Dr. R. E. Mortimer Wheeler, the late Director-General of Archæology in India, opened an excavation training centre at Taxila in 1944, where a large number of students were trained in the latest methods of archæological excavation. He also carried out excavations at the ancient port of Arikemedu near Pondicherry, which have yielded vestiges of Roman intercourse and have thus helped in the dating of an associated Indian culture of the 1st and 2nd centuries A.D.

In 1947, excavations were carried out at Brahmagiri and Chandravalli in the northern part of Mysore State. At the former site, several megalithic burials known as 'cists' and 'pit-circles' were uncovered. These belonged to a period between *circa* 200 B.C. and A.D. 50. Besides, remains of a crude chalcolithic culture (*circa* 800 B.C.-*circa* 200 B.C.) those of the Andhra culture (1st to 3rd century A.D.), were also obtained. At Chandravali remains of only the 'Megalithic' and 'Andhra cultures' were obtained. During 1948, excavations were undertaken under the direction of Mr. B. B. Lal at a site called Sisupalgarh near Bhuvanesvar in the State of Orissa. Here, a fort, roughly square on plan, with each side measuring about ¾ mile was brought to light. The fortification wall, now standing upto an average height of 25 to 30 feet, is pierced through by eight large gateways, two on each side. Around the fort flows a streamlet which seems to have served as a moat. The fort was built about 200 B.C. and seems to have been under continuous occupation till about the 4th century A.D.

The explorations conducted by the Deccan College Post-Graduate and Research Institute, Poona, in Gujarat have revealed the existence of two Stone Age cultures in the region, the first was in existence about 2,500, years ago and the second belonged to a time just before the beginnings of agriculture. A remarkable feature of the second culture is the existence of fossilized human skeletons and a large number of animal remains.

In 1945-46, the Institute excavated the ancient site of Brahmapuri at Kolhapur on behalf of the former Kolhapur State. This brought to light the existence of well-built brick houses, obviously part of a large city, which was in commercial contact with Rome, about 2,000 years ago. The excavations also gave an idea of the vicissitudes through which Kolhapur had passed since then. The Institute has also been conducting prehistoric explorations in Andhra and Karnatak, which have furnished valuable clues for correlating the various Stone Age cultures of the two regions. In 1949 it invited, in co-operation with the Government of India, Prof. F. E. Zeuner of London University to study the climatic phases and environment of Stone Age Man in India.

Museums—The Archæological Survey of India has devoted great attention to the organization of museums as centres of research and education. It maintains the archæology section of the Indian Museum at Calcutta, small museums at the Forts at Delhi and the Central Asian Antiquities Museum at New Delhi. Local Museums have also been established at the excavated sites of Sarnath and Nalanda, with the object of keeping the principal movable antiquities recovered at these sites in close association with the structural remains to which they belong.

Duplicates of antiquities from Mohenjo-daro and Harappa have been widely distributed among other museums.

The epigraphical material dealt with by the Archæological Survey has enabled the history of the various dynasties of the sub-continent to be established on a firmer basis and in greater detail. The "Epigraphia Indica" is now in the 27th volume, a revised edition of the Asoka inscriptions has been recently published, while the companion volume of post Asokan Brahmi inscriptions is under preparation along with two others devoted to the records of the Gupta and Kalachuri epochs. The volume of work done in south India, which is particularly rich in lithic records, will be apparent from the fact that over 20,000 inscriptions have been copied and noticed in the Annual Reports on south Indian epigraphy and a large number published *in extenso*.

Archæological Departments exist in a number of States. Prominent among these must be mentioned Hyderabad, Mysore, Madhya Bharat, Bombay and Rajasthan. In Hyderabad the systematic and scientific treatment of the frescoes at Ajanta is an outstanding achievement of the Archæological Department of the State. Besides this, attention has been devoted to the rock-cut temples at Ellora and many other structural temples. Among the Islamic monuments the great mosque of Gulbarga and the Bahamani mosque at Bidar have been fully conserved. Of late, systematic excavation of ancient sites as at Maski and Paithan has been a regular feature of the Department's work, the latest excavations at the Andhra city site of Kondapur and at Kallur in Raichur being fraught with results of immense importance.

The Mysore Archæological Department has completed nearly half a century of its existence. The first Director, Mr. B. L. Rice, published some 10,000 inscriptions in 12 volumes of the Epigraphia Karnatica. This progress has been well maintained, and the conservation work has rescued many famous temples, such as the Kesava temple at Somanathpur, and the temples at Belur and Halebid. Excavations conducted at Chandravalli and Brahmagiri have been very fruitful.

In Madhya Bharat the Department established in 1913 has done excellent work in exploration of ancient sites, such as Pawaya, Ujjain, Besnagar and Mandasor. The conservation of the Bagh caves and other ancient monuments and the maintenance of a good museum are among the other achievements of the Department.

In Rajasthan excavations initiated by Rai Bahadur Daya Ram Sahni have revealed the existence of a unique Buddhist establishment at Bairat and a city site near the Sambhar Lake. The excavations at Rairh, an ancient commercial and industrial mart, have brought to light large hoards of punch-marked and other coins of early date, and the work now started at the great site of Karkotanagar bids fair to assume great importance.

The Archæological Department of Bombay State has done valuable work in the listing of monuments and the exploration of several sites including Amreli and Pattan.

The amended Ancient Monuments Preservation Act has established a system of licenses for scientific excavations to non-official bodies. The first Society to take part in this work was the American School of Indian and Iranian Studies which, co-operating with the Boston Museum of Fine Arts, organized an expedition for work at Chanhudaro in Sind in 1936. Here several phases of the pre-historic culture of the Indus Valley represented by Harappa were unearthed. Unfortunately the work was discontinued after the first season. The University of Calcutta conducted excavations at Bangarh in north Bengal for a number of years with success and the Punjab Exploration Fund did good work at the site of Bhera now in Pakistan. Recently the University of Allahabad with the active co-operation of the Department of Archæology of the Government of India has undertaken short excavations at the ancient site of Kausambi in the Allahabad District where some work was done previously by the Department.

MUSEUMS, ART GALLERIES

India is rich in museums and art galleries, a list of which is given below:

National Archives of India, New Delhi; Delhi Fort Museum of Archæology, Delhi; Central Asian Antiquities Museum, New Delhi; Archæological Museum, Nalanda; Archæological Museum, Sarnath; Archæological Museum, Nagarjunikonda; Fort St. George Museum, Madras; Rajputana Museum, Ajmer; Indian Museum, Calcutta; Victoria Memorial Hall, Calcutta; State Museum, Bhuvaneshwar (Orissa); State Museum, Lucknow; Government Museum, Madras; Curzon Museum of Archæology, Mathura; Central Museum, Nagpur; Patna Museum, Patna; State Museum, Gauhati (Assam); Palace collection, Aundh; Mysore Government Museum, Bangalore; Baripada Museum, Mayurbhanj (Orissa); Khiching Museum, Mayurbhanj; Baroda State Museum and Picture Gallery, Baroda; Barton Museum, Bhavnagar (Saurashtra); Bhuri Singh Museum, Chamba (Himachal Pradesh); Archæological Museum, Himmatnagar (Idar); Archæological Museum, Gwalior; Hyderabad Museum, Hyderabad; Indore Museum, Indore; Albert Museum, Jaipur; Sardar Museum, Jodhpur; Jardine Museum Khajuraho, Chhattarpur (Vindhya Pradesh); Puddukottai Museum, Puddukottai (Madras); Watson Museum of Antiquities, Rajkot (Saurashtra); Museum of Archæology, Sanchi (Bhopal); State Museum, Trichur (Cochin); Government (Napier's) Museum, Trivandrum (Travancore); Victoria Hall Museum, Udaipur (Rajputana); Junagarh Museum, Junagarh (Saurashtra); Nawanagar Museum, Nawanagar (Saurashtra); Prince of Wales Museum of Western India, Bombay; Lord Reay Maharashtra Industrial Museum, Poona; Bharat Kala Bhavan, Banaras (U.P.); St. Xavier's College Museum, Bombay; Museum of Bangiya Sahitya Parishad, Calcutta; Asutosh Museum, Calcutta University, Calcutta; Bharat Itihasa Samsodhak Mandal, Poona (Bombay); Allahabad Municipal Museum, Allahabad; Victoria Jubilee Museum, Bezwada; Archæological Museum, Bijapur (Bombay); Victoria and Albert Museum, Bombay; Raipur Museum, Raipur (Madhya Pradesh).

PROTECTED MONUMENTS

The following list of protected monuments along with the place of location is given for purposes of easy reference:

Gandhara Sun Temple (8th century A.D.): Martand (Kashmir).

Sikh Golden Temple (1766 A.D.): Amritsar.

Goddess Sarasvati—Height 120 cm. (12th century A.D.): Bikaner.

Capital City (1459 A.D.): Jodhpur.

Kumbha Rana's Jain Temple (15th century A.D.): Ranakpur.

Hawa Mahal (1699 A.D.): Jaipur.

Gateway (17th century A.D.): Amber.

Female figures on a Kushan Period railing (c. 100 A.D.): Muthra.

Mother and Child—Kushan Period Sculpture (c. 100 A.D.): Muthra.

Gupta period Statue of Buddha—Height 217 cm. (c. 600 A.D.): Muthra.

Tomb of Isa Khan, the Pathan (1545 A.D.): Delhi.

Tomb of Humayun, the Mogul (1556 A.D.): Delhi.

Kutub Minar—Height 238 ft. with five storeys (commenced 1232 A.D.): Delhi.

Khas Mahal, Mogul Fort (17th century A.D.): Delhi.

Tomb of Itimad-ud-Daula (1622 A.D.): Agra.

Taj Mahal (1653 A.D.): Agra.

Bulanda Darwaza (1602 A.D.): Fatehpur-Sikri.

Sas-Bahu Temples (1093 A.D.): Gwalior.

Man Singh Palace of Chit Mandir (1486 A.D.): Gwalior.

Teli-ka-Mandir (c. 9th century A.D.): Gwalior.

Govind Palace of Vir Singh Deo (17th century A.D.): Datia.

Palace of Vir Singh Deo (17th century A.D.): Orchha.

Khandarya—Mahadeva Temple (c. 1000 A.D.): Khajuraho.

Vishnu reclining on the serpent Ananta, symbol of eternity, in Vishnu Temple (5th century A.D.): Deogarh.

Liberation of the elephant by Vishnu, in Vishnu Temple (5th century A.D.): Deogarh.

Shiva as the great ascetic—Maha Yogi (5th century A.D.): Deogarh.

Statue of an unknown woman—6 ft. 7 ins. high—in Indian Museum, Calcutta (5th century B.C.): Besnagar.

Sri Allata of Kaitan Rani Tower—Kirti Stambha (12th century A.D.): Chitor.

Temple of Vriji (1450 A.D.): Chitor.

Palace (16th to 18th century A.D.): Udaipur.

Temple (17th century A.D.): Udaipur.

A ceiling in Adinath Temple (1031 A.D.): Mount Abu.

Pillars and arches in Nemnath Temple (1230 A.D.): Mount Abu.

Rudramal Temple (950 A.D.): Sidhpur.

Kirti Stambha—35½ ft. high (c. 10th century A.D.): Vadnagar.

Sun Temple (1026 A.D.): Modhera.

Zenana of the Palace (19th century A.D.): Jamnagar.

Temple (18th century A.D.): Dwarka.

Nemnath Jain Temples (1177 A.D.): Girnar.

Tomb of Baha-ud-Din Bhar: Junagadh.

863 Jain Temples (11th to 20th century): Palitana.

Women's Gallery in Great Mosque (1364 A.D.): Mangrol.

Huttheesing Temple (1848 A.D.): Ahmedabad.

Niche in Great Mosque (1424 A.D.): Ahmedabad.

Window of Sidi Saiyad Mosque (16th century A.D.): Ahmedabad.

Mosque (15th century A.D.): Champaner.

Clock Tower and Palace (18th century A.D.): Baroda.

Baroda Gate—height 31 ft. (11th to 13th century A.D.): Dabhoi.

Buddha with attendants (4th to 7th century A.D.): Bagh.

Gateway and Stupa (c. 150 B.C.): Sanchi.

The Teaching Buddha—Cave No. 16 (4th to 6th century A.D.): Ajanta.

Entrance to Chaitya—Cave No. 26 (500 to 650 A.D.): Ajanta.

Kailash Cave Temple (8th century A.D.): Ellora.

Panel of Ravana shaking the abode of Shiva—Kailash Cave Temple (8th century A.D.): Ellora.

Mausoleum of Rabia Daurani (17th century A.D.): Aurangabad.

Chand Minar—height 100 ft. (1435 A.D.): Daulatabad.

Gondeswara Temple (12th century A.D.): Sinnar.

Pandu Lena Chaitya—Cave No. 18 (100 B.C. to 200 A.D.): Nasik.

Buddha—height 21 ft. (6th century A.D.): Kanheri; Wall in front of Cave No. 3 (6th century A.D.): Kanheri.

Shiva as Creator, Preserver and Destroyer—Trimurti—height 19 ft. (8th century A.D.): Elephanta.

Dance of Shiva—Tandava (8th century A.D.): Elephanta.

Marriage of Shiva and Parvati (8th century A.D.): Elephanta.

Donars in front of Chaitaya (100 A.D.): Karli.

Chaitya (100 A.D.): Karli.

Mahakapi Jataka of Buddha, in Indian Museum, Calcutta (180 B.C.): Bhahrut.

Maya's Dream, in Indian Museum, Calcutta (180 B.C.): Bhahrut.

Mausoleum in Khusru Bag (17th century A.D.): Allahabad.

Entrance of Ataladevi Mosque—height 75 ft. (1408 A.D.): Jaunpur.

Head of Parvati—height 12 cm. (5th century A.D.): Ahich Chatra (Bareili).

Tara, Consort of Avalokiteshwara, in the collection of K. J. Khandalawalla, Bombay (15th to 17th century A.D.): Nepal.

INDO-MUSLIM ARCHITECTURE

This begins with the 13th century after the permanent occupation of India by the Muslims. Their first mosques were constructed of the materials of Hindu and Jaina temples, and sometimes with comparatively slight alterations. The *Quwwat-ul-Islam* mosque near the Qutb Minar in Delhi and the *Arhai-din-ka-jhompra* mosque in Ajmer are the best examples of this kind. However, gradually new methods and principles of construction were introduced from Persia and other Islamic countries of the West. The Muslims brought the arch and the true dome, they used mortar (which became necessary because of the lateral pressure exercised by arches) and they introduced novel types of buildings (the mosque and the tomb). They laid the main emphasis on the perfection and the proportions of interior spaces which the temple builders had rather neglected.

The early "Pathan" architecture, especially of Delhi, was massive and at the same time characterised by elaborate richness of ornamentation. The forms in fashion under the Ghoris, Mamluks and Khiljis (extension of Quwwat-ul-Islam, tomb of Iltutmish, Jamat Khana at Nizam-ud-din, etc.) go back to the Saljuq style of Persia before the Mongol invasions. The Qutb Minar is the highest and finest example of a minaret and tomb tower type well known from Ghazni, Turkistan, Armenia and Asia Minor. On the other hand the Tughluq style (Tughluqabad, mausoleum of *Ghiyazuddin* Tughluq, Bijai Mandal, etc.) with its sloping plain walls, represents an indigenous creation based on military architecture.

With the disintegration of the multi-national Muslim state a variety of local styles developed. Under Firoz Shah and the Kashmiri, Sharqi, Sayyid and Lodi sultans Mongol and Timurid Persian art became influential (high mosque screens, glazed tiles). Under the later sultans of Delhi Hindu features infiltrated (Lodi Tombs at Delhi). In Malwa a similar architecture flourished at Mandu, etc. The apogee of "Pathan" art was reached under the Suri sultans (Purana Kila at Delhi; Sher Shah's tomb at Sasaram in Bihar).

In the provinces, however, a reaction set in. The sultans of Gujarat (Ahmedabad, Champaner, etc.) and Bengal (Gaur, etc.) adapted the local Hindu tradition to Muslim needs.

"Of the various forms which the Saracenic architecture assumed," says Fergusson, "that of Ahmedabad may probably be considered to be the most elegant." It is notable for its carved stone work; and the work of the perforated stone windows in Sidi Sayyid's mosque, the carved niches of the *minars* of many other mosques, the sculptured *Mihrabs* and domed and panelled roofs are so exquisite that they can challenge comparison with anything of the sort executed elsewhere at any period. No other style is so essentially Hindu.

The Bahmani sultans of Gulbarga and Bidar in the Deccan, who were, so to speak, wardens of the frontier against the Rajas of Vijayanagar, took over without any reservations the architecture of Mongol, Timurid Persia and Turkistan. The Madrasa of Mahmud Gawan at Bidar and many other buildings are utterly foreign. But after the fall of Vijayanager this attitude changed. In Bijapur, Golconda, and later in Bidar and Ahmednagar (including Daulatabad). Hindu influence was strongly felt. Hindu architecture was not copied, but forms of Hindu industrial art were grafted on Persian architecture, and the Persian forms were reinterpreted in a Hindu, sculptural spirit. In Bijapur this later Deccani style achieved perfection, especially in the Mihtar Mahal, Sat Manzil and Ibrahim Rauza. On the other hand Ottoman Turkish influence is also found, and the Persian halls on pillars or gigantic arches (Gagan, Anand, Sangit and Athar Mahal) are loftier than all other halls in India except the hall in Srinagar, Jami Masjid. The Gol Gumbaz, a masterwork of engineering inspired by the Aya Sofia and Salimiya at Stambul, has for long been the largest dome in existence.

As the last imperial dynasty, the Moghuls have left behind the greatest number of well-conserved buildings. Originally they made use of the Safavid style of Persia, a refined variety of Timurid architecture. Like later Bahmani art, it had a predilection for high arches, plain walls decked with richly painted encaustic tiles; domes, however, were high and bulbous. Already in Humayun's time the tile work began to be replaced by the mosaic of variously coloured stone slabs, developed in India since the Tughluq dynasty (Humayun's Tomb and neighbouring buildings in Akbar's time). Since his alliance with the Rajputs, Akbar encouraged an eclectic style, incorporating Lodi, Suri, Malwa, Gujarati-Muslim and especially Hindu forms. The palaces, mosques and mausolea of Fathepur Sikri bear witness to a passionate quest for a new universal style; in Agra Fort, in Jahangir's palaces at Agra and Lahore, Ajmer, Mandu, etc. the final results can be seen. After the victory of Muslim orthodoxy in Jahangir's last years it was again abandoned in favour of another highly sophisticated synthesis of late Safavi-Persian and earlier Indo-Muslim styles, executed in white marble, costly stones and painted stucco. The masterpieces of this style are the tomb of Itimad-ud-daula at Agra. The Agra Fort, the Taj Mahal, the Red Fort and City of Delhi and the Shishmahal at Lahore. The Taj Mahal (mausoleum of the empress Mumtaz Mahal) and the Moti Masjid are unsurpassed in their purity and elegant restraint and yet dreamlike romance. Under Aurangzeb this classic harmony was disturbed by another dynamism, a preference for tension and curves, naturalism and involution of ornament (Moti Masjid in Delhi, Bibi-ka Rauza at Aurangabad). Under Muhammad Shah, at the court of the Nawabs of Oudh, and of the Nizam, the Rajput, Sikhs and Marathas a picturesque late Mughal art experienced a last heyday (Qudsia Bagh and Safdar Jang's Tomb at Delhi: Lahore; Faizabad and Lucknow; Jaipur, Udaipur, Bikaner, Amritsar, Lahore). In the Punjab the Persian style of encaustic tiles survived through the 17th century, and in the 18th was revived by the Kalhoras and Talpurs of Sind.

MODERN ARCHITECTURE

With the arrival of Europeans, western styles of architecture were soon introduced. The Portuguese built churches and palaces in an agreeable baroque style. The early British colonial style of which many pleasant examples survive, especially in South India, was appealing in its simplicity and its clever adaptation to the local climate. During the 19th century public buildings were erected in a hybrid style composed of Classic, Romanesque, Gothic and Indian elements comparable with the derivative styles of the Victorian epoch, in Europe. In more recent times, three schools of thought have fought for supremacy; the first propagating a revival of indigenous art as still practised by Hindu and Muslim "master builders" surviving in Rajasthan and other parts of the country; the second a renaissance of the Gupta tradition (Sris Chandra Chatterjee) and the third proclaiming the development of a modern architecture on western lines. The western school has found the widest acceptance. The work of building **the new capital in Delhi was entrusted to Sir Edwin Lutyens and Sir Herbert Baker. This most ambitious scheme, incorporating the design and planning of a whole new city, has led to a new style of official architecture, the merit of** which is still a controversial question. The Hyderabad experiment, blending Hindu and Muslim with Mamluk-Egyptian and European features has been less successful. Frank Lloyd Wright and Corbusier exercise considerable influence at present. However, the contemporary use of reinforced concrete structures, though indubitably cheaper, safer and faster, emphasises the dangers of standardisation and suppression of national character. At present a young generation of architects fully trained in modern methods of construction and yet conscious of the glorious artistic heritage of their country is forming a new style still experimental but already with an individual note of its own.

We may wind up with a note on the School of Architecture in Bombay.

The School of Architecture, attached to the Sir J. J. School of Art, Bombay, is a pioneer institution in India for the teaching of architecture, providing a systematic and graded school course on modern lines and of the standard obtainable in other countries, for all who intend to practise as architects.

The School occupies the position and status of a recognised school, not only in India but in the whole of Asia, inasmuch as the school is recognised in respect of its course of study by the Royal Institute of British Architects and the Board of Architectural Education in England.

Students who successfully complete the full-time three years course at this School are eligible for exemption from the Intermediate R.I.B.A., Examination, London, which is not held in India.

The School has a full-time five-year course in Architecture which was brought to the Final R.I.B.A. standard in 1941 in respect of course and examination. Since 1947 the School has been conducting its own examinations and awarding certificates at the end of the 3rd and 5th years.

The Examinations in Architecture of the Government of Bombay are taken by external (or private) candidates by submitting specified Testimonies of Study, and on passing are granted the Elementary, Intermediate, Advanced and Diploma Certificates.

The School Final Certificate in Architecture is on par with the Government Diploma in Architecture in respect of course and examination and both are recognised by the Central and State Governments as also by the Bombay Municipality for granting Surveyor's Licence to practise.

The Indian Institute of Architects which was affiliated to the Royal Institute of British Architects in 1925 is a professional body of Architects in Bombay whose members are scattered all over India and Pakistan. The R.I.B.A. conducts the Special and Final R.I.B.A. Examinations in Bombay once a year.

The All India Diploma and Intermediate Examinations in Architecture of the Government of India are conducted by the All India Board of Technical Studies in Architecture and Regional Planning. These Examinations are held in New Delhi every year and candidates are granted Certificates and Diplomas.

Prof. of Architecture, Sir J. J. School of Art,
S. S. Reuben, F.R.I.B.A.

LITERATURE

Modern Indian Literature

THE common characteristics of present-day literary aspiration and activity in India in the main are two; namely, an attitude of realism and an angle of world-vision as against narrow nationalism of the immediate past. The result is a kind of scientific humanism. Man is the hub of the universe, but man as understood with the aid of the scientist's gospel and gadgets. But soon the study of man in all his integralness, including his entity as Spirit, will become the aim of Indian literature, thus falling into line with an age-long tradition.

In this bird's-eye view of current Indian literatures only names of important authors and here and there of their well-known works can be given. And this is all that is attempted here together with an indication of the trend towards the future of the Indian literatures.

SANSKRIT

Sanskrit language and literature maintained a steady and all-round progress in 1951. On several occasion Ministers of the Central Government and of States and State Governors have exhorted people to take more assiduously to the study of Sanskrit. Sanskritists, for their own part are trying to bring public opinion round to the view that the study of Sanskrit should be made compulsory for all High School students, the argument being that a study of Sanskrit would develop in them accuracy of thought and exactness of expression. A conference sponsored by the U.P Government discussed the advisability of introducing uniformity of standards in the Sanskrit examinations held in different parts of the country. The Government of Bombay have appointed a Committee to go into the question of the improvement and reorganization of the Pathasalas in the State of Bombay.

The main activity is still one of production of critical editions of works already published.

The Aravindo Ashram produced Part 2 of the *Siddanjana*, a fresh *Bhasya* of the *Rigveda* by Pandit Kapali Shastri. The Vaidika Samsodhana Mandal of Poona published the fifth and last volume containing 10 useful Indices of its monumental edition of the *Rigveda* with Sayana's *Bhasya*. The Svadaya Mandal of Pardi brought out some parts of the *Arseya Samhita*, the author-wise rearranged texts of the Vedas. Other publications include *Upanisat Kanda* in three parts (Dharmakosha Mandal, Wai); *Vyakarna-Mahabhasya*, Vols. 3 and 6 with Marathi translation (Deccan Education Society, Poona); *Bhavabodhini* a commentary on the *Mimamsashutras* (Pandit Malurkar of Kolhapur); a critical edition of *Brahadyoga-Yagnavalkyasmruti* (Kaivalyadhama Institute of Lonavla); *Srigaramanjari*, a work on rhetoric by a Muslim saint of Hyderabad; *Cola-Camgru*, a quasi-historical work and *Sahendra Vitasa* a historical poem edited by Dr. V. Raghavan. A new Sanskrit weekly *Bhavitavya* was started in Nagpur, while other new journals were 'journal of the Oriental Institute' (Oriental Institute) and 'Vak' (Deccan College Post-Graduate Research Institute, Poona). In Bihar a new institute for research in Sanskrit was inaugurated at Darbhanga. The International Academy of Indian Culture at Nagpur has a project for the publication of the entire Indian literature from the Vedas to the Tantras. Finally, the authorized Sanskrit translation of the Indian Constitution done by Pandits Lakshmana Shastri Joshi of Wai and Mangaladeva Shastri of Banares has gone to press, while some parts have actually been published.

HINDI

As a result of the decision of the Constituent Assembly Hindi has become the national language of India and has acquired a new prestige. It is the mother tongue of more than two hundred million people and is rich in epic and lyric poetry. Chandbardai, the court poet of Prithviraj, is supposed to be the first bard while later the literature was greatly enriched by the genius of Vidyapati, Soordas and Tulsidas who stand out as the foremost poets of the cult of devotion. Tulsidas's *Rama Charit Manas* has been widely popular and worshipped in every part of India, from the Himalayas down to the shores of the Indian Ocean for the last three centuries. Jaisi, the author of *Padmavat*, was the first romantic poet and Kabir and Mira, the Rajput Queen of Chitor, were the great mystics. But these poets wrote either in Dingal or in Brija Bhasha, Oudhi or Rajasthani. The Bhakti period of Hindi literature, was followed with the advent of the Moghuls by the age of expert technicians, who under the patronage of eminent rulers of the age built up the treasure house of Hindi poetry and illuminated the evershining Reeti Yug in which love in its various manifestations have been richly and dexterously portrayed. Bihari, Dev, Keshavdas, Bhusan and Matiram, five of the nine gems of Hindi poetry, belong to this golden age of Hindi literature.

The Hindi literature of today can largely be traced to the efforts of a man Bhartendu Harishchandra and an organization Nagari Pracharini Sabha of Kashi which developed Khariboli literature in all its variety and gave it a definite shape. Bhartendu was a remarkable man of versatile genius and he wrote poetry and prose with equal felicity. *Sattya Harishchandra* was his greatest achievement in the field of drama. He was a poet of love, a devotee of Radha Krishna, and throughout the country he was known as a great Vaishnava. He was an ardent patriot too. He raised *Khariboli* to the level of literary language. He evolved Hindi prose also and is rightly described as the father of Hindi drama. Encouraged by Lord Macauley, the Fort William College of Calcutta played an important part in the formation of modern Hindi prose. Lalloojilal, Sadal Mishra, Insha Allakhan and Munshi Sadasukh Lal gave Hindi its present form. Gopalram Gahmari, Devkinandan Khatri and Kishorilal Goswami were the products of the times of Harishchandra. Gahmariji wrote 205, Khatriji 46 and Goswamiji 25 novels. These writers of fiction made Hindi popular with the mass of the reading public. Devakinandan's novel *Chandrakanta* alone created a taste for literature among more than ten lakhs of readers of Hindi. The first two were also the pioneers of detective fiction while Goswami was the first to introduce the study of human character in the Hindi novel. They were followed by Gangaprasad Gupta, Amritlal Chakravarti, Harikrishna Johar, Lajjaram Mehta, Brijnandan Sahal, Jayaradmas Gupta and Pratap Narayan Mishra.

Pandit Mahavirprasad Dwivedi, the editor of *Sarasvati*, took the torch from Bhartendu and fostered the growth of Hindi literature during a critical period. Indeed he dominated Hindi literature for more than half a century. His literary acumen, education and creative faculty were an asset to Hindi. Under his guidance a group of poets and prose writers flourished, chief of whom were Ayodhyasingh Upadhyaya, Maithilisaran Gupta (who is happily still living) Nathuram Shankar Sarma, Rai Deviprasad Purana and Kamta Prasad Guru. The *Priya Pravas* of Upadhyayaji in which the poet successfully introduced Sanskrit meters into Hindi, has already become a classic. The publication of *Bharatbharati* made Guptaji famous overnight. He is undoubtedly the greatest poetic figure flung forth by the Dwivedi era.

The most successful novelist of this era was Premchand. At first he wrote in Urdu but later adopted Hindi as his medium. His *Sevasadan*, *Karmabhumi* and *Godan* has been the joy and inspiration of many. He expounded Gandhian ideology in his stories and raised a note of protest against social conditions that prevailed in the country during the first quarter of the twentieth century. He was also the first to introduce downtrodden peasants and field-labourers in his later work. His short stories can be compared with the best stories of Tagore, Tolstoy or Maxim Gorky. Other great fiction writers of the period are Pt. Sudarshan, Vishwambhar Sharma 'Kaushik', Chandiprasad Hridayesh and Chandradhar Sharma Guleri. Premchand was followed by Jainendra Kumar Brindabanal Verma, a great artist and thinker who wrote *Gadh Kundar* after the style of the English novelist Sir Walter Scott, Ila Chandra Joshi, whose *Sanyasi* brought forth a new style and an unorthodox subject matter, Bhagvati Charan Verma, Vatsyayan, Yashpal, Pahari Usha Mitra, Homvatidevi and several others. A new school of criticism also came into existence led by Mishra Bandhus, Ramchandra Shukla, Shyamsunderdas, Dr. Ram Kumar Verma and Hazariprasad Dwivedi.

Jayashankar Prasad, though a contemporary of Maithili Saran Gupta was the originator of the Chayavadi school of poetry. His *Ramayani* is perhaps the greatest epic of the last half century. He wrote several plays, which have become the proud and immortal possessions of Hindi. He has been the greatest Hindi dramatist of our age. Samitranandan Pant, Nirala and Shrimati Mahadevi are the best representatives of this school of poetry which at one time attained phenomenal popularity in the Hindi world. Pant's *Pullava* is the high water-mark of romantic mysticism and as a creator of symphony he is unique in Hindi verse. Mahadevi Verma whose *Yama* is a highlight, is looked upon as a modern Mira. The late Subhadra Kumari Chauhan achieved distinction as a poetess and her ballad on the Rani of Jhansi became very popular. Makhanlal Chaturvedi, Balkrishna Sharma 'Navin' and 'Dinkar' are the great poets of patriotism.

After the publication of Tagore's *Gitanjali*, prose-poetry came into vogue in Hindi, and the best writer of prose-lyrics of the present day is Shrimati Dineshnandini Dalmia. Acharya Chatursen is one of the greatest living literary figures, whose crowning achievement is the *Vaisali ki Nagar Vadhu*. The drama has its devotees in Madhava Shukla, Makhanlal Chaturvedi, Govind Bhallabh Pant, Lakshminarain Misra and Upendranath Ashka. Seth Govinddas, the dramatist, is a prolific writer, who is also playing a notable part in politics.

Freud and Marx, Eliot and Caudwell had their due share in moulding the opinions of the younger generation. Journalism developed rapidly and often capriciously and some magazines with a purpose, like 'Visva-Bharati Patrika', 'Naya Sahitya', 'Pratika', 'Alochana', etc., appeared on the scene. There have been some outstanding translations and contributions to Indological studies by Rahul Sankrityayana, Dr. Motichand, Vasudevasharan Agrawal, Hazariprasad Dwivedi and Bhagwatsharan Upadhyaya.

ASSAMESE

Modern Assamese literature may be said to date from the publication of *Arunodaya* (1846) and the writers who set the temper of the literature are Lakshminath Baezbarua, poet, short-story writer and dramatist; Hemchandra Goswami, poet and essayist; and Chandrakumar Agarwalla, poet and Hiteswar Barbarua, composer of sonnets. These writers bridge the last and the present century. With them may be mentioned Padmanath Gohain Barua, poet and novelist; Satyanath Bara, essayist; Rajanikanta Bardaloi, novelist, and Saratchandra Goswami short-story writer. Writers who established themselves before the Second World War are Mahi Bara, Rama Das and Vina Barua (Birinch Kumar Barua) in short story; Daibyachandra Talukdar and Dandinath Kalita in the novel; Raghunath Chowdhary, Jatindranath Doweran, Ambikagiri Roychowdhuri, Nilmani Phookan,

19718

Devakanta Barua, Ganeshchandra Gogoi and Nalinibala Devi in lyric poetry; Atulchandra Hajarika, Nakulchandra Bhuyan and Jyotiprasad Agarwalla in drama; Suryakumar Bhuyan, Banikanta Kakati, Benudhar Sarma, Dimbeswar Neog in historical and literary prose.

The years following 1942 have been one of social and ideological restlessness and have seen a socialization of the literary temper in a band of younger writers, such as Abdul Malik, Hemkanta Barua and Prafulladatta Goswami, in various fields. Among recent publications may be mentioned an anthology, *Adhunik Assamiya Kavita* (1946); Dr. Banikanta Kakati's *Sahitya Aru Prem* (1949); Abdul Malik's *Ejani Natun Chowali* (1951); Benudhar Sarma's *Maniram Dewan* (1950); Dr. Birinch Kumar Barua's *Jibanar Batat* (1944) and *Asamiya Katha Sahitya* (1950), Upendrachandra Lekharu's (edited) *Katha Guru Carita*.

BENGALI

In the fourteenth century when Chandidas, the first of her great poets, lived and wrote in the Vaishnavic tradition, Bengali already possessed a highly developed literature. It remained devotional in content and poetic in form down to the eighteenth century when prose ushered in the modern era. Prose became the vehicle for the intellectual awakening of the Indian Renaissance, led by Ram Mohan Roy.

The first great prose writer was Bankim Chandra Chatterjee, who wrote his historical novels in a magnificent language of his own. Rabindranath Tagore followed, bringing to prose a sinuous beauty. Sarat Chandra Chatterjee was pre-eminently a teller of tales with social import. Pramatha Chaudhuri gave penetrating clarity to the essay and short story.

In poetry Michael Madhusudan Datta introduced blank verse, composing epics in the heroic style. Subsequent writers reverted to the lyric for which Bengali, because of its sweetness, is a medium par excellence. Tagore brought international recognition to his land and language. His greatest contemporary was Satyendranath Datta.

After First World War all values were subjected to a critical examination. The soldier-poet Kazi Nazrul Islam started the revolt against the traditional forms. There was much bold experimenting in form and content both in prose and poetry. Among writers who were notable in this respect were Manindralal Bose, Bibhuti Bhusan Bandyopadhyay, Achintya Kumar Sen Gupta, Premendra Mitra Tarashankar Bandyopadhyay, Sudhindranath Datta, Bishnu Dey, Buddhadeva Bose, Jasimuddin and Annada Sankar Ray. Kazi Abdul Wadud and Sayed Mujtaba Ali scored many successes in *belles letteres*.

The drama was an innovation of the Renaissance and has yet to come of age. The first plays were social. Historical and mythological subjects followed. Among the more prominent play-wrights were Dinbandhu Mitra, Girish Chandra Ghose and Dwijendralal Roy. Tagore developed the mystic play.

The suffering brought by the Second World War left its mark on Bengali literature. Independence was not accompanied by any striking sense of spiritual release. Partition divided the loyalties of writers. The book trade was disrupted. Yet books are published in considerable number and writers of established reputation are not scarce.

Mr. Satinath Bhaduri's novel, *Jagari*, has been an outstanding piece of fiction during recent years, while Mr. Abanindranath Tagore's autobiographical works, Mr. Achintya Kumar Sen Gupta's experiment with the dialect of East Bengal Muslim villagers, Mr. Premankur Atarti's *Mahasthavira Jataka* and Shrimati Bani Ray, have set new styles in writing.

GUJARATI

Modern Gujarati literature has assumed a progressive form unshackled by tradition. The literature is marked by a great deal of creative energy tempered by realism. A striking feature is its variety. Mahatma Gandhi occupies a pivotal position because of a certain simplicity in his expression which helped to bring literature into the life of the common man. In the process his work lost nothing in literary elegance or depth of meaning. Posthumous publications of Mahadev Desai and Gandhiji continue to enrich Gujarati literature.

The writings of the pioneers of Sanskritic revival of the Sakshar Yuga, Govardhanram Tripathi, Manishankar Bhatt (Kant), Manilal Dwivedi, Nanalal, Narsinrao Divatia, Anandshankar Dhruva, Keshavlal Dhruva, Balvantrai Thakore are still popular. The loss of Mahadev Desai, Jhaverchand Meghani, Gandhiji and Nanalal has been a great blow to the development of Gujarati literature. The late Zaverchand Meghani is still very popular.

Vinoba Bhave, Kaka Kalelkar, Mashruvala, Sukhlalji, Harbhai Trivedi, Punyavijayji, Narhari Parikh, Dhansukhlal Mehta, Bhogilal Sandesara, Durgashankar Shastri, Bechardas Doshi, Santbal, Dolarrai Mankad, Kanaiyalal Munshi, Ramanlal Desai, Gaurishankar Joshi (Dhumketoo), Ramnarayan Pathak, Jyotindra Dave, Gopaldas Patel, Maganlal Desai, Chunilal Shah, Lilavati Munshi, Hansa Mehta, Ravishankar Rawal, Keshavram Sashtri, Anantrai Rawal, Vishnuprasad Trivedi and Ratilal Trivedi have all produced work which is marked by deep and serious thought. They maintain their appeal in different branches of literature.

Mohanlal Mehta (Sopan), Ninu Desai, Nandkumar Pathak, Pitambar Patel, Chinubhai Patwa, Panalal Patel, Ishvar Petlikar, Gulabdas Broker, Govindbhai Amin, Puratan Buch, Chunilal Madiya, Indra Vasavda, Jayanti Dalal, Shridharani, Darshak, Jaybhikhu, Jyotsna Khanderia, Niranjan Varma, Jaymal Parmar, Bakulesh, Suresh Gandhi, Ashok Harsha, Pushkar Chandarwarkar, Vrajlal Parekh, Barkat Virani and Adi Murzban belong to the younger generation of writers who are conspicuous in the field of the short story, play and novel.

Tribhuvan Luhar (Sundaram), Sundarji Betai, Chandravadan Mehta, Venibhai Purohit, Manek, Kolak, Raman Vakil, Abuvala Jhinabhai Desai (Snecharashmi), Bhanushankar Vyas (Badarayan), Umashankar Joshi, Avinash Vyas, Indulal Gandhi, Pujalal Dalwadi, Dasalji Parmar, Jaymangauri Pathak, Karsondas Manek, Nathalal Dave, Jethalal Trivedi, Amidas Kanakia, M. J. Gordhandas, Durgesh Shukla, Prahlad Parekh, Premshankar Bhatt, Umarbhai Kureishi, Ramanik Aralwal, Minu Desai and Mansukhlal Jhaveri are some of the younger poets of established merit, whose poems bear unconventional features and realistic sense.

Contemporary literature also includes many translations from English, Bengali, Marathi and Hindi literature. Nagindas Parekh, Kisonsinha Chavda, Bhogilal Gandhi, Gopalrao Vidvans, Prabhudas Gandhi, Bipin Zaveri, Jayant Parmar, Bachubhai Shukla, Ramanlal Soni, Ramanlal Modi, Prabhudas Parek, Pramila Shah, Shanta Gandhi, Ruparel and Mohanlal Dhami are some of the men who are distinguished in this field.

Sarta Gujarati Jodani Kosha compiled and published by the Gujarat Vidyapith is now accepted as the standard dictionary.

KANNADA

A new vision came into Kannada literature in the early years of this century when Muddana wrote his *Ramashwameddha* in a homely style, Shanta Kavi sang the glories of his native land, Panje Mangeshrao brought out his stories for children, and B. Venkatacharya and V. T. Galaganath published their translations of Bengali and Marathi novels. Karibasava Sastry, Cha. Vasudeviah and M. S. Puttanna were others who working through a medium of their own choosing played a distinguished part in the renaissance.

The literature struck out into newer ways with the succeeding band of workers such as Govinda Pai, B. M. Srikantia, D. V. Gundappa, Masti Venkatesa Iyengar, C. K. Venkata Ramayya, Kailasam, Kerur, M. R. Srinivasa Murthy, Bellave Venkatanaranappa, D. K. Bhardvaj, Alur, T. T. Sharma and others who among themselves covered nearly all the various branches of literature. At this stage one could see that the writers were gradually mastering their technique. Children's literature became more extensive. Books on science were becoming popular, while writers were also reaching out to non-Kannada literature and translating outstanding works. Bendre, Puttappa, Karanth, V. Sitaramiah, Gokak, P. T. Narasimhachar, Mugali, Rajarathnam, K. Shankara Bhatt and others have particularly enriched Kannada literature with a variety of books.

The battle royal between the champions of mass appeal and the advocates of a more aristocratic culture has perhaps, through the efforts of critics, ended in a compromise in favour of realism. Literature has digested the sharpness of A. N. Krishna Rao working through his novels and short stories and of Jagirdar working through his dramatic compositions. The short story begun by M. N. Kamath has found its adepts in Masti Venkatesha Iyengar, Ananda, K. Gopalakrishna Rao, M. V. Seetharamiah, Aswatha, C. K. Nagaraja Rao, L. S. Seshagiri Rao, Betageri, Katlimani Shanmugiah, Ananthanarayana, S. G. Sastry, Krishnakumar Kallur who make up quite a large army.

Drama forms a significant episode in the renaissance of Kanada literature. Basappa Sastry and Churmani who gave *Sakuntala* in Kannada helped to build the stage in the early years. But it is with Kailasam that drama assumed a new meaning. Today C. K. Venkataramiah, Jahgirdar, Kshcerasagara, Kaivar Raja Rao, Chi. Sadashiviah, Kallur, N. K. Kulkarni and several others hold the field. Full size novels are being written by Mirji Anna Rao, V. M. Inamdar, T. R. Subba Rao, A. N. Krishna Rao and Karanth.

Sali, Kahnolkar, Ekkundi, Adiga, Archik, Sridhar are outstanding in poetry. Shantakavi sang the glories of the nation in the early years; Govinda Pai, B. M. Sreekantiah and D. V. Gundappa have been great scholar poets. A. N. Murthy Rao, Gorur, Nadiger Krishna Rao and others have developed the typical essay. Among the scholars are T. N. Srikantiah, D. L. Narasimhachar, K. V. Raghavachar, Thimmappaih, Panchamukhi, Malvad and others. Padmanabha Puranik, J. R. Lakshmana Rao, R. L. Narasimhaiah, P. Srinivasa Rao and a few more have contributed to scientific literature. M. S. Subramanya Sastry, L. Gundappa, Gurunath Joshi, M. Vasudeva Murthy, R. Vyasa Rao, Siddavanahalli Krishna Sharma, A. Narayanaswamy Iyer have further enriched literature through translations from Sanskrit, Tamil, Hindi, Persian, Bengali and other literatures. Devudu, Hoysala, T. M. R. Swamy, B. S. Panduranga Rao specialise in children's literature, a field to which of late a good deal of attention has been paid. In the field of essay we have A. N. Murthy Rao, Gorur, Nadiger Krishna Rao, while N. Kasturi and R. Shivaram are noted for their humour. The contribution of women to Kannada literature is of a considerable order. Goramma, Shyamala, Kalyanamma, Vani, Savithramma and Belagere Janakamma are the well known names.

Historically, then, 1900 or thereabouts saw the beginnings of a new light in Kannada, 1920 gave a definite turn towards modernism, while in the period 1935-40 appeared the group of writers who are still active in their upsurge in the efforts of those who are working in various fields.

MAITHILI

The rise of journalism in the early years of the present century brought the modern period in Maithili literature to a culmination. The Age of Chanda Jha saw the rise of the Renascent Mithila (1880 to 1907) as the new patron of letters, the reading public, came into being. Kavishwara Chanda Jha was the first great modern writer. He was a poet, historian and prose writer—all in one.

The field of activity of some of the early masters—Jivana Jha (poet and dramatist), Mahamahopadhyaya Muralidhara Jha (essayist and editor) and Kusheshwara Kumar (poet), was Banares.

From 1909 to 1937 the periodical literature contained the best writing. Sitarama Jha (poet), Raghunandandas (poet and dramatist), Parameshwara Jha (historian), and Laldas were the outstanding names.

The end of this period saw the growth of new lyrical forms and modern fiction.

It is after 1937 that modern tendencies came to full flower. This period has in fact completely revolutionized the literature of Maithili. The language has not yet been able to get its due place in the educational and administrative life of Mithila, but it is today taught in the schools from the primary classes to the M.A. classes and its writers occupy a respectable place in the administration and elsewhere.

There has been a large number of translations from Sanskrit, Bengali and English. A spelling reform on scientific lines has been more or less accepted. A juvenile literature is being developed in all earnestness. In this respect the *Batuka*, a children's magazine, is doing commendable work. The most fruitful branches of prose have been the essay and the novel but the short story has become the most popular single activity in Maithili literature. Among the chief writers today are Mahamahopadhyaya Dr. Umesha Mishra, Pandit Ramanatha Jha, Bholalaldas, Jyotishi Baldeva Mishra, and Prof. Shrikrishna Mishra (essayists); and Prof. Harimohana Jha, Kumara Ganganand Sinha, Yoganand Jha, Upendranatha Jha, Prof. Umanatha Jha and Manamohan Jha (novelists and short story writers).

Poetry has undergone several changes. In form as well as in content the poets of today are very different from the traditional poets of Maithili. Of the old traditional Sanskritist type the leading representatives are: Sitarama Jha, Kashikanta Mishra, Ishanatha Jha, Jivanatha Jha and Kavishekhara Badarinatha Jha. The new poets are many but there are only three who have established themselves—Vaidyanath Mishra Yatri, Raghavacharya, and Chandranatha Mishra Amara.

The famous Kirtaniya Drama of Mithila is today extinct. It has not yet been possible to develop any distinct Maithili stage. Prof. Tantranatha Jha, a versatile poet, has however been instrumental in establishing a tradition of one-act comic plays (Prahasanas). In this form some other dramatists have also succeeded well. For the rest there have been plays of a more or less stereotyped nature.

There are not many women writers in Maithili today who can be compared with those writing in other Indian languages. Shambavi Devi, Arundhati Devi and Shrimati Leela may however be mentioned as representative names.

Maithili has excelled in humour and in the comedy of manners in its fictions. It is gradually freeing itself from the too close influence of Sanskrit and promises to become one of India's most successful regional literatures. There has been a widespread awakening among Maithilas to the inherent beauty and status of their own mother-tongue. The State Government is still slow in giving it full and proper encouragement.

(It may be added as a foot-note that Maithili is spoken in north Bihar by about 2.5 million people and its centre is Darbhanga. The leading newspaper is *Vaidehi* fortnightly, Lalbag, Darbhanga. The leading novelist is Harimohan Jha; the leading writer, Umesha Mishra; poets, Suman, Ishanatha Jha, Madhupa, Yatri, Sitarama Jha, Tantranath, Amara and Raghava. *A History of Maithili* by Jayakanta Mishra gives a most useful account of Maithili.)

MALAYALAM

Rich in poetical works Malayalam Literature has of late developed other literary genre like the short story, the novel, drama, essay, criticism, biography and pen-picture.

In the early decades of the twentieth century three eminent poets, Kumaran Asan, Vallathol Narayana Menon and Ullor S. Parameswara Ayyar came to the front rank from an array of poets experimenting in lyrical poetry. Later appeared Nalappattu Narayana Menon, G. Sankara Kurup, Vennikkulam Gopala Kurup, Vailoppillil Sridhara Menon, Changampuzha Krishna Pillay, Balamani Amma and Edapalli whose contributions to the lyric are famous. Among them G. Sankara Kurup is regarded as quite the most notable figure. The greatest modern lyric in Malayalam is Asan's 'Dead Flower', while the greatest names are besides Asan, Vallathol and Ulloor.

Novels and short stories existed in Malayalam even before the dawn of the modern era and the names of C. V. Raman Pillay, O. Chandu Menon, Appan Tampuran, M. R. K. C., Ampati Narayana Poduval and Dr. Chelnat readily occur to one's mind. The modern novels and short stories differ greatly from the older ones in technique and psychology. The short story was introduced in its present form by Moorkoth Kumaran. Today the best known short story writers are Vaikam Muhammed Basheer, S. K. Pottecckatt, Karoor Nilakandha Pillay, Thakazhi Sivasankara Pillay, Kesavadev, Varki, Antharjanam and Saraswathi Amma. Unlike the novel the Malayalam short story can stand comparison with the best stories in other languages. In the essay the best exponents are Kesari, Moorkoth Kumaran, K. Sukumaran, Narayana Pillai and Appan Thampuran.

Literary criticism is a new branch in Malayalam literature. A Balakrishna Pillay, a versatile scholar and research worker is the most influential of the modern critics. Joseph Mundasseri and Kuttikrishna Marar are others who are well enough known. The best play-wrights of the day are N. Krishna Pillay and Edasseri Govindan Nayar. Dr. Bhaskaran Nayar is a scientist and art-critic rolled into one while P. K. Parameswaran Nayar is the most successful of the biographers. Eminent scholars like Dr. C. A. Menon, Dr. Goda Varma and Dr. P. K. Narayana Pillay are engaged in research work and their contributions to the cultural heritage of Kerala deserve mention. P. Sridharan Pillay, popularly known by the pen-name 'Sitaraman' is the best living parodist in Malayalam after 'Sanjayan' (M. R. Nayar) who was also the most popular and best loved humourist of the age.

Since the advent of what may be called progressive literature in Malayalam, the writers of Kerala have formed into two distinct groups, the traditionalists and the moderns, Marxists as well as non-marxists. However, the best writers of the day belong to no party and to their positive stand may be attributed the all-round progress made by the Malayalam Language and Literature today.

MARATHI

Marathi has a rich literary tradition dating back to more than six centuries. Modern Marathi Literature, however, has developed mainly after 1870. It owes its inspiration largely to English literature and continues to be influenced by it. The essay has been used as a powerful instrument of social awakening and reform by distinguished authors like Lokahitavadi, Chiplunkar, Agarkar, Tilak, S. M. Paranjpe and N. C. Kelkar. Yet the Marathi essay has not lacked the literary graces.

Keshavasuta liberated Marathi poetry from the traditional forms and content. Balakavi was the poet of nature. Madhav Julian, Yeshawant and others belonging to Ravikiran Mandal have written romantic poetry. Recently Kusumagraj, Rege, Mardhekar and others have been giving expression to varied experiences in a more realistic vein.

Marathi drama contains rich treasures of which Maharashtra is very proud. There are historical and social plays and tragedies and farces. Most Marathi plays deal with social or political problems. Another characteristic of the Marathi stage is its domination by music. The leading play-wrights are Kirloskar, Dewal, Khadilkar, Kolhatkar, Gadakari, Varerkar and Atre.

Hari Narayan Apte, the most powerful Marathi novelist wrote historical romances as well as novels on contemporary social life. V. M. Joshi has written only a few novels, but he has greater insight into life than most Marathi novelists. S. V. Kelkar, editor of the Marathi Encyclopædia wrote novels which evince a wider social outlook and a greater comprehension of social problems. Phadke, Khandekar, and Madkholkar are among the more popular novelists. They have written mainly about love and idealism in the young. Sane Guruji had a Gandhian outlook and was almost as popular. Phadke, Khandekar and Y. G. Joshi have had a long run of popularity as short story writers. Their novels specially those written by the first two tell skilfully constructed stories. Of late new authors like Arvind Gokhale, Bhave, Madgoolkar and Gangadhar Gadgil have enriched the Marathi short story both in respect of form and content.

A notable trend today is the publication of dictionaries and books on subjects like economics, banking, politics, law, sports, etc.

ORIYA

The influence of Sanskrit was replaced by that of English and Continental literatures towards the close of the 19th century when Radhanath Rai and Madhusudan Rao flourished as modern poets. They gave a new orientation to Oriya poetry through simplicity of rhythm, diction and imagery. Of a number of epic poems *Mahayatra*, or the "Journey's End" of the Pandavas, written by Radhanath in blank verse, is considered to be the best in the field. Fakir Mohan Senapati who was a contemporary of these two poets is regarded as the father of modern Oriya prose. His "Six Acres and Eight Decimals" (*Chha Man Ath Gunth*), a novel is a little masterpiece. He was succeeded by a chain of notable writers such as Gangadhar Meher, Chintamani Mahanty, Nanda Kishore Bal and Gopabandhu Das. Of the living authors may be mentioned Pandit Nilakantha Das, Godavarish Misra, Padmacharan Patnaik, and Laxmikanta Mahapatra. Those who nursed Oriya prose to its present prominence were the late Gopal Chandra Praharaj, Viswanath Kar, and Brajasundar Das to which group also belong a number of living writers such as Sri Artaballabh Mahanty, Bipin Behari Rai, Ratnakar Pati, and Sashi Bhusan Ray and Girija Shankar Ray, Lingaraj Misra, Dr. Brajabihari Mahanty and Radhanath Rath.

After the first Great War, however, Oriya Literature took a new turn with a new set of values. It suddenly became conscious of the life of the millions of the poor and the downtrodden, of whose spokesman it decided to become. Thus began the *Sabuj* or the modern era under the auspices of the *Sabuj Sahitya Samiti*, a literary association of young authors, headed by Shri Kalindi Charan Panigrahi, Baikunthanath Patnaik, Annada Shankar Ray, Sarat Chandra Mukherji and Harihar Mahapatra. This association brought to its fold other writers of fame, such as Mayadhar Mansingh, Sachi Routrai, Radhamohan Gadanayak and Harish Chandra Baral. Shri Godavarish Mahapatra and the late Kuntala Kumari Devi also belonged to the *Sabuj* class though they did not visibly join the organization.

The *Matira Manisa*, a novel written by Shri Kalindi Charan Panigrahi, was a landmark in Oriya literature still unsurpassed in the field of fiction. Shri Gopinath Mahanty's *Paraja* is a very near approach to it. Shri Kanhu Charan Mahanty has written the largest number of novels and stories. Kalindi Charan, however, stands foremost in prose, poetry and fiction. Shri Ananta Prasad Panda, Nityananda Mahapatra, Ananta Patnaik, Rajakishore Ray, Rajakishore Patnaik, Kapileshwara Das and Manmohan Misra may also be mentioned as well known authors in the field of essay and short story.

Narayan has done. The Indo-Anglian novelist is at his best when he falls back on the components which make up the social sketch or skit—such as family and social humours, life's daily business and mischiefs, the difficulties of political intercourse, the hopes and renunciations of youth, the clash of modernity on old established tradition. He could write about the arrangement for a marriage, the election to a municipal council or a deal in tamarind or betel-nut, a transaction in the black market—write in such a way as to elevate these commonplaces into literature in the same manner as Anton Tchekov made memorable creations out of everyday occurrences in the Russian life of his day. R. K. Narayan's *Bachelor of Arts*, for instance, contains no striking events. But it is a deft, vivid, truthful piece of writing for all that. It depends wholly on character and atmosphere. It does contain love interest, but the love interest is decidedly of the Indian brand. The first girl cannot even be spoken to and the final bride only gets the length of casting down her eyes. And indeed little more than that happens at all. Within the last few years, Narayan has achieved a reputation with leading London literary critics. His novels, *The Bachelor of Arts*, *The English Teacher*, *The Dark Room* and his collection of short stories, *An Astrologer's Day*, have had increasingly wide sales.

Of late Indian novelists have shown a new awareness of what has been called "contemporary reality", and have rendered the current social and political forces in terms of human values. This is a significant trend. Outstanding in this class of writing are the works of Mulk Raj Anand and Bhabani Bhattacharya. Dr. Anand is concerned mainly with the problems of the underprivileged classes, as in *Untouchables* and *Coolie*. Dr. Bhabani Bhattacharya in *So Many Hungers!* has drawn a vivid picture of wartime reactions in Bengal. The measure of the success of these two writers is obvious from the fact that their works have been translated into most of the major European languages and have been best-sellers. In England *Untouchable* has been reprinted as a "Penguin" and *So Many Hungers!* has been selected as a book-of-the-month.

ESSAY, DRAMA

So much for fiction. Let us next rapidly pass under review Indo-Anglian achievement in essay, drama, criticism and biography.

Not many Indo-Anglians have used the essay form for the simple reason that it does not constitute a natural vehicle for the expression of Indo-Anglian artistic genius. The one outstanding success is S.V.V. of the *Hindu*. Some of his work was of the most delicious kind, light as a feather, satirically humorous, most intimately revealing of Hindu life. It can indeed bear comparison with the kind of work which E. M. Delafield used to do for *Punch*. No praise could be higher. Then there were the group of writers who flourished in the heyday of the *My Magazine* and *Merry Magazine* like R. Bangaruswami and A. T. Macnaughton Thomas. They did some fine work and gave their readers immense pleasure, but it must be confessed that a great deal of the humour was coarse and most of the language undignified. G. K. Chettur who always wrote with a sensitiveness to the finer points of the language was a more considerable figure. His work does not bulk large but some of his efforts are in the best English tradition. But the truth must be faced. The essay properly so-called is the expression of an attitude of mind which is rare in this country. As a branch of literature the essay originated with Montaigne in France but it has had its spiritual home in England where there is a certain disposition to deal with the minor occurrences of life in a big, light-hearted, mock-serious fashion. But the Indian spirit is flatly opposed to this mode of expression. It is deadly serious for one thing. For another it is disposed to deal with big issues in a big way. It can, for instance, describe with great subtlety the sensations produced by the sight of a star. But in the presence of a loaf of bread it may be dumb.

In the realm of drama the Indo-Anglian output is even more scanty. Whatever drama has been produced, is either heavily symbolical like that of Tagore, or frankly propagandist like that of Harindranath Chattopadhyaya. Taking the latter as a typical example, we find that Mr. Chattopadhyaya's plays are more in the nature of Socialist propaganda than genuine expressions of the dramatic spirit. His characters are mere puppets and neither speak nor act like human beings. Where, however, Mr. Chattopadhyaya lays aside his didactic purpose and follows his characters the dialogue acquires considerable force and eloquence.

CRITICISM, BIOGRAPHY

Much of Indo-Anglian criticism is dull and lifeless. In the first place, there is very little scholarly reviewing of books in Indian newspapers and periodicals. Criticism of poetry like the writing of it can be specially difficult. In any case critical work by Indo-Anglians can be justified only if the point of view from which the criticism is presented is thoroughly Indian. As it is, much of what passes for criticism is a mere rehash of the work of foreign critics, lacking conviction, vigour and originality.

Of late much critical work has come out of Indian Universities from painstaking conscientious scholars preparing themselves for a doctor's degree. The outstanding name here is that of C. Narayana Menon whose *Shakespeare Criticism* is far and away the most notable contribution made by any Indian to the scholarly study of English literature.

Another outstanding volume of criticism —which appeared towards the end of 1948— is Dr. Itrat Husain's scholarly monograph *The Mystical Element in the Metaphysical Poets of the Seventeenth Century*. This work, embodying researches in the field over a period of 10 years, was published in London and was consistently well received by competent judges. Equally, sound in his critical work is Dr. K. R. Shrinivasa Iyengar, of the Andhra University.

Indo-Anglians have made a better showing in the art of biography than in criticism. Wisely enough no attempt was made to imitate the manner of Lytton Strachey except in some of the smaller sketches. Nor is there anything in the style of Boswell which attempts to recreate a living personality by the sheer accumulation of detail. Most Indo-Anglian biographers are content to record in a straightforward manner the main facts in the life and times of their subject.

The greatest Indo-Anglian work in autobiography is, of course, Mahatma Gandhi's *Experiments with Truth*. The simplicity and the complete candour with which the Mahatma wrote make it one of the most moving personal documents of all time. Pandit Nehru's *Autobiography* is as much an exposition of Indian politics as an account of personal development. As politics it is excellent, but as autobiography it is inferior in human interest to the autobiography of Mahatma Gandhi. The literary quality of Nehru's writing is, however, of the highest order.

Since the Mahatma's tragic end, a spate of books on his life and achievements has appeared. Many of these, unfortunately have been hurriedly concocted and obviously written in the spirit of *carpe diem*. Not infrequently their literary merit has been nil.

THE PRESENT

Two books by Indian authors which have recently created interest are *And Gazelles Leaping* by Sudhin N. Ghose and *All About Mr. Hatterr* by G. V. Desani. The former—which has the advantage of a most attractive format and many remarkable black and white illustrations —is a record of childhood's memories by a young Bengali, whose writing might be termed in places an amalgam of Rudyard Kipling's style in his *Just So Stories* and Rumer Godden's delicate and knowledgeable touch in *The River* and *Black Narcissus*. Though not specifically termed a children's book it will undoubtedly have a wide appeal to youth, for it contains a delightful elephant and many quaint and likable characters drawn direct from the Bengali landscape. Mr. Ghose has no unnecessary frills in his writing and succeeds in evoking atmosphere in fluent straightforward prose with an occasional undercurrent of poetry. He has now followed up his first success with a new volume entitled *The Cradle of Clouds*.

Mr. Desani—who hails from Sind—has had a *succes de scandale* with his extraordinary novel *All About Mr. Hatterr*, which has been lavishly eulogised by many of the leading British literary critics. This rather incoherent piece of fiction is unlikely to appeal to the general public because of its esoteric nature. The author has clearly soaked himself in the work of James Joyce. The influence of Proust and Pirandello may also be detected in his narrative, which, in its rather gaudy patchwork, resembles a coat of many colours. There is undeniable cleverness here, but the writing—discursive and elliptic—too frequently goes off at a tangent, and the writer's philosophy and beliefs are somewhat difficult to assess. As a foundation for a literary reputation, Mr. Desani will have to produce something more lasting than this diverting display of verbal pyrotechnics.

Mr. R. K. Narayan's latest novel, *Mr. Sampath*, has received fairly good notices. This tale of a printer's woes is even slighter in treatment than the author's previous books, but it has subtlety and abundant humour and catches successfully the intricacies of thought in the Southerner's mind.

Dr. Bhabani Bhattacharya's new novel, *Music For Mohini*, has had the distinction of being published first in America, where it has been warmly welcomed. It is expected that *Music For Mohini*, a charming human story, would increase the public which the author attracted with his first novel, *So Many Hungers*.

Mention should also be made of the first translation into English of the short stories of that remarkable writer in Urdu and Hindi, Prem Chand, who died over fifteen years ago. Few Indian writers have displayed such intimate detail of life in the mofussil or such a fluent mastery of phrase. One of Prem Chand's stories translated is *The Shroud*; this little gem can bear comparison with the best of Tchekov and Turgenev.

Among the literary works that appeared in 1950 was a remarkable autobiography entitled *I Follow After*, by Lakshmibai Tilak. Though this is a translation from the original Marathi version, it deserves special mention since it ranks very high in this class of literature.

Another notable book published during the year was D. F. Karaka's *Betrayal in India*.

At the end of 1951 a new author, Nirad Chaudhury, received high appraisal with the publication of his bulky and somewhat pedantic *Autobiography of an Unknown Indian*. Mulk Raj Anand's *Seven Summers* also drew favourable notices. A well-chosen anthology, *Indian Short Stories*, was issued by Oxford University Press.

A SELECTION

Here is a selection from among the works of Indo-Anglians :

POETRY

Rabindranath Tagore: *Collected Poems and Plays*. Toru Dutt: *Ancient Legends and Ballads of Hindustan; A Sheaf Gleaned in French Fields*. Sarojini Naidu: *The Bird of Time; The Broken Wing; The Golden Threshold*. R. C. Dutt: *The Mahabharata; The Ramayana*. Aurobindo Ghosh: *Collected Poems and Plays*. Brijendranath Seal: *The Quest Eternal*. Harindranath Chattopadhyaya: *Ancient Wings; The Dark Well; The Feast of Youth; The Magic Tree; The Perfume of Earth*. K. S. Venkatramani: *On the Sand-Dunes*. Humayun Kabir: *Poems*. G. K. Chettur: *Gumataraya; The Shadow of God; The Temple Tank; The Triumph of Love*. Bharati Sarabhai: *The Well of the People*.

FICTION

Rabindranath Tagore: *Gora; Home and the World; The Wreck; Hungry Stones and Other Stories; Mashi And Other Stories*. R. C. Dutt: *The Lake of Palms; The Slave Girl of Agra*. K. S. Venkatramani: *Murugan the Tiller; Kandan the Patriot; Jatadharan and Other Stories*. K. Nagarajan: *Athawar House*. A. Subramaniam: *Indira Devi*. K. Raja Rao: *Kanthapura; The Cow and the Barricades*. R. K. Narayan: *Bachelor of Arts; The Dark Room; The English Teacher; Malgudi Days; Swami and Friends; Astrologers' Day; Mr. Sampath*. Mulk Raj Anand: *Coolie; Untouchable; The Village; Across the Black Waters; Two Leaves and a Bud; The Tractor and the Corn Goddess; The Big Heart*. Ahmed Ali: *Twilight in Delhi*. G. K. Chettur: *The Ghost City and Other Stories*. D. F. Karaka: *There Lay the City*. K. Ahmed Abbas: *Rice; Tomorrow Is Ours*. Hilda Wernher and Huthi Singh: *The Land and the Well*. Humayun Kabir: *Men and Rivers; Three Stories*. Bhabani Bhattacharya: *So Many Hungers; Music For Mohini*. G. V. Desani: *All About Mr. Hatterr; Holi*. Benu Chitale: *In Transit*. Zeenuth Futehally: *Zohra*.

DRAMA

Rabindranath Tagore: *Chitra; Post-Office; The King of the Dark Chamber; The Red Oleander; Sacrifice*. Chattopadhyaya: *Five Plays*.

CRITICISM

C. Narayana Menon: *Shakespeare Criticism—An Essay in Synthesis*. Itrat Husain: *The Mystical Element in the Metaphysical Poets of the Seventeenth Century*. Amiya Chakravarti: *The Dynasts and the Post-war Age in Poetry*. Aurobindo Ghosh: *The future of Poetry*. Amarnath Jha: *Shakespearean Comedy and Other Studies*. K. R. Shrinivasa Iyengar: *Lytton Strachey—A Critical Study*. V. K. Ayappan Pillai: *Shakespeare Criticism*. Brijendranath Seal: *New Essays in Criticism*. Humayun Kabir: *Poetry, Monads and Society*. Budhadev Bose: *An Acre of Green Grass*.

MISCELLANEOUS

Rabindranath Tagore: *The Religion of Man; Sadhana; Personality; Fireflies*. Aurobindo Ghosh: *Essays on the Gita; The Life Divine*. S. Radhakrishnan: *The Hindu View of Life; An Idealist View of Life*. M. K. Gandhi: *My Experiments with Truth*. Jawaharlal Nehru: *Autobiography; Glimpses of World History; Letters from a Father to His Daughter; The Discovery of India*. P. A. Wadia: *Mahatma Gandhi*. R. P. Masani: *Dadabhai Naoroji*. V. S. Srinivasa Shastri: *Life of Gokhale*. G. K. Chettur: *The Last Enchantment*. Khasa Subba Rao: *Men in the Lime-light*. D. F. Karaka: *I Go West; Chungking Diary; Out of Dust; I've Shed My Tears; Betrayal In India*. S. Natarajan: *West of Suez*. K. P. S. Menon: *Delhi-Chungking*. Minoo Masani: *Our India*. K. S. Venkatramani: *A Day with Shambhu; Paper Boats*. S. V. V.: *Chaff and Grain; Soap Bubbles; More Soap Bubbles*. Krishnalal Shridharani: *My India; My America*. Suddhin Ghose: *And Gazelles Leaping*.

SOME CULTURAL EVENTS

In Assam the first volume of Shri Birinchi K. Barua's "Cultural History of Assam" (written in English) was published during the year. The anniversary of the famous Assamese poet and dramatist Sankaradev (born 1449) was celebrated throughout Assam in the second half of 1951. Also at a function held in the summer of 1951, the bust of the late Lakshminath Bezbaroa, who for nearly forty years had dominated the Assamese literary scene, was unveiled by His Excellency Shri Jairamdas Daulatram, Governor of Assam.

Bengali :—The Rabindra Memorial Literature Prize for 1950-51 was posthumously awarded to the late Bibhuti Bhusan Bandyopadhyaya (d. November 1950, in his 50's) for his novel, *Ichamati*. The prize for a historical or scientific work went to Mr. Jogesh Chandra Ray for his 'Ancient Indian Life.' Shrimati Radharani Devi, Bengali poetess, was awarded the Bhuban Mohini Das Gold Medal for her original contribution to Bengali literature. The Delhi University bestowed the Narsinghdas Prize upon Dr. S. M. Ali for his *Deshe Bideshe*.

In January 1951 occurred the death at an advanced age of Shrimati Nirapuma Devi, author of *Didi* and other novels, a former recipient of the Jagattarini Medal for Literature, which in 1951 went to Mr. Rajsekhar Bose ("Parasuram"). Mr. S. Wazed Ali, an open-minded and balanced Bengali writer, died in June, and the great artist and writer Abanindranath Tagore on December 5th. The ailing Bengali writer, Kazi Nazrul Islam, was honoured in May on his 53rd birthday, both in West Bengal and in East and West Pakistan. He was also the recipient of a grant from the Government of India of Rs. 2,500 for medical expenses.

In August Mr. Prabodh Ghose, essayist and writer of short stories in the language of the people, died.

Gujarati :—Mr. Pannalal Patel, novelist, received the Ranjitram Gold Medal. Mr. Hargovind Premshankar Trivedi the poet and the brilliant and popular young novelist "Urmi" died in 1951.

Hindi :—The All-India Hindi Literary Conference awarded the Seksaria Prize to Shrimati Ushadevi Mitra for her short-story collection, *Sandhya Parvi*.

Marathi :—The sixth and last volume of *Sulabha Vishva-kosha*, a concise Marathi encyclopaedia, was published in June. The Bombay University divided the Dadoba Pandurang Tarkhadkar Prize between Prof. D. K. Sant and Dr. D. L. Sahasrabuddhe.

Oriya :—Dr. Bikram Deb Barma, Maharaja of Jeypore, well-known Oriya and Telugu writer, died on April 14th. The Kalinga Bharati Medal was awarded to Kumari Arati Patra. A fund of Rs. 60,000 was set up by the Utkal University, with Government and individual donations to foster Oriya language and literature.

Sanskrit :—A World University of Sanskrit was formed at Somanath Patan by the First All-India Sanskrit Parishad, on May 11th, 1951.

Sindhi :—The Sind Government has commissioned several selected writers to prepare works on great Sindhi writers of pre-Partition days, such as Shah Latif, Sachal, Bedi and Bekas.

Tamil :—The memory of the late S. Vriddhachalam ("Pudumaipithan") writer of over 200 short stories, who died in 1948, was honoured by public meetings throughout south India on July 2, 1951 and funds were raised for the support of his widow and their child. The death on August 24, 1951 of V. Ramaswami Aiyangar ("Va Ra") deprived Tamil letters of one of the best-known and popular essayists and biographers. Another well-known Tamil and English writer, K. S. Venkataramani, who was honoured on his 60th birthday in 1951 July, died early in 1952.

Telugu :—Several Telugu writers died in 1951, including Naluva Marepalli Ramachandra Sastri ("Kaviguru") a scholarly etymologist, and Prabhakara Sastri, a well-known savant who rescued several Telugu manuscripts from undeserved oblivion. Prof. V. N. Bhushan, a Telugu better known as an English poet and essayist, died on October 13th, 1951.

Urdu :—The Urdu poet Maulana Hasrat Mohani died on May 13th, 1951.

It may be mentioned also that writers from all parts of the country and from six language groups, Hindi, Bengali, Marathi, Tamil, Telugu and Urdu, gathered at Allahabad for the second anniversary celebration of the Sahityakar Samsad. The gathering was presided over by Rashtra Kavi Shri Maithili Sharan Gupta. The President of India, Dr. Rajendra Prasad, opened the exhibition of arts, manuscripts and 19th-century Hindi journals organized by the Samsad. He also laid the foundation stone of the Samsad's *Vani Mandir*.

In the field of dramatic literature, the late Ramsankar Ray and Radhamohan Rajendra Deb and among living writers Sri Aswini Kumar Ghosh and Kali Charan Patnaik have achieved distinction. There are several others like Bhanja Kishore Patnaik and Ramachandra Misra who are also contributing much to the dramatic literature of Orissa. Among the living writers in the field of poetry and fiction, mention may be made of Bichhanda Charan Patnaik, Narayana Mohan Deb, Kunja Bihari Das, Jayakrishna Misra, Dr. H. K. Mahatab, Lakshmidhara Nayak and Chandramani Das. At the present time Sri Krishna Chandra Tripathi, Gopal Charan Misra, Satyanand Chamupati Ray, Srimati Bidyut Prabha Devi and Kumari Tulasi Das happen to be among the youngest and most promising writers in poetry.

Of late a laudable attempt has also been made in critical literature and the names of Gaurikumar Brahma, Kanhu Charan Misra, Raja Kishore Ray, Gagan Bihari Mohanty, Chintamani Das, Sarveswara Das, Chintamani Panigrahi, Sidheswara Hotha, Pathani Patnaik and Srinivasa Misra deserve mention. These young writers follow mostly the line of Sanskrit and English criticism.

PUNJABI

Punjabi literature of today is fast growing into a powerful medium of expression for overfull minds and underfed stomachs. For the first time we find the common man and his problems forming the staple stuff of literature. With the increasing use of folk-tunes, folk-metres, folk-dances and folk-stage by intellectuals the distance between the literateurs and their readers or listeners is being narrowed down.

There are three distinct schools of Punjabi literature. The traditionalist school, which turns out *qissas* (long narratives in verse) and fresh versions of historical or biographical episodes is best represented by Kishore Chand, Vidhata Singh Tir, Munshi Singh Dukhi and Sital. The transcendentalist school, which believes in spiritual values, in underlining the good, the noble, the patient in life through idealistic poetry, *biography* and fiction is represented by Dr. Bhai Vir Singh, Dr. Mohan Singh Dewana, G. S. Khosla, Prof. R. L. Ahuja, Prof. G. S. Phull, Sri Dhani Ram Chatrik, Sri Nanak Singh, Sri Balwant Singh Chatrath, Dr. Sher Singh, Sardar Lal Singh Akali, Gurcharan Singh Sakhi and Awtar Singh Azad.

The most notable among the latest works are *Kati Patang* (novel) by Nanak Singh, *Vikas* (plays) by Ahuja, *Soma Rasa* (poems) and *Rang Tamashe* (short stories) by Dr. Mohan Singh and *Jiwan Niti* (essays) by Lal Singh.

The socialist school, also known as the progressive school, which sets out to portray evil in individuals and organizations includes Gurbakhsh Singh and Mohan Singh Mahir (both *journalists*), K. S. Duggal (novelist), Amrit Kaur (song writer), Harcharan Singh, Balwant Gargi and Sant Singh Sekhon (all three playwrights). The latest publications in this field include *Pattan di Beri* (plays) by Gargi, *Nawan Ghar* (short stories) by Duggal, *Piran Malle Rah* (novel) by Mohindar Singh, *Zindgi-Kala da Tukra* (essays) by Gurbakhsh Singh and *Bandargah* (poems) by Baba Balwant.

The work of research, anthologization and re-editing is making good progress at the Punjabi University and the PEPSU State Punjabi Department.

Two excellent guides to Punjabi literature are 'A History of Punjabi Literature' (English) and 'An Introduction to Punjabi Literature' by Dr. Mohan Singh.

A lot of fine work appears in journals like *Punjabi Dunya, Lok Sahitya, Panj Darya* and *Jiwan Sandesh*.

A welcome feature of the present time is the establishment of institutions dedicated to the encouragement and publication of original and critical works. The Punjabi Department of the PEPSU Government and the Publication Bureau of the Punjab University are two such institutions.

For the first time in the history of the Punjabi language big States like the Punjab and PEPSU have declared Punjabi to be one of the official languages of the State. In the PEPSU all gazetted officers as well as thousands of government employees have been asked to take a test in Punjabi. For the first time, again, M.A. examinations in Punjabi have been instituted, with the result that an elevation of the standard in critical appraisal of literature is taking place.

Already there is a consciousness of the great debt that the Punjabi people owe to their eminent writers. Dhani Ram 'Chatril', the septuagenarian poet, was presented with a beautifully printed Abhinandan Granth (memorial volume) at a representative function.

Dr. Vir Singh (poet, commentator, novelist and prose-writer) was honoured by the Punjab University by the conferment of an honorary degree of Doctor of Oriental Learning.

Punjabi literature today adequately represents the virility, simplicity and colourfulness of the Punjab.

SINDHI

In Sindhi literature the writers who flourished at the beginning of the present century were Dayaram Gidumal, Kalich Beg Mirza, Permanand Mewaram, Kauromal Chandanmal, Kewalram Salamatrai, Lilaram Watanmal and Wadhumal Gangaram. Among the writers who hold public attention today are Kishinchand Bewas, Lekhraj Aziz, Hyder Bakhsh Jatoi, Akbar Ali Ayaz, Bherumal Mahirchand, Jethmal Parsram, Lalchand Jagtiani, Usmanali Ansari, Ram Punjwani, Naraindas Malkani, Hotchand Gurbaxani, Umar Daudpota, Khanchand Daryani, Mangharam Malkani, Assanand Mamtora and Gobind Malhi.

The chief modern tendency is to discard romanticism and to deal in a realistic fashion with the domestic, social and economic problems of the present day.

There is a growing body of opinion in favour of the present Arabic Sindhi alphabet being substituted by the original Devnagri alphabet—specially among the Hindus who have migrated from Sind and settled in India.

TAMIL

The Jesuits printed the first Tamil book in 1577 A.D. They also published in Rome several Tamil books during the 18th century. Protestant missionaries followed suit and translated the Bible into Tamil while the Pandits brought out the prose versions of the ancient classics. Among these latter was Arumuga Navalar.

Modern Tamil Literature has been usually divided into two sections—the era of Navalar and the era of Bharathi. Arumuga Navalar of Jaffna was the first to write, edit, and publish almost all the classical books of the past in modern Tamil. It was he, who stirred south India by his simple homely language, and his example was soon followed by several other writers, among whom Rajam Iyer, Natesa Sastri, Poovai Kalyanasundara Mudaliar may be mentioned.

The greatest poet of the 19th century was, however, Ramalingaswamy; his songs are still recited by people in the south. Other poets who must be mentioned are Vedanayagam Pillai and Kunan Kuti Mastan. The former was a Christian and the latter a Muslim.

They were followed by Subramia Bharathi who was a great poet, essayist, short story writer and translator. He it was who introduced into Tamil modern trends, forms, shapes and the whole spirit of the new age. His Tamil made a direct appeal to the masses who found in his writings a perennial source of inspiration to guide them in every walk of life.

Though it is nearly thirty years since he died his writings still dominate the thought of the men and women of south India. There is no modern innovation in form, style or content that was not started by Bharati.

Dr. Swaminatha Iyer has made a valuable contribution to research; his edition of *Silappadikaram* is well-known.

Kavi Ramalingam is the State Poet. Deshigavinayagam Pillai, Shuddhananda Bharathi-Dasan, are some of the other well-known poets. Journalism is much advanced in south India and there are several Tamil dailies which attain a very high standard. T. S. Chokkalingam and C. R. Srinivasan are the two prominent editors of Tamil Nad. The weeklies are among the best attractions of south India, *Kalki* and *Ananda Vikatan* are two popular journals which combine a wide appeal with a high level of writing. R. Krishnamurthi is a prominent figure among the editors of the weeklies. A Tamil Encyclopædia is under preparation and South Indians are now trying to bring out several publications suitable to children. Among children's books may be mentioned P. N. Appuswamy's *Chitra Kathai Patu*, P. Perumal's *Kulanthais Arangu*, and Tamizh Oli's *Pappa Pathu*.

Translations of the *Vedas*, *Samhitas*, the *Ramayana* and *Mahabharatha* must also be mentioned. The Tamil lexicon is a monumental work.

In drama P. Sambhanda Mudaliar has written attractive plays.

There is now a great desire to enrich Tamil literature and the future is bright with hope as Mathathipathies like Dharmapuram, Tiruppanandal, are spending large sums of money on the preparation of critical editions of Tamil classics.

TELUGU

Veeresalingam, Chilakamarti, Tirupati Venkata Kavulu and Guruzada may be considered as the fathers of the Telugu literature of the twentieth century. They were followed by Gidugu, Venkata Parvatisvara Kavulu, Tallavajjhula Sivasankara Sastry, Chinta, R. V. M. G. Ramarau Bahadur, Chief Justice Rajamannar and Kalaprapurna Dr. C. Narayana Rao.

Among leading poets are Tummala Seetharama Moorty Choudary and Sri Sri.

Kalaprapurna Dr. C. Narayana Rao stands at the very centre of the new literary movement in Andhra. He has incidentally translated the Koran into Telugu.

URDU

Modern Urdu literature was dominated, before the advent of Iqbal, by Sir Sayed Ahmed, Mohd. Hussain Azad, Hali and Shibli. They were succeeded by Abdul Kalam Azad, Syed Suleman Nadvi, Mohd. Ali and Sheikh Abdul Qadir; while writers of fiction like Sharar and Sarshar were also prominent. Along with these may be mentioned the Nadva school and the Punjab group. The literature then passed through a third phase to which writers like Sajjad Haider, Niaz Fatehpuri and Abdul Ghaffar belonged. They in their turn were followed by a long line of younger and more progressive writers like Bedi, Krishen Chandr, Akhtar Ansari, Josh, Asghar and Jigar who not only gave a new turn to artistic expression but also introduced a dose of realism. The new literature thus faithfully reflect the many political, economic and social changes which have now taken in the country at large.

After the first World War and with the advent of urgent economic and social problems this realism became more pronounced and even aggressive. Sajjad Zaheer's *Angaray* and Kazi Abdul Ghaffar's *Laila ke Khutut* gave a definite turn to the pencraft of modern Urdu writers. Prem Chand became the torch-bearer of progressive literature and established close contacts with the life and social problems of the common people.

Recent political changes in the country have put Urdu on trial as the language of the people. Even in Pakistan where Urdu has been acknowledged as the national language it has had to face the opposing claims of regional languages, particularly Punjabi and Bengali. Advocates of Urdu are therefore anxiously watching developments in the Punjab and Eastern Pakistan.

In India Urdu has to fight for its very existence in view of the emergence of Hindi as the State language and the increasing influence of regional languages.

The setting up of the Anjuman Taraqqi Urdu in Aligarh has evoked in the hearts of Urdu writers in India great hopes and expectations.

THE FUTURE

Whither Indian literature? With an answer to this question this brief survey may be concluded. Indian literature is at the threshold of still greater achievements inasmuch as freedom brings out the best in the people and their artists and authors. Add to it the expected redistribution of States on a linguistic basis, which is bound to give a great fillip to further and fuller growth in each of the literatures. But there is also a danger in this against which a note of warning must be sounded—the danger of decentralization resulting in a narrowing down of the all-India angle of vision and attitude, on the one hand, and of world loyalty on the other. Prudence lies, however, in co-operating with the evolutionary spirit which is steadily moving towards one world, one religion, one people, one philosophy of life.

The Indian literatures, however, are still in the "reformative" stage, trying to adjust themselves to the speedily changing spirit of the times.

Aspects of Indo-Anglian Literature

An Indian writing in English starts off with a major handicap. He has to attain a certain degree of mastery over the medium before proceeding to use it as a vehicle for self-expression at the level of literature. Now it is true that Indians have scored certain remarkable triumphs in their use of the English language. Some have used it with great precision and clarity as, for instance, Mahatma Gandhi or Dr. Sarvapalli Radhakrishnan. Others speaking in English have reached remarkable heights of eloquence—Gokhale or Bhulabhai Desai in the latter days of his career. Yet others have been able to acquire a manner of writing whose rhythms are indistinguishable from those of an Englishman's English—G. K. Chettur, for instance, who had a true feeling for the English language, or V. S. Shrinivasa Shastri whose expression was always lucid, idiomatic and absolutely correct according to the best English standards. Finally, there are those like Pandit Jawaharlal Nehru, who for expressiveness or animation or range of subject-matter challenge comparison with the best work that is produced in England or other English-speaking countries.

But there is something which escapes even the best-schooled and the most sensitive among the writers, something which makes the higher branches of Indo-Anglian writing seem hollow and unreal. The truth is that while control over English for purposes of law or political and social discussion may come easily to the foreigner, control over English for purposes of self-expression at the highest level is a much more difficult achievement. This is just the reason why Indians writing in English have made a better showing in the literature of political, legal or general discussion than in literature properly so-called such as poetry, drama, fiction, essay or criticism.

POETRY

In poetry, for instance, which is the quintessence of literature, a great deal of early Indo-Anglian effort appeared quite stale and flat. Indeed here we come upon yet another obstacle which Indo-Anglians have had to overcome in their struggle for creative expression. For not only was the medium in which the poet was trying to express himself foreign but the very sources from which he drew his inspiration were also strange and alien. A great many Indo-Anglians knew little about the tradition in which they were born and their ancient culture and heritage. The history which they learnt at school was English history. The literature which fed their imagination was English literature. In fact much of the passion of young India for education was focussed in exuberant enthusiasm around English language and literature. They who had never heard an English skylark sing over an English meadow wrote whole essays on Shelley's *Ode to the Skylark*. In the hot aridity of an Indian summer, they puzzled over Keats's exact meaning when he called autumn a season of mists and mellow fruitfulness. The result was that when later they felt the need for self-expression themselves it was to the sights, the smells and the sounds of the English countryside that they turned for inspiration. Early Indo-Anglian writing was full of the song of the nightingale, the smell of the musk-rose, the beauty of the English spring or the bleakness of the English winter. The result was pure disaster for Indo-Anglian poetry. Neither in India nor in England did it carry any special appeal. To the Indian the verses seemed unreal, while to the Englishman they seemed at best like clever machine-made imitations of English classics. Not even such a gifted poet as Mrs. Sarojini Naidu succeeded in making robins and skylarks seem authentic. Everyone knows the advice which the famous English critic Edmund Gosse gave her "... write no more about robins and skylarks ... set your poems firmly among the mountains, the gardens, the temples ... introduce to us the vivid populations of your own voluptuous and unfamiliar province ... in other words be a genuine Indian poet of the Deccan, not a clever machine-made imitator of the English classics." Mrs. Naidu promptly changed her tune and turned to such typical Indian figures as the corn-grinder, the palanquin bearer, the bangle-seller or such authentic Indian landscapes as the call of the bulbul from a cassia plume, the song of the weaver at work at the loom, the voice of the shepherd gathering his flock under the pipal tree or the shout of the young Banjira woman driving her cattle across the fields. Here was Indo-Anglian poetry at its most natural and unpretentious—sweet, sensuous, sincere and unmistakably Indian,—though in rhythm and rhyme it still *remained consistently conservative*.

Indeed Mrs. Naidu's success marked a turning point in the history of Indo-Anglian poetry. It taught other practitioners of the art where to look for inspiration if they were to produce any worthwhile stuff. They saw that all genuine poetry was rooted in the tradition in which the poet was born or in modes of thought and action which were common to all humanity such as love, faith, desire, devotion, self-sacrifice. Thus, to cite a few examples, we have G. K. Chettur writing about a temple-tank or the Bevunje waterfall, Sheshadri about champak leaves, or Joseph Furtado about Brahmin girls. Of course, Rabindranath Tagore, towering in his world stature far above all else, had enriched the English literature by his inimitable "prose poems", but perhaps these cannot be called "Indo-Anglian", and the poet's translated work has anyhow to be left out of the narrow compass of this review. At a different, but very high level, we have the philosophical poetry of Aurobindo Ghosh and J. Krishnamurthi describing the adventures of those who set out in quest of Truth, Beauty and Goodness. These earlier poets—and among them should be mentioned Manmohan Ghosh, the doyen of Indo-Anglian poets—were mainly content with Tennysonian rhymes and rhythms. A later school of Indian poets have tended to break away towards the standards of Eliot, Auden and Ezra Pound. This, in spite of the imitative leanings involved, is all to the good, since it has infused new life and imagery into their work.

LANGUAGE PROBLEM

The difficulty about language remained as acute as ever, retarding complete freedom of expression, inhibiting mental processes and generally introducing an element of unreality into the work of the Indo-Anglians. The language problem was not, of course, peculiar to the poets; it was common to all practitioners of the art of literature—novelists, dramatists, essayists, short story writers as well as to poets. And unless the means were found of solving the language problem there was no chance of Indo-Anglian literature developing along healthy and vigorous lines. One suggestion was that Indians should evolve an English of their own. There was American English, Irish English, Welsh English. Why not, it was asked, Indian English? But then a further question arose: What is Indian English and exactly how does it differ from English English? Neither Raja Rao nor Mulk Raj Anand, the two supporters of this theory, clearly answered this question. Mulk Raj Anand wrote a pamphlet in which he hotly attacked English English under the name of King Emperor's English. But the kind of language in which he wrote the whole pamphlet did not seem very different from the kind of language which he was engaged in attacking at the moment. Indeed if one was to judge from the idiom which the other exponent of the theory used in his novel *Kanthapura* it would seem as though the new English consisted in little more than literal translation of Indian swear-words (son of a bitch, son of a widow) or Indian word groups (killing flies to mean whiling away time) into English. It was quite clear that the solution of the language problem did not lie along the lines suggested by Raja Rao or Mulk Raj Anand.

A second way in which the language problem has sometimes been met is through collaboration between an Indian and an Englishman. This has, on the whole, produced happier results though for obvious reasons it is not a solution which is frequently possible. Two examples of collaboration may be mentioned here. One is the autobiography of Mahatma Gandhi. The Mahatma himself informed his readers how the manuscript of his autobiography was touched up by his English disciple Miss Margaret Slade, better known as Mira Ben. The Mahatma, of course, wrote in a language which was entirely adequate for his purpose. But perhaps something of the even flow and the quiet beauty of the narrative can be partially ascribed to Mira Ben's co-operation. The autobiography of Mahatma Gandhi cannot, of course, be regarded as a good example of collaboration since the parts played by Mahatma Gandhi and Mira Ben in the writing of it were very unequal. A better example of collaboration is afforded by Hilda Wernher and Huthi Singh in their novel about Indian village life entitled *The Land and the Well*. Hilda Wernher who is the principal author has lived in such a village as she describes in the book: but she wisely sought the assistance of an Indian collaborator to make her ground doubly sure. The result is an authentic and fascinating record of the hopes and fears, joys and tragedies of peasant life in a north Indian village.

FICTION

Turning to Indo-Anglian fiction we find that there are many failures but there is also a large measure of achievement particularly in the realm of the short story. A number of short stories by Mulk Raj Anand, Bhabani Bhattacharya, R. K. Narayan and K. A. Abbas have appeared in British literary periodicals of the highest standing. There are some Indian novelists who tend to fall between two stools. They aim to attract and please the English reader and at the same time to attract and please the Indian. This leads inevitably to inconsistencies. An English critic (Mr. Hilton Young on one of whose papers part of the following sketch is based) has rightly stated that Indo-Anglian novelists must drop the habit of forcing Indian pictures into European frames, of distorting a Hindu story into the mould of the *Strand Magazine*. "Write well as an Indian," he said. "And Europeans will read you."

One of the difficulties of the Indian novelist is that in India sex does not make stories as readily as in Europe. And if someone tries to compose love stories on Western lines he will be doomed to failure for he is at once introducing an unnatural and jarring element. A way out is to handle the love interest in a delicate, elusive, unsubstantial form, as, for instance, R. K.

THE PRESS

BEFORE 1835 all printing of books and paper was subject to licence by the Governor-General in Council, and the licences were issued or refused at the discretion of Government. Act XI of 1835 repealed the old Regulations and merely required registration of the printer and stipulated a few other minor requirements. That Act was replaced in 1867 by the present Press and Registration of Books Act, and, except for an Act which was in force for one year during the 1857 upheaval, there was no further legislation directly affecting the Press until 1878 when the Vernacular Press Act was passed. That Act was repealed during the Viceroyalty of Lord Ripon in 1882. From that date until 1907 Government made no attempt to interfere directly with the liberty of the Press, the growth of sedition being dealt with in other ways by the passing in 1898 of section 124A of the Penal Code in its present form, which had been originally enacted in 1870, and by the introduction into the Penal Code of section 153A and into the Criminal Procedure Code of section 108. There were a certain number of prosecutions under those sections up to 1907. In 1908 the Newspaper (Incitement to Offences) Act was passed which dealt with papers inciting to murder or to acts of violence. This Act failed to have the desired effect.

The Indian Press Act, 1910, was a measure of wider scope, the main object of which, it was explained, was to ensure that the Indian press generally should be kept within the limits of legitimate discussion.

By the autumn of 1917 the Government of India had begun to consider the desirability of modifying at least one section of the Press Act to which great exception had been taken on account of the wide powers that it gave. Finally, after more than one consultation with Local Governments, a Committee was appointed in February 1921 after a debate in the then Central Legislative Assembly, to examine the Press and Registration of Books Act, 1867, and the Indian Press Act, 1910, and report what modifications were required in the existing law. That Committee made a unanimous report (for details see *Year Book* for 1948)..

In general the laws which affect the Press in India today are Press and Registration of Books Act, 1867; the Indian Copyright Act No. III of 1914; the Indian Official Secrets Act No. XIX of 1923; Sections 124-A, 153-A, 171-G, 255, 292, 293, 294-A, 295-A, 489-A, 499-502 and 505 of the Indian Penal Code; Sections 99-A-99-G and 108 of the Criminal Procedure Code; Sections 81, 84 and 87 of the Indian Evidence Act No. I of 1872; Sections 19 and 181-A of the Sea Customs Act No. VIII of 1878; Sections 5 and 7 of the Land Customs Act No. XIX of 1924; Sections 26, 27-A-27-D of the Indian Post Office Act No. VI of 1898; Section 5 of the Indian Telegraph Act No. XIII of 1885; Sections 40, 52 and 53(1)(*b*) of the Patents and Designs Act No. II of 1911; Section 69 of the Trade Marks Act No. V of 1940; the Press (Special Powers) Act No. XXXIX of 1947; The Contempt of Courts Act, 1926; Article 19 (1) (*a*) and (*g*) and Clause (2) and (6) of the same Article of the Constitution of India. The amendment to Article 19 (1) (*a*) reads: "Nothing in Sub-clause (A) of Clause 1 (the Citizen's Right to Freedom of Speech and Expression) shall affect the operation of any existing law or prevent the State from making any law in so far as such law imposes reasonable restrictions on the exercise of the right conferred by the said sub-clause in the interest of the security of the State, friendly relations with foreign States, public order, decency, morality, or in relation to contempt of court, defamation or incitement to an offence (This amendment is retrospective in operation); the Tax on Newspapers (Sales and Advertisements) Repeal Act No. XXVIII of 1951; the Press (Objectionable Matter) Act No. LVI of 1951.

HISTORY

The newspaper Press in India is an essentially English institution and was introduced soon after the task of organising the administration was seriously taken in hand by the English in Bengal. In 1773 was passed the Regulating Act creating the Governor-Generalship and the Supreme Court in Bengal and within seven years at the end of the same decade, the first newspaper was started in Calcutta by an Englishman in January 1780. More than a century and a half has elapsed since, not a very long period certainly, a period almost measured by the life of a single newspaper, *The Times* of London, which came into existence only five years later in 1785; but then the period of British supremacy was not much longer, having commenced at Plassey, only twenty-three years earlier. Bombay followed Calcutta closely, and Madras did not lag much behind. In 1789 the first Bombay newspaper appeared, *The Bombay Herald*, followed next year by *The Bombay Courier*, a paper now represented by *The Times of India* with which it was amalgamated in 1861. In Bombay the advent of the press may be said to have followed the British occupation of the island much later than was the case in Calcutta. In Calcutta the English were on sufferance before Plassey, but in Bombay they were absolute masters after 1665, and it is somewhat strange that no Englishman should have thought of starting a newspaper during all those hundred and twenty-five years before the actual advent of *The Bombay Herald*.

First Newspaper

The first newspaper was called *The Bengal Gazette* which is better known from the name of its founder as *Hicky's Gazette* or *Journal*. Hicky like most pioneers had to suffer for his enterprising spirit, though the fault was entirely his own, as he made his paper a medium for the publication of gross scandal, and he and his journal disappeared from public view in 1782. Several journals rapidly followed Hicky's, though they did not fortunately copy its bad example. *The Indian Gazette* had a career of over half a century, when in 1833 it was merged into the *Bengal Harkaru*, which came into existence only a little later. No fewer than five papers followed in as many years, the *Bengal Gazette* of 1780, and one of these, *The Calcutta Gazette*, started in February 1784, under the avowed patronage of Government, flourishes still as the official gazette of the West Bengal Government.

In 1821 a syndicate of European merchants and officials commenced the publication of *John Bull in the East*, a daily paper which was intended to reflect Tory opinion in India and set an example to the Press generally in the matter of moderation and restraint. The name of this journal was altered to *The Englishman* by the famous Stocqueler in 1836.

From its commencement the press was jealously watched by the authorities who put serious restraints upon its independence and pursued a policy of discouragement and rigorous control. Government objected to news of apparently the most trivial character affecting its servants. From 1791 to 1799 several editors were deported to Europe without trial and on short notice, whilst several more were censured and had to apologise. At the commencement of the rule of Wellesley Government promulgated stringent rules for the public press and instituted an official censor to whom everything was to be submitted before publication, the penalty for offending against these rules being immediate deportation. These regulations continued in force till the time of the Marquis of Hastings who in 1818 abolished the censorship and substituted milder rules.

This change proved beneficial to the status of the press, for henceforward self-respecting and able men began slowly but steadily join the ranks of journalism, which had then been considered a low profession. S Buckingham, one of the ablest and best kno of Anglo-Indian journalists of those da availed himself of this comparative freed to criticise the authorities, and under the sh administration of Adam, a civilian who te porarily occupied Hastings' place, he was ported under rules specially passed. B Lord Amherst and still more Lord Willia Bentinck were persons of broad and libe views, and under them the press was left pra tically free, though there existed certain reg lations which were not enforced, though Lo Clare, who was Governor of Bombay from 18 to 1835, once strongly but in vain urged t latter to enforce them. Metcalfe, who su ceeded for a brief period Bentinck, remov even these regulations, and brought abo what is called the emancipation of the pre in India in 1835, which was the beginning a new era in the history of the Indian pres Among papers that came into being, was t *Bombay Times* which was started towar the close of 1838 by the leading merchants Bombay, and which in 1861 changed its nam to the *Times of India*.

The liberal spirit in which Lord Hastin had begun to deal with the press led not on to the improvement in the tone and stat of the Anglo-Indian press, but also the rise of Indian-owned English and India language papers. The first newspaper any Indian language was the *Samache Durban* started by the famous Serampo Missionaries Ward, Carey and Marshman 1818 in Bengali. It received encourag ment from Hastings who allowed it to circ late through the post office at one-fourth t usual rates. This was followed in 1822 by purely Gujarati paper in Bombay called t *Bombay Samachar* which still exists, and th was laid the foundation of the Indian languag Press which at the present day is by far th largest part of the press in India.

From 1835 to the upheaval of 1857 the pres spread to other cities like Delhi, Agra an Gwalior, whereas formerly it was chiefly confine to the Presidency towns of Madras, Bomba and Calcutta. During the 1857 upheaval it freedom had to be temporarily controlled by th Gagging Act which Canning passed in June 185 on account of the license of a very few papers and owing still more to the fears of its circulatin intelligence which might be prejudicial to th ruling power. The Act was passed only for year at the end of which the press was once mor comparatively free.

Macaulay made sedition a penal offenc when he drafted the Penal Code, and journalism became a hazardous undertaking particularly with the growth of the freedom movement in th country. Subsequent history may be summarized in one sentence. Every time a campaign was launched against the Government some kind of public safety measure or emergency ordinance was at once put through; when pauses in the campaign occurred the laws were relaxed o abrogated. But some kind of emergency law remained on the statute book even after the advent of independence. The emergency law is represented by the Press (Special Powers) Act of 1947 and certain provisions in the Public Safety Measures Acts in the various States. It must be pointed out, however, that in all matters relating to the press Government seeks the advice of Press Advisory Bodies, which are set up in all the States and also at the Centre.

Three important developments in the history of the press were the formation of the Indian and Eastern Newspapers Society in 1939, the All India Newspaper Editors' Conference in 1940, and the Press Trust of India in 1940. The first two bodies were set up in the main to safeguard the common interests of the newspaper industry both on the business and editorial sides. The third body took over the ownership of the Associated Press of India and entered into partnership with Reuters Limited. The formation of all these bodies has helped to promote co-operation and understanding between Government and the press.

PRESS LAWS COMMITTEE

After the Second World War there was a general demand that Press laws should be brought in line with those prevailing in progressive countries and the Government of India appointed a committee of officials and non-officials on March 15, 1947 to review Press laws and suggest reforms. The Committee consisted of the following: Rai Bahadur Ganga Nath (*Chairman*), Nawabzada Khurshid Ali Khan, Rai Bahadur Sri Naraian Mahtha, Sri Prakasa, Diwan Chamanlal, Siddique Ali Khan, K. Srinivasan, S. A. Brelvi, Tushar Kanti Ghosh, G. V. Bedekar (*Secretary*). Evidence was submitted by Governments, press organizations and individual journalists. While the Provincial Governments were in favour of retention of the laws and even tightening some of them journalistic opinion on the whole seemed unfavourable. The A.-I.N.E.C. the most authoritative of all the bodies made a series of recommendations which could be summarized as follows:—The Post Office Act, the Criminal Procedure Code provisions and the Sea Customs Act could be left alone. Section 5 of the Telegraph Act should be amended so as to free messages intended for publications in newspapers. In respect of Sec. 124-A, I.P.C. the trial of sedition cases must be by jury. Trial of cases under Section 153-A may be made summary and *in camera* to avoid the evil effects of additional publicity. Sec. 144 of the Cr. P. C. should not be used to order editors not to publish news. The laws of contempt should be so amended as to permit *bona fide* reporting of judicial proceedings. Parliamentary reports should be made statutorily privileged. The conference gave it as its opinion that there was no justification for the humiliating restrictions imposed upon the Press by the various Provincial Public Safety Acts and said that there was need for guarantee against the powers under the Acts being abused. The operations of the Official Secrets Act, 1923 should be restricted to cases giving information to enemy in times of war and publication of confidential Government information likely to imperil public safety. The memorandum finally asked for outright repeal of the Indian States Act, 1922, Princes Protection Act, 1934, and Foreign Relations Act, 1932, and demanded constitutional guarantees for the freedom of the Press with a clause in the fundamental rights section that as in America the legislature here may pass no laws to restrict the freedom of the Press. Where there is no incitement to violence communication of news and expression of opinion should be free.

Report

The Committee which published its report on August 19, 1948 recommended the repeal of the Indian Press (Emergency Powers) Act, 1831 but some of the provisions of the Act were to be incorporated into the ordinary law of the country.

Other recommendations of the Committee were the exemption of the Press from Section 144 of the Criminal Procedure Code and the provision of a separate law, if necessary, for dealing with the Press in urgent cases of apprehended danger and the amendment of Section 124-A, Indian Penal Code, so that only incitement to violence against Government established by law would be treated as sedition.

The report includes an exhaustive historical review of the Press laws of India, a chapter on laws governing the Press in the principal countries of the world and a comparison of these with the Indian Press laws and also an examination of the Press laws of India with reference to the fundamental rights formulated by the Constituent Assembly of India and a chapter on the rights and responsibilities of the Press.

The Committee also recommended that an explanation should be added to Section 153-A of the Indian Penal Code (promoting enmity between classes) to the effect that it does not amount to an offence under that section to advocate a change in the social or economic order provided such advocacy does not involve the use of violence.

Another recommendation of the Committee is that the provisions of the Indian Telegraph Act and the Indian Post Office Act which relate to interception should be amended to provide that actions and orders of subordinate officers are reported to and reviewed by responsible Ministers of Government.

Repeal of the Indian States Protection against Disaffection Act, 1922 and the Indian States (Protection) Act, 1934, was also recommended.

The Committee were of the view that while the Foreign Relations Act, 1932, should be repealed, more comprehensive legislation should be undertaken to make provision on a reciprocal basis for the protection of heads of foreign States, foreign Governments and the diplomatic representatives in India from defamatory attacks.

Lastly, the Committee recommended that before taking action against the Press under emergency legislation, Provincial Governments should invariably consult the Press Advisory Committee or similar body.

The report is signed by all members, subject to certain dissenting views expressed by Mr. Brelvi and Mr. Srinivasan. There are separate notes by Diwan Chaman Lal, the Hon. Mr. Mohanlal Saksena and Mr. Tushar Kanti Ghosh.

In his note, Diwan Chaman Lal expressed the view that Government should take serious notice of the tendency towards the formation of monopolies in connection with newspaper production and news agencies and advocated the setting up of a National News Agency controlled by an independent public authority.

In regard to monopolies and cartels in the production of newspapers, Diwan Chaman Lal was of the view that steps should be taken to prevent concentration in the hands of "big business" of chains of newspapers. He also expressed the opinion that the law of defamation and libel was entirely inadequate and needed to be strengthened and that the penalties should be more severe.

In the second note, Mr. Tushar Kanti Ghosh expressed the view that the name of the editor should, as now, continue to be published in papers and that the editor alone should be held fully responsible in respect of matter appearing in his paper. Mr. Ghosh was of the view that proceedings against a newspaper under Section 124-A, I.P.C. (Sedition) should be tried with the help of a jury and that no prosecution should be encouraged in respect of any printed matter unless it amounted to clear incitement to violence. He also expressed his opposition on principle to any proceedings in a court of law being conducted *in camera* except in grave emergencies.

Mr. Mohanlal Saksena in his note expressed the view that the Official Secrets Act should be confined only to matters which must remain secret in the interest of the safety of the State. He thought that the Act should be amended accordingly and specific provision should also be made that powers under the Act should not be put into operation without the consent of the Minister concerned.

INTER-DOMINION AGREEMENT

In 1948 an attempt was made to draw up a newspaper code to help in the creation of friendly relations between India and Pakistan. There were also good-will tours of Indian and Pakistani journalists. Thus a group of journalists from Indian and Pakistani Punjabs met in Simla on April 29, 1948, and decided to appoint a joint committee to ensure that the code which the meeting had drawn up was observed by newspapers in the two Punjabs. An event of much greater significance was the conclusion of an agreement between the Governments of India and Pakistan covering the whole sub-continent. At the conference at Calcutta held earlier during the year the two Governments agreed that in order to create a better atmosphere they would take steps in co-operation with the representatives of the Press to ensure that (1) the press of one country did not indulge in propaganda against the other country, (2) did not publish exaggerated versions of the news of a character likely to inflame or cause fear or alarm to the population or a section of the population in either country, (3) did not publish material likely to be construed as advocating a declaration or war by one country against the other country or suggesting the inevitability of war between the two countries and (4) discouraged all propaganda for the amalgamation of India and Pakistan or of parts of the two countries.

It was hoped that if the press in the two countries carried out its obligations in the spirit of the agreement arrived at between the two Governments the relations between them would vastly improve.

The agreement noted above was reinforced by the formulation of a code by the Indo-Pakistan Joint Press Committee. The text of the code is as follows: "The Joint Press Committee of the A.-I.N.E.C. and the P.N.E.C. notes with satisfaction the response of the press of India and Pakistan to the resolutions adopted by the joint meeting of the Standing Committee of the A.-I.N.E.C. and the P.N.E.C. on May 5, 1950 at Delhi.

"The Committee calls upon the press of both countries to help to facilitate the further implementation of the Indo-Pakistan Agreement: (A) By avoiding dissemination of news calculated to undermine relations between the majority and the minority communities in the two countries; (B) By refusing to give currency to mischievous opinion of individuals or organisations likely to rouse communal passions or create a sense of insecurity among the members of the minority community; (C) By rigorously excluding from the press of each country, opinion directed against the territorial sovereignty of the other or purporting to incite war; (D) By seeking through normal press channels or Government agencies, verification of news of communal incidents before it is published; (E) By always exercising due care and caution in regard to the publication of reports of communal incidents; (F) By avoiding alarming headlines for reports of communal incidents; (G) By exercising care in the publication of pictures and cartoons likely to excite communal passions; (H) By affording full facilities to Governments for correction or contradiction of published reports."

The Indo-Pakistani Information Consultative Committee reiterated the principle that all problems in dispute should be discussed on their merits, without introduction of matters arousing communal passion or attacking the territorial integrity of either country of advocating war or creating a war psychosis and should not be made the basis of scurillous attack against the religion, culture and faith of either country or personal attack against their respective leaders.

Reference may here be made to a different kind of newspaper code bearing on internal questions which was tentatively adopted by the West Bengal Press Advisory Committee. The object of the code was to fight as the committee put it the growing menace of provincialism. The code consists of the following main points: 1. News must promote the basic concept of national unity, 2. disputes should not be presented as though they were disputes between communities or States, 3. photographs or cartoons which may stir up provincial prejudice should not be published, 4. suggestions for the alteration of boundaries should not be made in provocative language.

POSITION OF PRESS

In 1948, an Audit Bureau of Circulation was started in Bombay on the initiative of the Indian and Eastern Newspaper Society. The purpose of the Bureau was to certify net paid sales of newspapers and periodicals so that the results of press advertising could be more accurately calculated. In that year too the circulation of an English language newspaper (*The Times of India*), reached the high figure of 100,000.

A joint meeting of the Executive Committees of the Indian and Eastern Newspaper Society, the All-India Newspaper Editors' Conference and the Indian Language Newspapers' Association in 1949 suggested that newspapers must be listed among Central subjects so as to ensure that they were not exposed to any threats affecting their integrity or independence from any quarter. The meeting also urged the Constituent Assembly to guarantee the freedom of the press in the constitution itself in explicit terms, rather than by mere implication. Tax on the sale or purchase of newspapers and on advertisements published in them are all now on the Union list.

On the question of the freedom of the press the All-India Newspaper Editors' Conference passed a resolution at a meeting in 1949 requesting the Constituent Assembly to include a clause in the new constitutions guaranteeing fundamental rights to the press. The Conference at the same time made it clear that the press for its part must use its freedom with a due sense of responsibility. For instance, there were sections of the press which showed a tendency to overstep the bounds of legitimate criticism and indulge in scurrilous and offensive language, or practise gross distortion of fact and deliberate suppression of news. Such tendencies, the Conference urged, must be checked, if the press was to retain its good name. The question in fact, might be thoroughly looked into by the Standing Committee of the conference and by the various Press Advisory Committees.

The point was reiterated at a meeting of the A.-I.N.E.C. in March 1951. It condemned in a resolution the tendency in a section of the press 'to persist in deliberately publishing matter which is false, malicious and indecent and which contravenes accepted standards of presentation of news and comments.' It requested the President to look into specific cases that might be brought to his notice and take suitable measures to improve the professional standard of the journal in question. Courses in journalism in Universities in the various States were suggested by a separate resolution. The Committee also asked the President to resume negotiations for the setting up of a National Press Club in New Delhi.

Closely allied to the question of statutory restrictions by Government is monopoly control by capital. As stated elsewhere, Diwan Chamanlal had made suggestions on this problem in his note attached to the Press Laws Committee Report. Mr. R. K. Sidhwa also took up this question and declared his intention of bringing a Bill to control monopoly. The Bill would set up a Council of the Press of India whose primary duty was to prevent the growth of monopolistic tendencies in the management and control of the press. The Council would try to achieve this object by 1. setting up high professional standards in journalism, 2. introducing proper methods of imparting good training for journalism, 3. proper methods of recruitment, pay, etc., 4. keeping under review developments in the press tending to monopoly, 5. investigating and reporting whenever necessary on the membership of any newspaper company or press. In the course of a statement Mr. Sidhwa explained that newspapers and periodicals were gradually coming into the hands or under the influence of a particular class of people. Independent newspapers were bought by rich business men owning newspapers in different towns who dictated their own policy. It was desirable to put an end to such harmful tendencies and improve the lot of those who had entered the profession.

As for the working condition of journalists the Uttar Pradesh Newspaper Industry Enquiry Committee report published in 1950 stressed the need for suitable legislation to ensure the progress of the newspaper industry and to improve the conditions of service of newspaper workers. The report also suggested that all newspapers in the State should be classified according to capital invested, circulation and annual income, and placed into three separate categories.

JOURNALISTS' ASSOCIATIONS

Working journalists of India, met for the first time in the journalistic history of the country in October 1950 and set up a central representative body, "the Federation of Indian Working Journalists", with the object, among other things, of protecting the rights and interests of working journalists and of defending and preserving the freedom of the press.

The Convention, sponsored by the Delhi Union of Journalists was attended by representatives of 23 State and District journalist organisations, and was presided over by Mr. M. Chalapati Rau, Editor of *The National Herald*, Lucknow.

The Convention passed more than a dozen resolutions on various problems connected with the press and working journalists. The Convention condemned executive "inroads" into the liberties of the press and placed on record "its deep sense of appreciation" on the judicial decisions upholding the press and its rights.

The Convention also demanded the association of working journalists with Press Advisory Committees, and recommended that the work of accreditation and disaccreditation of correspondents be entrusted to professional bodies.

A code of professional conduct for working journalists was adopted while the President was authorised to nominate a Committee to draft a constitution and make recommendations on, among other things, organisation of working journalists on trade union lines.

The Convention expressed "grave concern" at the prevailing conditions in the profession—"growing unemployment, insecurity of service, long working hours and for the majority not even a living wage." It "demanded" that the employers should take "immediate steps" to improve the conditions, to introduced salary scales "in keeping with the responsibilities of an intellectual profession" and provide for adequate leave, insurance, provident fund and other facilities.

While urging the members to strive for such improvement "and forge sanctions wherever possible", the Convention "deeply" regretted the failure of Government to improve working conditions in newspapers and news agencies. It demanded the institution of an inquiry into the conditions of working journalists with a view to introducing legislation based on that inquiry to enforce minimum standards, and demanded that in all matters pertaining to the press the point of view of working journalists should be taken into account.

It also suggested that all the newspapers in India should be closed on Sundays so that weekly journalism might develop and journalists might be able to take part in cultural and social activities.

While deploring the conditions of mofussil correspondents, the Convention called upon newspaper owners to treat the correspondents on a par with the members of the editorial staff.

The Convention also adopted the following code of professional conduct:

"A member should do nothing that would bring discredit on himself, his newspaper, his profession or his professional organisation. He should not by commission or omission act against the interests of the Federation or the regional organisation of which he is a member.

"No member should seek promotion or seek to obtain the position of another journalist by unfair methods. A member should not, directly or indirectly, attempt to obtain for himself or any one else any commission, regular or occasional, held by a freelance member of the Federation or a constituent body.

"It is unprofessional conduct to exploit the labour of another journalist by plagiarism or by using his copy for any purpose without permission."

Working journalists, representing both English and language newspapers also met at a convention in Bombay on April 16, 1951 to adopt a charter of demands.

The charter referred to emoluments, allowances, terms and conditions of service, provident fund, pension and security of employment.

The charter demanded a minimum salary of Rs. 150 for the "ordinary grade" rising up to Rs. 900 in 25 years, the scale of pay for the "selection grade" being Rs. 350—Rs. 1,250, spread over a period of 20 years.

A compulsory provident fund and provision for pension and compensation was also demanded by the charter. On the question of security of service, the charter stated that the services of a journalist should not be dispensed with after he had been confirmed, except for gross insubordination or continued negligence.

A resolution demanding appointment, by Government, of a commission to inquire into the conditions of working journalists in India was also passed.

The Indian Federation of Working Journalists' Organization met in Calcutta in April, and passed a resolution which demanded that the Government of India should appoint a commission to investigate the existing conditions of the press with a view to improving its status and function.

The Federation suggested a comprehensive list of terms of reference for the proposed commission, including improvement of the standards of newspaper production, betterment of the conditions of work and security of service of journalists, promotion of a newsprint manufacturing industry, freedom of the press and repeal or amendment of laws not in consonance with the Constitution, re-examination of laws relating to libel and contempt of court.

Pending the institution of the Commission, the Federation suggests a separate inquiry by Parliament into the working condition of journalists in all aspects, this inquiry to be completed within six months of its inception. All labour welfare laws should be made applicable to working journalists.

A resolution which evoked considerable discussion related to official restrictions on journalists in the collection of news.

The Delhi Union of Journalists was congratulated on its successful opposition to the recent order of the Chief Commissioner of Delhi State restricting the rights of correspondents to gather news. The Federation called on all its constituent units to report to headquarters any such restrictions in force in their respective States.

"Grave concern" was expressed in another resolution at "the increasing tendency on the part of legislative bodies to usurp powers they do not possess under the constitution in the guise of protecting their rights and privileges." The recent cases of the Editor of "Swatontra" in Madras and of the acting editor of "Blitz" in the U.P. were cited as illustrations.

Anxiety was also expressed at retrenchments in newspapers and units were called on to keep a vigilant watch on this aspect.

LAW CASES

A number of cases occurred during the years 1949 and 1950 in which the judiciary intervened to set aside orders served on the press by the executive. For instance, in the Punjab a Full Bench of the Punjab High Court set aside an order of the Chief Commissioner of Delhi on the daily *Pratap* forfeiting the paper's security and demanding a fresh security of Rs. 5,000 (May 17, 1949). The order of forfeiture was based on two items, a letter from a refugee staying in a camp and a report about the withdrawal of Maulana Abul Kalam Azad and Mr. Rafi Ahmed Kidwai from a meeting of the Congress Working Committee. In delivering judgment the Judges remarked that S.4 (1)(D) of the Indian Press (Emergency Powers) Act should not be made use of for stifling legitimate criticism or the ventilation of genuinely felt grievances. The hatred, contempt or disaffection made culpable by the Act must in its intensity and depth be more than a mere feeling of resentment or disapprobation. The judges declared that the law of sedition in its present form was a little too nebulous and that the proceedings of the case in hand clearly demonstrated that people still required protection against the executive even under a national Government.

About two months later (July 14, 1949), the same newspaper was again involved in a case with the Chief Commissioner of Delhi, when a Full Bench of the Punjab High Court allowed an appeal by the editor of the paper against an order of the Chief Commissioner forfeiting its security for publishing certain articles and news items. In the course of their judgment the Judges declared that the desire to stifle legitimate criticism must be deprecated and that the press must be allowed more liberty of expression. The Judges then went on to say, 'The proceedings in this case would appear to show that even innocent and harmless utterances of the press are looked upon with disfavour by the executive authorities'.

Three other interesting cases in which a newspaper was involved would also bear mention. According to a judgment of the Bombay High Court (June 2, 1949), the keeper of a printing press cannot be presumed to be the printer of documents printed and published at the press under S. 9A of the Bombay Public Security Measures Act, 1947. (*This Act is now amended*). On this basis, Mr. Justice Gajendragadkar issued writs of *certiorari* and prohibition against the State of Bombay and Mr. V. T. Dehajkar, Secretary to the Government of Bombay at the instance of the People's Publishing House Ltd.

The second case involved a conviction. The Chief Presidency Magistrate of Bombay sentenced (July 28, 1949) one Ramesh Chandra, a member of the Communist Party to three months' rigorous imprisonment for committing a breach of the Press (Emergency Powers) Act by publishing an unauthorized pamphlet entitled 'Operation Asylum'. The accused argued that the pamphlet was brought out in 1946 when circumstances were entirely different. And he could not be prosecuted for the offence now. The magistrate, however, held that the language employed by the accused in the pamphlet was extravagant and the argument neither fair nor liberal.

The third case touched upon the freedom of the press more closely. The issue in Romesh Thappar *versus* the Government of Bombay (August 19, 1949 and September 20, 1949) was whether the order issued on the publisher of *Cross Roads* by the Government of Bombay on July 25, 1949 under S. 9(*a*) of the Public Security Measures Act prohibiting him from publishing his paper for a stated period—whether this order was an executive order or a judicial order. If it was an executive order the courts had no jurisdiction. But if it was a judicial order the Courts could intervene. In directing that the case must be disposed of on its merits the Chief Justice of the Bombay High Court and Mr. Justice Tendolkar held (September 20, 1949) that the order was judicial and not executive inasmuch as the Government had to decide objectively and not subjectively the nature of the action to be taken as well as the purpose. In other words, Government could take action only if the action was justified, *i.e.*, it was intended to prevent any activity prejudicial to public safety or maintenance of public order.

This is not, of course, the whole story, for there were also instances in which the courts upheld Government action. In any case, the law of a country is one thing, and what happens in actual practice is quite a different thing. From this point of view there is little doubt that the press in this country does enjoy the greatest amount of freedom in actual practice. This point, in fact, was forcibly made by Mr. C. Rajagopalachari when he opened the All-India Newspaper Editors' Conference at Bangalore in May 1950 when he was Governor-General. In the course of his speech he said, 'It is not the statutes that give us the measure of the rights enjoyed by the Press. There may be terrible-looking laws on the statute book, but to use a homely expression, the proof of the pudding is in the eating. On any day in the year I can if challenged produce a catalogue of things printed ... which would prove that there is no sort of restriction over writing or fear in the minds of journalists'. That may be regarded as a fair summing up of the whole position about press law in the country.

An enquiry into the conduct of a public servant could be public. A ruling to this effect was given by the Government of the Punjab when the question arising out of an enquiry in the State was referred to it in the course of the enquiry. The public servant in question had objected to the reporting of proceedings in the press.

The question of fundamental rights was raised in a case which came up before a full bench of the Punjab High Court in September 1950. The Court set aside an order of the Chief Commissioner of Delhi which forfeited all copies of a book entitled 'Now It Can Be Told.' The forfeiture order was based on the ground that the matter contained in the book tended to promote hatred and enmity between the different classes of the citizens of India. One of the Justices observed, "Forfeiture is calculated to and has the effect of interfering with the freedom of speech." A full bench of the Patna High Court held as 'unconstitutional and void' the provisions in the Indian Press Act giving power to the State Governments to forfeit the security deposited by a printing press, for the plant if it is used for printing a document which is an incitement to violence. The question arose from a petition filed by Shrimati Shaila Bala Devi keeper of a press who had challenged an order of the Government of Bihar demanding from her a security of Rs. 2,000 for publishing a pamphlet which in the opinion of the Government purported to preach violence and bloodshed. Counsel for the petitioner had questioned the validity of Section 4 (1) (A) of the Indian Press (Emergency Powers) Act of 1931 under which the action was being taken. Two of the three judges held that the Sections conflicted with the fundamental right of freedom of speech and expression.

A case of allied interest arose in Bombay when the High Court allowed a petition seeking for a writ of *certiorari* and for quashing the orders issued by the Chief Presidency Magistrate demanding a security of Rs. 1,000 from the printer and publisher of *Soviet Mitra* under the Indian Press (Emergency Powers) Act.

On the other hand a full bench of the Madras High Court held by a majority that the two provisions under Section 4 of the Indian Press Act 1-A and 1-B were valid. These Sub-Sections empowered Government to forfeit the security deposited by a newspaper or the press itself if it incites to violence or brings Government into hatred. Two of the justices held that the Sub-Sections were not repugnant to or inconsistent with the Constitution as they were saved by Section 19(2) of the Constitution which lays down that the freedom of speech and expression did not affect existing legislation. The third judge dissented, taking the view that the two provisions in the Press Act fell outside the scope of legislation permitted under Section 19 (2) of the Constitution. Leave to appeal to the Supreme Court was however granted. The judgment arose out of an application filed by the keeper of the Avanti Press of Rajahmundry and the editor and publisher of *Aruna* of Mangalore.

A bench of the Madras High Court also ruled that Section 3 (1) of the Press Emergency Powers Act was inconsistent with fundamental rights guaranteed under Article 19 (1) (G) of the Constitution which confers on all citizens rights to practise any profession or carry on any business. The judgment arose from the petition of a woman who wanted to start a press and had been asked to deposit a certain sum of money on the ground that she was a Communist sympathiser.

A ruling given by the Speaker of the Madras Assembly caused considerable agitation among newspaper-men. The Speaker appeared to have said in effect that any comments on proceedings pending before a legislature which might influence voting in the House would be tantamount to a breach of privilege and would thereby become actionable. The newspaper reaction to this was summed up by the President of the All-India Newspaper Editors' Conference the late Deshbandhu Gupta who said in a statement that the principle enunciated by the Speaker of the Madras Assembly struck at the root of democratic practices. It is in fact the specific duty of the press to comment on the proceedings pending before a legislature so as to affect the approach and views of the members of the legislature and influence their votes. If the press did not do this it would fail in one of its fundamental duties to the public which it ought to serve. There were also protests against the Speaker's ruling from many journalists' associations in the country.

Later the Speaker clarified his earlier ruling. He said that it was not every criticism of the proceedings of the House by newspapers influencing the vote that is a breach of privilege but only such criticism as is improper. Libel upon members, contempt of the House, attempt to bribe members and so on will amount to improper criticism or influence.

FOREIGN NEWS COVERAGE

There is a sense in which the coverage of foreign news was very poor. The press in fact failed to rise to the full measure of the challenge that the post-war situation offered to the press of this country. A whole new world had arisen in south and east Asia, with which India had close geographical and strategic ties. Many of the countries there had just become free like India. Others were throbbing with a new vitality. And all of them had much the same kind of economy as India and were faced with similar problems and difficulties. Yet no special attention was paid to development in this area. Another vast reconstruction movement was in progress in the war-devastated countries of Europe. They were trying to build a new order from scratch by using novel techniques such as mass participation. A backward agricultural society was transforming itself into a modern industrial economy largely through its own efforts. Hardly anything of this experiment, which was of such supreme interest to India found any reflection in the news columns of the Indian press. Instead attention was fixed almost entirely upon a set of incidents very narrow in scope connected with what the Americans call "the cold war." One read day after day of conflicts between cardinal and communist, of acrimonious protests from one Government to another, of flaming challenges thrown out to hypothetical aggressors, of international conferences at which groups of delegates met and went on snarling at one another. Much of this reporting was fundamentally futile and was made wholly tedious by the constant repetition of identical statements from foreign spokesmen expressed in identical language.

There was a more serious aspect of the situation on which attention was not sufficiently focussed. The whole nature of the foreign correspondence put the editorial staffs of Indian newspapers in a dilemma in which the news background was flagrantly at cross-purposes with editorial policy. While the editorial columns pressed for a policy of neutrality the news columns were filled day after day with the kind of reports which made that very neutrality appear not only wrong but diabolically wrong. The point was not whether the news reports were true or false but that they had a bewildering effect on the sort of reader who took a serious interest in international relations. Thus it was not only the editorial staffs of Indian newspapers that found themselves in a dilemma but also the External Affairs Ministry of the Government of India. Appropriately enough, the man who first drew attention to this disconcerting factor in the situation was the Minister of External Affairs himself, Mr. Jawaharlal Nehru. In an address which he delivered to the All-India Newspaper Editors' Conference in December 1950, Mr. Nehru used these words, "If you want peace among various countries it is hardly a sensible or logical approach to go about slandering each other, irritating each other and pointing

out the faults, errors and sins of the other...It leads to a closing up of people's minds and when minds are closed they become impervious to any argument or any peaceful approach."

Liaison with Government

Part of the trouble was that liaison between the press and the External Affairs Ministry was neither close nor continuous enough. Opinion was expressed at the same meeting of the Newspaper Editors' Conference that liaison might be more systematic, as in England for instance. On the staff of English newspapers, there is always a man who regularly interprets the mind and intention of the British Foreign Office to the English public. This man, the newspapers call, "Our Diplomatic Correspondent." Mr. Deshbandhu Gupta, then President of the Newspaper Editors' Conference asked that the External Affairs Ministry should appoint a public relations section and that there should be a committee of foreign editors of Indian papers for liaison with the External Affairs Department.

Part of the trouble also was that most Indian newspapers were understaffed particularly on the writing side. One was always grateful for ready-made copy that was near to hand and could be got to the printer without extra trouble. It was not as though the staff was actively biassed one way or the other: it was simply carrying out a routine job in a mechanical fashion. Thus the whole range of cold war terminology meant for use in the British and American press found its way as a matter of course in Indian newspapers without anyone's realizing what it was all about. Expressions like 'the free world,' 'satellite states,' though legitimate in editorial comment, had no meaning beyond propaganda when used in the reporting of news-events. They had, of course, a definite place in American and British political life as they were meant to produce a certain attitude in the public, but against the background of India's own foreign policy they were futile.

Not many Indian journalists were even aware that there was a "problem" here to which an answer had to be found in the interests of consistency. In this connection mention may be made of an address which the Deputy Minister for External Affairs delivered to the Bombay Branch of the Royal Asiatic Society. Dr. Keskar was speaking of the disadvantages which the first independent Government of India was facing in the formulation of a foreign policy of their own. Among the major disadvantages was a dearth of competent journalists who could provide the necessary guidance, give a lead, or discuss with knowledge and authority specific issues that arose from time to time in international relations, and help the Government of India to decide their course of action.

NEW RESTRICTIONS ON PRESS

On May 12, 1951 the Prime Minister introduced a Bill to amend the Constitution of India. One of the amendments concerning fundamental rights had an important bearing on the freedom of the press. It was explained that one of the objects of the Amending Bill was to prevent abuse of freedom of speech and expression involving security of the State and friendly relations with foreign powers as certain difficulties had been brought to light by judicial decisions and pronouncements.

The amendment involved the addition of three new heads of restriction to the freedom of speech and expression—public order, incitement to an offence, and friendly relations with foreign States. Regarding the first two, a series of Court decisions had invalidated such enactments as Section 4 of the Press Act forbidding publication of anything which offered incitement to or encouraged offence of murder or violence.

The term "public order" is made wider in scope. It has been made clear that the right of freedom of speech and expression to all citizens will be guaranteed provided such right would not prevent the State from making any law imposing, in the interests of the security of the States, friendly relations with foreign states, public order, decency or morality, restrictions on the exercise of such right.

Nor would the right to freedom of speech and expression affect the operation of any existing law so far as it relates to, or prevents the State from, making any law relating to contempt of court, defamation or incitement to offence.

The Law Member in the course of the debate on the Bill argued that the Supreme Court had given a particular decision because its rules of construction or canons of interpretation, unlike those of the U. S. Supreme Court, excluded the doctrine of the inherent "police powers" of every State to protect itself whether the Constitution expressly provided for it or not, and the doctrine of "implied power" by which the grant of one power to the State must be presumed to imply the first.

Given this interpretation by the Supreme Court how could the State discharge its obligations under the directive principles of State policy written into the Constitution if it was not to be allowed to legislate to give effect to them. One had to distinguish between the capacity of Parliament to make a law and the actual enactment of any particular law. The amended Article 1 (2), was therefore only an enabling measure and whether or not a law would abridge a liberty could be discussed only when Parliament was seized of that particular Bill. The amendment gave rise to a good deal of opposition in Parliament, the press and the country.

Large sections of the press and other independent bodies like the Supreme Court Bar Association wrote and spoke in terms of varying disapproval of what they feared might be construed as indecent haste and immoral precedent being shown by a Party Government on the eve of the first General Elections under the new Constitution to make that Constitution the creature of the Party manifesto.

In the course of a debate in Parliament Mr. Deshbandhu Gupta, then President, A.-I.N.E.C. described Mr. Nehru's arguments in favour of curbing the liberty of the press as "light-hearted" and "unconvincing." Freedom of the press, he said, was an essential attribute of democracy and any abridgement of that freedom would be disastrous. The Prime Minister himself had some months ago, while addressing the All-India Newspaper Editors' Conference, declared that it was far better to have a free press even if sections of it tended to be mischievous rather than have a controlled and regulated press. What had caused this sudden change of opinion when the national press had always warmly responded to the advice tendered to it from time to time by Mr. Nehru?

A 12-man deputation met the Prime Minister on behalf of the A.-I.N.E.C. Mr. Nehru told the deputation that while Government would not be prepared to postpone the amendments to Article 19 of the Constitution, they would try to modify them with a view to meeting the viewpoints of the press as far as possible.

Later a resolution was adopted by the A.-I.N.E.C. approving the stand taken by its President demanding the withdrawal of the proposed amendment to Article 19 (2) of the Constitution.

The Committee placed on record its considered opinion that the proposed amendment "is unwarranted and uncalled for," and hoped that the representations made by the President would persuade Government to reconsider their attitude towards the amendment.

The Committee authorised the President to take such further steps as he might consider necessary to protect the liberties of the press in view of the proposed amendment to the Constitution.

PROTEST MEETING

The matter had a sequel when the bill became law and a special session of the A.-I.N.E.C. held in Bombay on June 23 and 24, 1951 decided to suspend the working of all committees of the A.-I.N.E.C. functioning in an advisory capacity with Government both at the Centre and the States. The conference, however, authorized the Committee to review the decision if a situation calling for such a review arose, and referred to the Committee a proposal to refuse its co-operation with all committees and enquiries instituted by Government on matters relating to the press and press laws in India.

The resolution was an amalgamation of a substantial portion of a resolution moved by Mr. Frank Moraes and another by Mr. A. D. Mani. It was passed by 44 votes to 9. Mr. Deshbandhu Gupta presided.

The conference also called upon newspapers to suspend publication for a day as a mark of protest against "unwarranted and uncalled for encroachment on freedom of expression."

The conference then passed *nem com* five other resolutions as referred to it by the Subjects Committee, making it clear that the Indian press "will not rest until the amendment to Article 19 (2) is repealed and freedom of expression is restored."

One of the resolutions directed the newspapers to publish the following caption on the top of the leading article "Freedom of expression is our birthright and we shall not rest until it is fully guaranteed by the Constitution."

Another resolution stated: "The conference is of the considered opinion that, in order to impress on the public the fact that what is at stake is not the question of any special privilege to the press but something of direct and immediate concern to them and that the Amendment imperils the exercise of their right to freedom of expression.

"The conference urges on the electorate to demand from every candidate standing for election to Parliament and State Legislatures a pledge to work for and to secure repeal of the Amendment to Article 19 (2), of the Constitution and restoration of freedom of expression."

Mr. Frank Moraes, moving his resolution, said that Government had treated the press in a "cavalier and churlish fashion." He suggested that, in view of the fact that Government were "not interested in our views or representations," the Press should not associate itself with consultative and advisory bodies. That was the minimum, he remarked, they could do.

Mr. A. D. Mani, moving an identical resolution the contents of which were substantially incorporated in Mr. Moraes's resolution, observed that he wanted to give Government room for consideration of the amendment. "We should not shut the door for discussion of the issue," he said.

Mr. Joachim Alva remarked that by passing the resolution they were going to snap the liaison with Government established through press advisory committees.

Mr. J. Natarajan also opposed the resolution on the ground that they would have the effect of putting a blanket on all remedies.

Mr. C. R. Srinivasan referred to the theory put forward by some speakers that the press advisory system had not yielded results and had survived its usefulness. That was not a correct estimate of facts, he said, opposing the resolutions. "The system provided a vital link between the authority and the press," he said. He asked them to revise their opinions as by scrapping the Press Advisory Committees they would not develop any strength.

Mr. Deshbandhu Gupta, in an appeal to members, said he was looking forward to a spirit of accommodation among members and they would pass a resolution in a way acceptable to all. "If the conference is divided in its resolution," he added, "we are starting with a very big handicap in the struggle envisaged by it. The only criterion I would place in adopting the resolution is the general common measure of agreement. That should not be forgotten."

The resolutions of Mr. Moraes and Mr. Mani were suitably modified to accommodate all points of view. The amendment of Mr. Mani authorising the Standing Committee "to review the position in the light of the decisions of the plenary session if a situation calling for such a review arises" was incorporated in the resolution.

Mr. Gupta, in winding up the proceedings, said that the conference which had a membership of 200 represented about 90 per cent of the circulation of newspapers in the country. Its claim to be the most representative body of the press, he added could not therefore be an empty boast. The conference had in it members who had made noteworthy contribution to the cause of freedom.

Six members of the conference in a signed statement expressing their opposition to the resolution said that it would be inopportune and hence unwise to start "direct action against a democratic Government with a large popular support." The proper occasion for such a conflict, it was stated, would be the presentation of the new comprehensive Bill contemplated to be brought before Parliament, in case it is found to be injurious to our interest."

The signatories who did not take part in the voting on the resolution are: Messrs. H. M. Joshi, P. V. Gadgil, J. Natarajan, D. S. Potnis, D. R. Nisal and Mr. Puri (Delhi).

six crores to be drawn as and when required by way of assistance towards the setting up of ordnance factories and other institutions.

As regards the ten regiments of Gurkhas recruited from Nepal (an independent country), six were retained by the Indian Union and four were transferred to the British Government to form a part of the British Army by mutual agreement between the Governments of Nepal, India and the United Kingdom.

An agreement was reached between the Government of India and His Majesty's Government that all British Forces in India would be withdrawn soon after the transfer of power. Accordingly the first detachment of the British Troops—Army and Royal Air Force—approximately 1,500 strong left India on August 17, 1947 and the withdrawal was completed on February 28, 1948, when the last British Unit—First Battalion, the Somerset Light Infantry, sailed from India.

SENIOR DEFENCE FORCES OFFICERS

Chief of Army Staff and Commander-in-Chief, Indian Army, General K. M. Cariappa, O.B.E.

Chief of the General Staff, Indian Army, Maj.-Gen. S. P. P. Thorat, D.S.O.

Adjutant-General, Indian Army, Maj.-Gen. J. N. Chaudhuri.

Quartermaster-General, Indian Army, Maj.-Gen. K. S. Thimayya, D.S.O.

Engineer-in-Chief, Indian Army, Maj.-Gen. H. Williams, C.B.E.

Master-General of Ordnance, Indian Army, Maj.-Gen. Sant Singh.

Military Secretary, Indian Army, Brig. Sarda Nand Singh.

General Officer Commanding-in-Chief, Western Command, Lt.-Gen. S. M. Shrinagesh.

General Officer Commanding-in-Chief, Eastern Command, Lt.-Gen. Thakur Nathu Singh.

General Officer Commanding-in-Chief, Southern Command, Lt.-Gen. M. S. Rajendrasinhji, D.S.O.

Indian Navy

Chief of Naval Staff & Commander-in-Chief, Indian Navy, Vice-Admiral C. T. M. Pizey, C.B., D.S.O., R.N.

Chief of Staff, Naval H. Qrs., Commodore G. A. French, R.N.

Rear Admiral Commanding, I.N. Squadron, Rear Admiral N. V. Dickinson, D.S.O., D.S.C. & Bar., R.N.

Chief of Administration, Naval H. Qrs., Captain G. S. Kapoor, I.N.

Chief of Personnel, Naval H. Qrs., Captain B. A. Samson, I.N.

Commodore-in-Charge, Bombay, Commodore R. M. T. Taylor, R.N.

Commodore-in-Charge, Cochin, Commodore E. G. McGregor, D.S.O., R.N.

Naval Officer-in-Charge, Vizagapatam, Captain B. S. Soman, I.N.

Indian Air Force

Chief of the Air Staff and Commander-in-Chief, I.A.F., Air Marshal G. E. Gibbs, C.I.E., C.B.E., M.C.

Deputy Chief of Air Staff, Air Vice-Marshal S. Mukerjee, O.B.E.

Air Officer Commanding, Operational Command, Air Commodore Arjun Singh, D.F.C.

Air Officer Commanding, Training Command, Air Commodore R. H. D. Singh.

Air Officer-in-Charge, Technical and Equipment Services (Air H.Q.), Air Commodore A. M. Engineer, D.F.C.

Air Officer-in-Charge, Personnel and Organisation (Air H.Q.), Air Commodore, D. A. R. Nanda.

The Defence Forces of India used to contain a very large British element but the Government of India after partition decided to completely nationalise the Defence Forces at the earliest date possible. Since the decision was made the nationalisation of the Indian Army has proceeded rapidly. The Committee appointed to study the nationalisation problem under the chairmanship of Mr. Gopalaswamy Ayyangar completed its report by the end of 1947. Actually even before the completion of the report, about the time when it became clear that the country would have to be divided after August 15, 1947, nationalisation had started and it was just a question of speeding up the process. The number of British Officers in the new Indian Army has varied from time to time. The last British Commander-in-Chief, General Sir Roy Bucher vacated office on January 15, 1949 when General K. M. Cariappa succeeded him as the first Indian Commander-in-Chief.

In the Air Force there was really no problem of nationalisation as such as the Indian Air Force had no British Officers. However, it has been necessary to obtain on loan about a dozen British Officers. In addition, a few civilian British Technicians are also employed on contract in various Air Force Installations.

In the Navy, the full achievement of nationalisation must necessarily be delayed since there does not in fact exist an adequate number of Indian Officers with the requisite experience. The policy, however, remains the same as in the other two Services, only such British Officers being retained, or accepted on loan from the Royal Navy as are absolutely essential, that is to say, those whose place cannot be filled by Indian nationals.

DEFENCE ORGANIZATION

A point that may be mentioned at the start is that the order of precedence of India's Defence Services has been rearranged as the Army, the Navy and the Air Force.

Hitherto, the British tradition of regarding the Navy as the seniormost service had been followed in India too. But with the country becoming a sovereign democratic Republic, it has been decided to alter the order in view of the Army having undoubtedly played the most outstanding role in the long history of the country's defence.

Though now the Army is to be mentioned first, to be followed by the Navy and the Air Force, the change in no way implies that the Government of India attach less importance to either of the latter.

Notwithstanding their decision to change the order of precedence, Government propose to consider the three Services alike. In fact, their intention is to pay more attention to the Navy and the Air Force, which, though yet small in size, have to play an increasingly important part in future.

With the inauguration of the new constitution on January 26, 1950, the use of the prefix 'Royal', wherever it occurred in the designation of a service, a regiment, a corps or a unit of the Armed Forces, was discontinued. Similarly, the expression "His Majesty's Indian Ship" was also dropped.

The King's Colours awarded to different regiments of the Army were laid up on November 23, 1950, at the National Defence Academy, Dehra Dun, to be preserved as "treasured relics of the past" with due regard to their symbolic significance and historic associations.

The Defence organisation of India consists of the Ministry of Defence and the Armed Forces Headquarters, with their subordinate formations.

There have been very significant changes in the organisation and functions of the Ministry of Defence since 15th August 1947. In fact, the changes commenced somewhat earlier. Before September 1946, when the Interim Government first assumed power, the Commander-in-Chief was not merely the Supreme Commander, the Head of all the three Services, but was also the Defence Minister, and occupied a specially privileged position, second only to that of the Governor-General. With the appointment of a popular representative as the Defence Minister, the Commander-in-Chief stepped down but he still continued to be the Head of the three Services. Although, therefore, it was the Defence Minister who attended Cabinet meetings and obtained Government orders or passed orders himself on behalf of Government on important matters of policy, it was the Commander-in-Chief who, by virtue of his position as the Head of the three Services, continued to be the principal co-ordinator and played a decisive role in determining and shaping the policy of the Ministry. After 15th of August 1947, there was a further fundamental change. From that date onwards, each Service was placed under its own Commander-in-Chief, their new designations being: Chief of Army Staff and Commander-in-Chief, Indian Army; Chief of Naval Staff and Commander-in-Chief, Royal Indian Navy; and Chief of Air Staff and Commander-in-Chief, Royal Indian Air Force. Broadly speaking, it is in their capacity as Chiefs of Staff, that the three Commanders-in-Chief meet the Defence Minister and the Defence Secretary.

A revolutionary change in the role of the Defence Ministry was thus effected. For the first time, the Defence Ministry assumed its proper position, which had tended to become obscured when the posts of the Defence Minister and of the Commander-in-Chief of the Armed Forces were combined in one person. The Ministry of Defence is responsible for obtaining policy decisions of Government, for transmitting those decisions to and seeing to their implementation by the three Service Headquarters. Also, it is still more directly responsible for ensuring the implementation of Government decisions relating to certain other matters which fall broadly into two categories; firstly those which affect all the three Services, such as, the Ordnance Factories, the organisation of the Armed Forces Medical Services, the organisation of the Scientific Adviser, the Historical Section, the publication of Military Regulations and Forms, the Pensions organisation, etc.; and secondly, those which are more closely and directly connected with civil authorities and with the public, such as, the Military Lands and Cantonments organisation, acquisition and custody of land vested in Government for purposes of Defence, and the relinquishment of such lands when they are no longer necessary for these purposes, Marine Surveys and dangers to navigation, Soldiers', Sailors' and Airmen's Boards and Benevolent and Welfare funds. In addition there are a few other items which do not clearly fall under one or the other head, but which may be regarded broadly as falling in the second category, namely, the National Cadet Corps, the National Defence Academy, and the organisation of the Armed Forces Information Officer.

DEFENCE COMMITTEES

With a view to ensuring expeditious and efficient handling of work of such complexity and extending over so many subjects, a net-work of committees has been established at different levels. There is at the top the Defence Minister's Committee which deals with the more important of the Inter-Services problems; it is composed of the Defence Minister, the three Service Chiefs, the Financial Adviser and the Defence Secretary. The decisions of this Committee are final and binding on all concerned. Where important policy issues are involved, the Committee does not take a final decision but makes recommendations to the Defence Committee of the Cabinet. This is composed of the Prime Minister.

(Chairman), the Deputy Prime Minister, the Minister for Finance, the Minister for Defence and the Minister for Transport; and in attendance the three service chiefs, the Secretary, Ministry of Defence and the Financial Adviser, Defence. For all practical purposes the Defence Committee of the Cabinet constitutes Government in so far as the Defence Ministry is concerned.

No organisation under the Indian Armed Forces existed to undertake a systematic study of the extensive and highly developed defence science. Experience of World War II has shown the value of scientific research for the defence services, and India made a start by appointing, Dr. D. S. Kothari, as scientific adviser to the Ministry of Defence in July, 1948. The Defence Science Organisation which is engaged on various aspects of Defence Science continues to make steady progress.

Army Headquarters

The Army Headquarters functions directly under the Chief of the Army Staff and the Commander-in-Chief, Indian Army. It is divided into the following main branches which are again further sub-divided into directorates:—

General Staff Branch;
Adjutant-General's Branch;
Quartermaster-General's Branch;
Master-General of Ordnance Branch;
Engineer-in-Chief's Branch;
Military Secretary's Branch.

Under the Army Headquarters, the Army is organised into commands, each command under a General Officer Commanding-in-Chief of the rank of Lieutenant-General. The commands are divided into areas, each under the command of a G.O.C. of the rank of Major-General and the areas in their turn are sub-divided into sub-areas under the command of a Brigadier. These are static formations.

India is now divided into three commands, the Eastern Command, the Southern Command and the Western Command, the old Northern Command having gone to Pakistan. For organizing an adequate and efficient defence of the north-west frontier of India a purely operational command was established to start with. This was known as the "Delhi and East Punjab Command". One of the first tasks it had to carry out was the establishment of law and order in the disturbed province of the Punjab (I). and the evacuation of millions of Indian nationals from across the border. Later this Command had to assume operational responsibility in Jammu and Kashmir. This necessitated the command's reorganisation as it became clear that it could not function purely as an operational Command and that it was essential for it to take over administrative responsibilities over defined areas. Therefore, on March 1, 1948, it was brought up to the shape and size of a full-fledged static command like the Southern and Eastern Commands and was re-designated "The Western Command". Its jurisdiction extends from Mhow in the South in Cenfral India to the southern boundaries of Kashmir. It includes the whole of Rajasthan, Delhi and the Punjab (I).

THE INDIAN ARMY

The Indian Army is divided into numerous arms in just the same way as the British Army. They are: Armoured Corps; Regiment of Artillery; Corps of Engineers; Army Ordnance Corps; Technical Development Establishment; Corps of Electrical and Mechanical Engineers; Infantry; Army Service Corps; Army Educational Corps; Clerks Army Service Corps (Staff Duties); and Remounts, Veterinary and Farms Corps.

Armed Forces Medical Services.—The Government of India accepted the recommendations of the Special Committee, set up in 1946, under the Chairmanship of Dr. B. C. Roy (Chief Minister of West Bengal) to examine the question of integrating the medical services of the Armed Forces and sanctioned the integration of this service. A Director-General of the Armed Forces Medical Services was appointed in September 1948, and a start was made with the preparation of detailed plans for integration. The Indian Medical Service, as a separate service, ceased to exist on August 15, 1947 and its place was taken by the Indian Army Medical Corps.

The Royal Army Medical Corps, the Royal Army Dental Corps, Queen Alexandria's Imperial Military Nursing Service in India, which were primarily responsible for the medical care of the British troops ceased to function in India after August 15, 1947.

The Medical services of the Armed Forces of India are composed of the following categories of personnel and subordinate organisations:—

(*a*) Officers and other ranks of the AMC which came into existence on April 3, 1943 and organised on the lines of the RAMC. It embodies the late IMS (Military Wing), the IMD and the IHC.

(*b*) Officers and other ranks of the Army Dental Corps which came into existence on April 3, 1943 and is organised on the lines of the Royal Army Dental Corps.

(*c*) The Military Nursing Service.

(*d*) The Auxillary Nursing Service.

Territorial Army: On the attainment of independence India decided to raise a Territorial Army. The T. A. Act 1948, which repeals the Indian Territorial Force Act 1920, was passed by Parliament in September 1948. The main difference between the old Indian Territorial Force and the Territorial Army is that, while under the old Act its composition was limited to a few Provincial Infantry Battalions, the small number of medical officers belonging to the Medical Branch and the University Officers' Training Corps (U.O.T.C.), the Territorial Army consists of all arms of service, *i.e.*, the Armoured Corps, the Corps of Artillery including Anti-aircraft and Coastal Defence units, the Corps of Engineers including Port and Railway units, the Corps of Signals, Infantry, the Army Service Corps, the Army Medical Corps and the Corps Corps, of Electrical and Mechanical Engineers. The units raised are of two types, *i.e.*, Provincial units recruited from rural areas who undergo annual training of two to three months' duration at a stretch, and Urban units recruited from large towns where Territorial Army units have been raised. They undergo training on the weekly drill system, *i.e.*, in the evenings, Sundays and holidays with a small camp of not less than four consecutive days. The period spent in the camp may, however, be extended up to a maximum of 14 consecutive days, provided that in as far as the additional period beyond the initial period of four days is concerned, the individual volunteers and obtains the written consent of his employer, if necessary.

All able-bodied persons from the unskilled labourer to highly qualified technicians provided they are citizens of India, are eligible for recruitment. The age limits are 18 and 35 years relaxable in case of ex-service (Army, Navy and Air Force) personnel and civilians possessing technical qualifications.

The country has been divided into eight zones for purposes of recruitment which is done on zonal basis, *i.e.*, only residents of the zone are recruited in the units which are raised from that zone.

The role of the Territorial Army is as follows:—

(*i*) To relieve Regular Army of static duties and support the Civil Power if required.

(*ii*) To provide coast defence and Anti-aircraft units.

(*iii*) To provide field formations and units for the Regular Army if and when required.

When embodied, called out or under training, the Territorial Army personnel receive the same pay and allowances as are admissible to the corresponding ranks of the Regular Army. Officers of urban units proceeding to and from obligatory parades receive road mileage allowance. Junior Commissioned Officers and Other Ranks are allowed refund of any conveyance expenses incurred by them.

Junior Commissioned Officers and other Ranks of the urban units receive refreshment allowance based on every four hours of drill completed.

The Territorial Army was inaugurated in October 1949, and simultaneously the recruitment was thrown open. The response has been encouraging and the citizen army has made steady progress.

Minimum qualifications for officers' commission in the Territorial Army have been laid down. All civilian candidates are required to appear before a Services Selection Board as is being done for the candidates for the Regular Army. Ex-officers are interviewed by the Territorial Army Selection Board. The other ranks are recruited by the Territorial Army Unit Commanders and Recruiting Officers throughout the country.

In order to provide incentive to the Junior Commissioned Officers and men for hard and meritorious work, 2½ per cent of the actual vacancies available at the Military Wing of the National Defence Academy will in future be reserved for the personnel of the Territorial Army. On successful completion of the course at the N.D.A. they will be granted Regular commissions in the Army.

No officer or enrolled person is required to perform military service beyond the limits of India save under a general or special order of the Central Government. Every officer when performing duty as an officer and every enrolled person when called out or embodied or undergoing voluntary course of instructions or attachment with regular forces is subject to the Army Act.

The President has instituted two new awards for the Territorial Army. They are designated the Territorial Army Decoration and the Territorial Army Medal. The Territorial Army Decoration is to be awarded to a commissioned officer of the Territorial Army for 20 years' meritorious service. The Territorial Army Medal will be awarded by the President to junior commissioned officers, non-commissioned officers and men of the Territorial Army for 12 years' efficient service who have a minimum of 12 trainings and who are recommended.

A clasp will be awarded to those who, having been awarded the medal, complete a total of 18 years' efficient service and a further clasp will be awarded after completing 24 years' service with minimum of 18 and 24 trainings, respectively.

FORMER STATES FORCES

The States Forces, formerly designated "Imperial Service Troops," consist of the military forces raised and maintained by the Rulers of former States at their own expense and for State service. It has been the custom in emergency for State troops to be lent to the Government of India, and the Government of India have on many occasions received military assistance of great value from this source. During the years 1947 and 1948 very considerable numbers of the State Forces were employed, for service with the Indian Army.

The changes brought about as a result of the integration of the States have had their inevitable repercussions on the position of the State Forces. The Forces of the States which have merged into Provinces or which have been integrated into Chief Commissioners' Provinces were taken over by the Indian Army. So far as the Forces of the States Unions were concerned the Government of India took over entire control of some of them while in the case of the others the administrative Control was left with the Rajpramukh subject to certain conditions (see section on former States).

INDIAN DAILIES

It is estimated that there are about 300 dailies and over 3,500 periodicals in India.

Here is a list of English daily newspapers with the places of publication (the list is not exhaustive):

Hindustan Times (New Delhi); *Indian News Chronicle (Delhi)*; *Delhi Express* (Delhi); *Indian Express* (Madras); *Hindu* (Madras); *Mail* (Madras); *Indian Republic* (Madras); *Liberator* (Madras); *Times of India* (Bombay and Delhi); *Free Press Journal* (Bombay); *Bombay Chronicle* (Bombay); *Bombay Sentinel* (Bombay); *Bharat* (Bombay); *National Standard* (Bombay); *Evening News of India* (Bombay); *Free Press Bulletin* (Bombay); *Advance* (Calcutta); *Amrita Bazar Patrika* (Calcutta); *Hindustan Standard* (Calcutta); *The Nation* (Calcutta); *The Statesman* (Calcutta, Delhi); *National Herald* (Lucknow); *Pioneer* (Lucknow); *Leader* (Allahabad); *Searchlight* (Patna); *Indian Nation* (Patna); *Evening News* (Patna); *Hitavada* (Nagpur); *Tribune* (Ambala); *Assam Tribune* (Gauhati); *Hindustan Times Evening News* (Delhi); *Nagpur Times* (Nagpur); *Eastern Times* (Cuttack); *New Orissa* (Cuttack); *Telegraph* (Kanpur); *Daily News* (Bangalore); *Daily Post* (Bangalore); *Deccan Herald* (Bangalore); *Daily News* (Secunderabad); *Deccan Chronicle* (Secunderabad); *New Life* (Hyderabad).

PROVING OF WILLS

IN India if a person has been appointed executor of the Will of a deceased person, it is always advisable to prove the Will as early as possible. If the Will is in an Indian language it has to be officially translated into English. A petition is then prepared praying for the grant of probate of the Will. All the property left by the deceased has to be disclosed in a schedule to be annexed to the petition. Values must be shown as at the date of the Petition and Probate Fees will be calculated on such value. The Values of immoveable properties are usually assessed at 16⅔ years' purchase on the nett Municipal assessment, in the absence of a report from a competent architect. Unless otherwise prayed for, grant of probate is limited to the State in which it is granted. In all cases in which it is sought to obtain a grant of probate to have effect throughout India, such grant must be expressly asked for.

Probate Duty in Bombay.—Up to Rs. 1,000—Nil.

For the next Rs. 9,000 (*i.e.* upto Rs. 10,000), 2 per cent.; for the next Rs. 40,000 (*i.e.* upto Rs. 50,000) 3 per cent.; for the next Rs. 50,000 (*i.e.* upto Rs. 1,00,000) 4 per cent; for the next Rs. 1,00,000 (*i.e.* upto Rs. 2,00,000) 4½ per cent; for the next Rs. 50,000 (*i.e.* upto Rs. 2,50,000) 5 per cent; for the next Rs. 50,000 (*i.e.* upto Rs. 3,00,000) 5½ per cent; for the next Rs. 1,00,000 (*i.e.* upto Rs. 4,00,000) 6 per cent; for the next Rs. 1,00,000 (*i.e.* upto Rs. 5,00,000) 6½ per cent.; for amounts exceeding Rs.5,00,000 (on the portion over Rs. 5,00,000) 7 per cent. In addition to this Probate Duty there is, at present, a surcharge of 25 per cent introduced by the Bombay Increase of Court-Fees Act No. XV of 1943.

Exemptions from Probate Duty.—In determining the amount of the value of the estate for the purposes of probate duty the following items are allowed to be deducted:

1. Debts left by the deceased including mortgage encumbrances.

2. The amount of funeral expenses.

3. Property held by the deceased in trust and not beneficially or with general power to confer a beneficial interest.

In addition, there is general exemption for service personnel killed in action or dying on service in certain circumstances.

No probate duty is payable in India on the value of the estate left by the deceased outside India.

Procedure.—The particulars of the property of the deceased and the particulars of all items allowed by law to be deducted have to be shown in separate schedules. It is the practice of the High Court to send a copy of these schedules to the Revenue Authorities and if the properties, particularly immoveable properties, have not been properly valued, the High Court issues a notice to the petitioner requiring him to amend the schedule of property accordingly. In certain cases the Court requires citations to be published and served on such persons as the Court thinks are interested in the question of the grant of probate. If no objection is lodged by any person so interested within the time mentioned in the citation to the effect that nothing should be done in the matter of the petition for probate without notice to the person 'objecting' or to use technical language the 'caveator', and if the Will is shown to have been properly executed, probate is ordered to be granted. If an objection or caveat is filed, the petition for probate is converted into a suit in which the petitioner is plaintiff and the caveator is the defendant.

As probate, however, cannot be granted merely because the parties consent, the Will has to be proved. It is against public policy to enter into an agreement or compromise as to the genuineness or execution of the Will if the effect of such an agreement or compromise is to exclude evidence in proof of the Will.

EFFECT OF PROBATE

Probate has effect over all the property and estate moveable or immoveable of the deceased throughout the State in which the same is granted and is conclusive as to the representative title of the person to whom the probate is granted against all debtors of the deceased and all persons holding property which belongs to the deceased and will afford full indemnity to all debtors paying their debts and all persons delivering up such property to the person to whom such probate is granted. Probate can only be granted to an executor appointed by the Will and the appointment may be express or by necessary implication. Probate cannot be granted to any person who is a minor or is of unsound mind nor to any association of individuals, unless it is a company, which satisfies the conditions prescribed by rules made by the President in Council in that behalf. Where several executors are appointed probate may be granted to them simultaneously or at different times. If a codicil is discovered after the grant of probate a separate probate of that codicil may be granted to the executor if it in no way repeals the appointment of executors made by the Will. If different executors are appointed by the codicil, probate of the Will will be revoked and a new probate granted of the Will and codicil together. When probate has been granted to several executors and one of them dies, the entire representation of the testator accrues to the surviving executor or executors. Probate of a Will when granted establishes the Will from the death of the testator and renders valid all intermediate acts of the executor as such. When a person appointed an executor has not renounced the executorship, letters of administration will not be granted to any other person until a citation has been issued calling upon the executor to accept or renounce the executorship, but when one or more of several executors have proved the Will, the Court may, on the death of the survivor of those who have proved, grant letters of administration without citing those who have not proved. The renunciation may be made orally in the presence of the Judge or by a writing signed by the person renouncing and when made will preclude him from ever thereafter applying for probate of the Will appointing him executor. If an executor renounces or fails to accept an executorship within the time limited for the acceptance or refusal thereof, the Will may be proved and letters of administration with a copy of the Will annexed may be granted to the person who would be entitled to administration in case of intestacy. No person, who renounces probate of a Will, can, without the leave of the judge take out representation to the deceased in another character.

Probate is necessary in case of Wills of Europeans, East Indians, Armenians, Jews, Parsis and Indian Christians and also in case of Wills of Hindus, Buddhists, Sikhs or Jains, made on or after 1st September 1870, within the territories which at the said date were subject to the undivided Provincial Government of Bengal, or within the local limits of the ordinary original civil jurisdiction of the High Courts of Judicature at Madras and Bombay; or to all such Wills made outside the above specified territories or limits so far as they relate to immoveable property situate within those territories or limits.

Probate is not necessary, in case of Wills of Hindus, Buddhists, Sikhs or Jains not falling in classes specified above or of Wills of Muslim and Khojas.

Articles of Association of most of the joint stock companies contain an article to the effect that the Executor or Administrator of a deceased member who has obtained Probate or Letters of Administration as the case may be or the holder of the Succession Certificate shall be the only person recognised by the Company as having any title to his share. In such cases, the Company validly insists on the production of such legal representation before transfer of the shares of a deceased member whether he is a European, Hindu, Muslim, Parsi or otherwise.

Residuary Legatee.—When no executor has been appointed by a deceased in his Will or when the deceased has appointed an executor who is legally incapable or refuses to act or who has died before the testator or before he has proved the Will or when an executor dies after having proved the Will but before he has administered all the estate of the deceased, a universal or a residuary legatee may be admitted to prove the Will and Letters of Administration with the Will annexed may be granted to him of the whole estate or so much of it as may be unadministered.

After any grant of Probate or Letters of Administration with Will annexed, no other than the person to whom the same may have been granted has the power to sue or prosecute any suit or otherwise act as representative of the deceased until such Probate or Letters of Administration has or have been recalled or revoked.

Small Estates.—In cases where the value of the estate is Rs. 2,000 or less, an Administrator General's Certificate can be obtained. The procedure for obtaining this Certificate is simpler and less expensive. A fee of 3 per cent on the value of the estate is payable. The value of the estate has, however, to be taken as at the date of the death of the deceased. These Certificates are equivalent to Letters of Administration.

PROBATE OF FOREIGN WILLS

When a Will has been proved and deposited in a court of competent jurisdiction situated beyond the limits of the State, whether within or beyond the limits of India, and a properly authenticated copy of the Will is produced, letters of administration may be granted with a copy of such Will annexed, upon a proper application for the purpose being made to the appropriate court within whose jurisdiction such property is situate. It is not the function of the court in India to require evidence of the validity of the Will, if it is recognised as valid by the Court of domicile of the testator.

THE DEFENCE FORCES

THE present army of India originated in the small establishments of guards, known as peons, enrolled for the protection of the factories of the East India Company; but sepoys were first enlisted and disciplined by the French, who appeared in India in 1665.

After the declaration of war with France in 1744 the forces were considerably increased, but this did not prevent the French capturing Madras in 1746. Following the French example, the English raised considerable sepoy forces and largely increased the military establishments. In 1748 Major Stringer Lawrence landed at Fort St. David to command the forces of the Company. The English foothold in India was then precarious and the French under Dupleix were contemplating fresh attacks. It became necessary for the English Company to form a larger military establishment. The new commandant at once set about the organisation and discipline of his small force, and the garrison was given a company formation. This was the beginning of the regular Indian Army of which Lawrence subsequently became Commander-in-Chief.

In 1796 the Indian armies, which had been organised on the Presidency system, were reorganised. The European troops were 13,000 strong and the Indians numbered some 57,000, the infantry being generally formed into 75 regiments of two battalions each.

In 1824, the armies were reorganised, the double-battalion regiments being separated, and the battalions numbered according to the dates they were raised. The Bengal Army was organised in three brigades of horse artillery, five battalions of foot artillery, two regiments of European and 68 of Indian infantry, 8 regiments of regular and 5 of irregular cavalry. The Madras and Bombay armies were constituted on similar lines, though of lesser strength.

In 1857 the East India Company ceased to exist and their army was taken over by the Crown. At this time the army was organised into three armies, *viz.*, Bengal, Bombay and Madras, the total strength being 65,000 British and 140,000 Indian troops.

In 1895 another large reorganisation took place. This was the abolition of the three Armies and the introduction of the command system. Four Commands were formed, *viz.*, Punjab, Bengal, Madras and Bombay.

In 1907, Lord Kitchener considered that consequent on the delegation of administrative powers to Divisional Commanders, retention of such powers by Lieutenant-Generals of Commands led to delay in the dispatch of business. The Command system was therefore abolished and India was divided into two Armies—the Northern and Southern—each under a General Officer who was responsible for the command, inspection and training of the troops, but was given no administrative responsibilities.

Early in the First Great War both Army Commanders took the field and were not replaced until 1916 and 1917, when both had practically the same functions as their predecessors. It was then realised that administration was being unduly centralised at Army Headquarters and the machinery was becoming clogged with unnecessary details. To secure efficiency at A. H. Q., therefore, a certain measure of decentralisation was carried out in 1918. With the alteration of the designation "Army" to "Command" at this time, a considerable increase was made in the administrative staffs of the two Commands, and the General Officers Commanding were given powers to deal with all administrative questions other than those dealing with matters of policy, and new principles of war.

The commands were increased to four in 1920, each under a General Officer Commanding-in-Chief. One of these, namely Western Command, was abolished on the 1st November 1938, and replaced by an Independent District.

Chatfield Committee

In September 1938, an announcement was made on behalf of the British Government, that the outcome of the discussions regarding the role of land and air forces in India in relation to the defence problems of India, and the Empire which had been authorised in March of that year, had been considered by the British Government.

The need for early action to place the defence organisation of India on a more satisfactory basis was accepted, and, at the suggestion of the Government of India, an expert body of inquiry known as the Chatfield Committee was appointed by the British Government to visit India.

In the meantime and in the light of the progress made during the discussions that were held in the summer of 1938, the British Government in September, 1938, made certain offers of assistance, subject to approval of Parliament. These were an increase of £500,000 to the annual grant of £1,500,000 which had been paid to the Government of India, since 1933, in aid of India defence expenditure, a capital grant up to £5,000,000 for the re-equipment of certain British and Indian units in India, and the provision of aircraft for the re-equipment of certain squadrons of the Royal Air Force. It was further agreed that four British battalions should be transferred from the Indian to the Imperial establishment.

The following is the substance of the main recommendations of the Chatfield Committee Report:

Modernised Re-equipment.—The Committee reported that in the interests of Indian defence the whole of the army forces in India should be modernised with only such minor variations as would not affect the general level of efficiency. One of the most important features of the modernisation proposals was the mechanisation of the bulk of the cavalry and of the first line transport of a large portion of the infantry with the object of greatly increasing the mobility of the units.

With this end in view the Chatfield Committee recommended that the basis of distribution of the Army in India should be (A) Frontier Defence, (B) Internal Security, (C) Coast Defence, (D) External Defence Troops.

Supply of Munitions.—The principle that India should as far as possible be made in all major respects self-sufficient in munitions in time of war was accepted, and a scheme for reorganising, and, where necessary, expanding the Ordnance Factories in India was recommended.

Defence Gift to India.—The British Government took full account of the heavy capital cost involved which was estimated at some £34,330,000, or Rs. 45 crores. Accepting that this capital expenditure could not be found out of the resources available in India, the British Government offered to provide it from the British Exchequer. The sole condition attached was that India should bring her defence forces up to the standard of equipment necessitated by modern warfare and adjust her strategical plans to the conditions now obtaining in the world.

Of the total amount three-quarters would be provided as a free gift while one-quarter would be advanced by way of a loan. The interest on this portion, however, would be entirely remitted for the first five years; thereafter interest would become payable together with instalments of capital.

India's Defence Liabilities.—In estimating India's defence requirements, the Committee had to consider how far the prevailing conceptions as regards India's liability for defence could be held valid in the light of modern conditions.

The Committee recommended as a general principle that the forces maintained by India should be adequate not merely for the narrower purposes of purely local defence, but also to assist in maintaining what they described as "India's external security," and further that India should acknowledge that her responsibility could not in her own interests be safely limited to the local defence of her land frontiers and coasts.

It was fully appreciated that the forces maintained by India could only bear a small share in those wider responsibilities, and that she could not necessarily bear in full the cost of such forces as were maintained in India. The committee recommended therefore that the contribution hitherto paid by the British Government should be continued at the higher level of £2,000,000 a year to which it had been provisionally raised by Government.

On this basis it was estimated that it should be possible for India, without enlarging the annual provisions for defence expenditure, to meet the whole maintenance costs of the forces organised and equipped on the scale proposed. From this main principle the conclusion was drawn that if forces held in India for the purposes covered by the joint responsibility were used outside India in an emergency affecting India's external security, their ordinary maintenance charges to be borne by India.

The margin for external defence suggested was one-tenth of the forces maintained in India in the case of the Army.

PARTITION

The year 1947 was a landmark in the history of the Armed Forces of India. Consequent on the division of the country into the two Dominions of India and Pakistan, it was decided that each Dominion should establish its own Armed Forces. The Royal Indian Navy, the Indian Army and the Royal Indian Air Force were accordingly divided between the two Dominions on communal-cum-optional basis which worked out to the approximate proportion of one-third to Pakistan and two-thirds to the Union of India. A scheme was then evolved by which those units which were predominantly Hindu or Muslim should belong to India and Pakistan respectively: individuals of the other community serving in such units were given the choice as to which Dominion they wished to serve.

Thus each Dominion was allotted its own Sea, Land and Air Forces. India retained the title of Royal Indian Navy, Indian Army and the Royal Indian Air Force for these particular arms; while the titles of the Pakistan Forces became Royal Pakistan Navy, Pakistan Army and the Royal Pakistan Air Force.

Such a division and reorganisation of the Armed Forces needed a co-ordinating authority which was provided by the Supreme Commander's Headquarters. Field-Marshal Sir Claude Auchinleck, former Commander-in-Chief, was appointed as Supreme Commander with the specific purpose of reconstituting the Armed Forces for the two Dominions under the directional control of the Joint Defence Council, which consisted of representatives from both Dominions, the Governor-General of India Viscount Mountbatten being the independent Chairman.

Since the bulk of the work of reconstitution was completed sooner than it was anticipated, the Supreme Commander's Headquarters closed at the end of November 1947, and the Joint Defence Council on April 1, 1948. A communique explained that as nearly all the functions for which the Joint Defence Council was set up had been completed there was no need for such a body. The Executive Committee of the Joint Defence Council, however, which was renamed the Inter-Dominion Defence Secretaries' Committee continued in existence in order to carry out the remaining functions of the Joint Defence Council.

As for the ordnance factories, no physical division has taken place. India has assumed full liability for their book value, and has agreed to make available to Pakistan a sum of rupees

During 1951 even these forces were integrated with the Indian Army which completed the process of integration.

As the standard of training and conditions of service of the forces of the various States varied, it was found necessary to screen the personnel of the State Forces and only those who were found suitable were brought on to the Indian Army terms and conditions of service. Those who were acceptably graded, were commissioned in the Indian Army. Mustering out concessions previously sanctioned for the personnel of the Indian State Forces not absorbed in the Indian Army were liberalised. Personnel of the State Forces who were not absorbed in the Indian Army are now entitled to participate in the re-settlement schemes drawn up for the ex-soldiers of the Indian Army.

The office of Adviser to the State Forces in the Ministry of Defence has been abolished with effect from October 1, 1951, as most of the questions arising out of the integration was completed.

NATIONAL CADET CORPS

In July 1946 the Government of India appointed a Committee called the National Cadet Corps Committee under the Chairmanship of Pt. Hirday Nath Kunzru, the veteran Liberal leader. This Committee popularly known as "Kunzru Committee" submitted a 44-page report to the Government which was simultaneously released to the press when the formation of a 200,000-strong National Cadet Corps and a Territorial Force, already mentioned, were announced by India's Defence Minister, Sardar Baldev Singh in the Central Legislature on March 13, 1948. He said that one of the steps by which Government propose to impart military training to Indian youth was to implement immediately the report of the National Cadet Corps Committee.

The National Cadet Corps scheme was implemented in all Provinces and in the majority of the States of India on 15th July 1948. During the years 1948 and 1949, a total of 157 units of Senior Division and 395 Troops of Junior Division and 3 Troops of Girls Division were raised. This brought the total strength to 21,378 Senior Division, 35,200 Junior Division and 270 Girls Division by the end of 1949. During 1950, 10 units of the Senior Division, 73 troops of the Junior Division and 2 Squadrons of the Air Wing were raised. This brought the total strength to 726 Officers, 22,623 cadets of Senior Division, 1,455 Officers, 43,650 cadets of Junior Division, 9 Officers, 270 cadets of Girls Division and 4 Officers and 160 cadets of Air Wing by the end of 1950. A sub-unit of the Junior Division consisting of one NCC Officer and 30 cadets has also been raised in 9 Public Schools.

During 1951, 2 units of Senior Division, 6 Troops of the Junior Division and 1 Squadron of Air Wing were raised. This brought the total strength to 733 Officers, 22,837 cadets of Senior Division, 1,473 Officers, 44,190 cadets of the Junior Division, 9 Officers, 270 cadets of the Girls Division and 6 Officers and 240 Cadets of Air Wing by the end of 1951. 2 sub-units of the Junior Division consisting of 1 Officer and 30 cadets have also been raised in 2 more Public Schools.

National Cadet Corps units are being officered by professors and school teachers who have been granted National Cadet Corps commissions after they have successfully completed military training with Army units. A total of 631 professors and 1,295 school teachers have completed their training so far. There has been a great response from the student community with all Colleges and Schools having long waiting lists.

The enrolment in the National Cadet Corps is entirely voluntary and without any liability for service in the Armed Forces—"Government being confident that the enthusiasm of youth in general for serving the country is sufficient guarantee that the response in Colleges and Schools will be satisfactory."

INDIAN AIR FORCE

The Indian Air Force had its origin in the recommendations of the Skeene Committee in 1926. The Indian Legislature passed the Indian Air Force Act in 1932, and in 1933 the first flight of the Indian Air Force was formed at Karachi with four Westland Wapitis. From that first flight with six pilots trained at the R.A.F. College, Cranwell, has grown a Service which by 1946 had 8 Fighter and 2 Transport Squadrons and an anti-aircraft co-operation unit.

Trained originally for Army Co-operation work, the Indian Pilots had their first operational experience over the difficult flying country of the North-Western Frontier. They shared with the R.A.F. the duty of policing the tribal territory till the summer of 1941 when they took over the work completely.

On the outbreak of the war in 1939 the Indian Air Force Volunteer Reserve was formed for the purpose of guarding India's coast and keeping the shipping lanes open. It carried out this work with conspicuous success till the end of 1942 when it was embodied in the I.A.F. During the Burma campaign of 1942 the I.A.F. had its first experience of operations against a major power. No. 1 I.A.F. Squadron and Coastal Defence Flights distinguished themselves in these operations. From November 1943 till the end of the Burma campaign the I.A.F. Squadrons were fully engaged in offensive operations against the Japanese in the Arakan and Imphal Fronts. Equipped with Vultee-Vengeances, Hurricanes and Spitfires the I.A.F. Squadrons operated continuously on the Burma Front. Their particular duties included attack on enemy troops, supply dumps and lines of communications. Tactical and photographic reconnaissance, close support to the Army, dive-bombing and fighter escort work with supply-dropping aircraft, were the other tasks which the IAF carried out with notable success.

On March 12, 1945, His Majesty the King approved the designation of 'Royal' as a prefix to the Indian Air Force in recognition of the work done during the war. When India became a Republic on January 26, 1950, the use of the prefix 'Royal' was discontinued. In 1946 No. 4 R.I.A.F. Squadron went to Japan as part of the British Commonwealth Occupation Forces. Consequent on the partition of the country India received one transport and seven fighter squadrons as her share of allotment.

From August 15, 1947 the Indian Air Force became an independent Service under the Defence Ministry. The Indian Air Force is now commanded by Chief of the Air Staff and Commander-in-Chief, I.A.F. After partition, a new H.Q. Staff more or less equivalent to the Air Ministry, was established in Delhi with the object of planning, building up and directing the activities of the Indian Air Force. The Air Headquarters, New Delhi now consists of three main Branches—the Air Staff, the Personnel and Organisation Staff, and the Technical and Equipment Staff. Each Branch is under the charge of a Principal Staff Officer of the rank of Air Commodore or Air Vice-Marshal.

The I.A.F. played an invaluable part in the Kashmir Operations. Without this powerful wing of the country's armed forces it would not have been possible for India to give the State any help when it was urgently needed. In the Poonch Sector alone, cut off from the rest of the country, where refugees had gathered in thousands, the I.A.F. dropped tons of supplies, and airlifted nearly thirty thousand refugees. The flights to Leh over unchartered routes and at an altitude of 24,000 feet without proper flying facilities and to Gilgit in unfavourable weather conditions, present examples of great heroism and airmanship. During 1947 and 1948 the I.A.F. found itself busy with the urgent peacetime tasks of evacuating refugees. Then there was police action in Junagadh and Hyderabad.

Since the institution of Republican India's gallantry awards on January 26, 1950, four I.A.F. Officers have been awarded the Maha Vir Chakras. In addition, several other fighter and transport air-crew, officers and airmen and AOP. (Auster Pilots) have been awarded the Vir Chakras in recognition of their meritorious service in Jammu and Kashmir. Four I.A.F. personnel have also been awarded the Ashoka Chakra Class II instituted early this year. One officer of the Service was also more recently awarded Ashoka Chakra Class I.

A new 'all-through' flying training scheme was introduced in 1949 for training future I.A.F. pilots. This scheme replaced the former three-stage flying training at Initial Training Wing, Coimbatore, Elementary Flying Training School, Jodhpur and Advanced Flying School, Ambala. Under the new scheme a pupil-pilot receives service flying training from A to Z, at one of the two Air Force Academies instituted at Ambala and Jodhpur. I.T.W. at Coimbatore has now been raised to the status of an Academy for training I.A.F. officers of non-technical ground-duty branches. The staff of all these training establishments is wholly Indian.

A notable step in the development of the I.A.F. has been the establishment of a Technical Training College in India. Instituted on the lines of the well-known Air Services Training Limited at Hamble, Southampton, England, popularly known as the Air University of England, this College has on its staff a number of experienced British Instructors. Advanced training in engineering, signals and armament branches of the I.A.F. is imparted at this I.A.F.T.T. College to direct entry officers and officers commissioned from the ranks, and apprentices. Provided with some of the latest equipment and able guidance of skilled instructors, technical schools are turning out technicians capable of handling latest aircraft and equipment. The Navigation Training School, the Flying Instructor's School and the Aircraft Testing Unit are some of the more recent and important additions to the expanding air force of the country. Late in 1950 the I.A.F. rushed to the rescue of the earthquake victims in Assam and of the flood-stricken people in the Punjab.

INDIAN NAVY

On 15th August 1947, when India attained independence, the following ships were allocated to India: Sloops: SUTLEJ, JUMNA, KISTNA, CAUVERY; Frigates: TIR, KUKRI; Minesweepers: ORISSA, DECCAN, BIHAR, KUMAON, KHYBER, ROHILKHAND, CARNATIC, RAJPUTANA, KONKAN, BOMBAY, BENGAL, MADRAS. Corvette: ASSAM; Survey Vessel: INVESTIGATOR; Trawlers: NASIK, CALCUTTA, COCHIN, AMRITSAR. In addition, India got four harbour defence motor launches and all existing landing craft.

The Indian Navy now consists of: Cruiser (Flag Ship): DELHI; 11th Destroyer Flotilla: RAJPUT (Capt. D), RANJIT, RANA; 12th Frigate Flotilla: JUMNA (Capt. F), CAUVERY, SUTLEJ, KISTNA; Boys Training Ship: TIR; 31st Minesweeping Flotilla: KONKAN (Ms/31), RAJPUTANA, ROHILKHAND, MADRAS, BOMBAY, BENGAL; Survey Ship: INVESTIGATOR; Ocean-going Tug: HATHI; 321st Seaward Defence Motor Launch Flotilla: 3110, 3112, 3118, 3117; L.S.T. (Landing Ship Tank): MAGAR M.L.6420.

On 15th January 1949 Naval Headquarters was reorganised into five main branches each under a Principal Staff Officer styled as follows:—

Deputy Commander-in-Chief and Chief of Staff; Chief of Personnel; Chief of Administration; Chief of Material; Chief of Naval Aviation.

On 4th April 1949 a new appointment designated Commodore Indian Naval Squadron (Short title COMINS) was created. COMINS was responsible for the operations, administration and training of Indian Naval ships in commission. This appointment was subsequently raised to the status of Rear-Admiral Commanding Indian Naval Squadron (short title RACINS).

In August 1950 it was decided to set up a Secretariat in Naval Headquarters modelled on the Secretariat of the British Admiralty. The Head of the Secretariat is the Naval Secretary.

Indian Navy Since Partition

On September 15, 1948, I.N.S. DELHI, the 7,000 ton Cruiser of the Leander class acquired by India from the United Kingdom arrived at Bombay and was received by the Prime Minister.

Soon after the Indian Naval Squadron was formed with DELHI as the Flagship and all the available Frigates.

In the spring of 1949, India acquired three Destroyers from the Royal Navy which were re-named I.N.S. RAJPUT, RANJIT and RANA. These Destroyers form the 11th Destroyer Flotilla under the overall command of a Captain (Destroyers). On 23 January, 1950 they arrived in India and were received by the Governor of Bombay on behalf of the Government of India. The 11th Destroyer Flotilla then joined up with the Indian Naval Squadron.

On January 26, 1950 a historic change took place when the Royal Indian Navy shed the title 'Royal' and became the Indian Navy. The White Ensign was replaced by the new Indian Naval Ensign with due ceremony in all ships and establishments.

In January 1951, two Frigates of the Indian Naval Squadron—I.N.S. JUMNA and I.N.S. CAUVERY—sailed to the Persian Gulf on a good-will cruise. They visited ports in Iran, Iraq and Arabia.

In May 1951, the Indian Navy witnessed an epoch-making event in its history when the President, Dr. Rajendra Prasad as the Supreme Commander-in-Chief of India's Armed Forces presented the President's Colour to the Navy in a spectacular ceremony at Bombay. The President's Colour was received by the Navy with a 31-gun salute.

In June 1951 the Flagship, I.N.S. DELHI, accompanied by the three Destroyers, I.N.S. RAJPUT, RANJIT and RANA and Frigates, CAUVERY, KISTNA, SUTLEJ and TIR visited East Africa on a good-will cruise. On her way back home DELHI made a courtesy call on Madagascar, while the Destroyers visited various parts on the East African sea board. The Squadron returned home in the third week of July.

Routine combined training exercises were also carried out by the ships of the Squadron with the Royal Navy, the Dominion Navies, the Indian Air Force and the Royal Air Force.

Training

The training of ratings in the Indian Navy is now carried out in shore establishments at Cochin, Vishakapatnam, Jamnagar and Lonavla under the overall supervision of the Commodore-in-Charge, Cochin who, in addition to his other duties, carries out the function of the Commodore Superintendent Training Establishments.

Cadets for the Indian Navy now receive their general education along with the cadets for the Army and the Air Force in the Joint Services Wing of the National Defence Academy at Dehra Dun and on completion of this initial training proceed to United Kingdom for higher naval training. In future, however, when the National Defence Academy at Khadakvasla begins to function the general education will be provided in that establishment.

In August 1950 a naval staff course was inaugurated at the Defence Services Staff College at Wellington (Nilgiris). The Chief Naval Instructor is the Head of the Naval Wing.

Another development of importance is that of naval aviation, the preliminary steps for which have already been taken. As a first step some naval officers were sent to the United Kingdom for pilot and maintenance duties. It has been decided that for the present naval aviation will be restricted to the formation of a shore based Fleet Requirement Unit which will form the nucleus of trained personnel from which to expand at a later date.

The scheme to provide the Indian Navy with a dockyard capable of coping with the size of the fleet contemplated for the future, is under active consideration.

To co-ordinate all matters connected with scientific naval research and development and provide scientific assistance, a Scientific Adviser was appointed in March 1951.

Marine Survey vessels of the Indian Navy have for a long time been playing an important role in carrying out the survey of the country's coast, approaches to harbours and ports.

It is now proposed to set up a Hydrographic office of the Navy, when the necessary navigation charts could be produced.

NEW GALLANTRY AWARDS

Three new gallantry awards have been instituted by the President of the Indian Republic. They are designated the Param Vir Chakra, the Maha Vir Chakra and the Vir Chakra. These are for gallantry in combat with the enemy and come into force with effect from August 15, 1947.

The Param Vir Chakra is awarded for most conspicuous bravery, or some daring or pre-eminent act of valour, or self-sacrifice, in the presence of the enemy, whether on land, at sea, or in the air. It will rank first among all awards.

The Maha Vir Chakra will be awarded for acts of gallantry in the presence of the enemy whether on land, at sea, or in the air.

The Vir Chakra will be awarded for acts of gallantry in the presence of the enemy, whether on land, at sea, or in the air.

All members of the Armed Forces including members of the Nursing Services and civilians working with the Armed Forces are eligible for the above three gallantry awards.

If any recipient of a Chakra again performs such an act of bravery as would have made him or her eligible to receive the Chakra, such further act of bravery will be recorded by a Bar to be attached to the riband by which the Chakra is suspended, and for every such additional act of bravery, an additional Bar will be added, and any such Bar or Bars may also be awarded posthumously. For every Bar awarded a replica of the "Indra's Vajra" in miniature will be added to the riband when worn alone.

Every recipient of any of these decorations who is junior in rank to a Sub-Lieutenant in the Navy, a Second-Lieutenant in the Army, or a Pilot Officer in the Air Force, is entitled from the date of the act by which the decoration has been gained to a special pension, and each additional Bar conferred will carry with it additional pension, for life.

The rates of monetary allowance admissible are as below:—

(*a*) (*i*) Param Vir Chakra.—Rs. 50 p.m. (Rs. 70 p.m. in the case of J.C.Os. who have previously been awarded an award of the second Order of gallantry, such as the I.O.M.).

(*ii*) Each Bar to PVC—Rs. 20 p.m.

(*b*) (*i*) Maha Vir Chakra.—Rs. 30 p.m. (Rs. 50 p.m. in the case of J.C.Os. who have been previously awarded a gallantry award of the 3rd order such as the M.C.).

(*ii*) Each Bar to M.V.C.—Rs. 10 p.m.

(*c*) (*i*) Vir Chakra.—Rs. 20 p.m.

(*ii*) Each Bar to Vr.C.—Rs. 8 p.m.

On the death of such a recipient of the Chakra the pension will be continued to his widow until her death or remarriage.

Another gallantry decoration named the Ashoka Chakra in three grades, Class one, Class two and Class three, has been instituted for acts of gallantry other than in face of the enemy. This also comes into force with effect from August 15, 1947.

Class I of the Chakra will be awarded for most conspicuous bravery, or some daring or pre-eminent valour or self-sacrifice. Class II of the Chakra shall be awarded for conspicuous gallantry and Class III, for gallantry.

Members of Armed Forces and civilians alike are eligible for this award.

If a recipient of the Chakra of any of the three classes shall again perform such an act of gallantry as would have made him or her eligible to receive the Chakra of the same Class, such further act of gallantry shall be recognised by a Bar to be attached to the riband by which the Chakra is suspended and, for every subsequent act of gallantry, an additional bar shall be added and such bar or bars may also be awarded posthumously. For every such bar, a replica of the Chakra in miniature shall be added to the riband when worn alone,

If a recipient of the Chakra of any of the three classes shall again perform such an act of gallantry as would have made him or her eligible for the award of a Chakra of a class different from the one already received, such further act of gallantry shall be recognised by the award of another Chakra of the appropriate class. On those occasions, when only the riband is worn, an additional riband pertaining to the appropriate class shall also be worn.

A system of Mention-in-Despatches has also been instituted with August 15, 1947 to recognise distinguished and meritorious service in operational areas and acts of gallantry which are not of a sufficiently high order to warrant the grant of gallantry awards. The terms of eligibility for Mention-in-Despatches are the same as for gallantry awards. Names may be included posthumously and there is no objection to a person's name being mentioned in more than one despatch.

The following are the details of Republican India's new awards won by members of the Armed Forces:—

INDIAN ARMY
Param Vir Chakra—5 (3 posthumous).
Ashoka Chakra Cl-I—2 (1 posthumous).
Maha Vir Chakra—48 (17 posthumous).
Ashoka Chakra Cl-II—7 (1 posthumous).
Vir Chakra—284 (55 posthumous).
Ashoka Chakra C1-III—17.
Mention-in-despatches—1,112 (35 posthumous).

INDIAN AIR FORCE
Ashoka Chakra Cl-1—1.
Maha Vir Chakra—4.
Ashoka Chakra Cl-II—4
Vir Chakra—30 (2 posthumous).

The new gallantry decorations awarded by the Republic of India will be the first in order of precedence for wearing medals by the Defence Services with effect from January 26, 1950. Campaign medals to be instituted on or after January 26, 1950 will come next. Commemorative medals, *e.g.* Independence Medal awarded on August 15, 1947 will follow Campaign Medals and State Medals and Commonwealth awards will come last. The *inter-se* order of priority of new gallantry decorations will be Param Vir Chakra, Ashoka Chakra Class I, Maha Vir Chakra, Ashoka Chakra Class II, Vir Chakra, Ashoka Chakra Class III.

RECENT EXPLOITS

A short sketch of the work of the Indian Armed Forces after August 1947 may be given here.

Unprecedented disturbances broke out in the Punjab in the weeks following the partition of the country, resulting in large scale movement of population. The Army, whose aid was sought for tackling the problem set up in September 1947, a Military Evacuation Organisation on which fell the responsibility for rescue and movement of hundreds of thousands of refugees between the two new Dominions. Within six weeks the Organisation had moved 15 lakhs of Muslims to West Punjab and a larger number of non-Muslims from Pakistan to India. Foot convoys, which were the means of movement for the largest number of refugees were provided with military escort all along the route. The refugee trains were also escorted by the Military.

Unprecedented floods in the Punjab in October rendered the refugee routes unserviceable and Army Engineers worked hard and got them going within a week.

Hardly had the communal disturbances in the Punjab died down after partition in 1947, when the Indian Army was called upon to fight a prolonged campaign in Jammu and Kashmir to throw out large bands of raiders who had poured into the State at several points across the Pakistan border.

Owing to deterioration in the internal situation of Hyderabad State, consequent on the atrocities committed by the militant organisation of Razakars under a man called Kasim Razvi the Indian Union was forced to resort to "police" action in the State.

Indian troops entered Hyderabad territory on the morning of September 13, 1948, and marched along the main Sholapur-Secunderabad road to re-garrison Secunderabad and restore confidence among the panic-stricken people. Another column marched simultaneously from Vijayawada to Hyderabad. Whatever resistance Indian forces met with was from fanatical Razakars; the State forces simply fell back and back on Hyderabad City.

NATIONAL DEFENCE ACADEMY

The Prime Minister, Mr. Nehru, laid the foundation stone on October 6, 1949, of the buildings for the National Defence Academy at Khadakvasala, near Poona, an institution intended to provide basic training for officers in the Army, the Navy and the Air Force. As the construction of buildings will take some time, the scheme has been implemented by the addition of an Inter-Services Wing to the Indian Military Academy at Dehra Dun which commenced training officers for the three Services from January 4, 1949. The new institution, which was then named as Armed Forces Academy, is now re-designated the National Defence Academy, and the Inter-Services Wing is now known as the Joint Services Wing. When the National Defence Academy starts functioning at Khadakvasala, the Joint Services Wing will form the National Defence Academy.

The cadets receive two years' basic training at the Joint Services Wing of the Academy. The Naval and Air Force cadets will later proceed for advanced training to their respective establishments, while the Army cadets will join the Military Wing of the Academy for a further two years' course.

Commandant, National Defence Academy, Dehra Dun: Maj.-Gen. M. S. Wadalia.

EDUCATIONAL INSTITUTIONS

Lawrence Schools.—From funds raised from the public three schools were established one at Sanawar, in the Simla Hills, the other at Lovedale in the Nilgiri Hills and the third at Mount Abu for the benefit of the children of the British soldiers serving in India. After the partition, these schools could no longer function for the limited purpose of imparting education to the children of British troops, and as a result of the committee set up to examine and make recommendations as to their continuance and future development it has been decided to reorganise the schools at Sanawar and Lovedale as public schools to be run by the Ministry of Education.

King George's Schools.—Formerly King George's Military Colleges, these institutions have been reorganised on public school lines with the aim of providing a thorough general education and providing leaders in every walk of life. There are four such Schools situated at Jullundur, Ajmer, Belgaum and Bangalore. The schools are open to all boys irrespective of rank, caste, creed or social status. There is accommodation for 300 boys in each school. 50 per cent seats are offered to the children of Service Officers and civilians, while the remaining are reserved for the sons of J.C.Os. and O.Rs. of the Army and equivalent ranks in the Navy and Air Force. The old privileges and concessions for the children of service personnel (except officers) have been retained, where as a number of scholarships are offered to the children of service officers and civilians. The boys on admission are between 9-11 years of age. Their stay extends over a period of 7 years at the end of which they take the Senior Cambridge Examination.

School of Foreign Languages.—A school of foreign languages was established on February 1, 1949, at New Delhi to impart instruction in certain foreign languages to officers of the Armed Forces who are required to know certain foreign languages. As facilities for the teaching of foreign languages do not exist in this country to the necessary extent, it was decided to start a regular school for the purpose.

Other Ministries have also taken advantage of this school, and a large number of civilian officers and Non-Gazetted staff from them are now attending the school.

College of Military Engineering.—A School of Military Engineering was started in 1943, at Roorkee. Officers of the Corps of Engineers were given technical, tactical and administrative training at the school during the last war. After partition this school moved to Kirkee near Poona. The scope of instruction given at the school has considerably increased. Now the officers of the Corps of Engineers, Corps of Signals and Corps of Electrical and Mechanical Engineers are trained upto a degree standard in civil, telecommunication and Electrical and Mechanical Engineering respectively. The status of the school has now been raised to that of a college. Permanent buildings for the college are now under construction.

Armed Forces Medical College.—This institution was established by the amalgamation of the following wartime units:—

Army Medical Training Centre, Poona.

Army School of Hygiene.

Army School of Radiology.

Central Military Pathology Laboratory and Blood Transfusion Unit.

For Clinical Training, Military Hospital, Poona (Post-Graduate) a thousand bedded hospital is available for the College students.

The College trains junior and senior medical officers and specialists in various branches of the medical profession. Other Ranks are also given training in various technical branches to Laboratory Assistants, Radiographers, Sanitary Assistants, Blood Transfusion Orderlies and Dispensers. The Institution also provides the Armed Forces with all biological and chemical reagents for diagnosis of the diseases and blood transfusion material and equipment. It also manufactures dry plasma for transfusion purposes.

Applied research for prevention of diseases and maintenance of health is carried out in various departments of the College. Fundamental work in connection with these problems is also being prosecuted.

The following new departments were opened in the College during 1950: Virus Research Unit; Department of Anti-biotics; Department of Chemistry and Entomology. Selected civilian doctors are also offered facilities at the institution for advanced training in various branches of the medical profession.

Defence Services Staff College.—A new staff college, designated as the "Defence Services Staff College" has been established at Wellington (Nilgiris), South India, after the partition. Unlike the pre-partition Staff College, which was meant for training the Army Officers only, the new Defence Services Staff College trains every year about 100 officers drawn from all the three Services. The object of the training imparted at the Defence Services Staff College is to prepare officers to hold 2nd grade or equivalent staff appointments, and in so doing, to fit them, with further experience, for higher staff or command appointments.

The Air Technical College.—In order achieve self-sufficiency in technical training its personnel, the I.A.F. has established a Tec nical Training College. At the present momer the technical instructional staff of the Colle includes a few British instructors, but it expected that they will be replaced by I.A. personnel entirely in the course of a few yea

Naval Schools.—The Navy lost practical all its important Training Schools almost a of which were located in Karachi. These hav now been re-created at Cochin. They are a housed in temporary structures, which it hoped will be replaced by permanent ones ov a period of years.

There are a number of other Training Inst tutions which have had to be established c reorganised to meet the needs of one or th other of the Services. In spite of the existenc of these establishments, it is still necessar to send officers and men for training abroad That necessity will continue for some years t come. It is with some difficulty, however, tha the requisite number of vacancies at the Trainin Institutions abroad are secured.

INDIAN SOLDIERS', SAILORS' AND AIRMEN'S BOARD

These Boards are probably the most impor tant and valuable non-official institution connected with the Armed Forces. They were constituted in 1919, in place of the Centra Recruiting Board, the purpose of which was fulfilled with the end of the First World War. The object was at the outset to deal with a numbe of post-war problems—the finding of employment for ex-Servicemen released from the colours the relief of the dependents of those who had lost their lives in the war and of those who were incapacitated for further service, the education of ex-Servicemen's children and the safeguarding of the general interests of Serving personnel and their dependents. As years passed, the Board had gradually to adjust itself to normal peace conditions and it was decided to maintain it permanently for a series of duties which have from time to time expanded and developed.

The Board on 31st December 1922 had the residue of the war fund, known as the Imperial Indian War Relief Fund handed over to it. This formed the nucleus of its finances. The latter have since been husbanded with great care. The face value of the securities constituting the fund amounted on 31 March 1951 to Rs. 11,97,700, bearing an annual interest of Rs. 35,931.

The Board has its seat at New Delhi and co-ordinates the activities of State Boards which exist in each State. Under the control of these State Boards there exists throughout the country a network of District Boards reinforced in some cases by Tehsil or Taluka Committees and other kindred bodies.

Meetings of Indian S.S. and A. Board are normally held once a year.

The State Board is at the head of the State organisation and is normally located at the capital of the State. The Patron of the Board is H.E. the Governor and the President is the Chief Minister (or a Minister nominated by the Patron). The Secretary is usually a civilian officer in the State Secretariat, attending to these duties in addition to his own. But with a view to strengthening the organisation whole-time ex-army or State Service officers have been appointed in replacement of the part-time Secretaries in some of the State Boards.

The working unit is the District S. S. and A. Board, normally located adjacent to the Deputy Commissioner's or the Collector's office. These Boards are established in all districts from which recruits have been obtained in sufficient numbers. The President of the Board is the Collector or the Deputy Commissioner. Each Board has a paid Secretary, usually an ex-I.C.O. or ex-J.C.O.

In the more heavily-recruited districts, Tehsil or Zail sub-committees are formed with the Tehsildar, Zaildar or Mamlatdar as President and an Honorary Secretary, where necessary. These sub-committees are represented on the District S.S. and A. Board.

In February 1947, Army Headquarters appointed Recruiting officers as Military Vice-Presidents with the express object of assisting D.S.S.A.B. in their welfare duties.

From 79 District S.S. & A. Boards in 1939 when World War II broke out, the number has now risen to 174 in all.

OBJECTS

The following are the objects and duties of the District Soldiers', Sailors,' and Airmen's Boards:—

(*a*) Constantly to endeavour to promote and maintain a feeling of good-will between the civilian and military classes;

(*b*) To give all possible assistance to the President of the Board in his capacity as head of the district in all administrative matters connected with the ex-Serviceman or his family;

(*c*) To demonstrate the benefit of and so promote the desire for mutual co-operation between ex-Servicemen and civilian officials;

(*d*) To represent and explain to the civil authorities all matters of particular moment to ex-Servicemen that require the attention of the local administration;

(*e*) Generally to watch over the welfare of the ex-servicemen and their families, and the interests of serving personnel absent from home, with their units.

As regards item (*e*), quoted above, the function of the Board and corresponding organisations cover a wide range. Their main tasks are enumerated below:—

(*a*) To ascertain and intimate the whereabouts of an absent Serviceman to his dependents and to communicate to him news of all important matters affecting his family's welfare.

(*b*) To procure legal advice in the case of a law-suit against an absent Serviceman where there is no male member of his family capable of protecting his interests;

(*c*) To assist an absent Serviceman's family in the event of disease or famine;

(*d*) To assist ex-Sevicemen and their dependents in securing medals, pensions, arrears of pay, etc.;

(*e*) To investigate cases of ex-Sevicemen invalided out of the Indian Armed Forces for chronic diseases such as tuberculosis, leprosy, diabetes, etc., and to report them to the State Branch of the Indian Red Cross Society for medical assistance;

(*f*) To investigate applications for relief from the various military charitable funds.

The Indian Soldiers', Sailors' and Airmen's Board Fund is now used primarily for payment of special pensions to blinded ex-Servicemen, and to meet the expenditure on miscellaneous items such as bank charges, audit fees, etc., in connection with the administration of the fund. The surplus interest on investments is being utilised towards the maintenance of the District Soldiers', Sailors' and Airmen's Boards.

OTHER FUNDS

The following Central funds which are not under the control of the Indian Soldiers', Sailors' and Airmen's Board deserve mention:

1. *Armed Forces Benevolent Fund.*—This fund exists primarily for the alleviation of Indian Armed Forces and their dependents. This inter-services fund provides for relief grants to the disabled ex-Servicemen and dependents of those who lost their lives on active service and also for educational scholarships to children of ex-Servicemen killed in action.

The Defence Minister is the chairman of the General Committee of this fund, and the Defence Secretary is the Vice-President. The three Service Chiefs, the Adjutant General and the Financial Adviser are members of the board and the Secretary of the Indian Soldiers', Sailors' and Airmen's Board acts as its secretary.

2. *Flag Day Fund.*—The object of the Flag Day Fund is to provide relief for ex-Servicemen and amenities to serving personnel. The fourth Flag Day was organised on December 7, 1951 and contributions were collected from all parts of the country. The composition of the Managing and Working Committees of this fund is the same as for that of the Armed Forces Benevolent Fund. The 1950 collections amounted to nearly Rs. 8,61,129.

3. *Armed Forces Reconstruction Fund.*—The fund known as the Military Reconstruction Fund was initiated in 1942. The Government of India decided to contribute monthly to this fund at the rate of Rs. 2 for each combatant and Re. 1 for each non-combatant. Contribution to this Fund ceased on March 31, 1946. It was decided that 80 per cent of the fund should be distributed to Provinces and States to be administered by Provincial and State Committees and the remaining 20 per cent administered by a Central Committee. This Central portion of the Fund is known as "The Armed Forces Reconstruction Fund." This Fund was finally deemed to have been duly constituted on July 20, 1946.

The purposes of this fund are as follows:—

(*a*) Primarily to provide measures of a permanent nature to benefit those now serving and those who will in future serve in the ranks or as non-combatants enrolled in the Indian Armed Forces and their families. The fund will not normally be used to make individual grants.

(*b*) Finance measures relating to education, family welfare in the Lines, Servicemen's and Servicewomen's welfare in the Lines, Collective care of the disabled, Grants to Soldiers', Sailors' and Airmen's Board and setting up of ex-Servicemen's colonies in the States.

The Constitution of this Fund is the same as that of Armed Forces Benevolent Fund.

4. *The Army Central Welfare Fund.*—The object of this fund is to relieve distress among Indian Army Servicemen, ex-Servicemen and their dependents and to look after the welfare of the men and their families in the lines.

5. *The Indian Naval Benevolent (Association) Fund.*—This fund exists to relieve hardship or distress among certain categories of naval officers, ratings and their dependents.

6. *The Indian Navy Amenities Fund.*—This is a non-public fund maintained at Naval Headquarters and administered by:—

(*i*) The Commander-in-Chief, Indian Navy.

(*ii*) The Chief of Staff, Indian Navy.

(*iii*) The Chief of Administration, Indian Navy.

(*iv*) The Judge Advocate of the Fleet.

(*v*) The Chief of Personnel, Naval Headquarters.

Its income from investments and any grants made specially for expenditure during the year are utilised to make grants to Ships or Establishments for any welfare project or amenities (whether for officers or ratings) which commend themselves to the Administrators. The Sports Funds of Ships or Establishments are required to make quarterly contributions to the Indian Navy Amenities Fund and such contributions are treated as "Capital" and invested as and when occasion arises.

7. *The Indian Air Force Benevolent (Association) Fund.*—This fund exists to relieve hardship or distress among all ranks, past and present, of the Indian Air Force, and their dependents, especially those disabled by flying.

8. *The Indian Air Force Central Welfare Fund.*—This fund exists:—

(*a*) To assist messes, institutes and clubs both existing and to be formed, by grants and loans.

(*b*) To provide amenities such as indoor and outdoor games, radios, musical instruments, stage material, library books, etc. for Indian airmen.

(*c*) To make grants on behalf of the Indian Air Force charitable and philanthropic organisations which provide assistance to past and present members of the Indian Air Force and their dependents.

(*d*) To provide measures of a permanent nature for

(*i*) Servicemen's Education,

(*ii*) Family Welfare in lines,

(*iii*) Collective care of disabled Airmen, and

(*iv*) Grants to Soldiers', Sailors' and Airmen's Boards.

(*e*) To provide Maternity and Child Welfare facilities and Women's Institutes for families of Royal Indian Air Force Airmen.

(*f*) To provide assistance in the education of Airmen's children.

(*g*) To assist in construction of sports grounds at units, when such grounds are not provided at Government cost.

(*h*) To provide anything considered essential for the welfare and well-being of Indian Air Force personnel which is not provided at Government cost and is considered to be beyond the means of the personnel themselves.

ST. DUNSTAN'S (INDIA) FUND

St. Dunstan's (India) Fund is a charitable fund administered by a trust formed, under the Charitable Endowments Act, 1893, under the Chairmanship of the Hon'ble Defence Minister. The present assets of the Fund exceed Rs. 10 lakhs.

The predecessor body of this Fund, the Indian St. Dunstan's Committee opened a St. Dunstan's Training Centre in Dehra Dun in 1945 for the training of the war blinded servicemen in order to equip them with some trade of their choice. The main trades taught were knitting, spinning, rope and net making, blanket and cloth weaving, mat, basket and newar making. About 250 men have returned to their homes after receiving training at this institution and a grant for their resettlement. As the number of war blinded trainees was considerably reduced, the institution was made over to the Ministry of Education for the training of the civilian adult blind.

A skeleton After-Care Organisation of St. Dunstan's has been set up at Dehra Dun under the chairmanship of the Commandant, National Defence Academy. This Organisation will continue to render assistance and advice to the war-blinded ex-Servicemen, in their multifarious problems and try to resettle them in the place of their choice and to make them, as far as possible, economically independent.

THE CO-OPERATIVE MOVEMENT

THE outstanding feature of the rural economy of India is the appalling poverty of the rural population. The various estimates, official and non-official, that have been made of the income per head of population at various times leaves the matter absolutely in no doubt. The extent of an average holding, which is about 6 acres, for an agricultural family of 5 persons is too inadequate to maintain it in ordinary comfort even with the low standard of living which is so chafacteristic of the rural population. Moreover, cultivation is in a large measure exposed to the vagaries of the monsoon. In every 5 years there is but one good year, one bad year and three indifferent years. These unfavourable conditions might be mitigated to some extent by a well conceived policy of irrigation by the State; but so far, of the total cultivated area in the country, about 16 per cent. only has irrigation facilities from rivers, tanks or wells while the remaining 84 per cent. depends wholly on rainfall. Thus the frequency of failure of crops, owing to drought and floods, frost and pests, coupled with the low vitality and high mortality of the live-stock, render the economic position of the cultivator worse still. The inadequacy of the subsidiary occupation to supplement the slender income from agriculture contributes further to his extreme economic weakness. He has sufficient spare time on his hands to devote himself to subsidiary occupations but he has been exposed to the full blast of the competition of forces from the rest of the world and many of the industries on which he relied in the past have suffered largely from, or been wiped out by the competition of machine-made articles. He is now being drawn steadily into the sphere of influence of markets both national and international and he has neither the organisation nor the credit facilities to help him as in countries like the United States of America or Canada or some of the European countries. Though the recent rise in the prices of agricultural products has benefited him, his position remains essentially weak. In addition to these numerous difficulties, the agriculturist has another serious handicap in that he is largely illiterate. The percentage of literacy in India is still very low being only 13 per cent. and any progress in agriculture is well-nigh impossible without the background of general education. All these factors lead to what is the most outstanding feature of the rural economy of India—the chronic indebtedness of the cultivator.

RURAL INDEBTEDNESS

The Central Banking Enquiry Committee (1931) estimated that the total rural indebtedness of India was about Rs. 900 crores. The great rise in prices during the war and post-war period has lightened this burden and it may be fair to assume that rural indebtedness has come down to Rs. 500 crores. This colossal burden of debt is the root problem which has got to be faced in any attempt towards the economic regeneration of the masses. A peculiar feature of this indebtedness is that the debt which remains unpaid during the lifetime of the cultivator who contracts it passes on as a burden to his heirs, so that many agriculturists start their career with a heavy burden of ancestral debt which they in their turn pass on with some further increase to their successors. Ignorance and improvidence, extravagance and conservatism have further been held as the reasons for the continued growth of this heavy load. A marriage festival in the family tempts the cultivator to launch out into extravagance while funeral ceremonies prove no less costly. All these factors—the uneconomic nature of the agricultural industry, the chronic and heavy indebtedness and illiteracy all form a thoroughly depressing background to the rural economy of the country.

It is no wonder that under the circumstances detailed above the agriculturist has constant recourse to borrowing and that too not only for any permanent improvement that he may contemplate but for his current agricultural needs as also for periodical unproductive purposes such as weddings and funeral ceremonies. The absence of any banking organisation in the country-side has driven him into the arms of the *sowcar* or the *mahajan* who, while proving a very accommodating person, has acquired a grip on him from which the cultivator has found it impossible to extricate himself. The usurious rates of interest charged, coupled with various devices which increase still further the actual rate of interest, and the numerous services which the *sowcar* performs as a retail tradesman and the buyer of the cultivator's produce, make the *sowcar* the dominant force in the village, reducing the agriculturist to a position of absolute serfdom.

In 1883 the Land Improvements Loans Act was passed and this was followed in the next year by the Agriculturists' Loan Act enabling Government to advance loans repayable by easy instalments and at low rates of interest for improvements and also for current agricultural needs. In 1899 a Madras civilian submitted a report to the Madras Government on the possibility of introducing land and agricultural banks and the discussion thus initiated by him was continued by Mr. Dupernex, U.P. civilian in his "Peoples Banks for Northern India" (1900). The caste system of the Hindus and the ideas of common brotherhood among the Moslems were evidences of the peoples' natural aptitude for co-operation and the *nidhis* of Southern India furnished a practical proof of this aptitude. In 1901 the Government of the day appointed a committee to consider the question of the establishment of agricultural banks and the report of this committee resulted in the passing of the Co-operative Credit Societies' Act of 1904. The co-operative movement was thus launched in the country on the 25th March, 1904. The Act aimed at encouraging thrift, self-help and co-operation among agriculturists, artisans and persons of limited means and the societies that were to be started were intended to be small simple credit societies for small and simple folks with simple needs and requiring small sums only. Knowledge of and confidence in their fellow members which are the keynote of success were ensured by providing that a society should consist of persons residing in the same town or village or group of villages and should be members of the same tribe, class or caste. In order to provide facilities in urban areas for the small man, urban societies were also permitted. The Act introduced the principle of unlimited liability for rural societies. The local Governments were empowered to appoint special officers called Registrars of Co-operative Societies, whose duty it would be to register societies formed under the Act, to get the accounts of such societies audited by a member of their staff and in general to see that the societies worked well. The seed thus sown has grown in the course of 45 years into a fine tree with twigs and branches, spread out in many directions.

Since the launching of the movement in 1904, there have been amendments of the co-operative law and committees and commissions of enquiry to remedy defects and to suggest further lines of action.

GROWTH OF CO-OPERATION

In the first few years of the movement the number of societies grew very slowly but the growth was considerably accelerated from 1910 and the average number of societies from 1910 to 1915 was about 12,000. The pace of growth still further quickened after 1915 and now there are 1,42,677 agricultural societies and 27,273 non-agricultural ones. Progress in different parts has not been uniform. Uttar Pradesh and Madras have large number of societies while other major States like Bombay, Bihar, Madhya Pradesh and Assam show smaller figures. Punjab with 13,251 societies comes first in the number of societies (105·1) per one lakh inhabitants, while West Bengal comes second in that respect with 63·9. The progress in smaller areas, like Coorg and Ajmer, must be regarded as very satisfactory in view of their small population, since the number of societies per one lakh inhabitants works out in their case at 202·9 and 130·5 respectively. It is satisfactory to note that the co-operative movement has also spread in the B, C and D States. The total number of members of primary societies stands on the 30th of June 1950 at 126 lakhs. Taking the normal family at a little under 5, it is clear, that about 6½ crores of people in India are being served by this movement. There is no single movement rural or urban fraught with such tremendous possibilities for the uplift of the masses as the co-operative movement and other is no other movement which affects such a large percentage of the population. Among the States Bombay and Madras lead in the number of members of societies, 61.3 and 56.4 per one thousand inhabitants respectively, Punjab and West Bengal rank thereafter. This shows that the size of societies varies in different States and that Bombay, while having a smaller number of societies, has a larger average of membership per society as compared with the other States. Of the smaller areas Coorg takes a leading place with 265.2 members per one thousand inhabitants, while Hyderabad has an average of 81.6. Membership is a much better test in many respects of progress than the number of societies and from this point of view, the progress in Madras, Bombay, Coorg and Hyderabad must be regarded as quite satisfactory. There is also a third aspect of the growth of the movement. The number of societies, or the membership in the societies alone is not an index of the work that is being done and of the benefits which are being conferred by the movement. The societies are predominantly credit organisations or rather small banking institutions and the part that they play can be better appreciated from their working capital than from the number of members. In this direction the rapid progress so far achieved by the movement should also be noted. From about Rs. 68 lakhs, which was the average up to 1910, the working capital has advanced very rapidly and stands in 1950 at about Rs. 2,33 crores. It is gratifying to note that this large sum has been derived mostly from non-Government sources. The share capital, reserve fund and deposits together constitute above Rs. 173 crores. The State (Provincial) or Central banks and other societies contribute less —55 crores while the non-members or the outside public contribute about 55 crores. This latter item shows to a remarkable extent the growth of public confidence in co-operative institutions and speaks well in general of the management of the societies and the very useful purpose they serve in the banking organisation of the country. The distribution of the working capital by States gives us a further insight into the progress made in this direction by the co-operative movement in different parts of India. Bombay leads in their respect with 337 annas per head of population. Madras, Punjab and West Bengal come next with 210, 152 and 113. Among the smaller areas, Coorg comes out first with 473 annas per head of population while Ajmer comes second with 169. Of the States B and C Classes Mysore, Pepsu, Madhya Bharat, and Hyderabad have 107, 78, 77 and 76 respectively. Bombay is easily first in the matter of deposits from individuals which amount to more than 31½ crores out of a total working capital of 60 crores and this is one of the best tests of the success of a co-operative society. There has been very rapid progress in the number of societies, in their membership and in the working capital of these societies. Bombay and Madras lead in many respects, Uttar Pradesh showing a spurt in recent years. The smaller areas and the former Princely States have also achieved considerable progress though the movement there started comparatively later. The agricultural societies predominate in all the States while non-agricultural, that is, urban societies show a much slower development.

But before we proceed, we must explain the chief component parts of the structure as it has now been built up.

FINANCIAL STRUCTURE OF THE MOVEMENT

Apart from the comparatively few co-operative societies at present working for non-credit purposes, whether in urban or rural areas, a co-operative society largely means a small bank or a credit institution for providing financial accommodation to its members on a co-operative basis. Of these credit institutions, by far the greater proportion is rural. The rural credit society has, for its main purpose, the financing of the agriculturist and as such it needs funds. The original idea of co-operative credit lies in making available to the needy the surplus of the well-to-do brethren through the medium of the society but in the villages, the well-to-do and the needy rather form distinct groups, the former playing or trying to play the *sowcar*. Thus instead of comprising more or less all sections of the population of the village, a society is very largely made up of the needy section. Even if it was not, the slender savings of the well-to-do would not be enough to meet the wants of the needy and a village society cannot, therefore, be self-sufficient, making available the deposits of its well-to-do members as loans for the needy ones. The heavy load of unproductive debt of the average farmer, his habit of investing his savings, if any, in lands and ornaments, his illiteracy and consequent lack of the banking habit, soon made it apparent that rural credit societies could not be expected to raise the required funds in deposits either from members or locally. The question of funds for the working of a rural co-operative society thus becomes a vital question indeed. Central banks have therefore been brought into existence at the district headquarters in order to raise money from towns and make it available to the primary rural societies. Following up the idea further, it has been found necessary to have a provincial bank at the provincial headquarters to serve as a balancing centre for the central banks and to make available larger funds for the primary societies through the central banking institutions. The financial structure of the co-operative movement is thus largely composed of three parts—(*i*) the Agricultural Credit Primary Society, (*ii*) the Central Financing Agencies, and (*iii*) the State Banks. Obviously one more part in the structure seems possible and desirable, namely, an Apex All-India Co-operative Bank. So far, however, such a bank has not been started but the Reserve Bank of India has of late been giving loans to the State Co-operative Banks, notably in Madras, Bombay, Madhya Pradesh and Orissa.

AGRICULTURAL CREDIT SOCIETIES

The success of these societies is closely related to their very peculiar constitution. In an ordinary joint-stock company, a member is liable only to the extent of the value of his share holding and his liability is therefore limited; but in the case of agricultural credit societies, the liability is unlimited, that is to say, members are jointly and severally liable to the creditors of the society for the full amount of the debts incurred by it.

Credit is a blessing only if turned to productive account; if used up for unproductive purposes, it is a curse. It would enrich the producer but it would only impoverish the consumer. The agriculturist needs money for productive purposes such as his current agricultural needs, land improvement, purchase of stock and implements, manures and seeds, as also for unproductive purposes, such as repayment of old debts, weddings and funerals. In such circumstances, it is imperative for the management of a rural co-operative society very carefully to scrutinise the loan applications and examine the purpose for which loans have been asked and to see that the loan when sanctioned is used for the specific purpose. And yet it is this very respect that co-operative societies have fallen short in their duty.

THEIR RESOURCES

The funds of an agricultural credit society are raised from entrance fees, share capital, deposits or loans from non-members, loans from Co-operative Institutions, loans from Government and the reserve fund. The income from entrance fees and share capital is small compared with the financial requirements of the members. A large source from which funds are derived is deposits and loans. Loans from central banks in fact furnish the bulk of the working capital of these agricultural credit societies at present.

Low dividends and voluntary services resulting in low cost of management have made it possible to divert a substantial proportion of the profits of these societies to reserve funds, and thereby provide against unforeseen losses, bad debts and losses on the realisation of certain assets such as by investment depreciation. The general practice in regard to the use of the reserve fund in the business of the societies is that it is used as ordinary working capital.

The funds collected by the agricultural credit societies in India are at present by no means negligible. They aggregate to about 35½ crores of rupees. Their financial position as on the 30th of June 1950 stood thus :—

	In thousands of rupees
Share Capital	7,16,67
Reserve and other Funds ..	8,12,66
Deposits	4,09,76
Loans	15,81,66
Total Working Capital ..	35,21,75

The figures show that these tiny agricultural societies work with about Rs. 19 crores of their own capital (including members' deposits in this head) as against their outside borrowed capital of about Rs. 16 crores. The owned capital was thus about 54 per cent. of their total working capital, and this proportion is rising steadily as years pass.

CENTRAL FINANCING AGENCIES

The formation of banks in urban areas on co-operative principles, with the sole object of raising funds for advances to societies having been found necessary to place the financial structure of the movement on a sound basis, the Co-operative Act of 1904 was amended in 1912, and the Co-operative Societies Act II of that year provided for the registration of central banks with the sole object of financing societies.

Thereafter the number of central financing agencies grew rapidly specially in the Punjab, West Bengal and United Provinces. The function of these central societies was not only to supply the required capital to the primary societies but also to make the surplus resources of some societies available to other societies suffering from a deficiency of funds and to provide proper guidance to and inspection over them. On 30th June 1950 the number of central banks was 498.

There are four main sources from which a central bank derives its working capital which stood in 1949-50 at 50 crores: (*a*) Share Capital, (*b*) Reserve, (*c*) Deposits, (*d*) Loans.

The paid-up share capital and reserves of central banks constitute the owned resources of these banks as distinguished from borrowed resources and provide the guarantee fund against which additional funds are raised by them in the shape of deposits or loans. It is usual to prescribe a suitable proportion between the owned and borrowed resources of central banks in each State. The most usual proportion observed in practice between the borrowed and owned resources is 1 to 8. Deposits from members and non-members constitute the bulk of the borrowed capital of central banks. The total amount of deposits held by central banks in the year 1949-50 from individuals and other sources amounted to Rs. 23½ crores and from primary societies to Rs. 11 crores. Deposits in central banks are mainly of two kinds, *viz.*, savings and fixed. Current deposits are not universal but confined only to selected central banks in selected areas. The principle usually observed by these banks is not to grant loans to societies for periods longer than those for which deposits are available, and where loans for long periods are advanced the periods of deposits are also comparatively long. In addition to funds obtained by deposits, central banks raise loans from outside banks, from other central banks, from the local provincial bank and from Government. The total amount of loans held by the central banks in 1949-50 from outside banks, from other co-operative banks and from the provincial banks was Rs. 7 crores and from Government Rs. 98 lakhs. Central Banks ordinarily do not directly borrow loans from Government, but, in recent years, Orissa has held Rs. 5½ lakhs. This practice is more common in the B and C States, where Madhya Bharat, Kashmir, Hyderabad Rajasthan and Travancore-Cochin hold from their Government Rs. 1,19,2, and 2 lakhs respectively. Borrowings from outside banks are generally confined to accommodation obtained from the Reserve Bank against Government Securities or Promissory Notes executed by societies in favour of the Central Bank and endorsed by the latter in favour of the Reserve Bank. This accommodation is, however, limited and advances from other joint-stock banks are also now rare. The main source of loans is therefore, the State bank, and where a State bank exists, the central banks are generally prohibited from having any direct dealings with either the Reserve Bank or any other joint-stock bank or with one another. This rule is, however, not rigidly observed in Punjab and Madras. Several central banks, because of their long standing, possess sufficient resources to be independent of any outside financial assistance but they all continue credit arrangements mainly with the State bank on which they rely for emergencies.

In the initial stages, several central banks developed from ordinary urban societies which granted advances to individual shareholders. A few of such central banks have continued the practice and the amount advanced by central banks to individual members during the year 1949-50 was Rs. 8¾ crores chiefly in Bombay and Madhya Pradesh. Advances are made to individuals on the pledge of agricultural produce, thus combining trading with banking which is against sound banking principles and is thus roughly unco-operative since they finance the very middlemen whom co-operative sale seeks to eliminate. Besides, such advances encroach upon the domain of marketing finance and hamper the growth of co-operative marketing. The total advances made by central banks to societies at the end of the year 1948-49 amounted to about Rs. 67 crores.

After meeting management expenses the profits of central banks are distributed as allocations to reserves and dividends to shareholders. The combined net profits of the 496 central banks of the country during the year 1949-50 amounted to Rs. 52 lakhs on the total working capital of Rs. 50 crores; the rate of dividend paid varied from 3 to 6 per cent. in different parts of the country but the most usual rate paid was 6 per cent. per annum.

PROVINCIAL CO-OPERATIVE BANKS

At present, all the A class States have apex banks functioning in them. There are also apex institutions in Mysore, Hyderabad, Ajmer and Coorg. There are 12 such institutions in the whole country. The constitutions of these institutions vary considerably; but the functions of all these institutions are more or less the same, namely, the co-ordination of the work of the central banks and utilisation of finance in them for the entire state. It is found that in a large majority of the apex banks the constitution is a mixed one, that is, both in the general body of the banks as well as in the directorate, there are individual shareholders as well as representatives of co-operative societies and central banks.

All apex banks in the Union depend for their working capital largely on deposits from the affiliated co-operative societies as also from the public. It is, therefore, thought necessary to insist upon the maintenance of fluid resources on a certain scale and in some States the Government has prescribed definite rules with regard to the maintenance of fluid resources. The period for which deposits are accepted determines the maximum period for which they can lend out these borrowed funds to their clients, and in every State the apex bank has fixed for itself a maximum term, beyond which no loans are, in general, sanctioned.

While accepting deposits from co-operative banks and the general public, most of the apex banks have also dealings in current account with the latter. The Punjab apex bank does not encourage such accounts with individual non-members, as it does not wish to enter into competition with central banks. Apex banks also generally carry on ordinary banking business, such as collecting *hundis* and dividends from companies and collecting pay and pensions. As in every banking institution, these banks are also frequently troubled with surpluses and deficits, though at different times in different institutions. There is therefore interlending of surplus funds between these apex banks, and during the period of shortage of funds, deposits are accepted from surplusing banks, and some of them call for special season deposits allowing favourable rates of interest to tide over the period of shortage.

LAND MORTGAGE BANKS

The loans advanced by co-operative societies to their members and by the central financing agencies to their constituent societies are, from the very nature of the source from which they derive the bulk of their finance, for short or intermediate terms only. By concentrating upon the growth and multiplication of rural credit societies and thus upon facilities for short and intermediate term loans, the co-operative movement did not provide for the redemption of old debts or for increasing the earnings of agriculturists which alone would prevent any further increase in their debts and pave the way for the paying off of the old ones. And it is to supply the need for long-term loans to the agriculturists for land improvement and for the redemption of old debts that land mortgage banks have come into existence.

There are three main types of such banks. The strictly co-operative type is an association of borrowers who raise credit by the issue of mortgage bonds bearing interest and made payable to bearer. The commercial type works for profit and declares dividends. The third type—the quasi co-operative—has a mixed membership of borrowers and non-borrowers, operating over fairly large areas and formed with share capital and on a limited liability basis. The banks organised so far in the country are of the co-operative type, though strictly speaking they belong to the quasi co-operative variety, admitting as they do to the membership a few non-borrowing individuals for attracting initial capital as well as business talent, organising capacity and efficient management.

Bombay, for instance, has 19 land mortgage societies and a central Land Mortgage Bank, which have been successfully carrying on their business. Bengal has 2, Assam 2, Madhya Pradesh 26, while Madras has 126 primary land mortgage banks and a central land mortgage bank. Orissa, Mysore and Travancore-Cochin, each has a Central land mortgage bank and Mysore has 79 primary and mortgage societies. It is too early to pronounce on the success or otherwise of these few banks. The bulk of the funds of these banks have to be raised by debentures and for these purposes there will have to be in the States central land mortgage banks as in Madras, Bombay, Orissa and Mysore. Government will have also to render assistance to these institutions for the success of the debenture issue, and its guaranteeing the interest ought to meet all reasonable needs, though in special cases there would not be much harm in the Government's purchasing debentures of a certain value. The recent rise in the value of agricultural lands has tempted the agriculturist to sell one or more of the plots he holds and pay off a large part of his debts to the *sowcar* and to the Land Mortgage Bank from the price realised, so that the business of the land mortgage banks has been decreasing considerably. This factor with the low yield on investments has been causing some anxiety.

The operations of the Land Mortgage Banks and Societies in India during 1949-50 were as under:—

Number of Banks 5, with membership 8,871.

Number of Societies 283 with membership 1,86,330.

	Rs.	Rs.
Share Capital ..	26,67,776	46,05,911
Debentures from the public ..	5,81,75,234	8,75,877

Loans made to Banks and Societies ..	1,01,08 270	....
Profit	5,48,061	2,18,987

In the initial stages of the movement, it fell on the Registrar to carry on propaganda and organise co-operative societies. For this purpose the assistance of non-official honorary workers was imperative and in the various States a band of such workers was brought into existence, who as honorary organisers of the district or talukas actively co-operated with the officials in carrying on propaganda, organising new societies as a result thereof and looking after the societies so started in some measure. With the rapid growth of co-operative societies, however, it was felt that for the further propagation of the movement it was desirable to carry on work by co-operators themselves in a more organised manner and for that purpose co-operative institutes were started in the various Provinces. In 1930, the All-India Co-operative Institutes' Association was established to co-ordinate the activities of the provincial institutes, to formulate non-official co-operative opinion on important co-operative problems from time to time and to encourage the growth of co-operative literature, and has now been merged in the Indian Co-operative Union since May 1949.

NON-CREDIT AGRICULTURAL CO-OPERATION

For some years past increasing attention has been directed to other forms of co-operation for the benefit of the rural population. Credit is but one of the needs of the cultivator; its organisation through co-operation touches but the fringe of the problem; and different provinces have been experimenting upon the application of co-operative organisation to meet their various non-credit needs. The problems of irrigation, consolidation of holdings, improved sanitation, fencing, cattle insurance, dairying and supply of agricultural requisites, and above all the marketing of agricultural produce have been therefore engaging the attention of co-operators and societies for these purposes have been established here and there and have been working with varying success. In a land of ignorant and illiterate agriculturists, it would appear wiser to adopt the rule of one village, one society; but the complexities of the non-credit forms of co-operation had induced the authorities to avoid the multi-purpose or general society and to favour the single purpose society, and we had the curious spectacle of an agriculturist being viewed as a person with a bundle of several needs, each one of which it was proposed to meet separately. A single society trying to meet all the needs of the agriculturist would attack the *sowcar* on all fronts and would become a live force in the village and tend to promote the ideal embodied in the famous phrase: Better living, better farming and better business. However, co-operative opinion is fast coming to accept the wisdom of this and discard the theory of almost water-tight compartments. The agricultural non-credit societies in India on the 30th June 1950 were 25,860 distributed as under:—

Non-Credit Agricultural Societies, 1949-50.

States	Purchase and sale	Production	Production and sale	Other forms of co-operation	Total
Madras	1,130	853	1,130	5	3,118
Bombay	242	497	293	164	1,196

Madhya Pradesh	821	9	97	....	927
Mysore	1,416	10	45	....	1,471
Hyderabad	142	23	....	216	381
Others	1,207	246	247	486	2,186
Total ..	5,320	6,011	9,874	4,655	25,860

MARKETING SOCIETIES

Of these the most important are the marketing societies particularly for the sale of cotton in Bombay, and the consolidation of holdings and better living societies in the Punjab.

Marketing of Agricultural produce is the real crux of the whole question of rural prosperity and betterment, and as group marketing is always more effective than individual marketing especially in India where the individual producer is illiterate and constitutes a small unit, co-operative marketing has been accepted now as one of the most desirable ideals to work for. It is only the complexity of the working of co-operative sale societies, the difficulty of providing marketing finance, the lack of expert knowledge on the part of co-operative officials, and the lack of godown and storage facilities that have prevented the rapid multiplication of sale societies and their efficient working. The jute and paddy sale societies of West Bengal have not met with success, but the cotton grower in Gujarat, Khandesh and the Bombay Karnatak has reaped considerable benefit from the cotton sale societies. A few societies for the sale of other articles have also been organised in Bombay, such as for the sale of jaggery, tobacco, fruits and vegetables, chillies, paddy, onions and arecanut. West Bengal has several jute sale societies with a Jute Wholesale at Calcutta and paddy sale societies with a sale depot in Calcutta. Punjab has several commission shops to provide storage facilities so that the grower could wait for better prices, but which sell to local merchants yet, rather than to the merchants at the port. Madras has a number of sale societies, but their transaction is small and they have not yet made much progress. The United Provinces have organised the sale of sugarcane very effectively through Sugarcane Societies and the Marketing Union. Recently provincial co-operative marketing societies have been started with Government encouragement and assistance in Madras and Bombay the results of the working of which will be watched with great interest by co-operators all over the country. Both these Societies have been rendering useful service to the country by undertaking on behalf of Government work in connection with the distribution of manures, and other agricultural requisites, and rationing. It is indeed high time that Government gave to marketing societies consistent patronage in a fuller measure and linked up Co-operative Credit effectively with marketing.

During 1949-50, the value of goods sold amounted to Rs. 63 crores and the value of goods received amounted to Rs. 61 crores.

Purchase and Sale Societies, 1949-50. (*In lakhs of rupees.*)

State	Value of goods Received		Sold	
	As Owners	As Agents	As Owners	As Agents
Madras	17,43	24	17,37	27
Bombay	11,02	43	11,86	45
West Bengal	50	6	53	6
Uttar Pradesh	16,08	7	16,50	7
Madhya Pradesh	1,50	3	1,64	3
Punjab	50	....	47	....
Bihar	1,23	....	1,35	....
Orissa	1,06	24	1,50	24
Assam	5,70	....	6,03	....
Mysore	1,24	....	1,19	....
Hyderabad	51	....	50	....
Rajasthan	77	....	75	....
Travancore-Cochin	77	....	80	....
Delhi	58	1	61	1
Others	1,07	....	1,02	1
Total	59,96	1,08	62,12	1,14

Even agricultural credit societies and their central banks are doing non-credit work and are competing with marketing societies in a rather unfair way. This tendency is most marked in Bombay, where credit societies received goods worth Rs. 10 crores and sold goods worth Rs. 14 crores.

RURAL RECONSTRUCTION

One of the main reasons why the achievements of the co-operative movement fall so short of the expectations of the promoters and workers is the extreme backwardness of the rural population, and so the ultimate success or otherwise of the co-operative movement is bound up with general rural development and progress. The co-operative movement itself is a great experiment in rural reconstruction aiming to protect the agriculturist from exploitation by the usurer, the middleman—*dalal* and the merchant. Rural reconstruction has, however, of late years claimed an increasing amount of attention.

The old undivided Punjab was responsible for a very desirable type of co-operative society to promote better living among the members. The societies do not collect any levy from their members, except a small entrance fee and they lay down a programme of work and make rules for carrying it out from year to year, violation of which is punishable with fine under the by-laws. Though these societies in the first instance have for their object the curtailment of ruinous expenditure on marriages and other social occasions, they have also helped in various other matters. Some of these societies have levelled and paved and swept the village lands, some have promoted sanitation, some have induced the villagers to improve ventilation in their houses, some have repaired and roofed the village drinking well, some have arranged that all manure should be pitted, some have discouraged expenditure on jewellery, and some have stopped waste on farms. Thus in a variety of ways these societies generally have been great factors in the improvement of conditions in the life of the village. There were more than 1,080 such societies in the Punjab in 1949-50.

URBAN CREDIT SOCIETIES

While the chief objective of the co-operative movement was from the first to do service to the rural population, it must be remembered that the Act of 1904 permitted two classes of societies—rural and urban, recognising thus the suitability of the co-operative method for solving the problems of urban population also. At present there are in all 27,273 non-agricultural societies with a membership of 46,15,484. Of these, 7,534 are credit societies, the rest being societies for other purposes.

An important class of the urban population is that of the merchants and traders, and though the joint-stock banking system that has so far developed is quite well suited in many respects for them, from the point of view of the small trader, it is co-operative banking that is obviously wanted. The importance of People's Co-operative Banks promoted for the benefit of urban people without any distinction of caste or creed is, therefore, very great, for the financing of small merchants, artisans and craftsmen, and for the stimulation of trade and industries in and around district and taluka towns. The principal business of these banks is short-term credit and in this respect they resemble the ordinary commercial banks. In the absence of any industrial co-operative bank, it is also for the peoples' bank to finance small industrialists and help the development of cottage industries which still play a very considerable part in industrial economy. It is only, however, in Bombay and Madras that we meet with some good institutions functioning as peoples' banks. In Madras there are 1,191 non-agricultural credit societies but most of these are not real peoples' banks. Bombay has 1,496 societies and Punjab has 453 societies. Even here we hardly find any development of real peoples' banks. In West Bengal the societies number 385 and though these societies seem to have won public confidence the more important of them are salary earners' credit societies. Some of the divisions of the State have several big concerns, however, working on sound lines. The question of starting peoples' banks in Bihar and Orissa has not yet been seriously taken in hand. In Bombay, institutions with a working capital of Rs. 20,000 and more are classed as urban banks. Since 1922 co-operators in this State have been very keen on having a full-fledged peoples' bank in every taluka town, for it has been realised that with the proper development of urban co-operative banking, there is no doubt that the various units will come into touch with one another and that mutual settlement of terms and co-ordinated and harmonious work will greatly assist the development of inland trading agencies.

SAVINGS

In Bombay there were 118 urban banks in 1948 most of which were fairly successful. The total membership was 116,379 and the working capital was Rs. 10.15 crores. Urban banking has now been found so successful that de-officialisation and relaxation of departmental control will probably first be introduced with regard to them, supervision and guidance being made available from their own federations.

An important variant of the urban co-operative society is the Thrift Society. The system adopted is to collect regular savings every month for a continuous period of two to four years, invest the collected amount to the best advantage and pay back to the subscriber his amount at the end of the term with interest. Punjab has 171 thrift societies for women. Life Insurance Societies were started in Bombay, Bengal and Madras. The Bombay society started in 1930 largely through the efforts of Dewan Bahadur H. L. Kaji, has no share capital and works on a mutual basis. Baroda started a Life Insurance Society and the Post Office, Western Rly. and Messrs. Mackinon Mackenzie have special societies for their employees so that the 5 Bombay societies have a business in force of nearly 4½ crores. Similarly the 2 Madras societies have a business in force of a little under 4 crores, West Bengal with 10 societies, of about 3 crores and Hyderabad of about 3½ crores.

Madras has also a Co-operative Fire and General Society and a Co-operative Motor Vehicles Insurance Society. Recently a society called the All India Co-operative Fire and General Insurance Society has been registered in Bombay under the guidance of Dewan Bahadur H. L. Kaji.

Housing societies have assumed great importance due to the acute house shortage in big cities. Madras favours the individual house-ownership type, while Bombay favours the co-partnership type. There are 769 such

Production and production sale societies have been developing rapidly in recent years and in 1949-50, the sale of goods amounted to Rs.13 crores and the purchase of goods to Rs. 11 crores. Madras predominated with Rs. 60 and 62 crores respectively, Bombay coming next with Rs. 3¼ and 4 crores respectively.

The Consumer's Co-operative Movement did not achieve any striking success except in isolated cases like the Triplicane Urban Co-operative Society in Madras. The World War II changed conditions radically and led to the vigorous promotion of consumers' co-operative societies in India. The following table shows how Madras maintains the lead, with Assam and Bombay following :—

Primary Consumers' Stores, 1949-50

(In lakhs of rupees)

State	No. of societies	Membership (000)	Share capital	Purchases	Sales
Madras	1,743	579	97	23,60	25,59
Bombay	1,113	623	74	12,93	12,91
Assam	1,948	315	41	5,70	6,03
Mysore	811	56	11	95	98
Uttar Pradesh	505	280	26	16,17	16,57
Madhya Pradesh	495	36	6	1,22	1,28
West Bengal	354	45	6	55	59
Travancore Cochin ..	451	53	7	1,05	1,03

Two features of the development of consumers co-operation in Madras deserves special mention. The first is the penetration of stores societies in rural areas. The other feature is the organisation of wholesale or central stores. These last are 24 in number with sales amounting to Rs. 23½ crores. South India generally and Madras in particular have been very suitable areas for the consumers' movement. Whether the success achieved there is due to its being a land of cheapness and efficiency or to other causes, it is hard to discover.

REVIEW

The Co-operative Societies Act of 1904 had limitations which were soon recognised and at a conference of the Registrars, a Bill was drawn up which became the Co-operative Societies Act of 1912. This Act remedied the defects of its predecessor, authorized the registration of societies for purposes other than credit, substituted a scientific classification based on the nature of the liability for the arbitrary one into rural and urban and legalised the registration of Unions and Central Banks.

In 1914 the then Government of India reviewed the situation in a comprehensive resolution and recommended a change in the policy regarding the grant of loans to members, so that they might lend money for domestic purposes as well as for agricultural ones in order that the members might confine their dealings with the Co-operative Societies and be weaned from the *sowcars*. In 1914, the Maclagan Committee on co-operation was appointed and its report in 1915 led to the reorganisation and overhauling of the whole administration of co-operation. Punctual repayment of loans was insisted upon, and all those societies that failed to live up to the ideal of co-operation were sought to be eliminated. From this time onwards the share of co-operators in the movement assumed increasing importance and it came to be realized that for the success of the movement, deofficialising was necessary. The Government of India Act of 1919 made co-operation a State transferred subject and the State Governments were left free to adapt the 1912 Act to their own requirements.

The steady growth of the Central Financing Agencies relieved the Registrars partly of the need for attending to this very important matter in the development of co-operation; but propaganda still remained the function of the Registrar and his staff, paid or honorary, and it was perceived that non-official institutions should be established to take over this function from official hands. Accordingly Co-operative Institutes were started in various States in some cases as unitary societies reaching down to the village through their branches in the divisions and the district, in other cases as a federation or union more or less complete of the primary societies. The part these non-official bodies began to play henceforth became increasingly important, some adding to the primary function of propaganda, others such asco-operative education, supervision over societies and even audit.

ENQUIRY COMMITTEES

The steady progress of the movement—sometimes even too rapid—for nearly 20 years, however, was found hardly to lessen the colossal burden of indebtedness of the ryot, for co-operative credit necessarily confined itself to short-term loans. The first Co-operative Land Mortgage Bank was started at Jhang in the Punjab in 1920. Soon after other States followed suit.

While the movement was developing at a rapid pace it was found that financially the situation was worsening. Defaults in repayment were becoming increasingly common and Co-operative Committees of Enquiry were instituted in various States. Madhya Pradesh thought it necessary to have such a committee in 1922, while Bihar and Orissa followed with a similar committee in 1923. A few years after, the Calden Committee made similar inquiries for United Provinces and the Townsend Committee for Madras. These Committees carefully analysed the position in their respective States and made recommendations for the consolidation and rectification of the co-operative credit organisation and the extension of the non-credit side of agricultural co-operation. The powers conferred upon the State Government by the Act of 1919 to modify the Act of 1912 have been exercised by almost all States, except the East Punjab and Uttar Pradesh. Bombay passed the Co-operative Societies Act of 1925 making the object of the movement still wider than that of its predecessor and its preamble refers to "better living, better business and better methods of production" as the aim of the movement. The chief features of the Bombay Act of 1925 are the adoption of a scientific system of classification of societies, the improvement of the procedure for liquidation of cancelled societies, the extension of summary powers of recovery to the awards of arbitrators and the provision of penalties against specified offences. The Madras Act came into force in July 1932. West Bengal, Bihar and Orissa have also similar Co-operative Acts of their own. The progress of the movement in forms other than credit has not been very remarkable and credit societies still predominate, especially the Agricultural Credit Societies.

In 1926, the Royal Commission on Agriculture was appointed and co-operation formed only a part—though an important one—of its extensive enquiry. Since then, in consequence of the appointment of the provincial committees under the Indian Central Banking Inquiry Committee the co-operative movement in the different States has been further surveyed. But the provincial committees, for obvious reasons, confined their inquiries to banking in relation to agriculture, small industries and trade. Thus only those aspects of the co-operative movement which have an intimate bearing on the credit needs of the population and the development of banking facilities have been examined.

A few years back, the Government of Bombay appointed a small committee to inquire into the co-operative movement and to suggest how effective action could be taken to improve, extend and strengthen the movement. One welcome feature of the suggestions in the report is the adoption of the multi-purpose society as the primary unit in villages advocated strongly by the Agricultural Credit Department of the Reserve Bank.

The growing difficulties of the co-operative movement at a time of unprecedented depression led the Government of India to hold a Co-operative Conference at New Delhi in 1934. In 1936 and 1939, other Conferences of Registrars met at Delhi and discussed the situation further.

As a result, consolidation, rectification and rehabilitation of credit societies were accepted as the policy, whereas expansion and diversification were severely restrained. Official control was strengthened and the movement which was being passed on to the co-operators themselves in the twenties became more officialised than ever before.

It may also be mentioned that the former Princely States were not slow in introducing the co-operative movement in their territory, and the movement in some of the more important of the States, such as Hyderabad, Mysore, Baroda, Gwalior, Indore, Kashmir and Travancore made considerable progress, more or less on the same lines as those followed in the neighbouring Governors' States.

An important landmark in the history of the co-operative movement is the report of the Co-operative Planning Committee issued towards the end of 1946. The Report which is very comprehensive lays down the lines and principles of co-operative development for the next few decades. But the Report gives no indication as to the relative importance of different types of co-operative effort. So it is up to the State Governments now to lay down the priorities and start working quickly towards the goal. Already there is great expansion in the co-operative credit structure and experiments are being undertaken in co-operative farming. Cottage industries are being developed through co-operative industrial associations. The future of co-operation lies, however, in development and expansion of co-operative marketing and the organisation of subsidiary occupations for agriculturists and the vigorous growth of consumers' co-operation in urban areas with strong co-operative wholesales at the chief ports like Bombay, Madras and Calcutta.

Quite recently the U.N.O. and the I.L.O. have begun to evince greater interest in the development of the co-operative movement in Asian countries and an Asian Conference was held at Lucknow in the last week of October 1949, with the Hon'ble Mr. V. L. Mehta as Chairman and Dewan Bahadur H. L. Kajl as leader of the Indian Delegation. A similar Conference held in January 1950 at Newara Eliyah (Ceylon) by the I.L.O. of Geneva also had an important section on co-operation. Such Conferences clearly reveal the strides that India has taken in the development of the movement and establish contacts with other Asian Co-operators, much to the benefit of all concerned. The International Co-operative Alliances of London too is planning to take active steps for the promotion of co-operation in the Asian countries and may hold a Conference in India in 1954.

LABOUR

THE outline of the First Five-Year Plan of the Government of India prepared by the Planning Commission was published during the year. Prominent in the plan is a chapter on Labour and Industrial Relations wherein the Commission have expressed their views on problems relating to industrial relations, wages, working conditions, employment and training and productivity. While conceding to workers the right to strike, it suggests various measures for avoidance of disputes and settling of the disputes internally such as Joint consultation, Works Committees and conciliation and arbitration. In regard to wages, the Commission are of the view that any upward movement of wages is not desirable at this stage except where the existing rates are abnormally low. The Commission have, however, recommended full and effective implementation of the Minimum Wages legislation, profit-sharing in the form of periodic bonuses, establishment of permanent Wage Boards in each State and at the Centre. According to the Commission emphasis during the next five years should be on the effective implementation of existing legislation regulating working conditions in factories, etc. They emphasise the necessity of of increased facilities for technical and vocational training, and suggest improvements in the present system of recruitment.

Important legislative measures adopted during the year for the amelioration of the lot of the working classes are the Plantation Labour Act, the Provident Fund Ordinance (later replaced by an Act of Parliament) and the new Indian Mines Act. Considerable progress has been achieved by the Central and several State Governments in regard to the implementation of the Minimum Wages Act. The Employees' State Insurance scheme has finally been launched in Kanpur and Delhi and plans for its extension to other industrial areas have been completed. The agricultural labour enquiry started by the Government of India has been completed. Over 800 agricultural villages selected on the basis of a stratified random sample were covered by the the enquiry which is the largest of its kind so far conducted in any of the South-East Asian countries. The results of the enquiry are being tabulated and a report on the subject may be available shortly. During the year working class cost of living was on the increase in most centres but industrial unrest was not so much in evidence as compared to previous years. Production in several industries particularly coal, tea, cement, etc., showed definite improvement.

Under the constitution of the Republic of India the legislative relations between the Union and the States have been clearly defined and matters in respect of which laws are to be made have been distributed in three lists, *viz.*, the Union List, Concurrent List and State List.

The following are the principal matters of labour interest enumerated in these lists :

(*i*) *Union List (Union Parliament)* :

Participation in international conferences, associations and other bodies and implementing of decisions made thereat; Port quarantine, including hospitals connected therewith; seamen's and marine hospitals; Regulation of labour and safety in mines and oilfields; Industrial disputes concerning Union employees; Union agencies and institutions for:

(*a*) Professional, vocational or technical training; or (*b*) The promotion of special studies or research; Enquiries, surveys and statistics for the purpose of any of the matters in this list.

(*ii*) *Concurrent List (Union Parliament and State Legislature)* :

Economic and social planning; Commercial and industrial monopolies, combines and trusts; Trade Unions; industrial and labour disputes; Social security and social insurance; employment and unemployment; Welfare of labour including conditions of work, provident funds, employers' liability, workmen's compensation, invalidity and old age pensions and maternity benefits; and Vocational and technical training of labour; Factories; Inquiries and statistics for the purposes of any of the matters specified in the Union List and State List.

(*iii*) *State List (State Legislature)* :

Relief of the disabled and unemployable.

The Central co-ordinating authority in India for questions connected with labour legislation is the Ministry of Labour of the Government of India with the Labour Minister in charge. The administration of matters connected with the English and Indian Merchant Shipping Acts, the Mercantile Marine Department and Indian Seamen is with the Ministry of Transport. In respect of all the Railways, the Labour Minister is responsible for the administration of the Payment of Wages Act, 1936, Trade Disputes, Hours of Work for employees not covered by the Factories Act and regulation of employment of children. He is also responsible for Regulation of Labour and Safety in respect of mines and oilfields; trade disputes in industries, businesses or undertakings carried on by the Central Government; and Inter-State Migration.

LABOUR LEGISLATION

Among the more important Acts that govern labour conditions and relations in India are the following: 1. Indian Factories Act, 1948; 2. Indian Mines Act; 3. Payment of Wages Act; 4. Minimum Wages Act; 5. Workmen's Compensation Act; 6. Maternity Benefit Acts (States); 7. Indian Trades Union Act; 8. Industrial Disputes Act; Industrial Disputes (Appellate Tribunal) Act; 9. Tea Districts Emigrant Labour Act; 10. Shop Assistants Acts (States); 11. Employees' State Insurance Act; and 12. Industrial Statistics Act.

FACTORIES ACT, 1948

The first Factories Act in India was enacted in 1881. The law was amended from time to time, till finally, with a view to consolidating and amending the law regulating labour in factories the Factories Act, 1948, was passed and and its provisions came into operation with effect from 1st April 1949.

Scope. The Act covers all industrial establishments employing 10 or more workers and using power and establishments employing 20 or more workers and not using power. The State Governments have been empowered to apply the provisions of the Act to any premises, irrespective of the number of persons employed, where a manufacturing process is carried on with or without the aid of power, except where the work is done by the worker solely with the aid of his family. The distinction between seasonal and perennial factories no longer exists.

Licensing and Registration. The State Governments may make rules requiring the registration and licensing of factories. The Act lays down that the occupier of a factory shall, at least 15 days before he begins to occupy or use any premises as a factory, send to the Chief Inspector of Factories a written notice containing details regarding the factory such as the name of the factory, name and address of occupier, nature of work, details of power used, etc.

Health. The Act prescribes that every factory should be kept clean and free from effluvia arising from drains, privies, etc., and lays down stipulations regarding sweeping, cleaning, disinfecting, whitewashing, etc. Effective and suitable provision shall be made in every factory for securing and maintaining in every workroom adequate ventilation and such temperature as will secure to the workers therein reasonable conditions of comfort. No room in any factory shall be overcrowded to an extent injurious to the health of the workers and in existing factories 350 cubic feet of space should be provided for every workman. In new factories to be built the space for each workman shall be 500 cubic feet. Provisions relating to lighting, drinking water, latrines and urinals, etc., have also been laid down.

Safety. Elaborate provision regarding safety such as fencing of machinery, casing of new machinery and regulations regarding hoists and lifts, cranes, pressure plant, etc., have been laid down. Women and children are prohibited from employment on certain types of machinery. Precautionary measures against fire, dangerous fumes, explosive or inflammable dust, gas, etc., have been stipulated.

Welfare. Washing facilities for the workers, appliances for first-aid, rest shelters, creches, etc., are prescribed under the Act. In every factory where 500 or more workers are employed the occupier shall employ Welfare Officers. The State Governments may make rules requiring the maintenance of canteens in factories where more than 250 workers are ordinarily employed.

Hours of Work. Weekly hours of work have been fixed at 48 and daily hours at 9. The maximum spreadover allowed is 10½ hours. No worker shall work for more than 5 hours before he has had an interval for rest of at least half an hour. Payment for overtime has been prescribed at double ordinary rate of wages. No woman shall be employed in any factory except between the hours of 6 a.m. and 7 p.m. In special cases, however, the State Governments may vary these limits. A weekly day of rest has also been prescribed.

Employment of young persons. No child who has not completed his fourteenth year shall be required or allowed to work in any factory. A child who has completed his fourteenth year or an adolescent (a person who has not completed his eighteenth year) shall not be allowed to work in a factory unless a certificate of fitness by a certifying surgeon is in the custody of the manager of the factory and he carries while at work a token giving reference to such certificate. No 'child' shall be employed or permitted to work in any factory for more than 4½ hours in a day or between the hours of 7 p.m. and 6 a.m.

Leave. Every adult worker who has completed a period of 12 months' continuous service in a factory shall be allowed during the subsequent period of 12 months' leave with wages including dearness allowance for a period calculated at the rate of one day for every 20 days of work performed by him during the previous 12 months, subject to a minimum of 10 days. In the case of children the leave should be at the rate of one day for every 15 days of work subject to a minimum of 14 days.

Notifiable Diseases. Where any worker in a factory contracts any disease specified in the schedule appended to the Act, the manager of the factory shall send notice thereof to such authorities, and in such form and within such time, as may be prescribed. Further, if any medical practitioner attends on a person who is, or has been employed in a factory and who is, or is believed to be, suffering from any disease specified in the schedule the medical practitioner shall send a report in writing to the Chief Inspector.

Administration of the Act. The administration of the Act is left to the State Governments. Steps have been taken by most of the State Governments to strengthen the Factory Inspectorates. The Central Government have set up an advisory organisation, namely the Office of the Chief Adviser Factories.

FACTORY STATISTICS

Under the provisions of the Factories Act, 1948, registered factories submit annual and half yearly returns on employment to the Chief Inspectors of Factories in the various States. All-India figures are compiled by the Labour Bureau and are published in the Indian Labour Gazette. The figures for 1949 are somewhat wider in coverage than those for the previous years, especially on account of the fact that some of the former princely States have merged in the neighbouring States. As a result of such changes, the number of factories on registers increased during 1949 to 19,802, *i.e.*, by about 24 per cent. over the 1948 figure of 15,906.

The following tables set out the statistics of the average daily numbers of persons employed in Government and Local Fund factories and private factories during the years 1948 and 1949. These statistics follow the new industrial classification suggested by the U.N.; comparative figures for previous years are, therefore, not available.

TABLE I

EMPLOYMENT IN GOVERNMENT AND LOCAL FUND FACTORIES.

Industry	Average Daily No. of Workers Employed	
	1948	1949
Clothing	2,819	3,920
Dockyards	9,699	9,214
Electrical Engineering ..	3,503	4,582
Electricity Generating and Transforming Stations ..	3,772	4,786
General Engineering ..	23,061	26,615
Mints	4,292	3,481
Ordnance Factories ..	71,239	84,300
Printing Presses	17,180	15,574
Railway Workshops ..	116,902	106,508
Telegraphs	4,373	5,079
Water Pumping Stations	2,840	3,083
TOTAL	262,680	267,142

TABLE II

EMPLOYMENT IN PRIVATE FACTORIES.

Industry	Average Daily No. of Workers Employed	
	1948	1949
Textiles	1,031,044	1,045,140
Engineering	219,837	213,243
Minerals and Metals ..	101,013	108,505
Food, Drink and Tobacco	316,039	344,828
Chemicals, Dyes, etc. ..	112,700	119,851
Paper and Printing ..	62,903	86,461
Wood, Stone and Glass ..	95,570	102,000
Gins and Presses ..	78,949	73,957
Skins and Hides ..	26,848	28,703
Miscellaneous	35,724	41,545
TOTAL	2,080,627	2,146,233

Available information regarding age-sex distribution of factory workers in 1949 shows that 88 per cent were men, 11 per cent women and one per cent adolescents and children.

THE INDIAN MINES ACT

The conditions of employment of labour in Indian Mines are governed by the Indian Mines Act, 1923, as amended by the Amending Acts of 1928 and 1935. The Act of 1923 which came into force from the 1st July 1924 replaced the earlier enactment of 1901.

The Amending Act of 1928 made some minor changes concerning daily limits of the hours of work and regulation of shifts. As a result of the recommendations of the Royal Commission on Labour and the adoption of the Draft International Labour Convention on Hours of Work in Coal Mines the Act was further amended in 1935. Further minor changes were made by the Amending Acts of 1936, 1937 and 1946 and in the Ordinance of 1945.

The main provisions of the law regarding hours and conditions of work in Indian Mines as it now stands, are as follows :—

(*a*) No person is to be employed in a mine for more than six days in any one week.

(*b*) No person employed above-ground in a mine is to be permitted to work for more than 54 hours in any one week or for more than ten hours in any one day; and the periods of work of any such person are to be so arranged that along with any intervals of rest they shall not on any one day spread over more than twelve hours.

(*c*) The periods of work of a person employed below-ground in a mine are to be reckoned from the time he leaves the surface to the time he returns to the surface and are not in any one day to spread over more than nine hours. No person is to be allowed to remain below-ground except during his periods of work and where work below-ground is carried on by a system of relays, the periods of work of all persons employed in the same relay are to be the same and are to be reckoned from the time the first person of the relay leaves the surface to the time the last person of the relay returns to the surface.

(*d*) The employment in any mine of children under fifteen years of age is prohibited and those below the age of 17 are not permitted to work in mines unless certified medically fit.

(*e*) The Amending Act of 1946 makes it compulsory for the mines to maintain closed shower baths, separately for men and women, at or near the pithead. The Mines (Amendment) Ordinance, 1945, provided for the maintenance of creches in mines. The Ordinance was repealed in 1947 but the provisions of the Ordinance were incorporated in the Act.

(*f*) Accidents which cause bodily injury resulting in the enforced absence from work for more than seven days are to be recorded in the prescribed manner.

The Government of India promulgated regulations under Section 29(*j*) of the Indian Mines Act, 1923, on the 7th March 1929 prohibiting the employment of any woman underground in the coal-mines in West Bengal, Bihar and Orissa and the Madhya Pradesh and the salt mines in the Punjab with effect from the 1st July 1939 and in all other mines with effect from the 1st July 1929.

In view, however, of an acute shortage of labour in coal-mining areas this policy was temporarily reversed during the war years. There was considerable agitation both in India and abroad against the lifting of the ban on the employment of women underground. So the Government of India reimposed the ban with effect from 1st February 1946, and there is now no employment of women underground in coal-mines.

With a view to consolidating and amending the law regulating mines the draft of a Bill was prepared by the Government for discussion at the first meeting of the Industrial Committee for coal-mines. The Bill with some modifications was introduced in the Legislature on 8th December 1949. Some of the salient features of the Bill are : (*a*) it reduces the working hours of all adult workers, both surface and underground, to 48 per week; (*b*) it fixes the rate of overtime at 1½ times the ordinary rate for surface workers and twice the ordinary rate for underground workers; (*c*) it raises the age limit of persons employed underground from 17 to 18 and limits the hours of work of persons between 15 and 18 years of age to 4½ per day; (*d*) it provides for compensatory holidays and holidays with pay and (*e*) it makes provision for the health and safety of the workers on the lines of the Factories Act, 1948. The Bill has recently been passed into an Act.

MINING STATISTICS

The collection of statistics in respect of labour employed in mines dates from 1924. These statistics used to be published in the Annual Reports of the Chief Inspector of Mines in India. Commencing from the year 1940, the Government of India have been publishing abridged reports which contain no figures for numbers employed. Statistics for the 16 years from 1923 to 1939 were given in a table at page 480 of the 1942-43 edition of this publication. The Government of India have, however, published figures showing the average daily number of persons employed in all mines in the various States in India in the issues of the *Indian Labour Gazette*. Similar figures are also being published in a Monthly Bulletin which is being issued by the Chief Inspector of Mines. We set out the available figures in the following table :—

EMPLOYMENT IN MINES CLASSIFIED BY STATES.

(Figures for the Indian Union)

State	1939	1948	1949	1950
Bihar	170,384	238,727	232,673	239,994
West Bengal	60,965	89,141	90,231	92,074
Madhya Pradesh	41,666	42,259	53,277	65,335
Madras	14,549	15,612	17,502	15,961
Others	11,086	10,126	27,476	58,397
Total ..	298,650	395,865	421,159	471,761

THE PAYMENT OF WAGES ACT

The Payment of Wages Act was passed in 1936 and brought into operation with effect from 28th March 1937. Although in the first instance the Act applied only to factories and railways, the State Governments were empowered to extend its application to other industries. The Central Government have since extended its application to all mines and several State Governments have extended it to other industries, such as, plantations, omnibus services, etc. The Act applies only to wages and salaries which average below Rs 200 per month.

For purposes of the Act 'wages' means all remuneration capable of being expressed in terms of money and includes any bonus or additional remuneration but does not include travelling allowances, employers' contribution to provident funds, gratuities payable on discharge or the value of housing or other services rendered to the worker.

No wage period is to exceed one month and wages are to be paid within a prescribed time not exceeding 10 days from the end of the wage period. All wages are to be paid in coin and, or currency notes. Stipulations regarding the levy of fines and the manner of utilising the amount collected by way of fines have been laid down. Fines are not to exceed half anna in the rupee. Permissible deductions from wages on account of fines, absence from duty, damage to or loss of goods, housing, income-tax, recovery of advances, etc. have also been specified.

The administration of the Act, as far as factories are concerned, has been entrusted to the Inspectors of Factories in the States. In regard to persons employed in mines and in railways the responsibility of administering the Act rests upon the Chief Labour Commissioner (Central).

MINIMUM WAGES ACT, 1948

The Minimum Wages Act, 1948 received the assent of the Governor-General on 15th March 1948. An amendment to the Act is now under discussion. The original Act of 1948 was designed to provide for the fixation of minimum wages in certain employments wherein sweated labour is prevalent or where there is a chance of exploitation of labour. The Act covers the following industries for types of establishments: Woollen carpet making or shawl weaving; rice, flour or dal mills; tobacco manufactories (including bidi making); plantations; oil mills; employment under any local authority; road construction or building operations; stone breaking or stone crushing; lac manufactories; mica works; public motor transport; tanneries and leather manufactories; and agriculture. The appropriate Governments can extend the application of the Act to any industry wherein, in their opinion, minimum wages should statutorily be fixed.

The Act requires the Central or State Governments, as the case may be, to fix within two years from the passing of the Act minimum rates of wages payable to persons employed in the industries mentioned above. In the case of agriculture, however, minimum wages need be fixed only within three years. Minimum wages need not, however, be fixed in respect of employments in which there are in the whole State less than 1,000 employees. Under the Minimum Wages (Amendment) Act, 1950, however, minimum wages were to be fixed within three years in employments coming under both the schedules. A bill has recently been introduced in Parliament extending the time limit by another year in the case of employments in Part I of the Schedule and giving discretion to State Governments in regard to the time and the extent of application of the Act to employment in agriculture.

The Act provides for the fixation of minimum time rates, minimum piece rates, guaranteed time rates and overtime rates appropriate to different occupations, or localities and for adults, adolescents, children and apprentices. The minimum rate may consist of a basic rate and a cost of living allowance and/or cash value of concessions or it may be an all-inclusive rate.

The Act authorises the appropriate Governments to appoint Committees and Sub-Committees to hold inquiries and advise them to fix minimum rates of wages in respect of any scheduled employment or for the revision of these rates. They may also appoint an Advisory Board for co-ordinating the work of various Committees and also to advise Government generally in the matter of fixing or revising minimum rates of wages. The Central Government is to set up a Central Advisory Board for advising the Central and State Governments and for co-ordinating the work of State Advisory Boards. The Committees and Sub-Committees as well as the Central and State Advisory Boards are to consist of equal number of representatives of employers and employees, and of independent persons not exceeding a third of the total number of members.

The Central or the State Governments, as the case may be, can fix the number of hours of work per day, provide for a weekly holiday, etc., in regard to any employment in which minimum wages have been fixed under the Act.

The Central Government has now framed model rules under the Act for the guidance of State Governments. A Central Advisory Board has been constituted with representatives of the Central and State Governments and of employers and employees. The Central Government and several State Governments have already appointed competent authorities as required by the Act to ascertain, from time to time, the cost of living index number applicable to persons employed in the scheduled employments. Under powers conferred under Section 27 of the Act, some Governments have extended the application of the Act to other industries such as cement, potteries, glass industries, etc.

Minimum wages have been fixed under the Act in the following States in respect of the industries mentioned against each. The wages fixed are shown in brackets :

Madras : Tanneries (Re. 1-0-0 for casual labour and Rs. 1-5-0 for others); Dal, Flour and Rice Mills (Re. 0-12-0); Oil Mills (Re. 1-0-0); Tobacco including Bidi Manufacture (for 1,000—Bidis Rs. 1-2-0, Cigars Rs. 2-0-0; and curing Rs. 1-4-0 per day); Mica Mines (Re.1-0-0); Road construction and Building operations (Monthly wage Rs. 30-0-0 per month plus Rs. 40-0-0 Dearness Allowance).

Orissa : Agriculture (Re. 0-10-0 to 0-12-0 for Men and Re. 0-8-0 for Women).

Madhya Pradesh : Oil Mills (Rs. 1-2-0 to 1-4-0); Motor Transport (Rs. 1-4-0); Cement (Rs. 1-6-0 for Men and 1-4-0 for Women); Potteries (Rs. 1-6-0 for Men and 1-2-0 for Women); Tobacco Manufacturing (for 1,000—Re. 0-10-0 to Rs.1-6-0); Rice, Flour and Dal Mills (Re. 0-12-0 to 1-0-0 for Men and Re. 0-8-0 to 0-12-0 for Women); Local Authority (Re. 0-12-0 to 1-0-0 for Men and Re. 0-8-0 to 0-12-0 for Women); Road construction and Building operations (Re. 0-9-0 to 1-0-0 for Men and Re. 0-7-0 to 0-10-0 for Women); Stone breaking and Stone crushing (Re. 0-9-0 to 1-0-0 for Men and Re. 0-7-0 to 0-10-0 for Women); Glass Manufacture (Rs. 1-8-0 to 1-12-0); Lac Manufacture (Re. 0-15-6 for Men and Re. 0-11-6 for Women); Tanneries (Rs. 1-3-0) and Leather Goods Manufacture (Wages fixed on piece rates).

Punjab : Tea plantations (Re. 0-11-0 for Men and 0-8-6 for Women); Oil Mills (Rs.1-12-0); Stone breaking and Stone crushing (Rs. 1-12-0 for Men and Rs. 1-8-0 for Women); Tanneries and Leather Goods Manufacture (Rs. 1-12-0); Shawl weaving (Rs. 1-8-0); Rice, Flour and Dal Mills (Rs. 1-12-0); Local Authority (Rs. 40-0-0 to Rs. 60-0-0 per month); Agriculture (Re. 1-0-0 to Rs. 1-12-0 for Men and Re. 0-12-0 to Rs. 1-4-0 for Women).

West Bengal : Rice Mills (Re. 0-13-6 to Rs. 1-2-0 for Men and Re. 0-11-6 to 0-12-0 for Women); Flour Mills (Rs. 1-2-6); Tanneries and Leather Goods Manufacture (Rs. 1-15-6); Oil Mills (Rs. 1-14-9 for Men and Rs. 1-8-7 for Women—including Dearness Allowance); Public Motor Transport (Rs. 2-1-10); Tea plantations (Gardens: Re. 0-15-0 to Rs. 1-3-0 for Men and Re. 0-14-0 to Rs. 1-1-10 for Women; Factory: Re. 1-0-0 to Rs. 1-3-0 for Men and Re. 0-15-0 to Rs. 1-1-0 for Women); Cinchona plantations (Rs. 1-8-9 for Men and Rs.1-2-0 for Women); Local authority (Re. 0-11-1 to Rs. 1-14-9 for Men and Re. 0-8-7 to Rs. 1-1-10 for Women); Road construction and Building operations (Rs. 1-4-0 to 2-0-0 for Men and Re. 1-0-0 to Rs. 1-14-0 for Women).

Bihar : Woollen Carpet making and Shawl weaving (Rs. 1-12-0); Rice, Flour and Dal Mills (Rs.1-6-0); Bidi making (for 1,000—Rs.1-12-0); Oil Mills (Rs. 1-6-0); Road construction and Building operations (Rs. 1-4-0); Stone breaking and Stone crushing (Rs. 1-4-0); Public Motor Transport (Rs. 1-12-0); Tanneries and Leather Goods Manufacture (Rs. 2-6-0); Lac Manufacture (Re. 1-0-0 to Rs. 1-4-0); Mica Mines (Mines: Rs. 1-5-9; Works: Rs. 1-4-6); Tea plantations (Rs. 1-6-0).

Kutch : Agriculture (Re. 0-12-0 for Men and Re. 0-9-0 for Women).

Uttar Pradesh (Wages Proposed): Local Authority (Rs. 1-6-9); Agriculture (Rs. 1-2-0); Road construction and Building operations (Rs. 1-4-0); Tanneries and Leather Manufactories (Rs. 1-2-0); Woollen Carpet and Shawl weaving (Rs. 1-12-0); Rice, Flour and Dal Mills (Rs. 1-2-0); Tobacco including Bidi making (Rs. 1-2-0); Stone breaking and Stone crushing (Rs. 1-2-0); Oil Mills (Rs. 1-2-0); Lac Manufacture (Rs. 1-2-0); Public Motor Transport (Rs. 1-2-0).

Delhi : Flour, Rice and Dal Mills (Rs. 1-12-7 to 2-1-2); Road construction and Building operations (Rs. 1-12-0 for Men and Rs. 1-8-0 for Women); Stone breaking and Stone crushing (Rs. 1-12-0 for Men and Rs. 1-8-0 for Women); Motor Transport (Rs. 2-0-0); Local Authority (Rs. 2-2-6).

WORKMEN'S COMPENSATION ACT

The Workmen's Compensation Act was brought into operation with effect from 1st July 1924. The limitations of scope were to a large extent removed by amending Acts passed in 1926, 1929, 1931 and 1933.

Under the Act payment of compensation has been made obligatory on all employers whose employees come within its scope, and injured workmen or the dependents of those killed can obtain compensation in all cases where personal injury has been caused by accident *arising out of and in the course of employment* and where, except in the case of injury resulting in death, the accident is not directly attributable to the workman having been at the time of the accident under the influence of drink or drugs or to wilful disobedience of rules or orders or wilful disregard of safety devices.

Besides bodily injuries the contracting of certain occupational diseases such as anthrax and lead and phosphorus poisoning were deemed and treated for the purposes of compensation, as injuries caused by accident, provided however, that the worker concerned was in the service of the same employer for more than six months. Mercury poisoning was added to the list of original occupational diseases in 1926 in order to bring the Indian law into conformity with a Draft Convention adopted by the International Labour Conference in 1925.

This list was further expanded in 1933 and again in 1938 by the addition of (1) poisoning by benzene and its homologues or the sequelæ of such poisoning; (2) chrome ulceration or its sequelæ; (3) compressed air illness (Caisson Disease) or its sequelæ; (4) arsenical poisoning or its sequelæ; (5) pathological manifestations due to (*a*) radium and other radio-active substances, and (*b*) X-Rays; and (6) Primary epithelomatous cancer of the skin.

Main Provisions.—The main provisions of the Workmen's Compensation Act as it stands today are as follows:

Classes of Workmen Covered by the Act.—These have been specified in the definition of the term "workman" contained in section 2(1) (*n*) and in Schedule II. In all cases persons employed in an administrative or clerical capacity and those whose monthly earnings exceed Rs. 400 (except Railway Servants) are excluded.

Speaking broadly, the Act covers railways; factories; mines; seamen; docks; persons employed in the construction repair or demolition of buildings designed to be or which are of more than one storey or of twenty feet in height or of dams and embankments, roads, bridges or tunnels; or wharves, quays, sea walls or other marine work; the setting up, repairing, maintaining or taking down any telegraph or telephone line or overhead electric lines or cables; aerial ropeways, canals, pipe lines or sewers; the fire-brigade; railway mail service; persons employed in outdoor work in the postal and telegraphic services; operations for winning natural petroleum or natural gas; blasting operations and excavations; ferry boat services; cinchona, coffee, rubber or tea plantations; electricity or gas generating stations; lighthouses; cinematograph picture producing and exhibiting; divers; elephant and wild animal trainers and keepers and salaried motor drivers and cleaners. Recently persons employed in warehouses in markets employing ten or more persons have also been brought within the scope of the Act. Persons employed through sub-contractors by a person fulfilling a contract with a railway are also covered.

As far as seamen are concerned, those employed on ships registered in India are covered. But if accidents take place within the three mile limit of the territorial waters the Act applies even to those employed on ships not registered in India. But with a view to facilitating the settlement of claims in respect of seamen on ships not registered in India and to avoid litigation, provision has been made in the Lascar's Agreement for the settlement of claims for compensation on the lines of the Indian Act and in default of agreement the Commissioner of the Port where the agreements are signed has been accepted as the final authority to whom these matters should be referred for decision.

Not only workmen employed within the precincts of a factory or a mine but also men engaged in any kind of work incidental to or connected with a factory or any mining operation are entitled to the benefits of the Act. As far as factories are concerned, those using mechanical power and employing more than ten persons or those not using mechanical power and employing more than fifty persons are covered.

The State Governments are empowered to bring within the scope of the Act other classes of workmen whose occupations are considered to be of a hazardous nature.

Any person who is covered by the Employees' State Insurance Act, 1948, and who is entitled to receive disablement or dependant's benefit from the Employees' State Insurance Corporation is not entitled to claim any compensation from the employer under this Act.

Amount of Compensation.—The amount of compensation payable depends, in the case of death, on the average monthly wages of the deceased workman and in the case of an injured workman both on the average monthly wages and the extent of disablement. The term 'wages' includes overtime pay and the value of any concessions or benefits in the form of food, clothing, free quarters, etc. After the monthly wages of a worker are calculated the amount of compensation due is decided by a reference to Schedule IV which gives in a tabular form the amounts of compensation for death, permanent total and temporary disablement in respect of each of seventeen wage classes.

The amounts of compensation payable in the case of an injured workman whose monthly wages are not more than Rs. 10 are Rs. 500 for death, Rs. 700 for permanent total and half the monthly wages for temporary disablement. For a workman whose monthly wages are between Rs. 50 and Rs. 60, the corresponding figures are Rs. 1,800, Rs. 2,520 and Rs. 15 respectively. The maxima for persons earning over Rs. 300 per month are Rs. 4,500, Rs. 6,300 and Rs. 30 per month respectively. In the case of minors the amounts of compensation for death and for permanent total disablement are at a uniform rate of Rs. 200 and Rs. 1,200 respectively, and half the monthly wage for temporary disablement.

No compensation is payable in respect of a 'waiting period' of seven days following that on which the injury was caused; but many large firms pay compensation in lieu of wages with effect from the date of injury.

The interests of dependents in cases of fatal accidents have been safeguarded by ensuring that (1) all cases of fatal accidents should be brought to the notice of the Commissioner; (2) in all cases where an employer admits liability the amount of compensation payable is to be promptly deposited with the Commissioner; and (3) in cases where the employer disclaims liability and there are good grounds for believing compensation to be payable, the dependents get the information necessary to enable them to judge if they should make a claim or not.

A contractor has been given the right to be indemnified by his sub-contractor if he has had to pay compensation either to a principal or to a workman.

An employer is permitted to make to any dependent advances on account of compensation not exceeding an aggregate of one hundred rupees and so much of such aggregate as does not exceed the compensation payable to that dependent is to be deducted by the Commissioner from such compensation and repaid to the employer. Further, the Commissioner may deduct a sum up to Rs. 25 from the amount of compensation for the funeral expenses of a deceased workman and pay the same to the person by whom such expenses were incurred.

The Act is administered entirely on a State basis by Commissioners appointed by State Governments.

STATISTICS

All State Governments in India used to publish Annual Administration Reports on the working of the Workmen's Compensation Act. The Government of India summarised these Reports and published an annual survey under the title "Statistics of Workmen's Compensation". The Government of India stopped the publication of these summaries in 1939. An annual note on the working of the Act is being published regularly in the *Indian Labour Gazette* which is being issued by the Labour Bureau of the Government of India.

The latest available statistics on the subject will be found in the following table:—

Year	Total number of cases	Total compensation paid
		Rs.
1940	41,015	19,38,476
1941	39,045	15,84,293
1942	44,443	18,69,359
1943 †	44,826	22,83,991
1944 ¶	31,581	16,96,494
1945	67,390	42,25,339
1946 ‡	55,241	36,25,808
1947 @	53,574	33,26,495
1948	66,776	42,20,068
1949	92,763	44,26,218

Accident Insurance.—Facilities for accident insurance are now being provided by a number of leading insurance companies in the country and the most important of these are the Claims Bureau in Calcutta and Madras. In Bombay insurance companies are now concerned with half the number of cases that come up before the Commissioner. Insurance companies as a rule contest only cases involving questions of law or principle and are of benefit to all concerned.

The Millowners' Mutual Insurance Association, Ltd., Bombay, is an organisation of employers one of whose objects is the mutual insurance of members against liability to pay compensation or damages to workmen employed by them or their dependants for injuries or accidents, fatal or otherwise, arising out of or in the course of employment.

MATERNITY BENEFIT

The first Maternity Benefit Act in India was passed by the Government of Bombay in 1929. This was substantially amended by an Amending Act passed in 1935. A similar Act was passed in Madhya Pradesh in 1931. These were the first Acts of their kind in India. Since then, Maternity Benefit Acts have also been passed in the States of Madras, old undivided Bengal, Assam, old undivided Punjab, Bihar and Uttar Pradesh. The Bombay Act was, with certain modifications extended to Ajmer-Merwara and Delhi. In the year 1948 the West Bengal Legislature passed a separate Act for women employed in tea plantations under the title of the Bengal Maternity Benefit (Tea Estates) Act, 1948. Except for the Assam Maternity Benefit Act which covers women employed in both factories and on plantations and the Bengal Act, all the other Maternity Benefit Acts are applicable to women employed in factories only.

The subject of extending the benefits of such legislation to women employed in Mines was discussed at the Second Conference of Labour Ministers held in January 1941 and as the result of those discussions the Central Legislature passed the Mines Maternity Benefit Act, 1941, in the same year.

The main principles in all Maternity Benefit Legislation are the same: provision for the payment of a cash benefit to women for specified periods before and after childbirth, a compulsory period of rest after delivery and also before delivery if notice is given; but, in the latter case, the period for which an employer has to pay cash benefit is strictly limited. All Acts specify a qualifying period for the earning of the benefit: this varies from six months to a year. Women are prohibited, under penalty, from accepting employment under another employer during periods for which they are in receipt of cash benefit from the employer with whom this liability rests.

In the Central Act for women employed in Mines and in the U.P. Act additional bonuses of Rs. 3 and Rs. 5 respectively are provided for if the services of a qualified midwife are availed of; but, if such assistance is provided for by or in an institution of an employer, this bonus is not to be paid.

In U.P. and Bihar the Acts lay down that factories employing a certain number of women should maintain creches and appoint health visitors for looking after the welfare of the women workers.

Assam Act.—The Assam Act has certain provisions which are not met with in the other State Acts and the Central Government's Mines Maternity Benefit Act. One such provision is that no employer shall knowingly employ a woman in any job during the four weeks immediately preceding the day of her delivery save upon such suitable light work as may be recommended by a medical practitioner. The other Acts prohibit only the employment of women during the four weeks immediately following childbirth.

By another provision an employer is required either himself to provide upon the premises to which the Act applies free medical treatment and attendance for every woman entitled to maternity benefit, or to make such arrangements with a medical practitioner to provide such treatment and attendance during pregnancy, and at, and after confinement. If a woman declines to accept this free medical attendance and treatment provided by the employer or leaves the service of the employer, she forfeits the maternity benefit which is admissible to her under the Act. No qualifying period is required in the case of an immigrant woman who was pregnant when she first arrived in Assam.

The Act provides for the payment of maternity benefit at weekly rates unlike the daily rates found in the other Act. It provides for payment—(i) on plantations at the rate of Re. 1 per week during the period preceding the day of delivery and Rs.1-4-0 per week during the period following the day of delivery, provided that the total cash payment which the employer shall be required to make on this account shall be Rs. 14; and (ii) in employments other than plantations Rs. 2 per week or the average weekly wage or salary subject to a minimum of Rs. 2 per week. The Assam Government propose to amend the Act so as to raise the rate of benefit to 12 annas per day.

The Indian Tea Association has, however, recommended payment of maternity benefit at the rate of Rs. 5-4-0 a week for eight weeks. Although maternity benefit legislation does not apply to plantations in South India, the employers' associations have recommended payment of benefit on a voluntary basis at the rate of 12 annas per day for a period of eight weeks.

The qualifying period in the Central and in the U.P. Acts is six months and in the Ajmer-Merwara Act twelve months. In all the remaining Acts it is nine months. The maximum period for which maternity benefits can be paid is six weeks under the Ajmer-Merwara Act, seven weeks under the Madras Act, sixty days under the Punjab Act and eight weeks under all the other Acts. The rate of benefit used to be eight annas per day or the average daily wage whichever was less in most Acts but many Acts are now adopting a uniform eight annas a day. The Punjab Act gives average daily earnings or twelve annas per day whichever is greater.

THE TRADE UNIONS ACT, 1926

In March, 1921, Mr. N. M. Joshi, successfully moved a resolution in the Central Legislative Assembly recommending that government should introduce legislation for the registration and protection of trade unions. Opposition from employers to the adoption of such a measure was, however, so great that it was not until 1926 that the Indian Trade Unions Act was passed. This Act was brought into operation with effect from 1st June 1927 and was slightly amended in 1928 to facilitate the procedure of appeal against the decision of the Registrar refusing or cancelling the certificate of registration of trade unions by employers.

Apart from the necessary provisions for administration and penalties, the Indian Trade Unions Act, 1926, makes provision for three matters: (1) conditions governing the registration of trade unions; (2) the obligations to which a trade union is subject after registration; and (3) the rights and privileges accorded to registered unions. 'Trade Union' has been defined in such a way as to cover both combinations of workers and of employers but not of workers and employers. Persons under the age of 15 are debarred from membership of any registered union.

Registration.—The administration of the Act is entirely on a State basis and each State Government is required to appoint a Registrar of Trade Unions. A union is to be registered in the State in which its head office is situated and if this is transferred to another State, the registration has to be transferred to that State. Any seven or more members of a union can apply for registration but no union can be registered unless (1) its rules provide for certain statutory matters which have been laid down in Section 6; and (2) its executive is constituted in accordance with the requirements of Section 22 which lays down that at least fifty per cent. of the executive must consist of members actually engaged in the unit or group of units which the union proposes to cover.

The registration of a union may be cancelled or withdrawn at any time by the Registrar on the application of the union itself, or if the Registrar is satisfied that the certificate has been obtained by fraud or mistake, or that the union has ceased to exist or has wilfully and after notice contravened any provision of the Act, or if it has allowed any rule which is inconsistent with the Act to continue in force or has rescinded any rule which is required by the Act. Any union aggrieved by the refusal of a Registrar to register it or by the cancellation of its registration may prefer an appeal to a judge appointed by the State Government for the purpose; and, in the event of the dismissal of such an appeal, the aggrieved party has the right of a further appeal to the High Court.

Obligations, Rights.—The general funds of registered trade unions cannot be spent on objects other than those specified in Section 15 of the Act nor on political objects; but the Act makes provision for the creation of a separate political fund, subscription to which may be collected from such members as voluntarily desire to contribute to it. All registered unions are required to submit annually to the Registrar duly audited statements of accounts in prescribed forms together with changes in officers and the executive and a copy of the rules corrected up to date. Notices of all changes in the rules or of the registered name or the registered address of the office of the union, of amalgamations with other unions or of dissolution must be submitted to the Registrar in prescribed forms within prescribed periods of their occurrence.

Failure to carry out these obligations may result either in the cancellation of a union's registration or by the imposition of a fine. The Act further requires that the rules of every registered union should make adequate provision for the inspection of books of accounts and lists of members by the officers and members of the union. The Government of Madras have tightened up their regulations in connection with the maintenance, by registered unions of their registers. Among other things, all unions will now be required to maintain files of vouchers and machine-numbered subscription receipt books.

The Act confers on registered unions the right to corporate existence and of perpetual succession with power to acquire and hold both movable and immovable property and to enter into contracts. A registered trade union is immune from prosecution for criminal conspiracy in respect of an agreement, unless it is one to commit an offence, made between its members for the furtherance of a trade dispute or for restraint of trade and from any legal difficulties arising therefrom. It also enjoys immunity from civil suits in certain cases.

Registered unions are empowered to carry on any form of insurance activity without being under any obligation to secure professional advice as to the actuarial soundness of such business. By virtue of Section 118 of The Insurance Act, 1938, insurance business carried on by a trade union is not subject to the provisions of that Act.

One of the most vexed questions in connection with trade unions in India is that of their recognition by the employers. Many Bills aimed at compelling employers to recognise unions of their workers were introduced by private members in State Legislatures but these failed to carry the support of the Governments concerned. The subject was discussed at the Second Session of the Labour Ministers Conference and, as a result of the decisions then reached, the Government of India drafted a Bill intended to add a New Chapter dealing with the Recognition of Trade Unions and Rights and Liabilities of Recognised Trade Unions to the Indian Trade Unions Act. This was circulated to all State Governments for opinion after consultation with the interests concerned. In the light of the criticisms received, the Government of India drafted a new Bill on the subject and this was introduced in the Central Legislative Assembly by the Hon'ble the Labour Member on the 13th November 1943, and became law in November 1947.

Besides providing for compulsory recognition of representative trade unions by the employers the Act specifies certain acts as unfair practices on the part of employers and recognised trade unions and provides for punishment of a fine in the case of employers and withdrawal of recognition in the case of trade unions. The Act, however, has not been brought into force and already a bill has been introduced in Parliament for the consolidation of trade union law. This bill is meeting with considerable opposition from certain sections of labour.

STATISTICS OF TRADE UNIONS

One of the Annual Reports which the Government of India stopped publishing during the War and later revived is the one relating to the administration of the Indian Trade Unions Act. These reports contain statistics regarding the number of registered unions and their membership.

No State except Bombay has maintained any records for both registered and unregistered unions. The Labour Office of the Government of Bombay has collected full and complete information regarding all trade unions in the State of Bombay since the year 1922.

All-India Figures.—The following tabular statements show the latest available position in regard to Registered Trade Unions :—

NUMBER AND MEMBERSHIP OF REGISTERED TRADE UNIONS IN EACH STATE FOR THE YEARS 1948-49 AND 1949-50.

State	No. of registered trade unions		No. of unions submitting returns		Membership of unions submitting returns	
	1948-49	1949-50	1948-49	1949-50	1948-49	1949-50
Ajmer	16	15	15	15	5,532	5,684
Assam	71	67	43	39	107,725	118,188
Bihar	315	392	141	197	148,234	183,060
Bombay	410	460	295	390	421,128	417,642
Coorg	21	3	1	3	320	497
Delhi	59	60	48	59	25,486	31,412
Madhya Pradesh ..	88	109	60	74	33,590	48,436
Madras	597	550	296	183	150,180	116,560
Orissa	72	81	27	31	13,407	23,286
Punjab	8	41	8	36	2,866	14,400
U. P.	359	373	292	334	138,403	218,037
West Bengal	1,049*	1,155	534*	545	438,883	489,158
Bhopal	N. A.	3	N. A.	3	N. A.	797
Central Unions ..	105*	56	88*	41	474,353	153,936
Total ..	3,170	3,365	1,848	1,920	1,960,107	1,821,132

* The total number of registered unions (Central and States) in West Bengal was reported to be 1,086, out of which 751 submitted returns. Thirty-seven out of these 751 unions were Central unions. In the case of 515 unions, which failed to submit returns, the break-up into Central and States unions is not available.

The following table shows the number and membership of the Registered Trade Unions submitting returns for the year 1949-50, classified according to industries :—

Industry	Number of Unions Submitting Returns	1949-50		
		Number of members at the end of the year.		
		Men	Women	Total
I. Agriculture and allied activities	53	106,008	36,712	145,093
II. Mining and Quarrying ..	54	101,412	18,995	120,407
III. Manufacturing	803	696,723	51,679	752,404
IV. Construction	25	11,110	176	11,286
V. Electricity, Gas, Water and Sanitary Services..	97	24,112	1,138	25,250

VII. Transport, Storage and Communication ..	248	545,181	2,230	547,411
VIII. Services	154	45,627	4,869	50,496
IX. Miscellaneous	210	83,689	3,547	93,456
Total ..	1,920	1,688,887	119,566	1,821,132

The important all-India bodies to which trade unions have affiliation and their membership during 1950 are shown below :

	Number of Unions affiliated	Membership
All-India Trade Union Congress	736	758,314
United Trades Union Congress	332	385,827
Indian National Trade Union Congress	1,202	1,538,156
Hind Mazdur Sabha	456	681,592

INDUSTRIAL DISPUTES ACT

Recent years have witnessed a great deal of activity both on the part of the Central Government and of the State Governments in considering and enacting measures for the prevention and settlement of industrial disputes. Till the year 1929 the only law relating to the settlement of trade disputes was the Employers and Workmen (Disputes) Act of 1860. The Royal Commission on Labour in India referred to the necessity of establishing a permanent statutory machinery to deal with labour disputes. The Government of India in a Bill which they introduced in 1934 to make the 1929 Act permanent included in it some of the suggestions made by the Commission. This Bill was passed in April 1934. In 1936 an amending Bill was introduced which was passed into law in 1938.

The war showed certain inherent defects in this legislation and made it necessary for Government to supplement the Law by the enforcement of Rule 81 (A) of the Defence of India Rules. According to this Rule, the Government could refer any dispute for arbitration and enforce the award. The enforcement of this Rule in the large number of cases proved of great benefit both for labour, industry and the community as it considerably assisted in diminishing industrial strife. The enforcement of this rule was, however, a temporary measure and it was decided therefore, in 1946 to introduce the Industrial Disputes Bill in the Legislative Assembly which was passed into to an Act in March 1947.

The Act provides for setting up of two types of organisations, namely, (1) Works Committees and (2) Industrial Tribunals for the prevention and settlement of disputes. It makes conciliation compulsory in all disputes in public utility services and optional in other cases.

Section 22 of the Act declares any strike or lock-out in a public utility service to be illegal if it is commenced or declared (i) without giving to the employer or employees, as the case may be, a notice of strike or lock-out in a prescribed manner, within six weeks before striking or declaring a lock-out, or (ii) within 14 days of giving such notice, or (iii) before the expiry of the date of strike specified in any such notice ; or (iv) during the pendency of any conciliation proceedings before a conciliation officer and 7 days after the conclusion of such proceedings, etc. The Act also prohibits certain other strikes and lock-outs and declares them illegal if commenced or declared during the pendency of (i) conciliation proceedings before a Board and 7 days after the conclusion of such proceedings ; (ii) proceedings before a Tribunal and 2 months after the conclusion of such proceedings, or (iii) during any period in which a settlement or award is in operation, in respect of any of the matters covered by the settlement or award.

Government have introduced in Parliament the Industrial Relations Bill with a view to consolidating and amending the various State and Central laws on the subject. The principal object of the bill is to ensure uniformity in the principles underlying the law. This bill has, however, been the subject matter of considerable controversy especially on the part of labour.

Statistics

Statistics of industrial disputes in India have been collected since 1921. The following table sets out the number of disputes in some of the years since 1921, the number of persons affected by these disputes and the total time lost in man-days :

Year.	Number of disputes.	Number of workpeople involved.	Number of working days lost.
1921 ..	396	600,351	6,984,426
1926 ..	128	186,811	1,097,478
1931 ..	166	203,008	2,408,123
1936 ..	157	169,029	2,358,062
1939 ..	406	409,189	4,992,795
1940 ..	322	452,539	7,577,281
1941 ..	359	291,054	3,330,503

* Not known in 14 cases.

Statistics presented in this section relate to industrial disputes which have resulted in work-stoppages involving 10 or more workers. The yearly figures relate to the actual number of strikes and lock-outs in existence and the workers involved during the year, not being a summation in each case of the monthly figures. The figures for 1949 and 1950 are more comprehensive than the earlier figures as efforts are now being made to secure complete information regarding disputes in the Central sphere.

All the monthly figures are provisional.

THE INDUSTRIAL DISPUTES (Appellate Tribunal) Act, 1950.

The divergent and sometimes conflicting decisions given by the various Tribunals set up in different States under the Industrial Disputes Act, 1947 created serious anomalies leading to discontent and bitterness among parties to industrial disputes. To meet this situation the Government of India enacted the Industrial Disputes (Appellate Tribunal) Act, 1950 to enable them to set up a Labour Appellate Tribunal which would hear appeals from awards or decisions of Industrial Tribunals, Industrial Courts, Wage Boards, and other statutory bodies set up by the Central or State Governments to adjudicate on industrial disputes.

The Appellate Tribunal is to consist of a Chairman and such number of other members as the Government may, from time to time, think fit to appoint. The Chairman is authorised to constitute as many benches of the Appellate Tribunal as he may consider necessary. Each bench is to consist of not less than two members, one of whom is to be appointed as the President. The Appellate Tribunal is empowered to hear appeals from any award or decision of an adjudicating authority if (i) the appeal involves any substantial question of law, or (ii) the award or decision relates to wages, bonus or travelling allowance, employers' contribution to any pension or provident fund, gratuity payable on discharge, classification by grades, retrenchment and any other matter which may be prescribed by rules made under the Act. No appeal, however, can be preferred by any party (i) from any award made by the Industrial Tribunal appointed by the Government of India in June 1949 to decide industrial disputes in banking companies, (ii) from any award or decision of a Tribunal made with the consent of parties, (iii) from any settlement arrived at between the parties in the course of conciliation proceedings, or (iv) from any decision of an arbitrator appointed under any law with the consent of parties to settle the dispute.

The Act provides that all appeals should be preferred within 30 days from the date of publication of the award or decision or, where no provision for the publication of the award has been made, within 30 days from the date of making the award. The Appellate Tribunal is entitled to confirm, vary or reverse the award or decision appealed from and to award relief to the appellant. It can also determine and award costs. The decision of the Appellate Tribunal become binding on the expiry of 30 days from the date of their pronouncement. The appropriate Government can, however, reject or modify any decision before the expiry of the period of 30 days, if they feel that it would be inexpedient on public grounds to give effect to the whole or any part of the decision. In all such cases the Government concerned should place the decision together with their reason for rejecting or modifying it before the Legislature concerned.

During the period of 30 days allowed for filing the appeal or during the pendency of an appeal no employer shall alter the conditions of service to the prejudice of the workmen concerned nor shall he discharge or punish any such workman without obtaining the written permission of the Appellate Tribunal.

The Appellate Tribunal was constituted on 8th August 1950 and Mr. J. N. Majumdar was appointed Chairman. At present the Appellate Tribunal has four other members and two benches are functioning, one in Bombay and the other in Calcutta.

TEA DISTRICTS EMIGRANT LABOUR ACT

One of the earliest labour laws in India was the Assam Labour and Emigration Act of 1901 which was designed mainly to regulate the recruitment and engagement of indentured labour for the tea plantations in that State. The Acts was amended in 1908 and 1915. These Acts aimed, among other things, at the abolition of the indentured labour system. The abolition of the system, however, did not become effective till the repeal of the Workmen's Breach of Contract Act, in 1926. The whole question was subjected to a thorough examination by the Royal Commission on Indian Labour in 1929-30.

The Government of India implemented the recommendations of the Commission in the Tea Districts Emigrant Labour Act, 1932, which was brought into effect from the 1st October 1933.

The first object of this Act is to make it possible, on the one hand, to exercise all the control over the recruitment and forwarding of assisted emigrants to the Assam tea gardens as may be justified and required by the interests of actual and potential emigrants; and, on the other hand, to ensure that no restrictions are imposed which are not justified. State Governments are empowered, subject to the control of the Government of India to impose control over the forwarding of assisted emigrants (chapter III) or over both their recruitment and their forwarding as occasion may dictate (chapters III and IV).

The forwarding of recruits to Assam must be made through the prescribed routes where arrangements for feeding, rest and medical treatment have been made and by authorised forwarding agents. It is made unlawful to assist persons under 16 to migrate unless they are accompanied by their parents or guardians. A married woman who is living with her husband may only be assisted to emigrate with the consent of the husband.

Repatriation.—Full effect was given to the Royal Commission's recommendations regarding repatriation (sections 7 to 11) and it is further provided that where an employer fails to make all the necessary arrangements for the repatriation of a worker within fifteen days from the date on which a right of repatriation arises to an emigrant labourer, the Controller may direct the employer to despatch such labourer and his family or to pay him such compensation as may be prescribed within such period as the Controller may fix (sections 13 and 15).

Section 3 of the Act makes provision for the appointment of a Controller of Emigrant Labour with some staff and possibly one or more Deputy Controllers for supervising the general administration of the system which the Act seeks to establish. The charges for this establishment are to be met from an annual cess called the Emigrants Labour Cess which is to be levied at such rate not exceeding Rs. 9 per emigrant as the Central Government may determine for each year of levy.

The cess is collected by the Controller by the sale of certificates of emigration. Every assisted emigrant has to be provided by the employing interest on whose behalf he was recruited with such a certificate. All particulars about the emigrant together with a running record of the details of his employment in Assam are given on it. Failure to provide a certificate is punishable with a fine which may extend to Rs. 500. The rate of cess was reduced by the Government of India from Rs. 5 to Rs. 3 from 1st October 1938. It was subsequently raised to Rs. 4 for the year commencing 1st October 1939. In 1945, the cess was levied at the rate of Rs. 3 per assisted emigrant but was again reduced to Rs. 2 in 1946. For the year 1949-50 the rate of the cess was fixed at Rs. 3 and the same rate has been continued for 1950-51.

The provisions of this Act were intended, in the first instance, to apply only to emigration for work on tea plantations in eight specified districts in Assam, but power is retained to extend its application to other industries and to other districts in Assam if necessary.

The following details taken from the latest available Administration Report of the Controller of Emigrant Labour would be of interest :—

During the year 1949-50, the number of assisted emigrants was 26,468. There were also 6,109 non-assisted emigrants. The *per capita* cost of recruitment was Rs. 142-3-5 as compared with Rs. 124-5-11 during the previous year.

The number of adults and children living on tea estates in Assam was 501,688 and 503,544 respectively making the total of 1,005,232.

The Indian Tea Association have set up a Labour Department to look after the welfare of labour.

SHOPS AND COMMERCIAL ESTABLISHMENTS

The first laws in India for regulating conditions of work of employees in shops and commercial establishments was passed by the Government of Bombay in 1939. The Governments of the Punjab and Bengal enacted similar legislation in 1940. The Punjab Act was extended to Delhi in 1942. The Governments of Madras, U.P. and Madhya Pradesh passed laws to regulate conditions of work of shops and commercial employees in 1947 and the Government of Assam passed an Act on the subject in 1948. The Central Government have also passed an Act, namely the Weekly Holidays Act, 1942, which applies to those States which notify its application to them. The Bombay Government appointed in 1946 a Committee to enquire into the working of the Bombay Shops and Commercial Establishments Act, 1939. Based largely on the recommendations of this Committee a new Act was passed in 1949 which repealed the 1939 Act. During 1949 the Madhya Pradesh and U.P. Acts were amended. The provisions of the Acts are briefly described below.

Scope :—Subject to certain exceptions the Acts apply to shops, commercial establishments, restaurants and places of amusement in certain selected urban centres. The Government can extend their application to other concerns and other areas which they consider necessary. Some employees such as those employed in a confidential capacity and those whose work is of an intermittent character are excluded from the scope of the Acts.

Hours of work, rest intervals :—The Bombay, Madhya Pradesh and Assam Acts have fixed daily hours of work at nine. In U.P. and Madras the daily hours are eight while in West Bengal and the Punjab a ten-hour day has been prescribed. Rest intervals, of half an hour are prescribed in the West Bengal, U.P. and the Punjab Acts while an hour's interval has been granted in the Assam, Bombay, U.P. and Madras Acts. Opening and closing hours have also been fixed by the Acts. The Assam and West Bengal Acts, however, prescribe only closing hours. Most of the Acts also fix the maximum overtime work that can be taken from the employees. In some cases slightly different hours of work have been fixed for employees of commercial establishments, restaurants and places of amusement.

Holidays, Leave :—Provision has been made in all the Acts for weekly closure of shops and establishments although in some Acts, for example in Bombay and Assam, theatres, hotels, etc. are exempted from this provision. In addition to the weekly holiday, provision for privilege leave of 12 to 15 days in a year has been made in all the Acts. The Assam, West Bengal, Madras and U.P. Acts make further provision for casual leave and sick leave of 10 to 12 days and 12 to 30 days respectively.

Employment of children, young persons :—All the Acts, except the Bengal Act, have made provision for the regulation of employment of children and young persons. The minimum age for the employment of children in Assam and Madhya Pradesh is 12 while in Madras and U.P., it is 14. The hours of work for children and young persons are 7 per day in the Punjab, Madras and Madhya Pradesh and 6 in Bombay and U.P. Children are not allowed to work after 7 p.m. in Bombay, Madras and the Punjab and after 9 p.m. in Madhya Pradesh.

Payment of Wages :—The Bombay Act empowers the Government to apply the provisions of the Payment of Wages Act to establishments

covered by the Shops and Commercial Establishments Act. In Madras and U.P. the wage period should not exceed one month and in the Punjab it should not exceed a fortnight. The Assam Act fixes the wage period at one month. After they become due wages should be paid within 10 days in Assam and West Bengal, 7 days in U.P. and 5 days in Madras. In the Punjab wages should be paid on demand at the expiry of the wage period. Overtime wages are payable at twice the ordinary rates in Madras, U.P. and the Punjab, at one and a half times in Bombay and Madhya Pradesh and at one and a quarter times the ordinary rate in Bengal. Hotels, restaurants and other eating places in Bombay are, however, required to pay overtime wages at twice the ordinary rate. Fines and deductions are regulated under the Madras and U.P. Acts.

One month's previous notice or one month's wages in lieu of notice before discharge is stipulated in the Acts of U.P., Punjab, Madras and Madhya Pradesh. The Bombay Act provides for only 14 days' notice or pay in lieu thereof. The Madras and Bombay Acts make provisions relating to cleanliness, ventilation, lighting and precautions against fire in establishments covered by the Acts.

The Weekly Holidays Act, 1942 provides for a weekly closure of shops and for the grant of a weekly holiday to employees. The Act has been enforced in Bihar, Ajmer, Coorg and Orissa.

INDUSTRIAL STATISTICS ACT

The Act permits the collection of statistics with regard to any of the following matters: (1) prices of commodities; (2) attendance; (3) living conditions including housing, water-supply and sanitation; (4) indebtedness; (5) rents; (6) wages and earnings; (7) provident and other funds provided for labour; (8) benefits and amenities provided for labour; (9) hours of work; (10) employment and unemployment; and (11) industrial and labour disputes. Penalties are provided for persons refusing to supply information or failing to furnish the required returns. State Governments are empowered to appoint an officer to be the Statistics Authority for the purposes of the collection of any statistics under the Act and that Authority, when once appointed, has the power to call upon employers to furnish the information required. Penalties are also provided for in the Act for improper disclosure of information or returns by persons engaged in the collection of the information or the tabulation of the data.

The Act deals with collection of statistics relating to factories, such as production, etc., and matters dealing with labour welfare. The former provisions have already been implemented by the various States and the Director of Industrial Statistics has undertaken censuses of production. Reports on the censuses for the years 1946 and 1947 have now been published. In regard to the clauses of the Act dealing with statistics relating to labour, these are being implemented.

INDIA AND THE I. L. O.

India joined this organisation at the very start and since 1922 has been one of the eight leading industrial countries in the world and as such has been allotted a permanent seat on the Governing Body of the Organisation. India also contributes liberally towards the finances of the Organisation. In 1951 India's contribution amounted to U.S. $275,524·11 which was about 4.43 per cent. of the total contribution of all member States. India's share in the appointments of the office is, however, somewhat inadequate. The number of Indian nationals employed in the Geneva office is 11. The Indian Branch at New Delhi employs a director and three officers with other necessary staff.

India has so far ratified 19 out of the 100 Conventions adopted by the International Labour Organisation but has in addition incorporated into its national legislation the essential features of many other Conventions. Since the International Labour Organisation is essentially a Tripartite Organisation, India's membership of it has resulted in the formation of powerful central organisations both of employers and of labour for purposes of representation, etc., at the conferences.

The last ten years have marked a new development in the policy of the International Labour Organisation, namely, the holding of Regional Labour Conferences of Member States. The first and second such Conferences were held in Santiago de Chile and Havana respectively in 1936 and 1939. The Philadelphia Conference of 1944 passed a resolution recommending that an Asian Regional Conference should be held at an early date. Accordingly, the Government of India invited the International Labour Organisation to hold the Preparatory Asian Regional Conference in India and the invitation was accepted. The session of the Conference in India started on the 27th of October 1947 and lasted for over a week. More than 200 delegates from various countries, including America and some of the European countries, were represented at the Conference.

During the year the I.L.O. held two seminars in India, one dealing with Labour Statistics and the other with Factory Inspection.

The following is a list of Conventions ratified by India:—

1. Hours of Work (Industry), 1919.
2. Night Work (Women), 1919.
3. Night Work (Young Persons), 1919.
4. Right of Association (Agriculture), 1921.
5. Weekly Rest (Industry), 1921.
6. Minimum Age, 1921.
7. Medical examination of Young Persons (Sea), 1921.
8. Workmen's Compensation (Occupational Diseases), 1925.
9. Equality of Treatment, 1925.
10. Inspection of Emigrants, 1926.
11. Seamen's Articles of Agreement, 1926.
12. Marking of Weight, 1929.
13. Night Work (Women) (Revised), 1934.
14. Underground Work (Women), 1935.
15. Protection Against Accidents (Dockers) Convention, 1929, Revised in 1932.
16. Final Articles Revision Convention, 1946.
17. Labour Inspection, 1947.
18. Night Work (Women) (Revised), 1948.
19. Night Work of Young Persons (Industry) (Revised), 1948.

TRIPARTITE MACHINERY

A Plenary Conference of the representatives of workers, employers and Governments met on August 7, 1942 at New Delhi and decided that a collaborative machinery composed of the representatives of Governments, employers and workers in India should be established forthwith for the consideration of all questions relating to the conditions of labour.

It also decided that a Standing Labour Committee should be constituted.

The main function of the Standing Labour Committee is to consider and examine such questions as might be referred to it by the Plenary Conference or by the Central Government taking also into account suggestions made by State Governments, and representative organizations of Employers and Workers. Whereas the Plenary Conference is to meet at least once in every year, the Standing Labour Committee is to meet as often as it might be convened by the Central Government for the consideration of questions that may be before it.

In the light of the experience it was found that the subjects for the Conference or the Committee should be divided into (1) those dealing with general problems and (2) those covering all concrete questions relating to labour welfare and administration of labour laws. The former to be assigned to the Plenary Conference and the latter to be dealt with by a new body called the Labour Welfare Committee. The Standing Committee should cease to be a deliberative body and should act as the agent of the Conference.

Industrial Committees have been set up for important industries, such as plantations, cotton, cement, leather and coal.

The question of re-constituting the tripartite machinery was again placed on the agenda of the eighth Labour Conference held in April 1947. In view of the establishment of Industrial Committees, proposals were also made for the abolition of the Standing Committee but the workers' representatives were opposed to this change.

As there was imperative need after the advent of the Interim Government in September 1946 for a co-ordinated and uniform labour policy throughout the country, it was felt that the co-operation of the State Governments was necessary before giving final effect to Government's programme of amelioration of labour conditions. Separate conferences first with the Provincial Labour Ministers and then with the States Labour Ministers were, therefore, organised. Government's labour programme was discussed in detail at both these Conferences. This Conference was followed by a joint Conference of Provincial and States Labour Ministers. At the end of the year 1946 a special Conference of employers and workers was also held to consider the five-year programme.

Arising out of the adoption of the Industrial Truce Resolution in December 1947 at a conference of representatives of Government and of employers and employees, a Central Advisory Council was set up. Most of the States have also set up tripartite labour organisations. Committees of enquiry appointed by the various State Governments in connection with the implementation of the Minimum Wages Act are also tripartite in character.

WAGES AND CONDITIONS OF EMPLOYMENT

The last few years have witnessed an almost revolutionary change in the industrial wage structure of India. During the progress of the Second World War Government in their desire to maintain the tempo of production and also to increase it to the maximum took timely action to ensure that production did not suffer as a result of industrial unrest. As will be seen from another section, Central and State Governments tried to avert strikes or to settle them by timely intervention. During the progress of the War, Industrial Tribunals were also appointed to adjudicate in disputes under Rule 81A of the Defence of India Rules. The awards of adjudicators and of Industrial Tribunals and Industrial Courts have resulted in great benefits to labour and, as stated already, almost a revolution has taken place in the wage structure of industrial labour in this country.

No serial statistics of wages and earnings are available in India except for those compiled under the Payment of Wages Act. The returns under the Act, however, relate only to persons in receipt of wages and salaries of Rs. 200 per month. However, these data are of considerable value in showing the trends of earnings of industrial workers and the following table contains the details:—

AVERAGE ANNUAL EARNINGS OF FACTORY EMPLOYEES

State	1939 Rs.	1948 Rs.	1949 Rs.
Ajmer	163·7	527·2	552·0
Assam	263·7	795·8	951·1
Bihar	415·5	943·2	983·9
Bombay	370·4	1,141·9	1,210·1
Madhya Pradesh ..		609·2	841·9
Delhi	369·4	1,047·3	1,028·4
Punjab	296·0	675·9	858·7
Madras	175·9	611·8	726·6
Orissa	161·8	612·6	527·0
U.P.	235·6	887·1	993·0
West Bengal ..	248·7	723·9	839·0
All-India ..	287·5	883·0	985·9

RATES OF WAGES

Until the enforcement of the awards, etc., referred to above basic wages in many industries were abnormally low and in many cases the quantum of dearness allowance was four to five times the basic wage. This situation exists even today in certain centres and industries where wage regulation has not taken place as a result of awards of Industrial Tribunals, etc. However, as a consequence of the implementation of the recommendations of the Central Pay Commission by the Government of India and the enforcement of awards of Industrial Tribunals, a very large body of industrial workers in the country today are in possession of a basic wage which is very much higher than it used to be only a few years ago. The tabular statement below shows the basic wages and earnings of important categories of industrial workers in India.

STATEMENT SHOWING THE BASIC MINIMUM WAGE, DEARNESS ALLOWANCE AND THE MINIMUM MONTHLY EARNINGS OF WORKERS IN DIFFERENT INDUSTRIES (October, 1950).

Industry	Centre	Minimum basic wage	Minimum dearness allowance	Minimum monthly earnings
		Rs. a. p.	Rs. a. p.	Rs. a. p.
Cotton	Bombay City	30 0 0	56 10 0	86 10 0
	Ahmedabad	28 0 0	72 4 9	100 4 9
	Sholapur	26 0 0	58 4 9	84 4 9
	West Bengal	20 2 5	30 0 0	50 2 5
	Madhya Pradesh	26 0 0	43 9 8	69 9 8
	Madras	26 0 0	45 0 0	71 0 0
Jute	West Bengal	26 0 0	37 8 0	63 8 0
Engineering	West Bengal	30 0 0	25 0 0	55 0 0
Dockyards	Bombay (1)	30 0 0	35 0 0	65 0 0
	(2)	26 0 0	56 1 0	82 1 0
	Calcutta	30 0 0	25 0 0	55 0 0

WAGES IN MINES

It will be remembered that in May 1947, as a result of the recommendations of the Board of Conciliation, which were implemented by Government substantial increases in wages were granted to workers in the coalfields. The Chief Inspector of Mines in his Monthly Coal Bulletin publishes figures of average weekly earnings of certain categories of workers in different coalfields. The latest available information is given in the table below:

AVERAGE WEEKLY EARNINGS IN COAL MINES.
(October, 1951).

—	Assam	Raniganj	Jharia	Madhya Pradesh	Orissa	Hyderabad	Bikaner	Indian Union
	Rs. a. p.	Rs. a. p.	Rs. a. p.	Rs. a. p.	Rs. a. p.	Rs. a. p.	Rs. a. p.	Rs. a. p.

DEARNESS ALLOWANCE

Unlike many other countries in the world, industrial workers in India are being compensated for the rise in the cost of living by the grant of what is known as dearness allowance.

No definite principle has so far been evolved whereby a uniform percentage of dearness allowance could be fixed for the whole country at any given time. The scale of the allowance varies not only from centre to centre and industry to industry, but also, except where these matters are adjudicated upon, from unit to unit in the same industry at the same centre.

In coal mines dearness allowance is paid on the basis of a percentage of basic wages. In Bihar and Bengal the dearness allowance is 150 per cent of basic wages for those earning up to Rs. 30 per month.

In the Engineering industry in West Bengal dearness allowance is graded according to income and ranges from Rs. 25 per month in the case of those getting basic wages up to Rs. 50 per month to Rs. 50 for those getting more than Rs. 200. In Bombay some concerns pay at a flat rate and others on a graded scale. Several Adjudicators have granted dearness allowance either at the Bombay Millowners' Association scale which was Rs. 58-11-0 in December 1951 or at a percentage, varying from 66⅔ per cent to 85 per cent, of that scale. In Madras the rate varies from 8 annas to Re. 1-9-6 per day and in a number of concerns it is paid at a flat rate of Rs. 25 per month. In the tanneries and leather goods industry dearness allowance paid is around Rs. 25 per month in West Bengal and Madras, about Rs. 30 in Bombay and between Rs. 40 and 60 in Kanpur.

The Committee on Fair Wages appointed by the Government of India examined the question of dearness allowance and came to the conclusion that for the lowest categories of employees the target should obviously be compensation to the extent of 100 per cent of the increase in the cost of living, but that in the case of higher categories a lower rate of compensation should apply and that the amount of compensation should be based on salary scales or slabs.

BONUS

As in the case of dearness allowance the practice in regard to the quantum of profit bonus varies from centre to centre and industry to industry. In Bombay City the cotton mill workers received for the year 1950 a bonus equivalent to 15 per cent of basic wages earned. In the Madras and Madura cotton mills the system followed is to pay a bonus related to the dividend which is declared.

No bonus has so far been paid in the jute mill industry in West Bengal. The industrial Tribunal considered the question but deferred its recommendations in the matter pending the results of an investigation by experts and the Government of India.

The dockyards in West Bengal generally pay an annual bonus amounting to a month's wages. Some of the dockyards in Bombay pay two months' wages as bonus.

The Tata Iron and Steel Co. at Jamshedpur pay a good attendance bonus amounting to 10 to 12 per cent of basic wages and a performance bonus of 10 to 50 per cent of basic wages is also given to workers. To the latter, however, only skilled and semi-skilled workers are entitled. Under the Company's revised Profit Sharing Scheme, the employees are entitled to a share of 27½ per cent of the annual net profit of the company and such share is credited to and/or distributed among the employees of the company in proportion to the basic salaries and wages earned or deemed to be earned by such employees respectively during the year in which such net profits were earned by the Company.

All the units under the management of the Associated Cement Companies paid for 1950 a profit bonus equivalent to three months' basic wages. The Andhra Cement Co., Vijayawada, paid a bonus equal to one month's earnings including dearness allowance.

In the paper mill industry the mills in Orissa and Mysore paid for the year 1949-50 bonus equal to one month's wages and ¼th of total earnings respectively. The units in Hyderabad and Ahmedabad paid a month's wages for the years 1947-48 and 1948-49 respectively.

The Board of Conciliation appointed for the coal-mining industry recommended the grant of an annual bonus equal to four months' basic wages, split into two parts. An attendance bonus of two months' basic wages to those fulfilling specified minimum attendance requirements, and a production bonus related to output and basic earnings and subject to their qualifying for it on the basis of a minimum attendance of 66 days per quarter in the case of surface workers and 54 days per quarter in the case of underground workers in the case of collieries in Bihar and West Bengal. Bonus on the above basis is also to be paid, according to the Fact-Finding Committee's recommendations subject to a minimum attendance of 60 and 65 days in a quarter in the case of underground and surface workers respectively in Madhya Pradesh, Hyderabad and Orissa collieries. In Assam, the existing rate of bonus has been raised by fifty per cent. so as to raise the amount of bonus earned to a sum equal to four months' wages per year.

From the latest information available it would appear that during the period April 1950 to March 1951, about 30.1 per cent. of the workers in West Bengal, about 51.3 per cent. in Bihar and about 40 per cent. in Madhya Pradesh qualified for the bonus. Details regarding the number of workers receiving bonus and the amount of bonus paid are not available in respect of many mines nor is the available information uniform. The amount disbursed by way of bonus by collieries submitting returns was Rs. 35.45, Rs. 11.22 and Rs. 9.68 lakhs respectively in West Bengal, Bihar and Madhya Pradesh.

So far no bonus has been paid to plantation workers but recently bonus equivalent to 6¼ per cent. and 4 per cent. on total cash earnings during the calendar year 1948 was paid to workers employed in plantations in Madras and Travancore respectively. During 1950, nearly 40,000 workers employed in some 212 estates in the different plantation districts in South India were paid annual bonus amounting to Rs. 2,96,800.

PAY PERIODS

The period of wage payment varies from industry to industry and centre to centre and is mostly determined by tradition and custom. Allowing for minor differences in this respect and considering the major industries and the important centres it can be stated that in the jute industry in West Bengal and in the plantations the wages are generally paid weekly. The system of wage payment in the cotton textile industry in Bombay City and Sholapur is monthly. A peculiarity of Ahmedabad is that the wages are paid per *hapta* which varies from 14 to 16 days. The month is the accepted wage period for the railways. In some concerns wages are paid daily to certain types of workers, weekly to others, fortnightly to yet others and monthly generally to the clerical and supervisory staff.

Mining labour is mostly paid on a weekly basis.

HOURS OF WORK

The existing restrictions on hours of work in factories and mines subject to the Indian Factories and Mines Acts have been described in the sections dealing with those Acts. The most important happening in regard to hours of work in factories was the reduction of the weekly hours of work for adults to 48.

Actually, in many industries in this country during the war when three shifts were being worked, the hours of work were not in excess of 8 per day. In the coal-mines in Bihar and West Bengal the workers seldom work for more than five to six hours in the day or for more than four to five days in the week. According to a recent investigation the average weekly attendance of a coal-miner was 4·56 days. The cotton textile industry in almost all centres normally works a uniform 8-hour day. A recent development in the cotton textile industry is to work shifts on the basis of what is known as the Relay System. By this system a unit does not stop work during the noon recess and continues working throughout a whole shift, different batches of workers being given rest intervals by turns and the remainder being asked to do double substitute work for the time being.

In jute mills which are members of the Indian Jute Mills Association the hours of work are regulated according to the recommendation of the Association. On account of the difficulties of getting adequate raw jute, the jute mills in West Bengal were, from December 1949, working 42½ hours per week. Recently the jute mills have resumed working normal hours.

All the dockyards, many of the larger engineering and almost all the railway workshops work a 48-hour week but the daily hours vary according to the number of hours worked on a short Saturday. The hours in many of the mechanic shops of textile mills and in the larger non-engineering factories are usually half an hour to an hour less than those for process workers and approximate more closely to those in large engineering plants. Factories engaged in the production of metalware, however, work the full number of hours permissible under the Factories Act as also do oil and sugar mills.

In all cases where continuous production is necessary such as in electricity generating plants and certain water pumping stations, cement factories, etc., work is arranged on a system of three shifts—the different shifts changing over every week or fortnight. The change-over is so arranged that every workman gets a rest period of at least twenty-four continuous hours once in one week.

As far as railways are concerned, hours of work in railway workshops are controlled by the Indian Factories Act. Most of the larger running sheds have also recently been classified as factories and work in these large sheds is arranged on the basis of three shifts of 8 hours each. In the smaller sheds where work is of a fairly intermittent character, systems of two shifts of 12 hours each obtain but the work of the individual is so arranged as not to work each operative for more than 8 hours.

The question of hours of work of railway servants was one of the points submitted for adjudication to Mr. Justice Rajadhyaksha of the Bombay High Court who made the following recommendations:

The employment of railway servants under the Hours of Employment Regulations should be classified under anyone of the following heads:

(*i*) Intensive.

(*ii*) Continuous.

(*iii*) Essentially Intermittent.

(*iv*) Excluded.

(*i*) The statutory limit of weekly hours for persons whose employment is classified as intensive should be fixed at 75 hours a week on the average in a month;

(*ii*) The statutory maximum limit for the employment of continuous workers should be fixed at 54 hours a week on the average in a month;

(*iii*) The statutory maximum for staff classified as essentially intermittent should be 75 hours a week; and

(*iv*) For excluded workers no statutory minimum limit can be prescribed but this should not absolve the Administrations of their responsibility on humanitarian grounds, of seeing that unreasonable conditions are not imposed. The Government of India accepted these recommendations and by an Order dated 15th June 1948 declared them binding for a period of three years.

In the major municipalities the hours of work vary from department to department but are generally 8 to 10 per day. In the Water Works Department, the Pumping Station and Distribution Department in Madras, there is a regular system of change-over of shifts but such a system is not to be found in other municipalities. Speaking generally, municipal workers get a weekly holiday. Although those in the conservancy department get only half a day off per week, there is a certain amount of discontent among the conservancy staff for not getting a weekly holiday but since they are engaged on essential work most of the municipalities find it difficult to grant such a holiday.

COST OF LIVING

Bombay was the first State in India to compile and publish a price series intended for measuring changes in the cost of living.

In addition to the cost of living index series which the Labour Office of the Government of Bombay compiles for working classes in Bombay City, it also compiles similar cost of living index series for three other centres in the State of Bombay: (1) Ahmedabad; (2) Sholapur; and (3) Jalgaon. Those for Ahmedabad and Sholapur are published regularly in the *Labour Gazette* along with that for Bombay City. The average prices for the year ended July 1927 have been adopted as the basis for the Ahmedabad series while the one for Sholapur is based on the average prices for the year ended January 1928.

Other States in India which compile cost of living index series for working classes are Madras, Madhya Pradesh, Uttar Pradesh, and Bihar, the old undivided Punjab and Orissa. Mysore was the first Princely State to start the compilation of a Cost of Living Index for the City of Bangalore in 1942. The Mysore Government also publish now cost of living figures for Kolar Goldfields and Mysore. Among the other States which publish such figures are Travancore-Cochin and Hyderabad. These figures are reproduced regularly every month in the *Indian Labour Gazette* along with those for India.

The Government of Madras compiles nine series in all: one for Madras City with the average prices for the year ended June 1936 equated to 100 and eight other series for low paid employees at Visakhapatnam, Eluru, Bellary, Cuddalore, Coimbatore, Madura, Tiruchirapalli and Kozhikode with the average prices for the twelve months from July 1935 to June 1936 as base.

In Uttar Pradesh, one series with August 1939 as the base is compiled for working classes in Kanpur and five other series with prices at 31st July 1939 equal to 100 are specially compiled for low paid Government employees at Lucknow, Banaras, Bareilly, Meerut and Gorakhpur.

Average prices for five years are also the base for cost of living index for Ludhiana in the Punjab but the base period in the Punjab is the quinquennium ending December 1935.

The Government of Orissa compiles a cost of living series for its headquarters town of Cuttack on the same method and base as those adopted by the Government of Bihar and another with average prices during the year 1939-40 as base for Berhampur.

INDEX FIGURES

Owing to the variations in the method of compilation of these indices, they are not strictly comparable, but the table below shows the movement of cost of living index numbers in selected centres for the twelve months of the year 1951:—

1951	BOMBAY				U.P.	Madhya Pradesh	Madras	TRAVANCORE-COCHIN		MYSORE			HYDERABAD

* Base: Shifted to August, 1939=100. ** Base: Year ending June 1936=100. @ Base: Year ending July 1944=100.

The Royal Commission on Labour in India had commented on the unsatisfactory character of the cost of living index numbers published in India and the Rau Court of Enquiry were also greatly handicapped in their investigations owing to the paucity of reliable data in regard to the cost of living index numbers for industrial workers. The Government of India, therefore, in consultation with the State Governments, decided to launch upon an All-India Scheme for the preparation and maintenance of working class cost of living index numbers for selected centres in the country. This scheme was started in the year 1942 and was completed in 1946. Over 27,000 family budgets were collected in some 28 selected centres.

The main object of these investigations was to obtain weights for compiling and maintaining cost of living index numbers on uniform lines. Accordingly, the Labour Bureau of the Government of India started publishing regularly in the Indian Labour Gazette on base 1944=100 cost of living index numbers for some 15 centres in India and the latest available figures for these centres on base 1944 are given below:—

1951	Delhi	Ajmer	Jamshedpur	Jharia	Dehri-on-Sone	Monghyr and Jamalpur	Cuttack	Berhampur	Gauhati	Silchar	Tinsukia	Ludhiana	Akola	Jabalpur	Khoragpur	Mercara*

* Interim series for plantation workers on base July to December 1948=100. † Returns not received.

STANDARD OF LIVING

The Bombay Labour Office carried out two family budget enquiries for working classes in Bombay City, one in 1921-22 and the other in 1932-33 and the results were published in the years 1923 and 1935 respectively. Similar enquiries were also conducted in Ahmedabad and Sholapur cities and the results of both these enquiries were published in the year 1928. In Madras, the Director of Industries published in 1938 the results of an inquiry into the family budgets of industrial workers in organized and unorganized industries in Madras City conducted under the direction of the Commissioner of Labour. A number of family budgets were also collected at Kanpur in Uttar Pradesh and at Nagpur and Jabalpur in Madhya Pradesh with the object of compiling cost of living indices.

* Reference has already been made in the section dealing with cost of living index numbers to the fact that the Government of India carried out extensive family budget surveys in selected centres in India. The results of these surveys with the exception of the one at Kanpur have now been published. Separate reports on these surveys have been published for each centre and are available to the public. The statement on the next page contains in a tabular form the main results of these surveys.

ABSENTEEISM

One of the commoner complaints of Indian industrialists has been the high percentage of absenteeism and the large turnover in Indian factories, mines, etc. From the available information it is clear that the percentage of absenteeism in Indian industries and particularly in mines and plantations is very high. It amounts to about 10 to 15 per cent. in factories, and to about 25 to 30 per cent. in mines and plantations. The high percentage of absenteeism in mines is due largely to the fact that there is a periodical exodus of miners to their villages for purposes of cultivation. The high percentage of absenteeism in plantations can be attributed to the large amount of sickness which prevails, particularly in the tea plantations in Assam and West Bengal as well as to the fact that the workers are granted leave to attend to private cultivation. It is noteworthy that in factories in which the conditions of work and wages are satisfactory and also where there is a system of granting leave with pay apart from the statutory holidays with pay, the incidence of absenteeism is not so high as is otherwise the case. The available statistical data on absenteeism in certain types of concerns for the years 1948, 1949, 1950 and the twelve months of 1951 are given in the tabular statement below :—

Note.—The series relating to Bombay (columns 2, 3, 4, and 11) covered only the day shift till December 1948. The series now cover all shifts.

SOCIAL SECURITY

A bill incorporating a health insurance scheme was introduced in November 1947 in the Indian Parliament and was passed as the Employees' State Insurance Act on 19th April 1948. The following are its main provisions :

The Act applies to all factories including factories belonging to Government other than seasonal factories and covers employees in receipt of wages or salaries up to Rs. 400 per month. The administration of the Act is entrusted to an autonomous body called the Employees' State Insurance Corporation. A Standing Committee is to act as the executive of the Corporation. There is also to be a Medical Benefit Council to advise the Corporation on matters relating to administration of medical benefit, certification, etc. All these bodies are tripartite in character.

The scheme is contributory but the Central Government is to make an annual grant to the Corporation during the first five years of a sum equivalent to ⅛rds of the administrative expenses of the Corporation. The rates of contribution payable in respect of an employee have been fixed as follows :—

Group of employees	Employees' contribution (recoverable from employees)			Employers' contribution			Total contribution (employees' and employers' contribution)		
	Rs.	As.	Ps.	Rs.	As.	Ps.	Rs.	As.	Ps.
1. Employees whose average daily wages are below Re. 1	*Nil*			0	7	0	0	7	0
2. Employees whose average daily wages are Re. 1 and above but below Rs. 1-8-0	0	2	0	0	7	0	0	9	0
3. Employees whose average daily wages are Rs. 1-8-0 and above but below Rs. 2-0-0	0	4	0	0	8	0	0	12	0
4. Employees whose average daily wages are Rs. 2-0-0 and above but below Rs. 3-0-0	0	6	0	0	12	0	1	2	0
5. Employees whose average daily wages are Rs. 3-0-0 and above but below Rs. 4-0-0	0	8	0	1	0	0	1	8	0
6. Employees whose average daily wages are Rs. 4-0-0 and above but below Rs. 6-0-0	0	11	0	1	6	0	2	1	0
7. Employees whose average daily wages are Rs. 6-0-0 and above but below Rs. 8-0-0	0	15	0	1	14	0	2	13	0
8. Employees whose average daily wages are Rs. 8-0-0 and above	1	4	0	2	8	0	3	12	0

The insured persons are entitled to the following benefits :
(*i*) sickness benefit, (*ii*) maternity benefit, (*iii*) disablement benefit, (*iv*) dependents benefit and (*v*) medical benefit.

The implementation of the scheme throughout the country simultaneously being attended with practical difficulties, a plan of phased application of the scheme in different places was drawn up. Under this plan, it was proposed to introduce the scheme in Kanpur and Delhi in July 1950. The proposal had to be postponed at the last moment owing to objections received from employers in Kanpur that the introduction of the scheme in selected places, without its simultaneous application elsewhere, would place industries in those areas at a competitive disadvantage. To overcome these objections, and to remove a few other lacunæ, the Employees' State Insurance Act, 1948, was amended in 1951. Under the amended Act, the employers' contribution will be levied from employers throughout the country in a manner which will make the extra cost on all employers as equitable as possible.

The scheme was inaugurated in Kanpur and Delhi on 24th February 1952.

HEALTH, SAFETY

Such statistics of health and mortality as are collected and published relate to the whole community and no statistics are compiled separately for industrial workers alone. In the absence of such data it is not possible to generalise about these matters.

The War witnessed a tremendous drive against the scourge of malaria especially in the coalfields of W. Bengal and Bihar. For a time the whole organisation for fighting malaria by the use of D. D. T. was taken over by the army and deaths from malaria went down to a considerable extent in a couple of years' time. The Welfare Fund as has been pointed out, is also spending large amounts for fighting the scourge of malaria.

In the tea plantations of Assam and West Bengal the Indian Tea Association is spending large sums of money in order to reduce the incidence of malaria. Even so, in many of the industrial towns and in the tea plantations, there is still a considerable amount of illness resulting in absenteeism and loss of production.

Although there is not much evidence of the existence of occupational diseases notified under the Workmen's Compensation Act in the mining and factory industries of India, this may partly be due to the defective arrangements which exist for detecting such diseases. Silicosis on a considerable scale is, however, to be found in the gold mines in Kolar.

As in most things connected with the welfare of labour, the railways are in the forefront in the matter of the provision made for medical aid and relief. All railways maintain fully equipped hospitals with qualified surgeons, physicians and nursing staffs at suitable centres in addition to fully equipped dispensaries in charge of qualified medical officers at all places where there are sufficient numbers of workers to justify them.

The Government of India have provided adequate medical facilities in most of their own establishments such as Indian Naval Dockyard and the various Ordnance and Ammunition Factories. Several of the larger municipalities and public bodies such as the Port Trusts also maintain their own hospitals and dispensaries for the benefit of their workers.

All railways have undertaken extensive schemes of safety-first propaganda including the putting up of safety posters and safeguards both in English and in the Indian languages at all prominent points and places ; the free issue of illustrated booklets on accident prevention ; publication of special articles with photographs in railway magazines ; addresses and magic-lantern lectures ; and the organisation of special safety-first committees in the larger workshops.

The Millowners' Association, Bombay, has done a considerable amount of good work of a pioneering character in connection with Safety-first measures. Working in conjunction with the Safety-first Association of India, the Association drew up a Safety Code for the Cotton Textile Industry and this Code was published and put into operation from August 1940. It is of interest to note that most cotton mills in Ahmedabad had also established safety-first committees by the end of the year 1939. Factory Departments in all States do all they possibly can in improving safety measures in factories.

The Indian Factories Act requires the manager to report all accidents which cause death or bodily injury whereby the person injured is prevented from returning to his work in the factory during the 48 hours next after the occurrence of the accident. All classes of accidents namely, fatal, serious (*i.e.*, accidents which prevent a person returning to work for 21 days or more) and minor are to be reported to the Inspector of Factories and to the District Magistrate and in cases of any accident resulting in death to the officer in charge of the police station in addition.

It is the duty of the Inspector of Factories to make an investigation as soon as possible into the causes of and the responsibility for a fatal or serious accident, and to take steps for the prosecution of the person concerned if it is found that the death or serious injury resulted from any infringement of the provisions of the Act or of the rules framed under the Act. The Act also requires notice to be given of an accident which is due to any cause that has been notified in this behalf by a State Government, even though no injury may have resulted therefrom to any person.

The provisions contained in the Indian Mines Act with regard to the reporting of accidents are somewhat similar to those contained in the Factories Act but with the difference that every accident which occurs in a mine has to be recorded in a special register to be kept for the purpose.

Provision has been made for the training of miners in first-aid. There are also in the mining areas two rescue training centres where training has been given for fighting fires, etc. in coal mines.

In recent years the Government of India have been evincing a very great deal of interest in industrial safety. Sir Wilfrid Garrett, Chief Inspector of Factories in the United Kingdom, was officially invited to India to look into the many questions dealing with factory administration and Industrial safety. A new office called the Office of the Chief Adviser, Factories was started and this office now issues from time to time valuable literature on the subject of industrial safety.

INDUSTRIAL ACCIDENTS

The table below shows the number of accidents in Indian factories and mines in the years 1939 to 1950 :—

	FACTORIES				MINES			
Year	Fatal	Serious	Minor	Total	Fatal	Serious	Minor	Total

For the first time we have also now available in this country family living studies for plantation workers. These were conducted in the year 1947 by the Government of India and the results of these surveys have been incorporated in two separate reports. The tabular statement below contains details regarding the main findings of these enquiries in the plantations in north, east and south India.

COMPOSITION OF THE FAMILY, AVERAGE WEEKLY INCOME AND EXPENDITURE OF THE FAMILY AND THE ACTUAL AND PERCENTAGE DISTRIBUTION OF EXPENDITURE ON DIFFERENT GROUPS.

RECRUITMENT

Until recently, recruitment of labour in almost all industrial undertakings with the possible exception of Railway workshops, was effected through the medium of a recruiting agent, a *Sardar*, a *Mukkadam*, a *Mistri* or a jobber. As a result, however, of the recommendations made on the subject by various committees—notably the Royal Commission on Labour in India and the Bombay Textile Labour Inquiry Committee which have condemned this method of recruitment owing to the abuses which have come to be associated with it—many of the larger and more progressive concerns have appointed Labour Officers who are directly responsible for all new recruitment.

The evils in connection with recruitment were most marked in the case of casual or substitute labour. The Millowners' Association, Bombay, have dealt with the problem by establishing what is known as the "Badli Control System." Daily casual vacancies are filled only from card holders and whenever there is a permanent vacancy it is filled from these card holders. The evil influence of the jobber is thus eliminated. The system has been highly commended by the Textile Labour Inquiry Committee and the Government of Bombay have recommended its adoption by all mills in the other centres of the cotton textile industry of the State. A recent development in this matter is the 'decasualization' scheme of the Government of Bombay which has been introduced in some of the textile centres.

In the jute mill industry during recent years, many of the mills have established what are known as Labour Bureaux one of whose functions is to recruit labour. The Industrial Tribunal appointed by the Government of Bengal have stated in their award that despite the establishment of Labour Bureaux a considerable amount of recruitment was being done by the supervisory staff and have recommended that each jute mill should have a Labour Bureau and that all recruitment should be done through such Bureaux.

In this connection mention might also be made of the Employment Exchange started by the Northern India Employers' Association in Kanpur. Some progressive cotton mills in the South have also opened special Labour offices through which only recruitment is made.

LABOUR OFFICERS

The Millowners' Association, Bombay conducts special classes for the training of Mill Labour Officers and actively supervises and controls the work done by all such Officers where they have been appointed through the Association. Following the example of the Millowners' Association, Bombay, the University of Calcutta, in co-operation with the Indian Jute Mills Association, has recently inaugurated a special course of social work for giving suitable training to Labour Welfare Officers engaged in jute mills. The course covers both theoretical training and intensive practical work in the field, *i.e.*, the jute mills themselves. Among other institutions imparting training for Labour Officers mention may be made of the Tata Institute of Social Sciences, Bombay; Institute of Social Sciences, Banaras; Xavier Labour Relations Institute, Jamshedpur; Department of Labour and Social Welfare, Patna University; J. K. Institute of Sociology and Human Relations, Lucknow University, and the training course conducted by the Madhya Bharat Millowners' Association, Indore.

TECHNICAL TRAINING

About the end of the year 1940, the Government of India instituted a Technical Training Scheme designed to provide for the intensive training of a large number of skilled technicians required for the technical branches of the Defence Services and for ordnance and munitions factories. When the scheme was first initiated the number of persons to be trained was fixed at 15,000. This was later increased to 44,600.

The number of technicians trained under the scheme and supplied to the Defence Services up to 31st October 1945 was 83,867. More than 100,000 trained men have passed through the Training Centres during the five years of the operation of the scheme. With the termination of the war, however, the recruitment of trainees under the Scheme ceased.

Meanwhile the Government of India appointed a Special Committee with N. R. Sarkar as Chairman to consider the question of the establishment of a high grade technological institute in India possibly on the lines of the M.T.T. to provide advanced instruction and training in technology to meet the demands of industry.

The Directorate-General of Resettlement and Employment set up by the Government of India in July 1945 also organised several training schemes, such as, technical and vocational training, apprenticeship and vocational training for ex-Servicemen, etc. In 1947 schemes for technical and vocational training for displaced persons were also taken up.

The training schemes for displaced persons came to an end in March 1950 except in U.P. The training schemes for ex-Servicemen finally closed on 31st July 1950. In place of these a training scheme for adult civilians was started with effect from March 1950. For the present, 10,000 seats have been sanctioned under this scheme.

There were 208 training centres in November 1951 and the number of persons undergoing training in these centres was as follows:—

Technical training	7,309
Vocational training	1,568
Apprenticeship training..	813
Vocational training	358
TOTAL ..	10,048

EMPLOYMENT EXCHANGES

The following table contains particulars regarding registrations and placements by Employment Exchanges for the twelve months of the year 1951:—

WORKING OF THE EMPLOYMENT EXCHANGES IN INDIA

1951	No. of exchanges at the end of the period	No. of registrations during the period	No. of applicants placed in employment during the period	No. of applicants on the live registers at the end of the period	No. of employers using the exchanges during the period	No. of vacancies notified during the period	No. of vacancies outstanding at the end of the period

WELFARE ACTIVITIES

The Reports of the Labour Investigation Committee on labour conditions in 36 industries as also their Main Report as well as the issues of the Indian Labour Year Book published by the Labour Bureau of the Government of India contain detailed and comprehensive information regarding labour welfare undertaken in various States and industries. The following paragraphs briefly refer to the more salient features of welfare work that is being done in the country.

Until recently the Government of India had not undertaken any activities to promote the welfare of industrial labour employed in Central concerns. Recently, however, they have done a great deal in this respect. Reference has already been made to the institution of the Coal Mines and Mica Mines Labour Welfare Fund. Proposals for levying a cess to create a welfare fund for tea plantations is also under consideration. The Central Government have issued directives to all employing departments to constitute Labour Welfare Funds in all Government undertakings. The Fund is to be utilised for providing indoor and outdoor recreation, reading rooms, etc., to workmen employed in the undertakings. The Fund will be financed partly by Government grants.

The State Governments have also given up their policy of *laissez faire* in regard to welfare work. The first big step in this direction was taken during the regime of the Congress Ministries during the years 1937-39 when the Bombay Government instituted a large Welfare Department and undertook welfare activities themselves for all industrial workers in the principal industrial towns in Bombay. During wartime the Bombay Government and U. P. Government directly embarked on a policy of providing welfare measures and West Bengal followed suit.

Welfare work is now directly undertaken by the Governments of Bihar, Hyderabad, Madhya Bharat, Mysore, Saurashtra and Travancore-Cochin.

HOUSING

In the past the policy of Government as well as of industrial employers was to leave the matter of housing more or less in the hands of private enterprise. Only where accommodation provided by private enterprise was not available or where it was inadequate did employers step in and build houses for their employees. Even then housing of the employees was not given the importance it deserved and construction of houses was undertaken only when funds were available. In industries situated in out of the way places where private houses were not normally available as in mines and plantations the employers had perforce to provide some sort of living accommodation for their employees. The rapid growth in industrial employment made the housing problem serious and the influx of large numbers of workers to urban centres during the war further aggravated the situation.

The subject of industrial housing was thoroughly discussed at the seventh meeting of the Standing Labour Committee in August 1945 and a sub-committee was appointed to report on various aspects of the problem of industrial housing. The Committee recommended certain minimum standards for workers' houses. Industrial housing figured in the Industrial Truce Resolution adopted in December 1947. In April 1948 the Government of India announced as part of their industrial policy a scheme for the construction of a million workers' houses to be completed within a period of ten years but on account of financial stringency much headway could not be made in the furtherance of the scheme. The Government of India are now considering a new scheme for industrial housing under which it is proposed to grant subsidies to employers providing houses for their workers according to approved standards.

The subject of industrial housing has also been engaging the attention of several State Governments in recent years. The Governments of Bihar, Bombay, Madhya Pradesh, Punjab, U.P., Madhya Bharat, Mysore, Travancore-Cochin, have in hand schemes of industrial housing and some of the States, as for instance Bombay, have made substantial progress in regard to the construction of new houses.

As regards housing accommodation provided by employers, the standards vary widely. In the cotton mill industry only a small proportion of the workers are provided with houses. Some of the notable cases where good types of houses are provided for cotton mill workers are the Empress Mills, Nagpur, the Jiyajee Rao Cotton Mills, Gwalior, the Binny Mills at Madras and Bangalore and the Madura Mills. The jute mills in and around Calcutta have provided housing for about a third of their workers but the standards of housing provided leave much to be desired. In the engineering industry only the larger units generally provide housing for their employees. The Tata Iron and Steel Co. for instance, have provided 11,900 houses at Jamshedpur. In the dockyards, ports, paper mills, leather goods factories, etc. only the larger units of the industry generally provide houses and that too only to a small portion of their employees. The cement industry in India is much ahead of other factory industries in regard to the proportion of workers housed as well as the standards of housing provided.

In the coal mines up to 80 per cent. of the workers are housed in dhowrahs free of rent. The housing scheme of the Coal Mines Labour Welfare Fund constituted by the Government of India envisages the building of 50,000 houses for coal miners and already over 1,500 houses have been completed. The mining companies in the Kolar Gold Fields in Mysore have provided over 12,000 houses for their employers.

In the plantations nearly all the settled labour force have been provided with housing but the scale and standard of houses provided are far from adequate. However, in recent years the industry has become keenly alive to the urgency of the problem and at a recent Tripartite Conference the planting interests have agreed to replace the existing sub-standard houses by stages spread over 12 years. The members of the Indian Tea Association had completed by September 1950 about 10,000 new houses in Assam. From September 1950 to March 1951 another 13,364 houses were put up in Assam and 10,449 in Bengal. In South India 844 new houses were completed by employers in the membership of the United Planters' Association of Southern India during the period September 1950 to September 1951.

The Government Railways have provided more than 2,00,000 units of residential quarters for their employees. Over 9,000 new quarters were built by the railways during 1949-50.

Several co-operative housing societies have recently been formed in Ahmedabad through the efforts of the Ahmedabad Textile Labour Association.

SHELTERS, CANTEENS

Section 47 of the Factories Act, 1948 makes it obligatory for all factories employing more than 150 workers to provide adequate shelters and a suitable lunch room for the use of workers during periods of rest. Almost all large industrial establishments had provided tiffin rooms and rest shelters for their workmen. Most concerns had also permitted the establishment of tea stalls on the premises but apart from this, little effort had been made to run co-operative canteens on the lines of those which are associated with most of the large factories in the West.

About the middle of the year 1943, the Government of India recommended to all employers, through the Employers' Federation of India and the All-India Organisation of Industrial Employers, the opening up of more canteens for workers. In October 1943, the Central Board of Revenue issued instructions to all Income-Tax authorities stating that any loss incurred by employers in running canteens for workers should be allowed as a revenue loss in assessing income and excess profits tax while cost of building and equipment of canteens would be chargeable as capital expenditure. Some progress was made though not very much. Till 1945 there were only 37 canteens in Uttar Pradesh, 130 in Bombay, 70 in Madras and 13 in the Bengal area.

Pioneer work in this direction was done by Messrs. E. D. Sassoon & Co. in Bombay. This Company had established large canteens in all their mills. The management in each case bore the salaries of staff and the on-cost for equipment; and hot meals were supplied to the workmen at actual cost. The Company had also established a hostel for boarding and lodging its poor women workers.

The Tata Iron and Steel Company maintain a number of restaurants inside their works at Jamshedpur which ensure wholesome meals and refreshments to the workmen at cost price. A Women's Rest House has also been provided where women employees can wash and change and leave their babies to be looked after in their absence, these babies being served with milk and biscuits free of charge.

The Indian Tea Market Expansion Board which maintains four working centres in India at Bombay, Calcutta, Madras, and Kanpur organises new canteens in industrial establishments. It has a large trained staff for this purpose.

The war witnessed a very large expansion in the provision of canteens in Indian industry from north to south.

The Act of 1948 also provides for the setting up of creches in factories that employ more than 50 women.

Trade Unions.—Except for the Ahmedabad Textile Labour Association, the Railwaymen's Unions, and the Mazdoor Sabha of Kanpur labour unions have not done much by way of labour welfare. This has been due largely to lack of funds. Some of the Railwaymen's Unions have organised co-operative societies, and various kinds of funds for the provision of specific benefits, such as, legal defence, death and retirement benefits, unemployment and sickness benefits and life insurance, etc.

States.—In 1939, the Bombay Government first organised model welfare centres. The expenditure sanctioned in that year was Rs. 1,20,000 but it went up to nearly 11 lakhs during 1949-50. In all, there are now 50 centres classified under four classes—'A', 'B', 'C' and 'D'. At Bombay there are 3 'A' class, 13 'C' class and 2 'D' class centres, located in various parts of the city; at Ahmedabad, 1 'A' class and 7 'C' class centres; at Sholapur there are 1 'A' class and 8 'C' class centres; at Khandesh there are 2 'B' class and 4 'C' class centres and at Hubli 1 'B' class and 1 'C' class centre. There is one 'B' class centre each at Poona, Gadag, Barsi, Viramgaum, Broach, Surat and Nadiad. 'A' class centres have a full-time nursery school for children; a women's section providing literacy, sewing and embroidery classes and suitable games; outdoor games and gymnasium with all facilities for men; and separate arrangements for water-taps and shower baths for both men and women. Static as well as circulating libraries are attached to these centres; radio sets are provided; monthly cinema shows are arranged; and well-equipped dispensaries are attached. 'B' class centres are intended to be a replica of 'A' class centres but on a very much smaller scale. 'C' class centres provide indoor recreation and educational facilities, static and circulating libraries and dispensaries. 'D' class centres provide only outdoor recreation, such as games and sports. The centres have been very popular and the response from workers has been quite encouraging.

Welfare centres have also been opened in Bihar (2), in U.P. (33), in West Bengal (18), Mysore (2), Saurashtra (15) and Travancore-Cochin (3).

MEDICAL FACILITIES

Medical facilities provided by employers range from first-aid posts and dispensaries to first-class hospitals. In many of the factories there are not enough drugs and appliances, nor a qualified full-time medical man appointed. Some factories employ a part-time doctor who visits the factory premises once or twice a fortnight, or more often, just for an hour or so. Sometimes factories arrange to send their workers to private practitioners under an agreement. There are some examples, however, in which first rate medical facilities are provided. For example the Tata Iron and Steel Co. maintain a large well-equipped hospital with 400 beds, and also 8 outdoor dispensaries. Recently a Dental Clinic, an Ear, Nose and Throat Department and a Tuberculosis Clinic have also been opened. The Delhi Cloth Mills maintain a hospital which is fully equipped with X-ray apparatus and other modern appliances, and which gives free medical aid to both mill workers and their families and free food to indoor patients. The hospital at the Kolar Goldfield is a model of its kind. The Buckingham and Carnatic Mills of Madras and the three important groups of employers of the Assam Oil Co. at Digboi and many other employers have also provided adequate medical facilities. In all Class I railways in India there are medical departments under the control of chief medical and health officers with divisional medical officers seconded by a number of assistants.

Although the Factories Act requires that provision should be made for washing especially in factories where workers come into contact with injurious or obnoxious substances, very little effective provision exists in this regard because most factories only provide water for washing but not soap, soda, towels, etc. As for bathing facilities, extremely few employers provide this amenity. Section 42 of the Factories Act 1948 provides for the maintenance of such facilities in every factory.

Other types of welfare work done by factories relate to the provision of recreational facilities, amenities for the education of workers and their children, the provision of cost price grain shops, the establishment of co-operative societies, etc.

On Class I railways there are educational facilities to the children of the employees mostly free of charge. Staff Benefit Funds have also been created by certain railway companies which give monetary help to the children and widows of the deceased employees.

COAL MINES WELFARE FUND

This Fund was constituted under the Coal Mines Labour Welfare Fund Act of 1947. The principal objects for which this fund is to be utilised are defined in the Act. These are: (1) the improvement of standards of living including housing and nutrition, the amelioration of social conditions and the provision of recreational facilities for the benefit of the labour employed in the coal mining industry; (2) the provision of transport to and from work; (3) the improvement of educational facilities; (4) the provision of improvement of supplies of water; and (5) the improvement of public health and sanitation, the prevention of disease, the provision of medical facilities and the improvement of existing medical facilities. The Act makes provision for the appointment of an Advisory Committee consisting of Government Officers and an equal number of members representing colliery owners and workers employed in the coal mining industry of whom one has to be a woman.

The Act also contemplates the appointment of Welfare Administrators, Inspectors and other officers to supervise or carry out the activities financed by the fund. The functions of the Advisory Committee are to advise the Central Government on all matters which the Act requires Government to consult it and on any other matters arising out of the administration of the Act and the fund. Both the cost of administration of the fund and the salaries and allowances of the officers appointed in connection therewith are to be defrayed from the fund itself.

At present a cess of six annas per ton of coal or coke has been levied for being credited to the welfare fund. The principal activities of the fund which are financed out of this cess may be considered under the following heads:—

(*i*) Housing
(*ii*) Hospitals
(*iii*) Prevention of disease
(*iv*) Water supply
(*v*) Pit-head baths and creches and others.

The cess is now being apportioned between the Housing Account and the General Welfare Account of the fund in the ratio 2 : 1. A Coal Mines Labour Housing Board consisting of eight members has been set up. For the coalfields in Madhya Bharat a separate Housing Sub-Committee has also been appointed. The proposal is to build 50,000 houses for the miners: 31,000 in Bihar, 15,500 in West Bengal and 3,500 in Madhya Pradesh. Of these 1,500 are completed. Certain difficulties have been experienced in rapidly carrying out the programme and the progress made so far has, therefore, been somewhat slow. To speed it up a new scheme has been drawn up by Government. Under this scheme a subsidy of up to 50 per cent. of the cost of construction of houses built by colliery owners in accordance with the specifications prescribed by the Coal Mines Labour Welfare Fund will be paid by the Fund.

The fund gives certain grants and subsidies to various other funds such as the Leper Fund.

Special measures are being taken for the welfare of women and children and 20 women's welfare centres in the different coalfields have been started.

The regional hospitals and maternity child welfare centres at Katras and Tisra in the Jharia coalfield and Chora and Searosole in the Raniganj coalfield were opened. The work in regard to the central hospital for Jharia coalfield has been completed and plans and estimates for a Central Hospital for the Raniganj Coalfield have been prepared.

For the prevention of disease, grants are being made to the Mines Boards of Health and a scheme for the treatment of tuberculosis has been drawn up. Anti-malaria work is also in full progress.

The construction of pit-head baths and of creches has now been made compulsory. A few pit-head baths and creche buildings have been completed.

Mica Mines Labour Welfare Fund.—The Mica Mines Labour Welfare Fund Act, 1946, which was designed to constitute a similar fund for the benefit of mica workers, provides for the levy of an *ad valorem* duty not exceeding 6¼ per cent. on all mica exported from India. The Act provides also for the constitution of two Advisory Committees, one for Madras and one for Bihar.

The Committees appointed to look after the welfare of workers in mica mines have commenced work. It has decided to select suitable places in mica areas for sinking wells and for the construction of dispensaries. Certain beds are being reserved in the existing hospitals formica workers. A scheme for starting 4 multi-purpose Welfare Centres in Bihar has been sanctioned. In Madras three dispensaries have been started for use by mica miners and five radio sets have been installed in selected mica mining centres.

PENSIONS, GRATUITIES

The subjects which we deal with under this section are pensions, gratuities, profit sharing, provident funds, co-operative societies, grain and cloth shops, advances and loans.

All monthly and time-rated workmen in the industrial establishments of Government are entitled to pensions on retirement provided that a minimum of ten years' service has been put in. Outside Government concerns, pensions on retirement are almost non-existent although some concerns give small pensions to old employees who have put in long periods of trusted and faithful service but these are mostly *ex gratia* and cannot be claimed as of right.

All railway employees and the employees of local and public bodies and a few of the larger public companies receive gratuities on retirement. Gratuities are also paid to non-pensionable workers who have put in not less than thirty years' service in Government concerns.

In all cases specified periods of qualifying service have to be put in before gratuities can be earned. The rules of individual administrations vary widely but the most generally accepted principle is half a month's pay for each year of service limited to fifteen months' pay in all. Permanent Government servants who have put in less than ten years' active service are entitled to gratuity if they are compelled to retire on medical certificate.

A few large industrial establishments in India have started Retirement Benefit schemes where an account is opened for every individual worker to which a fortnight's or 13 days' pay is credited every year; interest is allowed and the amount standing to a worker's credit is paid to him on retirement.

The Tata Iron and Steel Company has instituted a gratuity scheme under which every permanent employee who has put in 20 years' service and whose salary does not exceed Rs. 500 per month is eligible for gratuity equal to half a month's pay for every completed year of service subject to a maximum of 12 months' pay. In certain specified cases, employees with less than 20 years' service also become eligible for gratuity.

Provident funds are of two kinds: (1) contributory, and (2) non-contributory. The Provident Fund Rules of different State Governments in India are by no means uniform. The Government of Bombay, by a notification dated 20th March 1941, made it compulsory for all Government servants in receipt of a monthly income of Rs. 50 per month who joined Government service before that date or of Rs. 25 per month who joined after that date to subscribe to the Government Provident Fund. Pensionable Government servants can only join the non-contributory section of the Fund.

State Railways and Ordnance factories have their own rules. Whereas it is obligatory for most categories of permanent non-workshop railway staffs with monthly pay over specified limits to join the provident fund, workshop employees with monthly and daily rates over specified limits are permitted to exercise an option. Once the option to join has been exercised, no withdrawal is permitted.

Compulsory Schemes.—Compulsory contributory schemes are provided for all permanent workmen in the factories owned by certain public bodies such as the Bombay Port Trust; whilst both compulsory and optional non-contributory and contributory schemes obtain for permanent workmen in the factories owned by most municipalities. Most of the larger public utility companies and corporations such as the Tata electricity generating and distributing plants, the Bombay Electric Supply and Tramways Company, Ltd., and the Burmah-Shell Corporation, to mention only a few of many, provide contributory schemes for the benefit of the majority of their workmen. Several others have schemes for their supervisory and clerical establishments but not for their workmen.

The most usual amount of deduction from pay is one-twelfth of the monthly pay but the amount contributed by employers varies from 50 per cent. to 100 per cent. of the amount put in by the employee.

All provident fund rules make provision for loans to subscribers from the balances standing at the credit of their accounts in respect of their own subscriptions, and for the compulsory repayment of these loans. Subscribers are entitled to

withdraw their own subscriptions at any time on retirement or on relinquishing their posts but the payment of that share of a contributory provident fund account which represents the employer's subscriptions depends on the putting in of specified periods of qualifying service-periods which show considerable variation.

As a result of the recommendations of the Board of Conciliation appointed by the Government of India, workers in coal mines are now entitled to a contributory provident fund.

Up to the end of September, 1951, the total membership of the Provident Fund was 3,83,000 and the total amount of contributions realised was about Rs. 243 lakhs.

On 15th November 1951 an Ordinance to provide for compulsory provident funds for employees in Cement, Cigarettes, Engineering, Iron and Steel, Paper and Textile industries was promulgated. Recently the Ordinance has been replaced by an Act of Parliament. The necessary scheme under the Act is being drafted by the Government.

Profit sharing in this country has mostly taken the form of payment of bonuses according to the profit making ability of a concern. The question of bonus has already been dealt with elsewhere.

The co-operative movement has made considerable progress in industrial establishment all over the country notably in the south during recent years. Almost all railway systems have co-operative banks and savings banks in addition to credit societies.

HOLIDAYS AND LEAVE

Under the Factories Act, 1948, the factory employees are entitled to a minimum of 10 days holidays with pay in the year. However the recent tendency for many units particularly in South India, has been to allow holidays with pay in excess of this limit. In many of the recent awards of Adjudicators, leave with pay up to 14 days has been awarded. It is noticed generally that in the south the provision of holidays with pay is much more generous than in Bombay or in the north.

Employees of the Central Government, including those working in railways, Government owned and managed factories and Government owned mines enjoy leave facilities to a much greater extent than do private employees.

LABOUR ADMINISTRATION

Apart from dealing with labour legislation and labour conditions and attempting and bringing about uniformity of standards in the different States the Ministry of Labour of the Government of India has recently undertaken additional responsibilities for the placement of civil and military demobilized personnel, refugees, etc. It has continued active co-operation with organized employers and labour organizations through the Tripartite Labour Conference and Standing Labour Committee.

Prior to the year 1920 there was little co-ordination between the Centre and the States in matters connected with Labour. The participation by India in the First Session of the International Labour Conference held at Washington in 1919 and the increasing interest taken by the Indian public in questions connected with labour made it necessary, however, both for the Government of India and the Governments of the more industrialised States not only to consider the question of the representation of labour in the Central and States legislatures but also to allocate to special departments or offices the administration of labour questions.

Since the War and the creation of the Tripartite Labour Conference the Ministry of Labour of the Government of India has considerably expanded its staff and it now deals with a much wider range of subjects than it did before the War.

Apart from the main Secretariat of the Ministry of Labour it has several attached and subordinate officers. The activities of some of these have been described in the relevant sections, such as Employment Exchanges and Resettlement, Miners' Welfare Fund, etc., but of some others are briefly given below.

Labour Bureau.—To meet the ever growing needs of Government, industry and labour for accurate and reliable information relating to labour conditions, labour legislation, etc., the Central Government established on 1st October 1946, a Labour Bureau with the following functions :—

(*a*) The collection of statistics relating to labour, etc.

(*b*) To maintain the cost of Living Index Numbers compiled under the Government of India's Scheme for the preparation of Cost of Living Index Numbers on uniform lines.

(*c*) To keep up-to-date the factual data relating to working conditions collected by the Labour Investigation Committee.

(*d*) To conduct research into specific problems with a view to furnishing data required for the formulation of policy.

(*e*) To edit the *Indian Labour Gazette*, and

(*f*) To edit a Labour Code of various Legislative enactments and the statutory rules made thereunder and a Year Book giving authoritative description of labour affairs in the country.

The Bureau has now been in existence for over five years. It has so far issued the following twelve publications :—

1. "Elements of Industrial Well-Being" by Sir Wilfrid Garrett, formerly Chief Inspector of Factories, U.K.

2. "Problems of Indian Labour—A Symposium".

3. Report on an enquiry into the Cost and Standard of Living of Plantation workers in South India, by Director, Labour Bureau.

4. Report on an enquiry into the Cost and Standard of Living of Plantation Workers in Assam and Bengal by Mr. S. R. Deshpande, Director, Labour Bureau.

5. Working of the Indian Trade Unions Act, 1926, during 1946-47.

6. Working of the Workmen's Compensation Act, 1923, during 1947.

7. Working of the Indian Trade Unions Act, 1926, during 1947-48.

8. Working of the Workmen's Compensation Act, 1923, during 1948.

9. Industrial Awards in India—An Analysis.

10. Statistics of Factories, 1947.

11. Working of the Indian Trade Unions Act, 1926, during 1948-49.

12. The Indian Labour Year Book, 1946, 1947-48, 1948-49 and 1949-50 issues.

Chief Labour Commissioner.—The Central Government, in the Ministry of Labour, have also appointed a Chief Labour Commissioner. This officer is in charge of industrial relations and conciliation, labour welfare, operation of labour laws, and maintenance of information regarding wage rates and conditions of work in Central undertakings. There are a number of deputies working under him known as Regional Commissioners. The Chief Commissioner of Labour and his deputies also intervene in disputes arising between Government and employees in the various central undertakings.

Chief Adviser of Factories.—In order to ensure uniformity in the administration of the Indian Factories Act and to improve conditions generally in Indian factories, the Government of India have appointed an officer designated the Chief Adviser of Factories. The first incumbent to the post was Sir Wilfrid Garrett, a distinguished officer of the Ministry of Labour in the United Kingdom. The Chief Adviser of Factories has a number of deputies, including deputies who attend to matters relating to the health of the workers and the sanitation and cleanliness of factories.

FORESTS

STATE Forests : 1,82,539 sq. miles ; Forests owned by corporate bodies : 1,369 sq. miles ; Private Forests : 58,196 sq. miles ; Total Forests : 2,42,104 sq. miles ; Total Land area : 12,66,892 sq. miles ; Percentage of Forests to Land : 19.190.

Even in the earliest days of the British occupation the destruction of the forests in many parts of the country indicated the necessity for a strong forest policy, but, whether or not our early administrators realised the importance of the forests to the economic and physical welfare of the whole country, the fact remains that little or nothing was done to check uncontrolled destruction with its inevitable results in erosion and sterilisation of the fertility of the land.

The years between 1850 and 1857 witnessed the first beginnings of forest conservancy in Southern India. It was a Memorandum of the Government of India issued in 1855, arising as it chanced out of the annexation of the Province of Pegu in Burma which first laid down the outline of a permanent policy for forest conservancy in India. Exploration, demarcation and settlement, followed by efforts to introduce protection and some form of organised management, were long and laborious tasks, which are even yet not completed. Nevertheless, large tracts of forest were saved from ruin and were gradually brought under increasingly efficient management. It was in 1862 that the Government of India submitted to the British Secretary of State detailed proposals for the administration of forests as a public estate for the welfare of the country as a whole. With the appointment of Brandis (later Sir Dietrich Brandis) as the first Inspector-General of Forests in 1863 commenced the scientific management of India's forest estate. Whatever may have been the opinions held in the past in some quarters regarding restrictions imposed by forest policy, there can now no longer be any doubt regarding the very substantial benefits which have accrued to the country through the formation of an extensive forest estate and that in her forests India now possesses a property of great value.

TYPES OF FOREST

More than one-tenth of the total area of the country is under the control of the Forest Departments. These areas are classified as reserved, protected or unclassed State forests. In the reserved forests rights of user in favour of individuals and the public are carefully recorded and limited at settlement while the boundaries are defined and demarcated ; in the protected forests the record of rights is not so complete, the accrual of rights after settlement not being prohibited, and the boundaries are not always demarcated ; while in the unclassed forests no systematic management is attempted, and as a rule the control amounts to nothing more than the collection of revenue until the areas are taken up for cultivation or are converted into reserved or protected forests. The total forest area of India and Pakistan under the control of the old Forest Department on 31st March, 1941, was 98,258 square miles or 11.4 of the total area. This was classed as follows : Reserved 72,936 ; Protected 6,772 ; Unclassed State 18,550.

Throughout this vast forest area, scattered over the length and breadth of the whole country from the Himalayan snows to Cape Comorin, and from the arid Rajasthan deserts to the eastern limits of the Assam hills, there is an infinite variety in the types of forest vegetation, depending on climate, topography, soil and other local factors. Vegetationally, the greater part of the country, including the Indo-Gangetic Plain, must be considered as in the tropics, but wherever there are mountains, such as the Nilgiris in the south, and the Himalayas and Assam-Burma hills in the north, subtropical, temperate and, in the north, alpine zones must be distinguished, each supporting its own forest types.

Next to the major altitudinal effects, rainfall is the most important factor in the determination of the nature of the forests, and within each of the main zones, tropical, subtropical, temperate and alpine, there can be distinguished wet, moist and dry forest types. In addition, various edaphic and seral types occur, dependent on local conditions, such as littoral (beach), tidal, fresh-water swamp, and riverain forests.

The following is a brief description of the main forest types :—

I.—TROPICAL FORESTS

1. Tropical Wet Evergreen Forests.—These are dense forests, with a large number of tree species all mixed together, but according to their heights forming several canopies or layers. The upper canopy trees, among which Dipterocarps are usually characteristic, are often 150 to 200 feet high, and they very often have clear stems of 100 feet before the first branch is reached. These forests are found in the areas with the heaviest rainfall. In the southern or Peninsular region, they occur along the Western Ghats from a little south of Bombay to Tirunelveli, *i.e.*, in the western parts of Bombay, Madras, Coorg, Mysore and Travancore-Cochin. In the northern or Indo-Gangetic region, the type is to be found in the wetter parts of West Bengal extending into the damper parts of the coastal strip of Orissa, and intermingled with the next two types over almost the whole of Assam. The type also occurs extensively in the Andamans.

2. Tropical Semi-Evergreen Forests.—These form an intermediate type between the wet and the moist types. They are fairly widely distributed in the northern region, occurring all over upper Assam and in north and south of West Bengal (Buxa, Jalpaiguri, Kurseong, Kalimpong), and in Orissa (Puri, Angul). In the south, however, the type is not extensive, owing to the steep rainfall gradient in the Western Ghats, and it is limited to narrow strips just north of Bombay, near Goa, south Cochin and part of Coorg. Forming a dense forest of several canopies, there are again numerous evergreen species, but mixed with them are many deciduous species, such as the Terminalias, and the general height is somewhat less than in the wet evergreen forests.

3. Tropical Moist Deciduous Forests.—In these forests the trees are leafless for part of the year, and although the canopy is complete, the forests are not so dense, nor are the trees so tall as in the preceding types. The height of the dominant trees varies from 100 to 150 feet. In the southern region, Teak is the chief tree, mixed with Terminalias and many other species. The type is widely distributed all over the centre and south of India, in Madhya Pradesh, Bombay, Madras, Mysore, Coorg, Travancore-Cochin. In the north, Sal (*Shorea robusta*) is the dominant species, and the type extends extensively through West Bengal, Assam, Bihar, Orissa, and Uttar Pradesh up to the eastern border of East Punjab.

4. Tropical Dry Deciduous Forests.—This type is found throughout the Peninsula, in Bombay, Madhya Pradesh, Hyderabad, Mysore and Madras, and in the Indo-Gangetic Plain, from Orissa, through Bihar and Uttar Pradesh to East Punjab, wherever the annual rainfall is from about 30 to 50 inches. In the south, the most important tree is again Teak, but there are many associates, which often become the dominant species. In the north, the forest is typically mixed, with Sal occurring only locally.

5. Tropical Thorn Forests.—The dry tract throughout the Peninsula, to the lee of the Western Ghats, from the extreme south to Indore and Bhopal, with a rainfall of only 20 to 35 inches per year, is characterised by a low open forest of thorny trees, of which various species of Acacia are especially common. The corresponding area in the north has an even lower rainfall, 10 to 30 inches per year. It lies chiefly in the drier parts of Uttar Pradesh, especially on unfavourable soils. Acacias are again characteristic, although less prominent than in the south and the related tree *Prosopis spicigera* is also generally distributed.

6. Tropical Dry Evergreen Forests.—A special type is met on the Carnatic coast, where the rainfall is 30 to 50 inches per year, largely from the retreating (north-east) monsoon in October and November. Here there is a low forest 30 to 40 feet high, consisting of small thick leaved evergreen trees, such as *Mimusops hexandra* and *Memecylon edule*.

II.—SOUTHERN SUBTROPICAL AND TEMPERATE FORESTS

These are represented only by wet types on the higher hills, such as the Nilgiris and Palni hills, where the rainfall is relatively high. The subtropical zone, from about 3,000 feet to 5,500 feet, has a dense evergreen forest of medium height (60 feet) in which *Eugenia* is a characteristic genus, with *Lauraceæ* and other families also well represented. Above this, in the temperate zone, rolling grassy downs are characteristic, as round Ootacamund, with patches of forest, known as sholas, occupying the sheltered folds in the hills. These forests, probably the relics of former much more extensive forests which have been reduced by burning, felling and grazing, are typically a relatively low but fairly dense evergreen type, 50 to 60 feet high, with a great variety of trees, among which *Ternstroemia*, *Eugenia* and *Meliosma* are typical genera.

III.—NORTHERN SUBTROPICAL FORESTS

1. Subtropical Wet Hill Forests.—This type occurs on the lower slopes of the Eastern Himalayas and in the Assam-Burma hills, from a little under 3,000 feet to 6,000 feet. The forests are mostly of good height (up to 150 feet) and density, characterised by many species of evergreen Oaks and Chestnuts, with many other temperate trees, such as Alder and Birch, which are deciduous for short periods. Pines are typically absent, or are confined to drier sandy soils or well drained ridges, while Dipterocarps sometimes extend upwards from the tropical wet evergreen forests.

2. Subtropical Moist Hill Forests.—These extend to the whole length of the Western and Central Himalayas, from East Punjab to Bhutan, mostly between 3,000 and 6,000 feet but descending in places to 2,000 feet, and ascending on southerly aspects to 7,500 feet.

The principal tree is the Chir or Chil pine (*Pinus longifolia*), which forms almost pure forests over extensive areas. Oaks, Rhododendrons and other trees mix with or replace the Chir at the higher levels and in damper situations.

The type extends eastwards into the Khasi, Naga, Manipur hills, but instead of the Chir the dominant tree is the Khasi pine (*Pinus khasya*).

3. Subtropical Dry Evergreen Forests.—These are open low scrub forests of evergreen trees and thorny shrubs, in which the chief species is the Olive (*Olea cuspidata*). They occur from about 1,500 feet to 5,000 feet in the Himalayan foothills and Kashmir extending westwards into Pakistan and other countries. The forests have mostly been considerably impoverished by grazing, lopping and felling and with protection the general density becomes much better.

IV.—NORTHERN TEMPERATE FORESTS

1. Wet Temperate Forests.—These are found in the Eastern Himalayas from Nepal eastwards, extending through West Bengal into the higher hills of Assam from about 6,000 feet to 9,500 feet. They are typically fairly dense evergreen forests, in which several species of Oaks and Chestnuts predominate, but many other species are also present, including typically deciduous trees such as Maple, Elm and Prunus.

2. Moist Temperate Forests.—Along the Himalayas in Uttar Pradesh, Kashmir, East Punjab, Nepal and the Darjeeling district, and Sikkim and Bhutan, at altitudes from 5,000 to 11,000 feet, and with a rainfall from 40 to 100 inches per year, are to be found extensive coniferous forests similar to the temperate forests of Europe and North America. The chief trees are Spruce, Silver Fir, Cedar (Deodar), Blue Pine (*Pinus excelsa*), and Tsuga. Cypress and Yew also occur to a less extent. Often these trees are mixed together, but pure crops of one or the other are generally more frequent, depending on the altitude, aspect and other conditions. Evergreen Oaks are also often present, particularly on southern aspects, while in the damper situations are often many broad leaved trees, also typical of European forests, such as Maples, Hornbeam, Horse Chestnut, Birch, Elm, etc.

3. Dry Temperate Forests.—In the inner ranges of the Himalayas, where the south-west monsoon is feeble, and the rainfall is usually less than 40 inches a year, and that is mostly in the form of winter snow, is to be found extending from 5,000 to 10,000 feet a drier and more open type of temperate forest. It consists chiefly of the conifers Cedar (Deodar), *Pinus gerardiana* and juniper (*J. macropoda*), with some Silver Fir and Blue Pine at higher elevations. Broad leaved trees, such as Maple, Ash and the Holm Oak, occur scattered or in pure patches, while the Olive spreads up from the dry subtropical zone. The type occurs in Kashmir, Chamba, Inner Garhwal and Sikkim. Among the herbs and shrubs present are many medicinal plants, such as *Artemisia* and *Ephedra*.

V.—ALPINE FORESTS

The uppermost forests of the Himalayas, from about 9,500 to 12,000 feet, consist of a dense growth of small trees and large shrubs, chiefly birch, Rhododendron and dwarf Juniper with patches of coniferous overwood of high level Silver Fir and Blue Pine.

This gives place to an alpine scrub above, consisting of dwarf Rhododendrons, Junipers and other shrubs, interspersed with patches of grassland, which form excellent grazing areas in summer, when they are covered with a great variety of beautiful alpine flowers.

VI.—SPECIAL FOREST TYPES

Among various special edaphic and seral forest types, the following may be mentioned :—

1. Beach Forests.—All round the coast, wherever a fair width of sandy beach occurs, there is a fringe of forest in which *Casuarina*, originally introduced from Australia, is now often the most characteristic species. Elsewhere, all evergreen and deciduous trees form a low but fairly dense fringe along the shore.

2. Tidal Forests.—In the Sunderbans of the Ganges-Brahmaputra delta, and along the mouths of other large rivers, such as the Mahanadi and Godaveri are to be found Mangrove (*Rhizophra*, *Brouguiera*, etc.) and Sundri (*Heritiera*) forests, typical of salt water swamps. Many of the trees have stilt roots for support, and knees " or pneumatophores projecting upwards from the swamps to provide aeration for the roots.

3. Fresh-water Swamp Forests.—These are very extensive, but are to be found above the salt water limit in the deltas of the large rivers, and also in depressions, often old river beds, in parts of Assam, West Bengal, Uttar Pradesh and Madras. They are subject to prolonged annual flooding and have various species according to the locality. The delta type in Bengal supports the best of the Sundri forests, often over 100 feet high.

4. Riverain Forests.—Along all the larger rivers on the banks of new alluvium are to be found stretches of moisture-loving trees, such as *Lagerstræmia flos-reginæ*, *Terminalia myriocarpa* and *Salix tetrasperma*. On recently deposited levels and sand, extensive stretches of which occur along many river courses both in the north and the south, are often to be found forests in various stages of succession, depending on how new or old is the deposit, on the rainfall and other local factors. Perhaps the most characteristic are the Khair (*Acacia catechu*), Sissoo (*Dalbergia sissoo*) and Tamarix forests found throughout the north from Assam to East Punjab. These forests are usually characterised by heavy grass, and with protection they slowly change to a more miscellaneous type of forest by the gradual colonising of other species.

VII.—THE BAMBOOS

No account of the forests of the country would be complete without a reference to the Bamboos, of which there are very many species occurring in the tropical, subtropical and temperate zones. Tall bamboos, such as *Bambusa arundinacea* and *Dendrocalamus hamiltonii*, often form a very dense undergrowth in the tropical semi-evergreen and moist deciduous forests, while *Dendrocalamus strictus* is locally abundant and economically important in the drier parts of the tropical moist deciduous forests and in some of the tropical dry deciduous forests. One of the important results of forest research is the utilisation of bamboos for the making of paper, but there are still extensive areas of forests with a dense undergrowth of bamboos, which are not at present economically exploitable and which often greatly hinder other forest operations.

FOREST POLICY

The general policy of the Government in relation to forests was definitely laid down in 1894 by the classification of the areas under the control of the Department into four broad classes, namely :—

(*a*) Forests the preservation of which is essential on climatic or physical grounds. These are usually situated in hilly country where the retention of forest growth is of vital importance on account of its influence on the storage of the rainfall and on the prevention of erosion and sudden floods.

(*b*) Forests which afford a supply of valuable timbers for commercial purposes, such, for example, as the teak forests of the centre and the south, the sal forests of the north, the centre and the north-east and the deodar and pine forests of the north-western Himalayas.

(*c*) Minor Forests, containing somewhat inferior kinds of timber and managed for the production of wood, fodder, grazing and other produce for local consumption; these forests are of great importance in agricultural districts.

(*d*) Pasture lands.—These are not "forests" in the generally understood sense of the term but grazing grounds managed by the Forest Department merely as a matter of convenience.

These four classes of forest are not always sharply divided from each other, and one and the same tract may to a certain extent be managed with more than one object.

Administration.—The forest business of the Government of India is carried out in their Departments of Agriculture. The Inspector-General of Forests is the technical adviser to the Government in forest matters. Under the Constitution of 1919 Forests were made a transferred subject in Bombay where they had long been administered by the Provincial Governments, and in 1924 the Reforms Inquiry Committee presided over by Sir Alexander Muddiman, the then Home Member of the Government of India, recommended that they be transferred to other provinces too unless any local Government on examination of the position could make out a convincing case against the transfer in its own province. After the Constitution of 1935 Forests were included in the schedule of Provincial subjects throughout India. And in the Constitution Act of 1950 they remain on the State list.

Territorial Charges.—The various States are divided into one or more Forest Circles, each in charge of a Conservator of Forests; usually States containing three or more circles also have a Chief Conservator who is the head of the Department for his State. Circles are divided into a number of Forest Divisions, in charge of members of the superior Forest Service. Each Division contains a number of Ranges in charge of Forest Rangers or Deputy Rangers; heavy Divisions are also sometimes divided into Subdivisions. The Ranges are further subdivided into a number of rounds and beats. These are protective as well as administrative subdivisions held by Foresters and Forest Guards.

Apart from territorial charges there are various important posts of a non-territorial nature connected with Forest Research and Education, Silviculture, Utilisation and the preparation of Forest Working Plans.

The training of Forest Rangers for India is concentrated at the Indian Forest Ranger College, Dehra Dun and the Madras Forest College, Coimbatore, both under the Government of India. Bombay and Mysore States have institutions of their own to train their Rangers.

The training of subordinates below the rank of Rangers is carried out in various local forest schools and training classes.

FOREST EDUCATION

Forest education in India first started with the founding in 1878, of a Forest School at Dehra Dun, for the training of forest rangers. Direct training for the Provincial Service officers started in 1912, and continued upto 1928, when it was closed, with the cessation of direct recruitment to the old Provincial Services. From the 1st November 1926, the training of Indian probationers for the Indian Forest Service was commenced, a separate Indian Forest Service College being established in the old Forest Research Institute buildings at Chandbagh, Dehra Dun. This College, however, had to be closed in November 1932, owing to the cessation of recruitment to the Indian Forest Service.

Following the constitutional changes since 1935, the old Indian Forest Service is slowly disappearing, and in its place each State is building up its own Superior Forest Service. For the training of officers for the Forest Services of the States, the Indian Forest College has been established at New Forest in conjunction with the Forest Research Institute. It was opened in May 1938.

Admission to the Colleges is confined entirely to nominees of the State Governments but candidates from adjacent countries such as Nepal, Persia and Ceylon have also been accepted from time to time. Recently the Government of India have offered to reserve a few seats for candidates of the South-East Asia region to encourage cultural relations and the Institute has been accepted by the F.A.O. as a recognised centre for training and advanced studies for forest officers and technicians of this entire region.

The Director of Forest Education though under the administrative control of the President is the Head of the Forest Colleges at Dehra Dun and Coimbatore. The Colleges are :—

(*i*) Indian Forest College with a Principal as the Head;

(*ii*) Indian Forest Rangers' College with a Director as the Head; and

(*iii*) Madras Forest College, Coimbatore, with a Principal as the Head.

Research.—The Ranger College became also a recognised centre of forest research in 1906.

In 1914 the first Forest Research Institute was opened on the Chandbagh Estate, Dehra Dun. Within a few years the war demand for forest produce emphasised the scope and need for extensive research far beyond that for which accommodation had been provided. Plans were therefore made for a new Forest Research Institute on the Kaulagarh (New Forest) estate a few miles out of Dehra Dun. The Institute was opened in November 1929.

It is under the administrative control of the President. There are the following branches, *viz* :—

(A) (*i*) Silviculture; (*ii*) Botany; (*iii*) Mycology; (*iv*) Statistical; (*v*) Entomology.

(B) (*i*) Chemistry of Forest Products; (*ii*) Minor Forest Products; (*iii*) Timber Mechanics; (*iv*) Service Branch; (*v*) Wood Preservation; (*vi*) Composite Wood; (*vii*) Wood Seasoning; (*viii*) Cellulose and Paper; (*ix*) Wood Anatomy.

In addition there is a Publicity & Liaison Branch under the Director of Forest Education which functions as a liaison office between the enquirers both of Government and commercial interest and the activities of the Institute in research, training and conference, etc.

No regular courses of training are conducted but limited facilities are available for training in research methods and for the training of technical personnel for related industries. Facilities for post-graduate degree for graduates of Indian and foreign universities, who already hold the first post-graduate research degree (of M.Sc. or Ph.D.) are available in Silviculture, including Forest Ecology and Forest Soils, Statistics, Forest Botany, Forest Mycology and Pathology, Forest Entomology, Minor Forest Products, Wood Anatomy, Timber Mechanics, Timber Physics, Wood Preservation, Cellulose and Paper, Composite Wood including plywood and adhesives, Chemistry of Forest Products and Wood Working. Normally research students are admitted on 15th July.

Silviculture, which deals with all the production side of forestry, is under the direction of a Silviculturist. Much of the actual research work is, however, decentralised and done by local State silviculturists in the States, but the Central Silviculturist co-ordinates their work, does all the statistical computing and acts as an information bureau on silvicultural matters for the whole of India.

Forest Products.—Forest produce is divided into two main heads—(1) Major produce, *i.e.*, timber and firewood, and (2) Minor produce, comprising all other products, such as bamboos, canes, leaves, fruits, fibres, grasses, gums, resins, essential oils, medicinal and poisonous plants, fatty oils and fats, dyes, tans and animal and mineral products. All aspects of research on the minor forest produce, such as survey, methods of exploitation and cultivation, are dealt with by the Minor Forest Products Branch, and their Chemistry and processing into articles of trade and industrial use by the Chemistry of Forest Products Branch.

The annual out-turn of timber and fuel from all sources averages about 306 million cubic feet.

In the Andamans notable developments have taken place. In the past, extraction of timber was done by elephant dragging with the result that only a fringe of the forests could be touched. Attempts were made in employing American methods of mechanical logging, for which machinery was bought and an American expert employed to take charge of the work. The costs of extraction, however, by these means proved too high. Recently the problem has been solved by means of light tramways, the trains of trucks being drawn by elephants which have been superannuated from ordinary work, and it has been found possible in this way to work large, hitherto inaccessible areas of forest very cheaply. Elsewhere in the country a great part of the trade in timber lies in the hands of contractors who are, on the whole, regarded trustworthy if sufficient control over their operations is exercised.

Forest Industries.—The important role which the forests of a country play in its general commercial welfare and in providing employment for its population is not always fully recognised. If accurate estimates were available for the country they would no doubt show that apart from the jungle population which is directly dependent on the forests and the large numbers of wood-cutters, sawyers, carters, carriers, craftsmen and others working in and near them, employment on an enormous scale is provided to persons engaged in working up the raw products. Among these latter may be mentioned carpenters, wheelwrights, coopers, boat-builders, tanners, drug manufacturers, rope-makers, lac-manufacturers, perfumers, gum and resin collectors, basketmakers, and many other classes of skilled labourers. The census shows nearly a million people and their dependents so employed in the country and nearly a further half million in the States, but these are probably below the actuals, as much forest labour is not whole-time labour, devoting seven or eight months in the year to forest work and the rest to agriculture. With the opening up of the forests, the extension of systematic working, the wider use of known products, and the possible discovery of new products, a steady and extensive development of industries dependent on the forests of the country may be confidently anticipated in the future.

Agencies.—The general practice of the Forest Departments in the Government of India and the various States is to conduct their own sales direct with timber dealers or large consumers though there are notable exceptions. Indian timber marketing in England (especially Andaman timbers) is now done under the direction of a Timber Adviser who is attached to the Office of the High Commissioner for India. Sales of Indian timbers and especially timbers from the Andamans are steadily increasing.

A large number of bulletins and other publications are issued by the Forest Research Institute. Of these a list can be obtained from the Publicity and Liaison Officer, Forest Research Institute, New Forest, Dehra Dun, who maintains close liaison with trade and industry.

(*b*) Excludes 9 sq. miles not under the Control of Forest Department.

(*c*) Excludes 254 sq. miles not under the Control of Forest Department.

(*d*) Excludes the following: (*i*) Private Protected 9,797 sq. miles, (*ii*) Unclassed Forests under B.P.F. Act, 500 sq. miles, (*iii*) Covered by Roads and Buildings 2 sq. miles.

(*e*) Includes 5 sq. miles owned by Corporate Bodies, 169 sq. miles owned by Private individuals and excludes 2,153 sq. miles under the Control of Revenue Department.

(*f*) Represents Reserved Lands and Leased Forests.

(*g*) Includes 458 sq. miles of Panchayat Forests (Class III) transferred to the Control of Forest Department but excludes 2,903 sq. miles under Panchayat management and 7 sq. miles under the management of other departments.

CLIMBING IN THE HIMALAYAS

THE results of mountaineering in the Himalayas which has now a history of nearly a hundred years behind it, may be summed up as follows: The highest mountains so far climbed are Annapurna in Nepal (26,000 ft.) by M. Hertog in 1950; Nanda Devi (25,660 ft.) by W. H. Tilman in 1936; and Kamet (25,447 ft.) by F. S. Symthe in 1931. Nanda Devi and Kamet are in the central Himalayas. Among the more important of the lesser peaks climbed are Siniolchu (22,610 ft.), Tent Peak (24,165 ft.). The higher peaks in the Himalayas on which attempts have been made are Mt. Everest (29,002 ft.), Mt. Godwin Austen or K2 (28,250 ft.), Mt. Kanchenjunga (28,146 ft.), and Nanga Parbat. Five attempts were made to climb Mt. Everest, the first in 1922 and the last in 1938. There were also two reconnaissance expeditions in 1921 and 1925. All the attempts made to get to the top failed, some of them disastrously. Two among the best known men who were killed were G. L. Mallory and A. C. Irvine both of whom died in the second attempt on Everest in 1924. The highest point ever reached in these expeditions is 28,100 ft. a height which was reached twice, first in 1924 and second in 1933. This is also the greatest height ever reached in any of the expeditions to the whole range. Mention may also be made of the air expedition which flew over Mt. Everest in 1933 and took many useful photographs of the peak. The results of the expedition on other peaks may be quickly summarized. Two attempts were made on Mt. Godwin Austen (1938, 1939) both of which were unsuccessful. On Kanchenjunga no less than five attempts were made (1905, two in 1929, 1930, 1931) but all of them ended in failure. Nanga Parbat was a German target, and saw four expeditions (1934, 1937, 1938, 1939) none of which succeeded in scaling the heights.

Some of the great names associated with Himalayan mountaineering are G. L. Mallory, A. C. Irvine, Hugh Ruttledge, F. S. Smythe, E. E. Shipton, N. E. Odell, W. H. Tilman, Dr. Merkl, Dr. Wien, Dr. Paul Baur and Dudley Wolf.

1951 EXPEDITIONS

The following are the major expeditions in the Himalayas in 1951.

A party of 8 climbers led by Eric Shipton explored the south-western approaches to Everest through Nepal, during August to November. Full accounts of the activities of this expedition were given in articles by Mr. Eric Shipton published in the "Times" of London and the Calcutta "Statesman." The party discovered a way through the difficult icefall to the Western CWN (glacier basin embedded between Everest, Nuptse and Lhotse). This opens a possible approach to the South Col. between Everest and Lhotse and an ascent on Everest from the South-east Col.

A New Zealand party of 4 climbers led by E. Riddiford went to Garhwal and made the first ascent of Mukut Parbat and 5 other peaks, two of which were over 20,000 ft. They also made two unsuccessful attempts on Nilkanta.

A French party of Club Alpin Francais, Section Lyonnaise made a successful ascent of Nanda Devi, first climbed in 1936. Unfortunately, two members who attempted to traverse the ridge leading from Nanda Devi West to Nanda Devi East Peak lost their lives.

A party of 4 members of the Himalayan Club—Gurdial Singh, Roy Greenwood, Nalini Jayal and Surendra Lall—climbed Trisul, only twice climbed before in 1907 and 1933. Subsequently the party carried out a reconnaissance of Hathi Parbat and later Greenwood and two sherpas climbed Rataban.

Incidentally G. Frey, Assistant Swiss Trade Commissioner in Bombay and a member of the H.C. was accidentally killed while climbing on the Sikkim-Nepal border on October 29, 1951.

Plans for 1952 are as follows: A Japanese mountaineering team will attempt to climb Kanchenjunga in the summer. This will be the first Japanese expedition since 1936. A British expedition will have a training exercise on the Everest group of Himalayas in April. The party consists of nine mountaineers and will be led by Eric Shipton. They will make an attempt on Mount Cho-oyu (26,750 feet) west of Mount Everest in preparation for an assault on Everest itself in 1953. A Swiss expedition organized by the Swiss Foundation of Alpine Research will try to climb Mount Everest. The party will consist of 12 members and will be led by Dr. Wyss-Dunant. An Italian expedition led by Mr. Ghigione will climb Gangotri glacier, while yet another expedition under the leadership of Mr. Tyson will also operate in the same area.

Below is given a detailed account of some of the more important of the past expeditions to the Himalayas.

A HISTORY

Owing to their immensity and the time and cost involved in undertaking expeditions into the Himalayas a great deal of mountaineering and exploration remains to be done in the world's highest mountain range. There are over fifty summits of 25,000 ft. and of these only two, Kamet (25,447 ft.) and Nanda Devi, (25,660 ft.) have been scaled, while there are innumerable lesser summits of such formidable difficulty, owing to the comparatively recent geological formation of the range, that judged by modern mountaineering standards the majority are inaccessible. The highest peak is Mount Everest (which by some measurements is 29,141 ft.). Next come Godwin Austen (K2), 28,250 ft. and Kanchenjunga 28,146 ft.

Pioneer Climbers.—Mountaineering in the Himalayas began some hundred years ago when surveyors crossed high passes and scaled peaks in the course of their work. Among these pioneers must be mentioned the Schlagintweit brothers, who in 1855 reached a height of 22,329 ft. on the Eastern Ibi Gamin, one of the subsidiary peaks of Kamet, while I. S. Pocock of the Survey of India set up a plane table at 22,040 ft. in the same district. Another notable early explorer was the famous botanist Sir Joseph Hooker who, in 1849, explored the Sikkim valleys of Kanchenjunga and made attempts to climb Kangchenjau, 22,700 ft. and Pauhunri, 23,180 ft. Some remarkable explorations were also carried out by the Pandits of the Survey of India. Among these men was Babu Sarat Chandra Das who traversed the Jonsong La, 20,200 ft.

Later in the nineteenth century came Lord Conway who, in 1892, made explorations in the Karakoram Himalayas, in the region of the Baltoro Glacier, one of the greatest of Himalayan glaciers, and climbed a peak of 23,000 ft. Sir Francis Younghusband also made explorations in the Karakorams and accomplished the first crossing of the Karakoram Pass. The Duke of Abruzzi also made a number of expeditions into this range and reached a height of 25,000 ft. on the Bride Peak. Mountaineering developed rapidly in the nineties, and a bold attempt was made by A. F. Mummery, Professor N. Collie and Brigadier-General the Hon. C. G. Bruce to climb Nanga Parbat. In a final attempt on the mountain, Mummery and his two Gurkhas were lost. In 1899 D. W. Freshfield made the first circuit of Kanchenjunga and explored the Nepal side of the mountain.

MOUNT KAMET

Meanwhile, thanks to Brigadier-General Bruce, Gurkhas, and later Sherpas and Bhotias were trained for mountaineering and, with the advent of first-class porterage, Himalayan mountaineering entered on a new phase. Dr. and Mrs. Bullock Workman made a number of expeditions into the Karakorams and W. W. Graham made a number of remarkable ascents, with Swiss guides, including an ascent of Kabru, 24,000 ft., which has been the subject of much controversy. Kabru was later attempted by two Norwegians, Messrs. Rubenstein and Monrad Aas, who got within a few feet of the top.

The present century opened with a number of remarkable ascents by Dr. A. M. Kellas, who died during the 1921 Everest expedition. He climbed several great peaks including Kangchenjau, Pauhunri and Chomiomo and made expeditions to the Central Himalayas where, with Colonel H. T. Morshead he reached in 1920 an altitude of 23,500 ft. on Kamet.

In 1907 Brigadier-General Bruce, Dr. T. G. Longstaff and A. L. Mumm explored the Garhwal Himalayas and reconnoitred Kamet. After this Longstaff, with the Swiss guides Alexis and Henri Brocherel, ascended Trisul, 23,406 ft. which, until the Jonsong Peak, 24,344 ft., was climbed in 1930 remained the highest summit reached at the time. In 1911 and 1912 attempts were made to climb Kamet by C. F. Meade and his Swiss guides and a height of 23,500 ft. was gained. Captain Morris Slingby also attempted Kamet at this time.

At last in the summer of 1931 a party of young British climbers led by F. S. Smythe succeeded in reaching the summit of Mount Kamet (25,447 ft.), the first peak over 25,000 ft. to be climbed.

MOUNT KANCHENJUNGA

The first attempt on Kanchenjunga was made in 1905 but ended in disaster, Lieut. Pache and three porters being killed by an avalanche. The second attempt in 1929 was made by a solitary American, E. F. Farmer, who also lost his life. In the same year a determined attempt was made by a party of Bavarian mountaineers led by Paul Bauer. A height of over 24,000 ft. was reached on the north-east spur before bad weather forced the party to retreat.

In 1930 a fourth attempt was made by an international expedition led by Professor G. Dyhrenfurth. The party attempted the mountain from the Nepal side, but were repulsed by an ice avalanche which killed one of the porters. Subsequently, they ascended a number of peaks including the Ramthang Peak, 23,200 ft. and the Jonsong Peak 24,344 ft.

The fifth attempt in 1931 was made by Bauer and his party, but failed at a slightly greater elevation than was attained in 1929. One of the party H. Schaller and a porter were killed by a fall during the expedition.

MOUNT EVEREST

There have been seven expeditions to Mount Everest of which those in 1921 and 1935 were reconnaissances and those in 1922, 1924, 1933, 1936 and 1938 attempts to reach the summit.

The preliminary expedition for the reconnaissance of the approaches to Mt. Everest carried out its work in the most complete manner under the leadership of Lt.-Col. C. K. Howard-Bury. The approaches to Mt. Everest on all its northern faces were thoroughly examined, and relations were established with the local authorities. On the information and experience of the reconnaissance expedition the second expedition to Everest was organised and set off the following year (1922) under Brig.-Gen. the Hon. C. G. Bruce. Capt. G. I. Finch and Capt. J. G. Bruce succeeded with the help of oxygen in reaching the height of 27,300 ft. During this expedition seven men were killed when an avalanche swept them over an ice cliff some 60 feet high.

The 1924 expedition was again commanded by Brig.-Gen. Bruce. But owing to his ill health Lt.-Colonel E. F. Norton took on the command. Lt.-Col. E. F. Norton and Dr. T. H. Somervell reached a height of 28,100

feet. Then a final attempt was made by G. L. Mallory and A. C. Irvine. They were assisted by a supporting party consisting of N. E. Odell and J. de V. Hazard. On June 6th they left the 25,000 feet camp with three porters who carried loads for them up to 26,800 ft. On June 8th they left camp for their attempt and were never seen again. On June 10th for the third time Odell climbed up to the 26,800 feet camp but could find no sign of Mallory and Irvine, and communicating with Norton evacuated the mountain.

The expedition of 1933 followed a successful effort by Lt.-Col. J. L. R. Weir, Political Officer in Sikkim, to obtain the permission of the Tibetan Government for a further attempt to climb the mountain. An Everest Committee was formed under the ægis of the Royal Geographical Society and the Alpine Club, and Mr. Hugh Ruttledge, formerly of the I.C.S., accepted an invitation to take charge of the expedition. Included in it as members were Mr. F.S. Smythe, leader of the successful Kamet Expedition of 1931, and Capt. E. St. J. Birnie, E. E. Shipton and Dr. C. R. Greene who climbed with Mr. Smythe in 1931. The expedition reached Calcutta in February and forthwith proceeded to its main task.

The 1933 expedition established its base in the Rongbuk Valley on April 17th and on April 21st. Camp I was established. Thenceforward the expedition was dogged by exceptionally bad pre-monsoon weather which greatly hindered the establishment of camps and made the ascent to the North Col. 23,000 ft. prolonged and arduous work. Camp IV, 22,800 ft. was not established until the middle of May after a 40 feet ice wall on the North Col. slopes had been climbed. The expedition was equipped with wireless which enabled weather reports to be received from the meteorological authorities at Alipore. One installation was at Darjeeling, one at the base camp and a third at Camp III, 21,000 ft. Camp III was linked to the North Col. by field telephone so that messages could be received up to 23,000 ft. from the plains of India in a short space of time.

Owing to a series of blizzards and high winds Camp V was not established until May 22nd. But it was pitched at 25,500 ft. several hundred feet higher than previously. The party was then cut off for three days by a furious blizzard and eventually had to retreat to Camp IV. The Camp was re-established on May 28th and on May 29th. Wyn Harris, L. Wager and J. L. Longland continued the ascent and finally pitched Camp VI at 27,400 ft., 600 ft. higher than in 1924, after a magnificent effort on the part of the porters. Longland then brought the porters down but had a terrible time in a blizzard and only by exercising great mountaineering skill steered them down to Camp V. The following morning Wyn Harris and Wager made a reconnaissance of the route to the summit and failing to discover a route along the crest of the north-east ridge finally followed the same route as Norton in 1924. They were stopped by dangerous conditions at 28,100 ft. and returned to Camp VI where they met Shipton and Smythe who had come up from Camp V, after which they descended to Camp V. The following morning Shipton and Smythe were unable to leave Camp VI owing to a high wind but on June 1st they made their attempt on the summit.

An hour and a half after leaving the Camp Shipton had to return owing to some internal trouble. Smythe carried on alone and reached approximately the same point as Wyn Harris and Wager before he was forced to retreat owing to the deep powdery snow resting on the steep slabs. Shipton descended to Camp V the same day in very bad weather and Smythe spent a third night at Camp VI descending to Camp IV next day in a blizzard. Owing to frost-bites, strained hearts, and high altitude deterioration the party had to retire to the base camp. A week later they returned to Camp III to make another attempt. Owing, however, to the breaking of the monsoon this had to be abandoned and the expedition returned to Darjeeling.

An extraordinary attempt to climb Everest was made in 1934 by Maurice Wilson, a young airman. Having penetrated Tibet in disguise he marched to Everest and with a few porters went on in reaching 21,000 feet. He then proceeded alone and nothing more was heard of him, until his body was discovered near the site of Camp III, 21,000 feet, by Shipton's party in 1935.

Early in 1935 the Tibetan Government granted permission for a further attempt to take place from June 1935 to June 1936 inclusive.

As there was no time to organise an attempt on the summit it was decided to send out a small party under the leadership of Mr. E. E. Shipton. This had as its objects: Collection of data as to monsoon snow and weather conditions; examination of alternative routes from the west, the trying out of new men for the summit attempt; physiological observations; a stereo-photogrammetric survey; examination of ice formations on the North Col.

This expedition proved that Everest cannot be ascended during the monsoon and that the only hope of an ascent is during the period immediately before the monsoon.

Conditions during the monsoon are extremely dangerous and the party had a narrow escape from an enormous avalanche that fell from the slopes of the North Col.

During the course of this reconnaissance two dozen peaks over 20,000 feet high were ascended.

1936 Expedition—The 1936 expedition was led by Mr. Hugh Ruttledge and included three of the 1933 climbers Messrs. Shipton, Smythe and Wyn Harris, and one of the 1933 Signals Officers Lieut. Smith Windham. It encountered exceptionally bad weather and unusual conditions. Before the monsoon, snowstorms rendered the mountain unclimbable and the usual pre-monsoon north-west wind was lacking to clear the snow away. However, Camp IV on the North Col. was established to schedule and the party were in position to attack the summit when the weather broke and two feet of snow forced them to retreat down the dangerous slopes of the North Col. To cap their discomfiture the monsoon arrived on the exceptionally early date of May 24th. Two attempts were made to re-open the route to the North Col. but on both occasions the party were in great danger and the attempt had to be abandoned when Shipton and Wyn Harris were carried down by an avalanche and nearly lost their lives. Subsequently reconnaissance parties ascended the main Rongbuk Glacier and examined the west side of the North Col. which, in spite of Mallory's unfavourable verdict, was found to be not only practicable but less dangerous in monsoon conditions than the east side.

The 1938 expedition consisted of seven climbers, H. W. Tilman, E. E. Shipton, F. S. Smythe, N. E. Odell, Dr. C. B. M. Warren, P. Lloyd and Capt. P. R. Oliver and was led by Tilman. It was considerably smaller than previous expeditions owing to economic reasons and because experience has shown that the small light expedition has as good and perhaps better chance of achieving its object than a large cumbersome expedition rendered comparatively immobile by its transport and tied down to a fixed plan. Though the expedition failed to reach the summit of Mount Everest it fully justified these beliefs and cost only £2,500 as against the £10,000 or more of previous Everest expeditions.

The expedition reached Rongbuk on April 6th and established Camp 3 on April 26th. Wind and cold made further advance impossible and the party descended to the Kharta valley for a rest and to recuperate from influenza, chills and sore throats. They returned in the middle of May during the commencement of the monsoon which broke on the unprecedented date of May 5th, one month to six weeks earlier than usual. The route up the North Col. was forced in dangerous snow conditions and the party had a narrow escape from an avalanche. Camp 4 was established on May 24th but snowstorms drove the party down. It was then decided to regain the North Col. from the west *via* the Main Rongbuk Glacier and Camp 4 was re-established after a difficult ice climb on June 5th. On June 8th Camp 6 was established by Shipton and Smythe with seven porters and the following day an attempt was made to reach the summit. Conditions, however, proved impossible owing to deep monsoon snow, and the party was forced to retreat after reaching a height of 27,300 ft. A further attempt by Tilman and Lloyd on June 11th met with no more success and the expedition had to be abandoned.

Aerial Expedition.—An interesting side to the exploration of Everest was an aerial expedition undertaken in 1933 for the purpose of photographing the mountain from the air. This venture was financed by Lady Houston. Major L. V. S. Blacker, formerly of the Guides, was its leader and in charge of its survey work, Lord Clydesdale chief pilot, Flt. Lt. A. McIntyre second pilot and Major P. T. Etherton, its London manager. Two specially equipped aeroplanes, adaptations of the well-known Wapiti, were provided. A special point in their equipment was the provision of compressed oxygen for supply through gas masks to the aviators at high altitudes. The expedition was not permitted to fly across the Tibetan frontier, so as to circle Mt. Everest, but both machines successfully flew over the peak and several good photographs were taken of it. By permission of the Nepal Government a line of flight from Purnea, the base of the expedition, across Nepal territory to Mt. Everest, was taken and along this route some good survey photographs were obtained as far as the poor visibility at the time of the flight in April, permitted.

An interesting mountainflight of which details were published in 1933 was one from Risalpur to Gilgit and back, undertaken by the R.A.F. at Risalpur in the course of its routine duties in October, 1932. The expedition was commanded by Flt. Lt. Isaac and was made by five of the machines ordinarily in use by the Force. The distance from Risalpur by way of the Indus Valley and past Nanga Parbat to Gilgit is 286 miles. It was covered in 2 hrs. 20 mins. on the outward flight and in 2 hrs. 5 mins. on the return journey. From Gilgit the machines further proceeded upon flights over the Hunza, Nagar and Rakjot areas. Brilliant photographs of Nanga Parbat and Rakaposhi, as well as of other places of importance or interest, were taken. Such flights were frequently made by the R.A.F.

NANGA PARBAT

The year 1932 saw a well organised expedition to Mount Nanga Parbat. It was conducted by Dr. Merkl, of Munich, and included Lt. R. N. Frier, of the Gilgit Scouts, who acted as transport officer, an American Mr. Rand Herron and Miss E. Knowlton, of Boston, U.S.A. Several determined attempts to reach the summit of the mountain in August were brought to an end by the break-up of the weather before they attained success.

The Disaster of 1934.—In 1934 Herr Merkl returned to the attack with an even stronger party, which included a number of well-known German and Austrian mountaineers and Captains Frier and Sangster of the Indian Army as transport officers. Fatality early overtook the expedition, Herr Drexel dying of pneumonia. Owing to various delays, Camp IV was not established until the end of June. The party then proceeded to rush to the peak leaving only skeleton camps behind. Finally, after a height of 25,600 feet had been reached, and Camp VIII established at 24,800 feet, a terrible blizzard broke. The party retreated, but owing to the storm and ill-equipped camps retreat became a rout during which no fewer than nine lives were lost, Herren Merkl, Welzenbach and Wieland and six Darjeeling porters—men who had accompanied the 1933 Everest Expedition. Of the Europeans only the two Austrians Herren Schneider and Aschenbrenner escaped whilst of the surviving porters, all of whom were frost-bitten, one or two spent a week without food or shelter.

In May 1937, another attempt was made to climb Nanga Parbat by a German expedition, headed by Dr. Wien. News reached Simla on June 20 that disaster had overtaken the expedition and subsequently it was learned that the entire party of climbers with the exception of one survivor, Dr. Luft, had perished. Eight of the nine members of the expedition were killed along with nine Sherpa porters. Mountaineering experts are of the opinion that the season was not very propitious for the ascent of the peak, which is considered to be more accessible in the autumn.

A further German attempt to climb Nanga Parbat was made in 1938 under the leadership of Dr. Paul Bauer. During the second half of July the party succeeding in reaching a height of over 23,000 ft. but were forced to retreat by bad weather. During the climb the bodies of Herr Willy Merkl and the porter Gay Lay, who perished in 1934 were discovered.

In 1939 another German expedition led by Herr Peter Aufshnaiter explored the Diamirai flank of Nanga Parbat.

Another expedition to the Karakorams took place in 1934 under the leadership of Dr. G. Dyhrenfurth. All four peaks of "Queen Mary" were climbed. The highest of these has been triangulated as 24,350 feet, but the party, state it to be more than 1,000 feet higher.

NANDA DEVI

In 1934 E. E. Shipton and H. W. Tilman, by a magnificent piece of exploration and mountaineering, succeeded in penetrating the hitherto impracticable Rishi Ganga to the glacier basin of Nanda Devi, thereby solving a problem that had exercised the minds of Himalayan mountaineers for many years and completing the work of pioneers such as Dr. T. G. Longstaff and Hugh Ruttledge. Shipton and Tilman also crossed from Badrinath to Gangotri *via* the Satopanth Pass and explored the head of the Gangotri Glacier. Profiting by the discovery of the route to the Nanda Devi basin an Anglo-American party, the leader of which was Tilman, successfully scaled Nanda Devi *via* its south-west ridge, on 29th August, 1936, Tilman and Odell being the climbers to reach the summit. This expedition was remarkable in that owing to the sickness of the porters the climbers had to carry their own camps up the mountain. This is the finest and most difficult peak yet climbed in the Himalayas.

In 1939 the first Polish expedition to visit the Himalayas succeeded in making the ascent of the East Peak of Nanda Devi. Unfortunately an accident led to the death of M. M. A. Karpinski and S. Bernadzikiewicz on Trisul above the Milam Glacier.

Lt.-Col. C. F. Stoehr, R.E., and Lt. D. M. Burn, R.E. lost their lives on 12th August 1932, while climbing on Panjtarni, near Pahlgam in Kashmir.

In 1935 an attempt to scale Peak 3 in the Karakoram Himalayas 25,400 ft. was made by Lieut. J. Waller, Lieut. J. Hunt, Dr. J. S. Carslaw and W. R. Brotherhood, R.A.F. A series of blizzards were experienced but the party reached a height estimated at 24,500 feet. There is no great difficulty between this point and the summit.

In the Autumn of 1935 the summit of Kabru was reached by Mr. C. R. Cooke who was accompanied to the foot of the final rocks by G. Schoberth who was forced to give up owing to a high altitude, cough and the risk of frost-bite. This ascent was made on November 18th, an unusually late date and is of great interest as proving that high Himalayan peaks can be climbed in early winter at least.

The 1936 French expedition to the Karakorams, like the Everest expedition, encountered very bad weather and accomplished little.

EAST HIMALAYAS

After Nanda Devi the most remarkable ascent of 1936 was that of Sinolchu (22,610 ft.), a peak once designated as the "embodiment of inaccessibility", in the Kanchenjunga range. This was made by a small German party under the leadership of Herr Paul Bauer. Siniolchu is one of the most beautiful peaks in the Himalayas.

In 1939, a party of Munich mountaineers, consisting of Herren Grob, Paidar and Sehmaderer, made the first ascent of the Tent Peak (24,165 ft.), in the Kangchenjunga range and attempted the Twins Peak (24,115 ft.) but were defeated by bad weather.

Other ascents in Sikkim were made by Marco Pallis's party who attempted Simvu unsuccessfully and by C. R. Cooke and F. Spencer Chapman who ascended several peaks of over 20,000 feet including the Fluted Peak.

During the summer of 1937 a number of peaks were climbed, the most notable being Chomolhari 23,997 ft. by F. Spencer Chapman with one porter, and the Mana Peak 23,860 ft. by Captain P. R. Oliver and F. S. Smythe, the latter completing the ascent alone as Capt. Oliver was insufficiently acclimatised. Three other peaks of 21,400 ft., 21,500 ft. and 22,481 ft. were also climbed by Oliver and Smythe and attempts made on Nilkanta and Dunagiri which were frustrated by bad weather. They also explored a remarkable plateau above the Banke Glacier, discovered in May 1937 by Lieut. R. A. Gardiner of the Survey of India. In addition, Smythe with three Tibetan porters climbed seven peaks of the Zaskar Range among them the very difficult peak of Nilgiri Parbat, 21,264 ft. in July 1937. During this expedition Smythe came upon some remarkable tracks in the snow which the Tibetan porters believed were made by a Mirka or *Abominable Snow Man*. These tracks were afterwards identified as bear tracks by the natural history authorities in London.

Garhwal was visited in 1939 by a Swiss expedition led by M. Andre Roch and two fine peaks were scaled, Dunagiri and the Wedge Peak.

GODWIN AUSTEN (K2)

In 1938 C. S. Houston led an expedition to the Karakoram during the course of which a bold and determined attempt was made to climb K2, 28,250 ft. After failure to obtain a footing on the n. w. ridge, the party, which included several veteran Sherpa porters, ascended the n. e. ridge to a height of 26,000 ft.

A further attempt on K2 was made by an American party in 1939 but ended in disaster, Dudley Wolfe, and three Sherpa porters losing their lives in stormy weather high up the mountain.

Another expedition to the Karakorams was that undertaken by Capt. J. B. Harrison, Lieut. J. O. M. Roberts, R. A. Hodgkin, Dr. T. Graham Brown and Lieut. J. Waller together with Dr. G. A. J. Teasdale and Dr. Elizabeth Teasdale. The principal objective was Masherbrum, 25,660 ft., After establishing Camp 7 at 24,600 ft. Harrison and Hodgkin reached a height of about 25,000 ft. before being forced to retreat by bad weather. In descending to Camp 6 they were overtaken by a blizzard and forced to spend a night in the open as a result of which they were seriously frost-bitten. The devotion of the Sherpa porters prevented a more serious disaster.

Further exploration of the Badrinath, Kedarnath ranges at the sources of the Ganges as well as various ascents were made by a German expedition under the leadership of Dr. R. Schwarzgruber in the autumn of 1938. A little less than 10 years later (August, 1947) a Swiss party claimed that it had ascended Kedarnath.

The Survey of India has been very active and much work has been accomplished during the re-survey of Garhwal and Kumaon under the direction of Major Gordon Osmaston, whilst several thousand square miles of country have been mapped by Shipton and Tilman during their expeditions to the Shaksgam in 1937 and by Shipton during his expedition to the Karakoram in 1939.

The Himalayan Club was founded in 1928, at New Delhi with the object of encouraging and assisting Himalayan travel and exploration, and extending knowledge of the Himalayas through science, art, literature and sport. The initiation of this Club was due to Sir Geoffrey Corbett, one-time Secretary, Commerce Department of the Government of India, and to Major Kenneth Mason, M.C., R.E., one-time Assistant Surveyor-General. The headquarters of this club has now shifted to Calcutta, and most of the members have left the country.

1949 EXPEDITIONS

There were no notable expeditions during 1940-48 because of the war.

A party of four Swiss made an expedition into the Himalayas in 1949. The party consisted of Dr. Edward Wyss-Dunant, a biologist who was to make scientific observations; Adolf Ruby and Jacob Bargetzi, two Alpine guides; and Anne Liese Lohnar famous woman Alpinist who lead the party. They were later joined by Rene Dittert, veteran mountaineer and author. The expedition was organized by the Zurich headquarters of the Swiss Foundation for Alpine Research and was to spend six months in the unexplored wastes to the north of Kanchenjunga.

Mr. Tilman led a three-month expedition to the Nepal Himalayas. He was accompanied by Mr. Peter Lloyd, a well-known Everest climber. The object of the expedition was partly mountaineering and partly scientific. The scientific section which was financed by a number of British scientific societies consisted of a geologist Mr. C. S. Scott, and a botanist Mr. O. Polunin. The object of the expedition was to explore the Langtang Himal range, of which the highest peak is Langtang Lirung, 23,771 feet high.

A Norwegian group originally formed for an attempt on Nanga Parbat tried unsuccessfully to climb Tirach Mir in Chitral (Pakistan) in 1949 July.

A Sikkim Himalayan expedition sponsored by the Hikers' Club of Bombay made a trip of the 18,000 foot high Sebula Pass in Sikkim in May 1948. The party was under the leadership of Mr. R. P. Ghandhy.

This party covered a distance of 160 miles in three weeks and had some interesting mountaineering experiences. This was the second venture of the Hikers' Club, undertaken not so much to discover mysteries of the Himalayan heights, as to give training in mountaineering to youth.

1950 EXPEDITIONS

In 1950 there were four important expeditions. A Norwegian expedition led by Prof. Arne Naess made the first ascent of the Tirch Mir in the Chitral range of the Himalayas. A Scottish expedition under the leadership of W. H. Murray traversed the Gharwal range from west to east. It also successfully made the first ascent of Uja Tirch which has a height of about 21,000 ft. But by far the most important event of the year was the ascent of Annapurna in Nepal by a French expedition led by M. Hertog. Annapurna which has a height of 26,000 ft., is the highest peak in the world so far climbed. A British expedition to Nepal under W. H. Tilman also tried to climb Annapurna unsuccessfully. The main purpose of this expedition however was scientific.

A French Himalayan expedition has been planned for 1951 by the Lyons section of the French Alpine Club and the Lyons Himalaya Committee.

It will climb in the Garhwal Himalayas, where though the highest peaks have been conquered there are objectives which lure a mountaineer.

"Our aim," said M. Roger Duplat, the leader, "is not so much to attack a summit as to conduct a three months' Himalayan campaign. Doubtless we shall make some ascents and reconquer, by a new path, a summit approaching an altitude of 8,750 yards."

The other members of the team were M. L. Gevril (35), M. A. Barbezat (28), M. L. Dubost (25), M. G. Vignes (24), M. L. Payan (30) and M. J. J. Languepin. M. Vignes and M. Languepin are the doctor and cine-cameraman, respectively, of the expedition.

SCIENTIFIC SURVEYS

THE **Botanical Survey** Department of the Government of India is awaiting reorganisation. Pending a new appointment the duties of the Director are distributed among (*i*) Dr. K. P. Biswas, M.A., D.Sc. (Edin.), F.R.S.E., F.N.I., Superintendent, Indian Botanic Garden, Calcutta and (*ii*) K. S. Srinivasan, B.Sc., M.Sc. (C. gr.), Curator, Industrial Section, Indian Museum. There is a staff at headquarters of one officer for systematic work and at the Indian Museum a Curator who is engaged in the development and maintenance of the Industrial Section.

The existence of the Botanical Survey, like that of the Geological Survey, has both a cultural and an economic justification. On general grounds it is obvious that a progressive Government should acquaint itself with the vegetable resources of the area it administers. The activities of the survey have much economic applicability—consisting as they do of investigations and researches into the systematics, limnology, distribution of plants, ecology and economic botany of plant life—the work accomplished in pure and applied botany at the Indian Botanic Garden during the last century and a half has exercised a profound and far-reaching influence upon the development of Agricultural Sciences and Forestry in India. The irreplaceable dried plant materials obtained by botanical explorations and preserved for more than one hundred and fifty-six years at the Herbarium of the Indian Botanic Garden, Calcutta, and more than 15,000 indigenous and exotic trees, shrubs and herbs cultivated in the open, prove to be most useful in dealing with such questions of considerable State importance as naturalisation of useful plants, introduction of new vegetable products into the country, the adaptation of raw produce to the requirements of manufacturing industry, land utilisation, preservation of rural areas, provision of national parks, drainage, sanitation and public health.

The Industrial Section of the Indian Museum was founded for the exhibition of the economic resources of India (economic plants and plant products) and for serving as a Bureau of public information by diffusion of knowledge on economic Botany. The section maintains a public gallery, where plants and plant-products, such as food, fodder, spices, crude drugs and pharmaceutical products, vegetables, fibres, dyes and tans, oil and oil-seeds, gums and resins are displayed with descriptive labels.

GEOLOGICAL SURVEY

The Geological Survey of India is one of the oldest Geological Surveys in the world. The present department, now under the Government of India, Ministry of Natural Resources and Scientific Research, was founded in 1851. Its primary function is the preparation of a geological map of India, the basis on which all geological work, including an appraisal of the mineral deposits of the country, must rest.

Up to the beginning of the present century, most of the geological maps prepared were on the small scale of 1" = 4 miles, many of the surveys being rather in the nature of geological reconnaissances with the object of obtaining a broad view of the geology of the country as a whole. During the last 40 or 50 years mapping has, wherever possible, been on a standard scale of 1" = 1 mile, and in certain areas of special economic importance on even larger scales.

The importance of geological work in connection with India's industrial development is now widely realised and, to meet enhanced demands, the gazetted cadre of the Department is being increased as rapidly as possible. The present sanctioned strength is 1 Director, 9 Superintending Geologists (including 1 Deputy Director), 32 Geologists, 1 Petroleum Geologist, 75 Assistant Geologists, 1 Chief Geophysicist, 2 Geophysicists, 5 Assistant Geophysicists, 1 Geophysical Technician, 1 Chemist, 10 Assistant Chemists, 1 Mining Engineer, 1 Deputy Mining Engineer, 3 Assistant Mining Engineers, 1 Drilling Foreman, 4 Drillers, 1 Administrative Officer, 1 Artist and 1 Registrar. This staff is divided into (*i*) Headquarters Division, and (*ii*) Field Staff. The Headquarters Division, with its office in Calcutta, includes 1 Deputy Director and 1 Assistant Director, who are in charge of general administration, 1 Petrologist and 1 Curator with assistant who identify rocks and minerals submitted for examination by the public and superintend the Museum collections, 1 Palæontologist with assistants who is responsible for the identification of fossils and supervision of the fossil collections, and a chemical staff working in the Headquarters Laboratory. The office sections include, in addition to the general administrative sections, a Library section, a Publication section and a Drawing office, including map and process sections. Geological maps are prepared in the Drawing office and smaller maps are also printed there. The departmental Library is well-equipped with books and publications on geological and allied subjects. These may be consulted by the general public and in certain circumstances may be issued on loan.

The Field Staff, who spend about half of the year on geological fieldwork in any part of the Indian Union and the remaining 6 months at headquarters, are deputed to work either in the Field Circles or in the Specialist Sections, the former consisting at present of 6 Circles, *viz.*, (1) Western Circle for Bombay, Rajasthan, Saurashtra, Kutch and Ajmer; (2) Northern Circle for Uttar Pradesh, Punjab, Himachal Pradesh, PEPSU, Delhi, Vindhya Pradesh, Madhya Bharat and Bhopal; (3) Central Circle for Madhya Pradesh and Hyderabad; (4) Eastern Circle for West Bengal, Bihar and Orissa; (5) Southern Circle for Madras, Mysore, United States of Travancore and Cochin, and Coorg; and (6) North Eastern Circle for Assam, Sikkim, Manipur and Tripura. The Specialist Sections consist of 5 Specialist Sections, *viz.*, (1) Mineral Development Section; (2) Engineering Geology and Ground Water Section; (3) Geophysical Section; (4) Drilling Section; and (5) Exploratory Mining Section. The Field Circles each embrace one or several States, while the activities of the 5 Specialist Sections cover the whole of the Indian Union. Each Field Circle is under the supervision of a superintending geologist.

The object of the Field Circles is to continue the detailed geological mapping of the Indian Union. The Survey works in close co-operation with the Public Works Deptt. of the various State Governments. The Geophysical Section is at present working mainly on water-supply and engineering geology problems, and on the location of small mineral deposits.

Every year, before the programme of the field surveys is decided upon, the State Governments are asked to give details of geological investigations, mineral surveys or engineering enquiries which they desire to have carried out.

Recently a Mineral Information Bureau has been organised within the Geological Survey of India with the object of assisting and advising the public on the development and utilisation of mineral resources. The Bureau publishes a quarterly journal called *Indian Minerals* in which information is given in language which can be easily understood by the general public.

The results of the investigations and researches of the Department are published in—

(*i*) *Records* of the Geological Survey of India, which include the Annual Reports, Annual Mineral Review, and short papers. One volume of 4 parts is published annually. Every 5 years, a Quinquennial Review of the Mineral Production of India, is published as a separate volume of the *Records*.

(*ii*) *Memoirs* of the Geological Survey of India; in general each volume deals in detail with a *particular area or a particular mineral.*

(*iii*) *Palæontologia Indica*, which deals entirely with palæontological matters.

As a part of the *Records*, a series of Bulletins on particular minerals have been published in recent years. These Bulletins are intended to summarise the geological information available in India on commercial minerals. As each edition goes out of print, these Bulletins are revised and reprinted.

The advice of the Geological Survey of India is taken by the Central Government and others on all questions of mineral policy including grant of mineral concessions. To encourage and assist the teaching of geology in classes and colleges, the Department presents collections of minerals, rocks and fossils and gives lectures to students and at times to the public with a view to popularising the study of geology.

SURVEY OF INDIA

The first authoritative map of India was published by D'Anville in 1752, when the exploration of the then unknown India was still largely in French hands. It was compiled from routes of solitary travellers and rough charts of the coast.

The Survey of India may be said to have been founded in 1767—ten years after the battle of Plassey—when Lord Clive formally appointed Major James Rennell, the first Surveyor General of Bengal, at that time the most important of the East India Company's possessions.

From these beginnings, this department has gradually become primarily responsible for all topographical surveys, explorations and the maintenance of geographical maps of the greater part of Southern Asia, and also for geodetic work.

A geodetic framework is essential in any large survey, but there are a number of other activities, all of them ultimately utilitarian which can be suitably combined with its execution, and the following are some of those which have been carried out in India:

Precise levelling for the determination of heights;

Tidal predictions and publication of Tide Tables for thirty-nine ports between Suez and Singapore;

The Magnetic survey;

Observation of the direction and force of Gravity;

Astronomical observations to determine latitude, longitude and time;

Seismographic and meteorological observations at Dehra Dun.

Indian geodesy has disclosed widespread anomalies in the gravitational attraction in the earth's crust, which have recently led to a reconsideration of the whole theory of isostasy. Systematic gravity investigation, which may be said to have been initiated in India by the Survey of India, are now being carried out intensively in all civilised countries.

Though revenue survey is primarily a record of individual property boundaries and is unconcerned with the surface features, ground levels and exact geographical position essential to a topographical survey, it was on the whole found economical to carry out both surveys together.

By 1905 however, the small scale topographical surveys compiled from the large scale revenue maps had fallen seriously in arrears, owing to the relatively slower pace and incompleteness of the latter, on which non-revenue-paying areas are normally shown blank.

An authoritative Survey Committee appointed by the Government of India considered the position in 1905. It was feared that a separation of the topographical and revenue surveys might result in a wasteful duplication of work and two overlapping but mutually discrepant systems of mapping. These objections were met by a ruling that the basis of both systems of survey should be identical and provided either by the Survey of India or under its supervision.

Subject to this principle, the remaining revenue surveys were handed over to the Provinces, which had always paid for them as part of the overhead charges of revenue collection, and the Survey of India was enabled to concentrate its energies on a complete new series of modern topographical maps in several colours on the 1-inch to 1-mile scale.

This new series had been rendered necessary by the natural demand for more detailed information to be shown on maps, especially as regards the portrayal of hill features by contours and proper classification of communications.

It was intended that the survey begun in 1905 should be completed in twenty-five years, and then revised periodically every thirty years. Owing however to the First World War and later retrenchments, only about three fourths of the programme had been completed by 1939, in spite of a reduction of scale for the less important areas.

Although from 1905 to 1939 new surveys were carried out every year, covering from thirty to sixty thousand square miles, an area roughly that of England, the maps of a large part of the country are still over 50 years old, printed mostly in black only, and have hill features shown by roughly sketched form lines or hachures; such changes in town sites, canals and communications as have been embodied in them have not been surveyed, but are entered from data gathered from outside sources.

Surveys and records of international and State boundaries have always formed an important item of topographical work, and in recent years numerous Guide Maps have been published of important cities and military stations usually on scales of about 3 inches to the mile, where the 1-inch to 1-mile scale is inadequate.

The use of air photographs for survey purposes has become a normal practice and air survey is employed wherever it is considered advantageous to do so. The Survey of India has arranged with a company in India for the supply, on contract rates, of such photographs as it may require for survey purposes.

Air photographs in pairs for stereoscopic examination or made up in the form of mosaics are very often of value in inspecting sites prior to undertaking detailed survey operations, or may sometimes render these unnecessary.

So far as work for the Central Government will permit, this department is prepared to undertake local surveys on payment for States, municipal and other local authorities and private firms; and will give advice as to the methods to be employed on such work. Surveys of the above description include:—

Forest and cantonment surveys;

Riverain and irrigation surveys;

Railway and city surveys;

Surveys of tea gardens and mining areas.

The department is also equipped to carry out lithographic printing and can undertake such work on payment.

With the establishment of an International Civil Aviation Organization, India will be required to keep up its share of certain international series of civil aviation maps and charts.

The administration of the Survey of India is in the hands of the Surveyor General of India under the Ministry of Food and Agriculture. The headquarters office of the Surveyor General of India is at Dehra Dun, U.P. and is under the administrative control of the Deputy Surveyor General.

There are three regional Directors of Survey Circles with their headquarters at Shillong, Dehra Dun and Bangalore and a Director of Map Publication with his headquarters at Dehra Dun.

The more purely geophysical and mathematical activities of the department are dealt with by the Director, Geodetic and Training Circle, Dehra Dun.

There are map printing offices at Dehra Dun and Calcutta, the resources of which may be made use of by Government Departments and the public for printing special maps, illustrations for reports, patents, diagrams, etc.

ZOOLOGICAL SURVEY

The Zoological Survey of India was founded in 1916 on the basis of the Zoological and Anthropological Section of the Indian Museum which itself is a descendant of the Royal Asiatic Society of Bengal. The extensive zoological collections cared for and maintained by the Zoological Survey of India partly belong to the Asiatic Society and the Trustees of the Indian Museum and partly to the Central Government. Besides the collections, which are rich in types and unique specimens of Indian fauna, the greatest asset of the Survey is its extensive zoological library, probably the second best in the Commonwealth and certainly the best in Asia. Under certain rules and regulations, the books are sent out to *bona fide* research students thereby encouraging zoological research even in the remotest corners of India.

In recent years, it has supplied staff for the development and research in fisheries and for the Plant Protection Bureau of the Central Government. Even from a purely utilitarian aspect the potentialities and resources of the Survey are very much under-exploited.

The objects for which the Zoological Survey of India was founded are (*i*) to undertake faunistic studies so as to acquire all possible information on the geographical distribution of Indian animals, (*ii*) to maintain and add to the national zoological collections started nearly a century and a half ago by the Asiatic Society of Bengal, (*iii*) to maintain and develop the public exhibits in the zoological galleries of the Indian Museum at Calcutta, (*iv*) to identify specimens as required by investigators in any part of the country and (*v*) to advise the Government on zoological matters.

The Zoological Survey of India publishes *Records* and *Memoirs of the Indian Museum* which are journals of Indian Zoology and recently the publication of the *Fauna of India* has also been transferred to the Survey. The Reports of the Zoological Survey of India published triennially are highly informative.

The Anthropological Section of the Survey was budded off in December 1945 and formed the nucleus of the Department of Anthropology, Government of India, under the Ministry of Education. With it the publication of "Anthropological Bulletins" was also transferred to that Department.

In 1948, the Government of India decided to transfer the Survey to Calcutta but as sufficient accommodation for housing the collections and offices could not be found in the compound of the Indian Museum, a large rented building (Jabakusum House, 34, Chittaranjan Avenue, Calcutta 12) was placed at its disposal. Library, Birds and Mammals Section and the office of the Curator, Zoological Galleries, are located in the Indian Museum while all other Sections and the main office are in the rented building. The Government proposes as and when funds permit to put up a fire proof building for the Department which has no building of its own.

Director.—Dr. S. L. Hora, D.Sc., F.R.S.E.

THE CURRENCY SYSTEM

THE history of Indian currency is fully summarised in the Reports of the Herschell, Fowler and Babington-Smith Committees, and the Chamberlain and Hilton Young Commissions. This historical retrospect is confined to a brief review of the facts and events of the past which chiefly influence the present and serve as a guide to the future.

By the Act of 1818 the East India Company made the silver rupee of 180 grains 11/12ths fine unlimited legal tender for South India. However the various Presidencies under the East India Company had rupees of different weights and fineness and the rupee of one Presidency was not legal tender in another. A uniform system of coinage was, therefore, found necessary which was obtained by the Act of 1835. The 1835 Gold and Silver Coinage Act was enacted so as to make the rupee unlimited legal tender and deprive the gold coins of their legal tender character throughout British India. But in order to avoid the embarrassing fluctuations in the rate of exchange with gold standard countries consequent on the severe slump in the silver market from 1872 onwards, it was decided in 1893, in accordance with the recommendations of the Herschell Committee, to close the mints to the free coinage of silver. The stoppage of silver coinage was followed by an appreciation of the rupee, and by 1898 it had reached the level of 1*s.* 4*d.*

Though the Fowler Committee recommended in 1898 that the British Sovereign should be a current coin in India, gold never became a substantial part of the currency circulation with the result that what was known as gold exchange standard was in fact the sterling exchange standard.

The Chamberlain Commission, appointed in April 1913 abandoned the ideal of a gold standard based on a gold currency and accepted in its place an exchange standard with an exchange currency of sovereigns not essential to the working of the system. As the First World War broke out soon after no action was taken on these recommendations. The war of 1914-18 put the currency system of India, in common with those of other countries, to a severe test.

The Babington-Smith Committee was appointed in 1919 when the rate was 1*s.* 8*d.* The Committee recommended the stabilisation of exchange at 2*s.* gold. An important member of the Committee, Mr. Dadiba Dalal of Bombay, differed from the majority and submitted a minority report.

The majority's recommendations were accepted by the Secretary of State and the Indian Coinage Act was amended in order to make the Sovereign a legal tender at Rs. 10. The attempt to hold the ratio at 2*s.* gold, however, failed owing to the keen demand for remittances to London despite the heavy sale of reverse councils at rates ranging between 2*s.* 3 29/32*d.* and 2*s.* 10 27/32*d.* With effect from June 24, 1920, the Government of India tried to maintain the rupee at 2*s.* sterling; but its inability to contract Indian currency at the rate at which commodity prices were falling depressed the exchange which fell below 1*s.* 3*d.* sterling and 1*s.* gold early in 1921. The 2*s.* ratio thus remained ineffective though Government incurred a loss of Rs. 35 crores by selling £ 55 million reverse councils.

Government, however, pursued a deflationary policy and the Government exchange recovered to 1*s.* 4*d.* sterling by January 1923 and showed a general tendency to move upward. It reached the level of 1*s.* 6*d.* sterling in October 1924 at which time it was equivalent to about 1*s.* 4*d.* gold. From that time till March 1926, the upward tendency of exchange continued, but it was prevented from rising above 1*s.* 6*d.* by free purchases of sterling on the part of Government. Meanwhile sterling was restored to parity with gold about the middle of 1925 and the rupee was in the neighbourhood of 1*s.* 6*d.* gold when the Hilton Young Commission was appointed in 1926.

GOLD BULLION STANDARD

The Hilton Young Commission held the view that "the currency of the country must be linked with gold in a manner that is real and conspicuously visible." It, therefore, recommended a gold bullion standard whereby an obligation should be imposed by statute on the currency authority to buy and sell gold without limits at rates determined with reference to a fixed gold parity of the rupee but in quantities of not less than 400 fine ounces, no limitation being imposed as to the purpose for which the gold is required. It would establish the principle that gold is the standard of Indian currency at a fixed ratio. Simultaneously it recommended that the legal tender quality of the sovereign and the half-sovereign should be removed.

In a minute of dissent, Sir Purshottamdas Thakurdas said that it was not possible to improve upon the ideal of a gold standard based on gold reserves. He warned that the recommendation of his colleagues to stabilise the rupee at 1*s.* 6*d.*, if accepted, would disturb the country's economy and expressed his view that the Executive had already made up its mind to work up to 1*s.* 6*d.* ratio long before the appointment of the Commission.

The monetary standard created by the Act of 1927 was a sterling exchange standard with the proviso that it was like the gold exchange standard so long as sterling did not go off the gold parity. While it retained most of the old features condemned by the Commission namely the conversion of silver rupee into paper currency, the duplication of reserves and the separation of currency from credit control, it represented an improvement over the pre-1916 standard by ensuring a statutory gold parity for the rupee and a statutory obligation on Government with regard to the purchase of gold and sale of gold or sterling.

The main controversy in the following years centred on the exchange ratio. From the beginning, however, Government were finding it necessary to take special measures to maintain the ratio of 1*s.* 6*d.* owing to its weakness. On February 10, 1927 when the Imperial Bank desired to borrow Rs. 2 crores from Government, it was charged seven per cent. as against the bank rate of six per cent. The position deteriorated further by November 1930 owing to rumours about the change in the ratio, and sterling to the tune of £5,650,000 was sold between November 1930 and March 1931 on speculative account. The weakness of the exchange was followed by contraction of currency during the same period. The net contraction of note currency during the five years ending 1931 was Rs. 102¼ crores.

THE CRISIS OF 1931

By 1931 the situation had become critical owing to the economic depression. The ways and means position was attempted to be buttressed by short term loans in the form of treasury bills which mounted upto Rs. 83.4 crores by August 1931 and thereafter by taxation and retrenchment. The flight of capital from India could not be checked and Government had to sell £11 million sterling to maintain the ratio at the lower exchange point between August and September 19, 1931.

On September 21, 1931, the pound sterling was divorced from gold; India had a Currency Ordinance; and the Secretary of State announced Government's currency policy in terms which were not in conformity with the Currency Ordinance. The confusion thus created necessitated the declaration of moratorium for three days in respect of banks and this unprecedented event was followed by the issue on September 24 of the Gold and Sterling Regulation Ordinance of 1931.

The Indian Gold and Sterling Sales Regulation Ordinance of 1931 had the object of maintaining the sterling paper standard by strict regulation of dealings in foreign exchange and the prevention thereby of the export of capital by nationals. The Imperial Bank of India was authorised to allocate exchange for certain definite purposes such as normal trade needs, excluding the import of silver and gold, contracts done before September 21 and for reasonable personal and domestic purposes. The linking of the rupee with sterling involving the loss of its freedom was strongly opposed by the public. The change ensured the flow of trade between India and the British Empire while placing India at a disadvantage in respect of her trade with countries having a gold standard. An outstanding feature of our trade thereafter was the unusual exports of gold.

Rupee Unlinked.—Consequent on India's membership of the International Monetary Fund and the fixing of par values in accordance with the Articles of the Fund Agreement, sterling ceased to be the sole determinant of the external value of the rupee. The convertibility of the rupee into other currencies was therefore provided for, by the enactment of the Reserve Bank of India (Second Amendment) Act, 1947, which was passed by the Central Legislature in April, 1947. The amendment repealed Sections 40 and 41 of the Reserve Bank of India Act which had obliged the Bank to buy and sell foreign exchange at such rates and on such terms and conditions as the Central Government may determine from time to time in conformity with their obligations as a member of the Fund.

DEVALUATION

Closely following the decision of Britain to devalue sterling in terms of the U.S. dollar, the Government of India announced on September 20, 1949 the devaluation of the rupee to the same extent, thereby changing the par value of the rupee in terms of the U.S. currency from 30·225 cents to 21 cents and in terms of gold from 0·268601 to 0·186621 grammes of fine gold to the rupee. The stock, bullion and commodity markets, banks, Government treasuries and other financial institutions were officially closed on September 19, 20, and 21 and the new exchange rates, therefore, came into force only after the end of the holidays.

Pakistan, although a member of the sterling area, decided not to devalue her currency with the result that her currency appreciated both in terms of the Indian rupee and the pound sterling and her trade with India came consequently to a standstill. On February 27, 1951, however, India recognised the Par Value of the Pakistani rupee under the Indo-Pakistani trade pact.

MONEY SUPPLY

The rate of wartime expansion in money supply in undivided India, after reaching its peak in 1942-43, witnessed a progressive decline during the subsequent war years. Money supply stood at Rs. 2,179 crores at the end of 1945-46. In the following year it improved to Rs. 2,210 crores and jumped up to Rs. 2,316 crores by the end of March 1948 following the aggravation of inflation resulting from decontrol.

The downward trend in money supply with the public in the Indian Union noticed in 1948-49 continued in the following year. It showed a net contraction of Rs. 18.4 crores during the year as against a net contraction of Rs. 43.3 crores in 1948-49.

During 1950-51 money supply with the public showed a pronounced rise of Rs. 99.2 crores. Of this, 84 per cent was accounted for by currency with the public and the balance of Rs. 15.5 crores by deposit money. The trends in money supply during 1950-51 passed through three phases: first, a continuation of the 1949-50 busy season up-trend during April 1950; second, a continuous fall from May to September and third, a sharp rise during the busy season from October 1950 to March 1951. The decline from May to September 1950 amounted to Rs. 95.8 crores as against a contraction of Rs. 119.6 crores in the corresponding period of 1949. The latter half of the year, however, saw a steep rise in money supply amounting to Rs. 188.8 crores, the bulk of which occurred during the last four months.

In the year under review (1950-51), a significant primary source of monetary expansion was the substantial payment surplus which was reflected in a net accrual of sterling of Rs. 37.6 crores to the Reserve Bank. Unlike the previous year, there were no additions to money supply on account of Government drawings on their balances. The main factors contributing to higher money supply would appear to be the unusually large seasonal expansion of bank credit amounting to Rs. 141.5 crores between December and March as against Rs. 67 crores in the corresponding period of the previous year and the large net addition to rupee securities held by the Reserve Bank amounting to Rs. 64.5 crores during the period of October 1950 to March 1951 as against a net addition of only Rs. 6.3 crores in the corresponding period of 1949-50.

NOTE CIRCULATION

Broadly speaking, in pre-war years, the two principal constituents of money supply, namely, notes in circulation and demand deposits, tended to move in opposite directions in the busy and slack seasons; notes in circulation fell and deposits rose in the slack season, while in the busy season note circulation rose and deposits fell. During war years these trends were submerged in the continued inflationary expansion of money.

With the termination of the war, the normal seasonal trends in note circulation re-emerged, while the trends in demand deposits showed some departures from the usual pattern. Thus in the years 1948-49 and 1949-50, deposits showed net declines both in the slack and busy seasons, the unseasonal contraction in the slack seasons probably reflecting drafts on deposits to meet the import surpluses of the pre-devaluation period.

During the slack season of 1950-51, notes in circulation fell by Rs. 99.76 crores and deposits rose by Rs. 12.93 crores. In the busy season, however, while note circulation went up by Rs. 206.88 crores, demand deposits registered a further net rise of Rs. 8.75 crores.

Absorption of Currency.—During the war and post-war years upto 1947-48, there was continuous absorption of currency, the total amounting to Rs. 1,363 crores (undivided India), comprising Rs. 1,144 crores of notes, Rs. 139 crores of rupee coin and Rs. 81 crores of subsidiary coin. This was followed by two years of contraction during 1948-49 and 1949-50, when Rs. 17.62 crores of legal tender currency were returned from circulation in the Indian Union. During the year under review, however, a renewed sharp expansion of Rs. 86.51 crores in the Indian Union took place, this being the highest absorption of currency in any of the post-war years. This gives a net absorption in the Indian Union of Rs. 68.89 crores during the three years 1948-49 to 1950-51. As against this trend, it is interesting to note that, following a total absorption of Rs. 254.46 crores in the quinquennium ended 1919-20, there was a continuous return of currency of Rs. 38.65 crores during the period 1920-21 to 1922-23.

In the pre-war years, however, the busy season, with its absorption of currency, usually began in August, September or October—mostly in September,—and ended with December, January or February, with an average duration of five to six months; the slack season, when currency returns, began usually in January, February or March and extended upto July, August or September, the average duration being six or seven months. In the post-war years, however, a tendency has been noticed for the busy season to prolong upto the end of April or even the middle of May, as during the years 1947-48 to 1950-51, thus extending its duration to seven or eight months and making the slack season of a comparatively shorter duration of four or five months.

During the war years, the tide of currency expansion resulting from steadily growing governmental outlays largely submerged the usual seasonal ebb and flow of currency. With the termination of the war, the rate of currency expansion slackened appreciably, and the seasonal pattern became increasingly evident in a process of adjustment to normal conditions, with the seasonal trends reasserting themselves by 1947-48. Other factors have also influenced the amplitude of seasonal fluctuations in the post-war years. The large absorption of notes of Rs. 130.77 crores during the busy season of 1947-48 (October to March) partially reflected also the effect of governmental deficit financing, particularly after the Partition and the policy of progressive decontrol adopted in December 1947. The return of notes of Rs. 124.86 crores during the slack season of 1949-50 (mid-May to October-end 1949), which is the largest seasonal contraction on record, was due, in part to the heavy payments deficits in that period. Owing partly to the difficulties, which arose in regard to the trade with Pakistan following devaluation, the busy season of 1949-50 began later than usual, *i.e.*, in November 1949 and continued upto mid-May 1950, the total absorption of notes during the period being Rs. 122.06 crores. This comparatively large absorption also reflected, in addition to the seasonal demand, the effect of export surpluses leading to the sizable accruals of sterling to the Reserve Bank, which followed the devaluation of the Indian Rupee in September 1949.

During 1950-51, the slack season lasted from mid-May to September-end; the net contraction in notes in circulation over the period at Rs. 99.76 crores was appreciably lower as compared with the absorption in the preceding busy season. Also, the seasonal fall in bank credit, amounting to Rs. 62.00 crores, during the period, was somewhat smaller than the expansion in the busy season immediately preceding. The contraction in the slack season of 1950-51 was accompanied by a net loss of sterling to the Reserve Bank of India following the emergence of a short-lived import surplus, sales of securities by the Bank and by a net inflow of funds on Government account reflected in accretions to the Central Government's balances with the Reserve Bank.

The busy season uptrend commenced with the beginning of October 1950 and was prolonged beyond the end of the financial year; it lasted as in the case of the preceding busy seasons upto about the middle of May. This prolongation of the busy season is partly attributable to the resumption of trade with Pakistan late in the season in terms of the Indo-Pakistan Trade Agreement of 25 February 1951.

During the period from 29 September 1950 to 11 May 1951, notes in circulation rose substantially by Rs. 206.88 crores to Rs. 1,302 crores, as against a rise of Rs. 122.06 crores in the preceding busy season. This seasonal expansion is the largest on record for peace-time conditions and compares with the war-time absorption of Rs. 215.01 crores in respect of undivided India noticed in the busy season period August 1944 to June 1945. The busy season witnessed an unprecedented expansion in scheduled bank credit amounting to Rs. 180.29 crores during the period from 24 November 1950 to 11 May 1951. The exceptionally heavy incidence of the busy season was attributable to the need to finance trade and movement of commodities at rising prices, to the continued high level of exports as well as to a degree of speculative holding of commodities. The busy season expansion in currency was also accompanied by a sizable increase in the Reserve Bank's rupee investment portfolio.

In the slack season of the following year, the note circulation was contracted from the peak level of Rs. 1,302 crores on May 11, 1951 to Rs. 1,134½ crores by the middle of November when the Reserve Bank raised the bank rate to 3½ per cent in order to tighten the credit during the forthcoming busy season. As a result from the low level of Rs. 1,128¼ crores at the end of November 1951, notes in circulation rose to Rs. 1,139¼ crores at the end of February 1952 as against a rise of Rs. 97 crores in the same period the previous season at Rs. 1,217 crores.

Circulation and Absorption.—In contrast to the declines, respectively, of Rs. 7.84 crores and Rs. 5.84 crores noticed in the preceding two years 1948-49 and 1949-50, notes in circulation registered a sharp expansion of Rs. 83.89 crores during the year under review. The rise in notes in circulation during 1950-51 is the largest during any year since 1945-46, and was the net result of (1) an absorption of Rs. 21.07 crores in April 1950, (2) a return of Rs. 89.00 crores during the slack season months, May to September 1950 and (3) an absorption of Rs. 151.82 crores during the busy season months, October 1950 to March 1951. As usual, the maximum monthly return of notes took place in the slack season month of July, when there was a return of Rs. 36.16 crores. This compared with a record return in the corresponding month of 1949 at Rs. 45.48 crores. The highest monthly absorption during 1950-51 was, as usual, in December, when it reached the record level of Rs. 49.47 crores as against Rs. 31.07 crores in December 1949.

During the year 1950, with the notable exception of Rs. 100 notes, all the other current denominations of notes in circulation registered a decline. The gross circulation of the Rs. 100 denomination, which had fallen from Rs. 540 crores at the end of 1947 to Rs. 426 crores at the end of 1949, showed a substantial rise of Rs. 75 crores to Rs. 501 crores at the end of 1950. The proportionate share of these notes in the total issues of all current denominations also correspondingly rose over the year from 38.1 per cent to 42.6 per cent. This denomination had constituted the largest proportion of the total notes during the years 1944 and 1945, but its proportion fell from 45.5 per cent at the close of 1945 to 38.9 per cent at the close of 1946, mainly on public apprehensions of possible demonetisation of this denomination following the demonetisation in January 1946 of notes of the denominations of Rs. 500 and above. During the years 1946 to 1949, Rs. 10 denomination had accounted for the largest percentage of total notes, although its share had shown a decline from 44.5 per cent at the end of 1948 to 43.5 per cent at the end of 1949. The proportion of Rs. 10 notes fell further during the year and stood lower at 41.1 per cent at the end of 1950 as compared to 42.6 per cent in the case of Rs. 100 denomination. The Rs. 5 and Rs. 2 denominations also showed a decrease during the year from 16.1 per cent and 2.4 per cent respectively, to 14.1 per cent and 2.1 per cent.

Rupee Coin.—Since November 1, 1943, when the standard silver rupee coin of eleven-twelfths fineness ceased to be legal tender, the 'rupee coin' in circulation in India has comprised (1) the Government of India one rupee notes issued from July 1940, which in terms of the Government of India's currency Ordinance of July 24, 1940 (No. IV of 1940), are deemed to be included in the expression 'rupee coin' for all purposes of the Reserve Bank of India Act, 1934, (2) the quaternary silver rupees (of one-half fineness) issued between December 1940 and June 1946, which continue to be legal tender and (3) the nickel rupees issued from June 1947. These

coins (as well as current India small coins) were also in circulation in Pakistan at the time of the termination of the Joint Monetary Arrangements with Pakistan on June 30, 1948. In terms of Section 3 of Part IV of the Pakistan (Monetary System and Reserve Bank) Order, 1947 (as amended), the India coins, including one rupee notes are being withdrawn from circulation by the State Bank of Pakistan and certain categories of them, as specified in the Order, returned and adjusted during 1950-51 was Rs. 30 lakhs, the total amount adjusted up to the end of March 1951 being Rs. 4.22 crores.

During the year under review, rupee coin circulation, in the Indian Union, rose further by Rs. 5.82 crores, as against an increase of Rs. 2.29 crores in 1949-50. This was brought about by a total absorption of Rs. 10.50 crores during April and May 1950, and October 1950 to March 1951, which was partially offset by a total return of Rs. 4.68 crores during the remaining four months of the year, namely June to September 1950. On April 6, 1950, the Reserve Bank received from the Government of India one rupee notes and coin of the value of Rs. 5 crores, in terms of Section 36 (2) of the Reserve Bank of India Act, against payment of legal tender value.

Small Coin.—Since 1944-45, when the war-time demand for small coin had carried the figure of absorption to the record level of Rs. 19.20 crores, there has been a progressive falling-off in the demand for this form of currency, and during 1949-50 there was actually a net return of small coin amounting to Rs. 2.16 crores, this being the first year since 1930-31 to show a net return. The year under review witnessed a larger return of Rs. 3.20 crores, which was the net result of a total return of Rs. 3.40 crores between June 1950 and March 1951 and a total absorption of Rs. 0.20 crore during April and May 1950. It will be noticed that small coin is normally absorbed, irrespective of the trends in notes and rupee coin in circulation. Over the period 1915-16 to 1950-51 there has been only 5 years of return, namely, two years of return after World War I in 1920-21 and 1921-22, two years after World War II in 1949-50 and 1950-51 and the depression year 1930-31. The return of small coin during recent years is presumably the result of the unusually heavy absorption noticed during the war and immediate post-war years.

Denomination-wise, all the denominations showed returns excepting the single pice and pie pieces, which recorded absorptions.

Agreement with Foreign Countries

When the Financial Agreement with the United Kingdom was extended in July 1948 for a period of three years, it was agreed that the amount of £80 million lying at that time to the credit of No. 1 Account would be available for current expenditure during the year ended June 30, 1949 and that a sum of £40 million should be released in each of the subsequent twelve-month periods. But as a result of unexpectedly heavy imports there was a considerable running down of the balances in No. 1 Account. The United Kingdom, therefore, agreed to permit advance transfers of releases for subsequent periods and also additional releases to enable India to meet her outstanding commitments under O. G. L. XI which was cancelled in May 1949. The agreement provided for a release of £81 million for the year ended June 1949 for which there was no provision in the previous agreement and a further release of a sum not exceeding £50 million to meet the liabilities entered into under the old O. G. L. XI prior to its cancellation. The annual releases for each of the twelve-month periods ending June 1950 and June 1951 were raised from £40 million to £50 million.

The previous year's agreement had fixed a limit of $60 million for India's drawings on the Sterling Area Central Reserves during the year ended June 1949. It was assumed that the hard currency deficit for the year would amount to $160 million and that $100 million would be raised by purchases from the I.M.F. Actually the deficit was higher and as a result of negotiations, which were merged with the discussions of the Commonwealth Finance Ministers' Conference, no quantitative limitation was imposed in the Financial Agreement of August 1949 on India's drawings on Central Reserves and India was re-admitted to full membership of the sterling area. An obligation which India assumed in common with other member countries as a result was to reduce her expenditure on dollar imports in the year July 1949-June 1950 to 75 per cent of that in 1948.

In 1951 an understanding was reached between the two Governments over the broad outlines of a new long-term arrangement. This was confirmed in February 1952. Under the agreement, the U.K. Government have agreed to release during the six years ending June 1957 a sum of £35 million a year from these balances. They have also agreed to transfer £310 million from Account No. 2 to Account No. 1, to be held by the Reserve Bank of India as part of the Currency Reserve, to be drawn upon only in an emergency. Provision has been made for the carry over of undrawn amounts from one year to another and for consultations between the two Governments in case it is found necessary in any year to make a call on a subsequent year's allocation in excess of £5 million. At the end of the period it is expected that the balances would have reached the amount normally required as a currency reserve; but if any excess is left, it will be transferred to No. 1 Account.

The circumstances under which normal commercial relations between India and Pakistan came to be suspended from September 1949 were reviewed in the last issue. On April 21, 1950 the two Governments agreed on a short-term arrangement for resuming trade upto July 31, 1950. The basis was a deal for the sale by Pakistan of 8 lakh bales of raw jute in terms of Indian rupees against which Pakistan could buy specified quantities of commodities which would be made available in the following quantum: jute goods (20,000 tons), cotton textiles (45,000 bales), mustard oil (7,000 tons), and steel (5,000 tons). Besides, several other commodities were allowed to be freely traded between the two countries with either Government undertaking to provide the foreign exchange. Despite the difficulties, the total value of trade in the six months ended September totalled Rs. 43 crores of which imports were Rs. 24 crores.

This agreement expired on September 30. In the meantime Pakistan had been accepted as a member of the International Monetary Fund and had communicated the initial par value of its rupee. Then followed the Korean war which created a boom in raw materials. India, on the other hand, experienced an acute shortage of raw jute at a time when the demand for jute goods was at its peak. On February 25, 1951 a satisfactory agreement was concluded with Pakistan on India's initiative. Under this pact, India instituted exchange control with Pakistan and the Reserve Bank of India simultaneously announced that it would buy and sell Pakistan rupees at the rates of Rs. 69-8-3 and Rs. 69-6-6 respectively for 100 Indian rupees and the corresponding rates in Pakistan were fixed at Rs. 144-0-0 and Rs. 143-13-3 respectively. On March 19, 1951 the Fund accepted the par value of the Pakistan rupee and the two Governments agreed upon a mode of settlement of transactions according to which the rupee balances accumulated by the respective central banks on account of current transactions would be convertible into sterling without any restrictions. This agreement is valid up to June 30, 1952.

EXCHANGE CONTROL

During 1950-51 sterling transactions resulted in net purchases of £235.56 million (Rs. 313.95 crores) as against £139.55 million (Rs. 185.98 crores) in the previous year. The Reserve Bank continued to buy sterling T.T. from banks for delivery within six months at 1*s.* 6*d.* and to sell for ready delivery at 1*s.* 5-63/64*d.* The Bank also sold sterling for delivery upto six months forward at 1*s.* 5-31/32*d.* but the demand was negligible.

There was no change in the basic system of exchange control in 1950-51 but certain minor changes did take place. On April 20, 1950 the transfer of a company from residents of India to residents of the U.K. and the granting of loans and advances to persons resident in the U.K. and to companies excepting banks controlled directly or indirectly by residents of the U.K. was disallowed without the permission of the Reserve Bank. The sterling accounts of residents in Paraguay with banks in the U.K. were designated as Paraguayan Accounts, sterling held therein was available for making payments to residents in scheduled territories and for transfer to other Paraguayan Accounts and pdyments for exports from India to Paraguay could be received in sterling from these Accounts or in rupees from the account of a bank in Paraguay. Denmark, Greece and Austria joined the 'Transferable Account' group. The Dutch East Indies guilder was removed by the U.K. Control from the list of specified currencies from December 6, 1950 and the method of payment for exports to Indonesia and the Dutch New Guinea thereafter was sterling from an appropriate account or rupees from the account of a bank in these territories.

The list of hard currency countries underwent considerable changes during the year under review. On May 10, 1950 Paraguay was removed from the list and Liberia was added to it from May 20. Following the inception of the EPU, Belgian Monetary Area, Western Germany and Switzerland came to be treated as soft currency countries and Jordan was included in scheduled territories with effect from July 1, 1950.

Consequent on the decision of the Canadian Government to permit, as from October 2, 1950, the exchange rate for the Canadian dollar to fluctuate, the Bank of England fixed a daily rate of exchange for Canadian dollars and authorised dealers in India were advised by the Reserve Bank to book all their transactions in this currency on the basis of London Control rates advised to them from time to time. After a fortnight, however, business was left for mutual negotiation with London and Canada subject to normal exchange control regulations.

The basic travel allowance to the sterling area and soft currency countries for personal convenience remained unchanged at £450 per adult and £225 per minor for three years plus allowance for return fares. The scale of exchange facilities, namely, Rs. 2,000 per adult and Rs. 1,000 per minor once in three years available for travel to Iran, Iraq, Persian Gulf ports, Saudi Arabia, Ceylon, Burma, Malaya and Indonesia also remained unchanged.

The repatriation of capital owned by residents of the sterling area had always been freely allowed. From May 1, 1950 the Scandinavian countries were treated on par with the sterling area for all capital transfers. In respect of other countries, Government decreed that (1) capital invested from January 1, 1950 in projects approved by the Government of India might be repatriated at any time thereafter, (2) any part of the profits derived from investments and ploughed back into projects with the approval of Government would be treated as investment for this purpose, (3) appreciation of any capital under the above would not, however, qualify for repatriation, and (4) such repatriation facilities would not apply to purchase of shares on the stock market unless it was an integral part of an approved investment project.

Trends.—There was a decline in the proportion of exports financed by sterling bills on London and that there was a gradual rise in the proportion of trade financed by bills drawn in the currency of the country of destination of the goods. There was also a tendency for a larger proportion of the trade to be financed in rupees. The proportion of exports to other non-sterling area countries financed by sterling bills drawn on London fluctuated throughout the year but the variations were small. Exports financed in rupees on the whole accounted for a lesser proportion of total exports than in the previous year.

Recent Developments.—With effect from June 8, 1951 the Bank of England raised the limit on import and export of Bank of England notes from £5 to £10 per person. Consequently the limit of import and export of pound notes has been raised to £10. In the following month sterling area nationals intending to emigrate to the U.S. and other American Account countries were granted an additional allowance of £250 per dependent subject to a ceiling of £1,000. The U.K. Control concluded a new payments agreement with Japan in September which dispensed with the settlement of trade transactions with Japan through the accounts opened in the name of the Supreme Commander, Allied Powers or any account of the Foreign Exchange Control Board, Tokyo. Simultaneously, the personal travel allowance was raised from £150 to £600 per adult.

Towards the end of 1951 an Ordinance was issued to amend the Foreign Exchange Regulation Act, 1947 to make it obligatory for a foreign company to furnish information relating to its assets and business arising out of dealings in foreign exchange including dividends. On December 15, 1951, the Bank of England announced that from December 17 onwards the London foreign exchange market which had been closed since 1939 would be re-opened. While the arrangements for export and import licensing or the exchange restrictions are left undisturbed, the changes cover (1) discontinuance by the Bank of England of its practice to quote forward rates and permission to authorised dealers to transact forward business at rates determined by supply and demand within the limits officially fixed and (2) the spread of the rates for spot business. The new dealing limit for the U.S. dollar is 2.78 to 2.82, for the French franc 972 to 988 and for the Dutch guilder 10.56 to 10.72. Greater freedom has also been given to the authorised banks to carry open positions.

Sterling Area Reserves.—Thanks to the devaluation of sterling in September 1949, followed by a boom in raw materials due to the Korean War, the sterling a ea was able to replenish its gold and dollar reserves substantially, the gain in 1950 being to the tune of $1.612 million against a loss of $168 million. The improvement continued in the following six months, the rise in the first and the second quarter amounting to $458 million and $112 million respectively. Thus at the end of June 1950 the reserves stood at the high level of $3,870 million.

The situation changed radically in the latter half of 1951 and the sterling area consequently lost $1,500 million from its gold and dollar reserves. The three main factors are: (1) current deficits of the U.K. and the rest of the sterling area with the dollar area, (2) capital outflow caused by a weakening of confidence in sterling and (3) deficits with non-dollar countries. In a sense all currencies are now hard but the dollar is the hardest. To arrest this trend, the United Kingdom announced a drastic cut of 10 per cent in imports, pushed up the Bank rate from 2 per cent to 2½ per cent in November and to 4 per cent in March, decided to cut capital investment and pledged to export £250 million more worth of goods. The budget was also framed with the sole objective of salvaging the pound sterling. Simultaneously a Commonwealth Finance Ministers' Conference was convened to chalk out a determined policy for defending the sterling and pave the way for its multilateral convertibility ultimately.

BALANCE OF PAYMENTS

Deficits in India's balance of payments were very rare occurrences in the pre-war period but they have become chronic during the post-war years. During 1946 and 1947 the deficits for undivided India were Rs. 28.3 crores and Rs. 39.5 crores respectively. In 1948 the deficit for India without Pakistan amounted to Rs. 143 crores and reached the peak of Rs. 156.8 crores in 1949 and this too, after taking into account the improved conditions which came to prevail during the last quarter of the year, *i.e.* after devaluation. The large deficits for recent years, however, have to be interpreted with caution. A part of this deficit was necessary to enable absorption of the release of sterling balances; but the presence of an element of disequilibrium in the situation was indicated by the fact that since the middle of 1948 the deficits exceeded the limit of releases earmarked for the period July 1948-June 1949.

Thus on the eve of devaluation, the position was that though the demand for India's exports including that from the hard currency areas was showing some signs of revival, speculative anticipations of devaluation were working in the opposite direction. Balance in the international accounts was being sought to be achieved by a combination of export promotion policy and a restricted import of goods both for the dollar and the soft currency areas.

Following devaluation, the rupee prices of approximately 25 per cent of India's imports from the hard currency areas were put up by 43.5 per cent leading to a deterioration in the overall terms of trade by about 10 per cent. On the side of exports, buyers from the non-devalued countries obtained a price advantage of 30.5 per cent over their competitors in the devalued countries.

The year 1950 saw a striking improvement in India's balance of payments. Excluding transactions with Pakistan, the year showed a surplus on current account of Rs. 61.5 crores compared to a deficit of Rs. 169.3 crores in 1949. There was a slight deterioration in the invisible account from Rs. +33.2 crores in 1949 to Rs. +31 crores; but this was more than made up by the mercantile transactions. Exports over the year rose by Rs. 114 crores reaching an all-time high at Rs. 540 crores, while imports declined substantially from the peak-level of Rs. 628 crores reached in 1949 to Rs. 510 crores in the following year. Government expenditure on food and stores was considerably less primarily on account of the lower food imports of 2.1 million tons in 1950 as compared to 3.7 million tons in 1949.

The surplus in India's balance of payments for 1950 was unevenly distributed between the two half years. That the bulk of the surplus was achieved in the latter half of the year was an indication of the assistance India's balance of payments derived from the international situation.

The foreign exchange assets of the official and banking institutions rose by Rs. 22 crores in 1950, the liabilities (excluding liability to I.B.R.D.) to the foreign official and banking institutions also declining at the same time by Rs. 11 crores. In 1949 a large current account deficit had caused a fall of Rs. 151 crores in foreign exchange assets and in addition the country had incurred liabilities to foreign official institutions (excluding I.B.R.D.) amounting to Rs. 2 crores.

The largest part of the improvement in India's balance of payments for 1950 was in the transactions with the sterling area, the deficit of Rs. 46 crores in 1949 being converted into a surplus of Rs. 59.7 crores. The payments position with the hard currency area changed from a deficit of Rs. 53 crores in 1949 to a surplus of Rs. 29 crores in 1950. The main contributory factor was the Korean war. Part of the explanation is, however, change in the currency area classification involving the transfer of Belgium, West Germany and Switzerland to the soft currency group in the second half of the year. The adverse balances with the "other area" amounted to Rs. 27.1 crores against Rs. 70.3 crores in 1949.

India's transactions on current account with Pakistan in 1950 were approximately in balance, the deficit being of Rs. 2 crores as compared with a deficit of Rs. 34.1 crores in the year ended July 1949. Transactions on capital account indicated a net transfer of Rs. 3.2 crores to Pakistan.

The following is the summary of India's balance of payments:—

INDIA'S BALANCE OF PAYMENTS—CURRENT ACCOUNT

(Rs. in crores)

	January—June 1949			July—December 1949			January—June 1950			July—December 1950

year arrangements had to be completed with a Swiss Banking syndicate for the first public offering of the bank bonds in Switzerland for 50 million Swiss francs for 12 years on a 3½ per cent. basis. The year also saw the broadening of the market for the Bank's bonds.

The basic character of the Bank's lending is governed by the Articles of Agreement which lay down that (1) loans made or guaranteed by the Bank shall, except in special circumstances, be utilised for specific projects, (2) the Bank's resources should be used to finance those projects most needed for increasing the country's productive resources, and (3) except in special circumstances Bank loans should be designed to meet foreign exchange expenditure rather than local currency expenditure. The Bank is, however, willing to make loans for local currency expenditures if the domestic savings of the borrowing country are reasonably fully employed in productive investment. Late in 1951 clause (1) was amended so as to permit the grant of a composite loan.

The two principal charges are interest and commission. The interest rate is calculated to exceed the cost at which the Bank can borrow in the market for a comparable period by a small margin which, together with the income from its capital, should be sufficient to cover the Bank's operating expenses and to yield a modest amount for its reserve fund. It also charges a commission of one per cent. per annum which is the minimum charge under the Articles of Agreement for the first ten years of the Bank's operation.

Under the Articles of Agreement, loans to non-governmental borrowers must be guaranteed by the "member or the central bank or some comparable agency of the Bank which is acceptable to the member." The Bank continues to study the various techniques needed in different countries. It also maintains a close relationship with its borrowers throughout the duration of each loan. In the normal course of its loan operations, it renders technical assistance to members in a variety of ways.

India's Foreign Liabilities & Assets

With a view to assessing more accurately the current status of the balance of payments and investment, the Reserve Bank of India was directed to undertake a comprehensive inquiry and frame a kind of international balance sheet of the foreign liabilities and assets of India as on June 30, 1948. The results of this inquiry were published recently as a report. The summary is given below :—

On the basis of overall figures, India appeared to be a creditor by over Rs. 1,300 crores; but after making adjustments for transfers to Pakistan already made and to be made and the deficits in the country's balance of payments during the 21 months subsequent to the date of the census and certain other extraordinary items as well as for the difference between the book value and the market value of liabilities, the excess of assets over liabilities is reduced by Rs. 680 crores. The adjusted international investment position of India thus seems to be one of surplus by about Rs. 664 crores taking into account the inter-governmental debt owed by Pakistan (Rs. 300 crores) and Burma (Rs. 53 crores). In assessing the significance of this figure, the need for maintaining a certain minimum amount of sterling assets as currency reserve must be taken into account. There are further considerations that the income account indicates a debtor position and that there has been a substantial reduction in the foreign assets since the date of the census.

India's foreign liabilities in the official sector amounted to Rs. 648 crores of which Rs. 426 crores were long-term, *i.e.*, maturing beyond June 1949 and Rs. 222 crores short-term. The liabilities of the non-official sector were composed of Rs. 144 crores by way of 'portfolio' obligations and Rs. 254 crores as 'direct' obligations. The total number of companies, shares of which were owned abroad and for which information was made available was about 2,300. There were 210 companies with a total invested capital of Rs. 44 crores, the value of the shares of the controlling interests amounting to about Rs. 28 crores and forming 68 per cent. of the total. Out of this, the United Kingdom accounted for Rs. 21.87 crores. The next group consisted of 150 companies with total capital resources of Rs. 47 crores of which about 95 per cent. was owned by foreign organisations. Here again, the United Kingdom accounted for 69.7 per cent. In the category of direct investments, the number of companies under the management of foreign controlled 'managing agency and companies' was 334. Of the total value of shares in these companies, the part owned by the managing agents amounted only to Rs. 13 crores or 14.6 per cent. Of this almost the entire control was shared between the United Kingdom (86.6 per cent.) and Malaya (13.1 per cent.). Controlled Indian companies numbered 32 with total capital resources of Rs. 6 crores of which the share of the controlling companies worked out to Rs. 1.59 crores.

Thus of the total value of ordinary shares of all the Indian joint stock companies amounting to Rs. 156 crores, the value of the foreign-held portion of the capital conferring control worked out to Rs. 85 crores or 54 per cent. composed of manufacturing groups (Rs. 22.96 crores), trading (Rs. 19.39 crores) and miscellaneous (Rs. 17.47 crores). Financial companies consisted mainly of investment companies and accounted for Rs. 13.86 crores.

Of the total foreign business investments in India amounting to Rs. 320.42 crores, Britain's share was Rs. 230 crores representing 72 per cent. of the total. Tea plantations accounted for Rs. 52 crores of which 80 per cent. was direct. Foreign resources in companies trading in mineral oils and engaged in the distribution of electricity stood at Rs. 22.57 crores and Rs. 19.35 crores respectively. Concerns specialising in investments with foreign-held obligations at Rs. 16.4 crores occupied the fourth place in order of importance, followed by the jute and cotton manufacturing companies, with a total foreign investment of Rs. 15.74 crores and Rs. 11.70 crores respectively.

The compilation of accurate information on India's investments abroad is rendered difficult by certain features relating to the ownership of those investments. Besides, the valuation of the properties left by migrant owners in Pakistan and Muslim evacuees in India have been left out. The valuation figures of real property in Malaya may also be over-estimated. After making allowance for certain other factors, the following picture is available :—

COINAGE

THE history of coinage in modern times dates back to August 29, 1757 when the first Indian Rupee was struck in Calcutta consequent upon the treaty of the East India Company with Nawab Siraj-ud-Daula who allowed the company the rights to establish a mint in this country. The coins produced were crude specimens struck between dies with a hammer and were really counterfeits of the Mughal coins then in circulation. The Act of 1818, however, marked the beginning of the Indian coinage system when the silver rupee of 180 grains troy 11/12ths fine was made unlimited legal tender by the East India Company for South India where gold coins had been in circulation. The foundation of a proper mint in the modern sense was laid six years later.

Since 1914 India has been undertaking orders for the coinage of foreign countries. Australia, Bhutan, Ceylon, Egypt, Pakistan, Saudi Arabia and Straits Settlements have already received coins minted at Calcutta. Portuguese India and British East Africa have also occasionally placed orders. A new phase was entered in 1952 by the opening of the new Government of India mint at Alipore, Calcutta which is capable of accepting large orders from abroad.

On August 15, 1950, a new series of coins was issued comprising the denominations of one rupee, half rupee, quarter rupee, two annas, one anna, half anna and single pice, with the Republic's distinct design of the Asoka emblem. The existing coins, which are gradually being withdrawn from circulation continue to be legal tender. The weight, shape and composition of the new coins, excepting the single pice, are identical with the existing coins, while an entirely new single pice coin minted in bronze and of the standard weight of 60 grains (reduced to 45 grains in February 1951) was introduced to replace the "washer" type coin.

The efforts started in 1906 to avoid the wasteful use of metal of a high value like silver for coinage achieved their objective in 1947 when the Indian Coinage Act was amended further in order to authorise the Government to issue all coins including the rupee in any metal.

Of late, silver has given way to base metals such as copper, nickel, and zinc chiefly for economic reasons such as (*a*) the supply and cost, (*b*) the ease with which the alloy can be processed, (*c*) the wearing properties of the alloy, (*d*) its appearance and resistance to discolouration and (*e*) its security against counterfeiting. The use of pure nickel is a recent innovation to this country.

SILVER

Mintage of silver rupees was undertaken in this country in 1835. It continued till June 26, 1893 when the Indian Coinage Act of 1870 was amended with a view to closing the mints for the unrestricted coinage of silver for the public. For four years, no Government rupees were coined with the object of attaching higher value to it as coin than bullion; but recoinage was again undertaken in 1897 and 1898 following the conclusion of arrangements with Bhopal and Kashmir for replacing the State currency by Government rupees. In 1899 there was again no coinage of rupees; but the need for it in the following year resulted in resuming its mintage which continued almost uninterruptedly till 1922 when it was suspended. The Currency Act of 1927 made the silver rupee and the silver half-rupee legal tender without limit, but open to issue at the will of Government.

In 1940 the then Government of India decided, as a measure of conserving silver resources, to adopt the fineness of one-half silver and one-half alloy for all three coins. Incorporated in the new rupee was a new security edge device consisting of the insertion of a shallow re-entrant in the centre of the milled edge which was considered to be a virtually absolute safeguard against counterfeiting.

All Victoria and King Edward VII rupee and half rupee coins of the old fineness were withdrawn with effect from April 1, 1941 and May 31, 1942, respectively and King George V and King George VI standard silver rupees were called back with effect from May 1, 1943. These announcements marked the end of the policy which originated over 50 years ago of converting the rupee which had previously been a full value silver coin into a token.

Under the Indian Coinage Amendment Act, 1918, silver two anna pieces are no longer coined and issued, but coins previously issued continue to be legal tender.

In April 1947, the Government of India enacted the Indian Coinage (Amendment) Act, 1947. Under the authority thus taken, the Government issued on May 24, 1947, two notifications, authorising the minting of rupee coin of pure nickel and prescribing its (standard) weight, dimensions, design, etc. The new coins, which were first issued from the Reserve Bank on June 2, 1947, were similar in design to the pure nickel half and quarter rupees, bearing on the obverse the King's effigy with the words, "George VI King Emperor", and on the reverse a tiger, the word "India", the year of issue and the denomination in English, Urdu, and Devanagari scripts. The issue of quaternary (silver) rupee coin was discontinued from the end of May, 1946 when the reform for the introduction of the nickel rupee was launched.

The total rupees minted in India since 1835 to the end of 1950 number 778,10,91,130. The details are given below :—

William IV Standard ..	16,39,78,572
Victoria Standard ..	352,13,80,138
Edward VII ,, ..	98,28,53,552
George V ,, ..	180,74,83,517
George VI ,, ..	98,02,178
George VI Quaternary ..	106,74,92,173
George VI Nickel ..	21,42,01,000
Asok Pillar ,, ..	1,39,00,000

On March 11, 1940, Section 5 of the Indian Coinage Act of 1906 was modified by an Amending Act. The amendment reduced the silver content of the four-anna coin from 11/12 or 41¼ grains of fine silver to 50 per cent. or 22½ grains. This brought the silver four anna coin into line with the British subsidiary coinage. With a view to preventing counterfeiting, the Government of India directed on July 15, 1943, that the quarter-rupee coin minted during and after August 1943 should have the same security edge as quaternary rupees and half rupees.

In 1941-42, the design of the half-rupee coin of 1941 and after was altered so as to make it conform to that of the quaternary rupee coin. The minting of the quaternary half and quarter rupee silver coins was, however, suspended by a notification in May 1946 in order to enable the Government to discharge the obligation to return in kind, within five years of the end of the war, the 226 million ounces of silver borrowed from the U. S. Government between 1943 and 1945.

NICKEL

The Act of 1906 also provided for the coinage of a nickel coin. It was directed that the nickel one-anna piece should thenceforth be coined at the Mint and issued. The notification also prescribed the design of the coin, which has a waved edge with twelve scollops, the greatest diameter of the coin being 21 millimetres and least diameter 19.8 millimetres. The advisability of issuing a half-anna nickel coin was considered by the Government of India in 1909 but after consultation with Local Governments it was decided not to take action in this direction until the people had become thoroughly familiar with the present one-anna coin. The two-anna nickel coin was introduced in 1917-18; and the four-anna and eight-anna nickel coins in 1919. The eight-anna nickel was withdrawn from circulation in 1924 but is still being received at Issue Offices only.

On account of the war, the demand for small coin greatly increased and in January 1942 the Government of India issued a new half-anna coin which economized metal and was convenient to the public. Further with a view to economising the use of nickel, it was decided to mint new half-anna pieces and the one-anna coin and the later two-anna coin in a nickel-brass alloy instead of the cupro-nickel alloy. The notification of January 24, 1942, provided for the mintage of the new half-anna coin of a square shape and equal to three-fourths the weight of one-anna piece. According to this notification, the half-anna and one-anna pieces were minted in nickel-brass composed of 79 per cent. copper, 20 per cent. zinc and 1 per cent. nickel. A similar change in the metallic contents of the two-anna piece was announced on March 21, 1942.

Towards the end of November 1945, the Government of India decided that further requirements of two-anna and one-anna pieces should be minted in the cupro-nickel alloy instead of nickel-brass alloy which had been adopted as a wartime expedient and later found unsatisfactory.

In May 1946 the Central Government authorised the minting and issue of half and quarter rupee coins in pure nickel owing to "inadequate supplies of silver in the open market and the prevailing high prices in India." These new coins were exactly the same size and weight as the early silver coins with designs usually adopted for decimal coins of 50 cents and 25 cents respectively. The new coins have no security edge and have been designed with the margin lettering and head of the King on one side and the name of the country, the denomination in three languages, English, Devanagari and Urdu, with the figure of an Indian tiger on the reverse.

Eight-anna cupro-nickel coins were withdrawn with effect from October 1, 1924 and are now received at the Issue Offices only.

COPPER AND BRONZE

Copper coinage was introduced into the Bengal Presidency (now East and West Bengal) by Act XVII of 1835 and into the Madras and Bombay Presidencies by Act XXII of 1844. The weight of the copper coins struck under Act XXIII of 1870 remained the same as it was in 1835. It was as follows :—

	Grains troy.
Double pice or half-anna	200
Pice or quarter-anna	100
Half-pice or one-eighth of an anna ..	50
Pie being one-third of a pice or one-twelfth of an anna	33⅓

The weight and dimensions of bronze coins were as follows :—

	Standard weight in grains troy.	Diameter in millimetres.
Pice	75	25·4
Half-pice	37½	21·15
Pie	25	17·45

Since 1924 double pice coin has been and is being withdrawn from circulation but it is still received at Treasuries and Issue Offices.

The Finance Department notification, dated February 23, 1943, provided for the mintage of the new pice with a smaller diameter and a circular hole in the centre, reduced in weight from 75 grains to 35 grains and with a metallic composition of 97 per cent. copper, 2½ per cent. zinc and one-half per cent. tin instead of the former fineness of 95½ per cent. copper, 3 per

The White Paper on the Budget narrates the story for 1951. Although the final figures for that year are not available, it observes, it is certain that there will be a substantial deficit. An indication of the size of this deficit is given by the reduction of the sterling balances held by the Reserve Bank which show a drop of Rs. 53 crores for the year as a whole. This deficit was due to two main causes, namely a fall in exports and an increase in the volume of imports as well as a rise in their prices. Although, owing to a rise in overseas prices, the country's foreign exchange earnings in 1951 were higher than in the previous year, this was more than offset by the heavier payments for the imports. There was also some deterioration in the dollar position during 1951. Against a contribution of $71 million in 1950, there may be a net withdrawal of $14 million from the Central Reserves in 1951.

A loan of $62.5 million has already been obtained from the World Bank for certain railway, agricultural and thermal schemes. The final figure of this loan is expected to be $59.8 million of which $45 million have been drawn. Repayment of the railway loan commenced in 1950 while that of the loan for agricultural schemes will start in June 1952. During 1951 the Government of India were also greatly assisted by the loan of $190 million from the U.S. Government for buying two million tons of food. This loan carries interest at 2½ per cent per annum and is repayable in semi-annual instalments over a period of 30 years commencing in June 1957.

A forecast of the balance of payments position during 1952 can at best be only a conjecture. Such data as are non-available do not, however, give any hope of an appreciable improvement in the position.

BRETTONWOODS ORGANISATIONS

The history of the Brettonwoods Organisations, the International Monetary Fund and the International Bank for Reconstruction and Development, has been given in the previous editions.

The deficit of the rest of the world with the United States in 1947 had reached a post-war peak of $11.3 billion. In the following year it fell to $6.3 billion; and in the last quarter of 1948 the gold and dollar assets of the rest of the world increased by $192 million for the first time in the post-war period. In the first quarter of 1949 there was a further rise of $28 million in the reserves. The second quarter of 1949, however, witnessed a drastic reversal, the reserves declining by $ 330 million and the loss of dollars from the reserves continued in the third quarter in spite of a drastic fall in imports of goods and services from the U. S.

The widespread devaluation of currencies that took place in September 1949 was the most far-reaching in any comparable period in recent times. Thirteen members agreed to new par values with the Fund, most of them involving a devaluation of approximately 30.5 per cent. in relation to the U. S. dollar. Six member countries with which the Fund had no agreed par value also depreciated their exchange rates, and similar action was taken by ten other countries that are not members of the Fund. The countries that devalued their currencies in September accounted for approximately 65 per cent. of total world trade as measured by world imports in 1948.

Par Values

On 18th December, 1946, the schedule of par values of the currencies of member countries was announced by the Fund. On September 20, 1949 this was revised by a large number of countries following devaluation of sterling in terms of the U.S. dollar. The following table gives par values of the more important currencies in terms of U.S. cents before September 1, 1949 and on December 31, 1949:—

	Pre-September 1949.	Dec. 1, 1951.
Australian pound	322·400	224·000
Belgian franc	2·281 67	2·000 00
Brazilian cruzeiro	5·405 41	5·405 41
Canadian dollar	100·000	Free Rate
Chile's peso	3·225 81	3·225 81
Cuban peso	100·000	100·000
Czechoslovakia's koruna	2·000 00	2·000 00
Denmark's krone	20·83 76	14·477 8
Egyptian pound	413·300	287·156
Ethiopian dollar	40·250 0	40·250 0
Finnish markka	Not established.	0·434 783
French franc	Since January 26, 1948 no agreed par value.	
Indian rupee	30·225 0	21·000 0
Iranian rial	3·100 78	3·100 78
Iraqi dinar	403·000	280·000
Italian lira	Par value not yet established.	
Lebanon's pound	45·631 3	45·631 3
Luxembourg's franc	2·281 67	2·0000 0
Mexican peso	20·597 3	11·560 7
Dutch guilder	37·6953	26·315 8
Norwegian krone	20·150 0	14·000 0
British pound	403·000	280·000
Pakistani rupee	Not Fixed	30·225 0

India was called upon to pay to the Fund its subscription of $400 million by 1st March, 1947. This had to be paid partly in the form of gold and partly in the form of rupees. Under the rules of the Fund, the gold subscription had either to be 25 per cent. of a country's quota or 10 per cent. of its net official holdings of gold and U.S. dollars whichever was less. As 10 per cent. of India's gold and dollar holdings was the lower figure, gold of this value was transferred to the Fund. Of the rupee subscriptions, a certain amount was credited to the Fund's account in the books of the Reserve Bank and the balance was paid in the form of non-negotiable non-interest-bearing promissory notes convertible on demand into rupees by crediting the par value to the account of the Fund.

The balance due on account of 2 per cent. of India's subscription amounting to $8,000,000 of which $40,000, was paid on 27th December, 1945, was paid in U.S. dollars on 12th August, 1946. In 1947 India paid $60,000,000 to the Bank (15 per cent. of its capital subscription), of which $52,000,000 were paid in Indian currency. A further sum of Rs. 79 crores was handed over to the two organisations in the form of non-negotiable non-interest-bearing securities in payment of the additional sum due to them following the devaluation of the rupee.

I.M.F.'s REPORT

The annual report of the International Monetary Fund for the year ended April 30, 1951 points out that 1950 was the first post-war year to show more progress towards general balance of payments equilibrium. Most European countries showed improvement in their payments position with the rest of the world and particularly with the U.S. The dollar deficit of the members of the O.E.E.C. which was $7.5 billion in 1947 was reduced to an annual rate of $2.0 billion in the first half of 1950. These improvements were made possible by increased output accompanied by decrease of inflationary pressures. Other factors were the policy of trade liberalisation of the O.E.E.C. and the facilities for intra-European credit and for currency transferability afforded by the European Payments Union. The payments position of the Latin-American countries also improved, their overall surplus in 1950 being $300 million as against a deficit of $500 million in 1947. Canada's surplus with non-U.S. countries of about C$800 million in 1949 nearly disappeared in 1950. In the Far East the majority of countries improved their payments position.

After stating that the devaluation played an important role in reversing the outflow of capital from Europe, the report says that the gold holdings of the U.S. dropped from $24.7 billion in September 1949 to $21.9 billion in March 1951, while the dollar holdings of other countries rose by $1.0 billion during the period. Taking into account the additions of newly-mined gold to reserves, the gold and dollar reserves of countries other than the U.S. increased by about $5 billion in the 18-month period and the share of the U.S. in the world's total monetary stock of gold (outside the U.S.S.R.), fell from nearly 70 per cent. in 1948 to about 60 per cent. in March 1951. The larger increases in gold and

dollar holdings in 1950 were in the sterling area as a whole and in Canada. There was a decline of nearly £300 million in the sterling holdings of countries outside the sterling area between 1946 and 1950, while those of sterling area countries increased by roughly the same amount.

After stating that the general structure of par values established in September 1949 has been maintained through an initial testing period of nine months followed by more than a year of drastic changes in trade resulting from accelerated rearmament, the report points out that "the great majority of countries do not have strong and persistently favourable balance of payments maintained without the help of restrictions." During the year under review, the fund agreed to adjustments in established par values with Ecuador and Paraguay and to an initial par value for Pakistan. An initial par value for the Finnish Markka was established on June 28, 1951. On September 30, 1950 the Government of Canada suspended its fixed rate of exchange and floated the dollar. The report also discusses the noticeable progress in relaxing exchange restrictions and increasing imports made in 1950-51.

Gold Policy.—In the articles of agreement of the I.M.F. gold has an important place, and the par values of member currencies are fixed in terms of either gold or the U.S. dollar of the weight and fineness in effect on July 1, 1944 (*i.e.*, $35 per fine oz.). The rates at which members should deal in gold are laid down in article IV, section 2 which reads as follows:—

> "The Fund shall prescribe a margin above and below par value for transactions in gold by members and no member shall buy gold at a price above par value plus the prescribed margin or sell gold at a price below par value minus the prescribed margin."

The margin prescribed by the Fund is one-fourth of 1 per cent.

Although most of the world's important gold-producers excluding Russia are members of the Fund, several very important gold-consuming countries, particularly the Middle Eastern countries, are not members of the Fund. Mainly because of their demand for gold at premium prices and the anxiety of the gold-producing countries to realise a higher price for gold, free markets in gold developed all over the world. On September 7, 1948, South Africa submitted to the Fund a proposal to export for dollars a considerable amount of semi-processed gold at a price above $35 per fine oz. Early in 1949, the Fund approved the proposal provided certain methods are adopted to ensure that it was sold to meet the needs of genuine manufacturers. Since then other gold-producing countries have joined South Africa in the agitation for raising the official price for gold or, alternately, to allow them to sell gold in the free market.

Throughout 1948 and 1949, the premium markets continued to expand but the Fund resisted the South African demand for relaxing the Fund's directives. Meantime, several other countries consulted the fund about a change in their subsidy schemes. In 1950 despite the Fund's opposition more than half the world production of gold went into monetary reserves. On September 28, 1951, the executive board of the fund passed a new resolution on Board's policy in which it emphasised the continued need for a sound gold and exchange policy and added: "the Fund's continuous study of the situation in gold producing and consuming countries shows that their positions vary so widely as to make it impracticable to expect all members to take uniform measures in order to achieve the objective of the premium gold statement of 1947." While, therefore, reaffirming its belief in the economic principles, stated the resolution, "the Fund leaves to its members the practical operating decisions involved in their implementation subject to the provisions of article IV, section 2 and other relevant articles of the agreement of the I.M.F."

Recent Developments.—By September 1951, the boom following the Korean war flattened and external disequilibrium cropped up in many countries led by the sterling area under the pressure of rearmament drive. The United Kingdom was the first country to reimpose import restrictions to defend the pound sterling. The whole of the sterling area fell in line with the British lead and France had also to follow suit because of the aggravation of domestic inflation.

As a result of a series of discussions the Executive Board of the I.M.F. decided on March 3, 1952 that a policy aimed at limiting the operations of the Fund should be ended. The declaration has been kept a secret but the document suggests, according to reports, that applications for drawings of dollars and gold by membernations be considered more realistically on the basis of the borrowing country's ability to repay. The new policy does not require the borrower to re-purchase its gold or dollar drawing in three to five years. This means that a member country having deposited 25 per cent. of its quota in gold or dollars can withdraw it with the minimum of difficulties. As for those countries with lesser quota paid in gold or dollar an opportunity to borrow up to 25 per cent. in gold or dollar is now provided.

Under article 5, section 8 (c) of its Articles of Agreement, the Fund levies charges on the excess of its holdings of the currency of the purchasing member over its quota. In addition a member buying the currency of another member from the Fund has to pay a Service charge of ¾ per cent. The Executive Board of the Fund approved on November 19, 1951 a new Schedule of charges for such transactions with its members to be effective from December 1, 1951. Since these will apply to future transactions, the Fund's excess holdings of Indian rupee remain unaffected. The changes bring down the Service charges from ¾ per cent. to ½ per cent. thereby providing more favourable terms for short term use of the Fund's resources, but its value as a source of long-term loans has definitely decreased as a result of the raise.

WORLD BANK

The sixth annual report of the International Bank for Reconstruction and development for the year ended June 30, 1951 states that the Bank made twenty-one loans totalling the equivalent of $297.1 million for developmental projects in eleven countries. The forty-eight loans made by the bank since its inception totalled $1,114 million; of this, $691.7 million have been disbursed and $17 million have been cancelled at the request of the borrowers.

In earlier years the bank's lending operations were almost exclusively confined to loans in U.S. dollars. During the past year, the direct and indirect dollar earnings of many countries have improved and the bank has obtained currencies other than U.S. dollars both through releases of 18 per cent. funds and through borrowing operations. The currencies thus made available include mainly Canadian dollars and European currencies.

Out of an aggregate advance of $1,114 million, loans made to four European countries for reconstruction purposes before the advent of the E.R.P. composed slightly less than half of this total or $497 million. Out of the balance, $271 million are for electric power, $149 million for transport and communications, $92 million for agriculture and forestry, $67 million for industry and $21 million for local financial institutions. Virtually all the latter loans have been granted to less developed countries.

During the five years of the bank's operations, a total equivalent to $26.2 million in non-dollar 18 per cent. funds has been released. In addition, many other member countries have expressed a willingness to consider releases of 18 per cent. funds at such time as borrowing countries need goods which can be purchased with such funds. There was evidence of a broadening of the market for the bank securities in the U.S. On February 28, 1951, the Bank offered in the United States a new issue of $50 million 3 per cent. bonds repayable in 1976. The Bank concluded its first financing with member nations other than the U.S. when it sold an issue of £5 million 3½ per cent. stock, 1976-81, to a London Syndicate and the reception of the issue was highly favourable. At the close of the fiscal

cent. tin, and 2½ per cent. zinc. The notification also provided for the discontinuance of the coinage of half-pice and pie pieces. The new pice was issued from the Bombay office of the Reserve Bank on February 1, 1943.

GOLD

Since 1870 there has been no coinage of double mohurs in India and the last coinage of single mohurs suspended as from 1891-92 was undertaken for a short period in 1918 only. The Currency Act of 1927 provided that "gold coins whether coined at His Majesty's Royal Mint or at any Mint established in pursuance of a proclamation of His Majesty's Royal Mint, shall not be legal tender in British India but such coins shall be received at any Government Currency Office.....at the rate of 8,47,512 grains troy of fine gold per rupee."

DECIMALISATION

With a view to simplifying accounting and facilitating calculations the Government of India had under consideration the introduction of a decimal system of coinage in India. The occasion, calling for a huge recoinage programme necessitated by the unpopularity of the nickel brass coin introduced in 1942 as a wartime measure, was considered to be most opportune for the proposed reform. The proposals under this system were that the rupee would remain unaltered and the half-rupee and the quarter-rupee, while retaining their present shape, size and weight, would be issued as 50 cents and 25 cents coins. The existing lower denominations of small coin would, however, be discarded and, instead, cupro-nickel coins of 10 cents, 5 cents and 2 cents and bronze coins of 1 cent and, if necessary ½ cent would be issued. A bill incorporating the above changes was introduced in the Central Legislative Assembly on the 18th February 1946 and circularised to elicit public opinion. The matter was, however, allowed to rest due to the great changes which followed in August 1947.

COINS IN CIRCULATION (END OF MARCH 1951).

BANKING

MODERN banking in India owes its origin to the British agency houses operating in Bombay and Calcutta in the eighteenth century. The banks in those days were connected with the introduction of their notes. The crisis that overtook the agency houses in the first half of nineteenth century had an adverse effect on this type of banking. Broadly, the history of Indian banking may be divided into three sections, one connected with the influence of the Presidency Banks, second following the establishment of the Imperial Bank of India in 1921, and third under the guidance of the Reserve Bank of India.

The Indian banking system embraces the Imperial Bank of India, exchange banks, joint-stock commercial banks registered in India and co-operative banks with the Reserve Bank of India as its friend, guide and philosopher. The following table gives its position at the end of 1950 :—

Liabilities and Assets of Banking Companies at the end of 1950.

(In crores of rupees.)

Liabilities—	1,044
Paid-up Capital	40
Reserves	27
Demand Deposits	581
Time Deposits	303
Total Deposits	884
Due to other banks	22
Other Liabilities	71
Assets—	1,025
Cash in hand and balances with the Reserve Bank	107
Percentage to Deposits ..	12·1
Balances with other banks ..	20
Investments in Government Securities	367
Other Investments	26
Total Investments	393
Percentage to Deposits ..	44·5
Loans, Overdrafts, etc. (*a*) ..	444
Due from Banks (*b*)	18
Percentage of (*a*) & (*b*) to Deposits	52·3
Fixed Assets	11
Capital Expenses	2
Other Tangible Assets	30
No. of reporting banks	430

The history of the Presidency Banks again falls into three well-defined stages. The Bank of Bengal was started in 1806, and it took 34 years more before the Bank of Bombay came into existence. The Bank of Madras however came only three years later in 1843. Prior to 1862, these Banks had the right of note issue and their main activity was to facilitate the borrowing operations of the East India Company and the financing of the trade of British merchants. Naturally, they were subject to Government control and their business was restricted by the terms of their charter.

In 1862, these banks were deprived of the right of note issue and were authorised to transact paper currency business as agents of Government. As compensation for the loss of their right of issue, they were given use of the Government balances and the management of the treasury work in the cities and towns where they had their branches. Four years later, however, they were deprived of the paper currency business and by the Act of 1876 severe restrictions were imposed on their business. This system continued till 1920 when the Presidency Banks were merged into the Imperial Bank of India.

IMPERIAL BANK

Under the Imperial Bank of India Act of 1920, as amended by the Amendment Act of 1934, the control of the Bank is entrusted to a Central Board of Directors with Local Boards at Calcutta, Bombay and Madras and such other places as the Central Board may determine. A more detailed reference to the salient provisions in the Act will be found in the earlier editions of the Year Book; but it may be mentioned here that under the agreement with the Reserve Bank of India, the Imperial Bank continues to be the sole agent of the Reserve Bank at all places in the Indian Union where there was a branch of the Imperial Bank and no branch of the Banking Department of the Reserve Bank of India before 1934.

The Imperial Bank has at present over 194 branches and over 200 sub-offices in India and Pakistan and is also the sole agent of the State Bank of Pakistan at places where the latter has no office.

RESERVE BANK OF INDIA

The idea of a central banking institution for the Indian sub-continent was mooted as early as in 1836 and was the subject of discussion and controversies for over seven decades. The White Paper on Indian reforms carried the matter a step further when it laid it down as a condition that before responsibility in respect of finance was introduced at the centre a Reserve Bank free from political influence should be set up.

The Reserve Bank of India Act was passed by the Legislative Assembly and received the assent of the Governor-General on 6th March 1934 and the Bank began to function on 1st April 1935. From this date, the Reserve Bank took over the management of the Currency Department of the Government of India by the creation of a special department known as the Issue Department. The assets of the Gold Standard Reserve were transferred to the Bank and were combined with the assets of the Currency Department. On July 1st the Banking Department was opened and the scheduled banks deposited the required percentage of their demand and time liabilities. The Clearing House was transferred from the Imperial Bank to the Reserve Bank as from this date.

Prior to its nationalisation as from January 1, 1949, the share capital of the Reserve Bank was 5 crores of Rupees in shares of Rs. 100 each, fully paid up. The Reserve Fund of Rupees five crores was provided by Government to the Bank in the form of Government Rupee Securities.

The Bank has offices of the Banking Department at Bombay, Calcutta, Delhi, Madras and London. At Kanpur it has a branch.

Management.—The general superintendence and direction of the affairs and business of the Bank is entrusted to a Central Board of Directors which exercises all powers and does all acts and things which may be exercised and done by the Bank. The Board is composed of :—

(*a*) A Governor and two Deputy Governors appointed by the Central Government after consideration of the recommendations made by the Board.

(*b*) Ten Directors nominated by the Central Government.

(*c*) One Government official nominated by the Central Government.

The Governor and Deputy Governors are the executive heads, and hold office for such term not exceeding five years as the Central Government may fix when appointing them, and are eligible for re-appointment. A Local Board is constituted for each of the five areas.

Functions

The Bank is authorised to carry on and transact the following commercial business, *viz.*,—the accepting of money on deposit without interest; the purchase, sale and rediscount of bills of exchange and promissory notes with certain restrictions; the making of loans and advances, repayable on demand but no exceeding 90 days, against the security of stocks, funds and securities (other than immovable property) against gold coin or bullion or documents of title to the same and such bills of exchange and promissory notes as are eligible for purchase or rediscount by the Bank; the purchase from and sale to scheduled Banks of sterling in amounts of not less than the equivalent of Rs. 1 lakh; the making of advances to the Central Government and to State Governments repayable in each case not later than three months from the date of making the advance; the purchase and sale of Government securities of the United Kingdom maturing within ten years from the date of purchase; the purchase and sale of securities of the Government of India or of a State Government of any maturity or of a local authority in India and Pakistan.

The Bank is authorised to act as Agent for the Central Government or any State Government in India, for the purchase and sale of gold and silver; for the purchase, sale, transfer and custody of bills of exchange, securities or shares; for the collection of the proceeds, whether principal, interest or dividends, of any securities or shares; for the remittance of such proceeds by bill of exchange payable either in India or elsewhere, and for the management of public debt.

Bank Notes.—The sole right to issue bank notes in India is vested in the Reserve Bank and at commencement the Bank shall issue currency notes of the Government of India supplied to it by the Central Government and on and from the date of such transfer the Central Government shall not issue any currency notes. The issue of bank notes shall be conducted by the Bank in an Issue Department which shall be separated and kept wholly distinct from the Banking Department.

The Bank shall sell to or buy from any person who makes a demand in that behalf at its office in Bombay, Calcutta, Delhi, Madras or Rangoon, sterling for immediate delivery in London at a rate not lower than 1*sh.* 5 49/64*d.* and not higher than 1*sh.* 6 3/16*d.* respectively; provided that no person shall be entitled to demand to buy or sell an amount of sterling less than ten thousand pounds. In April 1947 the Reserve Bank Act was amended consequent on India's membership of the International Monetary Fund and the fixing of the par value of the rupee. The amended Sections 40 and 41 of the Act now require the Reserve Bank to buy and sell foreign exchange at such rates and on such terms as the Central Government may determine from time to time.

The Bank shall make public from time to time the standard rate at which it is prepared to buy or re-discount bills of exchange or other commercial paper eligible for purchase under the Act.

The Bank will publish the accounts of both the Issue and Banking Departments weekly in the *Gazette of India*.

Every bank included in the Second Schedule shall maintain with the Bank a balance the amount of which shall not at the close of business on any day be less than five per cent. of the demand liabilities and two per cent. of the time liabilities of such bank in India as shown in the return referred to in sub-section (2).

Agricultural Credit Department.—The Bank shall create a special Agricultural Credit Department the functions of which shall be—

(*a*) to maintain an expert staff to study all questions of agricultural credit and be available for consultation by the Central Government [State Governments], provincial co-operative banks, and other banking organisations;

(*b*) to co-ordinate the operations of the Bank in connection with agricultural credit and its relations with provincial co-operative banks, and any other banks or organisations engaged in the business of agricultural credit.

The Bank shall, at the earliest practicable date and in any case within three years from the date on which this Chapter comes into force, make to the Central Government a report, with proposals, if it thinks fit, for legislation, on the following matters, namely:—

(*a*) the extension of the provisions of this Act relating to scheduled banks to persons and firms, not being scheduled banks, engaged in India in the business of banking and

(*b*) the improvement of the machinery for dealing with agricultural finance and methods for effecting a closer connection between agricultural enterprise and the operations of the Bank.

When the Bank is of opinion that the international monetary position has become sufficiently clear and stable to make it possible to determine what will be suitable as a permanent basis for the Indian monetary system and to frame permanent measures for a monetary standard it shall report its views to the Central Government.

The Reserve Bank of India Amendment Act, 1951, which became effective on November 1, 1951 introduces certain changes consequential on the new constitutional set-up as well as others to make good certain deficiencies experienced in the working of the Act. The Act is now extended to cover the whole of the Indian Union except the State of Jammu and Kashmir, removes the restrictions on the amount and maturity of the holdings of Government Securities in the Banking Department, permits the Reserve Bank to transact Government business in Part B States and to act, with the approval of the Central Government, as an agent for Foreign Governments. It also confines the right of the Imperial Bank to be the sole agent of the Reserve Bank to Part A and Part C States. The more important amendments relate to the extension of agricultural finance. Besides extending the period of accommodation to 15 months to finance agricultural operations or the marketing of crops, the Act now authorises the Reserve Bank to accept for purchase, sale and rediscount the signature of a State Co-operative Bank as one of two or more good signatures on bills of exchange and promissory notes.

In the matter of issue of remittances other than demand drafts, and purchase of telegraphic transfers, the sale and purchase by the Reserve Bank have been facilitated. Another important amendment relates to the revision of the form of weekly returns to be filed by banks so as to have a clearer picture of the financial position of banks.

Central Board of Directors

Governor.—Sir Benegal Rama Rau.

Deputy Governors.—N. Sundaresan and Ram Nath.

The following have been appointed as Directors of the Central Board :—

Sir Purshotamdas Thakurdas (Bombay); B. M. Birla (Calcutta); Sir Shri Ram (New Delhi); C. R. Srinivasan (Madras); Sir Rustom P. Masani (Bombay); Sir Manilal B. Nanavati (Bombay); D. N. Sen (Calcutta); Sahu Jagdish Prasad (U. P.); C. S. Ratnasabapathy Mudaliar (Coimbatore); R. M. Deshmukh (Amravati); and K. G Ambegaokar (Government Official).

The first four Directors have been appointed under clause (*b*) and the next six, under clause (*c*) of sub-section one of section 8, of the Reserve Bank Act, 1934, as amended by the Reserve Bank (Transfer to Public Ownership) Act, 1948.

Agreement between the Reserve Bank and the Imperial Bank.—The Imperial Bank of India is the sole agent of the Reserve Bank of India for Government Treasury business in Part A and C States where it has a branch and the Reserve Bank of India has no branch of the Banking Department. The remuneration payable by the Reserve Bank to the Imperial Bank in consideration of the performance of this function is governed by an Agreement between them made on April 5, 1935. It provides that during the first ten years the commission payable was to be calculated at 1/16th of one per cent. on the first Rs. 250 crores and 1/32nd of one per cent. on the remainder of the total of the receipts and disbursements dealt with annually on Government account by the Imperial Bank on behalf of the Reserve Bank.

The original agreement further provided that at the close of the said ten years, the remuneration payable was to be revised and it was to be determined at the end of each period of five years on the basis of the actual cost to the Imperial Bank of performing the functions as ascertained by expert accounting investigation. Accordingly, on May 2, 1945 a new agreement was effected for the quinquennium April 1, 1945 to March 31, 1950. The agreement was again revised on October 18, 1951 for the quinquennium ending March 31, 1955. The terms of remuneration effective for the above two periods are set out below :—

April 1, 1945–March 31, 1950.	April 1, 1950–March 31, 1951.
On the first 150 crores at 1/16th of one per cent.	On the first 150 crores at 1/16th of one per cent.
On the next 150 crores at 1/32nd of one per cent.	On the next 300 crores at 1/32nd of one per cent.
On the next 300 crores at 1/64th of one per cent.	....
On the remainder at 1/128th of one per cent.	On the remainder at 1/64th of one per cent. subject to the turnover in excess of Rs. 1,200 crores being paid at 1/128th of one per cent.

Report for 1950-51.—The report of the Central Board of Directors of the Reserve Bank of India for the year ended June 30, 1951 stated that the Bank's income for the year was Rs. 11.40 crores and the net profit Rs. 8.34 crores as against Rs. 9.91 crores in the preceding year. The fall in the net profit was mainly due to the heavy depreciation of securities in the Bank's investment account partially offset by higher earnings under 'discount' and exchange.

The Department of Banking Development was created in October 1950 mainly with the object of giving concentrated attention to the expansion of banking facilities to semi-urban areas and to the problems of rural finance. The Central Board approved proposals for an extension of remittance facilities at reduced rates, for the provision of better facilities for exchange of notes and coin, for the removal of impediments in the way of the expansion of commercial banks in rural areas, for the improvement of the machinery of rural finance and for the development of warehousing.

The primary function of the Department of Banking Operations is the supervision of the Indian banking system. For the adequate discharge of the important functions and the exercise of the comprehensive powers of supervision and control, an effective organisation for the periodical and systematic inspection of all banks is essential. It then refers to the amalgamation of the banking business of the Bharat Bank with the Punjab National and of four scheduled banks in West Bengal and says that the Reserve Bank has, however, no statutory power to direct banks to amalgamate.

EXCHANGE BANKS

The banks carrying on exchange business in India are merely branch agencies of banks having their head offices in London, on the Continent, in the Far East or the U. S. A. Originally their business was confined almost exclusively to the financing of the external trade of India; but in recent years, most of them, while continuing to play their main role, have also taken an active part in the financing of internal trade. Before the Great War, these banks used to do their business in India with money borrowed elsewhere; but the development of the money market in this country in the past three decades has enabled them to depend on internal deposits. Their investments consist to a great extent of the purchase of bills drawn against imports and exports to and from India.

The financing of the import trade originated and is carried through however for the most part by branches outside India, the Indian Branches' share in the business consisting principally in collecting the amount of the bills at maturity and in furnishing their other branches with information as to the means and standing of the drawees of the bills, and it is as regards the export business that the Indian branches are more immediately concerned. The Exchange Banks have practically a monopoly of the export finance in India and in view of the dimensions of the trade which has to be dealt with the Banks would under ordinary circumstances require to utilise a very large proportion of their resources in carrying through the business. They are able, however, by a system of rediscount in London to limit the employment of their own resources to a comparatively small figure in relation to the business they actually put through.

The bills against exports are largely drawn at three months' sight and may either be "clean" or be accompanied by the documents relating to the goods in respect of which they are drawn. Most of them are drawn on well-known firms at home or against credits opened by Banks or financial houses in England and bearing as they do an Exchange Bank endorsement they are readily taken up by the discount houses and Banks in London. Any bills purchased in India are sent home by the first possible mail so that presuming they are rediscounted as soon as they reach London the Exchange Banks are able to secure the return of their money in about 16 or 17 days instead of having to wait for three months which would be the case if they were unable to rediscount. It must not be assumed however that all bills are rediscounted as soon as they reach London as at times it suits the Banks to hold up the bills in anticipation of a fall in the London discount rate while on occasions also the Banks prefer to hold the bills on their own account as an investment until maturity.

The Banks place their funds in India and Pakistan for the purpose of purchasing export bills in a variety of ways of which the following are the principal:—

(1) Proceeds of import bills as they mature.

(2) Sale of drafts and telegraphic transfers payable in London and elsewhere out of India or Pakistan.

(3) Purchase of Council Bills and Telegraphic Transfers payable in India from the Secretary of State.

(4) Imports of bar gold and silver, bullion.

(5) Imports of sovereigns from London, Egypt or Australia.

Besides the British Exchange Banks, there are a few foreign banks operating in India. The earlier progress of Exchange Banks has been tabulated in the previous editions. The more recent trends are summed up below:—

GROWTH OF BANKING

The credit for giving an impetus to joint stock banking in India goes to the Indian Companies Act of 1860 which accepted the principle of limited liability, a factor indispensable to the raising of large amounts of capital. Till 1906 however, there were few banks in the country and their resources being meagre, the sphere of activity was also restricted. The *swadeshi* movement gave an impetus to indigenous banking activity in the country and between 1906 and 1913, the number of banks with capital and reserves in excess of Rs. 5 lakhs doubled and their deposits increased from Rs. 8 crores to Rs. 18 crores. The year 1913, however, was a rude shock when several banks led by the People's Bank of India and the Indian Specie Bank went into liquidation; and though the First World War did give a fresh impetus, and the share of Indian joint stock banks in the aggregate deposits of banks in the country increased from 21 per cent. in 1914 to as much as 32 per cent. in 1920, it is a fact that between 1913 and 1924 as many as 161 banks failed.

In the following seven years the joint stock banks in the country were adversely hit by the world depression; but the economic recovery that followed resulted in increasing the share of deposits of these banks. The increase was mainly achieved at the cost of the Imperial Bank of India and the Exchange Banks. Since then there was a steady development till the outbreak of the Second World War excepting for a minor set-back in 1938 as the result of the closing down of the Travancore National and Quilon Bank, Ltd. The pace of expansion accelerated during the war period and continued till August 1947 when the disturbances completely dislocated the banking system in the affected areas. Nevertheless, commercial banking in India as a whole presented an encouraging picture and even recorded further expansion.

The following statements give details about the position of Indian banking :—

Liabilities and Assets of Indian Joint Stock Banks Relating to Their Business in the Indian Union and Total Business

REVIEW FOR 1951

The year 1951 may be divided into two periods with November 15 as the dividing line, when the Reserve Bank of India raised the Bank rate by half per cent. to 3½ per cent. The way for the decision has, however, been paved much earlier. The call rate amongst the larger scheduled banks, which had been quoted at ½ per cent. since June 9, 1950, spurted upto one per cent. on January 5, 1951 and further to 1¼ per cent. on January 17. Term money rates were also quoted higher, while some banks put up their discount rates, the Imperial Bank of India stepping up its *Hundi* rate, which had remained unchanged at 3½ per cent. since January 18, 1949, to 4 per cent. on January 11. This was followed by the Government of India announcing on January 22 its decision to receive from February 1, 1951 Ten-year Treasury Savings Deposits repayable at par and carrying interest at 3½ per cent. per annum.

The busy season continued till May 11, and recorded the largest absorption of notes for any of the post-war years. Yet the monetary stringency was so heavy that the Imperial Bank of India stepped up its rate for advances against Government Securities for borrowings of Rs. 5 lakhs and more to 3 per cent. on March 14 and that for advances below Rs. 5 lakhs to 3½ per cent. on April 24. After May 11, however, the money market tended to be easy and a fall in the money rates was noted in the middle of July. Also, the fall in note circulation was larger in the current slack season than in any of the post-war years. At the same time the contraction of bank credit was slow accounting for 48 per cent. of the expansion in the busy season as against 90 per cent. a year ago.

It was in this background that the Reserve Bank decided to raise the Bank rate. It was explained that the change was a disinflationary measure. Simultaneously the Reserve Bank announced that during the busy season, 1951-52 it would, save in exceptional cases, refrain from buying Government Securities to meet the requirements of scheduled banks but would make loans and advances at the prevailing Bank rate against securities specified in Section 17(4) (*a*) of the Reserve Bank of India Act.

Immediatey after the rise in the Bank rate the Imperial Bank announced a general increase in its lending rates. Its rate for advances was stepped up from 3½ per cent. to 4 per cent., its *Hundi* rate from 4 per cent. to 4½ per cent. and its call rate for loans to scheduled banks against Government Securities for Rs. 5 lakhs and above and for less than this sum by ½ per cent. to 3 per cent. and 3½ per cent. respectively. Short-term money rates also tended to harden. Apart from the growing needs of crop finance, the demand for funds continued to rise because of heavy imports of U.S. cotton and the Imperial Bank stepped up its call rates by a further ½ per cent. on December 17. This was followed by the Exchange banks and other scheduled banks and thus brought into effective operation the enhanced Bank rate. This tendency became more pronounced in the last week of 1951 and, with the increasing resort by banks to the Reserve Bank for accommodation, the call rate amongst the larger scheduled banks was pushed up further from 2½ per cent. on December 29 to 2½ per cent. on January 4 and further to 2¾ per cent. on January 17. Term money rates were also placed higher at 3 per cent. as against 2½-2¾ per cent. at the close of 1951.

Bill Market.—With a view to relieving seasonal stringency, and as a first step towards building up an organised bill market, the Reserve Bank announced on January 16, 1952 its decision to make, at a concessional rate of 3 per cent. (*i.e.*, ½ per cent. below the Bank rate), advances to scheduled banks against the security of usance bills and notes eligible under Section 17(2) (*a*) of the Reserve Bank of India Act. As a further inducement to banks to help create a bill market the Reserve Bank offered to bear half the cost of the stamp duty incurred in converting demand bills into time bills. The proposed market, however, tries to segregate the one already built up by indigenous bankers.

Banking Progress.—At the end of 1951 there were 95 scheduled banks including 15 Exchange banks as against 98 at the end of 1950. In the year under review two scheduled banks were merged and the third one handed over its banking business to another scheduled bank. The process of weeding out uneconomic branches gained fresh momentum in the year under review and the number of banking offices of scheduled banks fell from 2,825 at the end of 1950 to 2,676 on September 30, 1951. Five leading joint stock banks had 753 offices as against 697 at the end of 1950, those of Exchange banks remained unchanged at 65; but there was a reduction of 10 offices in the case of the Imperial Bank of India at 392, while those of other scheduled banks dropped from 1,682 to 1,466.

The following table gives the consolidated position of scheduled banks :—

	(In crores of rupees) 29-12-1950	28-12-1951

BANKING LAW

Ever since 1913 when the banking crisis in this country stressed the need for separate legislation to govern the working of banks, this problem has been confronting the authorities.

On February 17, 1949 the Indian Parliament passed the Banking Companies Act and brought into effect from March 16. The legislation, called the **Banking Companies Act, 1949, marks the culmination of the long and chequered career of the proposal for a Banking Companies Bill, first mooted in 1939. It attempts to consolidate with certain modifications the relevant provisions concerning banking companies, contained in the Indian Companies Act, 1913, and various *ad hoc* measures taken by issuing ordinances.**

The detailed provisions have appeared in the previous editions. These include (1) definition of a banking company, (2) introduction of the licensing system, (3) minimum requirements regarding paid up capital of a bank incorporated in India, (4) obligation on the part of scheduled banks to keep minimum reserves with the Reserve Bank and submit weekly returns, (5) obligations on the part of non-scheduled banks, (6) compulsory maintenance after March 1951 of 20 per cent. of time and demand liabilities in India in cash, gold or unencumbered approved securities at a price not exceeding the current market value, (7) ban on interlocking directorates, employment of managing agents and making unsecured advances to directors or firms in which the directors are interested, (8) wide powers of supervision, inspection and direction for the Reserve Bank and (9) provision for opening of branches only with the permission of the Reserve Bank.

The Act was amended on March 10, 1950. The changes came into force from March 18, 1950.

The report on the administration of the law throws light on the extent of violations and the measures taken to prevent their occurrence. The Reserve Bank received in 1950 120 applications from 39 banking companies for permission to open new branches or to change the location of the existing ones. Of these as many as 103 were for the opening of new offices in India. 27 applications were rejected. Permission was granted for opening offices in Burma, Indonesia, Japan, Malaya and Nepal in respect of six applications.

During 1950 four banking companies from the Calcutta area, three scheduled and one non-scheduled, applied to the Court for a moratorium. On the Reserve Bank's report, one scheduled bank was ordered to be wound up, another withdrew its application and the remaining two concluded schemes of arrangement. 11 banks, eight of which were from the Madras area, went into voluntary liquidation, while 16 including three scheduled were ordered to be compulsorily wound up by the Court. Of these, six each belonged to the Madras and Calcutta areas.

Rural Finance

The Reserve Bank of India Act enacted in 1934 made it obligatory on the Bank to submit to the Government within three years proposals for the improvement of the machinery for dealing with agricultural finance and for an effective liaison between agricultural enterprise and the operations of the Bank. The report submitted about the end of 1937 pointed out certain fundamental difficulties in regard to agricultural finance and emphasised that the question of agricultural finance is closely linked up with the question of the improvement of agriculture. Before credit can become freely available to the farmer, he must be made creditworthy. The agency most suitable must have an educative as well as a purely business side. The report, therefore, concludes that the agency which satisfies the requisite conditions for agricultural finance is the co-operative society.

Apart from a more liberal use of the provisions of the Act, the Reserve Bank took the initiative in the formulation of a forward policy in regard to rural finance. The Rural Banking Inquiry Committee was appointed to inquire into the question of the extension of banking facilities in semi-urban and rural areas. The main recommendations have appeared in the previous edition.

The Reserve Bank convened a conference in the middle of 1951 to review its role in the sphere of rural finance. As a result, a standing advisory committee has been associated, as an expert body, with the working of the Bank's Agricultural Credit Department. A factual inquiry into the actual conditions prevailing in India in respect of rural finance has been undertaken with a view to formulating a long-term policy. The Reserve Bank of India Act has been amended with a view to making co-operative banks' paper eligible for re-discount and extending the period of accommodation from nine months to 15 months.

Indigenous Bankers

Long before the establishment of joint-stock banking companies in India or Pakistan indigenous bankers or *shroffs* flourished. Even at present they form an important credit agency in the banking system and are the only source of credit in many parts of the sub-continent. The difference between *shroffs* and money-lenders is that while the latter work generally with their own capital, the former use borrowed capital also either in the form of deposits from the public or by drawing and rediscounting *hundies*. A certain number of indigenous *shroffs* work on modern lines and transact all kinds of business which the ordinary joint-stock banks transact, including the issue of pass books and cheque books. They do not, however, publish balance sheets and their management is entirely in the hands of a single proprietor or a firm of proprietors.

No reliable estimates of the capital employed by indigenous bankers are available; but it is recognised that amongst the agencies financing agriculture, internal trade and small industries, they occupy a prominent position. Their operations are not attended with formalities and delay, and the majority of them combine banking with some form of trade and the capital employed in banking is not distinguished from that employed in trade.

In Bombay indigenous bankers on the approved lists of joint-stock banks get advances from these banks upto their respective limits. Banks also make advances against *shroffs' hundies*, the period for which is usually 60 days. In all Provinces, the indigenous bankers get remittance facilities from the Imperial Bank on the same terms as the general public do.

In pursuance of the recommendations of the Central Banking Inquiry Committee for linking indigenous bankers with the country's central banking institution, the Reserve Bank of India, on its formation, opened negotiations; but no agreement materialised since the indigenous bankers felt that the conditions laid down were rather irksome. The question was brought up for discussion again in 1946 when the Central Assembly considered the Banking Bill.

In his inaugural address before the All-India Shroffs' Conference in July 1951 the Governor of the Reserve Bank indicated that the primary responsibility of producing a constructive scheme for the linking of indigenous bankers with the Reserve Bank must rest on them. For this purpose, a change in their traditional outlook and practices was necessary.

The Interest Structure

Recent monetary theory looks on money rates as the basic influence at work in respect of a country's economy. Banks work within the conditions set by interest rates which, in turn, are regulated, under the modern monetary technique, by the central banking institution of a country. In this country, the yield on a non-terminable Government security is generally looked upon as a barometer of long-term interest rates, while the rate of the Imperial Bank on demand loans represents earnings on short-term investments. The Imperial Bank's *hundi* rate is the rate at which the Bank discounts first class trade bills. The call money rate is the rate for surplus money seeking investment and repayable at the option of the borrower or the lender subject to a minimum period of 24 hours. Bazaar Bill rates are the highest rates in the Indian money market and they are the rates charged by *shroffs*.

In the monetary history of the sub-continent the normal relationship between the short-term money rates and the long-term money rates is that the former stands higher than the latter. For three decades in the last century, the excess ranged between one and two per cent.; but since then, the difference has narrowed down and the recent tendency was that the short-term loan rates were actually lower than the long-term interest rates. This is mainly due to the exceptional demand of Government for loans.

Formerly each Presidency Bank fixed its own Bank rate which was not uniform. After the amalgamation of the Presidency Banks the Imperial Bank fixed the rate for the whole of the sub-continent until July 4, 1935 when the right to fix the official Bank rate was exercised by the Reserve Bank every Wednesday. The rate fixed represents the rate charged by the banks on demand loans against Government securities and is the standard rate at which the Reserve Bank is prepared to buy or rediscount bills of exchange or other commercial paper eligible for purchase under the Reserve Bank of India Act. This rate enables the Reserve Bank to have direct contact with short-term rates and the money market and to encourage or discourage scheduled banks to obtain more cash.

With the end of the first phase of the post-war period it became clear that the inflationary pressures were worsening throughout the world while capital was getting scarce. Country after country, therefore, resorted to credit restrictions. Following the aggravation of world-wide inflation after the Korean War the need for monetary discipline became all the more urgent and the United Kingdom followed the lead given by some of the European countries by raising the Bank rate from two per cent. to 2½ per cent. in the first week of November 1951 and to 4 per cent. on March 11, 1952.

Since the beginning of the Indian busy season in October 1948 the money market began to display a hardening tendency though borrowing by Government on the old basis of interest had become difficult much earlier. The tendency hardened in the following two seasons. For the first time in March 1951, the Government of India indicated that the policy of expanding the bank credit by supporting the gilt-edged market had reached the limit and, on November 15, 1951, the Bank rate was raised to 3½ per cent.

Money Rates.—The following is the trend of the short-term money rates in the country since 1938-39 :—

Year.	Bank Rate.	Imperial Bank *Hundi* Rate.		Call Money Bombay.		Bazar Bill Bombay.		Average Treasury Bill Rate.	Annual Deposits.	
		High.	Low.	Highest.	Lowest.	H.	L.		H.	L.
1938-39	3	3	3	2½	½	5½	3	1·63	2	1½
1939-40	3	3½	3	2½	½	6½	5½	1·86	2	1½
1940-41	3	3½	3	1½	½	6½	5½	0·89	2	1½
1941-42	3	3	3	½	½	6½	4½	0·82	2	1½
1942-43	3	3	3	½	½	6½	5	0·87	2	1½
1943-44	3	3	3	½	½	6	4½	0·90	1½	1
1944-45	3	3	3	½	½	5½	4½	0·49	1½	1
1945-46	3	3	3	1	½	5½	5½	0·38	1½	1½
1946-47	3	3	3	¾	½	7½	5½	0·43	1½	1½
1947-48	3	3	3	½	½	7½	7½	0·45	2	1½
1948-49	3	3	3	1	½	8½	7½	0·49	2	1½
1949-50	3	3½	3	1½	½	8½	7½	0·51	2	1½
1950-51	3	4	3½	1¼	½	9	8½	*Nil*	2	1½
1951-52	3 & 3½	..	..	1 1/16	½	..	..	*Nil*	2½–3	1½

Relative Rates.—The relationship between the long-term interest rates as represented by the yield on non-terminable Government loan and the short-term interest rates is established in the following table :—

Year.	Yield on 3½ p.c. Rupee Security.	Average Bank rate.	Excess or Deficit of 2 over 1.
1870 ..	4·3	5·16	+ 0·86
1880 ..	4·3	5·01	+ 0·71
1890 ..	4·0	5·92	+ 2·07
1900 ..	3·64	5·51	+ 1·87
1910 ..	3·72	5·47	+ 1·74
1920 ..	5·9	6·20	+ 0·07
1930 ..	5·1	5·88	+ 0·78
1931 ..	5·5	7·04	+ 1·54
1932 ..	5·7	5·02	— 0·70
1933 ..	4·3	3·56	— 0·74
1934 ..	3·9	3·50	— 0·40
1935 ..	..	3·46	..
1936 ..	3·52	3·00	— 0·52
1937 ..	3·63	3·00	— 0·63
1938 ..	3·55	3·00	— 0·55

Year.	Yield on 3 p.c. Rupee Security.	Average Bank rate.	Excess or Deficit of 2 over 1.
1940-41 ..	3·79	3·0	— 0·79
1941-42 ..	3·69	3·0	— 0·69
1942-43 ..	3·77	3·0	— 0·77
1943-44 ..	3·57	3·0	— 0·57
1944-45 ..	3·33	3·0	— 0·33
1945-46 ..	3·14	3·0	— 0·14
1946-47 ..	2·90	3·0	+ 0·10
1947-48 ..	3·03	3·0	— 0·03
1948-49 ..	3·03	3·0	— 0·03
1949-50 ..	3·07	3·0	— 0·07
1950-51 ..	3·15	3·0	— 0·15
1951-Oct. ..	3·24	3·0	— 0·24
1951-Dec. ..	3·73	3·5	— 0·23

Clearing Houses.—The Principal Clearing Houses in India are those of Calcutta, Bombay and Madras and of these the first two are by far the most important. In 1946-47 Clearing Houses were opened at Alleppey, Rajkot and Gaya and are being managed by the Imperial Bank of India. This brings the total number of Clearing Houses under the management of the Imperial Bank to 19. In Bombay, a Metropolitan Clearing Association was formed and registered in October 1946 to arrange for clearing for non-scheduled banks as the Bombay Bankers' Clearing House decided to restrict its membership and sub-membership only to scheduled banks.

Cheque clearances in the Indian Union declined to Rs. 6,198 crores in 1949-50 from Rs. 6,687 crores in the previous year which was incidentally a record year for cheque clearances. In 1950-51 there was, however, a sharp recovery owing to the broadening of business activity and the rise in prices following the outbreak of the Korean War and the rearmament drive and the total cheque clearances amounted to Rs. 6,577½ crores. Of the increase amounting to Rs. 379½ crores, Bombay alone accounted for Rs. 277¾ crores at Rs. 2,877½ crores. The year 1951-52, however, broke all previous records.

CLEARING HOUSE STATISTICS (In crores of rupees)

Year	Bombay	Calcutta	Delhi	Kanpur	Madras	Other Centres	Total

STOCK EXCHANGE

THE earliest reference to stock broking in India dates back to the end of the 18th century when transactions in Government securities and the shares of the East India Company used to take place in Calcutta under a *neem* tree. Similar references are also available about business in shares in Bombay before 1840. The boom following the American Civil war gave a great impetus to this business.

The Native Share and Stock Brokers' Association of Bombay was formally constituted by an indenture dated December 3, 1887. It has now about 450 members on its roll who carry on business in the Brokers' Hall bought in 1887 from the funds of the Association. Trading is governed by the rules framed by the Governing Board. The value of a broker's card fluctuated according to the volume of business in the market. Prior to 1939 it fluctuated between Rs. 8,000 and Rs. 20,000; in 1946 when business was brisk and the share market was in the best form, the sale of a card fetched Rs. 66,000; and at present it is around Rs. 20,000.

This is the only share market where forward business used to be conducted in an organised way. This business is governed by separate rules approved by the Government of Bombay under powers vested in them by the Bombay Securities Contract Control Act. This legislation was enacted in 1925 in pursuance of the recommendations made by the Stock Exchange Inquiry Committee in 1923, with Sir Wilfrid Atlay as President.

Thirteen years later, the Government of Bombay appointed a Committee, with Mr. W. B. Morison as Chairman, "to examine and report on the organisation and methods of working of the Native Share and Stock Brokers' Association, to consider whether any modifications are desirable in the interests of the investing public and to make recommendations."

The wild orgy of speculation that started in the share markets all over the country in 1943 called for Governmental action. On September 11, 1943, the Government of India issued Rule 94-C under the Defence of India Rules, prohibiting with effect from the 24th of that month all stock exchanges in India from permitting or affording facilities for *badla* transactions or for the making of any contracts other than for ready delivery contracts. In December 1945, this rule expired following the termination of the War and trading in shares was conducted on a ready delivery basis, the account being settled every fortnight. In 1951 the High Court ruled in a suit that any contract, where delivery is specified for a date, is other than a ready delivery contract. Consequently, the Board re-introduced the pre-war pattern of forward trading.

Besides the premier share market in Bombay, occasional attempts were made in the city to have an additional share market. In 1917 the Bombay Stock Exchange Ltd. was registered, but it ceased to function after a brief period. A new stock market was opened in 1938 under the name of the Indian Stock Exchange, Ltd.

Calcutta Association.—The Calcutta Stock Exchange Association was founded at No. 2, New China Bazar Road (now known as 2, Royal Exchange Place), Calcutta, with 150 founder members in 1908. Fifteen years later, it was registered as a limited liability concern. The Association is controlled and managed by a Committee and has a membership of 232 brokers.

The only registered institution in South India of brokers dealing in shares and securities is the Madras Stock Exchange Association, Ltd., registered in 1937.

During the boom period several stock markets were started at other industrial centres. These include Delhi and Kanpur.

The Ahmedabad Stock Exchange is also a registered body and recognised by the Government of Bombay under the Bombay Securities Contract Control Act.

Among the former States Hyderabad has a stock market of its own.

CAPITAL MARKET

Until the beginning of the Second World War the capital market had made a slow but steady progress; but its pace quickly accelerated during the War period when the monetary inflation and the rising trend of industrial profits served as a first class stimulant to its growth which was spectacular. The post-war period has, however, served mainly towards consolidating the early gains. A broad idea of the expansion of the market can be had from the fact that between 1938-39 and 1946-47, the interest-bearing obligations of the Government of India increased by Rs. 1,176 crores, while consent for the issue of capital was granted to the tune of Rs. 640¼ crores from May 17, 1943 to March 31, 1947.

Following the budget proposals for 1947-48, the capital market received a rude shock. The political conditions, the economic malaise, and mismanagement in certain industries led to loss of confidence in investment values and the share markets are now mainly in the hands of professional operators.

Following the partition of the country, the newly constituted Government of India decided to continue the taxation at a high level. They also announced their views on nationalisation of industries and undertook legislation to limit the dividends which curtailed the purchasing power of the investor. On the labour front awards of industrial courts and arbitrators created serious misgivings and wage costs increased while output per worker fell. There were several bank failures also and abuses of company management and floatation of new companies without due regard to sound principles accentuated the situation in the capital market.

There were signs of a return of public confidence in the capital market since September 1949. The flow of savings was, however, still small as a result of the reduced capacity to save on the part of the income groups who, in the past, had been the main support of the investment market and the post-war redistribution of national income in favour of the rural and lower income groups. On Government loan account there was a net outgo of Rs. 20 crores in 1949-50. The respective figures for 1948-49 and 1947-48 being Rs. 42 crores and Rs. 16 crores. The response to private issues in 1949-50 was small and where they were successful, the interest offered was higher.

The improvement in the capital market signs of which were visible in the previous year was maintained during 1950-51. Equity prices maintained the uptrend which had commenced in July 1949 and rose further following the outbreak of the Korean war, assisted by internal developments. The Reserve Bank's all-India index of variable dividend industrial securities (base 1938=100), which had fallen to 110 in July 1949 from the peak of 286 in August 1946, stood at 133 in March 1951 as against 115 a year before. For the year as a whole, the index rose by eight per cent. as against a fall of 16 per cent. in the previous year. Between April 1951 and June 1951 the index stood around 138.5 and sagged thereafter until it reached 121.7 in December 1951.

On the other hand, the gilt-edged market was throughout downward mainly on account of apprehensions about the future trend of interest rates. The Reserve Bank's index of Government and semi-Government securities, which stood at 100.9 in March 1950, fell to 98.6 in March 1951. The floatation in June 1950 of the 3 per cent. Government of India Loan, 1964 and in July of three ten-year State Government loans at below par was interpreted as official recognition of a hardening of interest rates. To stem the tide, the Reserve Bank had to purchase Government securities on a larger scale than in 1949-50 and the limitation of open market operation having been indicated by the Finance Minister on March 14, 1951, the market interpreted it bearishly.

The flow of savings whether to the market or through small savings was meagre; but the market responded to fresh issues more favourably than the year before though at slightly higher rates. The 3 per cent. cash-cum-conversion loan of the Government of India for Rs. 30 crores and the three State Governments loans amounting to Rs. 8 crores were fully subscribed. Small savings brought in about Rs. 25 crores in 1950-51 as against Rs. 26 crores in 1949-50. Private issues appeared to have been more successful than in 1949-50. The available data shows that the paid-up capital of joint stock companies quoted on the Bombay, Calcutta and Madras stock exchanges rose by Rs. 11 crores to Rs. 286 crores during 1950-51 in comparison with an increase of Rs. 3 crores in the previous year.

In view of the maturity of the 3 per cent. 1951-54 loan amounting to Rs. 86 crores, the Government of India had hoped to raise Rs. 100 crores from market borrowing; but it was possible to borrow only Rs. 50 crores by the issue of 3 per cent. loan, 1958, at Rs. 100 on August 22, 1951. Thus once again the actual borrowing fell short of the estimate. On the other hand, the total investment in Treasury Savings Deposits amounted to Rs. 15 crores in 1951-52. The Deposits introduced on February 1, 1951 bear three and a half per cent. interest. According to the Budget memorandum, Government have placed the receipts under small savings at Rs. 40.52 crores for 1951-52.

CONTROL OF CAPITAL ISSUES

To canalise the resources of the capital market in Government loans, the Government of India introduced on May 17, 1943 control over capital issues. The control passed through several forms, namely, (1) discouragement of long-range schemes till April 1944, (2) relaxation in regard to long-range schemes from April 1944 onwards, (3) exemption of companies other than banking and insurance companies for capital not exceeding Rs. one lakh with effect from August 1945 and (4) the raising of this exemption limit further to Rs. 5 lakhs in December 1945.

The Government of India introduced in March 1947 a Bill "to secure a balanced investment of the country's resources in industry, agriculture and the social services". The law, which was finally passed, was for a period of three years. It imposed on the Central Government an obligation to communicate to the applicant the reasons for refusal of permission and provided for the machinery of an advisory committee.

Control over capital issues continued during 1949-50 and the Capital Issues (Continuance of Control) Act passed in March 1950 extended the control upto March 1952. The amount sanctioned in 1949 was Rs. 63.03 crores in respect of 326 companies or half of that sanctioned in the previous year (Rs. 125.57 crores) and one-fourth of that in 1946 (Rs. 240.47 crores). As in the previous years, immediate schemes predominated, and group-wise, a majority of the schemes related to industrial ventures.

following the expected lapse of the Dividend Limitation Act. The reaction to the budget proposals was slight, the market having discounted the concessions that were granted. During March the share market was dominated by the tension in Indo-Pakistan relations and stock prices showed sizeable declines with Tata Deferred and Bombay Dyeing winding up the year ended March 31, 1950 at Rs. 1,600 and Rs. 1,041-4-0.

The recovery that began in July 1949 was sustained although the market tended to be unsteady at times. Professional activity, however, continued to predominate. Helped by the Indo-Pakistan Interim Trade Agreement of April 1950, the market generally ruled firm in the first quarter of 1950-51. Sentiment was also aided by Government's decision not to revalue the Indian rupee and the market turned distinctly bullish after the outbreak of the Korean war. In August the textile strike in Bombay introduced an element of uncertainty which was prolonged by the failure of Sir Owen Dixon's Mission in Kashmir, the publication of the Bank Tribunal's Award and the postponement by the International Monetary Fund of a decision on the par value of the Pakistani rupee. The market, however, looked up again about the middle of October being assisted, among other factors, by the failure of the textile strike in Bombay, the prolongation of the Korean war, the expected implications of the Colombo Plan, the Prime Minister's assurance on October 2, 1950 that a capital levy would not be imposed and the postponement by Parliament of the Industries (Development and Control) Bill. The firmness continued for the rest of the year following the Indo-Pakistan Trade Pact on February 25, 1951 and the budget proposals which did not contain any major levies on industry.

The above factors, together with the satisfactory working in 1949-50, sent up Tata Deferred to Rs. 1,867-8 on August 31; but Bombay Dyeing remained neglected around Rs. 950. In December 1950, both the shares advanced to Rs. 1,922-8 and Rs. Rs. 1,060, the special factor for the latter being the decision to issue bonus shares. In the last quarter of the year, the quotations advanced further to Rs. 2,007-8 and Rs. 1,073-12 respectively, Bombay Dyeing being quoted ex-right at Rs. 481-4 at the end of March 1951.

The table below, based on data collected by the Reserve Bank, indicates the trend in regard to paid-up capital and market value of share capital of companies quoted on the stock exchanges of Bombay, Calcutta and Madras :—

	31-3-1949	31-3-1950	31-3-1951
Ordinary Share Capital :			
Number of Companies	833	829	827
Paid-up Capital (Rs. in crores)	227·14	230·15	238·08
Market Value (Rs. in crores)	379·33	354·00	433·67
Preference Share Capital :			
Number of Companies	291	292	291
Paid-up Capital (Rs. in crores)	44·56	44·94	47·77
Market Value (Rs. in crores)	51·86	48·92	52·38

RECENT DEVELOPMENTS

During 1951-52 the Stock Exchange turned downward following the evaporation of inflationary pressures and the debacle reached its nadir in March 1952 when the crash on the market, preceded by a heavy slump in commodities, resulted in the closing down of the market until March 27 in order to enable the authorities to arrange for the smooth settlement of all outstanding business.

The initiative was seized by the gilt-edged market following the dearer money conditions and the statement of the Finance Minister on the limitations of the open market operations of the Reserve Bank. The average index number of Government and semi-Government securities steadily sagged from 98.4 in April 1951 to 97·9 in October. In the middle of November, the Reserve Bank raised its bank rate by ½ per cent. and consequently in its anxiety to adjust itself to the basic change in the interest rate, the index number for the gilt-edged market came to 92.1 in December. Thereafter the tight money conditions resulting in a sharp increase in bank advances reduced the index to 91.5 in January 1952. Around this level the market was fairly stabilised during February, but on March 11 the market received a rude shock from the decision of the British Government to raise the bank rate from 2½ per cent. to 4 per cent. and the 3 per cent. paper dropped from Rs. 80-12 to Rs. 80-2. It might be noted that its average price in 1949-50 and 1950-51 was Rs. 97-12 and Rs. 95-3.

In the industrial share market, the upward movement continued from the closing quarter of the preceding year till May when the index number for variable dividend securities touched 138.8. Thereafter the market was given a downward twist and closed at 121.5 in the last month of 1951. In January, the opening of the new year witnessed a mild recovery with Tata Deferred crossing Rs. 1,900. February, however, brought in its train seasonal apprehensions which deepened following the downward trend of commodity markets. Till February 9, the market ruled fairly steady, but thereafter there was heavy profit-taking and with heavy bear sales in the last week of the month, Tata Deferred dropped to Rs. 1,680 when the market was officially closed owing to a crisis.

INDEX NUMBER OF SECURITY PRICES

In view of the fact that a good many changes have occurred both in the number and in the relative importance of the scrips quoted on the stock markets, the Reserve Bank of India has started constructing a new series of General Purpose Index Numbers of Security Prices making it as broad-based as possible by selecting a large representative set of scrips from important stock markets. Altogether 398 scrips have been selected for the purpose and the year 1938 has been taken as the base period for calculating index numbers to facilitate comparison of the trends in the post-war period with the pre-war. The following is the trend of index numbers of security prices constructed by the Reserve Bank since December 1946 :—

1938=100

Average of Weeks	Government & Semi-Government Securities	Industrial Securities		Banks	Insurance	Investment Trusts	Electricity Tramways	Shipping and other Transport	Railways	Plantations	Cotton, Woollen and Silk Mills	Jute Mills	Coal	Mining and Oil	Iron and Steel	General Engineering	Sugar	Breweries	Chemicals	Paper	Cement

CHAMBERS OF COMMERCE

ASSOCIATED Chambers of Commerce of India, Royal Exchange, 6, Netaji Subhas Road, Calcutta. Registered in 1920 under Act VII, 1913 (Indian Companies' Act, 1913).

The object is to promote and protect the trade, commerce, industries and manufactures of the country.

In all there are three classes of members, *viz.*, Original, Additional and Associate, there are 11 Chambers of Commerce from different parts of the country as members of the association. Annual subscription of each member whether Original, Additional or Associate is Rs. 150 per vote.

OFFICE BEARERS FOR 1951-52 :—*President :* C. A. Innes ; *Dy. Presidents ;*—H. I. Wonfor, R. K. Jain.

Secretary :—D. C. Fairbairn, M.A., C.I.E.

Bengal Chamber of Commerce.—The Bengal Chamber of Commerce was founded in 1834 at Calcutta. The Bengal Chamber is registered with a declaration of membership of 330. Its objects are the usual purposes connected with the protection of trade in particular in Calcutta. There are three classes of members, Chamber, Associate and Honorary.

The following are the office-bearers of the Chamber for the year 1951-52 :—

President :—A. R. Eliott Lockhart, C.I.E.

Secretary:—D. C. Fairbairn, C.I.E.; *Deputy Secretary :* J. J. B. Sutherland, M. B. E.; *Assistant Secretaries :* W. D. Bryden, T. R. Crook and J. J. Rattray.

The following are the public bodies (among others) to which the Chamber has the right of returning representatives, and the representatives returned, for the current year.

The West Bengal Legislative Assembly.—J. R. Walker, F.T.I.

The Calcutta Port Commission.—R. J. Clough ; E. J. Pakes ; G. A. S. Sim.

The Board of Trustees for the Improvement of Calcutta.—T. Godley.

Regional Posts and Telegraphs Advisory Committee.—C. I. M. Arnold, M.B.E.

Calcutta Telephone Advisory Committee.—P. J. K. Parsons.

The W. Bengal Smoke Nuisances Commission.—R. J. Oliver ; R. Fraser.

The following are the recognised associations of the Bengal Chamber of Commerce:—

Calcutta Grain, Oilseed and Rice Association ; Indian Jute Mills Association ; Indian Tea Association ; Calcutta Tea Traders' Association ; Calcutta Import Trade Association ; The Wine, Spirit and Beer Association of India ; Indian Mining Association ; Calcutta Baled Jute Association ; Indian Paper Makers' Association ; Indian Engineering Association ; Calcutta Jute Fabrics Shippers' Association ; Calcutta Hydraulic Press Association ; Jute Fabrics Brokers' Association ; Calcutta Baled Jute Shippers' Association ; Calcutta Jute Brokers' and Dealers' Association ; Calcutta Hides and Skins Shippers' Association ; Calcutta Flour Mills' Association ; Calcutta River Transport Association ; The Master Stevedores' Association and the Paint Federation ; Calcutta Freight Brokers' Association ; European Mofussil Jute Balers' Association ; Port Said, Eastern Mediterranean and North African Freight Rate Agreement ; Calcutta Liners Conference ; Calcutta Continental Conference.

The Chamber does not assist in the preparation of official statistical returns. It publishes weekly the *Calcutta Prices Current*, and also publishes a large number of statistical circulars of various descriptions in addition to a monthly abstract of proceedings and many other circulars on matters under discussion.

The Chamber maintains a Tribunal of Arbitration for the determination, settlement and adjustment of disputes and differences relating to trade, business, manufactures, and to customs of trade, between parties, all or any of whom reside or carry on business personally or by agent or otherwise in Calcutta or elsewhere in India, by whomsoever of such parties the said disputes and differences be submitted. The Secretary of the Chamber acts as the Registrar of the Tribunal, which consists of such members or assistants to members as may from time to time, annually or otherwise be selected by the Registrar and willing to serve on the Tribunal. The Registrar from time to time makes a list of such members and assistants.

The Licensed Measurers Department of the Chamber was instituted in 1883 and is the only officially recognised concern of this nature in Calcutta. Its functions are mainly the weighment and/or measurement of cargo for freight purposes and for confirmation of invoice weights, and to act as arbitrator in cases of disputes over weights. Certificates issued for these purposes are accepted universally.

The Department is controlled by a special Committee and is supervised by a Superintendent, Head Office Manager and four Assistant Superintendents. A Staff of 129 Inspectors and Officers carry out the work of measurement and weighment at the Calcutta Docks and Jetties and on vessels loading at river moorings.

Address :—Royal Exchange, Post Box No. 280, Calcutta 1.

Bengal National Chamber of Commerce.—The Bengal National Chamber of Commerce, the premier institution of the Indian Commercial Community in W. Bengal, was founded in 1887. The objects of the Chamber are to aid and stimulate the development of commercial, agricultural and industrial enterprises in W. Bengal and Assam and to protect the commercial interest of all persons trading therein.

The constitution of the Chamber extends the facilities of Associate and Honorary Membership to the entire trading community in Bengal. The number of Ordinary members on the roll is about 500.

List of Associations Affiliated to the Chamber.—All-India Jute Mill Bobbin Manufacturers' Association ; All-Bengal Electrical Contractors Association ; Association of Engineers ; Bengal Motion Pictures Association ; Bengal Hosiery Manufacturers' Association ; Bengal Glass Manufacturers' Association ; Bengal Banks' Association ; Belgachia Jute Aratdars' Association ; Radio and Gramophone Trades Association of India ; National Small Tools and Cutlery Manufacturers' Association ; Bengal Industries Association ; Bengal Stationers' Association ; Bengal Bus Syndicate ; Bengal Trades' Association ; Bengal Oil Mills' Association ; Brickfield Association, Kotrung ; Bengali Jute Dealers' & Brokers' Association ; Calcutta Retail Cloth Shops Association ; Calcutta Electric Traders' Association ; Calcutta Iron Merchants' Association ; Calcutta Paper Traders' Association ; Calcutta Timber Merchants' Association ; Calcutta Salt Association, Ltd. ; Calcutta Rice Mills' Association ; Calcutta Stevedores' Association ; East India Jute & Hessian Exchange Ltd. ; Indian Insurance Institute ; India Society of Engineers ; Indian Lamp Factories' Association ; Indian Mining Federation ; Indian Soap & Toiletries Makers' Association ; Plywood Manufacturers' Association of India ; Tea Chest and Plywood Trades Association ; Indian Tea Chest Batten Manufacturers' Association ; India Battery Manufacturers' Association ; North Bengal Timber Merchants' Associations ; Radio Industries Association ; Tripura Tea Association ; Retail Textile Dealers' Association ; West Bengal Iron & Sheet Merchants' Association ; West Bengal Saw Mills, Association.

The Chamber enjoys the privilege of electing representatives to the West Bengal Legislative Assembly, the Calcutta Port Trust, the Calcutta Improvement Trust, W. Bengal Industries Board, Economic Enquiry Board, W. Bengal Board of Examiners for Boiler Attendants Appellate Authority under West Bengal Boilers Rules 1950, Indian Central Jute Committee, Indian Central Cotton Committee, Indian Coal Grading Board, Calcutta Corporation, State Sugar Board, West Bengal Electricity Licensing Board, West Bengal Boiler Commission, Calcutta Telephone Advisory Committee, P. & T. Regional Advisory Committee at Calcutta, State Transport Authority and other important bodies.

The headquarters of the Chamber are at Calcutta and its affairs are administered by a committee of 32 members in addition to the President, two Vice-Presidents, and the Honorary Treasurer, with the help of the Secretary and a number of Departmental Committees.

LIST OF OFFICE-BEARERS FOR THE YEAR, 1952-53.

President :—Dr. N. N. Law, M.A., Ph.D. ; *Vice-Presidents :*—P. Mukerjee, G. Basu, B.A. ; *Hony. Treasurer :*—Dr. Satya Charan Law, M.A., Ph.D.

Secretary.—S. R. Biswas, M.A.

Sr. Asstt. Secretary :—A. R. Dutta Gupta, M.A.

Office :—P-11, Mission Row Extension, 1st & 2nd Floors, Calcutta 1.

Telephone : Calcutta City, 3381 (2 lines).

Telegram : 'Conjoint.'

The Berhampur Chamber of Commerce (Orissa).—The Berhampur Chamber of Commerce was established soon after the formation of the State of Orissa. It is registered under the Indian Companies' Act and is recognised by the Government of Orissa. It maintains a library and an information service, arranges commercial arbitration and makes commercial opinion available to Government. It has nearly 60 members on its roll.

President :—P. Narayana Rao, B.A., B.L. ; *Vice-President:*—The Agent of Messrs. Haji Jamal Nur Mohamad ; *Hon. Secretary :*—I. Rama Murty. *Address.*—Berhampur, Ganjam Dist., B. N. Rly.

Bharat Chamber of Commerce.—(Established 1900). The main object of this Chamber is to foster the growth of commerce and industry in the country, to safeguard the interests of the commercial communities, to protect and promote the trade, commerce, manufactures, agriculture and industries of West Bengal, to watch over and protect the general commercial interests of persons engaged in trade, commerce, manufactures, agriculture or industries in India. It arbitrates in disputes arising out of commercial transactions and also issues certificates of origin to exporters of indigenous goods. The Chamber is generally consulted by Government on questions of public interest and commercial matters. It undertakes special enquiries and action for securing redress of legitimate grievances of any branch of trade or industry. It handles more than 80 per cent of distributive trade in cotton textiles and a good number of members are interested in export and import trade.

President :—I. P. Goenka.

Vice-Presidents :—P. L. Saraogi and G. L. Mehta.

Secretary :—B. N. Sengupta.

The following Associations are affiliated with the Chamber :—Kalimpong Chamber of Commerce, Kalimpong ; Bogra Cloth & Yarn Merchants' Association, Bogra ; B.T.A. Unit Holders' Association, Calcutta ; Darjeeling District Marwari Merchants' Association, Darjeeling ; Merchants' Association, Khargpur, B.N. Rly. ; The Calcutta Wheat and Seeds Association, Calcutta ; Sonada Merchants' Association, Sonada ; The Indian Jute & Cotton Association Ltd., Calcutta ; Assam Marwari Chamber of Commerce ; Calcutta Salt Association, Calcutta ; Cloth Merchants' Association, Siliguri ; Upper Assam Marwari

New issues (of 263 companies) sanctioned for the calendar year 1950 amounted to Rs. 74.75 crores as compared with Rs. 63 03 crores (326 companies) in 1949 and Rs. 125.57 crores (375 companies) in 1948. This brings the grand total since the introduction of the control on May 17, 1943 (subject to the fact that the figures up to August 15, 1947 are for undivided India) to 6,233 companies for Rs. 1,024·85 crores. No data is available of the actual number of companies floated or capital raised; but there was some revival of new issue activity in 1950-51 and many leading companies floated debentures at rates of interest ranging up to six per cent.

By an amendment, Parliament extended the Capital Issues (Continuance of Control) Act for another four years ending March 31, 1956. The Finance Minister said during the debate that in 1951, 16 per cent. of the applications in the industrial group and 21.5 per cent. in non-industrial group were rejected, the corresponding figure for 1950 being 9 and 20 respectively. Consent for new ventures in banking and insurance which were adequate was generally withheld. The industrial projects were turned down mainly because they did not fall within the pattern of Government planning or were of a speculative character or were immature. He also revealed that Rs. 8.18 crores were involved in unsuccessful applications for the issue of bonus shares. During 1951 out of 94 companies which applied for a total foreign investment of Rs. 15.03 crores, 81 companies were granted consent while 13 companies involving foreign capital to the extent of Rs. 22 lakhs were refused permission.

INDUSTRIAL FINANCE CORPORATION

Under the Industrial Finance Corporation Act, a Corporation was established on July 1, 1948 to provide medium and long-term finance to public limited companies and co-operative societies registered in India, including the acceding States, and engaged in the manufacture or processing of goods or in mining or in the generation or distribution of electricity or any other form of power. Individuals, partnership firms or private limited companies are thus excluded from the purview of the Corporation's operations. The authorised share capital is Rs. 10 crores, divided into 20,000 shares of Rs. 5,000 each, the paid up capital being Rs. 5 crores in respect of 10,000 shares issued. To this issue, the Central Government and the Reserve Bank of India subscribed Rupees one crore each, the scheduled banks and financial institutions like insurance companies and investment trusts, Rs. 1½ crores each, and co-operative banks Rs. ½ crore. The paid-up value of the share capital and dividends on it at the minimum rate of 2½ per cent. per annum are guaranteed by the Government. The Board of Directors consists of twelve members, of whom four are nominated by the Central Government and two by the Reserve Bank of India, and six are representatives of scheduled banks, insurance companies, investment trusts and other financial institutions.

The Corporation is authorised to borrow up to five times the amount of its paid-up capital and reserve fund. When the Reserve Fund equals the authorised capital of Rs. 10 crores, the borrowing capacity of the Corporation will be Rs. 100 crores. The Corporation may also accept deposits for periods of not less than five years, but the total deposits accepted may not exceed Rs. 10 crores. It is empowered to provide financial assistance in the following ways:

(*i*) grant loans or subscribe to debentures of industrial concerns repayable within a period of 25 years secured by sufficient pledge, hypothecation or mortgage of tangible assets; (*ii*) underwrite the issue of stocks, shares and debentures; and (*iii*) guarantee loans floated in the market repayable within a period not exceeding 25 years.

The Corporation is prohibited from subscribing directly to the shares or stocks of companies and is primarily a lender and not a partner in industry. Its policy is to finance the acquisition of fixed assets and thereby supplement rather than compete with the activities of commercial banks.

In September 1948 the Corporation started functioning with Mr. Shri Ram as Chairman and Mr. Ram Nath as Managing Director. In August 1949 the Corporation decided to augment its resources by issuing 3½ per cent. bonds repayable in 1964. The Corporation thus raised Rs. 580.5 lakhs by the end of 1951.

The nature of assistance that the Industrial Finance Corporation can render to the Industries is governed by the Act which permits help to be given only to public limited companies or co-operatives registered in India and engaged in the manufacture of goods, processing of goods, mining and generation or distribution of electricity or any other form of power.

Up to the end of 1951 the Corporation sanctioned a total loan of Rs. 10.45 crores to various industries the breakdown of which is given below:—

Textile machinery Rs. 58 lakhs, Mechanical engineering Rs. 49 lakhs, Electrical engineering Rs. 104½ lakhs, Cotton textiles Rs. 176 lakhs, Woollen textiles Rs. 35 lakhs, Rayon industry Rs. 50 lakhs, Chemicals Rs. 85½ lakhs, Cement Rs. 90 lakhs, Ceramics and glass Rs. 102 lakhs, Oil mills Rs. 2½ lakhs, Electric power Rs. 17½ lakhs, Metallurgical industries Rs. 35 lakhs, Iron and steel Rs. 42½ lakhs, Aluminium Rs. 59 lakhs, Sugar Rs. 20 lakhs, Mining Rs. 30 lakhs, Paper industry Rs. 12 lakhs, Automobile and tractor industry Rs. 50 lakhs and other miscellaneous industries Rs. 35.7 lakhs.

The annual report of the Corporation for the year ended June 30, 1951 showed a net profit of Rs. 7,93,637. After transferring Rs. 1,00,000 to the reserve fund, the balance was used to pay the guaranteed dividend of 2½ per cent. after calling upon Government to contribute Rs. 4,31,363 to make up the deficiency in the required amount. The distribution of shares of the Corporation on the date of closing of the account was as under:—Central Government 2,000; Reserve Bank 2,054; Scheduled Banks 2,475; Insurance Companies, Investment Trusts and other like financial institutions 2,528; and Co-operative Banks 943.

With the passing of the Part B States (Laws) Act, 1950, which came into force on April 1, 1951, the Industrial Finance Corporation Act, 1948, now extends to the whole of India except Jammu and Kashmir. On account of the conditions prevailing in the money market and the stock exchange, the Corporation did not consider it advisable to undertake underwriting commitments.

The rate of interest usually charged by the Corporation continued to be 5½ per cent. with a rebate of ½ per cent. for regular payments.

STATE FINANCIAL CORPORATION

An Act to provide for the establishment of State Financial Corporations was passed in October 1951. The Act enables the State Government to establish a Financial Corporation for the State under a name to be specified by notification and the State Government concerned, the Reserve Bank, scheduled banks, insurance companies, investment trusts, co-operative banks and other financial institutions will be entitled to subscribe to the share capital. Parties other than these can also be shareholders; but their aggregate holding will not exceed one fourth of the total capital. The shares allocated will not be transferable except to the State Government, the Reserve Bank or any other recognised financial institution.

The shares of the Corporation will be a trustee security under the Indian Trusts Act and an approved security under the Insurance and Banking Acts. The shares shall be guaranteed by the State Government in regard to the repayment of principal and the payment of annual dividend at such minimum rate as the State Government may, with the approval of the Central Government, fix by notification. The Corporation may issue bonds and debentures for increasing its working capital and accept deposits of not less than five years' maturity.

The management of the Corporation will vest in a Board of Directors composed of three nominated by the State Government, one by the Central Board of the Reserve Bank, one by the Industrial Finance Corporation of India, one each by scheduled banks, co-operative banks and other financial institutions and one to represent other shareholders. The Managing Director will be an ex-officio member of the Board. The first Board will be constituted by nominating the representatives of the various interests by the State Government.

The Corporation may transact the following business:—(*a*) the guaranteeing of loans raised by industrial concerns in the public market for not more than 20 years; (*b*) the underwriting of the issue of stocks, shares, bonds or debentures by industrial concerns; (*c*) the granting of loans or subscribing to debentures of industrial concerns repayable within 20 years; and (*d*) other business arising or ancillary to the above. The limit of accommodation to any industrial concern will be up to a maximum of one-tenth of the Corporation's share capital subject to a maximum of Rs. 10 lakhs.

All-India Legislation.—At present there is no legislation for the regulation and control of "stock exchanges except in the State of Bombay. The Bombay Securities Contracts Control Act of 1925 has also not proved particularly effective mainly because transactions outside a recognised stock exchange are, under the Act, merely void and not illegal. The Act does not also make a clear distinction between ready and forward business. To improve upon the Contracts Control Act the Bombay Government enacted in 1947 the Bombay Forward Contracts Control Act; but this Act has not been applied to securities presumably because central legislation on this subject has been in contemplation for the past seven years. Under the Constitution, Parliament can now enact legislation on this subject for the whole of India, thus ensuring uniformity in the law and rules governing stock exchanges as well as in the administrative machinery for the enforcement of regulations.

In 1950 the Government of India published their draft proposals to regulate stock exchanges on an all-India basis and later appointed a committee, with Mr. A. D. Gorwala as Chairman, to submit a revised draft bill. The main recommendations of the Committee are given below:—

(1) There should be only one recognised exchange in any one area. (2) Government must have powers to amend the rules and bye-laws of the recognised stock exchanges. These should cover the right of nominating their representatives on the Governing Board of the exchange, suspension of business and superseding governing body. (3) Each stock exchange must have a clearing house. (4) The settlement of account should be every fortnight. (5) A Stock Exchange Commission should be appointed to advise Government on matters affecting the control. (6) Government should have powers to compel any company to list its share on a recognised stock exchange.

The Committee was divided on the question of blank transfers—whether to abolish the practice or just restrain it.

COMPANY LAW

In 1951 the Government of India appointed an expert committee, with Mr. C. H. Bhabha as Chairman, to suggest an overhaul of the Company Law. But trafficking in managing rights and cornering of shares in the open market with a view to acquiring control over the management of well-established and reputable companies for anti-social purposes had reached such proportions that Government decided to promulgate an Ordinance on July 21, 1951. On September 14, the Indian Companies Act was amended. The main features of the changes are given below:—

(1) Any Amendment in the articles or agreement relating to the appointment of a Managing Director and the increase in the remuneration will be void unless approved by the Central Government.

(2) The Central Government, after an inquiry into the complaint made by the Managing Agent, Managing Director or any other director of a company that the change in the board of directors would prejudice the affairs of the company direct that the resolution will be effective only after it is confirmed by Government.

(3) Any change in the term of a Managing Agent after July 21, 1951 shall be void unless approved by the Central Government.

(4) A Managing Agent can transfer his office only with the approval of Government.

(5) A change in the Constitution of the Managing Agent will require prior approval of Government.

(6) When the affairs of a Company are managed in a manner prejudicial to the interests of the company or oppressive to some part of the members, a member can apply to the court for an order to wind up the Company. Government can also apply for a similar order.

(7) The Central Government may constitute an advisory commission to advise them on company affairs.

WAR AND POST-WAR TRENDS

Stimulated by the widespread belief that the war would bring about soaring prices, profits and dividends, the stock market developed a veritable boom and Tata Deferred were lifted from Rs. 1,300 on July 25, 1939 to Rs. 2,332-8 on January 1, 1940. Fresh taxation and war reverses pressed down the quotation for a time to Rs. 1,210 by April 7, 1942; but the continued doses of inflationary measures gradually recovered the rate to Rs. 2,252-8 on March 20, 1944. Then followed a mild recession on fears about the end of the war and budget jitters; but by the time Germany capitulated, the market had recovered from the shock. The Indian Government's post-war budget for 1946-47 surpassed the most optimistic expectations and this, together with the conversion of the three and a half per cent. Government Paper into three per cent. non-terminable loan or the 2½ per cent. 1976 loan, ushered in an orgy of speculation which literally lifted the market to an all time record level, Tata Deferred touching Rs. 3,640 in August 1946. An idea of the boom can be had from the following table about shares quoted on the stock markets:—

(Rupees in lakhs)

——	August 1939	July 1946
No. of Companies	628	758
Paid up Capital	Rs. 12,939	Rs. 17,330
Market Value	Rs. 20,441	Rs. 72,629

It was clear by the beginning of August 1946 that the rise in equities was artificial. The outbreak of communal rioting, the declaration of a series of strikes, the budget proposals of Mr. Liaquat Ali Khan aimed at redistribution of wealth, the partition of the country and its aftermath were the depressants in the following twelve months. They naturally broke the back of the stock market, Tata Deferred slumping from the peak of Rs. 3,640 in August 1946 to Rs. 1,550 in September 1947. It was at this stage that the economic malaise became a major factor in shaping the destiny of the equity market. Uncertain economic policies of Government, wild statements about nationalisation by Government spokesmen, industrial awards pushing up the wage costs irrespective of considerations of output, expansionist policy of Government and several other factors rendered a definite market trend impossible during 1947-48 which was finally wound up with a slightly pessimistic note, Tata Deferred closing at Rs. 1,517-8 on March 31, 1948.

For the first time, the Government of India felt the need for providing economic incentives for production and props for sustaining the investment markets. This was done through the budget proposals for 1948-49; but by that time another adverse factor had crept in. Several new companies had been started with inadequate resources and since the cost of imported capital goods had risen very high, it became difficult for many of them to continue. The freezing of capital in these companies scared away the middle class. Besides, the general economic uncertainty, the developments in Kashmir and Hyderabad, doubts regarding Government's attitude to private enterprise, anti-inflationary measures of the Government of India and the likely institution of profit sharing scheme and control over futures trading were some of the other adverse influences at work. Genuine investment interest consequently began to shrink and what little remained was withdrawn following the promulgation of the Dividend Limitation Ordinance issued on October 29, 1948 and the notification relating to the restrictions on future bonus issues of companies. Share values sank rapidly and reached practically the bottom by October 1948. The following table gives an idea of the capital depreciation between the end of the boom in July 1946 and October 1948:—

(Rupees in lakhs)

——	July 1946	October 1948
No. of Companies	758	779
Paid-up Capital	Rs. 17,330	Rs. 20,596
Market Value	Rs. 20,441	Rs. 40,563

In the following two months, trading was at a low ebb, operators showing disinclination to enter into larger commitments owing to the prevailing uncertainties in regard to labour, industrial earnings and, above all, Government's anti-inflationary proposals. In the following month, the threat of communism in South-East Asia and apprehensions of foreign competition and liberal imports hit the sentiment. A mild recovery was, however, noted as the year came to an end following the promulgation of the Ordinance empowering the Income-Tax Investigation Commission to compound cases arising from tax evasion and improved railway transport.

INDIAN SECURITIES

The following table indicates the broad trend of the prices of Indian securities during the war period and thereafter on the basis of the index numbers prepared in the office of the Economic Adviser to the Government of India with 1927-28 as the base for the index:—

	Government Securities	Fixed yield Industrial Securities	Variable Yield Industrial Securities									General Index
			Cotton (22 shares)	Jute (20 shares)	Coal (13 shares)	Iron and Steel (3 shares)	Tea (19 shares)	Sugar (3 shares)	Cement (1 Share)	Paper (2 Shares)	Banking (8 Shares)	
August 1939	117·6	137·7	59·4	117·7	131·7	369·5	57·8	74·7	149·6	174·0	119·2	98·5
1939-40	111·2	134·5	85·1	64·3	164·5	539·3	69·0	97·2	162·8	346·7	116·6	120·5
1940-41	114·6	147·5	85·5	54·6	149·0	507·1	67·5	86·2	159·4	299·4	123·8	117·4
1941-42	115·9	155·9	111·0	57·2	152·5	504·3	77·7	107·2	193·9	323·9	133·3	129·0
1942-43	115·0	144·9	146·6	53·9	161·3	441·5	86·9	141·7	235·9	359·9	144·9	138·6
1943-44	117·2	164·3	198·8	65·6	227·2	555·9	118·0	211·4	278·4	488·0	190·9	182·2

1946-47	120·4	197·8	267·1	133·3	408·8	787·2	170·5	236·6	303·4	888·1	286·7	268·6

POST-PARTITION TRENDS

Industrial share prices witnessed a continuation of the downward movement which had commenced in August 1946 till about the middle of July 1949 when many equities touched their lowest for the post-war period. Since then there has been a gradual and almost continuous recovery. With a market mainly confined to professional activity, the continued deterioration in India's payments position, a drop in silver prices and the fall in foreign stock markets had the effect of pressing down Tata Deferred and Bombay Dyeing to their lowest post-war levels of Rs. 1,091-4-0 and Rs. 902-8-0 respectively on July 8 and June 28, 1949. Thereafter, except for a few temporary set-backs, share prices tended to be generally upward. This enabled the authorities of the Calcutta Stock Exchange to withdraw with effect from August 5 and 12 respectively the floor prices they had fixed for the miscellaneous and jute sections. A liberalisation of depreciation allowance to industry, reports of higher production, the announcement of September 10 of a twelve-point official programme to overcome the textile crisis, the favourable reception to the scheme for financial integration of States and the Finance Minister's statement in Parliament on the need to revise the structure of direct taxation helped to sustain the improvement.

Devaluation brought about a spurt in equity prices; but Pakistan's decision not to devalue its rupee led to nervous liquidation. The sentiment was further depressed by a voluntary cut in the controlled prices of manufactured goods and the tentative proposals for amending the company law. By the middle of November the market resumed its upward trend and evinced a substantial improvement during the next 3½ months mainly on expectations of tax concessions in the Central Budget, other contributory factors being the fixation of higher targets of output, a reduction in coal prices and coal freights, and prospects of higher dividends

(v) And generally to do all that may be necessary in the interests of the realisation of the above objects of the Chamber directly or indirectly.

The Chamber has also the right to elect six representatives on the Bombay Port Trust, and one representative on the Bombay Municipal Corporation.

OFFICE-BEARERS FOR 1952.

President.—Pranlal Devkaran Nanjee.

Vice-President.—Ambalal Kilachand.

Representatives of the Chamber on various public bodies :—

Bombay Port Trust.—M. A. Master; Ramdas Kilachand; Tulsidas Mulji Vishram; Vallabhdas V. Mariwala; P. M. Chinai; Murarji J. Vaidya.

Bombay Development Dept. Advisory Committee.—Manu Subedar.

University of Bombay.—Ratilal M. Gandhi.

Sydenham College of Commerce Advisory Committee.—C. H. Bhabha.

Central Rly. Local Advisory Committee.—Mahomed Husein Hasham Premji.

Western Rly. Local Advisory Committee.—Prof. M. P. Gandhi.

Indian Central Cotton Committee.—Chimanlal B. Parikh.

Trustees of the Chamber.—Seth Chatrabhuj Gordhandas; Seth Pranlal Devkaran Nanji; Gordhandas G. Morarji; Bhawanji A. Khimji; Sir Behram N. Karanjia.

Bombay Board of Communications.—Keshavprasad C. Desai.

Institute of Science Advisory Committee.—Dr. K. A. Hamied.

Traffic Advisory Committee.—Navin H. Mapara.

Indian Sailors' Home Committee.—Vijaysinh Govindji; Vikramsinhji Shoorji Vallabhdas.

Hony. Adviser.—J. K. Mehta.

Secretary.—A. C. Ramalingam.

Asstt. Secretaries.—K. P. Daru; C. L. Gheewala.

Address :—Lalji Naranji Memorial, Indian Merchants' Chamber Building, Back Bay Reclamation, Churchgate Street, Fort, Bombay.

Phones.—26265, 26266.

Grams.—"Inchambu."

International Chamber of Commerce, Indian National Committee.—The Indian National Committee of the International Chamber of Commerce was established for the following purposes in the year 1929 :—

To participate in the promotion of the objects for which the International Chamber of Commerce, hereinafter called the "International Chamber," is established, namely :

(i) To facilitate the commercial intercourse of countries.

(ii) To secure harmony of action on all international questions affecting finance, industry and commerce.

(iii) To encourage progress and to promote peace and cordial relations among countries and their citizens by the co-operation of businessmen and organisations devoted to the development of commerce and industry.

The Indian National Committee has on its roll 28 commercial bodies as Organisation Members and 51 commercial firms as Associate Members.

OFFICE-BEARERS FOR 1951-52.

President.—C. M. Kothari, Madras.

Vice-President.—Shanti Prasad Jain, Calcutta.

Honorary Treasurer.—D. N. Sen, Calcutta.

Secretary.—G. L. Bansal.

Office.—28, Ferozshah Road, New Delhi.

Madras Chamber of Commerce.—The Madras Chamber of Commerce was founded in 1836. Any person or firm, interested in the general trade, commerce, or manufactures of the Madras State is eligible for Chamber membership. Distinguished persons, members of kindred associations, and officials interested in trade, commerce or industry in the Madras State may be elected Honorary Members of the Chamber. Honorary Members do not have to pay any subscription and are not entitled to exercise the privileges of Ordinary Members except to speak at any ordinary meeting of the Chamber. Other Chambers of Commerce may be Affiliated Members. Election for membership is by ballot. Every member other than an Honorary Member pays an entrance fee of Rs. 100, provided that banks, corporate bodies and mercantile firms may be represented on the Chamber by one or more members and are liable for an entrance fee of Rs. 100 once in every 10 years. The subscription shall not exceed Rs. 860 per annum, payable quarterly in advance, for each representative. Each Affiliated Member shall pay an annual subscription of Rs. 50 payable at the beginning of the calendar year.

The Chamber undertakes arbitrations and survey, and the granting of certificates of origin.

There are 82 Firms, who are Members of the Chamber; and there are 5 Affiliated Members and 7 Honorary Members of the Chamber in 1951. The officers of the Chamber are as follows :—

Chairman : H. I. Wonfor. *Vice-Chairman :* D. D. H. Thomas. *Secretary and Adviser :* G. T. B. Harvey, C.I.E. *Asstt. Secretary :* F. W. A. Morris, O.B.E.

The following are the Chamber's representatives on various public bodies :—

Mahratta Chamber of Commerce and Industries.—The Mahratta Chamber of Commerce and Industries is an institutional organisation representing the economic, commercial and industrial interests of Maharashtra.

Members, Funds and Properties.—The Chamber was established in 1934. Shreemant Sir Malojirao Naik Nimbalkar, Minister in-Charge of Public Works, Bombay Government, and 40 other leading industrialists, businessmen, firms and Joint Stock Companies are among its patrons. The Chamber conducts a Marathi Commercial Monthly named the "*Sampada*" for the benefit of its members and others.

Object and Activities.—Its principal object is to work for the commercial and industrial development of Maharashtra as an integral part of India, through local initiative and effort, and to infuse confidence in the people of the area in the management of economic and financial institutions on modern lines. Among the more note-worthy achievements of the Chamber can be mentioned the promotion of the Bank of Maharashtra, a leading Maharashtrian Joint Stock Bank conducted and managed by Maharashtrians, the encouragement of local enterprise in the field of general insurance business, successful advocacy for grant of post-war protection to cocoa-powder and cocoa-chocolate and hurricane lantern industries and protect the power-loom industry.

Every year this Chamber awards the G. S. Parkhe Industrial Merit Prizes and organises the G. P. Ogale Memorial Lecture on economic subjects and also awards to a student of the Brihan Maharashtra College of Commerce the B. S. Kamat Memorial Prize.

Government Recognition and Representations on Various Bodies.—The Chamber has received the recognition of the Central as well as the Bombay State Governments. It is represented on the Board of Trustees of the Lord Reay Maharashtra Industrial Museum, Poona; the Advisory Committee of the Sub-Regional Employment Exchange, Poona Area; the Local Advisory Committee of the Southern Railway, for the Bombay State; the Telephone Advisory Committee, Poona; Bombay Board of Communication, Bombay State; on the Regional Post and Telegraph Advisory Committee, Bombay Circle; State Advisory Council of Industries, Bombay; Police Advisory Committee, Poona; Goods Shed Advisory Committee, Poona. It is one of the two Chambers named for electing two representatives on behalf of trade, industry and commerce on the Court of the Poona University.

Merchants' Chamber of U. P., Kanpur.—The Merchants' Chamber of U. P. was established in November 1932, with the object of safeguarding the interests of trade and industry in Uttar Pradesh, providing regular and efficient statistical and intelligence service to the business firms and generally helping the promotion of trade and business in Uttar Pradesh through proper organisation of commercial opinion. The Chamber represents almost entirely Indian capital and has affiliated to its membership, Cotton Mills, Sugar Mills, Jute Mills, Silk weaving and Hosiery works, Oil Mills, Banks and Firms engaged in extensive dealings in Piece-goods, country produced Hide and Leather. Ten Commercial Organisations and Trade Associations of the State are also affiliated to the Chamber. The Chamber maintains a ceaseless channel of correspondence with the Central and State Governments and the various Railways on all points of commercial grievances, whether of general or of specific interest. It issues every month an English and Hindi Bulletin to its members who are scattered over the entire State. The report of the activities of the Chamber is a regular feature of the daily press of the State. The Chamber is represented on the U.P. Legislative Assembly, Court of the Lucknow University, Rly. Advisory Committees, State Economic Advisory Board, State Board of Agriculture and Animal Husbandry, Kanpur Municipal Board, and about 15 other spheres of public service. The constitution of the Chamber which is registered under the Indian Companies Act, 1913, with a licence under Section 26, provides for an Executive consisting of a President, a Vice-President and 19 Members of the Council. A wholetime Secretary is attached to the Council.

President :—Lala Parshottamdas Singhania.

Vice-President :—Kishen Narain.

Asst. Secretary.—R. Chandra, M.A., B.Com.

Head Asstt.—Shri Ram, B.Com.

Office.—15/57, Civil Lines, Kanpur.

Grams.—"Mercham."

Phone.—Kanpur No. 2469.

Punjab Chamber of Commerce.—The Punjab Chamber of Commerce has its headquarters at New Delhi and exists for the protection of mercantile interests on the usual lines in the Punjab, Delhi and Northern India. Membership generally is restricted to Banks, Merchants (wholesale), Railways and proprietors of large industrial interests. The entrance fee is Rs. 500 and the rate of subscription Rs. 300 per year for every member whether he has a place of business in Delhi proper, or outside. The Chamber is a member of the Federation of Chambers of Commerce of the British Empire, London and the Associated Chambers of Commerce of India, Calcutta. The Chamber is represented on the Municipal Committee of Delhi as well as various other Committees and Local Government Bodies.

OFFICE-BEARERS FOR 1951-52 :—S. P. Virmani, Amritsar (*Chairman, Managing Committee*); R. K. Jain, New Delhi (*Dy. Chairman*); S. D. Dhir (*Secretary*).

Address :—Scindia House, Curzon Road, Post Box No. 24, New Delhi 1.

Phone : No. 42127.

Grams :—"Chamber," New Delhi.

Southern India Chamber of Commerce.—Indian Chamber Buildings, Madras.—The Southern India Chamber of Commerce established in 1909 has its Registered Office in Madras. The objects of the Chamber are those usual for such bodies, concerning the promotion of trade, especially in the Madras State, and the interests of members. Special objects are stated to be :—

To maintain a Library of books and publications of commercial interest, so as to diffuse commercial information and knowledge amongst its members;

To establish Museums of commercial products or organise exhibitions, either on behalf of the Chamber or in co-operation with others.

There are three classes of members, Affiliated, Resident and non-Resident. The usual conditions as to eligibility for election prevail.

The Chamber is a member of the Federation of Indian Chambers of Commerce, the Indian Chamber of Commerce in Great Britain, and the Indian National Committee of the International Chamber of Commerce, Paris.

The Chamber holds survey and arbitration, issues certificates of origin and certificates of invoices; certificates of sampling, analysis and weights.

The right of electing three representatives to the Madras Port Trust was accorded to the Chamber by the Madras Port Trust Amendment Act, 1941. Members of the Chamber hold seats in the Madras Legislative Assembly, and the Chamber has also been accorded the right of electing a representative to that body. Co-jointly with the Nattukottai Nagarathars Association the Chamber has the right of electing a representative to the Federal Assembly. Under the Madras City Municipal Amending Act, 1936, the Chamber has the right of electing one Councillor to the Madras Corporation. Under the State Aid to Industries Act, 1923, the Chamber has the right to elect one member to the Board of Industries.

The Chamber also sends its representatives to the Madras Legislative Assembly, the Madras Port Trust, the Southern Railway Local Advisory Committee, Senate of the Madras University, Senate of the Annamalai University, Board of Industries, Board of Communications, the City Improvement Trust, the Indian Tea Market Expansion Board, the Textile Trade Marks Advisory Committee, the Madras Port Committee and the Board of Referees, Excess Profits Tax.

The Chamber has about 900 members on the rolls and has its own building. Forty-eight Associations in the City of Madras and Chambers of Commerce in the mofussil have been affiliated to this Chamber.

President :—M. A. Chidambaram Chettiar.

Vice-Presidents :—P. R. Nammalwar and Rao Bahadur V. S. Subramaniam.

Secretary :—K. A. Menon (Ag.).

U. P. Chamber of Commerce, Kanpur.—The U. P. Chamber of Commerce established in 1914, represents all the important commercial and industrial interests of Uttar Pradesh. The Chamber is recognised both by the State and Central Governments and jointly returns representative to the Uttar Pradesh Legislative Assembly. It is represented on the Kanpur Municipal Board, the Local Advisory Committee of the East Indian Railway, Central Railway, Rohilkhund Kumaon Railway, Bengal and North-Western Railway and on the Informal Committee of the East Indian Railway. The Chamber's representatives also sit on the State Boards of Industries, Economic Enquiry and Agriculture, High School and Intermediate Education and Governing bodies of Government, Textile and Dyeing and Printing Schools, Agricultural College, Sir H. B. Technological Institute, Kanpur, Board of Traffic and Communications, Senate of the Lucknow University, and Employment Board, U.P. and various other public bodies in the State. The Chamber is affiliated to the Federation of Indian Chambers of Commerce and Industry as also to the National Committee of the International Chamber of Commerce.

Membership :—Any firm, individual, company, corporation or association engaged or interested in trade, commerce or industry is eligible for membership of the Chamber.

The number of members on register is 260.

The following are the office-bearers of the Chamber for the current year.

President.—J. K. Srivastava, M.L.A.

Vice-President.—D. P. Singh and Gajanand Sutwala.

Secretary.—Satyanarain Bagla, M.A., LL.B.

Jt. Secretary.—P. C. Kapur.

Assistant Secretary :—P. K. Menon, B.A.

Technical Adviser :—S. R. Rallan, B.Com. (Hons.).

Upper India Chamber of Commerce.—The Upper India Chamber of Commerce, established in 1888, is concerned with trade, commerce and manufactures in Uttar Pradesh and has its registered office at Kanpur. Members are elected by the Committee, subject to confirmation by the next general meeting of the Chamber. Men distinguished for public service, or eminent in commerce or manufactures, may be elected honorary members of the Chamber by the members in a General Meeting and such shall be exempted from paying any subscription to the Chamber. There is no entrance fee for membership, but subscriptions are payable as follows :—A firm, company or association having its place of business in Kanpur, Rs. 500 a year; an individual member resident or carrying on business in Kanpur, Rs. 500; firms or individuals having their places of business or residence outside Kanpur pay Rs. 150 a year but the maintenance of a branch office in Kanpur necessitates payment of full rates.

The affairs and funds of the Chamber are managed by a Committee of ten members, which has power to constitute Local Committees of from four to seven members each at trade centres where membership is sufficiently numerous to justify the step. Such Local Committees have power to communicate only with the Central Committee.

The Chamber appoints Arbitration Tribunals for the settlement and adjustment of disputes, when invited to do so, members of the Tribunals being selected from a regular printed list of arbitrators.

The Chamber has a membership of 125 excluding 2 honorary, 13 affiliated members.

President :—G. E. Longdin.

Secretary :—Miss D. Seaton.

Office Superintendent :—R. K. Mehra.

Chamber of Commerce, Jorhat; Darjeeling Chamber of Commerce, Darjeeling; Swarna Rajat Kalakar Samiti, Calcutta.

Address: Imperial Bank Building, Burrabazar Branch, Calcutta 7.

Telephone No. B.B. 2265.

Grams: "Marchamber."

Bombay Chamber of Commerce.—Mackinnon Mackenzie Bldg., Ballard Estate, Bombay.—The object of the Bombay Chamber, as set forth in the Memorandum and Articles of Association, are to encourage and promote a friendly feeling and unanimity among commercial men on the general mercantile interests of the State; to promote, protect and to collect and circulate information on all matters of general commercial interest.

The Bombay Chamber was established in 1836, under the auspices of Sir Robert Grant, who was then Governor of Bombay.

All firms or persons engaged or interested in mercantile pursuits are eligible for election as Ordinary Members or Associate Members in their conventional or corporate name. The Chamber member's annual subscription is Ordinary Rs. 480, Associate Rs. 360. An Ordinary Member on election pays an entrance fee of Rs. 1,000 and an Associate Member Rs. 100.

Officials and others indirectly connected with the trade, commerce or manufactures of India, or who may have rendered distinguished service to the interests represented by the Chamber may be elected by the Committee Honorary Members of the Chamber.

One of the most important functions performed by the Chamber is that of arbitration in commercial disputes. Rules for this have been in existence for many years and have worked most satisfactorily. The decisions are in all cases given by competent arbitrators appointed by the General Committee of the Chamber.

The Chamber elects representatives as follows to various public and semi-public bodies :—

Bombay Legislative Assembly: L. A. Halsall, C.B.E.; E. L. C. Gwilt.

Bombay Board of Communications: A. A. Pugh.

Bombay Port Trust: R. W. Bullock and M. Paspatti.

Bombay Port Pilferage Committee: F. J. Kennedy.

Bombay Customs Advisory Committee: R. H. Schuepp.

Bombay Port Committee Export Advisory Committee: M. Paspatti.

Bombay Municipal Corporation: E. E. Cockram.

Sydenham College of Commerce Advisory Board: R. W. Bullock.

Bombay Smoke Nuisances Commission: E. D. Shephard.

Indian Central Cotton Committee: L. F. H. Goodwin.

Cotton Piecegoods and Yarn Advisory Committee: A. G. Sotiriadi.

Empire Cotton Growing Corporation: S. B. Samollys.

Back Bay Reclamation Standing Advisory Committee: L. A. Halsall, C.B.E.

Ex-Services Association, India: L. F. H. Goodwin, O.B.E.

Ex-Services Association, Bombay Branch: R. J. O'shaughnessy.

Royal Bombay Seamen's Society: N. H. G. Grant.

Indian Sailors' Home Society: Capt. B. F. Hall and Capt. V. Bicknelle.

I. M. M. T. S. Dufferin: N. H. G. Grant.

Traffic Advisory Committee: A. A. Pugh.

Federation of Chambers of Commerce of the British Empire: A. L. Hutson.

Central Railway Local Advisory Committee: F. J. Kennedy.

Regional Employment Advisory Committee: R. E. Peters.

Telephone Advisory Committee: L. A. Halsall, C.B.E.

Senate of the Bombay University: R. E. Forrester.

Bombay State Transport Authority: W. W. Russell.

Bombay Joint Town Planning Committee: R. W. Bullock.

St. George's Hospital Nursing Association: L. A. Halsall, C.B.E.

Trade Marks Advisory Committee: A. G. Sotiriadi.

Sick and Destitute Seamen's Fund: W. P. Edwards.

New European Hospital Trust:—L. A. Halsall.

Indian Central Coconut Committee: C. E. Bingham.

A special department of the Bombay Chamber is its Statistical Department, which prepares a large amount of statistical returns connected with the trade of the port and of great importance to the conduct of commerce. The daily statements consist of a Daily Trade Return detailing exports from and imports into and shipping news of the port of Bombay, Arrivals of Cotton, Wheat, Seeds, Vegetable Oils, etc., by rail and sea into Bombay. Import and Export Manifests are issued twice a week and statements of Rates of Exchange, Current Quotations, etc. and Imports of Foreign Raw Cotton into Bombay, weekly. The monthly returns consist of Detailed Return of principal imports from Europe and elsewhere, a statement showing the exports from India of cotton and seeds, a summary of exports from Bombay of seeds, oil-cakes and sundry commodities, a return of imports of piecegoods and yarns into Bombay and a statement of exports of cotton by sea from Bombay.

The Chamber has also a Measurement Department, whose business is that of actual measurement of export cargoes in the docks before loading in steamers. Certificates are issued to shippers and ship agents as to the measurement of cotton and other goods in bales and packages. From the measurements given in these certificates the freight payable by the shippers of goods is calculated. The measurers are in attendance on the quays whenever there are goods to be measured and during the busy season on duty early and late.

The affairs of the Chamber are controlled by a President, Vice-President and Committee of 10, who are assisted by standing sub-committees of which there are 13, *viz.*—(1) Chemicals & Drugs, (2) Electricity, (3) Engineering (Imports), (4) Export, (5) Finance, (6) Import, (7) Income-tax, (8) Industrial Affairs, (9) Insurance, (10) Piecegoods (Import & Export), (11) Railways, (12) Shipping and (13) Weather-Working Days.

The Committee as a rule meet at least once a fortnight. The General Meeting of the Chamber must be held once a year and not more than fifteen months after the holding of the last preceding General Meeting.

The membership of the Chamber as on 1st January 1952 was Ordinary Members 318, Associate Members 64 and Honorary Members 9.

GENERAL COMMITTEE 1951-52.—C. S. Pettit (*President*); L. A. Halsall, C.B.E. (*Vice-President*); C. A. Cunliffe; H. C. MacColl; Naval H. Tata; E. L. C. Gwilt; R. W. Bullock; J. C. Burns; K. R. Marfatia; Pratapsinh Mathuradas; E. W. Oakley; M. Paspatti; L. A. Boult (*Secretary*).

Calcutta Chamber of Commerce—*Object :*—To foster and develop Trade, Commerce, Industry, Agriculture, etc. and safeguard the interests of commercial communities of India.

Membership :—Any firm, company, corporation, or individual doing business, lawyer, physician, banker or man of public importance is eligible for membership on payment of subscription as determined by the committee subject to the approval of the Committee.

Administration :—The affairs of the Chamber are executed by an Executive Committee, Calcutta 1. Phone: Cal. B.B. 2744.

Cocanada Chamber of Commerce.—The Cocanada Chamber of Commerce was established on 29th October 1868.

The following are the office-bearers of the Chamber, which has its headquarters at Cocanada, the chief port on the Coromandel Coast north of Madras :—

Members of the Committee.—H. Churchill (*Chairman*), N. C. Krishnaiah, M. S. Subramanyam, W. Le Faucheur (*Secretary*).

The rules of the Chamber provide that by the term 'member' be understood a mercantile firm or establishment, or the permanent agency of a mercantile firm or establishment, or a society of merchants carrying on business in Cocanada or other place in the Districts of Kistna, Godavari, Vizagapatam, and Ganjam, and duly elected according to the Rules of the Chamber, and that all such be eligible but only members resident in Cocanada can hold office. Members are elected by ballot. The Committee, when called upon by disputing members or non-members of the Chamber, give their decision upon all questions of mercantile usage and arbitrate upon any commercial matter referred to them for final judgment. In either case a minimum fee of Rs. 16 must accompany the reference with Rs. 5 from a non-member and Re. 1 from a member as payment for the Chamber's Sealed Certificate.

The Committee consisting of 3 members, including the Chairman, is elected by ballot at the general meeting in January in each year for a term of 12 months. The entrance fee for each member, whose place of business is in Cocanada, is Rs. 100 and for each member whose place of business is elsewhere is Rs. 50. Subscription for members whose place of business is in Cocanada, Rs. 150 per annum, payable quarterly, for others Rs. 75 per annum, payable in advance. The Committee usually meets once a month on the penultimate Thursday and the general body meets on the last Thursday.

Delhi Chamber of Commerce, New Delhi.—Was established in 1949 and was registered under the Indian Companies Act 1913 in January 1950. The main object for which the Chamber was established was to safeguard the interests of Indian Commerce, Industry, Trade and Agriculture of the State of Delhi in particular and of India in general. Member of the Federation of Indian Chambers of Commerce and Industry, New Delhi and of the Indian National Committee of the International Chamber of Commerce, Paris.

OFFICE-BEARERS FOR 1951-52.—*President:* Kirpa Narain; *Vice-President:* Ganga Saran, M.L.A., R. K. Jain; *Honorary Secretary:* Sirdar P. S. Sodhbans, F.C.A., F.L.A.A. (Lond.). *Office:* Dilbar Building, Original Road, Paharganj, New Delhi.

Federation of Indian Chambers of Commerce and Industry.—The Federation has 123 Chambers of Commerce and Commercial Associations affiliated to it as Ordinary Members, 9 Overseas Members and 79 Associate Members, and is recognised by the Central Government as the premier organisation representing commercial and industrial interests in the country. The headquarters of the Federation are situated in New Delhi. The Federation provides for four classes of membership, namely Ordinary, Honorary, Overseas and Associate.

Among the objects for which the Federation is established are the following :—

(*a*) To promote Indian businesses in matters of inland and foreign trade, transport, industry and manufactures, finance and all other economic subjects.

(*b*) To encourage friendly feeling and unanimity among the business community and association on all subjects connected with the common good of Indian business.

(*c*) To enter into any arrangement with any Government or authority supreme, municipal, local or otherwise, that may seem conducive to the Federation's objects or any of them, and to obtain from any such Government or authority all rights, concessions, and privileges which the Federation may think desirable to obtain and to carry out, exercise and comply with any such arrangements, rights, privileges and concessions.

(*d*) To sell or dispose of the undertaking of the Federation or any part thereof for such consideration as the Federation may think and in particular for shares, debentures or securities of any other company having objects altogether or in part similar to those of the Federation.

(*e*) To take or otherwise acquire and hold shares in any other company having objects altogether or in part similar to those of the Federation.

(*f*) To undertake and execute any trusts the undertaking of which may seem to the Federation desirable either gratuitously or otherwise.

(*g*) To draw, make, accept, discount, execute and issue bills of exchange, promissory notes, bills of lading, warrants, debentures and other negotiable or transferable instruments or securities.

OFFICE-BEARERS FOR 1951-52.

President :—C. M. Kothari, Madras.

Vice-President:—Shanti Prasad Jain, Calcutta.

Hon. Treasurer :—D. N. Sen, Calcutta.

Secretary :—G. L. Bansal.

Office :—23, Ferozshah Road, New Delhi.

Indian Chamber of Commerce, Calcutta.—The Indian Chamber of Commerce was established in November 1925 to promote and protect the trade, commerce and industries of India and in particular the trade, commerce and industries in or with which Indians are engaged or concerned; to aid and stimulate the development of trade, commerce and industries in India with capital principally provided by or under the management of Indians; to promote and advance commercial and technical education and such study of different branches of Art and Science as may tend to develop trade, commerce and industries in India.

There are two classes of members, local and mofussil. The local members pay an annual subscription of Rs. 500 and the Mofussil members Rs. 250.

Office-Bearers for 1951 :—*President:* L. N. Birla.

Vice-President: Sir B. P. Singh Roy.

Secretary :—Dr. R. D. Tiwari, M.A., LL.B., Ph.D., D.Litt.

Deputy Secretary :—L. S. Bisht, B.Sc., LL.B.

The following Associations are affiliated with the Chamber :—

Indian Merchants' Chamber.—The Indian Merchants' Chamber was established in the year 1907. Its objects are :—

(*a*) To encourage friendly feeling and unanimity among the business community on all subjects connected with the common good of Indian merchants.

(*b*) To secure organised action on all subjects relating to the interests of the Indian business community directly and indirectly.

(*c*) To promote the objects of the Indian business community in matters of inland and foreign trade, shipping and transport, industry and manufacture, banking and insurance.

(*d*) To collect and disseminate statistical and other information securing the promotion of the objects of the Chamber, and to make efforts for the spread of commercial and economic knowledge.

(*e*) To take all steps which may be necessary for promoting, supporting or opposing legislation or other action affecting the aforesaid interests by the Government or any Department thereof or by any local body or bodies, and in general to take the initiative to secure the welfare of the business community in all respects.

(*f*) To make representations to Local, or Central authorities, Executive or Legislative, on any matter affecting trade, commerce, manufacture or shipping, banking or insurance.

(*g*) To undertake by arbitration the settlement of commercial disputes and also to provide for arbitration in respect of disputes arising in the course of trade, industry or transport, and to secure the services of expert technical and other men to that end if necessary or desirable.

(*h*) To advance and promote commercial and technical education and to found and support establishments and institutions for such purposes.

(*i*) To undertake special enquiries and action for securing redress for legitimate grievances of any branch of trade or industry as also all such other action as may be conducive to the extension of trade, commerce or manufacture or incidental to the attainment of the above objects.

(*j*) To secure the interests and well-being of the Indian business communities abroad.

(*k*) To secure, wherever possible, organised and/or concerted action on all subjects involving the interests of members including regulating conditions of employment of industrial labour in various industries represented by the members of the Organisation.

(*ii*) To nominate delegates and advisers, etc., to represent the employers of India at the Annual International Labour Conference of the League of Nations.

(*iii*) To take up, consider and formulate ideas on the subjects which are on the Agenda of each International Labour Conference.

(*iv*) To take all steps which may be necessary for promoting, supporting or opposing recommendations or conventions of the International Labour Conference.

export duties on certain commodities were levied or the rates of existing duties were raised as in the case of hessian, sacking, raw cotton, cotton waste and raw wool.

These measures had in part a steadying effect on the general trend of prices, the months of October and November registering a decline. Thereafter the prices resumed an upward trend which became pronounced following the Chinese intervention in the Korean war and touched a high level at 438.6 in March 1951. The prolongation of the Korean war, rising import prices, heavy export commitments and higher prices granted by Government in a number of controlled commodities like sugar, sugarcane, gur, foodgrains, cotton texiles and rubber, contributed to the uptrend in prices; it also embodied the result of the decontrol of prices of raw jute and jute manufactures on March 9, 1951. In December 1950 Government increased the prices of sugarcane and sugar from Rs. 1-10 and Rs. 28-8 per maund respectively fixed earlier in October at the preceding season's level to Rs. 1-12 and Rs. 29-12. Gur prices were raised further and the pool price of imported food was raised in January because of a rise in overseas prices and freight charges. The rise in import prices of raw cotton and the grant of an increase of Rs. 150 per candy for indigenous cotton for the 1950-51 cotton season was announced on June 16, 1950 but its effect by way of higher prices for cotton manufactures was noted only in the closing stages of the year under review.

During the first quarter of 1951, the prices of coarse, medium, fine and superfine cloth were raised by anything between 6 per cent. in the case of superfine and 17½ per cent. in the case of coarse varieties. The voluntary cut of four per cent. in yarn prices was restored on March 5. An interim increase in the price of raw rubber from Rs. 90-8 to Rs. 122-8 per 100 lb. was granted with effect from March 7, 1951.

PRICES IN 1951-52

The fight against inflation in the financial year 1951-52 was greatly assisted by three factors. The first was the budget which aimed at a substantial revenue surplus and sought to finance the railway development by raising passenger fares. Since then, the surplus estimated at Rs. 26.1 crores in the budget has been revised upward to Rs. 92·61 crores. This substantial transfer of purchasing power from the hands of the public to the exchequer helped to hold inflation in check. Secondly, the sale proceeds of the wheat obtained from the American loan have also had the same effect of reducing the money supply in the hands of the public.

Another important step was taken in the middle of November 1951 by the raising of the Bank Rate from three per cent. at which it stood from November 1935 to 3½ per cent. The third factor was of an international character. Following the economic difficulties caused by the burden of the re-armament drive, country after country led by the United Kingdom imposed import restrictions, while the United States had to prune defence expenditure because of the danger of inflation.

As a result of the above factors, the general price index steadily sagged from 457.5, the all time peak level touched in April 1951, to 433.1 in the last month of 1951. Though overseas food prices ruled remarkably firm, the Indian food prices dropped by 2½ per cent. and those of industrial raw materials dropped by more than 12 per cent. By the time the new year opened, exports proved difficult owing to buyers' resistance, while the monetary squeeze had rendered hoarding difficult despite credit expansion. Conditions deteriorated in February when the crop movement was in full swing and the general price index fell further to 415.9 thereby wiping out the advance of the past 13 months.

TRADE MARKS

THE Trade Marks Act, 1940 (Act V of 1940) was passed by the Indian Legislature in March 1940 to provide for the registration and more effective protection of trade marks. Sections 1 and 85 of the Act came into force at once, and under the latter section, intending applicants for registration were enabled to deposit their trade marks. About 158,000 trade marks were so deposited, which have since been classified and indexed.

Before the other provisions of the Act could be brought into force the Act was amended in 1941 (Act XXVII of 1941) to establish a separate Trade Marks Registry in Bombay under a Bombay Registrar with jurisdiction over textile marks only. The Amended Act came into force on the 1st June 1942, but had again to be amended by the Trade Marks Amendment Act, 1943. The Act was further amended in April 1946 (Act XII of 1946) with a view to avoiding conflict of registration in the Princely States which had either passed Trade Marks Act of their own or proposed to do so in the near future, and also to make trade marks registered in any territory effective in all territories in which trade marks legislation has been enacted.

On the Federal Financial Integration of States in April 1950, the administration of trade marks in the States was taken over by the Centre and centralised at the Trade Marks Registry Bombay. With the extension of the Central laws to Part B and Part C States, the Trade Marks Act, 1940, now extends to the whole of India except Jammu and Kashmir.

The main office of the Trade Marks Registry is at Bombay, and the Register is also kept at Bombay. Mr. K. S. Shavaksha, B.A. (Oxon.), Bar-at-Law, is at present the Registrar of Trade Marks.

There are at present two branches of the Trade Marks Registry. One is established in Calcutta, at which a copy of the Register and the Refused Textile Marks List are kept. The Branch Registry is in charge of the Deputy Registrar who is empowered under section 4 (2A) of the Act to discharge, under the superintendence and direction of the Registrar, any function which under the Act may be discharged by the Registrar. Any reference in the Act to the Registrar includes a reference to the Deputy Registrar when so discharging any such function. Where the Registrar directs the Deputy Registrar to deal with a particular matter, he has in disposing of such matter the same powers as the Registrar. At present, the Deputy Registrar of Trade Marks is Mr. B. C. Ojha, B.A., Bar-at-Law, B.Com. The other branch is at Bangalore under the charge of an Examiner of Trade Marks, Mr. J. R. Keshavaraj, B.A., who is Ex-officio Dy. Registrar of Trade Marks and has the same powers as the Deputy Registrar at Calcutta in respect of matters directed by the Registrar to be dealt with by him.

The following is a summary of the important provisions of the Trade Marks Act, 1940:

A "mark" includes a device, brand, heading, label, ticket, name, signature, word, letter or numeral or any combination thereof; a "trade mark" means a mark used or proposed to be used in relation to goods for the purpose of indicating or so as to indicate a connection in the course of trade between the goods and some person having the right to use the mark. A trade mark may be registered only in respect of particular goods or classes of goods. Any person who is desirous of registering a mark should apply to the Registrar in the prescribed manner. The application may be made either at the Registry at Bombay or at the branch office at Calcutta, or Bangalore.

Under section 6 (1), distinctiveness is the prime requisite of a trade mark for registration. A registrable trade mark must consist of or contain at least one of the following essential particulars: (1) name of a company or individual represented in a special or particular manner, (2) signature of the applicant or some predecessor in business, (3) one or more invented words, (4) word or words, having no direct reference to the character or quality of the goods and not being according to its ordinary meaning a geographical name or surname or the name of a sect, caste or tribe in India and (5) any other distinctive mark. A mark consisting of a name, signature, or any word other than such as fall within the above description is not registrable except upon evidence of distinctiveness. In determining whether a trade mark is distinctive the extent of the inherent distinctiveness of the mark, as well as its acquired distinctiveness by use or otherwise, will be considered. The commonly accepted name of any single chemical element or chemical compound is not registrable in respect of a chemical substance or preparation. Trade marks which are contrary to law or morality, or disentitled to protection in a Court of Law by being likely to deceive or cause confusion or which are likely to hurt religious susceptibilities, are not registrable. The Act contains also special provisions for the registration of certification trade marks, and for defensive registration.

When an application for registration has been accepted subject to such conditions, if any, as the Registrar might think fit to impose, the Registrar shall cause the application to be advertised accordingly. Under section 15 (2) any person may in the prescribed manner oppose an application so advertised within 4 months, and after hearing the parties, the Registrar will decide whether registration is to be permitted. The date of registration of a mark, if and when registered, shall be the date of filing of the application therefor at the Registry.

The registration of a mark will be in force for 7 years in the first instance, after which it may be renewed for a period of 15 years. In all legal proceedings relating to a registered trade mark, the fact of registration shall be *prima facie* evidence of validity of the registration and of all subsequent assignments and transmissions. Further, after seven years from the date of registration, the validity of the original registration cannot be questioned except on grounds of fraud or deception or unless the mark offends against section 8.

The registered proprietor of a trade mark is entitled to an action for infringement under the Act. This valuable right is extended to owners of "old" marks, who had applied for registration of their trade marks within five years from the commencement of the Act and registration of which has been refused by the Registrar. The rights of action to passing off are not affected by registration, and are expressly preserved under the Act. Registration gives to the registered proprietor the exclusive right to the use of the trade mark in relation to the goods for which the mark is registered. Where a mark is already registered by one person, the same or nearly similar mark cannot be registered by another person, except in case of honest concurrent use or of other special circumstances section 10 (2).

The proprietor of a registered trade mark has power to assign the mark, and may assign it whether in connection with the goodwill of the business or not. A registered proprietor may also assign an unregistered trade mark without the goodwill of the business along with a registered trade mark under certain circumstances. Any assignment made without the goodwill by the business must be advertised as directed by the Registrar.

A person other than the proprietor of a mark may be registered as a registered user, on application being made both by the proprietor and such person to the Registrar in the prescribed manner, accompanied by particulars relating to their relationship, the control of the one over the other, and other facts relevant to the "permitted" use. The registered user may under certain circumstances file an action for infringement in his own name as if he were the proprietor, but cannot assign or transmit the mark.

Any person aggrieved by the presence of a mark or entry on the Register may apply in the prescribed manner to the Registrar or to a High Court for rectification of the Register. The registered proprietor may apply to the Registrar for correction or cancellation of any entry in the Register, relating to his trade mark. He may also apply for alteration of the registered mark in any manner not substantially affecting its identity.

With effect from the 1st January 1947, it has been an offence to describe a trade mark as registered when it is not so registered. This does not however apply to a trade mark, for the registration of which an application was filed at the Trade Marks Registry before 1st January 1947 and which has not been disposed of by the Registrar. The use of the word "Registered" however, is permissible if it is clearly indicated that the reference is to registration of the mark under the law of a country outside India or if the word is used solely in relation to goods to be exported to a foreign country where the mark is registered. Declaration of ownership of a trade mark under the Indian Registration Act of 1908 is not equivalent to registration under the Trade Marks Act, 1940, and the use of the word "registered" to signify registration of declaration of ownership would therefore be an offence with effect from the aforesaid date. The use of Royal Arms, Heraldic devices, and State emblems without due authority may be restrained by injunction from the Registrar or at the suit of any other person who is duly authorised to use such Arms, etc., but the rights to their use acquired before the coming into force of the Act, are not affected.

All appeals from the decisions of the Registrar lie to the High Court.

There are also special provisions for registration of textile trade marks and for the constitution of an Advisory Committee to advise the Registrar with respect to usages of the textile trade.

The criminal law relating to trade marks is contained in the Merchandise Marks Act (IV of 1889), which has recently been amended. Section 3 of this Act enacts Sections 478—489 of Chapter XVIII of the Indian Penal Code.

During the transitional period, *i.e.* from the 15th August 1947 to the 31st March 1948, the Trade Marks Registry, Bombay, had been registering trade marks for both India and Pakistan in accordance with the special provisions made in the Indian Independence (Miscellaneous Transitional Provisions) Order, 1947. These arrangements, however, terminated on the 31st March 1948. The Trade Marks Act, 1940 now extends to the whole of India except Jammu and Kashmir.

PRICES AND PRODUCTION

INDEX numbers of prices reflect the movement of prices within the economic system of a country. From the point of view of the State Governments in this country, they are the basis for determining the land revenue assessments.

WHOLESALE PRICE INDEX

The compilation of index number of wholesale prices has been undertaken since 1913. For this purpose, 1914 was taken as the basic year and the data collected for Calcutta and Bombay. In the latter case, another series was undertaken on the basis of the 1929 price level computed as 100. Today several State Governments publish fortnightly and monthly statements of retail and wholesale prices of certain important commodities.

The following table gives the index numbers of wholesale prices for Calcutta and Bombay from 1914 to 1939 :—

(End of July 1914=100).

Year	Calcutta	Bombay
1914 ..	100	100
1920 ..	201	..
1921 ..	179	198
1933 ..	87	98
1936 ..	91	96
1937 ..	102	106
1938 ..	95	101
1939 ..	108	109

The outbreak of the Second World War brought to the forefront the need for better compilation of price statistics and the Economic Adviser to the Government of India proposed the compilation of index numbers of wholesale prices in India by groups of articles. This was week ended August 19, 1939 as the base for sensitive index. Subsequently, another index for general purposes was also introduced with the year ended August 1939 as the base.

The following table relates to the index numbers of wholesale prices since 1939-40 on the basis of the average of monthly figures and of the week ended August 19, 1939 being equivalent to 100 :—

Year	Agricultural Commodities	Raw Materials	Primary Commodities	Manufactured Articles	Chief Articles of Export	General Index
1939-40*	127·5	118·8	124·2	131·5	130·5	125·6
1940-41	108·6	121·5	113·4	119·8	114·1	114·8
1941-42	124·2	146·9	132·5	154·5	137·3	137·0
1942-43	166·2	165·9	166·0	190·4	161·7	171·0
1943-44	268·7	185·0	232·5	251·7	233·4	236·4
1944-45	265·4	206·0	240·5	258·3	243·9	244·2
1945-46	272·6	210·0	246·2	240·0	248·9	244·9
1946-47	313·8	235·3	280·0	259·1	296·8	275·4
1947-48	356·9	454·0	312·6	287·8	..	307·0

* Seven months ended March 1940.

The index numbers of wholesale prices of slightly different groupings with the year ended August 1939 as the base, are given below.

PRICE TREND

(Year ended August 1939=100)

Average of Weeks	Food Articles	Industrial Raw Materials	Semi-manufactured Articles	Manufactured Articles	Miscellaneous Articles	General Index
1947-48	306·1	377·5	261·6	286·4	456·2	308·2

* The figure in the bracket is with 1944 as the base.

PRODUCTION TRENDS

During the year ended June 1950 efforts were continued to increase food production and about one million acres of land were reclaimed under mechanical cultivation. The total of wells and tanks newly constructed or repaired came respectively to 97,000 and 4,000, while the minor irrigation projects completed and waterlifting appliances installed numbered 14,000 and 17,000 respectively. The additional production is estimated at 7.9 lakh tons in 1948-49 and 9.5 lakh tons in 1949-50. The target for additional food output for 1950-51 was fixed at 1.7 million tons and Rs. 23.34 crores were provided for the purpose ; but the actuals fell short of the target and Government appointed a committee early in 1952 to go into the question of the grow-more food campaign.

Foodgrains production in 1949-50 season increased by 1.29 million tons to 45.55 million tons in spite of the damage caused to the kharif and rabi crops by adverse season and natural calamities. The production of raw sugar rose to 4.94 million tons and of coffee to 17,238 tons. During 1950-51 season the outturn of the crops once again suffered and the loss of foodgrains was to the tune of 5.5 million tons.

Following the partition, India's cotton and jute industries continued to experience difficulties in obtaining adequate supplies of raw cotton and raw jute and efforts to reduce the country's dependence on outside supplies were initiated in 1949-50 and continued in the following years. In order to provide additional incentive to the cotton growers, the ceiling prices for cotton were raised with *Jarilla* stepped up from Rs. 620 to Rs. 770 and further to Rs. 820. As a result, an additional output of four lakh bales of cotton was secured bringing the total production in 1950-51 to 33 lakh bales. A three-year programme was initiated for raw jute with the result that the production was stepped up from 30.89 lakh bales in 1949-50 to 32.92 lakh bales in the following year and to 46 lakh bales in 1951-52. Production of five major oil-seeds rose from 4.5 million tons in 1948-49 to 5.1 million tons in 1949-50 mainly because of the price incentive.

The following table gives the details of production of industrial raw materials in the Indian Union since 1947 as well as for the pre-war year 1939 :—

PRODUCTION OF INDUSTRIAL RAW MATERIALS

Commodity	Unit	1939	1947	1948	1949	1950	1951
1. Oil-seeds	(000 tons)	4,811	5,148	5,117	4,502	5,142	5,069

10. Raw Silk	(000 lbs.)	..	2,122	2,232	2,104	2,127	..

INDUSTRIAL PRODUCTION

The rising trend in industrial production since 1948 was on the whole well maintained in 1950 with most of the industries recording appreciable increases. The cotton and jute textiles and sugar industries were, however, notable exceptions, the first due to shortage of raw materials and since these had a large weightage in the computation of the general index of industrial production, the official index of industrial production for 1950 stood at 105.2 as compared with 106.3 in the preceding year and 108.9 in 1948. The increase was Particularly marked in the output of cement, steel, salt, diesel engines and electrical goods industries.

The year 1951 was a record thanks to the improvement in the supplies of raw materials and a more realistic price basis. Special efforts were made by Government to procure raw materials supplies through the International Materials Conference. The most outstanding development was the abolition of the control over raw jute and jute goods prices. The general index of industrial production, with 1946 as the basis, touched the spectacularly high level of 116.6. Coal output touched a new high under the stimulus of export inquiry ; cotton manufactures rose by 10 per cent ; paper, sugar, and chemicals showed an all round rise ; and for the first time self sufficiency was not only achieved in respect of salt but it was revealed that India could start exporting it in small quantities. The only snag was that in several newly started industries, the output still lagged considerably behind the installed capacity. Among the new lines of manufactures may be mentioned linoleum, automatic looms, carding engines and aluminium powder.

Industry	Unit	1947	1948	1949	1950	1951
Finished Steel	(000 tons)	893	856	930	1,005	1,070

REVIEW OF PRICES

The outbreak of the Second World War in September 1939 introduced a new chapter in the history of Indian commodity prices. After an initial rise, the prices received a sharp setback following the loss of export markets ; but the entry of Japan into the war made heavy calls on India's resources from the Allies and the resultant rise in note circulation aggravated inflationary pressures and the pace of the rise. The index number of wholesale prices, with the week ended August 19, 1939 equal to 100, rose to 125·6 in 1939-40, but receded in the following year by 10·8 to 114·8. Since then it advanced by 19 per cent. to 137·0 in 1941-42, farther by 25 per cent. to 171·0 in 1942-43 and recorded the highest rise of 38 per cent. in any one year during 1943-44 when it touched 236·4. During 1944-45 the price index advanced by only 7·8 to 244·2 and reached 244·9 in the following year. It was during 1946-47 that the policy of decontrol sent up the general price index by about 11 per cent. to 275·4 and further to 307·0 in 1947-48.

Price trends during 1948-49 fell into two distinct phases—a continued rise from April to July and a comparative stability during the rest of the year, with signs of a downward trend in the last quarter of the year. The latter phase was associated with the reimposition of controls, and a net contraction of Rs. 18 crores in money supply during the last eight months of the year. The general index number, with the year ended August 1939 as the base, shot up from 347·9 to 389·6 by July and then tapered off to 370·2, the average for the year being 376·2 revealing a rise of 22 per cent. over the year.

With the opening of the financial year of 1949, the prices began to advance upward till the Economic Adviser's general index, which stood at 370·2 in March 1949, touched 389·8 in September 1949 which exceeded the post-decontrol peak level reached in July 1948 and climbed to 393·3 in October 1949. The jump resulted in part from a sharp rise in the prices of certain export goods, in particular, tea, black pepper, oils and oil-seeds. Following the devaluation of the rupee, the Government of India adopted an eight-point anti-inflationary programme including a voluntary cut in the prices of manufactured goods and brought down the price index from 393·3 in October to 381·3 in December 1949. These efforts, however, proved temporary and practically the whole of the improvement of the preceding two months was lost by the close of March 1950, the general index moving up to 392·4 in March. The average for the year worked out at 385·4 as against 376·2 in 1948-49.

The uptrend in the general price level noticed during the closing quarter of 1949-50 gathered further momentum in the following year, particularly in the latter half. The continuation of the gradual rise in prices since devaluation was accelerated with the outbreak of the Korean war and prices reached a peak at 438.6 in March 1951 recording a rise of 11.8 per cent. over the year as against a rise of 6.0 per cent. in 1949-50. The rise was, however, less marked than that in the U.K. and the U.S. where the increase was as much as 27.4 per cent and 20.3 per cent. respectively.

To meet the situation, the Finance Minister enunciated in August 1950 an eight-point programme outlining the major objectives of Government's economic and financial policy, which envisaged measures to hold the price line and to ensure, through increased production, economies and larger supplies, that the inflationary pressures did not get out of hand. Steps were taken to relax import controls and prevent hoarding of foodgrains through the amendment of the Essential Supplies (Temporary Powers) Act, 1946. The Centre also assumed powers to legislate for one year from August 15, 1950 in respect of trade and commerce and production, supply and distribution of goods and these were extended later by another year. This was followed by the promulgation of the Supply and Price of Goods Ordinance. As an anti-inflation measure and in view of the wide disparity between the internal and external prices, fresh

PATENTS AND DESIGNS

THE law relating to Patents and Designs in India is contained in the Indian Patents and Designs Act, 1911 (II of 1911), as amended from time to time, ending with the amendments introduced therein by the Part B States (Laws) Act, 1951 (III of 1951) and other *ad hoc* and ancillary legislations and the Rules issued thereunder.

This law at present extends to the whole of India except the State of Jammu and Kashmir. With the extension of the Law to the whole of the Indian Union, the pre-existing patent laws, if any, in the " Indian States " have been repealed. The law does not extend to Pakistan, United Kingdom or any British possession.

The Patent Office at Calcutta which was established under the Indian Patents and Designs Act, 1911, is the only Office for the whole of India except the State of Jammu and Kashmir. The Office is in the charge of the Controller of Patents and Designs. It has no branches or agencies elsewhere.

India is not a party to the International Convention for the Protection of Industrial Property. But, arrangements for giving " Priority " patents and registered designs exist between India on the one side and each of the following countries on the other, *viz.*, Australia, Canada, New Zealand, Eire, the United Kingdom, the Union of South Africa, and Pakistan. In the case of Ceylon, priority arrangements exist in respect of patents only and not in respect of designs.

PATENTS

The main provisions of the Indian Patents and Designs Act which regulate the granting of patents and patent rights are briefly as follows :—

Varieties of Patents.—The Act provides for the granting of four kinds of patents, namely :—

(*i*) a patent, which is dated as of the official date of the application for the patent;

(*ii*) a patent of addition, for improvement or modification of an invention for which invention a patent has already been applied for or granted;

(*iii*) a secret patent for an invention relating to instruments or munitions of war;

(*iv*) a patent claiming " Priority," which is dated as of the official date of the corresponding application for patent first made in a country outside India which has established reciprocal arrangements with India for mutual protection of inventions.

What may be Patented.—The subject-matter of a patent should be a " manner of new manufacture," which may be any process or apparatus for producing, preparing, or making an article, or any article of manufacture. It is essential that the process, apparatus or article of manufacture should suggest an act to be done or an operation to be performed, and that the result must be a vendible product.

Illustrations of patentable inventions are new textile machines, power plants, agricultural implements, domestic appliances, drying and moistening apparatus and processes, and sanitary appliances. New compositions of matter may also be patented if their properties would not be deducible from known properties of their constituent substances. In the field of chemical industry, new processes and apparatuses for manufacturing synthetic products, food stuffs, dyes, soda ash, caustic soda, bleaching powder, toilet preparations and processes for the treatment of oil seeds, by-products and waste materials, would be patentable inventions.

The discovery of a hitherto unknown natural law is not patentable. Similarly, a method of calculation or a new notation for writing music, a new method of curing diseases, natural substances suitable for food, cannot be classed as 'manufactures,' and are, therefore, not patentable.

What are commonly called " patent medicines " are medicines prepared by secret formulæ and are not usually protected by the grant of patents. The proprietors of such medicines may in most cases possess trade mark rights in the names by which the medicines are known. " Patent or proprietary medicines " may be registered under the Drugs Act, 1940, which contains provisions for the prohibition of the import, manufacture and sale of mis-branded drugs. Applications for registration of patent or proprietary medicines should be made to the Central Drugs Laboratory, 110, Chittaranjan Avenue, Calcutta.

Who may obtain Patent.—Any person in possession of an invention may obtain a patent, irrespective of his nationality. The term " person " includes a company, a firm or a partnership. An application for an ordinary patent (*i.e.*, a patent which would be dated as of the official date of the application) may be made by any person either alone or jointly with others. An application for a patent of addition may be made only by the applicant for the original patent to which it is an addition as long as the application for the original patent is pending, or by the registered proprietor of the original patent if it has been granted. An application for a secret patent should be made by the inventor himself. An application for a patent which claims a " Priority date " may be made by the person who has made the application on which the claim to priority is based, or by his legal representative, or assignee, either alone or jointly with others.

Government Servants.—Subject to any special conditions of service or to any special orders applicable to the persons employed in any particular department, all government servants are at liberty to apply for a patent direct to the Patent Office. Government servants employed in the Defence Services, in the Indian Navy and in the Indian Air Force should not apply for patents except in the manner laid down in the Special Regulations applicable to them. Government servants employed on scientific or technical research should not apply or cause or permit any other person to apply for a patent for an invention made by them, save with the permission of the Government and in accordance with such conditions as the Government may impose. Railway servants are also subject to similar restrictions.

PROCEDURE FOR OBTAINING PATENTS

An application for a patent should be drawn up on the prescribed form and forwarded to the Controller of Patents and Designs, the Patent Office, No. 214, Lower Circular Road, Calcutta 17. As a rule, the inventor, or his legal representative or his assignee should be a party to the application. The application should be accompanied by a specification in duplicate, prepared on the appropriate prescribed form, and also the prescribed fee.

Specifications.—The specification which should accompany an application may be either a Provisional Specification or a Complete Specification. A Provisional Specification should describe the nature of the invention. A Complete Specification must particularly describe and ascertain the nature of the invention and the manner of performing it in practice. A Provisional Specification cannot be filed in respect of an application claiming " Priority date." A Complete Specification should, therefore, accompany every such application.

If a Provisional Specification accompanies an application it will be necessary to file the Complete Specification within 9 months from the date of the application. This period of nine months may be extended by one month by paying an additional fee of Rs. 10.

Drawings.—If the invention is capable of illustration by means of drawings, suitable drawings should also be filed in duplicate.

Fees.—The fees payable in respect of the filing of an application accompanied by a Provisional Specification is Rs. 10, and in respect of the filing of an application accompanied by a Complete Specification is Rs. 30. The fee payable in respect of filing a Complete Specification following a Provisional Specification is Rs. 20.

The fees may be paid in cash at the Patent Office, or may be sent by Postal Order, Money Order or Cheque, made payable to the Controller at Calcutta.

Examination.—An application properly filed in the Patent Office is accorded a serial number and date. Every application in respect of which a Complete Specification has been filed is, before it is accepted, examined with a view to ascertaining mainly whether the invention is *prima facie* a manner of new manufacture or improvement, whether the nature of the invention or the manner of performing it is particularly described, and also whether the statement of claim sufficiently defines the invention.

Acceptance.—On the acceptance of an application (other than an application for a secret patent), the specification and drawings in respect of it become open to public inspection. The acceptance is advertised by the Patent Office in the Gazette of India. The specification and drawings are also printed and a limited number of printed specifications are made available for sale. Printed specifications are identified by their serial numbers and are sold by the Manager of Publications, Civil Lines, Delhi, at Re. 1 a copy.

Opposition :—The grant of a patent on any application (other than an application for a secret patent) may be opposed by any person within 4 months of the date of advertisement of its acceptance.

Some of the grounds on which the grant of a patent may be opposed are—that the invention sought to be patented has been publicly used or made publicly known in any part of India; that the nature of the invention or the manner of performing it is not sufficiently or fairly described in the specification; or that the applicant for patent is not the true inventor but the applicant obtained the invention from the opponent or from a person through whom he claims.

Sealing the Patent.—In the absence of any opposition, or in the event of an opposition if the application passes the opposition successfully, the Patent Office would send the applicant a sealing fee demand notice, and on receipt from him of his request for sealing the patent accompanied by a sealing fee of Rs. 30, a patent is sealed on the application and the sealing is notified in the Register of Patents.

TERM AND CONTINUANCE

The normal term of a patent other than a patent of addition is 16 years from its date; but in special circumstances the term may be extended for a further period not exceeding 10 years. A patent of addition remains in force as long as the main patent is in force.

The continuance of a patent other than a patent of addition and a secret patent is subject to the payment of certain renewal fees. No renewal fees are payable for the continuance of patents of addition and secret patents.

To compensate patentees for losses due to circumstances arising out of the recent war and civil disturbances that followed in its wake, an *ad hoc* legislation, called the " Patents (Extension of Term) Ordinance, 1948 (Ordinance No. XXVI of 1948) " was promulgated by the then Governor-General. The said Ordinance came into force on the 1st October 1948 and expired on the 31st March 1949. According to this Ordinance patents of the category specified in

Sections 2 and 3 thereof have been granted an extension of their term for five years, without prejudice to their being further extended under Section 15 of the principal Act.

Effect of Grant.—The grant of a patent under the Act confers upon the patentee the exclusive privilege of making, selling and using the invention throughout India and of authorising others to do so.

After a patent is obtained, the patentee may sell the patent outright, or may grant licences for its exploitation, or may work the patent himself.

Infringement of Patents.—If, during the continuance of a patent, any person makes, sells, or uses the invention protected by the patent without obtaining a licence from the patentee, or counterfeits or imitates it, the patentee may institute a suit for infringement against such person. The defendant in an infringement suit may counter-claim the revocation of the patent.

A suit for infringement may be instituted in a District Court having jurisdiction to try the suit, but when a counter-claim has been made for the revocation of the patent, the suit along with the counter-claim is decided by a High Court.

Compulsory Licence.—As a safeguard against abuse of monopoly rights, provisions have been made in the Act, so as to enable any interested member of the public to apply to the Controller for a compulsory licence. The grounds on which a compulsory licence may be applied for, the relief available, procedure for disposal of the application, appeals, and procedure for disposal of appeals are respectively laid down in sections 22, 23, 23D, 23F and 23G of the Act.

Licences of Right.—As a supplementary provision, the Act has also conferred on the Central Government the right to apply to the Controller for endorsement of patents with the words " Licence of Right ". The effect of such endorsement is given in section 23B of the Act. Procedure for disposal, appeals and procedure for disposal of appeals are the same as those for a compulsory licence.

DESIGNS

The main provisions of the Act relating to the registration of designs and registered designs are briefly as follows :—

A Design means only the features of shape, configuration, pattern or ornament, applied to an article by any industrial process or means. To be registrable under Part II of the Act, a design must be new or original, and must be applicable to an article. A model or principle of construction of an article, or anything which in substance is a mere mechanical device cannot be registered as a design. Trade Marks and trade names are not designs for the purpose of the Act. Literary or artistic creations such as books, pictures and music which fall under the Indian Copyright Act III of 1914, do not also come within the scope of the Indian Patents and Designs Act.

The novelty or the originality of a design is judged solely by the eye with reference to the external appearance of the finished article to which the design is applied. Neither the constructional details of the article which would not be visible in the finished article, nor the utility of the article, would be relevant for deciding the registrability of the design. The novelty and the originality of a design will be destroyed by the publication of the design.

For purposes of registration of designs, goods to which the designs are to be applied have been grouped into fourteen classes according to the substances composing the article. If an article is composed of more than one substance, it is classified according to the predominant substance.

WHO MAY APPLY AND HOW

Any person claiming to be the proprietor of a new or original design not previously published in India may apply for the registration of the design.

An application for the registration of a design should be drawn up on the prescribed form and should be forwarded to the Controller of Patents and Designs. The prescribed fee and four copies of the design should accompany the application. The fee payable for filing an application for registration of a design in any one of the classes Nos. 1-12 is Rs. 3, and for registration in class No. 13 or 14 is annas eight only.

The copies of the design which should accompany an application may be drawings, photographs, tracings or specimens. The representation of the design should be such as would enable a person looking at it to form a mental picture of the shape, configuration, pattern or ornament of the finished article to which the design is to be applied. Representations illustrating merely the method or principle of construction or the operation of the article, are not suitable.

It is possible to register a design in more than one class, if the article to which it is to be applied is composed of substances included in different classes.

Copyright on Registration.—The registration of a design confers upon the registered proprietor, for a limited period, the exclusive right to sell or to make for sale any article to which the registered design has been applied.

The period of copyright obtainable on registration of a design is initially five years, but this initial period can be extended to two further periods of five years each, on payment of a fee of Rs. 10 for each period of extension.

Infringement.—During the existence of copyright in a registered design, the unauthorised application of the design to the article in question for purpose of sale is prohibited. The penalty for each infringement is a sum not exceeding five hundred rupees recoverable as a contract debt; the proprietor may, in the alternative, elect to bring a suit for the recovery of damages and for an injunction against the repetition of the infringement, in which case the infringer is liable to pay such damages as may be awarded. By an amendment made in Section 18 of the Indian Sea Customs Act (No. VIII, of 1878), it has been rendered possible to stop the importation into India of goods bearing a pirated design.

Cancellation.—The registration of a design may be cancelled on the ground that the design has been previously registered in India, or the design has been published in India prior to the date of registration, or the design is not new or original. An application for cancellation may be made by any interested person at any time to a High Court, or to the Controller within one year from the date of registration on the ground of prior registration or prior publication mentioned above.

Registers.—The Patent Office maintains a Register of Patents and a Register of Designs. Particulars of name, addresses, nationalities of the grantees of patents, the titles of inventions, dates of patents, renewal of patents and transactions affecting the proprietorship or validity of patents are notified in the Register of Patents. Similar particulars in respect of designs accepted for registration are notified in the Register of Designs. The Registers are open to inspection by the public on payment of a fee of Re. 1 in respect of each patent or design.

Certificates.—Certified copies, sealed with the seal of the Patent Office, of any entry in the Register of Patents and the Register of Designs may be obtained by any person on application to the Controller, accompanied by the prescribed fee.

A technical library is attached to the office. The library is open to the public, free of charge.

A Patents Enquiry Committee, presided over by Dr. Bakshi Tek Chand, Member of Parliament submitted their final report to the Central Government on April 30, 1950. This report deals with all aspects of the subject and is priced Rs. 3 per copy. Copies of the report can be purchased from the Manager of Publications, Civil Lines, Delhi. The report is under consideration by the Central Government.

COPYRIGHT

COPYRIGHT in every original literary, dramatic, musical and artistic work means the sole right to produce or reproduce the work or any substantial part thereof in any material form whatsoever; to perform or in case of a lecture to deliver the work or any substantial part thereof in public; if the work is unpublished, to publish the work or any substantial part thereof. Amongst other things it includes the sole right to produce, reproduce, perform or publish any translation of the work; in the case of a dramatic work, to convert it into a novel or other non-dramatic work and in the case of a novel or other non-dramatic work or of an artistic work, to convert it into a dramatic work by way of performance in public or otherwise, and in the case of a literary dramatic or musical work, to make any record, perforated roll, cinematograph film or other contrivance by means of which the work may be mechanically performed or delivered. Copyright also includes the right to authorise any such acts as aforesaid.

Publication in relation to any work means the issue of copies of the work to the public but does not include the performance in public of a dramatic or musical work, the delivery in public of a lecture, the exhibition in public of an artistic work or the construction of an architectural work of art, but the issue of photographs and engravings of works of sculpture and architectural works of art shall not be deemed to be publication of such works.

COPYRIGHT ACT

Copyright in India is governed by the Indian Copyright Act III of 1914 which made the imperial Copyright Act of 1911 applicable to India with such modifications as appeared to be desirable for adapting its provisions to the circumstances of India. The portions of the Imperial Act made applicable to India form the First Schedule to the Indian Copyright Act III of 1914.

Copyright subsists throughout the parts of the Commonwealth to which the Imperial Act extends. Registration is no longer necessary but the publisher of every book has to supply a copy thereof as provided in the Copyright Act and in the Press and Registration of Books Act XXV of 1867. The author of a work is the first owner of the copyright therein and may assign the right either wholly or partially (copyright being a bundle of different rights) and either generally or subject to limitations, or may grant any interest in the right by license to another person but no such assignment or grant is valid unless it is in writing signed by the owner of the right in respect of which the assignment or grant is made or by his duly authorised agent.

DURATION OF COPYRIGHT

Generally the term for which copyright subsists is the life of the author and a period of 50 years after his death but at any time after the expiration of 25 years or in the case of a work in which copyright subsisted at the time of the passing of the Imperial Act of 1911, 30 years from the death of the author of a published work, copyright in the work is not deemed to be infringed by the reproduction of the work for sale if the person reproducing the work proves that he has given the notice in writing prescribed by the Government of India of his intention to reproduce the work and that he has paid in the prescribed manner to or for the benefit of the owner of the copyright, royalties in respect of all copies of the work sold by him calculated at the rate of 10 per cent. on the price at which he publishes the work.

If, at any time after the death of the author of a literary, dramatic or musical work, which has been published or performed in public, a complaint is made to the Supreme Court of India that the owner of the copyright in the work has refused to re-publish or allow the re-publication of the work or has refused to allow the performance in public of the work and that by reason of such refusal the work is withheld from the public, the owner of the copyright may be ordered to grant a licence to reproduce the work or perform the work in public as the case may be on such terms and subject to such conditions as the Supreme Court may think fit.

DURATION OF SOLE OWNERSHIP

In the case of works first published in India copyright is subject to this limitation that the sole right to produce, reproduce, perform or publish a translation of the work subsists only for a period of 10 years from the date of the first publication of the work but if within the said period the author or any person to whom he has granted permission so to do publishes a translation of any such work in any language, copyright in such work as regards the sole right to produce, reproduce, perform or publish such translation in that language is not subject to the limitation above prescribed.

The term for which copyright subsists in photographs is 50 years from the making of the original negative from which the photograph was directly or indirectly derived and the person who was owner of such negative at the time when such negative was made is deemed to be the author of the work.

MUSICAL INSTRUMENTS

The provisions of the Act as to mechanical instruments for producing musical sounds were found unsuitable to Indian conditions. "The majority of Indian melodies," it was explained in Council, have not been published, *i.e.*, written in staff notation, except through the medium of the phonograph. It is impossible in many cases to identify the original composer or author, and the melodies are subject to great variety of notation and tune. To meet these conditions S. 5 of the Indian Act follows the English Musical Copyright Act of 1902 by defining musical work as meaning any combination of melody and harmony, or either of them, which has been reduced to writing.

The Copyright Act does not apply to designs capable of being registered under the Patents and Designs Act II of 1911 except designs which though capable of being so registered are not used or intended to be used as models or patterns to be multiplied by any industrial process.

INFRINGEMENT OF COPYRIGHT

Copyright in a work is considered to be infringed by any person who without the consent of the owner of the copyright does anything, the sole right to do which is conferred by the Copyright Act on the owner of the copyright. Where copyright in any work has been infringed, the owner is entitled to all remedies by way of injunction, damages and accounts. Every suit or other civil proceeding regarding infringement of copyright must be instituted and tried in the High Court or the Court of the District Judge. An action in respect of infringement of copyright cannot be commenced after the expiration of 3 years next after the infringement. No Court inferior to that of a Presidency Magistrate or a Magistrate of the First Class can try any offence against the Copyright Act. It is not an infringement of copyright to publish a report in a newspaper of an address of a political nature delivered at a public meeting.

In the case of a work of joint authorship (which means a work produced by the collaboration of two or more authors in which the contribution of one author is not distinct from the contribution of the other author or authors), copyright subsists during the life of the author who first dies and for a term of fifty years after his death, or during the life of the author who dies last, whichever period is the longer.

Where a married woman and her husband are joint authors of a work the interest of such married woman therein shall be her separate property.

BULLION

PRECIOUS metals have always held a great place in the Indian economy both for purposes of ornamentation and for their value as store mainly because of the insecurity, lack of alternative sources of investment, and the general illiteracy of the people. The demand, however, depends on the state of the crops and their prices, or the season of the year. If it is the season of festivals and marriages, for instance, the demand will be higher.

SILVER

Prior to the more intensive exploitation of the Mexican silver mines in 1552, Spain was the world's biggest supplier of silver; but thereafter the American Continent began to assume increasing importance and now its production represents under normal conditions about 80 per cent. of the world's total silver output, while Australia is considered highly important as a potential source of supply. The downward trend in world silver production, noticed since 1940, was reversed during 1947, the estimated output of the Western Hemisphere rising to 120·2 million ounces, an increase of 8·5 per cent. over 1946. The increase was accounted for entirely by the United States whose output rose from 21·7 million ounces to 33·5 million ounces. The recovery in output was checked in the following year; but since 1949 an upward trend is discernible.

The following table gives details about the trend of silver production during 1946 and the past three years :—

(In millions of ounces)

	1946	1949	1950	1951*
United States	21·7	34·6	42·1	40·0
Mexico	48·3	49·5	49·1	41·0
Canada	13·7	17·6	22·4	23·0
Peru	—	10·6	13·5	13·5
Bolivia	—	6·6	6·6	6·7
Other South and Central American Countries	27·1	6·7	6·9	6·5
Total (Western Hemisphere)	110·8	125·6	140·6	130·7
Outside the Western Hemisphere	N.A.	23·0	24·5	24·5
World Production (Partial)	N.A.	148·6	165·1	155·2
India	0·015	0·011	0·16	N.A.

*Estimated by Handy and Harman.

Production outside the Western Hemisphere is difficult to estimate because the figures are so incomplete. In the Western Hemisphere it declined from 173·2 million ounces in 1942 to 110·8 million ounces in 1946. From this low level it steadily recovered to 140·6 million ounces by 1950, the major contributors being the U.S.A., Canada and Peru. Messrs. Handy and Harman estimate the output for 1951 at 7 per cent. below 1950. Outside the Western Hemisphere the principal producing country was Australia whose output remained unchanged at 10.5 million ounces.

History.—During the last war, the demand for silver increased for coinage as well as for war industries with the result that the U. S. stocks of silver declined by 340 million ounces, that is, from 3,343 million ounces in 1942 to 3,003 million ounces in 1944. To meet the demand, the U. S. A. passed the Green Act in July 1943 by which 410·9 million ounces of silver was given by the U. S. A. as lease-lend to be returned again, ounce for ounce, within five years after the declaration of the end of the emergency by the U. S. President. But this condition forced India and Britain to withdraw silver currency after the end of the war, with the result that the monetary demand for silver in the post-war period showed a downward trend. Simultaneously, the higher prices checked the consumption of silver by industries. After three successive years of decline, the U. S. Government holdings of silver showed a small gain of 1¾ million ounces at 2,718¼ million ounces at the end of 1946. These, however, rose phenomenally in 1947, the Treasury stocks including coins in circulation, soaring by 30 million ounces, from 2,718 million ounces to 2,748 million ounces and touched 2,896 million ounces at the end of 1951.

In the absence of an announcement by the U. S. President regarding the official termination of the war, no date had been fixed for the final settlement of the lend-lease silver accounts. The total outstanding of lend-lease silver as on December 31, 1947, stood at 410·5 million ounces.

Price movements of silver were largely governed by developments in silver legislation in the United States, the trend towards demonetisation and by the various restrictions on imports and exports. Following the expiry of the Green Act on December 31, 1945, a Silver Bill was enacted on July 31, 1946 authorising the Treasury to sell or lease for manufacturing use any silver, not pledged as monetary backing for silver certificates, at not less than 90½ cents per fine ounce and also to purchase all domestic silver mined after that day, if offered within one year after being mined, at a net price of 90½ cents. The tax of 50 per cent. on profits derived from transactions in silver, originally designed to prevent speculation at the expense of the Treasury, also continues to be in force in spite of considerable agitation.

On the other hand, the downward trend in the world's industrial demand noticed since 1946 was reversed, the estimated consumption rising from 121.3 million ounces in 1947 to 129·3 million ounces in 1948 as compared with the peak level of 176·5 million ounces in 1945.

The recent trend of silver consumption (partial data) is given in the following table :—

(In millions of ounces)

	1949	1950	1951

Total Consumption	178·8	183·2	228·6

1951 MARKET

The general pattern of the principal silver markets throughout the world did not change much during 1951 compared to the previous year. The price increases generated in most world commodity markets by the Korean situation were more extreme than the relatively moderate rise in the price of the white metal. The New York price continued to represent the basis for most international transactions; in London the market obtained no relief from exchange regulations; and Bombay remained isolated from the rest of the world in view of the continued ban by India on imports and exports.

In New York the opening rate of 80 cents was also the year's low, and the high of 90·16 cents was established on January 8. Right after the turn of the year, state Handy and Harman, there was a marked increase in demand. On January 4 the Bank of Mexico stated that although its stocks at the year-end amounted to about 42 million ounces, internal coinage needs, together with obligations to foreign governments, made further sales impossible. The resultant increase in price was thus due to the necessity of diverting some domestic silver from the U.S. Treasury to satisfy trade demand. Market supplies once again became restricted owing to transport difficulties in Mexico and consumers planned by the beginning of February to buy silver from the Treasury which had indicated a price of 91 cents per fine ounce under the authority granted by the Act of July 31, 1946.

From May the demand began to decline and on June 7 one of the principal producers offered silver at 89 cents. Later the Bank of Mexico announced that it would buy silver at 88 cents. Accordingly the New York price was issued at 87½ cents. There was, however, insufficient silver even at 88 cents and the published price returned to 90·16 cents on June 28 and remained unchanged at that level till October 4, when the market broke badly to 84¾ cents, but recovered on the following day to 88 cents. No further change in the rate took place in the rest of the year.

Imports of the metal in 1951 were estimated at 114 million ounces compared to 145 million ounces in the preceding year and 101·4 million ounces in 1949. On the other hand, exports totalled 8·3 million ounces. Despite the heavy purchases by the Bank of Mexico, its silver stocks declined by more than 10 million ounces in the year under review. It is estimated that the American carry-over of unsold stocks at the end of 1951 was unchanged at between 10 and 15 million ounces and about 107·5 million ounces were available to the U.S. arts and industries in 1951, while the stocks of the Bank of Mexico on December 31, 1951 amounted to less than 32 million ounces. Of the latter more than 25 million ounces are committed. It is, therefore, concluded that shipments to New York from Mexico will remain limited.

Reports from London place total imports for the first 11 months at 19 million ounces including 9 million ounces from Australia and 6 million ounces from Hong Kong and Persia as silver coins and 1.2 million ounces in metal from Hong Kong. Total exports in the same period amounted to 16 million ounces. Of these Netherlands bought 6 million ounces. The amount of silver released from official stocks in England for approved uses totalled about 16.5 million ounces representing an increase of 35 per cent. over the previous year's release. It is estimated that the Bank of England received only about 10 million ounces from the demonetisation of the silver coins.

The Bombay silver market remained isolated from the rest of the world and prices throughout 1951 remained comparatively high. Licensed imports were negligible around 46,000 ounces and the Reserve Bank made no sales to the market with the result that buyers had to rely, as in the previous year, on dishoarding of internal supplies augmented by an unknown quantity of metal smuggled into the country. A moderate quantity of silver coins from Nepal also came into the market. The high price for the year for nearby deliveries was reached around the end

of June when the Bombay quotation was about Rs. 208 per 100 tolas, equivalent on the basis of the official exchange rate to a little over $1·16 per troy ounce. Thereafter it declined to Rs. 183 equivalent to about $1·02 per troy ounce by the end of October after which the downward trend was more pronounced. The country's consumption dropped from an estimated 12 million ounces in 1950 to about 5 million ounces.

Reported demand for silver by foreign governments for coinage in 1951 amounted to some 44·580 million ounces, an increase of nearly 35·5 million ounces over the previous year. Saudi Arabia accounted for the largest portion used, having contracted with Mexico for about 26 million ounces. Next in importance was the demand from Western Germany estimated at 9·9 million ounces. Other foreign countries using silver for monetary purposes were Mexico with 4·5 million ounces and Canada with 3·8 million ounces. In the United States the Mint consumed 44·44 million ounces for subsidiary coinage as against 24·6 million ounces in 1950.

In spite of the marked falling off in demand during the last few months of the year, approximately 110 million ounces of silver were consumed in the American arts and industries during 1951. This represents a fall of 10 million ounces from 1950.

The following table gives the average silver quotations in New York and London since 1939 :—

	New York Official	London Spot
	Cents	Pence
1939	39·082	20·570
1940	34·773	22·281
1941	34·783	23·439
1942	38·333	23·499
1943	44·750	23·500
1944	44·750	23·500
1945	51·928	30·510
1946	80·151	48·700
1947	71·820	44·440
1948	74·361	45·004
1949	71·930	49·243
1950	71·169	64·796
1951	89·368	77·856

In the following table is indicated the amounts of silver held in the Treasury and outside the Treasury, broken down as to bullion, silver dollars and subsidiary coins :—

(In Millions of Fine Ounces)

	Dec. 31 1951 (est.)	Dec. 31 1950
Held in the Treasury :		
Securing Silver Certificates :		
Silver Bullion ..	1,603·7	1,578·3
Silver Dollars ..	232·8	241·9
Subsidiary Coin	1·3	2·6
Free Silver Bullion	127·0	159·9
Total Treasury Stocks	1,964·8	1,982·7
Outside the Treasury :		
Silver Dollars ..	147·0	139·1
Subsidiary Coin	783·4	739·4
Total Silver Outside the Treasury	931·3	878·5
Total Treasury Silver	2,896·1	2,861·2

From 1946 to 1950 the situation generally was one of over-supply. Since the middle of 1950, with the non-Communist world and especially the United States apparently committed to a long-term defence economy, there has been a growing demand for the use of silver not only in present lines but also as a substitute for those metals already under government allocation. Towards the end of 1951 and the beginning of 1952 the Bank of Mexico was a ready buyer of Mexico's output so that current shipments from that country were small. Cuba has not been a seller at any price below 90·16 cents. Unless trade demand in the U.S.A. declines permanently below current levels and assuming continued buying by the Bank of Mexico, any important price decline below 88 cents seems unlikely. The operations of the Bank of Mexico during 1951 resulted in a net fall of over 10 million ounces in official stocks without taking into account an additional 10 million ounces to be delivered in 1952. Its coinage needs will also provide an important outlet in the same year. On the other hand, it is not unlikely that other stocks might come into the market in the absence of an incentive to hold for a higher price. One such possible source is Japan, which holds about 50 million ounces pending official decision as to its disposition.

GOLD

Gold has played a key role in shaping the life and history of the world. Between 1493 and 1600, world's production of gold was placed at 24·2 million ounces. It steadily rose to 38 million ounces during the 50 years ended 1850. Since then, however, the production has risen rather spectacularly. The annual average output mounted from 3·5 million ounces in 1850 to 19·6 million ounces in 1929 and then to 35·2 million ounces in 1936, reaching the peak figure of 41 million ounces in 1940. The greatest part of this enormous increase came since the U. S. Administration raised its price of Gold from $20·67 per ounce to $35 an ounce which made the U. S. A. a sort of magnet strongly attracting the world's entire gold production. Details of Russian output since 1940 are not available; but it is believed to be considerable. During the war production received a set back owing to the diversion of manpower and equipment from gold mines to war requirements, but the downward trend started in 1941 was reversed in 1946. The following table gives the figures for world gold production in thousands of fine ounces.

World Gold Production

(In thousands of fine ounces)

—	1944	1945	1946	1947	1948	1949	1950

* Estimated or provisional figure.

The total world production in 1950 was placed at 26·1 million ounces representing an increase of 600,000 ounces over the preceding year. It was, however, still only 64 per cent. of the peak production attained in 1940.

The table below shows the changes in monetary stocks of gold with the Central Banks and Governments of certain countries.

Value of Monetary Stocks of Gold in Certain Countries

* Figures for 1948 and subsequent years are for Indian Union only.

The gold policy of the International Monetary Fund has been reviewed in the chapter on currency. Suffice it to mention here that on September 28, 1951 the Fund announced that it would no longer ban the sale of non-monetary gold at premium prices. Canada with an approximate production of 4¼ million ounces lost little time in taking advantage of the decision and permitted on October 26 mines to sell up to 100 per cent. of their gold output for export in any processed form not above 22-ct. fineness. It also announced later that the Gold Mining Assistance Act would be renewed on the same basis for a further period of two years. West Africa decided to permit the sale of only 40 per cent. of its current gold output, while Southern Rhodesia has agreed to limit to 17,000 ozs. per month which is approximately 40 per cent. of its production. A similar procedure was adopted by Tanganyika and Kenya. Australia also accepted virtually the same pattern.

As prospects of a quick settlement of the Korean war receded in the last quarter of 1950, the free market "Transit Europe" price rose from $38 to over $40 an ounce and hardened further to $44 in January 1951 on hopes of an early increase in the U.S. official price. With the relaxation of the international tension, the free market rate dropped towards the end of January to $42½ and in the spring to $40 where it remained throughout the summer. In October it fell further to $38¼ on renewed hopes of peace in Korea and prospects of larger free market supplies and thereafter moved between $38 and $39¼.

In view of the dominating position of the U.S. in the post-war world, the gold reserves of that country have become one of the indices of the economic position of other countries in the western group of nations. Until the latter part of 1949, the flow of gold to the U.S.A. continued to a point where reserves reached an all-time high of 24·7 thousand million dollars representing about two-thirds of the total official gold holdings of all nations, excluding the U.S.S.R. In the autumn of 1949 gold began to flow in the reverse direction, reflecting the effect of the sterling devaluation and the first signs of recovery among European nations receiving American aid. After the outbreak of the Korean war in June 1950, the balance of trade turned against the U.S. and the American outflow of gold quickened, running at a rate of about $250 million per month in the second half of 1950 and $300 million per month in the early part of 1951, after which the flow died down.

INDIA'S TRADE IN BULLION

Following the outbreak of World War II, restrictions were placed by India on the imports and exports of gold and silver. While imports were banned with effect from September 3, 1939, except under a license, export of gold alone were prohibited except with the permission of the Reserve Bank. Shipments to Empire countries and the U.S.A. continued to be free till June 11, 1943 and exports to neutral countries were permitted with the approval of the Secretary of State and subject to War Trade List considerations. From June 12, 1943, exports to all destinations except Ceylon were banned, while those to Ceylon were permitted under certain restrictions. The special facility given to Ceylon was, however, withdrawn on May 14, 1951.

The emergency powers, thus assumed by Government, were placed on a statutory basis by incorporating the necessary provisions either in the Foreign Exchange Regulation Act, 1947, or the Imports and Exports (Control) Act, 1947. Under the former Act imports and exports of gold are banned except with the permission of the Reserve Bank. In the case of silver, imports are banned but exports may be made under a licence from the Chief Controller of Exports. An appreciable inflow of smuggled gold has continued to take place.

The following table gives details of imports and exports of gold and silver :—

Yearly Average	Imports		Exports		Net Imports (+) Net Exports (—)	
	Ounces million	Rs. in lakhs	Ounces million	Rs. in lakhs	Ounces million	Rs. in lakhs

INDIAN MARKET

Though India happened to be an important consumer of the world's production of silver and gold, the bullion markets were not on an organised basis nor had the merchants any direct contact with London until 1905. The Exchange Banks in prominent cities used to negotiate all the deals before 1901 when a prominent choksey in Bombay opened his London office. In 1913-14 an Association of Silver Merchants was formed for the first time in Bombay and rules were framed for the settlement of accounts. Forward trading in gold was started in 1915 when for the first time gold was directly imported by a merchant from the U. S. In January 1923, the Bombay Bullion Exchange, Ltd. was floated with a view to putting forward trading on an organised basis. 13 years later the Exchange established a clearing house to facilitate the settlement of forward accounts. Till the outbreak of the Second World War, the market worked smoothly; but thereafter there were frequent suspensions, defaults and intervention by the High Court.

Towards the beginning of 1948, the Government of Bombay felt the need for reorganising the trade on a sound basis. With that end in view, a new Association called the Bombay Bullion Association was formed in September 1948 to replace the three existing institutions providing facilities for trading in bullion in Bombay city, *viz.*, the Bombay Bullion Exchange, the Marwadi Chamber of Commerce and the (Silver) Tukada Bazaar. The Government of Bombay extended the provisions of their Bombay Forward Contracts Control Act 1947 to the bullion trade on December 10, 1948 and forward trading in bullion was vested solely on December 25 in the new Association to the exclusion of the rest and defined the period of ready delivery as one day as against the maximum period of seven days allowed till then. A few days later, options were made illegal. The rules approved by Government provide for the appointment of two directors on the Board of the Association on behalf of Government. Forward trading under the auspices of the new Association was inaugurated on April 2, 1949 on the basis of monthly settlement under a new contract. The Association has a membership of 560 and has a governing Board of 20.

In March 1951 the Government of India introduced in Parliament a Bill to regulate forward trading in commodities. The Bill has been referred to the Select Committee.

MARKET REVIEW

In 1949-50 which was the first year of the working of the Bombay Bullion Association under the Bombay Forward Contracts Control Act, 1947, emergencies had arisen necessitating the intervention of Government in order to enact new bye-laws. In the following year, Government had, however, to supersede the Board owing to acute differences between its members and nominate a new one. The introductions of the margins led to court proceedings in May 1950. There were no official sales of bullion during 1950-51 except for a small quantity of silver valued at Rs. 3·32 lakhs disposed of on October 17 on behalf of the Porbunder Sub-Treasury and the State Bank of Saurashtra.

Since the commencement of World War II, bullion markets in India have been functioning, more or less, in isolation from world bullion markets. As a result, prices of gold and silver in India have been ruling substantially higher than in world markets. Though price movements were mainly influenced by internal factors, sentiment was, on occasions, as after the outbreak of the Korean War, affected by trends in world markets. Following the usual pattern of seasonal variations in prices, during 1950-51, the seasonal recession in prices between June and early November was followed by a steady uptrend which was more pronounced in silver. The uptrend was helped by fresh inflationary pressures and ready silver closed for 1950-51 higher while gold staged a slight decline.

During the larger part of the year, 1950-51, the quotations for silver ruled higher than in 1949-50. The average spot rate for 1950-51 was at Rs. 185-14-3 as against Rs. 174-11-0 in the previous year. In contrast, the quotations for gold were generally at lower levels than in 1949-50. The average spot rate for the year was Rs. 113-7-4 as against Rs. 114-14-11 in 1949-50. The trends in both metals, however, were more or less similar. The first phase was a continuation of the 1949-50 busy season uptrend, helped by the Finance Minister's statement that it would not be in the larger interests of the country to lift the ban on imports of gold while the manner of disposal of the available silver stocks with Government would be determined at an appropriate time. The second phase of recession, which started in June and continued until early November, seemed to have been influenced, in addition to the seasonal fall in demand, by certain special factors including heavy arrivals of smuggled and refugee gold and rumours of devaluation of sterling and of official sales of bullion. In the last phase which saw a resumption of the uptrend, the chief influences were (1) prolonged intensity of the seasonal demand, (2) a sharp rise in silver in the world markets, (3) a fall in supplies of gold as a result of the increased vigilance to check smuggling and (4) a deterioration in the international situation. The range of fluctuations during the year in the spot rate in Bombay was Rs. 15-6 as against a range of Rs. 12-8 in the previous year. The highest and the lowest rates were Rs. 120-2 (on May 6, 1950) and Rs. 104-12 (on November 2, 1950). During the year, the premium of the ready over forward varied between Rs. 1-15 and *minus* as. 11.

During the first two months of the year under review, sentiment in the silver section was bullishly influenced by several factors including a higher offtake, a rise in London and New York quotations and the imposition by the Government of India of a ban on imports into India of silver coins current in Nepal. The range of fluctuations in the rates for ready silver during 1950-51 was Rs. 24-14 as against a range of Rs. 33-14 in the preceding year. The highest and the lowest rates were Rs. 198-12 (on March 31, 1951) and Rs. 173-14 (on June 20, 1950), the corresponding rates in the preceding year being Rs. 192-12 and Rs. 158-14. The premium of the spot over the forward rates varied between Rs. 6-8 and *minus* as. 6.

1951-52 REVIEW.

The financial year 1951-52 opened with shortage of stock and upward trend of gold and silver, but the enthusiasm evaporated as the year moved forward. The speculative activities on the part of those was essentially confined to silver, which established an all-time high level. On the other hand the flow of smuggled gold became more intensified with the resultant fall in the market quotations.

In the first half of May 1951, there was a squeeze in silver and on May 14 a state of emergency had to be declared. Though the silver prices were consequently brought down, the stock position in the market during June was so heavy that a record *badla* charge of Rs. 11 was made in the settlement of silver accounts against bears and a system of margin had to be adopted and the settlement effected by compromise. In the following month, the speculative activity reached a climax and unprecedented levels of *badla* at Rs. 14 in silver on July 9 squeezed the bears. To curb speculation, the association, on the initiative of the Government of Bombay, introduced a system of automatic margin with effect from August 2. In the last quarter of 1951 and in the first quarter of 1952, however, the bullion market developed a sagging tendency which was accentuated by slump in the commodity market in the first week of March and stocks of gold and silver were thrown on the market irrespective of price consideration.

In the year under review, the spot quotation for silver touched an all-time peak level at Rs. 207-4 while the lowest level up to the middle of February was around Rs. 183-8. By and large, the forward quotation stood at a small discount over the forward position. Gold, on the other hand, maintained continuously a downward trend and fell from Rs. 118-10 touched in April 1951 to Rs. 104 at the end of December. Reduced demand, the decision of the International Monetary Fund in respect of gold sales to free market, rumours about devaluation and reduced offtake were the main factors to restrict the sentiment.

Since the beginning of November banks were reluctant to advance loan against bullion. This factor together with a large influx of smuggled gold and fears of a larger accumulation of stock hastened the downward movement towards the close of the year. Conditions, however, became worse in the last week of February owing to the deterioration in the commodity market and the spot rates for gold and silver dropped to Rs. 79 and Rs..139, which were new bottoms since the end of March 1945. In the latter half of March 1952 there was a minor recovery, but the general tone remained subdued.

The following statement gives the highest and lowest spot prices of gold and silver in Bombay with import duties since 1927-28 :—

	Gold (per fine tola).				Silver (per 100 tolas gross).			
Year.	Highest.	Lowest.	Average.	Import Duty.	Highest.	Lowest.	Average.	Import Duty.

NATIONAL INCOME

REALISING that national income estimates constitute a quantitative measure of the country's economic activity and their value increases more than proportionately if the estimates are available for more than a year, the Government of India appointed in August 1949 the National Income Committee composed of Prof. P. C. Mahalanobis (Chairman), Prof. D. R. Gadgil, Prof. V. K. R. V. Rao and Mr. R. C. Desai, Secretary of the National Income Unit, Ministry of Finance. Following Mr. Desai's resignation, Mr. Mukherjee was appointed at the beginning of 1950. The Committee was aided by a panel of distinguished foreign advisers consisting of Mr. J. R. N. Stone (Cambridge), Prof. Simon Kuznets (University of Pennsylvania) and Dr. J. B. D. Derksen (U.N. Statistical Office). Its first report was published on May 5, 1951 covering the estimates for the financial year 1948-49.

Agriculture, animal husbandry, and ancillary activities contribute roughly 48 per cent of the national income, says the report. Commerce, transport and communications amount to 19.5 per cent. Commodity production taken roughly as the total value contributed by agriculture, mining, manufacturing and hand-trades amount to Rs. 56·5 abja (milliard) or nearly two-thirds of the total national income. The estimated national income for 1948-49 is Rs. 87·1 abja. The population in 1948 was taken as 341 million and consequently the per capita national income works out at Rs. 255.

The following two tables give a broad picture of the distribution of national income though the Committee suggests that too much should not be read in the second table :

NATIONAL INCOME BY INDUSTRIAL ORIGIN : 1948-49

Item	Net Output (Rs. Abja)	Percentage
Agriculture :		
Agriculture, animal husbandry and ancillary activities	40·7	46·7
Forestry	0·6	0·7
Fishery	0·2	0·2
Total of Agriculture	41·5	47·6
Mining, Manufacturing and Hand-trades :		
Mining	0·6	0·7
Factory establishments	5·8	6·6
Small enterprises	8·6	9·9
Total of Mining, etc.	15·0	17·2
Commerce, Transport and Communications :		
Communications	0·3	0·3
Railways	2·0	2·3
Organised banking and insurance	0·5	0·6
Other commerce and transport	14·2	16·3
Total of Commerce, etc.	17·0	19·5
Other Services :		
Professions and liberal arts.	3·2	3·7
Government Services (Administration)	4·6	5·3
Domestic Service	1·5	1·7
House Property	4·5	5·2
Total of other Services	13·8	15·9
Net domestic product at factory cost	87·3	100·2
Net earned income from abroad	—0·2	—0·2
Net National Output at factory cost=NATIONAL INCOME	87·1	100·0

ESTIMATE OF NET OUTPUT PER ENGAGED PERSON : 1948-49

	Net Output (Rs. Abja)	No. of Persons Engaged (Lakhs)	Net Output per Engaged Person (Rs. in 000)
Agriculture	41·5	816	0·5
Mining and Factory Establishments	6·4	34	1·9
Small Enterprises	8·6	134	0·6
Total of Mining, Manufacturing and Hand-trades	15·0	168	0·9
Railways and Communications	2·3	11	2·1
Banking, Insurance and other Commerce and Transport	14·7	89	1·6
Total of Commerce, Transport and Communications	17·0	100	1·7
Professions and liberal Arts	3·2	47	0·7
Government Services (Administration)	4·6	35	1·3
Domestic Service	1·5	35	0·4
House Property	4·5	....	....
Total of other Services	13·8	117	1·2
NET DOMESTIC PRODUCT AT FACTORY COST	87·3	1,201	0·73

Out of a total net domestic output of Rs. 87·3 abja, the net output of government enterprises and government administration amounts to Rs. 3 abja and Rs. 4·6 abja representing 3·4 per cent and 5·3 per cent respectively of the total, while the net output of the private sector amounts to Rs. 79·7 abja equal to 91·3 per cent of the total.

The net national expenditure at market price totals Rs. 91·7 abja out of which government administration, government administrative capital expenditure and government enterprises capital expenditure are Rs. 6·3 abja, Rs. 0·8 abja and Rs. 1·2 abja, *i.e.*, 6·9 per cent, 0·9 per cent and 1·3 per cent respectively. It will be noted that government draft on private income amounting to Rs. 87·3 abja is to the extent of Rs. 6·9 abja composed of Rs. 2 abja as direct taxes, Rs. 4·2 abja as indirect taxes and Rs. 0·7 abja as miscellaneous fees, etc.

Dealing with the consumer expenditure, the report points out that only fragmentary and dimensional indications are available in isolated cases. For example, out of a total national product of Rs. 87 abja in 1948-49 the consumer expenditure on food probably amounted to about Rs. 46 abja or nearly 58 per cent of the national income. The high proportion of consumer expenditure on food shows in a general way the underdeveloped character of our economy.

FINANCE

THE war meant a change to Indian finance. To understand the implications of the change it may be noted, that (a) the aggregate war expenditure in India, including recoverable war expenditure during the period 1939-40 to 1945-46 came to Rs. 3,484 crores, India's share being Rs. 1,744 crores or about 50 per cent. and (b) that the over-all Governmental India's public revenue, expenditure and debt outlay (war and civil expenditure) amounted to Rs. 3,996 crores of which Rs. 1,462 crores or 37 per cent. was met out of revenue, the balance being partly reflected in the accumulation of sterling balances and partly in the addition to India's public debt which increased by Rs. 1,077 crores. The following table gives an idea of the change brought about by the war in between 1938-39 and 1945-46 :—

(Rs. in Crores)

	1938-39	1945-46
I—Central Government Budget		
Revenue	84·52	360·67
Expenditure	85·15	484·57
Deficit	—0·63	—123·90
II—Total Governmental Outlay	85·15	894·20
A. On India's Account :		
(*i*) Civil Expenditure	38·97	124·34
(*ii*) Defence Expenditure	46·18	395·32
B. Recoverable War Expenditure	—	374·54
III—Central Government Debt at the end of year—		
(*i*) Sterling Loans	464·94	33·84
(*ii*) Rupee Loans	437·87	1,492·20
(*iii*) Small Savings	141·45	221·52
(*iv*) Treasury Bills and Ways and Means Advances ..	46·30	83·33
(*v*) Total Interest Bearing Advancest	1,205·76	2,282·38

General Rise

Total revenue, both tax and non-tax, increased during this period rapidly. Customs receipts in contrast began to shrink owing partly to transport difficulties as the war reached its climax. From being the main source of revenue in 1938-39, at Rs. 40.51 crores, it dwindled to Rs. 25.12 crores in 1942-43, although it recovered to Rs. 39.76 crores by 1944-45. Central excise duties expanded during war years to a remarkable extent reflecting the increased purchasing power in the hands of the public. This expansion was secured not only by enhancing the rate on existing items but also by adding new items such as tobacco, vegetable products, betelnuts, coffee and tea.

The largest expansion in yield was, however, from direct taxation under corporation, income and excess profits taxes. These three taxes contributed from 20.2 per cent. in 1940-41 to 49.1 per cent. in 1944-45. From 1942-43 to 1945-46 one-half to three-fifths of the total revenue came from these taxes. Total tax revenue increased from Rs. 72.34 crores in 1938-39 to the peak figure of Rs. 282.67 crores in the revised estimates for 1945-46. Non-tax revenue also spurted up, specially after 1940-41, owing mainly to increased contributions from Railways and Post and Telegraphs and the larger profits of the Reserve Bank of India.

The expenditure under Defence mounted up steadily, especially after 1941-42, *i.e.*, after the entry of Japan into the war. From Rs. 49.54 crores in 1939-40 it rose to the peak figure of Rs. 458.32 crores in 1944-45, the last full year of the war. The charges for the servicing of debt more than doubled from Rs. 14.12 crores in 1938-39 to Rs. 22.21 crores in 1944-45 and Rs. 33.85 crores in the revised estimates for 1945-46 and this might have been larger still but for decreases in the effective rates of interest.

Deficits on revenue account grew in size from Rs. 6.53 crores in 1940-41 to Rs. 12.69 crores in 1941-42 and Rs. 112.17 crores in 1942-43 reaching the peak figure of Rs. 189.78 crores in 1943-44. With the deficit of Rs. 161.14 crores during 1944-45 and Rs. 144.95 crores in the following year, the total volume of deficits during the period 1940-41 to 1945-46 came to Rs. 627.26 crores.

POST-WAR PERIOD

The year 1946-47 may be regarded practically as the first post-war year which had to face the possible effects on the country's economy of a steep fall in war-time expenditure and income levels and the legacy of war-time inflation. The Finance Minister announced a substantial tax relief of which details are given below and envisaged a deficit of Rs. 44·06 crores after taking into account the war risks insurance funds amounting to Rs. 26·10 crores and tax reliefs. The revenue was placed at Rs. 311·65 crores and expenditure at Rs. 355·71 crores.

The tax relief included the abolition of E.P.T. after March 31, 1946, a special initial depreciation allowance of 10 per cent. on new buildings and of 20 per cent. on new plant and machinery, allowances for income-tax in regard to expenditure on research, the relief from import duties on raw materials and a reduction in duty on plant, a net reduction of as. 1½ in company taxation and an exemption from income-tax for two years in the case of residential buildings and an initial depreciation allowance of 15 per cent. for business premises. The ceiling of tax on life offices was lowered by three pies to as. 5. Concessions were also granted in respect of taxation on personal incomes.

Under indirect taxation, the duty on kerosene oil was reduced by nine pies from as. 4½ to as. 3¾ per imperial gallon and on motor spirit from as. 15 to as. 12. Later, further concessions were granted by reducing the duty on kerosene to as. 3, a reduction in excise duty from as. 2 to anna one and of anna ½ in the customs duty on betel-nuts from the proposed level, and a reduction in the unexposed cinematograph film from 6 pies per linear foot as originally proposed to 3 pies, in the price of a match box from 9 pies to 6 pies and in the price of a post card from 9 pies to 6 pies.

The policy of providing economic incentives to meet the post-war problems gave way to that aimed at social objectives in framing the budget for 1947-48. With that end, relief was given to lower income groups, business profits tax was introduced at 16⅔ per cent. on profits above Rs. one lakh, a graduated tax on capital gains exceeding Rs. 5,000 was levied, the rate of corporation tax was doubled and a steep increase was made in taxation of unearned incomes.

Following the political division of the country on August 15, 1947, the budget for the period August 15, 1947 to March 31, 1948 was presented on the basis of the then existing taxation. The budget for 1948-49 was framed with the object of providing incentives once again. It reduced the business profits tax from 16⅔ per cent. to 10 per cent., lowered the tax on undistributed profits of companies from as. 5 to as. 4, increased the limit of income for maximum taxation and gave special relief to small companies. Against this, the corporation tax was raised from two to three annas. Certain excise and customs duties were also raised.

Introducing the budget for 1949-50, the Finance Minister stated that the problem was one of raising additional revenue to cover the budget deficit and of considering adjustments in taxation in the light of experience. The twin objects were to check inflation and to allay the fears of business men and investors. With these ends in view, the relief in taxation took the form of abolition of the capital gains tax, reduction of the tax on incomes upto Rs. 10,000 by three pies, reduction in super-tax, rebate of half of the corporation tax to public companies with an income of Rs. 25,000, rebate of half the duty on aviation spirit, and abolition of the duty on exports of oilseeds and vegetable oils. On the other hand, indirect taxation was raised. The latter included a rise in postal rates, surcharges on import duties of a large variety of goods, a new duty of 15 per cent. on exports of cigarettes, cigars, etc. and an increase in the excise duty on sugar from Rs. 3 to Rs. 3-12 per cwt. and on tyres from 15 per cent. to 30 per cent. and the continuation of excise duties on mill cloth.

The additional taxation was expected to yield Rs. 20·59 crores, while the relief was to the extent of Rs. 5·35 crores. Minor changes were made in the taxation proposals by the Legislature and the budget for 1949-50, as passed by the Legislature, placed the revenue at Rs. 323·02 crores and expenditure at Rs. 322·53 crores. The defence expenditure on revenue account was estimated at Rs. 157·37 crores.

POST-INDEPENDENCE FINANCE

The Constitution of India declaring India a Sovereign Republic was made effective from January 26, 1950. It provides that the annual financial statement to be submitted to Parliament will show separately (1) expenditure charged upon the Consolidated Fund of India and (2) other expenditure proposed to be made

from the same Fund and will distinguish expenditure on revenue account from other expenditure. All revenues received by the Government of India and all loans raised by that Government and all moneys received in payment of loans will constitute the Consolidated Fund of India. All other public moneys received shall be credited to the public account. Parliament may establish a Contingency Fund which will be at the disposal of the President for making advances for meeting unforeseen expenditure pending its authorisation by Parliament.

The financial provisions in the Constitution divide the field of taxation between the Union and States. The Union List covers (1) taxes on income other than agricultural income, (2) customs duties, (3) duties of excise on tobacco and other goods produced in India except alcoholic liquors, opium, Indian hemp and other narcotic drugs and narcotics but including medicinal and toilet preparations containing alcohol, (4) corporation tax, (5) taxes on the capital value of the assets, exclusive of agricultural land, of individuals and companies and on the capital of companies, (6) estate duty on property other than agricultural land, (7) duties in respect of succession to property other than agricultural land, (8) terminal taxes, (9) taxes other than stamp duties on transactions on stock exchanges and futures markets, (10) rates of stamp duty on bills of exchange, cheques, promotes, bills of lading, letters of credit, insurance policies, transfer of shares, debentures, proxies and receipts, and (11) taxes on the sale or purchase of newspapers and on advertisements published therein.

The financial provisions of the Constitution of India closely follow the Government of India Act, 1935. It enumerates in three separate lists the Union, State and Concurrent subjects of legislation. Residuary powers of legislation vest in the Union Parliament. The items in the respective lists are broadly the same as under the Government of India Act, 1935. There are some changes in the division of tax resources between the Union and the States. Article 286 of the Constitution restricts the powers of the States in regard to sales tax with a view to ensuring uniformity in the principles governing the tax which, however, will be levied and administered by the States. A State Government cannot impose a tax on the sale or purchase of goods outside the State or if it concerns India's foreign trade or inter-State trade or if the goods in question are declared by Parliament to be essential to the life of the community. Taxation on the sale or purchase of newspapers and of advertisements published in them is included among taxes levied and collected by the Union but the proceeds will be assigned to the States. No changes are made in the sharing of income-tax proceeds. A prescribed percentage of the net proceeds from taxes on income other than agricultural income (exclusive of the corporation tax, taxes payable in respect of Union emoluments and proceeds attributable to Part C States) shall be assigned to the States in which they are levied. The limit of the total amount of the tax on professions, trades, callings and employments payable by any one person to a State or to a local authority is raised from Rs. 50 to Rs. 250 per annum. The provision that, if Parliament by law so provides, the whole or any part of the net proceeds of an excise duty levied and collected by the Union may be paid over to the States, is retained. The Union retains the power to levy surcharges on certain taxes for purposes of the Union.

The jute-growing States are no longer entitled to a specified share of the net proceeds of the export duty on jute or jute products. Under Article 273 of the Constitution, the jute duty is assigned wholly to the Centre; the States of West Bengal, Assam, Bihar and Orissa will receive, however, grants-in-aid, so long as the jute export duty is levied or for a period of 10 years, whichever is earlier. As under Section 142 of the Government of India Act, 1935, Article 275 of the Constitution of India provides for general grants-in-aid to such States as Parliament may determine to be in need of assistance; the amount of the aid may vary as between States and from year to year. The Article provides for grants-in-aid to States in respect of approved schemes of development for promoting the welfare of Scheduled Tribes or for raising the level of administration of the Scheduled Areas and for grants-in-aid to Assam of sums equivalent to (1) the average excess of expenditure over revenues during the two years immediately preceding the commencement of the Constitution in respect of the administration of (specified) tribal areas, and (2) the costs of such schemes of development as may be undertaken by that State, with the approval of the Government of India, for raising the level of administration of the said areas to that of the administration of the rest of the areas of the State.

The provisions relating to borrowing remain unaltered. The executive power of the Union extends to borrowing upon the security of the Consolidated Fund of India within such limits, if any, as may be fixed by Parliament and the giving of guarantees within such limits as may be fixed. A State can borrow within the territory of India on the security of the Consolidated Fund of the State. The Government of India may make loans to any State or give guarantees in respect of loans raised by a State. Prior consent of the Government of India is necessary for a State to raise a loan, if there is still outstanding any part of a loan made to it by the Government of India or in respect of which a guarantee has been given by the Government of India. In giving such consent, the Government of India may impose any conditions they may deem necessary.

A Finance Commission is required to be set up within two years from the commencement of the Constitution and, thereafter, at the expiration of every fifth year, or at such earlier time as the President may consider necessary (Article 280), to make recommendations *inter alia* as to (1) the distribution between the Union and the States of the net proceeds of taxes which are to be, or may be, divided between them and the allocation among the States of the respective shares of such proceeds, (2) the principles which should govern grants-in-aid to the States out of the Consolidated Fund of India and (3) the continuance or modification of the terms of any Agreement entered into by the Government of India with the Government of any Part B State.

INDIAN STATES' FINANCE

Prior to August 15, 1947, Provinces and States developed on different lines, though geographically India was one. With the attainment of independence by India, almost all States, with the exception of Hyderabad, Kashmir and Junagadh "acceded" to the Dominion in the three subjects of defence, external affairs and communications and also executed "standstill" agreements which maintained the existing "codes" in regard to most matters of common concern. The entry of the States into a defined "constitutional" relationship with the Central Government was followed by the formation of the States into the Unions approximating in size and resources to Provinces. This necessarily meant recognition of the principle of uniform sources of federal revenues and equality of the basis of contribution to federal finances and paved the way for the financial integration of the States with the Indian Union.

The Government of India appointed on October 22, 1948 a Committee of experts to inquire into the finances of Indian States and Unions of States with a view to facilitating their financial integration. The Committee was composed of Sir V. T. Krishnamachari, Chairman, Mr. S. K. Patil and Mr. N. Dandekar. The summary of its recommendations, which have been accepted by Government with a few modifications, is given below :—

(1) Income-tax should be imposed in all States. In States where there is no income-tax it should be imposed from April 1, 1950 or the date from which federal financial integration becomes effective at rates not lower than the pre-existing rates of the Saurashtra Union.

(2) A certain measure of gradualness in reaching the Indian level of rates of income-tax is necessary. The whole process requires a period of three to six years only, depending upon the level of pre-existing rates.

(3) Capital gains tax should not be levied in respect of capital gains accruing prior to federal financial integration.

(4) The commencing date of the first "chargeable" period for purposes of business profits tax should be the date of federal financial integration.

The White Paper on the Budget for 1950-51 elucidated the position further. It said: "The scheme of integration, which will take effect from April 1, 1950, places the States and Unions in the same position as the Indian provinces vis-a-vis the Centre. The present composite Governments of these States will be divided on a functional basis and the Centre will take over the Central subjects and services from these States with the related assets and liabilities. But since some of these States were financing what would be provincial services from the surplus of their revenue from Central subjects, some form of financial assistance to them to meet the dislocation caused by the lifting of federal revenue and expenditure from their budgets is obviously necessary. The Centre has agreed to make good (with certain adjustments) to the States the difference between the actual federal revenue lost to them and the federal expenditure saved to them as a result of federal financial integration. This reimbursement will be made in full for the first five years and on a diminishing scale for the next five years.

The States will be in the same position as provinces in the matter of sharing divisible sources of revenue like income-tax but any grant made to them to cover the federal revenue gap will be set off against this share. States which are left with a surplus as a result of the integration will retain the surplus but the Privy Purses of the former Rulers of these States will be recovered from them to the extent of this surplus. They will, in addition, get their appropriate share of divisible heads of Central revenue. It will be some time before the "revenue gap" of these States can be determined but on the basis of the information available it appears that assistance will be necessary to Hyderabad, Travancore-Cochin, Mysore and Saurashtra while Madhya Bharat, Patiala and East Punjab States Union and Rajasthan will not require assistance from the Centre.

As a result of the Government of Part C States Act, 1951, Coorg, Himachal Pradesh, Vindhya Pradesh, Delhi, Bhopal and Ajmer have had their own legislatures from April 1952. Each of the States will consequently have a Consolidated Fund of its own into which the revenues and receipts received in that State and belonging to it will be paid and from which the expenditure of the State will be met. In respect of Delhi State, however, the Act makes a reservation in respect of police, public order and lands and buildings in Delhi and New Delhi the receipts in respect of which as well as expenditure will still be included in the Central budget.

These States, however, have not been placed in the same autonomous position in regard to their finances as Part A or Part B States; their balances have not been separated from those of the Central Government and their capital requirements and the debt, deposit and remittance transactions will still be included in the Central budget. A grant-in-aid will be given, where necessary, to these States for balancing their budgets and keeping an adequate working balance in their Consolidated Funds. As the provisions of Part XII of the Constitution do not apply to Part C States, they will not receive any share of the net proceeds of income-tax or other divisible heads of the Central revenue like the Part A and the Part B States.

GENERAL STATEMENT OF REVENUE AND EXPENDITURE

(In thousands of rupees)

1950-52 Budgets :—The first budget of the Republic of India was presented by Dr. John Matthai on February 28, 1950 and since it covered the whole of the Indian Union, the figures with the previous years are not comparable.

The taxation changes proposed were : (*a*) concessional rates in respect of local postal deliveries, (*b*) reduction in the basic minimum charge for an ordinary telegram by an anna to as. 8 and for express telegrams by as. 2 to one rupee, (*c*) reduction in the maximum trunk call rate from Rs. 16 to Rs. 12, (*d*) abolition of the business profits tax, (*e*) reduction in the maximum rate of income-tax from as. 5 to as. 4 and from as. 3¾ to as. 3 for the slab of Rs. 10,000 to Rs. 15,000, (*f*) raising the exemption limit for undivided family from Rs. 5,000 to Rs. 6,000, (*g*) an increase of half an anna in corporation tax, (*h*) abolition of distinction between earned and unearned incomes, and (*i*) reduction in the maximum super tax rate from as. 9 to as. 8¾ to be applied to income above Rs. 1¼ lakhs and an increase of roughly one anna in rates on earned incomes below that level.

The total relief in direct taxation was of Rs. 14·99 crores of which the Centre would bear Rs. 7·87 crores. This, together with the relief in indirect taxation, brought the total relief on the Centre's account to Rs. 8·31 crores.

The Dividend Limitation Act was abolished.

On the recommendations of the Select Committee, Parliament made the following changes in the Finance Bill which was finally passed into law :—

(1) The exemption limit for the levy of income-tax raised from Rs. 3,000 to Rs. 3,600 in the case of individuals, unregistered firms and associations, and from Rs. 6,000 to Rs. 7,200 in the case of Hindu undivided families.

(2) In the case of match factories producing less than 100 gross boxes per day, the excise duty reduced from Rs. 2-14 to Rs. 2-13 per gross boxes of 60's and from Rs. 1-15 to Rs. 1-14 per gross boxes of 40's. In the case of the middling factories, the reduction is from Rs. 2-15 to Rs. 2-14-6 and from Rs. 1-15-6 to Rs. 1-15 respectively.

As approved by Parliament, the total revenue and expenditure for 1950-51 was placed at Rs. 338·59 crores and Rs. 337·88 crores respectively, leaving a nominal surplus of Rs. 71 lakhs. The revised estimates showed a surplus of Rs. 7,91 lakhs ; but the accounts actually closed with a surplus of Rs. 59·22 crores.

The Finance Minister, Mr. C. D. Deshmukh, placed the revenue at Rs. 369·89 crores and expenditure at Rs. 375·43 crores leaving a deficit of Rs. 5·54 crores on the basis of the existing level of taxation for 1951-52. The estimated deficit on capital account being Rs. 77·83 crores, the overall deficit was placed at Rs. 83·52 crores. To cover a part of the deficit, the following taxes were imposed : (1) Increase in corporation tax from as. 2½ to as. 2¾, reduction in the rebate of super tax to life offices from as. 2 to as. 1¼ in respect of profits accruing to shareholders. (2) A surcharge of 5 per cent., exclusively for Central purposes, on all income-tax and super-tax rates, excluding corporation tax ; but exemption for incomes not exceeding Rs. 7,200 of individuals and Rs. 14,400 of Hindu undivided families. (3) An increase of five per cent. in the surcharge on all items in the import schedule excepting those governed by specific agreements and mineral oils. (4) A 50 per cent. increase in the existing 100 per cent. surcharge on import duty on liquor, etc. (5) Rationalisation of the incidence of import duties on mineral oils other than motor spirit and kerosene. (6) Levy of a 10 per cent. *ad valorem* export duty on coarse and medium cloth. (7) Higher export duties on black pepper and cotton waste. (8) A 5 per cent. surcharge on excise duties on motor spirit. (9) Levy of an export duty of Rs. 80 per ton on groundnut kernel. (10) Rationalisation and increases of tobacco excise duties subject to certain concessions. (11) Imposition of sales tax in Delhi. (12) Enhancement of the export duty on jute sacking from Rs. 150 per ton to Rs. 350. The net increase from these changes was placed at Rs. 31·64 crores.

1952-53 BUDGET

The 1952-53 budget excludes the revenue and expenditure of five Part C States following their separation from the Centre and is based on the existing levels of taxation and continuation of the existing arrangements for the allocation of income-tax and payments of grants-in-aid. The total revenue is estimated at Rs. 424·98 crores and expenditure at Rs. 406·25 crores leaving a surplus of Rs. 18·73 crores. Of the latter, expenditure on defence services is placed at Rs. 197·95 crores and that under civil heads at Rs. 208·3 crores.

The budget for 1951-52 provided for a borrowing of Rs. 100 crores in the market and the receipt of Rs. 4·84 crores from the dollar loans taken from the World Bank. It was, however, possible to borrow only Rs. 50 crores and from the World Bank Rs. 3·24 crores. The revised budget also takes credit for a loan of Rs. 90 crores by way of the U.S. Wheat Loan. For next year, credit has been taken for only Rs. 25 crores from market borrowing and Rs. 1·06 crores for miscellaneous dollar loans.

The net receipts from small savings in 1951-52 are estimated at Rs. 40·52 crores against Rs. 42·86 crores assumed in the budget. For next year these have been taken at Rs. 44·57 crores.

The budget for 1951-52 provided for an overall deficit of Rs. 52 crores but the revised estimates indicate that this deficit may amount to no more than Rs. 4 crores. For next year the budget estimates provide for an overall deficit of Rs. 56 crores and at the end of the budget year the Government of India will be carrying a comfortable balance of a little over Rs. 100 crores.

DEBT POSITION

Under the Indian Independence (Rights, Property and Liabilities) Order, 1947, all liabilities in respect of loans, guarantees and other financial obligations of the Governor-General-in-Council outstanding immediately before the date of Partition have been placed on the Republic of India, subject to the recovery of an appropriate contribution from Pakistan. In regard to the outstandings in respect of Post Office Savings Bank and Post Office Cash, Defence and National Savings Certificates it was agreed that each country should take over liability for the deposits and certificates outstanding in its respective area subject to adjustment of transfers from one country to the other till March 31, 1948. A moratorium of four years has been given to Pakistan for the repayment of the Partition Debt. The first instalment falls due on August 15, 1952.

The outstanding public debt of the Government of India is expected to amount to Rs. 2,097 crores at the end of March 1952 and Rs. 2,113 crores at the end of 1952-53. The broad analysis of the debt compared with that at the end of 1938-39 is given below :—

(In lakhs of rupees)

	Total	Rupee Loans	Sterling Loans	Dollar Loans
31-3-1939 Account	9,49,77	4,84,82	4,64,95	....
31-3-1951 Budget	20,88,61	20,31,01	33,00	24,60
31-3-1951 Revised	20,97,23	19,54,71	30,48	1,12,04
31-3-1952 Budget	21,12,54	19,73,26	27,34	1,11,94

The liability for the British War Loan remains suspended while against the outstanding Railway annuities an equivalent deposit has been made with the U.K. Government who have undertaken to provide the necessary sterling as the payments fall due. Omitting these items, the total outstanding debt will be Rs. 2,068 crores at the end of the current year and Rs. 2,086 crores at the end of 1952-53, representing at the end of the budget year an increase of Rs. 1,205 crores over the corresponding figure at the end of 1938-39.

In addition, Government are liable to repay the balances in the various Provident Funds, the Post Office Savings Bank, the Post Office Cash and National Savings Certificates, the Depreciation and Reserve Funds of the Railways, Posts and Telegraphs etc. and certain other deposits, mainly relating to excess profits tax and income-tax. These balances are estimated to amount to Rs. 737 crores at the end of the current year and Rs. 776 crores at the end of 1952-53 after making a very rough allowance for Pakistan's probable share in them.

Taking the regular debt and these liabilities together the debt position of the Government of India will stand at Rs. 2,805·14 crores (revised) at the end of 1951-52 and Rs. 2,862·76 crores on March 31, 1952 as against Rs. 2,773·82 crores on the basis of the budget estimate on March 31, 1952. Allowing for these, the uncovered debt will amount to Rs. 331 crores at the end of 1952-53 as against Rs. 393 crores according to the revised estimates for 1951-52 and Rs. 576 crores in the budget estimates for 1951-52 and the pre-war figure of Rs. 188 crores.

The statement below analyses the interest bearing obligations of the Government and the interest yielding assets held by them :—

CAPITAL BUDGET

The budget for 1951-52 included a provision for a capital outlay of Rs. 77·1 crores and Rs. 62·61 crores for advances to State Governments. Capital expenditure is now estimated at Rs. 74·8 crores excluding a provision of Rs. 71 crores for the transfer to a Special Development Fund of the sale proceeds of U.S. wheat purchased from the loan granted by the United States Government. The revised estimate includes a provision of Rs. 78·78 crores for loans to State Governments out of which Rs. 15 crores will be met from the Special Development Fund.

For the next year a total provision of Rs. 68·73 crores has been made for capital outlay and Rs. 82.84 crores for loans to State Governments of which Rs. 25 crores will come from the Special Development Fund. The Central capital outlay includes Rs. 15.36 crores for Railways, Rs. 4·85 crores for Posts and Telegraphs, Rs. 9.85 crores for Industrial Development, Rs. 1·92 crores for development of Civil Aviation. Rs. 1·18 crores for additional Office and Residential accommodation in New Delhi, Rs. 40 crores for the River Valley schemes, Rs. 16·79 crores for Civil Works including Communications and Rs. 17 crores for capital outlay on Defence. Included in the provision for loans to States are Rs. 14·11 crores for rehabilitation of displaced persons and Rs. 7·62 crores for loans on grow more food schemes.

The provision for development and capital expenditure in the 1952-53 budget broadly follows the plan suggested by the Planning Commission in the First Draft of the Five-Year Plan. Government have accepted the broad plan of the Commission.

INCOME-TAX

Income-tax was first imposed in India in 1860 in order to meet the financial dislocation caused by the 1857 upheaval. The rate was four per cent. on all incomes above Rs. 500. Minor changes took place until the schedule was consolidated in the Act of 1886. This imposed a tax on all incomes other than agricultural income. In March 1903, the minimum taxable income was raised from Rs. 500 to Rs. 1,000. The income-tax schedule was completely revised, raised and graduated in the budget of 1916-17 to meet the deficit arising out of war conditions.

The next stage was Act XI of 1922 which is still our basic legislation in respect of income-tax, though numerous and sometimes radical changes have been made in it from time to time and particularly in 1939. The 1922 enactment recognised the expediency of limiting the Income-Tax Act to the provision of machinery and procedure for the assessment of income-tax, leaving rates of taxation to be fixed every year by Finance Acts. It adopted the principle of making the assessment on the income of the "previous year" and vested wide powers in assessing officers.

In 1935, the Government of India appointed a Committee (The Ayers Committee) "to make an investigation of the Indian income-tax system in all its aspects and to report upon both the incidence of the tax and the efficiency of its administration."

The amendments made in 1939 and subsequently have greatly elaborated the law. The tax is levied now not only on income as ordinarily understood but also on certain capital receipts which have been included in a special definition of "income." Tax at the rate fixed for the year of assessment is charged on the income of the "previous year." Both income-tax and super-tax are levied according to the slab system.

Prior to 1914, the receipts from taxation on income were hardly 3 crores; but they went up to Rs. 22 crores in 1921-22 owing to the increase in rates. The industrial depression, however, resulted in a set-back in the following years and even in 1938-39, it did not exceed Rs. 17.28 crores. The war period witnessed a strong emphasis on this source for the purpose of governmental finance and the revenue from this source realised in 1945-46 amounted to Rs. 178.03 crores representing 49.4 per cent. of the total revenue.

The more recent trend of collections is given below :—

1949-50 Accounts	..	Rs. 161·11 crores
1950-51 Accounts	..	,, 173·22 ,,
1951-52 Budget	..	,, 164·95 ,,
1951-52 Revised	..	,, 175·00 ,,
1952-53 Budget	..	,, 150·00 ,,

The recent increase is due to the special drive for clearance of arrears and to the operation of the scheme for the voluntary disclosure of hidden incomes.

While Corporation tax accrues in its entirety to the Centre, the net proceeds of income-tax, except the tax attributable to Central emoluments and Centrally administered areas and any Central surcharge, are divisible between the Centre and the States. The percentage to be assigned to the States has to be prescribed by the President by order after considering the recommendations of the Finance Commission and until such a Commission starts working prescribed by the President's order. For the present the States' share has been fixed at 50 per cent. of the net proceeds allocable between the Centre and States.

Under the scheme of federal financial integration the continuing States and Unions are entitled to the same share of income-tax as Part A States but this share is set off against any grants payable by the Centre to these States for meeting the actual loss caused to them by the lifting of federal revenue and expenditure from their budgets. The income-tax from these States is accordingly not included in the divisible pool but half the net proceeds in each State is computed as its share and paid to it or set off against its grant as the case may be. As Hyderabad, Mysore, Travancore-Cochin and Saurashtra are receiving grants to meet their revenue gaps which are higher than their estimated shares of income-tax revenue, no payment of income-tax share is due to them. The Unions of Madhya Bharat, Rajasthan and Patiala and East Punjab States are, however, entitled to receive a share of income-tax. The arrangement in regard to States merged in the former Indian Provinces is similar and in respect of these also as the grants exceed the estimated share of income-tax revenue, no payment on this account will be due.

The Income-Tax Investigation Commission submitted its report on the existing law of income-tax towards the end of 1948 and the same was published towards the end of 1949. The following summary of the principal recommendations will be found interesting :—

(1) A radical change is both necessary and justified in the treatment by the Indian Income-tax Law of persons resident in the Indian States.

(2) In taxing non-residents in respect of their Indian income, the rate appropriate to their Indian income with a surcharge of 20 or 25 per cent. may be adopted with an option to the assessee to prove his foreign income.

(3) The tax in respect of life insurance companies should be assessed on the aggregate of the dividends reserved for share-holders and so much of the bonus allocated to the policy-holders as is in excess of the load provided by the premia. The allowance in regard to renewal premium should be raised from 12 per cent. to 15 per cent. There is no justification for discriminating in favour of insurance companies and reducing in their case the 5-anna rate of income-tax to 45 pies in a rupee.

(4) There is advantage in public exposure of persons who are guilty of deliberately cheating the revenue.

(5) Income-Tax Officers should have powers to gather relevant information, particularly to deal effectively with persons suspected of having black-market dealings and to enter business premises and inspect accounts, to make a search of places and to call for information from banks and other business houses.

(6) The training to be given to officers directly recruited to the department should be improved.

(7) The investigation branch should be expanded and strengthened and the conditions of work of the ministerial staff should be improved.

On the basis of those recommendations mainly favouring the tax gatherer a bill to amend the Income-Tax Act was introduced in Parliament during the budget session of 1951; but it could not be pushed through.

The total references about tax evasion to the Commission numbered 1,540 up to the end of 1951. Of these 661 were disposed of. The Commission, in its report for 1951, complains that "many cases which really deserved reference had been omitted for one reason or another while many had been referred which are comparatively insignificant." It says that the machinery of investigation has gathered momentum. The total amount of concealment reported in cases disposed of is Rs. 29.16 crores while the settlement basis is Rs. 25.41 crores. In its opinion "the scope for making concealed profits has not in any manner lessened after 1947." It therefore urges Government to organise an inquiry branch to locate cases of tax dodging.

Guide to Taxes on Income (1952-53)

Part I.

RATES OF INCOME-TAX

A. In the case of every individual, Hindu undivided family, unregistered firm and other association of persons, not being a case to which paragraph B or C of this Part applies—

——	Rate	Surcharge
1. On the first Rs. 1,500 of total income.	*Nil.*	*Nil.*
2. On the next Rs. 3,500 of total income.	Nine pies in the rupee.	1/20th of the rate specified in the preceding column.
3. On the next Rs. 5,000 of total income.	One anna and nine pies in the rupee.	—Do—
4. On the next Rs. 5,000 of total income.	Three annas in the rupee.	—Do—
5. On the balance of total income.	Four annas in the rupee.	—Do—

Provided that—

(*i*) no income-tax shall be payable on a total income which, before deduction of the allowance, if any, for earned income, does not exceed the limit specified below;

(*ii*) the income-tax payable shall in no case exceed half the amount by which the total income (before deduction of the said allowance, if any, for earned income) exceeds the said limit;

(*iii*) the income-tax payable on the total income as reduced by the allowance for earned income shall not exceed either—

(*a*) a sum bearing to half the amount by which the total income (before deduction of the allowance for earned income) exceeds the said limit the same proportion as such reduced total income bears to the unreduced total income, or

(*b*) the income-tax payable on the income so reduced at the rates herein specified,—whichever is less.

The limit referred to in the above proviso shall be—

(1) Rs. 7,200 in the case of every Hindu undivided family which satisfies as at the end of the previous year either of the following conditions, namely :—

(*a*) that it has at least two members entitled to a share on partition who are not less than 18 years of age; or

(*b*) that it has at least two members entitled to a share on partition neither of whom is a lineal descendant of the other and both of whom are not lineally descended from any other living member of the family; and

(2) Rs 3,600 in every other case.

B. In the case of every company, not being a company to which paragraph C of this Part applies—

——	Rate	Surcharge
On the whole of total income	Four annas in the rupee.	1/20th of the rate specified in the preceding column.

Provided that in the case of a company which, in respect of its profits liable to tax under the Income-Tax Act for the year ending on March 31, 1951, has made the prescribed arrangements for the declaration and payment within the territory of India excluding the State of Jammu and Kashmir, of the dividends payable out of such profits, and has deducted super-tax from the dividends in accordance with the provisions of sub-section (3D) or (3E) of section 18 of that Act—

(*i*) where the total income, as reduced by seven annas in the rupee and by the amount, if any, exempt from income-tax exceeds the amount of any dividends (including dividends payable at a fixed rate) declared in respect of the whole or part of the previous year for the assessment for the year ending on March 31, 1951, and no order has been made under sub-section (1) of section 23A of the Income-Tax Act, a rebate shall be allowed at the rate of one anna per rupee or the amount of such excess;

(*ii*) where the amount of dividends referred to in clause (*i*) above exceeds the total income as reduced by seven annas in the rupee and by the amount, if any, exempt from income-tax, there shall be charged on the total income an additional income-tax equal to the sum, if any, by which the aggregate amount of income-tax actually borne by such excess (hereinafter referred to as "the excess dividend") falls short of the amount calculated at the rate of five annas per rupee on the excess dividend.

For the purposes of the above proviso, the expression "dividend" shall have the meaning assigned to it in clause (6A) of section 2 of the Income-tax Act, but any distribution included in that expression, made during the year ending on the 31st day of March, 1951, shall be deemed to be a dividend declared in respect of the whole or part of the previous year.

For the purposes of clause (*ii*) of the above proviso, the aggregate amount of income-tax actually borne by the excess dividend shall be determined as follows :—

(*i*) the excess dividend shall be deemed to be out of the whole or such portion of the undistributed profits of one or more years immediately preceding the previous year as would be just sufficient to cover the amount of the excess dividend and as have not likewise been taken into account to cover an excess dividend of a preceding year;

(*ii*) such portion of the excess dividend as is deemed to be out of the undistributed profits of each of the said years shall be deemed to have borne tax,—

(*a*) if an order has been made under sub-section (*1*) of section 23A of the Income-tax Act XI of 1922, in respect of the undistributed profits of that year, at the rate of five annas in the rupee, and

(*b*) in respect of any other year, at the rate applicable to the total income of the company, for that year reduced by the rate at which rebate, if any, was allowed on the undistributed profits.

C. In the case of every local authority and in every case in which, under the provisions of the Income-tax Act, income-tax is to be charged at the maximum rate—

——	Rate	Surcharge
On the whole of total income	Four annas in the rupee.	1/20th of the rate specified in the preceding column.

Part II.

RATES OF SUPER-TAX

A. In the case of every individual, Hindu undivided family, unregistered firm and other association of persons, not being a case to which any other paragraph of this Part applies—

——	Rate	Surcharge
1. On the first Rs. 25,000 of total income.	*Nil.*	*Nil.*
2. On the next Rs. 15,000 of total income.	Three annas in the rupee.	1/20th of the rate specified in the preceding column.
3. On the next Rs. 15,000 of total income.	Four annas in the rupee.	—Do—
4. On the next Rs. 15,000 of total income.	Six annas in the rupee.	—Do—
5. On the next Rs. 15,000 of total income.	Seven annas in the rupee.	—Do—
6. On the next Rs. 15,000 of total income.	Seven and a half annas in the rupee	—Do—
7. On the next Rs. 50,000 of total income.	Eight annas in the rupee.	—Do—
8. On the balance of total income.	Eight and a half annas in the rupee.	—Do—

B. In the case of every local authority—

——	Rate	Surcharge
On the whole of total income	Two and a half annas in the rupee.	Three pies in the rupee.

C. In the case of an association of persons being a co-operative society (other than the Sanikatta Saltowners' Society in the State of Bombay) for the time being registered under the Co-operative Societies Act of 1912, or under any law of a State governing the registration of co-operative societies—

——	Rate	Surcharge
1. On the first Rs. 25,000 of total income.	*Nil.*	*Nil.*
2. On the balance of total income.	Two and a half annas in the rupee.	Three pies in the rupee.

D. In the case of every company—

——	Rate
On the whole of total income	Four and three-quarter annas in the rupee.

Provided that—

(*i*) a rebate at the rate of three annas per rupee of the total income shall be allowed in the case of any company which—

(*a*) in respect of its profits liable to tax under the Income-tax Act for the year ending on the 31st day of March 1952, has made the prescribed arrangements for the declaration and payment in the territory of India excluding the State of Jammu and Kashmir of the dividend payable out of such profits and for the deduction of super-tax from dividends in accordance with the provisions of sub-section (3D) or (3E) of section 18 of that Act, and

STATE FINANCE

Details of revenue and expenditure and debt position of Part A and B States since 1947-48 has been summed up in the table below. The detailed budgetary position of each State is given under each head in separate chapters. The revised estimates for 1950-51 revealed that West Bengal accounted for the largest deficit, namely, Rs. 5 crores, followed by Orissa and the Uttar Pradesh with deficits of Rs. 1·94 crores and Rs. 1·36 crores respectively. Compared to the budget estimates, all Part A States show increased expenditure and the revenue is also higher than the budget estimates, particularly for Madras and Bombay due mainly to larger receipts from sales tax.

The post-war trend of increasing revenues and expenditures is maintained in the budget estimates for 1951-52 also. There are transfers from reserves to revenue of Rs. 11 crores in Bihar, Rs. 2 crores in Bombay and Rs. 96 lakhs in Madhya Pradesh. Adjusting for these transfers, total revenue and expenditure amount to Rs. 294·85 crores and Rs. 309·61 crores respectively with a deficit of Rs. 14·76 crores. Every Part A State has a deficit, large or small, except Bombay. In 1951-52 as in 1950-51, there are only minor tax changes. In Bombay, the Sales Tax Act was amended to prevent evasion and the administrative machinery for the collection of the stamp duty was tightened. In West Bengal the taxation on motor vehicles was raised. The Punjab pushed up the entertainment tax and the tariff for the supply of electrical energy from the Uhl River Hydro-electric scheme.

The capital expenditure of Part A States was estimated at Rs. 109·60 crores in 1951-52 as against Rs. 68·88 crores in the revised estimates and Rs. 52·60 crores in the budget estimates for 1950-51 and 1949-50 respectively. Three States, West Bengal, Orissa and the Punjab do not have any balances in Post-War Reconstruction or Revenue Reserve Funds. The aggregate funds of the rest of the Part A States were placed at Rs. 83·07 crores at the end of 1950-51 revised estimates and Rs. 51·26 crores in the 1951-52 budget as against Rs. 90·79 crores at the end of 1949-50.

Unlike Part A States, excise constitutes the most important single source of revenue in Part B States, followed by land revenue; the sales tax is comparatively unimportant. The abolition of internal customs is scheduled to take place gradually, to enable the States to develop alternative sources of revenue. The provision for social services is larger than for security services in Mysore and Travancore-Cochin; it is less in Hyderabad and PEPSU, and are about equal in Madhya Bharat and Saurashtra. Proposals for fresh taxation are largely confined to Mysore which has raised the tax on motor vehicles and registration fees and introduced new levies of health cess and seating tax on cinemas. In PEPSU a tax on cinema shows has been imposed and the stamp duties, registration fees and court fees have been raised to bring them on par with the neighbouring State, Punjab. In Travancore-Cochin, a 12½ per cent. increase in the duty on country *arrack* has been effected. In Saurashtra the duty on petrol has been doubled from two annas. Capital expenditure of Part B States is placed at Rs. 23·01 crores in 1951-52 compared with Rs. 16·79 crores in 1950-51. Irrigation projects and electricity schemes are the major items of capital outlay. The overall deficit of Part B States is placed at Rs. 9·43 crores in 1950-51 and Rs. 8·70 crores in 1951-52.

LAND REVENUE

The principle underlying the land revenue system in the country has been from time immemorial on the basis that government is the supreme landlord and the revenue derived from land is by way of rent. The official term for the method of collection is "Settlement". These are of three types. The permanent *Zamindari* System is mainly found in the Bengal area, Bihar, the U.P. and parts of Madras and covers roughly an area of 120 million acres equivalent to 19 per cent. of the total agricultural area of the subcontinent. In the second group are the temporarily settled Zamindars such as *Malguzari, Maharwari, Khoti, Narvadari, Bhagdari, Inami* and *Talugdari*. These are found mostly in Madhya Pradesh, the Punjab, parts of U.P., the Bengal area and Bombay covering about 30 per cent. of the area of the country. The remaining 51 per cent. or approximately 285 million acres are under the *ryotwari* system covering parts of Bombay and most parts of Madras, Berar, Assam and the Punjab area.

The Governments of Madras, the U.P., Bihar, Assam, Madhya Pradesh and West Bengal have decided to abolish the *Zamindari* system. To Madras goes the credit of being the first State to put a measure of this kind on the statute book. The Madras Bill received the assent of the Governor-General early in April, 1949. The validity of the Zamindari Abolition Acts was contested in the various State High Courts and the Supreme Court so much so that the Constitution Act itself was amended to make such bills valid. (See under Constitution.)

Land revenue was the mainstay of provincial finance till 1938-39 and still continues to be an important source of revenue. In U.P. and Madhya Pradesh, it represented 63.89 per cent. and 65.10 per cent. of the provincial revenues in 1938-39; but the respective percentage for 1949-50 was 19.36 and 31.38. Yet, its receipts have tended to be upward.

Following the Planning Commission's recommendations, several State Governments introduced better charges in 1951 on land for which new facilities by way of irrigation were made available.

EXCISE

The excise revenue in the country can be classified into two divisions—one derived from the Central Excise Duties and belonging to the Central Government's finance and the other derived from the manufacture and sale of intoxicating liquors, hemp drugs, toddy and opium. The latter is a provincial revenue. The revenue from the Central Excise Duties has increased by ten times since 1937-38. As against a comparatively small revenue of Rs. 7,66 lakhs in 1937-38 and Rs. 12,79 lakhs in 1942-43, the actuals for 1945-46 totalled Rs. 46,36 lakhs. The budget for 1951-52 estimated the revenue at Rs. 86 crores. These duties are at present levied on motor spirit, kerosene, sugar, matches, steel ingots, tyres, tobacco, vegetable product, betel-nut, coffee, tea, cotton cloth and coal cess.

The Budget of the Government of India for 1944-45 brought in force important changes in the field of Central Excises. It raised the rates of duty on unmanufactured tobacco and on cigars and cheroots and included in the Central Excise Tariff betel-nuts, coffee and tea.

A further change in respect of tobacco was proposed in the following year. Accordingly, the highest class of flue-cured tobacco in the excise tariff was sub-divided into three and subjected to a duty of Rs.7-8, Rs.5 or Rs.3-8 per lb., according as it was intended for use in manufacturing cigarettes containing more than 60 per cent., more than 40 but not more than 60 per cent. or more than 20 but not more than 40 per cent. by weight of imported tobacco. In order to avoid double incidence, some of the provincial Governments reached an agreement with the Centre by which they withdrew the provincial excise duty on tobacco in lieu of a share in the proceeds from the Centre's tobacco excise. Tobacco excise has been responsible for nearly half the receipts under Central Excise Duties.

The budget proposals for 1951-52 provided for a stiff increase in tobacco duties; but the Act, as finally enacted, slashed the proposals to the tune of Rs. 5 crores. The excise duty on cloth was first introduced in January 1949.

The 1951-52 Budget also provides for an increase of 5 per cent. in the excise duties on motor spirit and kerosene so as to equalise the duties of customs and excise and for certain changes in the excise duty on tobacco.

The provincial excise revenue in the country is derived from the manufacture and sale of intoxicating *liquors, hemp drugs, toddy* and opium. The percentage of excise to total revenues of the provincial Government increased from 16·0 to 24·5 between 1938-39 and 1945-46. Since then, however, excise revenue has been pushed into the background by the prohibition policy of the State Governments.

In the 1951-52 budget, it represented 11·24 per cent. of the total tax revenue of Part A States though the element was as high as 33·84 per cent. in Part B States.

The following table shows the proceeds from State excise in Part A States:—

	1946-47	1951-52 Budget
	(In lakhs of Rs.)	
Madras	14,68	36
Bombay	9,74	1,05
U.P.	6,74	5,84
Madhya Pradesh ..	2,24	2,15
West Bengal	6,42	5,98
Orissa	1,11	1,71
Punjab	3,32	2,01
Bihar	5,15	5,06
Assam	82	79
Total ..	50,22	24,95

CUSTOMS

Import duties have varied from time to time according to the financial condition of the country. Before the 1857 upheaval they were five per cent.; in the days of financial stringency which followed they were raised to 10 and in some cases 20 per cent. In 1875 they were reduced to five per cent.; but the opinions of Free Traders, and the agitation of Lancashire manufacturers who felt the competition of the Indian mills, induced a movement which led to the abolition of all customs dues in 1882. The continued fall in exchange compelled the Government of India to look for fresh sources of revenue and in 1894 five per cent. duties were reimposed.

Since the Great War of 1914-18, there has been a growing tendency towards larger reliance on Customs duties to meet the financial needs of the Centre. Between 1913-14 and 1924-25, a certain amount of shifting of the burden from the richer class to the masses was evident. Then came the policy of discriminating protection and of Imperial Preference in terms of the Ottawa Trade Agreement of 1932, which, in addition to the financial consideration shaped the Customs tariffs. The Customs schedule was completely recast in the Budget of 1916-17 in order to meet the budgetary deficit and the tariffs were raised again in 1921-22 to fill in the large gap between the revenue and the expenditure. The Supplementary Finance Act of 1931 imposed fresh increases in the import duties and the Tariff Amendment Act of January 1, 1933, provided for giving effect to the Ottawa Agreement. During the Second World War and in the post-war period, customs duties were used for augmenting Government revenues.

On the eve of the First World War, the revenue from Customs duties had totalled only Rs. 11.13 crores. By 1929-30 it reached Rs. 51.28 crores when the law of diminishing returns became operative and by 1938-39 it declined to Rs. 40.51 crores following the reduction in the international trade in the subsequent years of the war. The proceeds from the Customs duties in 1942-43 amounted to only Rs. 25.12 crores being the lowest for a quarter of a century. Since then, however, there has been a reversal of the trend and the revised estimates for 1946-47 placed the receipts at Rs. 87¼ crores and those for 1947-48 at Rs. 93 crores. The actuals of customs revenue were Rs. 126.15 crores for 1948-49 and Rs. 124.71 crores in the following year. The budget estimates for 1950-51 placed the receipts at Rs. 106.54 crores; but the revised estimates showed them at Rs. 145.31 crores. On this basis, the budget for 1951-52 expected the receipts to amount to Rs. 141.29 and the proposed increases in the duties were estimated to yield Rs. 8.75 crores.

The import tariff is cast in the form of a commodity schedule with broad distinctions indicating the treatment to be accorded to various classes of articles. The general rate of import duty (now 25 per cent. plus a temporary surcharge of 1.5th) applies to all articles other than those specially listed, certain luxury items which carry a high rate of tax, certain items subjected to protective duties and certain other items which are declared duty free or subjected to a low rate of duty, in the interests of indigenous industry or the economy of the country. Luxury items which are subjected to the heaviest rates of duty (ranging from 75 per cent. to 100 per cent. or more), mainly consist of tobacco manufactures, wines and spirits, artificial silk goods, gold plated articles, fabrics containing gold or silver thread, gold and silver thread manufactures, silver thread and wire, games and sports requisites, clocks and watches, etc. In the case of protected items, of which the more important are sugar, some chemicals, matches, silk and art silk fabrics, certain manufactures of iron and steel, sewing machines, cycles and certain items of machinery and parts, the rates of duty are fixed at such amounts and for such periods as are found necessary having regard to the recommendations of the Tariff Board. Grains and pulses and a number of raw materials for industry are on the free list, while specially low but varying rates of tax cover a large number of essential items like fuel oils, batching oils, lubricants, raw films, textile machinery, etc.

Export duties cover a number of items of which jute and tea are the most important. An important addition since 1949-50 has been the duty on black pepper. During 1950-51 new export duties were levied on cotton waste and raw wool at 50 per cent. and 30 per cent. respectively *ad valorem* and the export duties on raw cotton and jute manufactures were enhanced, the former from Rs. 100 to Rs. 400 per bale and the latter from Rs. 50 to Rs. 150 in the case of sacking and from Rs. 350 to Rs. 750 and later to Rs. 1,500 per ton in the case of hessian.

The 1951-52 Budget provided for an enhanced surcharge of 5 per cent. on all items in the import schedule except such of them as are governed by specific agreements under the general agreement relating to trade and tariffs, an increase in the present surcharge of 100 per cent. on ale, beer, spirits, and other fermented liquor by 50 per cent., rationalisation of the incidence of import duties on mineral oils, other than motor spirit and kerosene; a levy of an export duty of Rs. 80 per ton on groundnut kernel, and introduction of an export duty of 10 per cent. *ad valorem* on coarse and medium cloth excluding furnishing fabrics and manufactures like hosiery and apparel.

Until 1943-44 revenue from customs used to be less than Rs. 40 crores and though this was stepped up to Rs. 89·22 crores by 1946-47, the post-partition period witnessed a rapid rise aided by Government's desire to reduce the shippers' margin. The major expansion was under export duties. The revised estimates for 1951-52 place the customs revenue at Rs. 232 crores of which export duties accounted for Rs. 87·75 crores.

about 100,000 tons were fermented to make potable alcohol, and another 50,000 tons used as fuel or manure or for tobacco curing or for making inferior sweets. The rest, that is to say, as many as 335,000 tons were simply wasted. But if all the wastage was to be used for the production of power alcohol a secure market had to be guaranteed to the producer. This meant some sort of legislation to compel the users of petrol to mix in a certain proportion power alcohol with petrol in the ratio 20 : 80. The Joint Power Alcohol Enquiry Committee of Uttar Pradesh and Bihar, the Indian Chamber of Commerce and the Indian Tariff Board were all recommending a scheme for the starting of a power alcohol industry before the war for it was clear that alcohol-petrol was superior as a fuel to neat petrol. But an appeal to the Government of India failed as it was frightened of antagonising oil interests. Some of the State Governments, however, went ahead. Between 1939 and 1942, Uttar Pradesh, Bihar, Bombay, Hyderabad and Mysore all passed appropriate legislation for the purpose of encouraging use of power alcohol, Mysore giving the lead in this matter. In 1946 there were 5 plants with a capacity of 2½ million gallons but the actual production was about a million gallons. In 1947 the number of plants increased to 9.

Production in India

	1949 (million gallons)	1950 (million gallons)
Power Alcohol	4·229	4·497
Industrial ..	2·988	4·92

Even this increased production falls far short of the country's needs and more intensive planned development is necessary as the report of the panel shows. A new plant started production early in 1951 at Nasik, with an annual capacity of a million gallons. The estimated production of 4·5 million gallons in 1950 has been much lower than the target of 7 million gallons due to shortage of molasses in western U.P., want of sufficient offtake at the distilleries in eastern U.P. and Bihar and the suspension of the Power Alcohol Act in Mysore. More power alcohol plants, smaller in capacity to suit the sugar factories and further improvements in fermentation practice are needed to step up output.

Power Alcohol should also be made as in U.S.A. from the wood sulphite liquors, a by-product of the paper factories proposed to be established.

The Union Government has recently taken over responsibility for Central direction and control of the Power Alcohol Industry and in order to increase production raised the price payable for power alcohol from 11 annas to 14 annas per gallon, to distillers who are obliged to sell all the power alcohol to the State Governments.

The Planning Commission appointed by the Government to advise on the programme of national reconstruction reports that the installed capacity of alcohol production in 1950 was 15·817 million gallons consisting of 12·87 million gallons of power alcohol and 2·95 million gallons of rectified spirit. The actual production was 7·933 million gallons, consisting of 4·497 million gallons of power alcohol and 3·436 million gallons of rectified spirit in 1950.

The Commission envisages the expansion programme in the private sector to reach in 1955-56, an installed capacity of 24·067 million gallons made up of 21·118 million gallons power alcohol and 2·949 million gallons rectified spirit, and actual production of 21·66 million gallons made up of 19·00 million gallons power alcohol and 2·66 million gallons of rectified spirit.

(in million gallons) bulk

Year	Power Alcohol		Rectified Spirit		Denatured Spirit	Installed capacity Total
	A.	B.	A.	B.	B.	
1946	6·25	2·39	12·1	2·14	1·02	18·3
1947	6·25	2·73	12·1	1·77	1·08	18·3
1948	6·25	3·77	12·1	2·39	1·40	18·3
1949	8·86	4·22	11·74	1·95	1·09	20·6
1950	9·32	4·49	12·0	3·43	1·47	21·3
1951	10·0	7·20	12·0	3·6	2·0	22·0
Estimated Plan 1955–1956	21·12	19·0	2·95	2·66	—	24·06

A = total installed capacity. B = actual output.

THE CEMENT INDUSTRY

IN the history of Trade Associations in India, the cement industry provides an illustrious example of successful co-operative endeavour. Starting with small independent units, the industry passed through a period of vicissitudes before it could attain the present position of strength and solidarity.

The first venture in the manufacture of Portland Cement in India took place in 1904, in a small factory just outside Madras, but it quickly went out of business.

A few years later three new companies came into existence and laid the foundation of the industry as it exists today.

GROWTH OF INDUSTRY

Towards the end of the First Great War, the output of all cement factories was commandeered by the Government. The boom period which followed that war witnessed the springing up of a number of new cement factories. Most of these were erected within the geographical marketing areas of the existing works and internal competition set up an insensate scramble for business at any price, and for delivery over any distance, ignoring entirely the basic economic principle that as a cheap building material, it cannot carry heavy distribution of freight charges. This intense competition almost brought the industry to its knees. Three of the new companies went into liquidation and the shareholders lost between 2 and 2½ crores of rupees.

FORMATION OF ASSOCIATIONS

In 1925, following the result of an enquiry by the Tariff Board, the necessity for co-operation among the manufacturing units was clearly emphasised and as a result, an Association known as the Indian Cement Manufacturers' Association was formed. This proved to be a complete success as could be seen from the fact that during the four years of its existence not one single case of price cutting was recorded. Although described as a "Manufacturers' Association", its functions were only to fix and regulate selling prices. Each manufacturing company was a separate entity with its own selling arrangements and each was out to obtain as much business as it could possibly secure.

The Association was also responsible for the next step in co-operation. Its members agreed to a levy of 5 annas per ton on the sales to finance a joint service known as the Concrete Association of India which was formed in 1927 for the purpose of educating the public in the uses of cement and to provide free technical aid and advice to the consumer.

CEMENT MARKETING COMPANY

Inspired with a certain measure of confidence they took yet another step which was the formation of the Cement Marketing Company of India, Ltd., but, over this, negotiations were both delicate and protracted. No member company liked the idea of giving up control of its own sales; on the contrary, it wanted to secure as large a sales quota as possible. This latter point presented a very thorny problem and after considering various formulæ, an agreement was reached and a quota fixed based on the capacity of each.

In 1934, two new companies joined the pool adding a further tonnage. With the aid of the Concrete Association of India and a comprehensive publicity programme, sales were increased and during the Marketing Company's regime the average selling price of cement throughout the country was reduced by over 25%.

Its real charter was to operate the agreement entered into between the member companies and in this, there were a number of defects which were the cause of many uncertainties and suspicions. The quota was fixed rigidly but there was nothing in the agreement to prevent any company from enlarging its works to any extent it deemed fit and it was soon apparent to all that provision for future expansion had to be undertaken.

ASSOCIATED CEMENT COMPANIES

It was to put an end to all doubts and uncertainties about the future that the late Mr. F. E. Dinshaw mooted the merger scheme, its object being to make and deliver cement as cheaply as possible through rationalised production and distribution. This brought about the fusion of all the Indian cement manufacturing companies then in operation (with the exception of the Sone Valley Cement Co. Ltd.) into one unit known as the Associated Cement Companies Ltd., in 1936 whose Managing Agents are Cement Agencies Ltd. The benefit that accrued to the Industry by the development of new sites taken over from member companies at suitable centres was passed on to the consumer by way of reduction in selling prices. This reduction resulted in an increased off-take which made it possible to make further reductions. Thus, there was an average total reduction all over India of about Rs. 10 per ton from 1930 to 1936, which resulted in the consumers benefiting to the extent of crores of rupees.

The policy of the cement companies which eventually merged into the Associated Cement Companies, aimed at the establishment of a great national industry on sound business lines. Foreign competition was reduced to a minimum and as sales increased prices were reduced systematically each year. This was along the lines recommended by the Tariff Board and has definitely led to the advantages envisaged by them, viz., efficient running, cheaper production, low distribution costs and lower selling price to public.

DALMIA GROUP

The Industry was, however, again affected when, in 1938, the Dalmia Group of Companies which had come into being began to compete with the Associated Cement Companies. Happily, this state of affairs did not last long, and by the end of 1940, an agreement was concluded between these two major groups to market their output through a central organization. The Cement Marketing Co. of India, Ltd., was again brought into operation. Prices were reduced further and thereafter stabilised at an economical level restoring the industry again to a healthy footing.

The Cement Marketing Company then controlled and managed the sales and distribution of all the cement manufactured by the Associated Cement Companies and the Dalmia Group of Companies, the former having 12 factories in operation and the latter five. The output of all these factories represented about 85% of the whole industry as there were four other cement companies operating independently.

EFFECTS OF WAR

As on other industries, the recent war has had a vast effect on cement. With the rise in the cost of all materials required for the manufacture and packing of cement, production cost naturally increased. To off-set this, in part, the price of cement had to be raised but it was still maintained at a very reasonable level, the rate being controlled by the Industries and Civil Supplies Department. Even with the increase allowed by the Government after prolonged examination, the price of cement today compares very favourably with the price of other building materials as most of them have gone up by over 200 to 400 per cent.

Just before and for some time after the outbreak of hostilities, the demand from export markets both for Government and public use began to increase, and India eventually became the supply centre of cement to the Middle and Far East. The internal demand similarly increased. Practically 80% of the total output was taken by Government and the balance was strictly rationed for essential repairs. With the cessation of hostilities, the proportion of Government demand fell considerably but the total demand both of the Government and the public increased enormously.

In March 1948 the two groups the Associated Cement and Dalmia's separated by mutual consent owing to disagreement about price. They now market their products separately.

BENEFITS

The part which the cement industry plays in the welfare of the country may not be fully appreciated. Not only does it afford employment to thousands of men in the factories but it is also one of the largest consumers of Indian coal. The jute industry is also benefited because over 40 million jute bags are used annually for packing purposes. Then, there is the large freight revenue accruing to the Railways by the transport of coal, gunny bags and cement estimated at some crores per annum.

The progress which has been made has been largely due to the energy and enterprise of the Cement Marketing Company and the Concrete Association of India in educating the country in the uses of cement. Branch offices are maintained throughout India with a staff of over a hundred engineers, overseers and skilled masons who give technical assistance to cement users.

FUTURE DEVELOPMENT

At the time of the partition of India in August 1947 there were 18 cement factories in the Indian Union with a total capacity of 2.1 million tons per annum. During the last three years a number of cement factories in India expanded their capacity and three new factories were erected at Jamnagar (Saurashtra), Tirunelveli (South India) and Kottayam (Union of Travancore-Cochin), resulting in a total capacity of 2·9 million tons per annum.

Of the three new factories which were under construction in 1950 at Sevalia (Bombay State), Sawai Madhopur (Rajasthan) and Raj Gangpur (Orissa) the first, viz., Sevalia was inaugurated in 1951 April. With the completion of the other two factories and the extension to the existing ones it is expected that the total productive capacity is likely to be about 4 million tons by the end of 1952.

With the restoration of stability, the cement industry has retained its national importance in the sense that it is one of the few commodities that can enter into every one of the main schemes of national programme, viz., communications, irrigation and agricultural development generally and proper housing of the working classes. The cement industry owing to the urgency of the demand placed on it in the immediate post-war years and the orderly planning of future development has received due consideration from Government.

(*b*) is a public company with total income not exceeding Rs. 25,000;

(*ii*) a rebate at the rate of two annas per rupee of the total income shall be allowed in the case of any company which satisfies condition (*a*), but not condition (*b*), of the preceding clause; and

(*iii*) a rebate at the rate of one anna per rupee of the total income shall be allowed in the case of any company which, not being entitled to a rebate under either of the preceding clauses, is—

(*a*) a public company the shares of which were offered for sale in a recognised stock exchange at any time during the previous year, or

(*b*) a company all of whose shares were held at the end of the previous year by one or more such public companies as aforesaid:

Provided further that the super-tax payable by a company the total income of which exceeds Rs. 25,000 shall not exceed the aggregate of—

(*a*) the super-tax which would have been payable by the company if its total income had been Rs. 25,000, and

(*b*) half the amount by which its total income exceeds Rs. 25,000.

Explanation.—For the purposes of this paragraph of this Part, a company shall be deemed to be a public company only if it is neither a private company within the meaning of the Indian Companies Act, 1913, nor a company in which shares carrying more than fifty per cent. of the total voting power were, at any time during the previous year, held or controlled by less than six persons.

SALES TAX

Sales tax is a comparatively recent find in the field of provincial finance. The credit for introducing it first in India goes to Mr. C. Rajagopalachari, former Finance Minister of Madras, who was faced in 1939 with the problem of finding an alternative source of revenue consequent on the introduction of prohibition in the State. Since then it has become an important feature of the provincial revenues throughout the country. W. Bengal, Bihar and Bombay have adopted a single-point sales tax on the last sales, while elsewhere it is levied at every stage. A broad idea of the receipts from sales tax can be had from the following table:—

(In thousands of rupees)

—	First Levied	Receipts in First Year	Receipts in 1951-52 (Budget)
Madras	1939-40	33,99	15,10,00
Bombay	1942-43	11,34	12,35,00
Madhya Pradesh	1947-48	62,48	1,30,00
Uttar Pradesh	1948-49	4,00,00	5,35,00
Bihar	1943-44	—2,11	2,51,00
Assam	1947-48	2	40,00
Orissa	1947-48	5,61	70,00
Punjab	1941-42	32	1,70,00
West Bengal	1941-42	15,62	5,00,00

An important constitutional change in regard to the sales tax was incorporated in the Constitution of the Republic of India. Article 286 of the Constitution, imposes restrictions on the power of a State to levy a tax on the sale or purchase of goods where such sale or purchase takes place outside the State or in the course of the import of goods into or the export of goods out of the territory of India. Further, the right to impose a tax of this description will be regulated by Parliament in respect of sales or purchases taking place in the course of inter-State trade or commerce. Lastly, no sales or purchase tax can be levied on articles which are declared by Parliament to be essential for the life of the community, unless agreed to by the President.

THE ALCOHOL INDUSTRY

ALCOHOL has three uses. It can be used as a drink. That is the use for which it is best known. Second, it can be used for industrial purposes, for instance in the manufacture of a number of chemicals. Third, it can be used as a motor fuel, for the production of mechanical power, when we call it power alcohol.

Alcohol does not occur free in nature. It is produced by a slow decomposition of the juices of certain fruit specially grapes, of palms or other sugary substances when they are exposed to warm or moist atmosphere. The process is called fermentation, caused by the presence of certain micro-organisms, popularly called yeast. Commercially alcohol is obtained by the conversion of certain plant products called carbohydrates which include cellulose, starch and sugar. The cellulose and starch are first broken down to simpler sugary matter and then fermented by yeast to produce alcohol.

Potable Alcohol.—Let us now deal with alcohol as drink in more detail. Three types of potable alcohol are produced in the country, beer, toddy, arrack and certain varieties of 'foreign liquors.' Beer and toddy contain 2 to 10% alcohol while arrack and other liquors contain as much as 30 to 50%. Beer is produced from malted barley, and there are about 7 breweries in different parts of India and Pakistan. Arrack, a more popular drink, is obtained from the flowers of the mahua or mhowa tree or from fermented gur or molasses. But the most commonly used drink in the country is 'toddy' to give it its South Indian name. Toddy is obtained from the date palm. The palm is tapped and the juice is allowed to ferment.

There are, of course, the imported liquors but these are consumed chiefly by non-Asians and upper class Indians.

To pass to a statistical view of the liquor question, a great number of old pot, and coffey stills have always been in use but the major part of potable liquor is made in proper distilleries of which there are about 70 in India. Here is a table which gives a few facts about the production position in India.

Year	No. of Distilleries and Breweries	Production in million gallons	Capital invested in lakhs	No. of men employed	Cane-molasses produced in tons	No. of Sugar factories working
1946	71	12	350	3,000	3,50,000	145
1947	68	10·7	400	3,000	3,19,000	137
1948	68	10	400	3,000	4,12,000	135
1949	70	10	420	5,000	4,00,000	134
1950	70	12	450	5,500	3,80,000	137
1951	70	16	500	6,000	4,50,000	137

The figures for the imports of foreign liquors are given below:—

Year	Ale, beer, porter, stout in gallons	Spirits, liquors, wines, in gallons	Total gallons	Value of ale, beer, etc. in rupees	Value of spirits, etc. in rupees	Total Rs.
1946-47 ..	536,335	910,683	1,905,423	27,19,794	2,52,54,508	3,62,69,256
1947-48 ..	1,555,079	955,572	2,527,420	81,06,257	2,91,20,953	3,77,16,920
1948-49 ..	1,404,603	432,512	1,838,799	71,03,414	1,39,06,868	2,10,86,756
1949-50 ..	915,003	429,213	1,344,216	44,03,637	1,36,28,179	1,80,31,816
1950-51 ..	838,061	369,422	1,207,483	39,84,421	1,05,18,352	1,45,02,773
1951-52 .. (8 months)	713,995	408,434	1,122,429	35,49,848	1,32,13,942	1,67,63,790

So much for the production side. Now for the revenue. The States derive their excise revenue from taxes, fees and rents on local production and sale of liquors. Central Government derives its revenue from customs. Here are the customs figures in lakhs of rupees for India:—

Year	Ale, beer, porter and other fermented liquor	Spirits and liquors	Wines	Total
1947-48 ..	15·29	227.4	7·96	250·6
1948-49 ..	22.65	165·35	4·13	192·13
1949-50 ..	17·55	129·77	3·30	150·62
1950-51 ..	15·05	143·11	2·72	160·88
1951-52 .. (8 months)	16·90	143·72	2 02	162·64

It was proposed (Budget 1951) to impose a surcharge of 100% on the import duty on ale, beer, spirits and fermented liquor; the expected addition to the revenue was Rs. 40 lakhs.

Prohibition.—Prohibition is now the accepted policy in India, and in every State there is either complete prohibition or partial prohibition which is to attain completion in a definite number of years.

Prohibition is mainly enforced by the excise police but in certain States there are non-official voluntary bodies such as Vigilance Committees for detection and checking, or Prohibition Guards to help the regular Excise Police. In Bombay no liquor advertisements are allowed in newspapers or liquor scenes in films. Liquor shops have been converted into tea and refreshment hotels in Madras, while Bombay has opened centres where 'nira' is served in the place of liquor. In nearly every State one day or more have been declared as dry days.

Now that drunkenness is an offence in certain States punishable with imprisonment or fine or both the need for an objective test for intoxication arises. It has been suggested in this connection that it would be a good idea if we applied the same test as is being increasingly applied in the U.S.A. In some of the American courts intoxication is considered as present if the concentration of alcohol in the person's blood is ·15% or more. If the concentration is less than ·15% and more than ·05% the person's general behaviour and other circumstances are considered. The U.S. Courts have recognized the admissibility of such evidence and devised means of making such tests compulsory. One Supreme Court has ruled that the test of intoxication is not the amount of alcohol drunk, but the amount of alcohol present in the blood. A second test is the detection and estimation of alcohol vapour in the breath.

It is fully recognized, however, that legal prohibition alone is not enough to stamp out the evil of drink. Something must be done to remove the causes that produce alcoholism. Among the major causes which produce alcoholism are poverty, overwork and a certain feeling of ennui. In the case of chronic alcoholics the cause may lie deeper still, in a pathological condition of the person's mind or body. Therefore to achieve any lasting result a policy of negative prohibition should be backed by a constructive effort to provide better food, better housing, better living conditions, greater facilities for recreation and the proper type of education for the younger people. The need for a constructive effort of this nature is fully realized and every State Government has its own programme for mass education and enlightenment in this direction.

The loss in the excise revenue will be partly made up by fresh taxation such as sales taxes, industrial profits taxes or the raising of duty on liquor as in U.P. And second, the palms and the mhowa trees no longer tapped for toddy would now be available for the production of power alcohol resulting in a general increase of the country's fuel resources.

INDUSTRIAL ALCOHOL

We have already mentioned that alcohol is used not only as a drink but also for industrial purposes. Industrial alcohol is a very valuable material in the manufacture of chemicals like acetone, acetic acid, ether, chloroform, ethyl acetate, etc. It is also necessary as a solvent in the manufacture of fine chemicals, medical preparations, toilets etc. Since the last war its importance if at all has increased. It is now essential in the manufacture of ammunition and of artificial rubber.

In 1946 there were as many as 33 plants capable of producing 12 million gallons of industrial alcohol. But the actual production was as low as 5,031,400 gallons in 1945-46, 3,734,600 in 1946-47, 4·9 million gallons in 1948 and 2·988 million gallons in 1949. The undivided Government of India's Panel on Fine Chemicals, Drugs and Pharmaceuticals estimated that the medical requirements of the sub-continent were a million gallons annually and industrial requirements 10 millions, a target which they said ought to be reached in 15 years time. To make this possible, it is argued, the first essential is to abolish the present excise duty on industrial alcohol and the second is to have a uniform policy for the country as a whole. Industrial alcohol should not cost more than a few annas a gallon. As it is it costs the distiller about eight annas to make it. When the producer's and middleman's profit is added the price will increase to a point where it becomes uneconomic to use it.

MOTOR FUEL

We now come to the third use of alcohol, i.e. as motor fuel for the production of mechanical power. A great many countries in the world have to depend on imported petrol. So as a security measure some power alcohol is always being produced in nearly every big European country from local raw material such as surplus potatoes, wheat, molasses and so on.

India is a large importer of petrol. There is no reason therefore why India should not develop a power alcohol industry of her own especially when she is such a large producer of sugar. A great deal of the molasses which is a by-product in the manufacture of sugar is now going waste. Here are some figures which make the position clear. India had nearly 150 factories in 1942 producing sugar. Now out of the 485,000 tons of molasses produced in that year

The figures for production and imports of some of the important fertilizers are given below. All figures are in tons per annum :

AMMONIUM PHOSPHATE

Production 100 tons.

Imports :—	1945-46	3,853	Tons
	1948-49	3,984	,,
	1949-50	16,914	,,

AMMONIUM SULPHATE

Production :—	1946	22,459	Tons
	1947	21,278	,,
	1948	35,210	,,
	1949	45,935	,,
	1950	47,308	,,
Imports :—	1946-47	126,513	Tons
	1947-48	137,456	,,
	1948-49	133,183	,,
	1949-50	170,839	,,
	1950-51	370,024	,,

POTASSIUM NITRATE

Production about 5,000 tons.

SUPERPHOSPHATE

Production :—	1946	4,500	Tons
	1947	5,000	,,
	1948	21,358	,,
	1949	46,358	,,
	1950	52,432	,,
	1951	45,000	,,

FINE CHEMICALS

The term "fine chemicals" is applied usually to substances such as photographic materials, drugs and pharmaceutical products, paints, pigments and varnishes, and dyestuffs. The raw materials necessary for the fine chemicals industry are derived from both inorganic and organic heavy chemicals, the former of which were dealt with in the preceding pages. Among the organic chemicals, by far the most important are coal and wood distillation products, fermentation products, and aliphatic and aromatic synthetic chemicals. Only a few of these organic chemicals are produced in India and their figures for production and imports, targets for their future production, and main uses are presented in the following table. All the figures are in tons per annum except where otherwise stated.

Chemical	Production 1946-47	Production 1951	Target estimated for the next five years	Main uses
Acetic acid	300	300	17,000	Rayon, white lead, lead acetate, dyeing, rubber
Acetone	1,000	900	13,000	Solvent, explosives
Formaldehyde	60	60	1,000	Textiles, disinfectant, preservative
Methanol	60	60	1,200	Solvent, denaturant
Glycerine	2,100	2,500	5,000	Pharmacy, explosives
Benzene (gals.)	1,200,000	2,400,000	..	Solvent
Creosote oil (gals.)	5,000	8,000	..	Insecticide
Naphthalene	600	1,800	..	Disinfectant, etc.
Phenol	25	25	1,000	Disinfectants, plastics

The Tariff Board's inquiry in 1950 into the claim for protection of fine chemicals industry was confined to calcium lactate, iron-ammonium citrate, potassium citrate and sodium citrate. The principal raw material for manufacturing calcium lactate is lactic acid produced by the fermentation of products like potato starch, molasses, jaggery or milk whey. Lime is required for neutralising the lactic acid to form calcium-lactate. On the other hand, citrates are manufactured by combination of citric acid with various chemicals. Of the latter ferrous sulphate sulphuric acid, nitric acid, caustic potash, potassium carbonate, supercel and activated carbon are imported.

According to the Board's report submitted in the middle of 1950, there are six factories engaged in the production of calcium lactate, iron-ammonium citrate, potassium citrate and sodium citrate. The total rated capacity for the production of calcium lactate is 78 tons a year while for iron-ammonium citrate it is 79 tons. The aggregate capacity for both potassium citrate and sodium citrate has been placed at 345.66 tons. The actual output is hardly one-fifth of the capacity.

The annual demand for the next three years has been estimated by the Board at 60 tons for calcium lactate, 80 tons for iron-ammonium citrate, 200 tons for potassium citrate and 50 tons for sodium citrate. Government have, on the Board's recommendation, converted the 36 per cent. standard and 26 per cent. preferential revenue duty on calcium lactate into a protective duty.

Production of bromine and bromides at one of the alkali works has been attempted and an annual output of 75 tons bromine, 36 tons potassium bromide and 14 tons sodium bromide has been recorded. Coal, tar and wood distillation products are not sufficiently exploited to manufacture fine chemicals and even the wartime production of methanol and formaldehyde has been recently curtailed. Synthetic fine chemicals are yet to be turned out in India on a commercial scale.

Photographic Materials.—The basic chemicals required for the photographic industry are (*i*) gelatin, silver halides and sensitizers in the coating of film, plate and paper base, and (*ii*) hypo sodium sulphite metal, hydroquinone and chrome alum in the processing stages. The pattern of development in the manufacture of photographic chemicals follows closely the expansion of bichromate production. In the post-war period the industry was virtually on the verge of collapse; but the adverse balance of payments in 1949 necessitated import cuts and thus provided indirect protection to the industry. Borax, boric acid, acetic acid and metal and photographic-grade sodium sulphite are still imported. The present capacity of sodium sulphite is 800 tons and output 300 tons which meets the full demand. Production capacity of 30 tons Potash Chrome alum has been established. Hydroquinone is being manufactured in India since 1950 and the annual output is 25 tons. X-ray developing and fixing salts have been placed on the market since 1949.

The existing import duties on Sodium Thiosulphate, Sodium Sulphite and Sodium Bisulphite have been extended up to the end of 1954; but the industry is free to seek protection if the import control is liberalised and foreign competition intensified.

Pre-war mports of raw film base into India were enormous, the film industry alone consuming some 80 million ft. per annum. The Celluloid Industries Panel has recommended the installation of a factory for manufacturing 50 million sq. ft. of all types of raw film, and this should synchronize with the manufacture of gelatin, silver halides, sensitizers and other photographic materials in adequate quantities.

Drugs and Pharmaceutical Products.—Prior to World War *II*, India was almost entirely dependent on imports for the major portion of its requirements of drugs and medicines. The pharmaceutical industry developed considerably during the war period but is still in its infancy. During the war, India's requirements of galenicals were entirely met from indigenous sources. A target for producing 22 million gallons of power alcohol and rectified spirit has been fixed. Surgical dressings, vaccines and sera, rubber goods, laboratory stains and chemicals were produced on a large scale. Of the drugs of natural origin, Morphine, Codeine, Strychnine, Caffeine, Ephedrine, Santonin, Quinine were produced in sufficient quantities not only for meeting internal demands, but, in some cases, for purposes of export. Synthetic drugs manufactured at present in India are mostly made out of imported chemicals, and, to place the industry on a sound footing, it is of fundamental importance that the fine chemicals necessary as raw materials are produced in requisite quantities. In the case of penicillin a plant near Bombay has been installed to produce 105 million units in the next 2 years and four times as much in the next five years.

In the manufacture of proprietary medicines, the country has achieved self-sufficiency. In the field of tablet manufacture, there is in India a production capacity of 1,056 million tablets per annum. Glucose, normal saline, distilled, water, calcium gluconate, quinine bihydrochloride emetine hydrochloride, vitamins and liver injections as in the field of alkaloids, three-fourths of the demand is now being met from indigenous production and some of the alkaloids and salts are commanding a good export market. Before the partition, santonin and ephedrine used to be produced in large quantities; but the raw material being mostly in Pakistan, their output has dropped sharply. Two firms manufacture caffeine from tea-waste; but its production has also shrunk. The bulk of the needs of emetine is met by imports; but efforts to expand cultivation of the plant are in progress in West Bengal and Madras. The manufacturing capacity of opium derivatives has been stepped up to 8,000 lbs. and that of quinine from 70,000 lbs. in pre-war period to one million lbs. The output of strychnine at nearly 12,000 lbs. exceeds the demand and the surplus is being exported to Australia.

At present vaccines, sera, antitoxins and bacteriophages are finding an export outlet. The productive capacity in the private sector is placed at 60 million c.c. per annum and that of Government factories at 96 million c.c. The annual capacity of producing liquor adrenalin hydrochloride is 40 million c.c., that of liquor adrenalin tartrate 44 million c.c. and that of posterior pituitary extracts 50 million c.c. Rapid progress has been made in the field of liver extracts with nearly 21 firms with an annual capacity of 1.4 million lbs. The country has attained virtual self-sufficiency in inorganic medicinal chemicals, while considerable progress has been made with regard to the manufacture of synthetic drugs.

Recently foreign manufacturers have been taking keen interest in developing the Indian pharmaceutical industry. Already six companies started on the basis of Indo-foreign partnership have established factories for producing sulphadiazine, sulphaguanidine, P.A.S., Squibb's products, Boots products, Dettol and sulpha drugs.

Item	Average production figure in 1946-47	Target recommended for next five years
Paints and Enamels	50,000	100,000
Varnishes : All types	2,500,000 gals.	no target proposed
Superior	135,000 gals.	300,000 gals.
Pigments : Lithopone	....	5,000
Zinc oxide	4,000	6,000
White lead, red lead, lithrage and lead chrome	4,500	8,000
Titanium whites	....	3,000
Carbon black	....	500
Aluminium powder	250	500
Mercuric and cuprous oxides	....	500

Dyestuffs.—The dyestuffs industry is one of the key industries on the expansion of which rests the future development of explosives manufacture, the organic chemical industry and the pharmaceutical industry. The industry is, however, in an infant state and has a capital outlay of Rs. 25 lakhs exclusive of the figure for the recently started major concern in co-operation with American capital and technique. Six different concerns are at present engaged in the manufacture of stabilized azoles and developing salts. Out of nearly a dozen varieties of the solubalised vat, only two varieties, namely, green IB and blue 04B are now produced in the country. The new Indo-American project will have an annual production capacity of 2,000 tons.

Most of the raw materials required by the industry are imported and imports of dyes ranged between 12.87 million lbs. in 1946-47 and 7.51 million lbs. in 1949-50.

Coal Tar Distillation.—The lack of a well developed synthetic dyestuffs and resin industry has restricted the pace of progress of the coal tar distillation industry in this country. The total quantity of tar available for distillation is also inadequate compared to the needs of the the four tar distilleries which are working at half their aggregate installed capacity. Since the outbreak of the war, the industry has turned its attention to the manufacture of refined naphthalene, phenol and cresylic acids in addition to the production of road tars, creosotes, disinfectants and pitch.

Paints and Varnishes.—There are at present 53 paint factories and 5 pigment and colour manufacturers in India. Between 1948 and 1950 fifteen units came into existence and the installed capacity for standard types of paints and enamels was consequently stepped up from 50,000 tons in 1947 to 65,000 tons in 1950. The actual output, however, remained almost static around 30,000 tons. The raw materials employed in the manufacture of (*a*) paints and enamels, and (*b*) varnishes and lacquers, are pigments, drying oils and driers, solvents and thinners and naturally occurring and synthetic resins. With the exception of synthetic resins, all the other raw materials are available in the Indian sub-continent in sufficient quantities. The figures for the 1946-47 production and proposed targets for the various major items are given in the following table.

THE COFFEE INDUSTRY

COFFEE cultivation is mainly confined to the hilly tracts of South India, from one thousand to six thousand feet above the mean sea level, and is centred in the Malnad area of Mysore, Coorg, Madras, and the United State of Travancore-Cochin. In the lower elevations, which have a higher rainfall, the more delicate but better quality Arabica coffee has given place to the harder but coarser Robusta coffee.

The area and production, of the two varieties of coffee from 1945 to 1951 are as under:

AREA IN ACRES

Year	Arabica	Robusta	Total
1945-46	1,64,724	46,138	2,10,862
1946-47	1,67,414	49,502	2,16,916
1947-48	1,66,581	52,260	2,18,841
1948-49	1,66,679	54,357	2,21,036
1949-50	1,64,190	60,415	2,24,605
1950-51	1,64,190	60,415	2,24,605

PRODUCTION IN TONS

Year	Arabica	Robusta	Total
1945-46	19,300	6,200	25,500
1946-47	12,100	3,250	15,350
1947-48	6,970	8,830	15,800
1948-49	18,299	3,269	21,568
1949-50	*12,465	*7,646	*20,111
1950-51	15,043	3,237	†18,280

*Receipts up to end of March. † Upto 15th April.

Subject to seasonal variations, the average crop at present can be said to be about 20,000 tons, though there is a tendency for production to increase to 30,000 tons, but with the difference that there will be a bigger crop of Robusta.

The coffee industry in South India, like the other major quality coffee-producing countries in the world, Columbia and Venezuela, is essentially one of small growers. The total number of estates or holdings are reckoned at 27,352, of which 17,847 are below 5 acres, 2,235 are between 5 and 10 acres, 1,593 are between 10 and 25 acres, and 1,437 are over 25 acres. Besides there are 4,240 small holdings in Travancore, of which the areas under the different categories is not known. Thus scientific measures to improve production and marketing or to standardize the product, have got to be taken with the aim of reaching and ensuring the co-operation of these small growers.

INDIAN COFFEE BOARD

The pattern of consumption till the beginning of the Second World War was that more than 60 per cent. of Indian coffee was exported, and less than 40 per cent. was consumed in the internal market. When the export markets were dislocated as a result of the war, there was a danger of all the coffee produced being dumped in the internal market, with a serious drop in prices, and the ultimate ruin of the industry. Even apart from the war coffee prices in the decade 1929-39 were well below the cost of production, and most of the smaller units and many of the bigger units were also going off production.

It was at this point that the idea of forming a statutory body (now called the Indian Coffee Board), to increase internal consumption by propaganda, and also to control exports was first put forward. The body that was set up as a result did achieve both these aims. At the same time methods were worked out for increasing production and a larger allocation of manure was made for coffee estates to increase yields.

The average market prices in February 1951 were :—Rs. 215-3-0 per cwt. for Plantation, Rs. 208-7-0 for Arabica cherry and Rs. 203-3-0 for Robusta as against an export price of Rs. 338 for Plantation.

The peculiar feature of the year 1949-50 was that the average crop picked on account of adverse seasonal conditions, and the large export of 4,000 tons allowed in anticipation of an early bumper crop of 30,000 tons for the season 1950-51, did not materialise. The result was an artificial scarcity of coffee in the internal market and the soaring of prices, and the Board was hard put to it to keep internal prices down, on account of the low stock position.

The average market price per cwt. in March 1952: Plantation Rs. 196-7, Arabica Rs. 185-7, Robusta Rs. 180-9. The foreign market prices per cwt. in April 1952 : Santos Rs. 289-3, Gautemala Rs. 302-3, Salvador Rs. 283-13, Costa Rica Rs. 299-10, Colombia Rs. 293-12.

Since the beginning of 1952 coffee prices have taken a downward trend. The 1951-52 crop was estimated to amount to 21,500 tons consisting of 15,000 Arabica, 6,500 Robusta. A total of 1,000 tons has been ear-marked for export out of the 1951-52 crop.

THE CHEMICAL INDUSTRY

FOR purposes of industrial production, chemicals fall easily into one of two major groups : (*a*) Heavy Chemicals, and (*b*) Fine Chemicals. Heavy chemicals are produced in enormous tonnages and at a low cost, and are consumed almost wholly in industrial and agricultural operations. The term "Heavy Chemicals" is applied usually to substances such as the common acids, alkalies, fertilizer, etc., which are the foundation of the entire chemical industry. Their industrial utility is determined by their use of processing the raw materials of other industries manufacturing essential commodities, such as textiles, paper, soap, glass, leather, kerosene, motor spirit, lubricating oils, etc. Thus, while the cost of the basic chemicals will undoubtedly influence the development of the consumer industries, there must be an all-round development of the latter to enable the heavy chemicals industry to be placed on a sound footing.

Fine chemicals, on the other hand, are manufactured generally in relatively small amounts since purity is important; their production requires great skill and care in each operation under accurately controlled conditions. In this category are included photographic materials, drugs and pharmaceutical products, paints, varnishes and pigments, dyestuffs, etc.

The modern Indian chemical and pharmaceutical industry was founded in the early years of the twentieth century by pioneers such as the late Mr. B. K. Paul, Acharya P. C. Ray, Mr. T. K. Gajjar and Mr. B. D. Amin. The two World Wars provided the stimulant by raising the demand for the industry's products and shutting out foreign imports, while the development policy pursued by Government after 1946 helped the industry not only to consolidate its position but to achieve sizeable expansion. According to the census of the industry for 1950, there were 244 factories of which 81 were in West Bengal and 93 in Bombay. In 1948 there were as many as 292 factories. The weeding out of uneconomic units was mainly responsible for the fall in the number; but otherwise there was an all-round expansion of the industry.

The following table reveals the recent progress of the chemical industry :—

—		1947	1948	1950
Factories	(Number)	191	292	244
Capital Outlay	(Rs. in crores)	15·74	17·24	20·72
Fixed Capital	,,	9·03	9·50	18·87
Working Capital	,,	6·70	7·74	10·85
Workers employed	(Number)	32,250	32,605	33,525
Wage Bill	(Rs. in crores)	2·81	3·25	4·11
Materials Consumed	,,	8·34	10·80	17·82
Raw Materials	,,	N.A.	8·53	11·12
Packing Materials	,,	N.A.	2·02	2·98
Fuel, Water, Lubricants, etc.	,,	0·59	0·90	1·01
Value of Products	,,	17·64	20·44	31·73
Value added by manufacture	,,	8·00	11·73	18·91

HEAVY CHEMICALS

With the notable exceptions of borax, nitre and elemental sulphur, the heavy chemicals do not occur in nature, and they have, therefore, to be manufactured from naturally occurring raw materials. The names of the various heavy chemicals manufactured in India together with their use are given below :—

Chemicals	Main uses
Sulphuric Acid ..	Chief basic chemical
Aluminium Sulphate and alums	Paper, textiles, water treatments
Copper sulphate ..	Insecticide, fungicide
Ferrous sulphate ..	Textiles, inks, paints
Magnesium sulphate ..	Sizing, pharmacy
Sodium sulphate ..	Paper, textiles, dyeing, pharmacy
Sodium hydrosulphite	Textiles, sugar, gur
Sodium sulphide ..	Dyeing, paper tanning
Sodium thiosulphate ..	Photography, leather, textiles
Hydrochloric acid ..	Textiles, galvanizing, preparation of other chemicals
Calcium chloride ..	Refrigeration, road-making
Magnesium chloride ..	Textiles, paper, cement
Zinc chloride	Sizing, flux, dry cells
Nitric acid	Gold refining
Ammonia	Fertilisers, refrigeration, medicine
Ammonia carbonate and bicarbonate ..	Medicine, baking powder,
Ammonia chloride ..	flux, dry cells, sundry trades
Caustic soda	Soap, textiles, paper, other sundry trades
Soda ash	Glass, textiles, paper, silicates, washing, flux, etc.

Heavy Chemicals—*Contd.*

Chemicals	Main uses
Bleaching powder ..	Textiles, paper, public health
Chlorine	Water treatment, bleaching powder, chlorinated products
Potassium chlorate ..	Matches
Sodium bicarbonate ..	Medicine, food products, fire extinguishers
Sodium cyanides and ferrocyanides ..	Extraction of gold and silver
Sodium silicate ..	Lining, silk, soaps
Sodium and potassium dichromates ..	Textiles, leather, matches
Calcium carbide ..	Oxy-acetylene welding, mining operations

Imports of the following chemicals is banned since domestic production is sufficient :—

Alums, Aluminium Sulphate Ferric, Bichromates, Sodium and Potassium, Sodium Sulphate, Sodium Thiosulphate, Sodium Sulphite, anhydrous, Sodium Bisulphite, Sodium silicate, Sodium and Potassium acetate, Sodium and Potassium citrate, Calcium chloride, Chlorine liquid, Chrome Alum, Chrome Salts and Chromic acid, Ferrous Sulphate, Hydrochloric acid, Sulphuric acid, Nitric acid, Iron and Potassium bromide, Magnesium sulphate (Epsom Salt), Magnesium chloride, Magnesium carbonate heavy and Naphthalene.

The output of chlorine liquid and bleaching powder has been generally upward but that of bichromates has declined. In the case of liquid chlorine imports declined from 682,235 lbs. in 1938-39 to 654 lbs. in 1949-50 and the Government of India have declared that no import is now necessary. The present installed capacity is 22,000 tons and the output in 1950 was 3,970. Imports of bleaching powder halved from 10,656 tons in the pre-war year to 5,513 tons in 1949-50 and were slightly higher at 5,673 tons in 1950-51. The installed capacity has risen to 13,500 tons and the output stepped up from 1,500 tons in 1946 to 3,309 tons in 1950. In the case of bichromate there is a surplus capacity and though the production is downward the industry has built up a valuable export market. The Korean War provided a fresh stimulant for the industry. Its present rated capacity is 5,500 tons while domestic consumption is placed at 2,400 tons.

Calcium Chloride.—There are two manufacturers of calcium chloride of commercial quality. Their capacity is 1,500 tons but the production declined from 818 tons in 1946 to 229 tons in 1949. The Tariff Board made a report on the claim of the industry for protection early in 1950 and Government passed orders extending the protection up to March 31, 1952. As regards the Board's suggestion that imports of calcium chloride should be allowed only after taking into account the domestic production Government observed that this was acceptable for the duration of the import control instituted mainly for the purpose of balance of payments consideration.

Stearic Acid and Oleic Acid.—At the beginning of 1947 there were three units producing stearic acid and oleic acid. Since then one firm suspended manufacture owing to foreign competition and another unit expected to commence production on a large scale has not started production. The main raw materials are tallow, lime or caustic soda and sulphuric acid. The Tariff Board had estimated the demand for undivided India in 1947 at 1,000 tons for stearic acid and 500 tons for oleic acid. The Board placed the demand in 1950, when it undertook the next inquiry, at 700 tons and 600 tons respectively. Against a rated capacity of 1,300 tons the annual productions varied between 81·5 tons and 25 tons in respect of stearic acid and 8·2 tons and 1 ton in the case of oleic acid. Government have extended the protection up to December 31, 1951 and have also accepted the Board's recommendation in regard to taking indigenous production into account before granting licences when it reaches half the domestic needs. Government have also accepted the Board's recommendation that the industry does not need any subsidy.

Magnesium Chloride.—This chemical is used for making oxy-chloride cement and is extensively used in the textile mills for cloth sizing. The main raw material "Bitterns" is extensively available at Kharaghoda.

Potassium Permanganate.—About 200 tons of potassium permanganate represents a fair estimate of the annual needs of the Indian Union for the next two years. According to the Tariff Board's report submitted in 1950 the total capacity of the indigenous industry was only 50 tons and the actual production was about 10 per cent. of the domestic demand. Government have accepted the Board's recommendations in respect of replacing the existing protective duty by a revenue duty to meet their requirements of potassium permanganate from the indigenous manufacture.

SULPHURIC ACID

The acid industry is the key industry and the prosperity of a country is judged by the quantum of sulphuric acid consumed. The *per capita* consumption of sulphuric acid in India is only 0.63 lb. as against 125 lbs. in the U. S. A. and 45 lbs. in the U. K.

Over half a century ago the sulphuric acid industry was started in this country and thrived on the two wars despite Government turning down the Tariff Board's recommendation for protection in 1929. Prior to 1939, there were only 23 units manufacturing sulphuric acid. Now there are 49 plants with an annual installed capacity of 160,000 tons. 19 of them use contact process and the rest have chamber plants with 50,000 tons capacity. It is hoped that by 1955-56 the capacity would be stepped up to 208,000 tons with the addition of four units. The trend of production is given below :—

Year	1946	1947	1948	1949	1950	1951
Production (000 tons)	60·0	60·0	80·0	99·5	102·1	100·9

Yearly 46 per cent. of the sulphuric acid supplies go into the manufacture of various chemicals; but ammonia sulphate and superphosphates account for 32 per cent. Cotton textiles and oils take 3.31 per cent. and 3.61 per cent. of the supply respectively with accumulators, distilleries and leather taking about one per cent. each. The cost of production of sulphuric acid in this country is very high as most of the plant are of an uneconomic size. Of the 49 units only seven have a capacity of more than 25 tons per day and the raw material has to be imported. Against an annual requirement of 80,000 tons crude and 2,500 tons refined sulphur the International Materials Conference allocated 44,400 tons in 1951.

The industry also turns out hydrochloric and nitric acids. Very few factories, however, employ the "Manheim" type of furnaces for producing hydrochloric acid, the total annual output of which is now about 2,500 tons. The future trend will be mainly by the direct combination of hydrogen and chlorine. This process is presently being adopted by four firms. Nitric acid is manufactured mostly by treating sodium nitrate with sulphuric acid though in times of emergency, nitrate of potash locally available was used. Its chief use is in the manufacture of nitrates, explosives and dyestuffs. Gypsum occurs in Rajasthan, Madras, Kashmir and the Punjab. The main sources are in Bikaner and Jodhpur estimated to contain 15-20 million tons. Deposits in Tiruchirapalli (Madras) are also believed to be of the same size, pyrites have been a source of half the world's sulphur deposits. In India Bihar, Kashmir and Simla have these deposits; but there is no full estimate. Recently, supplies have been located in Karwar (Bombay). Sulphur can also be recovered from coal and by smelting sulphide metal ores. In India it is extracted from chalco-pyrites used as a raw material for recovering copper metal.

ALKALIES

The Indian Alkali Industry is essentially a product of the Second World War. Its main products are soda ash, sodium bicarbonate, caustic soda, bleaching powder, bleach liquor, benzene hexachloride, liquid chlorine and zinc chloride.

As a heavy chemical, caustic soda is of equal importance in the soap, paper, mercerized cotton, explosives, dyestuffs, vegetable oil, rayon, and other chemical industries. At present India's requirements of caustic soda are placed at 45,100 tons distributed as under: Soap 13,450 tons, Textile industry 12,000 tons, Paper 11,500 tons, Vanaspati 900 tons, Rayon 4,000 tons, Chemical 1,000 tons, Miscellaneous industries 750 tons and Government 1,500 tons. Since 1948 two more units have started production, and the six units had in 1951 an installed capacity of 19,068 tons. There are certain units which are producing their own requirements of caustic soda, and this capacity would come to some 3,000 tons.

There is a general tendency abroad to change over from the lime-soda to the electrolytic process for the manufacture of caustic soda, as there is an increasing demand in the synthetic organic industry for the by-product chlorine obtained by the latter method. In India, however, there is every danger that all the chlorine may not find suitable outlets in the immediate future. Hence, the decision to set up electrolytic caustic soda plants must be considered in relation to the possibility of the utilization of the by-product chlorine. Among the possible uses for chlorine may be mentioned the manufacture of hydrochloric acid, bleaching powder, hypochlorite solution, chlorinated rubber products, chlorinated plastics, D.D.T., etc. Soda ash is manufactured by the ammonia soda process.

India's requirements of soda ash are about 124,000 tons composed of glass industry 40,000 tons, sodium silicate 15,000 tons, textiles 9,000 tons, paper 5,000 tons, chemicals 6,000 tons, washing 44,000 tons and miscellaneous 5,000 tons. The present installed capacity is 54,000 tons; but until 1949 hardly one-fourth was used.

The World War II gave considerable impetus to the production of several heavy chemicals in the country. For instance the manufacture of important industrial chemicals, such as copper sulphate, sodium sulphide, anhydrous ammonia, bleaching powder, chlorine, dichromates, etc., was started, and the production of salts, such as aluminium sulphate, iron sulphate, etc., increased to a considerable extent. There was, however, no planning in these endeavours, and in some cases the quality of the product was also not sufficiently high.

India has stepped her installed capacity for the manufacture of liquid chlorine from four units (2,000 tons) to six units with an installed capacity of 8,500 tons. This is more than sufficient to meet all internal demands, but the difficulty is in transport. Long distances are involved and stand in the way of free transport of liquid chlorine from the factories to places of consumption. Following the heavy imports in 1948-49 and 1949-50 the industry asked protection and the Tariff Board recommended protective duties on imports at the following rates :—

Caustic Soda Rs. 8-10 per cwt. standard and Rs. 6-4 preferential; Bleaching Powder Rs. 2-8; and Liquid Chlorine Rs. 20-2 per cwt. standard and Rs. 14-8 preferential.

This recommendation was not, however, accepted by Government since the landed cost had risen after the completion of the report in December 1950.

There are three units for manufacturing bleaching powder with an installed capacity of 5,160 tons; but it is not being fully used.

From the bitterns in the manufacture of salt, India has now an established capacity for the manufacture of 200 tons of bromides. The internal consumption has been computed to be 60 tons. There is ample scope for catering to the export market.

Another by-product in the manufacture of salt is magnesium chloride. India is not only able to meet her internal demands but has been exporting magnesium chloride to various countries including U.K.

The demand for magnesium sulphate, alum, etc., is being fully met. There is also some export trade in these chemicals.

The match industry in India has expanded phenomenally during the last few years. At present the country's aggregate capacity for the production of matches is 40 million gross boxes. We are also having a flourishing export trade in matches. To cater to the needs of the match industry, the country requires a production of 2,000 tons of potassium chlorate.

The anhydrous ammonia being manufactured at present is converted almost entirely into ammonium sulphate, and very little is thus left over for refrigeration, medicine, and other uses. It should be possible to obtain about 300 tons per annum of anhydrous ammonia for these uses when the new plant for the manufacture of ammonium sulphate from gypsum and ammonia, now under construction, starts functioning. The bleaching powder manufactured at present is poor in quality, and the defect is attributed to low quality lime. It is necessary therefore to find deposits of and utilize high quality lime so that the available chlorine in the product is at least 30 per cent. Magnesium chloride and sulphate are now manufactured on the West Coast from sea and sub-soil bitterns. Large quantities of the former were exported before the War (about 1,300 tons in 1939-40), and it is gratifying to note that the exports have now increased to 3,200 tons.

Calcium carbide is a very important heavy chemical both in peace as well as in war. Its manufacture has not been undertaken so far in India due largely to difficulties in finding a suitable site where coal and high-grade lime occur together, and a cheap supply of electricity is also available. It is unfortunate that not much progress has been made in the erection of the 5,000 ton plant that was to be installed in Bihar.

FERTILIZERS

Food is one of the three dire necessities of human existence. To maintain crop yields in any established agriculture, it is essential to add the plant-food elements (nitrogen, phosphorus and potassium) to the soil year after year. The question of chemical fertilizers is thus of major importance in India with its rapidly increasing rate of population.

Pre-war annual production of ammonium sulphate and superphosphate was about 30,000 and 2,000 tons respectively. The output of superphosphates went up to 51,700 tons in 1950. There are at present 14 units with a capacity of 134,000 tons of superphosphates. The main raw material is rock phosphate for which Moroces is the chief source. The production of ammonium sulphate was stepped up from 45,900 tons in 1949 to 47,300 tons in 1950. Six firms are engaged in this industry, their installed capacity being 78,000 tons. The Government factory at Sindhri started production in 1952 and is capable of producing 3½ lakh tons annually.

The following table gives details about the more important items :—

(in tons)

Year	Soda Ash		Caustic Soda		Bleaching Powder		Liquid Chlorine	
	Production	Imports	Production	Imports	Production	Imports	Production	Imports
1946	12,000	57,883	2,900	29,890	2,000	7,316	1,500	—
1947	13,624	67,948	3,314	21,231	2,550	8,367	1,705	—
1948	29,150	102,594	4,383	91,589	3,400	11,520	1,800	—
1949	17,918	12,295	6,303	12,989	2,470	5,513	2,650	645
1950	43,790	29,817	10,846	22,067	3,300	5,633	3,970	48,288
1951	47,528	N.A.	14,722	N.A.	3,580	N.A.	5,270	N.A.

Note.—In the case of imports the year is from April 1.

THE COIR INDUSTRY

COIR is the trade name given to the fibre obtained from the husk of the coconut fruit. India and Ceylon have a virtual monopoly in the production of this by-product of the coconut industry and its development in these countries has been rendered possible by the fact that these coconuts are usually harvested when the husk of the fruit is still green, though the coconut within is ripe. Good quality coir can only be produced from the fresh green husk of the ripe fruit. If the nut is not fully ripe the fibre in the husk has not developed its full strength, and if the fruit has dried the fibre is weak, dark coloured and difficult to extract.

In Ceylon, the extraction is done by mechanical means on a factory scale after the husks have been retted in water for two or three weeks, and under such methods it is not possible to obtain either the colour or cleanliness of the fully retted Indian coir. The process consists of holding the husk against a revolving spiked drum which combs and extracts the fibre. The shorter fibres collect in the drum and after cleaning are classed as "mattress fibre." The longer fibres are retained in the hand of the operator and are classed as "bristle fibre" which is exported for use in the manufacture of brushes, etc. About 75 per cent. of the Ceylon produce is exported as raw fibre, and only 25 per cent. as yarn or manufactured coir.

The industry as far as the export trade is concerned, is confined to the backwater regions of the Malabar coast, Travancore-Cochin, and to the Laccadive and Divi Islands, which are administered by the Madras Government. The extraction of the fibre and the manufacture of coir yarn forms a well organised cottage industry. The freshly harvested nuts are purchased by merchants, dehusked and the husks are then conveyed down the backwaters to suitable places for retting. Such places are situated along the tidal reaches of the backwaters, and sites for retting are selected in places where the ground contains a considerable admixture of sand. Here, pits are dug, either in the backwater itself or on the banks and after lining these with palm leaves they are filled with the husks. After filling they are covered with plaited coconut leaves and weighed down with soil or mud. The husks are left to ret in these pits for a period of about eight months, the tidal rise and fall of the water and the porous nature of the ground ensuring constant water movement through the mass of retting husks and thus supplying aeration for the necessary bacterial action.

Women's Work.—At the end of this period, the husks are removed from the retting pit, washed in clean water and distributed among the local people who extract the fibre. This is usually spare time work done by the women of the house. Firstly, the outer skin of the husk is removed and the husk is then beaten with a wooden mallet on a block of wood or stone. This separates the fibre from the decaying pithy matter in which it is embedded in the husk. The fibre thus extracted is dried in the shade and then beaten or willowed with thin bamboo canes. The fibre is then returned to the merchant who further cleans this in a revolving drum furnished with projecting spikes resembling thin saw blades made of iron. Then the fibre is sorted out into colour grade and distributed among the local people who spin this into yarn. This is fundamentally a cottage industry. The fibre is first made into "slivers" and is then either spun by hand or on a wheel. Then it is returned to the merchant who again grades this for colour and splices the short lengths into a continuous length of 450 yards. Finally it is tied into bundles and is sold to the factories where it is either baled up for export or is manufactured into matting, door mats, braid, ship's fenders, rope, etc.

The yarn is very carefully graded, both for manufacture and for export, according to its colour, which is, in reality, a gauge of proper retting. The best quality coir is of a golden-yellow colour and the lowest grade grey which shows that the husks have either been over-retted or that the conditions for retting have not been satisfactory.

Properly retted coir is much more easily spun than machine made coir, because its fibres are clean and free from adhering pith and much more even yarn is obtained from it. It is also much stronger than machine made coir because none of the long or "bristle" fibres have been removed in the process of extraction. The colour is not only attractive, but is an indication that retting has been carried through to the correct stage.

Coir fibre, when made into ropes, is extremely elastic and thus yields to heavy strains, and has, therefore, special uses. It does not rot easily when exposed to atmospheric conditions, or to salt or fresh water, and in manufacture it is found to take dyes readily.

The Government of Madras are conducting a coir training school at Beypore near Kozhikode under the control of the Director of Industries and Commerce, where students are trained in improved methods of cleaning fibre, of spinning of coir yarn on the wheel, of producing ropes, belts, mats, rugs, mattings, etc.

A coir industrial school is also being conducted by the Government of Madras, Department of Industries and Commerce in Baruva, Srikakulam District, near the Uddanam tract, for giving training in improved methods of coir industry for the benefit of fishermen and other educationally backward communities of the area.

A small scale coir factory is now being run by the Department of Industries and Commerce at Beypore (Malabar Dt.), which is attached to the Government Coir School, Beypore.

A large-scale Coir Factory is also being started by the Department of Industries and Commerce, Madras at Beypore to be run on commercial lines.

The Government of Madras have constituted a Coir Advisory Board consisting of non-official businessmen, traders in coir and representatives of Chambers of Commerce with the Director of Industries and Commerce as Chairman to advise Government as to the steps necessary for the development of coir industry on up-to-date lines on the measures necessary for the proper grading of coir and coir products and to lay down suitable specifications with a view to maintaining the standard of quality, especially for export and also to explore the possibilities of developing export trade in coir.

The Department of Industries and Commerce Madras has deputed a Coir Demonstration party to the Laccadive and Amindive groups of Islands off the coast of Malabar for introducing and popularising the use of charkas for the manufacture of hard twist coir yarn and developing coir industry on up-to-date lines on the islands. The demonstration Unit started functioning with effect from December, 1951.

Coir Workers' Co-operative Societies exist in the districts of Malabar, South Kanara, and Srikakulam of the Madras State engaged in the production of coir yarn, ropes and other coir goods under the control of the Co-operative Department. The Department of Industries and Commerce renders technical assistance and advice.

The Trade.—During normal times the value of the coir trade is considerable, the imports into Great Britain alone, which represent less than 20 per cent. of the Indian exports, are shown in the Board of Trade returns as amounting in value to more than one million pounds per annum. It is an industry which provides a profitable occupation to the densely populated backwater tracts of western India, and it provides the raw material in the shape of yarn and fibre for a considerable part of industry in Europe. More than 80 per cent. of the manufactured coir products and more than 90 per cent. of the coir yarn imported into the United Kingdom are produced in India.

The War made a change to the coir trade. Coir production in India considerably dwindled owing to the shrinkage of overseas markets. The United Kingdom which was India's principal market before the War reduced her imports very considerably, while all the European markets were lost to India on account of restrictions imposed by all the importing countries on imports of coir. But the U.S.A. and Canada became important buyers of coir floor-coverings from India which took the place of Japan, China and Java which were supplying weed and grass mats in the pre-war years. During the War, coir was found to be a suitable substitute for hemp and sisal for cordage purposes and began to be used as such on a large scale on account of the non-availability of Manilla hemp and Javanese sisal, consequent on the Japanese occupation of the Philippine Islands and Indonesia. The War has shown that coir can be used for various other purposes also like the making of roads or a good wearing surface.

COTTAGE INDUSTRIES

COTTAGE industries have been variously defined by different authorities according to the number of persons employed in the units, the nature of the work, the use or rather the avoidance of the use of machines, power and so on. The field of cottage industries forks out into agriculture, forestry, animal breeding, fishing and mining. It is estimated that about 20 million workers are engaged in cottage industries in India. This figure does not include the large number of persons who engage themselves in agricultural pursuits side by side with production in some craft or in the processing of agricultural produce. This figure also does not include all the members of the artisan's family who assist him during their leisure. Classified figures are given in the table below:

Name of Industry	No. of persons employed
Textiles	50,00,000
Leather	24,00,000
Wood	20,00,000
Metals	40,00,000
Pottery, ceramics, tiles, etc.	20,00,000
Chemical products (vegetable oil, etc.)	10,00,000
Food	20,00,000
Dress and Toilet	11,00,000
Miscellaneous undefined industries (Jewellery, toy-making etc.)	6,00,000
	2,01,00,000

There is the benefit derived from providing subsidiary occupation to the rural population which has always to be reckoned. It is estimated that about 60 to 90 million man power is being wasted in India. Only cottage industries are capable of utilising this large man power.

Enquiries about Articles

Middle East Countries: Blankets (cotton, woollen and mixed), carpets; coconuts (desiccated), combs, coir mats and mattings, coir yarn fancy goods, furnishing fabrics, hats (pith and felt); hemp, twine and rope; ivory products (boxes, statues, bracelets, necklace etc.); Locks and pad-locks, shells for button manufacture, silk textiles, sporting requisites, toys, etc.

New Zealand and Australia: Bamboo and cane goods, carpets, embroidery and lace goods, sporting requisites.

South American Countries: Artistic textiles, leather goods, toys, lacquer work articles, embroidery articles, wood work, ivory products, etc.

Canada: Carpets and rugs, cane, poles and rattan, cocoa mats and matting, sports goods, lace goods, precious stones, coir and coir products, etc.

U.S.A.: Arts and crafts products such as carpets, brassware and silverware, silk, etc.

East Africa: Art products, fancy and ivory goods, silk goods, hosiery, jewellery, curios, etc.

TEXTILES

Textile production on a cottage industry scale in India has had a glorious past. Mummies in the Pyramids, dating from 2,000 B.C. have been found clothed in the finest Indian muslin. The ladies of the Imperial Courts of Rome and the mediaeval kingdoms delighted to deck themselves in Indian silk. Till the early modern period the fineness of Indian handloom fabrics was the wonder of the world.

After agriculture the handloom weaving industry is still the largest single source of occupation in India. It is estimated that the industry maintains a total population of over one million people. It employes more than 85 per cent. of the textile workers in India. The number of spinners and weavers engaged in khadi work under the All India Spinners' Association alone is 2,70,000. The number of weavers putting in full time work is 14,34,000 and part-time 7,47,000. There are 2,53,000 paid assistants and 25,73,000 unpaid assistants.

Number of Looms and Workers*

Region	No. of looms and weavers	No. of dependents	Total No. dependent on the industry
Assam	411,018	1,233,254	1,644,072
Madras	294,101	882,303	1,176,404
Punjab	227,295	681,885	909,180
U.P.	192,890	578,670	771,560
Bengal	121,019	363,057	484,076
Hyderabad	108,775	326,325	435,100
Bombay	103,300	309,900	413,200

* 1940

There are about 2 million looms in the country, of which 13 per cent. are idle. 72 per cent. of the looms are engaged in cotton weaving, 16 per cent. in silk, 5 per cent. in wool, 1 per cent. in artificial silk and 6 per cent. in other textile mixtures. 64 per cent. of the looms are throw shuttle looms, 35 per cent. fly shuttle looms and 1 per cent. of other categories.

The total production of cloth woven on a cottage industries scale is estimated at 30 per cent. of the total production of textiles in India. Out of the 68,000 lakh yards of cotton cloth no less than 20,000 lakh yards are produced by the handloom industry.

Total Value of Hand-woven Cloth*

	(In crores of rupees)
Cotton textiles	47
Silk	15
Artificial silk	4
Wool	3
Others	3·80
Total	72·80

* 1939

There is no State in the country where handloom weaving does not exist. But its importance varies largely from State to State. The weavers are generally found in important bazaar towns. In Assam the weavers are generally women, while in other States they are generally men. Cotton goods turned out on handloom are in the main saries, dhotees, towels, bed sheets, lungies and grey cloth, though shirtings, coatings, table cloths etc. are also being produced at some centres now.

Yarn and Cloth

Year	Yarn available to handlooms (in million lbs.)	Cloth produced on handlooms (in million yds.)
1900-01	161·6	646·4
1910-11	217·0	868·0
1920-21	232·8	931·2
1930-31	314·3	1,257·2
1931-32	333·1	1,332·4
1932-33	379·8	1,519·2
1933-34	315·5	1,262·0
1934-35	313·9	1,255·6
1935-36	362·6	1,450·4
1936-37	316·3	1,265·2
1937-38	323·3	1,293·2
1938-39	425·8	1,703·2
1949-50 approx.	350·0	1,400·0

Spinning

Annual consumption (according to counts) in million pounds

Region	Counts of yarn: 1-10	21-30	Above 40	Total all counts
Madras	6.13 (7.44%)	13.99 (17.04%)	15.57 (18.96%)	82.13 (22.86%)
U.P.	14.79 (28.89%)	4.31 (8.40%)	1.65 (3.22%)	51.21 (14.25%)
Punjab*	31.25 (63.93%)	1.88 (3.85%)	2.00 (4.09%)	48.88 (13.60%)
Bombay	2.81 (6%)	14.96 (32%)	11.69 (25%)	46.75 (13.02%)
Baroda	2.42 (80.46%)	0.19 (6.40%)	0.01 (0.16%)	3.01 (0.84%)
Kolhapur & Former Dn. States	0.01 (0.37%)	1.10 (41.20%)	1.15 (43.07%)	2.67 (0.74%)
Bengal*	0.44 (1.5%)	14.82 (50%)	5.93 (20%)	29.64 (8.25%)
Madhya Pradesh	2.58 (11.86%)	3.46 (15.90%)	0.93 (4.27%)	21.76 (6.06%)
Bihar	6.80 (35.88%)	0.89 (4.70%)	0.25 (1.32%)	18.85 (5.28%)
Hyderabad	3.16 (17.80%)	2.74 (15.48%)	1.47 (8.36%)	17.73 (4.93%)
Orissa	0.47 (3.19%)	4.33 (29.35%)	1.11 (7.60%)	14.73 (4.10%)
Travancore	0.34 (5%)	0.34 (5%)	0.34 (5%)	6.85 (1.90%)
Cochin	Negligible	0.50 (34.48%)	0.10 (6.9%)	1.45 (0.4%)
Assam	0.42 (6.25%)	3.00 (44.64%)	0.35 (5.21%)	6.72 (1.87%)
Mysore	0.09 (2%)	2.16 (48%)	....	4.50 (1.25%)
Jammu and Kashmir	Negligible	1.81 (77.68%)	0.02 (0.86%)	2.33 (0.65%)
Total	71.71 (19.95%)	70.48 (19.62%)	42.57 (11.84%)	359.21 ....

* Pre-Partition.

The rest is made up by yarn of counts 11-20 and 31-40.

There are about 2,00,000 spinners in the country who are working under one or other organisation whose total production of handspun yarn is estimated at 60 million lbs.

Ginning and pressing of cotton, newar and tape weaving, and durries manufacture are some of the allied industries.

Silk

Silk weavers are found in nearly every State in India. Assam and Bengal are the largest producers of silk. Women form the majority of the silk weavers in Assam where 2,03,000 looms are engaged in silk weaving. West Bengal has 14,426 looms with an output of 10 per cent. of the total Indian silk production. Saree, lungi, dhotee, chadar, paithani, pagota, turbans, brocades, etc. are the main silk fabrics. The brocades and silk fabrics of important centres like Banaras, Murshidabad, Surat, Amritsar have a particularly wide reputation. India is the only country where Tussar, Endi and Munga silk is produced. The worms of these varieties are harder in their habits and feed on the leaves easily available.

An allied industry is gold and silver thread work and gota making. These threads are used both in weaving and embroidery.

Wool

The pride of place in the manufacture of woollen articles goes to Kashmir where beautiful work with intricate designs is turned out in small cottages. The wool weaver is, however, found in most regions in the country where sheep breeding is carried on. Coarse blankets, etc. that are required by the villager for an all-type use are manufactured in most regions. There are certain centres which specialise in carpets and druggets. The other woollen products are loi (a type of blanket), gabba (milled loi), namda, patti (milled blankets), pattu (tweed cloth), pashmina, rugs and shawls. Embroidered woollen fabrics are produced in Kashmir and the Punjab.

Embroidery

Embroidery on cotton, silk and wool is done in many towns of India. In Assam, artistic stuff is turned out by ornamenting of cloth with cowries. There are famous centres in Bengal, Madras, the Punjab and Kashmir. Silk and cotton thread, wool, silver and gold thread are used in producing beautiful designs in flower, bird, fruit etc. Chikan work, kashida work, gold and silver lace, drawn thread work, crochet work, needle work, knitting and hosiery work are carried on in many urban centres.

Dyeing and Printing

Dyeing and printing is also an important industry. Various centres in different parts of India have specialised in the production of traditional designs. Kalamkari and printing and painting of cloth with permanent dyes is one of India's oldest art-crafts. The most important kalamkari centre is Masulipatam in Andhra. Usually wherever there are printers block-makers are also found. Screen printing is a recent development.

Caps, hats, turbans, shoe laces, ready-made clothes, twills and other articles of dress are manufactured in small units. Buttons of metal, horn, mother of pearl, shells, plastics, rags, etc. are manufactured at different centres. Umbrella handles and umbrellas and decorative articles, are also manufactured in some cities.

Flax, Jute Manufactures

Spinning and weaving of flax and jute and manufacture of gunny cloths and bags, canvas cloth, quilts, sails and tents is found in some centres in Bengal and other States. Weaving of mats and mattings of coir, screw pines, palmyra fibre, hemp, ambadi, sisal and coarse grasses is undertaken in many States. Fishing nets of some fibres are produced by fishermen. Ropes and twines are manufactured in almost every village. Coir mats are being manufactured in large quantities in Cochin and Travancore. Manufacture of brushes, door mats and furniture has been introduced lately.

FOREST PRODUCE

Aboriginals and some backward class people manufacture brooms, tatpattis, patravalis, fans and other household articles out of different leaves and grasses. At certain places the work turned out is very artistic. Rough cane and bamboo work is carried on in rural areas where baskets, screens, sieves, winnows, mats, etc. required by the villagers are produced. In urban areas finer work is done and boxes, tables, chairs, book cases and other articles of furniture are made. In Madras furniture with lacquer coating is a speciality.

There are 89 million acres of land under forest in India, where the woodcutter and the charcoal-burner find employment. The main produce from the forests is timber. Charcoal is manufactured in forest coupes from particular types of wood and transported to the cities. Amongst other forest produce are firewood, tanning material like harda, ghatbore, different types of barks and grasses, herbs, shellac, turpentine, etc.

ARTS AND CRAFTS

Carpentry is a key village industry.

The blacksmith is also found in every big Indian village.

Utensils of brass, aluminium, lead, tin, steel, copper and bell metal are manufactured at various centres in every State. Metal ware is either beaten ware (thoka) or castware. The metal and lead work of Assam, Punjab and Hyderabad, the bidri work (damascened work) of Bidar, Lucknow, Purnia and Murshidabad, enamelling work (meena-kari) specially in Jaipur, Alwar, Delhi, Lahore, Multan and Banaras are famous. Bell metal mirrors are produced in Travancore.

There are some units that undertake the highly skilled job of manufacture of mathematical, geometrical, surgical and other scientific instruments, wire drawing and manufacture of badla, chamki, salma etc. Motor body building has been started in some centres.

The silver and goldsmith is another craftsman who is found throughout the country. Lapidary work or stone grinding is a specialised craft followed in some centres specially in Bengal, Jaipur, Kashmir and Madras. In Madhya Pradesh there are some centres where lacquer work is done on silver. Lac bangles are produced at a number of centres in all States. In Assam lac ornaments are prepared set with false rubies and cheap garnets. Pearl fishing is carried on at different coastal centres.

The papier machie work of Kashmir is famous for its picturesque designs, colours and finish. This work is also done in some other States. The products include baskets, cigarette boxes, powder boxes, writing sets, shades, toys, vases, finger bowls, toilet sets etc. Even in villages crude baskets, etc. of paper pulp are made.

Crude toys are manufactured in every village and town.

Sports goods used in old Indian games like kites and kite flying yarn, chess, chowpad, painted playing cards, marionettes, masks, etc. are made in some centres. Sport goods required in the western games like cricket balls, bats, sticks, shuttle cocks, etc. are being manufactured in the Punjab and on a smaller scale in U.P.

Tabla and other Indian musical instruments are manufactured by highly skilled workers at some centres. Manufacture of harmoniums and violins has also been undertaken lately.

Stone-work, Pottery, Glass

Stone quarrying and stone cutting as a subsidiary industry to construction of buildings, roads, etc. engages unskilled labour as well as highly skilled artisans. The potter is an important village artisan who is still to be found in every big village. He manufactures cooking vessels, water pots, jars, tobacco pots, hukkas, etc. Manufacture of bricks and tiles is found throughout India. Lime burning also continues in most towns though lime is being replaced by cement now.

The most important among the cottage glass industries in the country is the manufacture of bangles. Before the war 80 per cent. of the total supply of bangles was met by Firozabad in U.P., 15 per cent. by imports from foreign countries and 5 per cent. from bangles manufactured in other provinces. Today about 50,000 people are employed in this industry. Glass beads are produced at various centres. Mirrors are made in Bombay.

CHEMICALS

Washing soap is manufactured at many centres on a cottage industry basis. Vegetable dyes and pigments, paints and varnishes, turpentine are still produced in some centres. The manufacture of fireworks is an old industry. The manufacture of ink, shoe polish, drugs and medicines, disinfectants, acids etc. has been started on a small scale in some cities. Candles are manufactured in Cochin and Travancore.

Scents, attars, hair oils, brilliantine, cold cream, udabatti, surma or antimony, kumkum, pith garlands and flowers, artificial flowers, wooden and horn combs, brushes, etc. are manufactured at many urban centres.

OIL PRESSING

The oil presser is another village artisan to be found spread throughout the country. There are a few centres where Rosa oil, lemon oil, eucalyptus oil, etc. are produced.

FOODS

There are 3 lakh ghanis in the country that press about 10 lakh tons of oil per year which is 33.3 per cent. of the total production of oil in the country. Neem oil is being produced in small quantities in certain areas in Madras and U.P. and at one centre in Bombay.

State	No. of ghanis working
Assam	987
Bombay	10,000
Bihar	5,761
Madras	30,200
Madhya Pradesh	16,550
Punjab	5,500
Uttar Pradesh	1,50,000
Hyderabad	10,400
Madhya Bharat	6,880
Mysore	2,630
Other States	60,000

Rice husking

Till recently three-fourths of the country's paddy used to be handled by hand pounders and one-fourth by rice mills. Because of the present procurement controls the proportion of paddy handled by mills has risen from 25 to 40 per cent.

(Quantity in thousand tons)

State	Hand-pounded						Machine-milled					
	Rice including brokens		Bran including some of the germ and very small fragments or particles of the rice kernel		Husk		Rice including edible brokens		Bran including some of the germ and very small fragments or particles of the rice kernel		Husk	
	Per cent	Qty.	Per cent	Qty.	Per cent	Qty.	Per cent	Qty.	Per cent	Qty.	Per cent	Qty.

[5] Average of 1946–47

The manufacture of biscuits, cakes, sweetmeat is carried on by small units for sales. Rice and flour milling, grain parching, pulses splitting, cashew-nut roasting, manufacture of salt, ghee, butter, cheese; jaggery made of sugarcane, datepalm, palmyra or coconut; sugar and sugar candies; manufacture of catechu, betel-nut curing, etc. are carried on usually in villages as subsidiary industries and in towns as full-time industries.

Among other industries subsidiary to agriculture are bee-keeping, extraction of bee-wax, bird rearing, duck breeding, cattle, sheep and pig breeding; poultry farming and manure making.

There are 5,700 bee colonies maintained in Bombay State and about 10,000 in Madras State. Bee colonies are also maintained in Mysore, Coorg, Travancore-Cochin Union, U.P., Punjab, Assam, Orissa and Madhya Pradesh. The total quantity of honey extracted in Bombay is about 59,000 lbs. per year. 99 per cent. of bee-keepers are agriculturists. Apart from extracted honey, wild honey is collected throughout India. 60,000 lbs. of wild honey is collected in Bombay State every year.

Fish curing, fish canning, drying and salting of fish and manufacture of fish oil are some of the industries subsidiary to fishing. The manufacture of bidis is prevalent in most cities. At some places cigarettes and cigars are also being produced. Tobacco for chewing and smoking and snuff are prepared at many places. Matches are manufactured by cottage units in Madras State.

LEATHER

Tanning is an important cottage industry in India. India is the largest single producer of hides and skins. Flaying is done on the spot by the village flayer. Out of the total amount of leather tanned the number of bag tanned hides and skins amounts to 43.8 per cent., pit tanned by small cottage units 41.3 per cent. and that tanned by the modern method to only 14.9 per cent. About 75 per cent. of the leather produced is used in footwear. An allied industry to leather is the production of glue, gelatine, resin, gutts and tallow. Enamelling on leather is done in Assam.

Annual production of kips, buffs and skins.

* Now in Pakistan. † Pre-partition.

There are several centres of hand-made paper specially in West Bengal. Paper at these centres is usually made out of waste paper. Rags, gunny cloth and fibres are also used some times. The All India Village Industries Association is making efforts to reorganise this decayed industry. The Hand-made Paper Research Centre at Poona and the Forest Institute at Dehra Dun have done valuable research.

The manufacture of pencils, fountain pens, crayons, etc. is carried on at some centres. Cardboard boxes and bags are made in many cities. Printing presses and allied trades like bookbinding and block making are carried on in almost all towns.

STATE HELP

The Government of India has set up a Cottage Industries Board consisting of 48 members to 1. advise and assist Government on the organisation and development of cottage and small-scale industries and function as an executive body; 2. examine and advise how cottage and small-scale industries can be co-ordinated with large-scale industries; 3. examine the schemes of the State Governments for the promotion of cottage and small-scale industries and to assist in co-ordinating them; 4. advise the Government on the marketing of the products of cottage and small-scale industries in India and abroad.

Government has also set up a Standing Handloom Committee consisting of 9 members to: 1. recommend to the Government of India on the proportion of yarn available from Indian production which should be supplied to each State interested in obtaining it for handloom weaving; 2. assist handloom weavers in obtaining dyes, chemicals, stores, etc. at fair prices through their recognised associations or through State Governments; 3. investigate and report on the best methods of marketing handloom products; 4. undertake research particularly into markets and improvements in production; 5. report when necessary, on conditions in the handloom industry.

Almost all the State Governments have passed acts or rules to regulate giving State aid to industries. Financial assistance is being given as loans and subsidies in nearly all States. Arrangements for marketing are being made at New Delhi and in most of the States through State Emporia or by encouraging provincial co-operative societies to undertake the marketing of cottage industries products. Schemes for training of artisans and production centres are also taken up in most of the States. In some States experiments on raw materials used in different cottage industries, tools and implements and research on production problems relating to cottage industries have been undertaken. Relief measures like reserving spheres of production for cottage industries, levying cess on factory-produced goods, stocking of raw materials by Government or co-operative agencies, removing discriminations, if any, in freight charges, etc., reserving portions of supplies to Government Departments for the cottage industry units have been put in motion by certain State Governments.

The organisation of co-operative societies of artisans and of co-operative workshops, with their own federations for supplies, sales and technical guidance is getting well under way through Government sponsorship. The co-operative movement with its organised banking and marketing institutions, its rural credit and multipurpose societies, its purchase and sale unions, its central financing agencies and co-operative training institutes offers vast scope for the development of cottage industries.

ENGINEERING INDUSTRIES

DURING the last decade, indigenous engineering industry has developed manufacturing capacity in automobiles, ships, radio receivers, Diesel engines, textile machinery, sewing machines, bicycles, power-driven pumps, ball-bearings, piston rings, machine tools, electric motors, electric fans and lamps, storage batteries, cables and wires, industrial boilers, etc. Even apart from these, there are innumerable items which play an important part in the industrial economy of the country which the engineering industry is capable of manufacturing.

Most of the mechanical engineering industries were almost non-existent or had negligible capacity till 1939, whereas, today there are as many as 75 comprising about 900 organised units. There are also a large number of small units which perform very useful service to industry in all parts of India. The following table indicates the pace of development in some representative industries.

Industry	Installed capacity in 1950	Production in 1950	As percentage of 1946	
			Installed capacity	Production
Diesel engines	5,300 units	4,596 units	680	971·7
Power-driven pumps	33,460 ,,	30,202 ,,	310	480
Power & distribution transformers	2,70,000 kVA	1,71,901 kVA	346	441
Electric motors	1,49,500 H.P.	81,795 H.P.	250	178·3
Radio receivers	77,200	45,100	965	1,484
Electric fans	2,78,400	2,10,189	202	180

The first attempts at large-scale manufacture of Diesel engines were initiated only in 1940. But the monthly production figures for September 1951 reveal an output at a rate of about 1,800 per cent over the 1946 level. Expansion has not, however, stopped at that. Three more projects have received sanction, while another two are under examination. As one existing unit contemplates doubling its present manufacturing capacity, the implementation of the new schemes will lead to a further two-fold increase in the country's existing capacity.

In the manufacture of electric motors the range of production has expanded to 50 H.P. and prototypes of 100 H.P. motors have already been successfully produced. The average monthly production of about 11,700 H.P., maintained during the first nine months of 1951, suggests a further increase this year of about 50,000 H.P. over the 1950 production level. This development has proceeded in spite of the demand being stifled by an inadequacy of available electric power for operation and Government's import policy during 1949. Against the country's estimated current requirements of 300,000 H.P. annually, it is creditable that the industry is supplying the total demand for one to 30 H.P. squirrel cage motors and about one-third of the demand for all types.

AUTOMOBILES AND LOCOMOTIVES

The automobile industry has made rapid strides in the last three years. There are at present 13 units engaged in the manufacture and assembling of trucks and cars. Five of the leading firms in the field have between them a paid-up capital totalling well over Rs. 10 crores. The installed capacity in the industry has since 1947 increased from 47,700 to 78,250 in 1950, an increase of about 64 per cent. This year, the output is likely to outstrip the 1949 total of 21,809, consisting of 6,671 cars and 15,137 trucks. Production in the first nine months of 1951 was 8,842 cars and 7,711 trucks.

At present India is importing 20,000 cars and 15,000 trucks annually valued at Rs. 17·5 crores. The existing units in the automobile industry have long-term production plans which, when fulfilled, will meet the country's entire demand for cars and trucks.

The estimated requirements in 1954 is considered to be in the neighbourhood of 40,000 units, and according to present plans, in five to ten years, it should be possible to meet the entire home demand by a hundred per cent Indian car. As it is, a sound foundation has been laid for this important industry, the only one of its kind in the whole of Asia. In addition to the progress which the automobile industry has made, it has also given rise to a number of ancillary and subsidiary industries, such as, the manufacture of storage batteries, rubber components, leather upholstery cloth and electric horns.

Another important industry new to India, recently established, is the manufacture of locomotives and loco boilers for Indian Railways with an investment of Rs. two crores. In addition to the manufacture of underframes and road rollers, which has been undertaken, this unit proposes to manufacture heavy agricultural machinery and other engineering stores.

The machine tool industry, of vital importance to the industrial progress of the country, which did not exist on any organised basis before the last war, had by 1946 achieved a firm footing, manufacturing 8,810 machine tools of which about 50 per cent were graded. The pace of progress is revealed by the fact that in 1942 only 312 machine tools were manufactured in the country revealing an increase of about 2,800 per cent by 1946 alone. Seventeen units are currently engaged in production, most of them specialising in machine tools; heavy-duty all-gear-head lathes and all-electric shaping machines have been successfully manufactured in India.

While the production of power-driven pumps on a large-scale was undertaken only after the last war, today the production has outstripped even the installed capacity, an indication of increased efficiency in the industry. Installed capacity for 10,600 pumps existed in 1946 which has risen by about 200 per cent to 33,460 pumps in 1950. Production in 1946 was 6,127 pumps having increased to 30,000 pumps in 1950, an increase of approximately 380 per cent. Average production during the first nine months of 1951 was at the rate of 122 per cent of the installed capacity, and an annual rate of about 650 per cent over the 1947 level of output. Meanwhile, the number of units engaged in producing power-driven pumps has doubled from four in 1947 to eight in 1950.

The power and distribution transformers industry has also developed considerably, especially since 1947. Installed capacity has risen from 78,000 kVA in 1946 to 270,000 kVA in 1950, an increase of about 245 per cent. Production has also kept pace, being 341 per cent over the 1946 output of 38,982 kVA during 1950, when it was 171,901 kVA. During the first nine months of 1951, average production was at the rate of about 400 per cent over the 1946 level.

The range of production has also expanded since 1947 when it was only 500 kVA and 22 kV on the H.T. side. It has now extended to 1,000 kVA and 22 kV on the H.T. side. Out of the five units currently in production, two major units are planning further extension in range and it is likely that by the end of the year transformers upto 2,500 kVA and 33 kV on the H.T. side will be manufactured.

The radio receiver industry which included only two units in 1947 had eleven units by 1950 producing some 45,100 receivers during the year, representing an increase of about 1,400 per cent over the 1947 level. In addition, there are a number of small firms established for the manufacture of battery-operated radio sets for rural areas.

The number of units producing electric fans has doubled from the pre-war figure to 20. During the war there were as many as 75 units engaged in this field. Domestic production is enough to supply the country's estimated annual requirements of 200,000 fans.

THE GLASS INDUSTRY

THE early history of glass in India is shrouded in mystery. The first Indian (Ceylon) references to glass are in the Mahavamsa, the chronicles of the Sinhalese kings (B.C. 306) when glass mirrors were carried in processions. The art of glass-making has been known in India for ages and at least in one branch, *viz.*, bangle-making, it has been practised for several generations by the Shishgars of Firozabad.

The modern glass industry can be said to have originated with the establishment of a factory for bottle-making at Jhelum by the Murree Brewery in 1892 with the help of a German expert. The high cost of manufacture, however, brought its early end. The first glass factory under Indian management was started at Titaghur with the help of an Austrian expert; but it had also to be closed down after ten years owing to lack of technicians. Several other attempts were made to establish factories at Allahabad, Ambala, Bahoji and Talegaon. Many of them succeeded with the help of Japanese technicians who introduced cheap and simple methods of manufacture. The two significant events contributing to the survival of the industry despite foreign competition were the First Great War which virtually paralysed the import trade and the Swadeshi movement. The latter factor particularly had the most stabilising effect.

An important development in the history of the industry was the setting up of the Paisa Fund Glass Works Training Centre at Talegaon in 1909 for training students in the practical art of glass manufacture. The courses were organised by Mr. I. D. Varshney on the Japanese pattern and many of the students trained at the works are now running independent factories of great reputation. Though Japanese manufacturers attempted to capture the Indian market during the Great War the period witnessed the expansion of the indigenous industry and the number of factories rose from 3 in 1914 to 14 in 1918. Lampware, bottles, jars and tumblers were the main products.

With the end of the war the tide turned and the revival of foreign competition hit the indigenous enterprise. In 1927 the industry approached the Government of India for protection against foreign competition and in 1931 the question was referred to the Tariff Board with Dr. John Matthai as President. The Board recommended that (1) the industry satisfied the conditions required by the Fiscal Commission and deserved protection and (2) that in order that the industry might develop on sound lines so that it might survive even without protection a central institution for training and research in glass technology should be established by Government. The Board's recommendations were not, however, favoured by Government on the ground that one of the main raw materials, namely, soda ash was not available in the country. Nevertheless, the industry continued to expand and added several new lines of glass manufacture including scientific glassware. Though in the process ownership changed hands frequently the industry was badly mauled during 1933-39 following the devaluation of the Japanese yen. Yet there were 80 factories in 1939 as against 59 in 1931, and 20 at the end of the First War.

The outbreak of the war in 1939 once again gave a fresh impetus to the industry by way of stoppage of imports from abroad and the creation of heavy demand for glassware for military requirements. Several new lines such as scientific glassware, boiler gauge glass, signal glass, etc. were perfected during this period. This was the period during which some of the factories established units of automatic and semi-automatic machines for manufacturing sheet glass, bottles, *etc.* and also put up improved types of furnaces. The number of factories rose from 80 to 174 and their production from 6 million sq. ft. of sheet glass and 43,000 tons of other glassware in 1939 to 13 million sq. ft. and 110,000 tons respectively in 1945.

At present there are in the Indian Union 224 glass factories including 93 manufacturers of bangles and beads and false pearls. The industry embraces diverse types of manufacturing organisation, varying from small workshops on a cottage industry basis to large-scale units controlled by proprietary and managing agency systems. The present distribution of glass factories in the country is as under :—

	Glass and Glass-ware	Bangles, Beads, etc.	Total Factories
Uttar Pradesh ..	24	90	114
West Bengal ..	34	..	34
Bihar	8	..	8
Orissa	1	..	1
Madhya Pradesh	6	..	6
Bombay	32	..	32
Madras	4	3	7
Delhi	3	..	3
Punjab	7	..	7
Former States Unions ..	12	..	12
	131	93	224

It will be seen from the above that the bangle making industry is concentrated in Uttar Pradesh. The majority of the glass factories, other than those engaged in the manufacture of bangles, produce either containers or lampware or both. There are at present about 20 to 30 factories manufacturing tableware in addition to containers. Three factories produce sheet glass, while about 19 factories produce scientific glassware.

The total capital invested in the industry is about Rs. 4 crores and its annual output is approximately valued at Rs. 10 crores. Hardly two dozen factories are, however, being run on a modern basis though the industry as a whole provides employment for 30,000 workers. The trend of production in the post-war period was mainly governed by the import policy and is summed up in the following table :—

	Glassware (Tons)	Sheet Glass (million sq. ft.)
1945	110,000	13·0
1948	65,000	6·25
1949	66,824	3·45
1950	86,098	9·57

The more commonly used raw materials are : sand, borax, soda ash and salt cake, dolomite, lime or limestone, salt petre and sulphur, manganese dioxide and colouring materials. Though supplies of sand are in plenty, its quality is not uniform. Nearly all the glass factories of northern India and West Bengal obtain their requirements of sand from the Allahabad district. Subsequent to the Tariff Board's inquiry in 1932, little progress has been made in the installation of grading and washing equipment for sand. Borax is mostly obtained from abroad, while soda ash is received from indigenous manufacturers and importers. Sufficient quantities of lime or limestone are available. Coal is the commonest fuel. The bulk of refractories is obtained from indigenous sources. The demand for refractories by the glass industry is estimated at about 10,000 tons per year.

Sheet Glass.—An official estimate places the indigenous demand for sheet glass at 39 million sq. ft. per annum while unofficial estimates vary from 25 to 31 million sq. ft. The Tariff Board estimated in 1947 that the consumption would be around 32 million sq. ft. per year for the next three years. There are at present three factories producing sheet glass with a rated capacity of 23·5 million sq. ft. Two additional units were established in 1950. During the pre-war period their average annual output was around 6 million sq. ft. In 1944-45 their output was at the peak level of 13 million sq. ft.; but thereafter it began to shrink reaching the bottom at 3·45 million sq. ft. in 1949. The steep fall was attributable to irregular supplies of raw materials and overseas competition which depressed prices and led to accumulation of stocks. Imports in the three post-war years averaged Rs. 79 lakhs per annum; but in 1950-51 the Government of India placed a ceiling of Rs. 50 lakhs with the result that the domestic output of sheet glass rose to 9·6 million sq. ft. in 1950.

Blownware and Pressedware.—The majority of factories in India produce blownware by semi-automatic or mouth-blowing process; but in recent years a few completely automatic machines have been installed. The total annual capacity for blownware and presseoware is estimated at 125,000 tons bottles and phials, 10,000 tons of lampware, 9,000 tons of tableware and 4,000 tons of pressedware for 1950 for which the demand is estimated at 120,000 tons comprising 100,000 tons of bottles and phials, 10,000 tons of lampware and 10,000 tons of tableware and pressedware. After registering a sharp rise to 110,000 tons in 1945, production started falling and was about 70,000 tons in 1948 and 69,000 tons in 1949. Imports of phials and bottles and lampware have fallen considerably in the post-war period, the only exception being 1947-48 during which there were heavy imports.

Bangles.—There are three main types of bangles, namely, Reshmi, Hollow and Fancy, which are manufactured in the country. There are about 90 medium-sized factories which come under the purview of the Factory Act, in Firozabad, besides several hundreds of workshops on a cottage industry basis in Uttar Pradesh, in Madras and in Poona. Their total productive capacity was estimated at 35,000 tons of which nearly 30,000 tons was attributed to the medium-sized factories. Shortage of raw materials, transport difficulties and the grouping of the 86 factories into 29 units as a means of rationalisation for the purpose of supply of raw materials affected production which dropped to 15,000 tons in 1949 during which cottage industries produced about 2,000 tons of bangles.

Research Institute.—An important event in the history of the industry is the opening of the Central Glass and Ceramic Research Institute at Calcutta on August 26, 1950. The institute conducts fundamental research having a bearing on the different branches of glass and ceramics. Its other functions are testing and standardisation, technical assistance to the industry, dissemination of information and training of technologists. Technical work at the institute started in 1948. The institute has done important work in foam-glass, China glass, liquid gold colour, survey of sands and survey of raw materials. Fundamental studies on the properties of raw materials needed by the industry have been undertaken and work on the study of talc available in the country is in progress.

IMPORTS

The following table gives the trend of imports.

	1948–49		1949–50		1950–51

TARIFF BOARD ENQUIRY

The claim of the glass industry for protection was referred to the Tariff Board as already stated in 1931. The Board felt that the dependence of the industry on imported soda ash did not invalidate the claim to protection. The Government of India, however, rejected the recommendations of the Board on the ground that there was no indigenous source of supply of one of the most important raw materials. However, by way of relief to the industry, Government granted a refund of the entire duty on soda ash of British or British Colonial origin and of the excess over 10 per cent. *ad valorem* in the case of other soda ash.

In 1947, the industry again made an application for protection which was referred to the Tariff Board on March 20, 1948. The main recommendations of the Board on this application are as follows :—1. Machinery should be installed for washing and grading of sand to improve the colour and uniformity of the finished product. 2. Detailed investigations should be undertaken by the Geological Survey of India for discovering deposits of sand of high quality. 3. There is considerable scope for improvement in the quality of indigenous sheet glass. 4. The existing revenue duty of 45 per cent. *ad valorem* on sheet glass should be converted into an equivalent protective duty and should remain in force upto March 31, 1952. 5. The concession of duty on imported soda ash should be withdrawn. 6. The quality of indigenous glass blownware and pressedware has improved considerably during the last decade and the estimated fair selling prices of indigenous make are considerably lower than the landed costs of corresponding imports. The need for imposing a protective duty does not, therefore, arise. 7. The existing revenue duty of 60 per cent. *ad valorem* on imported bangles sufficiently safeguards the position of the bangle industry. 8. In their trade negotiations with neighbouring countries, Government should negotiate for exports of indigenous bangles to those countries. 9. The Government of Uttar Pradesh should make available to the bangle factories sufficient quantities of raw materials and consumable stores. 10. The bangle manufacturers of Uttar Pradesh should organise themselves into one single association for the development of the industry on healthy lines. 11. Early steps should be taken by the sheet glass units to mechanise their branches. In respect of blownware and pressedware, large scale mechanisation is not feasible. Complete mechanisation of bangle-making is not desirable since it is essentially a cottage industry; but the state governments should examine the possibility of its mechanisation for improving technical efficiency without causing hardship to labour. 12. Steps should be taken to avoid wasteful use of soda ash. Government have accepted the recommendations of the Board.

FIVE-YEAR PLAN

The Five-Year Plan, outlined by the Planning Commission, has fixed the following targets for the main items of glassware :—

—	1950–51 Installed Capacity (Tons)	1950 Production (Tons)	1955–56 Installed Capacity (Tons)	Targets Production (Tons)
Hollow-ware	211,000	86,000	232,000	174,000
Sheet-Glass	12,000	5,000	36,000	27,000
Bangles	35,000	16,000	35,000	17,000

It will be seen from the above that the Plan does not contemplate any increase in the installed capacity for manufacturing hollow-ware and bangles in view of its excess. On the other hand, the installed capacity for sheet glass is proposed to be extended three times. A section of the glass manufacturers is, however, of the view that two major factories are between them in a position to meet the whole demand. Its main complaint is about the uneven flow of raw materials and fuel.

HIDES, SKINS AND LEATHER

THE Republic is regarded as a surplus area in respect of its resources of raw hides and skins. It is estimated that normally it produces 16.2 million cattlehides, 5.5 million buffalo hides, 23.2 million goat and 15.1 million sheep skins a year. Only a portion of the cattle and buffalo hides is obtained from slaughtered animals and the bulk, about 75 to 80 per cent. is derived from animals that die a natural death. On account of this the output of hides increases when famine, flood, cattle epidemics, etc., take an undue toll of livestock. Goat and sheep skins are, however, derived from animals slaughtered for meat and their production remains more or less at a steady level.

Just before the Second World War, about 10 per cent. of the buffalo hides, 22.5 per cent. of the cow hides (kips), 6.5 per cent. of the sheep skins and 80 per cent. of the goat skins available in the Republic annually were exported and the balance tanned in the country itself. But over a course of time the surpluses for export dwindled considerably except in the case of goat skins. This was due to the expansion of hide and sheep skin tanning in the country. Goat skin tanning did not expand much.

Curing Methods.—Cattle hides are cured for the export trade by air drying and dry salting. The better grades of the former are dried out, being stretched lengthwise on frames, and are called "framed" hides, and the inferior ones are dried by spreading on the ground and are known as "crumpled" hides. Air dried hides are treated with a solution of arsenic to ward off insect damage before export.

Dry salt curing is done mostly in the Bengal area with a saline earth known as "Khari Salt" which consists principally of sodium sulphate mixed with varying proportions of sodium chloride, magnesium sulphate and earthy matter. Goat skins are mostly dry salted and to a lesser extent air dried.

The **Agricultural Marketing** Adviser to the Government of India attempted to grade slaughtered cattle hides. Hide-grading stations were started at slaughter houses at Delhi, Agra, Bandra (Bombay), Bareilly, and Rampur, and specifications for grades were formulated. Hides and skins were included in the Schedule to the Agricultural Produce (Marketing and Grading) Act of 1937. An attempt was made by the Central Agricultural Marketing Department, Government of India, to improve flaying in the slaughter houses where grading stations were started by giving a bonus to flayers.

The Department has published a Report on the Marketing of Hides in India and Burma (Marketing Series No. 36) and another Report on the Marketing of Skins in India and Burma (Marketing Series No. 40) which contain valuable information regarding Indian hides and skins.

Primitive Tanning.—The Indian tanning industry may be divided into two categories, primitive and modern.

Primitive tanning is carried out principally by the people of the tanning caste which is a Scheduled Hindu community known as the Chamar. They tan according to indigenous methods and their products may be divided into a number of typical groups, *viz.*, (*i*) the miscellaneous crude leather produced in the villages to meet local needs, (*ii*) the bag tanned buffalo sole leather produced in the Punjab area, Calcutta, Bombay and many other places which is extensively used for making shoes, (*iii*) tanned sheep skins of the Punjab area known as "Kabuli Bheris" used as a cheap book-binding leather throughout the country, (*iv*) half tanned leather of Madras and Bombay.

The first three varieties are all consumed in the country itself while the better grades of the fourth are exported chiefly to the U. K. and from there to other countries. The half-tanned cattle hides and calf skins are known in the international trade circles as East India tanned Kips and Calf Skins. These are retanned and finished in the importing countries for making shoe upper and other varieties of dressing leather. The cattle hides used to be tanned formerly with avaram or turwar bark (*Cassia auriculata*) which occurs in south and western India. But after the First World War they were tanned in Madras with wattle bark formerly imported from South Africa and now from East Africa as India has stopped trade with South Africa. The goat and sheep skins in Madras and the cattle hides in Bombay are still tanned with avaram bark.

Modern Tanning.—Leather for harness and saddlery for military equipment has long been manufactured at Kanpur by western processes of vegetable tanning in pits from buffalo and heavy cow hides using the local tanstuffs, babul bark (*Acacia arabica*) and myrobalans (*Terminalia chebula*). At present large quantities of East African wattle bark and its extract (Mimosa Extract) are also being used as the supply of babul bark is inadequate.

Since the First World War sole leather has also been manufactured in Kanpur, Agra, Calcutta and Madras from buffalo hides according to modern process for use in ammunition boots and better types of civilian footwear. Its output is now quite considerable. The Second World War greatly stimulated the production of vegetable tanned harness and sole leather and all the big and medium sized tanneries capable of producing these leathers were engaged in their manufacture. Most of them extended their plants to cope with the war demand for leather and were supplying practically the whole of their output to the Government.

FILM INDUSTRY

THE Indian Film Industry is about 40 years old and can claim to be the largest of the medium scale industries of India. The early years of the industry's development took place in Bombay, and more than 70 per cent of the total annual production of Indian films still comes from Bombay State, the balance being supplied by Madras and Calcutta. There are about 60 studios in India and nearly 300 concerns engaged in producing films. The principal studios are located, besides Bombay, at Poona, Kolhapur, Calcutta, Madras, Salem and Coimbatore. It is estimated that about Rs. 40 crores are invested in the production, distribution and exhibition of films in India. The total number of persons finding employment in the industry is put at 100,000.

The year 1951 has been full of events for the Indian film industry. The working of the Central Censor Board, with regional offices at Bombay, Calcutta, and Madras, started regularly from January 1951. Thirty-five millimetre colour films were made for the first time. For instance, Government of India's Films Division flew over the Himalayas to make a technicolor film of the mountains, while in Bombay the shooting of a historical film, "Jhansi Ki Rani", with plans for distribution in U.K. and U.S.A. of the English version, was started with Technicolor personnel and equipment. Also, positive film of the "safety" type began to be supplied to the producers from the second half of 1951.

Another interesting development was the production of Hindi versions of South Indian films which proved a great success.

Three main functions are involved in the film industry: production, distribution and exhibition which must balance one another. As a matter of fact the Indian film industry is in an unbalanced state where production greatly exceeds exhibition. Far too many films are produced every year than are, or can, be shown.

Another striking feature of the industry is that production is confined exclusively for catering to theatrical audiences. Although a large market for non-theatrical films is available in educational institutions, no commercial production of such films has so far been attempted. Only the Defence Services and some industrial concerns have produced films as aids to technical training.

As mentioned above, only 60 studios are available for production of films, while the total number of producers is nearly 300. This means that the majority of producers work in hired studios. There is thus a large class of "independent producers" who cannot be expected to take a long-term view with the result that much of the earnings of the industry are not ploughed back into it.

The Government of India is also a major producer of films through its Films Division. Some of the States too have film production units of their own for publicity purposes, which could also be used to improve the technical standards of Indian films.

The majority of feature films produced continues to be in Hindi, although it is customary for the Films Division to dub its newsreels and documentaries in five languages in all: English, Bengali, Hindi, Tamil and Telugu. In 1948, films in Gujarati showed an unusual high rise, while during the next two years production of Bengali films shot up. Telugu and Malayalam films have also since shown a tendency to rise. Such an increase probably indicates that stray producers are continually drawn towards the industry in a search for easy returns.

Since the partition, which took away a part of the exhibitors' market (in Pakistan) producers of Hindi and Bengali films have suffered a setback. South Indian producers however, are rapidly coming up to compete with their rivals in the North by making Hindi versions of Tamil and Telugu films. No such attempt to gain the South Indian market is however evident among producers in the North.

EXHIBITION OF FILMS

When we pass to the exhibition aspect of the industry we find that imported films account for a large part of trade. The exhibitors pay import duties at the rate of 4 annas per foot, while copies for the Indian market are processed in the country itself. Most of the first-class houses in the larger towns are ear-marked for showing imported films.

It is remarkable that in spite of the growing demand for Indian films, imports of foreign features and shorts have not shown any appreciable decline for the past five years—a situation which is all the more remarkable when we remember that figures before 1947 are for India and Pakistan together, while those for the later years are for India only.

Some of the facts about the industry make interesting study. On an average about 300 feature films have been imported per year for the past ten years, while the yearly average for Indian feature films produced during the same period has been 210. Again out of a total of 2,600 theatres about 10 per cent show only imported films, while 85 per cent are available exclusively for Indian films.

While an imported film is shown for six days, an Indian film is shown for 75 days. It is therefore reasonable to infer that Indian production has no relation to the number of cinema houses available. Only a small part of the total films produced is released in the same year.

Distribution is organised through five circuits in which the country is divided for this purpose. From an accompanying table, it will be seen that there are 2,600 cinema theatres in 1,313 cities and towns in India. Of these towns with a population of over 100,000 account for nearly 600, while 2,000 theatres are distributed over the rest of the 1,250 towns. The four main cities of Bombay, Calcutta, Delhi and Madras have between them over 200 theatres.

Admittedly this is a small number for India's size and population when we find that Great Britain and France have each nearly 5,000 cinema houses. The major obstacles in the way of the development of the industry are the low standard of living, lack of electric power supply and the unsatisfactory conditions of road transport. More theatres of the present type are obviously necessary though there is reason to think that a wider use of the 16 mm. film may provide part of the answer in areas where the conditions under which the 35 mm. films are exhibited are technically unsatisfactory.

There are factors in which the film industry can take legitimate pride. The fact that it has grown to such proportions in the face o dishcartening obstacles is itself a great achieve ment. Almost all the technicians in the industry are self-made men; they have had no formal training in any recognized institution. The same is true of many of the leading actors and actresses.

The Indian film industry has been passing through a critical time. The Film Enquiry Committee has made its recommendations (March 1951). But so far Government has taken no action.

Costs of production continue to rise. Also, Indian films cannot be exported to Pakistan in adequate numbers because of the strained relations between the two countries. If free movement was allowed Hindi films would get another 200 odd theatres in West Pakistan and the Bengali films more than half the present number of their theatres in East Pakistan.

A standing complaint of the industry is taxation local, State, and Union Government. Unlike other industries most of the raw material for the production of Indian films is imported. On the other hand there is a quick turnover in the film business. The dividend it pays is relatively high. What the industry could demand with justification is that the proceeds of the entertainment tax should be used for training actors and technicians.

With the establishment of the Central Censor Board with headquarters in Bombay, a great advance was made in standardizing censorship methods. The fees charged for censoring were, however, raised from Rs. 5 per 1,000 ft. to Rs. 40. The formalities for getting films censored also became a little more complicated. Under the Provincial Censors it was usual to publish every month the tabulated results of their work in Government Gazettes. This is not kept up at present either by the Central or the Regional Boards, with the result that authoritative information about aspects of the industry are harder to come by. For instance, if a producer were to know what modifications have been proposed it would serve as a guide to plan his own work. It would also be easy to check whether a producer has in fact carried out the changes proposed by the Censors. If official information is not published there is always the risk that the censors' cuts may be ignored.

In regard to the classification of films as for adults (A) and unrestricted (U), out of 118 films censored during 1951 in Bombay, only four were granted (A) certificates.

16 MM. FILMS

The 16 mm. film has not received the attention it deserves. Its potentialities have not yet been adequately explored.

Economy of cost and storage are two main factors in favour of the 16 mm. film (1,000 ft. of 35 mm. = 400 ft. of 16 mm). Colour is also easily available and the film can be processed and copies made in India itself.

About 50 full length Indian features, mainly in Hindi, Marathi and Gujarati, are available in 16 mm. The layout for the 16 mm. film theatre is small and the whole equipment is portable (about the size of two portable typewriters in all). There is therefore a vast scope for the development of the 16 mm. theatre on commercial lines. The general practice in this matter is however, very strange. Whenever features are reduced to 16 mm., the new versions are released only after the exploitation of the standard size is complete.

There are 16 mm. libraries of films suitable for non-theatrical audiences maintained by the British Information Services and the U.S. Information Services through their Regional offices. These offices also maintain trucks equipped with projecting machinery, and shows are arranged free of cost wherever wanted. Many industrial houses have also made good films, some in colour, of great value for education or information and they are easily available for showing through schools and institutions.

In the Defence Forces, 16 mm. films have been extensively used for training and entertainment. There are Inspectors of Visual Education under Directors of Public Instruction in the States who do valuable service by using 16 mm. projectors in educational institutions. They are, however, mainly dependent on imported films. The biggest single 16 mm. library of films in India is maintained by the Inspector of Visual Education in Bombay who makes the films available regularly to schools under him. The Ministry of Education in Delhi has recently started building up a library of 16 mm. educational films. The work done through the Social Education Scheme of the Madhya Pradesh Government is also worthy of note, particularly because of the exhibition arrangements through 26 well-equipped motor vans.

The recommendations of the Film Enquiry Committee cover a wide range. The Union Government is to exercise control over the production of films.

Three bodies are to be created for this purpose, a Film Council, a Production Code Administration and a Film Finance Corporation.

With its 18 members the Film Council is to manage a training institute which will finally develop into a film academy; it is also to set up a story and casting bureaux. The Film Council will bring into being in the first instance two panels, one each for educational and short films, and will be followed later by two more, for exhibition and distribution of films.

Audience research as also research for promoting technical efficiency will be additional responsibilities of the Film Council.

The Film Council is thus intended to supervise and regulate the industry in matters of production and professional conduct. It should also help in bringing into being an association of producers, directors, distributors, exhibitors, technicians and artists.

The Committee also recommends the licensing of studios which should be established in special film colonies.

Forty-three Tanneries producing pit tanned buffalo sole leather were brought under Government control and their productive capacity increased to about 2 million buffalo hides annually. During the war the tanneries could not work to full capacity through lack of raw hides. The supply of buffalo hides has not only not improved after the war out has been considerably reduced due to the partition of the subcontinent and less slaughter (most probably on account of the control which has been imposed on animal slaughter in some States). The clogged trade with Pakistan has caused a shrinkage of the market formerly operated by Indian tanneries and this shrinkage is preventing the tanneries producing sole leather from working to full capacity.

Chrome Tanning.—The outstanding feature in the field of modern tanning in the country since the First World War is the phenomenal development of chrome tanning, especially for the manufacture of the shoe upper leather, Box and Willow sides from cattle hides and Box and Willow calf from calf skins. A number of tanneries at Kanpur, Calcutta and Madras are engaged in the production of these leathers. Some of the tanneries are quite big and equipped with the latest chrome tanning machinery while there are large numbers in Calcutta which are small. Indian Box and Willow sides are being regularly exported to the United Kingdom and their demand and consumption in India is considerable. After the partition of the subcontinent the production of chrome tanned shoe upper leather namely, Box and Willow sides and calf has suffered reduction. This has been due to two causes. Firstly the clogged trade with Pakistan has resulted in an appreciable shrinkage of the market formerly enjoyed by Indian chrome tanners, and secondly due to the control of cattle slaughter supply of cow hides of the quality required for the production of high class chrome shoe upper leather has been considerably reduced.

Other items of modern tanning which have made some progress are belting leather, chamois leather, suede leather, vegetable and chrome patent leather, improved type of case leather, picking bands, roller skins, chrome lace leather, motor car upholstery, leather, etc. India's tanning capacity is fairly large. It can tan all its buffalo hides and nearly all its cow hides and sheep skins. Exports of these hides and skins in the raw condition is not so necessary now as it was previously. As goat skin tanning has not developed in India satisfactorily Indian goat skins have to be exported in the raw state.

There are a few training centres among which the Bengal Tanning Institute in Calcutta, Jullundur Tanning Institute, Jullundur City, Government Tanning Institute, Bombay and Leather Technology Section of Alagappa College of Technology, University of Madras may be mentioned. These Institutes are maintained by the respective State Governments. A central leather research Institute is proposed to be established by the Central Government in Madras. The foundation stone of this Institute is already laid. There are also peripatetic tanning demonstration parties under the Industries Department of the Government of West Bengal, Uttar Pradesh, Bihar and Orissa which hold instructional classes in rural areas to introduce improved processes of tanning.

To look after the interests of the Indian Tanning Industry a Tanners' Federation was started a few years ago. Its headquarters are at the Upper India Chamber of Commerce, Kanpur. Most of the organised tanneries in India are members of the Federation.

Recent Developments.—There was not any appreciable progress in the leather industry during 1950. Production of leather has decreased in comparison with that during the war period. This has been due to shortage of raw materials such as raw hides and skins, vegetable tanstuffs and tanning chemicals, insufficient transport and the partition of the sub-continent and consequent loss of market. The stoppage of import of South African wattle bark has created a shortage of vegetable tanstuffs needed for the production of sole and half tanned leathers.

Future prospects of the leather industry are bright. The shoe wearing habit of the Indian people is increasing and the demand for shoes is also on the rise.

The glace kid industry is still undeveloped in the Indian Republic. This holds out a good prospect of development as the country produces goat skins which are very suitable for making glace kid. Research for developing the technique for large scale manufacture of glace kid is being carried out at the Bengal Tanning Institute under the auspices of the Council of Scientific and Industrial Research of the Government of India.

Other possible lines of development are industrial leather goods like leather belts, picking bands, pickers, roller skins, etc. Production in these lines has already commenced.

Turning to the question of capital we find that the leather industry of the country is still mostly unorganised and consists of an innumerable number of small units for tanning, and shoe and leather goods making. It is, therefore, not possible to secure accurate information regarding the capital invested in it. At a rough estimate it may be placed at about Rs. 20 crores.

As regards plant and equipment tanning machines such as shaving, staking, buffing, glazing, boarding, sole rolling machines and tanning drums and paddles are locally made. There are two firms in Calcutta which have specialized in making these tanning machines. More intricate machines like splitting and measuring machines and leather presses have to be imported. All tanning tools are locally made. No attempt has, however, been made to manufacture shoe machines in India.

Tannery labour is mostly recruited from the Chamar community. There is as yet no shortage, and the recruits pick up modern methods of work and machine operations quite well. Skilled personnel to work as technical assistants in tanneries are being trained in the provincial tanning institutes. The trained men are giving a good account of themselves in commercial tanneries. There appears to be a dearth of skilled supervisors for the shoe industry as training institutes for the shoe industry are still lacking in this country. There is thus a great need for State shoe institutes.

Foreign help is necessary to develop new lines of manufacture like glace kid. For other lines local talent appears to be adequate.

Compared with the leather industries of Europe and U.S.A., Indian leather industry is still unorganised and inadequately developed. It has to depend upon Europe and U.S.A. for some machinery, chemicals and many other materials. Until these ancillary industries develop the Indian leather industry will be handicapped in comparison with the leather industry of Europe and America.

Here are two tables which may prove useful:

Export of Tanned and Dressed Leather

(In Tons)

—	1946-47	1947-48	1948-49	1949-50	1950-51

Skins Tanned or Dressed ..	93,44,157	6,64,08,584	7,20,49,897	10,23,28,518	6,91,04,636

THE JUTE INDUSTRY

JUTE is a bast fibre obtained from the *Chorchorus Capsularis*, a tall plant which grows under hot and very damp climatic conditions. The fibre obtained is hard-wearing, though weaker than flax or hemp. Jute occupies a vital position in the world food economy because of the great demand for sacking and is yet unsurpassed in its traditional uses despite the increased competition from substitutes.

World production is centred almost entirely in the Indian sub-continent where much of the crop is grown in the Ganges delta. It rose from 1,173,000 tons in 1949 to 1,413,000 tons in 1950 as against 1,255,000 tons in 1938; of this, Pakistan's and India's share were 778,000 tons and 588,000 tons respectively with Brazil and Formosa ranking third and fourth, their production being 17,000 tons and 6,000 tons respectively.

RAW JUTE

Though the Indian jute industry was developed for nearly a century as a homogeneous organisation, with a plentiful supply of raw materials, its troubles started with the outbreak of the war and the resultant shortage of rice. The production of raw jute in undivided India was brought down from 131·7 lakh bales covering an area of 56·6 lakh acres in 1940-41 to 54·4 lakh bales on 19 lakh acres in 1946-47. The partition of the country split up the industry by transferring 70 per cent of the production of raw jute to Pakistan and the jute manufacturing industry to India.

Placed in this unenviable position, India had two alternatives, namely, reliance on Pakistan for raw material and growing more jute to achieve self-sufficiency ultimately. In 1947-48 and 1948-49 India received 48·19 lakh bales and 40·8 lakh bales from Pakistan, but the shortage became acute following the deadlock resulting from the devaluation of the Indian rupee and the non-devaluation of the Pakistani rupee. The Government of India, therefore, decided to devise special measures for raising the Indian output of raw jute in order to feed the manufacturing industry.

From 6·5 lakh acres in 1947-48, the area under jute was stepped up to 19·5 lakh acres in 1951-52 and production from 16·5 lakh bales to 46·7 lakh bales. In West Bengal about 2 lakh acres were diverted from paddy to raw jute. But elsewhere the rise in jute output was brought about mainly by double-cropping and by bringing under jute low-lying tracts in Uttar Pradesh. It is estimated that India earned a profit of Rs. 106 crores between 1947-48 and 1950-51 by growing more jute on additional acres and importing rice to make up for the diversion of acreage.

The following table gives the details of the production trends in the Indian Union:—

Year	Lakh acres	000 bales
Average 1936-37 to 1938-39..	8·7	1,904
1943–44	7·1	1,463
1944–45	5·9	1,164
1945–46	5·9	1,459
1946–47	5·3	1,320
1947–48	6·5	1,658
1948–49	8·3	2,055
1949–50	11·6	3,117
1950–51	14·5	3,270
1951-52	19·5	4,677

Indian Central Jute Committee.—Prior to the partition of the country, the Indian Central Jute Committee, which was established in pursuance of the recommendations of the Royal Commission on Agriculture, looked after the jute interests of undivided India. The decision to reconstitute it was taken at its annual meeting on December 10, 1947 when the members representing jute producers from Pakistan were excluded and the Committee's activities outside the Union were brought to an end. One of the primary functions of this Committee is to improve the yield of jute per acre. In 1951 the Committee decided to intensify its campaign for a better yield and quality.

Prices.—Jute prices have generally followed the trend of prices of rice which is an alternate crop. Since September 19, 1949, they have, however, been regulated by Government. The latter developments in the field of raw jute have been summed up in a subsequent paragraph; but the following table about the trend of prices in Calcutta should be interesting:—

WHOLESALE PRICES OF RAW JUTE

Year	Firsts	Lightnings
	Rs. a. p.	Rs. a. p.
August 1939 ..	38 8 0	35 8 0
1946-47	123 5 0	118 7 0
1947-48	177 7 0	172 11 0
1948-49	206 8 0	195 12 0
1949-50	192 14 0	182 14 0
1950-51	293 0 0	283 0 0
August 1951 ..	350 0 0	340 0 0
Sept. ,, ..	260 0 0	250 0 0
Oct. ,, ..	290 0 0	280 0 0
Nov. ,, ..	275 0 0	265 0 0
Dec. ,, ..	285 0 0	275 0 0
Jan. 1952 ..	320 0 0	310 0 0
Feb. ,, ..	285 0 0	270 0 0

Exports.—The control over export of raw jute was first introduced in 1942-43 as a war measure with the sole object of checking the supply passing into the enemies' hands. Later on, owing to world shortage, the control was assumed by the Combined Raw Materials Board in Washington in 1943 and the Government of India made allocations in consultation with this Board. This system was ended in June 1946; but a new control was instituted with the object of ensuring an equitable distribution of raw jute among India's regular customers.

After the partition, raw jute became the main bargaining point along with jute goods in the conclusion of bilateral agreements. In the jute year 1949-50 exports totalled only 6¼ lakh bales including cuttings. These represented special shipments since there was a blanket ban. The details of exports in the financial year are given in the chapter on Trade.

During 1949-50 and 1950-51 arrivals of Pakistani jute hardly totalled 8·2 lakh bales and 17·7 lakh bales respectively. Early in March 1951 the Government of India decided to withdraw the control on jute and jute goods and consequently though the prices of raw jute rose to a record level of Rs. 540 for Firsts by June 1951 the flow of supplies from Pakistan was better and the mills could have on hand *ten* weeks' supplies. The statistical position of raw jute for 1951-52 season is given below:—

	Bales
Opening Stock	879,400
Indian Crop	4,677,000
Pakistani Supply under Agreement	2,956,790
Total supply ..	8,513,190
Estimated Mill Consumption ..	5,724,000
Carry over ..	2,789,190

Though India has thus achieved self-sufficiency, she still depends on Pakistan for quality jute.

The following table gives the trend of mill consumption of raw jute:—

Year ended June	Lakh bales
1946-47	60·3
1947-48	61·7
1948-49	62·0
1949-50	49·1
1950-51	51·1

JUTE INDUSTRY

Considering its present size, the jute industry of West Bengal is of very recent origin. The first jute mill was erected at Rishra in 1855 thanks to the efforts of George Acland, an Englishman, who began his life as a midshipman in the navy, and Mr. John Kerr of Douglas Foundry. The first power loom was introduced four years later and the original out-turn was only 8 tons per day. The pioneers, however, got very little out of the venture; but their lead was followed by Mr. George Henderson who launched the Borneo Jute Co. in 1859. By 1864, the Company doubled its works and earned profit equal to double the capital. Eight years later, the Company was converted into a limited liability company and was known as "Barnagore Jute Factory Co., Ltd." Four other mills followed in succession of which Gouripore, Serajgunge and India Jute Mills are well known even now. In 1947-48 there were 99 mills employing 328,000 workers. The number of mills remained unchanged in the following two years; but in 1950-51 there were 106 mills with 327,000 workers employed.

The progress of the industry during the past few years is summed up in the following table:—

PRODUCTION, EXPORT AND CLOSING STOCKS OF JUTE GOODS

(In thousand tons).

Year (July-June)	Production					
	Hessian	Sacking	Others*	Total	Exports	Stocks
Average 1936-37 to 1938-39 ..	501	628	36	1,165	1,004	147
1939-40 ..	576	646	42	1,264	1,147	146
1940-41 ..	449	499	36	984	821	145
1941-42 ..	591	588	46	1,225	825	251
1942-43 ..	484	662	59	1,205	689	275
1943-44 ..	393	521	40	954	635	195
1944-45 ..	415	545	40	1,000	677	177
1945-46 ..	463	581	41	1,085	801	188
1946-47 ..	418	510	34	962	800	176
1947-48 ..	483	520	32	1,035	896	120
1948-49 ..	494	577	110	1,081	872	107
1949-50 ..	285	505	111	901	787	71
1950-51 ..	329·7	493	35·2	857·9	649	90·4

* Includes production of non-member mills in 1948-49 and 1949-50.

Price Trends.—In common with the prices of other commodities, jute goods presented a firm front since 1936-37 and reached the peak o the price in 1947-48. Then followed a slight fall; but the prices began to rise again till they reached the peak in September 1949 when the Government of India instituted price control to counteract the adverse effects of devaluation. On March 9, 1951 the Government of India decontrolled raw jute and jute manufactures and raised export duties on jute goods. The following table gives the average quotations of jute manufactures since 1940-41 :—

PRICES OF JUTE MANUFACTURES

July-June	Hessian 40"×8 oz. per 100 yards	B. Twills—2¼ lbs., 44×26½" 6×3' per 100 bags
	Rs. a. p.	Rs. a. p.
Average		
1940-41 ..	13 14 0	32 3 0
1941-42 ..	18 11 0	38 10 0
1942-43 ..	17 5 0	56 4 0
1943-44 ..	21 5 0	66 9 0
1944-45 ..	22 2 0	64 2 0
1945-46 ..	21 15 0	65 7 0
1946-47 ..	35 10 0	97 7 0
1947-48 ..	43 14 2	118 14 3
1948-49 ..	40 11 0	137 12 0
1949-50 ..	43 7 0	155 12 0
1950-51 ..	54 1 0	183 12 0

In order, however, to have a correct perspective on the prices of raw jute and jute manufactures, the following index number of prices will be interesting :—

INDEX NUMBER OF PRICES

(Base July 1914=100)

Period	Raw Jute	Manufactured Jute	% of Jute Goods to Raw Jute
Average of 1919-23 ..	110	142	142
,, ,, 1924-28 ..	114	156	137
,, ,, 1929-33 ..	59	88	149
,, ,, 1934-38 ..	49	69	141
,, ,, 1939-43 ..	87	134	154
,, ,, 1944-48 ..	188	274	146
1947 ..	251	366	146
1948 ..	296	383	129
1949 ..	290	391	135
1950 ..	301	424	141
1951 ..	517	645	125

It will be seen from the above that the period 1914-18 marking the war period witnessed the loss of markets for raw jute and the broadening of the demand for jute goods with the result that while prices of raw jute slumped, those of jute goods continued to mount up. In the following eight years, there was a move towards restoration of the equilibrium and in the four years preceding the second war, the ratio of the price index of jute goods to that of raw jute had settled down to 141. The Second World War once again blocked the overseas demand for raw jute and in 1939-43 the rise in the prices of raw jute was unable to keep pace with the increase in the price index of jute goods. By 1947 the ratio had settled down to the more or less normal level of 146; but the partition of the country dislocated the supplies from Pakistan which received better enquiry from Europe following the rehabilitation of the jute industry on the continent and the ratio declined to 129 in 1948, but recovered to 135 in the following year despite the trade deadlock in the last two months of the year. By April 1949, the disparity continued to press down further with the price index of raw jute at 303 and of jute goods at 341 reducing the ratio to 113 only. It was at this stage quite clear to the industry that it was not worth its while to use the raw material and the subsequent measure resulted in pressing down the respective price indices to 280 and 487 with a ratio of 174 for September 1949. Thereafter, the Government of India maintained the statutory price control in terms of the index number for raw jute at 301 and that for jute manufactures at 424 and the ratio remained constant at 141.

On March 9, 1951 the Government of India decided to abolish control over raw jute and jute goods and the immediate effect of the decision was reflected in the sharp rise in prices of both raw and manufactured goods. The rise was more spectacular in raw jute whose price index rose from 301 in February 1951 to 804 in June than in jute goods which moved from 424 to 782 and then declined to 738 in June when the ratio worked at a record low level of 92. The prospect of a bigger crop and the overseas resistance to high prices for jute goods, however, pressed down the prices thereafter. Within less than two months the raw jute index dropped from 804 to 376 in August while that of jute manufactures to 568 and the ratio sharply recovered to 151.

RECENT DEVELOPMENTS

The abolition of the control over jute and jute manufactures on March 9, 1951 marks an important stage in the battle of the Indian jute industry for survival. During the period of the control, the Government had stepped up the export duty on hessian by three stages to Rs. 1,500 by November 1950 and the sacking duty to Rs. 350. Immediately after decontrol, both jute and jute goods registered a sharp advance under speculative stimulus; but by the middle of June it was obvious that the overseas markets were sagging. For a time, jute manufactures resisted the trend even though about 90 per cent of hessian and 70 per cent of sacking depended on foreign buying; but by the end of the third quarter of 1951 the overseas buyers had developed such a remarkable resistance that the situation called for a revision of Government policy in the context of a comfortable supply of raw material.

Despite the mounting stocks, the Indian Jute Mills' Association decided to raise working hours to 48; but the overseas markets began to shrink at such a rapid pace that Government was obliged to halve the export duty on hessian on February 19, 1952 to Rs. 750. This failed to attract inquiry from abroad and on March 5 it was decided to issue free licences for shipments to Japan and 13 non-sterling countries in the European Payments Union. A fortnight later the quota restrictions were totally abolished. These measures could not check the rising trend of unsold stocks and the Indian Jute Mills Association decided to revert to 42½ hours working with effect from April 1, 1952.

Surveying the problems at the end of February 1952, Mr. K. D. Jalan, President of the Indian Jute Mills Association, said: "We have emerged from an era of scarcity; and there is available this year from India and Pakistan a raw jute crop which is the second highest ever to be produced. We still, however, have too great a dependency on Pakistan until quality is given equal prominence with quantity.

"Here in Calcutta in the jute mills is to be found the largest concentration of any single industry in the world. The varied resources of other producing countries are, however, in combination, of considerable significance constituting roughly 40 per cent of the entire world jute mill industry. Our looms are divided as between 65 per cent hessian and 35 per cent sacking. Consequently we can expect in normal times a production which constitutes 53 per cent sacking and 44 per cent hessian. During January this year, however, hessian dropped to 32 per cent of our production and sacking increased to 65 per cent.

"What now stares us in the face is that the demand for our goods by the two countries, U.S. and Argentina, previously taking over 65 per cent of our hessian production is now halved in relation to an output which in itself is down by a quarter of its previous level and raw jute costs are beyond our control. In contrast with earlier days, India's monopolistic position in jute has entirely disappeared. European producers who previously supplied 3·8 per cent of the American trade increased their percentage in 1951 to 16·8. In contrast to Calcutta being virtually the sole supplier of sacking goods, recent reports indicate that substantial quantities have been taken from continental producers and new jute manufacturing industries are springing up not only in countries cultivating a fibre akin to jute but in Pakistan where there is first class jute in abundance at a cost cheaper to them than to us."

The following table gives the trend of production, mills' stocks, and despatches in the current jute season :—

(In thousand tons).

Month in 1951	Opening Stocks	Production	Export	Local Purchases	Despatches	Closing Stocks
July	90·4	71·6	72·4	12·4	84·8	74·9
August	74·9	75·7	72·3	8·7	81·0	69·0
September	69·0	66·3	64·1	8·2	72·3	63·5
October	63·5	69·2	50·6	9·5	60·1	72·0
November	72·0	82·0	58·8	10·7	69·5	83·4
December	83·4	84·3	73·6	10·0	83·6	84·5

Substitutes.—In the year the battle of substitutes was intensified following the sharp rise in the prices of jute goods. Besides, exports of raw jute from Pakistan to Europe in preference had also an adverse effect on the position of the Indian jute industry. In the U.S.A. the first crop of Kenaf was harvested in September 1951 and 37,500 bales were expected to be realised from 15,000 acres in April. Because of jute scarcity the Belgian jute districts reverted to the use of substitute fibres grown in Belgian Congo. Brazil was engaged in developing a new fibre plant producing about ten times more fibre per stem than the jute plant.

A more spectacular progress was, however, noted in the field of using paper bags instead of jute bags. In the U.S. a very pronounced shift from burlap to paper was reported by the potato trade in 1951 during which three-fourth of the crop was handled in paper bags. Canada has launched a more ambitious scheme for raising the output of paper bags and South Africa set up a factory for the same purpose in addition to the intensification of the experiment on wild stokroos.

THE LAC INDUSTRY

LAC is a resin which finds extensive application in industries chiefly for gramophone records, furniture polish, sealing-wax, felt hats, abrasive wheels, electrical insulation, leather dressings, etc. India holds practically a monopoly for this resin, as it accounts for nearly 85 per cent. of the world production.

Lac is secreted by insects known as *Laccifer lacca, Kerr* which live on the twigs of trees mostly in Bihar, Madhya Pradesh and the neighbouring regions. Important trees that lend themselves to successful lac culture are *Palas, Ber* and *Kusum.*

Lac cultivation is carried on extensively by thousands of villagers each of whom collects only a few pounds and sells it to manufacturers or their agents. The raw lac, thus collected, is converted by washing and melting into refined forms by about 350 factories which are mostly situated in Bihar. These factories are small establishments with small capital outlay and employ labour only intermittently. Most of the operations are carried out by manual labour. There is, however, one large factory near Calcutta where refined lac of various grades is made on a large scale with mechanical equipment and processes.

For a few years before World War II, the production of lac was in excess of demand and prices were low. But during the first phase of the war prices increased and production decreased when price control was imposed by Government and for a time all purchases for export were canalised through the Ministry of Supply. With the cessation of hostilities and removal of restrictions prices went up and have continued to go up but production is still below normal. If the output of raw lac is increased the existing factories could easily double their production without much additional capital or equipment and neither materials nor personnel need be imported.

The annual production of raw lac in India is about 50,000 tons which when refined yields about 30,000 tons of seed-lac, button-lac and shellac in which forms they are used in industries. But the world demand for lac is still in excess of supply and synthetic resins have already largely replaced it in the making of gramophone records, and are seriously threatening to replace it in other fields too chiefly because of the high prices now prevailing.

The Indian Lac Cess Committee is conducting a research institute at Namkum, Ranchi, where investigations are in progress for better methods of cultivating lac and for its wider uses. Results already obtained are being demonstrated through a specially trained staff. Among new materials arising out of the recent researches of the institute are plastic moulded articles, baking insulating varnishes and paints, waterproof emery paper, flexible micanite and rexine cloth.

THE NON-FERROUS INDUSTRY

ACCORDING to Dr. D. N. Wadia, formerly Mineral Adviser to the Government of India, mineral resources of India for aluminium, copper and antimony are sufficient to meet our present and future requirements. As regards lead, zinc and tin, our resources are not likely to be sufficient and imports will be required to meet the deficiency in these metals. And about the rest of the non-ferrous metals, our mineral resources are negligible. The position regarding these metals is briefly described below :

(*a*) **Aluminium Ores** :—India is rich in deposits of high grade Bauxite which are estimated at 250 million tons. These are generally located in Jabalpur and Balaghat Districts of Madhya Pradesh, Belgaum, Kolhapur, Thana and Kaira Districts in Bombay; Ranchi Plateau in Bihar; and Shevaroy Hills in Salem, Madras.

(*b*) **Copper Ores** :—Copper pyrites is the principal ore of copper. The deposits of copper pyrites in India are in Singbhum and Baragunda in Bihar; Khetri mines in Jaipur; Sikkim State, Mysore State and in the Salem District of Madras State. Although only the Singbhum deposits are worked at present, the copper belts of Sikkim and Khetri are very promising.

(*c*) **Lead Ores** :—Lead ores are known to occur at a number of places in India. Special mention may be made, however, of lead deposits in Jaipur and in Zawar Mines in Udaipur, where lead is found in association with zinc; in Chhota Udaipur in Gujarat and in Hazaribagh in Bihar.

(*d*) **Antimony Ores** :—Antimony ore deposits have been found at the Shigree Glacier in Lahaul, Kangra District, Punjab (India).

(*e*) **Zinc Ores** :—At present zinc deposits are known to occur at only two places in India: Zawar mines in Udaipur and in the Riasin District in Kashmir State.

(*f*) **Tin Ores** :—Several localities are known in India where tin stone (Cessiterite) has been found in small quantities. The most interesting of these areas is that in the Hazaribag District of Bihar. None of these ores are said to be very promising.

The only non-ferrous metal produced in India before the war was copper. The Indian Copper Corporation Ltd. started working the Singbhum copper deposits in Bihar in 1928-29. The average production of refined copper before the war was 6,000 tons per annum.

There was practically no refining industry for the recovery of metal from scrap and most of the industrial non-ferrous scrap was exported to Japan and Germany.

As regards processing of semi-manufactures the only production was of brass sheets by the Indian Copper Corporation Ltd. averaging about 8,000 tons per annum, and electric copper wires and Insulated cables by the Indian Cable Co. Ltd. According to a report of the Tariff Board (Commission) in 1931, the production of this company in 1930-31 was about 1,250 tons and its maximum capacity was about 3,500 tons.

DEVELOPMENT SINCE 1939

(*a*) **Production of Virgin Metals** :—The Indian Aluminium Co. achieved production of Aluminium ingots in 1943 and the Aluminium Corporation of India started production in 1944. The Indian Aluminium Co. started at first by reducing imported alumina from Canada into aluminium in their Smelter Plant at Alwaye in the United State of Travancore-Cochin. The Company's Alumina Works is situated at Muri in Bihar; they have been engaged in production since 1947. The Aluminium Corporation of India has its Smelter and Alumina Plant near Asansol. The combined capacity of both these concerns for aluminium ingots is 7,000 tons per annum. Their total production of aluminium ingots was 3,249 tons in 1946, 3,218 tons in 1947, 3,372 tons in 1948, 3,490 tons in 1949 and 3,600 tons in 1950. In 1951, the production of aluminium ingots was 3,850 tons. The Aluminium Target Committee set up by the former Industry and Supply Ministry of the Government had fixed the target figure for 1950 at 3,550 tons. The production achieved by these two factories is very low as compared with their installed capacity due to various adverse factors, over which they had no control.

The Indian Aluminium Co. has prepared a scheme to set up a new plant in Orissa with a capacity of 15,000 tons per annum. The scheme has been approved by the Government.

A new Company was floated in 1948 in Madhya Pradesh with the financial support and backing of the Government of Madhya Pradesh for starting an aluminium factory in the State which contains rich bauxite deposits. The management of the concern is now taken over by the State Government. The prospects for the economic production of aluminium in the State seem to be very favourable, as both coal and high-grade bauxite are found in close vicinity and cheap power will be available from the use of low quality coal found in abundance. As India is importing about 12,000 tons of aluminium at present and as about 7,500 tons of extra aluminium sheets per annum will be required for the new programme for the manufacture of aircraft, wagons and buses, there is wide scope for a new plant with a sufficiently high capacity.

A Smelter was set up during the war at Bombay by the Star Metal Refinery with a capacity of 300 tons of antimony per annum. This capacity has now been increased to 900 tons, per annum. The ore brought from Chitral State (Pakistan) was used for smelting antimony and the plant had reached full production in 1946-47. After the partition of the subcontinent, the ore supplies from Chitral were cut off and as a result the production suffered. The production for the last three years was 100 tons in 1949, 576 tons in 1950 and 328 tons in 1951. The low production in 1949 was due to heavy imports of antimony in the previous year and also to the decline in the demand.

The average annual production of copper during the war years 1940 to 1946 was 6,100 tons showing only a slight increase over pre-war production. The production of copper in 1949 was 6,300 tons, in 1950 6,600 tons and 7,080 tons in 1951. The production could be increased if the lower grade ore was also utilised which at present is rejected in the process of mining. The prospecting of copper mines in Khetri at Jaipur was started in the year 1947, but the work has not been pursued with enough vigour so far, and no concrete results have been achieved.

A new Lead Smelter at Katrasgarh in Bihar has been recently put up with a capacity of 7,000 tons per annum. The production of lead in 1949 and 1950 was, however, only about 600 tons a year due to the difficulties of transporting ore from the Jawar mines in Udaipur to the Smelter. The company has now set up an ore dressing plant at the mines which will reduce the weight of the ore to be transported. The capacity of this plant is reported to be 9,000 to 10,000 tons of lead concentrates of 60 to 65 per cent. lead and 7,000 to 8,000 tons of zinc concentrates averaging 55 per cent. zinc. The company was recently given a big loan by the Industrial Finance Corporation and its production should rapidly increase in future, particularly as the price of lead has increased very much since the Korean War. The production in 1951 was, however, only 880 tons.

No progress has been made in the production of zinc in India. Although the Jawar mines were originally prospected by the Geological Survey of India for zinc and although the ore in the Jawar mines contains about 13 per cent. lead and 9 per cent. zinc, there is no immediate proposal for producing zinc. The present plans are

only to produce from the zinc-bearing ores lithopone and zinc oxide which are required for the paint industry.

(*b*) **Production of Semi-manufactures :**—The greatest progress in the Non-ferrous Industry made since 1939 is in regard to the semi-manufactures. Several brass and copper rolling plants have been started for rolling brass and copper sheets mainly in Bombay. The combined capacity of these new plants which are already set up is about 20,000 tons per annum.

The two aluminium producing companies have also set up plants for rolling aluminium sheets. The present combined capacity of both these plants is only about 3.000 tons.

Some lead sheets are also manufactured in the Calcutta area, but at present they are rolled in 3 ft. width, while the chemical industries require lead sheets of 7 to 9 ft. width. Aluminium and lead foils for tea-chests are also manufactured in the Calcutta area and the present capacity is estimated to be sufficient to meet India's requirements.

Several rolling plants for rods and bars of brass, copper, etc. were started during the war, and recently an Extrusion Press has been set up in Calcutta by National Tubes and Pipes Ltd. Arsenical copper rods which are required for Railway locomotives as boiler stays were manufactured in Jaipur by the Jaipur Metal Industries Ltd. during the war and all the requirements of Railways can be met by indigenous production. The present capacity for rods and tubes of brass and copper may be estimated at about 10,000 tons, which is enough to meet the present requirements of the country. The manufacture of lead pipes was started during the war at Konnanagar in former undivided Bengal.

A new plant for lead pipes was also set up in Bombay during 1949. The present production is about 500 tons per annum, but this could be increased to 1,000 tons, if required.

A plant for the manufacture of electrical wires and cables was set up near Calcutta during the war by the National Insulated Cable Co. The total production of electrical bare copper wire and cables of this company and the Indian Cable Co. is estimated to be about 10,000 tons per annum.

A plant specially designed for the manufacture of aluminium cables was set up about a year ago in Travancore at Kundara by the Aluminium Industries Ltd. Another plant is likely to be put up at Jaipur shortly, which would make India self-sufficient as regards the requirements of aluminium cables estimated to be 8,000 to 10,000 tons per annum for the new electrification projects.

Two plants for enamelled copper wire required for making electric motors and fans were set up, about a year ago, one in Bombay and the other in Calcutta. The total capacity of these two plants is 2,000 lbs. per day. When these plants start operations successfully, they will fill up an important gap in the production of essential requirements in non-ferrous semi-manufactures.

A number of concerns have been started for manufacturing different kinds of non-ferrous alloys. The refining and reconditioning of Railways scrap and other industrial non-ferrous scrap is now done in this country, which was formerly largely exported. The total present alloying capacity in the country may be estimated at about 20,000 to 25,000 tons per annum.

GOVERNMENT POLICY

The Government have passed orders on the recommendations of the Tariff Board regarding the non-ferrous industry in their resolution dated 11th June 1948. In most cases, the Tariff Board had recommended that the existing revenue duty of 30 per cent. should be converted into a protective duty of 30 per cent. In certain cases, the duty was converted into a protective duty at a lower rate, as in the case of zinc and lead sheets where it was fixed at 20 per cent. In the case of arsenical copper rods, brass rods and brass wires, a protective duty of 35 per cent. was recommended. The Government have accepted all the recommendations of the Tariff Board, except the recommendation regarding remission of duty on all plant and machinery imported since the case of the non-ferrous metal industries was referred to the Board. Government said that though they could not accept the recommendation regarding the refund of duty on machinery already imported, they were considering the general question of the removal of the import duty on machinery. Government have since passed orders reducing the import duty on machinery from 10 per cent. to 5 per cent. which is applicable to all industries. In their resolution, Government have also drawn the special attention of the industry to the recommendation of the Tariff Board in regard to the appointment of qualified technical personnel and technical Directors, to which they attach very great importance. It is to be hoped that the industry will pay due attention to this recommendation and fully implement it in their own interests. One leading concern has already done so.

Protection to Aluminium Industry

In a resolution dated May 15, 1949 the Government of India passed orders regarding protection to the Aluminium Industry. The Tariff Board had submitted its report about four years ago. The protection to the Industry is given partly by customs duties and partly by the grant of subsidies to the two producing companies.

As regards the protective duty, the existing import duty of 30 per cent. *ad valorem* was to be continued and in addition further specific duties were to be imposed as follows :—

Year	Rate of additional duty on ingots in rupees per ton.	Rate of additional duty on sheets, strips and circles in rupees per ton.
1949–50	328	121
1950–51	237	46
1951–52	146	*Nil*

The rates of subsidies to the two producing companies were fixed as follows :—

Year.	Rate of subsidy in rupees per ton.	
	Indian Aluminium Company.	Aluminium Corporation.
1949–50 ..	330 (on sheets & circles)	710 (on sheets & circles) 900 (on ingots)
1950–51 ..	230 (on sheets & circles)	610 (on sheets & circles) 825 (on ingots)
1951–52 ..	130 (on sheets & circles)	510 (on sheets & circles) 750 (on ingots)

These rates of duty and subsidy are based on the landed cost ex-duty of aluminium ingots being Rs. 1,275 per ton, and of 20 gauge circles being Rs. 2,614 per ton and are liable to suitable adjustments if these prices vary appreciably. The Aluminium Pool was abolished from 15th May, 1949.

In 1950 the Tariff Board held its second inquiry into the Aluminium Industry. The Board submitted its report to the Government. As a result of the recommendations of the Tariff Commission, Government of India have passed orders that the existing protective duty of 30 per cent. *ad valorem* will continue till May 1952, before which date the scheme of protection will be reviewed.

In view of the increased price of imported aluminium, the levy of additional specific duty on aluminium ingots, sheets and circles was discontinued. The rate of subsidy on the sale of ingots payable to the Aluminium Corporation of India was reduced to Rs. 120 per ton and that too payable only upto the end of October 1950, no subsidy being payable later. No subsidy at all would be paid to the Indian Aluminium Company for the period November 15, 1950 to May 14, 1952.

IMPORTS

The imports of both metals and manufactures during the period 1946-47 to 1950-51 increased very much due to the starving of the Indian market during the war years. The manufactures constituted about 40 per cent. of the total imports during this period. Detailed statistics are given below :—

IMPORTS OF NON-FERROUS METALS & MANUFACTURES

	1946-47 (Tons)	1947-48 (Tons)	1948-49 (Tons)	1949-50 (Tons)	1950-51 (Tons)

WORLD PRODUCTION

The following tables give figures of production in the 6 largest producing countries of the world for copper, aluminium, zinc and lead which are the most important of the non-ferrous metals.

COPPER

(In tons of 2,000 lbs.)

Name of country	1946	1947	1948	1949	1950
U. S. A.	695,000	1,073,000	1,056,000	961,000	1,112,000
Canada	167,000	199,000	212,000	224,000	231,000
Rhodesia	205,000	218,000	235,000	290,000	315,000
Belgian Congo	158,000	166,000	171,000	156,000	194,000
Chile	395,000	450,000	468,000	387,000	381,000
Japan	26,000	41,000	60,000	82,000	93,000

TOTAL WORLD OUTPUT	Not available				

* British Zone only.

THE OPIUM INDUSTRY

OPIUM, which is one of the most important and remarkable vegetable drugs known to man, is a light brown to dark looking tough solid with a characteristic smell and bitter taste. It is obtained from the unripe capsule or fruit of the poppy, Papaver Somniferum, to give it its scientific name. The capsule or fruit is scratched or cut and the juice which keeps slowly exuding from the cuts during the night is removed early in the morning and allowed to dry further in the shade before it is ready for packing.

Opium is one of the best drugs for sleeplessness produced by painful disease, and along with its derivatives it is a fine remedy for cough, asthma, diarrhœa, piles and other nasal and throat disorders. It is also an expectorant and an anti-spasmodic. Though opium has great uses as medicine it can also be fully abused. It is a habit forming drug and can be dangerous to both mind and body. The opium addict becomes a physical and mental wreck in course of time losing all interest in life and business, or he becomes a hardened criminal. The opium dens of the world are indeed notorious for their vice and crime. For these reasons most countries regulate the sale and distribution of opium under Dangerous Drugs Rules. To combat illicit traffic in drugs international control organs have been set up, such as the Opium Advisory Board, Permanent Control Opium Board, and Drug Supervisory Board. And so at the San Francisco Conference in 1946 it was decided that the international control agencies should be brought into relation with the Economic and Social Council of the U.N.O. to be better able to fight the evil.

The poppy is grown chiefly in Eastern Europe and Asia specially in U.S.S.R., Turkey, Iran, India and China, the last of which is a big producer as well as consumer. The world medical requirements of opium are estimated at 1,000 tons. And though world production has tended to fall since 1936 it was still as high as 1,600 tons in 1938 (excluding China and Afghanistan) that is to say, 600 tons in excess of the world's medical needs.

Since 1940, however, production has increased to meet increased medical and other legitimate requirements.

The following figures show how exports rose from 1945 to 1950-51 :—

1945-46	49 Cwts.	Rs.	75,432
1946-47	220 ,,	,,	3,81,000
1947-48	320 ,,	,,	8,66,424
1948-49	234 ,,	,,	7,83,910
1949-50	1,776 ,,	,,	58,69,908
1950-51	4,305 Chests=5,852 Cwts.		
	Value Rs. 1,91,73,048		
1951-52 (7 months),	2,057 Chests=2,933 Cwts.		
	Value Rs. 1,04,03,720		

1 Chest = 140 lbs.
1 Md. = 82 2/7 lbs.
1 Seer = 2 lbs.

The net receipts (receipts less expenditure) of the Government of India have fluctuated :—

1941-42	Rs.	+41	lakhs
1942-43	,,	+26	,,
1943-44	,,	— 2	,,
1944-45	,,	— 5	,,
1945-46	,,	—52	,,
1946-47	,,	+48	,,
1947-48	,,	+51	,,
1948-49	,,	+35	,,
1949-50	,,	— 4	lakhs
1950-51 (Revised) ..	,,	+195	,,
1951-52 (Budget) ..	,,	+38	,,

Another point which is worth mentioning is that while the consumption of opium for medical purposes increased, excise opium sold to State Governments diminished.

Present Position.—The policy of the Government of India before the transfer of power was one of suppression of excessive indulgence but non-interference with moderate use. In effect this remains the policy of the Government today. In 1945, there were 12,000 to 14,000 licensed shops in the sub-continent selling opium albeit in small quantities and the average consumption in eating and smoking was on an average 200 tons per annum in the decade 1930-40.

The poppy is grown today in U.P. and in parts of central India, Rajasthan and Madhya Bharat. This opium is bought by the Government of India at the fixed rate of Rs. 9 a seer and made into three kinds of opium at two factories, at Ghazipur and Neemuch—1. provision opium (71° opium) for export, 2. excise opium (90° opium) sold to State Governments for local consumption, and 3. medical opium (87·5° opium) for the Medical Departments in India and for export to London for sale to chemists. The exports are made to Aden, Burma, Nepal, Zanzibar, etc. by agreement with their respective Governments. The price of the opium sold to the States is Rs. 18 per seer and of the opium exported is £129 to £240 per cwt.

Apart from the medical needs of the sub-continent which amount to about 25 cwts., and of the exports for medical purposes to the U.K., which amount to 15 to 25 tons annually, some opium is also used to manufacture morphine and codeine in India. In 1943 the Government Alkaloid Works at Ghazipur produced 2,000 lbs. morphine and 424 lbs. codeine with their salts. The Government of India Panel on fine chemicals (before partition) estimated a target production of 3,000 lbs. and 1,500 lbs. of morphine and codeine salts respectively for 1946. The requisite opium needs for this purpose were estimated to be in the neighbourhood of 50 tons. In the future, however, the Government of India is expected to limit the production of opium to the medical and scientific requirements of India and for exports according to international agreements.

The expenditure on opium consumed in the sub-continent still amounts to about Rs. 2 to 3 crores per annum. In U.P. alone opium consumption was as high as 250 cwts. a year, in spite of duty on it being raised by 20 per cent. Whatever may have been the policy in the past it is vitally necessary to stamp out addiction to the noxious drug. Assam led the way when it introduced prohibition in March 1941. The loss of State excise revenue may be as high as 3 crores (duties vary from Rs. 51 to Rs. 140 per seer) but it will be amply compensated by higher national health and morale.

REVENUE ESTIMATES. (Rs. in Lakhs)

1949-50	1950-51	1951-52
accounts	revised	estimate
123·74	300	235

(In Lakhs of Rs.)

	1949-50 (actuals)	1950-51 (actuals)	1951-52 (estimate)
Sale of Medical opium	—	·10	·15
Sale to State Govts.	40·59	78·28	78·38
Receipts in England	59·90	154·04	50·0
Miscellaneous ..	23·47	67·61	106·57
Net Revenue ..	123·74	300·0	235·0

EXPENDITURE ESTIMATES. (Rs. in Lakhs)

1949-50	1950-51	1951-52
actuals	revised	estimates
127·33	104·57	197·3

The expenditure is expected to be more than offset by the receipts to be realised.

THE PAPER INDUSTRY

PAPER making was introduced in this country in the tenth century by Muslim rulers and became a fine craft during the regime of Akbar. Till the advent of the British rule it flourished as a cottage industry all over the country; but thereafter the manufacture of hand-made paper was mostly confined to jails. With the advent of industrial revolution in the country, the craft was on the decline. It was, however, in the 'thirties that Mahatma Gandhi made efforts to revitalise the industry and some of the best types of paper are now turned out by hand in the country.

The first paper mill on a modern scale was started in India about ninety years ago by Dr. William Carey and the second was established in 1867 on the banks of Hooghly near Calcutta. The initial enterprise was, however, a failure; but some of the machines acquired by the Titaghur Paper Mills floated in 1882 have really paved the foundation of the industry in this country. Simultaneously, several mills were started in other centres as well, including Lucknow and Gwalior. The latter mill had to be closed down because of the losses; but its machinery was acquired by the Bengal Paper Mills which had started production at Raniganj in 1891. In Bombay State the first paper mill was started in 1887 and was known as the Deccan Paper Mills.

Until 1925 the progress of the industry was rather slipshod and though several concerns were started, there were only nine mills in the country with an installed capacity of 33,000 tons. The Bamboo-Paper Industry (Protection) Act of 1925 provided an opportunity to the mills to repair the damage caused by the incessant and intensive use of their plant during the Great War and of overcoming the difficulties of getting stores and machinery and thus promoted the development of bamboo-pulp as the main raw material. The protective tariff on paper was renewed on the recommendation of the Tariff Board in 1932 and imported wood-pulp was also subjected to a duty of Rs. 45 per ton. This pulp duty had the direct effect of preventing the establishment of new paper mills designed to work on imported wood-pulp and of concentrating on the exploitation of bamboo-pulp resources. The industry continued to be protected till 1947 when on the recommendations of the Tariff Board, Government decided to end it but assured the industry of its revival in the event of recurrence of competition.

Prior to the outbreak of the Second World War, India's total consumption of paper averaged 203,574 tons a year of which 149,975 tons were imported varieties. The difficulty in getting paper from abroad during this period provided an opportunity for expanding the output and by 1944 there were 16 mills to turn out 103,883 tons of paper, excluding strawboard, as against 53,811 tons in 1937-38.

Structure.—The third census of the industry taken in 1948 revealed that there were 39 factories with a fixed capital outlay of Rs. 537 lakhs and a Working Capital of Rs. 283 lakhs. West Bengal and Bombay accounted for 12 and 13 factories respectively, with Uttar Pradesh and Madras ranking third and fourth having 6 and 5 factories respectively. Bihar, Punjab and Orissa had one factory each, but the census did not consider the factories in Mysore and Hyderabad. Despite this limitation, the following details may be interesting :—

(Rs. in lakhs)

Fixed Capital	537	
Working Capital	283	820
No. of persons employed ..	20,368	
Salary and Wages	200	
Fuel, etc.	104	
Raw Material	247	
Chemicals	151	
Packing Material	21	
Other Materials	55	
Total Materials consumed ..	..	474
Total ex-factory value of Materials consumed ..	..	474·6
Total ex-factory value of Products and by-Products.	..	991·8

Production.—The bulk of the productions comprises the more common types of paper, especially printing and writing paper. The manufacture of superior varieties is also undertaken but on a restricted scale. There is no mill manufacturing newsprint at present. The following table gives the trend of production :—

(In 000 tons)

Year	Installed Capacity	Total Production	Printing & Writing	Wrapping	Special Varieties	Board
1946	105	106	65	15	7	18
1947	105	93	53	17	5	18
1948	105	98	50	17	13	17
1949	110	103	59	13	11	19
1950	114	109	70	15	5	19
1951	137	131	78	24	3	26

According to the President of the Indian Paper Mills Association, the installed capacity of the industry at the beginning of 1952 was 158,500 tons as against 115,400 tons a year ago. He also claimed that the manufacturing cost was the cheapest in the world.

Raw Material.—Sabai grass and bamboo are the chief raw materials which are available locally. The use of imported woodpulp has been gradually discouraged and hardly 10 per cent. of the raw material is imported. Of late, however, the industry has been placing a greater reliance on rags, hemp, hemp ropes and waste-paper. One important mill is exclusively dependent on waste paper and rags.

For many years the paper pulp section of the Forest Research Institute at Dehra Dun has been carrying out experimental work in connection with the development of new fibres for paper-making, and it has been reported that considerable success has been obtained in making craft paper from bamboo pulp. Two paper mills have now been successfully manufacturing craft papers from bamboo for over a year. The industry is making a voluntary contribution of four annas per ton of paper for expenditure on research.

Recent enquiries show that the Kashmir and Tehri-Garhwal can supply fir and spruce in quantities sufficient for the establishment of a newsprint mill in Kashmir and U.P. The two species of wood are well known raw material for the production of mechanical pulp for use in newsprint manufacture and the suitability of both the species from the two States has recently been tested at the Forest Research Institute, Dehra Dun. Most of the established mills have plans for the expansion of production and several new companies have been floated for the manufacture of paper, board and also newsprint which last is to be manufactured from the timber found in the forests of Madhya Pradesh. But the abnormal rise in the cost of machinery and the difficulties of importing these from abroad, however remain.

The Panel of the advisory Planning Board set up in 1944-45 recommended the establishment of mills for newsprint in Kashmir, Tehri-Garhwal and Punjab and set the target of production at 20,000 tons in 1951 and 40,000 tons in 1956 against an anticipated annual consumption of 60,000 tons and 100,000 tons respectively.

The Panel anticipating increased demand for both paper and board in the next four years, recommended a large expansion of the industry aiming at a target of production in each case, as shown below :—

Kinds of paper.	Anticipated annual consumption in tons.		Target of indigenous production.	
	1951	1956	1951	1956
All types of paper other than newsprint	220,000	312,000	169,000	302,000
All types of boards including strawboards ..	75,000	119,000	75,000	119,000

As regards the location of new paper mills for the expansion of the industry, the Panel is of the opinion that no new mills should be set up in West Bengal, but instead should be distributed in the following suitable areas :—

Paper :—In Madras, Bombay, Assam, Punjab, Madhya Pradesh, Vindhya Pradesh, Uttar Pradesh and Bihar.

Boards :—In Bombay, West Bengal (near Calcutta), Madras, Madhya Pradesh, Orissa, Punjab, Uttar Pradesh and Hyderabad State.

Hand-made Paper :—The Panel recommends the expansion of this industry by organising systematically for the production of special types of paper, with semi-mechanisation of some of the processes.

The Panel, while of the view that the projected increase of paper and board production can be left to private capital and enterprise without direct financial assistance from Government, has recommended that (*i*) a survey should be made of all cellulose raw material, (*ii*) that the paper pulp section of the Dehra Dun Forest Research Institute should be converted into a Pulp and Paper Research Centre, the Government sharing the cost with the industry and (*iii*) that at least 6 young Indians should be sent abroad every year for higher training in addition to technicians trained at the Dehra Dun Centre.

The Government accepted the Panel's recommendations regarding targets of production and location of mills but no orders have been passed on the other recommendations, although some State Governments have started experimenting on suitable raw materials such as planting of encalysters and mulberry trees and growing of bhabar grass on preserved areas.

FIVE-YEAR PLAN

During 1952, mills have planned to raise the capacity mainly because 8,000 tons unit is considered as the minimum size of an economic unit. The Mysore Paper Mills expect to double their capacity to 8,000 tons by 1953. The Cauvery Valley Paper Mills with a capacity of 3,000 tons is expected to go into production in 1952 while Ballarpur Paper and Strawboard with 8,000 tons capacity will start operations in 1953. Thus, the industry's installed capacity is expected to rise to 183,000 tons by 1953.

The Planning Commission came to the conclusion early in 1951 that the production and consumption targets for 1956 might be fixed at 312,000 tons and 322,000 tons respectively. It also felt that having regard to the distributed supply of raw material, a certain degree of regionalisation could be achieved so as to discourage the evil of present over-concentration in a certain area. Accordingly it fixed the following programme :—

Variety of Paper	No. of Units	New Capacity (Tons)	Location
Writing and Printing ..	10	80,000	Madras, Bombay, Orissa, Punjab, U.P., Bihar, Assam, Madhya Pradesh and Vindhya Pradesh.
Wrapping Paper—			
Light Weight	6	48,000	U.P., Bihar and Bombay.
Heavy Weight	2	20,000	Madras and Punjab.
Kraft Paper	3	30,000	Bombay, Orissa and Madhya Pradesh.
Total	21	178,000	

According to the President of the Indian Paper Mills Association, it requires Rs. 2 to 2½ crores at present to install a mill of about 8,000 tons to 10,000 tons capacity and the capital turnover is very slow compared to most other industries. Besides, there is the problem of securing technical personnel. Because of these factors, the draft outline of the Five-Year Plan lowered the production target to 212,000 tons.

In regard to newsprint manufacture, it is recognised that the annual consumption of newsprint is around 35,000 tons and the Sirpur Mills in Hyderabad is engaged in putting up a 15,000-ton plant. The Planning Commission has come to the conclusion that even though there are large sources of raw materials such as silver fir and spruce in Northern India, the Madhya Pradesh scheme, on which capital expenditure was already incurred, deserves preferential encouragement. Started originally as a private enterprise with the support of the State Government, this concern is now being managed by the State. Towards the end of 1950 the inquiry committee reported that the scheme would be a success in spite of the inflated capital outlay provided Rs. 325 lakhs were made available to the company by Government. It is learnt that the State Government has succeeded in persuading the Government of India to come to its rescue.

THE PLASTICS INDUSTRY

THOUGH casein was known to the Egyptians and celluloid was discovered as early as 1865 it would be correct to describe the plastics industry as one of the newer industries. Within a little over two decades, however, plastic products have become the basic materials for industrial and constructional purposes and the number and variety of articles made of plastic substances indicate that few industries have such a wide range of products with possibilities of their utilisation in diverse ways as this industry. The flexibility with which plastic materials can be worked makes them simpler and cheaper than metal, wood, stones, ceramics or glass. They are being increasingly required in the manufacture of machine parts, electric gear, automobile and aircraft construction, in addition to a multitude of domestic requirements. This industry also offers possibilities of assisting in the establishment of a fully developed chemical industry in the country.

PRESENT POSITION

The plastics industry in India has been largely developed during the Second World War and is primarily concerned with turning out finished product from imported raw material. Before 1939, there were about a dozen moulding concerns manufacturing celluloid and other articles out of imported moulding powders and semi-fabricated plastic goods. The difficulty of importing moulding powders during the war led to the manufacture of phenol-formaldehyde moulding powder by a few concerns within the country. Plywood bonding resin is also produced on a small scale. A factory was recently established at Hyderabad in joint co-operation with a British enterprise for manufacturing phenolic resin-bonded laminated sheet, based on paper and fabric. A few machines for the production of tubes and rods have been installed in two or three places, but their production is very limited.

At the end of 1950 there were 80 major factories as against 41 in 1949. The capital invested is Rs. 6 crores and some 10,000 workers are engaged in the manufacture of plastics. The manufacture of plastics articles comprises four branches : compression moulding, injection moulding, extrusion and fabrication. The progressive increase in the machine capacity is given below :—

	1950	1951
Injection moulding..	506 ozs.	700 ozs.
Compression ..	9,608 tons	7,000 tons
Extrusion	pressure 64"	pressure 60"

For this purpose the annual requirements of raw materials are placed at 5,000 tons of thermo-plastics, 3,000 tons of thermo-setting moulding powder and 250 tons of fabricating material. The actual output of plastic moulded articles during the past three years is given below :—

Year	gross in lakhs
1948	3.75
1949	10.18
1950	22.97

Official figures about production are made available for 1951. They place the output of plastic moulded articles at 14.4 lakhs gross and that of bakelite moulding powder at 459,000 lbs. The monthly capacity of the latter was 150,000 lbs. in January 1952 as against 84,000 lbs. a year ago.

In the absence of the production of moulding powders and semi-fabricated goods, which, in turn, depends upon a well-developed chemical industry for supplying the necessary basic materials, only the moulding and fabricating sections of the industry, using imported raw materials, have been established. The industry also suffers from technical drawbacks from the point of view of organisation, equipment and machinery. Injection moulding side is limited to the production of utility articles and the extrusion side has only recently been developed. Fabrication is restricted to a few utility articles and most of the production in this line comes under the category of "fancy goods", with the exception of umbrella handles, spectacle frames and fountain pens. Nearly a dozen factories have installed machinery for manufacturing moulds ; but the work is still in an experimental stage. Among the new lines added recently may be mentioned automobile parts, radio parts, umbrella handles, wall titles, coat hangers, waist belts, artificial eyes, spectacle frames, and caps for collapsible tubes. The industry has also developed casein plastic and plastic leather cloth successfully and has on its programme, the manufacture of radio cabinets.

Only one firm is engaged in the manufacture of phenol-formaldehyde moulding powder for sale to the moulders. It was established in 1946 and has a rated capacity of about 900 tons per annum on the basis of working two shifts. The actual production was, however 72 tons in 1947 and 125 tons in 1948 and 255 tons in 1950. Proposals for manufacturing urea and formaldehyde at Sindhri are under examination. An acetate rayon plant has been put up at Hyderabad and will, when in production, make available cellulose acetate for the moulding industry.

An important development in 1951 was the signing of contracts between the Government of India and the oil companies for setting up oil refineries in various parts of India. As a result, chemicals such as benzine, acetylene and ethylene gases are expected to be made available for the manufacture of plastics raw materials. It is, however, pointed out that most of the demand being transitory does not provide a stable basis for the industry.

PROTECTION

The Tariff Board, after completing its inquiry in August 1949 into the claim of the plastic industry for protection, came to the conclusion that the industry is established and conducted on sound business lines, although there was considerable room for improvement both in its commercial and technical organisation. The Board found that the finishing section of the industry had developed before the establishment of the industries supplying intermediate and basic raw materials. At the same time, it endorsed the opinion of the Panel on Plastics and Cellulose Industries that "India possesses the resources necessary for the production of raw materials required for the synthetic plastics industry and has, in addition, an abundance of naturally occurring resins and resin-forming materials." It further found that it was in the national interest to grant protection to it and that the probable cost of the protection to the community would not be excessive.

The Board's main recommendations are given below :—

(1) In the absence of a fully-developed chemical industry supplying the basic raw materials for the moulding powder section of the industry and in order to reduce the cost of production of moulding powder, the manufacturers of such powder should be allowed a refund of the whole of the duties payable on the principal raw materials used in the manufacture of powder. This should be available to those who produce at least 200 tons of phenol-formaldehyde moulding powder per annum.

(2) The existing revenue duty of 30 per cent. *ad valorem* on moulding powder should be converted into an equivalent protective duty which should be kept in force till March 31, 1953.

(3) Imports of phenol-formaldehyde moulding powder should be permitted only to the extent of the gap between the domestic demand and production.

(4) In view of the need to expand the domestic market for plastic goods, assistance to the industry should be given in other ways than by an increase in the import duty.

(5) The section of the industry manufacturing plastic goods such as soap-boxes and spectacle frames should be helped by granting a reduction in import duty on such raw materials as are not manufactured in the country from 30 per cent. to 20 per cent., both *ad valorem*. The rate of duty on raw celluloid should also be 20 per cent. *ad valorem*.

(6) In respect of electrical accessories, the existing revenue duty should be converted into a protective duty to remain in force till March 31, 1953 and the present preferential rate of 24 per cent. on imports from the United Kingdom should be raised to 30 per cent. and the standard rate adjusted in accordance with the terms of the Indo-British Trade Agreement.

(7) In regard to spectacle frames, the existing revenue duty of 20 per cent. should continue.

(8) Early steps should be taken to set up a central moulding powder factory in order to co-ordinate the production of the existing units and others to be established and to ensure economical production.

(9) In view of the necessity for standardisation of plastic-ware and rationalisation of its production, the scheme for having a central mould-making shop should receive early and favourable consideration of Government.

(10) Indian manufacturers of plastics should keep abreast of technical developments in other countries.

(11) Early steps should be taken by the industry for the formulation of proper standards for moulding powder and finished articles.

(12) The existing revenue duty of 30 per cent. *ad valorem* on phenol-formaldehyde moulding powder should be converted into a protective duty.

(13) The duties of 25 per cent. standard, on phenol and of 30 per cent. standard and 26 per cent. preferential, both on formaldehyde and hexamine, these three being the principal raw materials used in the manufacture of phenol-formaldehyde powder, should be refunded on import to the manufacturers of moulding powder, who have a minimum annual production of 200 tons.

The Government of India issued orders on January 7, 1950 on the Board's recommendations. In regard to the main recommendation of the Board suggesting a reduction in the import duties on raw materials used by the industry in producing plastic goods like soap boxes, Government came to the conclusion that "the requirements of the case would be adequately met by a reduction of duty from 30 per cent. *ad valorem* to 20 per cent. *ad valorem* in respect of only cellulose nitrate (sheets, rods and tubes), rennet casein and polyvinyl chloride resin." This meant that raw materials like urea-formaldehyde moulding powder, polystyrene, cellulose acetate, cellulose and butyrate, would continue to be subjected to 30 per cent. duties.

PLASTICS PANEL

The Panel on Plastics, appointed by the Government of India in 1947, recommended that the moulding industry should be expanded to use about 3,000 tons of moulding powders annually during the next five years and that types of automatic presses, etc., should be imported. Moulding plants, the Panel opined, might be located in any part of the country, preferably near trade centres. A moulding plant utilising 100 tons of moulding powders per annum is considered a minimum economic unit under Indian conditions. Two Die making establishments should be set up, preferably at Bombay and Calcutta.

The Panel also considered that the expansion of the plastic moulding industry could be left to private enterprise ; but if private capital were not forthcoming to instal die-making plants, Government should subsidise the undertaking.

The Panel further recommended that the production of the following synthetic moulding powders should be started as soon as the basic chemicals required for their manufacture were available at economic rates and the demand was sufficiently large to justify the erection of an economic unit for each type: (1) Phenol-formaldehyde (1,500 tons), (2) Cellulose Nitrate (2,000 tons), (3) Urea-formaldehyde (500 tons), and (4) Cellulose acetate (1,000 tons). For a long-range industrial development plan, the production of the following synthetic plastics was recommended: (1) Melamine, (2) Furfural-phenol, (3) Nylon, (4) Polye-thylene, (5) Alkyd, (6) Vinyl, (7) Acrylate, (8) Silicone.

Stating that there were bright prospects of developing the naturally-occurring resins for use in the industry, the Panel strongly felt that intensification of co-ordinated research on the utilisation of lac, bhilawan and cashew-nut oil, must be undertaken.

A synthetic or a natural resin is very seldom in a condition suitable for direct moulding and requires the addition of filling materials. Wood flour is one of the most important of these. The Panel recommended that the manufacture of wood flour should be undertaken in India and an annual production of 1,500 tons aimed at.

THE RAYON INDUSTRY

WORLD'S first rayon factory capable of producing about a hundred pounds of rayon a day was erected in France in the year 1884. Today the world production of rayon, inclusive of staple fibre, has risen to the staggering amount of over 2,000 million pounds. This man-made fibre has beaten age-old textile fibres like silk and wool quantitatively and now occupies a position second to that of cotton, which is also being threatened by staple fibre.

But in spite of the large consumption amounting to some 75 tons of yarn per day and costing about five crores of rupees to the sub-continent annually in the pre-war days, there was no rayon manufacture in India or Pakistan till 1945. In the post-war period, in spite of the high level of prices, the separation of Pakistan from India and the difficulty of obtaining rayon due to shortage in the world market, India consumed on an average about 60 tons of rayon yarn per day at an annual cost of Rs. 15 crores approximately, as evidenced by Table I below.

The Indian Central Cotton Committee and the Board of Scientific and Industrial Research evinced early interest in this new industry and did very useful spade work by instituting research and collecting reliable data. The first industrial concern to be formed with the object of manufacturing rayon in India was the Travancore Rayons Ltd., which was quickly followed by the Sirsilk Ltd., and the National Rayon Corporation Ltd. Table II gives certain particulars about these companies. (See below.)

No new company has since been formed for rayon manufacture. But the Travancore Rayons as well as the National Rayon Corporation have already placed their product in the market and will soon have reached their capacity production, though their actual production figures are not available yet. The Sirsilk had practically stopped its activity due to political conditions in the early stages of the execution of the project. But in view of the decision of the Hyderabad Government to carry on the work considerable progress has been made at the factory site, although quite a lot remains yet to be done pending the decision regarding the Managing Agency of the Company.

MACHINERY

The mechanical equipment required for producing rayon is highly complicated and has for the present to be obtained from specialised firms in foreign countries. The Travancore plant is British cum Swiss, the Hyderabad plant entirely British, while the Bombay plant is American. However, there are several simple items of machinery such as tanks, containers, etc., which could doubtless be made locally and this fact has not been lost sight of by the industry in its own interest.

The absence in this country of technicians, capable of looking after the new rayon industry is a problem for Managing Agents. There is, however, only one way of solving the difficulty; and that is to give a thorough training to selected young men in rayon factories either at home or if possible abroad. One of the companies has already moved in this matter, and seen to it that the technical side is Indianised right from the start. Though it is desirable that the other two companies follow the example of the first company in this particular respect, their plans are not known. There is little likelihood of any serious difficulty arising out of lack of trained labour as the Indian labourer has enough intelligence to grasp and enough dexterity to execute new methods of work.

The combined daily production of the three plants, operating at full capacity, will be 16½ tons of rayon, which is about 25 per cent. of the sub-continent's post-war consumption after the separation of Pakistan. The consumption of rayon would certainly have been much higher in this country even now, if only rayon were available. Obviously there is vast scope for expansion of this industry in India.

STAPLE FIBRE

Any review of the rayon industry would be incomplete without a consideration of staple fibre, which is nothing but cut rayon. Staple fibre which is hardly two decades old, showed a higher production figure than that of filament rayon during the last war. It was originally invented as a substitute for cotton in those countries which had no direct access to raw cotton. Although this new fibre offers today immense possibilities of permutation and combination in spinning and weaving, it will suffice for the present to look upon it only as a substitute for cotton.

As the bulk of the cotton grown in India has a short staple, the country has got to depend on imported cotton for spinning finer counts. Although the efforts of the Indian Central Cotton Committee spread over a quarter of a century succeeded in growing long staple cotton, the actual yield of this variety formed just a fraction of India's requirement and by far the major portion of this yield has to come from Pakistan as a result of partition. India thus suffers from a serious shortage of long staple cotton, which could best be substituted by staple fibre manufactured in the country itself to an appreciable extent.

In fact India at present suffers from a serious shortage of cotton, regardless of its staple length. The all too ambitious scheme of the Government of India to make the country self-sufficient in food, jute and cotton at the same time, has not shown any striking results at least so far and frantic efforts have to be made to buy cotton from foreign countries at the sellers' price. After partition, India's imports of cotton have risen enormously as evidenced by the staggering figure of Rs. 100 crores for the imports of cotton in the year 1950-51 alone. The best, perhaps the only solution for this enormous drain is the manufacture of staple fibre in India. Messrs. Birla Bros. took a step in the right direction when they recently signed a contract for a 15 tons a day staple fibre plant, which will be located in Madhya Bharat. The manufacture of staple fibre must under the circumstances be looked upon as the most urgent problem India has to solve, next in importance only to food.

The war scare leading to stock-piling of essential raw materials has created a serious danger for our nascent rayon industry by creating a shortage of rayon-grade pulp in the world market. Unless, therefore, the rayon industry acts immediately and with foresight towards the manufacture of rayon-grade pulp from indigenous cellulose-bearing raw materials such as, bamboo for example, it is likely to land into the same unenviable predicament, which the rayon weaving industry had to suffer in India during the Second World War on account of the non-availability of rayon yarn. Fortunately for the industry, considerable work has already been done to this end and all that is now needed is to push it through courageously even at some cost. That will save the industry from its dependence on imported pulp, besides saving some exchange for the country.

TABLE I

Imports of art goods into the country.

		1948-49	1949-50	1950-51
Art Yarn	Lbs.	39,970,056	36,939,060	35,274,577
	Rs.	12,82,78,636	10,45,62,067	14,70,87,312
Art Piece-goods	Yds.	4,019,677	14,250,293	1,798,200
	Rs.	1,03,64,527	3,14,77,315	41,66,505
Staple Fibre	Lbs.	52,694	488,697	12,585,993
	Rs.	65,619	648,428	1,89,85,328
Staple Fibre Yarn ..	Lbs.	750,195	2,757,991	1,319,607
	Rs.	19,91,451	77,62,894	32,56,777
Total imports of Rayon and S. F. etc.. ..	Rs.	14,12,76,070	15,48,86,307	17,39,42,728

TABLE II

Name of Company	Formed in	Authorised Capital in lakhs	Issued Capital in lakhs	Process of manufacture	Projected production per day	Plant located in
The Travancore Rayons Ltd.	January 1946	Rs. 200	Rs. 150	Viscose	5 tons Rayon; 1½ tons Transparent Paper	Travancore
The Sirsilk Ltd.	August 1946	500 (O.S.)*	200 (O.S.)*	Acetate	5 tons Rayon	Hyderabad State
The National Rayon Corporation Ltd.	1946 (?)	1,000	350	Viscose	6½ tons Rayon	Bombay State

* 100 Indian Rupees = Approximately 116 O.S. Rupees.

THE RUBBER INDUSTRY

INDIA produces about 16,000 tons of rubber a year which is a little more than one per cent. of the world production of rubber. Broadly speaking there are six major areas in the world where rubber is produced, and if all these areas were placed in the order of their importance as producers of rubber India would come last. The figures quoted below are for 1950:

Countries	Quantity in tons (*One ton* = 2,240 *lbs.*)
Malaya	694,086
Indonesia	687,212
Ceylon	113,500
Indo-China	48,482
India	15,599
Sarawak	55,615*
Total	1,764,494

During the year 1951 India produced 17,148 tons of rubber. The tapable acreage during that year was 148,739 acres and the average yield per acre per annum was 258 lbs.

Area Under Cultivation.—The area under rubber cultivation in the sub-continent before the year 1925 was nearly 68,000 acres. Today the area under cultivation in India stands roughly at 170,506·56 acres. Some twenty years ago, about 90 per cent. of the rubber plantations were owned by Europeans. Today the whole industry is predominantly Indian in character and composition.

Here is a statement showing area under rubber cultivation as on December 31, 1951 according to the years of planting.

	Acres
Planted earlier than 1938 ..	106,542·97
Planted in 1938 ..	1,771·91
,, ,, 1939 ..	4,017·75
,, ,, 1940 ..	3,666·01
,, ,, 1941 ..	2,123·66
,, ,, 1942 ..	5,961·53
,, ,, 1943 ..	14,742·83
,, ,, 1944 ..	11,369·38
,, ,, 1945 ..	9,441·58
,, ,, 1946 ..	4,236·85
,, ,, 1947 ..	2,703·72
,, ,, 1948 ..	1,276·35
,, ,, 1949 ..	1,096·97
,, ,, 1950 ..	1,415·81
,, ,, 1951 ..	824·49
Total ..	171,191·81

Of the whole area under cultivation by far the biggest single part is in Travancore (in Travancore-Cochin) as the following statement showing distribution of acreage under rubber cultivation according to States as on December 31, 1951 makes clear:

	Acres
Travancore	122,548·05
Cochin	13,812·44
Madras State	30,772·86
Assam	50·00
Coorg	3,196·20
Mysore	396·03
Andamans	407·00
West Bengal	9·23
Total ..	171,191·81

Some of the estates are over 100 acres in extent but the overwhelming majority are less than 5, and in between 100 and 5 there are all gradations:

	Acres
257 estates of and above 100 acres	103,117·42
201 estates of and above 50 acres and below 100 acres ..	13,512·52
1,321 estates of and above 10 acres and below 50 acres	25,127·72
9,807 estates of and above 1 acre and below 10 acres ..	28,046·18
2,421 estates below 1 acre ..	1,387·97
14,007 .. .. Total	171,191·81

* Inclusive of other Asian countries.

Total Production.—The most important statistics of all relate to the total amount of the production of rubber in the country. As has already been stated, this is between 16,000 and 17,000 tons a year. The yield per acre is disappointing and compares unfavourably with the average yield in Ceylon or Malay or Indonesia.

While the average yield per year per acre in the country varies from 250 to 290 lbs., the average yield per acre in Ceylon varies from 350 to 400 lbs. In Malaya and Indonesia it is higher still, being as much as twice the Indian yield. The Indian grower ascribes the difference in yield chiefly to difference in soil, climate and the distribution in rainfall, which result in high production cost. According to the Government speaking through the Member for Industries and Commerce (Sept. 4, 1947), however, the low yield can be ascribed to out-of-date methods adopted in growing rubber even after due allowance is made for climatic conditions. Here are the production figures for the country:

Year	Production (Tons)	Tapable acreage	Average yield per acre per annum in pounds
1947	16,449	129,370	285
1948	15,422	118,811	291
1949	15,587	123,791	282
1950	15,599	137,888	253
1951	17,148	148,739	258

The total amount invested by the rubber producing industry in the country is roughly 12 crores. The estimated value of rubber produced in the country during 1950 at the rate of Rs. 85 per 100 lbs. is about 297 lakhs of rupees. All the figures we have cited together testify to the part played by the rubber growing industry in the economy of South India and the importance of ensuring that the industry pays its way.

The Minister for Commerce and Industry announced in Parliament on March 19, 1951 that the Tariff Board had been asked to report on rubber prices and until this was done the price of rubber would be Rs. 122-8-0.

The Rubber Board had considered that matter in 1950 October and passed a resolution unanimously that the price of Indian rubber should be raised from Rs. 90 to Rs. 100. When the situation subsequently changed, the Minister said, he personally went to Madras and discussed the matter with the representatives of the Madras and Travancore Governments and the rubber industry. They came to the unanimous conclusion that as an interim measure the price should be raised to Rs. 122-8 until the recommendations of the Tariff Board were known.

In the course of the debate that followed a member complained that the rubber growers in India were not given an economic price, with the result that out of 44 companies which produced rubber the shares of only 11 were being quoted on the market.

Tyre prices had been consistently raised with the support of Government and today tyre prices in the country were more than 60 per cent. above the prices in the United Kingdom, where the same firm of Dunlops manufactured tyres with rubber bought at four shillings, eight and a half pence (over three rupees) a pound in Malaya as against 13½ annas in India.

Mr. Mahatab, in the course of his reply said that only prices of cycle tubes and tyres were under control. Rubber manufacturers had increased prices by 18 per cent., three per cent. for excise duty and 15 per cent. for the increased price of raw rubber.

The manufacturers, he said, wanted an increase in prices on three grounds (1) increased cost of manufacture, (2) proposed increased prices for indigenous raw rubber and (3) increased price of foreign raw rubber.

Present Position.—Till about the middle of 1934 there was practically very little consumption of indigenous rubber in the sub-continent. Even as late as 1939, out of a total of 16,500 tons produced only about 5,600 tons were accounted for by internal consumption. About two-thirds of the rubber produced was thus available for export, a fact which necessitated Indian participation in the international agreement on the export of rubber. As has already been stated, in 1939 internal consumption rose to 5,600 tons. From then on it continued to increase steadily till in 1941 it reached the figure of 14,297. During the war the demand for rubber soared higher still partly because of the greater requirement of the Allies and partly because supplies from the chief rubber producing countries, like Malay, Java and Burma were not available.

The present position of the rubber growing industry is different from its position either before the war or during the war. There is a big internal market, for a great rubber manufacturing industry (*i.e.*, using rubber as its raw material) which has grown up. It consumes more rubber than the growers can produce so that some three to four thousand tons have actually to be imported to meet its total requirements. And when rubber-manufacturing enterprises, now in the process of formation, start operating the industry will need larger imports still or a much larger production than exists today. The present world price of rubber is three times the Indian controlled price. So unless the production is proportionately increased the rubber manufacturing enterprises will be very much handicapped. The danger from foreign competition is eliminated by the difference in price. As the market for raw rubber has appreciably expanded, it will be an impetus for the Indian growers to produce more.

Indian Rubber Board.—The old undivided Government of India appointed an *ad hoc* committee presided over by Sir Frederick James in 1945 to consider the danger from foreign competition and the difficulty which the Indian grower was likely to face due to the lesser world price of rubber that prevailed at the time. The report of this Committee was considered at a Conference of representatives of planters, manufacturers, dealers and of the various Governments held at Coimbatore in June 1946. The recommendations of that Conference were generally accepted by the old undivided Central Government and the Governments of Travancore and Cochin, and legislation to implement these recommendations were also brought into force by these Governments.

Finally a body under Central control, called the Indian Rubber Board was constituted with headquarters at Kottayam by an Act of the Central Legislature in 1947.

The objects of the Board were to develop the rubber industry, to see to the marketing of rubber, to regularize import and export and generally to look after the interests of the industry.

Two of the questions with which the Board deals are what prices should be maintained for Indian rubber in the interests of both the producing and consuming sections of the rubber industry and second what level of imports should be permitted.

SERICULTURE

SERICULTURE is carried on mainly as subsidiary to Agriculture. There are about 51,000 rearing families engaged in rearing silk worms in the Mysore State at present. They are also agriculturists by profession.

The total area under mulberry is about 80,000 acres at present. Mulberry is cultivated both as rain-fed and irrigated crop. The yield of leaf per acre per year from rain-fed garden is about 4,000 lbs. Average yield from tank irrigated gardens per acre per year is about 8,000 lbs. whereas in the case of shallow well irrigated and deep well irrigated gardens it is 10,000 lbs.

The total production of cocoons per year is about 240 lakh lbs. and the raw silk produced may be put at 15 lakh lbs. Based on the area under mulberry, the total requirement of disease-free layings in the State is estimated to be about 600 lakhs of layings per annum.

After the Government Organisation was set up the Central Farm at Channapatna began to produce small quantities of disease-free layings on 'Pasteur System' and to educate ryots to use the same. To supplement the work of the grainages which produce only disease free seed by a controlled campaign of seed cocoon production, there are now 4,000 selected seed cocoon rearers to produce Mysore seed cocoons, capable of producing about 4,000 lakhs of seed cocoons, *i.e.*, the entire requirements of the industry for seed cocoons in Mysore and Madras. About 96 per cent of the cocoons produced in the State are used for reeling and only 4 per cent for seed purposes.

Sericultural education in Mysore is given in a practical manner in the Government Silk Farms, such as Channapatna, Mysore, Kolar, Mugur and Sidlaghatta.

The total area under mulberry in the Madras State as it stood on June 30, 1949 is 21,453 acres. In black cotton soils, the annual yield of mulberry leaf is about 4,000 lbs. per acre and in read loam or sandy soils, the yield is about 3,500 lbs. Under the present organisation and with the existing acreage under mulberry cultivation, the productive capacity of reeling cocoons and silk will be 45 lakh lbs. of cocoons and about 3 lakh lbs. of raw silk of both filature and charka grades

The sericultural industry was started in Uttar Pradesh in September 1948. The silkworm races reared are univoltine and multivoltine, Bengal, Mysore and Kashmir races of mulberry and also Eri silkworms. About 2 dozen families have taken it up. The industry is practised as subsidiary to agriculture. The estimated annual production of Eri is 3 mds. dry weight and that of mulberry 2 mds. 2 srs. dry weight. Reeling on a limited scale has been started at the Government Sericultural Station, P.O. Doiwala for demonstration purposes. As the industry has recently been started the department of industries provides rearers with rearing appliances on a returnable basis. The cocoons are purchased by the Government farm till they instal their own reeling equipment.

In Bombay roughly 700 acres are under silkworm food. The estimated annual production of cocoons is 30,000 to 40,000 lbs. The estimated annual production of raw silk is 1,500 to 2,000 lbs. There are 11,339 looms in weaving pure silk goods only, and 25,498 looms for mixture weaving and artificial silk mixed goods.

Bengal's silk industry is said to have been carried on from time immemorial. The production of raw silk in 1947-48 was about 4 lakh lbs. The Bengal Government has limited its function to the supply of seeds to the rearers. The area under mulberry is 15,000 acres. The estimated actual annual production of cocoons and raw silk are: cocoons (6,735,543 lbs.) and raw silk (407,644 lbs.).

About 1,425 persons spread over in about 435 villages conduct rearing and reeling operations in the Punjab. The silk industry in the Punjab has come to be considered as one of the best subsidiary industries. It gives a part time occupation to about 95 per cent of rearers. The remaining 5 per cent take up reeling on commercial lines. There are about 75,000 mulberry trees available in the Punjab for the purpose of silkworm rearing. Apart from this, the Department maintains its own mulberry farms and nurseries and the total area of land under these plantations at present is about 75 acres.

The estimated total annual production of cocoons and raw silk is 650 mds. and 130 mds. respectively. The entire cocoon crop harvested in the Punjab is ultimately reeled off except 50 mds. of green cocoons which are purchased by the Department for seed production. Approximately 30 per cent of the rearers reel their cocoons themselves and the remaining sell away their crop to the Government Silk Factory and to other private silk merchants maintaining charka organisations.

BIHAR & KASHMIR

In Bihar about 50,000 people are engaged in tassar silkworm rearing, about 200 people in rearing mulberry silkworm and about 2,000 people in rearing Eri silk worm. The estimated total annual production is nearly 50,000 Kahan of tassar cocoon, one lakh lbs. of raw reeled tassar and 60,000 lbs. of tassar waste per annum. Forty-five thousand lbs. of cocoon mulberry and 3,000 lbs. of raw charka reeled silk are produced. Besides 60,000 lbs. of pierced cocoon and 21,000 lbs. of handspun Eri yarn, are produced all over the State.

Bihar has got a very old silk weaving industry and Bhagalpore is the centre of silk weaving. There are about 10,000 handlooms working on silk, art silk and mixed varieties, besides 225 powerlooms mostly worked on silk. About 20 per cent of the local silk and the rest foreign silk are used by the weavers.

The total annual production of reeled silk and waste silk in Madhya Pradesh is estimated to be 160,000 lbs. and 150,000 lbs. respectively. There are two Government seed supply stations. There are about 1,500 handlooms, weaving tassar and mixed fabrics.

Silkworm rearing is practised by the rearers in Kashmir as an auxiliary occupation next to agriculture. Regular labour as well as permanent staff are entirely dependent on this industry and it is their main occupation.

The silk industry in Kashmir depends only on full-grown mulberry trees. The production of cocoons and raw silk in 1950-51 was estimated as follows: cocoons (31,500 mds.), superior silk (162,500 lbs.).

The silkworms are reared both from locally manufactured and imported seed. Silkworm rearers, in this State, are under contract to sell all their cocoons to the Sericulture Department against cash payment. The cocoons are graded before reeling. It may be added here that the silk industry in Kashmir is being run on Government monopoly basis and no rearer can reel the cocoons raised from the silkworm allotted to him. Silk is sold mostly direct to consumers and not through middlemen.

A weaving factory of 125 powerlooms controlled by the Government is run on modern lines with modern machinery. Besides, there are about 400 local factories, one powerloom factory of 22 looms and about 4,000 handlooms owned by some 350 factories.

The race of silkworm reared in Jammu is univoltine. Raw silk is produced only in the Government Factory at Jammu, the production in 1948-49 being 11,067 mds.

TARIFF BOARD RECOMMENDATION

Early in 1952 the Tariff Board submitted its report on the Sericulture Industry to the Government of India. The following are the more important recommendations of the Tariff Board :—

(*i*) An *ad valorem* duty of 30 per cent and a specific duty of Rs. 3-14-0 per lb. should be levied on raw silk, tariff item 46; (*ii*) The existing duty of 30 per cent *ad valorem* on silk waste and noils, tariff item 46(1), should be continued; (*iii*) The same rate of duty should be levied on silk yarn including thrown silk warps but excluding sewing thread, tariff item 47 (a), as on raw silk, namely, 30 per cent *ad valorem* plus a specific duty of Rs. 3-14-0 per lb.; (*iv*) An *ad valorem* duty of 30 per cent and a specific duty of Rs. 5 per lb. should be levied on yarn spun from silk waste, excluding sewing thread, tariff item 47 (b); (*v*) The existing duty of 30 per cent *ad valorem* should be continued on yarn spun from noils, excluding sewing thread, tariff item 47 (c); (*vi*) The existing duty of 30 per cent *ad valorem* should be continued on silk sewing thread, tariff item 47 (1); (*vii*) An *ad valorem* duty of 35 per cent should be levied on pongee, tariff item 48 (a); (*viii*) An *ad valorem* duty of 40 per cent should be levied on fuji, boseki and corded (excluding white cord), tariff item 48 (b); (*ix*) An *ad valorem* duty of 35 per cent, should be levied on other silk fabrics covered by tariff item 48 (c); (*x*) The industry should continue to be protected upto December 31, 1952 for the present; (*xi*) Imports of silkworm seeds should be allowed free of duty; (*xii*) The quantum of imports, if import prices fall, should be so adjusted as to meet the gap between estimated demand and domestic production; (*xiii*) While the Board's estimate of the fair selling price of raw silk should remain valid during the extended period of protection, the position regarding the *c.i.f.* prices of imported silk should be reviewed by the end of June, 1952.

The Government of India has accepted recommendations No. (*i*) to (*vi*), (*x*), (*xi*) and (*xiii*). As regards the Board's recommendations No. (*vii*) to (*ix*), Government have come to the decision that the existing duties should continue for the present.

THE SHIPPING INDUSTRY

THE decline in Indian shipping and ship-building started early in the nineteenth century following the introduction of steam as motive power and steel as body and continued right down to 1920 as the result of the policy of the Government of India in supporting British shipping. Under the guidance of Mr. James Mackay, who was later known as Lord Inchcape, the British India Steam Navigation Company became a powerful organisation. Its resources were wide enough to launch a rate war against any new entrant with the result that the company eliminated all its rivals and obtained a virtual monopoly of carrying India's trade with the rest of the world. Later Lord Inchcape succeeded in taking control of Australian shipping companies, but he achieved the greatest success of his career in 1916 when the British India and the P. & O. Steam Navigation Co., Ltd. were amalgamated. This amalgamation brought under his control a fleet of over two million tons of shipping. So far as Indian shipping was concerned, the British shipping had already thwarted the early efforts of Mr. J. N. Tata to charter steamers for carrying Indian yarn to China and wiped out the Bengal Steam Navigation Co. in 1910.

It was in 1920 that British shipping was confronted with the prospect of real competition from Indian shipping. Soon after the end of the Great War, the Scindia Steam Navigation Company was floated. The promoters soon learnt that a single ship would not suffice to make the company self-supporting and bought and berthed steamers in Rangoon. This started a deadly rate war which was followed by an offer of the British India to buy Scindia Steam. The heavy losses sustained from cut throat competition during the first four years resulted in wiping off a portion of the Scindia capital. Finding that this did not deter the company from carrying on its activities, a ten-year agreement was made in 1924 whereby the Scindia Company was allowed to carry 75,000 tons of cargo. Although the story on the west coast of India was less tragic, four small Indian companies suffered from the British India's offensive in the 'thirties and some of these concerns were brought under the wings of the Scindia. In the following nine years, the company also acquired control over Indian companies plying on the Konkan Coast.

During the Second World War, most of the Indian ships were requisitioned by the Government of India and several of them were lost following enemy action. With their fleet depleted and a steep rise in replacement costs, Indian companies entered the post-war period. It was estimated that there were, at the end of the War, eleven Indian companies having 63 steamers with a gross tonnage of 131,748. Of these, Scindia controlled six and accounted for 91 per cent. of the tonnage. In the following years an additional fleet was acquired by Indian companies three of whom extended their services to London, New York and other foreign ports. Yet India occupies practically the last place in any list of world companies.

GOVERNMENT POLICY

The first tangible measure taken by the Government of India in response to several resolutions moved in the Central Legislature was to appoint an Indian Mercantile Marine Inquiry Committee in 1923. The main recommendations of the Committee were :—

(1) Reservation of coastal trade for Indian shipping by a system of licences. (2) Purchase by Government of one of the existing British lines operating on the coast with a view to its eventual transfer to an approved Indian concern. (3) Consideration of the question of bounties to purely Indian shipping companies. (4) Mail contracts in which the whole subsidy is paid by India should include a stipulation to take Indian apprentices on the scale recommended for the licensing system.

No action was taken on these recommendations except that the training ship "Dufferin" was assigned and reconditioned for the purpose of training deck officers. In 1935, facilities were provided on the ship for training marine engineers. In 1930 the Viceroy convened a conference of shipping interests and a temporary solution was sought by an agreement between Scindia and British India. This agreement was revised in 1934 on the following basis: (1) Division of the cargo between the three companies in the coastal trade of India, Burma and Ceylon. (2) Permission to Scindia to carry passengers on the Rangoon-Coromandel coast and the Rangoon-Chittagong runs. (3) The total gross tonnage of Scindia to be raised to 100,000 gr. tons. (4) Joint fixation of rates and provision for arbitration in the event of a dispute. (5) Scindia's undertaking not to compete with the P. & O. and the British India in overseas trade.

After the end of the Second World War, the Planning Department of the Government of India appointed a Policy Committee on Shipping. It observed: "For a country of its size, the length of its coastline and its strategic position sthwart one of the world's main sea routes, India possesses a distressingly small number of deep sea ships which at the outbreak of the war stood at no more than 30 with a total of less than 150,000 tons gross. The vulnerability of India's position has been revealed by the stress of wartime conditions, but by no circumstances more glaringly than by her inability to find adequate shipping from her own resources to provide for the transport of the food supplies required by her. The rectification of this state of affairs should be one of the immediate post-war objectives." It recommended that the acquisition of an adequate share in world's carrying trade should be the aim of India's post-war shipping policy and recommended measure to achieve this objective.

This was followed by the constitution of a Reconstruction Policy Sub-Committee, with Sir C. P. Ramaswami Aiyar as Chairman, in 1945. This Sub-Committee submitted its report in March 1947 which was approved by the Policy Committee. Its principal recommendations were :—

(1) India needs two million tons gross tons of shipping to carry more than 10 million tons of cargo and about three million passengers a year. The figure does not include country craft.

(2) Hundred per cent. of the purely coastal trade of India, 75 per cent. of India's trade with Burma and Ceylon and with geographically adjacent countries, 50 per cent. of India's distant trades and 30 per cent. of the trades formerly carried in Axis vessels in the Orient should be secured for Indian shipping in the next five to seven years.

(3) As the Indian shipping industry is still very young, emphasis should now be placed on how Indian companies can expand their fleets and the Indian Shipping Board should be empowered to control deferred rebates, rate-cutting and all other evils arising from monopolies.

The Government of India, by their Resolution dated July 12, 1947, fully endorsed the view of the Committee that India, like other important maritime countries, must adopt a dynamic policy with regard to Indian shipping. It agreed that the definition of "Indian Shipping" should be shipping owned, controlled and managed by Indian nationals. They also laid down that the following conditions should qualify any shipping company for treatment as "Indian shipping companies" :—

(*a*) The steamers of the companies should be registered at a port or ports in British India. (*b*) At least 75 per cent. of the shares and debentures of the companies should be held by Indians in their own rights. (*c*) All the directors should be Indian. (*d*) The managing agents, if any, should be Indian.

Government further announced that it was their intention to assist Indian shipping as far as possible in securing the shares recommended by the Sub-Committee.

The Resolution of the Government of India was followed by a conference of shipping interests in Bombay on November 3, 1947 when the Commerce Minister explained the plans of the Government of India for setting up three shipping corporations with an authorised capital of Rs. 10 crores each to operate on three distinct routes, namely, (1) India/Persian Gulf, India/Red Sea and Egyptian Ports, India/China and Japan, and India/Australia, (2) India/America and India/Malaya and the Straits, and (3) India/East and South Africa and India/U.K.

RECENT DEVELOPMENTS

The additions to Indian tonnage in 1951 consisted of 14 ships of an aggregate G. R. T. of about 38,000, including, in addition to three ships built at Visakhapatnam, one large ship built in the U.K., one purchased second-hand, two new Diesel ships built in Japan and seven small ships purchased second-hand. On the other hand, three ships of an aggregate G. R. T. of 14,000 were sold and one ship of 1,000 tons gross was lost, leaving a net increase of 24,000 tons gross. The total Indian tonnage of ships of over 150 G. R. T. at the end of 1951 was 417,225 as against 393,824 at the end of the previous year.

The system of licensing and control introduced in the coastal trade, in accordance with the provisions of the Control of Shipping Act of 1947, continued in force.

Since the announcement by the Government of India in August 1950 of its decision to implement the policy of coastal reservation, Indian shipping has made steady progress in this trade. The total net tonnage available to Indian companies for employment on the coast and the near trades was 210,000 tons as against 205,000 in the previous year, but most of the chartered tonnage had to be given up owing to an excessive increase in the charter rates. Owing to world factors, a substantial proportion of the British tonnage was also withdrawn. As a result, efforts were made to secure the best possible utilisation of the available tonnage and all essential movements were catered for. Indian companies were consequently able to secure fuller cargoes for their ships in the trade and were also able to increase their share. In terms of cargo liftings, the share of Indian companies amounted to 94 per cent. in the trade as against approximately 80 per cent. in the previous year and 62 per cent. at the end of 1949.

An event of great importance in the history of Indian shipping was the agreement concluded with the British shipping interests regarding coastal trade. As a result, a new Indian Coastal Conference, consisting primarily of Indian shipping companies, has commenced functioning, with effect from January 1, 1951, in the place of the old Tripartite Shipping Conference which was composed of only the British India Steam Navigation Company, the Asiatic Steam Navigation Company and the Scindia Steam Navigation Company. The two British shipping companies are now associated members of this new Coastal Conference with restricted rights. There are at present 13 Indian concerns engaged in the coastal trade.

Since 1948 Indian shipping companies have been participating in the overseas trade. Both Scindia and Indian Steamship are now full members of the India/U.K./Continent Conference and have received an increased share in the trade. They are now entitled to operate 12 ships each, whether owned or chartered, as against 8 in 1948 and the position will be reviewed at the end of 1954. Although there was no addition to the Indain tonnage employed in the overseas trades during 1951, the Indian companies were able to consolidate their position

THE STEEL INDUSTRY

SOME of the major facts about the industry can be stated at once. The total output capacity of the steel industry is about 1·46 million tons of finished steel. Actual production of finished steel in 1951 was about 1·07 million tons. Approximate imports and exports of iron and steel materials and their values during the year 1951 were as follows :—

Imports	
Tonnage	Value Rs.
2,08,646	20·11 crores
Exports	
92,757	1·84 crores

The number of employees in the Tata Iron and Steel Co., at Jamshedpur is about 41,090.

The art of smelting and shaping iron has been known and practised in the country from very early times and a regular trade in iron with foreign countries is known to have been in existence. The famous iron pillar at Delhi, which is estimated to have been erected some 2,000 years ago, bears adequate testimony to the skill and craftsmanship of the early Indian workers. The country also supplied steel from which the famous Damascus or the Wootze sword or dagger blades used to be made.

The aborigines of Central India and other neighbouring districts have also been known to smelt ore into iron in small mud furnaces with the aid of wooden bellows for the supply of the necessary blast to produce the metal. This primitive method of smelting iron, however, almost died out with the gradual industrialisation of the country although even during recent years the aborigines round about the steel town of Jamshedpur have been found smelting iron ore in this way. After the abortive efforts of Mottee and Farquhar in 1779 which were the first recorded attempts made in the country to manufacture iron and steel on a commercial basis, one Mr. Josiah Heath, a retired Madras Civil Servant, attempted to establish a Works at Porto Novo with the monetary assistance given by the East India Company but unfortunately with his death and owing to a number of other difficulties that project also met with complete failure.

The next commercial enterprise was the Barakar Iron Foundry at Kulti which ultimately passed into the hands of the Barakar Iron & Steel Co. in 1887. Two years later, this plant was modernised and became known as the Bengal Iron Co. They were the first to produce pig iron in the country on modern lines.

TATA IRON AND STEEL

The first successful and the most outstanding attempt to manufacture steel in the country on a commercial basis was, however, that of the Tata Iron & Steel Co. and credit is due to the indefatigable perseverance and foresight of Jamsetji Tata for his pioneer efforts for the establishment of a steel industry in India. Jamsetji Tata's sons and their Indian associates with the valuable assistance of American technical experts succeeded in establishing the Tata Iron & Steel Co. which started its Steel Works at Sakchi in the year 1908. Pig iron was made in 1911 and the first steel ingot a year later. Several additions to the plant have since been made from time to time and this Company has now the capacity to produce over 850,000 tons of finished steel per annum. What was before a small village of Sakchi has thus today grown into the foremost industrial city of India, and has been renamed Jamshedpur in memory of the founder of the Company. The present block capital invested by the Company in its works is about Rs. 42·67 crores.

INDIAN IRON AND STEEL CO. & SCOB

The Indian Iron & Steel Company was started in 1918 at Hirapur about 4 miles from Asansol junction on the East Indian Railway. It has now two plants, one at Hirapur and the other at Kulti. The Hirapur plant has two modern blast furnaces equipped with coke ovens, turbo blowers, pig casting machines, ore handling plant and the necessary locomotives for internal transport. The coke oven plant comprises up-to-date coal handling equipment and three batteries of coke ovens designed and erected by Simon Carves. The latest of these comprising 72 ovens, came into operation in March 1950, whilst the older ones are each of 40 ovens. The daily output of coke is a little over 2,000 tons. At present tar, ammonium sulphate, crude benzol and coke oven gas are the only bye-products recovered. The surplus gas is utilised in the SCOB works.

Both furnaces have been remodelled from time to time and are each rated at 750 tons daily output.

The Kulti plant has two blast furnaces both old and out of date, having a combined annual capacity of approximately 250,000 tons of pig iron. Kulti has its own coke oven plant consisting of 4 batteries of coke ovens. The annual capacity of these batteries is appoximately 200,000 tons of coke. These batteries are also equipped with bye-products plant to recover gas, coal-tar, ammonia and crude benzol.

The importance of the Kulti plant is on account of its iron foundry which is the largest in the East. The foundry consists of five separate sections each laid out for producing a particular type of casting (general casting, railway sleepers, pipes, sanitary fittings, pressure pipes, etc.).

A mechanised non-ferrous foundry has recently been added to the works and is being equipped with all necessary pattern making, core making, machining and finishing facilities. The total annual output from all foundries at Kulti is approximately 70,000 tons, including the output of the non-ferrous foundry.

The Machine Shop at Kulti is one of the most up-to-date and well equipped shops with the most modern machine tools and accessories. Kulti also generates its own power and its increased requirements are being supplemented from Hirapur on the Company's own transmission line.

The Steel Corporation of Bengal is equipped with Open Hearth Furnace Plant, 2 Bessemer Converters, a 40" Blooming Mill, 34" and 18" Rolling Mills, Sheet Mills and Galvanising Plant. Products rolled include rails, structurals, bars, sheets and billets. The present annual capacity of SCOB is about 250,000 tons of finished and semi-finished steel, but it has a planned potential capacity for development to about one million tons a year.

	1949	1950	1951
Ingot ..	.. 285,155	268,980	354,602
Saleable Steel	.. 224,328	203,397	263,231

About 8 million tons of pig iron produced by this Company were exported after satisfying the local demand to Japan, America, Great Britain and some parts of the Continent of Europe until the outbreak of the war. During the war also considerable quantities were exported to the U.K. In 1936 the Company absorbed the Bengal Iron Co. Ltd. which operated in Kulti at a distance of about 7 miles from Hirapur. In addition to a blast furnace and coke oven plant for the production of about 275,000 tons of pig iron, the Bengal Iron Co. had an old established foundry for the production of pipes and different kinds of castings. After its acquisition by the Indian Iron & Steel Company the foundries were reorganised and a plant for the spinning by centrifugal process of pipes was erected. This is the only plant of its kind in this part of the world. After the amalgamation of the two Companies the Steel Corporation of Bengal Ltd. was constituted in association with the Indian Iron & Steel Company in 1937. Under agreement between the two Companies the Indian Iron & Steel Company supplies all the requisite pig iron (hot metal), power, gas, water, etc. to the Steel Corporation of Bengal. The capacity of the Steel Corporation of Bengal is about 250,000 tons of finished and semi-finished steel including rails, structurals, sheets—both black and galvanised and billets. The first ingot was cast at the Corporation's Works on 11th November 1939 in the record time of only about two years and seven months after the constitution of the Company; five days later the first ingot was rolled on its 40" blooming mill. During the war some extensions were undertaken of which the principal one was the Duplex Plant. Owing to the difficulty in obtaining plant and machinery during the war the plant came into operation only in 1947. In spite of the difficulties experienced by the Company owing to the war in respect of obtaining the necessary supervisory staff and the training of Indian labour, it was able to supply for war purposes about a million tons of steel. The authorized capital invested by the Indian Iron & Steel Company in its two Works at Hirapur and Kulti is 7·5 crores, and that invested by the Steel Corporation of Bengal is 10 crores.

In close proximity to the works of Indian Iron and the Steel Corporation and under the managing agency also of Messrs. Martin Burn Ltd. are the works of the Indian Standard Wagon Company Ltd. for the construction of wagons and other railway rolling stock. This Company also receives from the other two Companies some of its raw materials, power, gas, water, etc.

MYSORE IRON WORKS

An iron works was started at Bhadravati in Mysore State in 1921 to which a steel plant was added in 1934. During World War II, a 25-ton basic furnace together with two small electric furnaces were installed. Their present annual production capacity for finished steel is about 25,000 tons. During the War, they made a valuable contribution to the steel industry by manufacturing ferro-silicon in their electric furnaces and thus averted a crisis in the steel production as during the war the import of foreign ferro-silicon was scarce, and but for the ferro-silicon made in Mysore, the production of good quality steel would have been impracticable. The ferro-silicon plant in Mysore is producing annually about 1,600 tons of ferro-silicon. Arrangements were made to increase the production to 6,000 to 8,000 tons per year by the beginning of 1950, and the new ferro-silicon plant of this capacity is now in operation. The production will be sufficient for the requirements of ferro-silicon of the entire steel industry in India. A rod and strip mill for the manufacture of wire rods and baling hoops which was installed during the war is also in operation. An electric pig iron furnace has been ordered by the Mysore State. This furnace will supplement the production of charcoal pig iron and when it comes into operation early in 1952 the finished steel capacity of the Mysore Works will be raised to 100,000 tons per year. A Bessemer Electric Duplex Steel Plant and a Billet and Light Structural Mill are proposed to be added to reach this capacity of finished steel. Action is also being taken to install a Wire and Wire Products and a Seamless Tube Mill.

During the War the Mysore Iron and Steel Works also developed a steel foundry for making steel castings required by the Railways and the various industrial concerns in the country, such as cement plants, oil mills, etc. It has a capacity of about 250 tons of steel castings, per annum, which is being gradually increased to a capacity of about 500 tons per annum.

There is a development programme on hand which proposes to install within the next two to five years a small tool and alloy steel plant of about 1,000 tons initial capacity per annum; and a stainless steel and silicon steel sheet plant to make about 5,000 to 10,000 tons of these products per annum. Trial manufacture of ferro-manganese has been started and it is proposed to manufacture other ferro-alloys also like

in these trades and to secure fuller employment for their ships. The freight earnings of the Indian concerns from the overseas trade totalled about Rs. 7¼ crores in 1950-51 against Rs. 5.77 crores in 1949-50. The India Steamship Co. secured admission to certain Conferences engaged in the India Continent trade.

The first Government-sponsored shipping corporation, known as the Eastern Shipping Corporation, Ltd., managed by Scindia was registered on March 24, 1950 with an authorised capital of Rs. 10 crores and an issued capital of Rs. two crores, 74 per cent. of this amount being contributed by the Government of India and the balance by the managing agents. The corporation is at present operating with two owned cargo ships in the India/Australia trade and with one chartered cargo-cum-passenger vessel in the India/Malaya trade.

The corporation is actively considering the possibility of increasing its own tonnage and a decision in principle has been taken to have two fast cargo ships built at the Visakhapatnam shipyard. For this purpose, it is proposed to increase the subscribed capital to Rs. 4 crores by the issue of an additional Rs. one crore early in 1952 and another crore next year.

Freight Market.—The year 1951 demonstrated the keen susceptibility of freight rates to the shifts in the movement of materials caused by the unexpected economic and political developments. Under the stimulus of the Korean war and the U. S. stockpile, the freight market ruled strong and the buoyancy was carried a stage further, despite the release of tonnage from the U. S. Reserve Fleet, by the European demand for coal and the eastern demand for food. There were over 350 charter fixtures to and from Indian ports. A notable development towards the end of the year was the revival of Japanese competition.

The U. K. Chamber of Shipping index advanced from the 1950 end level of 115.7 to 151.9 for January 1951 and touched the peak at 203.8 in May. Following the release from the U. S. mothball fleet, freight rates eased sharply with the index touching the bottom at 149.3 in August. With the resumption of brisk trade movement, however, the rates again assumed an upward trend and the index shot up to 190.4 in October and thereafter tended downward in sympathy with the world-wide plans for curtailing imports. The average index of tramp shipping freights with 1948 as base moved on only moderately from 82.3 in 9149 to 84 in the following year but more than doubled to 173.7 in 1951.

Trading Schemes.—The Training Ship "Dufferin" and the Nautical and Engineering College continued to train officers for the Merchant Navy. Steps were taken in 1951 to increase the equipment of the College. The construction of the new Marine Engineering College at Calcutta is in progress.

The Training Ship T. S. "Andrew" renamed T. S. "Bhadra" continued to be stationed in Calcutta and the T. S. "Lady Fraser" renamed T. S. "Mekhala" commenced functioning as a training ship for ratings at Visakhapatnam in February 1951. During the year under review, 620 boys received training as ratings and the intake of both the ships has been recently raised to a total of 80 per month. It is proposed to provide additional shore facilities near the training ships and it is hoped that this would enable the intake to be increased further.

Planning.—The draft outline of the five-year plan stresses the urgent need for increasing the Indian-owned tonnage by the grant of loans by Government to Indian shipping companies. The Commission has suggested a provision of Rs. 14.94 crores composed of Rs. 4 crores for coastal ships, Rs. 6¼ crores for overseas ships and Rs. 4.44 crores for the Eastern Shipping Corporation. During 1951-52 a budget provision of Rs. one crore was made for loans for purchase of ships and a total provision of Rs. 3 crores has been proposed in the 1952-53 budget for the same purpose. Loans to the tune of Rs. 75 lakhs have already been sanctioned to two Indian shipping companies for buying two second-hand cargo vessels for the coastal trade and it has also been agreed to advance a loan of Rs. one crore to another Indian shipping company during the next financial year to construct a ship for its overseas trade. About two-third of the capital is thus provided by Government and is repayable in six annual instalments with four per cent. interest.

The first lot of three ships built on Government account in the Visakhapatnam Shipyard were completed during the year. Two of these were sold to the Scindia Steam at the equated U. K. parity price and the third one is proposed to be sold to an Indian company on the basis of competitive tenders.

Sailing Vessels.—Following the report of the Sailing Vessels Committee in 1949 the Government of India decided in January 1952 its decision to set up an organisation to deal with the problems of sailing vessels. Owners will be encouraged to organise themselves on an all-India basis and to evolve a uniform system of trade practices. Government has decided to reserve coastal traffic under sail for Vessels of Indian registry.

SHIP-BUILDING

The history of India's ship-building Industry is a story of past glory dating from 1500 B.C. Even under the Marathas, the progress of Indian ship-building industry continued unabated. With the beginning of the steel age, the indigenous industry fell on evil days and by 1858 the country ceased to have a great shipping and ship-building industry.

The credit for building the first modern ship-building yard goes to the Scindia Steam Navigation Co., Ltd. This was founded at Visakhapatnam in 1941 and its progress continued unabated till 1942 when the threat of enemy action necessitated the stoppage of construction. Construction was resumed in 1943 and the company completed two berths in 1947 with a building capacity of 8,000 to 10,000 tonners. The first steamer built in this yard was launched on March 14, 1948 by Pandit Nehru.

In 1948, however, it was apparent to the company that the building costs in India were so high that the yard could not be used without the help of Government. A claim for construction differential subsidy in respect of ships built at this yard was submitted to Government by the company. Later, the company even suggested to Government that they should buy the yard. Owing to financial stringency, Government could not do this; but meantime, they have placed orders for steamers on a cost-cum-no-profit basis.

The Government of India entrusted the question of developing the industry for inquiry to a French Mission in 1949. The report of the Mission says: "It should be possible to obtain indigenously certain light equipment for the industry. In regard to the heavy propelling machinery and steel forgings, we consider that efforts should be made to establish such an industry in India". After examining the various sites for ship-building yards, it concludes: "It is evident that the site at Visakhapatnam is the best in India under existing conditions." It has also made several recommendations for developing the yard at Visakhapatnam. The yard, with its present capacity, can have in hand five ships simultaneously under construction; but it can be an economic unit only with five or six ship-ways. For this about Rs. 2 crores are required.

On January 21, 1952 "Hindusthan Shipyard Ltd." was registered to take over this yard. The Government of India holds a two-thirds interest in the Company and Scindias one-third. The valuation of the shipyard has been provisionally agreed at Rs. 270 lakhs which will be paid by the issue of fully paid shares of the new company for Rs. 103 lakhs and the balance in five equal annual instalments. The aggregate initial capital of the company will be Rs. 309.9 lakhs.

INLAND WATER TRANSPORT AND PORTS

Before the railways were built inland water transport was the only highly developed mode of transport. Even today there are parts where river or canal navigation is still active. As against 45,000 miles of rail-road tracks, the total length of waterways in undivided India was about 25,000 miles comprising 10,000 miles of rivers and 15,000 miles of canals.

Apart from the major ports of Bombay, Calcutta, Madras, Cochin, Tuticorin, the Saurashtra ports and Mormugao, practically all the other ports are open roadsteads without much modern equipment for loading or unloading. The Port Development Committee appointed in 1945 emphasised the importance of improving, extending and modernising the general facilities at the existing major ports to cope with all foreseeable traffic demands. The report of the Ports (Technical) Committee recommended major works at Visakhapatnam, Madras, Bhatkal and Sika. Though the Port Development Committee estimated the capacity of major ports at about 25 million tons as adequate, it observed that "on the grounds of defence and strategic requirements of the country and the industrial and agricultural and economic development, a deep sea port on the East Coast is a great necessity." Accordingly, the task of developing Visakhapatnam as a sheltered deep sea port has been accepted.

Port Working.—In the field of port administration the outstanding developments during 1951 were the passing of the Port Trusts and Ports (Amendment) Act and the completion of the arrangements for the commencement of the main harbour works for the development of a new major port at Kandla. The foundation stone of this port was laid by the Prime Minister on January 10, 1952. The object underlying the enactment of the Port Trusts Act was to achieve uniformity in port administration and to bring about a greater measure of central control and supervision in matters of policy and to effect a considerable degree of decentralisation of authority in matters of day to day administration in the major ports of Calcutta, Bombay and Madras. The Act was brought into force on July 16, 1951.

The working of the Calcutta Port in 1950-51 resulted in a deficit of Rs. 52 lakhs. The year 1951-52 is expected to close with a deficit of Rs. 50 lakhs. The total tonnage passed through the Port during 1950-51 was imports 3,040,572 tons and exports 4,460,927 tons, while the corresponding figures for the following nine months are 2,413,883 tons and 4,382,326 tons. The number of vessels that entered the Port in 1950-51 was 1,177 while those for the subsequent nine months were about 1,000.

During the year complaints were made by shipping companies and the trade about the deterioration in the draft of the river Hooghly within port limits. This is partly due to the accumulation of dredging neglected during the war. This factor, combined with the age of the dredgers and the consequent increased time taken for their overhaul caused a progressive deterioration in the draft in the river. Two new dredgers have been put into commission as a result of which there was a distinct improvement in 1951.

The working of the Bombay Port in 1950-51 was expected to result in a surplus of Rs. 2,400 on the general account; but the actuals are likely to show a more substantial surplus. The 1951-52 budget had estimated the surplus at Rs. 91.4 lakhs; but that figure is also likely to be surpassed. The total tonnage passed through the Port in 1950-51 was: imports 5,185,235 and exports 1,701,889 as against 3,354,845 and 975,872 tons in the following seven months. The total number of vessels which visited the Port during 1950-51 was 2,866 and those up to the end of October 1951 were 1,403.

The Madras Port showed a surplus of Rs. 44.79 lakhs in 1950-51 and though the budget for 1951-52 placed the surplus at Rs. 2.34 lakhs, the revised estimates are substantially higher. The Port finances are in sound condition and the

accumulations in reserves are satisfactory. The total tonnage during the year 1950-51 was imports 1,925,152 and exports 248,976 while the respective figures upto December 1951 are 723,769 and 210,221. The number of vessels that entered the harbour in 1950-51 was 1,048. The number in the current year up to the end of December 1951 was 685. The entire capital expenditure is being met by the Trust from its own funds since 1949-50. The most important problem for the Port is the sand movement which is tending to shoal up the entrance to the harbour. The problem is being tackled by dredging, installing a sand pumping equipment and erecting a sandscreen.

Port Development.—All the preliminary investigations connected with the Kandla Port Development Project have been completed. The design for the main harbour works have been accepted and it is expected that the construction works will soon be commenced. Detailed estimates for the project amounting to Rs. 12.95 crores have been approved and a provision for Rs. 2.4 crores has been made in the 1952-53 budget. The Government of India is satisfied that the project would be a self-sufficient unit over a period of 60 years.

The planning and development of the township would be under the control of a Land and Development Board which has been set up with the Development Commissioner, Kandla, as Chairman. The work of linking up Kutch with the mainland by a metre-gauge rail connection is also in progress. Kandla is being linked with Deesa on the Palanpur-Deesa Branch line and Deesa with Ranwara on the Samdari-Ranwara line of the Western Railway. The construction of the Kandla-Deesa section has almost been completed and the line is expected to be opened for traffic in October 1952.

Investigations in connection with a ship canal from Diamond Harbour to Kidderpore Docks are being continued. A proposal to set up a technical committee to examine the possibility of an increased and steady supply of silt-free head-water from the Ganga is under consideration. The Bombay Port Trust has prepared a scheme for the modernisation of the Prince's and Victoria Docks which are unable to provide berths for modern vessels of large beams, deeper draft and displacement. As against the 26 second-class berths for ships of less than 450 ft. in length, the modernised docks will provide 14 first-class berths and 8 second-class berths resulting in an additional cargo handling capacity of about 8 lakh tons. The Madras Harbour is proposed to be extended by adding a wet dock capable of accommodating four large ships. The Cochin Port proposes to take up in 1952-53 the construction of an oil tanker berth in the Ernakulam Channel, certain installations for black oil on the Willingdon Island and two warehouses.

Development Under Plan.—The major ports have also drawn up programmes of development schemes for execution during the planned period. Their total cost is estimated at Rs. 55.95 crores out of which schemes costing about Rs. 49 crores are to be executed within the period 1952-53 to 1955-56. The details are given below:—

Bombay.—Improvement of oil discharge facilities and installation of electric cranes in Alexandra Docks are planned. Reorganisation of electrical distribution system and construction of a thermal generating station for the port are in view.

Calcutta.—Important plans are River Training Works, construction of additional berths for coal and general cargo, purchase of dredgers, tugs and survey vessels, construction of a mechanical ore berth, installation of a heavy lift crane and restoration of Gardenreach Jetty.

Madras.—Construction of oil dock for crude oil and dangerous petroleum, construction of a transit shed and a double storeyed warehouse, and purchase of cranes, vessels and barges are in view.

Cochin.—Construction of four additional berths and additional roads and railway facilities.

National Harbour Board.—The National Harbour Board was constituted in August 1950 in order to advice Government on port development. The Board accepted in November 1951 the recommendations of its special officer (see below) for dividing the minor ports for administrative convenience into three categories, namely, intermediate ports handling over one lakh tons of traffic every year; minor ports, handling between 1,500 tons and 100,000 tons and sub-ports. It also recommended the creation of a Port Development Fund to finance the improvement of these ports by levying a surcharge on all goods passing through the ports, both major and minor.

Minor Ports.—Towards the end of 1950, the Government of India appointed Mr. S. Nanjundiah as Special Officer to make proposals regarding administrative machinery and other improvements necessary to ensure fuller use of minor ports. His report was issued late in 1951. The principal recommendations are as follows: The existing minor ports may be classified into intermediate, minor and sub-ports; an early decision should be taken regarding the construction and use of small size steamships for the coastal trade; countrycraft industry should be fostered by providing facilities at ports for their laying up and repairs; ways and means for financing the minor ports to the tune of about Rs. 2½ crores should be considered; defunct ports should be declared closed.

Lighthouses.—The scheme for the development of lighthouses has made some headway: Works for the Bhatkal, Aruala and Dolphin's Nose lights have been taken up. The last named, with a light of 5 million candle-power, would be the most powerful light in India. The question of electrification of the lighthouses is under consideration. The lighthouses of Bhatkal and Alleppey have been declared general lighthouses.

GOVERNMENT ORGANIZATION

Three Ministers were concerned with shipping activities in India, namely, the Commerce, Transport and the Industries. The first was responsible for the administration of the Merchant Shipping Acts and of measures to ensure safety of ships at sea, for regulating recruitment and conditions of service of Indian seamen both in Indian and foreign ships and promote their welfare, for the development of an Indian Mercantile Marine, for providing facilities for merchant navy training and generally for all matters pertaining to merchant shipping. The Transport Ministry was responsible for the administration of the Port Trusts, and the Industries Ministry was concerned with the ship-building yards. Under the Cabinet reorganisation scheme, shipping became the sole concern of the Transport Ministry early in 1951. While matters of policy are dealt with in the Ministry, the newly created office of the Director-General of Shipping serves as an executive office, as distinct from the Secretary, for the co-ordinated implementation of policy. The office of the Controller of Indian Shipping, the Mercantile Marine Department and the Lighthouse Department have come under his administrative control. The administration of the Merchant Shipping Acts and Rules made thereunder, at the ports is undertaken by the Principal Officers, Mercantile Marine Department at the principal ports. The Assistant Director of Seamen's Welfare and his officers carry out the planning and execution of schemes and projects for seamen's welfare, scrutiny of the schemes and projects recommended by the Welfare Committees at the ports and administration of the Merchant Seamen's Welfare Amenities Fund.

The Inter-Governmental Maritime Consultative Organisation is a specialised agency attached to the United Nations Organisation, on the lines of the I. T. O. and I. C. A. O., to deal with shipping problems on an international level. It emerged out of the discussions of the United Nations Maritime Conference at Geneva in 1948 which was attended by 36 maritime countries including India.

Its objects are (1) to provide machinery for co-operation among Governments in the field of Governmental regulation and practices relating to technical matters affecting shipping engaged in international trade, (2) to encourage to adopt the highest practicable standards of maritime safety and efficiency of navigation, and (3) to encourage the removal of discriminatory action and unnecessary restrictions by Governments affecting shipping engaged in international trade. The functions of the Organisation are consultative and advisory.

ESTABLISHED IN 1888

The name famous all over the country for its service to:

AGRICULTURE & ENGINEERING

KIRLOSKAR

PLOUGHS, PUMPS, SUGARCANE MILLS,
GROUNDNUT DECORTICATORS,
STEEL FURNITURE

KIRLOSKAR BROTHERS LTD.

KIRLOSKARVADI (DIST. SOUTH SATARA).

INDIA

ferro-chrome, ferro-titanium, etc., utilising local mineral deposits and the Hydro-electric power resources of the State.

Mention may also be made of the 134 recognized steel re-rolling mills in the country which produce certain sections of steel materials from billets and scrap supplied by the main steel producers as well as from imported billets. The production from the re-rolling mills excluding that from the four major re-rollers namely Messrs. Eagle Rolling Mills, Indian Steel Rolling Mills, Indian Steel and Wire Products and Guest Keen Williams was about 96,000 tons during the year 1951. The total estimated capacity of the re-rollers is about 500,000 tons a year on a three-shift working. They are, however, handicapped by the insecurity in respect of supply of their raw materials and this has, perhaps, to some extent, retarded the normal development of the industry. The Government of India propose to put up two new Steel Plants each with an annual capacity of 500,000 tons one in Madhya Pradesh and the other in Orissa.

WARTIME

While the first World War gave an impetus to the steel industry in India and enabled it to supply steel rails to be laid for war purposes in the Middle East, World War II witnessed still greater developments.

The steel industry before World War II had mostly confined itself to the manufacture of ordinary mild steel. Only the ordnance factories and some electric foundries made small-scale attempts to manufacture special grade high quality steels. High tensile steels, corresponding to the American high-yield strength, corrosion-resistant structural steels, as well as the English high tensile steels were, however, developed even before World War II by Tatas and these high tensile steels are known as "TISCOR" and "TISCROM". The latter which is a chrome-manganese-copper, high tensile structural steel fully satisfied the requirements of the British Standard Specification 584 and is corrosion-resisting with high tensile strength and good ductility. About 17,000 tons of this steel were used in the construction of the new Howrah Bridge which spans the river Hooghly at Calcutta—the third largest cantilever bridge in the world. With the outbreak of World War II, the strategic position of the sub-continent and the gradual stoppage of imports owing to increased shipping difficulties, threw a challenge to India's iron and steel industry, and the industry rose to the occasion and successfully produced almost all the varieties of steel used in general engineering practice and machine construction, such as high-speed steels, hot-die steels, tap steels, nickel-chrome steels, special steels for shear blades and punches, die steel for the mints, etc.

Some Achievements.—The main developments in steel-making under the pressure of wartime necessity occurred at the Tata Iron & Steel Co.'s Works. Tatas made special alloy steel products for direct war demands such as bullet-proof armour plates varying in thickness from 4 mm. to 14 mm. for the fabrication of armoured vehicles, bullet-proof rivet bars for the manufacture of rivets for use on these vehicles, bullet-proof plates for howitzer shields and gun turrets on armoured vehicles, nickel-chrome steel rounds for the production of 18 and 25 pounder armour piercing shells, special deep drawing quality steels for cartridge cases and for rifle and machine-gun magazines, stainless steels for surgical instruments, special steel sheets for the manufacture of nose containers for high explosives, aircraft bombs, and nickel-chrome molybdenum steel bars for the manufacture of parachute equipment, etc. These are only an indication of the rich variety of special quality steels developed by The Tata Iron & Steel Co. Research on permanent magnet steels using indigenous raw materials was also undertaken in order to meet the urgent demands of the Posts and Telegraphs Departments of the undivided Government of India, owing to the acute paucity of imported magnet steel bars.

While Tatas as the principal steel producers in India were responsible for the development of special steels, the Mysore Iron & Steel Works also made use of the resources at their command in manufacturing special steels at their Works. With the outbreak of the Second World War, they made additions to their plant and installed a half-ton Heroult furnace and a Hoskins crucible furnace. In 1941 a Moore's Electromelt furnace of 3½ tons capacity was installed which enabled them to make high-speed tool steels, shear blade steels, heat and wear-resisting steels, austenitic heat-resisting nickel chrome alloy steel, stainless steel, etc. In 1944, at the instance of the Council of Scientific and Industrial Research, the Mysore Works developed and successfully manufactured nichrome steel suitable for drawing into wire.

A Milestone—Mention may also be made here of the research carried out on refractory materials and clays particularly at the Testing Laboratory in the Research and Control Department at Jamshedpur which ensured the industry, during the war, a supply of improved quality bricks and shapes for the building and repair of the various furnaces in the Steel Works. Another point of interest is the valuable work that has been done with regard to high temperature mortars for which the industry had to depend hitherto on imported products at very high prices. This determined research has now enabled The Tata Iron & Steel Co. to develop very superior types of mortars for high temperature work.

The establishment of a Wheel, Tyre and Axle Plant at Jamshedpur in 1941 may be regarded as an important milestone in the progress of Indian steel industry. At that time it was hoped that the opening of this plant would be a prelude to a large-scale manufacture of locomotives in India. Within two years of the opening of the Wheel, Tyre and Axle Plant at Jamshedpur, the Jamshedpur Engineering and Machine Manufacturing Co. commenced making chilled wheels for the State Railways. Efforts in this direction were previously made by Indian firms but the operating conditions in the manufacture of Indian pig iron, the high percentage of ash in the coke and the humidity due to which the chill becomes uncontrollable stood in the way. The Jamshedpur Engineering and Machine Manufacturing Co.'s entry in this field, however, has been a success.

On 1st June 1945, the East Indian Railway Workshops at Singhbhum were transferred to Tatas for the manufacture of boilers and locomotives. Steam locomotives complete with boilers have been manufactured in Indian Railway Workshops at Jamalpur and Ajmer. The Jamalpur unit built as many as 214 broad gauge locomotives, 103 boilers and 99 tenders till 1926 (when the locomotive workshop was closed), and the Ajmer Workshop manufactured no less than 435 metre-gauge locomotives between 1896 and 1940. The starting of the Tata Locomotive and Engineering Company Ltd. is, however, the first attempt by a private firm to manufacture boilers and locomotives on a commercial basis.

The manufacture of locomotives and boilers as a private enterprise in India was first started by the Peninsular Locomotive Company with a capital of Rs. 60 lakhs. After spending about Rs. 30 lakhs on the construction of workshops at Singhbhum, Bihar, the promoters of the Company decided to abandon the project, because the Tariff Board refused protection to the industry. In 1927 the Government purchased the Singhbhum Workshops from the Peninsular Locomotive Company and made them over to the East Indian Railway for the manufacture of railway carriage underframes. The underframe factory was closed down in 1934. During the war the Singhbhum Workshops were made over to the Defence Department for the assembly of armoured vehicles. After the war, when the Defence Department intimated their desire to shut down the workshops, Messrs. Tata Sons Limited purchased the workshops and floated a new Company, the Tata Locomotive & Engineering Company Ltd., for the manufacture of locomotive boilers and locomotives, under a 16-year contract with the Government of India.

Boilers—Although the E. I. Railway Workshops were taken over by the Company in June, 1945, considerable spade work had been done before that date. The possibility of manufacturing locomotive boilers in the existing shops had been explored and with the assistance of the Railway Board officials, lists of machinery and components required for boiler manufacture to be ordered from U. K. had been prepared and orders placed in 1944. Despite delay in the receipt of essential machinery and components the first boiler was turned out in May, 1947. The Company has since established boiler production on a regular basis and has produced more than 125 boilers by February, 1951.

While the production of locomotive boilers was being carried on, the workshops were being remodelled and expanded into an up-to-date Locomotive Building Workshop with a capacity of about 100 completed locomotives plus 100 extra loco boilers per year, on the basis of single shift operation. The new shops were completed and made over for production by the end of 1951, and the first two locomotives, for which the bulk of the components were supplied by the technical associates, Messrs. Krauss-Maffei A. G. of Munich, Western Germany, were turned out in January 1952. A progressively larger proportion of components will be manufactured by the Company in the coming months.

It is also proposed to install an up-to-date mechanized steel foundry for the production of all types of steel castings. When completed, this foundry will provide, among others, all the steel castings required for the manufacture of locomotives in this country.

At present, besides locomotive boilers, the Company also produces steam road-rollers in collaboration with Messrs. Marshall Sons & Co., Ltd., of the U. K., and the Indian Ordnance Factories. Carriage underframes are also being manufactured at the rate of 30/35 per month for the Indian Railways.

In addition to the Works of the Tata Locomotive & Engineering Co., Ltd., the Government of India have constructed a locomotive manufacturing factory at Chittaranjan in West Bengal. This factory has been designed for a capacity of 120 locomotives and 50 extra boilers per annum on a single shift operation.

The plant and equipment used in the steel industry in India are mostly of foreign manufacture and unfortunately the industry has to continue to depend on imported machinery for the present.

Where only a quarter of a century ago, India had to depend chiefly on foreign technicians for the development of the industry, during the last few years labour and skilled personnel employed in the Indian steel industry have been mostly Indian. This has been possible owing to the foresight of the managements in training suitable Indian youths for the steel industry. Tatas today have a technical institute at Jamshedpur where there are two classes of apprenticeship. One is the Trade Apprenticeship Course, the duration of which is two years. The other is the Graduate Apprenticeship course, the duration of which is also two years. After the period of training is over, these apprentices are generally absorbed by the Company in vacancies which occur from time to time.

PROTECTION

During the depression after World War I, the iron and steel industry in India had to face foreign competition when imported steel was being dumped in the Indian market at rates cheaper than the rising cost of Indian steel. In 1923 The Tata Iron & Steel Company applied to the Government for protection for the steel industry. As a result of the tariff enquiry of the Steel Company's case, protection was given to the iron and steel industry in India in the year 1924 by imposing protective duties on the

imported iron and steel materials of those categories which were being produced in India. Since 1924 there have been three main tariff enquiries into the case of the iron and steel industry—in 1924, 1926 and 1934. In between there were three supplementary enquiries and five special enquiries for the subsidiary industries in India. The scheme of protection sanctioned as a result of the tariff enquiry held in 1934 was to remain in force for seven years till 31st March 1941. Before, however, this protection expired, World War II intervened, and the protective duties on imported steel were continued from time to time by continuation Acts, the last extension being for a period of one year till 31st March 1947.

During World War II the imports of iron and steel into India declined and the prices of imported materials went up. Thus during this period the foreign competition to the Indian steel industry ceased to exist. From 1st October 1939 to 30th June 1944 though there was control over the steel prices in India for supplies meant for war requirements, there was no statutory control over commercial prices. From 1st July 1944 commercial prices were also brought under statutory control and there was only one set of selling prices for war and non-war purposes. The manufacturers were however allowed separate retention prices (as distinct from issue prices), for war and non-war supplies. After the termination of the War the need for separate retention prices no longer existed and so from 1st April 1946 there was only one set of retention prices. Retention prices have been generally lower than selling prices and the surcharge, *i.e.* the difference between the selling and retention prices is refunded to Government by the producers to create a fund mainly to subsidise imports.

The scheme of protection to the Iron and Steel Industry in India was discontinued from 1st April 1947 as there was no need for protection but the quantum of protective duties continued as revenue duties. There is however protection to certain categories of tool, alloy and special steel products manufactured in India, which would last up to 31st December, 1954.

The last Tariff Board enquiry held in 1949 was to consider the fair retention prices for the producers, *viz.* The Tata Iron & Steel Company, SCOB and Mysore Iron & Steel Works. On the recommendation of the Tariff Board retention prices have been fixed by Government for these producers on the basis of cost and reasonable profit. These prices were brought into force for a period of two years with effect from 1st May 1949.

Under the orders of the Government of India, a further enquiry about the revision of the retention prices of the two main steel producers, the Tata Iron & Steel Co. and the Steel Corporation of Bengal was held by the Tariff Board early in the year 1951 and on the basis of the Board's recommendations, the retention prices of steel have been revised from 1st July 1951 and will remain in force for a period of three years from that date. Increase in the works costs of both the companies during the year 1950 and first half of 1951 was also examined by the Board and the Government allowed an increase of Rs. 11 per ton in the retention prices for both the producers for the period January 1950 to June 1951. Subsequently on a representation made by the SCOB Government enhanced the increase in their retention prices for 1950 to Rs. 22 per ton. The Government also sanctioned that the Steel Corporation of Bengal should be reimbursed a sum of Rs. 14·17 lakhs, representing the Company's share of profits payable to the Indian Iron & Steel Company for 1950 from the Iron & Steel Equalisation Fund.

The claim of the Mysore Iron & Steel Works for an increase in their prices is under examination by the Tariff Commission.

o o

THE SUGAR INDUSTRY

THE Sugar industry is the second largest industry in India, next only to the Cotton Textile Industry, with a capital of about Rs. 36 crores invested in it. It is one of the biggest employers in the country supporting nearly 20 million agriculturists, employing no less than 3,500 University men and 1,30,000 workers skilled and unskilled. The present position and importance of the sugar industry in the industrial economy of India is due in a large measure to the liberal tariff policy pursued by the Government of India in granting tariff protection to the industry from 1932 till March 1950.

The following table will show at a glance the changes in the excise duty and import duty on sugar, sugar candy and molasses in India from 1937 till 1st April, 1952.

TABLE

Excise Duty on Indigenous Factory Sugar per cwt.	Protective Import Duty per cwt.	Additional Duty per cwt.	Total Import Duty per cwt.
	Rs. a. p.		Rs. a. p.
From 28th February, 1937 .. .. .. (Rs. 2-0-0).	7 4 0	Equivalent excise duty Rs. 2-0-0	9 4 0
From 1st April, 1939 .. .. (Rs. 2-0-0).	6 12 0	Equivalent excise duty Rs. 2-0-0	8 12 0
From 1st March, 1940 .. .. (Rs. 3-0-0).	6 12 0	Equivalent excise duty Rs. 3-0-0	9 12 0
From 1st April, 1942 .. .. (Rs. 3-0-0).	6 12 0	Revenue surcharge of 20% on import duty and equivalent excise duty of Rs. 3, with 20% surcharge thereon.	11 11 2
From 1st April, 1949 .. .. (Rs. 3-12-0).	6 12 0 (Revenue Duty)	Revenue surcharge of 20% on import duty and equivalent excise duty of Rs. 3-12-0, with 20% surcharge thereon.	12 9 7½
From 1st April, 1950 .. .. (Rs. 3-12-0).	6 12 0	,,	12 9 7½
From 1st March, 1951 .. .. (Rs. 3-12-0).	6 12 0	Revenue surcharge of 25% of Revenue duty and equivalent excise duty of Rs. 3-12-0, with 25% surcharge thereon.*	13 2 1

* *With effect from 1st March* 1951-52, *a surcharge of 5 per cent. more on the import duty tended to enhance the import duty on sugar as stated above. The total Import duty of Rs.* 13-2-0 *per cwt. works out to Rs.* 9-10-3 *per maund while the excise duty of Rs.* 3-12-0 *per cwt. works out to Rs.* 2-12-1 *per maund.*

The protective import duty was replaced by revenue duty of the same amount, viz., Rs. 6-12-0 *from 1st April* 1950, *according to a clause in the Finance Bill* 1950.

As a result of the recommendations of the Tariff Board in January, 1950, the Government of India removed the protective import duty on sugar, with effect from the 31st March, 1950. The Government, however, imposed a revenue duty of the same amount from the 1st April, 1950. This duty is, however, subject to revenue exigencies, and is removable at any time, without any further enquiry by the Tariff Board, or notice to the trade or industry. The total import duty was Rs. 12-9-7 per cwt. till February 1951. With effect from 1st March 1951, the import duty was enhanced to Rs. 13-2-0 per cwt. on account of 5 per cent. extra surcharge on the import duty.

Protection.—It would be interesting to observe here that protection to the sugar industry, which was given initially for a period of 14 years, under the Sugar Industry (Protection) Act 1932, expired on the 31st March 1946. Protection was continued by the Government of India till 31st March 1947, and a Tariff Board inquiry was undertaken in January 1947 to decide what action was to be taken in regard to the duty on sugar after 31st March 1947. On the basis of the recommendations of the Tariff Board which conducted a summary enquiry, protection was continued at the same level by the Government of India till 31st March 1949, and it was continued for a period of one more year, ending on 31st March, 1950.

On the recommendations of the Tariff Board of 1950, the Government of India decided to withdraw protection to the sugar industry. Thus, after a period of 18 years, protection was terminated. The Government of India have decided, however, to continue the revenue duty on sugar at the same rate with effect from the 1st April, 1950. The revenue surcharge on this duty was increased from 20 per cent. to 25 per cent. with effect from 1st March, 1951. This duty can be altered or removed by Government to suit their revenue exigencies, without prior notice, and the industry cannot count upon its continuance.

PRODUCTION

During this period of twenty years, production of sugar in the country has risen considerably, from 290,000 tons in 1932-33 to 1,241,000 tons in 1939-40 and to 1,300,000 tons in 1951-52. This has been the maximum production in undivided India. During the war period production was generally on the decline and was well under 1,000,000 tons.

The following table shows the number of cane factories working in India, and production of sugar from cane factories, gur refineries, khandsari, and net imports of sugar during the last 20 years, and estimates for 1951-52.

Year (November-October)	No. of Cane Factories working in India	Cane Factory Production (November-October)	Sugar Refined from Gur (January December)	Khandsari Production estimates (Nov.-Oct.)	Total Production of Sugar in India (Nov.-Oct.)	Net Imports (Excluding Re-exports) of Sugar in India (Nov.-Oct.)
		Tons	Tons	Tons	Tons	Tons
1932-33*	57	200,000	80,000	275,000	645,000	389,730

1951-52**	138	1,300,000	2,000	35,000	1,337,000	—

* These figures refer to Undivided India. ** These figures from 1937-38 to 1947-48 in columns 2, 3, 4, 5, 6 except column 7 are *vide* " Indian Trade Journal " June 1, 1950. (b) These figures are *vide* M. P. Gandhi's Sugar Annual 1951-52. (a) Government of India purchased 60,050 tons of sugar from U.K. (60,000 tons at the rate of Rs. 56 to 62 per ton) and (50 tons from U.S.A. at the rate of $6.5 per 100 lbs.) at a total estimated value of Rs. 4 crores. Out of this quantity only 5,550 tons reached India in 1949-50 (before November 1950). In February, 1951, it was announced that Government had no intention to import more sugar in 1951 except the balance of 32,050 tons, 28,000 tons having reached India before February 1951.

The acreage under cultivation of sugarcane has kept pace with the increased production of sugar. From 39·97 lakhs acres in 1937-38, it went up to 47·49 lakhs acres in 1940-41. Since then it has gone down, varying from year to year. In 1951-52, it was 4·314 lakhs acres.

The acreage under improved varieties has gone up from 11,305,000 acres in 1931-32 to nearly 30 lakhs acres in 1945-46. Since then in the Indian Union about 90 per cent. of the acreage under sugarcane is said to be under improved varieties. The average cane production per acre has not, however, increased during all these years, and this factor is greatly responsible for the present high cost of sugarcane and consequently of sugar in the country.

The following table shows the acreage under sugarcane, under improved varieties, production of cane per acre, gross production of gur, and calculated production of cane-crop* from 1932-33 to 1949-50. Since 1937-38, the figures are for the Indian Union only.

Year	Total acreage under sugar-cane in thousand acres	Acreage under improved varieties in thousand acres	Average cane production per acre (in tons)	Gross production expressed as gur (in thousand tons)	Calculated production of sugarcane (in thousand tons)
1932—33 ..	3,425	1,845	14·9	4,859	51,129

* *Vide* Indian Sugar Industry Annual, 1950.

The sugar industry was controlled by the Government of India, from 1942 to 10th December 1947, when control over sugar was lifted. Along with sugar production, gur was also controlled. While the control succeeded to a certain extent in preventing the indiscriminate rise in prices, it failed to increase production of sugar, although it was the avowed object of the Government to increase production. With the decontrol of sugar and the fixation of higher prices of sugar by the Government of India, with effect from the 1947-48 crushing season, in order to enable them to enhance the minimum price of the raw material, namely, sugarcane, from Rs. 1-4-0 per maund to Rs. 2-0-0 per maund in U. P. and Bihar, the principal sugar-producing States of the country, larger quantities of sugarcane were available to sugar mills for the crushing season, and consequently production of sugar went up.

The price was reduced in 1948-49 to Rs. 1-13-0 per maund of cane in U. P. and Rs. 1-10-0 per maund in Bihar in order to decrease the price of sugar. The price of sugar was fixed at Rs. 28-8-0 per maund in the place of Rs. 35-7-0 as in the year 1947-48, and the profits of the industry were also thus reduced considerably by the reduction in price.

The cane prices were fixed at Rs. 1-10-0 per maund in U.P. and Rs. 1-10-0 per maund in Bihar, in 1949-50. The price of sugar was fixed at Rs. 28-8-0 for E. 27 quality in 1949-50, in the place of Rs. 28-8-0 for D. 24 quality in 1948-49. There was also a cane cess of 0-3-0 per maund of cane in U.P., Bihar and Bombay in 1949-50.

For 1950-51 season, the price of cane was increased by annas 2 per maund to Rs. 1-12-0 per maund and consequently, the price of sugar was put up to Rs. 29-12-0 for E.27 quality. Increase in price above Rs. 29-12-0 was allowed in certain areas depending on the cost of production with a view to offering incentive to increased sugar production to a target figure of 11 lakh tons. The same prices were maintained for the 1951-52 season, and regional prices of sugar were fixed on an *ad hoc* basis for 1951-52. The ex-factory prices for 1951-52 per maund were: Bihar-North Rs. 31-0-0; Bihar-South Rs. 33-0-0; U.P. West Rs. 30-8-0; U.P. East Rs. 31-8-0; Mysore Rs. 29-12-0; Bombay Rs. 29-12-0.

CONSUMPTION OF SUGAR

The *per capita* consumption of sugar in the country at the present time is very low and works out to only about 6 lbs., in addition, of course, to 24 lbs. of gur, the total *per capita* consumption of sugar and gur being about 30 lbs. during the last few years. The *per capita* consumption of sugar in other countries is considerably higher as can be seen from the following table.

Per capita consumption of sugar in various countries (in lbs.).

Name of country	Per capita consumption		
	Pre-war	1948	1949
Australia	116	129·0	114·5
Brazil	34	66·8	51·7
Cuba	88	65	82·1
France	52	42·7	57·1
Germany	52	..	63·3
Japan	33	..	29·1
U.K.	106	86·3	112·6
U.S.A.	97	93·3	103·2
India	30*	31·1*	29*
Pakistan	..	..	24*

* The figures include figures for gur also.

It must be observed here that the Government of India appointed a Sugar Panel to investigate the possibility of increasing the sugar output of India. The report of this panel was published in 1946. They recommended a target of production of 1,600,000 tons of sugar to be reached at the end of 5 years, of which 1,550,000 tons were for internal consumption and 50,000 tons for export outside India. The target was later increased to 1,850,000 tons.

As a result of the partition in August, 1947, the Government of India reviewed their previous decision on the Panel's recommendation, and they decided in 1948 that the target of production should be lowered to 16 lakh tons per annum.

The Tariff Board of 1950 estimated the present demand of sugar in the country at 13 lakh tons, and added that with the improvement of economic conditions in the country, the demand was likely to increase further in the next four or five years. The Tariff Board, therefore, thought that there was scope for increasing the productive capacity of the industry (presently estimated at about 13 lakhs tons) either by expansion of the existing units or installation of a few new units.

The Planning Commission which reported in August, 1951 expected the production of sugar in India at the end of five-year period in 1955-56 at 15 lakhs tons.

Capital Outlay.—The capital invested at the present time in the sugar industry is roughly of the order of 36 crores of rupees. The Sugar Panel estimated that the total cost of machinery required for (a) fuller exploitation of the existing capacity of the sugar factories, (b) enhancement of the capacity of the existing small plants, and (c) construction of 20 new factories of 1,000 tons of cane crushing capacity per day, would be about 11·12 crores of rupees. If to this we add the cost of establishment of 25 new factories decided upon by the Government of India while reviewing the recommendations of the Sugar Panel in 1947, the total cost would be about 22 crores of rupees for the machinery.

A large bulk of the existing sugar machinery had been imported from various countries, *e.g.*, U.K., Germany, Czechoslovakia, France, etc., but it is possible that in the years to come certain units of the sugar machinery can be fabricated in India, and if the new plants are fabricated in India, it would be of great help to the engineering industry of the country as well.

Production Target.—It might be of interest to note that the number of working sugar mills in India at the present time is 139. The acreage under cane in the Union of India was approximately 4,324,000 acres in 1951-52. Although the total acreage under cane, namely, 4,300,000 acres, appears to be very large, it comes to only about 2 per cent. of the cultivated area in India, and is approximately 35 per cent. of the world's sugarcane acreage.

The annual estimate of the total value of sugar and gur made in India works out to 260 crores of rupees in recent years, and the *per capita* expenditure on sugar and gur works out to Rs. 10. The sugar industry gives employment to 1,33,500 skilled and unskilled workmen, and interests of not less than 20 million cultivators, are indissolubly linked with the sugar industry (*Vide* the Indian Sugar Industry Annual, 1951-52 by M. P. Gandhi).

The production of sugar in 1949-50 fell much below the anticipated target of 11 lakh tons and was only 9.75 lakh tons as against 10.07 lakh tons in 1948-49, in spite of the revenue concessions offered at the instance of the then Deputy Prime Minister, Sardar Patel. This was mainly owing to the high prices of *gur* and *Khandsari* which were uncontrolled while the ex-factory price of sugar was fixed at Rs. 28-8-0 per maund. This led to the diversion of cane from sugar manufacture to gur and Khandsari production. With a view to maximising sugar production in 1950-51 season, a new policy for sugar was announced on December 1, 1950 by the Food Minister, Mr. K. M. Munshi, permitting free sales of sugar produced in excess of 107 per cent. of the production in 1948-49 or 1949-50 whichever is lower, after the rationing requirements of 10 lakh tons were met from such production. The policy has succeeded in augmenting production and sugar was released for free market sales in 1951, and was available at annas 12 to annas 14 per lb. in the free market, as against the black market rate of Re. 1-0-0 to Rs. 1-8-0 per lb. in 1950. The production of factory sugar during 1950-51 was 11,16,000 tons, and there was a carry-over of over 1,00,000 to us in November, 1951. The continuance of a slightly revised but essentially similar policy of selective control for 1951-52, and the emergence of several unique features *e.g.* precipitate fall in the price of gur from its controlled rate of Rs. 19 per maund to Rs. 9 and Rs. 10 per maund, has raised the production of sugar to 13 lakhs tons in 1951-52, which is more than sufficient for the present requirements of this country.

The minimum price of cane in 1951-52 was fixed at Rs. 1-12-0 per maund, as in 1950-51. The price of sugar was maintained at the same level in 1951-52. In view of the bumper production, the Government will have to think of allowing export of some sugar to adjacent countries. The Government have also announced their intention, in April 1952, to lower the cane prices in the 1952-53 season. This will automatically mean a lowering of the price of sugar also in 1952-53.

IMPORT EXPORT POSSIBILITIES

The production of sugar in India at the present time is slightly more than its present estimated consumption, namely, 13 lakh tons per annum. There is in the country, also, the capacity for the production of a larger quantity of sugar to the extent of 14 lakh tons. It is not likely that in the present shortage of foreign exchange generally, and dollars particularly, the Government of India will encourage any importation of sugar from any foreign countries, even if sugar is available at competitive rates. The price of foreign sugar today is not substantially lower than the price of Indian sugar, and with the addition of the revenue duty of Rs. 13-2-0 per cwt., the price of foreign sugar will be somewhat more than the price of Indian sugar. India's cost of production of sugar is, however, on the high side, principally due to the high cost of sugarcane, which accounts for nearly 60 per cent. of the price of sugar. Other causes responsible for the high price of sugar are the high central excise duty, and the provincial cess on sugarcane of about 3 annas per maund of cane which approximates to nearly Rs. 1-14-0 per maund of sugar. The Tariff Board of 1950 recommended that the price of sugar be reduced gradually in the next five years to Rs. 18 or Rs. 19 per maund with a cane price of Rs. 1-0-0 per maund at the end of the five-year period, by doubling the yield and improving the quality of cane. The Tariff Board also stated that according to their estimate, the fair ex-factory price of sugar (E. 27 quality) could be reduced to Rs. 24-12-0 per maund in 1950-51. But contrary to their expectation, it was found to have been increased to Rs. 29-12-0 with the cane price increased from Rs. 1-10-0 to Rs. 1-12-0 per maund in 1950-51 season, mostly to offer incentives to the cultivators to grow cane rather than other crops, so that the sugar factories should no more suffer from shortage of cane and should have adequate cane for crushing throughout the season.

Gur Production.—Having discussed the production of sugar in some detail, it would be of interest to turn to the production of gur which is an article of direct consumption in India, and the production of which is nearly three times as large as that of sugar. The following table shows the calculated net production of gur in India for direct consumption from 1931-32 to 1950-51.

Year (November-October)	Calculated net Annual Production of Gur for direct consumption (in Tons)	Year (November-October)	Calculated net Annual Production of Gur for direct consumption (in Tons)
1931-32	2,758,000	1941-42	2,829,000
1932-33	3,240,000	1942-43	3,015,000
1933-34	3,486,000	1943-44	3,499,000
1934-35	3,701,000	1944-45	3,633,000
1935-36	4,101,000	1945-46	3,578,000
1936-37	4,268,000	1946-47	3,574,000
1937-38	4,364,000	1947-48	3,492,000
1938-39	2,131,000	1948-49	2,830,000
1939-40	2,441,000	1949-50	2,714,000
1940-41	2,414,000	1950-51	2,800,000

SUGAR PRICES

Prices of sugar have been fixed since 1942 by the Sugar Controller for India for all factories and they were compelled to sell their sugar at controlled rates and also to consign their sugar to destinations which were specified by the Sugar Controller from time to time. The average price of sugar in 1942 was Rs. 12-4-0 per maund, in 1944 Rs. 15-6-0 per maund, and in 1945 Rs. 16-12-0 per maund. The price fixed in 1946-47 was Rs. 20-14-0 per maund. The minimum price of sugarcane was also on the increase during this period, to compensate the cultivator for the higher cost of cultivation.

Immediately after sugar was decontrolled on the 10th December 1947, the maximum price of sugar was fixed at Rs.35-7-0 per maund, and at the same time the minimum price of cane, which was Rs.1-4-0 per maund in 1946-47 season, was increased to Rs.2-0-0 per maund, both in U.P. and Bihar.

In 1948-49, the price was reduced to Rs. 28-8-0 per maund (for D.24 quality). The minimum price of cane was also brought down to Rs. 1-13-0 per maund in U.P. and Rs. 1-10-0 in Bihar in the same period.

In 1949-50, the price of sugar was Rs. 28-8-0 per maund for E.27 quality and the minimum prices of cane were Rs. 1-10-0 per maund in U.P. and Bihar and Rs. 1-12-0 in East Punjab.

The excise duty on sugar, at present is Rs. 3-12-0 per maund plus a revenue surcharge of 25 per cent. The excise duty on Khandsari produced in factories by power is annas eight per cwt.

In the 1951-52 season, the prices of sugar were maintained at the same rates as in 1950-51, and regional prices were fixed on an *ad hoc* basis to allow for higher costs of production etc. The price for E27 quality sugar in Bihar-North was Rs. 31-0-0 per maund, in Bihar-South Rs. 33-0-0, in U.P. West Rs. 30-8-0, in U.P. East Rs. 31-8-0. In Bombay and Mysore, it was Rs. 29-12-0 per maund. Price differentials for various grades were also fixed.

Free sale of sugar was also allowed to factories at uncontrolled rates, where their production exceeded the basic quota. The basic quota for 1951-52 was fixed at 95 per cent of the average production of each factory during the two years 1948-49 and 1949-50. Half of the excess production of each factory, in excess of its basic quota, was to be allowed to be sold in the free market, and the other half, together with the basic quota, was reserved for distribution by Government at controlled rates.

Due to a very large production in 1951-52, the free sale prices of sugar were only slightly higher than the controlled rates.

THE TEA INDUSTRY

AMONG plantation crops in India tea is the most important. The indigenous tea plant, growing in a wild condition, was first discovered in Assam about 1820. It soon drew the attention of the East India Company, which after some enquiries started an experimental garden in 1835. After being in operation for five years, the plantations of the Government were sold in 1840 to the Assam Company, the first tea concern and to this day the largest company in the Union. It fared badly during the first ten years of its existence, but about 1852, its condition began to improve and its success made the prospects of the industry appear so promising and attractive that speculators eagerly rushed into it.

The discovery of the indigenous tea in Sylhet (now in Pakistan) and Cachar gave the necessary impetus for an expansion of the industry into the Surma valley, and in a few years thereafter the whole of the upper portions of the north-east region (both the Brahmaputra and Surma Valleys) was converted into a huge tea plantation. Thus, the foundations of the present tea industry were laid during the fifties of the last century. Since that period the growth of the industry has been phenomenal and in less than a hundred years India has become the tea garden and tea-shop of the world.

The following table shows the growth of the Industry since 1905 :—

Year	Area under tea in thousands of acres	Production in millions of lbs.	Year	Area under tea in thousands of acres	Production in millions of lbs.
1905-09 (Average)	539	242	1936	842	390
1910-14 ,,	591	290	1937	842	423
1915-19 ,,	662	374	1938	840	447
1920-24 ,,	709	336	1939	841	463
1925	728	364	1940	840	471

1935	841	389	1950	777	606

* From now on figures are for India only.

It will be seen from the table that since the beginning of the present century, while the area under tea has risen by 49 per cent., the production has increased by over 201 per cent.

Assam and West Bengal are the two important centres of the tea industry in India, Assam alone accounting for more than half the total production. In 1950, Assam produced 325 million lbs. or 53 per cent. of the total production. West Bengal produced 181 million lbs. or 29¾ per cent., southern India 98 million lbs. or 16 per cent., while the balance was grown in Bihar, Uttar Pradesh, Tripura, Nepal and the Punjab.

With the partition of the sub-continent about 74,000 acres under tea fell to Pakistan's share. Pakistan, by the way, produced about 52 million pounds in 1950.

EXPORT TRADE

Although there has been a steady increase in the domestic consumption of tea in recent years, India is still able to export large quantities to other countries, the principal among which is the United Kingdom. In some years over 80 per cent. of the total quantity of tea produced in the sub-continent was exported but this figure dropped in 1945-46 to 70 per cent. Of the total exports of 393 million lbs. from India during 1950 the United Kingdom took 275 million lbs. that is to say, India sent 69.5 per cent. of her tea exports to the U.K.

Consequent on the sterling work done by he Indian Tea Market Expansion Board nd since 1949 by the Central Tea Board the onsumption of tea in India during the last en years has risen from 70 million pounds er annum to the present figure of 157 million ounds per annum. The sub-continent thus ecomes one of the leading tea consuming reas although its per capita consumption ompared with such countries as the U. K., lire and Australia is exceedingly low. Since ugust 1949, the propaganda work of the Indian ea Market Expansion Board has been taken ver by the Central Tea Board, constituted nder the Central Tea Board Act, 1949, which as replaced the Indian Tea Cess Act, 1903.

The outbreak of war gave rise to entirely ew conditions. In the United Kingdom, he entire tea trade passed under the control f the Government. A Tea Controller for ndia was appointed to administer the emergency ea control scheme. Owing to the suspension f re-exports from London, the need for eplenishing their stocks by America and the olonies and the transfer of their demand by ome of the markets supplied by Java to Indian ea, there was a strong demand for practically ll kinds of tea and the export quota was, herefore, raised to 95 per cent. in October 939 and was kept unchanged at 95 per cent. or the next season. In June 1940, however, he International Tea Committee reduced he quota for 1940-41 to 90 per cent. for all articipating countries. The reduction had a timulating effect on the markets, but it was oon discovered that in view of the increased equirements of the United Kingdom, U. S. A., nd other countries, the maintenance of the xport quota at 90 per cent. would result in severe curtailment of the available supplies nd the quota was revised to 92½ per cent. n October 1940. The export quota for 1941-42 as fixed at 125 per cent. of the standard xports and this figure was maintained up to 1st March 1950. The export quota figure for 950-51 was fixed at 130 per cent. of the standard xports and that for 1951-52 at 135 per cent.

The International Tea Agreement which was due to expire on 31st March 1943 was extended to cover the period of the duration of hostilities and a clear two years thereafter. Before it expired on 31st March 1948 a new Agreement was prepared and signed for a period of two years up to 31st March 1950. On 8th May 1950 a new International Tea Agreement was signed by the Tea Producers of India, Pakistan, Ceylon and the Netherlands East Indies extending control over the export and planting of tea for a period of five years up to 31st March 1955.

PRESENT QUOTAS

But no export quota figure was declared for the year 1948-49 as India's standard export figure had not been determined under the International Tea Agreement. The Indian Tea Licensing Committee were authorised however to issue licences to cover exports upto 400 million pounds. This quantity was subsequently raised to 408,723,539 lbs. of which 8,723,539 lbs. was to be reserved to cover exports under the Indo-Russian Food Agreement. The allotment when expressed as a percentage of the standard export figure, which was declared in a notification dated 28th May 1949 as 348,246,170 lbs. amounts to approximately 117.3 per cent. or 78.6 per cent of the crop basis of estates.

For the year 1949-50 the Government of India as in the previous year authorised the Committee to issue licences to cover exports amounting to 400 million pounds. This figure was subsequently raised to 411 million pounds and later to 435 million from both of which quantities 11 million pounds had to be reserved to cover exports under the Indo-Russian Food Agreement.

The final export figure of 435 million pounds is equivalent to 125 per cent. of India's standard export figure and is the highest release that can be made at present under the International Tea Agreement.

Under the 1950-55 International Tea Agreement the degree of regulation fixed for the year 1950-51 was 130 per cent. of the standard export figures and the Government of India allowed exports for the year up to that figure.

The following table shows tea exports by sea from the Indian Union to the chief importing countries :—

Country	1948-49 (Millions of lbs.)	1949-50 (Millions of lbs.).	1950-51 (Millions of lbs.)
United Kingdom ..	281·3	276·3	278·1

Chile	0·4	2·0	2·5
U. S. S. R. ..	14·8	11·0	—
Eire	21·4	12·9	28·0

PRICES

After the outbreak of war prices of tea rose strikingly and the average auction prices of Rs. 1-0-9 and Re. 1 for the years 1941 and 1942 respectively were higher than in any previous season. Auction sales for teas with export rights were suspended from 15th September 1942 until 1947 and block purchases were made by the British Ministry of Food on behalf of all Allied and certain neutral countries. Prices paid were based on the average received by growers in the years 1936, 1937 and 1938 together with an allowance to cover the extra cost of wartime production. The upward trend in tea prices which had begun during the early years of war was maintained when auctions of tea with export rights were renewed in Calcutta in 1947 as the following table shows :

Year	Average prices at auction sales (Calcutta) — Teas Leaf & Brokens with export rights: Price per lb.	Teas Leaf & Brokens with export rights: Index No.	Teas Leaf & Brokens for internal consumption: Price per lb.	Teas Leaf & Brokens for internal consumption: Index No.

The rate of duty under the Indian Tea Cess Act of 1903 was fixed at Rs. 1-6-0 per 100 lbs. on January 10, 1948. This Act was superseded by he Central Tea Board Act of August 1, 1949 and the cess was increased on November 5, 1949 to Rs. 1-10-0 per 100 lbs. and on May 15, 1950 o Rs. 2-0-0.

THE TEXTILE INDUSTRY

COTTON

INDIA is the birth place of raw cotton and cotton manufactures. Cotton clothes have been found in the ruins at Mohenjo-Daro, representing the Indus Valley civilization of five thousand years ago. In ancient Rome, Indian muslins and chintzes were the fashion and the Dacca muslins received such poetic names as "running water", "woven air", and "evening dew." Even at the end of the seventeenth century, large quantities of cheap but graceful calicoes used to be sent to England and these could only be stopped by a legislative ban on their imports.

Ever since the opening of the sea route during the rule of Alexander the Great, Indian cotton has figured as an important article of export. The American Civil War resulted in a close blockade of the Confederate ports and produced a cotton famine in Lancashire thereby throwing the English spinners back on India for the supply of raw material. Exports mounted up sharply from 528,000 bales to 973,000 bales and the fancy prices realised from these sales brought to Bombay an enormous flow of wealth.

The area under cotton in undivided India gradually rose to a peak of 28,403,000 acres by 1925-26 for which the outturn was placed at 6.2 million bales, as against 2,090,000 bales in 1899-1900. The world depression in the 'thirties, however, hit the crop adversely and the production for 1931-32 totalled only 4,007,000 bales. The Indian cotton crop reached an all time record level of 6,234,000 bales in 1937-38; but Japan's subsequent decision to reduce her purchases of short staple cotton from India brought about an equally sharp contraction in the cotton crop which was estimated at 4,909,000 bales in 1939-40.

The outbreak of the Second World War reminded the growers of the fortunes they had made in the past wars and consequently the crop was stepped up under the stimulus of rising cotton prices to 6,223,000 bales in 1941-42. The war developments, however, upset all calculations and the quotation for the Broach contract fell sharply to Rs. 148. This synchronised with the launching of "grow-more-food-campaign" by the Government of India with the result that the acreage under cotton dropped by 22 per cent. and output by 26 per cent. to 19,203,000 acres and 4,702,000 bales respectively in 1942-43. The crop was higher in the following year in sympathy with better cotton prices; but the statutory ceilings on prices and legal restrictions on cotton cultivation reduced the acreage and output to the 32-year old record low level of 14,860,000 acres and 3,530,000 bales in 1945-46.

The position of cotton in India at the time of the partition can be had from the following details for 1946-47 :—

	Indian Union	Pakistan	Undivided India
Area in million acres	11·5	3·4	14·9
Yield per acre in Lbs.	90	188	113
Production in lakhs of bales of 392 lbs. net :			
¾" and above ..	4·5	5·4	9·9
Below ¾" and above 11/16".	13·0	7·9	20·9
11/16" and below ..	8·5	2·7	11·2
Total Crop ..	26·0	16·0	42·0

The total mill consumption for the country in the same year was 39·4 lakh bales. Out of this, the Indian Union used up 38·6 lakh bales composed of 21·8 lakh bales of Indian cotton, 9·8 lakh bales of Pakistani cotton and 7 lakh bales of other foreign cotton. Quality wise, short-staple (11/16" and below) cotton amounting to 5·4 lakh bales was exclusively indigenous. In the medium staple (above 1/16" but below ¾"), 12·5 lakh bales were of Indian origin and these were supplemented by an intake of 5·6 lakh bales of Pakistani cotton. On the other hand, the main source of long-staple cotton was non-Indian, Pakistani and other foreign growths accounting for 4·2 lakh bales and 7·0 lakh bales respectively out of a total of 15·1 lakh bales.

The statistical position of cotton in the Indian Union during the four seasons of the post-partition period is summed up in the following table :—

(In lakhs of bales)

	1947-48	1948-49	1949-50	1950-51
Opening Stock	41·27	31·36	16·84	17·16
Production	31·90	23·00	29·71	33·00
Imports—				
Pakistan	4·08	3·40	—	0·07
Other Countries	6·92	7·38	12·51	8·28
Total Supply	84·17	65·14	59·06	58·51
Mill Consumption	42·11	42·55	38·85	36·10
Exports	8·00	3·05	2·35	1·69
Extra Factory Consumption ..	2·70	2·70	2·70	2·70
Total Distribution ..	52·81	48·30	41·90	40·49

It will be seen from the above that the country had eaten up 24·43 lakh bales out of its carry-over during the first two years of the partition and even after raising the domestic output by 6·71 lakh bales and cutting down mill consumption and exports by nearly 4·4 lakh bales. The Government of India had to make special arrangements for importing 12·5 lakh bales in 1949-50. Following the stoppage of trade with Pakistan in this season, imports from the U.S. were stepped up from 0·1 lakh bales in 1948-49 to 2·8 lakh bales in the following year.

The problem of feeding the large cotton textile industry thus became acute. Broadly, it was as much the creation of Pakistan as of Government's policy to encourage food crops in preference to cash crops. In the two years preceding the war, the average acreage under cotton in the tracts now lying in the Indian Union was 20·97 million acres and the output 4,059,000 bales. Even in 1941-42 season the cotton production was 4,424,000 bales from 20·47 million acres. The difficulty in selling cotton abroad, followed by a rigid control of raw cotton prices at uneconomic levels and restrictions on cotton acreage, brought down the area under the crop as well as its size to 10·66 million acres and 2,188,000 bales in 1947-48 season. The next year's adverse weather conditions gave a fresh blow to the human effort and though the area under cotton rose to 11·29 million acres, the crop was reported to be the lowest at 1,767,000 bales. It was, however, in 1949-50 that the stoppage of trade with Pakistan following the exchange deadlock that the danger of excessive dependence on outside sources was specifically brought home.

Planning.—Early in 1950 the Government of India decided to take measures for stimulating cotton production. Under the short-term plan brought into force immediately, (1) all restrictions on cotton cultivation were removed, (2) irrigation facilities were made available, (3) land revenue was remitted in respect of land newly brought under cotton cultivation, (4) the States were guaranteed that the resultant loss in their food supply would be made good by the Centre and (5) the basic ceiling prices were raised for 1950-51 season by Rs. 150 per candy.

Simultaneously, a detailed plan for each State was prepared in order to increase cotton production by six lakh bales over 1949-50. Owing to bad weather, however, the actual output in 1950-51 could show a gain of a little over three lakh bales. To provide fresh incentives the following season, Government raised the ceilings by another Rs. 50 and the target was fixed at 40 lakh bales. The actual crop is not, however, likely to exceed 35 lakh bales owing, once again, to adverse weather.

The problem diagnosed by the Indian Central Cotton Committee revealed that India would require a supply of at least 39 lakh bales of Indo-Pakistani varieties if she were to export 2·70 lakh bales of short-staple cotton which were unwanted. These would be composed of 8·75 lakh bales of long staple, 19·92 lakh bales of medium staple and the rest of short-staple. Since the actual out-turn in 1949-50 was 29·71 lakh bales, it was concluded that self-sufficiency could be achieved only by raising the production of long-staple and medium growths by 94 per cent and 27 per cent respectively.

According to the Draft outline of the five-year Plan, an increase of 12 lakh bales in the cotton production has been estimated during the five years (1951-52 to 1955-56) covered by the Plan. The regional distribution is as follows :—

Bombay 168,000 bales, Saurashtra 159,000 bales, Madras 218,000 bales, Madhya Pradesh 128,000 bales, Madhya Bharat 91,000 bales, Hyderabad 88,000 bales, Punjab 79,000 bales, Rajasthan 75,000 bales, PEPSU 56,000 bales, Uttar Pradesh 46,000 bales, Mysore 75,000 bales and other States 17,000 bales.

CENTRAL COTTON COMMITTEE

The constitution of the Indian Central Cotton Committee in 1921 was an important landmark in the history of this leading cash crop of the country. The introduction and extension of superior varieties of cotton on which the Committee annually spends about Rs. 10 lakhs

has gradually changed the face of Indian cotton. The production of medium and long staple cotton (⅞ inch and above) increased by 95 per cent. between 1922-23 and 1943-44, while that of short staple cotton (below ⅞ inch) dropped by 49 per cent. during the same period. Prior to 1922, there was no production of cotton of one inch and above staple; but the same was placed in 1943-44 at 654,000 bales. Simultaneously, the Committee tackled the question of yield which rose from 96 lbs. to 109 lbs. in the quinquennium 1937-42 and to 112 lbs. in 1943-44. The bulk of the benefit was, however, derived by cotton tracts which are now within the territories of Pakistan.

In view of the country's heavy dependence on foreign cotton especially of long staple, the committee has of late financed certain schemes. The possibility of bringing the entire winter Cambodia area in Madras with extra-long staple varieties is being surveyed. Work for producing long staple cotton in the canal irrigated area of Punjab is in progress. The major irrigation projects now under construction in Punjab, Madras, Bombay and Hyderabad may bring about four million acres of new land under irrigation. Another six million acres might be reclaimed from fallow and waste land. Should these calculations prove correct, the problem of cotton shortage will be brought within the exact of solution.

COTTON TRADE

Bombay has been the heart of the cotton trade for the past one hundred years. From here has spread a network of regulated markets throughout the cotton growing tracts. Trading in futures forms an integral part of the market in Bombay. This was organised first in 1921 under the Cotton Contract Control Act whereby the East India Cotton Association was recognised by the Government of Bombay. Government enacted in 1932 the Bombay Cotton Contracts Act which confined its limit to the city of Bombay and Salsette. It stipulated that the by-laws of the recognised associations were subject to the approval of Government and contracts not in accordance with such by-laws were void.

A radical reform in the structure of the forward market in cotton was introduced in 1947 following the report of the Bombay Cabinet on the control of forward trading in Bombay State. It vested the monopoly of organising hedge trading in cotton in the East India Cotton Association, conferred powers on the Government of Bombay to impose by-laws on this Association and to nominate four members on the Board, and stipulated that the membership will be open without limit. It also paved the way for the merger of the Mahajan Association into this Association. The question of setting up regional markets in the State is being investigated by a committee.

Until the outbreak of the war, forward trading was covered by three contracts denominating three principal groups of Indian cotton. Broach was the best cotton grown in Western India; Bengals was the name given to the varieties grown in the north; Oomras covered growths in Madhya Pradesh and the surrounding area. Besides, there was another group classed as Southerns embracing cotton in South India.

These contracts were replaced in 1942 by a single contract, known as the Indian cotton contract with Khandesh Jarilla of ¾" staple as the basis along with other varieties having staples between ¾" and ⅞" tenderable against it. This contract was specifically devised to suit the wartime conditions and a post-war contract was introduced for the 1948-49 season. The principal changes in the contract are: (1) Raising of the basic staple length of Jarilla to 25/32" with a tolerance of 1/32". (2) Raising of the basic staple length of Broach to 25/32" with tolerance. (3) Lowering of staple basis for Westerns to 25/32" with 1/32" tolerance and for Coomptas to 27/32" with 1/32" tolerance. (4) Making Surti, 289F and Cambodia cottons tenderable upto 15/16" and inclusion of Dholleras, Kutch, Bijapur, and Bagalkot cottons among tenderable varieties. (5) Exclusion of Pakistan styles from tenderable varieties. (6) Abolition of upcountry tenders except in the event of an emergency. (7) Restriction of tender months to February, May, July and September.

During the last three decades of the nineteenth century, Broach contract declined from Rs. 255 to Rs. 150¼; but the upward movement that followed thereafter lifted it to Rs 561 by 1923-24. Once again, it had a setback and Japan's decision to reduce purchase of Indian cotton brought down the quotation to Rs. 157 in 1937. The initial period of the war was marked by a subdued tone owing to the loss of overseas markets; but the introduction of the Indian cotton contract to replace the Broach and allied contracts was signalised by a revival of speculative activity. On March 12, 1943, this contract touched Rs. 637 and the Government of India closed down the futures market on May 1, 1943. This was followed by the official regulation of the movement of cotton, fixation of floors and ceilings and the resumption of trading in new crop on the basis of a new contract. In September 1947, the contract remained grounded at the floor level of Rs. 430; but trading in new crop contract for the 1947-48 season started with a bullish tone and both May and July contracts touched Rs. 712 on April 9, 1948 and an emergency was declared by the Board. After it was annulled, the May contract touched Rs. 798. Since August 1948 the futures market was controlled by the cotton control.

Since the beginning of the 1948-49 season cotton prices ruled at or above the official ceilings with the result that forward trading could be had only for a few days in a year. In 1949-50 the actual prices ruling in the upcountry centres were far in excess of the ceilings. In the following year the Government of India raised the maximum prices by Rs. 150 per candy in order to provide an incentive to the cotton grower; but the Indian cotton prices being out of tune with the world price level, the administration of control became difficult, Government were obliged to introduce monopoly buying and all varieties of cotton, irrespective of their quality, had to be purchased at the maximum permissible price. In 1950-51 also the futures market remained closed because the cotton prices were threatening to pierce through the ceilings.

EXPORT TRADE

Until 1936-37 Indian cotton had assumed importance because of its value in the export market. Nearly half the output of cotton of undivided India used to be shipped abroad. Among them, Japan was the most important customer. In 1937, Japan switched over its purchases to China and exports fell precipitately from the all time record level of 4,268,000 bales during the year ended March 31, 1937 to 2,703,000 bales in the following year. The bottom was knocked out by the initial war reverses and exports were reduced to only 282,000 bales in 1943-44. Exports began to look up thereafter reaching 911,000 bales in 1946-47. The period of free exports was extended upto November 30, 1947 after which date, export of Indian cotton of staple 13/16" and above was banned. On January 19, 1948, the statutory floors and ceiling prices were abolished and exports of cotton were restricted to Bengal Deshi, Oomra Deshi, Mathia, Assams and Commillas and the export duty was doubled from Rs. 20 per bale to Rs. 40. On March 15, 1949, exports were totally banned in view of the growing seriousness of the stock position, but an exception was made in favour of hard currency countries. In December 1949 the Government of India fixed an export quota of two lakhs bales for the 1949-50 season and limited the exportable varieties to Bengal Desi, Mathia, Assam and Comilla.

Early in November 1950, an ordinance was issued by the Government of India enhancing with immediate effect the export duty on raw cotton from Rs. 100 to Rs. 400 per bale. Simultaneously, export duty at 50 per cent *ad valorem* was imposed on cotton waste. The duty on raw cotton was halved to Rs. 200 and that on soft cotton waste was reduced from 50 per cent to 30 per cent on March 14, 1952 following the crash in commodity markets and the difficulty in selling abroad. The trend of exports has been summarised in the chapter on Trade.

IMPORT TRADE

A word at this stage about imports of raw cotton has been rendered necessary owing to the fall in domestic production consequent on the partition of the country. Until 1928-29 imports averaged a lakh and a half bales; but the growing tendency among mills to switch over to finer counts rendered higher imports obligatory. Another development was the virtual disappearance of imports of Persian growths by 1937-38. Following the partition of the country imports of cotton supported nearly one-third of the activity in the cotton mills. Trends in imports have been reviewed in the chapter on trade.

The statistical picture as presented by the *official sources* has been presented earlier in this chapter. According to the trade, however, the crop estimate is lower and consequently, the carry-over for the next season is placed at 15¼ lakh bales as against 18 lakh bales claimed by the official sources.

Owing to the tight supply situation and the boom in the world cotton market which lifted the New York quotation for middling 15/16" to 45·76 cents per lb. the administration of the control bristled with difficulties. The prices tended to pierce the official ceilings and Government had to resort to sealing off the tracts and appoint their own nominees for the marketing of the crop. This had a salutary effect on the feverish activity but the nominee system had to be ended following the judgment of the Madras High Court that the order was unconstitutional and void.

RECENT DEVELOPMENTS

According to the trade estimates the Indian cotton year, 1951-52, opened with a carry-over of 15·32 lakh bales including three lakh bales of foreign cotton. The estimated crop of the year was 35 lakh bales, while imports were expected to be, on the basis of firm commitments, 14·25 lakhs of which Americans would account for 11·25 lakhs. This would mean a total supply of 64·58 lakh bales for the season. Until December 1951, the authorities were at pains to ensure the success of the cotton control while there was literally a scramble for buying cotton. The change in the Bank rate and disinflationary policy pursued by the Government had, however, adverse effects on the buyer's psychology and the sentiment was depressed after the turn of 1951 following the crash in Alexandria, the recession in the world trade in cotton textiles and the evaporation of the seller's market in raw cotton throughout the world. Conditions deteriorated in February 1952 and the first week of March witnessed heavy liquidation in all the commodity markets throughout the country. The cotton market had its own share and in Bombay, *Jarilla* slumped from Rs. 845 to Rs. 625 bringing down along with it other varieties.

The change had far-reaching repercussions. Mills suddenly withdrew from the market and importers were left with huge stocks of foreign cotton to be financed with costly bank credit. On the other hand, the absence of buyers for Indian cotton had an adverse effect on the cotton markets in the interior. This development prompted the Government of India to halve the export duty on raw cotton and reduce the export duty on cotton waste from 50 per cent to 30 per cent. Even then enquiry from abroad for Bengal Desi had not appeared. To reduce the pressure of stocks on the domestic market, the Government of India relaxed the distribution control in the middle of March and this was followed by the abolition of the control on cotton seed.

COTTON MILL INDUSTRY

The Indian cotton textile industry, as we see it today, is only one hundred years old. Though the first unsuccessful venture was launched at Calcutta in 1820, Bombay had the privilege of establishing the first cotton mill of the country in 1854. The pioneer was an Indian, Mr. Cowasjee Nanabhoy Davar. The American Civil War gave a fillip to India's trade and industry and by the end of 1861 there were nine mills in Bombay and in the following twenty years 47 mills were erected. The high dividends paid by these mills attracted more capital and enterprise to the industry and, for the first time, the tendency of setting up mills in the cotton growing tracts became visible. At the end of the nineteenth century, there were 193 mills equipped with 4,945,783 spindles and 40,124 looms and had a capital investment of Rs. 14 crores. On the eve of the First Great War, the number rose to 271 with a capital investment of Rs. 20 crores.

During the war, the industry was able to earn huge profits owing to cessation of foreign competition and paid fancy dividends. This attracted fresh investors and between 1920 and 1925, as many as 84 mills were erected in the country at a cost which was later found to be inflated. The year 1929 saw the onset of world depression which became severe for the cotton textile industry owing to the intensification of Japanese competition, and, under the protective umbrella, the industry had to put its house in order. By the time the Second World War broke out, the industry had firmly entrenched itself.

In the inter-war period, the number of mills increased from 258 to 389, of spindles from 6.7 millions to 10 millions and of looms from 118,000 to 202,000. The production of yarn more than doubled in weight and of piecegoods nearly trebled in length with the result that the share of imports in the country's cloth supply dropped from about four-fifths to less than a fifth. The period also witnessed the introduction of numerous technical improvements, installation of modern equipment and the development of new bleaching, dyeing, printing and finishing processes which in turn, enabled the industry to produce a wide range of cotton goods to suit the complex tastes of the vast population.

The Second World War brought a fresh boom to the industry. With the British textile industry geared up to the war and the entry of Japan into it, India virtually enjoyed a monopoly. To meet the growing demand for cotton goods, the industry raised its output and created a production record of 4,870.6 million yards of cloth and 1,680 million lbs. of yarn during the year ended March 31, 1944. The decline in the following two years was caused by shortage of coal; unstable political conditions adversely affected production in 1947 and 1948 and shortage of raw material proved an important bottleneck in 1949 and 1950.

The position of the industry may be summed up in the words of the committee of experts of the United Nations which, in its report on the cotton textile in the ECAFE region prepared in 1948, said: "In India, the textile industry today, on the basis of capital invested, labour employed and money value of the output, is the biggest of the factory industries with a block capital of Rs. 1,000 million and providing employment to 500,000 to 600,000 workers. The total value of production at current prices is approximately Rs. 4,000 millions." The report ascribes the fall in output from 4,688 million yards in 1945 to 2,838 million yards in 1947 to (1) strikes and lockouts, absenteeism, slackness in the efforts of labour, communal troubles, (2) reduction in working hours from nine to eight per shift, (3) gradual change over to more remunerative fine counts, and (4) old worn out machinery and short supply of parts.

Until 1929, Bombay occupied a leading place in the location of the industry and though the industry in this city has not expanded after 1929 and the number of mills has fallen by 16 in the following years, the State still continues to play the leading role. The tendency towards a wider dispersal of the mills is due to supply of raw material and consumers near them. The following table gives details about the distribution of mills in India, together with particulars for Pakistan, as on August 31, 1951:—

Cotton Spinning and Weaving Mills Working as on August 31, 1951.

Where situated	Number of Mills	Number of Spindles installed	Number of Looms installed	Average No. of Hands employed	Approximate Quantity of Cotton consumed		Remarks
					Cwts.	Bales of 3½ cwts.	
Bombay City and Island ..	65	29,39,162	65,384	1,11,713	32,39,761	9,25,646	1 Mill not working

Total: Pakistan	27	3,36,810	5,562	11,538	3,04,976	87,136	

*This number does not include 26 mills which have either been registered and/or are in course of erection.

The industrial census undertaken in 1948 reveals a steady advance on the part of the cotton textile industry in its structure in the post-war period as is evidenced by the following table:—

Particulars	Unit	1946	1949
No. of factories registered	1,000	483	584
Fixed capital	Rs. crores	55	56
Inventory (raw materials, fuels, finished product, etc.)	,,	75	113
Employment	Thousands	651	698
Wages and salaries (mixed wages)	Rs. crores	51	88
Value of materials consumed (mostly raw materials, chemicals, fuels, etc.)	,,	129	216
Value of products	,,	226	324
Value added by manufacture	,,	97	108
Production: Yarn	Million lb.	1,368	1,356
Cloth	,,	3,912	3,900

The magnitude of the industry can be gauged from the fact that in 1948 it consumed over 2 million tons of coal, coke, charcoal and firewood, 46 million gallons of fuel oil, 874 million KWH of electricity, 66,444 million gallons of water, 2·3 million gallons of lubricating oil. The basic raw material consumed amounted to 3·7 million bales valued at Rs. 141 crores. Chemicals and sizing materials accounted for Rs. 6·34 crores while colours and packing materials cost Rs. 3·53 crores and Rs. 2·98 crores respectively. The value of mill stores was estimated at Rs. 13·19 crores.

The quantity of yarn produced in 1948 totalled 1,262 million lbs. of which 1,027 million lb. was up to 30 counts, 1,777 million lb. between 31 and 50 counts and 57 million lb. between 51 and 80 counts leaving one million lb. of more than 88 counts. Excluding the quantity used in factories, the mills produced in 1948

woven goods totalling 3,786 million yards. Grey varieties constituted 48 per cent. of the total with fancy designs of the same varieties placed at 46 per cent. This means that 94 per cent. of the output was in the category of utility goods. Dhoties accounted for 803 million yards of which 561 million yards were grey. Shirtings and long cloth of grey variety totalled 541 million yards and that of fancy 811 million yards, while printed ones accounted for 133 million yards. The total output of sarees was 494 million yards of which grey and fancy were 343 million yards and 149 million yards respectively. Cambrics, mulls, lawns and voils were mainly fancy, their output being 230 million yards, as against 64 million yards of print and 24 millions of grey.

The following table shows at a glance the progress made by the Indian cotton mill industry during the last forty-six years :—

Year ending August 31	Number of Mills	Number of Spindles installed	Number of Looms installed	Average No. of Hands employed daily	Approximate quantity of Cotton consumed	
					Cwts.	Bales of 392 lbs.
1904	191	51,18,121	45,337	1,84,779	61,06,681	17,44,766
1914	271	67,78,895	1,04,179	2,60,276	75,00,941	21,43,126
1920	253	67,63,076	1,19,012	3,11,078	68,33,113	19,52,318
1921	257	68,79,804	1,27,783	3,32,179	74,20,805	21,20,230
1922	298	73,31,210	1,34,620	3,43,723	77,12,390	22,03,540
1923	336	79,27,938	1,44,794	3,47,380	75,30,943	21,51,698

* Upto 1947, the figures are for undivided India. The subsequent details are for the Indian Union only.

TARIFF PROTECTION

Until the slump that followed the First Great War of 1914-18, the cotton textile industry had to depend on its own resources for survival and expansion. In the initial stages it had to counteract the activities of the British cotton textile industry which looked to India as a vital market. Following the latter's agitation against a revenue duty on imports of coarse yarn and cloth, it was finally abolished in 1878. Fifteen years later, the Indian mints were closed to the free coinage of silver. This resulted in a fall of about 12 to 15 per cent. in the exchange rate which, in turn, brought the export trade with China and Japan to a standstill. To make the situation worse, an excise duty of three and a half per cent. was imposed in 1896 on cloth manufactured in the country in order to offset the effect of the import duties which had been re-imposed in 1894 for revenue considerations. For more than three decades, the industry agitated for its abolition.

The beginning of the twentieth century signalised the growth of industry in China and Japan which were India's markets at one time, and the depression that followed the First Great War became particularly severe owing to Japanese competition in the home market. In August 1925, a deputation representing the Millowners' Associations of Bombay and Ahmedabad waited on the Viceroy; but on failing to get the excise duty abolished, the industry reduced the wages by 11¼ per cent. This measure brought in its turn a wave of labour strikes and the depression deepened.

A Special Tariff Board was appointed to inquire into the position of the industry in 1926 and simultaneously the excise duty was abolished. (A detailed history of the tariff protection appears in the previous editions of the *Year Book*.)

TEXTILE CONTROL

It was mentioned earlier that the outbreak of the Second World War created an unprecedented demand for Indian cotton goods. The demand began to outstrip supply from 1940 onward and the situation worsened as Japan advanced towards Burma. Cloth prices began to soar rapidly and the consumer was hit badly. By May 1943, cloth prices reached an all time record level and the Government of India issued in June 1943 the Cotton Cloth and Yarn (Control) Order with the object of making cloth available to the civil consumer at a reasonable price. Under this Order, the Textile Commissioner was the administrative head of the control and a Textile Control Board was set up to advise Government through the Textile Commissioner on matters connected with the control of cotton, yarn, cloth and textile auxiliaries.

Under this control, (1) ceilings were imposed on ex-mill, wholesale and retail prices of cloth and yarn, (2) limits were laid down for holding stocks of cloth and yarn by mills and dealers, (3) movement of cotton and cloth was controlled, (4) prices were required to be stamped on cloth, (5) cotton prices were allowed to fluctuate within a range of maximum and minimum prices fixed by Government which had powers to requisition cotton at ceiling prices, and (6) price movement of mill stores was regulated. In May 1945, the control was further tightened by fixing quotas of cloth for each State in order to facilitate the introduction of cloth rationing and by making it compulsory for mills to use ninety per cent. of their weaving capacity for producing utility cloth. The latter proved unsuccessful within a few months and for the first time since 1940, cloth consumption began to fall.

Between June 1943 and December 1945, the control had helped in bringing down cloth prices with the co-operation of the industry, and the Economic Adviser's index number of cloth prices showed a fall of 251 to 262. Though the year 1946 and 1947 witnessed a rise in manufacturing cost and the industry agitated for an increase in prices, Government successfully resisted the demand. In January 1948, the price control was left to the industry and three months later the control was ended with an assurance to the consumer that it would be re-imposed if the experiment proved detrimental to national interests.

The abolition of control signalised a fresh wave of speculative activity and the prices of cloth began to soar once again. As a result, the control was re-imposed on July 30, 1948 and production control was introduced on November 30, 1948. The latter was amended in March 1949 in the light of the recommendation of a special committee and was finally abolished in September 1949.

During the decontrol period, the question of cloth prices had been investigated by the Tariff Board. In suggesting ex-mill prices the Board assumed that a rate of four per cent. on gross block was an adequate provision for depreciation every year. On December 14, 1948, Government accepted most of the recommendations of the Board; but millowners complained that *ad hoc* prices fixed under the Board's formula were unremunerative. In March 1949 the details of the new price schedule were circulated among mills by the Textile Commissioner. Almost simultaneously, Government extended the excise duty levied on January 1, 1949 on superfine cloth to fine and medium and coarse cloth. Thus, there was an additional burden of 25 per cent. on prices of superfine cloth in which warp yarn was of more than 48s, 6¼ per cent. on ex-mill prices of fine varieties and of three ples per yard on coarse and medium goods.

The Textile Commissioner announced on November 1, 1949 a cut of four per cent. in ex-mill prices of cloth and yarn. On February 1, the price structure was again revised on the basis of official ceiling prices for Indian cotton and actual prices of imported cotton. Since the latter meant a slight increase in prices, Government reduced the excise duty on superfine cloth to the same extent with a view to maintaining the *status quo* in respect of the retail prices to the consumer. The effect of the revision was that retail prices of fine and superfine remained unchanged, and there was a negligible reduction in prices of medium and coarse goods.

REVIEW OF 1951

The year 1951 was, on the whole fruitful to the cotton industry despite the tussle between the industry and the authority over the price control. Partly due to the improvement in the administration of the cotton control and partly on account of the timely efforts made by Government to secure raw cotton from abroad, the supply of raw material was fairly adequate at reasonable prices and with the demand for finished goods continuing to broaden the industry was able to raise the production substantially as will be seen from the following table :—

Monthly Average	Yarn (million lb.)	Cloth (million yards)
1946 ..	114	326
1947 ..	108	313
1948 ..	121	360
1949 ..	113	325
1950 ..	98	305
1951 ..	109	340

The first quarter was notable for a controversy over the prices since Government did not raise the prices of cloth following a rise of Rs. 150 in the cotton ceilings. Late in January, however the prices were revised, the increase being 7·5 per cent. for coarse goods, 15 per cent. for fine goods and 6 per cent. in the case of superfine varieties. The exclusion of medium cloth from the price review, however, intensified the millowners' agitation and in the first week of February a fresh announcement was made raising the prices of coarse counts by anything between 12·84 per cent. and 19·42 per cent. and between 2·64 per cent and 10·68 per cent in the case of medium varieties over 1950 end ceilings. On the last day of the month, the four per cent cut voluntarily effected in October 1940 was restored in respect of yarn in order to step up its supply to handlooms.

This revision proved inadequate in respect of cloth woven from imported cotton which enjoyed an exceptional boom and in April 1951 the prices of fine goods and superfine goods were further raised by 7½ per cent. and 33 per cent. while those of coarse and medium goods were increased by about 4 per cent. It was this increase which provided the real stimulant for broadening the activity in the mills. The latter half of the year, however, witnessed a downward trend of cotton prices in the world markets and the price mechanism evolved by the Tariff Board consequently called for a reduction in cloth prices in July. The cuts ranged between 1 and 1¼ per cent. in fine varieties and between 11·63 per cent. and 14 per cent. in superfine goods. A further lowering of prices was rendered necessary in the last quarter of 1951 for the same reasons, the extent of reduction being upto 4·70 per cent. in the fine group and upto 20 per cent. in respect of superfine goods.

There was no fundamental change in the control over production and distribution. The bulk of the output meant for domestic consumption was marketed through the State Government's nominees, while about a third was distributed by the mills through dealers of their choice.

EXPORTS

Prior to 1937 India's cotton textile industry mainly concentrated on the home market excepting in the war years. For the first time, the glut of stocks necessitated the mills in 1937 to explore foreign markets in the East with a view to enabling them to continue the double shift system. The outbreak of the war resulting in cutting off both Lancashire and Japan from Asian markets came as a boon to the industry and exports of cotton piecegoods reached 818 million yards valued at Rs. 38.76 crores in 1942-43. Then followed a set-back owing mainly to domestic shortage of cloth supplies and rising prices and by 1947-48 exports shrank to 192 million yards. The low export in that year was caused incidentally by the levy of an export duty of as. 4 per square yard with effect from November 1947. This was replaced by an *ad valorem* duty of 25 per cent. in March 1948 from which handloom cloth was exempted and the duty of as. 6 per lb. of yarn was withdrawn.

Exports became further difficult following the withdrawal of price control, and the subsequent re-institution, coupled with the reduction in export duty to 10 per cent. in November 1948, failed to push up exports of cloth and on March 26, 1949 the Government of India were obliged to impose price control on cloth shipped from this country. This had also no response from abroad. Government, therefore, abolished the export duty altogether in June. As a part of the measures to clear stocks and avoid mill closures, free export licensing of cloth and yarn upto 20s was introduced a month later. This enabled Indian cloth to have a price advantage over its competitors and exports began to look up despite the fact that Pakistan had by that time ceased to be India's customer. On February 1, 1950 the Central Government abolished price control on cloth exported, but directed the mills not to sell cloth to shippers at more than eight per cent. above ex-mill prices. This encouraged the industry to cater directly for export markets and there was a certain amount of confusion and dislocation of trade. Ultimately, a fortnight later, the restriction on prices to be charged to shippers was also withdrawn.

Textile exports touched an all time record level of 1,102 million yards of cloth and 85·1 million lb. of yarn in 1950. The year 1951, however, shifted the emphasis from export to home market. By April the per capita supply of cloth, mill and handloom had fallen by 9·7 yards and Government was obliged to tighten the export control. Even before the end of 1950 the orders booked for 1951 had exceeded 1,000 million yards and the ceiling of 840 million yards on export caused resentment both among exporters and importing countries. Besides, the method of allocating export quotas so as to favour uneconomic units and frequent changes in destinational quotas had adverse repercussions. Undeterred by these developments, the export duty on coarse and medium goods was introduced at 10 per cent in 1951-52 budget and pushed up to 25 per cent. in mid. 1951.

HANDLOOM INDUSTRY

Hand weaving has been the largest single unit among India's small scale industries controlled mainly by a small class of entrepreneur. It is also the oldest industry of the country. Yet very little information is available about it. It is essentially an urban industry and the combined capacity of India and Pakistan was placed in 1942-43 around 2,000 million yards. The industry was then reported to have two and a half million looms of which 64 per cent. were throw-shuttle looms and the rest fly-shuttle. The industry then supported about 2,400,000 weavers. Throughout the history of the industry, the supply of yarn was the factor governing its fortunes.

Prior to the First World War, the major portion of cloth supply was from this source; but the First World War reduced the production of handloom cloth from 1,088 million yards to 506 million yards. In the following years, the tariff policy of Government, *Khaddar* movement and the changing habits of the population adversely affected the fortunes of the industry and the final blow was given by the erection of power-looms. Apart from the drop in production, the fall in the wages of handloom weavers was severe by 1932-33, according to the Tariff Board.

The economic plight of the handloom weaver focussed the attention of the Government of India and State Governments on the remedial measures and as a result of the recommendations of the Industries Conference held in 1933, the Centre distributed Rs. 50 lakhs as a grant to the industry. This grant helped the State Governments to launch schemes for marketing of handloom cloth and improvement of its designs. The grant was finally stopped in April 1947.

The hope that the Second World War would give a fillip to the industry did not materialise owing mainly to shortage of cotton yarn. The Government of India, therefore, appointed a Fact Finding Committee in 1943 to undertake a comprehensive survey of the industry and suggest remedial measures. The establishment of the Cottage Industries Board in August 1948 marked a fresh milestone in the history of the industry. It was followed by the appointment of a Standing Handloom Committee for which a grant of Rs. 10 lakhs was given. As a result of its deliberations, the question of reserving a section of the field for handloom has been engaging Government's attention.

Throughout 1949, the industry's position was rather bad mainly because of the change in the market from sellers' to that of buyers'. The high cost of production could not be offset by the excise duty on mill cloth and even the relief in freight could not bring a tangible relief. Owing to a fall in exports, especially to Pakistan which ceased buying from India in September 1949 and reduced purchases in the Indian market, the industry had to accumulate stocks and was unable to use its full quota of cotton yarn.

During 1950 the prospects for the industry brightened following the re-emergence of a sellers' market; but the shortage of yarn was a source of great distress. The supply of yarn in 1950 was approximately 52 per cent of the quantities made available in 1946.

Early in 1950 the All-India Handloom Board constituted in 1949 was replaced by the Standing Handloom Committee which recommended the reservation of certain fields of cloth manufacture exclusively for the industry. Government accepted the recommendation on May 8, 1950 and the Textile Commissioner notified that the mills and power looms would not be entitled to manufacture with effect from July 1, 1950 the following varieties: dhoties with border exceeding ¼" or with borders having zari, muga or artificial silk yarn, checked lungis, gumchas and chaddars, bedcovers and certain varieties to bedsheets, counterpanes, tablecloths, napkins, gauze, bandage and jaconet cloth and dusters and coarse cloth of plain weave. It was also announced that Government had decided to

reserve the manufacture of coloured and checked sarees and honeycomb towels for the handloom industry, but that orders would be passed only after the present shortage was eliminated. On June 19, 1950 mills were directed not to manufacture for internal distribution sarees with borders exceeding 2¼" in width or with zari or gold coloured art silk yarn in the border and/or with coloured yarn in the body.

In 1951 the yarn supply for the industry was better and its production consequently showed a handsome gain. According to the Industry Minister the supply of cotton yarn towards the end of 1951 was 60 million lb. a month as against 30 million lb. a year ago.

The following table gives at a glance the trends in the post-partition period :—

	1947-48	1948-49	1949-50	1950-51
No. of Mills	408	416	420	420
Spindles (000s)	9,764	10,145	10,366	10,999
Looms (,,)	197	197	198	194
Yarn (Million lb.)	1,329	1,476	1,303	1,197
Mill made cloth (million yards).	3,770	4,298	3,831	3,718
Handloom cloth (million yards)	1,230	1,170	1,140	750
Exports (million yards) ..	192	340	689	1,269
Per Capita Supply	14·1	15·0	12·6	9·7

DEVELOPMENTS IN 1952

Throughout 1951 cloth prices commanded a fancy premium over the official prices owing to the demand outstripping supply. With the opening of 1952, however, the consumers showed resistance to higher prices in the wake of a downward trend of demand as well as prices abroad, and goods began to accumulate in the market. Nevertheless, the millowners continued to agitate for revision of the price structure, the basis for which was laid down by the Tariff Board in 1949. In Bombay production suffered owing to the cut in power supply and yet the market appeared to be well-stocked. Fears that there might be a shortage of cloth prompted the Textile Control Committee to think in terms of launching a drive for raising the production of utility goods. This psychology of scarcity, however, received a certain jolt in February when it was known that the quota of cloth export for the first half of 1952 composed of 250 million yards, together with a carry-over from the preceding season of 150 million yards, might not be lifted. The next stage was a crash in the commodity market in the first week of March and its repercussions on the cloth market. The resultant demoralisation was so heavy that premiums on the official ceiling prices were not only wiped out but cloth was offered in most cases at below the official ceilings. Even then, the State Governments were unwilling to lift the quotas.

To remedy the situation the Government decided not to allocate superfine and certain varieties of fine cloth to the States after the end of the financial year, leaving the industry free to market these varieties. Simultaneously, restrictions on the export of cloth to Aden, Hong Kong, Malaya, Djibouti and Macao and Tangier were removed with immediate effect and diversion of destinations was permitted.

THE TOBACCO INDUSTRY

THE Portuguese are credited with having conveyed the tobacco plant and the knowledge of its properties to the sub-continent about the year 1508. Though there are many species in the genus *Nicotiana*, the tobacco of commerce comes only from the two species *Nicotiana tabacum* and *Nicotiana rustica*. Of the two, the former is more common and also commercially more important.

The Indian Union is one of the principal tobacco producing regions of the world, being third after U.S.A. and China.

In 1949-50, the area and production of tobacco in the major tobacco growing areas was as follows :—

Area.	Acreage.	Yield (Pounds).
Ajmer	8	2,877
Assam	664	390,073
Bihar	35,155	47,131,705
Bilaspur	160	54,805
Bombay	165,941	88,852,074
Coorg	28	8,697
Madhya Pradesh ..	2,475	924,235
Delhi	863	1,790,717
Himachal Pradesh ..	365	119,386
Punjab	6,129	6,052,600
Madras	304,185	273,853,207
Orissa	9,927	4,975,406
U. P.	40,387	77,131,359
West Bengal	5,833	4,162,110
Rampur (U.P.)	303	277,445
Not allotted	500	537,223
Grand Total ..	572,923	506,263,919

RESEARCH

A great deal of research work has been done in the sub-continent during the last 30 years both by the Government and by private agencies.

A sum of rupees ten lakhs is now being annually set apart for research, development and marketing work on this commodity, out of the receipts of excise duty which is being levied on tobacco since April 1943.

The Government of India have set up an Indian Central Tobacco Committee on the lines of the Indian Central Sugarcane Committee and other Central Commodity Committees already functioning. This Committee whose jurisdiction is now limited to the Union of India is fully representative of all interests relating to tobacco from the grower to the consumer, including research workers. This Committee came into being in November, 1945, and the annual grant of Rs. 10 lakhs set aside for the improvement of production and marketing of tobacco has been placed at the disposal of this Committee.

The Committee has already established a Central Tobacco Research Institute at Rajahmundry (Madras) for fundamental research on all types of tobacco, a Cigarette Tobacco Research Station at Guntur (Madras), a Bidi Tobacco Research Station at Anand (Bombay) and a Main Experimental Research Station for Cigar and Cheroot Tobacco at Dindigul (Madras) and a Hookah and Chewing Tobacco Research Station at Pusa (Bihar). Laboratories for these stations have yet to be constructed and equipped. Of these, as a measure of economy, research on Bidi tobacco conducted at the Bidi Tobacco Research Station at Anand has been transferred to the Institute of Agriculture, Anand and the Cigarette Tobacco Research Station has been converted into a field-cum-sub-station of the Central Tobacco Research Institute, Rajahmundry. In addition, the Committee is intending to establish a main experimental Research Station for cigar wrapper-tobacco in West Bengal of which soil and climatic conditions are considered to be suitable for producing quality wrapper-tobacco for use in the country's cigar manufacturing industry.

Each Main Station will have sub-stations for the particular types of tobacco. A sub-station for hookah and snuff tobacco at Ferozepur (Punjab) and a sub-station for Bidi tobacco at Nipani (Bombay) have already been started. Sub-stations for cigarette tobacco will be started in due course. The Committee is already carrying out exploratory survey work with a view to determining the location for such sub-stations in the various parts of the country in so far as their suitability is concerned. In conjunction with the Madras Government the Committee has undertaken the production and distribution of H. S. 9 seed to the cultivators with a view to ensuring uniform production of good quality Cigarette tobacco. It has also undertaken the demonstration of the correct methods of cultivation, handling and curing of cigarette tobacco to enable the cultivators to adopt these methods and increase their yield. Experiments on the shade cultivation of wrapper tobacco is in progress.

The Committee's headquarters are in Madras.

The Cigarette Tobacco Research Station at Guntur has evolved a strain of cigarette tobacco, *viz.*, Amarelo 5 which is better than the standard imported American variety of Harrison Special, in that it gives a higher yield of top grades bright leaf, cures better and matures earlier. This strain however possesses a flavour which is generally not liked by English smokers. In order to do away with this flavour, the Committee is making crosses with Amarelo 5, so that if a strain retaining its parental characteristics but without this flavour is evolved, it may be introduced into U.K. markets.

The Indian Agricultural Research Institute, at New Delhi, isolated Pusa T. 28 and T. 63 among *N. tabacum* varieties and Pusa T. 18 among *N. rustica* for chewing and *hookah* purposes respectively. Details of the methods of flue-curing of Virginia tobacco were worked out in 1928.

At the Tobacco Research Station at Nadiad, the Bombay Department of Agriculture, isolated Gandiu 6, Pilu 45, Kelin 28 and Kallu 49, heavy yielding *bidi* and chewing tobacco strains. Attempts are also being made to improve the Nipani tobacco at the Tobacco Research Station at Nipani.

The Madras Department of Agriculture at the Agricultural Research Station at Guntur isolated the high yielding strain T. 20 in *Natu* or country tobacco for *cheroot* and pipe purposes and early maturing strain (HS 9) of Harrison special, the cigarette tobacco variety which is very popular in India and Pakistan.

The Tobacco Research Sub-station at Guntur for the improvement of the quality of cigarette tobacco found that jowar (*Andropogon Sorghum*) as a preceding crop to tobacco helped to improve the quality of cigarette tobacco better than maize and variga (*Panicum Miliaceum*).

The India Leaf Tobacco Development Company, the largest buyers of tobacco in India have been experimenting since 1920, chiefly in the Guntur area (Madras) and also in Saharanpur (Uttar Pradesh) and Whitefield (Mysore State), on the commercial possibilities of Virginia tobacco production and have helped to build up the Virginia Tobacco Industry to the position it now occupies.

The cultivation of Virginia tobacco in the Mysore State has increased appreciably during recent years due also to the impetus given by the Mysore Tobacco Company.

MARKETING

The marketing survey of tobacco conducted by the Agricultural Marketing Adviser to the Government of India revealed the urgent need for standardising the methods of grading and preparing tobacco before putting it on the market. With a view to assisting the trade in this direction, the Indian Tobacco Association, which consisted of representatives of growers, dealers and manufacturers, was formed at Guntur. Since then, another association known as the East India Tobacco Federation, has come into being with the same object in view. Under the Agricultural Produce (Grading and Marking) Act, rules were framed in 1937, laying down grade designations, definitions of quality, methods of marking and packing for unmanufactured flue-cured and sun-cured Virginia and sun-cured *Natu* (country) tobacco. Grade specifications for unmanufactured sun-cured Jutty (Madras), sun-cured *Motahari* (Nicotiana Rustica), Jati Bishpath (N. Rustica) and Jati tobacco (N. Tabacum) all grown in the Bengal area have since been prescribed.

With a view to controlling the quality of tobacco exported from the country, the Government of India have banned under the Sea Customs Act of 1878 the export of unmanufactured tobacco of flue-cured and sun-cured Virginia, sun-cured *Natu* (country), *Motahari* and Jutty grown in Madras, Jati and Jati-Bishpath grown in West Bengal, Top Leaf and White Burley and sun-cured *Desi* tobacco (*N. tabacum*) of chewing type grown in Bihar. An inspectorate staff was appointed in 1945 consisting of a Chief Inspector and several Inspectors for examining the quality of tobacco and for supervising its grading on the basis of specifications laid down for Agmark grades. The staff was considerably augmented at the beginning of 1946. A panel of members from the trade has also been set up to settle disputes between the Inspectorate and the authorised packers in respect of the quality of tobacco.

The total quantity of tobacco graded during the period from April 1950—March 1951, was 272,359 packages containing 88.88 million lb. valued at 11.93 crores of rupees. The details and particulars are given as under :—

Kinds of Tobacco.	Quantity (in lb.).	Value (in Rs.).
Flue-cured Virginia ..	76,856,710	11,26,45,052
Sun-cured Virginia ..	707,120	5,61,067
White Burley ..	585,910	4,70,437
Sun-cured *Natu* (Country)	8,039,650	55,14,004
Jutty	2,688,000	6,46,924
Motahari	6,000	8,969
Grand Total ..	88,883,390	11,98,46,453

Another important aspect of marketing improvement is the regulation of markets. Attempts at regulating the market charges for tobacco have been made only in Madras so far, where the provisions of the Madras Commercial Crops Markets Act were applied to tobacco in Guntur District and Bezwada taluq of Kistna District in 1939. In this connection, the Guntur Tobacco Market Committee was set up in the same year, and this Committee took up the regulation of market practices regarding weighment, trade allowances and methods of sale. Market yards have been opened by the Committee where the growers and dealers are given facilities for transacting their business in tobacco. This Committee is also attending to the dissemination of market news and propaganda for improving the cultivation of tobacco.

As a first step towards improvement in the present system of marketing of tobacco in India, the Indian Central Tobacco Committee, in collaboration with the Government of Madras,

under the provisions of the Commercial Crops Market Act, has organised from 1950 marketing season open sales system of compulsory buying and selling of tobacco in auction floors of the Guntur Tobacco Marketing Committee in one centre of the Guntur District (Madras), so that the grower may get fair price for his produce. The ruling prices of tobacco both in the country as well as outside it are notified for the information of the growers and merchants.

A scheme of compulsory buying and selling in market yards of specified markets will be started in other trading and assembling centres of tobacco in South India which is the largest area for tobacco production, if the experiment proves successful in Guntur.

With a view to effecting improvement in the existing condition of marketing in India and to collect and disseminate the available marketing intelligence, the Committee has appointed a qualified Marketing Officer with whose help the Committee is issuing monthly bulletins giving necessary statistics on tobacco and a quarterly journal containing original researches and other useful articles.

For the benefit of the smaller growers in the Guntur area, the Committee is establishing a tobacco re-drying factory to be located at a suitable place. With a view to popularising Indian tobacco in European countries, finding out its sales and keeping the Indian exporters informed about its position in those countries from time to time, the Committee has appointed a Sales Officer in the U.K.

PRODUCTION

Indian production is concentrated in five clearly defined areas.

(1) THE GUNTUR AREA comprises the districts of Guntur, Kistna, East and West Godavary and adjoining portions of Hyderabad State. Varieties of *N. tabacum* are exclusively grown in this area. Prior to the introduction of flue-curing of Virginia tobacco in 1928, all the tobacco was sun-cured. The tobacco produced in this area is grouped into (*i*) Virginia :—(*a*), Flue-cured (*b*), Sun-cured, (*ii*) Country or *Natu* tobacco, invariably sun-cured. In the first group Harrison Special and in the second group *Thoka Aku, Kara Aku* varieties are important. Flue-cured tobacco is being used in the country and is also exported to the United Kingdom and other European countries, and Egypt for the manufacture of cigarette and pipe tobacco. The sun-cured Virginia and *Natu* tobacco are used for making cheaper cigarettes, etc.

The soils are deep, heavy black cotton soils and rich in lime. Tobacco seed is sown in Guntur in September and in other districts in October-November. Seedlings are transplanted from October to November. The crop is grown invariably without the help of irrigation and is harvested from January to March. The flue-cured Virginia tobacco is marketed from January to April while the sun-cured Country and Virginia tobaccos are marketed from March to June. There are nearly 7,700 flue-curing barns and the Virginia tobacco is cured by means of artificial heat radiated from hot iron pipes arranged on the floor of the barn. The sun-curing is done by stringing the leaf to jute twine and curing them on racks pitched on the open field for drying in the sun.

To the Indian Leaf Tobacco Development Company Ltd. goes the credit for establishing the industry of Virginia tobacco production and for assisting the growers in seed and seedling distribution, research and propaganda in manurial requirements, proper methods of curing and ensuring a market for the tobacco by buying the major portion of the production.

(2) THE NORTH BIHAR AND BENGAL AREA comprises the district of Muzaffarpur, Darbhanga and Purnea in Bihar and Jalpaiguri, Malda, Barhampore and Dinajpur in West Bengal. In this area both the *N. tabacum* and *N. rustica* varieties are grown. A major portion of the production of *N. tabacum* is utilised for chewing, while a fairly large quantity is used for cigar and cheroot manufacture. The production from *N. rustica* is utilised for hookah purposes.

The soils of North Bihar are light, ash-coloured, deep, and of Gangetic aluvium, rich in lime generally and in potash in isolated areas. The raising of seedlings commences in August and transplanting in October-November. The crop is generally not irrigated. Harvesting begins in February-March and the produce is ground-cured. It is marketed from April to the middle of June.

The soils of North Bengal are mostly alluvium. They are sandy loam, greenish white in colour and fine in texture. The depth of the soil varies from place to place. Moisture holding capacity is poor due to want of humus in the soil. The raising of the seedlings commences in September and transplanting in November. The crop is generally irrigated from wells. Harvesting begins from March. The produce is ground as well as rack-cured.

(3) THE CHAROTAR (GUJARAT) AREA comprises Anand, Borsad, Petlad and Nadiad talukas of Kaira District. This area is grown wholly with varieties of *N. tabacum*, chief among which are (*i*) *Gandiu*, (*ii*) *Piliu*, (*iii*) *Keliu*, (*iv*) *Kaliu*, (*v*) *Saijpuri*. Of late attempts have been made to grow a few acres under *Calcuttia* variety of *N. rustica*. The first three varieties of *N. tabacum* provide the *bidi* tobacco, while *Kaliu*, being irrigated with well water rich in salts (nitrates), is eminently suited for *hookah* and snuff purposes. *Saijpuri* is used extensively for chewing. Besides, the Bombay Department of Agriculture and the former Baroda State have worked for the introduction of Virginia tobacco cultivation in the area. The Virginia tobacco was successfully cultivated and cured over about 200 acres and serious attempts are being made to extend the area under this type.

The soils are light sandy loams to dark coloured heavy clays. Sowing is done in July and planting of seedlings in August. *Piliu* and *Keliu* are grown without irrigation, while *Gandiu* is grown dry or irrigated. *Kaliu* and *Saijpuri* are irrigated. The crop is harvested in December-January. The leaf is either air or ground-cured. The tobacco is sold from the latter half of December to the end of June with the peak period in March and April.

(4) THE NIPANI AREA includes the Belgaum and Satara Districts of Bombay along with Kolhapur, Sangli and Miraj. In this area varieties of *N. tabacum*, viz., *Mirji, Sangli, Nipani, Jawari, Kare Baglani* and *Surti* are mainly grown. Of the varieties of *N. rustica, Pandharpuri* is the one which is most widely grown. Except for the tobacco produced on the riverine soil, which is used as *Hathpan* for chewing, all the tobacco is converted into *Jarda* or *bidis*. The *Pandharpuri* tobacco is very strong, while the *Nipani* tobacco is very mild and sweet.

The soils are of trap and alluvial slate origin, black and deep heavy clays, though tobacco is grown on a small area on the red loams. The nurseries are sown in the middle of June and the planting is done in the first week of August. The crop is harvested in January and is ground-cured. Supply of tobacco to the market is greatest in February and March and starts dropping by June.

(5) THE SOUTHERN MADRAS AREA comprises mainly of Madura and Coimbatore Districts of Madras State. In this area, cigar filler and binder and chewing tobaccos are mostly grown. In Madura District well-drained soils particularly of sandy type and dark in appearance is preferred, though tobacco is also grown on red loam type. The nurseries are sown in December-January, transplanting is done after 45 days and harvesting in April, while in Coimbatore District the crop is grown in all types of soils with free drainage and good aeration. Sowing commences in November-December, transplanting in January-February and harvesting in February-March. In both the districts tobacco is ground cured and pit-cured.

Most of the tobacco exported from the country to Aden and other near-by areas is from the Charotar and Nipani areas. Apart from these four important areas, each State grows a fairly large quantity of tobacco mostly consumed in the respective areas themselves, and attempts are in progress, through *ad hoc* committees established for the development of tobacco to grow several different types, *e.g.*, cigarette, *bidi, hookah*, chewing and snuff tobaccos upto the limit of the areas' requirements in the first instance. The Indian Council of Agricultural Research, New Delhi, and the Indian Central Tobacco Committee, have been rendering great help in this direction.

Exports and Imports

In 1949-50 tobacco worth Rs. 241 lakhs was imported through India representing a decrease of 34 per cent. as compared with the value of imports in 1948-49. The total value of the tobacco exported from India in 1949-50 was Rs. 1,196 lakhs as against Rs. 826 lakhs in 1948-49. These figures refer only to export and import trade by sea and air registered at Indian Ports.

THE VEGETABLE OIL INDUSTRY

In the year 1951, the Vegetable Oil Industry followed the same pattern as in the previous year. The outbreak of the Korean war had given another spurt to the world demand for oils and fats and much higher prices were recorded in 1951 than in the previous year. Government controls on exports continued throughout the year with the result that conditions in the export market were frequently unsettled due to sudden changes of control regulations. Efforts of Government to bring down prices succeeded to a partial extent.

The world supply situation of oils and fats in 1951 showed considerable improvement. In his address to the International Association of Seeds Crushers last year at Brighton, Mr. J. C. A. Faure remarked that the world supply situation was definitely improving and the quantity of oils and fats entering the export markets had reached pre-war figures. According to him, high prices drew out larger supplies from all the producing countries. Since the last few years, China has again appeared in the export market for groundnuts and soya beans. Increasing supplies of copra are available from the Phillippines and Indonesia. U.S.A. continues to supply the export markets of the world with substantial quantities of soya beans, soya bean oil, and cotton seed oil.

ESTIMATED WORLD PRODUCTION OF OILS AND FATS

Year	World production	World population	Per Capita supply	Per Capita deficit on pre-war level	Quantity required to restore to pre-war per capita level
	000 M. tons	Million	lb.	lb.	000 M. tons
Pre-war 1934—1938 Average	21,587	2,130	22·3	..	..
1949	21,874	2,375	20·3	2·0	2,200
1950	23,045	2,400	21·2	1·1	1,280
1951 (Estimates)	23,170	2,425	21·1	1·2	1,400

In view of the efforts of the Indian Government to increase the production of oilseeds in the country, it would be interesting to observe the phenomenal increase of the production of oilseeds in U.S.A., Canada and Brazil during the last few years :

	1949	1950	1951 (estimated)
SOYA BEANS :			
U.S.A. ..	6,184,821	7,687,768	6,000,000
Canada ..	69,777	81,406	81,000
CASTOR SEEDS :			
Brazil	195,616	127,946	196,000
LINSEED :			
Canada ..	56,550	113,500	187,500
U.S.A. ..	1,091,600	981,575	900,000

The rapid growth of synthetic detergents in U.S.A. and Europe during the last few years should interest the vegetable oil industry in all countries. It is estimated that the production of synthetic detergents released 350,000 tons of oils and fats for other purposes in U.S.A. in the year 1949 with the result that exports of oils and fats exceeded imports.

MARKET PRICES

Vegetable oil prices in the country reached their peak in this country in the first half of 1951, and suffered a gradual decline in the second half and a steep fall in the first quarter of 1952. It was generally believed that the principal cause for the spiralling prices during 1951 was due to the Korean war and the strained international situation. This was disproved when the prices of all commodities dropped substantially following the measures taken by Government in tightening credit facilities given by banks. Speculation and hoarding by speculators had inflated the prices in this country and when this was no more possible, there was a rapid fall in the market prices.

The tabular statement given below shows the average prices of oilseeds and oils in the principal centres for the last ten years :

OILS & OILSEED—AVERAGE PRICE PER TON

Market	1943 Rs.	1944 Rs.	1945 Rs.	1946 Rs.	1947 Rs.	1948 Rs.	1949 Rs.	1950 Rs.	1951 Rs.	March 1952 Rs.
SEEDS :										
Copra, Cochin	560	615	744	1,243	943	982	1,283	1,488	1,564	750
Groundnut, Bombay ..	386	315	317	465	613	685	784	875	911	550
Mahua, Bombay ..	298	305	417	553	587	536	566	640	653	450
OILS :										
Coconut, Cochin ..	843	967	1,121	1,845	1,465	1,462	1,913	2,240	2,350	1,170
Groundnut, Bombay ..	882	806	834	1,190	1,439	1,555	1,743	1,885	2,006	1,100
Mahua, Bombay ..	980	1,017	1,266	1,765	1,643	1,562	1,644	1,844	1,882	1,130

Even though there has been a very steep rise in the price of oils during the last ten years, oilcakes have not appreciated in value to the same extent. This is mainly due to the fact that their use is either as cattle feed or as fertilizer and in both cases their price is fixed by alternatives available to the user.

Production of Oil Seeds.—The principal oil seeds of the Indian Republic are groundnuts cotton seed, rape seed, mustard seed, linseed, castor seed, sesamum, copra and mahua seeds. Pakistan produces mainly cotton seed and rape seed.

Groundnuts.—Of all the oilseeds produced in the country, groundnut is the most important and forms over one-third of the total production. The average annual production of kernels during the triennial period 1948-50 was 2,800,000 tons. As it is a subsidiary food besides being a source of edible oil and as its oil-cake is of value both as a cattle feed and as a fertilizer, considerable restrictions have been imposed on groundnut and its products both by the Central Government and by the State Governments with a view to conserving its supplies.

Madras State produces nearly 45 per cent. of the total production followed by Bombay 25 per cent., Hyderabad State 20 per cent and the rest of the country 20 per cent. An attempt is being made to extend the cultivation of groundnuts in Uttar Pradesh and the Punjabs both Indian and Pakistan. In many parts of India it is used as a subsidiary food to cereals. In the year 1950-51 exports accounted for 36,210 tons of kernels and 62,210 tons of groundnut oil. With the growth of the crushing industry and increased consumption in the country, exports have declined and are more in the shape of oil than as seed.

Cotton Seed.—If quantitative production is the main consideration, cotton seed follows groundnut. The annual production during the triennium 1947-49 was 1,145,000 tons in the Indian Republic. Only a small portion of this large production is, however, crushed for producing cotton seed oil. The bulk of it is used for feeding cattle. Pakistan produces about 40,000 tons annually, production being confined to Western Pakistan. As this is the only source of edible oil in that region, considerable quantities are crushed for supplying the fat requirements of the region.

Several factors are responsible for the neglect of this important oil seed as a source of oil in India. In the first place, before the Second World War, India had surplus production of edible oils in the crushing of groundnut, copra, mustard and sesamum. Secondly, the oil content of cotton seed is less than in the other seeds mentioned above and hence the yield is less. Thirdly, oil mills equipped for crushing the other seeds have to be further equipped with delinters in order to crush cotton seed. Fourthly, cotton seed oil requires special treatment in order to remove the gossipol to make it suitable for edible purposes.

Due to the growing shortage of edible fats, attention of technicians in the oil industry is being drawn to cotton seed as a substantial source of edible oil and it is likely that its crushing may be taken up on a wide scale within the next few years. As things are, there is considerable waste of national wealth as both the lint of great value to the rayon industry and the oil of value for edible purposes are wasted in feeding cattle.

Rape Seeds.—Several varieties of rape seeds are grown in India. Of these, mustard is the most important. The other varieties are Toria and Taramira. Mustard oil is used for cooking purposes all over northern India and Pakistan. The other rape seed oils are used for lubrication in all up-country areas near the crushing mills as they are more economical than mineral lubricating oils. Some quantity is exported and some used as an adulterant to mustard oil. The total annual production is about 900,000 tons in India and about 100,000 tons in Pakistan.

Copra.—Though the production of coconuts is very widespread in the coastal belts of India, most of the copra for industrial purposes is produced in the south-west coastal belt comprising South Kanara and Malabar. In Mysore State and in the northern districts of Madras State, a small proportion of the coconut production is being diverted for milling purposes. The annual production is about 170,000 tons. This quantity of copra yields about 105,400 tons of oil. As the Indian demand is however far higher, the deficiency is met by imports of copra and coconut oil from Ceylon, Malaya, Seychelles and Indonesia. Before the war imports were far larger than what they have been during and after the war due to disturbed conditions in Malaya and Indonesia. There has, therefore, been a considerable deficit in the country's requirements.

With a view to stimulating the development of copra and allied industries, the Central Government established the Indian Central Coconut Committee seven years ago. Though this Committee has established experimental farms, distributed seedlings, and conducted propaganda in coconut growing areas, there does not seem to have been any appreciable increase in the production. Besides, when we consider that the price of copra and coconut oil are eight to ten times as high as pre-war, and the grower earns good profits, it is all the more surprising that production has been practically static. One must not overlook the fact, however that the coconut palm does not bear fruit for five years after plantation and there is therefore a possibility that the new plantations are still too young to bear fruit.

The average annual consumption of coconut oil in India during the ten years ending 1948-49 has been about 157,000 tons. Of this quantity about 36,000 tons have been consumed in the soap industry, 47,000 tons in the manufacture of toilet articles, 70,000 tons for edible purposes and the balance for other sundry uses. All the coconut cake produced in the country is consumed as cattle food.

Statement showing quantities in tons of milling copra produced and imported, coconut oil produced and imported during the period 1941-42 to 1950-51.

Year	Milling copra Produced	Milling copra Imported	Coconut Oil Produced	Coconut Oil Imported (nett)	Total Coconut Oil Supplies
1941-42 ..	170,597	108,508	173,046	45,807	218,853

1950-51 ..	—	8,627	—	18,546	—

Linseed.—The production of linseed in India is about 400,000 tons per annum. Pakistan has only a small production. Madhya Pradesh would account for nearly a third of the production, Uttar Pradesh a quarter, Bihar and Orissa a fifth and Hyderabad State a tenth. The rest of India accounts for the balance. About half the production was exported before the war and the rest crushed in the country. A good proportion of the linseed oil and linseed cake was also exported. Since 1940, the paint industry has made considerable progress and indigenous consumption has increased. The exports are far less than pre-war. In the year 1950-51, 67,099 tons of seeds and 5,436 tons of oil were exported.

Sesamum Seed.—The annual production of Sesamum or Til seed is about 400,000 tons. It is grown in most parts of India, Uttar Pradesh and Madras being the largest and accounting for one-fourth and one-fifth of the production respectively, the balance being spread over the rest of the country. Before the war, it was the most widely used cooking oil in the country. Since the last few years, with the high price of all vegetable oils in general and the Government legislation that all Vanaspathi should contain at least five per cent. of til oil, its use for culinary purposes was displaced by the cheaper groundnut oil. The Til cake too is extremely popular for feeding both milch and draught cattle.

Castor Seed.—The annual production is about 140,000 tons, of which Hyderabad State produces more than half. The State of Madras produces about 30,000 tons and the balance is accounted for mainly by Mysore and Bombay. Before the war, more than half the crop was exported but after 1942, the heavy military demand for castor oil for lubricating aircraft engines in the country itself, gave an impetus to the crushing industry. After the war, though the indigenous demand was reduced, the export market had not been regained till 1950-51, when 78,315 tons of seeds and 23,393 tons of oil were exported. Since the year 1940, Brazil developed production of castor seeds and is now a serious competitor in the foreign markets to India.

Nearly 70,000 tons are crushed in the country yielding 26,000 tons of oil and 44,000 tons of cake. The cake, though useless for feeding cattle, has a high nitrogen content and hence is used as a valuable fertilizer for sugarcane.

Several other oil seeds are also available in the country, but at the present time the total production of all of them for crushing purposes does not exceed 100,000 tons. These are Mawrah, Niger seeds, Kardi seed, Hongay, Neem, etc. There is considerable potential value in several of them as Mawrah yields a very valuable soapmaking oil, Kardi and Niger seeds yield drying oils. With the imposition of restrictions on the export of groundnut seeds and oil, Kardi and Niger seeds have entered the export market in the last few years.

PRESENT POSITION

As there are no authoritative statistics of production for the Vegetable Oil Industry, and whatever information is available is only from indirect sources, it is impossible to get a true picture of the state of the industry today. According to the Agricultural Marketing Report on Linseed, Groundnuts and Copra, it was estimated that 25 lakhs to 30 lakhs of tons of seeds were crushed annually in the pre-war days. On the outbreak of the war (as has already been stated), not only was the export of oil seeds severely curtailed but there was a very rapid rise in the price of oil seeds, oils and oil cakes. These two factors gave a tremendous impetus to the oil crushing industry. A survey conducted during 1944-45 indicated that nearly 35 lakhs of tons were being crushed annually.

According to the Marketing Reports referred to above, it is gathered that the machinery employed in the crushing industry consisted of 400,000 bullock-driven *ghanies*, 1,000 manually-operated screw presses, 10,000 power-driven rotary mills, 900 expellers, and 75 hydraulic presses. On this basis the block capital invested in the industry would exceed Rs. 12 crores.

The *ghanies* are responsible for crushing nearly 1,000,000 tons of oil seeds. They are spread all over the country, mostly in villages. They are chiefly used in crushing sesamum and mustard seeds, as the cold pressed oils of these seeds are sold at a premium on account of their superior flavour. The manually-operated screw press is mostly used for crushing castor seed as application of heat is necessary to extract its oil. The power-driven rotary mill is popular for crushing copra and rape seed. All these three types of machines, namely, the *Ghani*, the Screw Press and the Rotary Mill were developed in this country and hence the oil miller has not to go far to buy new ones or to repair old ones.

Both the Expeller and the Hydraulic Press were imported into this country during the last forty years. The Expeller is becoming more and more popular for crushing groundnuts due to its greater efficiency and is displacing the other indigenous types. The Hydraulic Press is used for crushing mowrah and cotton seed.

Even though several Indian workshops took up the manufacture of expellers during the war, the large increase cannot be explained unless the earlier surveys were defective.

Besides the mechanical pressing devices for extraction of oil from oil seeds, there is the chemical process of extracting the oil by solvents such as benzene, carbon tetrachloride, trichlorethylene, etc. This process is of great importance to India and the world as it enables one to extract the maximum quantity of oil from the seed. During the last few years two or three plants have already been erected and one or two are in the course of installation. Many more plants are necessary in India to recover the enormous quantity of oil at present being lost in the oil cakes.

THE FUTURE

During the last few years, the Central Government has evinced considerable interest in the development of the Vegetable Oil Industry in the country. The Post-War Planning Department of the Government appointed the Oils and Soaps Panel in 1944, to survey the existing state of the industry and to suggest future lines of development. This Committee completed its investigations in 1946 and submitted the results of its survey and its recommendations for the future expansion of the industry.

The Government constituted the Indian Central Cocoanut Committee under an Act of the Legislature in 1944, with the primary object of encouraging the growing of cocoanut and developing the copra and coir industry. This Committee has already established two research centres, one at Kasargod, South Kanara and the other at Krishnapuram, in the Union of Travancore-Cochin, for conducting research on the various aspects of the growth of the cocoanut tree, and also established several nurseries for the supply of seedlings of approved variety to the growers. It publishes a monthly Bulletin which is of great value to all interested in the copra industry.

Besides the Indian Central Cocoanut Committee, the Government has recently constituted an Indian Oil Seeds Committee to develop the growing, marketing and manufacture of oil seeds and their bye-products. One of the fundamental questions which this Committee has taken up for consideration is whether this country should go in for the increased utilisation of oil seeds at home or revert to the pattern of pre-war economy under which oil seeds constituted an important item of the export trade of this country.

VANASPATHI

Though the action taken by the Government in the formation of the Committees gave considerable encouragement to the Oil Seed Trade and the Vegetable Oil Industry, the Vanaspati Industry received a set-back early in 1947. The Vanaspati Industry though a minor branch of the Vegetable Oil Industry is one of the most highly organised and efficient industries. Its history is interesting. It started on a small scale in 1930. Then it grew rapidly as shown in the Table below :—

Year	No. of factories	Sale in sub-continent in Tons
1937	5	32,000
1938	5	40,000
1939	9	51,000
1940	11	65,000
1941	12	84,000
1942	12	71,000
1943	16	87,000
1944	18	103,000
1945	21	134,000
1946	21	138,000
1947	23	96,000
1948	26	127,000
1949	38	152,728
1950	39	167,653
1951	41	172,000

In 1944, the Government introduced legislation to control the industry by establishing a Vegetable Oil Products Controller and also promulgated the Vegetable Oil Products Control Order. Under this control, the quality of the product was standardised and new factories had to obtain permits before starting operations. The number of factories in 1944 was 18 with a total capacity of 166,000 tons. Under the new regulations 22 new factories were licensed and their locations were defined so as to spread the industry all over the country, instead of allowing them to concentrate in limited areas.

These factories have since been established and all the 40 factories are now in production. The total capacity exceeds 500,000 tons per annum. Sales of Vanaspathi in the year 1951 have, however, been only 172,000 tons. Some of the factories have produced, besides Vanaspathi, technical hardened oils for supply to the soap industry. Nevertheless, the production has been far below the installed capacity due mainly to the fact that even this product is under excise control and cumbersome regulations have to be followed by users.

One reason for the fall in production is the uncertain attitude of Government to this industry. There has been a great deal of controversy on the effect of Vanaspathi on a person's health. One body of opinion urged that it is definitely harmful to health. Government constituted an inquiry and several Medical and Biological Research Institutes entrusted with this inquiry reported in 1947 that Vanaspathi was not harmful to health. Another argument against Vanaspathi is that its universal use has seriously affected the ghee industry. Government have recently banned the use of flavours resembling ghee in Vanaspathi. Against this theory it is contended that the quantity of butter and ghee produced is only about 450,000 tons and hence it is not sufficient to give even 3 lb. *per capita* per year and that Vanaspathi, being more stable and more palatable than crude vegetable oil, fulfils the poor man's fat requirements. Since 1947, Government has been levying an excise duty of Rs. 140 on every ton of edible product produced.

The opinion of the trade is as follows : Because of the exorbitant excise fee of Rs. 140 per ton, the consumer has to pay more for his daily article of diet. By decontrolling the product, not only will the consumer benefit by a lowering of price but a fillip will be given to more extensive use of hardened technical oils in the soap manufacture and thereby reduce the imports of coconut oil for this purpose.

THE WOOLLEN INDUSTRY

THE Indian woollen industry has a long and illustrious tradition—the shawls of Kashmir have maintained their world reputation for a considerable time—though it was only in the eighteen-seventies that the power-loom was first introduced into the woollen industry. That the indigenous handloom woollen industry covering a wide variety of fabrics from fine shawls to coarse blankets—or *Kamblis*, to give their Indian name—has not been entirely replaced by the mill industry is itself a tribute to the skill of the Indian worker. The Indian woollen industry has, however, a long leeway to make up before it can either supply the needs of a growing population or satisfy the demand for better varieties of woollen wear.

The first power spinning plant appears to have been the Cawnpore Woollen Mills, established in 1876, followed in 1882 by the New Egerton Woollen Mills, Dhariwal, the Bangalore Woollen, Cotton and Silk Mills also in 1882 which took over a concern known as the Bangalore Woollen Mills and by the Bombay Woollen Manufacturing Company at Dadar in 1888. The mills at Amritsar were chiefly meant for producing carpet yarn.

The First World War gave a fillip to the woollen industry, both the mill industry and the handloom industry. After the end of the war, more mills were started, especially during the period 1919-20, and the capital invested in the industry reached the total of nearly Rs. two crores. The war-time prosperity, however, proved impermanent and the industry had to face severe competition, especially from Japan.

This will be clear from the fact that, while the total imports of woollen cloth increased between 1931-32 and 1934-35 from 5.5 million yards to 13.7 million yards, imports from Japan alone increased from 1.2 million yards to 7.3 million yards. Representations were made to the Government of India about the need for protecting the Indian woollen industry. The Tariff Board examined the case for protection of the woollen industry in 1935 and recommended a scale of protective duties ranging from four annas per lb. to one rupee per lb., depending upon the class of goods imported, in addition to *ad valorem* duties of 25 to 40 per cent. The Government of India, however, did not accept these recommendations, on the ground that the industry, especially the worsted branch, depended upon imported raw materials and therefore, was not entitled to protection. As regards the woollen branch, the Government of India felt that the Board's recommendations were vitiated by the fact that an important section of the industry had failed to appear before the Board to tender evidence. The only recommendation that was accepted by the Government was of a minor nature and related to the need for technical advice and assistance to the small-scale woollen industry. The Government of India made a grant of Rs. five lakhs with a view to helping this section of the woollen industry.

The outbreak of World War II hit the Indian woollen industry in a variety of ways, the most important of which was the industry's difficulties in getting supplies of yarn. The power-loom weaving mills in Amritsar and Ludhiana, producing shirtings, light weight suitings and shawls, were particularly depressed, owing to shortage of yarn, though some relief was later provided to the mills, thanks to imports of yarn from the U.K. and Australia arranged by the Government of India. The war-time demand, however, provided a fresh impetus to the industry and the annual outturn per shift increased from seven million lb. before the war to nearly fifteen millions.

PRESENT POSITION

There are three main groups of mills, those which operate both woollen and worsted systems, those with woollen or worsted systems only, and lastly, the Amritsar group of mills which purchase ready spun yarn, and from that stage occupy themselves in weaving, dyeing and finishing.

Among the first group, the Cawnpore Woollen Mills and the New Egerton Woollen Mills, Dhariwal, each with more than 15,000 spindles and operating both woollen and worsted systems, are the largest units in India at the present time. Raymond Woollen Mills, Bombay, were recorded to have 13,280 spindles in 1946 of which a large proportion were worsted spindles.

In 1950, as many as 21 mills were operating in India. There were in addition, six more mills in the course of erection and designed to add a further 20,000 spindles and 100 looms to the local industry. Four of these are intended to produce worsted yarns.

The existing capacity of the woollen industry consists of about 50,000 woollen spindles, 40,000 worsted spindles, 2,300 power-looms and one lakh handlooms. Out of the 2,300 power-looms about 800 power-looms were in the Amritsar area. The Amritsar group of mills also had 2,400 woollen and 18,000 cotton spindles while there were about 700 power-looms and 4,000 handlooms located in that area, which were not always working on woollen fabrics. The present output of the industry is difficult to estimate, in view of the paucity of statistics. Production in 1948 is estimated at over 23.6 million lb. In 1949, the production, it was computed, was slightly lower, at approximately 20 million lb. Production, during 1950, fell further to about 18 million lb. The fall in production was attributed to the restrictions on the imports of raw wool and wool tops and also to the resistance of consumers to higher prices. But these figures do not include the production of small-scale and cottage industry units. The industry, it is estimated, gives employment to about 25,000 people.

While considering the present position of the woollen industry in India one could also take note of the statistical information provided by the Rege Committee though the information relates to the year 1944. This Committee, which was appointed by the Government of India to go into the question of labour conditions in various industries, submitted a report on the woollen industry also. According to its findings, the number of woollen mills in India during 1944 was 24. Out of these, 15 were in the area formerly called British India and 9 in the former Indian States. They employed 17,201 persons daily. Besides, there were 19 woollen carpet and shawl weaving establishments and 73 hosiery factories employing 3,382 and 264 persons respectively. As many as 8,000 workers out of 17,201 were employed in factories using mechanical power.

Then there is information collected and published by another well-known authority. According to this authority there are today 79 manufacturing units engaged in the production of woollen cloth, yarn, carpets, shawls, blankets, rugs, etc. These mills are distributed as follows: Bombay 11, West Bengal 2, Bihar 1, Mysore 4, Madras 3, Punjab 40, Rajasthan 2, U.P. 13 and Kashmir 3.

RAW WOOL

Fortunately for India, the woollen industry has not been affected by the partition in respect of raw material, to the same extent as have the Indian cotton textile and the Indian jute mill industries. The total production of wool in India before the partition was 2.5 lakh bales, of which one lakh bales were consumed at home, the balance being exported. That this position remains more or less unaffected is evident from the fact that Pakistan's internal production is only about 20,000 bales.

The demand for woollen piece-goods cannot be met and there is no doubt that there is great scope for extension of production in a number of varieties, particularly finer varieties. It may be mentioned here that the weight of piece-goods imported during 1935-36 to 1939-40, averaged eight ounces to a yard as against the Indian average of 16 ounces to a yard, which indicates the demand for finer varieties of woollen fabrics. There is also a considerable demand for soft blanket and rugs of the type manufactured in Europe. Indeed, the Panel on woollen industry appointed by the Government of India in 1945 estimates that the approximate Indian consumption of mill made woollen fabrics should be at least 60 per cent. more than it was before the war.

The following table shows the comparative figures of imports of woollen manufactures into India for the years 1938, 1948 and 1949. Since September, 1949, however, there has been a virtual stoppage of such imports due to severe import trade control regulations.

(In lakhs of lbs.)

—	1938	1948	1949
Woollen and worsted piece-goods	13·8	26·7	23·6
Worsted yarn and knitting wool	33·9	18·8	35·1
Blankets and rugs..	40·8	34·8	44·9
Goods of wool mixed with other fibres	13·7	15·1	23·1
Roller cloth, clearer cloth and sizing flannel	1·6	1·2	1·1
Hosiery and knitted goods	0·8	1·2	0·7
Carpets and floor rugs	1·4	2·4	1·5
Other sorts	13·6	10·0	6·7
Total	119·6	110·2	136·7

Indian woollen industry has considerable scope for expansion in most varieties of woollen manufacture, the extent of the increase envisaged by the Panel being from 19,027,500 to 30,500,000 million lbs. or about 55 per cent.

Workmanship has improved steadily and a much greater variety of designs is available. But the most striking improvement in woollen yarns and materials, however, is still confined to medium and coarse qualities, though in worsted and in hosiery yarns and fabrics the tendency towards finer qualities has been more pronounced. It is for this reason that the Panel thinks that the industry would be well-advised to concentrate on the following types of goods:

1. Cheap blankets and rugs of the European type using blends containing processed wools;
2. Tweeds and allied fabrics of the cheaper varieties;
3. Light weight worsted; and
4. Mixture cloths and tropicals.

In India woollen yarns of counts below 24s are being manufactured. In order to give protection to these manufactures, the Government is allowing imports of raw wool tops without customs duty. There is besides, a customs duty of 30 per cent. on the c.i.f. Bombay price for all knitting hosiery and weaving yarns imported from abroad. The producers of yarns are, therefore, in a position to compete with foreign manufacturers in worsted woollen yarns in crossbred and botany qualities in counts below 24s. Indian spinners are manufacturing excellent hand knitting wool in 2, 3, and 4 ply in any twists which are popular in India. In the manufacture of woollen hosiery yarns in counts ranging from 7s to 24s worsted counts, India has taken the lead. The country is yet to cover a great leeway in the manufacture of woollen weaving yarns and these are being imported under the O.G.L. from European countries. Production of hand knitting wool and woollen yarns in weight amounted to 9·14 lakh lbs. and 22·74 lakh lbs. respectively in the year 1946-47.

Thus, while the question of increasing the production of woollen materials is an important one, it is no less important that this increase should be accompanied by improvement in quality. The finer types of wool, for instance (used for making tweeds, overcoatings, civilian blankets, rugs, and serge waft yarns) have generally to be imported from abroad. One encouraging sign, however, is that experiments conducted in sheep breeding centres in India have indicated that it is possible to improve the quality of Indian wool.

Raw Materials.—The following comments from the New Delhi Office of the International Wool Secretariat pleading for a new census of India's wool wealth are noteworthy:

"Conflicting statements are made in regard to India's wool clip and amount available for internal consumption. From the consuming end we are told that, apart from the very high prices ruling today, mainly brought about by external demands, quantities available are insufficient, whereas the merchants say that wool is available, but better prices can be obtained abroad than in this country.

"From time to time, attempts have been made to assess the position. The last census of sheep population and clip were taken out in 1945, when it was estimated that there were 37,024,000 sheep and the total clip was in the region of 54,800,000 lbs. This, of course, can only be an estimate, based on known figures in each State, as the census took place before the partition. In addition to the estimated clip, some six million lbs. of Tibet wool was imported through Kalimpong, making a total of 60,800,000 lbs. Of this quantity, 25,000,000 lbs. were exported, leaving a total of 35,800,000 lbs. for home consumption. This figure is higher by several million lbs. than preceding years.

"In view of this, it is apparent that either the mills and cottage industries are consuming more or the sheep population has declined since the last census with a relative shrinkage in wool supplies. It, therefore, cannot be too firmly emphasised that there is an urgent need for new census, when India's wool wealth can be correctly assessed."

Machinery.—The problem of technical re-equipment of the woollen industry depends for its solution on the availability of machinery from abroad. The war-time backlogs in replacements need urgently to be tackled. The Government of India has announced that every facility is being afforded to the industry for importing machinery for replacement purposes while every care is taken to see that the already adequate capacity for production of heavier types of goods is not added to. The Panel on woollen industry, it might be noted in this connection, considered it desirable that "the manufacture of woollen machinery, at least the essential parts, should be established in this country." This question will perhaps be taken up when the efforts now being made in the country for the manufacture of cotton textile machinery begin yielding concrete results, since the manufacture of woollen machinery has many things in common with the manufacture of cotton textile machinery.

COTTAGE WOOLLEN INDUSTRY

The cottage woollen industry, the products of which have maintained through centuries a reputation for quality, is now facing some very difficult problems, such as, lack of facilities for the purchase of raw materials, and equipment, lack of finishing and marketing facilities, lack of standardisation of the products of the industry and absence of adequate technical guidance and finance. The industry suffered much during the pre-war years from the change of fashions and also from competition from shoddy fabrics from Italy and Poland. At the outbreak of the war which brought some prosperity to the industry, there were about one lakh handlooms working in the sub-continent. The wartime prosperity has again proved too short-lived for the cottage woollen industry.

The chief centres of the industry are Kashmir, Amritsar, Agra, Gwalior and Jaipur for high class carpets, Mirzapur and Bhadoi for medium and cheap class carpets, Bangalore and Warangal in the South for druggets.

Among the different woollen fabrics manufactured on cottage industry basis in the country the most important is perhaps the hand-made carpets, an industry which can be traced to the early Mughal period. Indian carpets form an important item of the country's export trade and constitute the major portion of the exports of woollen manufactures. In pre-war years, carpets and rugs used to be exported to the tune of 8 to 9 million lbs. valued at Rs. 80 to Rs. 100 lakhs. When the demand for carpets is normal the industry employs 30,000 to 40,000 workers on its 8,000 to 10,000 looms.

The industry faces two chief difficulties. In the first place, there is considerable uncertainty in marketability, largely due to the fact that the industry deals in luxury goods, nearly 90 per cent. of which is exported abroad. Secondly, the industry has to compete, on the one hand with cheap machine-made carpets in foreign markets and, on the other, with similar classes of carpets from China and Persia. There would appear to be considerable scope for market research in this field. It must be emphasised here that India has all the raw materials needed for machine-made carpets, like wool, cotton and jute, and the cheap "machine-made carpets", such as those which enter into competition with Indian carpets can also be made, provided the requisite types of machinery are imported from abroad. The establishment of this industry, as the Wool Industry Panel has pointed out, "will supplement and not compete with the demand for hand-made carpets and, if properly organised, will open a very useful vista for a considerable volume of exports."

The Panel on woollen industry made two notable recommendations in this respect. In the first place, the Panel recommended that the State Departments of Industries should establish carding, designing, dyeing and finishing centres at suitable places. Secondly, the Panel emphasised that the cottage woollen tweed and rug industry which "prospered during the war as a result of scarcity and of high prices can only survive if it turns its attention to the production of exclusive lines of woollen goods, in other words, prestige products."

MINES AND MINERALS

MINERALS form the starting-point of those endless series of manufactures on which modern industrial civilisation rests. Mineral resources of India cannot be described as enormous for a country of its size and population. Except in minerals such as iron ore, aluminium ore, mica, manganese, magnesite, thorium and titanium, of which the exportable surpluses are large and of world importance, the deposits are of decidedly limited extent and call for a policy of strict conservation and planning. Certain new methods of discovery have come into vogue and it is possible that by using these methods new deposits of petroleum, a few new coalfields, ore-bodies, large underground water deposits, etc. may yet be discovered. But on the whole it is safer to take a modest view of India's mineral resources.

The present position may be described as follows: India is well supplied with iron ore, manganese ore, titanium, mica, bauxite, magnesite, refractory materials, natural abrasives, steatite, building stones, limestone and a few other minerals. Some of these are abundant enough to allow her to export a certain quantity for some time to come. There are, however, certain minerals in which India is deficient and has to rely on imports to a greater or less extent. These are copper ore, silver, nickel and cobalt, lead, zinc, tin, mercury, tungster, molybdenum, petroleum and petroleum products, sulphur, fluorite, graphite, potash, asphalt, etc. On the whole it may be said that India is fairly well endowed with the raw materials for manufacture of iron and steel, aluminium, magnesium and titanium.

LACK OF POLICY

Till recent times the subject of mineral development had received scant attention and there had been no well planned national mineral policy. Several of the States whose annual mineral production amounted to crores of rupees had no competent agency to regulate the development and conservation of their mineral resources. The few foreign firms, who had adequate resources and technical knowledge to process the products, have concentrated their attention in exploiting the oil resources (petroleum) and some of the metallic minerals, specially gold and copper; the indigenous mining enterprise, on the other hand—with very few notable exceptions—has been mainly confined to exploit those minerals which could be readily sold in foreign markets without any processing, like manganese ores, chromite, ilmenite, sillimanite and several others. Unlimited exports of these useful minerals combined with the unmethodical manner of working their deposits—picking out the richest and readily saleable portions leaving the rest as unutilizable waste—were heading towards rapid depletion. Moreover the sale of such unprocessed minerals in foreign markets used to fetch us disproportionately small amounts as compared to the price we have to pay for their finished products.

As a first step to check this unregulated and unsystematic working and utilization of minerals, the Government of India enacted the Mines and Minerals (Regulation & Development) Act, in 1948 and have now established a Bureau of Mines to advise them in all matters relating to mining and the mineral industry in general.

INDIAN BUREAU OF MINES

The Indian Bureau of Mines was set up in March 1948, but until late in that year it was merely a continuation of the Office of the Mineral Adviser. The Bureau continues to tender advice to Government on mineral concessions and has taken the lead in formulating rules for the issue of mineral and petroleum licenses and leases. These rules were notified under the former Ministry of Works, Mines & Power No. M-II-155(24)-2 dated 18th October 1949 and No. M-II-152(17) dated 27th December 1949 respectively, and are in force in all areas except Kashmir, Hyderabad, Mysore and Travancore-Cochin. Rules have also been framed under Section 6 of the Mines and Minerals (Regulation & Development) Act for conservation and development of mineral deposits and they are now under consideration.

The Bureau's work in future will be to secure the following objectives:—(*i*) Estimation of the country's resources in all minerals in collaboration with the G.S.I.; (*ii*) advising the adoption by mine owners of the method most suited to the mineral that is being worked by each one of them; (*iii*) Regulation of the export of key minerals such as Manganese ore, Chromite, Ilmenite, Mica, etc. with a view to safeguarding the country's interests; (*iv*) Research work in connection with the beneficiation of all minerals and advice to the mineral industry on matters relating to the upgrading of the minerals being mined.

Under the new Constitution, mineral rights vest in the States that have acceded to the Indian Union and they exercise these rights in accordance with the Mineral Concession Rules 1949. The Central Government will exercise powers only to the extent of co-ordinating the policy of the State Governments, taking into consideration special local conditions and national interest. In certain restricted spheres they will also exercise revisionary powers over the action of State Governments.

Steps have been taken to expand the organisation of the Geological Survey of India, which is engaged in the task of protecting, investigating, and mapping mineral deposits, and tackling the engineering problems connected with the country's big hydro-electric projects.

Geophysical Surveys.—The Geological Survey of India organised a Geophysical Section in 1945 with a view to building up an organisation for undertaking geophysical surveys in different parts of the country. During 1951 it covered geophysical exploration for sulphide deposits in Bihar and Mysore, for manganese ore in Madhya Pradesh and oil near the Gulf of Cambay.

Magnetic survey in the Balaghat District (Madhya Pradesh) resulted in the discovery of numerous manganese ore deposits at shallow depths. Another manganese ore belt was located near Ramtek (Madhya Pradesh) where drilling has been recommended. At Ghogha in Bombay State the survey in connection with oil showed a broad anticlinal structure with a few local highs and a further investigation is contemplated.

An outstanding development of the year is the advent of the Air Borne Magnetometer. The Standard Vacuum Oil Company has, under an agreement with the Government of India initiated in October 1951 an aero-magnetic survey over the vast alluvial plain of Bengal and Assam to study the prospects of structural anomalies in the exploration for oil.

Deposits of sulphur have been discovered at Ladakh and of pyrites at Amjer (Bihar), Tara Devi (Simla Hills), Ingaldhol (Mysore) and Vynad (Madras). A 12-mile long belt of pyrites has been located in Kaiga in Karwar District. Ratnagiri has been found rich in ilmenite sands containing 50 per cent. titanium. A pilot project for producing lignite has been launched in South Arcot District of Madras under the U.S. Point Four Technical Aid Programme.

The Geological Survey of India has drawn a Five-Year Plan costing Rupees one crore. This is being implemented from 1952.

PRODUCTION TRENDS

The improvement in the overall position in respect of production and supply of minerals noticed during the year 1949 continued in 1950 also. The production of fuels which constitute the most important group among minerals registered only a slight rise in 1950 owing to the increase in output of coal to 31.919 million tons as compared to 30.124 million tons in 1948 and 31.681 million tons in 1949. The production of non-metals rose considerably in the year under review. The output of mica, which had dropped from 363,000 cwt. in 1948 to 270,000 cwt. in the following year, recovered to 314,000 cwt. in 1950. Magnesite recorded an improvement from 48,000 tons to 91,000 tons but dropped to 55,000 tons in 1950. The production of manganese ore rose continuously from 526,000 tons in 1948 to 646,000 tons in 1949 and further to 902,000 tons in 1950. The output of chromite tended downward from 23,000 tons to 19,000 tons and then to 14,000 tons in 1950. The combined index of production of non-metals, however, showed a handsome rise mainly on account of mica and salt registering a substantial increase. The overall position in respect of production and supply of minerals was appreciably better in 1950 than in 1949.

The index numbers of mineral production and domestic supply are given below:—

(Base 1948 = 100)

Minerals	Production		Domestic Supply	
	1949	1950	1949	1950
Fuels	105·1	105·8	109·6	114·3
Coal	105·2	106·0	104·2	106·3
Petroleum	101·7	99·4	129·8	144·2
Metals	103·3	124·4	77·3	88·4
Gold	91·1	109·4	89·2	107·6
Manganese	122·8	171·5	52·0	88·8
Iron	122·9	129·4	122·6	126·9
Copper	102·2	111·8	102·2	111·8
Ilmenite	109·2	93·0	109·2	93·0
Chromite	82·6	60·9	68·4	57·9
Silver	84·6	123·1	2·6	3·0
Non-Metals	82·4	98·5	86·5	104·2
Mica	74·5	86·5	..	..
Salt	87·9	113·6	86·1	104·2
Clay	100·0	N.A.	104·7	N.A.
Saltpetre	206·8	N.A.	206·8	N.A.
Magnesite	189·6	114·6	158·8	111·8
GENERAL INDEX ..	101·0	107·3	102·6	109·6

COAL

The Indian coal industry came into existence about the middle of the 19th century and has made rapid strides thereafter under the stimulus of industrial expansion at home and the demand from abroad. The most important coal fields are Raniganj and Giridih. The States in which coal is found are West Bengal, Bihar, Madhya Pradesh, Orissa, Hyderabad, Vindya Pradesh, Assam and Rajasthan. Indian coal falls mainly into two classes, namely, high grade steam and low grade steam.

The Metallurgical Coal Conservation Committee placed the reserves of coking coal at 329.6 million tons in respect of selected grade, 395.7 million tons of grade I quality and 49.1 million tons of grade II quality. With stowing, washing and blending the committee thought that a reserve of 2,000 million tons of good quality coking coal could be obtained. The geological survey of India estimated the reserves of non-coking coal at 39,650.25 million tons of which gondwana coal represented 37,113.25 million tons and balance terciary coal.

The following table gives the details of output, despatches and exports :—

Year	Production (million tons)	Despatches (million tons)	Exports (million tons)
1946 ..	28·829	27·380	..
1947 ..	29·760	25·575	0·935
1948 ..	29·655	26·442	1·270
1949 ..	31·504	28·134	0·903
1950 ..	32·261	28·615	2·600
1951 ..	34·307	..	..

The working party for the coal industry came to the conclusion in 1951 that a stage had come when zonal production should be resorted to and there was need for conservation of good quality coking coal. It also observed that there were great potentialities for the coal fields of Assam, Orissa, Singareni, Madhya Pradesh, West Bengal and Bihar.

Recently the mineral concession rules were revised by the Government of India. The rules (1949) limit the period of the leases to twenty years with the option of one renewal for another twenty years. The rules also require the certificates of approval from the State Governments. The Government has also constituted a committee to consider all applications for opening mines.

Mechanisation in the industry is at a very early stage of development. In the middle of 1951, there were only 374 coal cutting machines in 118 coal mines which represented hardly one-fifth of the total output. There were nine mechanical loaders of which two were out of order while the number of conveyors was only 19. An event of great importance was the introduction of coal washing plant, for the first time in the history of the industry, by Tatas in their West Bokaro mines. There are in India at present 843 working collieries, the majority of which are small.

In earlier times the coal used to be sold by the name of steams. For the first time the Indian Coal Grading Board was constituted in 1926. The maintenance of grades requires beneficiation but only 71 collieries are fitted with screening plants and mechanical chutes, the rest of the mines doing the work by hand labour. The Coal Grading Board has split up the area into Raniganj and Jharia coal fields and has carried out extensive work in the field of grading. In 1944 the necessity was felt to control production and distribution of coal and the Colliery Control Order introduced what is known as Coal Commissioner's grade.

Since 1944 the industry has been operating under Government's direction. Besides fixing the prices, Government has devoted special attention to the problem of welfare. Among the various Acts passed by the Legislature thereafter may be mentioned (*a*) the Industrial Disputes Act and Rules (Central), 1947, (*b*) Coal Mines Welfare Fund Act, 1949, (*c*) Coal Mines Provident and Bonus Scheme Act, 1948 and (*d*) application of the Payment of Wages Act to coal mines in 1950.

The history of the coal control in the country dates from almost the beginning of coal production in India and today it embraces production, distribution, allocation, prices and wages.

Recent Developments

The outstanding development in 1951 was the broadening of export enquiry following the shortage of coal in Europe and the transport bottle-neck in South Africa. The tentative estimate places the export of coal at 2.6 million tons in 1951. Another important event was the promulgation of the ordinance on January 8, 1952 for stowing for safety and conservation and extending the Central Government's control over coal mines. The ordinance provides for the establishment of the Coal Board with the Coal Commissioner as the chairman. The ordinance is on the lines of the recommendations made by the Planning Commission early in 1951 for enacting a law to regulate production, distribution and prices of coal and miners' welfare.

The industry has expressed its dissatisfaction at the composition of the Coal Board packed with Government officials.

The Railway budget for 1952-53 announced an increase of 30 per cent. in the coal freight.

Dealing with the export trade, the President of the Indian Mining Association said at the annual meeting in March 1952 that the industry's biggest difficulty was the export surcharge originally imposed in February 1951 at Rs. 11 per ton. Since October, more moderate rates were, however, introduced. He also complained about the transport bottle-neck in the Calcutta port.

During 1950 exports accounted for 1.37 million tons exclusive of the demand from Pakistan amounting to 1.83 million tons. Railways were responsible for an offtake of 11.14 million tons representing nearly 30 per cent. of the total demand. The industrial demand of States for coal totalled 20.88 million tons out of a grand total of 36.10 million tons. Of this, West Bengal accounted for 6.4 million tons with Bihar ranking second at 4.46 million tons. Uttar Pradesh ranked third with 2.19 million tons followed by Bombay which accounted for 2.08 million tons. The demand from Madras, Punjab, and Kashmir was around 1 million tons each.

IRON ORE

On account of the high ash of Indian metallurgical coke, it is usual in estimating the Indian iron ore reserves to accept only ores with an iron content of 60 per cent and above. Ores below this iron content are used only in very small quantities in Indian blast furnaces.

The following is the production of iron ore :—

	1948		1949	
	Tons.	Rs. in lakhs.	Tons.	Rs. in lakhs.
Singhbhum (Bihar)	1,145,034	56·28	1,364,878	68·97
Ratnagiri (Bombay)	—	—	10,000	1·20
Madhya Pradesh	224	0·14	838	0·49
Mysore	53,050	7·40	51,694	6·58
Orissa—				
Keonjihar	432,194	11·86	561,687	10·72
Mayurbhanj	654,085	27·31	819,425	38·71
Total	2,284,587	102·99	2,808,522	126·66

The production of iron ore in 1950 was estimated at 3 million tons.

India possesses perhaps the largest reserves of high-grade iron ore in the world as well as large quantities of low-grade ores. The estimated resources are :—

	Reserves (million tons)	Quality (Per cent.)
Bihar and Orissa ..	10,000	58 to 68
Mysore and Sandur ..	330	33 to 68
Hyderabad	2,500	58 to 66

Large deposits of high grade ores are limited to a few areas of which the following fields require special mention :—

(*i*) *Singhbhum and Orissa :* In what is known as the Singhbhum Iron Belt, consisting of the Singhbhum District, in which the Tata Iron & Steel Company's Steel Works are situated, and the neighbouring States, there exist some of the richest iron ore deposits in the world. The iron content of the ore considered usable varies from 60 per cent to 65 per cent and these deposits have recently been estimated at 8,000 million tons, which are sufficient for the iron and steel requirements of India for centuries. In other parts of the world, Brazil for example, equally rich iron ore may be found, but rarely can it be loaded at the iron works so cheaply as in India. The advantage India possesses in the shape of iron ore is, therefore, very great.

(*ii*) *Mysore :* There are big deposits of hæmatite and quartz—magnetite ore in Mysore but the latter are of low-grade and would require concentration before using them. The ores used in the Bhadravati Iron Works are from the Bababudan Hills and can be compared to Singhbhum ores containing about 60 per cent iron. Incidentally, the total quantity of ore available is not less than 100 million tons. Limonites deposits are also known to exist but they have not been properly explored owing to transport difficulties.

(*iii*) *Madras :* Very large deposits, mainly magnetite, occur in the Salem and Ceded Districts and in Sandur. They have been estimated at 200 and 150 million tons respectively. They will, however, require concentration before use, and there may be considerable losses in the process.

(*iv*) *Madhya Pradesh :* Large deposits of hæmatite are found in the Bastar, Chanda, Drug and Jabalpur districts of this State. Of these, those in Bastar are of very large magnitude and are of the order of 1,000 million tons. It is expected that the Chanda and Drug deposits will shortly be utilised for feeding a new iron and steel works to be established in Madhya Pradesh.

(*v*) *Other Areas :* In Hyderabad the Bailadila range in Bastar District is reported to have hæmanite deposits which are inaccessible and far away from coal fields. The only source of high-phosphorus ore is in Bengal. It is poor in iron content being 35 per cent to 45 per cent and most of the easily available ore in this locality has been exploited. Rich ores also occur in Goa; but no estimate of its size is available.

MANGANESE ORE

Though Mr. H. G. Turner reported the existence of manganese ore deposits in the Vishakhapatnam District towards the close of the nineteenth century, scientific exploitation of the deposit began only at the beginning of this century. Sir Lewis L. Fermor has left behind his memoirs on manganese ore deposits in India which, published in 1909, provide a valuable source of information. Since then there has been a constant endeavour to locate rich deposits. North Kanara and Panch Mahals in Bombay, Goa, Vishakapatnam and Sandur in Madras, Shimoga, Chitaldurg and Tumkur in Mysore and Balaghat, Bhandara, Chhindwara and Nagpur districts in Madhya Pradesh are today considered as the most valuable and economically workable centres.

The industry's fortunes are directly linked with the trend in the world market for iron and steel and very few of the old concerns have a very long life. The Vizianagram Mining Co. was wound up in 1946 after surviving the shock of two serious depressions. As early as in 1907 India, with an output of a little over nine lakh tons, had displaced Russia as the world's leading producer of manganese ore; but after the great war Brazil became a serious rival to India. Between 1924 and 1928 India's production averaged 953,039 tons as against 624,635 tons in the preceding four years.

During the period of world depression, several mines had to be closed down and in 1933 the production was hardly one-fifth of the peak recorded in 1927 with value less than five per cent of that in the year preceding the economic crisis. The Second World War gave a further shock to the industry following the collapse of France which was India's most important customer and the production dropped to 210,583 tons in 1945. The recent production trend together with the export and export price is summed up below :—

Year.	Output (Tons).	Export (Tons).	Export Price.
1946	252,916	..	16d.
1947	451,034	..	28d.
1948	526,876	330,000	32d. plus 15% export duty.
1949	645,825	544,000	62d.
1950	901,609	728,000	86d.

The boom was pushed up still further in 1951 when manganese ore with 48 per cent and 38 per cent grades could fetch a price of Rs. 170 and Rs. 115 per ton respectively. The marketing was, however, subjected to Government control both in regard to quantities and destinations; but towards the close of the year Government withdrew from the field owing to lack of relevant information and, instead, the attention was diverted towards the problem of avoiding waste through unscientific mining and grading.

MICA

Mica has been treated as a strategic material and India accounts for a big slice of the world trade in it. Indian mica generally means muscovite mica from Bihar, while Madras mica is of green variety and Rajasthan produces ruby of stained quality. It is a key material for the electrical industry but has hardly any domestic market.

Though India used to ship mica long before the dawn of this century, the real importance of the commodity was brought to the fore by the Great War which made heavy demands on the Indian industry. Since then the export trade in mica has flourished and after the end of the Second World War the question of laying down authoritative standards was seriously taken up. The following is the trend of exports :—

Year.	Cwts.	Rs. in lakhs.
1948	295,818	515·79
1949	283,935	675·08
1950	416,866	1028·03

NON-FERROUS METALS

The non-ferrous metal industry covers the important industrial metals including lead, zinc, copper, tin, aluminium, nickel and antimony. It also includes rare metals such as gold, titanium, manganese, berryllium, thorium, and cerium. While the country is rich in some of the rare metals and can command valuable latent sources of copper, aluminium and, to a certain extent, lead, her annual imports are around Rs. 25 crores. Nevertheless the past decade has noted considerable progress in the field of evolving methods for processing metallic ores and improving and expanding the non-ferrous metals industry

Copper.—Rajasthan, Singhbhum and Baragunda in Bihar, the Sikkim State, Kumaon and Kangra Valley in the Himalayas and the Mysore State are considered to have extensive deposits of this metal. At present, however, only one mine is being worked. The Indian Copper Corporation's works at Singhbhum treats about 350,000 tons of ore annually. The following table gives the trend of production :—

Year.	Tons.
1946	6,311
1947	5,932
1948	5,864
1949	6,390
1950	6,614
1951	7,083

Aluminium.—Deposits of bauxite are extensively found throughout the country. The important sources are Ranchi and Palamau districts of Bihar, Kolhapur, Kaira and Thana districts of Bombay, Jabalpur, Balaghat and Bilaspur districts of Madhya Pradesh, Salem district of Madras, the Bababudan hills of Mysore, and the States of V.P. and Bhopal. The industry is hardly a decade old and the actual production did not start before 1943 even though it was long recognised that the reserves of bauxite were no less than 250 million tons including 35 million tons of high grade.

Two concerns have been in production with an installed capacity of 7,000 tons. One of them has its alumina plant at Muri in Bihar, reduction works at Alwaye in Travancore and rolling mills at Belur near Calcutta. The production trend is given below :—

Year.	Tons.
1946	3,236
1947	3,204
1948	3,361
1949	3,481
1950	3,596
1951	3,849

Lead.—Galena, an ore of lead, is reported from several places in the country. The deposits at Hazaribagh and Manbhum in Bihar, Durg in Madhya Pradesh, Datia and Gwalior in central India and Jaipur and Zawar in Rajasthan, were in the past exploited. The resources at Zawar were exploited during the war by a private party and later by Government and have thereafter been acquired by a private company. The following is the trend of production in the background of an annual consumption of about 13,000 tons :—

Year.	Tons.
1946	—
1947	189
1948	625
1949	594
1950	628
1951	859

A lead-zinc pilot floatation plant has been recently erected at Zawar; but so far no zinc is smelted and the concentrate is exported on condition that half the zinc content is re-shipped to India.

Antimony.—During the Second World War, antimony ore was mined in Baluchistan; but this source was closed after the partition and the smelting industry in Bombay had to be fed by imports from Bolivia. The installed capacity is for an annual production of 700 tons; but the actual production is small as will be seen from below :—

Year.	Output in Tons.
1946	132
1947	235
1948	330
1949	100
1950	376
1951	328

Tin.—Deposits of cassiterite are available in Nurungo in Hazaribagh district of Bihar; but there is no indigenous production of the metal at present.

GOLD AND SILVER

India's gold which had lured many invaders has also battled the geologists. The Kolar Gold Fields are the most important source of gold at present. The mines are along a narrow strip about five miles long in the Mysore plateau 2,900 feet above sea level. The grade of run-of-mine ore varies between 6 and 10 cwts. per ton in the four mines working in the area. One of the mines is claimed to be the deepest in the world. Recently two more mines were re-opened, one by the Mysore State near Ballara and the other by the Hyderabad State near Raichur. The trend of gold and silver production is given below :—

Year.	Gold (000 ounces).	Silver ounces.
1946	132	—
1947	172	—
1948	180	12,797
1949	164	13,550
1950	196·9	15,676
1951	226·2	17,180

RARE METALS

The recent technological advances for meeting the rigorous demands of modern times have focussed the attention of the various countries on the possibilities of using new metals or modifying known metals. Some of the rare metals which were scientific curiosities till recently are now being produced on a commercial scale in Western countries. It is known that the soils of India contain ores from which some of these rare metals can be recovered. The Government of India and the Travancore-Cochin State Government have jointly floated a joint stock company, the Indian Rare Earths Ltd., to process

the monazite sands of Travancore. The Company hopes to extract a mixture of oxides of rare earths containing cerium lanthanum, praseodymium, neodymium and ten other metals of the rare earth group.

Cerium is now being extensively used in glass manufacture, cores of cinema electrodes, catalyst in chemical manufacture, as abrasive in optical glass fabrication and in some structures of steel. The use of thorium salts in manufacture of gas incandescent gas mantles is well known. It is also used in glass manufacture, benzene synthesis, metallurgy and cloth impregnation Intensive search has located deposits of pitch blend containing a high percentage of Uranium oxides in Rajasthan. A belt of Uranium minerals over 150 miles long has been found in Bihar and there are sporadic occurrences in Madras as well.

Vanadium is of great value to the manufacture of certain types of steel. Appreciable reserves bearing titaniferous iron ores containing about 3 per cent oxides of vanadium have been discovered in Bihar. Tungsten ore accepted as of strategic importance is found in parts of West Bengal and Rajasthan. Chromite ores occur mostly in Chitaldurg (Mysore) and Singhbhum (Bihar). The minerals containing columbium and tantalum used to prevent weld decay and corrosion respectively have been traced in small quantities in the mica producing areas like Nellore, Monghyr, Gaya, Mysore and Travancore.

Beryllium used in metallic springs and in manufacturing X-ray tubes is produced from the ore known by that name. It is found in Rajputana, Bihar and Nellore in Madras. Gallium and germanium are found in coal. More recently a rich source in the mineral sphalerite was reported from Nepal. The National Metallurgical Laboratory at Jamshedpur is examining the economics of Mysore and Singhbhum chromites and of low-grade chrome ores from Talur (Mysore) and has evolved a new electrolytic technique for separating beryllia from beryl. The National Chemical Laboratory of Poona has developed quick methods for estimating vanadium, beryllium, uranium and germanium.

LITHIUM

Lithium is an important light metal of strategic significance. In India lithium minerals were first noticed as early as in 1874, and are commonly found as constituents of granite pegmatites. The sources are Pihara (Bihar), Jodhpur, Bastar (Madhya Pradesh) and Ooregam (Mysore). Kashmir is reported to have crystalline white blocks in a valley north of the famous saphire mines. Nevertheless no systematic survey of the resources has yet been undertaken.

SALT

From a humble beginning of making salt from sea water the Indian salt industry has not only attained self-sufficiency but is now in a position to cater to the needs of the neighbouring export markets. The industry has made remarkable progress both in the public and private sector but its progress in the post-war period is particularly spectacular.

During 1951 the Government of India decided to run their salt works as a commercial corporation while simultaneously rationalising the salt control. This is administered by a Salt Controller; but there is a salt advisory committee to advise Government on all problems affecting the industry. Among the major decisions of the year may be mentioned the introduction of a uniform system of licences, continuation of the zonal system of distribution and the banning of the sale of salt by measure. The last decision has not yet been implemented.

Early in the year the Centre was thinking of nationalising the distribution of salt; but towards the end it was decided to leave the marketing to private trade channels and to pursue vigorously a policy of augmenting salt production. With that end in view, the Geological Survey of India has been directed to survey the Mandi mines for rock salt and the Salt Department has been asked to tap subterranean brine in places where the rainfall is high.

The following table gives the trend of productions:—

Year.	Output in million maunds.
1946	38
1947	52
1948	63
1949	55
1950	71
1951	76

The report of the Salt Experts' Committee appointed by the Government of Saurashtra furnishes interesting details about the industry in this important area where salt is produced by solar evaporation both from sea and sub-soil brine. There are at present nine major salt works on the sea coast of Saurashtra and four in the Runn of Kutch. Three more salt works are expected to start production in 1952. The State produces about 16.5 per cent of the total Indian production. Beyond the State limits are the Government salt works at Kharagodha.

The salt resources of Rajputana lie in the west but the only lake source in actual production is at Sambhar. Active salt works also exist at Didwana and Pachbadra where salt is produced by special processes from subterranean brine. In Bombay State which is the third important source of salt, the industry is concentrated on the coastal tract and though the quality is not crystal white and the lumps are rather small, it commands a good market in some of the neighbouring States. Salt is manufactured in the open salt pans by solar evaporation.

The following table gives the tonnage of mineral production in India:—

HYDRO-ELECTRIC DEVELOPMENT

INDIA is severely handicapped compared with other lands as regards the generation of power by the consumption of fuel, coal or oil. These commodities are all difficult to obtain, and costly except in a few favoured areas. Coal supplies for example are chiefly centred in West Bengal and Chota Nagpur and the cost of transport is heavy. Water power and its transmission by electricity offer, on the other hand, good possibilities, both as regards the quantity available and the cheapness at which the power can be supplied, in certain parts of the country.

Water power schemes, pure and simple, are generally difficult because the power needs to be continuous, while the rainfall is only during a small portion of the year. Perennial rivers with sufficient water throughout the year are practically non-existent. Water, therefore, must be stored for use during the dry season. Favourable sites for this exist in many parts in the mountainous and hilly regions where the heaviest rainfalls occur and the progress already made in utilising such opportunities by the electrical transmission of power affords encouragement for the future. Further, hydro-electric schemes can sometimes be associated with important irrigation projects, the water being used for both electricity generation and irrigation.

The total electrical power installed at present in the country is nearly 2 million kW, of which less than half a million kW is water power. The *per capita* consumption of electric power in India is ridiculously low. It is 9.2 kW hours as against 986 in England, 1,470 in U.S.A., 3,518 in Canada, 1,944 in Switzerland, 3,099 in Norway and 2,000 in Sweden.

At the present time, power projects aggregating to a total installed capacity of about 1.3 million kW are actually under execution in various parts of the country. Besides, there are other schemes with an aggregate capacity of about 1.4 million kW on which final decision regarding implementation has not yet been taken, but which are under preliminary consideration by the authorities concerned.

Roughly speaking, schemes under execution may be expected to be in commission during the next quinquennial period and a large portion of the schemes now under consideration may be completed in the next ten years.

The aggregate generating capacity of the country has grown as follows :—

1900	1,130
1905	11,750
1910	31,347
1915	57,286
1920	130,009
1925	327,152
1930	598,140
1935	900,402
1940	1,208,422
1945	1,319,316
1948	1,399,410

Both the Union and the State Governments have been fully alive to the need for development.

The Central Government have recently enacted legislation, The Electricity (Supply) Act, 1948, with a view to bringing about proper rationalisation of the industry and to assist in the rapid electrification of the country. The Act provides for the formation of Provincial Electricity Boards in the States which will take control of generation of electricity by all the licensees. It is felt that the Provincial Electricity Boards, which will be semi-autonomous bodies free from political influence, will be in a position to carry on efficiently the business of electric supply and power development in the larger interests of the region.

It also provides for the creation of a Central Electricity Authority for exercising a close scrutiny of the work of the Provincial Boards and to advise them on all major power development schemes that may be taken up by the Boards from time to time. This body has already come into being.

Under construction in India today are eight multi-purpose projects, three power schemes each costing over ten crores of rupees, 24 schemes of between two and ten crores of rupees each and 90 schemes somewhat under rupees two crores each.

The total estimated cost of the projects under construction and consideration spread over a number of years is about Rs. 1,900 crores. When completed, these works will add about 10 million kilowatts of hydro-electric energy to the country's existing two million.

Among the most important projects which are under construction are the Bhakra Nangal (Punjab), Damodar (Bihar and West Bengal), and Hirakud (Orissa). There are other projects which are under different stages of investigation. These include Kosi (Nepal and Bihar), Tikarpara and Niraj (Orissa), Narmada, Tapti and Sabarmati (Bombay and Madhya Pradesh), Indravati (Bastar), Sone, Rihand and Nayar (U.P.), Chambal (Rajasthan and Madhya Bharat), Dihang, Manas and Barauli (Assam). The total power generation on these projects may be 10 million kilowatts.

It must be admitted that work on the projects which are under construction is generally behind schedule owing chiefly to financial stringency. Below are given more detailed analyses of hydro-electric projects.

BOMBAY

The greatest hydro-electric undertakings in the country are the three schemes developed and brought into operation by Tata Sons, Ltd., and continued under their management until 1929, when they were transferred to the management of the Tata Hydro-Electric Agencies, Ltd., in which Messrs. Tata Sons retained a substantial interest. These undertakings are :—

(*a*) The Tata Hydro-Electric Power Supply Company, Ltd. Supply started in 1915.

(*b*) The Andhra Valley Power Supply Company, Ltd. Supply started in 1922.

(*c*) The Tata Power Company, Ltd. Supply started in 1927.

These three Hydro-Electric stations together with the Chola Steam Station of the Central Railway supply a demand of nearly 250,000 kW in and around Bombay up to as far south as Poona.

The favourable position of the Western Ghats which rise to a height of more than 2,000 feet above sea-level within a few miles of Bombay with their heavy rainfall was taken full advantage of for providing Greater Bombay and vicinity with an adequate and economical power supply.

Khopoli.—The hydraulic works of the Tata Hydro-Electric Power Supply Company are situated near Lonavla at the top of the Bhor Ghat. The monsoon rainfall is stored in three lakes, namely Lonavla, Walwan and Shirawta, from which it is conveyed in open masonry canals to the Forebay at Khandala and thence through steel pipes to the Power House at Khopoli at the foot of the Ghats, where the head at turbine nozzles is 1,725 feet or approximately 750 lbs. per sq. inch. The capacity of the Power Station at Khopoli is 65,000 kW. This scheme was formally opened by the Governor of Bombay on the 8th of February 1915.

Bhivpuri.—Investigations in 1917-18 led to the discovery of a site on the Andhra River just to the north of the Tata Hydro-Electric Supply Company's lakes, where additional power could be developed. These investigations resulted in the formation of the Andhra Valley Power Supply Co. and the construction of the schemes, the principal features of which consist of a reservoir formed by a dam about 190 feet high, across the Andhra River and a tunnel 8,700 feet long driven through solid trap rock to the scarp of the Ghats, from which the water is taken in steel pipes 4,600 feet long to the turbines in the generating station at Bhivpuri. The head of water at turbine nozzles is 1,740 feet or approximately 750 lbs. per sq. inch. The electrical energy is transmitted to Bombay over a transmission line 56 miles long for augmenting the supply from Khopoli. The present capacity of this station is 69,000 kW.

Bhira.—The Tata Power Company's scheme on the Nila-Mula River to the south-east of Bombay was investigated and developed along lines similar to the Andhra Valley scheme and has an installed capacity of 132,000 kW with the addition of the sixth set expected to go into service by April 1952. The power is transmitted to Bombay over a transmission line 76 miles long and is used to augment the supply of the two earlier companies to mills, factories and railways.

The Tata Hydro-Electric System, comprising the Tata Hydro-Electric Power Supply Company, the Andhra Valley Power Supply Company and the Tata Power Company, is operated as an integrated electric power system serving an area in the State of Bombay of more than 1,000 square miles. It is the largest power system in the country having a fixed capital expenditure in excess of Rs. 16 crores and an annual output representing more than one-fourth of the total electricity production.

Electric service is rendered to the textile mills and other industries of Bombay and the suburban areas, to the railways for electric traction, to local authorities, and, in bulk for retail distribution, to the electrical undertakings supplying Greater Bombay, Poona and ten other localities within the area.

During the year 1950-51, the three hydro stations and the railway thermal power station, which is connected to the system, together generated 1,358 million units of electric energy.

The transmission network of the system consists of 496 circuit miles of 100,000-volt lines and the distribution network of 106 circuit miles of 22,000-volt overhead as well as 101 miles of 22,000-volt and 116 miles of 6,600-volt underground cables. Substantial additions to the transmission and distribution network are expected to be made during the next few years. The interconnected transmission lines of the Railway add another 272 circuit miles to form the combined Tata Hydro-Railway Grid.

The rate for energy delivered to the Mills, Factories and Railways has, for several years, shown a steady decrease and now averages 0·35 of an anna per unit, which compared favourably with that in any large commercial centre in the world. This power supply greatly enhances the natural advantages Bombay has as a great manufacturing, trading and shipping centre.

Grid Schemes

For the development of industries and agriculture in the State of Bombay, the Bombay Government has embarked on the provision of an electrical grid scheme somewhat on the lines of the British Grid. It is at present proposed to develop grid schemes area-wise in the different parts of the State which may be interconnected at a later stage.

In the State of Bombay, there are at present 120 licensees in operation. In the case of three of these, the licensees have hydro-electric stations, their installed plant capacity being 248,000 kW. These three licensees serve by bulk supply Greater Bombay, Poona and six other townships. Almost all the remaining licensees generate their own electric energy. Of these, one has an installed capacity of 97,500 kW, another has an installed capacity of 5,476 and remaining have relatively small power houses. Most of the licensees operate in urban areas. Besides, there are 22 power stations owned and operated by the Bombay Government including those of the merged States.

The objects with which the Government of Bombay have set up the Electric Grid Department are : (1) to rationalise the generation of electricity by generating it at a few selected

stations having natural advantages, (2) to make available progressively large amounts of electricity at low rates, and (3) to bring the energy within reach of a progressively increasing number of the urban and rural population.

The objects are being achieved by the establishment of an Electric Grid System in regions which lend themselves to such development economically under quasi-state control. New power stations—both hydro-electric and thermal—are being established. These and the existing efficient generating stations of licensees, wherever practicable, will be interconnected by the Grid lines. Inefficient generating stations are being closed down and the licensees concerned supplied bulk power. Wherever possible, rural areas within the Grid regions are being supplied electricity from the system.

Small Diesel Stations are being established in isolated townships, which have some cottage industries and which cannot, within reasonable time, be served from the Grid.

To promote rapid development of the use of electricity by agriculturists and cottage and small scale industrialists specially in rural areas, it is proposed to assist them financially in acquiring electrical machinery and equipment on hire purchase terms.

The development programme under execution at present consists of: (1) North Gujarat Grid Scheme, (2) South Gujarat Grid Scheme, (3) the Jog-Karnatak Electric Grid Scheme, (4) Extension of the Chola Power Station of the Central Railway, (5) the Radhanagari Hydro-Electric Scheme, (6) Extension of the Gandevi Power Station of the former Baroda State, and (7) Rural Electrification and Small Towns Schemes based on small Diesel stations or distribution of power purchased from the existing licensees. Besides this, the Department is entrusted with the work of operation and maintenance of power houses in merged States which were owned and operated by the various former Indian States.

North Gujarat Scheme

Under this scheme power is being purchased in bulk from the power station of the Ahmedabad Electricity Company at Sabarmati and distributed to various load centres in the North Gujarat Area. The scheme when completed will comprise about 70 miles of 66/110 kV line, 14 miles of 33 kV and 50 miles of 11 kV transmission lines and about 480 miles of distribution lines a receiving station at Sabarmati and 66/11 kV step-down transforming stations at Baroda, Nadiad, Anand, Barejadi and Petlad and 33/11 kV sub-stations at Kalol and many 11kV/400-230 Volts sub-stations in various towns and villages to be served.

The Ahmedabad Electricity Company have constructed a new power station known as "B" station consisting of four 15,000 kW steam turbo sets negotiated by the Government with the Company in the year 1944-45. In order to meet the ever growing requirements of power, the Government have negotiated with the Company the establishment of a further new power station known as "C" station, initially consisting of three 15,000 kW sets orders for which have already been placed by the Company, and the first set of which is expected to be in Commission by the middle of 1953. The ultimate capacity of this "C" station is estimated to be 120,000 kW.

The 66/110 kV transmission line between Ahmedabad and Baroda and 33 kV line between Ahmedabad and Kalol have been energised and supply commenced to Baroda, Nadiad, Anand and Kalol licensees as well as to several industries. The work of erecting 11 kV lines in rural areas and the laying of distribution lines in the villages is in progress. Supply has already commenced in some villages and is being gradually extended to other villages. This scheme is estimated to cost approximately Rs. 268 lakhs.

South Gujarat Scheme

This scheme provides for the installation of a steam power station at Utran near Surat, initially comprising two turbo alternator sets of 7,500 kW each for supply of power in areas from Surat to Bulsar, and construction of 66 kV transmission line over a distance of about 33 miles from Surat to Billimora.

The construction of the power house is completed. The erection work of three boilers of 50,000 lbs. hour capacity and one turbo-alternator set of 7,500 kW is also nearing completion. The power house is expected to go into commission by the end of April 1952 for supplying power initially to Surat licensees. The erection of 22 kV line from Utran to Surat will be completed shortly. Orders for power transformers, sub-station equipment and other 66 kV line materials have been placed and the line is expected to be energised by the end of 1953. The scheme is expected to cost Rs. 376 lakhs.

The former Government of Baroda was persuaded to abandon the scheme of establishment of steam station and to take power in bulk at Baroda, Petlad, Kalol, Navsari and Billimora from the Grid schemes for distribution within the State territory. Negotiations were conducted with the Western Railway for the use of a common power system on a co-operative basis by the Railway for meeting its power requirements for traction purposes between Ahmedabad and Bombay and by the Bombay Government for supplying electric service to urban and rural population residing within the economic distance of the various sub-stations *en route*. When the Railway electrification scheme is decided on, it will be necessary further to develop more power at the generating stations in North Gujarat and South Gujarat areas and also the transmission systems.

Negotiations were also conducted with the Central Railway for the use of a common power system in the Nasik and Khandesh areas. However, due to financial stringency, the proposal for joint development in these areas has been dropped for the time being.

Other Schemes

Supply of electric power to the towns of Ratnagiri, Chiplun, Malvan and Vengurla in Ratnagiri District and Islampur, Peth in South Satara District has already commenced from the small Diesel stations set up at each of the places. Supply has also commenced to the ten villages of Bulsar taluka and 21 villages of Satara taluka under the respective Village Electrification Schemes based on power purchased from the licensees at Bulsar and Satara respectively.

None of the schemes mentioned above can at present supply any large industrial load, but with the new Surat Steam Station it will be possible to supply power for industrial use under the Bulsar Taluka Electrification Scheme.

In addition to those mentioned above, small Diesel stations are being established during the next five years in about 20 townships containing about 2,000 dwelling houses or more and having village industries, the production of which can be appreciably increased by the use of electric power. A list of the towns provisionally selected is given hereunder :

Division	District	Town
Northern	Ahmedabad	Dholka
,,	,,	Dhanduka
Central	East Khandesh	Erandol
,,	,,	Parola
,,	,,	Dharangaon
,,	Sholapur	Akluj
Southern	Belgaum	Chikodi
,,	,,	Gokak
,,	,,	Hukeri
,,	,,	Konnur
,,	,,	Sankeshwar
,,	,,	Bailhongal
,,	Bijapur	Guledgud
,,	,,	Kamatgi
,,	,,	Jikal
,,	,,	Sulebhavi
,,	,,	Amingad
,,	,,	Hungund
,,	,,	Gudur
,,	Dharwar	Gajendragad

Power purchased from Tatas was proposed to be distributed in the area between Lonavla and Talegaon.

All the above schemes have been administratively approved by Government. Excepting the schemes for Dholka, Dhandhuka, Akluj and Gajendragad and the scheme of electrification of rural areas between Lonavla and Talegaon with power purchased from the Tatas, which have been postponed at present due to financial stringency, all other schemes are under execution and some of them are expected to be in operation in 1952-53 while others in 1953-54.

Jog Power.—In consideration of the consent given by the Government of Bombay to the Government of Mysore for the electric development of the waterfall at Jog under certain conditions, the latter has agreed to supply the Bombay Government, electric power upto 11,500 kW at Jog. The scheme for distribution of Jog Power in the Dandeli, Dharwar, Hubli and Gadag areas, as well as in Byadgi, Ranibennur areas has been approved by Government. Survey work of 110 and 33 kV transmision line routes is in progress. Orders for almost all the materials for 110, 33 and 11 kV lines and sub-stations have been placed. Some of the sub-station equipment has already arrived. Electric supply is expected to commence in 1953. The scheme is estimated to to cost Rs. 213 lakhs.

Salient features of other hydro projects which are likely to be undertaken within the next few years are given hereunder :

Koyna Project.—The Bombay Government had sanctioned the detailed investigation, survey work and preparation of the project report of the Koyna Hydro-Electric Scheme. The project report was completed in January 1950 and submitted for consideration of Government. The tentative proposals envisage the construction of a dam approximately 300 feet high above the river bed across the Koyna River. The total quantity of water to be impounded would be 156,000 m.c.ft. out of which 44,500 m.c.ft. were proposed to be utilised for irrigating 446,000 acres of land in Bijapur and other districts. The scheme could develop 225,000 kW continuous power (340,000 firm) after reservation of water for irrigation as above. However, with all the water used for power supply, 400,000 kW continuous (580,000 firm) could be developed. The scheme was expected to cost Rs. 92 crores. However, later on objections were received from the other neighbouring States regarding the utilisation of full quantum of available water by the Bombay State. The question was then discussed in an Inter-State Conference and it was finally agreed that the maximum quantity of water to be diverted for power development should not exceed 67,500 m.c.ft. The possibility of developing the scheme by stages was also examined and a report on the development of the first stage of the project for the effective capacity of 240,000 kW to supply power to the Bombay-Poona area at a cost of approximately Rs. 34 crores was prepared by the Bombay Electric Grid Department and submitted to the Government for their consideration.

Kalinadi Project.—Preliminary survey work connected with the scheme was sanctioned by the Government of Bombay in January 1947. The work was entrusted to Messrs. Associated Consulting Engineers (India), Bombay. The final report indicates that 325,000 kW continuous is available in the Kalinadi Basin, distributed in four power stations. Initially the development of one power station at Supa, capable of supplying about 50,000 kW to the districts of Dharwar, Kanara, Belgaum and Bijapur is being examined.

Bhatgar Hydro-Electric Project.—A demand of about 10,000 kW can be met from this source, provided the power station is linked up either with Koyna when and if developed or Tata system at Poona. Consideration of this scheme will be taken up after 2 seasons' work has been put in on the proposed new irrigation dam at Vir, which will provide a balancing and supplementary reservoir.

Bhandardara-Randha Electric Scheme.—A demand of 16,800 kW can be met from this source. In addition to this, a further 7,500 kW can be obtained during the monsoon. This power can be firmed up by the establishment of

a steam station of the installed capacity of 15,000 kW in this area. The scheme was sanctioned by the Government of Bombay in 1945 but its execution had to be postponed as under the present conditions, development of this source of power cannot be undertaken economically. The question of its execution will be reviewed in due course.

Narbada River Project.—The Central Water Power, Irrigation and Navigation Commission are investigating the possibilities of power development by impounding the waters of the Narbada River in Gujarat. It is reported that at one of the Dam sites at Limbdi, 200,000 kW continuous power can be generated. This power when available will be utilised in Gujarat in place of the present thermal power.

Tapi (Tapti) Project.—Under this project, which was initially intended to be an irrigation scheme only, it is now proposed to also develop Hydel power with initial installed capacity of 24,000 kW the ultimate capacity being 216,000 kW. The work is being carried out by the Central Waterpower Irrigation and Navigation Commission on behalf of the Bombay Government. The Tapi Hydel power when available will supply the power requirements of the South and the North Gujarat Electric Grid Schemes.

Radhanagari.—Consequent upon the merger of the Kolhapur State with the State of Bombay, the Radhanagari Hydro-Electric Works have been taken over by the Government of Bombay. The Radhanagari scheme is a multi-purpose project viz. Irrigation, power generation and water supply and comprises construction of a dam, about 140 feet high above the deepest foundation across the Bhogavati River, about 32 miles from Kolhapur, and a power station with an installed capacity of 4,800 kW at Radhanagari in Kolhapur District.

Most of the materials for 33 kV, 11 kV and 400 volt lines have been received. The erection of 33 kV R.C.C. poles are in an advanced stage. Erection of the two generating sets is completed and supply from the power station is expected to commence shortly. The scheme is expected to cost Rs. 258 lakhs.

Gandevi Power Station.—The former Baroda Government had sanctioned the extension of the Gandevi Power House at an estimated cost of Rs. 2.76 lakhs providing for installation of two 255-kW Diesel generating sets, switchgear, etc. and extension of the Power House building with a view to increasing the capacity of the Power Station to meet the increasing demand for power. The erection has been completed and the sets are already in commercial operation.

Power Shortage in Bombay.—The load development in the area served by the Tata Hydro-Electric System has exceeded the available capacity. The available power is distributed to the existing consumers by staggering of working hours or days of the various industries. Although additional hydro capacity of 22,000 kW, now under erection by Tatas, is expected to be in service very shortly and another 24,000 kW of thermal plant ordered out by the Central (formerly G.I.P.) Railway for their Chola Power Station, is expected to be in service by about October 1952, further generating capacity of about 60,000 kW is required in the system to serve the immediate demands from large industrial loads and for domestic requirements which are awaiting power supply. For this purpose, the Government of Bombay have ordered out 54,000 kW of thermal capacity consisting of three 18,000 kW sets which are being installed in the Chola Power Station of the Central Railway, which is being extended for this purpose. This additional capacity is expected to be commissioned by about April 1953.

The total available capacity of the entire inter-connected system in Bombay area, including the new addition mentioned above, is expected to be fully utilised by end of 1954 and further generating capacity is required to meet the further growing demand for power in this area. On the basis of the latest load survey carried out by Tatas, it appears that about 100,000 kW capacity is required between 1955 and 1959. The thermal capacity of 54,000 kW mentioned above, decided upon by Bombay Government in 1949, was based on the assumption that large bulk of hydro-electric power from the Koyna Project, if immediately sanctioned at the time, would be available to Bombay area by about 1956 which may necessitate addition of one more 18,000 kW thermal unit at Chola. However, as delay has taken place in sanctioning the Koyna Hydro-Electric Project which is not now expected to be completed until about 1958 or 1959, it is decided to order out adequate thermal plant to meet the power demands upto that period. Provision of additional thermal generating capacity for the immediate requirements in the next few years is at present under active consideration of Government.

Rationing of Electric Power

Due to the partial failure of monsoon in the catchment areas of Tatas' lakes in 1951, there has been considerable deficit in the kW capacity of the system. Consequently, rationing of power had to be introduced for almost all classes of consumers except essential loads such as hospitals and very small domestic consumers. The cut originally imposed was 33⅓ per cent which has been later adjusted to 23 per cent for large industrial consumers only so as to enable maintenance of industrial production as much as possible. The rationing of power is proposed to be removed as soon as the monsoon conditions permit in July 1952.

MYSORE

The first Hydro-Electric scheme of any magnitude undertaken in the country or indeed in the East, was that on the Cavery River in Mysore State, which with its generating station, transmission line and distributing system was inaugurated in 1902.

Sivasamudram.—The Cavery River rises in the State of Coorg in the Western Ghats and flows across Mysore State. The principal object of this scheme was the supply of power to the mining companies on the Kolar Gold Fields about 92 miles from Sivasamudram, the site of the generating station. This transmission line was for a number of years the longest line in Asia. Since 1902 the supply of electrical energy from Sivasamudram has been provided for Bangalore and Mysore Cities and 226 other towns and villages in the State.

The initial undertaking has constantly been expanded and its total normal capacity now stands at 60,000 H.P. With the addition of the Shimshapura station's coming into existence in 1940, an additional 23,000 H.P. installed capacity has been added.

Jog Scheme.—Demands for large additional blocks of power made it necessary for Government in continuing its policies for the industrial development of the State, to sanction the construction of Jog Falls Power Station at Jog for the production at the first instance of about 48,000 kW without in any way interfering with the beauty of the Jog Falls on the Sharavati River which have been famous for their scenic beauty and grandeur.

The first stage of the Project with an installed capacity of 48,000 kW was put into service with four units of 12,000 kW each on February 21, 1948. The cost of this stage and that of all the civil engineering works for the second stage amounts to Rs. 5.6 crores. The work on the second stage is in progress now and with its completion, the total capacity of the station would be 20,000 kW. It consists of four more generator units of 18,000 kW each. This work is estimated to cost Rs. 2.65 crores.

The Jog Power plant supplies energy to the north and north-eastern parts of the State up to Mysore and Mandya, along Chickmagalur, Hassan, Holenarsipur and Belgola. It supplies power to the Ceded Districts from Ujjini on the Madras border. To the Tungabhadra project, a block power of 2,000 kW is being supplied. The State of Bombay receives 11,500 kW at the station itself and 1,500 kW at Harihar border. To South Canara of Madras State, this plant supplies 6,000 kW and another 2,000 kW is being supplied to Coorg.

A 110-kV transmission line constructed from Bhadravati to Bangalore enables transmission of 50-cycle Jog Power to Bangalore where the frequency conversion from 25 cycles to 50 cycles is rapidly progressing.

At present Mysore supplies electricity to 503 towns and villages and to 3,034 irrigation pumping units within the State limits. With the Rs. 100 lakhs grant from the Government of India under the "Grow More Food," power will also be provided for another 2,000 pumps by June 1952.

The transmission system consists of over 900 route-miles of 78,000 and 37,500 volt lines with a total of 1,350 miles of circuits. The transmission system is extended to supply hydro-electric power to the four corners of State. With the construction of the new transmission lines and on the generation of power at Jog, over 600 miles of 110 kV new transmission lines will be in service.

TRAVANCORE-COCHIN

The first electrical undertaking to operate in the erstwhile Travancore State was the Hydro-Electric Station established in the High Ranges by the Kannan Devan Hills Produce Co., Ltd., in 1905, to meet the power requirements of the Company for lighting and factory drive. Towards the close of 1927 the Government initiated a programme of electrical development in the State by establishing a thermal station at Trivandrum, in March 1929. The rapid expansion of the Trivandrum Electric Supply served as an incentive to private enterprise to come into the field. A thermal station was started at Kottayam in 1932 for the supply of power to that town, under a license. Another private agency took up the supply of power at Nagercoil in 1934.

A scheme for the supply of power to Quilon was inaugurated by the Government towards the middle of 1934. A licence for the supply of power to the taluks of Shencottah and Pathanapuram was granted to a private agency in 1940 and the supply was inaugurated in 1941.

With the development of the hydro-electric supply within the State, the thermal stations at Kottayam, Quilon and Shencottah were shut down, the supply to these towns being made from the hydro-electric system.

In the erstwhile Cochin State, thermal stations were established at Ernakulam, Trichur and Nemmara. Excepting the thermal station at Nagercoil which is still licensee owned, the remaining four thermal stations are under departmental control and are mostly run during peak load hours and to supplement the summer shortage.

Pallivasal.—In view of the demand for electric supply being extended to several areas, the Government decided to initiate a large hydro-electric system to meet the growing demand for power. As a first step towards this objective, the Pallivasal Hydro-Electric Scheme was sanctioned by the Government in 1931 and the work was taken up immediately afterwards. The first stage of development was completed by the beginning of 1940 and the supply was commenced in March 1940. The scheme utilises the water of the Mudirapuzha River diverted at Munnar through a tunnel 9 ft. by 8 in. and 10,200 ft. in length.

The first stage installation consisted of two parallel steel penstock lines each 7,800 ft. in length feeding three 5,000 K.V.A. Alternators generating at 11,000 volts and directly coupled to pelton wheels operating at 1,980 ft. head. Immediately after completing the first stage, the second stage extension works of the Pallivasal Hydro-Electric Project were taken in hand and are now in progress. Two additional sets each of 7,500 kW have so far been installed thus bringing the total installed capacity of the station to 28,500 kW. With the completion of the Madupatty Dam in the upper reaches of the Mudirapuzha river, the installation of the sixth and the last 7,500 kW set and certain modifications to the first three units in the power station, the installed capacity of the Pallivasal power station will be raised to 37,500 kW.

Power is stepped up to 66,000 volts for transmission to plains. The primary transmission network now consists of 434·14 route miles of 66 kV lines, 26 route-miles of 33 kV lines and 24 route miles of 22 kV lines and seven 33 kV sub-stations. The distribution network consists of nearly 668 miles of 11 kV lines, 21 miles of 400/230 volt lines and 204 distribution centres.

The availability of hydro-electric power in most of the important commercial and agricultural centres coupled with the impetus given to industrial and agricultural operations consequent on the situation created by the Second World War, has resulted in a steadily growing demand for power. The connected load is over 2,200 kW with a maximum peak load of about 28,500 kW. The total generation during 1951 was 170 million units. About 77·5 per cent of the power generated is used for industrial purposes and the rest for agricultural and domestic needs. Electrolitic production of aluminium, tea factories, fertilizers and chemicals, ceramics, textiles, paper, plywood, oil mills, saw mills, tile factories, mineral factories, engineering workshops, etc., constitute the main industrial load.

The situation created by the Second World War has given a strong impetus to industries in general and in the wake of it, a growing demand for power. During war-time, one of the major industrial concerns supplied with power from the Government system was the Indian Aluminium Company. Several thousands of acres of land both in Central and North Travancore, have been brought under cultivation with the aid of electric drive.

Owing to the delay in augmenting the generating capacity of the Pallivasal Station, it was found necessary to resort to other arrangements for making available additional power to meet the demands arising out of commitments already made. As a result of the negotiations with the Government of Madras, it has been possible to get a block of 3,000 kW of power from the Papanasam System. A 66 kV single-circuit line connecting Kundara to Shencottah has been constructed and the supply from Papanasam was inaugurated at the beginning of September 1946.

Sengulam.—The demand for power as foreseen now is so heavy that it has become an urgent necessity to explore the possibilities for further hydro-electric developments. Two new projects have been taken for execution and works on these are progressing satisfactorily. The first of these, the Sengulam Hydro-Electric Project envisages the utilisation of the tail water discharged from the Pallivasal Power station over a head of 1,200 feet. The project is under execution and is estimated to cost Rs. 300 lakhs. The water discharged from the Pallivasal generating station will be taken through the channel toga storage pond from which it will be pumped to a balancing reservoir nearly 30 feet above the storage pond through a tunnel nearly 5,700 feet long. The water from the balancing reservoir will be taken to another tunnel 5,770 feet long through a low pressure pipe-lines and two penstocks to feed four Pelton-driven alternators each rated at 12 M.W. The various works connected with the project are well under way and the first unit in the Sengulam Power Station is expected to be commissioned by the beginning of 1952.

The Poringalkuthu Hydro-Electric Scheme will utilise the water of the Chalakudi river. In the first stage of the project which is now under execution the installed capacity will be 24,000 kW comprising three sets each rated at 8,000 kW. This Scheme is scheduled to be completed by the end of 1953.

MADRAS

Madras now ranks next to Bombay in its hydro-electric power output. Three hydro-electric stations are now in operation. Besides extensions to the existing plants, two more stations are under construction.

The water power sites in the State are mostly in the Western Ghats especially in the region of the Nilgiris and the Palnis. Sites in the Eastern Ghats are few and some of them are on border streams. While it is unsafe at this stage to give an estimate of the maximum water power available in the State it may be assumed to be around 500,000 kW continuous. This does not, however, include power that can be developed from future large irrigation dams like those projected at Polavaram on the Godavari and on the Krishna and Pannar rivers under the Krishna-Pannar Project.

To develop the available power resources in an orderly and rational way and make it available over the whole State cheaply and in abundance, an 'Electric Power Grid' was conceived by the Madras Government over 20 years ago.

The grid in the south where it is well formed consists at present of three hydro-electric power stations, viz., those at Pykara, Mettur Papanasam and two thermal stations at Madras and Madural. A good portion of 13 districts from Chittoor to Tinnevelly and Chingleput to Malabar is covered by the Grid. In the central and northern regions of the State the grid is yet to take shape. In the north there are thermal stations at Vishakapatnam, Cocanada, Bezwada and Nellore, each serving the local area. The Ceded Districts area is fed from the Jog supply from Mysore and thermal stations at Kurnool, Cuddapah, Prodattur and Anantapur and a few smaller Diesel engine stations.

With the completion of Machkund Hydro-Electric project on the Orissa border and the Tungabhadra Hydro-Electric Scheme in the Ceded Districts, the separate areas of the Grid will get extended and interlinked until eventually a single grid covers the whole of the Madras State.

The installed generating capacity under the Madras Grid totals 195,300 kW. It has about 5,100 miles of high tension line, operating at voltages from 11,000 to 111,000, and 4,000 miles of low tension distribution lines. There are 34 extra high tension sub-stations of 110 kV and 66 kV, and 44 of 33 and 22 kV with transformer capacity totalling 247,000 kVA and 1,766 distribution transformer stations with an aggregate capacity of 110,800 kVA. The total connected load to the Grid is 468,750 kW. A total of 1,960 towns and villages are receiving supply from the Grid. Among the important industries which are served are textile mills, cement factories, electro-chemical works, sugar factories, steel rolling mills, railway workshops and ship-building.

There are over 274,000 consumers of all classes: 111,000 served directly by the department and 163,000 by licensees distributing Government power. The total power generated in 1950-51 amounted to 682 million units representing more than 99 per cent of the total power output in the State. The capital investment made upto April 1951 was nearly Rs. 21·7 crores and the revenue in 1950-51 was Rs. 3·78 crores.

Madras leads all other States in India in rural electrification with 1,960 villages electrified of which about 1,100 received supply from the Grid, the rest from self-generating licensees. Nearly 16,700 pumps for lift irrigation and 1,800 rural industries are run on electricity with a connected load of 92,000 kW. Rural industries include ginning cotton, hulling rice, pressing oil, shelling nuts, crushing cane and milling flour.

Pykara Scheme.—The scheme utilises the waters of the Pykara river which drains from the Nilgiri plateau having a catchment area of nearly 38 square miles and a fall of about 3,100 ft. The flow though perennial is very irregular and often drops to values around 20 cusecs during the dry season. The estimated potential capacity of the full development is around 40,000 kW continuous.

The first stage of development was commenced at the end of 1929 and was completed at the end of 1932. This stage utilised the regulated flow of the river with small storages of 58 million cubic feet in the forebay and 28 million cubic feet in the Glenmorgan Reservoir. The rapid growth of load necessitated the early construction of the Dam at Mukurti to store 1,400 m.c. ft. with open spillways. The work was commenced in January 1935 and completed in June 1938. By installing automatic gates over the spillways the storage capacity was raised to 1,800 m.c. ft. in April 1946. The final stage now under construction will provide a further storage of 2,000 m.c. ft. by the construction of a new dam across Pykara river

Water from the intake of the river is led by a flume to the forebay from whence it is led through a single 78" diameter steel pipe 1,000 ft. long to a surge tank at the head of the penstocks. In the first stage two pipes each in 3 sections of diameter 27", 24", 21" with a total length of about 9,300 ft. were laid. In the second stage a third penstock of 42", 39", 37½" diameter was added.

The initially installed plant comprises three 7,810 kVA, 3 phase, 600 r.p.m. alternators coupled to 10,900 H.P. Pelton wheels. Power is generated at 11,000 volts, 50 cycles and stepped upto 110,000 volts by means of three 7,810 kVA, 3 phase, 11 kV and 66-110 kV transformers.

In 1939 two 12,500 kVA generating units and two 12,500 kVA transformers were added. The Pykara-Coimbatore transmission line was changed from 66 kV to 110 kV operation to suit the increased load demand. In 1947 two 5,000 kVA, 11/66 kV transformers were added to feed the 66 kV line to the West Coast.

Power is transmitted to Coimbatore, which is the main receiving station and also the chief load centre by means of a 50 mile double circuit 110 kV line. The line is extended therefrom at 66 kV to Tiruppur, Erode, Udumalpet, Sembatti and Madurai. At Erode and Madurai tie is established with the Mettur and Papanasam Systems respectively. Power is now supplied from Pykara to Calicut and Cannanore through 66 kV lines.

This system has 1,722 miles of transmission lines of voltage ranging from 11,000 to 110,000 in service. There are nine extra high tension sub-stations with transforming capacity of 140,680 kVA and 734 distribution transformer stations with an aggregate capacity of about 41,600 kVA.

The final stage of the Pykara Project consisting of a second dam across the Pykara river to provide a storage of 2,000 m.c. ft. a new penstock, and two generating sets of 13,600 kW each at Pykara station is under execution. This will not only meet the power deficiencies of Mettur and Papanasam stations during periods of unfavourable water conditions but will also meet the demands arising out of the large scale industrial and agricultural developments in the southern districts in the near future.

To supplement the output in the Hydro-Grid during water scarcity, an auxiliary steam station at Madurai with an initial capacity of 4,000 kW was completed and brought into operation in February 1951.

Mettur Scheme.—The engineering features of the Mettur Hydro-Electric Scheme provide an interesting contrast to the Pykara Hydro-Electric Scheme. The Mettur Dam, one of the largest structures of its kind in the world is 176 ft. high and can impound a total of 93,500 m.c. ft. of water. This storage is primarily for irrigation purposes but part of the water let down for irrigation is utilised to the best advantage for the generation of hydro-electric power.

During the construction of the dam 4 cast iron pipes 8'-6" in diameter had been built into the structure and equipped with the necessary valves, gates, screens and other fittings. Each pipe is designed to discharge a maximum of 1,250 cusecs for power purposes.

Work on the initial installation with 3 units of 10,000 kW each was commenced in the latter part of 1935 and the station started operation in June 1937.

The operating head varies from 160 ft. at full reservoir level to a minimum of 60 ft. The average head is 135 ft.

The power house is situated immediately below the Mettur Dam. The units are 12,500 kVA 250 r.p.m. generators, coupled to overhung type twin

horizontal Francis turbines, one on each side. The turbines operate under a variable head from 60 to 160 ft. developing a maximum of 16,000 H.P. each. Power is generated at 11,000 volts, 50 cycles, 3 phase and stepped upto 66,000 volts for transmission to various load centres. The voltage of transmission will shortly be raised to 110,000.

The fourth generating unit was commissioned into service in October 1946.

Power is transmitted to Singarapet in the north and Erode in the south by means of two 66/110 kV trunk lines (a total mileage of 100 miles) taking off from the power station. At Erode the Mettur System is linked with Pykara network. 66 kV lines have been extended in the north to Vellore, Tiruvannamalai and Villupuram and in the south to Trichinopoly, Tanjore and Negapatam. To ensure proper voltage regulation two 2,500 kVA synchronous condensers are installed at Trichinopoly.

Considerable lengths of 11,22 and 33 kV lines have been constructed for extending power to various places. 1,826 miles of high tension lines of all voltages are now in service. There are 27 E.H.T. and H.T. sub-stations with an aggregate transformer capacity of 117,600 kVA. The number of distribution transformer stations are 519 and have a total capacity of 30,200 kVA.

Papanasam Scheme.—This is the third hydro-electric scheme to be undertaken by the Madras Government. The first stage of the scheme was started in 1938 and the station commenced operation in July 1944.

The Tambraparni river drops about 300 ft. over the picturesque Papanasam falls at the foot of the Western Ghats in Tinnevelly District. The power development consists in regulating the river flow and harnessing the energy that was wasted over the falls. The catchment is benefited by both south-west and north-east monsoons, the latter generally preponderating.

Six miles above the falls a reservoir of 5,500 m.c.ft. is formed by constructing a masonry dam 170 ft. above river bed and 800 ft. long. About ¾ mile above the falls the water is diverted from the river course by a weir 1,350 ft. long and 35 ft. high giving a pondage of 28 m.c.ft. for daily regulation. Water is conducted by two 9 ft. low pressure steel pipes from the diversion weir to the surge tank at the edge of the cliff and from thence through four 66" penstock pipes 520 ft. long down the hill slope to the power house which is located near the Agastya temple at the foot of the Papanasam Falls. One low pressure pipe and 3 penstocks only were installed in the first stage. The second low pressure pipe and the fourth penstock were laid under the second stage extension which was completed in July 1951. The gross head developed is 330 ft.

The generating plant consists of four vertical alternators of capacity 7,250 kVA, 600 r.p.m. coupled each to a Francis reaction turbine of 9,850 B.H.P. of which three were installed under the first stage in 1944-45 and the fourth recently in July 1951.

The generation is at 11 kV, 3 phase, 50 cycle and power is stepped upto 66 kV by means of four 7,250 kVA, 1,166 kV transformers.

The transmission system extends to Tuticorin, Koilpatti and Madura, and is linked with the Pykara Hydro-Electric System at Madurai. For purposes of voltage regulation two 2,500 kVA synchronous condensers are installed at Madurai.

The system has 594 miles of high tension transmission lines, thirteen E.H.T. and H.T. sub-stations with transformer capacities totalling 72,725 kVA. and 211 distribution transformer stations with an aggregate capacity of 11,600 kVA.

Bulk power to the extent of 3,000 kW is being delivered to the Travancore-Cochin Union Government at the State borders near Shencottah.

Five-Year Programme.—With the ending of war, the Madras Government sanctioned several schemes constituting a 5-year plan of development. The plan provides for (*a*) four new power houses at Machkund, Moyar, Nellore and Madurai; (*b*) extensions to five existing power houses—Pykara, Papanasam, Madras, Vijayavada and Visakhapatnam—and (*c*) 1650 miles of new high tension line.

In 1950-51 sanction was accorded to the Tungabhadra Hydro-Electric Project and a number of transmission and distribution extensions.

All these schemes will add 200,000 kW of extra generating capacity to the Grid. In other words, when the plan is completed, the existing generating capacity will have been doubled.

Work is in full swing on all the schemes. Delay in the supply of steel, cement, power plant and lack of a sufficient number of civil engineers have, however, been impeding progress. The plan has been incorporated in the first Five-Year Plan by the National Planning Commission of India and the estimated expenditure for the five years 1951-56 is Rs. 50.24 crores.

Of the schemes included in the plan, the Nellore thermal station with a generating capacity of 5,000 kW was completed and brought into operation in October 1950. The Madurai thermal station a 4,000 kW turbo set was commissioned into service in February 1951. The Papanasam power house extension was completed with the addition of the fourth 7,000 kW unit. And Moyar power house and Madras station first stage extensions will be completed early in 1952-53. The generating capacity of Vijayavada and Visakhapatnam thermal stations was increased by 6,000 and 3,000 kW respectively. The areas will ultimately be connected to the Machkund Hydro-Electric Station.

All these schemes which are all now under construction cover a major part of the State and will result in doubling the existing generating capacity and add nearly 2,000 miles of H.T. lines.

WEST BENGAL AND BIHAR

The Damodar Valley Project.—This is the most important development scheme serving West Bengal and Bihar jointly. Of the seven multi-purpose dams included in the entire Project, four form part of the First Phase Programme now under implementation. The Tilaiya dam will be ready in 1952, the Konar dam in 1953, the Maithon dam in 1954, and the Panchet Hill dam in 1955, when an irrigation barrage and 1,500 miles of canals and distributaries, of which 83 miles will be navigable, will likewise be finished. A 150,000 kW thermal power station at Bokaro is also included in the First Phase Programme, and will come into commercial operation at the end of 1952, together with 470 miles of high voltage (mainly 132 kV) transmission lines, of which nearly 150 miles have already been erected, and put into commission. The First Phase alone will provide perennial irrigation for one million acres, generate 126,000 kW hydro-electricity, and control floods up to 650,000 cusecs. The extra foodgrains expected to be produced on completion of the First Phase are about 10 million maunds, yielding at present prices Rs. 30·48 crores annually. The estimated monetary value of the extra jute is Rs. 3·60 crores per year and the sale proceeds per annum of the D.V.C. power has been calculated at Rs. 4.18 crores. On the basis of prices prevailing in 1951, the revised cost estimates for the First Phase amount to Rs. 76 crores.

Mor Project.—The opening of the Mayurakshi canal in July 1951 marked the successful completion of an important phase in the Rs. 15½ crore Mor Project, one of the principal post-war development schemes in West Bengal. Besides irrigating an area of 600,000 acres, the project will provide about 4,000 kW of electric power annually. The necessary plant has already been installed.

Kosi Project.—The most important scheme in Bihar is the Kosi Project now under investigation with the Central Waterpower, Irrigation and Navigation Commission. It will be a multi-purpose project for irrigation, drainage, reclamation of water-logged areas, malaria control, fish culture and recreation facilities. The project comprises a dam, 750 feet high across the Chatra Gorge in Nepal just above the temple of Baraha Kshetra, to store about 11 million acre feet of water, power plant at the dam site capable of generating upto 1.8 million kW of power at 50 per cent load factor, a barrage in Nepal across the Kosi to control and stabilise the river channel, and to divert its supplies into two canals, one on either bank, for irrigating about a million acres in Nepal territory, and a second barrage near the Nepal-Bihar border with two canals on the left and one on the right bank, for irrigating over two million acres of land in Bihar. The project is estimated to cost rupees 90 crores. The execution of the scheme is expected to take about ten years.

ORISSA

The unified development of Mahanadi Valley has been decided upon by the State of Orissa and is being executed through the Central Waterpower, Irrigation and Navigation Commission, Government of India. It comprises three units namely the Hirakud Dam Project, the Tikarpara Dam Project and the Naraj Dam Project, each with its own canal system and hydro-electric power installations. The three units are capable of independent development and also of forming an integrated part of the basin wide plan. It has been decided to make a start with the Hirakud Dam Project.

Machkund Scheme.—The construction of the Machkund Hydro-Electric Scheme has been undertaken jointly by the States of Orissa and Madras. The Scheme will harness the Duduma water falls on the Machkund river which forms the boundary between Orissa and Madras in that stretch. A gross head of 840 feet is available there and with the help of a storage reservoir, built to regulate the minimum flow, a power house of 100,000 kW will be installed. The reservoir will be created by constructing a dam at Jalaput, some 18 miles above the falls, to a height of 134 feet above the bed of the river and it will impound 25,450 million cubic feet of water to supplement the river flow during dry season. Power will be generated at 11 kV and stepped up to 132 kV for transmission to the respective States.

The cost of the scheme is estimated to be Rs. 931.79 lakhs, shared in the ratio of 70 : 30 by Madras and Orissa respectively, and the power generated will be utilised by the States in that ratio in accordance with an agreement entered into between the States. Orissa has prepared a scheme for distribution of the power in the State at an estimated cost of Rs. 2 crores.

Power from the project is likely to be available in 1953. It will be transmitted by a 132 kV line to Berhampur *via* Jeypore and Rayaghada and will be made available at present in Koraput and Ganjam Districts.

The Hirakud Dam Project.—This involves the construction of a dam—150 feet high and gross storage capacity of the reservoir 5.3 million acre feet—across the Mahanadi about nine miles upstream of the town of Sambalpur, gravity and lift canals on either side and two hydro-electric installations. The project will provide irrigation to 1,094,953 acres of land, generate 350,000 kW and will also provide navigation facilities. The whole scheme is estimated to cost rupees 47.81 crores and will earn an annual return of 4.29 per cent on the sum-at-charge.

The construction of the Hirakud Dam will also substantially relieve the State from flood and drought, by providing stored supplies.

ASSAM

Assam possesses large potentials of hydro-power. It has roughly been estimated that it should be possible to generate upto four million kilowatts of continuous power in that State by developing eleven sites on different rivers. These projects would involve storage by construction of high dams involving a total reservoir capacity, during monsoon, of 68 million acre feet. Most of these projects can be designed as multi-purpose schemes for power generation, perennial irrigation, extension and improvement of navigation and flood control.

The Government of India through the Central Waterpower, Irrigation and Navigation Commission has undertaken the investigation of two multi-purpose hydro-electric schemes, *i.e.*, the Dihang and the Manas. Due to the havoc caused by the 1950 earthquake in the area where the Dihang project is contemplated work has had to be suspended. The investigation of the Manas hydro-electric scheme is reported to be well under way.

The site of the proposed dam and the reservoir will lie within the Bhutan territory. The survey will be taken up after the Bhutan Government gives the necessary approval. Air survey of the site has, however, been already completed. Gauge discharge and silt observations are being now taken. Economic statistics for 43 villages in the river basin have also been collected and land classification and soil survey for 147 villages have been made. A silt laboratory has also been established. Rs. 1,71,722 were spent on this work up to the end of the last year.

The State Government has established a small office for purposes of investigation of small rivers and streams for generation of electrical power for local needs. In one scheme namely the Umtru hydro-electric scheme, the work of collection of data has been completed and now the work of the detailed estimate and design of a power station of 8,000 kW is in progress. Three 2,000 kW sets are to be installed initially and a fourth to be added at a later date. The idea is to proceed with the investigation of other hydro-electric projects of a similar type in different places in the State of Assam where there is a demand for power for the development of local industries.

The tribal areas near the foot-hills of the Naga, Garo and the Lushai Hills offer possibilities for the installation of small hydro-electric stations for the development of cottage industries. The State Government is also proceeding with the investigation of such small schemes in the Hills areas. All activities however have had to be curtailed due to financial stringency in the State.

KASHMIR

A scheme of much importance from its size, but more interesting because of the developments that may be expected from it than for the part which its current supply already plays in the life of the countryside, is one installed forty years ago by the Kashmir Durbar, utilising the river Jhelum, near Buniyar about twenty miles from Baramulla.

The headworks of the Jhelum power installation is situated six and a half miles from the power house at Mohora and the main connection between the two is a timber flume. These works and the forebay at the delivery end of the flume have a capacity for carrying water sufficient for the ultimate generation of 20,000 electrical horse-power. Four pipes 792 feet long lead from the forebay to the power house and from forebay to water wheels there is an effective head of 399 feet. There are four horizontal water-wheels, each coupled on the same shaft to a 1,000 kVA, 3-phase, 2,300 volt, 25 cycle generator running at 500 r.p.m. The power house is of sufficient capacity to allow of 15,000 kW generating plant being installed within it. Two transmission lines run side by side as far as Baramulla, 21 miles from Mohora at which point one terminates. The other continues to Srinagar, further 34 miles.

This power station is now old and its machinery has outlived its assigned life. At present it supplies power to Srinagar, Baramulla, Sopore and other villages nearby. The capacity being insufficient and the supply being unreliable, a hydro-electric-cum-irrigation scheme with the ultimate capacity of 18,000 kW by harnessing the Sindh river at Ganderbal has been taken in hand. The execution of the scheme is in progress according to programme and expected to be completed within two to three years.

At Pahalgam a small hydro-electric station of about 186·5-kW has been erected for the convenience of the visitors there.

The Jammu power house employs four generating sets. Of these, one 265 kW set is driven by a Diesel oil engine and the remaining three (two of 350 kW and one of 160 kW) are driven by water turbines.

The necessity for augmenting the power supply in the Jammu area being urgent, a steam turbine driven generating plant of 1,500 kW capacity has been installed at Miran Sahib and connected with Jammu by a 6,600 volt line. The present supply being inadequate and unreliable the Kashmir Government has been allowed to purchase from the Government of the Punjab about 1,500 kW from Jogindernagar power Station at an estimated cost of Rs. 23·8 lakhs. This scheme is expected to be completed in 1953.

Schemes pertaining to two hydro-electric power stations at Khirum and Udhampur are under survey.

A small Hydro-Electric installation has been set up at Bandipore, a town 40 miles to the north-west of Srinagar, in 1951, by utilising a small irrigation channel emanating from River Madhmati, with a head of 25 feet. Its present capacity is 30 kW, which is shortly going to be supplemented by another set of 30 kW.

The outstanding feature of this small scheme is that it has been financed entirely by the local co-operative stores and the electric light in the locality is supplied on a co-operative system. As the country-side in Kashmir abounds in small streams and channels, it is considered more feasible to build up small power stations for electrifying suburbs than laying and maintaining long transmission lines over sparsely populated areas. The Department is, therefore, planning to undertake a few other such rural electrification schemes.

UTTAR PRADESH

The Ganga Canal Hydro-Electric Grid.—This system supplies power at attractive rates for domestic, industrial and agricultural purposes to 14 districts in the west of the State and to Shahdara in Delhi. Seven of the ten falls available for electrification have been developed and stand-by steam power stations at Chandausi and Harduaganj with installed capacity of 19,000 kW have been constructed. The Grid thus has no less than 38,000 kW of installed capacity. A new hydro-electric station at Mohammadpur with an installed capacity of 10,500 kW is under construction. At Harduaganj steam station an additional power plant is under erection which will raise the installed capacity of the station from 10,000 kW to 20,000 kW. Besides supplying some 93 towns with current for light and fans and minor industries, the Grid provides energy for irrigation pumping from tube-wells and open wells.

The Ganga Valley State Tube-well Scheme comprises about 2,300 tube-wells, covering the districts of Moradabad, Bijnor, Budaun, Muzaffarnagar, Saharanpur, Meerut, Bulandshahr, Aligarh and Etah, introducing irrigation on the volumetric system over approximately one million acres hitherto without any source of irrigation. This supply of cheap power from some 2,300 sub-stations is already having an important bearing on the economic disposal of crops and the development of minor industries in the urban centres and rural areas.

The Sarda Canal Hydro-Electric Scheme.—This is one of the major schemes the Uttar Pradesh Government have in hand at present. It is proposed to combine into a single drop a number of existing drops on the existing Sarda Canal between its mile 7 and mile 20 and to install a power station near Khatima about 9 miles from Banbassa, the headworks of the Sarda Canal. The power house will generate 41,400 kW out of which 23,000 kW will be firm power. The cost of construction of the power station including plant, about 12 miles long tail race channel and allied works, is estimated to be Rs. 7 crores approximately. This project will supply electric power to the Kumaon, Rohilkhand and Oudh divisions for domestic, agricultural and industrial purposes. It will also augment the power supply of the existing Ganga Hydel Grid.

The Pathri Power Station Project.—This will add an installed capacity of 20,400 kW, out of which 8,500 kW will be firm power, on the Ganga Hydro-electric Grid by the construction of a power house on a by-pass power channel at Bahadrabad on the Main Ganga Canal. The project is under construction and is expected to cost approximately Rs. 2.6 crores.

There are several other schemes under consideration, the more important of them being the Pipri Dam and Power Station Project estimated to cost over 29 crores of rupees—Rs. 19.25 crores for dams and Rs. 10 crores for transmission lines—the Yamuna Hydro-Electric Project estimated to cost rupees 21 crores, the Nayar Dam Project estimated to cost rupees 21 crores and the Ramganga Project at a cost of some 22 crores of rupees.

PUNJAB

The Bhakra Nangal Project.—The completion of which will turn the Punjab into a regular granary and make it a highly industrialized State, is now under construction. The most important feature of the project is the construction of a 680 feet high dam on the river Sutlej, forming a reservoir with a live capacity of 5.725 million acre feet. The 90-feet Nangal Dam which is under construction on the same river about eight miles downstream of the Bhakra Dam will provide necessary storage to smoothen out the diurnal variations in releases from Bhakra Plant and a diversion for the Nangal Hydel Canal which takes off just above this dam. The Nangal hydel canal is designed for a capacity of over 12,500 cusecs, and three power houses, two of which having a head of 98 feet each are under construction on this canal. The Nangal Dam is nearing completion and it is expected that the erection of the first generating set in Power House I will soon be completed and the second set will be ready later in 1952. Thus it will be possible to commence commercial supply of electricity from this power house by the end of 1952. Power House II is also expected to be ready for commercial supply of power by the end of 1952.

The firm power potential of the project works out to 400,000 kW at 100 per cent factor. This power will be utilised in the States of the Punjab, PEPSU, Himachal Pradesh, Delhi and Rajasthan.

New irrigation canals of an aggregate capacity of 15,400 cusecs, *i.e.*, Bhakra main line which takes off from the Nangal canal, Bist Doab Canal which takes off at Rupar, and Sidhwan which takes off from the existing Sirhind Canal, are all under construction and will command an area of 6.5 million acres in the States of the Punjab, PEPSU, and Rajasthan, out of which 1.6 million acres is at present virgin waste land. Annual irrigation expected is 3.6 million acres which will yield 1.13 million tons of food grains and 800,000 bales of cotton. The project is estimated to cost Rs. 132.9 crores. The costs chargeable to the irrigation and hydro-electric portions works out to Rs. 57.4 crores and Rs. 75.5 crores respectively. The whole project including the dam and canal is programmed to be completed by 1957-58.

Mangla Scheme.—This project provides for the generation of 10,000 kW of hydro-electric power at Mangla near the Irrigation Branch Head Works on the Upper Jhelum Canal from a head of 30 ft. and minimum flow of approx. 5,000 cusecs in the head reach of the canal. It also provides for the linking of this power station by a double circuit 132 kV line with the 132 kV Grid sub-station at Jhelum which would be constructed under the Rasul Hydel Scheme.

The addition of a pipe line and two 12,000 kW pelton wheel generating sets at Jogindranagar is an extension of the existing hydro-electric works of the Uhl River Scheme at Jogindranagar and is meant for developing additional power which in cold weather periods during shortage of water at the headworks at Brot will be supplied by means of the Mangla Hydro-Electric Scheme but, when there is a shut down of that generating plant during summer, it will be supplied by these additional sets at Jogindranagar power station which has an ample supply of water in summer to run five machines.

These two schemes are therefore primarily meant to supplement each other during the low water periods at the respective power stations, thus ensuring a constant supply of

additional power all throughout the year. The schemes are estimated to cost Rs. 99.52 lakhs.

Uhl or Mandi.—Situated on a spur of the Dauladhar Range at elevations ranging between 6,000 and 4,000 feet above sea-level, and connected by means of a tunnel over 15,000 ft. long, are the works of what is known as the Uhl River Hydro-Electric or Mandi Scheme which is now operated by the Punjab P.W.D. Electricity Branch.

Due to the extensive nature of the construction works, it was found necessary to build two small temporary hydro-electric power stations one at Dhelu near Shanan and the other at Thuji near the headworks at Brot which were linked together to constitute a combined installed capacity of 1,440 kW.

Shanan Power Station.—The initial installed capacity of Shanan Power Station is 48,000 kW. The plant consists of four 17,000 B.H.P. Pelton wheels, running at 428.5 r.p.m. each driven by a single jet of water and connected to a 12,000 kW, 11,000 volt, 3 phase, 50 cycle alternator.

From the Shanan Power Station energy generated at 11,000 volts is stepped up to 132,000 volts which is the highest voltage adopted for this purpose in the country. The transmission system comprises a double circuit 132 kV trunk transmission line supported on steel towers 80 ft. high normally set 1,000 ft. apart but with spans extending even upto 3,360 ft. in the hills. This line supplies sub-stations at Kangra, Pathankhot, Dhariwal and Amritsar.

A single circuit 132 kV line also runs from Amritsar to Jullundur and is continued at 33 kV to serve Goraya and Ludhiana sub-stations. From these various sub-stations lines radiate to supply between them the Amritsar Municipality and the Jullundur Electric Supply Co. and also to Kapurthala at two points.

HYDERABAD

Nizamsagar Power Station.—The Nizamsagar Reservoir, located on the Manjira river, is now supplying water for irrigation to a large area. Sometime ago a scheme was started for developing power from the fall available at the head of the irrigation channel. The head at the reservoir and at the three drops immediately below are being combined to give a fall of approximately 65 feet maximum and the discharge into the irrigation channel is being used to generate up to 15,000 kW of power. Three water turbines of the feathering propeller type, each connected to a 5,000 kW generator will be installed in the power house which is under construction. Only a small part of the power generated at Nizamsagar will be used for local supply to nearby villages and the area in the vicinity of the power station. The bulk of the power will be stepped up to 66,000 volts for transmission to Hyderabad city where an immediate demand exists.

All the plant for this station has been ordered and is in course of delivery. Materials for the 68 miles of transmission line have arrived in Hyderabad and construction of the line will be taken up shortly.

Devanoor Scheme.—Above the Nizamsagar reservoir, the Manjira river makes a wide loop and, by building a dam near Devanoor village, and short circuiting this loop by a power canal so as to discharge directly into the Nizamsagar reservoir, it is possible to obtain a head of approximately 375 feet total. The flow will be approximately 1,200 cusecs perennial and power will be developed at two stations along the canal.

Besides being a very economical development for power, the Devanoor scheme has other advantages. It will serve to augment the water supply to Hyderabad city and to increase the area under cultivation in the irrigation scheme. Further, when it is developed, it will enable the Nizamsagar power scheme to be operated at a higher load factor and, consequently, nearly double the yield of energy from this scheme.

The total amount of power available from Devanoor will be approximately 40,000 kW perennial, and this is one of the few schemes available to supply continuous power.

Tungabhadra Schemes.—In conjunction with the Tungabhadra irrigation scheme it is possible to generate over 100,000 kW of hydro power at a number of stations along the canal system. In the early stages of power development, energy will be supplied to the areas adjacent to the main dam and will be transmitted to Raichur, Yadgir, Gulbarga and Narayanpet. Later on, as the demand grows, further generating capacity will be installed and the main grid loop in the south-western portion of the State will be completed allowing power to be transmitted at 132 kW to Hyderabad, and to Gulbarga (*via* Hatti Gold Mines), so as to link up with the Grid in the north-eastern part of the State.

Plans for a station to accommodate five units of 7,500 kW capacity have been prepared and orders have been placed for head-gates which will be built into the dam structure.

At Sivapur, about 10 miles down the irrigation canal, a dam is being constructed. At this dam there is a fall of 60 feet and it is proposed to install three units of 10,000 kW capacity in a station which will be controlled from No. 1 Power Station.

Below Sivapur, there will be another reservoir at Timmapur, where the irrigation requirements can be dropped through 30 feet thus generating about 10,000 kW.

Above this point the canal has been designed for a capacity of 7,000 cusecs, so that surplus water can be used at the Dam Site and Sivapur drops, and can also be dropped through another 190 feet back to the Tungabhadra river. Power can be generated from this surplus water, using the above head, and the power available will be about 50,000 kW seasonal.

At Ipra, near Raichur, a further power station can be installed with a capacity of about 10,000 kW.

Krishna Schemes.—Two power schemes have been investigated on the Krishna river, one in the upper reaches above the junction with the Tungabhadra and one in the lower reaches where it passes through a range of hills near Devarkonda. The upper Krishna will give a capacity of approximately 50,000 kW and the lower station at the lower Krishna about 100,000 kW. Further investigation of these two projects has to be taken up.

Godavari Schemes.—Apart from these sources, power will be generated on a large scale under the Godavari Valley Development. The Godavari main project will have eleven power sites, large and small. These are at (1) Kawalguda site 45,000 kW, (2) North Bank Canal Developments (four in number), 60,000 kW, (3) South Bank Canal Development (two in number) 40,000 kW, and (4) South Power Branch Development (four in number) 30,000 kW. The total amount of power generated at these places will be 175,000 kW.

The Godavari Thermal Power Station at Ramagundam forms a part of the larger industrial development of the valley which is rich in natural mineral resources. On account of its vicinity to the coalfields, the rich lime deposits in the surrounding hills and a perennial supply of water from the Godavari, this area is ideally suited for thermal power development. For the present a power station is planned for generating 37,500 kW of electricity with provision for a further extension of a generating capacity of 152,000 kW when sufficient industrial load is developed in the area. At a future date, the power station is to be linked with the hydro-electric system proposed under the Godavari Valley Development, forming a loop covering practically a third of the Hyderabad State and connected to the main 132 kV Grid. In this event the power station will serve to supply energy to the system in periods of peak load or at times of low water level in the Godavari reservoir.

The power station, covering 270 acres of land is situated in the centre of the area selected for future industrial development, thus saving long transmission lines to points of distribution.

The cooling tower has already been completed except for timber stacks. Boilers are in an advanced stage of erection and work on the installation of turbo-generators will soon be started. The total expenditure up to date is Rs. 12.2 millions on machinery and civil works.

The Lower Godavari affords possibilities for production of more power. At Inchanpalli, where there is a drop of 120 feet, there is an excellent site. The 20,000 cusecs available from the Wainganga Project in Madhya Pradesh can be utilised by constructing a dam for the purpose of pondage and supplementing the regulated discharge by another 5,000 cusecs. This is one of the best sites in the State with possibilities of developing 200,000 kW of power. From the Poorna and the Penganga developments 6,000 and 30,000 kW respectively could be generated.

The power station at Hyderabad is to be expanded at a cost of Rs. 5.00 millions so as to raise its capacity to 26,000 kW. At Azamabad plans have been completed to construct a mammoth power station. Meanwhile, Singareni Collieries will supply electricity, through a 33,000 kW transmission line, as a temporary measure to Khammamet, Dornakal, Garla and Mahbubabad.

The hydro-thermal grid system will in course of time electrify the remotest corners of the State. The State Grid has already been planned and some of the transmission lines have been surveyed while others are under construction. The Grid will be designed for primary distribution at 132,000 and 66,000 volts. The secondary distribution voltages will be 33 kV, 22 kV and 11 kV. Electrification of Parbhani, Manwat, Sailu and Poorna is also contemplated by taking a line from Nanded, while Armoor and Bodhan will get electric supply from Nizamabad. The important links will be the 132 kV lines from Tungabhadra to Hyderabad *via* Raichur and Mahbubnagar and to Papannapet *via*, Gulbarga, and the lines connecting the Ramagundam station with the Godavari schemes and with the rest of the Grid *via* Nizamabad and Warangal, Papannapet and Hyderabad.

BHOPAL

To generate electric power badly needed to help industries develop in Bhopal, the Government of Bhopal have prepared for the sanction of the Government of India the Kolar Nadi Hydro-Electric-cum-Irrigation Project, estimated to cost rupees four crores. A storage reservoir to be constructed across the Kolar Nadi, a tributary of the Narbada, will have a storage capacity of about 390,000 acre feet. The water stored during rains will be utilised, at first, for generating 16,500 kW of electric power. The tail water will be picked up lower down and utilised for irrigating 96,000 acres of land.

RAJASTHAN

The Jawai River Irrigation-cum-Hydro-Electric Project in Jodhpur Division was taken in hand as early as in 1946. Work is in full swing and is expected to be soon completed. The reservoir across the river Jawai has a capacity of 0·17 million acre feet and besides irrigating some 110,000 acres, will supply water for two generating stations, 1,570 kW maximum output at the canal head and 2,530 kW maximum output at the canal tail where a drop of 92 feet occurs. The cost of the scheme is estimated at 3·24 crores of rupees.

The Chambal Irrigation and Hydel Development Project (Madhya Bharat and Rajasthan) aims at harnessing the Chambal for irrigation, hydro-electric generation and flood control by the construction of three dams and one barrage for the benefit of both Madhya Bharat and Rajasthan States. A dam 190 feet high will be constructed near Chaursigarh Fort with a storage capacity of 7 million acre feet. Hydro-power to the extent of 28,000 kW to 38,000 kW at 100 per cent load factor will be developed and the area to be irrigated will be 40,000 acres. The second dam, 100 feet high near Rawatbhata with a storage capacity of 1.3 million acre feet, will develop 30,000 kW to 40,000 kW power at 100 per cent load factor and will provide irrigation facilities for an area of 10,000 acres. The third dam 145 feet high will be located near Gapernath and will develop 30,000 kW to 40,000 kW power at 100 per cent load factor. The barrage will be located near Goanari village and the canal taking off therefrom will irrigate one million acres. The total cost of the scheme is Rs. 28 crores. The work on the project was started in October 1948.

IRRIGATION

THE area under irrigation in India is about 49 million acres and is the largest irrigated area in any country of the world. Although on the partition of the country some of the biggest irrigation works in the north of the subcontinent went to Pakistan, still the irrigated area left in India is more than twice of that irrigated in the United States of America or in Pakistan the next two countries in order of irrigated area. The total capacity of India's canals is over 220,000 cusecs and is over 60,000 miles in length. The total capital outlay on irrigation works is over rupees 125 crores.

At present eight multi-purpose schemes, one major irrigation scheme, three power schemes each costing over Rs. 10 crores, and 24 schemes each costing between Rs. two crores and ten crores, and 99 schemes each costing less than Rs. 2 crores, are under actual construction. The total estimated cost of the 12 major schemes is Rs. 438 crores. In addition to generation of power the completion of these projects will progressively increase the area under irrigation and improve the food supply as under :—

Year.	Irrigation (1,000 acres).	Additional food million tons (based on present standard of agriculture).
1951-52 ..	647	0·2
1952-53 ..	1,114	0·4
1953-54 ..	1,997	0·7
1954-55 ..	4,315	1·4
1955-56 ..	5,499	1·8
1956-57 ..	6,685	2·2
1957-58 ..	7,502	2·5
1958-59 ..	8,527	2·8
1959-60 ..	9,190	3·1
Ultimately ..	12,949	4·3

The total estimated cost of the projects under construction and of those which have not yet been started is about Rs. 1,900 crores, spread over a number of years. All these works, if and when completed, will add over 42 million acres to India's existing 49 million acres irrigated area.

The following are the new projects under construction : Bhakra-Nangal Project (Punjab), Damodar Valley Project (Bihar and West Bengal), Hirakud Dam Project (Orissa), Tungabhadra Project (Hyderabad, Madras), Gangapur Storage Project (Bombay), Kakrapar Project (Bombay), Godavary Project (Hyderabad), Lower Bhavani Project (Madras), and Mayurakshi Reservoir Project (West Bengal).

The following schemes have been sanctioned but work on them has not yet started : Kosi Project (Bihar), Gandak Valley Project (Bihar), Ghatprabha Valley Project (Bombay), Koyna Hydro-electric Project (Bombay), Broach Irrigation Project (Bombay), Krishna-Pennar Project (Madras), Ramapadasagar Project (Madras), and Pipri Dam and Power Station Project (Uttar Pradesh).

The following are the different measures, which are envisaged and the extent to which, on the first estimates which have been framed, additional production may be secured from each of them.

	Area (Acres).	Additional Production (Tons).
Major Irrigation Projects	8,712,000	2,272,000
Minor Irrigation Schemes	7,621,000	1,932,000
Land Improvement & Reclamation Scheme	7,405,000	1,524,000
Manure and Fertilizer Schemes, Seed Distribution Schemes, other Sources ..	..	1,474,000

For the financial year 1951-52 the following sums of money were allotted : Bhakra, Rs. 16 crores ; Damodar, Rs. 9 crores ; Hirakud, Rs. 5 crores.

The geographical situation of India and the rainfall conditions are such that for successful cultivation, irrigation in one form or other is necessary in all parts of the country, where the mean annual rainfall is less than 50 inches.

The chief characteristics of the rainfall in the sub-continent are its unequal distribution over the country, its irregular distribution throughout the seasons and its liability to total failure or serious deficiency. The normal annual rainfall varies from 460 inches at Cherrapunji in the Assam hills to less than five inches in parts of Rajasthan.

The second important characteristic of the rainfall is its unequal distribution throughout the seasons. Except in the south-east of the Peninsula, where the heayiest precipitation is received from October to December, by far the greater portion of the rain falls during the south-west monsoon, between June and October. During the winter months the rainfall is comparatively small, the normal amount varying from half an inch to two inches, while the hot weather, from March to May or June, is practically rainless. Consequently it happens that in one season of the year the greater part of the country is deluged with rain and is the scene of the most wonderful and rapid growth of vegetation ; in another period the same tract becomes a dreary, sun-burnt waste.

From the agricultural point of view however, the most unsatisfactory feature of the rainfall is its liability to failure or serious deficiency. The average annual rainfall over the whole country is about 45 inches and there is but little variation from this average from year to year, the greatest recorded being only about seven inches. But if separate tracts are considered, extraordinary variations are found. At many stations annual rainfalls of less than half the average are not uncommon, while at some less than a quarter of the normal amount has been recorded in a year of extreme drought.

Classing a year in which the deficiency is 25 per cent. as a dry year and one in which it is 40 per cent. as a year of severe drought the examination of past statistics shows that, over the precarious area, one year in five may be expected to be a dry year and one in ten a year of severe drought. It is largely in order to remove the menace of these years that the great irrigation systems in parts of the country have been constructed. In the arid tracts where the annual rainfall is less than 15 inches, no cultivation is normally possible without irrigation.

SOURCES OF SUPPLY

Supplies for irrigation are obtained from three sources :—

(1) directly from the waters normally flowing in natural channels,
(2) from the storage of flood-waters flowing in these streams or directly of rain water from small catchments, and
(3) from the waters available in the subsoil.

In different parts of the country, the extent to which supplies are available from the three sources mentioned above varies, so also does the extent to which the available sources can be utilized economically. The first of the three sources mentioned above *i.e.*, the normal flow of rivers, is generally the cheapest and the easiest to exploit and has been practically exhausted in the extensive irrigation works already built in the country, particularly in northern India and along the eastern coast.

The bulk of the rainfall in India is concentrated in the four monsoon months when the rivers carry huge discharges, of which only a small proportion can be utilized for irrigation at that time. The flow in the remaining eight months of the year is comparatively small and not enough for meeting the irrigation requirements for the vast areas dependent on these rivers. In this respect the rivers in the Indo-Gangetic plain are somewhat better off as the snow and glaciers in the Himalayas form a storage reservoir from which perennial supplies are available in these rivers. The rivers in the rest of India have no such natural storage and artificial storage works have been in existence in these areas from very old times. In northern India also, since the normal perennial flow of the rivers has by now been used up, new projects are largely based on storage. Storage projects, by their very nature, are more costly than 'diversion projects' but there are two important features of these projects which offset their high cost. These are the possibilities of hydro-electric generation at the dams and the protection afforded against floods.

Subsoil waters have been used in India for irrigation from times immemorial by means of ordinary percolation wells. During recent years electrically driven tube-wells have opened up a new means of utilising ground-waters on an extensive scale.

GROWTH OF IRRIGATION

Irrigation in India has been practised from ancient times but it is mainly during the past 100 years that extensive State-controlled works have been constructed extending the benefits of irrigation to vast areas.

A start was made early in the nineteenth century when three important indigenous irrigation works, *viz.*, two canals from the river Yamuna, and the Cauvery Delta System (Madras) were remodelled and irrigation facilities extended over large areas. The success obtained on these systems led to the construction, one after another, of the many big projects of diversion of river flow for irrigation purposes and of some storage works also. In India today we have a vast net-work of canals in Uttar Pradesh, the Punjab, the deltaic areas of Madras and some parts of Bihar. There are about 118 high dams distributed mainly in Bombay, Madhya Bharat and southern India. It is interesting to note that the number of all storage works mainly earthen works, big or small, exceeds 35,000 in Madras and 25,000 in Mysore State.

IRRIGATION STATISTICS—Table I.

Area Irrigated

Name of Unit.	1946-47 acres.	1947-48 acres.	1948-49 acres.

(a)—Below 500 acres.

There has during the last sixty years, been a steady growth in the area irrigated. The area irrigated in 1947-48 from all sources was 48·95 million acres (excluding some States for which figures are not available), which is 20 per cent. of the net area sown.

The area irrigated in 1947-48 by Government works was the largest in Madras where it was 8·1 million acres. Uttar Pradesh came next, with an area of 5·47 million acres, followed by the Punjab with an area of 3·52 million acres.

FINANCES

Irrigation works are divided into three classes, *viz.*, productive, unproductive and minor works.

Productive.—A productive work is one, the net revenue of which within ten years from the date of its completion is sufficient to cover its working expenses and the interest charges on its capital cost. The rate of interest on the capital outlay of works constructed during the different periods have varied. For works sanctioned before 1st April 1919, the rate is 4 per cent, for works sanctioned between the 1st April 1919 and 1st August 1921 it is 5 per cent, and for works sanctioned between 1st August 1921 and 31st March 1937 it is 6 per cent. For works sanctioned after 1st April 1937, *i.e.* after the introduction of the Government of India Act, 1935, different percentages have been adopted in different parts of India. In most of the States, the rate is now 4 per cent. The Government of India have recently fixed 3½ per cent as the rate of the return on capital for determining whether a capital work should be classed as productive. This rate which took effect from April 1, 1949 applies to all projects financed by the Central Government and also for determining the productivity of State works for which loans may be sought from the Centre. There has been a strong feeling that this percentage should be reduced further even below the present rate of interest to take into account the indirect benefits which irrigation projects bring to the community and the Government. Productive works are financed either from the general revenue or more often from funds raised on Government security. Such loans stand as

public debt against the administration concerned till cleared from surpluses of revenue in accordance with the rules in force. Most of the largest irrigation works in India belong to this class.

Unproductive works are those which yield a net revenue which is less than the percentage fixed for productive works. They are constructed primarily with a view to protecting the precarious tracts and to guard against the necessity for periodical expenditure on relief of the population in times of famine. They are financed from the current revenues, generally from the annual grants for famine relief and insurance.

Minor.—These are small works for which detailed capital or revenue accounts are not maintained. Such works may be productive or unproductive.

Table III shows the financial results of productive and unproductive works upto the end of the year 1946-47 in some States.

* 1945-46 figures.

In addition capital outlay in the former Indian States exceeds rupees 30 crores for which details are not available.

CHARGES FOR WATER

Charges for water supplied for irrigation from Government canals, etc., are levied at different rates and in different ways in the various administrations. In most areas water rate is paid separately from land rent according to the area actually irrigated and matured, the rate varying with the crop sown. In some areas, notably in Hyderabad, on minor works in Bombay and wet lands in Madras and southern Orissa, assessment for irrigated crops includes both land rent and water rate. Other methods of assessment based mostly on the quantity of water supplied, have been tried but the average cultivator in the country fully understands the principle of "No crop, no charge" and has little confidence in any system in which the liability of water charges is independent of the area and the quality of the crop sown.

A different system of assessment is in force in parts of West Bengal, Madhya Pradesh and for long leases and Kharif season leases in Bihar, where a cultivator pays a small rent for a term of years whether he takes water or not. In these areas the normal rainfall is high and irrigation is required only occasionally, when the rains fail or are delayed. Here the cultivator really pays a small annual premium to ensure that he can get water whenever he requires it.

Perennial block system is in force on major irrigation works in the Deccan. There are six-year sugarcane blocks which are demarcated into suitable plots in which the irrigator is allowed to have sugarcane to the extent of one-third of the area of the block and the rest of the area can be put under any seasonal crop in the monsoon and rabi seasons. There are also two seasonal blocks, which run for six-years at a time and in which the irrigator is entitled to grow seasonal crop in the monsoon and rabi season. In addition there are six-year garden blocks and 30 years' agreements with sugar factories to give them water for specified areas of sugarcane with specified inch-depth. All these constitute fixed commitment on Deccan Canals for which water has to be earmarked for each season. Any additional supplies during monsoon or rabi can be sanctioned for additional monsoon and kharif crops on application. Water rates are assessed on a seasonal basis for various types of crops.

By far over the greater part of the country water is paid for separately, the area actually irrigated is measured and a rate is charged per acre according to the crop grown. Lower rates are often levied in case where irrigation is by "lift", that is to say where the land is too high for the water to flow on to it by gravity and consequently the cultivator has to lift it on to his field.

The rates charged are different in each administrative unit and often vary considerably from canal to canal in a single unit. Water rates on some important crops as assessed in some States are as given under :—

Name of State	Name of Crop					
	Sugarcane	Rice	Cotton	Wheat	Maize	Pulses and Milleta
Punjab	Rs. a. p. 9 0 0 to 11 1 6	Rs. a. p. 6 8 0 to 6 8 10	Rs. a. p. 3 8 0 to 5 4 0	Rs. a. p. 4 4 0 to 4 4 7	Rs. a. p. 3 12 6 to 4 4 0	Rs. a. p. 2 8 0 to 3 4 5
Madras	7 8 0 to 12 0 0	6 4 0 to 10 0 0	3 2 0 to 10 0 0	....	3 2 0 to 10 0 0	3 2 0 to 10 0 0
Uttar Pradesh	5 0 0 to 12 0 0	4 0 0 to 7 8 0	2 8 0 to 5 8 0	3 0 0 to 5 0 0	3 0 0 to 5 0 0	2 8 0 to 3 4 0
Hyderabad	27 0 0 to 33 0 0	One crop 11 0 0 to 13 0 0 Two crops 17 0 0 to 18 0 0	....	....	....	....

Taken as a whole, irrigation is offered on extremely easy terms, and the water rates represent only a very small proportion of the extra profit which the cultivator secures from the water he receives.

AGRICULTURE

THE agriculture of the sub-continent with its wide range of physical and climatological conditions, varies considerably in character and scope. There is scarcely any cultivated crop of the temperate, sub-temperate or tropical zone which cannot be grown in some part of this vast region from the warm humid coastlands to the perennially temperate altitudes of its mountain ranges.

The total geographical area of India is 811 million acres. Since all the States do not collect statistics of land utilisation and since there are certain pockets of the reporting States for which agricultural statistics are not available, data on land utilisation are not available completely for the entire geographical area of the country. Figures of classification of area by land utilisation in 1948-49 were available for 580 million acres, out of the total area of 811 million acres. Most of the unclassified area appears to be unsuitable for cultivation because of hilly or mountainous terrain, desert land or arid climate and is mostly situated in parts 'B' and 'C' States and Andaman and Nicobar Islands. Out of 580 million acres, 273 million acres represented uncultivated area, comprising forest (87 million acres), areas not available for cultivation (93 million acres) and 63 million acres as the area left fallow. The remaining 244 million acres represented the net area actually sown with crops during the year 1948-49. Taking into consideration the areas sown more than once, the total cropped area in the year 1948-49 was 277 million acres. Of the total cropped area during 1948-49 food crops occupied 228 million acres and non-food crops 49 million acres. The total area irrigated in 1948-49 amounted to 47 million acres. Including the area sown more than once, the total area of irrigated crops was 50 million acres.

In the sub-continent's agriculture, the dominant climatological factor is the monsoon and, in most parts of the country, the total annual rainfall is precipitated between the months of June and October. The winter and early summer months are generally dry and high temperatures prevail in the months of March to June, prior to the break of the monsoon rains. Thus the agricultural season is naturally divided into two main sub-divisions the Kharif season of the monsoon and the Rabi season of the cold weather. Each of these seasons has its own distinctive crops. The greater part of the Indo-Gangetic plain and the northern tracts of the Peninsula are served by the main monsoon which falls between June and October. During these months the average rainfall for the whole of the sub-continent is about 47 inches, varying from 15 (or less) to 50 inches in the main cultivated tracts. Rainfall in the cold weather season between December and March is generally not more than 2 to 4 inches. The bulk of the rainfall in the south of India, including most of the Madras State and a large part of the territories of the States of Hyderabad and Mysore, is received from the north-east monsoon and falls during the period October to February.

SOILS

Four main soil groups can be recognised in the sub-continent, *viz.*, (1) the red soil derived from rocks of the Archæan system which characterizes Madras, Mysore and the south-east of Bombay and extend through the east of Hyderabad and Madhya Pradesh to Orissa, Chota Nagpur and the south of W. Bengal, (2) the black cotton or *regur* soils which overlie the Deccan tract and cover the greater part of Bombay, Berar and the western parts of Madhya Pradesh and Hyderabad with extensions into central India and Bundelkand; *regur* soils also occur in Madras though not so typical as proper regurs; (3) the great alluvial plains, agriculturally the most important tract in the country as well as the most extensively cultivated includes mainly the Indo-Gangetic plain embracing northern Rajasthan, most of the Punjab area, the plains of Uttar Pradesh most of Bihar and the West Bengal area and half of Assam and (4) the laterite and lateritic soils which are found in east a belt round the Peninsula and extend through West Bengal into Assam and Burma. Besides these soils there are muck soils in Travancore and forest soils in the northern part of India.

In addition to the four main groups of Indian soils mentioned above, the desert soils of the sub-continent occupy a large tract in Pakistan extending over the whole length of Sind, along the edge of the Indus alluvium, Rajasthan and the south Punjab area of which the Thar—Rajasthan desert—alone occupies an area of 40,000 square miles. Saline and Alkali soils also form an important group of Indian soils which are known as *reh* or *usar* in Uttar Pradesh, *kalar* in Sind, *rakkar* and *thur* in the Punjab and *chopan* or *karl* in Bombay State. Such soils are characterized by a high degree of impermeability and "stickiness" together with high alkalinity and frequent presence of large excess of free salts. They are usually poor in nitrogen and humus and unsuitable for crop growing without previous reclamation. A considerable amount of working the reclamation of these soils has already been done in the Punjab area, Sind and Bombay which shows the possibility of bringing these unproductive lands back to cultivation. Forest soils occupy a large part of the sub-continent. Investigations on the nature of soil profiles of the Chaubatia Hill in U.P. and of the Kulu Forest in the Punjab area indicate that these soils belong to the Brown-Earth and Podsol groups.

Survey.—In Bombay State soil survey and mapping have been in progress in several sugar factory estates of the Bombay-Deccan since 1940 on a contract basis. The surveys of the estates of 8 sugar factories and 2 gur factories, comprising an area of over 60,000 acres, have been carried out, of which varietal, manurial and irrigational technique for maximising sugar production on economic limits are being worked out. A scheme for soil survey of the sugarcane cultivators' lands on the Deccan Canals has been taken in hand by the Bombay Government on the basis of which cultivators will be advised to introduce improved cultural, irrigational, manurial and rotational schedules according to soil types.

Soil survey work has also been taken up in Uttar Pradesh by the State Government. In order to conduct the work in the shortest possible time, the State has been divided into five soil climatic regions, in each of which a small and fully equipped soil laboratory has been set up. The work when completed will enable the cultivator to know the potentialities of his soil, its nutritional requirements and the ways of ameliorating the defects in his lands.

Extensive irrigation survey and mapping are in progress in connection with the 'river valley projects' undertaken by the Central Waterways Irrigation and Navigation Commission and the Damodar Valley Corporation as a part of the National planning for development.

At the Indian Agricultural Institute, Delhi, the collection of data on soil survey available in the various States has now been completed after three years of work and was expected to be shortly published.

Soil survey of the farm of the Institute and of its substation at Karnal have been completed and soil maps prepared. Soil survey of the Rann of Kutch has been taken in hand. The Rann of Kutch is subject to flood by sea water and preliminary survey indicates that it is possible to reclaim the area by washing out the salts as Zuyder Zee in Holland. The survey shows the existence of a considerable amount also of gypsum in the area.

The study of the properties of the colloidal constituents of various types of Indian soils by methods developed at the Calcutta University, is in progress at the Indian Agricultural Research Institute to understand the development and genesis of these soils.

Soil Conservation.—The important question of soil conservation and development is receiving greater attention and considerable work on both the aspects has been taken in hand, particularly in the Punjab area and in Bombay State. A sample soil conservation survey conducted over 80,000 acres of the scarcity tract of Bombay State, reveals that over 71 per cent. of the land surface has been denuded either partially or severally out of which about 32 per cent. area is unfit for crop growing.

A basic soil region map of India has been prepared at the Indian Agricultural Research Institute. This will enable each soil region to be used according to its capabilities and treated in accordance with its needs.

Run-off and soil loss studies on black soils of the Deccan derived from basalt have been carried out at the dry farming research station at Sholapur and Bijapur (Bombay) and at Hagari (Madras). The average percentage run-off of total annual rainfall is 18, 22 and 20, and the average soil loss in tons per acre per year, is 44, 8 and 6 at Sholapur, Bijapur and Hagari, respectively, on 1.25 per cent. slope. Similar studies are also in progress on the red and laterite soils derived from granite at Nanjanad (Madras), and from old alluvium at Shantiniketan (Visva Bharati Soil Conservation Research Station, West Bengal). At Nanjanad, in one season, the soils loss on 20 per cent. slope, was 1 ton per acre under sod and six tons per acre in cultivated fallow. At Shantiniketan, the soil loss is as much as 23 tons in a year in a bare plot on 1.7 per cent. slope.

AGRICULTURAL EQUIPMENT

The Co-operative movement in this part of the country played a notable part in increasing agricultural production in different ways and assisting the 'Grow More Food Campaign'. With the operation of the Bombay Agricultural Debtors Relief Act and the Bombay Money-lenders Act, demand for loans from the agriculturists for current agricultural operations increased and the Co-operative Societies have taken upon themselves the responsibility of providing crop finance to the agriculturists at cheaper rates of interest. Considerable progress has been made in the non-credit side of the movement by organization of multi-purpose societies, taluka and district sale organisations and establishment of regulated markets with a view to creating an effective link between credit and marketing. The introduction of the Warehouses Act has accelerated the pace of further development of the movement in this direction. The possibilities of harnessing the co-operative machinery effectively, so as to enable the agriculturists to increase the unit of cultivation and derive the advantages of large-scale farming in the form of increased production have been fully explored. Numerous projects have been undertaken by Government by means of irrigation, bandharas, bunding, reclamation and colonization of waste lands, tractor ploughing, supply of improved seeds and manure to the agriculturists with a view to implementing the 'Grow More Food Campaign'. As a result of this, a number of farming, lift irrigation, crop protection, land improvement societies have been organized on a large scale, so as to ensure the agriculturists optimum production on land. Co-operative societies have been encouraged to undertake the work of distribution of seed and manure among agriculturists. The above measures coupled with the initiation of Sarvodaya Development Schemes, schemes for colonization of waste lands in different parts of the States, etc., have contributed largely to the betterment of the economic condition of the agriculturists.

Government is giving assistance in the form of loans and subsidies to co-operative societies for purchase of lift irrigation machinery, ploughs, tractors, diesel engines and other agricultural requisites including better seeds, manure, etc., and technical assistance is given to them by Government in working out the schemes.

Livestock.—Practically all cultivation in the sub-continent is done by bullocks and the efficiency and capacity of these in different districts varies considerably. The best types in common use are capable of handling what would be considered as light single-horse implements in Europe. Bullock power is also used for raising water from wells for field irrigation, for driving the chaff-cutter and the sugarcane crusher and for treading out the grain in the threshing yard. In general, the Indian cultivator cares well for his draught bullocks which, in most cases, constitute the most important part of his moveable property.

Implements.—In general, cultivating implements are few and simple and remarkably well suited for the tillage operations for which they have been evolved. The ploughs are usually of wood, tipped with an iron or steel point, and stir rather than invert the soil. Iron ploughs are also extensively used in some districts. A heavy wooden beam is commonly employed to serve the combined purposes of roller, clod-crusher and soil-compactor. In the black cotton soil areas, the *bakhar*, a simple type of broad-bladed harrow, is in general use. In many States, seed drills or seed tubes are also utilised for drilling the crops in rows to facilitate inter-cultivation. In less advanced tracts, the seed is merely broadcast and ploughed into the soil. Practically no harvesting machinery is in use, the crops being cut or gathered by hand and threshed—in the case of grain crops—under the feet of bullocks. Cereal crops are winnowed by the agency of the wind although cheap mechanical winnowing machines, designed by agricultural engineers, are receiving attention from the more advanced cultivators.

With reference to the introduction of improved agricultural implements, this work is now being largely done by private business and agencies which are extending rapidly in the rural areas. One notable development of recent years in connection with agricultural implements is the large extent to which improved types are now being manufactured and sold by village craftsmen. The chaff-cutter has become most popular, for which there is a keen demand in the villages. The mechanical cultivation of land is becoming very popular especially in large estates and newly opened-up tracts. The reclamation of weed-infected land is done by tractor cultivation by the Government.

Land Development.—Considerable attention is paid in many areas of the country notably in Bombay and the Punjab area to land development measures designed to check erosion from torrential and excessive rainfall and to the preservation of soil and moisture, which are essential for the successful growing of crops. In Bombay a Land Development Section of the Agricultural Department was formed in the year 1943-44 and this has now been renamed as Soil Conservation Section. This section is undertaking large scale projects of Land Improvements which include bunding or terracing of the cultivated lands and trenching and afforestation of uncultivable lands lying in the upper catchments or water-sheds—all on contour alignments. This provides labour for the scarcity or famine areas and will help to protect them from famine or scarcity in the future. The total acreage so far improved and protected in the State is over 6.5 (six and a half) lakhs of acres. The Section now carries out bunding and land improvement works in light and medium soils and attends to the maintenance of bunds, etc. Investigations are in progress with a view to evolving a technique for carrying out bunding in deep black soil areas.

The amended Bombay Land Improvement Schemes Act is applied to several water sheds.

CULTIVATION AND TILLAGE

The improvement of the ordinary cultivation and tillage methods in common use in the sub-continent offers a vast field for increasing the yields of field crops and, consequently, the profits of the agriculturists. In many parts cultivation is good but, particularly in the non-irrigated tracts and in areas liable to failure of rainfall, there is much room for improvement. The research work done on dry farming methods conducted under the auspices of the Indian Council of Agricultural Research points to the great benefits accruing from thorough cultivation including occasional ploughing and manuring, repeated harrowings and inter-culturings, wider spacing and lower seed rates.

The main object of tillage methods for *rabi*, *i.e.*, for cold weather crops, is the conservation of soil moisture and the preparation of a good seed-bed to ensure germination of seeds. To achieve these objects, repeated harrowings are given which produce good surface mulch over a moist sub-soil. The practice of drilling the crops with wider spacings permits inter-cultivation of the crops by bullock-implements and the use of low seed rates reduces the competition for moisture. For *kharif*, *i.e.*, monsoon crops, the preliminary cultivation of the fields is less intensive. Dry farming researches so far done in the sub-continent deal mostly with cereal crops which are mostly erosion-permitting; and erosion-resisting crops like legumes have not been tried. Recently, these legumes, such as, groundnut, Matki (Phaseolus aconitifolius) and Hulga (Dolichos biflorus), have been found to be very successful in controlling erosion and run-off and in increasing crop yields when grown in strips on contours below the erosion-permitting crops. This technique, known as contour strip cropping, has now been taken up for detailed study in Bombay State.

Among the factors which tend to keep down the standard of cultivation in many States are the appalling poverty of the farming population in general, the small size of the holdings, further fragmentations and subdivision in the course of time over wide areas resulting from the peculiar laws of inheritance, certain systems of land tenure where the cultivator has no interest in the permanent improvement of his holding, lack of adequate bullock power, good seed and implements, irrigation and manure, transport, communication and marketing facilities and stores, uncertainty of the return he gets from his labour and capital as well as the low proportion his produce fetches in the consumer's price due to the long and indeterminate chain of middlemen and speculators coming in between; the influx of non-cultivating classes into the trade with absolutely no permanent interest in the same; and lastly the apathetic outlook of the traditional farmers towards farming only as a way of life for sub-marginal existence and not as a profitable, progressive and dynamic industry.

IRRIGATION

The chief characteristics of Indian rainfall are its unequal distribution throughout the country, seasonal irregularity of precipitation and liability to failure or partial deficiency in many tracts. The average annual rainfall for the whole country is about 45 inches and there is little variation from this average from year to year. But, within individual tracts, remarkably wide variations in total annual rainfall are found. At many recording stations, annual rainfall of less than half the average precipitation are not uncommon, and in cases of extreme drought, less than one-quarter of average rainfall has been recorded in precarious tracts. Such tracts include Uttar Pradesh except the submontane regions, a large portion of Bihar, most of the Madras and Bombay States omitting the coastal belts, and portions of Madhya Pradesh. The canal system of the sub-continent is by far the largest in the world. Out of the total cultivated area in the Indian Union of 249 (1947-48) million acres, about 49 million acres are irrigated annually from one source or another. Of this huge area 20 million acres are irrigated by canals, 13 million acres by wells, 9 million acres by tanks and 7 million acres from other sources. The percentage of irrigated area to total cultivated area is, however, small, being only 19.16 per cent. for the Indian Union as against 66.67 per cent. for Pakistan, 77.46 per cent. for Egypt and 48.38 per cent. for Japan. Protective irrigation works have made agriculture stable instead of precarious in many districts. (*For details see article on Irrigation.*)

About one-quarter of the total irrigation of the country is got from lifting water from wells ranging in depth from a few feet to over fifty feet. Their numbers have greatly increased in recent years largely through Government advances for their construction. The recurring cost of this form of irrigation has, however, greatly increased owing to the high price of draught cattle and the increasing cost of their maintenance.

All agricultural departments are now giving increased attention to the better utilisation of underground water-supplies, existing wells being improved by boring and tube-wells of large capacity installed and equipped with pumping machinery. In scarcity areas the large scale bunding operations undertaken by the Bombay Department of Agriculture will lead to the increase in the water-supply of wells. Efficient types of water lifts are rapidly replacing the old-fashioned *mhotsa*.

Tank irrigation is common in Central and Southern India. Large quantities of rain water are stored in lakes (or tanks) during the rainy seasons and distributed during the drier seasons of the year. Often the indirect effect of the tank in maintaining the sub-soil water level is as important as the direct irrigation.

Construction of temporary Bandharas across streams and small rivers after heavy monsoon period is over is also common in parts of Bombay and Madras States for irrigation during the drier *rabi* period. The Government of Bombay has recently opened a separate Department for increasing such minor irrigation works throughout the State. This Department will also be responsible for lift irrigation works at suitable sites along perennial rivers.

The great bulk of agricultural land in India is deficient in organic matter. In the other agricultural countries of the world, this want is usually met by the return of farmyard manure to the land or by the use of compost made from crop residues and similar waste organic materials,

IRRIGATION RESEARCH

Contributions from India to Irrigation Science are of an outstanding nature. There are at present (including Ceylon), nine research organisations which carry out research and model experiments on problems confronting engineers in the field of irrigation, canal and river engineering.

Experimental research in India, in connection with irrigation, is of recent origin and the first in the field was Bombay, where a Hydrodynamic Research Station was opened on a small distributory near Poona in 1920. As the supply of water available for experiments was limited at this place, the station was shifted in 1925 to Lake Fife at Khadakvasla. The station was taken over by the Government of India in 1937, to assist irrigation and river training research problems from all parts of India and was renamed as the Central Waterpower Irrigation and Navigation Research Station early in 1948. In order to meet the increased demand for research facilities from the Central, and State Governments, the station is being expanded. When reorganised, the Station will comprise nine sections, *viz.* (1) River and Canal Hydraulics, (2) Navigation, (3) Soils and Soil Mechanics, (4) Concrete and Materials of Construction, (5) Mathematics, (6) Statistics, (7) Physics, (8) Chemistry and (9) Hydraulic-Machine Testing. The Bombay Government, however, continues to maintain a separate research station where, *inter alia* the problem of the disposal of untreated sewage of Poona by irrigation methods continues to be examined and developed.

The Research Organisation in the Punjab was opened in 1925, in U.P. in 1930, in West Bengal in 1941, Madras, Mysore and Hyderabad in 1945.

The research work done at all these stations is co-ordinated by the Central Board of Irrigation.

Some of the outstanding achievements in research include (1) Design of earthen channels so that they may neither silt nor scour, (2) Devices of silt exclusion, (3) Theory of sub-soil flow for the safe construction of hydraulic structures on permeable foundations, (4) Methods dealing with scour caused by falling water, (5) Siphons for the automatic release of flood surplus water from storage reservoirs, and (6) Design of canal falls and what is perhaps the most important, (7) the automatic and equitable distribution of water on a scale not known elsewhere in the world.

IRRIGATION ORGANISATIONS

Besides the Irrigation Departments of various States, there are two Central bodies dealing with irrigation matters, *viz.*, the Central Waterpower, Irrigation and Navigation Commission and the Central Board of Irrigation.

The Central Waterpower, Irrigation and Navigation Commission was set up by the Government of India in 1945 with the object of initiating, co-ordinating and furthering, in consultation with the State Governments concerned, schemes for the control, conservation and utilisation of water resources throughout the country, for purposes of water-power generation, irrigation, navigation and flood control, and if so required, the construction of new schemes. The Commission is a strong technical organisation and consists of one Chairman, three full time members, and other technical and administrative staff. They have at present the Hirakud Dam Project and Kakarpara Project under construction and many others like the Kosi Dam under investigation.

The Central Board of Irrigation which was set up in 1931, is a Central organisation which has as its members all Irrigation and Hydro-electric Chief Engineers of all administrations in India. It is the function of this Board to co-ordinate research on irrigation and allied subjects conducted at all the irrigation research stations in India and Ceylon. Meetings of the Board and its Research Committee are held annually. The research work carried out during each year and other technical papers and problems are discussed and published in the Annual Reports (Technical). In addition the Board also publishes a Quarterly Journal, Monthly Abstracts of the literature received in the library, Popular Series Leaflets and books on various technical subjects. The Board maintains one of the finest libraries on irrigation, hydro-electric and allied subjects where enquiries from engineers in India and abroad are dealt with.

The Board is also the National Committee in India for the International Commission on Large Dams and International Commission on Irrigation and Drainage and also the liaison body for the International Association of Hydraulic Structures Research. It deals with all research work on irrigation, soil mechanics and allied subjects and keeps reciprocal contacts with foreign bodies dealing with such problems. The Board also looks after the work of the Indian National Society of Soil Mechanics and Foundation Engineering which is affiliated to the International Society of Soil Mechanics and Foundation Engineering.

NEW WORKS

During the last few years there has been considerable activity all over India in connection with Multi-purposes projects (Irrigation and Power). Many new schemes, large and small have been taken up for construction, purely for irrigation. Small range schemes are boring tube-wells, extension in existing canal systems, constructing small bunds for taking out small channels, etc. Tubewell boring has been done in a large scale in Uttar Pradesh and it is expected that these tubewells after completion will bring in addition about 700,000 acres of land under irrigation.

The total estimated cost of all Irrigation and Power Projects included in the first part of the Plan is Rs. 734 crores. On this an expenditure of Rs. 144 crores has been incurred upto the end of March 1951. During the five year period covered by the plan it is proposed to spend Rs. 450 crores on these schemes. Rs. 140 crores will be spent after this period. The projects are proposed to irrigate an additional area of 8·8 million acres in the last year of the plan. After the completion and full development of these projects, the total addition to the area irrigated will be 16·5 million acres. Besides the irrigation aspects of these projects they will add 1·93 million kilowatt of Power also.

The annual expenditure on and likely benefit from these projects, year by year, would be as follows :—

Year	Expenditure (Rs. Crores)	Additional Irrigation (Area in acres)
1951–52 ..	99	1,559,000
1952–53 ..	112	2,710,000
1953–54 ..	100	4,525,000
1954–55 ..	77	6,725,000
1955–56 ..	53	8,832,000
Ultimate ..	—	16,501,000

Projects which are likely to add to the food production of the country and which are most remunerative have been put in to receive priority over projects relating to other uses of river waters. Approximately after the completion of these projects in Five-Year Plan the following would be the addition in irrigation in various States.

	(acres)
Bihar	50,000
Bombay	897,400
Hyderabad	671,000
Madhya Bharat	1,050,000
Madras	565,000
Mysore	221,000
Orissa	900,000
Punjab	4,075,000
Rajasthan	123,750
Uttar Pradesh	882,951
plus 700,000 tube-well scheme	
West Bengal	1,662,000
Saurashtra Union	179,970
Travancore-Cochin	108,800
Bhopal	6,800

In addition to the above Projects which ha been included in the first Five-Year Plan, the are other irrigation and power projects und consideration, which have been or are bei taken up for investigation. The aggregate co of all of these projects is expected to be abo Rs. 1,400 crores. When they are completed fifteen or twenty years, the area now und irrigation (49 million acres) will be doubled.

Multi-purpose plans are being prepared provide for irrigation, hydro-electric power, floo control, navigation, recreation facilities and fi culture. The most important of these und actual construction include :

Bhakra-Nangal Project (Punjab).— Th principal feature of the project is the co struction of a dam about 680 feet high the river Sutlej near the village of Bhak about 50 miles upstream of Rupar Town the Ambala District. The total storage capaci of the reservoir is estimated to be 7·20 millio acre feet, of which 5·6 million acre feet will b available for use. The reservoir will exter to about 50 miles above the dam.

The dam will be of the straight gravity typ in concrete. The length at the top will be abo 1,650 feet. During the construction of the dar the waters of the Sutlej will be diverted throug two 50-feet diameter tunnels, one on each sid The length of the two tunnels will be about on mile. Pilot headings of these tunnels hav since been completed and their enlargement t a full diameter of 50 feet is in progress.

About eight miles downstream of Bhakra Da site, Nangal Dam is under construction on th river Sutlej. This dam will serve firstly t divert the requisite supplies from the river fo the Nangal Hydel Canal, secondly to provid storage to smoothen the fluctuations in supplie due to load variations in Bhakra Power Plan The Nangal Canal will take off from the le bank of the river Sutlej at Nangal Headwork It will be a lined canal about 40 miles long wit a maximum capacity of about 10,000 cusec The Bhakra Main Line will take off from th tail of this channel at Rupar. There will b three power houses on the Nangal Canal. Th first two power houses, each utilising a head o 98 feet, are under construction and are situate 12 and 18·6 miles downstream of the Nanga Dam and the third is to be located at Rupa with a fall of about 60 feet into the Sirhind Cana

The firm power potential of the project work out to 400,000 kW at 100 per cent load factor This power will be utilised in the States of th Punjab, PEPSU, Himachal Pradesh, Delh and Rajasthan.

New Irrigation canals consisting of the Bhakr Main Line which takes off from the Nanga Canal, and Sidhwan Branch which takes off fron the existing Sirhind Canal, are under construc tion, and will command an area of 6·6 millio acres in the States of the Punjab, PEPSU an Rajasthan, out of which 1·6 million acres i at present virgin waste land. The annua irrigation expected is 3·6 million acres whic will yield 1·13 million tons of food grains an 800,000 bales of cotton. The project is estimate to cost Rs. 132·9 crores. The cost chargeabl to irrigation and hydro-electric portions work out to Rs. 57·4 crores and Rs. 75·5 crore respectively.

Damodar Valley Project (Bihar and Wes Bengal).—The Damodar Valley Project whic is one of the most important multi-purpos schemes and is to benefit the States of Bihar an West Bengal, has as its main features the con struction of (*a*) Multi-purpose storage dams with hydro-electric plants, (*b*) two additional hydro electric plants, at Konar No. II and Berm respectively, (*c*) the Steam power plant of 20,00 kW capacity, (*d*) an irrigation project with a net work of irrigation canals and distributio measuring 1,553 miles, (*e*) a 90 miles long naviga tion canal, and (*f*) a power transmission grid The ultimate benefits that will accrue from thi scheme include (*a*) effective flood control of the Damodar River, (*b*) perennial irrigation of 967,00 acres including 195,000 acres now irrigated in the kharif season, resulting in an additiona yield of rice and rabi crop amounting to Rs. 18,65 crores a year, (*c*) the generating of 240,000 kW of electric power, which will promote the growth of industry, lead to the electrification of railways, etc., and (*d*) cheap transport facilities through the navigation canal. The estimated cost of the scheme is Rs. 67·90 crores. The construction of some of the dams was started in 1948 and 1949 and the entire project is programmed to be completed by 1954-55. The development of the Damodar Valley is planned on T.V.A. lines and the Damodar Valley Corporation, set up by the Central Government by an Act, is in charge of the Project.

Hirakud Dam Project (Orissa).—The dam will be nearly three miles in length across the main channel of the river Mahanadi with 17 miles of low dykes on the two sides. The maximum height of the dam above the bedrock will be about 150 feet. The reservoir will have a gross storage capacity of 5·98 million acre feet. Nearly 0·9 million acres of land will be irrigated. Of this nearly 0·4 million acres will be irrigated by pumping the water by means of electric power generated by the power houses proposed in the scheme.

There will be two power houses; one at the dam with an installed capacity of 225,000 kW and the other about 17 miles downstream (at a subsidiary dam) with an installed capacity of 96,000 kW.

With the construction of the Hirakud Dam, it will be possible to afford substantial and adequate measures of flood protection to the delta area at relatively small cost. The regulated releases of water from the Hirakud reservoir will permit appreciable improvement in the navigability of the Mahanadi.

The cost of the Hirakud Dam project including the main transmission lines and grid substations is Rs. 48 crores.

Tungabhadra Project (Hyderabad, Madras).—The Tungabhadra Project, work on which has been taken up jointly by Madras and Hyderabad, has as its main feature a masonry dam about 160 feet high and 7,942 feet long across the river Tungabhadra, a tributary of the Krishna near Mallapuram in Bellary District. The main dam, 158 feet high at the deepest foundation, will be of the straight gravity type and will be in rubble in cement and surkhi mortar. It will be 6,000 feet long with a spillway in the centre and bulk head sections at either end. At the low saddle at the left flank there will be a composite dam of 2,000 feet length. The effective capacity of the reservoir will be 2·6 million acre feet.

On the Madras side the head available at the dam is 60 feet and that at the 15 mile of the canal, 110 feet. These heads will be utilised for developing hydro-electric power from the waters drawn for irrigation. About 7,000 kW of firm power will be developed and 14,000 kW of seasonal power for eight months in a year. The main canal will be 225 miles long and will irrigate a total area of about 300,000 acres in Bellary and Kurnool Districts. The most important work on the canal is an aqueduct across the river Hagari at the 81st mile of the canal. This aqueduct will be 2,400 feet long and will consist of 58 spans of 35 feet each. The cost of the project to Madras is Rs. 17 crores. It is programmed to be completed by 1952.

The length of the canal on the Hyderabad side is 140 miles with a carrying capacity of 7,000 cusecs at the head, to irrigate 671,000 acres. Hydro-power is proposed to be generated at the dam and at the drops on the canal to the extent of 150,000 kW. The estimated cost on the Hyderabad side is Rs. 12·1 crores. The work is well in hand and is programmed to be completed by 1954.

The Gangapur Storage Project (Bombay).—This Project comprises an earthen dam with a reservoir of 126,500 acre feet capacity on the river Godavari at Gangapur in Nasik District. This will supplement the existing supplies to the Godavari Canals and also provide water supply to Nasik City. It is also proposed to harness falls below the dam, if possible, for generation of power. The work on the project is in hand and is expected to be completed by 1953-54. The additional area to be brought under irrigation is 37,500 acres and the increase in food production will be 7,500 tons. The estimated cost of the project is Rs. 334 lakhs.

The Kakrapar Project (Bombay).—This Project has been taken up by the C.W.I.N.C. on behalf of the Government of Bombay and was inaugurated on November 1, 1949. The project is proposed to be developed in two stages. Stage I comprises the construction of a cement concrete dam in the bed of the river Tapti with earthen dam on both banks impounding a gross storage of 1,000,000 acre feet for providing seasonal irrigation to 550,000 acres and perennial irrigation to 50,000 acres. The installed hydro-electric capacity will be 24,000 kW. The cost will be Rs. 12 crores. Work on this stage was started in November 1949 and is expected to be completed by 1952-53. In stage II the height of the dam will be raised for increasing the gross storage capacity to 3·55 million acre feet. There will be two power houses, one at the dam site and the other at the end of a 16 mile power canal with a total installed capacity of 200,000 kW. The firm power available at 60 per cent load factor will be 133,000 kW. There will be in addition high level canals commanding a gross area of 100,000 acres. Stage II will cost Rs. 31 crores and is expected to be completed by 1956-57. The scheme will ensure partial flood control of the river.

The Godavari Project (Hyderabad).—This is a multipurpose scheme and envisages the construction of four dams, two on the main river Godavari and two on the tributaries, the Kaddam and the Manair. The canals will take off from the lower dam on the Godavari on both the north and south banks. The total capacity of the reservoirs formed by the dams will be about 3·0 million acre feet. The total area irrigated will be two million acres. In addition hydro-power to the extent of 175,000 kW will be generated at the dam and the drops on the canals. The total cost of the scheme including power development and transmission lines is estimated at Rs. 75 crores. As a first step in the implementation of this scheme, a part consisting of the dam on the Kaddam tributary and the canal from it, 90 miles long, has been taken up at a cost of Rs. 8·4 crores. This partial scheme will bring under irrigation 227,000 acres. The work is programmed to be completed by 1955.

The Lower Bhavani Project (Madras).—This comprises the construction of a dam, 160 feet high and 1,520 feet long with earthen flanks across the river Bhavani, a tributary of the Cavery. The site is about 20 miles from the Mettupalayam railway station. A canal on the right side, 121 miles long, will irrigate about 200,000 acres of cotton, cholam and rice crops in Coimbatore District. The cost of the scheme is Rs. 8·2 crores.• A start on the construction was made in 1948 and it is scheduled to be completed by 1954.

The Mayurakshi Reservoir Project (West Bengal).—This project comprises the construction of a low masonry dam 117 feet high to store 0·5 million acre feet of water, a weir at Tilpara and a canal system extending over 1,240 square miles on both sides of the river Mayurakshi. The scheme will bring under irrigation an area of 595,000 acres for kharif and 1,000,000 for rabi crops. In addition 4,000 kW hydro-power will also be generated. The estimated cost of the scheme is Rs. 15·5 crores. The project is under construction and is programmed to be completed by 1954.

SCHEMES NOT YET BEGUN

The Kosi Project (Bihar).—The Kosi project envisages the construction of a dam of an unprecedented height of about 785 feet above rock foundations on the Kosi River, a mile upstream of Barahkshetra temple in Nepal, for flood control, power, irrigation, navigation, soil conservation, silt control, fish culture and recreation, etc. The barrage will be constructed across the Kosi at Chatra in Nepal and the canals one on either bank will take off to irrigate 3·845 million acres, out of which 0·52 million acres will be in Nepal and 3·325 million acres in Bihar. The power station to be installed in the body of the dam will have an installed capacity of 1·8 million kW. The project has been planned for construction in seven stages. The total scheme is to cost Rs. 177 crores. The work on stage I was expected to be started in 1951.

The Gandak Valley Project (Bihar).—This project envisages the construction of a barrage across the Gandak River at Tribeni Ghat just below the offtake of the existing Tribeni canal and two new canals one on either bank of the river. The area to be brought under irrigation is 2·5 million acres in Bihar, 0·75 million acres in Uttar Pradesh and 0·1 million acres in Nepal. The scheme is estimated to cost Rs. 25 crores.

The Ghatprabha Valley Project (Bombay).—This project comprises the construction of two storage dams, one on the Ghatprabha river and the second on the Hiranykeshi, a tributary of the Ghatprabha river. The whole scheme is expected to cost Rs. 30 crores and when completed will irrigate about 600,000 acres. The project is intended to be developed in two stages.

The Koyna Hydro-electric Project (Bombay).—The Koyna Project contemplates the construction of a dam across the Koyna River at Jalkwadi. The scheme is ultimately capable of generating 580,000 kW of firm power at about 75 per cent. load factor. The scheme is estimated to cost Rs. 65 crores.

The Broach Irrigation Project (Bombay).—This consists of a dam 160 feet high approximately 48 miles north-east of Broach on the Narbada river. The canal systems on both banks will command an area of 1·8 million acres. The scheme is estimated to cost Rs. 10 crores and will take seven years for completion.

The Krishna-Pennar Project (Madras).—This project is by far the most important scheme in the State of Madras. It consists of the construction of two reservoirs, one in Kurnool district on the Krishna River near Siddeswaram and the other on the Pennar by a large canal cut about 100 feet deep through the ridge separating the two rivers. Between the Krishna and the Pennar, large areas would be brought under irrigation in Kurnool and Cuddapah districts. The total area to be irrigated will be 3·2 million acres. Large blocks of firm and seasonal power will also be developed. The estimated cost of the project is Rs. 120 crores excluding the cost of works required for power generation.

The Ramapadasagar Project (Madras).—Like the Krishna Pennar is a super project costing about Rs. 129 crores. It envisages the construction of a concrete dam, 430 feet high with the lowest foundation level 190 feet below the river bed. The project will irrigate 2·7 million acres of 1st and 2nd crop and will improve the existing supply of another 2·11 million acres of land. It will develop 150,000 kW of firm power and provide in addition, navigation facilities from the port of Vishakapatnam to the hinterland of the lake. The annual food production is expected to be 1·1 million tons. The project will take 10 years for completion.

The Pipri Dam and Power Station Project (Uttar Pradesh).—This Project is proposed to impound nine million acre feet of water by a 280 feet high dam across the river Rihand, a tributary of the Sone, near village Pipri. The power house will have an installed capacity of 240,000 kW and it will also bring under irrigation about four million acres of land. The estimated cost of the scheme including transmission and transformation, is about Rs. 31·2 crores. Preliminary investigations have been completed and contract drawings specifications prepared. However, due to financial stringency, work on this scheme has been considerably slowed down.

In India, however, cattle dung is largely utilised as village fuel and only about 40 per cent. of it is used for manurial purposes. The practice of composting is now being rapidly developed in many areas. The cultivation of green manure crops is also making headway especially in the irrigated tracts, and many State Governments allow concessions to encourage their extension. The use of certain oil-cakes, especially groundnut and castor cake, is on the increase and this method of manuring is now common with many irrigated crops. With regard to artificial fertilisers, nitrogenous organic manures, *e.g.*, *ammonium sulphate* and *nitrate of soda*, are being extended in use through the efforts of departmental and private agencies and the question of the manufacture of such manures is now receiving close attention of the Government of India and State administrations. A factory for the manufacture of ammonium sulphate in India has been established at Sindhri in Bihar.
