AMERICAN SURVEY

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items, which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Still Debating Disarmament

WASHINGTON, DC

BY dropping off the rope France has brought to a standstill the always faltering ascent of the summit from the West. The Americans, having been doubtful starters, are now watching with fascinated horror to see if their ancient ally can ever regain its hold. In the meantime Mr Dulles has gone off to his Canadian island for a week's secluded thinking before facing Mr Macmillan, who, to judge by his breezy appearance on American television, still considers a reunion with the Russian leaders as a good thing.

The Prime Minister's arrival to pick up a couple of honorary degrees and to talk to the President has been sweetened by a long step towards the achievement of a major aim of British policy—the restoration of full atomic co-operation between Britain and the United States. The Joint Atomic Energy Committee of Congress completed on Wednesday the seven months' gestation of the Bill to amend the restrictive provisions of the 1954 Act, although it has still to be approved by both Houses. The long delay has arisen, not from any great reluctance to renew the partnership with the British, but from concern that the Bill should not by loose wording authorise the furnishing of a nuclear "do-it-yourself kit" to France at a time when its government is so uncertain.

The Administration has given assurances that the sole immediate beneficiaries of the provisions for sharing information on nuclear weapons will be the British; but these have not satisfied members of the committee who have a shrewd suspicion that, unless the President is able to plead legal obstacles, he will be under heavy pressure from the French not to play favourites with Britain. Since the Bill could hardly discriminate between fellow members of the North Atlantic Treaty Organisation by name, and since technical advances might overtake discrimination by description, the Administration has had to agree to wording which will make it particularly easy for Congress (which will probably mean, in effect, for the Joint Committee) to block any individual international arrangement under the extra scope that will be given. Normally such an agreement will have to lie before Congress for sixty days, during which a resolution of disapproval could be passed, before coming into effect. But this year it will only have to be thirty days, thus ensuring that Britain will be taken care of before the congressional session is over.

Once Britain's special interest is safeguarded, the British government is expected to lean heavily on the side of a summit meeting at which disarmament will be the main topic. There is excellent reason to believe that Mr Dulles is now more favourably disposed to such a prospect. For one thing he would like to strengthen the political position of Mr Macmillan. For another his distaste for involving the prestige of the President in the details of international negotiation is balanced by a realisation that this is probably the only way to come to grips with Mr Khrushchev, the real source of power in Russia. Furthermore, whatever the official scientists may say to minimise the effects of atomic radiation on mankind, Mr Dulles is fully aware of the general anxiety in the world and the advantage which this gives to Russian propaganda.

Mr Dulles has throughout been extremely unwilling to have the President appear to be propelled up the summit by the force of public emotion. The Nato meeting at Copenhagen assured him that the allied governments had public opinion in their countries under better control than he had feared. He considers that this gives him greater freedom of action but, despite his great influence within the Administration, his views have not yet prevailed entirely. There is indeed still a major internal debate going on as to the position the United States should adopt on disarmament. Mr Strauss, the chairman of the Atomic Energy Commission, and most of the military experts stick firmly to the complete western "package" of last August; while some government scientists, including Dr Hans Bethe, who was chairman of a committee to advise on inspection methods, such influential members of Congress as Senators Humphrey and Symington, the surviving supporters of Mr Stassen's views within the State Department, and a good many outside voices have favoured a separate agreement on the suspension of nuclear tests.

MUCH of the public controversy, particularly whenever the personality of Dr Teller, "the father of the H-bomb," has been involved, has suggested that the main issue is whether the Russians could cheat if tests were suspended. But this is not in fact the heart of the internal debate. Mr Strauss's position is that, assuming that the United States is now ahead in the general development of nuclear weapons and assuming that the inspection system would be ironclad, a freezing of the present state of proven knowledge "would still be a disadvantage to us, since they have the weapons necessary for aggression and we do not yet have all the types of weapons necessary for defence."

Mr Strauss and his supporters consider that such a handicap would be worth accepting if it were the price for ending the production of atomic weapons since this, unlike the suspension of tests, would be a first instalment of disarmament, properly so called. This would involve in effect the unwrapping of the Russian "package" which links the suspension of production to the destruction of stockpiles of nuclear bombs and the abandonment of American overseas bases. It would also mean, as Dr Spofford English, of the AEC's research staff, explained to the Humphrey subcommittee on disarmament, that some five hundred foreigners, including 174 inspectors, scientists and engi-

neers, would have to be permanently admitted into every major Russian (and American) atomic installation, checking practically everything that was done there.

Basically Mr Strauss's critics do not dispute his technical facts: the difference is one of judgment. They hold that the experiment of setting up the first international inspection system inside Soviet territory is so important that, quite apart from the humanitarian argument in favour of limiting radiation, this in itself would make the dangers of suspending tests worthwhile. Mr Dulles's current position is reported to be somewhat in between these two. He tends to favour separating the suspension of tests from the ending of production, but does not think it is enough of an accomplishment on its own. He would like a further effort to set up an Arctic inspection zone, possibly with a rather firmer offer on the part of the Strategic Air Command to refrain from its more pointed practice flights, and he has not abandoned his hope of "neutralising" outer space. Indeed it is one of his remaining ambitions to achieve something that will relieve the appalling danger of war starting by accident once the two sides become dependent on unmanned supersonic missiles.

Given the nature of this internal debate it is obviously sensible to find out from the Russians what amount of inspection they would really accept. The President's note to Mr Khrushchev last Saturday acknowledges his reluctant acquiescence in technical studies, even though they be confined to the suspension of tests. It was accompanied by the appointment of three scientists, headed by Dr Teller's closest colleague, Dr Lawrence, to meet the Russians in a month at Geneva. The final American policy will await the outcome of that meeting, just as its implementation will have to await the resolution of the French agony.

Taxes—Texas-Size

President Eisenhower has now decided that the American economy is showing enough signs of resilience not to need the rather unpredictable extra bounce that a tax cut might give to it. Thus the long debate among his advisers has ended in a victory for those, led by the Secretary of the Treasury, Mr Robert Anderson, who believe that a reduction in taxes is too uncertain in its effects—because the money released might not stimulate consumer spending or, if it did, might do so in a dangerously inflationary way—to be used unless the situation gets markedly worse. The President asked Congress on Monday to keep corporation taxes and excise duties at their present levels after June 30th, when they will automatically fall to lower levels unless Congress renews them.

At the same time he made it clear that he has no intention of asking for any general reduction in income taxes. The Democrats from Texas who lead both Houses of Congress appear to have accepted Mr Anderson's arguments against any major cuts. The combination of this influential trio of Texans (Mr Anderson springs from the Texan crop of Democrats for Eisenhower) seems to ensure that there will be no large-scale congressional revolt against the President's decision. There is still some sentiment, particularly in the Senate, in favour of trimming excise duties, particularly on motor cars, but the weighty voice of Senator Byrd has also spoken in support of Mr Eisenhower.

It was remarkable how little demand was heard for tax cuts at the conference of State Governors earlier this month; they are supposed to reflect local opinion more closely than do members of Congress in Washington. The public's main concern is apparently with the width of the deficit in government spending. Last week the Director of the Budget Bureau again forecast that even without tax cuts this will be between $8 and $10 billion, well over 10 per cent of total expenditure, in the fiscal year beginning in July. It is felt that the main danger of a large reduction in taxes, with such a deficit, is that, if the economy now begins to revive from other causes, the extra spending power would produce an intolerable inflationary pressure, and at that point it would certainly not be easy to induce Congress to increase taxes again. An increasing number of economists believe that the recession is now reaching some kind of bottom, but whether it is the sort of bottom that the economy will bounce off, or grind along indefinitely, or even fall through to new depths, no one can say. The prospect of an upswing in the reasonably near future is still only a twinkle in the eye of Mr Weeks, the optimistic Secretary of Commerce.

Doctored Doctrine

Preoccupied though Mr Dulles may be with "more problems to decide than any one man can possibly attend to and master"—to quote Mr Walter Lippmann—his resourceful legal brain has hit on an interpretation of the Eisenhower Doctrine which, by stretching it unmercifully, covers the dispatch of troops to Lebanon should this become unavoidable. Nothing would be more distasteful to the United States than to intervene; it hopes devoutly that the arms which have been sent will suffice and will not be misused. But if the United Arab Republic were to seize power openly in Lebanon, the American and British Governments, which are working closely together, would feel that they had to act, if they were not to stand condemned in the Middle East of being false friends. Lebanon, after all, was the only Arab country to embrace the Eisenhower Doctrine.

The irony is that the doctrine, which provides against an attack by a communist-controlled country, could not be invoked to help the Lebanese; Mr Eisenhower would have difficulty in declaring that Egypt, which bans the Communist party, is under the control of international Communism. The President has inherent powers to act without reference to the doctrine, but this would look a trifle foolish after all the fuss made last year to obtain congressional sanction in advance. Mr Dulles's triumph is to have discovered apparent authority to intervene against an attack from non-communist sources in lines added to the Administration's draft of the resolution by Senator Humphrey. This preamble states that

> the United States regards as vital to the national interest and world peace the preservation of the independence and integrity of the nations of the Middle East.

With an innocent air, Mr Dulles insisted that the Senate would hardly have added a meaningless phrase and that, if this one means anything, it places on the President greater responsibility in the Middle East than he had before.

Senator Mansfield has protested in vain that nothing was farther from the mind of the Foreign Relations Committee than to broaden the resolution. In 1957 the Democrats, still incensed over the handling of the Suez affair, were insisting that the President already had powers to act and were reluctant to share his responsibility. In turning the tables so neatly on his former tormentors, Mr Dulles has found a way, if rather a tortuous one, out of the stranglehold which the Eisenhower Doctrine seemed to impose on American freedom of action. Coupled with flights of Globemasters and the presence in the Mediterranean of a navy task force, this may be inducing President Nasser to hold his hand.

New Thinking on Aid

WASHINGTON, DC

The speech made last week in New York by Mr Douglas Dillon, the Deputy Under Secretary of State for Economic Affairs, was intended as a trial balloon to see if the atmosphere was propitious for new advances in America's response to the Soviet economic challenge. Although the Treasury was not consulted, it did not, as so often in the past, shoot down the balloon the moment it was released. Mr Dillon, whose presence in the State Department has imparted a new intellectual vigour to its economic leadership, outlined a number of ideas which are still only at a tentative stage within the Administration.

In the first place he proposed that the rate of purely American loans to under-developed countries should be stepped up to a level of $1 billion a year. This would mean that the initial capital endowment of the new Development Loan Fund, which will amount to $925 million if Congress appropriates all the money for which the President has asked, will have to be replaced every year. To avoid annual fights over the appropriation Mr Dillon would understandably prefer to see Congress revert next year to the Administration's original plan, under which the loan fund, like the Export-Import Bank, would have substantial authority to borrow from the Treasury.

Secondly, Mr Dillon offered a qualified endorsement to Senator Monroney's plan for enlisting the participation of other advanced industrial countries in an International Development Association, affiliated with the World Bank. He would, however, first strip it of those features which have most appeal for the Senator. As originally conceived the Monroney plan was an ingenious scheme for absolving members of Congress from having to vote any more for foreign aid, while ensuring that there would be a continual flow of funds to the under-developed countries, all at practically no direct cost to the American taxpayer. The trick was to persuade other countries to put up two-thirds, while the United States put up one-third, of the voting stock of the new association—America's portion to be the $300 million already appropriated for the Development Loan Fund—and to add to these resources the large bundles of foreign currency which the United States has been acquiring under the special schemes for disposing of its surplus farm commodities abroad. Then loans, in which hard and soft currencies would be mixed in suitable proportions, would be made on easy terms to countries that were angling for help from the World Bank but could not quite meet the bank's conditions. The loan from this new source would be a "secondary mortgage," taking care of a segment of a development project and thereby making the remainder of it "bankable."

The Administration's initial reaction was to pour the coldest of water on the idea of using local currencies, since to employ any of these outside their country of origin would be to make claims on that country's resources which it usually could not afford to meet. It was also pointed out that, from all indications, the contributions that would be forthcoming in convertible currency from other countries were likely to be so modest that an organisation founded upon them could not possibly meet the whole need for economic aid. Nevertheless Mr Dillon is anxious not to throw away the germ of a good idea. He would like the United States, over and above the $1 billion it should lend unilaterally every year, to offer to help finance such a development association, if only to put some pressure on its more prosperous allies to add something to the kitty.

This more forthcoming attitude is being encouraged from the sidelines by the World Bank, which feels that it could be much more helpful in many cases if it had this additional instrument—always assuming that it was firmly under the bank's direction. Indeed some officials of the bank think that the difficulty of raising non-dollar funds for making soft loans has been exaggerated. And they point out that, on the basis of their experience with, for example, the bank's multiple currency loans to the Indian railways, very little of the new association's capital would need in practice to be convertible. An additional virtue of such an approach in their eyes is that it would be conducted under the bank's weighted voting system and would thus head off the danger of establishing something like Sunfed, under the auspices of the United Nations, in which the Communists and the recipient countries would have a majority of the votes.

But it was Mr Dillon's third point—that the resources of the International Monetary Fund should be increased to reflect the increase in the volume and value of world trade over the past thirteen years—that has aroused the most attention. He presented it exclusively in terms of easing the difficulties with their balance of payments which primary producing countries encounter during falls in world prices. The United States now has no instrument particularly suited to this purpose. The Export-Import Bank, which is primarily intended to stimulate the sale of American products, has occasionally been made to serve, on the theory that a country in difficulties needs to have its trade refinanced if it is to preserve the existing level of dollar imports. The bank is about to repeat this experiment in the case of Colombia and is considering similar requests from Brazil, Chile and Uruguay.

But such a use of the Export-Import Bank's resources is looked at askance by the World Bank, which feels that this tends to undermine its own efforts to induce such countries to put their internal finances in order. In many ways it is felt that the IMF, being an international body, would be in a better position than an American bank to tie such strings to its help. Moreover, now that the United States is more inclined than it was to do something to support the economies of Latin American countries and others similarly situated, the strengthening of the International Monetary Fund seems to offer an alternative to participation in international commodity agreements.

American officials are most anxious, however, to avoid any impression that this is an attempt to do by the backdoor what many people in Britain, including *The Economist* in its "Appeal to America" in the issue of May 3rd, have been suggesting—the use of the IMF to meet the problem of a general lack of liquidity and in particular to give support to the sterling area. Indeed the American govern-

ment's economists flatly deny that sterling presents any such problem in the terms in which it has been stated. The suggestions that have been made for dealing with it, and even the mere hint of a raising of the price of gold, have consequently met with an icy response. Those Americans who want to extend the usefulness of the IMF, and those officials of the fund itself who detect a less negative American response to their own modest efforts to gain more elbow room, are alike fearful that even the hint of more ambitious proposals from London will ruin their chances. That perambulatory pair from the British Treasury, Sir Robert Hall and Sir Leslie Rowan, are well aware of these fears and have been treading with extreme circumspection.

Since Mr Dillon's proposals, if they are approved, will almost all require fresh legislation, and the Administration is anxious not to distract attention from the current foreign aid Bill and the five-year extension of the President's tariff-cutting powers, which it is trying to push through Congress, no final decision can be expected until next year at the earliest. However it is an encouragement to see something stirring, and Mr Dillon will be in a stronger position from which to advance his case if Congress enacts the rider which the Senate Foreign Relations Committee added to the foreign aid Bill last week. It would raise his status to that of a full Under Secretary of State, an acknowledgment in itself of the importance of the international economic front.

Death in a Clear Sky

Not even America's broad skies are broad enough to let aircraft fly in safety when many of them are exempt from the controls that govern the movements of others. The collision over Maryland last week between a civil air liner and a military jet trainer, in which everyone except the pilot of the jet was killed, was the third of its kind this year. In all, there have been 160-odd mid-air collisions over the United States in the last ten years, but of the six involving airliners—with a total death roll of 300—military aircraft have also been concerned in five. Capital Airlines, which owned the Viscount destroyed over Maryland, alleges that within a couple of days of the disaster two more of its pilots reported "near misses" by military aircraft.

In good weather, aircraft fly under a system known as "visual flight rules"; when the weather deteriorates they operate under "instrument flight rules," according to which a flight plan has to be submitted to the Civil Aeronautics Administration (CAA) and the aircraft's movements are directed from the ground. The fact that the vast majority of crashes come out of a blue sky suggests that, as air lanes grow more crowded and planes fly faster, the visual flight rules are no longer adequate. The sub-committee of the House of Representatives which deals with civil aviation funds has now asked that all flights by military jet planes be made subject to instrument flight rules, but the CAA has replied that it simply does not have the equipment to handle so many extra aircraft. For the time being, the services have agreed to put under instrument flight rules all aircraft, except those engaged on tactical operations, which are scheduled to move through a civil air route at heights under 20,000 feet.

Control over military aircraft is likely to be extended rather beyond these limits in the near future. President Eisenhower has suggested a number of proposals which would remove some service planes entirely from the centres of danger and put a larger proportion of the rest under civilian ground control. But the danger does not come solely from military planes (the worst collision of all, that over the Grand Canyon in 1956, involved two civil airliners) and the problem will not be solved until the CAA can make its control machinery foolproof. From July 1st, airliners

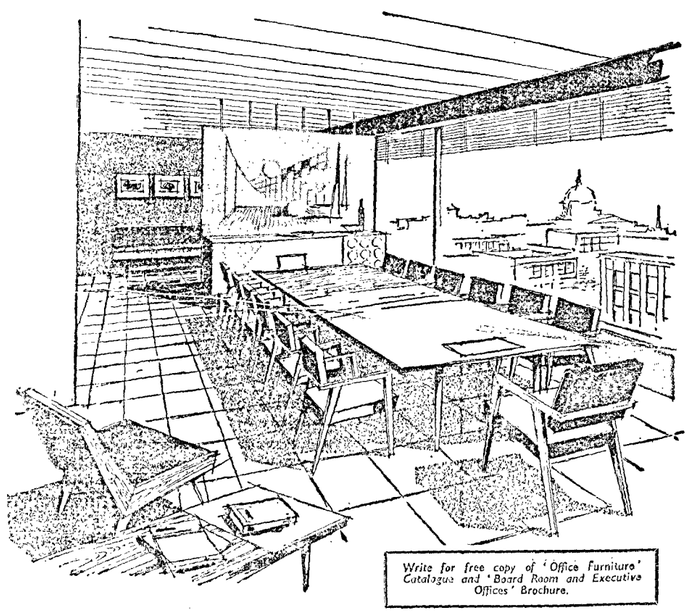
"Great System"

Herblock in the *Washington Post*

flying above 10,000 feet will operate under instrument flight rules, whatever the weather, and three coast-to-coast "skyways" are to be established in which all aircraft will be continually under ground control. Congress was asked earlier this month to authorise a five-year programme costing $2¾ billion—an expansion of plans offered in the last two years—for improving the system of regulating the country's ever-swelling volume of air traffic. After the Maryland disaster, few will wish to economise.

Profiteering in Polio?

The indictment on criminal anti-trust charges of all the five firms which were successful in meeting the overwhelming demand for poliomyelitis vaccine three years ago arouses mixed feelings. It would be shocking if, as the grand jury alleges but the companies deny, these firms had submitted uniform price quotations to public authorities, prevented competition in the distribution of the vaccine and kept other pharmaceutical concerns out of the market. Profiteering in polio, if proved, would turn public opinion against the drug industry, which is already being investigated by the Federal Trade Commission for alleged conspiracies in fixing the prices of antibiotics.



And there you are—
in the centre of London

Piccadilly Circus in fact. And of course the Midland Bank is there. Head south across the Circus, and you'll find the new West End Overseas Branch of the Midland Bank. And that makes sense, for this branch was planned expressly for you and all other visitors to London. You can change Travellers Cheques there, as well as the currency from your own country, and you can get all the advice you require on the hundred-and-one matters that need attention during your stay. This branch of the Midland Bank, too, is one of the most comfortable and up-to-the-minute in Europe. Make a date to meet your friends there.

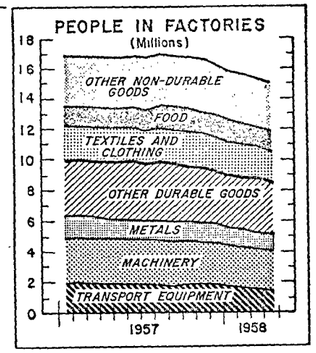
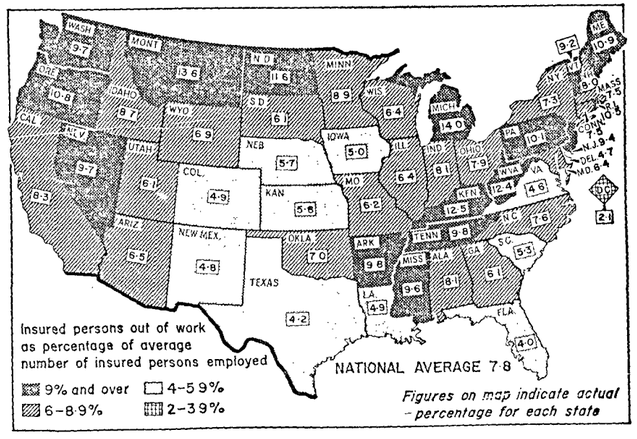
These five firms—and a sixth, Cutter Laboratories, which soon dropped out—were licensed by the Department of Health in 1955 to produce the Salk vaccine and urged to make an all-out effort as a "patriotic endeavour." In the same year Congress passed an Act, authorising the federal government to buy the vaccine for states, counties and cities, under which $53 million was spent. Of the 205 million doses of vaccine turned out between 1955 and the end of 1957, about half were sold to the government, which at first was the sole buyer. The federal authorities were completely taken by surprise by the demand for vaccination and in that hectic summer of 1955 no time was wasted in haggling over the price. It was not until 1956, when the drug firms, by a brilliant technical achievement, had produced a flood of the vaccine, that local authorities began to complain that all the bids they received were at identical prices. The companies point out with pride that they cut prices twice, but to the Department of Justice the significant thing is that these cuts were identical. The largest producer, Eli Lilly and Company, has reduced its prices five



The Pattern of Unemployment

WHILE the total number of people employed in the United States has been increasing steadily, from 61,988,000 in February to 62,907,000 in April, and almost certainly went up again in May, the rise has been accounted for by seasonal increases in the number of jobs available out of doors, in building and on farms, not by any improvement in employment in factories. Meanwhile the number of Americans seeking work has been going up. As a result, while unemployment did fall a little in April, on a seasonal basis it stood at 7.5 per cent of the labour force, compared with 4.1 per cent a year earlier. Of the 5,120,000 people without work in April, about one-third had been employed, or had not wanted a job, in March; but rather more than another third, 1.9 million, a post-war record, had been out of work for fifteen weeks or more, 600,000 of these for at least six months.



Apart from agriculture, with 5.6 million workers in April, and construction, with 2.7 million, the only categories of work in which employment has been increasing recently are in government (7.6 million employees in April), in finance, insurance and real estate (2.4 million) and in miscellaneous services (6.7 million); these three groups are also employing more people than they were a year ago. Jobs in mining have declined from 862,000 last August to 766,000 in April, while those in transport and other public services went down from 4.2 million to 3.9 million over the same period. The recession is also affecting employment in wholesale and retail trade, which provided only 11.2 million jobs in April, compared with an average of 11.5 million for the whole of 1957. But manufacturing is by far the most important category of employment and here, as the chart shows, the decline has also been by far the most serious—and has centred in the industries making durable goods, particularly automobiles and factory equipment. Even those who are still employed are doing less—and earning less; the average number of hours worked each week in April in factories was 38.3—the lowest since the war.

The variations in the intensity of this unemployment in mid-March among insured workers—that is, roughly speaking, among employees in industry and trade, about four-fifths of the non-farm workers in the country—is shown on the map. But it does not include those who had already exhausted their right to unemployment benefit; over 700,000 persons have done so already this year and by Christmas the number will probably be about 2.5 million. In March, 1957, only one state, North Dakota, had over 9 per cent of its insured labour force

out of work and the figure for Michigan, which held the record with 14 per cent this March, was only 4.3 per cent. This state, the centre of the automobile industry, has about 460,000 unemployed at present. It is by far the hardest-hit state in the hardest-hit region, which also covers Illinois, Indiana, Ohio and Wisconsin. This heavily industrialised area contains nearly a quarter of the insured labour force and has accounted for about one-third of the total national rise in insured unemployment over the past year.

Sources; Bureaus of the Census, of Labour Statistics and of Employment Security.

times; the vaccine is now selling at about half the 70 cents a dose it cost originally and the company has been left with very large stocks, which run the risk of losing their potency and their value. Americans have become apathetic now that paralytic polio has been reduced by 85 per cent.

The president of Eli Lilly puts the average profit made on each dose at 6¼ cents—a not unhandsome return although the risk which firms took with their capital must be considered. Under a law passed a few years ago but never tested, the federal government can file civil damage suits when it believes it has suffered financially from violations of the anti-trust laws. Such a suit is now likely. But against the millions of government money which may be recovered there must be set the possibility that in another emergency the industry may think twice before it comes to the rescue.

Bad Time to Buy

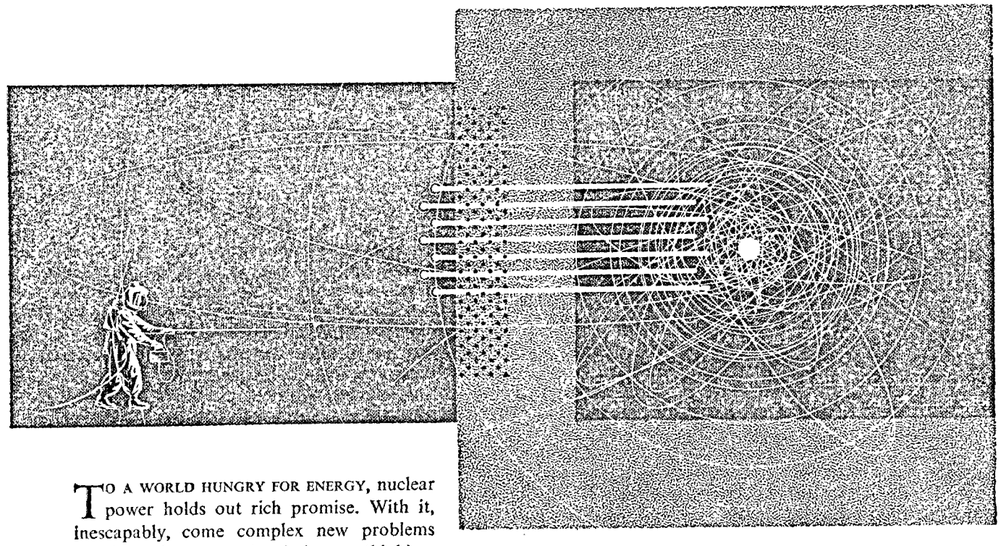
AGRICULTURE, for so long the Cinderella of the American economy, has suddenly become the belle of the statistical ball and, as is natural in these circumstances, is being blamed for some of their troubles by its unhappy sisters in Detroit and other industrial centres. Farm incomes, unlike all others, have been going up this year as a result of higher prices for such commodities as fruit and meat which are temporarily in short supply. But this has also meant higher food prices—which again in April forced the consumer price index up to another new record. This means that consumers have been spending more on food since few of them seem [illegible] their eating habits unless forced to to consider changing [illegible]—and do so by unemployment. What they are considering—are reconsidering—are their purchases of durable goods, automobiles, household equipment and so on.

Consumer incomes as a whole may not have fallen much—total personal incomes have in fact been rising since February, largely through increased payments under the various social security schemes—but consumer spending on durable goods has dropped, from $34.4 billion in the last quarter of 1957 to $31.5 billion in the first quarter of 1958. Meanwhile other types of consumer spending rose by rather more, it seems, than is explained by higher prices. The ever-growing population has something to do with this increase, just as part of the decline in sales of household goods is accounted for by the drop in the number of new families now being formed; there are fewer young people to get married because there were fewer babies born in the depressed nineteen-thirties. But the main factor behind this recent refusal to buy durable goods is evidently a natural feeling that the economic and international future is too uncertain for any non-essential and large-scale spending, or for any new long-term debts, to be undertaken.

There are few American families today, at least in the upper income groups with money to spend, who cannot manage with what they have in the way of durable goods; moreover a certain inverted snobbery seems to have developed—keeping down with the Joneses—so that it is now smart to go on driving a 1955 car or washing with an outdated machine. From the point of view of curing the recession it is unfortunate that the things industry needs to sell most are just the things consumers need to replace least. The promotional campaigns which have been spreading from city to city—one, rather paradoxically, began with all motor dealers in town closing their showrooms to attend a rally—with the slogan of "you auto buy now" have been running head on into the belief that now is in fact the time not to buy. It is a belief which will probably only be shaken when—and if—prices of durable goods begin to show really worthwhile declines.

Namesmanship

WASHINGTON, DC



PRIMARY elections, in which the voters of each party pick their entires for the finals in November and which will go on through the summer, are first and foremost field days for the active party man. Thus gamesmanship is fairly to the fore and, of all its variations, the oldest and most frequently tried is the namesman's ploy. It is a well-known fact that voters get confused with the enormously long ballot paper, with lists of candidates for nomination for anything up to forty or fifty congressional, state or local offices. The thing to do, provided your man can absolutely rely on a firm block of loyal personal supporters, is to confuse the remainder of the voters still further.

The Democratic party's primary in a marginal mid-western congressional seat provides an example of one variation of this ploy. In 1954 the front-running candidate, who was little known personally but had been endorsed by the party organisation, had a South European name with a first letter high in the alphabet. His main opponent engineered the additional candidature of one Mr John Adams, who refrained from campaigning. This had three advantages: firstly, some people always vote for the first name on a list and, since this was alphabetical, Mr Adams was on top; secondly, [illegible] he was a Negro and other Negroes who knew him might be expected to [illegible] vote for him; and thirdly, he had the only Anglo-Saxon name on the ballot and some of those who did not know him might vote for him for this reason. Actually on this occasion the front-runner still won. But he was defeated in the finals by the Republicans who made telling use of two points which his enemies in the Democratic party had dug up during the primary: that he had not spent much time in the constituency—having gone to Oxford to get educated—and that certain disconnected passages from his doctoral thesis might suggest that he was anti-Catholic. This year he was nominated again without much difficulty, having spent most of the interval doing penance by teaching at a local college for Catholic girls.

A second form of the namesman's ploy comes this year from the east side of Baltimore, where the struggle for the Democratic nomination, which means in effect the election, for the Maryland State Senate is traditionally between men with Italian and men with Polish names. According to sworn evidence in court the supporters of Mr Dabrowski, one of the leading candidates, had "shanghaied" a tugboat captain, Mr Fernando Bertalo, plied him with whisky, and "fast-talked" him into filing for a place on the ballot, where his name would appear immediately above that of the other principal aspirant, Mr Bertorelli. The other side counter-ployed; Mr Bertalo was induced to withdraw and, when the ballot paper was published, the name of Mr Dabkowski was found just above that of Mr Dabrowski. Also in the running for the same job were Mr Borowski and Mr Berzymowski.

WITHIN THE RADIATION ZONE

Shell meets the challenge

TO A WORLD HUNGRY FOR ENERGY, nuclear power holds out rich promise. With it, inescapably, come complex new problems which can be mastered only by new thinking.

Conventional lubricants, for instance, are useless when exposed to radiation. They break down, thicken and form harsh solids. Yet the lubricants needed for mechanisms close to the reactor may have to withstand radiation 4 million times stronger than would kill a man. Some of them have to take such punishment continuously for two years or more, for the complicated mechanisms they lubricate cannot be serviced without closing down the reactor altogether—a costly business with plant involving a capital outlay of some £50,000,000.

Here was the challenge... Where was the answer? Shell was first to foresee the problem. In 1953, a special group was set up at Shell's Thornton Research Centre to study the effects of atomic radiation on lubricants. Searching tests took place there and under actual reactor radiation at the Atomic Energy Research Establishment at Harwell; and in 1957, after four years of research, Shell introduced the first-ever range of Atomic Power Lubricants, named Shell APL.

This is the only range of proved radiation-resistant lubricants on the market today. Oils and greases from this range, as well as other Shell Industrial Lubricants, are in daily use both at Harwell and at Calder Hall, England, the world's first full-scale nuclear power station. They have also been chosen for the new British atomic power station now being built at Bradwell, Essex.

Here is Shell "Leadership in Lubrication" in action—anticipating a need, undertaking fundamental research, and finally developing the products to solve a problem of world-wide importance.

MUST HAVE SAVED US THOUSANDS

"Look—here's one of the detectors in the automatic fire alarm system I was telling you about. Am I glad we got it!"

"Why, has it worked already?"

"Yes, indeed! We had a fire last Friday night—probably caused by a cigarette-end, the fire brigade said—which could have been very serious. But this A.F.A. detector gadget called the brigade and they got the fire out before most of us had heard anything about it."

"Wonderful. How does it work then?"

"Well, all over the building we've got those little detectors—quite unobtrusive in most cases—they are wired to a central indicator board and then straight on to the fire station control room. The fire brigade say that all the best people have A.F.A. nowadays—Guinness, John Browns, Debenhams and so on."

"Does it cost much?"

"Surprisingly reasonable—and of course we get an insurance rebate. I advise you to look into it—it must have saved us thousands!"

THE WORLD OVERSEAS

The Tottering Republic

FROM OUR PARIS CORRESPONDENT

THE General had not long to wait in his village. In the early hours of Wednesday journalists were crowded in the elegant Elysée Palace. M. Pflimlin was resigning after a night of threatening rumours and bewildering revelations. The first eight days of M. Pflimlin's mock battle were described in these columns last week. The government's ability to walk a middle road between Gaullism and a popular front was then obviously in doubt. Some commentators in Paris believe that such a possibility did exist—that a government resolved to punish the culprits and prepared to appeal to the people of France could have carried the day. The Communists were so frightened of the Gaullist prospect, it is argued, that they were willing to play a merely defensive part. The government could have used them without becoming their prisoner. It could also have forced the generals into obedience by the threat of national resistance on the broadest popular base. But the risks involved were growing every day, while Algiers was showing its determination to impose its solution by open force if necessary. Against the threat of landings by paratroopers, it is not enough to appeal to the people ; it is necessary to arm them. The government claimed that it refused to make this choice ; but it made a choice in refusing. With the generals in Algiers demanding de Gaulle it was merely a question of time before M. Pflimlin sought salvation at Colombey-les-deux-Eglises.

Ordinary Frenchmen, however democratic their outlook, never had much enthusiasm for the antics of their parliamentarians. The government's double-talk about mortal danger and non-existent enemies was not of a nature to inspire them. Political parties talked in different voices ; trade unions issued contradictory orders. All this led to an apathy always favourable to a *coup d'état*. For Whitsuntide Parisians flocked in thousands to the countryside. A brief tour in the provinces gave your correspondent the impression that the mood of provincial Frenchmen had ceased to be vigilant or even interested.

On Whit Monday parliament gave one more of its bewildering performances. And yet by then the facts were plain to see. Algiers had cast aside the mask. Emissaries from Algiers, in conjunction with paratroopers and political allies on the spot, had taken over in Corsica. The armed insurrection was spreading across the Mediterranean. Similar *coups* were expected in continental France. What did the National Assembly, recalled for the occasion, do to face the situation ? It spent the day discussing lifting the parliamentary immunity of M. Pascal Arrighi, the Corsican deputy who had flown over from Algiers to lead the plot. In vain did M. Mitterrand, trying not to leave the monopoly of plain speaking to the Communists, implore the government to drop the legal fiction that the army in Algeria was its obedient servant. The unreality of M. Pflimlin's attitude gave his right-wing critics ample opportunity to claim that M. Arrighi could not be guilty, because he had flown to Corsica in a plane provided by General Salan, whom the Paris government itself had invested with full powers. M. Arrighi's immunity was lifted, all the same.

By then, however, interest had shifted elsewhere. The Communist-led trade union organisation, the CGT, had called a strike for Tuesday. Socialist deputies, reluctant to play the part of dupes in this tragi-comedy, expressed their wish that the strike should succeed. Before the news of this tougher Socialist attitude had time to spread all eyes were turned to a black Citroen fighting its way through the holiday crowds on the way to Paris, and carrying General de Gaulle ; a day of make-believe was to be followed by a night of hide-and-seek.

The Nocturnal Meeting

Trick departures, special escorts, decoys—the meeting between the general and the prime minister was surrounded with an amount of secrecy usually reserved for a shady deal. Even now all light has not been shed on the meeting at the chateau of St Cloud or on its background. Enough, however, is known about the facts, and about the springs of conduct of the two protagonists, to attempt a reconstruction.

M. Pflimlin had for some time been convinced that he could not cope with the situation. The army, he believed, was out of his control. He was living under the permanent threat of perhaps 6,000 paratroopers from Algeria landing at Marseilles and Toulon and proceeding from there to occupy France with help from inside. He also believed that General de Gaulle was the only man acceptable to the generals in revolt. M. Pflimlin was therefore willing to give in to this blackmail and hand over to the general. Yet the first move was made by M. Mollet, the Socialist, who implored the general by letter to use his authority to prevent the further spread of the rebellion. (What else this letter contained is not yet known.) Contacts were thereupon established and General de Gaulle drove up to town on Monday night to strike a bargain with the government. The sudden hardening of the Socialists prevented MM. Mollet and Moch from attending the meeting.

Did the prime minister of the republic offer the general the succession in terms and with a timetable ? Probably not. But he certainly outlined the prospect. According to reliable reports, M. Pflimlin was only trying to save face. He would be defeated in the constitutional debate—refusing to count the votes of the Communists on his side—and President Coty would then call on General de Gaulle. Thereupon the general would consult the leaders of the "national" parties and the leaders of the Independents, the MRP and the Socialists would endorse his take-over bid.

The plan was simple but it met with two unexpected

obstacles. One was the general's own haste. On Tuesday at lunchtime the world learnt about the mysterious meeting of the previous night. General de Gaulle kept part of the bargain. He asked the troops to obey their commanding officers. He did not make this request, however, on behalf of the existing government. He did it as the prospective leader of the nation: "Yesterday I set in motion the regular process necessary for the formation of a republican government." Did the general act in such a hurry because he genuinely feared that events might move too fast, or was he merely using this argument of an impending *Putsch* to force M. Pflimlin's hand? In any case, M. Pflimlin was left in no position to keep up appearances.

More important, however, was the Socialist resistance. Already on Monday the parliamentary group had expressed its wishes for the success of the communist-led strike. During that night M. Mollet managed to reverse the decision in the party's executive committee. But after General de Gaulle's announcement on Tuesday the Socialists wrecked their secretary's manœuvres. By 112 votes to 3 they swore that they would never climb on the Gaullist bandwaggon. For a second time on an historic occasion (the first was the European Defence Community debate) M. Mollet misjudged the mood of his followers. On the parliamentary plane this miscalculation could mean the difference between apparent legality and a *Putsch* in the transition to Gaullism. It could have an even greater importance in the country. The Communist strike had been, on balance, unsuccessful. But the workers might give a different answer to a combined appeal of the two parties and all the trade unions. Once again, there was a vision of a popular front.

Selling The Pass

In the meantime, M. Pflimlin was trying to play his part of the script with alterations rendered necessary by the change in the situation. The assembly was to debate the now somewhat irrelevant constitutional reform. It was asked by the government to delay its sitting until M. Pflimlin was ready with his statement. Anti-Gaullist deputies refused to depart, fearing to be faced with a *fait accompli*. Finally, at half-past nine in the evening, M. Pflimlin climbed the rostrum. He admitted his contact with General de Gaulle, denying, however, that he had offered to hand over. The government would only resign if defeated in the chamber. Constitutional reform was now forgotten. M. Bidault then asked the pertinent question whether the general could have made such a declaration if no promises had been made to him. M. Duclos told M. Pflimlin that the Communists would vote for the government so as to deprive him of "an alibi" for his flight. M. Ramadier, on behalf of the Socialists, begged the prime minister not to desert his post.

The assembly was already working under duress. The general's supporters in the chamber told M. Pflimlin in cynical terms that he was not abandoning power, but power was deserting him. In the lobbies they spread rumours that the republic's choice was between graceful surrender and capture, between the general and paratrooper colonels, that tomorrow would be too late.

M. Pflimlin received 408 votes against 165. Nevertheless, after a short cabinet meeting at the Matignon he rushed his resignation to President Coty. He chose a pretext flimsier than the Communist vote—the resignation of three Conservative ministers, which everyone knew had been pending for days. M. Pflimlin, the champion with faked muscles, had played his prescribed part in the barter of the republic. The question now was whether the Socialists, for all M. Mollet's entreaties, would refuse to play theirs.

The Mass March

On Wednesday afternoon (May 28th) Paris woke up, bringing a new element into all the calculations. In coming out into the streets the settlers of Algiers reminded Parisians that this was their own ancestors' speciality. It took them two weeks to remember this tradition, but then they responded massively to the call of a committee of vigilance embracing Christian Democrats, Radicals and Socialists. The Communists having joined in of their own accord, the crowd was really impressive. Official estimates put it at about 250,000. Your correspondent watched marchers proceeding from the Place de la Nation to the Place de la République for a couple of hours and yet did not see the end of the procession. In this multitude there was a fair sprinkling of intellectuals, though industrial workers seemed to predominate. Several important parliamentary figures, like MM. Mendès-France and Mitterrand, joined the column. The marchers walked in ranks of about 30, earnest yet confident, as if they themselves had been pleasantly surprised by their strength. Serious slogans against fascism and for the republic alternated with examples of Parisian wit, such as "De Gaulle to the Museum," "Soustelle à la Poubelle," "Paratroopers to the Factory Bench," and so on. There were no incidents. This quiet demonstration of strength apparently made an impact on the provinces. Was it the inaugural march of the popular front, or the funeral march of the republic?

If 40,000 rioting settlers in Algiers could bring about a radical change of the French political system, several times that number of Parisians felt entitled to oppose it. Called in to form the government after such a demonstration, General de Gaulle could look like somebody parachuted from Algiers rather than a man brought to power by popular clamour. In the circumstances, it became more important for the general to muster a massive majority in the representative chamber.

While the crowd began to disperse the Elysée Palace was frantically busy. Just before midnight M. Coty finally charged the presidents of the two parliamentary chambers to discuss with General de Gaulle the terms of that "exceptional procedure" which the general had declared indispensable to his taking over the reins. But the general was still not at all sure of parliamentary investiture. The mass march had scared the Independents into whole-hearted support for a strong man. But it stiffened Socialist resistance to him. Late on Wednesday night, the Socialist parliamentary party and executive committee still refused to change their minds, despite M. Mollet's appeals.

On Thursday morning they were still hostile to General de Gaulle but were ready to reserve judgment until they had heard President Coty's message. M. Coty took this unprecedented step to force the issue and open the way to the general. At 3 pm M. Le Troquer read the president's message to a packed chamber. The president recalled his pleas for constitutional reform in the past, and warned the Assembly that the country was now on the brink of civil war. He informed parliament that he had turned to "the most illustrious of Frenchmen"; he was trying to find out on what conditions General de Gaulle, a man of "incomparable moral authority," would agree to form a government of national salvation. If parliament put obstacles in the way then he, the president of the Republic, would resign. The supreme referee was taking sides. His message was greeted by boos and cheers, by shouts, songs, and cries of "Fascism will not pass."

The attitude of the Socialists suggested that they would stick to their earlier decision. If so, the legal veil will be torn, and then if Algiers is still determined to impose its will it will have to use the paratroopers; indeed, at this moment (Thursday evening), there are rumours in the Palais Bourbon that it is preparing to do so.

Lebanon's Struggle

FROM OUR MIDDLE EAST CORRESPONDENT

Beirut, Wednesday

The statement of Sami Solh, the Lebanese prime minister, to the effect that his government will never seek an amendment to the constitution at least settles one question with respect to the presidency. Camille Chamoun will not stand for a second term of office. Thus the prime minister has now said what the president steadily refused to say as recently as last week. Yet there is very little doubt that the government statement was made after consultation with the president and with his approval. Such by-play reflects the delicate political and personal factors at work on the Lebanese stage. On purely legalistic grounds the president's stubborn silence was justified. He never said he would stand again and was therefore under no obligation to say he would not. Yet the obvious threat of violence that has hung over the country for several months would have suggested to a more flexible statesman that this was not the time to stand on legalistic forms.

The general situation remains static in the towns and fluid in the countryside. In Tripoli, Beirut, Sidon and Tyre the opposition has maintained positions with only occasional and largely accidental clashes. In the Bekaa valley (Baalbek) and the mountains in the north and east, armed bands and government units are circling each other without much resort to force. The frontier with Syria, judging from extremely confused reports, has virtually disintegrated and routine frontier inspections such as customs are being carried out along a straggling line in the Bekaa valley. Beirut port is working at a much reduced tempo and the slow turn-around of ships together with the diversion of others to ports elsewhere in the Levant must soon begin to show itself in shortages and rises in prices. Indeed, such effects are already discernible. Meanwhile, the government has raised the dispute to an international plane and the next step is the Arab League meeting in Tripoli at the end of the week. The Lebanese government has prepared a complaint against the United Arab Republic; it is reported that a parallel complaint against western interference has been prepared by Cairo. The debate should be an interesting test of current thinking in other Arab states. King Faisal and King Hussein have sent messages of support to President Chamoun. Logically, therefore, Iraq and Jordan should back the Lebanese complaint. The UAR and Yemen will certainly oppose it. With two votes committed on either side, Saudi Arabia, Sudan and Libya are left with the deciding roles to play.

It seems unlikely that Saudi Arabia, now struggling back to the neutrality from which it was diverted by King Saud's support to Jordan, will wish to take sides. Amir Faisal's government is approaching its many serious problems with great caution and he cannot welcome a rumpus. The Sudan, having just won a swift victory over President Nasser in the matter of the frontier dispute, cannot want a renewal of the quarrel. And the Libyan government will scarcely jump in where Saudi Arabia and the Sudan fear to tread. Amid this welter of negatives it is improbable that the debate can be other than sterile. The Arab League was never famous for the crispness and clarity of its resolutions; and members must be aware that an open breach on this issue would be the death-blow to a body already rendered moribund by the quarrel between Cairo and Baghdad. The most probable outcome would seem to be a package resolution condemning all forms of intervention; or perhaps there will be no resolution at all.

What then? Discussion of the Lebanese complaint in the Security Council, with a Soviet veto hanging over it, can only embarrass the western powers; to declare themselves in Lebanon's favour can only prejudice their efforts to put their relations with Cairo on a more reasonable basis. Dr Malik, though pressed to do so, was unable or unwilling to suggest any concrete steps that the Security Council could take to improve the situation. In short, the internationalisation of the issue can only postpone the taking of internal decisions—now becoming increasingly urgent for the salvation of the country.

German Socialists Turn to New Men

FROM OUR BONN CORRESPONDENT

When the Social Democrats left Stuttgart at Whit weekend, with their biennial party conference behind them, the Sudeten Germans moved into the town for their annual rite of staking a claim to territory beyond Germany's present frontiers. After the international decencies of socialism, the nationalist stridencies that have so often disquieted Europe once again reverberated in the bright Stuttgart air.

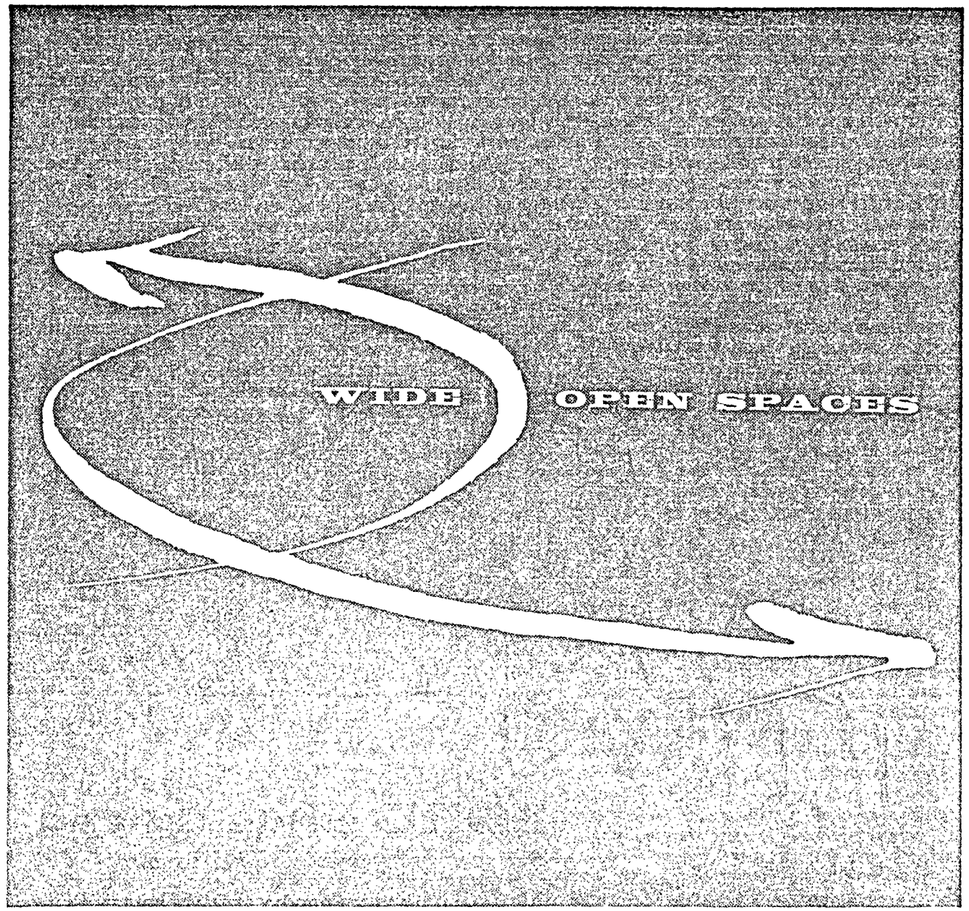
To foreigners whose business it is to watch political activities in Germany, decency is a characteristic quality of Social Democratic gatherings: decency on the platform, decency among the crowd, decency somehow even in the performance of the brass band. By German standards the Social Democrats have perhaps too much of it. They have acquired a mousey and bumbling look in the eyes of the greater part of the electorate, and they consider themselves in danger of being permanently dismissed as no more than "decent chaps"—decent, yet, with their woolly ideas about defence and property, not qualified to govern. The delegates assembled at Stuttgart made it their special business to enable the party to cut a more compelling figure without sacrificing any of its principles. They sought to produce an unequivocal statement of policy on current issues. They approved the draft of a new long-term basic socialist programme, which is to be given final form twelve months before the 1961 federal elections. And they did not shirk disputing the merits of the party leadership and making some important changes. Consequently they have aroused

and will continue to arouse more attention than has been their lot for many a month. But whether they have set course towards becoming the everyman's party of which some of their reformers dream, is debatable. The embarrassing freight which some members of the crew have furtively dumped to starboard seems to have been triumphantly hauled up, without having suffered much of a sea change, by others fishing on the port side. It is labelled no longer Karl Marx, but Herbert Wehner.

After two or three hours' barbed exchanges about the electoral failure last September, Herr Wehner was elected one of the two new deputies to the chairman (the other being Herr Waldemar von Knoeringen, the Bavarian socialist leader) and thus, with his exceptional energy and talents, has become a potential successor to Herr Ollenhauer as party chief. Herr Ollenhauer, under whose moderate and gentle leadership the Social Democrats have twice failed at the polls, is obviously now in risk of losing his title. Although he was re-elected chairman, he received 49 votes fewer than he did at Munich two years ago. Of the 380 delegates present 45 voted positively against him. One protested from the floor that the party had blundered in using the election slogan "Ollenhauer instead of Adenauer"; and the man who was charged with having disseminated the slogan—the party's publicity chief, Herr Fritz Heine—was not re-elected to the executive committee, on which he had served for thirty-four years. Some other "old faithfuls," including Frau Herta Gotthelf, hitherto director of the party's work for women and refugees, and Herr Franz Neumann, of Berlin, who endured the Nazi years in a concentration camp, were treated likewise against Herr Ollenhauer's express wishes. Younger and more adaptable men have been brought into the executive committee for the first time—personalities like Herr Willy Brandt, the popular Chief Burgomaster of Berlin. Professor Carlo Schmid, who had been named on the floor as the comrade most qualified to be a socialist chancellor, was re-elected to the executive committee. Professor Schmid declined to stand for any higher office, but he nevertheless received fourteen demonstrative votes for the chairmanship.

This long-simmering dissatisfaction with the mediocrity of the Ollenhauer regime expressed itself most strikingly in the elevation of Herr Wehner. An apostate communist party official, Herr Wehner still stands impenitently out on the left. While Herr Ollenhauer and Herr Heine were émigrés in the west, Herr Wehner was in Moscow and Stockholm. Physically and mentally robust, he hushed and excited the conference as no other speaker did. His election was the only one that provoked a cheer. As a footnote to Herr Deist's nebulous thesis proposing control, rather than nationalisation, of key industries, which the delegates had accepted somewhat hesitantly, Herr Wehner declared (before his election): "I am one of the old-fashioned persons for whom the so-called class idea has not yet been superseded." Still more electrifying was his unorthodox approach towards the problem of partition. Reunification would not be brought any nearer, he maintained, by refusing to deal in any way with the east German authorities. A beginning should be made by trying to alleviate living conditions in east Germany through official negotiations at least on some level. The goal should be reunification by stages. "There is no compelling scientific reason that prevents one part of a big country being administered more socialistically than the main part, in which free enterprise predominates. It is perhaps a little complicated, perhaps undesirable, but not altogether impossible. . . . Only one thing is unwaivable: personal and civic liberty for all Germans alike. Everything else is open to discussion."

This kind of talk cannot but have an impact. Whether it will win votes is another matter; no doubt it is possible that in 1961 it will be more convincing than it is today. It now remains to be seen how far Herr Wehner will succeed in establishing the ascendancy he won at Stuttgart. The twenty-nine members of the executive committee are about to meet in Bonn to appoint a nine-man presidium which will be chiefly responsible for putting policy into effect. Herr Wehner's future will depend a great deal on his relations with this new body. He has bitter enemies both inside and outside the party. Herr Heine has resigned from his post as press chief. Other resignations may follow as the deputy chairman asserts himself.



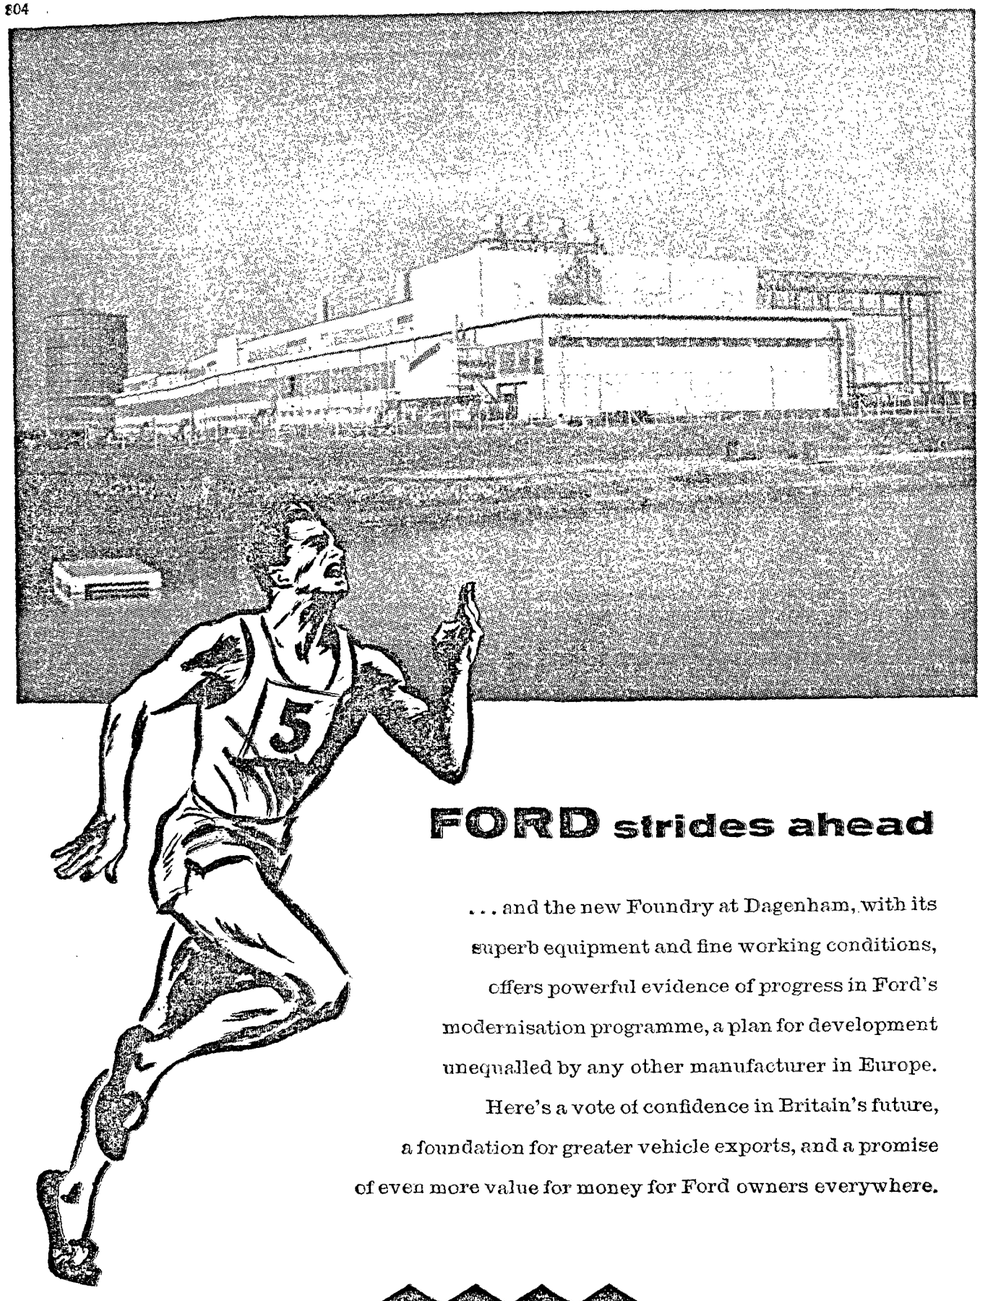
Three Communities at Stake

FROM OUR SPECIAL CORRESPONDENT

THE sedate assembly of the three European communities —Euratom, Coal and Steel and the Common Market— which met at Strasbourg on May 13th and 14th, was rudely disturbed by the news from Paris. On the 13th the deputies were listening sleepily to a discourse about the world economic climate from the president of the high authority at Luxemburg and musing on the subject of a European capital. Next day the benches where the French deputies had sat were bare. The shadow of General de Gaulle now falls across the three communities. A French government under his leadership would not necessarily walk out of them, but the close working relationship between French officials and their counterparts in other member countries, above all Germany, upon which the European edifice is built, might well be seriously impaired.

France, even while it has provided leadership and inspiration for European integration, has been, all along, the weak link in the chain. It both fathered and destroyed the European Defence Community. And though it has taken the plunge and joined the common market, its commitment has always seemed somewhat unreal against the background of chronic payments difficulties and a political system powerless to overcome them. French advocates of European integration have long seen in it a means to rejuvenate their country from outside—through competition and through powerful institutions which would make up for the shortcomings of French ones. There are many able young Frenchmen on the staffs of the Six, who, disgusted with the shortcomings of their country's *système*, hope to outwit it from Luxemburg or Brussels. But they have not had a chance to prove their imaginative thesis. The premises of France's European policy may shift just when the communities are in their infancy.

Their three principal organs—the council of ministers, the executive commission, and the assembly—have still not even managed to decide on a common seat. That was what the assembly met to talk about; but the buck, passed to them by the ministers, has been thrown up in the air to hang there until the end of June. In the debate a delegate from Luxemburg, knowing perfectly well that the Grand Duchy would not get the whole embryonic European government, was still gaily disputing the obvious need to put it in one place: "A ghetto for good Europeans: what a



Go west, young man, heading not for the rolling hills but for the rolling mills of South Wales. They, too, are open country to people who recognise opportunity when they see it.

The GKN mills in Cardiff operate as the principal re-rolling unit for the GKN Group. To supply much of the rolled steel needed by the group companies might seem a full time job. GKN (South Wales) Ltd., think otherwise.

They also find time to export steel and steel products to more than a hundred overseas markets and to manufacture some 500 million wire nails every week—around half of Britain's total output. They are concerned with large-scale production and small-scale accuracy; with thousands of tons and thousandths of an inch. A steel billet weighing over 900 lb. may end up as wire, as reinforcing bar or as strip, sections, angles and channels with an infinity of end uses. GKN (South Wales) Ltd., is one of the companies in the GKN Group. The steel products of the Group run into thousands and its opportunities are no less plentiful. If you want to get away from it all, GKN is not the place for you. But if you want to be right at the heart of industrial life and progress, it certainly is.

THE GKN GROUP OF COMPANIES FOR ANYTHING AND EVERYTHING IN STEEL

GUEST, KEEN & NETTLEFOLDS, LTD., (HEAD OFFICE) LONDON WORKS, SMETHWICK, 40, STAFFS

FORD strides ahead

. . . and the new Foundry at Dagenham, with its superb equipment and fine working conditions, offers powerful evidence of progress in Ford's modernisation programme, a plan for development unequalled by any other manufacturer in Europe. Here's a vote of confidence in Britain's future, a foundation for greater vehicle exports, and a promise of even more value for money for Ford owners everywhere.

FORWARD WITH FORD OF DAGENHAM

target for a Russian H-bomb ! " Let Luxemburg keep at least a ministry, ran his theme. Brussels, with plenty of empty flats and good communications, may be the capital in the end, but, for the sake of peace, Strasbourg may keep the assemblies and Luxemburg a court. Meanwhile, European ministers, officials and deputies traipse, gipsy-like, with all their camp-followers—secretaries, press officers, coffee-brewers—at vast expense from one capital to the other.

The absence of a common seat underlines another problem: how is the coal and steel community to be merged into the new ones ? Euratom and the European economic community should obviously be grafted on to the stem at Luxemburg, so that they can make use of its administrative experience and absorb its political prestige, until in time it becomes a mere ministry for coal and steel within the broader administration. But Brussels is already the chief operating centre of the two new schemes. If the coal and steel organisation is not moved there soon the political sap in it may run back before the juncture is complete. This could be harmful—notably in the field of cartels. The high authority has never seriously challenged the process of reconcentration in the Ruhr, which may be entering a decisive phase just when Luxemburg's powers are on the wane. French and German industrialists, too, are getting together to face the common market. Yet the anti-cartel laws in the Rome treaty are ambiguous, and machinery for enforcement may not exist for years.

The flight of the French deputies from the assembly, as well as of Italians and Belgians, who had elections in the offing, brought out another problem. Members of national parliaments have not got time to do two jobs at once. Yet the Six now have an executive which is at work full-time, making policies. Is Europe to be built by the technocrats ? The common market envisages direct elections of European deputies. But could these pure creatures keep their feet on the ground of national politics and enjoy real political power ? As more and more European governing is done, the need for a live assembly will become more acute.

Yet despite these shortcomings, the infant communities are remarkably lusty. Even in the assembly, where there is still too much fine talk, live issues are at stake, and the international groups—liberal, Christian, socialist—sit together and have developed a real working solidarity. Even in the debate about the capital, where so many national interests are at stake, they divided on party lines, and the Christian group moved the adjournment with an adroitness which would have been admired at Westminster. The assembly's committees are already doing valuable detailed work.

Above all, the new executive commissions of Euratom and of the economic community are providing a constructive drive. The economic commission has set up its administration, and it is already playing the vital creative role for which it was cast—formulating and devising policies for the council of ministers above it. The commission is manned by able men, equal in calibre to most national cabinets. Its president, Professor Hallstein, who in Bonn seemed cramped and limited by the Chancellor's tutelage, has acquired new stature and breadth of outlook with his new responsibilities. And the active and constructive part played by France's permanent representatives on the executive commission has in some measure compensated for the dangerous weakness of the voice of France in the council of ministers. In the near future, the commission may well take the initiative on the cartel issue by a decision that the provisions of the treaty have the force of law, even though no machinery of enforcement yet exists.

The commission has long since recognised that its most urgent problem is the free trade area. Yet in this as in the other key problems of the community, events have still to show just where the weight of power lies. The commission has been struggling to create a common policy for the free trade area talks. But in the council of ministers the national differences between, say, the French on one side, and the Germans and the Benelux countries on the other, appear more openly. Last week, when the council met to consider France's financial difficulties, it agreed to " view favourably " any proposal for a six-nation approach to other international bodies—say, the European Payments Union—on France's behalf. Such solidarity might be sorely tested by a change of regime in France. The free trade area talks may well provide a critical test of the power of the various organs of the new communities, of the balance between the member nations, and of the new-won unity which the Six proclaim.

Unindignant Swedes

FROM OUR SCANDINAVIAN CORRESPONDENT

THE special election for the second chamber of the Riksdag which will be held in Sweden tomorrow, June 1st, has a double interest. Sweden does not have parliaments of variable duration, as Britain does, and elections must normally take place for each chamber every four years. Because of this inflexibility, the Swedish parliament has almost never before been dissolved during the fixed four-year periods. This spring's dissolution is the first time it has happened since 1922, and it occurred then only in order to put into immediate working a new law of universal suffrage.

A dissolution has now been resorted to because the Social Democratic government under the premiership of Mr Erlander, which holds a minority of seats in the second chamber, was defeated in April on a bill to establish a compulsory system of additional pensions over and above the basic old age pension. This is the second point of interest in the special election. Nobody knows when a defeat in parliament is important enough for a Swedish government either to dissolve and resort to new elections or else to hand over power to the opposition, Sweden having no vote-of-censure system. The Social Democrats hope that an election campaign which can be fought on the rousing pensions issue will provide them with their best opportunity to reverse the gently downward trend that has characterised the party's fortunes at the polls since 1944. There has already been a noticeable tendency on their part to try to make this an " election of indignation " against the other parties, which are accused of opposing the demolition of " the last class barrier."

It seems almost impossible for the Social Democrats to win the eleven extra seats they need for an absolute majority. They perhaps have a chance of scoring the seven gains which are indispensable for a combined Social Democratic-Communist majority. The most likely result, however, is that the Social Democrats will win no more than three or four seats or—if they fail to reach the critical figure of 45 per cent of the votes—lose two or three. Within the

opposition, it is very probable that the Conservatives will win a few seats at the expense of the erstwhile Agrarians, who now call themselves the Centre party.

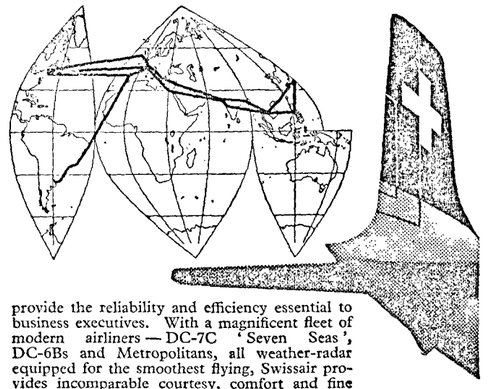
The plan to make this an "indignation election" has not been totally successful. Of the three parties in opposition, the Conservatives and the Centre party are opposed to any legislation for additional pensions, and are thus suitable targets for the government's campaign. But the leading opposition party, the Liberals under Professor Ohlin, have proposed an alternative to the government's bill. Except for the building up of the fund during the first 40 years, the Social Democratic scheme provides for a purely distributive system, in which the premiums paid on behalf of the working population each year go directly to give pensions to old people proportionate to their former income. One of the great advantages of this system is that it automatically provides protection against inflation; when prices and earnings grow, the premiums rise correspondingly and so does the sum available for the distribution of pensions that year. The danger is that, except for the fund already mentioned, there will be no new saving. As the new pensions will decrease the amount of savings which people put by for their old age, there is a serious risk that the net result will be a diminution in total national savings.

This is one of the reasons why the Liberals have chosen a capital reserve system for their proposal, the principle of which is that everyone should contribute over the years the amount of his own pension. A disadvantage of this compared with the distributive scheme is that within the capital reserve system, which will be built up on the principle of fixed premiums, it is impossible to say exactly what the size of pensions will be. The outcome depends, among other things, on the rise of the national income. Another disadvantage is the lack of automatic protection for the value of the pensions during a severe inflation. In order to solve this problem, the Liberals propose to invest the pension fund in "value-guaranteed" securities. If the Social Democrats fail to win enough seats to put their own proposal into law, a compromise between the Social Democratic and Liberal schemes may be the only practicable solution.

Mr Kishi on Top

FROM OUR CORRESPONDENT IN TOKYO

For their failure to make any appreciable dent in their conservative opponents' majority in Japan's seventh postwar election, the Socialists can blame Red China and Mr Khrushchev. They have indeed already done so. The Socialist party chairman, Mr Mosabûro Sûzûki, declared forthrightly in a television broadcast immediately after the results were known (and in which he appeared in unwonted harmony on the same programme and side by side with the victorious Mr Kishi) that China's suspension of Japanese trade and Russia's allegations that American planes based in Japan carried nuclear weapons were "aimed to sway the election in our favour but in fact provoked public antipathy against us."



This is a bitter pill that China and Russia between them have made the Japanese Socialists swallow, and one that may have important repercussions on the Japanese Socialist movement. Not that the Socialists expected to win the elections: but they had hoped to gain up to 25 more seats. This hope was based on the continued steady growth of a Japanese urban working-class that is strongly influenced by the socialist-minded trades union federation, *Sohyo*; on the left-wing thinking of the university professors and schoolteachers who mould the minds of Japanese youth; and above all on the strong antipathy of the Japanese voters to discredited militarism, with which the conservatives tend to be associated because of their hankering after a change in the constitution that will pave the way for more full-blooded (and fully legal) rearmament.

What actually happened was that forty million Japanese turned out to vote, in a record postwar poll; and they did so because they were roused from political apathy by what most of them regarded as Chinese and Russian attempts to dictate to them what sort of a government they should have. The Chinese dramatically broke off all trade, and took the trouble to make it clear they were doing so because they wished Mr Kishi to be replaced; the Russians followed with their election time-bomb about American planes; and Mr Khrushchev clinched the matter by declaring (in a reply to a leading question put him by *Sohyo*) that Russia reserved the right to drop hydrogen bombs on Japan, unless the Japanese chased the Americans out of both Japan and Okinawa. The Socialists may well claim that these blundering tactics by foreign communist powers cost them dear.

In the upshot, the Japanese political picture remains ostensibly what it was after the previous elections of 1955. The conservatives, now united in one Liberal-Democrat party, hold about the same number of seats as they did then, if pro-conservative "Independents" are counted in; and so do the Socialists, who are also now united in one party. The Liberal-Democrats still lack the two-thirds majority required to change the constitution; but the Socialists, contrary to what most observers had expected, seem as far off as ever they were from being able to begin to think of taking over the reins of government. The similarity of the two post-election pictures may, however, be only on the surface. For the elections have probably strengthened Mr Kishi's position within his own party, as well as giving him his first real mandate from the people. The Liberal-Democrats will continue to suffer from factional strife, but there is now a better-than-even chance that Mr Kishi's faction (together with that of his younger brother, Mr Sato) will come out on top.

Mr Kishi, who is approaching 62, appears a much more alert leader than either of his two predecessors in office, Mr Ishibashi and Mr Hatoyama, both of whom were ailing and older men. Moreover, his election performance suggests that his appeal to the masses may have been seriously underrated. There has never been much doubt about his political acumen, but his critics have been grumbling for over a year about the absence of a "Kishi boom." During the election campaign, however, Mr Kishi alone of all the candidates of all parties drew full houses. It would not be entirely surprising if the man whom the Socialists persisted in dubbing "war criminal Kishi" succeeded in touching off a Japanese renascence that managed to combine a strong nationalist tinge with fuller acceptance of the responsibilities inherent in Mr Kishi's earnest advocacy of a policy of still closer ties with the West. It is just because they fear such a policy by Japan that China and Russia strove so clumsily to unseat or weaken Mr Kishi; it will be ironical indeed if their zealous meddling in Japanese politics turns out to have promoted it.

SWISSAIR
Switzerland's Winged Ambassadors

provide the reliability and efficiency essential to business executives. With a magnificent fleet of modern airliners — DC-7C 'Seven Seas', DC-6Bs and Metropolitans, all weather-radar equipped for the smoothest flying, Swissair provides incomparable courtesy, comfort and fine cuisine on its world-wide services. Over a network of 72,000 miles Swissair is the acknowledged envoy of all that is finest in the Swiss tradition.

DIARY OF A VOYAGER

We sight the Rock

Soon after passing Trafalgar, we sighted Gibraltar on our port side—strong, magnificent sentinel guarding the nine-mile wide gate to the Mediterranean.

A fellow passenger aired his knowledge that the Greeks and Romans had called it Calpe or Alybe, that the eminence opposite on the African coast was Abyla, and that the two together formed the Pillars of Hercules of the Ancients. I jauntily added that the name Gibraltar was a corruption of Jebel Tariq, Jebel meaning Mount, and Tariq after Tariq ben Zaid who invaded Andalusia from Morocco in A.D. 711.

I thought of all the fighting the Rock has seen before and since Admiral Sir George Rooke took it for Britain in 1704 — Moors, Spanish, French, all had had a go at it. Well, long may its Barbary Apes live and multiply; if they go, Legend says we lose it. But my faith in Britain banishes any worry on that score. Besides, who could wish for more blissful freedom from care and worry than a sea-voyage — or for deeper comfort and better service than voyaging P & O.

P&O *a Commonwealth lifeline*

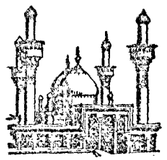
Barclays in Menton

Barclays Bank (France) Limited announce the re-opening of a new branch at Menton. The establishment of this new office completes the Bank's representation on the Riviera, where branches are already established at Cannes, Nice and Monte Carlo.

BARCLAYS BANK (FRANCE) LIMITED

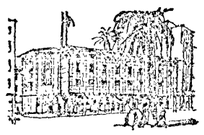
54 Lombard Street, London, E.C.3.
An Associate Company of Barclays Bank Limited.

PARIS BRANCH:
33 RUE DU QUATRE SEPTEMBRE, PARIS.



OTHER BRANCHES:
AIX-LES-BAINS, BIARRITZ, BORDEAUX, CANNES, HAVRE, LYONS, MARSEILLES, MONTE CARLO, NICE AND ROUEN: ALGIERS AND ORAN.

FIDUCIA·ET·FIDES



A tale of Twenty-two Cities

From Tunisia to India, from Aden to Iraq are the Cities, twenty-two of them—in fifteen states. They all have this in common: every one is in an area where a dramatic transformation is taking place, a transformation from a traditional past to modern statehood. Every one, too, contains a branch of The British Bank of the Middle East, a Bank dating back to 1889 and closely associated with the rapid development taking place today.

Tunisia, Libya, Lebanon, The United Arab Republic, Syrian Region, Iraq, Jordan, Saudi Arabia, Kuwait, Bahrain, Qatar, Muscat and Oman, Dubai and Sharjah, Aden and India: these are the territories where The British Bank of the Middle East operates. It has intimate knowledge and experience of their political, economic and financial affairs. If you are interested in new markets and the limitless possibilities of development in this vast area, The British Bank of the Middle East can give you the reliable help and advice you need.

THE BUSINESS WORLD

GAS UNDER PRESSURE—I

Today's Dearest Fuel?

The postwar years have been a period of great expansion in the total energy consumption in this country. . . . It is disappointing to note that the share taken by gas, although it has increased, has not increased to anything like the extent of either electricity or oil. . . . Both electricity and oil are invading the province of heat provision which at one time was more particularly the field of the products of the gas industry, either gas or coke.

—Dr J. Burns, Chief Engineer, North Thames Gas Board, in his Presidential Address to the Institution of Gas Engineers, May, 1958.

It does not take an expert to recognise that the economic difficulties facing the gas industry today are more than short-term troubles, but a warm year of slack business certainly points them up. Fuel consumption as a whole in Britain went down last year by about 2 per cent. But consumption of coal for burning raw was more than 5 per cent down; coke consumption, except at blast furnaces, was 10 per cent down; and gas sales were 2 per cent down. Electricity sales were 5 per cent up, and sales of oil as a general fuel, in spite of the aftermath of Suez, 2½ per cent up. In those uses where fuels compete, 1957 was a year to sort out the weak fuels from the strong.

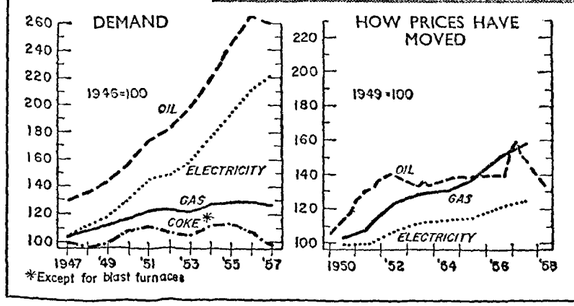
Competitive strength, between fuels of roughly equal convenience, is largely a matter of price. Gas prices went up about 5 per cent last year, while electricity prices rose only 3½ per cent; prices of fuel oil and paraffin, after jerking up during the period of shortage, later fell sharply again. Ever since the war, gas prices have been rising much more than those of electricity or oil. It is true that "on a thermal basis," as Dr Burns said last week, a unit of electricity is priced higher than its equivalent in town gas. But the therm that the customer is interested in is the therm of heat that his appliances give him from the fuel he buys, according to their thermal efficiency. And if one compares, for example, a typical domestic price for gas with the "follow on" unit charge for current used in an electric heater, taking account of relative appliance efficiencies, that remaining advantage fades. There is room for endless argument about the figuring in tables such as the one overleaf; but it may well be that today, for domestic heating as well as in industry, gas is becoming the most expensive fuel of all. Yet there are hopes, not too far off or too fantastic, of making it again one of the cheapest.

It is true that gas has never been put forward as a cheap fuel: the gas industry traditionally offers it for "selective heating," such as cooking and supplementary space heating, supported by the cheapest fuel of all, coke, for basic heating. This "complete heating service" is based on the nature of the carbonisation processes used in the British industry—the largest in the world primarily concerned with making gas, since the American industry now relies on natural gas and the German gas grids were built to distribute the gas produced in making coke. Out of a ton of coal, carbonisation produces 80 therms of gas and another 160 therms of heating power in half a ton of coke, plus various other by-products. Gas is the main product; all the costs of the product are set against it, less whatever the by-products will fetch. On the cost side, that makes for cheap coke; on the demand side, the price coke will fetch is related roughly to what people have to pay for coal. In recent years, therefore, coke prices have risen much more than those of gas, let alone electricity or oil. As a result, consumption of coke has not expanded at anything approaching the rate of the more convenient, selective fuels. "The complete heating service" has encountered increasing price resistance in the home; and though gas sales have gone well ahead in industry, coke sales have not.

Nobody in the gas industry is ignoring this sharpening of competition in the markets for its main product; but their explanations of the phenomenon differ. Most people fasten their attention on one factor: the rising price of carbonisation coals. These have risen more than the average price of coal, partly because the price of mining them happens to be high and partly because of the facts of supply and demand. In particular, their prices have risen far more than those of the small coals for steam-raising used by gas's main competitor, electricity, and seem certain to go on doing so. Moreover, it is a perennial complaint in the gas industry that its main competitors both possess unfair advantages. Motor fuels, it notices, carry most of the costs of petroleum refining: until recently, at least, fuel oil and other general fuel products have been sold for what the market will bear, as coke has. As the gas industry sees it, electricity too, in lighting, can use its monopoly of part of the market as a base for competing in the rest: people who have to pay the standing charges, covering most of the capital involved in generation, transmission and distribution, to get their electric light, are then offered "follow on" heat or power at a marginal running rate.

Whether or not its analysis of its competitors' tariffs is correct, gas possesses no such monopoly. Its base load is cooking demand; this rests on an established consumer preference, rather than on any precisely demonstrable technical superiority. But this base load is itself open to "all-electric" competition for electricity at "follow-on" rates; it has to bear the costs of gas distribution, which are very high when spread over the comparatively small—and steadily shrinking—number of therms the average domestic consumer takes. The gas industry's elaborate and costly gas distribution systems handle only about 4 per cent of the fuel used in this country.

To some other people in the gas industry, its present tribulations go yet deeper. Even apart from the rising price of carbonisation coals, they feel that the industry has reached the limits of development with its existing carbonisation processes. These are technically most efficient processes (of the order of 60-70 per cent thermal efficiency): they involve expensive plant, in which further increases in efficiency would probably cost more than they would return; and they make two fuels that are not necessarily complementary. That last fact complicates one of the advantages a plant engineer would normally seek in seeking further economies with efficient, capital-intensive equipment: making the units bigger and putting the plant where the raw material can be had cheaply. Even in mains at low pressure, if the distance from coalfield to consumer exceeds, say, 50 miles, it would be cheaper to make the gas at the pithead and pipe it to the consumer. But if one is making half a ton of relatively bulky coke in addition from every ton of coal one carbonises, transporting that as well would offset the saving. So carbonisation has traditionally been carried out close to the markets for the gas and the coke: which means in many small plants, not a few big ones. One of the major technical economies that this industry has genuinely achieved since it was nationalised has been to root out the tiniest and most inefficient works, using regional grids to serve their areas from more efficient ones. But there are limits to such rationalisation; and developments completed or in hand must by now nearly have exhausted the most profitable possibilities. Meanwhile, in 1958, gas is becoming too dear to compete.



For differing reasons, therefore, the gas industry has for some years been looking for alternatives; alternative gases or ways of getting gas; alternative production techniques; and alternative methods of distribution. There has been no reluctance to consider experiments (though from time to time fashion seems to have had something to do with the emphasis of research, mainly according to the whim of ministers). The industry has been

- relying on purchasing far more gas than at present from outside—coke oven gas, tail gases from refineries, liquefied petroleum gases;
- exploring for natural gas in Britain;
- experimenting with the liquefaction of natural gas overseas and with tankers to import it liquid, at minus 250 degrees Fahrenheit, into this country.
- switching over to oil—for peak and base load gas plants, at low and at high pressures, using light oils, heavy fuel oils and crudes, or anything a refinery has to spare;
- experimenting with complete gasification processes, which make gas without coke, from oil or from coal;
- considering large-scale gas grids, which would move gas around on a national scale—across the existing area boundaries of this decentralised public industry.

From time to time, indeed, the array of possibilities that gas has been considering has given the impression of a man jumping off a sinking ship and setting off bravely "every which way" at once.

For the onlooker, indeed, it is far easier to recognise the economic difficulties of the gas industry than readily to sort out the rhyme or reason of its undeniably strenuous efforts to overcome these with science. The multiplicity of effort does indeed contain large elements of reinsurance, as it certainly needs to. To the onlooker, if not perhaps to everybody inside, this industry looks to be approaching the end of a chapter, as it did 70 years ago when electricity began to bite into its monopoly of artificial lighting. Welsbach's invention of the incandescent mantle in 1887 did not merely prolong the life of gas in the lighting field; it showed the industry the future it could gain in selective heating. Today, the economies of conventional fuels and processes may be pricing gas out of that selective heating market; its only chances of continued expansion lie in radical technical change. But that technical change—which does look, now, to be on the cards—could in its turn transform the economic opportunities of gas from a selective to a general heating fuel; even, perhaps, the cheapest. The rationale of the gas industry's technical strivings, and the kinds of cost they will need to achieve to succeed, will be examined in a second article. But one thing can be said about this industry, psychologically as well as technically: pressure makes things happen.

THE GAS INDUSTRY AND ITS COMPETITORS

THE PRICE OF DOMESTIC HEATING

(Allowing for efficiency of appliances in use)

	Typical cost pence per therm May, 1958	Efficiency of use %	Price per useful therm
Coal	7·5	35	21·4
Coke	8·0	40–70*	11·4–20·0
Fuel Oil	9·0	80	11·5
Gas	21·0	60–90†	23·3–35·7
Electricity	34·1	100	34·1
Paraffin	16·1	100	16·1

* In open fires, stoves, or central heating.
† Gas fires, with flues or without.

Buses in Cities

Public transport in and out of town, everywhere in Britain, has an unprofitable peak to scale

By this week end the world's largest urban bus undertaking will have been off the road for four weeks—with no tragic inconvenience to its former passengers. But little more than a quarter of the capital's million and a quarter peak-hour commuters, who provide the great bulk of each day's passenger movements, normally travel to the central area by bus; and the proportion of bus passengers among the three-quarters who perambulate at off-peak times is still less than a third. Most of the rest go by tube or rail and only 5 per cent use their cars. This access to alternative, though for many not as convenient, means of transport has diluted the effectiveness of the strike. But how many of London Transport's bus passengers who have found these other ways of getting to their destinations will return to the buses when the strike ends? Will more peak-hour regulars return, for instance, than off-peak casuals?

This touches directly upon the principal contemporary fact of life for urban bus operators. Modern habits of living, the suburban semi-detached, the car, and television, have hit them all in much the same way. Twice-daily surges into and out of town centres have grown, in volume and distance, more or less with the increase in urban population. The car has not made much inroad into the peak movement, which largely determines the total investment in carrying capacity that the bus operator is expected to provide. But by contributing to peak-hour congestion cars impede the operator's chances of getting more vehicle miles out of his fleet by quicker and more regular running. More important still, with the newer social habits of shopping locally, spending evenings at home, and motoring at the week-end, the car has reduced the bus operator's chance of carrying as many passengers at less busy times as he did. In recent years the number of passenger journeys on all bus services has not risen as much as the total number of vehicle miles, so total revenue has not been buoyant, and capital and running costs have increased. Thinner profits have been made on off-peak operations to subsidise the costly and expanded peak-hour services.

Cross-subsidisation is the only way in which bus undertakings can operate, in urban or rural areas. Indeed, the idea of "areas of averaging," whereby profitable services carry uneconomic ones, is the very basis of the licensing system for road passenger services. Most operators charge a standard rate of fare according to mileage, except for the now archaic, but embedded, system of workmen's tickets—which could well be brought to an end—and, in the provinces, the taper for longer mileages. But their costs per vehicle-mile vary widely, and sometimes quite capriciously, with the time of day, week and year, the conditions of traffic, and the part of the route served. Costs per passenger-mile would undoubtedly show even greater variation with the particular load carried at each stage.

In spite of this fractious relation between costs and charges, and although peak traffics have increased much more than total traffics, most urban bus undertakings have been able to break even, without raising fares as much as wage rates have gone up. Labour costs account for not quite half of their total outgoings, but the possibilities of improving the productivity, in the narrow sense, of drivers, conductors, and maintenance staff are not considerable, unless there were greater co-operation from the unions than ever seems likely. Municipal undertakings publish separate accounts, and in the larger cities they are not in an unhealthy state. But the records of other urban operators forming part of the Tilling and Scottish groups, owned by the Trans-

port Commission, and in the British Electric Traction group, which is partly owned by the commission, are not readily available. Even the road services of London Transport, excluding the tubes, have managed to cover their "share" of the Transport Commission's central charges (calculated by the Chambers committee as £1.5 million for 1953) in six of the nine years for which accounts have been published since 1948.

THE most obvious way of surmounting increased costs is to increase the carrying capacity of the bus; this adds insignificantly to total operating costs but can make an appreciable difference to the size of fleet, and therefore to the number of staff and amount of maintenance expenditure, needed to handle peak traffics. In 1949, for instance, Manchester's fleet of 1,370 buses averaged 56 seats to each vehicle; it now has a slightly smaller fleet with an average of 58 seats each; and new regulations allowing an extra foot in length, have enabled the corporation to put 65 seaters on the road. Local authority undertakings as a whole ran nearly 2,900 buses with a seating capacity of 56 or more at the end of 1955; a year later the number exceeded 4,000, while their total fleets had increased only by 500 or so to about 15,500.

Improved design has also helped by reducing vehicle weights; increasing engine efficiency has improved fuel consumption; so has closer attention to driving methods. Fuel costs have been cut from roughly 13 per cent of the total to about 16 per cent in the last three years. A reduction, or the abolition, of the fuel duty, which is the hardy spring perennial of the industry, would not solve all their problems for all time. If a cut were to be passed on to the passenger, who in effect bears the impost now, the slight reduction in fares would probably not produce many more passenger miles; and if the operators pocketed some or all of the relief it would merely provide them with a cushion for a few years. It would not meet the persistent fall in off-peak traffic, the principal cause of their troubles.

Operators have also eliminated many unprofitable services and reduced their "dead mileage." Bus undertakings are not allowed to forget the public obligations that passengers expect as of right but are not so keen to pay for, but they manage to shake off some dead branches and to adjust the frequency and length of services to the patterns of traffic. But they also have to fit these in with working schedules of staff and vehicles, which is not so easy.

But success in the main problem of the growing divergence between the volumes of peak and off-peak traffic means finding ways of attracting passengers back in these less busy hours, pressing for a staggering of working hours, and lowering the costs of the peak-hour services. Hopes for improvement from stimulation and staggering have never been very sanguine. The cheaper fares that London and some other operators have at various times offered in the evenings have not been a success. A cut of, say, a quarter in midday fares in cities where there is no appreciable lunch-time traffic at present would have to produce an increase of a third in passenger mileage before the takings increased. A 15 or 30 minute shift of working hours could make a lot of difference to peak hour congestion for the passenger, though not as much in the capacity the bus undertaking has to provide. But, again, there is little sign of it.

The main way in which operators meet this peak demand is by bringing out older vehicles. Improved design and maintenance have lengthened the life of buses, and by the time they are retired for these twice-daily appearances their capital cost has been largely written off. To use specially designed utility-type models, with fewer seats and more standing room, would not be more economic if their cost had to be recouped purely from peak-hour operation. They might be incorporated economically in a fleet that works throughout the day if the operators believed that the public were prepared to accept transport of a less comfortable standard; but hardly any urban operator does—yet. More "limited stop" buses, offering express runs at higher fares, have been introduced successfully by the provincial operators, and London Transport has also introduced them in the last two years. But unless these vehicles can get back to do at least one extra journey during peak travelling time there is no saving for the operator. The main cost of peak hour capacity, using older vehicles, is the wages of the crews, and London Transport, unlike most provincial undertakings, is not easily able to save on off-peak labour costs. In London, by a long standing agreement with the unions, crews' wages have to be paid in full for any idle periods between morning and afternoon duties. The idea of employing part-time drivers and conductors soon runs up against the difficulty of finding labour willing to work only at such times; and, similarly, suggestions that fares could be collected by conductors only during peak hours would mean redesigning buses and might be practicable even then only if the same fare were charged whatever the mileage travelled. Fares are collected by the driver, with or without the help of coin machines, in the United States; but their system of one uniform fare, whatever the distance, is increasingly disliked by urban transport undertakings there. The "more refined" method of mileage charges used here is considered, in fact, as the first step necessary to resurrect public transport in American cities.

Public urban transport is beginning to be suggested again in the United States as the least inefficient way of tackling the immense problems of urban congestion. In Britain, public transport is still on the decline, and as the car population grows it is likely to decline more. Here, buses are still just about paying their way; but the task of meeting the cost of the demands of the peak-hour traveller out of the other declining services is likely to become steadily harder. The public will have to choose between paying for this peak-hour service—by higher peak fares, or by higher fares in general. It will certainly have to accept more inconvenience as its peak demands grow.

BUSINESS NOTES

IN THE MARKETS

Soft Going

FRANCE by a close head from Mr Cousins with 5½ per cent a bad third might be the way a race reader would record the running on the stock market this week. The race has not been dramatic: the excitement in Kaffir shares has died down, though no big losses have been recorded. Industrial equities have been little more than steady, with *The Economist* indicator falling 0.8 to 183.6. And the gilt-edged market has remained firm. Business has been light, with investors awaiting the next twist in the French crisis and the developments in the bus strike.

But the waiting race may favour some horses, especially those carrying gilt-edged colours. At the short end of the gilt-edged market, the buying that immediately followed the reduction of Bank rate from 6 to 5½ per cent was a little too hectic and there were some attempts from Lombard Street to sell this week on an unwilling market. But prices throughout the list have been pegged higher by the Bank

	Price, Sept. 18, 1957	Price, Mar. 21, 1958	Price, May 21, 1958	Price May 28, 1958

* Ex dividend. Gilt-edged prices shown net of accrued interest.

rate reduction and clearly the reduction does not impede—though it may not greatly enhance—the prospects for further funding sales. The recent conversion offer and the earlier 5½ per cent Funding issue have given the Government broker stocks with dates ranging over 1963, 1974 and 1982–84 to meet any demand that may arise. Gently the tap prices have been raised. But the technique of funding itself, the big sales of gilt-edged which occurred before Bank rate was changed, and the prospect of new issues of fixed interest securities to come will prevent any excitement in the market, even if 5½ per cent points to an eventual 5 per cent.

The New Zealand issue has now been digested and a local authority issue is in the offing, though whether it will come before or after the ABI issue seems to turn on the outcome of the French crisis and the bus strike. Such an issue reduces the pressure on the mortgage market where short-term rates have come down—seven days' money from 6⅛ per cent to 5⅝-5¾ per cent and seven years' loans from 6¼ per cent to 6¼ per cent—but long-term rates remain unchanged. There has been no sudden surge of hot money from France into the mortgage market, for the French government is keeping a stern eye on bank balances; but there is as yet no sign that the reduction in Bank rate has encouraged borrowers to go longer.

Weak Franc, Weak Dollar

MOST of the interest of the foreign exchange market has been focused on the political crisis in France and on the continuing weakness of the American dollar—a weakness that is the exact opposite of what many people predicted, though it conforms to the experience of the exchange market in earlier American recessions, including the last. The market in French francs has remained narrow and is dominated by the fact that there is, naturally enough, a technically short position in this currency. That explains why the spot rate improved suddenly from frs. 1180½ to frs. 1178½ on Wednesday when the way seemed to be prepared for the formation of a de Gaulle government. The short technical position in francs has also been apparent in the inordinately high rates that have been paid for carrying over short positions in francs from day to day. For such accommodation up to 4 francs per day against sterling has been charged, which expressed in terms of an annual rate of interest is well over 120 per cent.

The underlying pressure on the franc has been more apparent in the fluctuations in the price of gold in Paris and in the weakening of the rates for Bank of France notes in foreign centres; in London the rate touched 1360, but on Thursday it improved to 1316. The French authorities have already taken defensive measures, including the sudden cancellation of all tourist allowances. They appear to have overlooked their obligations under the Treaty of Rome setting up the common market, which came into effect at the beginning of this year, to consult their partner countries before effecting this breach of principle. In consequence the French government had to obtain a retrospective waiver. It has also been intimated that France will need to contract out of its obligations to cut tariffs and raise quotas on common market trade in January next; it seems still more certain that France will postpone its liberalisation of trade with all OEEC countries that it had promised to undertake next month.

Events in France and in the Middle East have kept business in the foreign exchange market unusually quiet. Sterling has been inclined to give way slightly against European currencies. In part this is a seasonal movement but it also reflects the fact that Continental bankers have been watching Mr Cousins and his doings more attentively than have the exchange dealers in the United States. Against the dollar sterling has fluctuated within the very narrow limits of $2.81⅜-2.81¼. The main feature has been

the weakness of the dollar against currencies other than sterling. The dollar is now at or below its parity in terms of all European currencies and is near the floor of its permissible fluctuations against sterling, Swiss francs, guilders, Belgian francs and German marks. A mild run from the dollar is still under way; this largely accounts for the continued outflow of gold from the United States, which has involved the loss of more than $1,000 million since the beginning of this year.

AIRCRAFT INDUSTRY

Clouding the Issue

THE debate on the aircraft industry before Whitsun gave the Minister of Supply an opportunity to look at its future prospects—a contraction in employment, which has now shrunk to about 250,000, to a possible level of about 150,000, though only if the industry can continue to sell a fair volume of its products abroad. This is the projection of three separate trends: the limits imposed on defence spending; the switch to guided missiles that take fewer resources to build and are needed in smaller numbers than an equivalent force of manned supersonic aircraft; and the size and cost of a modern civil airliner which are so great that substantial export orders over and above any placed by domestic airlines are required for economic production. The Ministry is coming to believe that the future of the civilian aircraft industry depends increasingly on its commercial strength, and the ability to offer competitive credit terms.

The Minister is quite right to spell out these facts in the bluntest possible manner to an industry that has an unusual capacity for self-deception. Aircraft companies always believe that better times are just around the corner and that the darkest hour is the one that precedes either a major technical change or a re-armament boom and often enough in the past they have been right. But when the Parliamentary Secretary said in the plainest possible terms "I regret very much . . . that I cannot see any prospect of any major government production order for the Gloster Aircraft company after its present order for Javelin fighters has been completed" it is doubtful whether his words were taken at their face value. Repeated warnings do not stop small companies from trying to carve out a foothold in an industry where the government is doing everything in its power to reduce the number of companies.

It was more the pity that the debate was so strongly reminiscent of any typical postwar debate on the textile industry, with members pleading for special measures to bring work to aircraft factories in their own constituencies and ignoring completely the basic reasons for the industry's contraction. If these members are prepared to vote for a bigger defence budget, let them say so. If not, they should not complain when defence orders are cut. The points that Mr Jones raised, particularly those that touched on export credits, deserved more serious discussion than they received.

OPTION DEALINGS

What Kind of a Market?

"SUBJECT to satisfactory rules and conditions being framed," the Stock Exchange Council will lift the ban, now nearly twenty years old, on option dealings. So the Council, having turned down earlier requests for a resumption of dealings, has bowed to the wishes of the majority of Stock Exchange members. Two-thirds of their number voted in last week's poll on option dealings, and by a two to one majority—1,485 votes for and 766 against—favoured the revival of the pre-war practice. Members and investors alike will not find it easy to recall the intricacies of option dealings, and the Council has decided to set up a committee, with power to take evidence and to invite the co-operation of members with the necessary expertise, to frame suitable rules.

Presumably the "put," the "call" and the "put and call" will come back, but they are hardly likely to come back under the same rules that governed the option dealings before the war. Among other questions, the committee will have to decide in what securities option dealings should be allowed and whether the money for the option is to be put down at the end of the currency of the option, as it was before the war, or at the beginning. With the manifest reluctance in high places in the Stock Exchange to accept option dealings the rules seem likely to be tightly framed.

What kind of a market will emerge? Option dealings will encourage speculation. That is not a judgment on the desirability or otherwise of speculation, but a recognition of the fact that a tax system which encourages the search for capital gains breeds a circle of professional or semi-professional operators. But will option dealings significantly increase the turnover of the stock market? Certainly it was in that hope that many members voted in favour of their resumption. More than before the war, institutional investors dominate the market, and they will not be concerned with options. But in the unlikely event of private investors becoming interested in a big way, could the market finance option dealing on a large scale? Before the war dealers used to cover themselves by buying half the stock represented by the options they had sold which they then contangoed to postpone settlement. But the prewar contango facilities no longer exist, as the capital deployed by jobbers has shrunk and they dislike leaving their books unbalanced for long. The market that seems likely to appear may be narrow, specialised and volatile.

MOTORS

Ensuring Body Supplies

IT is not altogether surprising that Standard should have made its offer for the entire share capital of Mulliners (Holdings) Ltd., the Birmingham car body makers, which already builds Standard bodies—to be distinguished from H. J. Mulliner and Company Ltd., the coach builders for Rolls Royce and Bentley—nor altogether a coincidence that its announcement should have come while the Pressed Steel strike was beginning to cut deep into the motor industry's output. Standard, alone of the big five, controls no body-making plant itself. It gets the bodies for its Vanguard and Ensign models from Pressed Steel, for its 8 hp and 10 hp saloons from Fisher and Ludlow—which is owned by BMC—and Mulliners supply bodies for the Triumph range and the small Standard vans. Most of Mulliners' work stems in fact from its Standard contract, and clearly if the bid is accepted Standard will aim to build up its new subsidiary's facilities so as to become less dependent upon outside body-makers. Standard has offered 11s. in cash for each of Mulliners' 300,000 10s. 7 per cent cumulative preference

An exceptional investment opportunity

offering high interest with maximum security

Rarely before in this century have investment yields been as high as they are to-day, but equally rarely has the investor stood in so much danger of capital loss.

Within the past twelve months the prices of Government securities have fallen on average by 12 per cent, and those of industrial ordinary shares by almost twice as much; and, with the economic outlook so uncertain further wide fluctuations in share values cannot be ruled out.

INTEREST 7½% PER ANNUM

An investment free of these risks is offered by Awley Finance, a company specialising in the financing of hire purchase and credit sale transactions; the investor depositing his money with Awley Finance can assure himself of the exceptionally favourable return—even by present-day standards—of **7½ per cent per annum, without exposing capital to erosion by Bank Rate adjustments, Stock Market upheavals,** and so on. Deposits can always be encashed at their full face value at agreed periods of notice of six months or less, while arrangements can be made for substantial withdrawals on demand, and this investment does not entail any costs of stamp duty, brokerage fees, or legal charges. The interest rate is **FIXED** under the terms of the Company's deposit receipt, and is **not automatically reduced in the event of a reduction in Bank Rate.**

Assets exceed £1,500,000
Capital and reserves exceed £750,000

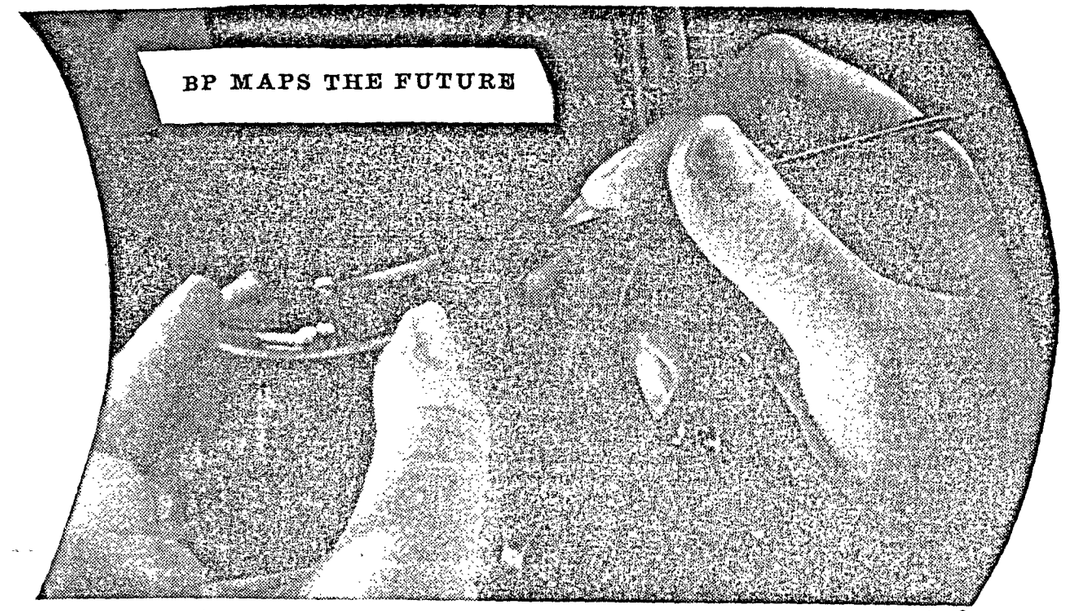
But, it may be asked, is the money deposited with a hire purchase finance company safe, especially at a time when a recession may be on the way? The answer is that it enjoys complete security under any conditions with Awley Finance. The Company's total assets exceed £1,500,000, it has capital and reserves exceeding £750,000, and its earnings record is excellent; but in addition to the protection given to the depositor in the exceptional strength of the Company's financial structure, **Awley Finance follows the practice of limiting deposits to a sum not exceeding its own capital and reserves.**

No prior charges on assets

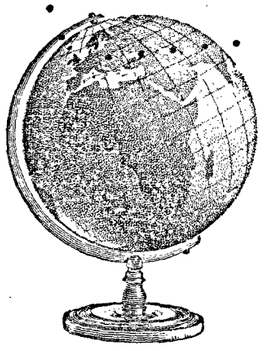
As there are no prior charges, deposits are therefore covered by assets to the extent of more than 200 per cent, which means that they are completely safeguarded against any conceivable disturbance of hire purchase activity arising from changes in the economic situation. And deposit interest, it should be noted, is covered several times by earnings and takes priority over dividends.

Interest is paid quarterly . . .

. . . and can be paid gross (i.e. without deduction of United Kingdom Income Tax) if the deposit is made for a fixed period. Awley Finance supplies its depositors with audited Accounts and Balance Sheet at the end of each HALF-YEAR, enabling depositors and their financial advisers to maintain up-to-date observation on the Company's trading progress and financial soundness.



* * * * *



Because of its own restriction on total deposits, Awley Finance can accept only a limited amount of new money, and early applications are therefore invited from those wanting to take advantage of this exceptional investment opportunity. **Balance sheet and earnings record will be supplied on request.**

Please apply for full information to the Secretary

AWLEY FINANCE CO. LTD.

35 DALE STREET MANCHESTER 1

A sample of catalyst for use in oil refining is about to be analysed in a spectrometer at the BP Research Station, Sunbury.

How will these hands shape tomorrow's motoring?

WHOSE HANDS ARE THESE? They are the hands of a chemist at the research station of The British Petroleum Company at Sunbury-on-Thames. One of nearly a thousand BP research workers whose main task is to conjure more and better products from one single substance—crude petroleum.

Among the many different users of oil products, no one has gained more than motorists and motor-cyclists from the work of these men and women. No one has more to gain in the future. To quote one example, BP Energol Visco-static, the all-weather motor oil which reduces engine wear by 80%, was a recent Sunbury triumph. The result of many months of patient research. In 1917 Sunbury Research Station began with one modest house. Now it occupies thirty-nine acres and is still expanding.

Besides its laboratory and development work, Sunbury carries out the most exhaustive proving-tests of BP products and processes. The latest major addition to its resources is a motor fuels engine-test laboratory, where cars can be tested at speeds up to more than 100 m.p.h. under temperature and humidity conditions equivalent to the most extreme tropical climates.

Thus, constant research ensures the supreme quality of BP products for use all over the world, and even more efficient fuels and oils for the engines of tomorrow. At Sunbury, the future takes shape today.

THE *British Petroleum* COMPANY LIMITED

shares, and three of its own 5s. ordinary shares plus 2s. in cash for every four of Mulliners' 4,875,000 1s. ordinary shares. On the eve of the offer the Standard 5s. units stood at 7s., putting a price of 5s. 9d. on the Mulliner units (against a market price of 4s.).

Standard may have just been able to escape running into any trouble from the Pressed Steel strike. The Swindon plant, where the 31-day strike took place, supplied certain panels for Standard bodies to Pressed Steel's plant at Cowley and it so happened that Cowley had a sizeable stock of these panels. Standard thinks that it should be able to keep to its schedules until this week-end: what happens early next week depends on how quickly the Swindon plant can get back into business. Ford and Vauxhall, on the other hand, never had any cause for worry: Vauxhall makes its own bodies and the Briggs plant, which Ford now owns, supplies all of Ford's needs except for the bodies for its convertible models, which come from Carbodies in the BSA group. EMC and Rootes were the main sufferers and the strike probably cost them at least 10,000 vehicles. BMC gets possibly half of its bodies from its Fisher and Ludlow and Nuffield Metal Products plants, Pressed Steel supplying most of the rest: the strike is believed to have cut Austin's output by about 5,000 vehicles and Morris may have lost at least 1,500. Rootes, however, relies much more heavily upon Pressed Steel since its own body making subsidiary, British Light Steel Pressings, makes only the Humber Hawk body. Rootes' lost production probably exceeded 3,000 vehicles.

MONEY MARKET

Sharp Fall in Bill Rate

THE Treasury bill rate fell by rather more at last Friday's tender than many people outside the market had expected; the discount market raised its common bid by 1s. 11d. to £98 15s. 11d., equivalent to a cut in its discount rate of ¼ per cent to 4⅛ per cent. At the time of each of

Expansion at Ford

ALONE among Britain's motor manufacturing companies last autumn, to people inquiring about output prospects for 1958, Ford replied that it was already working to capacity: it would hardly be able to do much more until the £65 million investment programme that it had begun at the end of 1954 began to mature. That has not prevented the company from pushing output up to 1,830 vehicles a day, as against the 1,650 it was pushing through at the end of November—from facilities with a rated capacity of 1,600 a day. But this has cost a vast amount of overtime, extra trouble and congestion in the for management, and congestion in the existing works at Dagenham. Some of what Ford decided to buy with its £65 million is already working—such as the new Thames Foundry that it showed to visitors this week—but the extensions and new plant will not be complete before spring next year.

That expected date of completion will be about six months earlier than Ford originally reckoned. The company did accelerate its programme to some degree, though not to the financially agonising extent of its rival Vauxhall. Three of the major new units, including the big new press shop at Briggs, have been completed ahead of schedule, and there are hopes that the new "PTA" building will be too.

This paint, trim and assembly building is in a sense the core of reorganisation at Dagenham. At present it is a gaunt framework of structural steel alongside the main road past the 562-acre Ford site. But when it is complete next April, it will house the assembly lines for all the models of car made at Dagenham: the existing River plant will concentrate on assembly of the commercial vehicles and tractors. From the extended and re-equipped press shop at Briggs the completed car bodies, ready for painting, will come across the road on a bridge conveyor straight into the new building instead of on loader lorries as they do today; after painting and furnishing, they meet engines, transmissions and other components from the machine and sub-assembly shops of the main plant.

THE "PTA" plant, which alone accounts for about 1,400,000 square feet out of the 3 million being added to productive floor space under the present programme, is the largest [illegible] The Thames foundry, single new item. The [illegible] which Ford claims is the most advanced in Europe, is the next: it is now producing heavy castings such as cylinder blocks and heads, mainly at the moment for commercial vehicle engines, and big castings for the Fordson tractors. It is certainly one of the cleanest foundries in the world: there is a complete change of air for the whole building, which measures 533,000 square feet on two main floors, every eight minutes. Elaborate overhead handling equipment, power-controlled by individual operators, moves ten 2,000-lb ladles to and from the cupola furnaces to pour the main castings. Cores to form the internal cavities of the big castings are baked from sand of which the mixture is controlled according to pre-set punched card programmes. The foundry will have a capacity of about 400 tons of castings a day, two-thirds of the whole Ford output (existing foundries at Dagenham and Leamington will continue operating).

HOW FORD OF BRITAIN HAS GROWN

Output: Vehicles per Day		Floor Area: (million sq. ft.)	
Opened		1946	2·2
1931	c.100	1954	6·2
1938	460	1957	8·0
1946	372	1960	9·2
1947	470		
1948	627		
1949	622	Employees	
1950	750	1946	15,700
1951	700	1954	40,000
1952	666	1957	44,000
1953	957	1960	50,000
1954	1,220		
1955	1,458		
1956	1,333	Fixed Assets (£ million)	
1957	1,398	1946	£14 mn.
April,		1954	£42 mn.
1958	1,830	1957	£81 mn.

In cost, the main items in this Ford programme rank roughly as follows:

	£ million
Paint trim and assembly building	10
Thames Foundry	
[illegible]leted beginning 1958)	7½
(completed [illegible])	5½
Briggs press shop modernisation	2
Spare parts plant, Aveley (completed 1956)	2
Machine shop, Basildon (completed 1957)	2

Rearrangement and modernisation of existing workshops at Dagenham will have cost £10-15 million more by the time they are over. Extension of the existing press shop, a new die-storage building, a new body division toolroom, a new forge, and a machining plant at Woolwich, plus extensions outside London, make up the balance.

In this programme, Ford's emphasis has been as much on re-equipment to cut costs as on increasing capacity as such. It appears that when the whole plan is complete, Ford capacity without overtime may be of the order of 2,200 units a day: the company says "double the 1954 capacity." But when one considers what Ford is at present getting out of its rated capacity, such figures appear conservative.

the two previous changes in Bank rate, the reduction to 6 per cent in March and the increase to 7 per cent last September, the bill rate was initially established perceptibly closer to Bank rate, less than ½ per cent below it. But last week's margin of $\frac{11}{16}$ per cent is by no means unusually large; it compares with a margin of just over ¾ per cent following the previous ½ per cent reduction, from 5½ to 5 per cent in February last year.

The steepness of last week's downward step, at a stage when a cut in Bank rate had been widely expected, is to be explained partly on tactical grounds. The market had outwitted outside competitors at previous tenders by going into reverse and increasing its discount rate—it may be noted that last week's rate was less than ½ per cent below the rate on May 2nd; this involved missing most of the bills, and last week it needed to make its bid fully competitive. Its allotment rate jumped to 60 per cent, following the poor rates of 44 and 20 per cent at the two preceding tenders. But there were influences other than tactical ones in the magnitude of last week's reduction. Many people in the discount market expect to see a Bank rate at 5 per cent before mid-summer.

The Treasury bill tender established the pattern of Lombard Street dealing rates; and as credit has continued to be rather taut, the discount market's margins have not been wide. The market had to take loans at the new penal rate on Thursday itself, keeping it "in the Bank" for the fourth successive day, and further penal loans were needed on Tuesday after Whitsun (though the amounts involved have throughout been small). Hence flexible rates on overnight loans have ranged up to 4⅝ per cent, and dealings in August maturities have generally been at 4¾ per cent, though the market has also obtained 4$\frac{23}{32}$ per cent. It is too soon to assess the average cost of the market's money—including, that is, the half portion or so that is taken at 3¾ per cent, the clearing banks' new minimum—but it seems likely to be between 4⅛-4¼ per cent.

ARGENTINA

Disappointment in London

On May 2nd, the day after the new government of President Arturo Frondizi took office, the cash payment was due from Buenos Aires under the long drawn out agreement to compensate Primitiva Gas for its expropriated properties. The lack of any remittance to honour an agreement signed only a month before has made the poorest impression in London. It might be assumed that the new government is swamped by accumulated business, which would mean nothing worse than an administrative hold-up. But a month's delay could argue something much more disagreeable—that the new government is determined to look closely at the commitments undertaken by the provisional government and to delay payment until it finds time to satisfy itself about them. Meanwhile, neither cash nor bills have appeared and the City is fast drawing an adverse conclusion about a regime that, it was hoped, would honour Argentina's word.

This is not the only case for concern. A bill has been prepared for submission to the Argentine Congress which seeks to expropriate the quebracho plantations and factories in Santa Fe belonging to La Forestal, the subsidiary of Forestal Land. Its sponsor is Senator Weidman, who represents the province of Santa Fe, where La Forestal has its biggest installations. This is not the first occasion on which Senator Weidman has campaigned for expropriation but now he has reached the stage of drafting a bill that can only add to the considerable embarrassments of the Frondizi government. The president declared a month ago that Argentina's grave economic problems could not be solved by any further confiscation "at variance with the ideals of a civilised nation." But already his government of Intransigent Radicals is under pressure and the fact that Senator Weidman is seeking to introduce a confiscation bill into a Senate composed wholly of Intransigent Radicals is far from encouraging. Further, it appears that a similar threat of expropriation has been levelled against the Bovril properties in Santa Fe. It must be hoped that President Frondizi will stick to what he said a month ago; if not, the inevitable effects on Argentina's credit abroad are bound to jeopardise the chances of foreign assistance towards Argentina's economic advancement.

LAID UP SHIPS

No International Accord?

When twelve representatives of most of the world's shipping met last week under the auspices of the Internation Chamber of Shipping to discuss ways of meeting the depression in freight rates, there were few signs of any strong support for an agreed international scheme, except from the Greek representatives. They discussed the two principal plans that had been put forward: the refurbished tonnage stabilisation scheme of the British, a voluntary arrangement by which owners of ships still in business would pay a levy to those whose vessels have been laid up; and the Greek plan for the automatic laying up of a ship once it fails to get a profitable rate and for the control of its release to the market again. Both plans would need fairly full co-operation from all the major owners, and the meeting did not suggest that either would readily get it. It was finally decided to set up a committee, but no date has yet been set for its first meeting.

Apart from the Greeks, the general feeling seems to be that the industry has had a number of good years now to prepare for any lean times ahead; that as the tonnage laid up now exceeds 7 million tons gross, dry cargo and tanker, it may be a little late to start a scheme going; and that in any case this figure is still only about 8 per cent of the total world fleet. No doubt these attitudes are to some extent mixed with the idea of letting the Greeks stew in their own juice. Certainly, the Greeks have had to lay up a higher proportion of their tonnage than the others, and there is no sign of any early revival in freight rates. Some British owners, however, are beginning to become more worried about the prospects of manning laid-up vessels when business does improve. Before the depression, it was becoming progressively difficult to get crews and the slump is not likely to make future recruiting any easier.

ATOMIC ENERGY

Fire at Chalk River

A small fire broke out a week ago in Canada's main research reactor at Chalk River. In some ways it recalls what happened at Windscale last October. Reports are incomplete, but it is understood that the accident

Everyone drives better in a Vauxhall

occurred in the NRX reactor, a fair-sized research installation, developing 40 MW of internal heat. Among other things, this reactor makes a high proportion of the cobalt "bombs" used for cancer treatment all over the world and its special facilities have been used by both Britain and the United States. A breakdown at NRX is of more than purely local interest.

The fuel rods of this reactor are enclosed in aluminium tubes sunk into a tank holding 18 tons of heavy water. The heat generated in the fuel is removed by a combination of air and water cooling inside the tubes holding the fuel. One of the fuel rods broke, which is not unusual, and the reactor was shut down to remove it. The shut-down operations put an immediate end to fission inside the reactor, but they cannot prevent a considerable further rise in the temperature of the fuel after fission has ceased—a reflex twitching after life has ceased. Such a sharp rise in temperature occurred at Windscale. Whether it was aggravated at Chalk River by a simultaneous failure of the cooling system is not clear. A raging red-hot rod was drawn out of the reactor into the air, and the inevitable happened. The uranium exposed by the break oxidised violently and burst into flames outside the reactor (not inside it as at Windscale). It contaminated the room in which the rods just removed from NRX are held for a period while they cool down. This kind of radio-active contamination can be countered by washing down walls and chipping off a section of the concrete floor. Small, high-powered research reactors are a breed quite apart from the lumbering mammoths built for power generation, and there are certain admitted and recognised risks attached to operating them. But a burst fuel element can occur in any reactor, and the Chalk River incident is a reminder of the precautions that need to be built into a plant that handles fuel outside as well as inside the reactor.

POWER

Hedging Euratom's Bets

ESTIMATES of how much somebody will be using of something in 1975 are a little less popular today than they were a few years ago, but OEEC has not stopped projecting. Its Electricity Committee has just published a study* of the likely course of electric power development from now until 1975. OEEC papers, however, have one notable quality (sometimes an advantage, sometimes not): they are based mainly on official data from the countries concerned, and are approved by those countries. Whatever the quality of the forecasting, it is based on the best guesses that responsible officials are prepared to hazard at the time.

HOPES AND EXPECTATIONS ABOUT ELECTRICITY, UP TO 1975

(Euratom "maximum" estimates for six countries May, 1957)	—	15 (1967)	26	48

Sources: OEEC, 1958; Euratom Report, 1957

The interest of this report lies mainly in the comparison it affords with the "Target for Euratom" suggested by that organisation's "three wise men" a year ago. That was a hard-headed report: its economic appraisal of the kinds of nuclear power station on offer, for example, was more searching than any of the official figuring here has ever been. But it set the six members of Euratom most ambitious targets: the aim of 15,000 megawatts of nuclear generating capacity by 1967, with the rate of commissioning new nuclear plant rising to well over 4,000 megawatts a year by 1970.

In the table, these estimates of the maximum practicable nuclear effort are set against what the six countries in Euratom actually expect to achieve—along with expectations in Britain and in the other OEEC nations. It shows that managers of the electricity industries in these countries are a good deal more sanguine about the total growth of electricity by 1975 than Messrs Armand, Etzel and Giodani were a year or so ago; but also planning for a good deal slower build-up of nuclear power. Their reckoning of total nuclear capacity in the OEEC area by 1965, 1970 and 1975—including Britain, which is far ahead of the rest of Europe—is no more than the Euratom report postulated as targets for its six prospective members. Britain has itself made no firm estimates beyond 1966, though the Secretariat sets down a rather modest guess. But clearly the British share might be about half of the nuclear capacity that OEEC's Electricity Committee is reckoning on by that time. The Six are hastening much more slowly than their three mentors thought might be possible.

HP INSTALMENTS

A Sub-Postmasters' Clearing?

AN intriguing plan is being considered in the long search by hire purchase finance houses for a cheaper way of collecting their regular instalments. The search was set off eighteen months ago when the clearing banks announced that from February, 1957, they would impose a charge of 1s. for each cash lodgment made over their counters by debtors under hire purchase agreements, and that the charge would be levied not on the person making the payment but on the finance house to whose account it was credited. The finance houses objected strongly to this system, and advised their customers to use other means of payment, such as the postal order.

More positively, an approach was made to the Post Office seeking special facilities for in-payment and clearing of these instalments. The Assistant Postmaster-General set up a committee, which reported that the additional work involved would impose excessive new burdens on the staff at peak periods around the week-end, and that the necessary increases in staff and premises were not considered justifiable. But there are post offices and post offices. Earlier this month the Federation of Sub-Postmasters held its annual conference. This body represents nearly all the 23,000 country and suburban grocers and general stores that are privately owned but supplement their income by

* The Electricity Supply Industry in Europe, 1957-75. OEEC. HMSO, 10s. 6d.

carrying out the simpler post office business under contract: in number they swamp the 1,770 Crown Post Offices. The conference agreed in principle to advise its members to operate the scheme that St Martin's le Grand had rejected. Briefly, this scheme would enable a customer of a finance house to take his instalment to a sub-post office, hand it in with a voucher indicating details of the payment, and himself pay a fee of 6d. for the sub-postmaster's, or sub-postmistress's, bother. The sub-postmaster would then pass on the payments received and the vouchers in bulk, and these would be sent not to the finance houses individually but to a new clearing house, where the vouchers would be sorted and the finance houses duly credited.

The details of the plan are now being considered by the three organisations that represent Britain's host of finance houses. The scheme raises interesting possibilities. Its attractions to the finance houses, relieved of their bankers' shilling, and to the sub-postmasters with the customer's 6d. for the shop till, are obvious enough; nor, so far, does the Post Office seem to have raised any objection in principle. A number of sub-post offices have for some time collected, on their own account, payments on gas and electricity bills, and a few will collect rates for their local councils. In all these cases the Post Office authorities naturally insist that the business is done in the private shop and not at the post office counter, and they are bound to ask the same of the new business. The postal order for the pools and the payment on the telly may in future involve queueing twice.

COCOA

How High a Price?

For the time being there are to be no further discussions on the stabilisation of cocoa prices or international control of the commodity. The International Study group, however, will remain in being for work on statistics and technical problems. The decision not to proceed with a control scheme came as no surprise to the cocoa market. In contrast to most commodities, cocoa is scarce because of the shortfall of the last African crop. Prices have been climbing steadily and touched £400 a ton this week, compared with £228 a year ago.

With West Africa now virtually out of the market—only about 10,000 tons remain unsold—Brazil is expected to continue to play a waiting game. The Bank of Brazil has suspended its own method of minimum price fixing and in future the Bahia Cocoa Commission will fix minimum prices on a day to day basis in relation to world prices. Brazil does not appear to be a willing seller, though prices there are well below African prices. Cocoa is likely to remain firm until more is known about next season's crop outlook. But the longer term prospect is scarcely as bright. High prices are likely to make consumers dig their heels in; in the United States cocoa consumption in the first quarter of the year fell by 5 per cent. And if the prospects for a better crop are confirmed this summer, the market may well fall from its present somewhat artificial levels.

Meanwhile the 1957 trading results of the leading British cocoa consumers have made a good showing. Total sales by the Cadbury Brothers group and other subsidiaries of the parent company, British Cocoa and Chocolate, rose from £79½ million to £82½ million. Cadbury group sales were up from £76.8 to £78.9 million and the consolidated net profit increased from £3,659,015 to £4,925,757. But Mr Laurence Cadbury, the chairman, says that for the past two years the industry's capacity has been overhauling the country's demand for chocolate and sugar confectionery. Consumption now shows signs of contracting. That downturn, and the sterner competition that it threatens, can hardly reconcile the chocolate industry to high cocoa prices.

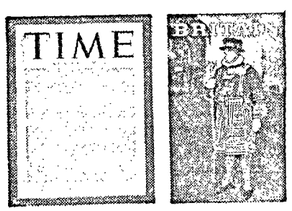
CONVERTIBLE DEBENTURES

Warning from the "Pru"

Outside the Government departments, the Prudential Assurance Company is the biggest single investor in this country. Every new issue of any consequence is planned with a thought to the reactions of the "Pru" and the other big institutional funds. At Holborn Bars each week the deployment of £1 million or more of new money has to be planned. Last year, as the chairman, Sir Frank Morgan, explained to shareholders at the annual general meeting, the "Pru" invested £69 million—including £6½ million in British Government or guaranteed stock, £10 million in property, £11 million in mortgages, £16 million in ordinary shares and £16 million in debenture and loan stocks including some with conversion rights into ordinary shares.

On any matter of investment policy Sir Frank's words are bound to carry great authority. Investors and issuing houses alike should take heed of what he has to say about convertible debenture and loan stocks:

> This is a type of security which has become increasingly popular in recent years, but it should be borne in mind that the incorporation of options could prove to be disadvantageous to the borrowing companies and their shareholders. We, as institutional investors, would generally prefer capital to be raised directly in fixed interest securities or ordinary shares rather than in a convertible form, but we do recognise that there can be special circumstances which make an issue in this appropriate in a particular case.



Sir Frank did not go on to specify the particular cases, but his general point on the limited usefulness of convertibles will command much agreement. The convertible debenture imposes severe restrictions on a company's ability to raise further capital. What company with a large number of unconverted options outstanding could come to the market with a rights issue of ordinary shares? If the options are exercised the watering of the equity is bearable because even-

* 30s. in 1952; 30s. 11d. in 1953. † 15s. 8d. in 1951.

Sir Arthur Morse, Chairman of the British Travel & Holidays Association, welcomes the world to Britain. In the company of other leading Britons—selling products and services abroad—he recognises the role of international advertising as an integral part of every sales programme. As an export trade, tourism was one of the major dollar earners in 1957.* TIME, The Weekly Newsmagazine, New Bond Street, London W.1.

* *approximately* $179,200,000

TRAVEL IN BRITAIN ... SOLD AROUND THE WORLD ... *advertised in TIME!*

ings and dividends are rising. But suppose that growth does not occur at the right time within the currency of the options. What then? The conversion right then has no interest for the investor who wants an equity holding and that loss of attraction is bound to be reflected in the price of the convertible stock itself. The company will have saddled itself with big fixed interest charges, to the detriment of the existing equity. To be an acceptable form of investment the convertible debenture calls for something more than the presumption of growth: it requires near-certainty, and immunity from any downturn in trade. How many companies can guarantee so much?

NUCLEAR ECONOMICS

The Price of Plutonium

A SPEECH that Sir John Cockcroft made in Brussels recently showed a subtle change of attitude. It was less the speech of a scientist than of a man conscious of directing a very large industrial undertaking with the eyes of the world upon it and the markets of the world opening at its feet. He talked about the practical aspects of operating Calder Hall and of a subject of special interest to foreign countries, the Atomic Energy Authority's capacity to provide nuclear fuel. This, and not the capacity of design consortia in industry, sets the upper limit to the rate at which Britain can build nuclear power stations.

The AEA's processing plants are being greatly extended. A new uranium smelting plant is being laid down for the production of billets of the pure metal, and another plant is planned for the manufacture of ceramic elements from sintered uranium. Considerable extensions are being made to the chemical separation plant at Windscale, where used fuel elements are broken down into their constituent parts. Two of these, fission wastes (the broken fragments of split uranium atoms) and depleted uranium, have at present only a limited market value but the third constituent, plutonium, is in a class of its own. The AEA, which is offering to sell uranium fuel elements, fully manufactured, for much less than the notional figure of £20,000 a ton quoted by Sir John, is offering to buy back those same fuel elements after use for a minimum price of £5,000 a ton for the sake of the estimated 2 kilograms of plutonium each ton is expected to contain.

This price is an estimate of the civil value of plutonium as a fuel—plutonium from commercial power stations is of too low a grade for weapons. But no satisfactory method of using it has yet been devised. British metallurgists are certain that the technique of burning this particularly intractable metal will have been mastered by the time the first nuclear power stations are functioning—French scientists, facing much the same problem, are not.

Meanwhile the economics of nuclear power on the Calder Hall system are still influenced, although to a diminishing extent, by the selling price of by-product plutonium. In the early days, the AEA assumed that a credit of at least 0.17 pence per kilowatt-hour of electricity sent out was a fair sum to allow for the plutonium output of a civil power station, and it might even be worth considerably more than ¼d. a kilowatt. With gross generating costs reckoned at 0.76d. per kilowatt, this credit played an important part in making the estimated net cost of nuclear electricity reasonably comparable with that of coal-fired stations. The "credit" figures have since been sharply revised—downwards. At the price quoted by Sir John Cockroft, the plutonium credit has dwindled to a minute fraction of a penny, 0.06d. per kilowatt, and it no longer makes a significant difference to the estimated cost of a single unit of electricity. And it is still advisable to stress that this estimated market value rests on the use of techniques as yet unmastered.

COPPER

Outlook Improved?

THE copper market has steadied, largely because of more optimistic reports from the United States. Mr Clyde Weed, the chairman of Anaconda, has forecast a slight improvement in American domestic demand for, he said, consumers had liquidated stocks to a point where immediate delivery was requested for nearly all orders. On the other hand, Phelps Dodge, the US producer, has announced a further cut in output which brings its total cuts in production over the past eighteen months to 40 per cent. The effect of this cut, however, was balanced by the announcement that the 51-day-old strike at Anaconda's Chuquicamata mine in Chile had been settled and that the workers had agreed to make up some of the 34,000 tons of output lost during the strike. The American customs smelters have twice raised their prices since last Thursday, from 23.75 cents to 24.25 cents a lb, though the producers have held their price at 25 cents. Although this suggests that demand is showing some signs of revival, stocks in producers' hands will have to be reduced much more before a radical change in the market can be expected.

FUEL CONSUMPTION

Over to Oil Again

OIL consumption has been moving strongly ahead this year, while coal consumption languishes. In the first three months total consumption of petroleum products in Britain was up 17.6 per cent over the first quarter of 1956 (leaving out the Suez-shadowed first quarter of 1957), with the "black oils" that compete in the general fuel market increasing far more than the specialised motor products such as motor spirit. Fuel oil deliveries in the first quarter were 44 per cent higher than two years before, though this reflected special increases in deliveries to power stations and industrial demand in general did not show such big increases. Coal consumption, in the same months, was by contrast more than 2½ per cent down on the 1956 figure (though by now it is rather better than in 1957). One should not exaggerate the significance of the switch to oil: total oil consumption in the first quarter, including motor fuels, was 7,679,000 tons, which on a thermal basis represents only about a fifth of the tonnage of coal used during the period. But the trends continue.

Fuel oil deliveries in the first quarter, incidentally, were almost double those of motor spirit, which were indeed fractionally lower than in early 1956. The private motorist was still taking more, with deliveries to dealers up 7.7 per cent over the two years. But demand from commercial consumers declined, mainly it seems as a result of increasing use of diesel vehicles: "derv fuel" deliveries were up 16 per cent on the first quarter of 1956. As more commercial vehicles move out of the petrol market and more high-compression engined new cars are delivered, the proportion of this market taken in the premium grades of petrol rises: it was 54.4 per cent in the first quarter, against 46 per cent in 1957 and 48.7 per cent in 1956. The massive sales of paraffin heaters in recent years are steadily pushing up burning oil deliveries: these were 38 per cent up on early 1956, though this winter's weather has been milder than that one's was.

RUBBER

Against Stabilisation

NO other commodity has to contend with competition from a synthetic product to the same extent as natural rubber. The qualities of synthetic rubber are being improved and production, especially in Europe, is being stepped up. Price in the end may become the sole deciding factor. The full realisation of this severe and growing competition has prompted Sir John Hay, the G.O.M. of British natural rubber industry, to speak out firmly against any international scheme for the stabilisation of natural rubber prices. In his address to stockholders of United Sua Betong he says that any such scheme for natural rubber would be fraught with great dangers:

> The inevitable increase in costs, the depletion of cash resources tied up in stocks and restrictions on output would create intolerable burdens on an industry which must meet the severe competition of a synthetic product not so handicapped.

Above all, he added, the rubber industry's access to world markets must remain unimpeded, and its capacity to produce unfettered. Sir John points also to the dangers of anything short of universal agreement: the present tin scheme by its omissions has given great impetus to production in Russia and China, and thus imposes the need for even further restriction by participants in the scheme.

Discussing the future price for natural rubber—which has fallen less steeply than many other commodities—Sir John is guarded. There is the uncertain outlook for the United States motor industry: but demand in Europe, which is now a larger consumer of natural rubber than the United States, has so far held up well, while demand from Russia, her satellites and China, which last year together took about 280,000 tons, is unpredictable. In translating the various speculations into figures, Sir John arrives at a not too unsatisfactory picture that production this year at a restricted 3,520,000 tons will exceed consumption by 60,000 tons.

SHORTER NOTES

The Estate Duties Investment Trust accepted £486,789 of new business in the year to March 31st last against £465,617 in 1956-57 and the book value of its investments rose from £1,773,004 to £2,073,250. Its issued ordinary capital increased by £500,000 to £2 million, and if conditions are favourable, EDITH, which raised £500,000 on a secured loan in 1955, proposes to issue a further £500,000 of loan capital this year.

* * *

The Co-operative Congress has agreed unanimously to "receive" the report of the independent commission on co-operative production and marketing. The report will be discussed by the various societies this summer and decisions about its drastic and radical recommendations are not likely to be taken until a special congress meets in the autumn.

* * *

A former director has presented a petition for the compulsory winding up of Orthodox Unit Trust Limited, the managing company of Orthodox Unit Trust. The directors, who say they intend to resist the making of an order under the petition, have stated that the petition has "no effect on the position or security of the certificate holders in Orthodox Trust or on the value of the units of the trust." The price of the units remained unchanged at 8s. 1cd.-9s. 8½d.

* * *

The small materials testing reactor at Dounreay began working last week-end. This is a research reactor, the twin of one at Harwell, used for testing plant construction materials under the conditions they are likely to experience inside an atomic pile. The big breeder reactor at Dounreay, which was tentatively scheduled to start up in April, is not expected to be completed now until the end of the year.

* * *

Production ceased at the Upper Forest and Worcester steel and tinplate works in January: the share capital of this company, which was nationalised in 1951 for £250,000 and could obviously never have been sold back to private owners, has been transferred for a nominal consideration to Richard Thomas & Baldwins Limited, the last big steel company that still belongs to the State.

* * *

Lobitos Oilfields is repeating a total dividend of 14 per cent and 4 per cent special distribution from the realised profits of investments. Group net profits are £870,962 for 1957, compared with £697,492.

COMPANY AFFAIRS

BRITISH AND COMMONWEALTH SHIPPING

THROGMORTON STREET had expected that the directors of British and Commonwealth Shipping would do no more than to maintain the ordinary dividend for 1957 at 17½ per cent on the capital as increased by last year's 5 per cent scrip issue. In fact, by declaring a final of 13½ per cent, the directors have set the total dividend at 20 per cent, and have proposed yet another 5 per cent scrip issue. Yet on this news the 10s. units gained only 6d., to stand at 31s. 3d. and yield 6.4 per cent. It seems a poor response to the unexpected increase in the dividend, backed by most satisfactory trading results in 1957. After providing £494,000 more for depreciation at £3,514,000, the gross surplus earned last year was £9,534,000, compared with £9,047,000 in 1956. The net surplus has risen from £4,491,900 to £4,815,000, covering the new dividend as much as eight times.

But reasons for the not over joyous reception are not hard to find. Investors realise that earnings in the early months of 1957 had been swollen by exceptionally high tramp rates and by the fact that the Suez troubles brought forward the completion of certain voyage accounts from 1956 into the 1957 reckoning. Now rates for dry cargoes, in which the Clan Line side of this company is especially interested, are low and profits are hard to earn. The liner interests of the Union-Castle side of this venture will offer some protection to earnings. But total profits seem likely to fall; even granted the big earnings cover, it would be wise not to look for anything more than the repetition of 20 per cent on the capital as increased by the proposed scrip issue. On that sort of assumption the yield is realistic.

NUCLEAR POWER RESULTS

DESCENDING, not without loss, from the peaks of the nuclear power boom, investors have recovered some sense of proportion at lower altitudes. Yields on the atomic power stocks are still low—running around 5 per cent they are on a par with Old Consols—but they are no longer ridiculously thin. Much of the new finance needed by the nuclear power contractors has now been found. Contracts are big and should in the end produce satisfactory profits. But when these initial contracts are complete, will fresh ones be waiting for every consortium? Contractors have had to charge large sums for research and development against profits from their established businesses in conventional boilers and engineering plant. Their sales and orders have expanded but not their profits and there is little chance of increased earnings this year. Atomic power cannot conjure away increases in working costs.

Simon-Carves is an established maker of coke ovens, colliery equipment, chemical plant and conventional power plant and is joined with General Electric in a nuclear power consortium. Last year it reported an increase in turnover from £20.8 million to £27.5 million, yet trading profits rose by only £11,910 to £1,643,973 while net income fell from £686,416 to £659,967. Simon-Carves's order book should "ensure reasonable prosperity for the next few years," but the chairman, Mr R. B. Potter, adds that profits this year will "be about the same as those for 1957" and that no benefits from new processes, particularly nuclear power, will appear for some years. The strength of the group's liquid resources (which have risen from £2,563,000 to £3,162,000) as much as the prospect of satisfactory, if unspectacular, results encouraged the directors to raise the ordinary dividend from 20 to 25 per cent. At 25s. xd. the 5s. units yield exactly 5 per cent.

John Thompson is an established boiler-making concern, and is in a consortium with Associated Electrical Industries in a contract for a nuclear power station. A year ago it raised about £1,300,000 by a rights issue of ordinary shares and the dividend for the year to December 31st is left unchanged at 25 per cent on the new capital, as was then forecast. Its 5s. units stand at 24s. 6d. to yield 5.1 per cent. Last year gross profits fell by £139,906 to £2,411,055.

Richardsons, Westgarth, in association with Crompton Parkinson, is a member of Atomic Power Constructions but this consortium has not yet secured a contract though Richardsons, Westgarth has already charged research and development expenditure on nuclear power engineering directly to its revenue account. But Richardsons, Westgarth has a big order book for conventional equipment and last year it raised over £3,300,000 on a convertible loan stock for modernising and expanding its plant. For the year to March 31st it has left the ordinary dividend effectively unchanged, paying 10d. per 10s. unit, so that at 14s. 6d. the yield is 5¾ per cent. The profits of the group as formerly constituted before the acquisition of Parsons Marine Turbine and Humber Graving Dock, have fallen from £1,204,000 to £1,170,000. The profits of these new subsidiaries bring the 1957-58 total up to £1,470,000, compared with £1,358,000 in 1956-57 when nine months' earnings from Humber Graving Dock were included.

TURNER AND NEWALL

WHEN a cash issue of ordinary shares is made a dividend forecast is desirable and in the present state of the capital market it is essential for success. When a scrip issue of ordinary shares is made, a forecast of the dividend, which depends upon earnings and not upon a book-keeping change in the number of shares in issue, is much less desirable. If the scrip issue occurs towards the end of the financial year the anticipation of the final dividend declaration by a few weeks is no great matter. But where months lie ahead in which profits have still to be earned, directors who make such forecasts display a certain temerity.

The directors of Turner and Newall, have made such a forecast. On the capital as doubled by a scrip issue they have declared an interim of 5 per cent so as to reduce the disparity between the interim and final payments and they have forecast a final of 10 per cent. This would make 15 per cent in all for the year to next September 30th, effectively the same payment as was made in 1956-57. By this forecast they have put a peg on the price of the £1 ordinary units, which at 60s. 10½d. currently yield 4.9 per cent. Are shareholders not to be trusted to draw their own conclusions from a statement about the disparity between the two payments and from the cautious comments the directors make about trade? Can directors be certain beyond any real doubt about profits that will not be known for well over six months?

WHITBREAD

AMONG brewery shares, Whitbread "A" ordinary units are low yielders. That is a tribute to the company's forceful management, which has been active in modernising its tied houses, in selling bottled beers on a national scale and in acquiring interests in other breweries. But other breweries have pursued similar policies, and competition has limited the advances in profits which have been made. Last year brewing profits, both gross and net, did slowly rise and against this background Whitbread's results are not so impressive. Before tax the group's profit rose from £2,699,302 to £2,958,782 and after tax and minority interests from £1,132,348 to £1,303,889. But these figures include a special credit of £194,457 in 1957 (against £24,282), so that the gross income from trading has risen from £2,675,020 to £2,764,325 and the net income is practically unchanged at just over £1,100,000.

Last November the interim ordinary dividend was increased from 7 to 8 per cent and now the final is left unchanged at 17 per cent, making 25 per cent for the year (against 24 per cent). But the yield of 5.8 per cent offered by the £1 "A" units at 85s. 6d. is low for a section of the market that is still essentially composed of income stocks.

BORAX (HOLDINGS)

THE speculative steam in the 5s. ordinary units of Borax (Holdings) escaped a good time ago. The big gains were made, and taken, when the reorganisation scheme was planned and

d through. Investors who came in er who held on too long are now ing *some big* book losses. *The* s have been as low as 14s. 10½d. year, compared with a high of 20s. and of 36s. in 1957. They now stand s. 3d. and on the 8¾ per cent divi- paid out of accumulated reserves is country they offer the risible of £2 10s. 9d.

w far can growth be discounted? answer for the Borax shares seems e: too far. The new and costly lopment at Boron, California, took r and cost more to start up than been anticipated and in the three hs to December 31st the American diary made a loss. Modifications now been made to the plant, and *operators*, the directors say, have ined in experience and improved fficiency." As a result the American diary made a profit in the first ter of this year more than sufficient ipe out the earlier loss. But over half year to March 31st the profit 578,957 for the group is less than ird of the profit of £1,987,178 d in the six months to March 31st, . Production at Boron failed by a nificant margin" to meet demand in due course, the directors hope, reased earnings expected from the derable capital outlay made in recent s should be realised." This, they " will not be achieved this year."

JAGUAR CARS

the unchanged ordinary dividend of 12½ per cent the 5s. units of r Cars yield a mere 2.4 per cent. ors have waited a long time for directors to dip into the massive gs to pay a generous dividend. t prevented the directors from doing the year to July 31st last, when the dividend absorbed only £25,875 a net income of £315,321? Was it re in February, 1957? Only now is recovery from that fire "almost plete" and it delayed the introduc- of the new XK 150 models. But with this setback the group suc- ed in producing more cars than ever before, and its gross trading profit advanced from £795,205 to £844,176.

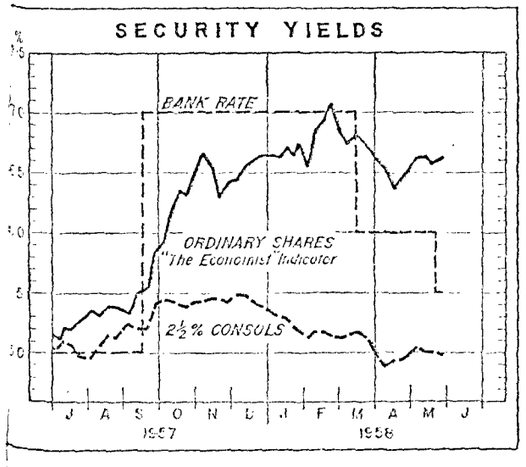
Or are the directors parsimonious because the group is still short of liquid funds, with bank loans of £319,149 exceeding the cash balance of £235,703? If that is so investors will regret that the chairman, Sir William Lyons, makes no reference to the need for permanent capital or the ways in which it could be raised. Self reliance can be carried too far; Jaguar Cars, with a promise of more generous dividends, would surely have no difficulty in securing new money. Its trading record is sound and Sir William comments that its range of cars is now in greater demand than when they were first introduced and that output has been "further substantially increased" in the first months of this year.

MARKS AND SPENCER

SIR SIMON MARKS does not issue a statement with Marks and Spencer's full accounts, so they add little to the information investors gained from the preliminary statement, discussed in these columns on May 17th. But they do include a comfortable looking balance sheet. By March 31st, perhaps as a result of the company's policy of cutting some prices, the book value of stocks had been reduced from £11,123,333 to £10,488,284. That was achieved in a year in which turnover rose from £125 million to £130 million, the gross trading profit advanced from £14,698,183 to £16,234,578 and the ordinary dividend was increased from 30 to 32½ per cent.

The company's liquid balances have been reinforced, from £5 million to over £7 million. A two-year programme to rebuild some stores and to extend others will cost between £5 and £6 million; that is well within Marks and Spencer's own financial compass. What should dominate investors' thinking when they look at the yield of 3¾ per cent offered by the 5s. "A" units at 43s. 4½d. is not capital finance but how this multiple can maintain the pace of its growth—in earnings as well as sales.

London Stock Exchange



FIRST DEALINGS:	May 14	June 4	June 18
LAST DEALINGS:	June 3	June 17	July 1
ACCOUNT DAY:	June 10	June 24	July 8

LABOUR disputes and the political situation in France have had a restraining influence on the stock market, outweighing the effect of the reduction in Bank rate. Last Thursday's gains in gilt-edged stocks were held and the undertone remained firm, but some industrial shares lost their initial gains. The level of business contracted and failed to recover fully after the holiday. Short-dated Government securities were adjusted to the new level of interest rates, while the irredeemables were mostly ¼ higher on balance, while 3½ per cent Funding 1999-2004 rose ⅜ to 71¼ and 3 per cent Gas 1990-95 rose ⅞ to 65½.

Bank shares improved, with Lloyds rising 1s. to 44s. 6d. Union Discount improved 1s. 3d. to 50s. 3d. Insurances were also very firm; Pearl jumped 3s. 9d. to 90s. and Prudential "A," quoted in 4s. units, gained 5s. 9d. to 168s. 9d. Motor manufacturers were easier, Standard slipping 10 6s. 7½d., and Rolls-Royce weakening 2s. 10½d. to 86s. 10½d. Among tobacco shares, Godfrey Phillips rose 1s. to 13s. on the higher dividend, but the leading stocks were lower. Although Turner and Newall reached a peak of 64s., disappointment with the dividend caused a subsequent fall to 60s. 10½d.

Oil shares were uncertain, but closed barely changed in most cases. The higher distribution lifted Ultramar 1s. to 69s. 6d. and Lobitos strengthened 7½d. to 14s. 4½d. after the results. The prices of gold mines fell away slightly in less active trading conditions, the older mines suffering a greater relative decline, but finance houses remained strong. Anglo-American Corporation rose 3s. 1½d. to 138s. 1½d. and General Mining 1s. 10½d. to 93s. 1½d. Tin producers weakened on the reduction in dividends announced by Ampat and Siamese Tin.

THE MONEY MARKET

FOLLOWING the ½ per cent reduction in Bank rate on Thursday of last week, the Treasury bill rate fell by ⅜ per cent at Friday's tender. The fall was rather steeper than had been generally expected. The increase in the market's bid of 1s. 11d. per cent represented a cut in its discount rate of 7s. 8d. per cent, to £4 16s. 4d. per cent; the average rate of discount on the whole allotment fell by 7s. 5½d. to £4 16s. 6d. The market succeeded in raising its allotment rate on bids at the common price to 61 per cent, compared with 44 and 20 per cent at the two preceding tenders. Total applications dropped by nearly £10 million to £412 million, while the allotment was up by £10 million, to £260 million.

Credit conditions in Lombard Street after the Bank rate cut were as stringent as they were immediately before it. On Thursday of last week the market had to take a small amount at the new Bank rate, despite moderate special purchases, and on Tuesday, when owing to the Whitsun holiday two days' repayments fell due, very small further borrowing from the Bank was necessary. On the following day market supplies of credit were just adequate, and the banks were substantial buyers of August maturities, mainly at 4¼ per cent and also at 4 23/32 per cent. Last week rates on commercial bills were reduced in line with the fall in the Treasury bill rate; bank bills are now quoted at 4⅛-5 per cent, and three months' fine trade bills at 6-6½ per cent.

S. T. SADASIVAN, General Manager

Suddenly I thought

"Who'd pay the bills for... my widow?"

"Since I can't be certain of living to a ripe old age, how *can* I be certain that, whatever happens, my wife and children will be looked after?"

So I did the sensible thing.

I decided it was time I insured my life. And I did. It was as simple as that—so simple that I can't think why I put it off so long.

Luckily—or rather, sensibly—I went to The London Assurance, and really they couldn't have been more helpful. I was pretty vague about the whole business, but when they suggested a Life Policy that not only fits my present position but gives me something to build on in the future, also, I knew I'd come to the right people.

I certainly did the right thing when . . .

COMPANY MEETINGS

CAMMELL LAIRD & COMPANY LIMITED

1957 A BUSY AND ACTIVE YEAR

REMARKABLE CHANGE IN TRADING CLIMATE AFFECTS SHIPPING INDUSTRY

SHIPYARD RECONSTRUCTION PLAN ALTERED TO MEET EXISTING CONDITIONS

REVIEW OF GROUP'S WIDESPREAD ACTIVITIES

PROFITS MORE DIFFICULT TO EARN AND ORDERS MORE DIFFICULT TO OBTAIN

MR J. C. MATHER STRIKES A WARNING NOTE

The ninety-fourth annual general meeting of Cammell Laird & Company Limited was held on May 28th at Birkenhead, Mr J. C. Mather, JP (the Chairman), presiding.

The following is the Chairman's statement which had been circulated with the report and accounts for the year ended December 31, 1957:

1957 was a busy year for the Group and good progress has been made in all sections, *in spite of national strikes* and other difficulties. It is pleasant to be able to record a substantial increase in the Group net profit and I am sure that shareholders will join with me in thanking all those who have contributed by their loyalty and hard work to the satisfactory results disclosed.

During the year Mr R. W. Johnson was appointed Chairman of Cammell Laird & Company (Shipbuilders and Engineers) Limited while retaining his appointment as Managing Director of that Company. He has resigned from his position as Managing Director of the Parent Company and therefore becomes subject to retirement by rotation: accordingly he offers himself for re-election at the Annual General Meeting.

Our Joint Secretary, Mr M. Milnes, retires on May 31st after nearly forty-two years' service with the Company. He joined the staff of Cammell Laird & Company Limited, Cyclops Works, Sheffield, in June, 1916. In April, 1929, Mr Milnes was transferred to Birkenhead to assist the then Secretary, Mr J. W. P. Laird, and was appointed Registrar of the Company. This *position* he held until he succeeded Mr E. Bernard Jones in the Secretaryship of the Parent Company in June, 1954.

I should like to place on record our sincere thanks to Mr Milnes for his long and devoted service to our affairs and to wish him good health and every happiness in his retirement.

The year 1957 saw a remarkable change in the climate of British industry and commerce, especially in the shipping trade upon which so much of our business depends. When the year opened the shipping boom which had continued more or less since the end of the war appeared to be more vigorous than ever. By the end of the year, however, we had seen a financial crisis which was met by a very high Bank rate and drastic *restrictions of credit, and we had also seen* the end of the shipping boom. Freights were falling rapidly, ships were being laid up in increasing numbers, and this process has continued since the end of the year. It is not surprising, therefore, *that while our* shipbuilding company has an order book which includes a wide variety and size of vessel and will provide a steady flow of *work for our yards for some time to come, new orders became scarce during the year* and still remain so. Our steel making subsidiary, The Patent Shaft & Axletree Company, has also been fully occupied throughout the year, but here again, while the order book for plate remains very good, there have been signs of a falling off in demand for other products of the company such as sheet, sections and bars and these signs have become more noticeable since the end of the year.

Although it is impossible to forecast how long this process will continue or how far it will go, I am not one of those who subscribe to the theory that the world is facing slump conditions. It is clear, however, that all sides of the *Company's activities are* moving into a period when profits will be more difficult to earn and orders more difficult to obtain.

ACCOUNTS
PARENT COMPANY'S BALANCE SHEET

The increase in Other Trade Investments is attributable to a further investment of £90,441 which we have made in the Share capital of North West Tugs Limited, for whom we have built two new tugs during the last twelve months.

The advances to our steel-making Subsidiary Company, The Patent Shaft & Axletree Company Limited, have now reached the agreed figure of £1,200,000 *and the difference owing by that Company at* December 31, 1957, represents Interest and Dividend.

Quoted Securities have been reduced by the sale, during the year of £1 million (nominal) of Gilt Edged investments, realising a profit of £40,787 on the written down value of the investments sold, but in accordance with our normal practice we have *again written our Quoted Securities down to* their market value on the Balance sheet date, resulting in a transfer to Provision for Depreciation in Market Value of Quoted Securities of £107,026. As a result, Capital Reserves have been reduced somewhat compared with last year.

CONSOLIDATED BALANCE SHEET

The Fixed Assets in the Consolidated Balance Sheet reflect the progress of the Development Schemes in the Companies of our Group and we have taken this opportunity of showing separately expenditure so far incurred upon Shipyard Reconstruction and upon the Development Scheme of The *Patent Shaft and* Axletree Company Limited, together with particulars of depreciation provided, against the respective assets concerned.

On the other side of the account retentions by Subsidiary Companies amount to £821,262 for the year and these additions left the Subsidiary Companies with Profit and Loss balances unappropriated on December 31, 1957, of £989,999.

Loans and interest *accrued thereon constitute a new item* in the Consolidated Balance Sheet. The Secured Loans reflect borrowing by The Patent Shaft & Axletree Company Limited from F.C.I. under a debenture; the unsecured Loans represent the loan from Metropolitan-Cammell Carriage & Wagon Company Limited to The Patent Shaft & Axletree Company Limited.

In the case of The Patent Shaft & Axletree Company Limited, due to the effect of Initial Allowances on the Development Scheme, there will be no liability, for Schedule D Income Tax on January 1, 1959. A transfer has, however, been made to the Taxation Equalisation Reserve Account in the books of that Company, approximating to the income tax and profits tax saved on the 1957 profits, due to Initial Allowances on the Development Scheme.

CONSOLIDATED PROFIT AND LOSS ACCOUNT

The Group Operating Surplus has increased by nearly £350,000 compared with the previous year, which must be considered very satisfactory in view of the difficulties encountered in 1957. Dividends from our Associated Companies and Trade Investments have increased in 1957, but Other Investment Income and Interest have been reduced, following the realisation of a part of our investments to meet capital expenditure.

The net profit available for appropriation by Cammell Laird & Company Limited is £518,767. An Interim Dividend of 4 per cent less tax, absorbing £122,475, was paid on October 26, 1957, and a Final Dividend of 11 per cent less tax, absorbing £336,807 and leaving £59,485 to be carried forward in the books of the Parent Company is now recommended. Your Board considers that this increase in the dividend is justified by the year's results, but shareholders will, of course, realise that the maintenance of this rate of dividend must depend on future

profits, which, as I have already mentioned, are now more difficult to earn.

CAPITAL COMMITMENTS

Of the commitments in respect of capital expenditure at December 31, 1957, as shown in the Notes, £1,250,000 in respect of the Parent Company represents subscription for a further 1 million "B" Ordinary Shares of £1 each in English Steel Corporation Limited, at a price of 25s. per £1 share. The balance of Group Capital Commitments at December 31, 1957, aggregating £4,865,178 consists of orders placed under the Reconstruction and Development Schemes of the Subsidiary Companies.

CAMMELL LAIRD & CO. (SHIPBUILDERS & ENGINEERS) LTD.

Ship Construction.—In common with other shipbuilders and engineers this Company suffered from the effects of national and local strikes during the early part of the year. These seriously affected the building programme, although by a determined effort it was possible to make up some of the time lost.

During the year nine vessels totalling 92,626 gross tons were launched compared with seven ships totalling 77,375 tons in 1956, and apart from 1950, which included the launch of HM Aircraft Carrier *Ark Royal*, it is the highest tonnage figure ever recorded by the Company. The vessels launched were as follows: s.s. *Hemisinus*, a tanker for Shell Tankers Limited; s.s. *Irish Spruce*, a cargo vessel for Irish Shipping Limited; HM Submarine *Grampus* for the Royal Navy; s.s. *British Justice*, a tanker for BP Tanker Company Limited; m.v. *Rockhampton Star*, a refrigerated cargo vessel for the Blue Star Line Limited; s.s. *San Gerardo*, a tanker for the Eagle Tanker Company Limited, Nassau; s.s. *Lucellum*, a tanker for Messrs H. E. Moss and Company's Tankers Limited; m.v. *Nicolaos S. Embiricos*, a cargo vessel for Messrs S. G. Embiricos Limited, as agents of Compania Naviera Epsilon S.A., of Panama City; and m.v. *Heath Cock*, a tug for North West Tugs Limited. Seven vessels, including three of the ships launched in 1957, were completed and delivered to their Owners, including HM Anti-Submarine Frigate *Tenby*.

At the close of the year the keel was laid of the new 38,000-ton Mail, Passenger and Cargo liner *Windsor Castle* which is being built for the Union-Castle Mail Steamship Company Limited.

Engineering.—The Engineering Department again experienced a good year, producing a number of sets of steam turbine double-reduction geared machinery; in addition, various sets of diesel machinery have either been completed or are in course of building for the Royal Navy.

Work proceeded throughout the year on the gas turbine installation for the tanker *Auris*. This installation, which is now well advanced, includes a reduction gear unit incorporating a new design of hydraulic reversing coupling of Pametrada design which the Company is pioneering. It is hoped to run trials of this machinery in the near future.

In the field of research, close collaboration is being maintained with Messrs Babcock and Wilcox Limited on the development of nuclear propulsion for ships, and, as far as the more conventional types of marine prime mover are concerned, investigation is being made into methods of providing improved and more economical installations for merchant and Naval vessels. During the year the scope of the Gearing and Vibration

Department, which is doing important work in diagnosing vibration problems in vessels whilst in service, was also extended.

The main Boiler Shop has again had a satisfactory year's work.

SHIP REPAIRING

Reviewing the activities of the Ship Repair Department, it is evident that the closure of the Suez Canal had an adverse effect on the volume of repair work during the first five months of the year, so much so that the largest dry dock was occupied by vessels requiring repairs for only 10 days in the first four months of the year, while another of the dry docks lay empty from the beginning of February until the last week in May. This depressing state of affairs was due to the postponement of annual overhauls and special surveys of tankers whilst the Suez crisis prevailed; and the situation was further aggravated by the National strike in the industry, as this kept away dry cargo ships which might have filled at least part of the gap. From the beginning of May work accumulated in sufficient volume to keep the Department busy to the end of the year. The modernisation of HM cruiser *Nigeria* was completed during the year and she was handed over to the Indian Navy at the Shipyard on August 29th by the First Lord of the Admiralty, being received by the High Commissioner for India and renamed *Mysore*. In the course of the year the Department has also been engaged on refitting submarines for the Royal Navy. The volume of ship repair business has greatly diminished in comparison with recent years. Our efforts to compete in the repair market are restricted by shortage of labour in the steel working trades, and we have unfortunately had to turn down on this account some available work, including the refitting of two vessels destined for the *German Navy. This was unfortunate*, for if we had had the necessary steel workers to undertake the work, we could have found employment for a considerable number of other trades.

GENERAL

The future programme of new construction covers a great variety of ship types. These include the prototype of the guided missile destroyer, submarines and anti-submarine frigates, and general and refrigerated cargo ships, tankers ranging from 31,000 up to 65,000 tons deadweight, and a large passenger liner.

Efforts to increase production have been hampered by a shortage of skilled personnel, *particularly among the steel trades. Despite* the national shortage in these trades everything possible has been done in this country and even further afield to recruit the tradesmen required, but so far with very little success. A further problem in the steel trade is that the age grouping of our workpeople shows a high proportion in the older age groups and a survey of the position in the district shows that insufficient men are being trained to make good the prospective wastage. It is to be hoped that the Unions with whom this problem has been discussed will face the position realistically, as the increasing numbers of young men reaching 16 years of age affords the opportunity of correcting the position.

The problem of maintaining a stable labour force in shipbuilding is complex. The building of hulls will give fairly steady employment to the steel trades but, according to the fitting-out of these hulls as cargo, passenger or fighting ships, there follow considerable variations in the numbers of fitting-out trades required. A solution requires the co-operation of all the separate Unions involved in shipbuilding. At present, due to

changes in the types of ships being built, and in particular to the falling off of Admiralty work, the numbers employed in fitting-out work have fallen. As many of these trades are also affected by the reduction of employment on building and civil engineering there is now some unemployment in the district. This position could be relieved if we were able to increase the number of men employed in steel-working trades.

In my statement last year I referred to our plans for carrying out a major scheme of reconstruction in the Shipyard, which would take about eight years to complete and cost approximately £17 million. Since that time the country's economic position has changed considerably and we, like many others, have had to review our plans. After detailed and careful consideration of various factors, in particular the desirability of reducing the financial burden imposed on your Company, it was decided that the reconstruction scheme in general could be conveniently spread over a greater period of time and implemented in three phases. Work has already been commenced on the first phase which will cost just over £8 million and which it is hoped to complete by 1960. This phase includes the construction of new Plate Shops and Welding Bays in the South Yard, and the construction of a jetty between the two large berths in this Yard; the erection of heavier capacity travelling cranes; the construction of a new repair dry dock on the site of the present No. 5 dry dock; certain ancillary improvements to the Engine Works and electrical supplies; and the construction of a Tanker Cleaning Berth. It is hoped that these projects, together with improved techniques and working facilities, will result in a much smoother throughput from stockyard to berth and greater and more economical production. It is our aim in undertaking this important scheme of reorganisation and reconstruction to maintain our position in the shipbuilding, engineering and ship repairing industries, and, given the wholehearted co-operation of all who are employed by the Company, I am sure that this aim can be achieved.

THE PATENT SHAFT & AXLETREE CO., LTD.

The Company has had a satisfactory year and output and sales have been well maintained. Towards the end of the year, however, the demand for some of the Company's products began to fall off and it is likely that the total output in 1958 will be less than in 1957.

Shareholders will recall that this Company is also involved in a large reconstruction scheme which is now well under way and very satisfactory progress has been made with the civil engineering work and the erection of buildings; items of plant and machinery are now commencing to arrive on the site and there is every reason to believe that the Scheme will be completed during the first half of 1959 and the greater part of the Company's output will then consist of steel plate.

During the year the loans advanced by the Shareholders reached the agreed total of £1,600,000 (£1,200,000 from Cammell Laird & Company, Limited, and £400,000 from Metropolitan-Cammell Carriage & Wagon Company, Limited) and borrowing commenced under the £6 million Loan Agreement with Finance Corporation for Industry, Limited, £500,000 having been advanced by the end of the year. A Debenture secured by a floating charge on the whole of the Company's assets was issued to Finance Corporation for Industry, Limited, on May 20, 1957, in connection with this Loan Agreement.

Interest incurred during the year on the loans has been written off to Profit and Loss

Account. Profits for the year would have shown a considerable increase over those of the previous period if it had not been for this loan interest, and the loan interest to be charged against the profits in 1958 will of course be very much greater than in 1957 as the Development Scheme progresses, and it is probable that the Profit and Loss Account for 1958 will show a net loss.

It was always envisaged that, as a result of the policy of writing off to Profit and Loss Account the loan interest incurred during the construction period, no profit could be expected to arise during 1958, or indeed until the Development Scheme is completed and the new plant comes into operation.

METROPOLITAN-CAMMELL CARRIAGE & WAGON CO., LTD.

Rail Transport.—The Metropolitan-Cammell Carriage & Wagon Company Limited achieved in 1957 a new high record for the number of passenger vehicles built by them in any year. Their output totalled 564 coaches, including 239 diesel railcars, making 351 supplied by them for the modernisation of British Railways, for whom continuous output of standard steel main line coaches and wagons was also maintained. A prototype train comprising seven light-weight cars with unpainted aluminium alloy exteriors was supplied for the London Transport tube service. Shipments commenced in the latter part of the year under contract for 349 coaches for the Reef electrified suburban service of the South African Railways, whilst output of vehicles for a similar service in Rio de Janeiro was continued. Large numbers of wagons despatched to New Zealand and India also contributed towards a greater annual total value of deliveries than before attained.

New orders for wagons were obtained from Rhodesia, New Zealand, the Sudan and British Guiana. An order for underframes and bogies provided re-entry to the traditional Argentine market. Further orders were also obtained for diesel railcars, main line coaches and wagons for British Railways. The company had a satisfactory order book at the end of the year, but it was evident that financial restrictions leading to a decline in demand, particularly for wagons, would create even greater competition for further home and export business.

Road Transport.—The continuance of similar competitive conditions was also indicated for the road transport industry, but it is hoped that the considerable interest shown in a 78-seater, double-deck, rear-engined 'bus, will result in further orders. Shipments to New Zealand, Iran, Spain and Jamaica accounted for over 40 per cent of the Company's increased output of 'bus bodies last year, whilst new orders were obtained from some of the leading Municipalities in the home market.

The Company has special interests in South Africa as, in addition to its wholly-owned Subsidiary — Metropolitan-Cammell Carriage & Wagon Company Africa (Pty.) Limited of Johannesburg—which acts as a Sales Organisation for Railway Rolling Stock in the Union and in adjoining territories, it was largely instrumental in forming some 12 years ago, and has a substantial shareholding in, Bus Bodies (SA) Limited of Port Elizabeth —manufacturers of Omnibuses and Trolley-buses of a very high standard, incorporating many of the Metro-Cammell patents. This Company has built, and is continuing to supply, large numbers of bus bodies for Operators in the Union. In this undertaking the Company is jointly interested with Leyland Motors Limited.

The Metropolitan-Cammell Company is also interested, again jointly with Leyland

Motors Limited, in Zambesi Coachworks Limited—a newly incorporated Bus Manufacturing Company in Salisbury, Rhodesia.

ENGLISH STEEL CORPORATION LTD.

The year was one of steady progress and consolidation. All Works in the Group were well occupied throughout, and employees at the end—16,584—exceeded by 154 the opening complement. Steel production at 582,178 tons was slightly lower than the record output of the previous year. The value of uncompleted orders carried into 1958—£31 million—was approximately equal to the value with which 1957 was commenced.

In Sheffield, the demand for heavy forgings continued unabated from customers in the shipbuilding, electrical engineering and general engineering industries at home and abroad. Direct exports were 14 per cent of turnover, a large proportion of which was delivered to Canada and many items delivered in the United Kingdom were for incorporation in plant destined for overseas. A number of very heavy forgings was made during the year and 39 ingots exceeding 150 tons were produced. Of these, seven weighed 275 tons each and utilised the maximum steel-making facilities at present available.

During the year the Plate Rolling Mill—originally installed for the production of armour—was reconditioned and modified for rolling commercial alloy and carbon plate. The potential output has been trebled and the mill can now roll slabs of 80 tons in weight and produce plate up to 18 inches in thickness, or 13 feet in width. Much of the output will be in the form of large stainless steel slabs for conversion into sheet and strip by Firth-Vickers Stainless Steels Limited.

There has been a good demand for steel castings of the types produced in the Foundry, which has confirmed faith in the policy of specialisation which has been pursued for a number of years. Very substantial orders from overseas were received for railway specialities, such as automatic couplers, side frames and bolsters and one-piece bogies. A machine shop of 100,000 square feet for machining railway castings and special forgings is under construction and will be completed during 1958. The development programme of the Iron and Steel Industry has absorbed a large proportion of the production capacity for heavy steel castings; these castings included four back-up rolls, each 70 tons in weight and of a size never previously made in Great Britain.

The Drop Forge and Spring Departments benefited from the increased demands of the motor car industry and were well supplied with work at the end of the year. Orders have been placed for the erection of new buildings and plant for spring production, and these facilities are expected to be available early in 1959.

All rolling mill plant was kept in operation throughout the year. Greater availability of nickel enabled larger quantities of the more highly alloyed qualities of steel to be produced during the latter months.

In Manchester another very busy year was experienced by Taylor Bros., who produce railway wheels, tyres and axles. Direct and indirect exports represented 43 per cent of turnover. The Wheel Plant, which was completed in 1952, has been a major factor in the success of Taylor Bros. and for periods has produced wheels at a rate of 75 per hour for full shifts against a designed maximum output of 60 wheels per hour. Jointly with Canadian interests, a company has been formed in Montreal to manufacture wheels for the Canadian market. The plant is expected to commence production at the end of 1958.

A South African subsidiary, Steel Wheel & Axle South Africa (Pty.) Limited—already machining and assembling wheels and axles supplied by Taylor Bros.—has been successful in commencing production of railway axles.

Darlington Forge has shared the prosperity of the shipbuilding industry on the North-East coast, and general engineering elsewhere and its Foundry and Forge have been fully occupied.

Firth-Vickers Stainless Steels Limited had another very successful year and new outlets for its products continue to be developed. New production equipment which came into operation at the end of year should give a material increase in output during 1958.

Site preparation for the major development of the 500 acre site at Tinsley, Sheffield, continued and arrangements have been made for road, railway and public services. Building schemes and plant designs for steel melting and forging plant are being prepared but no major contracts for construction have yet been placed.

The report and accounts were adopted and the dividends, as recommended, were approved.

The retiring directors, Mr R. W. Johnson, Mr P. J. D. Toosey and Mr J. H. Bromfield, were re-elected; the remuneration of the Auditors, Messrs Cooper Brothers and Company, was fixed and a resolution amending the Articles of Association having been duly sanctioned, the proceedings terminated.

TRANSPORT DEVELOPMENT GROUP

(Lightermen, Wharfingers and Transport Contractors)

YEAR OF PROGRESS

The ninth annual general meeting of Transport Development Group Limited (formerly General Lighterage (Holdings) Limited) was held on May 23rd in London.

The Chairman, Mr P. S. Henman, in his statement said that profits for the year before tax amounted to £328,237, which was £39,851 more than the profits for the previous year. The increased profit should be viewed against an increase in turnover of £503,675 to a total of £2,881,878 and the measure of the year could be gauged by the fact that profit before tax represented 11.4 per cent of turnover in 1957 and 12.1 per cent of turnover in 1956.

During the year, there had been major additions to the Group, the chief of these being the purchase of the share capital of The Erith & Dartford Lighterage Company Limited. A new subsidiary known as Continental Ferry Trailers Limited had also been formed by using the Continental Ferry. This subsidiary was providing a direct road transport service to the countries of Western Europe. Demands for the service were increasing on both sides of the Channel and it would be in still greater demand if an increased measure of free trade in Western Europe was brought about.

The report was adopted and the total dividend of 12½ per cent (1956 11 per cent) and distribution of 1 per cent (1956 1½ per cent) free of tax, out of accumulated capital profits were approved.

Resolutions increasing the capital of the company from £2 million to £3 million, and amending the Articles of Association were also approved.

SCHWEPPES LIMITED

THE HONOURABLE R. HANNING PHILIPPS ON TEN-YEAR REVIEW OF SUSTAINED PROGRESS

The sixty-first annual general meeting of Schweppes Limited was held on May 29th at the registered office of the company, Schweppes House, 1-4 Connaught Place, London, W.2, The Honourable R. Hanning Philipps, MBE (the chairman), presiding.

The following is an extract from the statement by the chairman which had been circulated with the report and accounts for the year ended December 31, 1957:

The outstanding event of the year for your Company was the acquisition in August, 1957, through an exchange of shares, of the old-established and successful business of L. Rose & Co. Limited. In return for the issue of £386,100 of Schweppes Ordinary Stock and £189,396 of Preference Stock we acquired the whole of the L. Rose & Co. Ordinary and Preference Stock and 88 per cent of their Preferred Ordinary Stock.

I am happy to say that Mr Lauchlan Rose, their Chairman, has since joined our Board and I shall presently have the pleasure of asking you to confirm his appointment.

Arising out of this amalgamation of two great leaders in the Soft Drinks Industry we have formed a joint sales Company called Rose Kia-Ora Sales Company to market the world-famous Roses Lime Juice, Roses Squashes, Dubonnet and other lines, in conjunction with our Kia-Ora Squashes and Suncrush. We have every reason to look forward to a profitable future for this Company under the able direction of Mr C. F. J. Barker, the Managing Director of L. Rose & Co. Limited.

HOME SALES

During 1957 Schweppes Home Trade Sales increased by 19.7 per cent over the previous year. These excellent figures were greatly helped by the successful introduction in May of two new carbonated drinks, Bitter Lemon and Bitter Orange, which proved unexpectedly popular.

HOME PROFITS

The Schweppes Home Net Profit, before taxation, amounted to £1,427,348, compared with £1,114,340 in 1956. This is a record in the history of the Company.

The L. Rose & Co. net profit before taxation amounted to £337,986 compared with £227,921 for 1956; a record for that Company also. After providing for taxation the profits earned prior to acquisition have been transferred to Capital Reserves, leaving only the balance of £63,194 to be included in Schweppes Consolidated profit.

I now come to the Schweppes consolidated figures, covering our whole world-wide operations, which show a net profit before taxation of £2,119,670 compared with £1,211,116 in 1956. This again establishes a record for our Group of Companies.

Reverting to the figures for the Parent Company your Directors have placed to General Reserve the sum of £350,000. And they now recommend the payment of a final dividend of 15 per cent on the Ordinary capital as increased in connection with the acquisition of L. Rose & Co. compared with 12½ per cent in the previous year. The balance of profit amounting to £140,915 is carried forward to next year.

In raising the total dividend from 17½ per cent to 20 per cent for the year we are endeavouring to pass on to shareholders part of the proceeds of increased productivity. While we could undoubtedly have paid out more, we had to take into account the fact that the annual sum required to keep in top trim the large number of factories and the vast amount of plant and machinery now employed is in the nature of half-a-million pounds, which can only come from surplus profits.

REVIEW OF PROFITS

The rise in the Parent Company's profits was mainly the result of an increase in sales of our carbonated drinks of 22 per cent, and more efficient production and distribution.

While the rise in the figure of consolidated profits embraces many small items spread over the world, the main improvements were in our Kia-Ora Company which benefited from a long overdue rise in the price of squashes, which were last raised in 1948; in our Pepsi Cola franchise in this country—which extended its area of distribution; and in Schweppes USA which for the first time traded at a small profit.

PROSPECTS

For the first three months of 1958 Schweppes Home Sales show an increase of 22 per cent and I can see no reason why we should not have another good year of trading.

TEN YEAR REVIEW

It is interesting to remember that it is just ten years since the Soft Drinks Wartime Association ended and we were again allowed to trade under our own Schweppes name.

This may therefore be a suitable occasion for a short review of the subsequent growth of our business.

SALES AND PROFITS

Home sales have increased five-fold. Home profits before taxation in 1948 were £256,000 and in 1957 £1,427,000. Furthermore the consolidated results of the trading of the Parent Company and our controlled Subsidiaries both at home and abroad showed a profit before taxation of £440,000 in 1948 and £2,120,000 in 1957.

EQUITY

The shareholder who invested £100 in Ordinary Stock at a cost of £331 in 1948 and who has since taken up the various stock rights issues at a cost of £203, would now hold £267 Ordinary Stock worth at current Stock Exchange quotations £1,041, a capital gain of £507 over the period. This represents a capital growth of some 8½ per cent per annum.

PRICES

It has been the policy of the Board to hold prices, and over the whole decade our net selling prices have increased only 2 per cent. This compares with the 51 per cent increase both in the Index of Retail Prices and in the wholesale prices of food products.

PRODUCTION

The Company has invested heavily in buildings, plant and machinery, and equipment, of the most modern design, and has adopted the most up-to-date techniques in line production and bulk handling. As a result the annual output per operator has risen from 132,000 bottles in 1948 to 312,000 in 1957.

INVESTMENT

Our total investment has been £4,951,000, of which £2,274,000 represents direct investment in buildings and plant, etc., and the balance of £2,677,000 investment in Subsidiary Companies at home and abroad. A further £1,155,000 has been taken up by increased stocks of materials and debtors, etc., necessary to finance the increasing business. The money for this expansion has come from shareholders by way of new cash amounting to £1,980,000; profits ploughed back £2,869,000; and the balance of £1,257,000 represents outside businesses acquired and paid for by the exchange of shares.

ADVERTISING AND PRODUCTIVITY

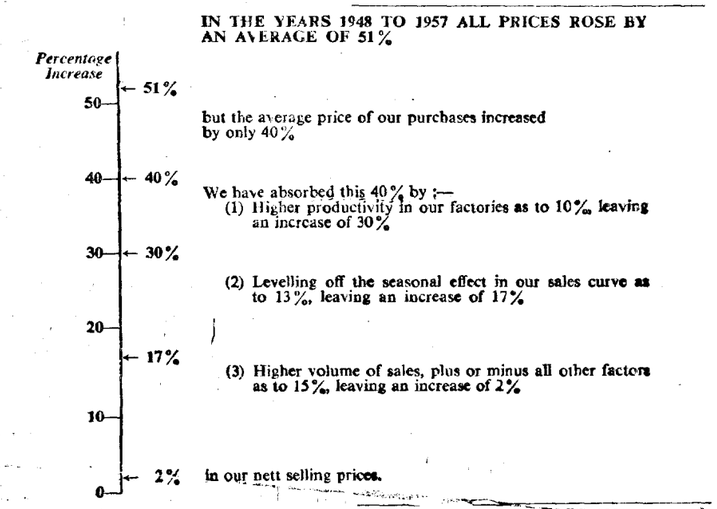
To enable our capital investment to be utilised to the full, in other words, to keep our factories and plant in constant production throughout the year, we have adopted a policy of advertising our products at the off-peak sales periods, notably in the autumn and winter, rather than in the summer months, as used to be our practice. As a result of this rearrangement of our advertising thrust, we have been able to even out and spread our sales, so as to fill in the production troughs which were in the past so pronounced. December has for some years been our greatest trading month.

I draw your attention particularly to this aspect of our policy because it seems to me an interesting example of the intelligent use of advertising as a direct means of increasing productivity in a trade which was formerly regarded as highly seasonal in character. Moreover, and this is of equal importance, although the sterling cost of our advertising has shown a steady increase over the last ten years, calculated as a cost per unit of output there has been a substantial reduction.

The extent to which advertising has flattened our sales curve and thus enabled a level flow of production is shown by a comparison of the sales in the four quarters of the year in 1948 and 1957:

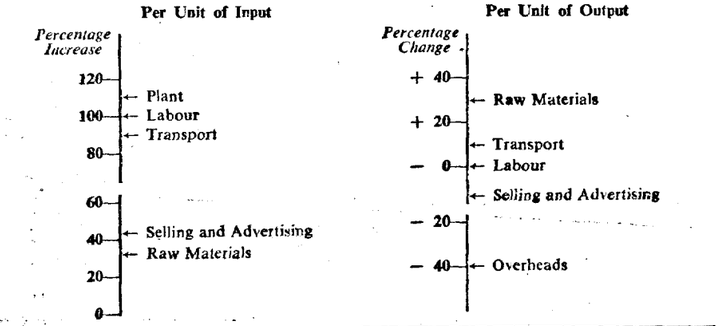
	1948	1957
	%	%
(i)	19	16
(ii)	26	26
(iii)	31	28
(iv)	24	30
	100	100

It will be observed that the first quarter of the year in which we deliberately do little advertising is now substantially below the other three quarters, which remain relatively uniform. This enables us to complete the vital annual maintenance of our plant during the early months of the year instead of spreading it over a much longer period from about September to Easter.



MATERIALS

Although there has been a general increase of 51 per cent as measured by the Index of Retail Prices, the actual increased cost of our own raw material supplies has been only 40 per cent. This is mainly due to the benefits of centralised buying of an increasing volume of purchases.



INCREASED COSTS

The substantial increase in sales volume over this period has absorbed the whole of our increased costs; and taken as a whole, the profit per unit sold has been maintained over the period. Thus it can be said that all the turnover increase has been gainful.

The following chart shows how:

Expressing the situation in another way, labour, raw materials, plant and transport have all increased in varying percentages expressed at a cost per unit of "input" but due to the reasons given previously, not all have increased when expressed in terms of cost per unit of "output." As the following chart shows, the cost per unit of output of some of these items has actually fallen. This is another way of saying that the efficiency in using them has increased enormously.

WAGES

Rewards to our employees have been kept in parallel with the increase in the prosperity of the Company. Between 1948 and 1957 their total earnings per head have doubled, due to increased basic wages and productivity bonuses. In addition the employees' share of profits placed in the profits pool and distributed as annual bonus in 1957 was, per employee, 4.8 times the sum distributed in 1948. The total sum distributed in this way has increased 8.7 times over that of 1948, but there are of course more employees to share in it. Notwithstanding these increases the labour cost per unit produced is the same now as in 1948.

INCREASE OF EMPLOYEES

Although sales and thus production have increased five times during the period, the number of our employees has barely doubled.

In the previous annual statement I referred to our personnel policy of establishing all employees after a short period of trial. Establishment means guaranteed employment, a good health scheme, two weeks holiday with pay (three weeks after ten years), membership of the pension fund, and a promotion and training scheme which applies to every employee who wishes to seek advancement in the Company's service. And at every one of our branches there is a hard working and enthusiastic joint consultative committee. On this basis, we have been outstandingly successful in obtaining the co-operation of employees at every level, and this has been the greatest single factor in enabling me to record today the progress I am now reporting to you.

Bearing all this in mind I am sure you would wish me to join in congratulating our Management on their outstanding achievement, and all our employees on the manner in which they have consistently risen to the occasion and made our success possible.

The report and accounts were adopted and the final dividend on the Ordinary Stock of 15 per cent, less income tax, making 20 per cent for the year, was approved.

THE LONDON ELECTRIC WIRE COMPANY AND SMITHS

TOTAL OUTPUT MAINTAINED

The forty-ninth annual general meeting of The London Electric Wire Company and Smiths Limited was held on May 22nd in London.

Mr E. L. Wildy, chairman and managing director, in the course of his speech, said: The Group Profit for the year subject to taxation at £775,632 is £239,809 less than for 1956. In the course of the year the price of copper fell by £86 per ton to £181 10s.—at December 31, 1957. The whole of the Group's working stock has been valued in the Accounts on the basis of this price and depreciation of £305,000 has had to be met. Fortunately, we had available a provision of £193,000, which has been used for this purpose, with the result that only £112,000 has been charged in arriving at the Group Profit.

Turning to the Consolidated Balance Sheet, you will see that the capital employed has increased marginally to £8.8 million. Liquid resources are still strong, though less than at the end of 1956 in spite of the fall in the price of copper.

The equipment at our factories is now up to date and, although a certain amount of new plant continues to be installed in order to cater for changing demand and to increase efficiency, it can be said that our main expansion programme, started in 1954, was substantially completed in 1957. Productive capacity was, therefore, rather greater than in 1956; but the total volume of output in the year was approximately the same.

A SERIOUS FACTOR

A serious factor of the year's operations was the continued increase in cost of certain items, such as fuel and transport, over which we have no control. In spite of improved methods of manufacture, we have been able to absorb only a part of these increased costs and, reluctantly, we have had to increase the selling prices for certain of our products. On the other hand, customers derived immediate benefit from the fall in the price of copper to which selling prices are geared. Some of these price increases, however, were introduced too late to have much effect on the year's results.

Difficulties following the Suez crisis, and credit restrictions which in the second half of the year were greatly intensified, interrupted the normal rate of expansion. With productive capacity throughout the country recently increased, this lack of growth has led to keen competition. The tendency for our customers to reduce their inventories has been accelerated and we have had to increase our stocks of finished goods to be in a position to provide the rapid delivery required.

THE CURRENT YEAR

I am able to tell you that demand for your company's products and the trading profit of the Group in the early months of the year have at least been maintained by comparison with 1957. You will, however, appreciate that it is yet too early to forecast an improvement over the whole year—although we hope to avoid the heavy charge for stock depreciation that was suffered in 1957.

The inevitable increase in the use of electricity and the favourable position that your Company is in to take advantage of any upsurge in economic activity encourages me to look forward to the future with confidence.

The report and accounts were adopted.

CADBURY BROTHERS LIMITED

GROUP HOME AND OVERSEAS SALES RISE TO £82½ MILLION

EFFECTS OF RAW MATERIAL PRICE FLUCTUATIONS

MR L. J. CADBURY ON RESTRICTIVE TRADE PRACTICES ACT

The 59th annual general meeting of Cadbury Brothers Limited will be held on June 16th at Bourneville, Birmingham.

The following is the statement by the Chairman, Mr L. J. Cadbury, which has been circulated with the Report and Accounts:

During the last two years it has been clear that the manufacturing capacity of our industry has been rapidly overhauling the country's demand for chocolate and confectionery. At the same time there has been a slight contraction in consumption. The average consumption per head of the population per week in 1956 was 8.6 ozs. In 1957 it was 8.3 ozs. Thus we are now subject once again to the full blast of competition, and, though our home sales were again a record, it was by the narrow margin of less than half of 1 per cent.

As a matter of fact we sold 3,000 tons more last year than in 1956, but for comparative purposes this has to be corrected because for financial reasons 1957 was a 53-week year.

In the export field our sales to the USA and Scandinavia were down, as well as those to the reduced British Forces overseas. In our other traditional export markets we showed an increase of 8 per cent. The latter included increased dollar exports of specialised lines for sale by our Canadian subsidiary.

OVERSEAS COMPANIES' RECORD EARNINGS

I am glad to say that all our overseas companies showed increases both in cash and tonnage sales. Between them and subject to tax they made a record trading profit of £1¼ million. Some of them are however facing difficult times. The Eire Company has to cope with a falling population and a by no means buoyant economy. The New Zealand and Indian Companies are liable to have their output restricted by import licences cutting down some of their raw material supplies. With the object of obtaining our milk ingredients from within the country, we are experimenting in India with buffalo milk. Certain technical problems have to be solved here, however, before we can use it without in any way affecting the quality of our goods.

For some years after the war we had a successful export trade to Germany. As Western German manufacturers got into their stride [illegible] and import duties became a more important factor we had to give careful consideration to the future of the goodwill we had established there. It was clear that we could not look to a continuation of a prosperous export trade from this country. We decided, therefore, to have four principal lines manufactured on a royalty basis, and last year our sales in Germany topped the equivalent of £1 million. In view of the uncertainties surrounding the development of the European Free Trade Area we regard this as a decision that may prove of some importance. The joint statement recently issued by the Federation of British Industries on behalf of the six OEEC countries outside the Common Market is encouraging. It recommends that certain processed products of agriculture (which we assume includes chocolate and biscuits) should be liberalised in the same way as industrial products in general.

Adding together the sales of our group of companies, including the fellow subsidiaries of our parent Company, the British Cocoa & Chocolate Company, our total sales at home and overseas increased from £79½ million in 1956 to £82½ million last year. The BC & C consolidated accounts show that profits after tax rose from £3.7 million to £5 million and the assets from £64 million to £74.5 million. Part of this increase is due to a revaluation of buildings and plant at certain of our subsidiaries and part to profits retained in the business. On the other side of the consolidated balance-sheet it will be noted, however, that our taxation liability stands at £4.5 million against a comparable figure of £2 million last year.

COCOA PRICES

Turning to cocoa, we again had a difficult year from the price point of view. It opened with the spot price slightly over £200 per ton. The trend was downwards and it reached its lowest figure of £180 per ton at the end of February. It remained at this level for about a month, then began to rise and reached its highest point at £360 per ton in mid-November, the year closing with a spot price of £320.

There were two main reasons for the increase of £180 per ton during the year, namely the Brazilian selling policy and lower world crops.

When prices were low, Brazil, selling through a single agency, introduced a minimum selling price scheme; at the time of introduction about £70 per ton above world prices. Luckily for Brazil, the recent Ghana and Nigerian crops, due to abnormal rains, were poor: 270,000 tons against nearly 400,000 tons the previous year. This gave Brazil all the support needed, and indeed pushed prices far beyond their minimum to the figures I have just given.

This rise in the price of our chief raw material has been reflected in a slight increase in the price of some of our principal lines this Spring, though the stocks it is our policy to hold have cushioned the impact. Nevertheless we look with some apprehension at cocoa continuing at its present price and the effect this may have [illegible] may have on chocolate consumption.

SUGAR SUPPLIES

Our sugar supplies are affected by the operations of the new Sugar Board which began to operate on January 1, 1957; unfortunately in very unusual circumstances. Its prime duty is to buy about two-thirds of the exportable Commonwealth raws at a negotiated price and to pass it on to UK refiners at the world price. Any loss is recouped by the imposition of a surcharge on all sugar; any profit is dispersed by a distribution payment. The Board began by announcing a surcharge of 1s. 2d. per cwt.

The world price at the beginning of the year, however, was unusually high at 73s. 7½d. a cwt (refined) owing to the Suez crisis, poor beet crops, shortage of stocks, and high freight rates. As a result, by July the Board had accumulated so much profit that the surcharge was removed and a distribution payment of 4s. 8d. per cwt. was introduced. But the world price later fell steadily so that two or three months ago there was a switch in the reverse direction and we are now paying a surcharge again of 11s. 8d. per cwt.

There have thus also been fluctuations in the price of our sugar. The time-lag and uncertainty of changing from surcharge to distribution payment has made costing prices of finished goods difficult, especially for the confectionery side of our industry.

MILK AND DAIRY PRODUCE

Next to cocoa, we actually spend more money buying milk and dairy produce than any of our other raw materials—over £6 million. We use about three-quarters of the milk we buy for making milk chocolate; the rest we sell, some of it going to our bottling plants in Herefordshire and Anglesey from which we meet local domestic milk requirement.

Here again we are in the hands of a single seller, the Milk Marketing Board. After prolonged negotiations we have recently secured a reduction from the Milk Marketing Board but our prices are still well in excess of the realisation price of milk for butter and cheese, the latter having been as low as 8¼d. per gallon. At the same time the Board is being faced each season with increasing surpluses of milk. It is a matter for consideration whether further price concessions might encourage more industrial consumption.

During the year we took a controlling interest in the Anglesey & Caernarvonshire Farmers Dairies Limited, which has a cheese manufacturing plant at Bangor, Caernarvonshire. Our object in this was to consolidate our milk area in North Wales, to provide means of balancing our milk requirements, and to increase our reserve of milk.

DISTRIBUTORS' MARGINS

Last year we had a renewed request for an increase in distributors' margins and, after very considerable discussion, at the end of July gave a further [illegible] per cent. This brought the distribution margin on our blocks and pre-packed goods up to 21.8 per cent, a figure lower than prewar but of course on a much higher money turnover.

RESTRICTIVE TRADE PRACTICES ACT

In 1956 the Restrictive Trade Practices Act was passed. As a result, last year we revised, and filed with the Registrar of the Court set up under the Act, the Agreement we have had for many years with our principal competitors. We are now waiting for its reference to the Court where it will in due course have to be defended.

The main object of this Agreement is and always has been to control the costs of distribution and, with that aim, to agree upon margins to the trade. It also seeks to control various advertising trade concessions, as well as such things as gift-coupon schemes. In order that such an Agreement can operate, there must be some price from which the margins can be calculated. As prices are so fundamental, the Agreement provides that the parties will give to each other notice of any changes and that they will confer with a view to agreeing margin percentages, i.e. the difference between consumer and trade prices.

Our view is that agreement upon margins and other costs of distribution is in the interests of the trade and public.

Linked with the question of trade margins is that of retail price maintenance. We have always believed that the right course has been to fix a fair margin to the trade and, having done that, to protect that margin from the actions of price cutters. The new Act permits us individually to continue our policy of retail price maintenance and has given the right to proceed against a price cutter even though there is no direct contract between him and the manufacturer.

PENSION FUNDS

In this country we have four Funds providing pensions for men, women and widows. They were founded long before the Welfare State was thought of, and the senior one celebrated its fiftieth anniversary last year. Their combined assets amount to over £15 million.

During the course of the year our actuary gave us the quinquennial valuation of our two largest Funds. I am glad to say we were able as a result to increase the rates of pension by 20 per cent and 15 per cent respectively.

Approved Company Funds such as ours have been subject to a certain amount of criticism recently on the grounds that they are subsidised by the taxpayer. It is true that the contributor gets his contributions allowed for tax purposes, the employer his contributions as an expense, and the income of the Fund is free from tax; but when in due course each subscriber becomes a pensioner he is liable to tax on his pension in the ordinary way. Further, the present system has the support of the Millard Tucker Report, which says, "We have decided to recommend the adoption of the same general plan of exempting the build-up of bona fide and reasonable schemes, and taxing the benefits."

Legislation on pensions is promised by both the major parties and we hope this principle will not be tampered with. At the moment we have only seen the Labour Party's scheme and do not know the nature of the present Government's proposals. Whatever programme is in due course implemented by Parliament we are bound to be affected, perhaps seriously. But one thing is clear: whatever line pension legislation may take, it can only be successful if the value of money is kept stable. This is a task which successive Governments since 1945 have failed to achieve, and one on which the reception of the Cohen Report is not very reassuring.

DEVELOPMENT PROGRAMME

Turning once more to the printed accounts, it will be seen that Cadbury Brothers Limited transferred from general reserve £4,745,790 to the BC & C Company by means of a special Ordinary Dividend. This was capitalised by the latter Company and one new share issued for every two held. This still leaves our assets very much above our issued capital.

Like all growing firms, our development programme over the last few years has not been eased by the policies of the financial authorities. We have tried to keep in step with them and in certain instances have been able to postpone new work. To make any sudden or important change is difficult. We plan our development budget about four years ahead. This may seem a very long time, but often to put up a new building means scrapping an old one and finding temporary accommodation for the processes it has housed. This is particularly the case with factories such as Bournville that have been established some time and have little space left to build on. By their very nature, therefore, most of these projects are spread over years and, once started, have to be carried through. Though we have varied the timing of our development programme, this has been through an endeavour to conform with the climate of the country's economy rather than to the pressure of interest rates and tightness of money.

At the moment our development budget at home and overseas stands at about £15 million over the next four years. No one can foretell the course of business and prosperity over that period and we are clearly accepting certain risks, but ones which we have every confidence are justified.

BEYER, PEACOCK & COMPANY LIMITED

(Locomotive Builders and General Engineers)

MR HAROLD WILMOT'S STATEMENT

The annual general meeting of Beyer, Peacock & Company Limited was held on May 20th in London, Mr Harold Wilmot, CBE (Chairman and Managing Director), presiding.

In the course of his review the Chairman said that the position of the Group at December 31, 1957, continued to be one of financial strength and liquidity and the operating results for 1957 were closely in line with the forecast made last year.

Referring to new products, the Chairman said that during the year the Company had developed some new products and they continued to improve their existing range. He said that in order that the Company should have an interest in all forms of railway motive power a new Company was recently formed—Beyer Peacock (Hymek) Limited. In that Company they held half the equity, the other half being held by Armstrong Siddeley Development Company.

The Chairman continued: Demand for our agricultural equipment products continues to expand and sales are now at very satisfactory levels.

The Chairman said that during 1957 the Board made a bid for the shares of the Anti-Attrition Metal Company Limited. The result was that the Company now held 87½ per cent of the equity of that business, which would add to the variety of the Group's products.

He said that some further extensions of the Group were in contemplation. Their continued policy was to broaden the basis of operation in a logical way so as to avoid, if possible, the more severe effects of demand fluctuations in any one product.

Regarding future prospects, the Chairman said: In the absence of some fairly quick improvement in world conditions it may well, for a period, be impossible to maintain total turnover on the scale of recent years.

The report and accounts were adopted and the proposed final dividend of 6 per cent, plus a bonus of 6 per cent, making 16 per cent, less income tax, for the year was approved.

TOZER KEMSLEY & MILLBOURN (HOLDINGS)

The tenth annual general meeting of Tozer Kemsley & Millbourn (Holdings) Limited will be held on June 18th in London.

The following is an extract from the circulated statement of the chairman, Mr Joseph R. Millbourn.

The Group profit for the year £391,504 after allowing for Overseas and UK taxation, is a record in our history.

The increase in our turnover and trading profit emanated almost entirely from the Union of South Africa.

Mr Millbourn said that the shares of the overseas subsidiaries had been revalued, and as a result of that revaluation the value of Shareholdings in Subsidiaries had been increased by £700,000 in the Balance Sheet of the Company, thereby creating a capital reserve of the same amount. The board proposed, subject to the Shareholders approving the necessary increase in the Authorised capital, to capitalise that reserve of £700,000, by issuing 700,000 Ordinary Shares of £1 each fully paid to the Ordinary Shareholders on a one for one basis, bringing the total issued share capital up to £1,700,000. Capital Issues Committee consent to that issue had been obtained.

Mr Millbourn concluded: The current year has opened well and results for the first quarter are satisfactory, but the outlook for the remainder of the year is obscure and somewhat cloudy.

We are fully alive to the changing pattern of world trade, and I am confident we will develop new channels of income to replace income we earn at present from traditional sources which may decline.

EQUITABLE LIFE ASSURANCE SOCIETY

RECORD NEW BUSINESS

The 196th annual general meeting of the Equitable Life Assurance Society was held on May 28th in London.

The following are extracts from the speech of the President, Mr J. H. Bevan:

The Report and Accounts circulated to members reveal a very pleasing increase in the new business written by the Society. The new life assurance contracts consisted of nearly 5,000 policies for a total sum assured of just under £7 million, after deducting re-assurances, a record in the history of the Society, exceeding by £1,400,000 the previous record established in 1955.

And we would once again remind members that this expansion has been achieved in spite of the fact that we pay no commission to agents who consequently bring us no business. Moreover since we are a mutual office and pay no dividends all profits earned by the Society accrue for the sole benefit of members having with-profit policies.

Claims by death at just under £300,000 were relatively low.

The funds at the close of the year amounted to nearly £31½ million.

Substantial depreciation in the value of securities was inevitable in a year which witnessed a crisis in the affairs of this country. We were nevertheless able to say that, in the opinion of the directors, the total assets set forth in the Balance Sheet were fully of the value stated therein.

The report and accounts were adopted.

THE UNITED SUA BETONG RUBBER ESTATES LIMITED

ECONOMIC PROBLEMS OF INDEPENDENT MALAYA

FALLACIES OF PRICE SUPPORT SCHEMES

SIR JOHN HAY ON THE RUBBER OUTLOOK

The forty-ninth annual general meeting of The United Sua Betong Rubber Estates Limited will be held on June 4, 1958, at 19 Fenchurch Street, London, E.C.3.

The following are extracts from the circulated Statement of the Chairman, Sir John Hay:

The fall in the price of rubber may not be so steep as that experienced in other commodity markets but that is because natural rubber, in recent years, has not risen so high. The fall, however, has gone far enough to cut severely into our margin of profit. Events are too unpredictable to justify a firm expression of opinion regarding the future course of prices. The motor vehicle industry in America is particularly sensitive to any setback in trade and it is not expected that car production in 1958 will exceed 4½ million cars against over 6 million in 1957. On the other hand Europe, which is now a larger consumer of natural rubber than USA, has so far shown no contraction in demand. Whether that happier state of affairs will continue must depend not only on whether there is early recovery in America but on political developments in Europe which have taken a course which, if continued, can hardly prove favourable to industry. Russia and her satellites, as well as China, are now ranked as large consumers of natural rubber. We have not sufficient information upon which to base any estimate of their probable requirements for 1958. We proceed on the supposition that they will not fall below the amount taken in 1957 which was approximately 280,000 tons. Figures of exports from Indonesia for the first two months of this year show a decline of over 20,000 tons. If this trend were continued, it would prove an important set-off against a fall in consumption. It is not unkind, however, to assume that from that territory there have been shipments of rubber which have escaped published returns. Moreover, Indonesia's need for foreign exchange is so dire that despite internal strife a real effort will be made to maintain the production and export of rubber, although the methods employed may not be conventional and some of the figures may not enter into official computation. In our attempt to translate these speculations into figures we arrive at the not too unsatisfactory conclusion that the production of natural rubber in 1958 may not exceed consumption by more than 60,000 tons with the former at 1,920,000 tons and the latter at 1,860,000 tons. But from what is written here it will be appreciated that any such figures must, in all the circumstances, be received with reserve. The one certain fact is that unless rubber prices rise, of which at present there is little indication, our profits for the current year will fall substantially. That, however, is a prospect which can be regarded as only temporary and one which this Company is well equipped to meet. Trade will recover and natural rubber freely available in all its unique qualities will be required in increasing quantities despite the competition of a rapidly expanding synthetic industry.

MALAYA'S NEEDS

The new and independent Government of Malaya is to be congratulated on the success of its operations against terrorists and on the marked progress made towards the restoration of law and order. True, they have been greatly assisted in these operations by British troops but that is only an example of the benefits of friendly co-operation which, far from impairing the authority of the local Government, has strengthened and sustained it. This success, if followed up by a corresponding co-operation in the economic field, could be productive of immense benefits to Government and its people. The maintenance and improvement in the standards of living of a rapidly expanding population can only be provided by economic expansion necessitating a continuous flow of fresh capital which cannot be supplied internally. This matter was the subject of discussion at the fourteenth session of ECAFE, which met at Kuala Lumpur in March last. The group of companies of which this is an important member has demonstrated its confidence in Malaya in a practical manner. In the post-war years we have ploughed back over 100 million dollars which have been applied to extensions and replacements but, despite assurances of fair treatment for overseas capital, the general flow has been far from adequate to the country's needs. This is no doubt due in part to terrorist activities which have been, until recently, a feature of conditions in postwar Malaya as well as to more serious events in other Eastern territories. Economic considerations, however, have not been without their influence. Industries with which Malaya's name is publicly identified offer little scope for new entrants as capital costs are now too high to give hope of successful competition with existing enterprises. For example, it would cost about £250 per acre to plant and equip a new rubber estate as well as involve a denial of revenue for nearly a decade. Investment in established companies can be purchased at a fifth of that figure with a substantial immediate return. Similar conditions obtain in respect of other agricultural enterprises as well as to mining. These facts may point to the disagreeable conclusion that Malaya's industrial credit is low and that there is much need to encourage existing as well as new capital enterprises. Internally, the treatment of foreign capital has been fully in accordance with Government's assurances. Externally, an official tendency to discriminate has developed which tends to give the impression of an attitude of ambivalence to overseas capital, not well attuned to the needs of the situation. This would seem to be based on a misunderstanding of the obligations of capital domiciled here and carrying on operations in Malaya. Such business in its Eastern activities is generally conducted through the medium of subsidiary companies or managing agents. Either method permits of wide delegation of authority and provides an informed source from which guidance can be given to those at home respecting the manner in which their business should be conducted in conformity with the laws and customs of the country. Similar methods are employed throughout the world and are generally acceptable in all countries without any suggestion that they derogate from Government authority.

The transfer to Malaya of the head office of a company, the capital of which has been raised in the UK, would in practice deprive the subscribers of their rights of ultimate control and on that ground would be resisted by them. Any attempt to influence such a movement would not only fail but would result in a serious check to even the present limited flow of capital. In this country there exists a fund of goodwill towards Malaya, which should be harnessed to profitable ends through free economic co-operation. It is a pity that the present should be chosen as an occasion for announcing officially that no resident in the UK will be invited to join the Malayan delegation to the Rubber Study Group, a forum for discussion of rubber problems in their international aspects. By this decision a large and important section of rubber producers are debarred from joining with representatives from many other countries in their studies. We, of course, recognise and accept the fact that the choice of the Malayan delegation is a matter wholly within the competence of the Government of that country. But in deciding on the composition of a delegation to an International Conference, concerned with the study of external problems, more valid considerations than the accident of domicile might with advantage prevail. I have had a long association with Malaya and I am very mindful of the many courtesies and kindnesses that have been extended to me on my many visits. I would not venture on these remarks except I were prompted by friendly feelings and a desire for the welfare of the country.

PRICE STABILISATION

Proposals for the stabilisation of rubber prices have at different stages in the industry's history been the subject of examination. Its recurring attractions have again asserted themselves, for the subject was not only ventilated at the last Study Group meeting but it also occupied attention at the Economic Conference for Asia at their March meeting this year. The strange thing is that it should be revived at a time when rubber in its price has, for some time now, shown a greater degree of stability than is historically associated with that commodity. This new behaviour is, no doubt, due to the steadying influence of the synthetic product, the price of which scarcely varies. The untimeliness of this proposal and the arguments advanced in its support give colour to the belief that the term stabilisation is used on this occasion as a euphemism for a price support scheme conjuring up in some minds the inviting prospect of an unvarying profit for the producer with the comforting assurance of a regular revenue for his Government, a pleasant prospect indeed, but one alas, remote from economic realities.

Rubber is produced in over a dozen territories spreading over four Continents. It is a world commodity with a world market and selling at a common basic price. Any scheme for regulating price would require international agreement on a world scale the provision of large funds for the acquisition of stocks, the power to restrict output and the administrative ability to do so effectively and equitably. It is difficult to believe that the many widespread producing territories in all their variability could conform to these essential conditions. The dangers of anything short of universal agreement are unhappily exemplified in the present tin scheme which by its omissions has given great impetus to production in Russia and China, necessitating increasing and burdensome restrictions on others. To embark on any such scheme for natural rubber would be fraught with great danger. The inevitable increase in costs, the depletion of cash resources tied up in stocks and restrictions on output would create intolerable burdens on an industry which must meet the severe competition of a synthetic product not so handicapped. The natural rubber industry could not afford any addition to existing burdens. Above all, its access to world markets must remain unimpeded, and its capacity to produce unfettered, for only under such conditions could it hope to survive as a dynamic force in a rapidly changing world.

THE PRUDENTIAL ASSURANCE COMPANY LIMITED

(Incorporated in England)

In the course of his remarks at the Annual General Meeting held on May 22, 1958, at 142 Holborn Bars, London, E.C.1, Sir Frank Morgan, MC, Chairman of the Company, said:

Before turning to particular aspects of our affairs I will refer to one feature—the increase in the funds of our Life Branches—which has a double significance. It is, in the first place, a broad measure of the net saving achieved through Prudential policies, to the advantage of millions of policyholders and their dependants and to the benefit of the national economy. Secondly, it is a truer measure of the progress of our business than is provided by a mere statement of the new sums assured. Last year the total funds of our Life Branches increased by the impressive amount of £48 million. Of this, £10 million was attributable to our overseas business and £38 million to the United Kingdom.

ORDINARY BRANCH

The Ordinary Branch continues to make excellent progress. The pace of its expansion can be gauged from the fact that over the last 10 years both the premium income and the funds of this Branch have more than doubled.

Under individual assurances issued in the United Kingdom there have in recent years been marked increases in the average sum assured per policy and a trend towards contracts which contain a larger element of life assurance, that is to say towards whole life assurances, longer-term endowment assurances and policies providing income benefits or mortgage protection.

In the development of the Ordinary Branch our overseas business is playing a steadily increasing part. Once again in 1957 a record volume of new business was written by the Overseas Branches. The expansion of our Canadian Branch during the year was outstanding, the new sums assured showing an increase over 1956 of 33 per cent. In our other principal Branches record amounts of new sums assured were also written: the increases over 1956 were 12 per cent in Australia, 9 per cent in New Zealand and 21 per cent in the Southern and East African territories.

Not only have we achieved a remarkable expansion in our overseas life business in recent years, but because of our policy of quoting premiums and declaring bonuses in each territory which are appropriate to local conditions our overseas business continues to pay its own way and is in excellent financial shape.

INDUSTRIAL BRANCH

Progress in this Branch continues to be steady but not spectacular. Over many years, and particularly during the last decade, the character of the business, which at one time consisted mainly of small whole-life policies, has been changing. Although the provision of death cover is still a basic function of this Branch, the death claims paid last year amounting to £13 million, industrial assurance policyholders have to an increasing extent preferred policies which combine saving with death cover. In consequence endowment assurances constitute a growing proportion of the business. Policies are also being effected for larger amounts; whereas in 1938 the average sum assured per policy issued was £27 it is now £73.

Our field staff have continued their efforts to keep premature discontinuances of policies to a minimum, and I am glad to record that the proportion of new policies in this Branch which lapsed within one year after issue was again less than one-tenth. Among policies on which premiums had been paid for a year or longer, and for which, accordingly, a free policy or in many cases a surrender value was obtainable, economic conditions led to a somewhat higher rate of discontinuance than in recent years. It was, however, still at a low level, being less than 3 per cent.

From the surplus of the year a sum of over £11,900,000 has been allocated to provide bonuses on Industrial Branch policies. It is just 50 years since we began a profit-sharing scheme in this Branch, with a first allocation to policyholders of £140,000. This was equivalent to about one-third of the amount then allocated to the shareholders, whereas for 1957 the policyholders' allocation is almost 13 times as great as that of the shareholders.

BONUS DECLARATIONS

The wide range of our business, geographically and in types of contract, results in a corresponding range of bonuses which give a somewhat complex appearance to our bonus declarations. On this occasion increased bonus rates have been declared for policies issued in this country and in some overseas territories. Details of these have already appeared in the Directors' Report, but I wish to refer particularly to the special bonuses which we have again declared in both Life Branches. These, as hitherto, apply only to those policies issued in the United Kingdom prior to January 1, 1954, which become claims during the current year, but on this occasion the rates have been increased.

The introduction of special bonuses in 1956 was, as I then explained, a consequence of an exceptional increase in the dividends from our holdings of ordinary shares in this country, and of our view that, since these increases largely arose from investments made in the past, the older policyholders had a prior claim to benefit from them. In making such a radical departure from our traditional method of distributing surplus we were, not unnaturally, cautious; now, two years later, we feel justified in increasing the amount of these special bonuses. As an example of their operation I will give you the facts of a typical Ordinary Branch claim that we paid last month. The policyholder took out a 25-year endowment assurance for £1,000 in 1933 when he was aged 37. The total amount paid in premiums over the 25 years was £1,043 and this outlay was, of course, substantially reduced by income tax rebate. In return he had been covered against death for £1,000 with bonus additions throughout a period which included a major war. At maturity he received the sum assured of £1,000, with normal reversionary bonuses of £389 and the special bonuses which amounted to £105, making a total of £1,494. This is an actual case; not only did the policyholder do well for himself financially but during the 25 years his mind must often have turned with relief to the security his policy provided.

NATIONAL SUPERANNUATION

At the very time when I was addressing you last year the Labour Party was making public its outline of a national superannuation scheme. Hints also of a Government scheme continue to appear in the Press. The effects of such schemes on the country and on our business could be very important, whether for good or bad and it is imperative that quiet and sober consideration should be given to the problem. The intervening year since the publication of the Labour Party's outline has given everybody time to think and I imagine that the general consensus of opinion would now be that the scheme was too ambitious.

Moreover, closer examination of the scheme strengthens the grave doubts about its consequences for employees who are members of existing pension schemes, whether self-administered or insured. Pension arrangements are inevitably complex and it is not enough to have good intentions about allowing members of existing schemes to contract out of an enlarged State scheme. The practical problems are formidable and can override the good intentions.

Detailed consideration of these problems and of the effects of such an enlarged scheme on the national economy confirms the conclusion that serious consequences would follow if the State should depart appreciably from its proper function of ensuring that the basic needs of the elderly are met. In this respect I would not wish to interpret the phrase "basic needs" in a narrow sense. But I am convinced that it would be unwise for the State to go further than this.

PERSONAL AND OCCUPATIONAL SUPERANNUATION

The doubts and uncertainties surrounding the subject of national superannuation have not prevented further growth of retirement provision on a personal or on an occupational basis.

At our Annual Meeting in 1951 my predecessor, Sir George Barstow, announced that the Prudential was ready to issue group pension policies with participation in profits. He then said, "The step which we are now taking will be a major development in the progress of British insurance." Although progress was at first slow the force of Sir George's remark will be appreciated when I tell you that the premium income from this business is now over £7 million per annum. We also find that there is a considerable market for widows' pension schemes in conjunction with schemes for retirement pensions.

Individual retirement annuity contracts for the self-employed and others in non-pension-

able employment which we introduced as a result of the Finance Act, 1956, have continued to prove popular, and during 1957 we extended our prospectus to include a with-profit retirement annuity policy.

Whatever changes in the field of national superannuation may take place we may be sure that scope will remain for other provision to be made for retirement, and no unnecessary obstacle should impede this development. In this connection it may be recalled that the Finance Act, 1956, also gave considerable benefits to assured pension schemes arranged in one particular form. The result is that a great amount of work is being done by employers, life offices and the Inland Revenue in connection with the alteration of pension schemes so that they may qualify for the benefits to be derived from the 1956 Act. It would be a very great help to all concerned if this labour could be avoided and it would seem eminently reasonable to give the same taxation advantages to all pension schemes, in so far as they provide benefits of the same type.

Another disadvantage of the present legislation in regard to pension schemes is the amount of work involved in establishing under the control of trustees a pension scheme for a small group of employees, whether the scheme is self-administered or assured with a life office. Any simplification of the present elaborate procedure would greatly facilitate the extension of the pension movement among those employers who have very small staffs.

GENERAL BRANCH

In the General Branch the premium income for 1957 together with that of our American subsidiary exceeded £16,900,000, showing an increase of £1,700,000. Approximately one half of the total premium income arose from overseas sources. Gross interest earnings also increased substantially.

The underwriting experience for 1957 showed a marked improvement over that for the previous year, despite a continuance of unfavourable results in some overseas territories, particularly in Canada. The adverse experience in Canada has been shared by many other companies and such steps as are possible are being taken to improve the position. Our experience in the United Kingdom has, however, been good, but in two accounts—fire and motor—home profits were outweighed by overseas losses. A revision of our Home premium rates for certain classes of motor business became operative in July and this factor, together with the diminution of traffic due to petrol rationing earlier in 1957, improved the results of our motor business in this country. Unfortunately the number of accidents continues to rise, and the design of the modern car, admirable though it is in many ways, does contribute to the increasing cost of repairs. During 1958 the revision of rates will become fully operative, but it is too early to say whether this will prove sufficient to meet the rising claims.

The sickness and accident account has proved satisfactory and we especially welcome the very considerable improvement in the miscellaneous account. Our experience in marine, aviation and transit insurance business continues to be satisfactory and the fund is in a strong position. The sum of £50,000 which we have released broadly covers provision for taxation.

The figures of our American subsidiary, The Prudential Insurance Company of Great Britain, are annexed to the accounts before you. A small underwriting loss is shown, but the overall position is healthy and a dividend of 7½ per cent was again declared on the capital of $1,500,000.

DIVIDENDS

Under our Articles of Association there is a close link between bonuses to policyholders and dividends to the A shareholders, and the increased distributable surpluses in the Life Branches have enabled the Directors once again to improve the proportion of these surpluses allocated to the policyholders and at the same time to increase the amount allocated to the shareholders. In each of the Life Branches the policyholders' allocation, which for 1956 was approximately 92.6 per cent of the distributable surplus, is now 92.8 per cent.

The total allocation to the A shareholders represents 2s. per £1 share more than in the previous year, the declared dividend of 29s. 6d. net being 3s. per share greater and the amount credited to the Dividend Reserve Fund representing 1s. less per share than a year ago.

The net dividend declared on the B shares is increased from 3s. 6d. to 3s. 9d. per £1 share. The allocations to shareholders from the General Branch are again more than covered by the interest earnings of the General Branch funds after deduction of the relevant taxes.

INVESTMENTS

During 1957 the institutional investor was faced with several important developments, of which the most notable were the threat to the pound and the counter measures taken by the Government. The decline in the country's exchange reserves mainly reflected the loss of confidence in sterling both at home and abroad, due to the fear of continued inflation. In this situation the demand for ordinary shares and for overseas securities in the summer months together with the weakness of the market for fixed-interest securities bore many signs of an incipient flight from the currency. This was a most grave situation. The expectation of further inflation is itself inflationary, and the capital market cannot fully perform its functions if fixed-interest securities fall into disrepute.

On this occasion, however, the action taken by the Government was sufficiently vigorous to convince the world that they were at last determined to call a halt to inflation. As a result the position of the pound was made more secure and the pressure of inflation was reduced. Both as a life assurance company and as an institutional investor we wholeheartedly support the aim of stabilising the purchasing power of the pound.

The change in the climate of opinion led to an improvement in the gilt-edged market and, with the growing evidence of recession in the United States and the development of a more realistic attitude on the part of investors to the problems facing the British economy, ordinary share prices weakened considerably. Despite the unsettled outlook, the year as a whole saw an active new issue market, which once more has shown proof of its resilience. The restriction of bank credit and, in some industries, the pressure on profit margins, obliged many companies to seek a larger proportion of their finance from the market. In recent months, however, there have been signs that the boom in capital investment is tailing off, and it would not be surprising if this were reflected in a rather lower level of new issues during the rest of 1958.

The increase in our funds, together with the proceeds from redemptions and sales, enabled us to make new investments of £69 million in 1957. The major items were £16 million in debentures, £16 million in ordinary shares, £10 million in property investments and £11 million in mortgages. In addition we invested £6½ million in securities of, or guaranteed by, the British Government. The amount invested in mortgages was substantially less than in 1956 and this was due to a falling-off in the direct loans on mortgage to municipal authorities. At the present time such loans are generally in a form which for taxation reasons is less attractive to a life fund than to some other institutional investors. Our investments in debentures during the year included purchases of convertible debenture and loan stocks. This is a type of security which has become increasingly popular in recent years but it should be borne in mind that the incorporation of options to convert into ordinary shares could prove to be disadvantageous to the borrowing companies and to their shareholders. We, as institutional investors, would generally prefer capital to be raised directly in fixed interest securities or ordinary shares rather than in a convertible form but we do recognise that there can be special circumstances which make an issue in this form appropriate in a particular case.

At this time last year I was able to say that there had been a substantial rise in market values since the end of 1956. This rise was not maintained and was outweighed by the considerable fall that occurred during the latter part of 1957, particularly after the sharp increase in Bank Rate. However, of greater importance from our point of view were the improved yields that we were able to obtain on new investments and also the further modest increase in dividends from ordinary shares during the year. The gross rate of interest earned on the Ordinary Branch fund increased by 3s. 6d. per cent to £5 13s. 8d. per cent and on the Industrial Branch fund by 5s. per cent to £5 16s. 7d. per cent.

Some rearrangement of our investment reserves was made at the end of the year which led to some further writing down of our holdings of British Government securities. Nevertheless it is clear that the low values obtaining at the end of 1957 were not of a permanent nature and we felt that it was undesirable that these and other groups of fixed-interest securities should be written down to their market value. As a result of the heavy depreciation during the year the aggregate market value of all our investments was less than the Balance sheet value, but the difference was amply covered by the Branch contingency funds.

STAFF

In surveying a record of continuing progress there is a tendency to forget the difficulties that have to be overcome. They are, however, by no means negligible. In the work of our field staff, at home and overseas, many problems arise, not the least of which is the natural desire of the community to secure present benefits by the purchase of tangible goods, to the neglect in many cases of adequate provision for the future. It is against this background that we have to measure our progress and it says much for the application and industry of the field man that despite the competition of consumer goods he is contributing in so great a measure to the growth of the nation's savings and the expansion of the Company in all its Branches.

I feel sure you will wish me, on your behalf, to express our warm appreciation of the services rendered by the management and by all the men and women of the Prudential staff at home and overseas.

The Resolutions subdividing the Company's Shares were duly passed and as from today the A Shares will be quoted in denominations of 4s. and the B Shares in denominations of 5s. (1s. paid). The dividend payable on November 13, 1958, will accordingly be 1s. 6d. per 4s. A Share instead of 7s. 6d. per £1 A Share.

PRESSED STEEL COMPANY

INCREASED BALANCE OF PROFIT

FURTHER EXTENSION OF PRODUCTION FACILITIES PLANNED

MR A. ABEL SMITH'S STATEMENT

The thirty-first annual general meeting of the Pressed Steel Company Limited was held on May 28th at Winchester House, Old Broad Street, London, E.C., Mr Alex. Abel Smith, TD, JP (chairman of the company), presiding.

The secretary (Mr J. S. Kean, CA) read the notice convening the meeting and the report of the auditors.

The following is the Statement by the Chairman circulated with the report and accounts for the year ended December 31, 1957:

Ladies and Gentlemen,

PROFIT AND APPROPRIATIONS

From the accounts you will see that the balance of profit for the year ended December 31, 1957, after charging debenture interest and all taxes, was £1,527,121; this compares with the previous year's figure of £951,682 from which, however, there was set aside £238,635 for increased cost of replacement of plant, machinery and equipment; in accordance with the Board's decision to which I referred last year, no further appropriations are at present being made to this reserve. Taxation was higher by £742,452, and the charge for depreciation and obsolescence of buildings, machinery and equipment was also higher by £146,220, reflecting a further increase in the fixed assets of the Company.

From the profit of £1,527,121 referred to above, there must be deducted the expenses amounting to £65,981, incurred in connection with the Debenture Issue and with the increase in authorised capital, also the amount of the regular dividends on the Preference Shares and the interim dividend of 6 per cent paid last November on the Ordinary Stock, aggregating £171,412. This leaves £1,289,728 to be added to the balance of £1,363,023 carried forward on Profit and Loss Account from 1956, and gives a balance of £2,652,751 to be dealt with.

Your Board now recommends a transfer to General Reserve of £500,000 and the payment of a final dividend on the Ordinary Stock of 14 per cent less tax, requiring £304,929. This leaves £1,847,822 to be carried forward.

BALANCE SHEET

There appears for the first time the item of £2 million 5½ per cent Convertible Debenture Stock 1977/82. Authorised share capital has also been increased by £1 million in order to meet the conversion rights attached to the Debenture Stock. The proceeds of the issue of this stock are reflected in an increase in fixed assets of £1,664,457 and in a strengthening of the liquid position. Outstanding capital commitments at the end of the year amounted to £1,630,000. A further major extension of production facilities is planned, to which I now refer.

PROPOSED ISSUE OF £3,500,000 DEBENTURE STOCK

Our motor car customers have recently advised the Company of yet another upward revision in their estimates of the number of car bodies which they will require from 1959 onwards. Your board has decided that in order to meet these requirements it will be necessary once again to increase capacity at Cowley and at Swindon; to finance this expansion it is proposed to raise further permanent capital by an issue of £3,500,000 Debenture Stock. The proceeds of the issue will be utilised for the carrying out of the expansion programme as well as for the provision of additional working capital. Treasury consent has been obtained to an issue of Debenture Stock which will not carry conversion rights. Further details will be given in a letter which I propose shortly to address to holders of the Company's Ordinary Stock, Preference Shares and 5½ per cent Convertible Debenture Stock, to all of whom the new Debenture Stock will be offered.

MOTOR CAR BODY DIVISION

The year 1957 opened with evidence of some improvement in the demand for motor car bodies from the low point reached in December, 1956. The upward trend gained momentum and by mid-summer practically all the ground lost in 1956 had been recovered. Since then there has been a further gradual but nonetheless steady improvement in our business. Rising demand enabled us to build up production at Cowley and in particular at our Swindon factory, where the benefits of the modern lay-out were apparent. Our capacity at Swindon is now to be further augmented by an additional building of over 300,000 sq. ft.; the new lines will embody automation and the latest techniques for the manufacture of car bodies.

We are further expanding our already important engineering research and development facilities in order to be able to give the maximum service to our customers; among other things our engineers are keeping in close touch with developments in the field of plastics, and are continuing to experiment in the application of these materials to press tools and car body components.

The all-important cost factor was helped during the first part of the year by the ability of our home mills to supply sufficient sheet steel to meet our needs. But as the volume of production rose, it became necessary to resort once more to large scale purchases of American and Continental sheet for which we have to pay substantial premiums. This underlines the urgent need for an increase in the strip mill capacity of this country; this would not only help costs but would also save outlays of foreign exchange, particularly USA dollars. It is encouraging, however, to note that our steel industry was recently able to announce a small reduction in prices.

RAILWAY CARRIAGE AND WAGON DIVISION

Our Linwood factory showed satisfactory results. Production of standard passenger brake vans continued throughout the year. This order is now completed and our production lines are busy with the order for utility vans to which I referred last year.

The Company recently obtained an important order from the British Transport Commission for passenger rolling stock required in connection with the Glasgow suburban electrification scheme.

Production of 16-ton mineral wagons also continued, although at a declining rate as the completion of this important contract draws near. When the last wagon rolls off our production line in June, we shall have supplied no less than 74,350 of this type of wagon to British Railways. Orders are in hand for other types of wagons, but the quantities involved are considerably smaller.

I am glad to report that the Company has successfully negotiated the lease of the factory which adjoins our Linwood property; we now have an overall floor area there of almost 1 million sq. ft. The added space will not only give us much needed elbow room, but will also enable us to take on additional work as and when it becomes available.

PRESTCOLD REFRIGERATION DIVISION

Domestic sales of Prestcold refrigerators responded impressively to the spells of warm weather which we experienced last summer, despite the handicaps of hire purchase restrictions and a penal 60 per cent rate of purchase tax. This year's budget has, I am glad to say, at last brought us some relief in one direction in that purchase tax has been reduced to 30 per cent.

The commercial side of our business once again showed satisfactory results.

We are continuing our efforts to build up our export trade in both domestic models and commercial equipment and are concentrating particularly on the southern hemisphere where the main selling season corresponds with our winter months when home sales inevitably decline.

OUTLOOK

Our motor car body business, as I have indicated, shows promise of moving into higher volume than ever before. We believe the optimism of our customers is well founded and with our increasing production facilities we expect to be ready to meet their requirements.

As regards railway equipment, although we are constantly endeavouring to widen our range of export business, the British Transport Commission continues to be our largest customer. The railway modernisation programme, and its tempo, is therefore of considerable importance to us. Orders are, however, now tending towards a larger variety of types of rolling stock. This entails more frequent adjustments in lay-out which in turn means higher overheads than is the case when a long run of one type is involved. I am nonetheless satisfied that our Linwood factory will continue to make an important contribution to the success of the Company.

I look for continued expansion in our commercial refrigeration business. In the domestic field, our new economy 3 cu ft Prestcold model known as the "Packaway" has been particularly well received by the public. We believe that we have the most comprehensive range of refrigeration equipment in the country and with the reduction in purchase tax, I anticipate a further improvement in sales.

This all adds up to an encouraging picture, but I must add a note of caution. Deflationary forces are at work in the world today from which Great Britain has so far succeeded in remaining largely immune. If these forces should gain momentum, due, for instance, to a further deterioration in the economic climate in the USA, it is unlikely that our country can remain unaffected.

The other possible danger which I foresee is a renewal of the rise in manufacturing costs. During the past twelve months, apart from the premium we have to pay for imported sheet steel, costs have remained relatively stable. This has undoubtedly been an important factor in enabling our motor car customers to increase their business, especially in the export field. But if the influences which give rise to increasing costs are allowed once again to become dominant, the position not only of our Company but of the whole country will suffer.

ORGANISATION OF MANUFACTURING DIVISIONS

The three main activities of the Company have up to the present time been run as one unit. The point has now been reached when both the railway and the refrigeration business have grown to a size and reached an importance that, in the opinion of the Board, warrants the administration being divided into three separate divisions, each with its own board of Divisional Directors who remain, however, answerable to the main Board. This reorganisation was effected towards the end of last year and you will see at the beginning of the accounts the names of the executives who have been appointed to each of the Divisional Boards.

TRIBUTE TO STAFF

I have always felt that the tribute to the staff which a Chairman customarily pays tends to become a rather impersonal formality. It is certainly not intended to be such and on this occasion I want to say a little more than usual. Our Company is justifiably proud of its staff, be it management, be it production staff or be it those who carry out the many service jobs without which no large organisation can be run. In the past twelve months, which have been particularly busy, all, in their special ways, have made their contribution and in voicing my appreciation I feel sure that I am speaking for the whole body of our shareholders.

The report and accounts were unanimously adopted and the dividend, as recommended, was approved.

The retiring directors, Mr Henry F. Tiarks and The Right Honourable Lord Ashburton, DL, JP, were re-elected, and the remuneration of the auditors, Messrs Price Waterhouse and Company, having been fixed, the proceedings terminated.

RAND MINES, LIMITED

MR W. M. FRAMES'S REVIEW

The Sixty-third Ordinary General Meeting of shareholders was held in Johannesburg on May 30, 1958. The following is an extract from the circulated statement by the Chairman, Mr W. M. Frames, dated May 23, 1958:

GROUP REORGANISATION

You will have noted in the Annual Report the details of the changes that have been made in the Central Mining—Rand Mines Group organisation, and will probably recollect the Press announcement of August 13th last in this connection. From September 1, 1957, Rand Mines has rendered executive, administrative and technical services to the South African Companies of the Group. The transfer to Rand Mines Limited of the Technical Departments previously under the administration of Central Mining Finance Limited in South Africa was effected smoothly.

CAPITAL

Details are given in the Directors' Report of the recent issue of 700,000 Reserve Shares. The net proceeds of the issue amounted to £2,344,395. Of this amount £1 million has been lent to Harmony Gold Mining Company Limited towards financing the expansion of that Company's operations. Before the end of the year £250,000 had been advanced and the balance will be drawn by July 31, 1958. This loan is repayable in four half yearly instalments of £250,000 commencing on June 30, 1960. Of the balance, a portion has been used to increase investments in mining, financial and industrial Companies in South Africa, and a substantial amount is held in liquid form and is available for employment in any proposition which offers promise of a favourable return.

FINANCIAL RESULTS AND INVESTMENTS

The profit of £768,910 showed little change as compared with that of the previous year. After taking into account £427,504 being the balance of Profit and Loss Account at December 31, 1956, £1,196,414 was available for appropriation. Dividends absorbed £723,411 and £40,000 was transferred to Exploration Reserve, leaving the balance of Profit and Loss Account at £433,003 to be carried forward to 1958. Quoted investments were taken into account at cost less amounts written off but in no case above market value at December 31, 1957. Unquoted shares were valued at cost or at a conservative valuation, being less than cost, by the Directors. Owing to a fall in the Stock Exchange value of some of the quoted securities and a revised valuation of some of the unquoted securities it was necessary to depreciate certain investments by a total amount of £308,634.

After allowing for this depreciation and the investment of net additional funds of over £500,000, the total book value of investments increased by £223,149 to £8,328,684. The market value of the Company's quoted investments increased by £1,012,355 to £10,593,027. Of these quoted investments three-quarters are in gold and coal mines, 85 per cent of which have a life expectation in excess of 20 years. The net cash surplus at the end of the year was £1,901,623, an increase of £1,515,658 over the previous year, resulting from the increase of capital towards the end of the year.

ASSOCIATED COMPANIES

Gold Mining: Compared with the previous year the tonnage milled by the Witwatersrand and Orange Free State mines of the Group in 1957 decreased by 1,284,036 tons to 15,961,396 tons, owing mainly to the cessation of milling by Modderfontein B. Gold Mines, Limited, New Modderfontein Gold Mining Company, Limited, and Welgedacht Exploration Company, Limited, and the curtailment of operations by Crown Mines, Limited. Although the yield at 4.378 dwt increased by 0.172 dwt the total ounces fine recovered fell from 3,627,110 to 3,493,597. Working profits from gold at £10,277,500 were £407,409 less than the year before, while the profits from uranium increased by £680,347 to £2,957,608. Total dividends and repayments of capital increased from £5,051,801 to £5,490,676. Tax and lease consideration increased by £464,295 to £4,331,588 and uranium loan repayments including interest decreased by £4,950 to £919,254.

Development footage decreased by 75,677 feet to 335,557 feet, the footage sampled at 154,290 feet being 65,059 feet less than the year before. Estimated available ore reserves decreased by 3,095,000 tons to 29,939,000 tons.

Coal Mining: The demand for coal in the inland market continues to be greater than the supply owing to transport limitations and to a shortage of non-European employees. As I pointed out in my address last year, increased mechanisation is being undertaken in some cases to offset the labour shortage. Despatches of coal from both Witbank Colliery, Limited, and Van Dyks Drift Colliery decreased compared with the previous year. In the case of the former Colliery this was due to a severe shortage of non-European labour at Wolvekrans, where additional mechanised equipment has been installed and more is to follow, and in the case of the latter to a shortage of railway trucks. The Group has now acquired a further Colliery interest through the purchase by Welgedacht Exploration Company, Limited, of the Utrecht Colliery in Natal.

Industrial: The demand for cement in the Union slackened off somewhat at the beginning of 1957, but since then has taken an upward turn. The additional plant being installed by the Pretoria Portland Cement Company, Limited, at its Slurry works will be completed during the current year. Increases in the cost of new equipment continue to bear heavily on the Cement Industry. So far, with the one exception, referred to in the Annual Report, increases in the controlled selling prices of cement have been determined by the Authorities solely on the considerations of profits per unit—a method which, of course, fails under the present circumstances to provide adequate compensation for the cost of replacements and extensions.

The demand for lime continued to increase, particularly so in respect of the requirements of the Uranium Industry.

Since the close of the last financial year of The Hume Pipe Company (S.A.) Limited there has been a decline in the demand for the products of that Company's factories situated at the Cape.

DIRECTORS

After the close of the financial year Brigadier R. S. G. Stokes and Mr W. D. Wilson resigned their seats on the Board and Mr S. D. H. Pollen and Mr W. Marshall Clark were appointed to the Board to fill the vacancies. As Shareholders will be aware, Brigadier Stokes had been a Director of the Company since 1935 and on behalf of the Board and the Shareholders I should like to thank him particularly for the long and valuable services he rendered to the Company.

As an item of Special Business you will be asked to pass a resolution amending the Articles of Association whereby the maximum number of Directors permitted will be increased from 12 to 15. In the event of your passing this resolution Lord Bailieu and Mr B. G. Twyeross will, as announced on March 19, 1958, be asked to join the Board.

HARLAND AND WOLFF, LIMITED

SUBSTANTIAL OUTPUT ACHIEVED DESPITE DIFFICULTIES

COMPETITIVE EFFICIENCY MENACED BY LABOUR DISPUTES

SIR FREDERICK E. REBBECK ON ESSENTIALS FOR MAINTAINING A BALANCED PROGRAMME OF WORK

The seventy-third Annual General Meeting of Harland and Wolff, Limited, was held on May 22nd at the registered offices of the Company, Queen's Island, Belfast. Sir Frederick E. Rebbeck, KBE, DSc, DL, Chairman and Managing Director, presided.

The Secretary read the Notice convening the meeting and the Report of the Auditors.

The Chairman said:

As the statement of Accounts and the Directors' Report have been in your hands for some time I propose, with your agreement, to take them as read. (Agreed.)

In comparing the results with those of the previous year you will have noticed that the charge for Depreciation in the Accounts of the Parent Company has been raised to £600,000. The additional £100,000 has been necessitated by the increase in the Fixed Assets since 1954 when the Annual charge was raised to £500,000.

The reduced profit on trading for the year under review is attributable in no small measure to interruptions caused by strikes and labour disputes. So far as ship construction was concerned, the orderly progressing of the work suffered not only from the cumulative effects of these interruptions but also from the consequences of deficiencies in steel supplies. In an endeavour both to maintain a balanced programme and to meet our commitments to customers, we were involved in additional costs which were not recoverable in the final prices of the contracts.

Nevertheless, the Directors propose to maintain the Dividend of 10 per cent on the Ordinary Stock in respect of the year ended December 31, 1957. They propose that £100,000 should be added to the reserve for Fixed Asset Replacement, and £11,930 be carried forward on Profit and Loss Account in the books of the Parent Company. The addition to the Fixed Asset Replacement Reserve is in continuance of the policy of maintaining adequate reserves for the purchase of Plant and Machinery, which has enabled the Company to carry out year by year a steady programme of modernisation and improvement.

LAUNCHINGS EXCEED 174,000 TONS

During the year naval and merchant vessels totalling over 174,000 tons gross were launched from the Company's shipbuilding yards. The most important ship was RMS *Pendennis Castle* (29,000 tons gross) for The Union-Castle Mail Steamship Company, Limited, which is now fitting out. This fine passenger liner, intended for the weekly mail service from Southampton to South African ports, will be the largest of the eight mail ships engaged on this run.

Other vessels launched included a number of important cargo liners, oil tankers, an ore carrier, the frigate *Blackpool* and two coastal minesweepers. Contracts completed during the same period comprised sixteen merchant vessels for British, Norwegian and American owners, the Light Fleet Carrier *Bonaventure* for the Royal Canadian Navy, and three coastal minesweepers for HM Navy.

This substantial output was achieved despite the difficulties in regard to steel supplies and the adverse effects of strikes on production to which I have already referred. I emphasised last year that if the Company's capacity is to be used to the full, two conditions must obtain. Firstly, not only must our intake of steel be satisfactory in terms of quantity, but it must also be suitably geared to our requirements, and, secondly, we must have a period of stability free from wasteful labour disputes. These two conditions, however, were far from being fulfilled during 1957. The position in regard to steel supplies improved towards the end of the year in terms of both volume and sequence, but not in time to prevent the postponement of a number of launches and completion dates.

LABOUR RELATIONS

As I have already mentioned, in the field of labour relations we did not experience the period of tranquillity for which we had all hoped. A number of strikes of national and local origin, the intermittent imposition of embargoes on overtime, and various forms of restriction on normal working combined further to disrupt production schedules already upset by the effects of labour troubles which occurred during 1956. The result was that building times were extended beyond economic limits with the financial consequences to which I have referred. The most serious stoppage with which we have been faced for many years has, I am glad to say, just ended with the return to work on Monday of this week of the platers employed at our Belfast Works, who were on strike for eleven weeks. Within two weeks of the commencement of the strike, work on ships on the stocks was brought to a standstill and eventually over five thousand other men were rendered redundant.

A NOTE OF WARNING

Whilst I am glad to say that our present order book provides a varied and well balanced programme of work for some time to come, I must sound a note of warning. Against a background of a diminishing number of inquiries for new tonnage, and increasingly competitive conditions, it is particularly important that all our employees, in whatever capacity they may be engaged, should fully appreciate the necessity for wholehearted concerted effort to maintain efficiency and reduce costs. Exorbitant and unrealistic wages and other claims, backed by strikes or other forms of militant action, can only impair our competitive efficiency and damage our reputation.

Merchant vessels under construction, or to be laid down, include three 20,000 ton passenger and cargo vessels for Royal Mail Lines, Limited, the 45,000 ton passenger liner *Canberra* for the Peninsular and Oriental Steam Navigation Company, and several important groups of cargo liners, tankers and ore carriers for British and foreign shipowners. Thus, apart from the *Pendennis Castle*, to which I have already referred, we have orders for four large passenger carrying vessels, work on which will ensure the satisfactory utilisation of our extensive facilities at Belfast and continuity of employment for large numbers of our finishing trades.

An interesting and varied range of naval work continues to engage a substantial proportion of our productive capacity. Contracts include the construction of a guided missile destroyer, three frigates and three coastal mine-sweepers for the South African Navy. In addition, we have been entrusted with the building of a frigate and the fitting-out of the Light Fleet Carrier *Hercules* for the Indian Navy.

DIVISIONAL ACTIVITIES

The Marine Engineering Division was fully engaged throughout the year on the construction and installation of main and auxiliary machinery for merchant and naval vessels building in the Company's shipyards and for hulls building by other shipbuilders. During the year the output of main propelling units amounted to over 243,000 I.H.P.

The Industrial Engine Division maintained a satisfactory level of activity during the year. We produced diesel engines for a range of public services, also a number of compressor units under our arrangement with the Cooper-Bessemer Corporation of Ohio, USA, for industrial purposes. The Electrical Division was well employed on the installation of electrical systems on board vessels building in the Company's shipyards, and in the manufacture of alternators and other electrical equipment. Despite some contraction in the markets for the products of both Divisions, the position in regard to new orders is reasonably satisfactory.

Our Steel Constructional Division continued to work to full capacity throughout the year and a number of important new contracts have been secured.

The Company's three large and well equipped Repair Establishments at London, Liverpool and Southampton again handled a large volume of repair work. As usual Belfast and Glasgow carried out a number of important ship and engine repair contracts.

DIRECTORATE

It is with profound regret that I refer to the death in December, 1957, of Mr William Strachan, Jnr. We all feel keenly the passing of an esteemed colleague who rendered outstanding service to the Company since he joined the Board over twenty-two years ago.

Since the end of the year under review Mr H. C. MacEwan has resigned from the Board and at the end of this month will retire from his executive position with the Company after forty-six years' loyal service.

We are pleased to welcome to the Board Sir Andrew McCance, DL, DSc, LLD, FRS, Chairman and Managing Director of Celvilles Limited, and Mr W. T. Underwood, MA, ACA, an executive officer of the Company, who were appointed in November, 1957, and March, 1958, respectively.

In conclusion, I take the opportunity to

thank all members of our staff for their loyalty and service throughout the year.

The Report and Accounts were adopted; the proposed dividend was approved; the retiring Directors, namely, Sir Andrew McCance, Mr W. T. Underwood, Mr N. McCallum, Mr R. Newell and Mr W. H. Park were re-elected. Messrs Price Waterhouse and Company were re-appointed Auditors and their remuneration was fixed.

The Meeting terminated with a unanimous vote of thanks to the Chair.

AMALGAMATED BANKET AREAS

The twenty-second annual general meeting of Amalgamated Banket Areas Limited was held on May 28th in London.

Major-General W. W. *Richards*, CB, CBE, MC, Chairman, presided.

The following is an extract from his circulated Statement:

The profit of £35,730 for the year ended September 30, 1957, has been largely utilised to write off Diamond Drilling Expenditure, £8,371, and Provision for Obsolete Stores, £25,000.

It was not until the end of the year under review that mining operations resulted in satisfactory profits and, I am happy to say, the improvement has been well maintained ever since.

The results of the first six months of the current year's operations, October, 1957 to March, 1958, have improved our Company's financial position very considerably.

Since the end of the year, both tonnage and grade have shown most satisfactory increases. The Mine is now producing monthly over 60,000 tons of ore averaging about 5.0 dwts. per ton.

Development has been stepped up considerably, totalling 26,792 feet, as compared with 17,323 feet the previous year.

The total available ore reserves at September 30, 1957, were computed at 1,281,107 tons of an average value of 5.487 dwts. per ton over a width of 39.13 inches.

TECHNICAL EFFICIENCY

Mr C. J. Burns, a director, said: On the technical side every effort has been made to reduce costs and improve efficiency. For example, explosives which are consumed in considerable quantities have received the attention of your consultants and mine's staff. A careful study of this subject has resulted in increased efficiency in as much as since March, 1957, the explosive costs per total footage of development have resulted in a saving of £9,612 per annum, and for mining of £29,665 per annum of total pay ore mined, a total saving of £39,277 a year. On the power side careful planning and spreading of the electrical load have resulted in very economical operation of the power plants throughout the year.

The report and accounts were adopted.

FREDERICK LAWRENCE LIMITED

In the report of the Annual General Meeting which appeared in last week's issue the Comparison figure for the previous year's Profit on Trading was given as £11,886, whereas this should have read £111,886.

YORKSHIRE INSURANCE COMPANY

RECORD PREMIUM INCOME

The annual general meeting of the Yorkshire Insurance Company Limited was held on May 28th, at York.

The Right Honourable Lord Middleton, KG, MC, LLD, chairman, in the course of his speech, said:

Life Department.—Once again the Life Department has transacted a record volume of business. The total new sums assured amounted to nearly £26 millions, compared with a little over £24 millions in the previous year.

Fire Account.—Premiums in the Fire Department for the year amounted to the record figure of £5,086,904 compared with £4,826,501 last year, thus resulting in an increase of £260,403. The loss ratio incurred rose to 49.68 per cent compared with 45.50 per cent in 1956.

Accident and General Account.—Premium income advanced by £728,223 to a new record of £10,328,944. Expenses, including commission, have been reduced from 37.53 per cent to 35.87 per cent. The claims cost was slightly reduced at 62.74 per cent.

Marine Account.—Premium income for 1957 was £2,589,187 compared with £2,153,873 in 1956, an increase of over 20 per cent. Claims totalled £1,971,189 against £1,667,816 in 1956.

We recommend that the dividend should be at the same rate as last year, which will absorb £168,188.

The report and accounts were adopted.

ADAMS PEAK TEA ESTATES

The thirty-eighth annual general meeting of Adams Peak Tea Estates Limited was held on May 22nd in London, Sir Charles Miles, OBE (the Chairman) presiding.

The following is an extract from his circulated review:

The profit for the year ended December 31, 1957, after charging Depreciation, is £34,778 which compares with £45,570 for the previous year. The result may be considered very satisfactory in the circumstances, as after the Suez crisis the market took a decided downward trend and the recovery in prices for the type of tea produced by your Company did not materialise until later in the year. As a result, the average prices received for our teas, both in London and Colombo, were lower than in 1956 and although the crop produced was nearly 60,000 lb above the 1956 outturn, the value of sales proceeds declined by some £6,000.

Your Board has decided to transfer £3,000 to General Reserve and to recommend a dividend of 25 per cent, less Income Tax, leaving a balance of £19,905 to be carried forward.

A very high standard of manufacture was maintained during 1957 and our teas met with a good demand and sold readily.

With regard to the current year, crop to the end of March is 239,105 lb, a decrease of 5,627 lb, compared with the same period last year. At present the teas are selling very well, but it is too early to hazard an opinion as to prospects for 1958.

The report was adopted.

LONDON BRICK COMPANY LIMITED

ANOTHER SUCCESSFUL YEAR

GREATER EFFICIENCY COMBATING MENACE OF RISING COSTS

MR A. T. WORBOYS ON WIDENING RANGE OF PRODUCTS

he fifty-eighth annual general meeting London Brick Company Limited was held May 22nd in London.

r A. T. Worboys, CBE (the chairman), ded and, in the course of his speech, :

he Trading Profit and Sundry Income the year amounted to £2,673,265 com- d with £2,179,576 for the previous year. *r providing £400,000 for depreciation,* 685 to write down our investments, 845 for expenses in connection with the ase of authorised and issued capital November 15, 1957, and £1,320,813 for ion and other charges, there remains a profit of £895,522. To this has been d £312,047, the unappropriated profits e beginning of the year, and £8,783 taxa- adjustment for previous years, and there ains a balance available of £1,216,352.

e are pursuing our conservative policy placing £350,000 to General Reserve and, deducting this amount, the net dividend *the year on the* 8 per cent Cumulative ference Stock, the net interim dividends per cent on the £3,900,000 Ordinary k and 10 per cent on the larger Ordinary k of £5,200,000, there remains £380,764 e carried forward. The Directors do not mmend any further dividend for the year 7.

caling now with our two Subsidiary panies, Stewartby Housing Association ted continues in full operation.

ith regard to Transformers (Watford) ted, our manufacturing Subsidiary Com- y, the high level of output reached in 1956 substantially maintained during 1957. entered 1958 with orders on hand at a tisfactory figure, considerably higher any previous level.

evere competition resulting in reduced t margins still persists, but due to sus- ed and unremitting efforts by all em- ees and greater efficiency in various rations, the net trading profit shows that upward trend referred to last year is tinuing.

PARENT COMPANY'S ACHIEVEMENTS

The accounts portray the results of a successful year and reveal a sound financial position. The satisfactory results obtained cannot be attributed to any one single factor; they have been obtained from the accumulation of patience, perseverance and effort by all the departments in our organisation, resulting in better work flow and the more efficient employment of labour. You will see clearly what I mean when I tell you that the man hours per thousand bricks made in 1957 were the lowest ever in the history of the Company and represented a saving of 1,000 workers based by the 1939 basis. Furthermore, this saving has been obtained in spite of our manufacture of various new types of products, many of which were not even envisaged before the establishment of our Research Laboratories.

The year has seen an increase in the total production of bricks and brick equivalents. This is no mean achievement when it is appreciated that this was done without any increase in kilns. We are also now reaping the benefits from our consistent policy of mechanisation.

In the last year many new facts have emerged as a result of intensive studies both in our Technical and Research Laboratories and in the Works as applied to our clays and conditions. All these facts confirm the wisdom of our decision to instal temperature measuring and other instruments in our kilns as rapidly as possible. This is going ahead as fast as we can obtain equipment and train our staff in the new techniques involved.

Brickmaking, as we know it, involves a good deal of engineering skill. Our Engineering staff are ever on the alert for speeding up processes by producing new machines or improving existing ones. Through their concentrated efforts over the years, it has been possible to so improve and equip our engineering shops with modern plant that the resulting increase in efficiency is reflected in considerably lower costs for many of our day to day requirements. For example, it is now possible for us, with our new machines, to turn out in 7½ hours parts which previously it took us 21 hours to make. Similarly, other parts can be made in 8½ hours compared with 15 hours and yet another operation which hitherto took four hours can now be done in half an hour. These time savings form a useful contribution to our continual search to reduce production costs and are also reflected in our efforts to hold prices steady. Only by such means are we able to combat the menace of the general upward spiral and its disturbing effects on production and sales.

PRICE STABILISATION

You may recall that, when addressing you in May, 1956, I dealt at some length with price stabilisation. At that time I told you that we had made no advance in our prices since March, 1954, despite the fact that we had satisfied wage demands, increased charges for coal, electricity, transport and other materials required in the course of our operations. The two subsequent advances in the price of our bricks in effect mean that since March, 1954, to the end of 1957, our prices have only been increased to the extent of 8s. per thousand bricks, an achievement of price restraint which has been gained only through an ever increasing efficiency in every field of the Company's operations.

It may have been noted from Press announcements that the Board of Trade has directed the Registrar of Restrictive Trade Agreements to give priority in references to the Restrictive Practices Court to Agreements relating to a variety of products including bricks. This Company has understandings with other Fletton Brick makers in regard to maintaining uniformity of delivered prices in parts of this country which, on advice, were considered to be registrable under the Restrictive Trade Practices Act, 1956. The general pattern of determining delivered prices follows the principles which were established by Statutory Orders made by the Minister of Works and in force up to May, 1948, when control of brick prices was abandoned. In due course it may be necessary for these arrangements to be justified before the Court.

HIGH LEVEL OF DELIVERIES

Turning to the building industry generally, 1957 was a year of difficulties and changing fortunes. However, the trade was blessed by an unusually mild winter and we continued to achieve a strong order book, deliveries of the Company's products being maintained at a very high level, although towards the end of the year there were indications of an impending decline.

A feature of the year has been the continued growth of our facing brick trade. In the last five years our deliveries of facing bricks have grown by 35 per cent and they have never been more popular, providing as they do a range of pleasant colours and textures at reasonable prices. The Dapple Light Facing, upon which a good deal of research was centred, was put on the market in 1955 and is proving an especial favourite and is undoubtedly a winner. Steps have been taken to augment production of this brick.

During the year we produced a new facing brick called the "Phorpres Heather Facing." The Heather Facing was introduced at the 1957 Building Exhibition. It was given a very favourable reception and is a most popular addition to our range of facings.

With the addition of the Heather, our facings now comprise the Rustic, Sandfaced, Cortex, Saxon, Tuscan, Golden Buff and Dapple Light, and any downward trend in the demand for one type of facing brick stimulates our endeavour to increase our range still further.

Although prices for our pipes and all types of our bricks were advanced on April 15th last year following the increases in wages, the revised prices did not affect the strength of our competitive position, as was proved by the number of orders taken in the following months. Throughout the year our bricks remained competitive in most areas of the British Isles.

There was no alteration in our prices for hollow clay blocks, which have remained unchanged since July, 1955. The maintenance of price stabilisation for these products is a factor which has helped us to maintain deliveries of hollow clay blocks throughout the year. Floor block sales too have remained good.

The increase in the production of Field Drain Pipes continues and deliveries throughout the year constituted a record.

Last year you may recall I was somewhat optimistic in my forecast and the results I have reviewed today confirm the views I then expressed. Today, however, to make any long term forecast is an extremely difficult task, but the trading results so far this year are only slightly below those for the corresponding period of last year. During the last few weeks there has been a distinct uplift in demand and, if the present strength continues, results for the year should be satisfactory.

The report was adopted.

REED & SMITH LIMITED

RESULT SATISFACTORY

The forty-sixth annual general meeting of Reed & Smith Limited, was held on May 28th at The Rougemont Hotel, Exeter, Devon, Sir Arthur C. Reed (chairman of the company) presiding.

The chairman said: While the profits for 1957 are down compared with the previous year, your Directors consider the result satisfactory bearing in mind the difficult trading conditions which your Company, in common with the rest of the Industry, has been experiencing during 1957. As would be expected in what has been virtually a buyers' market, competition has been severe and, with the costs of labour, transport, coal and many other items still rising, it is not surprising that profit margins have been reduced.

TURNOVER FULLY MAINTAINED

Despite increased competition, however, we have managed to obtain a reasonable share of the available business and it is encouraging to note that our turnover has been fully maintained.

The Scrip Issue to shareholders last year was effected by capitalising £268,905 of the General Reserve. Your Directors feel that it is prudent gradually to rebuild this reserve and propose, therefore, to transfer £143,905 from Profit and Loss Account bringing the total of the General Reserve to £575,000.

The Interim Dividend paid during the year on the increased Capital was 6 per cent, less income tax, and the Directors now recommend a Final Dividend of 9 per cent, less income tax, making a total of 15 per cent, less income tax, for the year. This is equivalent to 22½ per cent on the old capital and compares with the 20 per cent Dividend paid last year.

The purchase of the entire capital of The New Taplow Paper Mills Limited was completed on May 31, 1957. This has already proved beneficial to your Company and your Directors are satisfied that this acquisition has further strengthened the Group by entering a still wider field of paper manufacture.

This addition, together with further capital expenditure at our other Mills, has increased our fixed assets by more than £300,000 compared with a year ago, and it should be noted that current assets exceed current liabilities by over £745,000.

I am pleased to report that the work on the modernised and enlarged papermaking machine at Watchet and the new machine at Stoke Canon has now been completed and that both machines are running well.

I should mention that we are in the process of installing up-to-date plant for the further clarification of "trade-waste waters" and considerable progress has already been made. These installations have been designed to satisfy the high standards demanded by the Authorities. Shareholders will appreciate, however, that expenditure of this nature does not increase our profit-earning capacity.

THE CURRENT YEAR

I know you will expect me to say something about the current year. While trading conditions remain difficult, the figures for the first four months are reasonably satisfactory and we are in a better position than ever before to take full advantage of any improvement in general trading conditions.

It is with regret that I have to report that Mr George Oswick, whose valued services to the business extend over a period of more than 50 years, finds that he is no longer able to give full-time service to the Company. He has, however, indicated his willingness to remain a Director and be available in an advisory capacity and we are all very pleased to know that we shall have the continued benefit of his wise counsel and long experience in conducting the Compa affairs.

In these circumstances, the Dire appointed Mr Gunner to the Board during year. He has served in the organisatio many years and has been Joint Sales Man since 1954.

The report and accounts were adopted

THE BRITISH VACUUM CLEANER AND ENGINEERING

GROWING DEMAND FOR SPECIALISED PRODUCTS

The fifty-fourth ordinary general meeting of The British Vacuum Cleaner and Engineering Company Limited was held on May 28th at Leatherhead.

Mr O. D. Angell (the Chairman) presided and, in the course of his speech, said:

During the early part of the last accounting period, petrol rationing and its hindrance in travel restrictions, coupled with the already crippling burden of inflationary pressure, gave your Board much concern with regard to home trade, but the intensification of efforts to produce economies and the overhauling of our sales and production methods may be expected to afford satisfactory long-term reward.

The realisation of our holding in an Associated Company for £52,500 (a profit of £37,500) helped to the easement of our finance, and here I would add that we still retain a most harmonious business relationship based on the continuing mutual desirability of collaboration and the true goodwill derived from friendship at executive level which has developed over the years.

Your Directors are aware of the challenge of European Free Trade and to strengthen our prospect in this field a determined effort is being made to establish through a subsidiary Company, an export market in Germany. Our Export Sales Organisation is under close scrutiny in order that no stones will remain unturned in our endeavours to earn our full share of this large potential.

Although a much improved result is before you, your Directors are far from complacent, and no effort will be spared to consolidate and expand our earning ability.

In view of the improved Consolidated Balance Sheet position your Directors felt justified in recommending a maintained dividend. Shareholders net funds now amount to £1,063,694 compared with £1,047,575 last year, after allowing for the maintenance of the 10 per cent dividend.

THE OUTLOOK

Your Directors are confident that their policies over the last few years, together with active steps taken over the last few months, have borne fruit, and provided we are not faced in the near future with some new National calamity beyond our control, we believe we shall be able to report a continued recovery in the fortunes of your Company.

In the course of a detailed review of the field of activities covered by the Company the Chairman commented on the Goblin Vacuum Cleaner, Goblin Washing Machines and the Goblin Teasmades. He continued: Beyond this we have a substantial range of Industrial Cleaning Equipment with many applications. We are now established in the highly specialised manufacture of small p sion motors and our range is constantly b extended to cover many of the requirem of the Aircraft and Electronic Indus Our highly qualified team of Technician capable of meeting the ever growing de for development of this type of unit. Time Recorders find acceptance in all mo Factories in Great Britain and we are be ing well established in this field in parts of the world. This also applies to Master Clock Systems.

Not only do we market all these Appli but we are manufacturing more and mo the component parts each year with resu economies.

I make special mention of these aspec our production because we do not be that it is generally appreciated that our potential for reward is far beyond the sa our domestic appliances, although eve this competitive market we should, with ful management of sales and produc provide the larger part of our overhead upon which the fruitful results of our specialised lines can accrue to the bene our Company.

The report was adopted.

LISBON ELECTRIC TRAMWAYS

The annual general meeting of Li Electric Tramways Limited will be hel June 25th in London.

The following is an extract from the lated statement of the Chairman, The Honourable the Lord Rathcavan:

The number of fare-paying passe carried on the Company's vehicles durin year 1957 continued to increase, although again tram passengers declined slightly. 1957 passengers carried totalled 368,90 as compared with 363,728,000 in 1956, a crease of 5,181,106, or 1.42 per cent, w the mileage run by our vehicles (comp both trams and buses) at 30,178,386, pared with 29,821,712 in 1956, show increase of 356,674, or 1.20 per cent. tween both services well over a million paying passengers were carried per day.

When one considers that the correspo figure of passengers carried for the year just ten years ago, was only 268 m against 368 million for 1957, these fi show a remarkable increase in such a time, bearing in mind the continual g of motor cars and scooters.

Our total fleet of 757 vehicles now co of 243 buses, of which 114 are double-de 414 trams and 100 trailers.

Although revenue has again increased penses have also risen considerably. Company contributed £463,689 to the Revenue of Portugal and to the Muni Revenue of Lisbon during the year, a crease of £14,418, or 3 per cent over

After providing for all charges, the operations show a profit of £64,315. Directors recommend a total Ordinary dend for the year of 6 per cent net.

HIGHLANDS AND LOWLANDS PARA RUBBER COMPANY LIMITED

MR T. B. BARLOW'S STATEMENT

The fifty-second Annual General Meeting of the Highlands and Lowlands Para Rubber Company Limited, will be held in London on June 3, 1958:

The following is an extract from the circulated review of the Chairman, Mr T. B. Barlow:

The year 1957, when a profit of £278,955 was earned, was even more successful than 1956. The final dividend will be 25 per cent, which will make a total for the year of 37½ per cent. In addition a 7½ per cent tax free distribution from land sales was made in December, 1957, this is equivalent to 13 per cent less tax.

Stockholders benefit by oil palm profits, which at £33 per acre (£32 per ton) are worthy of note. From 7,584 acres of rubber in bearing and 3,352 acres of oil palms the profit from each crop amounted to £125,000. With 2,307 acres of rubber to come into tapping and 685 acres of oil palms to mature —the future can be faced with confidence.

The Board decided to make stock units transferrable in 2s. units instead of £1 units as from April 16, 1958.

Relationships with labour throughout the year have been excellent.

It is expected that the rubber estimate of 4,498,000 lb and palm oil estimate of 2,900 tons for 1958 will be exceeded.

Replacement continues with an annual programme of about 700 acres.

MALAYA

Politically the outstanding event was Malaya's acceptance of independent status within the Commonwealth. The country-wide celebrations were carried out in a spirit of harmony and goodwill on all sides. After "Merdeka" the relationship between all races remains good. The Prime Minister, Tengku Abdul Rahman, has on many occasions clearly indicated his Government's wish to attract foreign capital and to offer it security.

But if the past has been satisfactory both politically and economically, the present situation is a challenge to the Malayan Plantation Industry.

It is estimated that in the last two years nearly 200,000 acres of European owned estates have been sold, many of which have been fragmented. This procedure has emphasised the value of the social and essential services, which the large estates provide and which may well suffer in the case of these being divided up into smallholdings; for instance water and electricity supplies, drainage, sanitation, medical and educational facilities, maternity benefits, etc., are lost or curtailed. There is a feeling that this disposal of estates is reaching saturation point, and the stage is fast being reached where too many acres are being chased by too few dollars.

Just as British capital and managerial capacity is valuable to Malaya, the Malayan produce and tin are most important to the Sterling Area, which, excluding the UK, derived no less than 12 per cent of its 1957 dollar earning exports from Malaya. In addition, during 1957 Malaya's and Singapore's imports from the UK were £90,300,000 and exports to the UK £70,800,000.

THE CITY AND MALAYAN RUBBER COMPANIES SHARES

It may well be asked why rubber shares are on a 20-25 per cent yield basis. The answer is that institutional and professional investors will not invest in "small" companies where there is inevitably a poor market and broadly speaking the Malayan rubber industry consists of scores of such companies, which despite their good management and efficiency are not attractive to the big investors of the City of London. The export trade to Malaya and Singapore and the imports therefrom, totalling £161 million in 1957 are very much the concern of the City. The City should therefore support the Planting Community and take a far greater share of the capital of these companies. Not only will this be a safeguard against political insecurity but it will also provide support to the export and import trade of Malaya, in which these institutions are so largely concerned, both through their direct interest in these trades and also through banking, insurance and shipping.

The nominal issued capital of Malayan Estates, amounting as it does to little more than £53 million, is a small sum compared to the investing capacity of the City and the trade at stake. There are signs that these facts are coming to be realised in certain enlightened and influential quarters. Suggestions have been made that in this era of large companies the process of association and grouping should be extended to the plantation industry by the creation of large holding companies, which would enable the existing operating units to be maintained with their present efficient organisations and at the same time provide a far more attractive investment for the institutions.

The Board have fostered these ideas and in order to prepare the way for the beginning of such association stockholders are asked to agree to an increase of authorised capital to £1 million.

1957 has been a good year for the Company, its stockholders and its staff. Although the prices of rubber and palm oil are lower in 1958, increased crops and reasonable costs should safeguard the current year's trading, always provided nothing unforeseen occurs.

Yield per mature ac.	583 lb	.85 tons
Profit per mature ac.	£13	£33
Profit	5.5d. per lb	£32 per ton

BLOCK & ANDERSON LIMITED

CONTINUED PROGRESS

MR W. E. BLOCK'S REVIEW

The twenty-seventh annual general meeting of Block & Anderson Limited, was held on May 28th, at the registered office of the company, Banda House, Cambridge Grove, Hammersmith, W., Mr A. E. Block (deputy chairman and joint managing director) presiding.

The Secretary (Mr W. Crosskey, FCWA) read the notice convening the meeting and Capt. R. M. Peat, of Messrs Peat, Marwick, Mitchell & Co. read the report of the auditors.

The following is the Review by the Chairman, which had been circulated with the report and accounts for the year ended November 30, 1957, and was taken as read:

The progress of your Company continued during 1957 and sales were again increased.

The group profit before taxation is £219,213 as against last year's figure of £231,962. This is due partly to the unavoidable expenses incurred in moving to our new headquarters and to the continued increase in costs which cannot always be passed on to our customers.

DIVIDEND RECOMMENDATION

In addition to the Interim Dividend of 10 per cent paid last November, your Directors propose a final dividend of 25 per cent, less tax.

This represents a total distribution of £70,000 before tax on an increased Ordinary Capital of £200,000 as compared with a distribution of £61,250 last year. Your Directors have considered it prudent to write off immediately certain of the work on the new buildings as representing initial repairs to the structure. The balance of undistributed profit to be carried forward in the Consolidated Balance Sheet after allowing for the dividend payment, the writing off of building work and the dividend on Redeemable Preference Shares amounts to £276,732 against £230,135 brought in.

At home we are beginning to reap the benefit of the new branches established last year. In Canada and South Africa our subsidiaries continue to expand and we are in the process of opening further branches in both countries.

EXPORT SALES MAINTAINED

In spite of all difficulties and increased competition in many countries abroad, our export sales were maintained and your Directors are making every effort to intensify our export sales drive where conditions allow.

Towards the end of 1957 we moved in our premises at Hammersmith. This has already given us greatly improved control and co-operation of all departments and will make itself felt in more economical working and increased facilities for research development and further expansion.

You will have seen from the letter sent with the Notice of the Extraordinary General Meeting held on April 21, 1958, that the cost of re-building and re-equipping our new premises had to be provided in part out of Working Capital. At that meeting a Resolution was passed to increase the Company's authorised Share Capital by the creation of 2 million new Ordinary Shares of 1s. each. Your Directors made a "Rights" Issue of 300,000 Ordinary Shares of 1s. each on the basis of three new shares for every forty shares held at a price of 3s. 4d. per share. Allotment Letters were posted on April 21, 1958.

CURRENT FINANCIAL YEAR

The initial result obtained during the current financial year justifies my belief that, barring major changes in existing conditions, your Company's satisfactory trading and progress will be maintained.

In conclusion, on behalf of the Board and myself, I should like to thank all members of our personnel at Home and Abroad for their loyal service and co-operation during the past year.

The report and accounts were unanimously adopted and the dividend, as recommended, was approved.

The retiring director, Mr V. H. Block, was re-elected and the directors having been authorised to fix the remuneration of the auditors, Messrs Peat, Marwick, Mitchell & Co., the proceedings terminated.

LIMMER & TRINIDAD LAKE ASPHALT

SIR JOHN HATHORN HALL'S REVIEW

The eighty-sixth Annual General Meeting of the Limmer & Trinidad Lake Asphalt Company Limited, will be held on June 19th, in London.

The following is an extract from the statement by the Chairman, Sir John Hathorn Hall, GCMG, DSO, which was circulated with the report and accounts:

In the Asphalt Industry, 1957 proved to be a year of increasing difficulty. It is therefore a matter for congratulation that the Group's Trading Profit for the year fell only marginally short of the record profit of 1956. Depreciation, however, absorbed approximately £25,000 more than in the previous year and consequently the Group Net Profit was about £10,000 less than in 1956.

Your Directors recommend the payment of a Final Dividend of 9 per cent making a total of 15 per cent for the year.

In 1957 the turnover of both Parent Company and the Subsidiaries was slightly in excess of that for 1956, which was itself a record. However, we continued to experience during 1957 a falling off in profit margins. With our modern plant and equipment, the maintenance of a high rate of turnover is essential to our business.

During the year we changed the name of the International Asphalte Company Limited to The Limmer & Trinidad (International) Asphalt Company Limited, with the object of acquiring Overseas Trade Corporation status for that Company.

Although your Group is in a much more fortunate position than some in still having a very satisfactory order book, I think it unlikely that we shall be able to repeat in 1958 quite the same excellent trading results as for 1957. But any slight setback will, I am confident, be short-lived.

ASSOCIATED FISHERIES LIMITED

At the General Meeting held on May 22nd in London, Mr W. A. Bennett reported that the marked decline in the trading profit of the Group, of which warning was given last year, had unfortunately materialised. The main cause of the sharp fall in profit was quite beyond the Board's control, namely, the acute shortage of fish on the Distant Water grounds. The 1957 total catch was the lowest in seven years. There was also a marked decline in the demand of the consuming public in comparison with the two previous years. The small rise in overall price realised at auctions of ¾d. per lb was insufficient to compensate for the heavy drop in the catch and cost of processing plants working at limited capacity. Although total group turnover increased, profit margins were very much reduced by the heavy decline in productivity of the fishing grounds, rising costs and depreciation charges.

After covering all costs and depreciation, the profit remaining out of every £1 of income is 8.4d., of which taxation will absorb 5.2d. Net Dividends will account for a further 2.2d., leaving slightly less than 1d. retained to assist in meeting the ever-increasing costs of replacement and development.

Substantial amounts were spent in developing subsidiaries engaged in distribution, including the production and marketing of "Eskimo" brand of consumer and catering packs of frozen fish, fruit and vegetables, poultry, etc.

THE OUTLOOK

Since the close of the year the adverse factors had not only continued but had been greatly accentuated. Though the outlook was depressing, they could face the future knowing that they had a sound and vigorous organisation in a position to go ahead when the tide turned.

FINANCIAL NOTICES

THE COMMITTEE OF LONDON CLEARING BANKERS.—NOTICE is hereby given that the maximum rate of interest allowed by the under-mentioned London clearing Banks on deposits, which must be lodged for a minimum period of 7 days and be subject to a minimum notice of withdrawal of 7 days, will be THREE AND A HALF per cent. per annum until further notice.

APPOINTMENTS

COMMERCE LECTURER

Lecturer in Commercial subjects required by Iraq Petroleum Company for the Kirkuk Industrial Training Centre. The selected candidate will be required to prepare Iraqi apprentices and adult employees for the R.S.A. examination at Intermediate and Advanced Level and to assist in "on the job" training of accounts apprentices. Applicants should possess a degree in Commerce or equivalent qualification and previous teaching experience in a Technical or Commercial College. Teaching Diploma and business experience desirable. Age limit 35. Service, which is recognised as teaching service for pension purposes by the Ministry of Education, is on three year (renewable) contracts with pensionable pay not less than £1,250 per annum, plus large local currency allowances. Annual leave with paid passages. Fully furnished accommodation provided at nominal rental but owing to shortage of married quarters married applicants should be prepared for 12 months' initial separation.—Reply in detail, quoting No. 808, to Staff Manager, Iraq Petroleum Co., Ltd., 214 Oxford Street, London, W.1.

ACTUARIAL OPPORTUNITIES IN U.S.A.

The Equitable Life Assurance Society of the United States has several openings at its Home Office in New York, for men interested in an actuarial career in the United States. Candidates should be up to about age 30 and have passed some or all of the examinations of the Institute of Actuaries, or of the Faculty of Actuaries.

Those interested should write to Mr Harry Walker, Second Vice-President and Associate Actuary of the Equitable, at 393 Seventh Avenue, New York, 1, New York, U.S.A., stating their qualifications, including age, education and experience. Interviews with Equitable representatives will be arranged in Edinburgh on July 21st and in London on July 22nd and 23rd.

MARKETING EXECUTIVES

A London Market Research Organisation of international reputation at home and on the continent seeks British-born marketing executives (30-45) for Holland and Amsterdam.

Marketing experience of branded consumer goods an essential and preference will be given to men with experience with a national manufacturer/distributor or an advertising agency.

Ability to assess and discuss marketing issues intelligently with marketing managers is essential, as is the ability to interpret market research findings. A knowledge of Dutch for the appointment in Holland is not essential, but fluent German is required for the Austrian appointment. Initial salary of up to £2,000 p.a. according to experience.

Applications, which should include curriculum vitae, will be treated in strictest confidence.

Write to WRIGHT JOHNSON LTD., Employment Consultants, 70 Queen Victoria Street, London, E.C.4 (City 2176).

UNIVERSITY COLLEGE OF SWANSEA

Applications are invited for either an ASSISTANT LECTURESHIP or a LECTURESHIP in PURE MATHEMATICS from October 1, 1958.

Salaries: Assistant Lectureship, £700 to £850 per annum. Lectureship, £900 to £1,650 per annum.

Commencing salary in each case will be at a point on the appropriate scale according to age, qualifications and experience. Membership of the F.S.S.U. and children's allowance scheme.

Further particulars may be obtained from the Registrar, University College, Singleton Park, Swansea, to whom applications (six copies) must be sent by June 21, 1958.

UNIVERSITY OF MANCHESTER

RESEARCH STUDENTSHIPS AND RESEARCH GRANTS IN ECONOMIC AND SOCIAL STUDIES

Applications are invited for the above studentships and grants, tenable for one year in the first instance and renewable for a further period not exceeding two years. The studentships are normally of the value of £350 or £400 per annum. They are open to candidates who have obtained the degree of Bachelor or Master in this or any other approved University, and applications are acceptable from students who expect to graduate this summer. The successful candidates will be expected to pursue research in Economics, Economic Statistics, Government, Social Administration, Social Anthropology or Sociology. Applications should be sent not later than July 1, 1958, to the Registrar, The University, Manchester, 13, from whom further particulars and forms of application may be obtained.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS

Applications are invited for the post of ASSISTANT SECRETARY (FINANCE) at the Royal Institute from men aged between 30 and 45 with a qualification in accountancy and some experience of cost accounting or organisation and method. Starting point on a Salary scale of £1,250 by £50 to £2,000 according to age and experience.

Further particulars and application forms, which must be submitted by June 20th, may be obtained from the Secretary, R.I.B.A., 66 Portland Place, London, W.1.

D.S.I.R. HEADQUARTERS, Regent Street, London, requires Economist in Senior Scientific Officer grade to deal with economic aspects of the Department's scientific research policy. Qualifications: 1st or 2nd Hons. degree in economics plus 3 years experience of research in applied economics in industry or university. Understanding of the methods and objectives of scientific research desirable. Salary: £1,190-£1,410 (men); women slightly less. Prospects of promotion and for candidates under 31 also of establishment.—Application forms from Ministry of Labour and National Service, Professional and Executive Register (Reference PE.901), Atlantic House, Farringdon Street, London, E.C.4.

ACTUARY required, directly responsible to the Partners of a leading Stock Exchange firm, with long established and extensive Institutional connection. Position offers great scope to the individual with initiative and ideas. Age 25-35 preferred. Investment experience an advantage but not essential. Applicant sitting finals might be considered.—Write, in confidence, giving full details to Box 938.

INTERNATIONAL MANUFACTURERS' ASSOCIATION with small staff centred in London, requires male Graduate, with some business experience, as Personal Assistant to the Secretary General. Excellent French essential, other languages useful. Salary according to experience, but not less than £900 per annum.—Box 942.

MERCHANDISING EXECUTIVE

Leading international advertising agency has a vacancy in its Marketing Department for a Merchandising Executive. The man we are looking for is probably 25-35 and presently a Brand Promotions Manager with all-round sales promotion and merchandising experience in the grocery or toiletries fields. It will be an advantage to have some field selling experience. It will be a necessity to have a flair for producing merchandising ideas including sales aids, consumer and trade promotions, point-of-purchase display, etc.

To arrange a meeting, write in confidence, giving qualifications, experience and present salary, to Box 940.

EASTERN GAS BOARD
ASSISTANT TO THE STATISTICIAN

Applications are invited for the appointment of an assistant to the Statistician at the Board's offices in Tottenham. Applicants should hold an Honours Degree in Economics or Commerce, or be sitting for the Final Examination in one of these subjects this year.

The work will be mainly concerned with the preparation of statistical reports for the guidance of management, and calls for attention to detail and the ability to write clearly rather than a high level of mathematical statistics.

The successful candidate may be required to pass a medical examination and, unless already subject to a pension scheme by virtue of the Gas (Pension Rights) Regulations, 1950, will be required, if eligible, to join the Board's Staff Pension Scheme within six months from taking up the appointment.

The salary will be in accordance with grade A.P.T.6 (£670-£750 per annum) of the National Salary Scales for Gas Staffs and the initial placing within this grade will be subject to the candidate's qualifications and experience. Promotion beyond this grade would be dependent upon proved ability.

Forms of application may be obtained from the Chief Accountant and are returnable to him not later than Saturday, June 21, 1958.

R. H. EPPS,
Secretary.
2 The Abbey Garden,
Great College Street,
Westminster, S.W.1.

UNIVERSITY COLLEGE OF NORTH STAFFORDSHIRE

Applications are invited for the post of Lecturer or Assistant Lecturer in Mathematical Economics, the appointment to be taken up on October 1, 1958. Salary in scale £900 x £50 to £1,350 x £75 to £1,650 p.a. (Lecturer) or £700 x £50 to £850 p.a. (Assistant Lecturer).—Applications should reach the Registrar, The College, Keele, Staffs, from whom application forms may be obtained, not later than June 7, 1958.

THE UNIVERSITY OF MANCHESTER

Applications are invited for the post of ASSISTANT LECTURER IN ECONOMICS in the Faculty of Economic and Social Studies. Preference will be given to candidates with interests in mathematical economics and/or econometrics. Salary on a scale £700 to £850 per annum. Membership of the F.S.S.U. and Children's Allowance Scheme.—Applications should be sent, not later than June 14, 1958, to the Registrar, the University, Manchester 13, from whom further particulars and forms of application may be obtained.

ORGANISATION AND METHODS

Applications are invited from men with experience of Organisation and Methods work both in factories and offices. A University degree would be an asset but is not essential. Applicants should have a knowledge of modern punched card machines and several years experience in an O. & M. Department of a large organisation.

A generous salary will be offered to the right man. The Company has good conditions of employment with excellent pension scheme. Applications should be submitted in writing giving details of education and training, appointments held and current salaries. All applications will be treated in the strictest confidence.

Company Personnel Manager, E. GOMME Limited, Spring Gardens, High Wycombe, Bucks.

ATTWOOD GROUP OF COMPANIES
ENGINEERS—ECONOMISTS—STATISTICIANS

Research projects of unique character are undertaken by the Attwood Group on behalf of U.K. and overseas manufacturers. Such projects are aimed at resolving problems in product design, distribution, marketing, and at formulating objectives, policies, and plans in these fields. This type of work is complementary to the other activities of the Group and the pace of expansion is quickening. We are therefore seeking additional staff who can be moulded into our plans for development. Applicants must have a good honours degree with experience in economic, marketing, operational, or social research, or in engineering development work. These qualifications must be supported by exceptional personal qualities of which integrity is paramount. Ambitious men will find the opportunities they seek for developing their talents. Additionally the rate of growth provides considerable scope for those capable of accepting wider responsibility.

Applications in confidence, stating education, experience, age, etc., to the Wallace Attwood Company, Research Division, Chantrey House, Eccleston Street, London, S.W.1.

UNIVERSITY OF OTAGO
DUNEDIN, NEW ZEALAND

Applications are invited for the position of SENIOR LECTURER or LECTURER IN ECONOMICS.

Salary range, Senior Lecturer £1,315 x £50—£1,615 per annum; Lecturer £1,025 x £50—£1,275 per annum.

Further particulars are available from the Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1.

Applications close, in New Zealand and London, on June 30, 1958.

EDUCATION FOR ELECTRONIC DATA PROCESSING

Within a decade no major organisation in this country will be without some form of electronic computer or data processing equipment. Before these machines can be put to profitable use a major educational programme must be carried out for all levels of management and for specialist staff.

IBM, whose leadership in the field of EDP is acknowledged, therefore proposes to expand considerably the scope of its training activities, and applications for positions in the Education Department are invited.

Candidates should have a genuine and creative interest in teaching; a sound understanding of organisation problems; a logical, lateral mind; and the determination to work hard to master new and exciting skills and communicate them to others.

A degree or professional qualification is essential; a good scientific or mathematical background and/or some years' business experience are highly desirable. Age up to 30.

Generous free life insurance and pension plans are in operation.

Applications to the Personnel Manager, 101 Wigmore Street, London, W.1, quoting reference ED58/1.

THE UNIVERSITY OF MANCHESTER

As the result of a grant from the Nuffield Foundation the Department of Social Anthropology and Sociology plans to carry out a study of a Lancashire town, and applications are invited for the following posts: (a) A RESEARCH ASSISTANT Grade II, initial salary within the range £700-£850 per annum, the appointment to be for one year from October 1, 1958, renewable for a further two years. Applicants should have a degree in Sociology or Social Anthropology and should have some training in statistics. The successful candidate will be required to study the social organisation of the town from published and unpublished sources; (b) A SENIOR RESEARCH WORKER, initial salary within the range £800-£1,000 per annum, the appointment to be for two years from October 1, 1958, or October 1, 1959. Applicants should have training in Sociology or Social Anthropology and field experience in one of these subjects. The successful candidate will be required to carry out a study of a section of the working-class population of the Town. Both appointments carry membership of the Children's Allowance Scheme.—Application forms and further particulars may be obtained from the Registrar, the University, Manchester, 13, to whom applications should be returned by not later than June 23, 1958.

AIR SUBSCRIPTION RATES

Subscriptions to many countries can be sent either by direct second-class airmail or in bulk by air freight for onward posting from central distribution points. Airmail is invariably more expensive but usually quicker by about 24/48 hours. Where only one service is shown this is because the alternative is either not available or not recommended.

RITCHIE CALDER'S *Signposts to the Atomic Age*

Trade routes beneath the Sea . . .

THERE IS A POWERFUL AGENT, *obedient, rapid, easy, which conforms to every use, and reigns supreme on board my vessel. Everything is done by means of it. It lights it, warms it, and is the soul of my mechanical apparatus . . .*

"Thus Captain Nemo, in *Twenty Thousand Leagues Under the Sea*, explained the unlimited range of his submarine *Nautilus*. In January 1955, Jules Verne's vision of 1873 was fulfilled. The United States atomic submarine, appropriately called *Nautilus II*, put to sea, driven by an inexhaustible source of power.

Captain Nemo's *Nautilus* was not a war-vessel, but a submarine yacht. Now submarine oil tankers, bigger than any ship afloat, are contemplated. Similarly we could have submarine freighters. But why not passenger liners as well? Under-water *Queen Elizabeths* could be far larger and could travel far faster and far farther.

We just need to get used to the idea of submerging. Already we climb beyond the clouds and "above the weather" in high-speed air-liners. This, we recognise, is part of our mastery over the elements—the captain chooses his levels and his lanes to avoid the upheavals of the lower atmosphere and secure favourable upper winds.

The same applies to that other element, the ocean. Since the first frail craft put out to sea, men have endured the heaving and tossing of the waves, the battering of the winds and the torments of the storms. Even the greatest liners fare badly when Atlantic rollers are 60 feet high.

Designers of the surface ships have to contend with many factors—the resistance of water, the erratic wave-formations and the drag of the winds on the superstructure. They can streamline submarines to shear the water. They have to allow for depth-pressures on the hull but they can ignore the waves, since with the reserves of power of an atomic-engine, the vessels need never surface except in sheltered waters. Winds can be discounted.

Already submarines of 100,000 tons are regarded as a practical proposition but the bigger, the more economic in terms of atomic power. Even in such dimensions they could command speeds higher than the fastest fish (the swordfish is reputed to travel at 57 miles an hour) and could circumnavigate the world on a pittance of nuclear fuel. Like the air-pilots, the captains could choose the currents and lanes to best advantage. With atomic-powered searchlights, passengers would have revealed to them a world inhabited by strange creatures. Tourists could sail up the oceanic canyons, like pleasure cruises up Norwegian fjords. They would voyage between the peaks of the submarine mountain ranges.

As Jules Verne wrote, over 80 years ago: *It is marvellous! You were right, Captain Nemo, to make use of this agent which takes the place of wind, water and steam.*

But he did not know the real nature of that agent—nuclear power." [R.C.]

* * *

MITCHELL ENGINEERING *are designing and constructing Nuclear Power Plant to meet world needs in the New Atomic Age.*

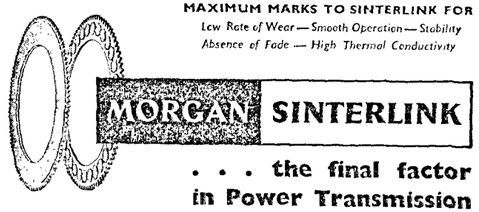
it's like this

SINTERLINK

has it buttoned up



Morgan SINTERLINK has indeed got friction buttoned up. In a way that is of extreme importance to the designer, the manufacturer and the user of all heavy duty machinery that incorporates a clutch.

And now SINTERLINK faced clutch plates are available in a unique "button" design that makes for even greater gripping power and quicker heat dissipation.

SINTERLINK, whether in button or continuous form, is made from sintered metal. Because it is metal, it will not only *withstand* heat, but will conduct it away as well. Because it is sintered, it brings to clutches infinitely longer life—under even the most punishing conditions.

Some printed matter about this is available, or one of our technical representatives will quickly respond to a 'phone call or letter.

MAXIMUM MARKS TO SINTERLINK FOR
Low Rate of Wear — Smooth Operation — Stability
Absence of Fade — High Thermal Conductivity

. . . the final factor in Power Transmission

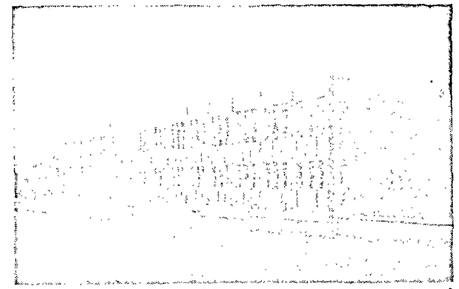
Money is dear but . . . today BEECHAM BUILDINGS cost less

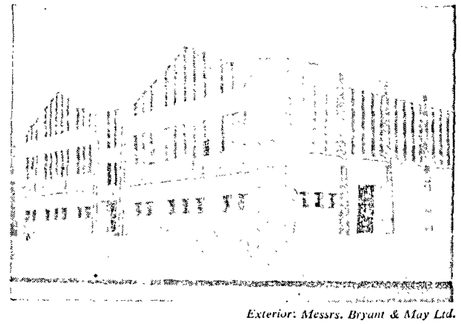


Beecham Buildings construct high-quality commercial and industrial buildings—from office blocks and small factories to large industrial layouts covering many acres at prices which, over the past twelve months, have actually fallen. We accomplish it in these days of 5½% by working quickly and eliminating waste.

WE STREAMLINE PRELIMINARIES

We in Beechams have the *complete* building organisation, including departments for every phase of building from first design to final finishing. Consequently we can quote firm prices as soon as sketch designs are agreed, saving much valuable time over the usual procedure when outside contractors must be consulted for quotations, and enabling us to move on to a site months earlier.

WE BUILD BY MODERN METHODS



Because we employ advanced techniques, we are able, without sacrificing *quality*,* to put up your factory faster, perhaps in only half the time you could have it built by older methods. You will get into production months earlier with a quick return on invested capital. With capital tied up at 5½% this saving in time is a heavy saving in money. Every contract is kept under one control. Every operation is timed and its completion dovetailed into the schedule, ensuring maximum efficiency and minimum site delay. The use of planned factory production of precision cast concrete units, served by our own fleet of specialised transport—ensures control of quality, free from the hazards of the weather. Beecham methods mean rationalisation; and rationalisation means economy.

Office block for Messrs. Nortons-Tividale Ltd. Tipton, Staffs.

Rubber

Eastozone® 30, 31 and 32, Eastman antiozonants, protect rubber products against cracking and checking caused by atmospheric ozone. Effective, economical Eastozone antiozonants are easily incorporated into the rubber recipe during processing. They slowly exude to the surface in the finished rubber product, functioning as a long-lasting chemical barrier to ozone attack. *Eastman organic intermediates*, including technical grade hydroquinone, are useful in the manufacture of rubber chemicals such as accelerators, antioxidants and polymerisation inhibitors. *Tenamene 3*, a non-staining antioxidant, is particularly useful in protecting white rubber stocks against the deteriorating effects of atmospheric ozone.

Protective Coating

Cellulose Acetate makes tough, water-resistant wire and cable coatings. *Cellulose Acetate Butyrate* produces lacquers, adhesives, airplane dopes and melt and peelable coatings possessing high strength, flexibility and excellent weathering properties. *Solvents, Plasticisers* and their intermediates are available in a broad range, including economical isobutyl acetate and isobutyl alcohol.

Textiles

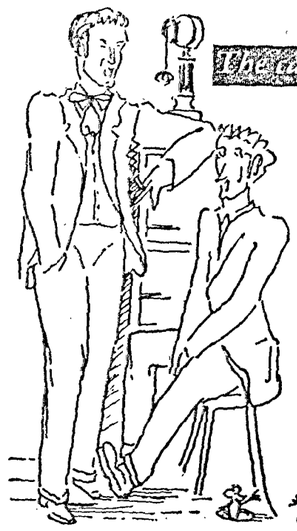
Dyes of outstanding fastness are available for synthetic fibres. *Cellulose Acetate* flake is used for producing acetate-fibre spinning solutions.

Petroleum

Tenamene® 1, 2, 3 and *60* and *MD 50* are gum inhibitors and metal deactivators used extensively in motor and aviation fuels to maintain quality during storage and use.

Food and Agriculture

Tenox® antioxidants protect food and animal feed against oxidative deterioration. They are supplied in a wide range of formulations to meet specific processing conditions. A line of commercial-grade antioxidants is also available for protecting industrial products.



Waxes and Polishes

Epolene®, a low-molecular-weight polyethylene wax, is produced in regular and emulsifiable grades. It is recommended for use in paper coatings and polishes and as an upgrading agent for paraffin and other waxes.

Stocks of many of these products are maintained in Europe, assuring quick delivery. If you would like to investigate any of these quality products, call or write Eastman's European Sales Office in The Hague. They will put you in touch with our local representative. He and a member of the Eastman organisation will gladly work with you toward obtaining the most effective use of Eastman chemical products in your operation.

The case of the (new) temporary typist

Office boy George (Adonis) Smith discusses LIFE with Bill (Casanova) Brown . . . in the firm's time, of course.
" Funny how girls don't seem to stay here long, Bill. Think we're losing our grip?"
" Might be, George. But this last one wasn't here long enough to look at us twice. Typed half a letter and scarpered off ".
But the clue was in the typewriter. The unfinished letter read " Dear Sirs, I'm sorry, but I just cannot work here . . . your offices are too dirty and depressing. Why don't you try a coat of paint?"
Why not try the SMITHSON paint service. Our Technical and Colour Advisory Services can save you time and money . . . have a word with us now.

Smithson Reg.

Makers of fine paints and varnishes since 1790.

A private entirely independent Company devoted to good paint-making and really personal service.

THOMAS SMITH & SON LTD., 238/240 Whitechapel Road, London, E.1. Telephone: BIShopsgate 3717/8/9

Here's a man with a new factory on his mind.

Problems dance before his eyes.

How best to achieve that Class 1 rating for spread of flame?

How to ensure really good thermal insulation?

What about cost?

Then he hears about Stramit Class 1 Slabs.

Yes, his troubles are over. When he uses Stramit Class 1 slabs for the roof-decking in his new factory, he automatically achieves a Class 1 rating for spread of flame and superb thermal insulation values (U=0.23) *at no extra cost.* And bearing in mind that Stramit slabs when used as roof-decking are part of the factory's structure, their cost is amazingly low. As little as 1/3d. per square foot, in fact.

Stramit Class 1 slabs, made from scientifically-compressed straw and covered with a special asbestos facing, are immensely strong and durable. Stramit is also available in many other grades and facings for use as wall-linings, ceilings, partitions and non-load-bearing thermal insulation. Perhaps it can solve one of your problems, too.

For structural thermal insulation

'ENGLISH ELECTRIC'

A century ago, a geological curiosity; today, a vital factor in industry and even international affairs. That is the brief story of oil—nearly eight thousand million gallons of which are refined in this country every year. Modern refineries depend largely on electricity for their operation; and ENGLISH ELECTRIC has supplied steam turbines, gas turbines, diesel engines, generators, transformers, switchgear and motors for refineries both in Britain and overseas.

bringing you

One of the ENGLISH ELECTRIC products for which oil is vital is the diesel-electric locomotive like the 1,000 h.p. type shown here, one of the most modern forms of transport—clean, flexible and economical in operation. This Company has experience of railway modernization in thirty different countries, and is a leading supplier to British Railways of electric and diesel-electric locomotives, including the world's most powerful single-unit diesel-electric locomotive, the 3,300 h.p. ENGLISH ELECTRIC "Deltic."

The General's Hour

GENERAL DE GAULLE is now the French Republic. Whether or not he wishes to be a "dictator," he is now the dictator of France. He holds the republic's powers; its responsibilities rest on him. Its very existence is in his hands, to do with as he chooses, or as best he can. This much stands clear today; nothing else does, except the ineluctable problems, the legacy of the republic and of its crisis, that confront him and to which not even he can offer an easy solution. For France, in fact, only one decision has been taken, and one danger averted, by the transfer of authority to the general: the decision not to risk a military coup in Paris itself and the civil disorder which would have followed it. The national assembly's vote of confidence, less than three weeks after the general first broke his silence at Colombey, was given under this coercion; and, as M. Mendès-France emphasised in the debate, the general himself was still subject to the pressures of the very men in Algiers, and in metropolitan France, who precipitated the crisis. How far General de Gaulle is free, or can become free, to obey the instincts which his own characteristic sense of patriotism and of history might be expected to prompt, is not yet sure. On this freedom to act, to break out of the political toils which (of a different sort) bound every republican prime minister, what is promising and positive in the Gaullist experiment depends.

The big questions before the general are Algeria and finance, and the two interlock. Is he, in political fact, the arbiter and conciliator he sought to be? Can he make his abitrament in Algeria independently of MM. Soustelle and Delbecque, and of the assurances they have given to the settlers there in three weeks of emotional oratory? Will the army, in the persons of Generals Salan and Massu, give its first allegiance to the general or to M. de Sérigny and the Committee of Public Safety in Algiers? And can the general implement a national economic policy in France itself independent of the interests which backed his return to power? General de Gaulle's first words in Algiers, his first and evidently incomplete list of cabinet ministers, and his prudent act in lifting M. Pflimlin's press censorship can none of them be considered definite clues yet to what his policy, and the political condition of the French state, will be in a month's or two months' time. The enigma remains.

General de Gaulle did not make any valid assertions on the future of Algeria on his first triumphal day there on Wednesday. The power of government in Algiers is among the powers he has personally assumed; if it remains a fact after the enthusiasm generated by his arrival dies down, he will be able to tackle all of France's problems in the Maghreb. He has already added a fresh note to French policy in North Africa by his civil exchange of greetings with President Bourguiba and the King of Morocco. He may be in a position to come to terms with Tunisia and Morocco, as his harassed predecessors could not. In any case, both countries will ask for the evacuation of French troops and both will regard

his attitude towards them as an earnest of his intentions in Algiers.

The general's decisive task is still to clear up the present confusion of French attitudes towards the future of Algeria. It remains to be seen whether the rebel (FLN) leaders will accept his invitation to their followers to vote as Frenchmen in the coming elections. He may find it necessary to offer the Moslem nationalists further concessions to induce them to call off the rebellion. He may even be able, as others have not been, to make an offer sufficiently attractive to win over sufficient of the rebels to split their ranks.

Time and again, during nearly four years of warfare, the FLN leaders have themselves said that Algerian independence would have to come by stages. The general's aim must be a political not a military solution—if there is to be a solution at all. But it was not only confusion and weakness that caused the earlier mistakes of his political predecessors. Independence must mean independence; but to find the highest common factor of acceptable independence between the legitimate aspirations of the Arab rebels and the rightful fears of the now rebel settlers is a herculean—and may be sisyphean—task. Certainly it has not been revealed by the mass emotion, however caused, of recent weeks. But it is also certain that, if General de Gaulle is to show the strength to match his powers, he must arrive at an explicit recognition, and a precise definition, of eventual independence for Algeria. The rest, an amnesty for political offenders and the election of a constituent assembly with nationalist leaders in it, would follow.

The problem cannot be settled now by "assimilation" with France or by the local "integration" of French and Moslem Algerians. The Algerians themselves have to discover how much they need, as indeed they do, French help of every kind. In the uproar of the insurrection, the voice of M. Chevallier, the liberal mayor of Algiers, has been lost; but it is one to which the general should listen in reckoning the worth of the protestations of settler spokesmen on the impossibility of a Franco-Moslem community without direct French rule. The general's past pronouncements have all encouraged the belief that he prefers a federal solution. And this will very probably be attempted for "black" Africa below the Sahara if MM. Houphouet-Boigny and Jacquinot, both ministers of state in the new cabinet, direct policy there.

THE urgency of a political solution in Algeria is made acute by the financial difficulties—born of the continuing war—which press importunately on the general's new government. The French boom has hidden the full implications of the Algerian war from many ordinary French folk. France's industrial advance is very real and exciting; but France's prosperity, while the francs have been pouring into Algeria, has been bought by uninhibited expenditure of exchange reserves. Now the cupboard is nearly bare. M. Gaillard's new-style devaluation in September did bring some slight improvement in the trade balance during the winter, but France is still living so far beyond its means that most of the money raised abroad this spring may be gone by autumn. Heads are being shaken in Washington and Bonn at the prospect of the hungry Oliver coming again for more.

In the winter Washington was moved to lend its aid by the threat of a political crisis from which there would be no way out but a right-wing coup or a popular front; and Bonn by the fear that France would be unable to fulfil its obligations under the common market treaty. The bad dreams are coming true; but the money is being spent just the same. This time France's allies, while they must be prepared to lend again if the new government first makes a decisive start towards putting its affairs in shape, must brace themselves to refuse if it does not. There can be nothing but admiration for the investment boom which has done so much in the past five years to rejuvenate French industry and French economic attitudes. A France which can sustain within the common market its recent pace of industrial growth—of the order of 10 per cent a year—will be a great expansive force for the whole European economy. But to make France solvent more radical measures are now needed than *import restrictions*, rationing and new nibblings at the budget: more even than the possibility of a further devaluation, which M. Pinay is bound to weigh seriously, and a harder squeeze on credit. Only if, in addition, decisive political initiatives can now be taken to remove the source of the economic strain—the Algerian war—will France be free of its self-imposed shackles, and the allies be able to feel confidence that new aid will not follow the past loans down the drain.

ALTHOUGH the general's financial embarrassment must play an important part in his relations with the western allies, he is not the man to go to Washington képi in hand. Nor can it fairly or sensibly be expected of him. He will take for granted that France's place in western councils (the vacant chair which Sir Winston Churchill once pointed out to M. Mendès-France) will be occupied on the broadest basis of equality and fraternity. The messages from old friends which President Eisenhower and Mr Macmillan have sent him show goodwill in this; something more distinct and positive should be settled by the President and Prime Minister in Washington next week. No doubt the kind of regime, and the kind of policies, which the general will eventually decree for France will affect the closeness of the new version of the oldest western association. But there is also no doubt at all that, if Sir Winston had still been sitting on the Government front bench, the call would have already gone out, warmly, ringingly, constructively, encouraging the new French leader, and his old ally, to fraternity in the Atlantic alliance and liberty in France.

Very likely the idea of a strong man in Paris sends

shudders down the back of the State Department—which knows something already of the general's views. But there is this to be said for a strong and scrupulous man: when he gives his word he can keep it. The xenophobia that marked the opening of the crisis in France has to be reckoned with; so, perhaps, has the general's own past inclination to go it alone in Moscow—and elsewhere. But the reasons that brought France into Nato still stand today; the general needs the West as the West needs him. France is still at the West's core.

It is, however, to Dr Adenauer in Bonn that General de Gaulle has made his one reassuring gesture so far: the appointment as foreign minister of M. Couve de Murville, *the ambassador to the Federal Republic*. At the same time, the retention of MM. Mollet and Pflimlin in the cabinet gives some sign that the policy of the Europeans is not to be abandoned. In the long run, both politically and economically, France's full influence in Europe will be reasserted only as its concern in North Africa is put into a new perspective.

WHAT is perhaps least measurable of all is the future of political life and democratic institutions inside France itself. The assembly has armed the general with full legislative powers, *including the duty to* produce a new constitution. The referendum on his constitutional proposals will be in three months' time; a general election, in France and Algeria, could follow immediately after. There can be little expectation that it will be the same parliament, which has given up its political responsibilities until October, that will eventually reassemble. With such authority as General de Gaulle has been given, the time limit of six months after which it is envisaged that the public powers can, in his own phrase, "resume their normal functioning" has little real meaning. The kind of regime which the general himself wants remained obscure during his brief exposition this week, though he did state a number of unexceptionable general principles; but the regime his original backers look for is all too plain. It may even be that, within the next few days, the Gaullist cabinet will embrace quite other men than the Fourth Republicans who made up most of the first, disarming list. The question of who really will have the general's ear, whoever sits as minister of state, has been there from the beginning, and remains.

The real question, indeed, is upon whom in France General de Gaulle will seek to base his authority. In the last hours of republican rule, he saw, and responded to, the force of the manifestations of popular reluctance to accept him. The troubled resistance of more than half the Socialist deputies despite M. Mollet's entreaties, and the scepticism of much independent opinion had their effect. He has declared his good intentions towards republican democracy, and has done nothing yet to disprove them. But if, in fact, he is determined to stand out against the claims of those who enthroned him, he will have to seek positive political backing from the broad middle of opinion between the extremes of Left and Right. The non-communist trade unions have remained aloof from the government, but they may not be sorry to see a prime minister with whom they can negotiate without fear that he will fall tomorrow. If the political parties, after their debacle, can stay alive and vigilant, then it can be hoped that French democracy, now in eclipse, will not be blotted out. But the general has first to show that he can shake off his camp-followers. He has all France to lead.

THE ALTERNATIVE GOVERNMENT—I

A High Investment Party?

This is the first in a series of articles about Britain's alternative government. Does Labour want to be the party of high investment? Or does it want to be the party of high consumption, favouring regular annual wage increases? It cannot be both

IT is by no means certain that Labour is going to win the next election, but at the moment this obviously looks a distinct probability. Some of the best heads in the Labour party are therefore doing some important private thinking, not about how to get back into office—a subject which has dominated their minds far too much for seven years—but about what they want to do when they get there, and how they can get into a posture to do it. In a series of articles this summer, of which this is the first, *The Economist* intends to participate in this debate. The approach will be from the radical, but not the socialist, point of view.

Every incoming government needs to carry with it into office some image of its principal purpose. Labour has had some pretty dreary images in recent years—the party of nationalisation, or of equality, or ultra-safe social security. But, in the last few months, another image has come to the fore in Labour thinking,

which deserves to be very much encouraged. This is the picture of Labour as a party that should bend all its energies to bringing about a massive increase in Britain's real investment. It is patently the right purpose for a modern left wing party to adopt. A government which could steadily increase this country's real investment from the present £3,400 million odd a year to over £5,000 million a year within a term of office—a perfectly possible objective—would be a government which could, by the end of its period of office, have transformed society in Britain very much for the better; and to transform society for the better—by getting built all those gleaming new factories, roads, hospitals and schools—is the one thing that men of the left ought most to want to do. There is no other half-so-obvious way forward to Labour's main aim of a much richer common people.

But how to tread it? Fortunately, one part of the problem—that of stimulating the will to invest in private industry—should not be very great in Britain in this age of vast technological innovation, provided Labour does not deliberately shatter confidence there. Mr Butler discovered this when he introduced his investment allowances; in his own words, the horse reared wildly—too wildly for the economy at that time to contain—as soon as it smelt the oats of freedom. The much bigger problem is that if Britain is to increase its investment it must increase its saving—in the only real sense of holding down consumption; it cannot, simultaneously, both bake its cake and eat it. In other words, a high investment Labour party would have severely to eschew its attractive array of policies designed to raise consumption standards generally and at once; and in particular, it would have to foster a very extreme sort of wage restraint. Let us be blunt about this. The object of a high investment Labour party would have to be to see that real wages (and salaries) do not increase as fast as productivity. That is what increasing savings, in a Labour society, must mean.

THIS is a very tall order, particularly for a party which constitutionally wants to do everything at once. To do justice to Labour's best brains, however, some of them do realise that it is an order which their policy would require them to try to fulfil. The misfortune is that they think that the best way of doing this is by cozening—or, as they say, doing a deal with—the big trade union leaders. At the top of the party, there seems to be a disinclination to consider *any* of the awkward implications of such a deal; it sometimes seems that Mr Gaitskell's idea of a Labour government is one in which Mr Cousins will do what he (Mr Gaitskell) asks, while Mr Cousins's idea of a Labour government is one in which Mr Gaitskell will do what he (Mr Cousins) will like. But Labour men a little below these lofty reaches will be more frank. To people of *The Economist's* mode of thinking, they will say something like this:

In the early years of our next government, we may well have to do a lot of things which you will think disastrous and which even we will think pretty dreadful: compulsory dividend restraint, confiscatory capital gains taxes and changes in death duties, prudish morality taxes on any forms of enjoyment in which Mr Cousins thinks that only the conspicuously wealthy indulge. We blush to think about all this, as we know that these measures will distort the economy rather than curb it—and thus will do no direct economic good.

But we think that they will do less direct economic harm than you assume. The great indirect gain from them will be that the trade union leaders will then agree to wage restraint. Under cover of that we will be able to get the £500 million or more increase in annual production each year which everybody knows that Britain could achieve if only this problem of wage inflation (and foreign reactions to it) were out of the way. We will then be able to devote this £500 million or more a year to increasing investment, and so establish a new and highly developed economy; and, after three years or so, we will be able to emerge, for consumption as well as investment, into the sunlit uplands of the much richer Britain that both you and we want.

THIS is the present line of argument of some of the most intelligent people in the Labour movement. How extraordinary it is that they do not see that the two major premises which underlie it are quite obviously wrong. One trouble about this policy of soaking a few rich men in order to encourage Mr Cousins is that the measures proposed would inhibit increased private investment from taking place in the first place; the anæsthetist is to kill the patient so that the surgeon will have absolute quiet while performing the operation. The other—and even more obvious—trouble is that most trade unionists would not regard these measures as making a wage freeze any more palatable. Although a few politically-minded leaders like Mr Cousins might be willing to trade wage restraint for a policy that made a few rich men poorer, the mass of union members do not care a button who is getting poorer; their very sensible sole concern is to get richer themselves.

The likely pattern of events under a Labour government, if this policy were adopted, would therefore be roughly as follows. Measures which are supposed to encourage investment will be announced, but accompanied by these soak-the-rich devices which will tend to inhibit it. These will be said to be a *quid pro quo* for wage restraint; but this latter policy, at a time when undistributed profits are supposed to be going up, will lead to the threat of a rash of unofficial strikes. In order to avoid these, the trade union leaders will go back on the policy of wage restraint—although claiming that they are still abiding by it in principle. They will explain that, but for the policy, the inflationary wage demands they are putting up would have been more inflationary still. Price and wage inflation will follow, accompanied—since foreign investors would be even more scared by the policy than domestic ones—by a bigger-than-ever flight from the pound. To rectify this

situation, Labour will have to cut back production—including, quite certainly, investment itself. The last state of the economy will be much worse than the first.

IS there any way in which Labour could escape from this frustrating cycle of events? Quite obviously there is. It is, put quite simply, to determine and declare that, when it is the nation's Government, it will be independent even of the trade unions. The plainest lesson of Britain's recent industrial history—it deserves to be re-emphasised again and again—is that the threat of strikes has been much more damaging than strikes themselves. In a complex modern economy—where there are so many alternative sorts of transport, fuel or whatever is being strike-bound—isolated stoppages are nearly always less crippling than they are expected to be before the event. The party that will eventually beat inflation, and lead Britain back to expansion, will be the party that is prepared to allow certain strikes to happen, instead of buying them off. The whole tone of Labour's recent propaganda has been designed to spread the impression that, although a Labour Government would in fact be better placed than any Conservative Government to resist strikes in order to beat inflation, it will never be prepared to resist them. It is extraordinarily difficult to see why.

The Tories have never made the same mistake of excessive tenderness towards their paymasters. They are even more dependent on industrialists' money and farmers' votes than Labour is dependent on Mr Cousins. But they know that their keenest supporters are often precisely the ones whom they can most afford to offend, because these are the people who have no other party to which to go. In consequence, the Tories have done some things in the industrial field (the Restrictive Trade Practices Act is one example, and the negotiations for a free trade area in Europe are another) from which a Labour government would have been likely to flinch; even in agriculture they have introduced a degree of economic discipline from which Mr Tom Williams always fled. There has been some crafty Conservative politics, as well as sound national statesmanship, in all this. Even in their political posturing before their election—to take a trivial but illuminating example—the Tories promised to impose an excess profits levy, which was an economically nonsensical promise to make but perhaps a politically advantageous thing to do. The equivalent promise on Labour's side would be to do something which would make trade union leaders as cross as company directors were over EPL. But to cock such a snook would never occur to Mr Gaitskell in a month of wet Sundays.

IT is because no such gesure of independence would ever occur to the Opposition's present leaders that Labour has still not really grown up as a political party, recognisable to outsiders as a truly national (as distinct from purely sectional) force. In this year's manœuvring over industrial relations Labour has appeared to be more firmly committed than ever to support the sectional interest of trade union leaders, as distinct from the real interest of all citizens, including trade unionists. Until it can escape from this appearance, it will not deserve to win any of the radical vote; and much more important, it will not be able to accomplish in office the things it really wants to do for Britain. This is the first lesson for it to mull over this summer. More to come.

The Dragon's Teeth

Japan's difficulties in its dealings with Peking are a reminder to China's smaller neighbours that they have to adjust themselves to the prospect of life with a major communist power

MR KISHI won his election on May 22nd to an accompaniment of boos and catcalls from Peking. The Chinese, as Chinese, have no particular love for the Japanese prime minister, once a Japanese colonial administrator in Manchuria. As communists, they were ready, a few weeks ago, to sign appetising trade agreements with the Japanese, and for this they got Mr Kishi's blessing. At this, however, the other Chinese in Formosa bristled, and Mr Kishi, having tried desperately to have it both ways, found himself back where he started, without the trade pacts, but hand in hand with the Chinese nationalists.

It was then that the calligraphers of Peking dipped their brushes in gall and began to charge Mr Kishi with "collusion" with Chiang Kai-shek and the "Syngman Rhee clique"; with estranging the neutrals of south-east Asia and tying them to the American "war chariot"; and with trying to revive the "Greater East Asia co-prosperity sphere." At the same time the men of Peking accuse the United States of pouring weapons into Indonesian rebel hands and of directing the "Chiang clique" to send soldiers and agents to help the rebels. The Americans are being warned of the "very dangerous consequences" of this alleged intervention.

These are fighting words. Those directed at Mr Kishi, if slightly less pugnacious, are nevertheless intended to revive a bogey to which many people in Asia are, with reason, sensitive—that of an aggressive, resurgent Japan that has neither learned nor forgotten anything; and the contrast between the image of interfering warmongers and that of a mild, pacific China mindful of the famous "five principles" is underlined,

in the Peking statement on Indonesia, by references to Bandung and talk of dangers to which the Asian and African peoples find themselves exposed. The point will not have been lost on people who were impressed by China's decision, at the beginning of March, to withdraw its forces from Korea and to consent—on unstated terms—to free general elections throughout the divided country.

Presumably Chairman Mao Tse-tung had no need to consult Mr Khrushchev before he turned on Mr Kishi. But the communist "line" on the Indonesian rebellion is clearly a concerted affair, for Peking's statement on it came within twenty-four hours of a similar statement from Moscow. Behind this verbal unanimity is the hard fact of the Sino-Soviet treaty of alliance of 1950 which, on the one hand, lent Soviet power to China's elbow and, on the other, gave the Russians some power of restraint over China's foreign policy.

WHAT, however, *is* China's foreign policy? Is it as mild and friendly as the smile on Mr Chou En-lai's face? Is the decision to quit Korea a new leaf turned over? Can China's neighbours henceforth sleep peacefully on their grass mats? All the evidence seems to show that, if there has been a change, it has been purely tactical and that the objectives of China's policy have remained untouched. If this is so, the answer to each question is No. On the other hand, a change of tactics on the part of a potential enemy can sometimes make life bearable where before it was unendurable. To that *extent*, a smaller and weaker neighbour may find himself able to sleep with merely one eye open.

The public statements of governments and their leaders seldom provide more than a partial insight into their real aims. This is truer of communist governments than of others. In China's case, however, official statements, supplemented by backward glances into history and an assessment of vital interests, do suggest a fairly rounded picture.

The "old China hand" is often bewildered by the behaviour of the Chinese People's Republic, because it conforms only in some respects, and not in others, to that of the China he has known. The truth is that in China, as in Russia, the interests of communism are superimposed on the traditional interests of a great power. If Chiang Kai-shek had won the civil war, he would have been as determined as Mao Tse-tung to prevent the resurgence of Japan; he would have reasserted China's suzerainty over Tibet; and his interests would have been served, as were those of the former emperors of China, by the creation of buffer states on its periphery. It is partly an accident of history that two of China's present buffers—north Korea and north Vietnam—are communist states.

Where Mr Mao's China—in foreign policy—has differed from the hypothetical China of a victorious Kuomintang is in its choice of alliances and its use of an ideology to further national aims beyond its borders. The failure of some otherwise well-informed specialists on Chinese affairs to understand China's use of subversion among its neighbours has caused much misapprehension about its policies.

The cornerstone of these policies is, in fact, the Sino-Soviet alliance—an alliance that would never have been forged had the victors in China not been communists. It is an alliance that is economic as well as military; and it has made China dependent on Russian aid for its industrial development and on the Soviet block for much of its trade. This reorientation of a trade that traditionally looked outward to the eastern and southern seas was a development for which history had made few preparations; the new rail and other communications between China and Russia, made necessary by the change, have had to be built by its authors. These communications are of military significance, too; any power involved in war on the Chinese mainland would find the Chinese armies well supplied by their Russian allies.

This dependence on Russia has not prevented China from pursuing aims of its own. Usually, these aims are complementary to Russia's; sometimes, they appear to be competitive. For instance, the furtherance of communism in Asia is a common objective, but in recent years Peking has seemed to be setting itself up as an alternative to Moscow as a pole of attraction for international communism. The Asian communist parties were nearly all suckled in Moscow in the Comintern days; but Mr Mao's prestige as the first successful leader of a communist revolution in Asia is far greater than Mr Khrushchev's as the mere successor of Stalin. Yet the fundamental identity of aims is unlikely to diminish within the first generation of communism in China. Any policy based on the notion that China and Russia can be split apart within the next decade, or more, is probably illusory.

IF this view of the Peking-Moscow axis is correct, then China's small neighbours will have to get used to the long-term prospect of living next to a major communist power. Is China now a better neighbour than, say, in 1950? Certainly, the reckless spirit of earlier years seems to have given way to a more sober appreciation of risks. The days of direct intervention, as in Korea, seem distant. Only the occupation of disputed border territory in Burma eighteen months ago has served to remind the peripheral states that the Chinese will probably continue to probe for weak spots. The interminable Sino-American talks in Geneva—now in suspension—have brought Peking no nearer to renouncing the use of force to settle the Formosan question. But Peking, which agrees with the Nationalists in considering Formosa to be simply a province of China, is logically consistent in seeing the Formosan question as a domestic affair to be settled by means of its own choosing.

Invasion of neighbouring countries thus now seems a remoter possibility than before the advent of the hydrogen bomb, before the creation of Seato and before the Bandung conference; the hard lesson of the Korean war has also been learnt. But the good neighbourliness of the Chinese communists is a very strictly relative term. Neighbours with Chinese minorities—and this applies to all of south-east Asia—automatically have a fifth column in their midst; if, in addition, they recognise the Peking government and give its envoys and agents normal facilities, they are flooded with communist propaganda—as in Cambodia—or find the funds of the local communist party to have mysteriously swollen, as in Indonesia.

No easy solution exists to the problem of China's relations with the outside world. But it may be consoling to China's neighbours to reflect that the internal preoccupations of a regime trying to industrialise a vast and unwieldy country, beset with challenges from intellectuals and national minorities within its borders, are not conducive to rash outside adventures. This allows them time to think and time to order their affairs; still, in the long run the temptations of south-east Asia for a country with a fast increasing population will prove hard to resist.

A more immediate problem was posed by the reports in April, cited by an American senator, of a vast underground detonation in China. Any comprehensive disarmament negotiations will have to include communist China. The origins of America's existing policy of refusing recognition to Peking are intelligible, but this policy would be hard to reconcile with the inclusion of China in any effective programme for general disarmament. The prospect is at present only a gleam in the eye; but, if teeth are to be extracted all round, why not the dragon's?

NOTES OF THE WEEK

STRIKES AND WAGES

Odd Man Still Out

TO tell simple economic truths to trade union leaders may, as Mr Gaitskell appears to think, be provocative. But it can also be singularly effective. Although the situation on the labour front remains complicated and delicate, the prospects for avoiding wage inflation have visibly improved in the past few days. The first—and welcome—development came on Thursday of last week, when Mr Cousins's colleagues on the TUC moved very quickly to persuade him not to widen the bus struggle into a petrol and power strike as well. The orthodox union view of this threat was set out by Mr Robens in an article in the *News Chronicle* this week, in which he said disapprovingly that a strike which would have to be met by troops being put on the petrol lorries would have the widest implications and would be "a conflict which no union, however powerful, however strong, could hope to win."

On the same Thursday—and possibly more important than anything that has happened during the bus stoppage—the mineworkers' executive accepted an arbitration award that gave their members no wage increase this year. The opportunity that then seemed to be opening before the Government was not the crude one of "ditching Mr Cousins." On the contrary the prospect was that—if a settlement could be reached with the London busmen which would not break the main wages line—the Government might after all have won its way this year towards acceptance of a reasonably non-inflationary pattern of wage increases: a pattern ranging generally between nought and about four per cent per eighteen months. This would be a greater success in containing wage inflation than had seemed likely immediately after the railway settlement. It might have important implications for the future of economic policy. Provided external developments permit, it might even justify the latest variation of the motor car metaphor which the Chancellor of the Exchequer used during a week-end by-election speech: "We are ready to take the brakes off the economy directly we can see it is safe, and that time is approaching very rapidly now."

The First Chink that Failed

IN these circumstances, there was a sound case for the peace formula which Mr Macmillan suggested that London Transport should offer to Mr Cousins. If only the concessions in that formula had been offered for the first time last weekend—if only three-quarters of them had not been offered immediately after the railway settlement—the packet offer of last Saturday might well have been accepted. But most of these considerable concessions had been offered to Mr Cousins on May 21st—on what had then looked like a wave of surrender which he thought he could make roll further along. He had already threatened to do dire things as a demonstration that these concessions were not sufficient. Since then his TUC colleagues had asked him not to do these dire things after all, but Mr Cousins felt that he could still rely on their moral support if he refused to be discomfited. The premature exposure to the "chink of light" on May 21st had ruined the picture, and Mr Cousins stood by his familiar tactic of demanding the last little bit more.

The little bit more which he demanded on this occasion was that London Transport should pay a "token increase" of 4s. a week to his country busmen at once; he said that this would cost only £3,000 a week and, as London Transport is losing £300,000 a week in bus receipts during the stoppage, he found its refusal to meet this claim beyond comprehension. There is, of course, another figure against which this maximum gain of £3,000 a week to busmen should be measured: the £500,000 or more which his 50,000 members must be losing in wages every week that the strike lasts. There could be no more damning proof than Mr Cousins's own arithmetic that this strike was no

longer a matter of protecting the standards of living of the busmen; it was now purely a matter of safeguarding what Mr Cousins calls "dignity and honour," which is a euphemism for saving his own personal face.

The elder brethren of the TUC showed commendable good sense on Wednesday in still "advising" him not to extend the strike to petrol and power workers. When Mr Cousins agreed to reopen negotiations on Wednesday, it seemed that they might also have done a good service to the unfortunate busmen themselves. Unfortunately, Mr Cousins broke off these negotiations after the briefest of encounters. The odd man is still out.

Black Workers and Red Ones

MR COUSINS has a mounting array of other serious problems on his hands. The unofficial strike at London (and now also Tilbury) docks—in which his TGWU men are engaged—is now the most damaging of the current stoppages; its economic effects are discussed on page 917. This strike seems, in very large part, to be communist-arranged and communist-sponsored stuff. It arose out of the stoppage of Smithfield meat drivers—a stoppage whose principal effect so far has been to show how many of the men employed at that hotbed of restrictive practices have well-paid jobs which are blatantly unnecessary. The butchers have been collecting their meat from secret depots themselves. In sympathy with the meat men, one section of the London docks, through which meat is imported, came out on strike. This immediately created a temptation for two sorts of so-called "blacklegging": for butchers to haul some of their meat out of cold storage at the docks themselves, and for office staffs of the wharfingers to move odd bits of perishable cargoes which were lying about on the quayside to where they could be used. As the strike waxed and waned along the waterfront, members of the unofficial body which is organising the strike spread stories of instances where these heinous offences were said to be being committed: sometimes their stories referred to incidents which had occurred before the men went back to work last time, sometimes to incidents which it is not certain had occurred at all. But always they added fuel to the flames. By last Saturday 15,000 of London's 28,000 dockers were on strike, 112 vessels were idle and 45,000 tons of perishable cargo were beginning to rot on the quayside.

In these circumstances, the public wharfingers—the employers who are suffering from the stoppage but who are not responsible for the men's discipline—began to get restive, and decided that they really would use their office staffs to move food before it went bad. The wharfingers accused the National Dock Labour Board and the unions of not being able to control the men, and asked the board for permission to use unregistered labour to move their perishable goods. The board, evenly divided as it is between employers and unionists, could reach no majority decision on this request, so the employers decided on their own initiative to get their office staffs to move the goods. The strikers' committee is hard at work trying to persuade dockers in other ports than London to respond to this "show of force" by striking in sympathy. So far they have partly—but only partly—succeeded; by Thursday a total of 19,000 dockers were out, and 122 vessels were idle.

A further complication is added by the notification, sent by the four dockers' unions to the Minister of Labour, that a dispute—official this time—is pending over the dockers' rejected claim for this year's wage increase. Mr Cousins, who cannot really want to be associated with the main instigators of the present dock strike, would be well advised to let this claim go to arbitration, if direct negotiations cannot settle it. Although there may not be a good case for a wage increase for the dockers, there does seem—as was suggested in these columns last week—a strongly arguable case for the introduction of a pensions scheme for them.

MR MACMILLAN AND THE PRESIDENT

The Crux for Trade

IT is no secret that the principal subject of Mr Macmillan's conversations with President Eisenhower next week is going to be "economic problems"—in the main those problems of world liquidity which *The Economist* discussed in its "Appeal to America" on May 3rd. The developments since our article appeared have been interesting, but frankly not reassuring. As Mr Dillon's recent thoughtful speech in New York showed (see page 791 of our issue last week), the American government may be ready to grant that the recent fall in the incomes of the poorer primary producing countries may strengthen the case for gradually increasing the scale of aid from developed to under-developed lands. Because this is a worthy humanitarian ideal, because schemes to increase investment in the under-developed countries are also being discussed by Commonwealth officials in London, and because such investment would increase the flow of dollars to the outside world, it may be pretended among allies of goodwill that this would be an effective alternative approach towards solution of the principal problem. Unfortunately, it would not.

★

Let it be made clear again what that principal problem is. Mainly as a result of the pegging of the dollar price of gold at its prewar level, the increase in the value of trade between the free countries has far outstripped the increase in the value of reserves underpinning it. The whole system of finance for international trade in the free world is therefore now dangerously top-heavy. One consequence of this is that the timing of anti-recession moves among America's allies is going to be (indeed is being) inhibited. This is a major reason why purchases—and prices—of the poorer countries' primary materials are so low; the enforced check to production is also, in itself, of awkward political significance at a time when production in the Communist countries is still expanding.

A still greater danger, however, concerns the present system's vulnerability to speculative movements of currency. At the moment, against most people's expectation at this stage of the American recession, the main speculative movement across the exchanges is a flow of dollars out of America; as America can afford this, the Americans may ask why Britain should worry. Why Britain should worry is that the very fact of the present currency flow out of America—at a time when the Americans would presumably agree that they themselves are not following either wildly inflationary or confidence-shaking socialist policies—shows how uncertain and perverse these currency flows can be. If the speculative movement turned round again to hit sterling (under circumstances which this time really would not be Britain's fault), then there would have to be some curtailment in the sterling system—under which, at present, sterling finances up to 50 per cent of world trade, although backed by only about 5 per cent of world reserves. If the use of sterling in world trade had to be restricted at a moment of delicate balance during a trade recession, then the international liquidity squeeze could turn into a more dangerous international liquidity crisis than the Americans may at present conceive.

The ways of avoiding this (still contingent) danger are obvious. Either there should be some device for underwriting the sterling system; or there should be a considerable expansion in the resources of the IMF, which could then share with sterling the burden of financing much of the world's trade at moments of strain; or the dollar price of gold should be increased. It is not likely that President Eisenhower and Mr Macmillan will reach open and bitter disagreement about these problems next week: the danger is rather that they will reach secret and friendly agreement to look into the problems further, and then that nothing much will be done. It was this process of amiable, hidden and unsuccessful confabulation which brought about the demise of the old "Robot" convertibility plan for sterling in 1953-55. This time, after he has presented any proposals he has with him to President Eisenhower, Mr Macmillan would be well advised to publish them. There has been insufficient openness—as well as insufficient urgency—in debate about this most crucial of the economic problems before the free world.

Split Levels

JUST fifteen years ago both Mr Macmillan and General Eisenhower were in North Africa, rather anxiously watching General de Gaulle make a dramatic descent on Algiers to sort out the French position. History may never repeat itself exactly, but it sometimes enjoys stirring the same ingredients together again and observing the result. This week Mr Macmillan has been packing his briefcase for his visit to the President with one ear cocked to catch the resounding echoes of the new French prime minister's return to Algeria; and his talks in Washington next week will be given a whole new dimension by the uncertainty about France's future role in the western camp.

Mr Macmillan's approach to his North American engagements has been characteristically relaxed. He found time to see the Derby run on Wednesday, and perhaps was relieved to find that the French threat was not as alarming as the tipsters had feared. He is travelling light as regards accompanying advisers, and his programme includes visits to two universities as well as to Washington and Ottawa. But the Prime Minister's sometimes deceptively casual manner cannot, on this occasion, disguise the number and urgency of the issues that must be discussed. Apart from the complex of economic issues (on which any new course now set by France will of course impinge), and the Middle Eastern instability at present focused on Lebanon, there is the whole broad field of dealings with Russia. And this last is not even confined to the matter of preparing for summit talks. Exchanges on other levels are also contemplated or actually proceeding. In diplomacy, as in contemporary house design, the split level now seems to be all the rage.

Thus, while the western ambassadors in Moscow have now completed the first round of their separate interviews with Mr Gromyko, ambassadors in Prague have also been summoned to hear of Czechoslovakia's anxiety to play a part in the game; and between Washington and Moscow there has been a rich and rare exchange of proposals and counter-proposals dealing with Antarctica, with joint campaigns against disease, with the opening up of areas at present closed to travellers, and with the possibility of increasing trade now that the Cocom strategic controls are about to be relaxed. Nobody seems inclined to quarrel with the Nato council's dictum, in its Copenhagen communiqué last month, that "conferences at the summit are not the only way, or necessarily the best way, of conducting negotiations."

Talks and Tests

THE most promising field for actual progress at an early date still seems to be the gathering of experts to discuss how a suspension of nuclear tests could be supervised. Mr Khrushchev's latest message on this subject, delivered last Saturday, started some needless hares by urging that the experts should meet in Moscow instead of Geneva and that, as well as the three existing nuclear powers and France (which is nearing the threshold of the club), Poland and Czechoslovakia and "India and possibly some other countries" should be represented. But Mr Nehru, for one, has shown commendably little eagerness to snap at this bait; and there are indications that Mr Khrushchev's sensibilities about parity in numbers can be accommodated. At least the Russians do not seem to want the experts' meeting to become as large and cumbrous as a summit conference on the scale they originally proposed would be.

If it does prove possible to get the expert talks started within the next few weeks, this will end the unhappy period, now dragging on into ten months, during which there has been no substantial discussion of any aspect of disarmament between the powers. This vacuum was created by the Russians' decision, after they had tested their ICBM, to boycott disarmament talks in the appropriate United Nations organs, a boycott in which they persisted even after the UN disarmament commission had been enlarged, at their insistence, to near the point of ineffectiveness. The talks now projected will not be formally within the UN framework, but Mr Eisenhower has emphasised, in his messages to Mr Khrushchev, the need to keep the United Nations in the picture. Mr Hammarskjöld, who paid a brief visit to Britain this week, has not concealed his strong feeling of the need to draw the handling of disarmament back into a UN context. Significantly, he has now taken personal charge of disarmament questions in the secretariat, removing these matters from the scope of his under-secretary for political affairs, a post which is about to be occupied by a Russian, Mr Dobrynin.

RUSSIA AND FRANCE

Heads We Win

THE pace of events in France has driven the Kremlin to extremes of caution. Marshal Voroshilov was reported last week to have said that if General de Gaulle were good for France the Russians would welcome him, though they did not think he was. This report was denied in Moscow on the rather curious ground of non-interference in the affairs of other countries: a principle newly dis-

covered. Simultaneously, the correspondence from Paris in Soviet newspapers was toned down and the emphasis was shifted to straight reporting.

Moscow's caution has coincided with a certain softening of the French communist line. If the assumptions of French communist leaders (described on page 899) prove right, Mr Khrushchev need not be very gloomy at the prospect. Civil war, with risks of world conflagration, has been averted. On their analysis, the general will start the job of undermining Nato and a popular front will finish it off.

★

But there is no certainty that the general will in the end give place to a popular front; and in the meantime Mr Khrushchev can overplay his hand. If he were to decide, in order to speed up the disintegration of the Atlantic Alliance, to invite the general to Moscow, the communist faithful in France—and perhaps elsewhere in western Europe—would suffer a shock comparable to that of the Hungarian insurrection, and the whole west European communist movement might suffer from the shock. It is being freely suggested that the Russians might contemplate inviting the general; but it would have political drawbacks.

RUSSIA AND JUGOSLAVIA

Mr Khrushchev's Trojan Horse

AMONG the communist competitors in being nasty to the Jugoslavs, Mr Khrushchev himself has now snatched the palm from the Chinese and the Albanians. On Tuesday he descended—apparently at very short notice—on the Bulgarian party congress in Sofia and in a heated harangue called Jugoslavia the "Trojan horse of imperialism," and maintained—as did the Chinese Communists two weeks ago—that the Cominform resolution of 1948 (for which he publicly apologised to Marshal Tito three years ago) was "basically correct." He alleged that the Americans would never give a communist country help unless it were serving their interests and declared that there could not be two kinds of socialism in the world—one which is "furiously hated" by the imperialists and another which they accept and support. In short, Mr Khrushchev appears to have decided to tell the Jugoslavs roundly that they must either stand up and be counted with the rest of the communist block or else stop pretending that they have comradely—or any other—connections with it.

Events will show whether Mr Khrushchev really meant what he seemed to say. There is, however, no convincing evidence that he himself has not undergone a genuine change of heart towards the Jugoslavs who have unmistakably asserted their independence; indeed, the very violence of his Sofia speech suggests the bitterness of disillusion. The Jugoslavs for their part have certainly lost their illusions about him. When Russia first "postponed" its economic aid after the Hungarian revolt they made the best of it; this time they have firmly protested and propose to demand compensation if Russia does not think again. They point out that Russian deeds are beginning to be "in terrible contrast" to Russian words.

This is not a situation which the west can watch with lofty detachment; for the chances of a genuine relaxation of tension between Russia and the western powers are bound to suffer if Moscow quarrels violently with Marshal Tito for allegedly being a tool of the west.

TERRITORIAL WATERS

Gunboats for Iceland?

THE British attempt to resist the extension of national fishing limits has been seriously challenged by Iceland's unilateral move to extend its territorial waters from four miles to twelve. The Faroe Islanders have followed the Icelandic lead. Norway is hesitating. The chain reaction, so much feared, threatens to set in, with the nations that have plenty of fish off their coasts seizing by national action what they could not get at Geneva by international accord.

For British trawlermen the prospect is a grim one. Talk of a "fish famine" in Britain is of course nonsense; Icelandic trawlermen can catch the fish and sell it here. But the loss of these traditional fishing grounds would be a hard blow for the deep-sea fishemen of Grimsby and Hull. Mutterings about Nasser, Makarios and gunboats can be heard. Perhaps Mr Sandys has abolished the last gunboat. But at least he might grunt the naval equivalent of "Let them eat cake" and send an aircraft carrier.

Unfortunately this may be exactly what the Icelanders would like. A vigorous political effort will have to be made to reach an agreement with our allies round the northern seas, preserving what rights within the twelve-mile line can be preserved for outsiders who have traditionally fished there. But nothing would do more harm to the British case in the eyes of the world than the sight of a peevish Britannia bullying a tiny ally. If the battle were to be fought in the waters off Reykjavik more modern political weapons would have to be used. Frog-fishermen, sprawling pathetically across the path of the oncoming kayaks, might offer passive resistance. But the Icelandic waters are cold. Paris, the headquarters of the North Atlantic Treaty Organisation for European Economic Co-operation, is the right place to resolve the dispute.

LIBERALS

Balancing on Which Fence?

NEXT Thursday the Liberals are putting their recent revival—and their administrative resources—to a considerable test by fighting three by-elections in Conservative-held seats on the same day. This week, in advance of that test, their party has been very much in the news. Mr Morgan Phillips—in a surprisingly sharp article in *Labour Press Service*—has castigated them for holding "unhealthy" victory torch parades, for facilely promising "easier times," and for seeming "to adapt their policy conveniently, according to the requirements of the constituency being contested" (remarks which recall that the proverbial pot was not wrong in calling the kettle black, but merely insufficiently abashed). On Thursday the resolutions submitted by constituency Liberal associations for next September's Liberal assembly were published—and, unhappily, a generally dreary lot of catchpenny resolutions they are. There is not a single worthwhile, vote-risking proposal among them. Finally, Mr Grimond has published an important pamphlet on "The New Liberal Democracy," which—this is not necessarily a disadvantage—is bound to annoy the Conservatives very much.

Mr Grimond's main concern is to explain what the Liberals would do if they held the balance of power in Parliament after the next election. In general, their principle would be to allow the party with most MPs to form a government, but to keep a veto on its activities. (The Liberals would not, for example, allow a minority Labour government to nationalise steel, or to undertake "a vast increase in government expenditure.") But if the other parties were fairly evenly balanced, the Liberals would have to make a choice. "There was a time three or four years ago," says Mr Grimond, "when I thought that the Conservative party might really turn into a progressive party." But now, although not finally committing himself, he is inclined to think that there may be more hope of liberalising the Labour party; and he is certainly intent on slapping down the would-be embrace of some Conservatives who have recently suggested that their party and the Liberals should automatically be regarded as cosy anti-socialist bedfellows together. "It now seems likely," says Mr Grimond, "that there will be a Tory party on the right and Liberal and Labour parties on the left."

This apparent assumption that a Labour government could be liberally tamed more easily than a Tory one could be liberally hotted up is controversial; if Mr Grimond, in such a position, could really liberalise the present Labour party, he would perform a signal service to the country. But also, one would have thought, a herculean one. The real question to ask, however, when reading this statement of policy by the Liberal leader, is whether it serves to liberalise the Liberal party itself: whether the trend is towards risking annoying a lot of people (but towards inspiring a lot of others) by moving towards the extreme centre, or towards annoying as few voters as possible by relapsing into the dead centre (for example, by not specifying which producers Liberals would hurt in their entirely praiseworthy stated objective of "putting the consumer first"). Unfortunately, it must be said, with considerable regret, that the trend of the Liberal policy proposals in this pamphlet still seems to be towards annoying as few special interests as possible.

DEFENCE

Forces and Commitments

MR SANDYS can claim two boosts for his policy this week. The first is the agreement with Germany on support costs. The second is a remarkably good batch of recruiting figures, which seem to improve his prospects of achieving his aim of all-regular volunteer forces of 375,000 men by 1961-62, including an army of 165,000. To make ends meet under his policy, Mr Sandys must increase volunteers and reduce commitments, and he has now visibly pulled the two ends nearer to each other.

Under the agreement with Germany Mr Sandys has at last reached a compromise which will bury the irritating argument about support costs for three years. This reduces the prospective annual cost of the forces in Germany in terms of foreign exchange from £47 million a year to around £30 million; and, besides paying a subvention of £12 million outright towards British budgetary and foreign exchange costs for three years, Germany is also depositing £50 million for arms purchases (which will further ease foreign exchange difficulties), and is advancing the repayment of three instalments of Germany's postwar debt. At the same time, it has been agreed with Bonn (though not yet with Nato) that British forces can be reduced from 55,000 at the end of 1958 to 45,000; the second tactical air force will be kept in Germany, but in what strength is not specified. Though this cut of 10,000 men is represented as a measure to meet the exigencies of foreign exchange costs, in fact it will also conveniently ease the manpower budget, since it represents almost a division saved for the strategic reserve. It may also be assumed that British arguments for the further reduction of forces in Germany have by no means been exhausted. For example the problem of keeping 45,000 regulars, as opposed to conscripts, fully trained as the German army takes over facilities formerly used by Rhine Army may well be used as an argument by the Ministry of Defence for further reductions.

Mr Sandys has increasingly to look forward to the situation which will face a British minister of defence in 1961-62 when it is planned that conscription will end. If the rate of recruitment in the first four months of this year is maintained (and Mr Sandys seems very confident that it will be), there will be in 1961 about 125,000 volunteers with the colours; with 20,000 officers, this would make a regular army of 145,000. If recruiting improves further—and it rose sharply in April—the final gap of 20,000 might be bridged; but if not, there will be a gap for a few years in which every regular will be desperately valuable—so that the fewer tied down overseas the better. On present recruiting the full force of 165,000 would be attained in 1965. The question will be whether there is a gap, therefore, and if so whether that gap is to be bridged by retaining some national servicemen or cutting things fine for a few years. It is clear enough which way Mr Sandys's inclinations will go if he should be still at the ministry. He will be for cutting things fine. But whether a regular army with 45,000 men in Germany, and 100,000 to 120,000 available for use elsewhere, will be enough in 1961-62 remains a completely open question. It is one that should be carefully debated in the months ahead before British conventional forces become too small to constitute an adequate "little deterrent."

EDUCATION

Demand for Teachers

THE 1960s are supposed to be a decade of great prospective reforms in education—of an increase in the school leaving age, a reduction in the size of all primary school classes below 40 and secondary school classes below 30, the introduction of county colleges for all from 16 to 18. In view of these plans—and in view, also, of the present welcome, but unplanned, tendency for children to stay longer at school voluntarily—there is going to be a need to bring perhaps 90,000 more teachers into the schools, above the present number of 247,000. Unfortunately, present plans to increase the teacher training course from two to three years mean that teachers from the training colleges may be reduced by a third, and at just the wrong moment.

The Central Advisory Committee for Education (England), which is reviewing the education of young persons of 15 to 18, is very concerned about this problem. In advance of its main report—which is due next year—its chairman has written to the Minister of Education, and drawn attention to this need for 90,000 more teachers; to the implications of the increased length of teachers' training; and to the decision, made some time ago, not to

increase the number of places in the colleges. Indeed, it looks as if the situation might grow even worse than present statistics suggest, because the bulge will probably not pass through the schools as quickly as was once forecast, owing to the continued high birthrate, and because there are signs that wastage from the teaching profession is increasing.

Mr Lloyd has referred the problem to the National Advisory Council on the Training and Supply of Teachers, who, it may be hoped, will make their recommendations promptly. If nothing were done, either plans for educational improvements would have to be ignominiously postponed, or an attempt made to carry them through with some sort of emergency teachers training scheme like that with which the gap was plugged after the war. This latter device, though perhaps better than nothing, would be an admission of failure and improvidence. The expansion of the universities may be expected to produce more graduate teachers in the sixties, but even if half the increase in university students now planned took to school teaching, this would not provide the numbers required. Somehow, therefore, more teachers must be got out of the training colleges.

THE UNIVERSITIES

Seven per cent Students?

THE Government has promised grants for university building which are intended to bring the number of students from about 97,000 this year up to 124,000—and possibly 136,000—in the mid-1960s. This figure is based very broadly on the anticipated national needs of technologists and teachers, together with population trends of school-leavers: and it is no doubt related also to the Treasury's estimate of tolerable budgetary costs. But this has always left out of account the question of how many young people in this country should ideally have a university education. It is a complex question, but interesting light on it is shed by the "Report on a Policy for University Expansion" published recently by the Association of University Teachers. After some preliminary, and useful if demnish, observations on what a university education should be, the report estimates that the schools could in principle increase the number of boys and girls taking two subjects in the GCE at advanced level by 55 per cent over 1954, and that the university intake could be correspondingly increased. The proportion of the population which has a high enough IQ, or native intelligence, to meet present university entrance requirements is estimated at 6.9 per cent, compared with the 3.2 per cent which reached the universities in 1954.

To bring to the universities and technical colleges 95 per cent of those who could benefit at the present minimum intellectual level prescribed would, the report calculates, require at least 145,000 places in British (excluding Northern Ireland) universities by 1965. If teachers' courses and some university courses were lengthened, the required student population would be raised from 145,000 to 185,000. Clearly, even on the basis of present university entrance standards, it will be necessary to raise the Treasury's sights if British higher education is to be made adequate to the nation's real mental potential—by at least five new universities of about 4,500 students apiece, besides some further expansion in existing universities. But the Association of University Teachers is disappointingly cautious about this prospect; even if the money were available, it doubts if the university staff could be recruited on such a scale.

The short reply to the last objection is that the proportion of seconds among dons (now 41 per cent) will have to be increased. And a short commentary on the association's estimate of the potential student population is that it leaves entirely out of account the need to provide some form of higher education for those who cannot be crammed through GCE with two passes at A level. The real need for university expansion is thus even greater than this otherwise imaginative and valuable report suggests.

BELGIUM

Poised See-Saw

IN the next few weeks, Belgium's political leaders may face some tricky negotiations as they attempt to form a government; for the electoral see-saw has swung the former opposition, the Christian Social party, into delicate balance with the left-centre coalition parties. The coalition of socialists, who held 86 seats in the assembly, and liberals (25) has enjoyed a comfortable majority over the Christian (catholic) party (96 seats) ever since 1954, when a long period of right-wing government was brought to an end. In last Sunday's poll the catholics have made a comeback. They now have 104 seats in the chamber compared to a mere 105 between liberals and socialists combined. In the senate, or upper house, the catholics may have an outright majority.

The next government may therefore be an awkward match between catholics and liberals or all three major parties combined. But election battles cannot be forgotten overnight. It was on the timeworn schools issue—the lay parties demanding financial priority for state-owned schools, the catholics equality between these and catholic schools—that the catholics won most votes last Sunday. And they have promised to cut conscription from the present fifteen months to twelve.

To Belgium's allies, however, these differences are less important than the common ground between all the major parties. There are two communist deputies in the Belgian parliament. All the other deputies give sturdy support to Nato and European integration. Even the catholic offer to cut conscription owes a good deal to the example of other allies. Nor should a change of government bring much change in economic policy. Belgian heavy industry, a weathervane of the world economic climate, has suffered more from the current depression than any other area in Europe, but the economy as a whole is being sustained by the good business the Brussels fair is bringing in. The exhibition and the impressive new road system Belgium is building are important features of the expansive economic policy introduced by the last government. A new government could hardly abandon this in a time of world recession.

SWEDEN

Tantalising

TANTALUS, whose fingers were never quite able to close on the succulent fruits that hung above his head, would sympathise with the emotions of the Swedish prime minister this week. Hr Erlander and his Social Democratic government fought last Sunday's election almost solely on their proposal to crown the welfare state with a generous (and compulsory) system of supplementary pensions. They succeeded in rallying their party's slowly declining electoral fortunes as much as their most optimistic supporters had hoped. By winning six extra seats, the Social Democrats have restored themselves to their 1948 strength. On that basis they would, if they accepted the support of the five communists in the new chamber (having subtracted one from their own total, as they have to provide the Speaker), be able to put through their pensions Bill with the narrowest possible margin of 116 to 114. But the postal votes remain to be counted next week, and these invariably favour the right wing. The Conservatives hope to gain one seat in Stockholm from the communists, which would produce a tie, 115-all, the Speaker having no casting vote. If the Liberals recover another from the Social Democrats in Örebro, as is possible, the supporters of a compulsory pensions scheme will once more be in a minority.

Hr Erlander will not offer his Bill again until next year.

Sand on Their Boots

FROM the first sounds of breaking glass and splintering woodwork in the Algiers government building, the British press pricked up its ears and gave the French crisis the full treatment. News editors and everyone else looked only to Paris; the *Daily Telegraph* even datelined a leader from there. President Gronchi, the London busmen, and Jerry Lee Lewis's child-bride found themselves pushed on to inside pages. Among Fleet Street's regulars, in addition to Mr Cousins, only Archbishop Makarios and Manuel, the Glasgow murderer, ever really broke back into the headlines until Marianne's head had safely rolled into the wastepaper basket.

The general was Fleet Street's favourite early on, and by the end he was given general backing. The *Daily Mail* made its jump first. "It is not for us," it wrote stiffly on May 15th, "to take sides in what could be a new French Revolution." But by the 20th it found the general "like Churchill in a way." The *Telegraph* was not far behind. On May 22nd it was still saying: "Let us hope . . . that M. Pflimlin's exceptional majority is more than a temporary expedient." But the next time it wrote, two days later, it was coming round: "Cincinnatus is an awkward character; but there is every reason to believe that he is genuine and not a second edition of the 'Prince President'."

Parisians who turned to Fleet Street when the censorship descended on their own papers did not need to look far for the Gaullist bias. "Midnight Crowds Go Wild With Joy" said the *Daily Express* on May 30th when President Coty sent for the general. "Don't Try to Stop Him," said the *Mail* ominously on the same day above a picture of General Massu. But the prize for understatement went to the *Chronicle* for its headline: "His Plan: Send MPs on Holiday." As it was, headline writers generally had a hard time of it. The one day that the *Manchester Guardian* chose to give the crisis a banner line across the front page was May 28th. "Pflimlin Accepts de Gaulle's Challenge" it proclaimed in its London edition; before London read it M. Pflimlin had already resigned.

Anyone who relied on the London evening papers could have been pardoned for believing that M. Pflimlin had gone long before. The chorus was unanimous. "De Gaulle Is In—Pflimlin Out" said the *Standard* positively on May 27th. "Yes, It's de Gaulle," the *News* confirmed. Next day there was some climbing down "Coty Speeds Move to Call de Gaulle," said the *Standard* lamely. But at least it had tipped a winner.

Scoops were rare, and sometimes dearly bought. The *Daily Mirror's* "Flight from Paris" on Saturday, May 17th (inspired by the customary rush of weekending Parisians down the *Autoroute de l'Ouest*), was corrected on the 19th, but this only gave piquancy to Mr Cecil King's statement on the 21st that denunciations by fuddy-duddies "must puzzle the many millions who look to the more sprightly papers for guidance in national and international affairs. . . . " Other notable stories to which there were no follow-ups included Mr Delmer's 40,000 miners, armed by M. Jules Moch to stop the Gaullists (*Express*, May 20th) and the *Mail's* scarifying discovery: "Paratroops Landed Secretly in France" (May 28th). Did they have sand on their boots?

Personal reputations were, naturally, there to be enhanced. Among those who received published accolades were Mr Delmer, Mr Randolph Churchill (whose interview with General Massu was printed in both the *Express* and the *Standard*), and Mr Michael Foot, who was actually expelled for insulting President Coty. After Mr Foot's exclusive story, rivals did not talk so loudly about how often their editions had been seized by the Paris police. The *Daily Herald* (May 31st) allowed Mr Foot his own bid for historical fame: "I have no doubt that if Thomas Paine had been in Paris during these tremendous days he might have been expelled, too." Why "might"?

The less sprightly papers treated the crisis in their own ways. While the *Manchester Guardian* gave its readers a leader in French, *The Times* doggedly translated despatches from *Figaro's* correspondent in Algiers, M. Serge Bromberger. When *The Times* did get a man to Algiers two of his messages reported successive phases of the situation together on June 1st. On one page the leaders of the coup had been struck by a "proverbial thunderbolt" at the news of General de Gaulle's cabinet; on another, not having got so far, they were still relaxing in the hour of victory and giving away their little secrets. One of these was General Massu's sense of moral distaste at the third-degree methods he had to practise in Algiers against the FLN. But "it was his duty as a Christian and a soldier to go on with the work. This must be said to put into perspective the various wild stories about tortures which circulate in liberal circles in Paris and London."

Several axes were ground bright and sharp before the public gaze. The *Daily Worker*, with the London busmen to champion as well as M. Duclos, found the answer on May 29th: "Only unity can hold off fascism in France. Only unity can defeat the Tories in Britain." On June 3rd the *Worker* printed the heading "Dictator" above the picture of—Sir John Elliot. To the *Daily Express* on May 30th General de Gaulle was the man who "would certainly have carried through the Suez affair once it had been launched," to the *Sunday Express* (June 1st) he meant "curtains" for united Europe.

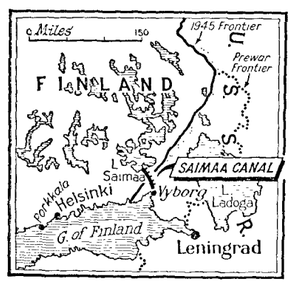
This was not Fleet Street's shining hour by any means, although many of its correspondents did valiantly and deserved much better of their sub-editors at home; there were some splendid cartoons, including notably those of Illingworth and Ronald Searle. And what was the total effect on the reader? Among so many competing voices perhaps the one clear message was the *Mail's* on May 16th: "As we said yesterday, the West is in danger."

His best hope might then be to amend it just enough to win over a few Liberals, the only one of the three non-socialist parties who favoured any legislation at all for supplementary pensions. But the Liberals, losing twenty of their 58 seats, have just suffered a stinging defeat. Their leader, Professor Ohlin, says that they will not support the Social Democrats' Bill, and the survivors of the slaughter are likely to conclude that they suffered because they went too far to the left on the pensions issue. Swedish politics are moving into a new and more bitter phase. The leading position of the Liberals in the opposition during the past decade marked the triumph of compromise and a general acceptance of most parts of the welfare state. Now the *centrifugal* forces seem to be reasserting themselves. Leadership of the opposition passes to the Conservatives, who are not only against establishing a right to supplementary pensions by law but are also committed to substantial cuts in the existing social services. If the Social Democrats try to push through their pensions plan unchanged, with the aid of the communists, the opposition's protests will be acrimonious. The Agrarians (who now call themselves the Centre party, although the adjective fits the Liberals better) were the Social Democrats' allies until last autumn, but they have just scored a major success by flatly opposing their former comrades on the pensions issue. As the rival forces gather themselves farther out to right and left, the rumble of impending battle gathers over Sweden's long political calm.

BRIGGS MOTOR BODIES

Stewards in Retreat?

An announcement from Dagenham last Friday should ring a bell. The twenty-two unions with workers at Briggs Motor Bodies, a subsidiary of the Ford Motor Company, have agreed in principle that conditions of work should be standardised throughout the Ford organisation. This could mark an important shift of power in this former stronghold of the shop steward movement. On the face of it, there would seem to be little for the unions to object to in the company's plans which, by regrading workers and altering the system of tea and wash breaks, would enable considerably higher wages to be paid at Briggs. But for nearly five years the Briggs shop stewards have used their powerful influence against the proposals because, irrespective of their benefits, they would make factory conditions less a matter for shop floor bargaining and more one for negotiation between company and union executives. These stewards will now doubtless do their utmost to see that their unions' agreement to standardisation in principle never means anything in practice.



There are indications, however, that the shop stewards' power has been on the wane since the strike in February of last year, over the dismissal of Mr McLoughlin for ringing a bell summoning the men to a meeting in working hours. Until then the stewards had been allowed virtually a free rein, and their committees had become "unions within a union," disposing of large funds raised by lottery, running a belligerent newspaper and generally pursuing a very militant line. The ordinary workers considered themselves helpless under the rule of this private empire; as one leader of the General and Municipal Workers put it this week (at a conference of that union which has been remarkably courageous), any worker at Briggs who was singled out as being against the stewards felt that he was "for the high jump." In the fifteen months before the McLoughlin strike, there had been 289 minor unofficial stoppages at the works, an average of more than one every other day. But since then, and in spite of prophecies that the company's "tough" policy would create more ill feeling than ever, labour relations have much improved and the number of stoppages has dwindled away. There is thus a reasonable chance that the company's proposals, which have still to be signed by each union individually after consultation with their members before they can become effective, will go through. If they do, the story of Briggs since the company stood up to the McLoughlin strike will deserve to be regarded as a very significant one.

FINLAND

Eyes and Hands

"The Finn does not believe until he sees." Quoting this proverb at a Kremlin dinner last week, President Kekkonen tried to reassure his hosts that although his fellow countrymen were apt to be "unduly sceptical," they would eventually come to share his own complete trust in Russia's goodwill. "Even the most stubborn Finn is convinced by facts that he can feel with his hands." When Mr Kekkonen went home on Saturday, he took with him two things that any Finn could see: a promise of a long-term Soviet credit *running to about £40 million*, and an offer of transit rights through the Saimaa canal. But many Finns, especially those who (as the president apologetically admitted in reply to a forthright speech by Mr Khrushchev) still tend to "rake up the past," may be inclined to reserve judgment on the value of these things until they can feel them with their hands.

The Saimaa canal was one of Finland's main arteries before the 1939-40 war. It links the open sea with the network of lake and canal routes that give access to the country's chief source of wealth —its forests. Unused since Russia annexed the Vyborg area, including half the length of the canal, it has fallen into such neglect that the Finns reckon it would cost well over £10 million to reconstruct it. Under the agreement now envisaged, each country would repair and maintain its own part of the canal, and Russia would lease to a Finnish agency sites for the storage and transhipment of cargoes at the sea end. But it does not look as if the Finnish seaman's union will get the treaty rights on strips of land along the banks of the canal about which it has been insistent.

As to the promised credit, the Finns, who had hoped for a loan in gold, can now expect only deliveries of Soviet goods and equipment. The offer of equipment for the iron and steel works which they want to erect in the north must be tempting to a country beset by serious unemployment and foreign exchange problems. But cautious Finnish eyes have noted that just a few days before Russia made this offer, it abruptly cut off the larger credits which it had granted to Jugoslavia—a blatant use of economic pressure for political purposes, about which the Soviet press has, understandably, not informed the Russian public. Cautious Finnish hands may soon be feeling round the back of the "selfless and unconditional" offer of aid to see how many strings are attached.

BURMA

U Dum and U Dee

Like *Tweedledum* and Tweedledee, the two rival factions in Burma's ruling party have agreed to have a battle. The rules, announced a month ago, provide that whichever side is defeated in the imminent parliamentary trial of strength will become a loyal opposition. Each group is to get half the party funds. Officials are not to be victimised for having backed the loser. "Both sides should practise friendliness by attending each other's functions." The prime minister, U Nu, is sure that the soldiers will not be tempted to intervene, because they "hate the practice of the army seizing power, and are fully aware of the futility of this practice, as proved in many countries." *O si sic omnes.*

It all smacks of cricket—with bodyline bowling banned. At first both U Nu and U Ba Swe (who held the premiership for eight months in 1956-57 while U Nu was trying to reform the party) showed a preference for the umpire's role; but as the split in the party widened, they were forced to take different sides. U Nu is now captaining the Establishment team, while U Ba Swe opens the batting for the challengers together with another deputy premier, U Kyaw Nyein, who looks like hitting out pretty vigorously all round the wicket.

The real winners may prove to be the communists. The opposition National United Front, which they dominate, has hitherto been dwarfed by the huge parliamentary majority of the ruling Anti-Fascist People's Freedom League. They have now taken a hand in the game by pledging U Nu their support. The split in the League is bound to strengthen immediately their tactical position; and the premier may well face an embarrassing choice between surrendering office and retaining it with the Front's help. But in the long run Burma stands to gain much by acquiring a vigorous democratic opposition. The League, which has been in power ever since 1948, the year of independence, is ridden with faction, favouritism and lethargy; and all attempts to reform it from within have failed. It is much farther gone in decay and disunity than India's Congress party—although less than Pakistan's Muslim League. The present rift arises, it seems, more from rivalries between individual personalities and cliques than from anything else; but even a rift of this kind, "as proved in many countries," can lead to the birth of a healthy two-party system. May the spirit of fair play outlast this week's parliamentary Test.

NEW VOLUNTARY HOSPITAL

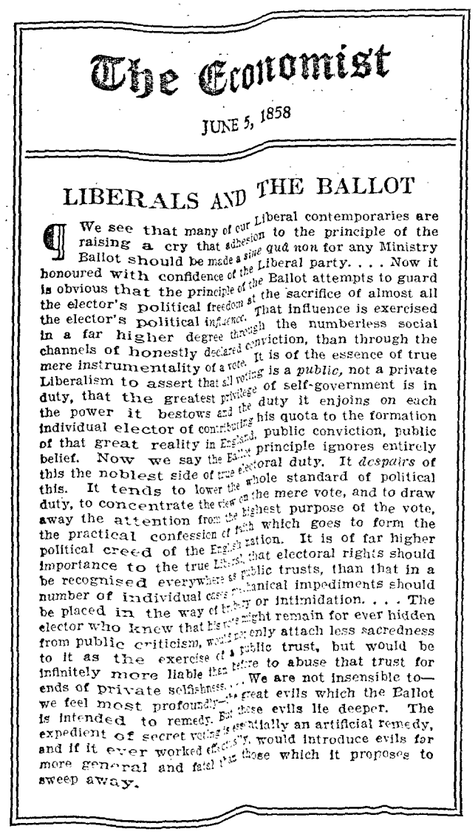
The Triumph of David

Exactly seven years ago, David—in the shape of a group of general practitioners in the Kingston and Malden area of Surrey—began his second fight against Goliath—in the shape of the South-West Metropolitan Regional Hospital Board and the whole weight of bureaucracy. David had lost the first fight. The regional board had closed the Kingsten Victoria Hospital, a hospital run by general practitioners with the assistance of outside consultants, in order to transform it into a *gynæcological unit* for the Kingston general hospital, and the Ministry of Health had upheld the board's decision. Thereupon the displaced doctors, convinced that it was against the interests of both the patient and good medical practice for the general practitioner to be excluded from the hospitals, as the structure of the health service demanded, set up a trust to raise enough money to start a new voluntary hospital of their own.

Against all odds they have succeeded, and the New Victoria Hospital opened its 21 beds to patients last week. The doctors, general practitioners and consultants, are *unpaid*; they will treat acute medical and surgical cases; and there will be out-patient clinics. Funds for the new hospital have come in from all over the world, but the bulk has been raised from local sources and by time-honoured methods: subscriptions (ordinary and covenanted); house to house collections; collecting boxes; entertainments; the collection and sale of salvage. The patients, however, will not be asked, as they were under the old voluntary hospital system, to contribute what they can afford towards their treatment and maintenance, unless they elect to have one of the two private rooms, for which the full cost will be charged.

It is, however, one thing to whip up funds to launch a venture and quite another to raise enough to maintain it over the years. The hospital still has to consolidate its initial triumph. Is there a big unsatisfied demand for a small hospital where patients can be cared for by their own doctors? If continued local support for the New Victoria proves this, it is something to which the Ministry of Health must pay attention. That department, and the regional hospital board, ought also to look at the New Victoria's costs. They are estimated at £13 6s. a patient a week. This sum, after allowance is made for the unpaid services of the medical staff, is about £2 a week cheaper than the cost of similar hospitals in the same region. If this apparent financial advantage is genuine, and if the advantage is maintained, the new hospital will have a part to play in the fight to keep down hospital costs throughout the country.

CONSUMERS' PROTECTION



A Fabian for Efficiency

Over recent years several influences have coincided to focus public interest on the question of consumer guidance. On the technical side there is the development of synthetic fibres, detergents and plastics; much more technical expertise is needed to judge these than the ordinary buyer—even when quite competent to assess more traditional wares—can bring to the job. On the economic side, rising standards and hire purchase have between them increased the weight, in the normal domestic budget, of "consumer durables" such as refrigerators and television sets; a mistaken once-for-all purchase matters much more than an equally "bad buy" of perishable goods. On the legal side a salutary change of expert opinion has made possible the launching, without fear of libel actions, of the semi-official Consumer Council with its quarterly "Shoppers' Guide" and the wholly private Consumer Research, Ltd., with its more sharply discriminating periodical

"Which?" Finally, recent publicity about the murkier techniques of advertising has helped to make consumer education a live issue.

The latest expression of this growing influence is a Fabian research pamphlet, "Efficiency and the Consumer,"* which provides a critical survey of the whole field of consumer protection—from the various Weights and Measures Acts, Food and Drugs Acts and Merchandise Marks Act to the two consumer-guidance organisations and certain instructive measures applied in other countries. It is a sensible and liberal-minded study, patently concerned—unlike certain previous publications on similar themes—with helping consumers to get what they want rather than with making them buy what the enlightened Left thinks proper or with slapping down the business man. Indeed, except for a rather silly attempt to attribute all the benefits of the Conservatives' Merchandise Marks Act of 1953 to pressure from an Opposition which had neglected the matter through six years' tenure of office, "Efficiency and the Consumer" bears very few signs of party origin. The author advocates more action by local authorities under the Merchandise Marks Act; clearer division of labour, rather than amalgamation, between Consumer Research and the Consumer Council; a state service to get information to where it is most needed; and an educational campaign through the co-ops, the trade unions, the women's institutes, and above all the schools. With reservations about the proposed state service—especially when seen in a socialist context of increased public enterprise and consequently increased political pressures—all these aims are commendable. The educational programme which is suggested has the added advantage that a generation which had assimilated it would be armoured not only against the wiles of advertisers, but also against a very large proportion indeed of currently popular socialist tosh.

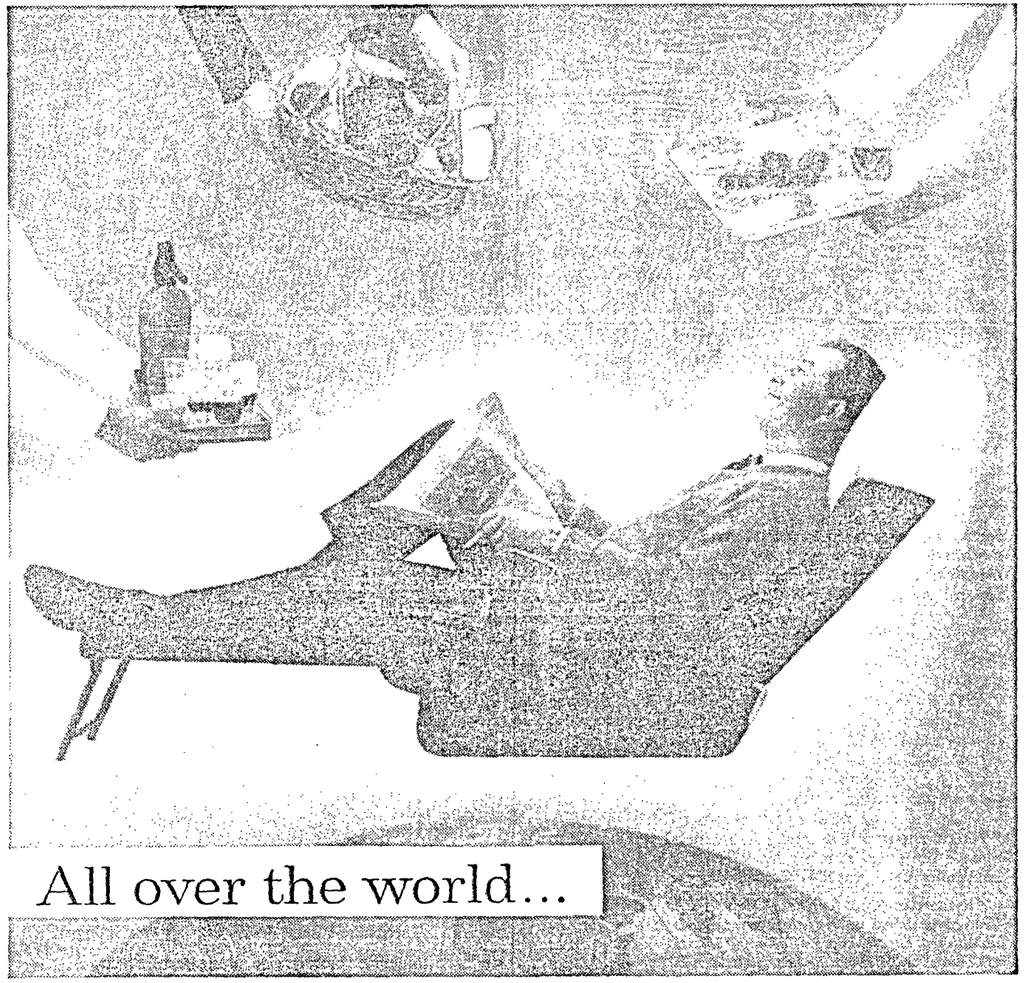
*"Efficiency and the Consumer." By C. D. Harbury. The Fabian Society. 32 pages. 2s. 6d.

The Economist

JUNE 5, 1858

LIBERALS AND THE BALLOT

¶ We see that many of our Liberal contemporaries are raising a cry that adhesion to the principle of the Ballot should be made a *sine qua non* for any Ministry honoured with confidence of the Liberal party. . . . Now it is obvious that the principle of the Ballot attempts to guard the elector's political freedom at the sacrifice of almost all the elector's political *influence*. That influence is exercised in a far higher degree through the numberless social channels of honestly declared conviction, than through the mere instrumentality of a vote. It is of the essence of true Liberalism to assert that all voting is a *public*, not a private duty, that the greatest privilege of self-government is in the power it bestows and the duty it enjoins on each individual elector of contributing his quota to the formation of that great reality in England, public conviction, public belief. Now we say the Ballot principle ignores entirely this the noblest side of true electoral duty. It *despairs* of duty, to concentrate the view on the mere vote, and to draw away the attention from the highest purpose of the vote, the practical confession of faith which goes to form the political creed of the English nation. It is of far higher importance to the true Liberal that electoral rights should be recognised everywhere as public trusts, than that in a number of individual cases mechanical impediments should be placed in the way of bribery or intimidation. . . . The elector who knew that his vote might remain for ever hidden from public criticism, would not only attach less sacredness to it as the exercise of a public trust, but would be infinitely more liable than before to abuse that trust for ends of private selfishness. . . . We are not insensible to—we feel most profoundly—the great evils which the Ballot is intended to remedy. But these evils lie deeper. The expedient of secret voting is essentially an artificial remedy, and if it ever worked effectually, would introduce evils far more general and fatal than those which it proposes to sweep away.



CHINA

A Mountain of Posters

THE gap between the rosy speeches of politicians and the drab reality outside the conference hall is hardly a monopoly of the communist world. But neither Mr Macmillan nor Mr Gaitskell on the eve of an election could, even if they wished, compete with Mr Liu Shao-chi, the ageing theoretician of the Chinese Communist party. In a speech before the party's eighth national congress in Peking, Mr Liu referred to the "posters with big characters" that are being put up all over his vast country as part of the campaign of criticism and self-criticism. A speaker's denunciation of himself and others is normal communist procedure, but in China it has become a revolution by boredom, a bloodless form of terrorism that is China's special contribution to the art of ruling without the consent of the governed.

In this method, the poster has become a gadget of universal utility. Some weeks ago the *People's Daily* was saying that the power of the poster lay in the fact that "everything is revealed in the sunlight." Mr Liu spoke of it—and of the debates that went with it—as "the noble, communist way of doing things." He might have added that nobility, in this instance, was coupled with extravagance. In Peking, the ubiquitous street committees have been making housewives produce their quota of posters; children have been neglecting their homework to write posters criticising their teachers and the teachers themselves produced 2,000 each, criticising one another. Some buildings virtually disappeared behind posters and the *People's Daily* carried a letter from eight clerks complaining that they had to attend so many anti-waste and rectification meetings that no time was left to carry out the suggestions they received.

Posters apart, the main emphasis of the congress has been on "leaping progress" at home and, abroad, on virulent denunciations of Jugoslav revisionism. In the face of opposition from intellectuals, "bourgeois rightists" and national minorities, there does indeed seem to have been progress in China in recent months. Mr Liu claimed that production during the first four months of the year was 26 per cent higher than in the same period last year. Chairman Mao Tse-tung's slogan, "Catch up with and outstrip Britain in 15 years"—which Liu quoted—seems nearer to coming true in coal than in steel. Mr Liu expects China to produce 180 million tons of coal this year, and 7.1 million tons of steel. Great increases in productivity are also claimed. Whether these encouraging signs are being registered because, or in spite, of rectification and other unproductive campaigns is difficult to determine.

BOAC takes good care of you

FLY BOAC—FOR SURE! You'll relax and enjoy your journey, secure in the knowledge that BOAC takes good care of *everything*.

BOAC's reputation for all-round excellence is founded on a superb airliner fleet — plus expert personnel and close attention to details. Your comfort is assured . . . your meals are always delicious . . . and wherever in the world you fly — across the Atlantic, to Africa, to Australia or the East—experienced cabin staff devote all their skill to your well-being. Fly BOAC—for certain!

For full details of BOAC world-wide routes and de Luxe, First Class, Tourist and Economy Class services, consult your local BOAC Appointed Travel Agent or BOAC, Airways Terminal, Victoria, S.W.1 (VIC 2323); 75 Regent Street, W.1 (MAY 6611); or offices in Birmingham, Leeds, Manchester, Liverpool and Glasgow.

Answers to correspondents

"Why have special glasses for drinking sherry? It's the same sherry whether it's served in a tumbler or a tankard."
—H. B., Droitwich.

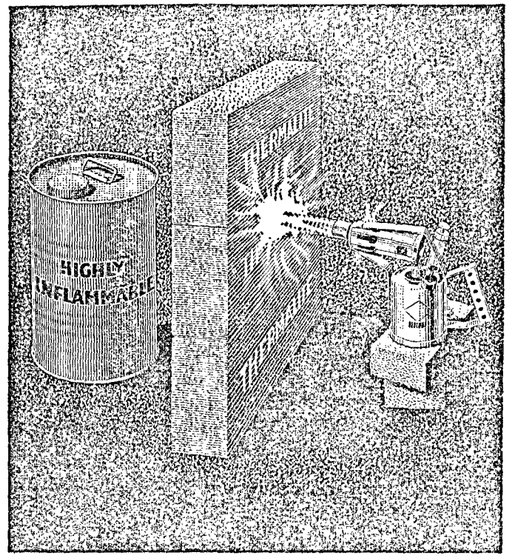
And how right you are, H. B.! But it's good housekeeping to serve sherry in a small, tulip-shaped glass—that way the bottle lasts longer. After all, if you cut cucumber sandwiches as thick as doorsteps instead of wafer thin, you'd soon run out of bread, wouldn't you?

"My friend was refused a small sherry in a wine bar because he wasn't wearing a jacket. Is this in order?"
—Indignant, Balham.

There is no law that coats must be worn when drinking sherry, and I must confess that on occasion I have removed mine before sitting down, in the solitude of my little den, to a bottle of Mackenzie's Vintners Cream! Without knowing the full facts of the case I hesitate to give an opinion. Perhaps the man was wearing braces.

"After a sherry at our annual staff dance I was unable to remove the glass from my nose. How can I avoid this happening next year?"—Wendy, Harrow.

How embarrassing for you, Wendy! I hope it is off now. The conventional sherry glass certainly is a trap for the uninitiated, but the knack of draining it to the last drop comes with practice. Throw the head well back and follow through with the elbow high. Good luck!



"Unaccustomed as I am to public drinking, I'm always at a loss for words about wine, and so have to drink alone. Could you lend me the book called "Oenophilia" which you reviewed recently?"—Tongue-tied, Surbiton.

Alas, the only copy is now wedged under my sideboard; if I remove it, the bottles might fall off. But don't despair: fine words flow freely after a fine wine.

This is why

THERMALITE-YTONG

Load bearing insulating building blocks

are safe

insulation

Thermalite-Ytong load bearing insulating building blocks give exceptional thermal insulation and fire resistance.

They present no fire hazard being entirely non-combustible. Recommending themselves particularly as an infilling to steel or concrete frame constructions, they provide insulation as an integral part of the structure. More efficient insulation, in fact, than any other of comparable cost.

LETTERS

Training for Teachers

SIR—I hope that you will allow me, as *someone with* experience of several colleges none of which is connected with the London County Council, to correct some misconceptions in your article of May 24th on teachers' training colleges.

The expression "teacher factories" is quite unjustified by the conditions in any training college. The education given in the colleges is adapted to each student's abilities and is governed as regards academic studies by his or her own choice. Certainly none of the colleges maintained by the London County Council is among the group of those with more than 400 students. Moreover, they are all well known for their liberal conception of life and study.

It is a pity that your correspondent allows himself to make such unwarranted and tendentious statements as "a number of the colleges are simply not good enough to imprison a girl for a third year." It shows that he does not realise that the responsibility for the academic standards of every college rests upon one of the area training organisations, nearly all of which are under university auspices. One academic subject at least, carried to quite a high level, is a requirement for the students in every area training organisation.

The assertion that the decision to increase the length of the course from two to three years was purely political is quite unfounded. The National Advisory Council which recommended this reform to the Minister of Education represents the universities, the employing authorities, and the teachers' organisations, as well as those concerned with the training of teachers.

The suggestions that the longer course should be introduced piecemeal or should be restricted to certain colleges or certain groups of students are not new. They were fully considered in discussions leading up to the final decision and were emphatically rejected as unworkable. Different branches of the teaching profession face different kinds of demands, some more intellectually rigorous, others requiring deeper professional insight. But among teachers and those who staff the training colleges there is a profound conviction that three years is the shortest time in which a student can develop sufficiently in depth of thought, breadth of knowledge and personal experience to be ready to embark on the education of children. The purpose of the extra year is indeed to give what all teachers need, that further education of which your correspondent writes.—Yours faithfully,

Whitelands College, Putney E. M. WILLIAMS, Principal

Gas Under Pressure

SIR—Your article of May 31st does not mention one important reason why gas may be failing to compete with electricity for domestic use. This is the higher capital cost to the householder of gas heating installations. As an example, two years ago I was quoted £89 for the supply and installation of an instantaneous gas water heater (in a new house being built) compared with £20 for an electric immersion heater. Also there is the capital cost of the additional flue construction needed if gas fires are used for supplementary space heating.

These costs are not entirely under the industry's control, but they must seriously affect future gas sales.—Yours faithfully,

Hatfield A. H. LECKIE

Cyprus

SIR—Your correspondent in Nicosia wrote in *The Economist* of May 10 that I have "lavished professions of allegiance on the archbishop, as the obvious leader of the Greek Cypriot community—but at the same time I have doggedly maintained that whenever negotiations take place, the Left must have a share. . . ."

I would like to make the position of the Pancyprian Federation of Labour more clear. No Cypriot disputes the ethnarchic role of the archbishop. Your correspondent correctly writes that our federation recognises the archbishop as the obvious leader of the Greek community.

We accept the archbishop as the chief spokesman for the whole community in any future negotiations and as during our recent talks with him in Athens we realised an almost complete identity of views on all most important issues, we do not rule out every idea of authorising his Beatitude as the sole spokesman.

The important question at present is not whether the Left—or any other political group—must have a share in any future talks. The important question is how to get the British Government to understand that the return of the archbishop is one of the prerequisites for the restoration of that peaceful atmosphere suggested by the United Nations General Assembly.—Yours faithfully,

ANDREAS ZIARTIDES
Pancyprian Federation of Labour

Tanganyika

SIR—Your special correspondent's reply to our letter of May 31st is misleading.

What does he hope to prove by stating that "total revenue in 1957 was more than twice that in 1949"? If he means national income more than doubled in that period, where are the figures? We know of none published before 1952 or after 1954. If he means that tax yields (in money terms, note) measure changes in real national income, he is out on a limb. This would only be so if tax rates remain constant and the coverage of the tax system remains the same. Over the period in question, there have been changes in tax rates and an extension in coverage in Tanganyika, not to mention considerable delays in tax collection. If we applied this second interpretation to the UK, the real national income would appear to have risen nearly six-fold over the last twenty years!—Yours faithfully,

ALAN T. PEACOCK
D. G. M. DOSSER
Edinburgh University

Buses

SIR—One very important hindrance to the reduction of costs by omnibus operators was omitted from your most interesting article in last week's issue.

Leyland Motors now offer a double-deck bus of revolutionary design, with front entrance, and rear engine, seating over seventy passengers. Unfortunately, however, the unions have been most obstructive, and have prevented the widespread introduction of this vehicle. Their argument is that as fewer buses will be needed to carry a given number of passengers, fewer crews will be necessary, and redundancy will result.

A second method by which costs could be reduced, and more people encouraged to make trips by bus, would be by speeding up services. At present, most services operate on an average speed of 16 mph, except in some country areas where 20 mph is worked. If the Ministry of Transport would allow a higher maximum speed for public service vehicles, in line with their modern power and braking efficiency, the companies could operate with 20 per cent fewer vehicles, 20 per cent faster. One of the reasons for the popularity of the long distance express coach services is that the coaches used on these services normally travel at far above the maximum speed which is legally permitted.—Yours faithfully,

Oxford JOHN V. ORMSBY

Treatment of Offenders

SIR—With reference to your comment on the treatment of offenders last week, may I draw your attention to the Margery Fry Memorial Fund?

Margery Fry had a life-long interest in the prevention of crime and the treatment of offenders. It is envisaged that the fund might be used for such purposes as the granting of scholarships; the financing of research schemes; the setting up of pioneer projects for the rehabilitation of offenders; and that it might help the establishment of an Institute of Criminology.

It is hoped that many people will give generously to this fund. Donations should be sent to: John Cole Esq., 66, Lincoln's Inn Fields, London, W.C.2.—Yours faithfully, HUGH J. KLARE

Howard League for Penal Reform, S.W.1

BOOKS

War in the Desert

The Sidi Rezeg Battles, 1941

By J. A. I. Agar-Hamilton and L. C. F. Turner.
Oxford University Press. 565 pages. 52s. 6d.

THE second volume to be published of the official South African war histories shares the merits of the first ("Crisis in the Desert") by the same hands: clarity, vigour, fairmindedness, a gift for visual topography, and readability. The product of careful and detailed research into British and enemy papers and memories, the narrative swings freely from the exploits of a solitary patrol, the cold darkness of a single desert night, to the rigorous consideration of the broader strategy of the campaign, without losing either perspective or the "feel" of the battle.

Indeed, maybe there is too much perspective. If this volume shares the virtues, it also continues the severely critical approach of its able predecessor, the tone of austere omniscience (occasionally—and embarrassingly—punctuated by a rather nudging facetiousness): this results in a diminution all round, the indication that everyone was pretty poor at his trade, so that the not especially impressive South African performance lies blanketed in the general amateurishness. Not that the South Africans' contribution stays less rebuked than the rest's, but it emerges into a conclusiveness: nobody was very efficient, but some were very brave. "Crusader" may not have been a very clever battle; even so, it was not fought by dwarfs. It would be grumbling especially about an admirable study, to make too much of this—men are touchy about a desert where friends lie buried; moreover, one is astonished how successfully the writers have recaptured the tone of this particular operation, in which morale seeped upwards rather than down, even (so the book suggests) affecting the planners, of whom there were, evidently, too many. Few armies can have gone into battle in such high spirits as the Eighth Army into its first; perhaps that was why. Nor can the saga of "Jock" Campbell be told again too often.

In a most valuable chapter the authors argue that Britain's so-called inferiority in tank armament was less marked than some will recall; what was at fault was rather the doctrine—or at least the practice—of pitting tank against tank.

British tank cannon, it is clear, were due far more to the need to their own anti-tank opposite batteries on the other hand. British tank crews generally had no system of co-operation with their artillery, and of their complete inde other arm of the service.

If this was so, the eventual plan was the more unfortunate since it depended initially upon three armoured brigades, not in mutual support, seeking out the enemy armour, Ariete at Bir el Gubi and the two Panzer divisions in areas unknown, before striking into the rear of the enemy investing Tobruk; not enough had been learned from "Battleaxe" in June. Only Norrie among the senior commanders seems to have seen the issue straight and the importance of Sidi Rezeg from the beginning; and he kept his head throughout. Once more, the authors are mystified by "Strafer" Gott; again, the ubiquitous Rommel is portrayed as less competent than some of his subordinates; yet again, the strong wind of Auchinleck's determination blows fresh throughout the book. Its first half is the better, perhaps because of the nature of the battle. It would be unfair to expect a false tidiness thereafter, when as the result of Rommel's "dash to the wire" (here clearly revealed as not directed at British dumps), all became confusion. Each side in these admirably delineated chapters of accidents was rescued by the other's errors, the battle being won when one of them became aware that he was beaten.

> The casualties of Eighth Army had been heavy. . . . Tank crews were bewildered by the serious losses . . . and the very necessary caution which had replaced the dashing gallantry of the first clash might easily become excessive. The infantry had suffered equally. If the forces of the *Panzergruppe* were approaching exhaustion, so were those of their opponents, and it was very doubtful whether the latter would be capable of the vigorous action needed to eject the Italian and German forces if they did not choose to go of their own accord.
>
> In the end it was the imponderables that decided the battle. British generalship is open to many criticisms at this stage but it was not lacking in the necessary quality of resolution

—least of all Auchinleck's.

Second Empire, Revised

The Political System of Napoleon III

By Theodore Zeldin.
Macmillan. 196 pages. 24s.

EVER since 1789 French politics have been, in the English view, in more or less chaotic confusion, with tumults such as rage at the present day never far below the surface; and Louis Napoleon's reign as prince president and emperor has seemed, under a superficial appearance of order, as chaotic and as confused as the rest. Dr Zeldin now seeks to explain to us, in clear and simple terms, what the politics of the second empire were about. "How men survived in politics and how new men entered it," "What politics meant to the members of parliament," "How the government won elections in its early years and why it later ceased to win them," are among his chapter headings; and his advantages for tackling such questions include access to a great mass of documents, official and private, which have not been worked over before.

Study of this new evidence has provided him with several new theories, most of them destructive of the views of earlier writers. He distrusts, for example, M. Goguel's view of Louis Napoleon as the representative of the "party of order," and M. Guillemin's insinuations that leading Bonapartists went into politics for money; though in such a spendthrift age the latter charge cannot be met—as Dr Zeldin seems to think it can—by proving that some Bonapartist ministers died comparatively poor. The author has not, perhaps, taken the time or the space to work out his ideas so fully as they deserve; this is a young man's book, and the actual text of his essays covers only 168 sparsely printed pages. Half a dozen valuable electoral maps, at the end, show over the thirty years 1848-1877 the permanent strength of Bonapartism in south-west France, the permanent hostility to it of Paris and Provence, and its varying fortunes elsewhere in the country. More use of the data incorporated in them might have been made in the text, where the election analyses are not always clear.

Sometimes Dr Zeldin seems to be dazzled by his own ingenuity in unearthing statistics, and to take little heed of their significance: it is rather odd, for example to quote 114,275 francs as a large sum spent by the central government in 1868 on supporting local newspapers throughout provincial France, and to cite two pages later a deputy who spent almost as large a sum to secure his own return for a single seat. But the book has one great merit: it will make its readers think.

Social Charade

The Rainbow Comes and Goes

By Diana Cooper. *Hart-Davis.* 256 pages. 25s.

ONE day, perhaps, sociologists will study aristocracies in the spirit in which they now investigate the middle and working classes. All these groups, now fast intermingling in western Europe, have varied enormously with national characteristics. A comparative study would have to do more than tell of dynasties, wars and revolutions or even the interpenetration of classes. It should describe, above all, styles and manners. Upper classes (like upper nations) have been more or less irritating. The British one has been widely admired for its simplicity and sense of proportion: qualities absent, by common consent, from certain cynical and fossilised grandees on the Continent who subsist separately from their contemporaries in a kind of continuum of their own.

Lady Diana Cooper's first volume of memoirs is valuable because it describes vividly a youthful Edwardian coterie distinguished by an infectious originality of manners. The Great War carried off most of the group's young men: Asquith, Shaw-Stewart, Horner, Charteris, Rupert Brooke were names that would doubtless have figured in politics, diplomacy or literature. Lady Diana, who married a survivor and a man of exceptional talent and determination, seems to have been the only woman of the coterie who had later the opportunity to use Edwardian spontaneity in modern public life. The technique, roughly, was to turn serious social functions into something of a charade. Applied to Maurice Thorez or Charles de Gaulle the method was fascinating. It made mincemeat of Ernest Bevin and annihilated all lesser fry. Nobody could really cope with it.

The young group of 1910, so absurdly called the "Corrupt Coterie," seems to have been in fact innocent, cultured and ultra-romantic. "Our pride," writes the authoress, "was to be unafraid of words, unshocked by drink and unashamed of 'decadence and gambling.'" Which words, how much drink and what brand of decadence is not specified; but the enterprise was evidently as far from the Regency as from the oncoming twenties.

The irresistible part of the memoirs deals with Lady Diana Manners' childhood in London and the country. Her mother, to judge from her drawings and sculpture illustrated in the book, must have been a woman of strong feeling. The Duke, secretary to the Prime Minister, emerges as a bureaucratic person of uncertain temper. "He once threw a napkin at my mother because she had asked Princess Beatrice of Battenberg to lunch without telling him." Then there was the late Duke, who enjoyed having tourists romping round Belvoir three times a week. "They represented to him England and liberty and the feudal system and were a link between the nobility and the people." This marvellously ramshackle sentence epitomises the solid confidence of the Victorian aristocracy; so unconscious was its behaviour and so far in spirit from the calculated "public relations" of some of its descendants, who open their houses to the public and feature unceasingly in the press.

There were nurses and foreign governesses. "Mademoiselle came to us . . . from a family in Toulouse via a situation in Tiflis. . . . She was proud of her figure and, after pressure, showed us her breasts. They were a great surprise to me." Fraülein, "a criminal type, filthily dirty, of monstrous greasy appearance," was sacked; barricaded herself into her room; cooked for herself on a spirit lamp; and wrote a scurrilous pamphlet about the Duchess, which was privately printed and distributed all over London.

The author is at her best in these subtle and earthy descriptions, which have a humour and humanity that lie deeper than charades.

Political Garden Plot

The End of North's Ministry, 1770-1782

By Ian R. Christie.
Macmillan. 429 pages. 40s.

TWENTY-EIGHT years ago Sir Lewis Namier closed his "England in the Age of American Revolution" with the promise, "My next book, if ever written, will be on 'The Rise of Party.'" He is redeeming this promise by editing a series covering the years 1754-1784. The authors are those working on the co-operative "History of Parliament," but in the narrative series each has his own "garden plot." These are small and intensively cultivated. Mr Brooke took the years 1766-1768, while Mr Christie scrutinises those from 1780 to 1782. These unhappy closing years of the American war saw a despairing Lord North facing disaffection within the ministry and radicalism in the Commons. The general election of 1780, a surprising move since parliaments normally ran their full course, failed to strengthen the ministry, which fell after the defeat of Yorktown.

Mr Christie's book is distinguished by the high standards of scholarship set by Sir Lewis Namier. He has systematically analysed the papers of John Robinson, George III's election manager, and recorded every fluttering heart-beat of the dying ministry. His findings are interesting. There is no basis for the opposition cries that the reign had seen an increase in the influence of the Crown. Instead, the number of Treasury boroughs had decreased since 1761, while the number of placemen in the parliament of 1780 "was lower by about a quarter than the high peak reached about 1761." Government expenditure upon the election was small in proportion to that of private individuals, and some was inefficiently applied to popular constituencies, showing an interesting sensitivity to opinion. Issues, sharpened by the American conflict, now did affect politics, and Mr Christie estimates that a third of the new House had party affiliations, whereas Mr Brooke found only a quarter. But party is for Mr Christie still a curious exotic in the herbarium of connections and independents. Burke "spoke as a voice in the wilderness"; and the Rockingham party, between seventy and eighty strong, was quite exceptional in its size. But it did now answer to Burke's definition of party made a decade earlier, and until the French Revolution its members were held together by "admiration and affection for their leaders and agreement on great issues of policy."

Interesting as Mr Christie's conclusions are, he restricts them to parliament and carefully walls in his garden plot, considering external events only "in so far as they had some bearing upon the attitudes of politicians and upon parliamentary events." The radicalism of these years is not much explored by Mr Christie, whose plot is planted with stiff rows of cuttings from Sir Lewis Namier's estate. The election of 1780 and the members returned are rigorously analysed in relation to Sir Lewis's findings for 1761. But while those were of major importance, the same method now gives a diminishing yield. Is it worth the labour to discover that the parliament of 1780 was "slightly, but not significantly, younger than the Parliament of 1761," or to learn that "the army officers of 1780 conformed to much the same pattern as those of 1761," or to tease readers with the clue that "not one of the guards officers was a Scotsman"? Sometimes the comparisons, as in the case of placemen, are worth making; but often they serve only to enhance the value of the original as against the reproduction.

Card Index of Scientists

Six Wings: *Men of Science in the Renaissance*

By George Sarton.
Bodley Head. 318 pages. 25s.

GEORGE SARTON, who died before this book was published, was a great pioneer: no one has equalled the service he did to the history of science by the patient accumulation of facts. It is in great part due to him that the vast night of early science, where formerly there hung only a few widely spaced luminaries, now glimmers with innumerable points of light. But he remained a compiler, a card index scholar; surrounded by files and catalogues, he could discover, he could copy and arrange, but he could not communicate. Even in this book, lectures given to students after a lifetime devoted to his subject, Sarton was unable to distill his knowledge; he remained the servant of his data to the end.

"Six Wings" (the title is "a reference to the famous astronomical tables compiled in Tarascon (Bouches-du-Rhône) in 1340-65, and beyond them to the seraphim") is hardly more than a catalogue of names and *curricula vitæ*, grouped according to subject: exploration and education; mathematics and astronomy; physics, chemistry, technology; natural history; anatomy and medicine. The work ends with a chapter on Leonardo, the reconciler of science with art. The author's massive "Introduction to the History of Science" only went up to the end of the fourteenth century; this present book, together with its predecessor, "The Appreciation of Ancient and Medieval Science During the Renaissance" take the story forward to 1600.

Viewed as a survey of scientific activity it has several drawbacks. Issues and trends appear but fitfully through a crowd of names, some of minimal importance. The text bristles with unilluminating detail and unnecessary allusions to obscure scholarly disputes. The notes are at the back; infuriatingly, because the text has no literary charm that would be marred by their presence at the foot of the page. There are numerous misleading statements: that Erasmus "was not a poet," for instance;

A Review of Commonwealth Raw Materials

Volume I

A report by the Commonwealth Economic Committee to the Governments of the Commonwealth. Covering a wide range of raw materials and sources of energy, it provides a comprehensive study of the position of Commonwealth countries against the background of world trends of production, consumption, trade and prices. Numerous statistical analyses up to 1955 with pre-war comparisons are discussed with textual references to resources and to some important later developments.

Price 15s. (*post* 1s.)

Volume II, to be issued later, will comprise detailed studies of the raw materials position in individual Commonwealth countries.

The World Today
Dean Acheson

'At the very least I should like Mr. Gaitskell to make this brilliant little book compulsory reading for all members of his Shadow Cabinet.'
R. H. S. CROSSMAN (*New Statesman*)
(HARVARD UNIVERSITY PRESS) 17s. 6d. *net.*

OXFORD UNIVERSITY PRESS

that "Dürer was always practical and earthbound" and that he was uninfluenced by Leonardo; that Brunelleschi was "the creator of . . . Santa Maria del Fiore." To call Leonardo's letter to Lodovico Sforza "pathetic" because it laid stress on military engineering rather than painting is to misrepresent the respect given to this art during the Renaissance. But for all this, the period dealt with is a crucial one, and no other book provides quite this sort of information. A crank or a platitudinarian in the realm of ideas, Sarton as an encyclopædist was a genius, and "Six Wings" will take its place among those works from which, in the course of time, the history of early science will be written.

Topography of the Terror

The Way of the Tumbrils

By John Elliot.
Reinhardt. 180 pages. 18s.

THE Algerian Committee may yet prove that Paris is not France—as the French provinces proved it in 1848 and 1871. But Paris, dominating the drama of the great Revolution, was the stage on which the principal actors played their parts. Here we can follow them from their entrances to their final exits. Sir John has found, or imaginatively reconstructed from clues, the houses in which they lived and worked, where they argued, were judged and imprisoned, murdered by mobs, or executed by the guillotine. He takes us back through place and time to the older Paris of crumbling houses and narrow streets, breeding places of disease, crime and political violence. It is fortunate that Baron Haussmann, who destroyed so much of the old to make room for the new, founded in the Musée Carnavalet the collection of prints and documents that is one of Sir John's principal sources of evidence.

Explorers using this book will not be distracted by arguments about the motives of the historical characters they will meet. The Girondins may not have been so idealistically pure as Charlotte Corday thought—but her desire to avenge them burns with a clear heroic flame as she journeys to Marat's house and, her mission completed, is taken to trial and death. Danton was, perhaps, less politically (and financially) innocent than the author seems to think—but his statue still defies the invaders, his great laugh still echoes in the Court de Commerce, his contemptuous answers still thunder in the place where he was tried. Danton had no doubts about Robespierre's aims, or where they would lead him—nor has Sir John; and he has penetrated a modern bar, a patisserie and a cosmetic shop to find the room in which the "cold cruel tyrant" cowered, as the cart carrying the great tribune rumbled past.

The Revolution did indeed devour its children—not only its leaders but also, in Paris alone, thousands of comparatively unknown and harmless victims. More moving than his somewhat lengthy story of Marie Antoinette's martyrdom, already described in detail so many times, is Sir John's pilgrimage to the scene of the September Massacres; and to the "Mousetrap" in the grim prison where the condemned waited for trial, the tumbrils and the guillotine.

Their last journey, through streets and over bridges little altered, is clearly marked on a map, which shows how the old Paris can still be found in the new. There is a well-chosen bibliography; and Peter Roberson's illustrations are topographically *helpful—though his* "sansculottes," breaking unexpectedly into the narrative, seem to have been recruited from *Punch* rather than from the purlieus of St Antoine.

Labour in Embryo

The Advent of the Labour Party

By Philip P. Poirier.
Allen and Unwin. 288 pages. 25s.

THIS is a piece of conscientious research by a lecturer in Ohio State University. It covers the period from the foundation of the socialist societies and the democratising of the trade unions in the last twenty years of the nineteenth century to the "triumph" in the general election of 1906. Its central *pivot is the establishment* of the Labour Representation Committee in 1900.

The publisher's note tells us that this is "a crucial but neglected period in Labour party history." Crucial, no doubt: but surely not neglected. This is well trodden ground, as is indicated by the bibliography at the end of the book. There are not only several general histories, but also a much larger number of biographies and autobiographies. Those interested in the embryonic stage of the Labour party will have trodden these paths many times already. What have they to learn by treading them again under Mr Poirier's guidance? The answer is, not much. Anyone who has read the relevant parts of Elie Halévy's 1895-1906 volume will know that it is really all there, in essentials: less detail but more colour and emphasis.

Nevertheless, this is an excellent textbook, rather dry perhaps, but dry is not wholly a word of dispraise. Mr Poirier knows his stuff, and *though presumably* an American he writes the kind of English that is found agreeable on this side of the Atlantic. His very lack of emphasis will appeal to the palate of the discriminating reader, as for example in an appraisal of the youthful MacDonald on pages 178-9:

> It might be argued that his solicitude for Independence was always *equalled*, if not excelled, by his resourcefulness in draining Independence of any political disadvantage. He . . . would regard Independence as primarily a political weapon. Impatient of doctrinaires who stood in the way of the broadest party structure, he had developed a philosophy of socialism so embracing that the programme or doctrine of no particular group was likely to confine him.

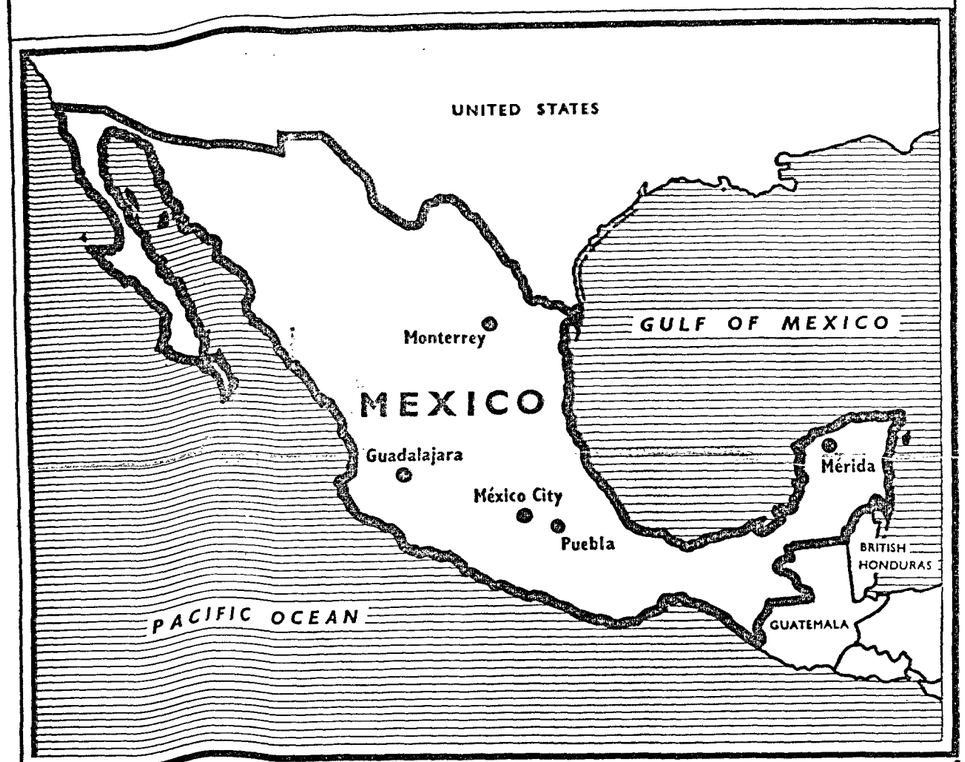
That is a good style. Where have we met it before? Surely in Creighton's "History of the Papacy."

TAPE A LETTER

FOR YOU, THE EXECUTIVE. A Stenorette Dictating Machine will record 25 minutes continuous dictation per spool of tape. It will also record telephone calls and conferences verbatim. It has automatic erasure, back spacing and place finding facilities. It costs as little as it does because Stenorettes are made by the largest manufacturers of tape recorders in the world.

Average cost **52 gns.** (including the basic accessories)

FOR YOU, THE SECRETARY. A Stenorette puts more time at your disposal; makes life more interesting; helps you catch that earlier train more often. And knowing how to operate it *adds to your qualifications.*



GRUNDIG Stenorette DICTATING MACHINE

More than 200,000 now in daily use

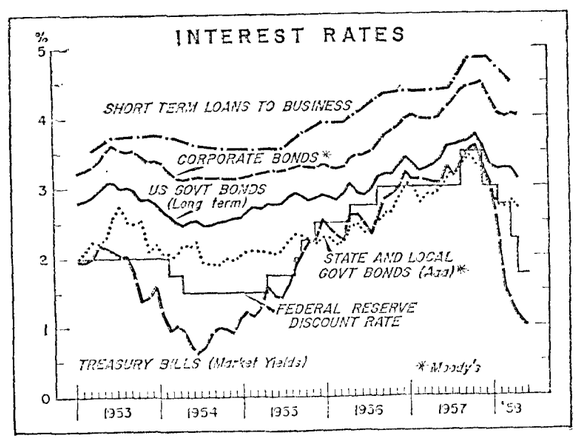
AMERICAN SURVEY

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Long-term Issues at the Treasury

WASHINGTON, DC



IF it be an act of virtue in the modern economic world to worry as much about tomorrow's inflation as about today's recession, the Secretary of the Treasury, Mr Anderson, has displayed a virtue possibly unparalleled in the western world since the war. While five million unemployed cool their heels and while about 30 per cent of the country's productive capacity lies idle, Mr Anderson has not only stubbornly—and successfully—resisted a tax cut which would have increased the Budget deficit, but he has flown in the face of orthodoxy by issuing $1 billion worth of 27-year bonds. This was undeniably an act of great courage ; whether it was foolhardy remains to be seen.

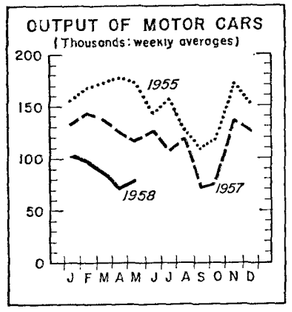
Of all the factors in his decision, the one which probably was uppermost has nothing to do with the recession ; it is the annoying tendency of the average life of the securities which make up the public debt to shorten with the passage of time. To Mr Anderson it is imperative that more of the debt should be longer-term in order to make it easier for the Federal Reserve Board to control a future inflation. When too much of the debt is short-term and refinancing operations must be frequent, the central bank has to relax its pressure on the money market on too many occasions in order to help out the Treasury. Another problem is the tendency of short-term debt to be absorbed by the banking system and to produce a liquidity in the economy that made it difficult, during the 1955-57 inflation, for the central bank to halt inflation by control of the supply of money alone. With this general viewpoint Mr Martin, the chairman of the Federal Reserve Board, completely agrees and, contrary to report, he has not been opposed to funding operations during a recession.

Moreover, the Treasury found during the recent boom that it was quite impossible to lengthen the life of the debt at the very time when the traditional theory of debt management would have called for it. Mr Anderson and his capable Under Secretary, Mr Baird, are thoroughly convinced that long-term borrowing by the Treasury will always prove positively demoralising in periods of rising interest rates and heavy demand for credit. Their thinking is supported by a recent joint report of the presidents of the twelve Federal Reserve Banks. The tentative conclusion of the report is that the Treasury should probably give up all idea of using debt management as a counter-cyclical instrument, and should instead make efforts to issue long-term bonds in limited amounts whenever market conditions are propitious, regardless of the state of economic activity.

Mr Anderson has followed this prescription. But are market conditions propitious ? Long-term interest rates have not fallen much, despite a fairly vigorous easy money policy on the part of the central bank, because supply and demand have not permitted them to come down. A steep drop in yields immediately after the Federal Reserve Board reversed its policy in November promptly stimulated the issue of an enormous volume of corporate and state and local government issues, and the drop in yields ended as quickly as it had begun. A $1.7 billion long-term Treasury security in February added to the supply. And now, just as it seemed possible that at long last the volume of borrowing would begin to reflect the heavy decline in private investment in plant and equipment, the Treasury has asked for another $1 billion.

Though there was a sharp split in the financial community when it was first hinted that the Treasury might use the June financing to float a long-term issue, by the time of the actual announcement there was a large majority which supported Mr Anderson's decision. Presumably the belief was that the supply of other issues was about to decline and that therefore the effect of the new Treasury bond, at the most, would be to delay an inevitable decline in yields on long-term securities. Thus, the reasoning went, the issue could not be accused of depriving other borrowers of funds nor of interfering with recovery. However, the many families who had hoped to buy houses on mortgage this year—or had hoped to refinance old mortgages—may be forgiven for wondering when the promised decline in interest rates is going to reach them. The same is true of the treasurers of hard-hit state governments and

corporations, which still find themselves forced to pay rates far higher than the postwar average, although they had been taught to believe that interest rates fell during recessions.



Admittedly it is only long-term interest rates that have proved so sticky. The yields on Treasury bills have dropped from a postwar peak of about 3.6 per cent last autumn to below 1 per cent; this is about as low as they went during the recession of 1953-54. Other short-term rates have fallen comparably, although the "prime" rate which the banks charge on loans to their most credit-worthy borrowers has remained well above the 1954 level. Critics of the Federal Reserve Board feel that the prime rate and the long-term market show that the easy money policy has not been pushed with nearly enough vigour. It is pointed out, for example, that most of the new reserves supplied to the banks have been needed to offset the billion-dollar outflow of gold, and that therefore little new money has been supplied to the monetary system.

The central bank, however, is convinced that the response of the economy to its policy has been "phenomenal" and "unprecedented." Mr Martin and his colleagues point out that the "free" reserves of the banks average about $500 million which is all that they conceivably need; that the "active" money supply has been prevented from declining; that the total of bank loans and investments has expanded by the enormous sum of $7.5 billion since November, compared with a rise of only a quarter as much in the same period a year ago; and that supply and demand, not monetary policy, are the main determinants of long-term interest rates. It is certainly true that credit has been fully available up and down the range of the market. This is dramatically demonstrated by the sudden revival of interest in the government-insured mortgages for housing which last year, with their fixed ceilings on interest rates, had lost almost all their appeal for investors. What is more, the important thing for economic activity is that mortgages should be written and corporate and state-local government issues be sold, not the interest rate at which the money is lent.

For the rest of the year, unless Mr Anderson becomes quite carried away by his wish to lengthen the maturity of the public debt, the prospect must be for a further lowering of interest rates. A big reduction in the volume of new corporate issues is widely expected. The demand for bank credit from corporations is already fully reflecting the recession as businessmen continue to liquidate their stocks at a rate unequalled since the war. About the only thing which might prevent a gradual softening in yields on long-term securities would be a vigorous economic recovery. But practically nobody expects this and consequently Mr Anderson's gamble may do little harm in the short run and will do good in the long run.

No Contract, No Matter

THE ghosts of militant American miners, who coined the slogan, "No contract, no work," must be raising their eyebrows at their fellow-workers in the Michigan motor car factories this week. The members of the United Automobile Workers' union employed by the three big car companies—General Motors, Ford and Chrysler—have been working without a contract since their agreements with the companies expired at the end of last week. The three companies, confident in the knowledge that unemployment has weakened the union's finances (nearly a third of its members, being out of work, pay no dues) and that they themselves have little to fear from a strike because there is a two months' supply of new cars in dealers' hands, have unitedly refused to budge from their offer of a plain two-year extension of the old contracts. This would give an annual rise of 7 cents in the hourly wage rate plus a small cost-of-living increase this year. Mr Walter Reuther, the union's leader, having quietly put on one side his earlier requests for a shorter working week and a profit-sharing scheme, in the end took his stand on demands for improvements in "fringe" benefits: higher unemployment and pension payments, and financial aid for workers affected by re-deployment. But there was still an unbridgeable gap when the contracts expired.

Even without the contracts, it is business nearly—but not quite—as usual. Despite the effect of the Memorial Day holiday last week, the production figures for cars revived slightly in May, but there is still no sign of a significant increase in demand that would haul the industry out of its troubles. The decisive question now is how the bargaining position of the two sides will change before the time comes for the companies to start making their 1959 cars. The dazzle of chromium on the new models brings an answering gleam of hope to Mr Reuther's eye, for the companies will be far more vulnerable to a strike threat when these start to move along the assembly line. But the companies also have a weapon. Now that the union is working without a contract, the company will no longer collect its dues for it. The union will put members with collecting boxes on the gates of the plants, but workers who refuse to pay (and are consequently dismissed from the union) will not do so at the peril of their jobs; where there is no contract, there is no "union shop" either. How much this will undermine the union's finances is a moot point and it remains to be seen whose side time is on.

California—Set to Go

THIS week's primary election, in which Californians chose the candidates for next November's general election, produced few surprises; indeed, for the two top vacancies there was only one intra-party contest, for the Republican senatorial nomination, left vacant when the incumbent, Mr Knowland, decided to run for Governor, thus forcing the incumbent Republican Governor, Mr Knight, to play musical chairs and run for Senator. He was in no danger of being pushed out of the game in the first round but the primary confirmed that both he and Mr Knowland are in serious danger of defeat in the finals. Mr Knowland will then be competing with Mr "Pat"

Brown, the present Attorney General of California, and Mr Knight will be opposed by Representative Clare Engle. Mr Engle has been regularly returned to Washington for the last fifteen years, but he is not as well known all over the state as is the popular Governor Knight. Mr Brown, the only Californian Democrat to win an important state-wide election in the Eisenhower landslide of 1956, is a famous vote-getter—but so is Senator Knowland.

This week, however, Mr Brown did much better than Mr Knowland, and Mr Engle than Mr Knight, thus giving a sharp upward twist to the already soaring spiral of Democratic confidence that this year California's voters will at last allow the Democrats to govern them. Under California's unconventional cross-filing system, the candidates for party nominations put their names on the ballot paper of the opposition party as well as on that of their own party, so that the primary becomes in effect a preliminary popularity contest. Mr Brown got rather more Republican votes than Mr Knowland did Democratic and much more support from his own party than Mr Knowland did from his, so that on the combined results Mr Brown ended up far ahead—a good psychological start towards final victory. One reason for Mr Brown's success was that the Senator was too occupied in Washington to have time for barnstorming at home; when the campaign proper starts in the autumn, he will be free from congressional duties. Another reason was that the Democratic poll was much heavier than the Republican, which suggests that the Democratic organisation had concentrated on getting out the labour vote.

The Democrats are counting on this vote to give them their victory in November, not only because they expect that unemployment will be the main issue in this election, but also because Mr Knowland, convinced that the majority of voters want to protest against the "excessive power" of the trade unions, is basing his campaign on his anti-union "bill of rights" for workers. His courageous obstinacy about what to everyone else seems a losing cause is much resented by other Republican candidates, who feel that Mr Knowland is jeopardising their chances as well as his own. For this and other reasons, California's Republicans are going into this campaign as bitterly divided as the Democrats in this state have traditionally been—but as this year, for once, they are not.

Of Questionable Benefit

FIRST conceived as a simple, speedy way of putting more spending money into the pockets of the unemployed whose benefits under the insurance scheme had run out, the unemployment compensation Bill, as finally passed by Congress after two months, poses more questions than it answers, and may well provide only a little help for a few sufferers. That the Senate approved it unanimously, after only token protests from those who have human interests closest to their hearts, and that the Administration was prepared to welcome it, is additional evidence of the lack of urgency in current official thinking about the present trend of the recession. In fairness to the Administration, however, its main reason for urging the Senate to accept the House's version of the Bill without change was to ensure that the legislation would not be delayed further by arguments over how to reconcile two different Bills.

This tactic succeeded, but as a result the final Bill, instead of being mandatory, as the Administration originally asked, leaves it to the individual states to decide whether or not their unemployed shall receive the additional benefits which the federal government is authorised to advance. The actual amount would vary with the varying state laws, but most industrial workers would get about $30 a week for another 13 weeks after they had exhausted their regular insurance rights. If the money advanced has not been repaid by the state, out of its insurance reserves, within four years, then there will be an increase in the tax on employers to cover the debt.

According to Mr Mitchell, the Secretary of Labour, this tax is levied by the federal government and is no concern of state legislatures; if it were, many of them would have to be summoned specially to allow the new facilities to be used this year. On first consideration, at least, few state governors agree with Mr Mitchell that they do not need to consult their legislatures; the Governor of Maryland is already calling his into special session. Furthermore, quite apart from the question of whether the Bill violates the actuarial principles on which the insurance system is based, state legislators, and governors too, are dubious about accepting aid which might eventually mean higher taxes on local businesses. So far only the governors of a few of the hardest-hit states, including Michigan, New York and Illinois, have announced that they will accept the help offered by the Bill. But others will probably have second thoughts if employment continues to decline and if the number of insured workers who have exhausted their right to benefit continues to mount.

EXPLODING CITIES—VII

Limiting Urban Sprawl

FROM A SPECIAL CORRESPONDENT

BY 1975, metropolitan areas in the United States will occupy approximately twice the territory they do today. This elemental fact of urban sprawl has at last brought city planning to the fore in a country where the use of natural resources, including sheer space, has always been prodigal and exuberant. The number of American cities with official planning agencies more than doubled between 1942 and 1954; the movement is now expanding to include much-needed metropolitan bodies to plan for the scores of municipalities and the several counties that may constitute a single metropolitan area. During 1957 alone, some eight states passed laws to allow local governments in metropolitan areas, both present and prospective, to plan together for their future growth. Federal legislation reflects the change; whereas the Housing Act of 1937 aimed only at the replacement of bad housing, its scope was broadened in 1949 to include community development, and the urban renewal legislation of 1954 not only offered the first direct federal aid to city planning but also required that the local agencies, as a condition of receiving support for projects, should produce a comprehensive plan showing how the proposed renewal would fit into the development of the community.

The fact is that cities are spreading out even faster than they are gaining population. Each family provided with a new house today uses about twice as much land as a new

family did thirty years ago. Manufacturing plants, which used to be built several storeys high, accommodating hundreds of employees on an acre, all of whom came to work on foot or by public transport, now stretch out in single-storey munificence, surrounded by huge car parks for their workers; the number of employees an acre may be as low as ten or twelve. A growth of a thousand in the population of a city of a century ago meant a mere ten-acre addition to the urban area; now such an increase will absorb between 100 and 200 additional acres. With the best of planning, such growth produces problems; without it, chaos.

A local planning board may have much power or little; the Standard City Planning Enabling Act, prepared by the Department of Commerce for the guidance of local communities, suggests that the approval of the planning commission be required for major projects, from new streets to public services, subject only to reversal by a two-thirds vote of the city council. Even where such real power is not granted to the commission, it may exercise effective influence as long as there is a requirement that it must be consulted, since councilmen can then be held publicly accountable for ignoring the planners' advice. Still, there are few areas of local government more subject to political pressure than planning, and such evils as "spot zoning" (individual exceptions to zoning ordinances, voted by the council at the behest of interested parties) are hard to eradicate. It helps if the city charter is of the "strong mayor" variety, with a small, modernised council, which is able to resist local pressure. Even then, planning may be negative, based largely on zoning restrictions concerning the use of land, the permitted density and height of buildings, and the like; these are enforced under police powers.

Planning of a more positive kind has had a great impetus from the urban renewal programme, which has already begun to remake the heart of such cities as Philadelphia and New Haven, and has focused attention on saving the urban core. The chances of reversing, even partially, the exodus to suburbia are vehemently debated. Transport is a key problem here, and the automobile, expanding both in size and numbers, is the chief villain. A survey of Providence, Rhode Island, shows that while 70 per cent of the population live within a five-minute walk of a bus stop, only 10 per cent use the bus as often as twice a week. Public transport is everywhere caught in a vicious cycle: as the number of passengers declines the difficulties of maintaining adequate service increase; as the quality of service worsens, the volume of passengers suffers. Building more superhighways merely increases congestion at the centre of cities. The bolder planners are suggesting that the city's core must revert to the pedestrian, who might be assisted by pavements like horizontal moving staircases; the automobile would be banished to the periphery.

Whether or not people can be lured back to the city will depend on the relative attractiveness of the core and the fringe. The great advantage of the fringe is undoubtedly the freestanding house and its "yard" or garden. There are even those who argue that suburbia does not really need the parks, which it all too clearly is not getting, because Americans, with their barbecue pits, their children's sandboxes and their $1 billion a year spent on gardening, find their parks on the home half-acre. But few can view the drab expanse of uninspired match-box houses that constitute the majority of suburban building estates without serious qualms for the future.

Where possible, planners strive to introduce variety into the new developments. They press for green belts, either in the form of parks or of land reserved for agriculture, as a means of giving some significant shape, as well as breathing space, to suburban communities. The battle to save good arable land near cities has led, in California, to the incorporation of some rural areas for the express purpose of enacting zoning restrictions to keep the builder out. Again, some suburbs accustomed to priding themselves on their "strictly residential character" are now encouraging within their borders the development of "industrial parks," containing attractive (and attractively taxable) plants, whose plans must be approved by the local planning board before building permits are issued. But the chance to build "new towns" on the British model is rare in the United States; usually the most that the planner can do, even where local government makes good use of his services, is to hedge the private developer about with conditions.

Such restrictions scarcely provide satisfactory assurances that these new developments will become living, and liveable, communities. Moreover, it is far from certain that suburbanites are ready to accept metropolitan government, without which metropolitan planning is difficult at best. Nor is it entirely clear, despite the urban renewal programme, that all the major federal projects will be required to contribute to sound planning; some fear that the huge new federal highway programme will be dominated by the engineers and by local economic interests, with the planners running a poor third. But at least the planners have caused many to question the traditional American assumption that expansion *per se* is good, and to realise that the United States could conceivably be choked by its own growth unless order can be established quickly.

Previous articles in this series appeared in the issues of January 4th and 25th, February 22nd, March 15th, April 12th and May 3rd. Individual studies of how the explosion is affecting particular places will follow.

"Your Office Seems To Be On Fire"

Damaging Decision

TRADE union leaders, who are reluctantly resigned to legislation protecting their members against the exploitation by union officers which has been shown to exist in some instances, last week faced trouble from a new and unexpected quarter. The Supreme Court gave individual workers a potentially devastating weapon against the excesses of organised labour when it ruled, by the wide margin of 6 to 2, that state courts may award punitive damages against trade unions, even though the National Labour Relations Board has jurisdiction over the unfair labour practice involved. In the past the Court has acted on the assumption that Congress, in the Taft-Hartley Act, meant to supersede state legislation in the field of labour relations. The majority held, however, in the Russell case, that the federal government does not have the exclusive jurisdiction which would give the unions "substantial immunity" from the consequences of illegal acts such as mass picketing.

The practical point is that the labour board may award a worker only the wages he lost through the action of the union; the state courts may award punitive damages. The Russell case involved a non-union worker, who was awarded lost pay of $500 and damages of $9,500 for "mental anguish" because he was prevented by pickets of the automobile workers' union from entering a plant in Alabama; such punitive damages, in the view of the Chief Justice who, with Justice Douglas, dissented from the decision, may reduce some trade unions to bankruptcy and inhibit others from acting as effective bargaining agents for their members. Already, in Alabama, the UAW is faced with 29 other suits for a total of $1.5 million in damages arising out of the same strike.

Technically, the right to strike is not affected, so long as there is no mass picketing and no coercion. In fact, although trade unions will try to supervise their pickets more closely, it is not always possible to keep emotions from getting out of hand and, if trade unions are to be held responsible for everything which is done on the picket line, the cost will be heavy. This will be particularly true in states where judges and juries tend—as they do in the South—to be anti-union. The most serious effect of the decision may be to licence 48 different points of view on the responsibilities of trade unions. The obvious remedy would be to amend the Taft-Hartley Act to provide for uniform treatment of suits for damages. But the trade unions would be in a stronger position to demand such a change if in the past they had not fought so bitterly against the Taft-Hartley Act and had not resisted, until a few weeks ago, the public's feeling that they should be made more responsible to their members.

Spliced Wire Services

THE Department of Justice, after consideration, has decided that there is no case for forbidding the bans of the two privately owned news agencies, or wire services, the United Press, controlled by the Scripps-Howard newspaper group, and the Hearst-owned International News Service. INS has been losing money for years and, undermanned though it has been, has been kept going only by a subsidy of $3 million a year from its Hearst owners; the UP's financial position has not been altogether healthy either. The courts have held that, although the law bars mergers which tend to reduce competition, it does not forbid the acquisition of a failing business by a stronger one. All that is now left of INS is the last letter of the new agency's by-line, UPI.

The swallowing up of the weakest of the three news agencies should, in fact, mean more rather than less competition for the Associated Press, the giant co-operative service owned by its member newspapers. It may be on the conscience of the Department of Justice, and it should certainly be a lesson to all aspiring trust-busters, that the successful suit thirteen years ago to destroy the "monopoly" of the AP had the practical effect of destroying what chance the UP and INS had of competing with it. In 1945 the Supreme Court ruled that the AP service must be made available to all applicants; before that an AP franchise could be obtained for a newspaper or broadcasting station only if other AP members in the area consented, which they were unlikely to do.

The result was to reduce the demand for the services of the other agencies, who already were at a competitive disadvantage since the AP can use the news-gathering services of its members for local events. When duplications are eliminated—a few newspapers took both the UP and the INS service—the new agency should have about 950 clients among daily newspapers in the United States, compared with 1,243 for the AP. Healthy as this more even competition will be, it is cold comfort for the staff of INS, most of whom are thrown out on to a shrinking market for journalists, and for all those who value variety of views and hate to see the field of journalism being swept clear of all but the mighty.

Tourists by Express

FROM A CORRESPONDENT IN NEW YORK

OF the hordes of American travellers who will flood Britain and the Continent this summer, undaunted by the recession at home or crises abroad, a considerable proportion will make their travel plans through the American Express. Oldest and biggest of the American firms that deal in tourism, it provides this help in various forms and at varying costs. What Thomas Cook and Sons has been to the British traveller for more than a century, the American Express now is to the American—only more so. The extent of that "more so" reflects in part the rapid changes which have come about in transport facilities as well as in international responsibilities.

The British firm rose with the expansion of the British Empire in the nineteenth century, the American firm is expanding with American interests in the air age. Until the last war ushered in transatlantic air services Americans were cut off from most other continents by great watery distances that took days or weeks to cross. This meant that holidays abroad were limited to the upper income groups who could take a month off, or to academic people who had their summers free. Air travel has now brought Paris as close to New York in point of time as it was to London before the war, but among the growing numbers of tourists there are still many who are venturing abroad for the first time and who feel the constant need of a guardian hand. That need the American Express satisfies in ways that the more experienced British might not ask of Cooks.

In 1890, when the American Express was concerned with the movement of goods, not people, Mr Fargo, the president of the firm and a member of the family which founded the famous Wells Fargo Company, now a subsidiary of the American Express, went to Europe armed with letters of credit. Once he got off the beaten track, he found "no more use for them than for so much wet wrapping paper." Arriving home, he ordered a subordinate to invent a negotiable unit which would be almost as acceptable as currency, yet would be safeguarded against loss. The American Express travellers' cheque with its double signature, one written on purchase, the other when it is cashed, was the answer. (Thomas Cook, on the other hand, claims to have issued similar sterling cheques as early as 1873, and dollar cheques in 1874.)

Mr Fargo foresaw the utility of the invention, and he must have thought that it would be profitable—as it is now that $5 million worth are issued every year—but he was curiously blind to the fact that travellers' cheques would do best allied to a flourishing tourist business. He went so far as to proclaim his belief that there was "no money in the tourist business as conducted by Thomas Cook and Sons and, even if there were, this company would not undertake it." How thoroughly time has contradicted him is visible in the crowds that flood the office of the company in the Haymarket, or the turbaned Sikhs who cool off in the air-conditioned comfort of the Karachi office, recently doubled in size to accommodate the increasing demand for tourist and banking services. The American Express now caters for Mr Fargo's detested travellers in 35 countries around the world.

BORN to speed the shipment of valuable goods within the United States at a time when slow canal boats were the best link between East and West, the American Express has widened its operations but it still sells service in an increasingly varied number of forms and places. In travel, the possibilities have broadened as flying has brought wide areas within reach of the man on a two-week holiday. Mr X wants to see Israel, to fish for salmon in Galicia, or to skin-dive off Sicily? The American Express will plan his trip, get him a guide and a set of hotel reservations, advise him on equipment and sell him a form of negotiable currency, all for cash or on credit. He may use their offices as his address, they will hire a car for him, tell him about doctors and advise him on wardrobes and the baby's milk supply.

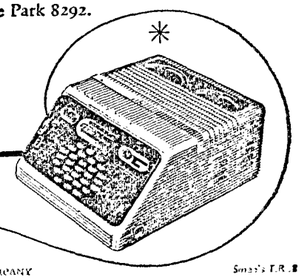
The many services which its 399 offices provide vary to a certain extent from country to country. Thus, though the American Express is an important factor in banking in Pakistan, it is not licensed to do local banking in the United States. Its overseas subsidiary claims a network of fully licensed commercial banking offices in the principal cities of Europe and Asia; the American company limits itself carefully to international business. The local offices try to strike a happy medium between local practice and American habits, no easy matter in Madrid, which early risers find still sleepy at 10 a.m., or in Mexico, which takes a two-hour siesta at noon-time. The Paris office, in particular, combines the charm and utility of the village post office, the bus station and, for conversational purposes, the super-market. Traditionally, at least, it comforts the homesick, brings lovers together, and rescues the suicidal. As a gossip centre its potential is known to every journalist. The company is well aware of the importance of these fringe services. The expense of free mail distribution it defends as a form of "salted peanuts on the bar. They cost us money, but they sell beer."

Travel and its adjuncts are the best advertised of the services which the American Express offers, but those adjuncts are being widened into so many fields that the company's corporate structure begins to look like an octopus. The firm, which is a holding company with subsidiaries and sub-subsidiaries, has consolidated assets of $667,635,100 and an income (in 1957, which was a banner year) of $6,870,545. It engages in freight forwarding and overseas banking, ships household goods abroad for military personnel, runs, through Wells Fargo, an armoured car service in New York, and operates a hotel in Mexico; in 37 American states it checks stocks for firms that want to borrow on them, and banks that want to lend on them; in several cities it will accept payments of gas, electric light and telephone bills.

Its most recent expansion is into the business of renting automobiles and lorries. By a merger with the Hertz company which operates a drive-yourself scheme that functions in Europe and parts of Latin America as well as in the United States, a new holding company has been established to spread the use of this popular and convenient service.

One explanation of the accelerated growth of the American Express is that Americans who have bought their full share of finned motor cars and television sets now want something else to give them social standing, and find it in foreign travel; the firm's expansion also reflects the widening military and economic ventures of Americans, and the intellectual curiosity stirred by these ventures. Moreover, Americans who knew Europe before the air age are beginning to declare themselves bored with that continent and hungry for something newer and stranger. The time needed for a world cruise by boat has so far limited the satisfaction of this desire to the elderly and retired, but the arrival of the jet age may change this. The American Express is now planning jet tours which will take travellers around the world in four weeks, with no more stops and little more trouble than used to be encountered in a four-week tour of Europe. The cost, according to their calculations, will be a small deterrent.

Criminal Pricing?



THE anti-trust indictment brought against 29 of the leading American oil companies accuses them, in effect, of using the permission which they were given at the time of the Suez crisis, to co-operate in order that Europe might be adequately supplied with oil, as a screen behind which they conspired to raise the price of oil to the consumer. The result of this criminal agreement, it is alleged, is that the price of crude oil went up 35 cents a barrel and the retail prices of products 1 cent a gallon in January, 1957; the indictment covers all the United States except the west coast where a separate action is being brought. At the time a congressional inquiry charged the companies with "price-gouging," but they argued, and still argue, that the increase was essential if the necessary supplies of oil for Europe were to be assured. What the Department of Justice apparently objects to is not so much the actual increase in price as that it was imposed simultaneously by all the companies everywhere. The maximum penalty under the present indictment for each of the companies is $50,000, but there is a possibility that the department may broaden the criminal suit into a civil proceeding against the general marketing policies of the industry.

Thirty minutes dictation – and I never picked up a pencil!

And that's not the only thing I like about Tape-Riters. They're so self-contained – no fussing with discs, reels or recording sleeves. My boss just dictates at his speed for me to type at mine . . . *and right first time!* Of course, in our typing pool the Tape-Riter centralised system works wonders. It's hard to believe we are now doing more work – *and with no extra staff.* Life seems so easy with a Tape-Riter. There are Tape-Riter centralised systems or single machines for your business too! Why don't you have a word with the Tape-Riter people today? Their Mr. Simpson will be glad to arrange for an executive to discuss your problem. The telephone number is HYDe Park 8292.

Save money—
make TAPER-LOCK your standard method of fixing to shafts

Use a TAPER-LOCK Bush and fix your pulley to its shaft in less than a minute. TAPER-LOCK Bushes are interchangeable too; you can fit them to any diameter shaft. They cut out keyways, save space and have no dangerous projections.
TAPER-LOCK Bushes are off-the-shelf stock at 19 Fenner Branches. Many Distributors at Home and overseas also stock them.

J. H. FENNER & CO. LTD. HULL

Branches at: Belfast, Birmingham, Bradford, Bristol, Burnley, Cardiff, Glasgow, Hull, Leeds, Leicester, Liverpool, London, Luton, Manchester, Middlesbrough, Newcastle-on-Tyne, Nottingham, Sheffield, Stoke-on-Trent.

LARGEST MAKERS OF V-BELT DRIVES IN THE COMMONWEALTH

Quaglino's

FOR THE BEST IN BANQUETING

QUAGLINO'S will open London's newest Banqueting Suite on October 1. Here will be provided the good food, good wine, and good service which have made Quaglino's famous. The accommodation available ranges from rooms suitable for small business lunches up to the spacious ballroom holding 400 guests for a dinner and dance.

Please write or telephone:-

THE WORLD OVERSEAS

Steps to the Throne

FROM OUR PARIS CORRESPONDENT

Now that General de Gaulle has cleared so quickly and successfully the parliamentary obstacles to his return and that telegrams of congratulation are pouring in from around the world, it is not in the fashion to scrutinise the last steps in his ascent to power. Yet these must be recorded, and not for the sake of historical accuracy alone. The manner of the climb to power is seldom without effect on the nature of the reign.

When autumn comes the general may, or may not, be confirmed in his position by a popular vote. He was not, however, called to office by the voice of the French people but rather by the government's cowardice, the relative indifference of bewildered Frenchmen in France, and the *dictation* of the Algerian settlers and soldiers. In Paris the only "gaullist" voice was the cacophony that disturbed the peace of the night on Thursday and Friday of last week. The bright young things from the fashionable quarters—the *merveilleux* of 1958—drove through the streets sounding their horns to proclaim their attachment to the general and to "French Algeria." Yet the most ardent gaullist would not claim this fashionable joy-ride by the excited few as a "popular" verdict—inviting, say, comparison with the republican mass march of the previous Wednesday. But the republican parties did not call the people of Paris out again. "We are no longer capable of three glorious days in succession," a Parisian remarked.

The epilogue was played out in the Palais Bourbon, where the votes of the socialists were still needed for a legal performance. M. Mollet, chief inspirer of the gaullist succession, was permanently rushing between Socialist meetings and the general's headquarters. M. Vincent Auriol, a former president of the Republic, came to his rescue and their combined efforts succeeded in breaching the façade of hostility to de Gaulle in the party. The twin arguments of the general's liberalism and the threat of civil war gained ground. But when it came to the vote last Saturday, it turned out that the majority of Socialist deputies was still against the general. A compromise was reached by granting the deputies, on this occasion, a free vote, and freedom to join the new government if they chose.

Socialist resistance to threats and wooing had many causes. One reason was a reluctance to be a consenting victim and to lend a legal appearance to what some of the Socialists called a paratrooper investiture. Combined with this was a feeling of guilt that if things had come to such a pass it was largely through the Algerian policies sponsored by the secretary of their own party. The names of Mollet and Lacoste suddenly became anathema to many Socialists. But they were not only looking back. There are Socialists who think that the apparently ageing general, for all his gifts, will prove another Hindenburg. The threat of civil war, to them, is simply postponed and they do not want to leave to the Communists the undisputed leadership of the popular forces. In the assembly the ghost of Vichy haunted the lobbies, producing the so-called "complex of the eighty" (the number of deputies who voted against the transfer of power to Pétain in 1940). An unkind critic summed up the attitude of many Socialists as a combined desire to be among the eighty and to see de Gaulle elected nevertheless.

The Communists have certainly acted on the assumption that the battle has only been delayed, though it is not clear whether they have not just made a virtue of necessity. Their moderation may have been dictated by the knowledge that in isolation they could not mobilise the strength to resist General de Gaulle and the forces of the law. Whatever the reason, they avoided a full-scale clash, acted as the faithful defenders of "republican legality" and wooed unceasingly their reluctant allies. They voted to the end against General de Gaulle's return. On the day of the investiture the militants were called out, but they were told to parade, not to fight. Several, nevertheless, were wounded in skirmishes with the police. But the party was still ostensibly avoiding a trial of strength.

The Communists' future strategy seems to be based on historical analogy. To them the next stage in France will be the "liberal empire." Only when the general gets lost in the Algerian maze (and, in their opinion, he cannot help it) will the regime become fully authoritarian, the general revealing his Bonapartist leanings or making way for others who will. Then will come the real battle and the Socialists will be left with the choice between unity with the Communists or mass desertion by the rank-and-file. In the meantime the Communists will prepare the ground by common action in the various vigilance and anti-fascist committees. Whatever the worth of this analysis, it has certainly influenced the stand of other anti-gaullists who are frightened to leave the monopoly of resistance to the Communists.

Such, then, was the situation on the eve of the transfer of power. The Bourse was recovering its confidence. Gold was falling; the franc and French and Algerian shares were picking up. The Right, both extremist and orthodox, had rallied to the general. The MRP was following suit after some reassurances about foreign alignments and European policies (thrice M. Robert Schuman was told by an emissary that it was not the general's habit to go back on a signed treaty). Most Radicals were now favourable. But the question remained whether the general would agree to face parliament if the majority of Socialists refused to back him. M. Mollet, who had staked his political future on the Gaullist card, begged him to go on and the general agreed on condition that M. Mollet should lend him his name (for what it was now worth) as a sign of socialist approval.

And so to Sunday, June 1st. At three in the afternoon the general entered the packed chamber. For a moment

he surveyed what were by now to him unfamiliar surroundings and faces. Then his tall figure towered above the rostrum as he read his brief speech of investiture. The government was asking for full powers for six months "to restore the unity of the nation." The general asked also for a mandate to rewrite the constitution and submit the result to a popular referendum. The relationship with the "associated states" would be redefined in the process. The assembly must vote the necessary laws rapidly and then depart until October. The speech lasted only a few minutes before the general was gone, giving no indication of his foreign policy nor of his plan for Algeria and only the vaguest hints about the constitution. All he did say was that it would be based on universal suffrage, the separation of powers and governmental responsibility to parliament.

The composition of the cabinet was not much help either. Admittedly, the colonialist *ultras* had been excluded. Indeed, the general was taking over the main figures of the dreaded "system." M. Mollet, who had dominated this sorry legislature, and M. Pflimlin, who had presided over its last abdication, were included among the four ministers of state; the conservative M. Pinay at the ministry of finance was a guarantee of orthodoxy. The newcomers were mainly civil servants. The choice of M. Couve de Murville, ambassador to Bonn, for the ministry of foreign affairs was interpreted as a reassurance for "Europeans"; that of M. Guillaumat, of the Atomic Energy Commission, to the ministry of defence as a sign of contemplated modernisation. But will they be more than subordinates? More important is the fact that the whole cabinet is tentative, to be reshaped after General de Gaulle's return from Algiers.

Voting in the Dark

The deputies were thus asked to vote in the dark. The alternative to the general was civil war. They were to trust him, his past, and his spoken confidences to party leaders. In the circumstances, it is not astonishing that the best speeches were made for the opposition. M. Mendès-France balanced a severe criticism of the performance of the Fourth Republic with a declaration of faith in the republican parliamentary system. He concluded that this was not a free vote; and he could not give his consent under threat. M. Mitterrand proclaimed that the general "in law, will get his power from the representatives of the nation; in fact, he holds it already from the *coup de force*." M. Duclos, significantly milder than on previous occasions, expressed his confidence in the opposition of the people as a whole. M. Cot, a *progressiste*, claimed that since it was carried under duress, the vote was null and void; he, too, appealed to the verdict of the people.

General de Gaulle was invested by 329 votes to 224. In addition to the 147 Communists and their allies, the votes against were cast by 49 Socialists (42 voted in favour), 18 Radicals, three followers of M. Mitterrand and three members of the MRP. The majority, though not impressive, was sufficient to get the vote on special powers through; it was not enough for the new clause on constitutional revision, which required approval by at least three-fifths of those voting. The commissions immediately set to work. For the next 24 hours one often had the impression of watching a congress of solicitors convinced that, even in these exceptional circumstances, democracy could be preserved by the clever drafting of a paragraph. The government agreed to some clarifying amendments, but it was sure of ultimate victory. Having come to the point of abdication, the assembly could not now turn back. The general made the submission easier, even, in the end, coming to the chamber to answer questions. The last night session was the setting for a remarkable performance.

It started, as expected, with an ultimatum: the final text submitted by the government must be approved or the government would insist on the inevitable consequence. The general's parliamentary skill was shown in the discussion of amendments. He was full of charm and indulgence. He made a graceful actor's bow to a Communist who suggested that sedition was now followed by seduction. He was full of republican fervour: the lower house was to be *supreme*; *there* was to be no presidential government; to be among the deputies was a pleasure and an honour. Was this the man who had been so scathing about the regime at his press conference two weeks before? The socialist rebels decided to abstain, assuring a government majority. Even the journalists in the lobby started to talk of the general's conversion.

Only when it was over could one appreciate the quality of the performance. The general had not given in an inch. He had rejected the proposal that the constitution be submitted to parliament before the referendum on the ground that he would refuse to set the executive and the legislature at odds before the people. Yet, when M. Mitterrand asked him whether, on other occasions, he would decline to appeal to the electorate over the head of parliament—a manœuvre dreaded by republicans since Louis Napoleon—the general remained silent. M. Bidault made the apt parting comment: "Today chamber music, tomorrow *musique militaire*."

In Algeria

On Wednesday the general began his Algerian pilgrimage. Algiers greeted the man it had imposed on France in a mood of delirious triumph, mingled with doubts. Addressing the huge crowd massed in the Forum, the general assured it of his sympathy and understanding. Then, taking at their face value the slogans of political equality launched recently by the settlers, he proclaimed that the Moslems of Algeria were now fully-fledged Frenchmen and as such would take part in the constitutional referendum (to be held in three months' time) and in parliamentary elections. Has the general opted for the policy of integration, which at best is a political gamble beyond France's economic possibilities? (This week, in an interview granted to *L'Express*, President Bourguiba stated that he would not insult the intelligence of the French authorities by suggesting that they might seriously think of basing a constructive policy on the so-called "fraternisation"). The more left-wing of General de Gaulle's supporters in Paris, still convinced that he will grant Algeria a form of independence, stress the facts that he did not use the word integration and that he reserved the right to discuss the future with the Algerian representatives produced by the elections. But beyond the delphic passages in the text, one thing is clear. The general is banking on the soldiers, whom he is seeking to bring under his full control. "I rely on the army for today and tomorrow." In this crisis, the tragic weakness of the state's authority has enabled the army to discover its vocation as king-maker. And the army has proclaimed that it will not tolerate any other master than the general. This is a key factor for the future of French politics.

Germany and the General

FROM OUR BONN CORRESPONDENT

EVEN for the congenitally imperturbable Dr Adenauer these have been disquieting days. For nine years the Chancellor has unwaveringly staked Germany's future on the development of the closest practicable political, economic, and military ties with France. Swallowing old prejudices, and sometimes deep misgivings, the majority of voters have allowed themselves to be persuaded that this is all for the best. Now this national act of faith and expiation has been called newly into question. If the promised fruits of west European integration, rooted on Franco-German ground, are not actually to be as severely blighted as was at first supposed, no one doubts that they will now be much longer in the growing. And they will cost more to grow. There, for the majority of normally self-interested Germans, if not for their Carolingian chancellor, is the rub.

Naturally there has been much consultation of the records in order to discover what General de Gaulle has ever said or written about Europe in general and Germany in particular. Some have found comfort in his contemplation of the "dazzling prospect" of a pooling of German and French resources, "the latter embracing those of Africa." But heads have also been wagging uneasily over the General's one-time surmise that a rearmed Germany intent on reunification might drag the West into war with the Soviet Union. General Speidel, the German commander-in-chief of the Atlantic pact land forces in Europe, nipped over to Bonn from Paris last week, and has apparently assured Dr Adenauer that General de Gaulle's emergence is unlikely to impair the Nato alliance beyond aggravating the delays already experienced in arming effectively. Anxiety has been further allayed by the appointment of M. Couve de Murville as foreign minister. Ambassador in Bonn since 1956, the unostentatious, hard-working M. de Murville is a known and respected quantity in the shifting scene. In a broadcast twelve months ago he dismissed the concept of a Franco-Russian alliance against Germany as anachronistic, and he has since assured an audience of Hamburg businessmen that France has no intention of embroiling the rest of Europe in military adventures in North Africa.

Dr Adenauer's policy does not look so seriously fractured after all. Certainly the French army's intensified preoccupation with Algeria will encourage some incorrigibles to redouble their advocacy of stronger and more independent German national forces; but they probably do not count for very much. Tired critics of Dr Adenauer's inflexibly Nato-bound foreign policy are praying that General de Gaulle will push Nato into a less rigid posture. Their prayers may be granted; but, as others are already pointing out, they are probably over-sanguine in assuming that Germany would automatically be a beneficiary of any friendlier western relations with Russia.

What seems to be dashing public confidence in Dr Adenauer's "little Europe" policy at the moment is not so much General de Gaulle's suspected aversion from it as the anticipated warmth of his embrace and the motives behind it. It is not expected that the French will want to back out of their commitments. But it is expected that they will delay the process of economic integration by invoking all the protective clauses which the Rome treaties afford, and that they will demand yet more financial help from the common market and from the Organisation for European Economic Co-operation. It is being pointed out that Germany is already financing France through these channels to the tune of DM 2 billion (some £170 million), of which DM 800 million (£68 million) is earmarked for the development of French territory overseas. And it is being suggested that the time has come to refuse any new requests for financial help—beginning with a refusal to pay any more to support the French forces that scarcely exist in Germany.

So far the Germans have exercised singular restraint in their discussion of the crisis. One reason for this is their own not so distant experience of the pressures that push a nation to dispense with democratic procedures; they do feel some sympathy with the French. Another is their awareness of Germany's past contribution to the present enervation of France. But a less sympathetic note is beginning to be sounded. "There can be no mystic approach to the unromantic business of national finance," says the *Frankfurter Allgemeine Zeitung*. "General de Gaulle's policies are likely to prove expensive. Greatness costs money."

Lebanon's Reluctant Compromisers

FROM OUR MIDDLE EAST CORRESPONDENT

Beirut, Wednesday

THE Libyans, backed by the Sudanese, seem to have taken over from King Saud the role of Arab mediator-in-chief for which the Saudis are presumably more than grateful. The council of the Arab League, meeting at Benghazi to hear the Lebanese complaint against the United Arab Republic, has an intricate task before it and at the time of writing most delegates seem to expect the discussions to continue until the end of the week. Beirut reports suggest that the mediators are now trying to win general acceptance of a three-point programme: there should be a cessation of all inter-Arab press and radio warfare; the Lebanese government should withdraw its complaint from the Security Council; and an inter-Arab commission should visit the United Arab Republic and Lebanon in order to investigate various charges and counter-charges. Although it is reported that a majority of the Arab states not immediately involved in the dispute would welcome a compromise on these lines, neither Lebanon nor the United Arab Republic has explicitly commented on the plan. Implicitly, however, the Lebanese government has entered a strong reservation by means of an official statement insisting on a short time limit for the cessation of all interference in Lebanese affairs.

Interference is of many kinds, some of which are difficult to detect or control. It is therefore not altogether clear what stoppage of interference by any given date really means. Probably the Lebanese government has in mind the immediate cessation of propaganda attacks from Cairo and Damascus which President Nasser could certainly bring about at the drop of a hat. Yet even so the Lebanese government would withdraw its complaint from the Security Council only with considerable misgiving. What President Nasser can easily stop he can easily restart. And if attacks were started again at some future date the Lebanese case would have lost much of its impact. It is already three

weeks since Dr Malik announced the government's intention of going to the Security Council and it is arguable that its case has already lost some of its gloss. The only advantage delay has brought to the government is that it has been able to accumulate fresh evidence of interference.

It is arguable whether the compromise solution favoured by the Libyans is unduly favourable to the United Arab Republic. The council is considering a specific complaint directed by one state against another. Yet a resolution asking for the cessation of all inter-Arab propaganda warfare puts all states on the same footing. The implicit condemnation of Cairo and Damascus becomes the implicit condemnation of Baghdad also—even of Beirut for that matter. In return for this dubious victory the Lebanese are asked to withdraw the case from the Security Council, thus denying themselves the opportunity of winning a clear-cut propaganda advantage. It must be admitted, however, that the western powers would probably regard the withdrawal of the complaint with some relief, since it would relieve them from having to indulge once more in the dangerous practice of taking sides in Middle Eastern disputes.

Meanwhile efforts for a political solution in Lebanon itself seem to have made no progress whatever. All mediators, while giving public expression to vague hopes, confess that their past efforts have completely failed. The insistence of the extremists on complete victory suggests that they are now looking far ahead. They have already won the point that originally caused the flare-up: President Chamoun will not succeed himself. They have also made it virtually certain that whatever government is at the helm in the future, Lebanon will loosen its western ties and seek a more "positively neutral" position in line with Nasserist nationalism. What more do they want? Increasingly open discussion of a revision of the electoral law and of holding new elections suggest that they may be aiming at a change in the balance between the various minority interests on which the present state of Lebanon rests. That might mean effectively rewriting the "National Pact" of 1943—the fundamental document in the history of the state.

Australian Spotlight

FROM OUR CORRESPONDENT IN AUSTRALIA

Victorious Premier

THE perky little premier of Victoria, Mr Bolte, was returned to power with an increased majority in last week's elections to the Legislative Assembly. His Liberal-Country party government could show solid progress over the last three years in such fields as housing, schools, child welfare, the plans for a new technological university and, last but not least, in enabling Victorians to buy petrol on Sundays and drinks with their dinner. But Mr Bolte's gains were due not to his vigorous government, but to the split in the Labour party. His party polled fewer votes than in 1955, but it got the second preference votes of the breakaway Democratic Labour party. The DLP lost its only member but is undismayed: it increased its share of the total poll to 14 per cent and succeeded in its principle aim of keeping the Australian Labour party out of power until such time as it sheds Dr Evatt and what it regards as his pro-communist policies.

Father Figure

What sort of portent is this for the federal elections in December? No other state has so strong a Democratic Labour party as Victoria. The trouble started here in 1954, when Dr Evatt accused the Victorian executive of the Labour party of plotting to depose him and recognised only a minority of the executive which thereupon seceded. In Victoria, therefore, what became the DLP inherited the assets and organisation of the Labour party, whereas elsewhere it had to build from scratch as a minority breakaway movement. In Victoria, moreover, it has the support and blessing of the Roman Catholic church, whereas in New South Wales and South Australia the church seems to recommend fighting communism from within the ALP.

Nevertheless, the Labour party in New South Wales and Queensland is well and truly split and in both states the split has occurred since the last federal election in 1955. With the DLP's second preferences, Mr Menzies should gain between five and ten seats. His position looks so impregnable that many Liberals consider it unnecessary to buy Country party support by offering the Treasury to its new leader, Mr McEwen, when Sir Arthur Fadden retires in December.

Two trends, moreover, are in Mr Menzies's favour. The first concerns immigration. More than half the 1,250,000 people who have come to live in Australia since the war came from countries other than Britain and a high proportion are Roman Catholic and anti-communist. On the whole, they vote Liberal. No wonder Dr Evatt complains of the low proportion of Britons and of political tests that exclude Communists. The second trend that favours Mr Menzies is the rise in his own reputation. He is at last getting in his own country some of the honour he has long enjoyed in Britain. Never mind if he doesn't do anything, he's a world statesman and a national asset; Good Old Bob, the authentic father figure.

Territorian Tyrant

No father-figure is the Minister for Territories, Mr Paul Hasluck. One of his charges, the Northern Territory, is rebelling against paternal rule. In Northern Territory you find the Australians of the books and films. It is a country where men are men and there is only one woman to every three of them; where a population of only 19,000 inhabits 600,000 square miles; and where that population is at present very angry. As they drive their cattle along a thousand miles of burning stockroute, or dig uranium ore at Rum Jungle, or let strong beer wash the red dust from their throats in some corrugated-iron oasis, the Territorians brood on their wrongs.

The Territory was once a part of South Australia (which ran right across the continent from north to south), but in 1911 it was ceded to the Commonwealth government. It was provided with a resident Administrator, who, however, has never fully controlled the services that are nominally under him. Almost everything has to be referred to Canberra—1,800 miles from Darwin—where decisions are made unhampered by local knowledge and without undignified haste. The Territory's voice in Canberra is a mere whisper: it has one member in the House of Representatives and he may vote only on "Territory matters"; there is no representation in the Senate. Since 1947 there has been a Legislative Council, consisting of the Administrator, six nominated and five elected members. Months ago the council's select committee on constitutional reform proposed changes that would give Territorians some slight say in how their tax contributions were spent and mark a small advance towards statehood. But the report seemed to sink without trace in Canberra's files. In furious protest the elected members resigned from the council; all but one of them has now been re-elected.

Mr Hasluck, it now appears, was on the very point of presenting the report to the Cabinet. He may feel that the aspirations of the local people do not necessarily go hand in hand with greater efficiency, and that the Australian taxpayer, who shoulders an annual burden of several millions for the Northern Territory, should call the tune. But at present it is surely called from too far away.

Waterside Agitator

By contrast with the recalcitrant Territorians, a trade union almost as big as the entire population of Northern Territory will follow its leader even against its own interests. The leader is Mr Jim Healy, the communist general secretary of the Waterside Workers' Federation, under whose leadership Australian ports have been paralysed time and time again. There was a notable period of peace last year when Mr Healy was overseas; but trouble began again early this year in Melbourne, over the size of gangs. The Commonwealth Arbitration Commission ruled that the standard gang should be fifteen men, but it upheld the employers' right to split gangs for the smaller jobs. That led to a national strike on April 9th, and frequent stoppages in Melbourne ever since. The employers then obtained a "rule nisi" from the Commonwealth Industrial Court, calling on the Federation to show cause why it should not be charged with a breach of the award. As a result, the waterside workers have accepted the order—"for the time being." Perhaps they are tired of losing pay; and perhaps they are at last beginning to see how damaging their union's policy has been to their long-term interests; it has caused a huge loss of freight to the roads and hastened the introduction of mechanical handling.

Top People in Israel

BY OUR SPECIAL CORRESPONDENT

As a new society Israel ignores many of the tiresome shibboleths of the old world. The young state is refreshingly clear of the snobberies of birth, money and intellect that perplex older societies. The only social distinctions that force themselves on a visitor are between Jew and Arab, and —much less sharply—between eastern and western Jew. Other divisions are blurred. But the Israelis, who take great pride in their state's social unity, are disturbed to find incipient signs of social division. They argue that when the state was first established, the basic reason for its social homogeneity was a sense of common achievement in the face of danger that bound Jews together whatever their origin. In the last ten years, despite recurring crises, this bond of emergency and high endeavour has slackened.

The most important split is between western and eastern Jewry. Although the European Jew will deny that he thinks his oriental compatriot in any way inferior to himself, he is inclined to support his argument by quoting the individual exception in a manner that recalls that hoary seal of racial prejudice: "Many of my best friends are Jews." Everyone knows someone who is married to an Iraqi or engaged to a Yemeni and this acquaintance is produced as triumphant proof of a liberal spirit. But there is still very little mixing between the two groups. The North African or Asian Jew is criticised for not fitting into the Israeli pattern of society; more in sorrow than in anger it is admitted that the oriental, of the first generation at any rate, is not community-minded.

This in Israel is a severe criticism. New immigrants from any source are roughly classed into the good or bad, the sheep or goats. The sheep are those who put the claims of the community first; the goats are those who stick heedlessly to their individual ways. Anyone public-spirited enough to fit into the pattern gets along splendidly. The immigrant who suits the Jewish agency's book by possessing the right skill or profession, or who joins a co-operative farming settlement, or who goes straight to an industrial development area and stays there, is popular with everyone. The small trader from Beirut who wants to set up a booth in Tel Aviv; the tailor or dyer from Warsaw who just wants to go on tailoring or dyeing; the lawyer or economist or journalist who clings to his old profession—these are swimming against the tide.

The young state cannot afford the luxury of supporting them. Public feeling, too, is against them. They are free to try to make a life for themselves in the old way, but they get no help. There are too many lawyers already, and litigation is not encouraged; the economist from eastern Europe has the wrong kind of experience; the small shopkeepers are hopelessly under-sold by the subsidised and efficient Histadruth stores. Immigrants who agree to face the rigours of undeveloped land can walk straight into a small house; but newcomers with their hearts set on Tel Aviv or Jerusalem will be lucky if they can squeeze into a shack outside the town or into a friend's spare room. The children will, quickly enough, be moulded into Israeli shape by the schools and by the army; parents who cannot find a *modus vivendi* between their own interests and those of the state are the misfits.

Snobbery about wealth is still very rare. Salaries are too much alike for money alone to be the incentive for hard work; a cabinet minister will probably not earn much more than twice the wages paid to his shorthand typist. A small group of business people occupy themselves by keeping up with one another, but their influence does not radiate far outside their own circle. The more idealistic old-timers, however, are dismayed and distressed that there should be any rich Israelis at all; as one commented with obvious regret for the past: "Five years ago an Israeli woman wearing a fur coat would have been spat at; now nobody takes any notice."

Intellectual snobbery cannot take roots in a country where highly educated men and women have done, or are still doing, manual work. There is no question of the intellectuals regarding themselves as a group apart. The taxi-driver or the road-mender may be a university graduate and the members of the older collective farms pride themselves on their productions of Brecht plays or on their classical quartets.

The aristocrats in Israel are those who came to the country before independence day in 1948. The longer their residence in the country, the higher their social status. Nobody in Israel cares who your father was or which school you went

Monsanto

Through creative chemistry, Monsanto turn yesterday's dreams into present-day realities

The pain-killer that goes to sea, et cetera

Fairey Atalanta, sea-going family cruiser, which you can sail, beach and trail.

ONE CHEMICAL, a thousand and one uses. That's phenol — of which, in Britain, a large proportion is produced by Monsanto.

The makers of tablets containing aspirin use a pain-relieving phenol derivative. Boatbuilders use others — phenol-formaldehyde adhesives for bonding plywood. Turned into oil of wintergreen, phenol flavours toothpastes and soothes backaches. It is the basis of modern weed-killers, of timber preservatives, and of more than 100 dyes. It is used in the manufacture of nylon, synthetic resins, lubricating oil solvents and plasticizers. Its uses are so many and so varied that — it is said — a country's degree of industrialization can be judged by per capita phenol consumption.

Monsanto chemists have originated, or collaborated in, many of the advances made in applications of phenol. Thanks to Monsanto's big investment in research, they will continue to do so. It's another way Monsanto brings a better future closer.

If you, as a manufacturer, are interested in chemicals, it will pay you to get in touch with Monsanto.

MONSANTO CHEMICALS LIMITED

to ; the criterion for this type of social snobbery is the length of time you or your family have been in Palestine. The nearest equivalent in Israel to what is called the Establishment in England is the Second Aliya, the community of Russian Jews who came to Israel before the first world war ; the prime minister, Mr Ben-Gurion, is one of them. The sabra, or native-born Israelis, fall over backwards not to patronise immigrants ; the conscious effort that this requires of them betrays their sense of superiority.

Dr Salazar Keeps a Date

BY A CORRESPONDENT RETURNED FROM PORTUGAL

To say loftily, as Dr Salazar told his municipal officers last week, that "if our regime had been completely institutionalised earlier, and the election had been run differently, the country would not have lost prestige through the current presidential campaign," was to put things mildly. But in the eyes of the world this mildness, academically paternal, typifies Sr Dr Professor Salazar—as the Portuguese style him—even more than the remarkable achievements of his statecraft in the economic and political sphere, which have largely transformed Portugal, increasing its influence, during the past thirty years.

A bookkeeper of genius, a sagacious negotiator, selflessly devoted to his task, the Portuguese premier speaks in public as seldom as possible, for he is aware, evidently, that his words of wisdom will be above the collective head of his audience. At 69, he wearily confronts the class, whose instruction distracts him from serious, private research for their ultimate benefit.

Shots in the street and the clatter of armoured cars and sabres are a startling echo from the past and a broad hint that it does not pay authoritarian rulers to dabble with democratic forms. The least that they risk for the sake of appearances is to look ridiculous in a disguise which would scarcely pass muster as fancy-dress. Since the outbreak of the Spanish civil war, when gunfire halted a couple of Portuguese warships escaping down the Tagus to join Franco's enemies, order had been kept to perfection in Portugal by the police. Quiet reigned, the quiet of a political vacuum, in comfortable contrast to the bygone 20-year period of turbulence that disposed abruptly of a prince, two kings and five out of eight presidents by murder, menaces or military coups.

It is no wonder that the government, its official supporters in the National Union, and many of the people (70 per cent, as claimed after the latest polling) regard the "untimely and useless debate" at election times as a social evil. But if the authorities think it an evil, why do they think it a necessary one ? There are various other possible means of choosing a new president every seven years, if his predecessor serves the full term in office. The Portuguese phrase for window-dressing is *para o ingles ver*—for the Englishman (and his American cousins, no doubt) to see. Even so, the Constitution stipulates that all literate male Portuguese taxpayers over the age of 21, and women at the head of a household or possessing a high-school diploma, have the right to vote. This electorate, numbering probably close on 1,500,000 in a population of nearly nine millions, is considered safe.

It is indeed safe, for obvious reasons. A 30-day open season for criticism provides speakers with little enough leeway to demolish the walls of a Jericho built and strengthened throughout 30 years by the defenders, especially if the campaign is reduced to 27 days and an attenuated censorship lingers on *sub rosa* to hamper the Opposition forces. The novelty of a three-sided contest indicated that others now, besides the orthodox old-guard left-wing democrats, had noticed flaws in the bastions of Dr Salazar's well-ordered counting house—but it also showed a lamentably real division among the motley besiegers, who combined only when three-quarters of their allotted time was up to follow the more colourful, though the less reliable, of their two leaders.

Since neither the fiery Independent, General Humberto Delgado, nor the worthy Democrat, Dr Arlindo Vicente, stood a chance of defeating the taciturn Navy Minister and government candidate, Rear-Admiral Americo Tomas, the decision that Dr Vicente should drop out of the running, and return to the semi-obscurity of his legal practice, was sensible, although inevitably both difficult and tardy. The general, himself holding a government post as director of civil aviation, was the dark horse who soon managed to lead the lagging field in spectacular fashion behind the certain and unstrained winner.

★

The flamboyant, rabble-rousing Delgado, damned by shocked upholders of the status quo as "America's candidate," was indirectly responsible for the rioting and the repression that took the immense majority of Portuguese citizens, whether meekly peaceful or disgruntled, by surprise. By attacking Dr Salazar almost from the start of the campaign, he lifted the lid off the huge, gently simmering cauldron of discontent which nobody had imagined that even a presidential candidate would dare to stir. He did so in uniform, as a respected member of the kitchen staff. As soon as he declared that his first act, if elected, would be to sack the prime minister (a redundant gesture, as the latter automatically offers his resignation to a new Chief of State), the fat was in the fire. He had made his point.

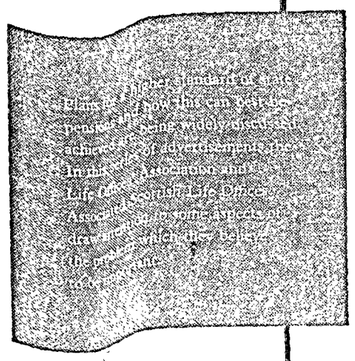
Thus he has ensured that in future the issue—for Dr Salazar or against him—will be clear-cut and recognised as such. The Portuguese political climate has undergone a change. General Delgado's gamble has failed to split the Army ; it has only succeeded in alerting the strong man in Salazar's cabinet, Colonel Santos Costa, the minister of defence. Colonel Costa is credited with having vetoed the suggestion that General Craveiro Lopes, whom he dislikes, should occupy the Palace of Belem for a second presidential term. Dr Salazar paid graceful tribute to the forgotten outgoing President, whose career in office since 1951 was summed up by a Lisbon wit with an epitaph made up of the titles of Mlle Françoise Sagan's books—*Bonjour Tristesse ; A Certain Smile ; Within a Month, Within a Year ;* and *The Broken Date*. His presumptive successor, Admiral Tomas, may be relied upon by "the armed forces of Portugal," whose backing Colonel Santos Costa has promised his colleague "now and always," not to break a date. The French crisis, a more telling example in Portugal than any muffled stormy rumbles from across the Spanish border, helped to make that firm assurance doubly sure.

Schweppshire LADS

J. R. B. D. PENNIWELL

The story of J. R. B. D. Penniwell, the actor, has a happy ending, though it is not generally known what this is. His early training admirably suited him for the stage. With parents in Simla, a great-aunt who was a Lady-in-Waiting, and a prep school overlooking the exact right piece of the East Sussex coast, it was not surprising, with his initials, that he played cricket during his year at Cambridge for the Ice Cream Cornets; though his total name more closely suggests his secondary aspiration, which he achieved when he played lawn tennis—actually men's doubles, if rather base line—in the first County meeting after the War.

Obviously destined for straight stuff, he was offered, after 6 months' training in Basic Movement at the Boltons Academy, a part at the Haymarket Theatre, where he appeared in the last five minutes of *Murder by Proxy* as the very sound young man who in fact actually did it.



He was so sound and young over such a long period that he was asked to be sound in Beverly Hills where he rented a house, a replica in stucco of the cottage of a Normandy fisherman which his agent advised him to convert into an imitation of a Somersetshire tithe barn.

But as time passed it seemed to him that he was becoming so generally recognised that nobody ever actually remembered his name, and it made him discontented. He suffered from irrational fits. He took a dislike to his stage friend Overman, who though totally unsound had been born practically in the wings of the Old Marquess Music Hall, O.P. side. He made attempts to do unsuitable things. He took the part of Kant in a Third Programme dramatised biography of this philosopher. But it was not until he played the part of King Lear for six weeks at the Coldmarsh Repertory Theatre, at a salary of £4.15 a week that he was genuinely mentioned in the Sunday newspapers, and finally accepted not only as an actor, but as a man whose blood, besides being blue, reeked of grease paint as well.

SCHWEPPERVESCENCE LASTS THE WHOLE DRINK THROUGH

PENSION POINTS: I

Meeting Basic Needs

One of the principles of the Beveridge Report was that any compulsory state pension scheme should be limited to provision for basic needs. The present National Insurance scheme follows this principle by providing pensions at a flat rate in return for flat-rate contributions.

But it is often argued that a person's basic needs in retirement are to some extent related to his standard of earnings before retirement. Should the pensions, therefore, be increased to include a graded element, the contributions also being graded?

This could be done, but if any scheme of graded increases were to come into full operation quickly so that the older workers and their wives might benefit significantly, it would be necessary to meet the cost of these increases largely out of the current contributions of all workers. That is, the scheme would have to be financed on traditional National Insurance lines. This would mean that the graded element would need to be strictly limited otherwise the contributions would become intolerably heavy.

Thus unless the graded pension were restricted to provision for basic needs, its purpose would be defeated: for the increased National Insurance contributions and state subsidy needed to finance anything beyond this would add to inflationary pressure and would reduce the real value of the pension. We believe that any additional pension commitments incurred by the community should necessarily be confined to providing for basic needs only.

GAS UNDER PRESSURE—II

Tomorrow's Cheapest Fuel?

NONE of the new ways of getting gas with which Britain's gas industry is now experimenting provides coke as well. This is not, primarily, a matter of policy. A "one-fuel" policy for this industry, moving away from processes that produce one fuel as a main product and another as a by-product to be sold for whatever it will fetch—as gasworks now sell coke and coke ovens now sell gas—has long had its advocates. Today the gas industry is looking beyond these traditional carbonisation processes to a wide array of alternatives. But the reasons, economic and technical, for doing this are inescapable. Coking and gas coals have been rising in price even more than coal in general, and seem likely to go on doing so. Carbonisation processes such as the continuous retort and the coke oven require immensely costly plant, and have reached a technical maturity where they seem to offer little chance of increasing efficiency even further. So the "coke plus gas" service that the industry now sells, beset by the strong competition of electricity and oil, is today in danger of being priced out of its main traditional markets. The gas industry is looking beyond carbonisation as a matter of necessity, not of choice.

Nevertheless, this necessity may offer the industry wholly new opportunities. The coke that one makes with gas out of a ton of coal costs nearly as much to transport as the coal itself: so the gas industry has never been able to exploit the economies inherent in making gas where the coal is cheap, at pitheads, and piping it to the market much more cheaply than solid fuel can be moved. Gas production without coke could thus cut the industry's transport costs. Moreover, it would enable the gas industry to seek higher efficiency in the direction that electricity still manages to secure it—by producing in larger and larger units. "Gasification" processes that make the raw fuel completely into gas would by definition spread their costs over the much larger volume of their main product. And if these processes are practicable at all with coal, they will be practicable with much cheaper coal. From it they will be able to make gas of a higher quality than today, which could be fed direct into the high pressure mains of a national gas grid, yet further reducing transport costs.

THIS neatly interlocking pyramid of technical possibilities, which the gas industry has been obliged to investigate by competition from economically stronger fuels, thus offers it a hope, not too far distant, of turning the tables. New techniques might well enable gas to compete not only in the "selective fuel" market for cooking and supplementary heating, as it does today, but also as a general fuel for all kinds of heating, invading the markets for which it now offers coke. If gas could be supplied cheap enough to meet the solid fuels on "price per useful therm," without allowance for its cleanliness and convenience, it could transform the commercial situation of this industry.

Nor should the significance of this in Britain's total energy policy be lost. Gasification processes can handle the very coals of which there seems certain to be a growing glut in future—power station smalls. This is a crucial point. As nuclear stations come in at the base of electricity generation during the next 20 years, electricity's demand for coal must reach a peak and then gradually decline. There can be few alternative customers for the small coals that power stations now burn so efficiently, in an economy tending to demand its fuel in cleaner, more convenient forms than raw coal of any kind; yet a large proportion of whatever coal is mined will inevitably be smalls. Gasification offers the only real chance visible at present of bridging this gap between the indigenous fuel Britain can produce cheaply and the kinds of fuel that modern consumers prefer.

The consumer, like Miss Doolittle, says "Show me." What price would one need to sell gas at to tap this

wider market? Can the industry hope to supply it at such a price? And if so, when?

Broadly, what such a service would eventually need to offer would be gas at about 1s. a therm to domestic consumers, and about 10d. a therm to industry, (reckoned against today's prices for other fuels, and the relative efficiencies with which fuels are used). A national high-pressure grid would be a very large investment, but when "transmitting" really large volumes it might cost only a penny or so a therm. The total distribution costs of gas are high today: they add almost 100 per cent to the cost of gas production. But the distribution system could handle five times the gas that is sold today at little extra cost: if gas were offered cheaply enough to sell in such volumes, distribution costs per therm could be sharply reduced.

What is required, broadly, is to put gas into a high-pressure national grid at, say, 8d.-10d. a therm. That "target" cost for gasification may be compared with a modern carbonisation plant, which will produce gas at 1s. a therm plus twice the thermal value in coke sold for 6½d. a therm. Gasification can use cheaper coal; it gets three times as much gas from every ton of it; and it uses modern continuous-flow techniques from chemical engineering that vastly increase the velocity of production and cut capital costs correspondingly. Coal takes twelve hours to carbonise into gas and coke; it can be gasified to completion under pressure in as many minutes.

UNQUESTIONABLY the best existing process for the complete gasification of "run-of-mine" coal is the German Lurgi process, In it a mixture of steam and oxygen is reacted with coal under a pressure of 20-30 atmospheres; the hydrogen produced, along with carbon dioxide and monoxide, converts the coal into gas of a somewhat lower calorific value than British town gas. Initially at least, the full-scale Lurgi plant that is now being put up in Scotland will use oil hydrogenation to enrich this gas to the quality required. The Lurgi process will give the British gas industry invaluable experience in high-pressure technique; but, as it stands, it does not completely fill the bill the gas industry has in mind. Its efficiency is reduced by the conditions required for the removal of ash by a mechanical grate, which lower thermal efficiency and create effluent problems. What the Gas Council's research station at Solihull and the Ministry of Power have been studying are techniques that avoid these disadvantages.

First is a joint project for gasification at higher temperatures than in the Lurgi plant based upon the removal of ash as a molten slag. This is at the pilot plant stage at the industry's research station at Solihull and at the Ministry's gasification development project at BICURA in Leatherhead; the "slagging gasifier" would achieve higher efficiency, cheapen by-product recovery, and simplify ash disposal. The gas made could be enriched with methane produced from coal, so that this would be an all-coal process.

So would the third process being developed by the Gas Council, which would adopt "*fluidised*" techniques for handling finely-divided solids as a liquid to gasify any size of coal down to dust. This process would split what goes on in a Lurgi plant into two: the coal would be hydrogenated to produce gaseous hydrocarbons plus a solid residue for gasification in steam and oxygen—offering finally a gas of as high a calorific value as town gas today, with less sulphur and carbon monoxide and unaltered burning characteristics.

THESE improved gasification processes, the gas industry's research department believes, will eventually be able to take coal at 3d. a therm and turn it into gas at a conversion cost of 2-2½ times the cost of the raw material—obtaining from by-products (oil, benzol, phenol, ammonia and sulphur) a yield of about 3d. per therm of gas. The capital charges per therm would be low because of the vastly higher throughput. The largest carbonisation plant in the world, Beckton, makes 200 million cubic feet of gas a day; what the industry now has in mind for the future would be a series of gasification plants of 200-300 million cubic feet a day, located on the coalfields, and making gas at a pressure of 20-30 atmospheres to go straight into the high-pressure mains of a national gas grid.

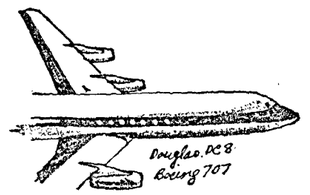
But the new coal gasification processes are not yet out of the pilot plant stage; engineering commercial prototypes, and learning how to work them, must at best take four or five years. So "eventually," in the context of designing full-scale coal gasification works, can hardly mean before the mid-sixties. In the meantime, gas has to compete; it needs to learn about high pressure techniques; and carbonisation coals will probably go on getting dearer. One medium-term answer being tested by the industry is oil gasification — preferably with high pressure processes, which have a high thermal efficiency and large yields of aromatic oils as by-products. A prototype commercial unit is now being installed at Manchester to gasify crude and heavy oil by the production of hydrogen in Texaco gasifiers, followed by enrichment with oil hydrogenation. A variant being developed at Solihull would hydrogenate oil by hydrogen obtained by re-forming part of the gaseous hydrocarbons produced.

Given a market for the by-products, the oil processes offer large volumes of gas at prices lower than one could achieve on carbonisation plant put in today, allowing the gas industry a chance to defend and develop its market in the meantime; moreover, they offer the industry much-needed experience with pressure techniques. Though it is inherently easier to make gas out of a liquid than out of a solid, oil is a convenient fuel in its own right. Making another, perhaps slightly more convenient, one out of it can hardly in the long run offer the economic advantages of making a convenient fuel out of small coal, a dirty raw fuel that nobody will want as such. But successive Ministers of (Fuel and) Power have swung violently from urging the gas industry to concentrate entirely on oil techniques, two or

three years ago, towards urging it to consider nothing but coal: the industry is not going all of either way.

Moreover, the main eventual coal gasification processes would not be economic for meeting the sudden demand for extra gas that can occasionally occur in the winter. The gas industry can meet its daily and weekly peaks of demand by storage—in which a high pressure grid would be a large new factor: it has always had to meet seasonal extremes with specialised plant of low capital cost. Further processes under development at Solihull would provide for peak load pressure gasification from light distillate oil: or possibly from methanol, which could be synthesised from coal and stored as a liquid "off-peak."

NOBODY in the gas industry is anxious to make gas if they could buy enough cheaper, or find it underground. Expansion in the steel industry has made a large development of coke-oven capacity inevitable; the gas boards have always reckoned on buying the extra coke-oven gas that steel companies want to sell to them (though eventually if base-load gas becomes available really cheaply the economics even of metallurgical carbonisation should alter). From oil refineries in Britain, moreover, a variety of tail gases or surplus refining fractions are sometimes economic to buy and convert into town gas. Similarly, the Gas Council has financed exploration for natural gas in Britain (not finding much) and is now experimenting with buying natural gas overseas, liquefying it, transporting it liquid at *minus 250 degrees* in special tankers, and turning it into town gas for sale here.



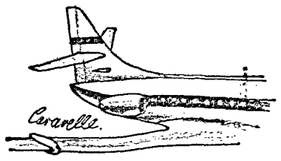
A shift in its own production methods will not make the industry any less eager to buy marginal gas wherever it is on offer. In spite of the expensive technical difficulties of importing natural gas—as against importing more oil, if the economy wants imported fuel—and the question how much one will eventually have to pay suppliers for it, this intriguing possibility can still turn out to be more than marginal. But the cost at which this industry hopes soon to be able to make gas, from oil and eventually from small coal, must condition its bargaining with outside suppliers for future purchases.

Those hopes, quite logically, offer the gas industry the possible chance of competing far more effectively in the domestic and industrial fuel markets than it has for many years; of becoming, indeed, the main general heating fuel. But today they are still only fair hopes. Between now and the time when they can be "put up or shut up," the industry has to get along as best it can against stronger competition—which, besides being a reinsurance, is the best justification for its eclecticism in seeking cheapish gas in the meantime wherever it can get it.

Not everybody in this industry itself sees the way forward with quite the same eyes. Nor has everybody in it yet realised that a national grid moving gas from the coalfields, based on pressure gasification, could mean central groupings of production which would cut across the structure of this nationalised industry that the theorists so often praise as the decentralised ideal. Chances of a prosperous tomorrow will not excuse the gas industry from short commons and making do today. But the chances are real and invigorating; as real as, say, economic nuclear power, *no more remote*, and eventually capable of providing energy a good deal cheaper.

The Big Jets

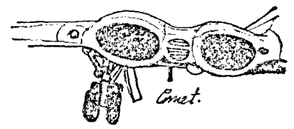
In a few months, jet airliners will begin regular services across the Atlantic; the sketches accompanying this article show some of their distinguishing features.



WHEN the Douglas DC 8 jet airliner took off in a cloud of black smoke a few days ago on its maiden flight, the last of the first generation of jet airliners had begun its proving trials. There are five of these air liners; in descending order of size and range, two are American, one is British, one Russian and one French. Only one, the Russian, is actually in service and beginning to make increasingly numerous appearances in western European capitals. Of the rest, there is a good chance that one of the two American jets, an early version of the Boeing 707, will start carrying passengers across the North Atlantic in October, followed in a matter of weeks by the de Havilland Comet IV. The French Caravelle is expected to come into service inside Europe soon after Christmas and the last of the group, the American Douglas DC 8, may appear on the North Atlantic at the end of 1959.

These five represent a completely new type of airliner, one that combines the structural problems of a fast fighter with the economic problems of a civil transport: as in first attempts, their designs are relatively crude and easy to fault. These may seem harsh words to use of machines that share a uniform elegance of line and extreme precision of construction; but no other description would be wholly fair either to the men who designed them or to those who are now putting their successors on the drawing board. The Vickers VC 10 jet airliner which the British Overseas Airways Cor-

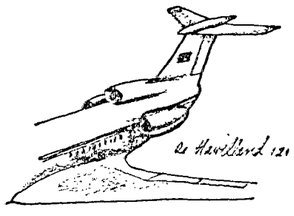
poration should get in six years' time, or the de Havilland 121 airliner which British European Airways will have at around the same date, belong to a second generation of jets, more refined machines that should not be compared with those now going into service.



The world's first, short-lived jet airliner service was opened by the Comet 1 in 1952 and ended abruptly two years later when metal fatigue split open two aircraft in quick succession. Because jet engines have an avid appetite for fuel, it was difficult even then to build a jet airliner capable of making a profit at fares controlled by operators of cheaper, piston-engined aircraft. The Comet accidents made it plain to the world that there were no short cuts to economical jet design, such as using the thinnest, lightest skin to keep down total weight. To protect them from metal fatigue at high altitude, jet airliners were going to need stiff and heavy skins. From such considerations, it became clear that these aircraft were only going to pay if they could carry on average 100 or more passengers.

Very broadly, the time when these big jets have become available depended on when there were engines powerful enough to lift them. The aircraft themselves could have been built at almost any date since the end of the war. Progress was more rapid in Europe than in America simply because many of the routes flown by European-based airlines such as BOAC, Air France (also a Comet operator) and the Russian Aeroflot, are much less exacting than the blue riband routes of American airlines. A jet airliner capable of operating between 500 and 2,000 miles could have been built around the medium-powered jet engines available from the mid-1950s onwards. One capable of crossing the North Atlantic, or even operating a coast-to-coast express service inside the United States, could not.

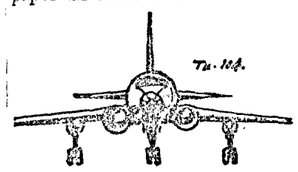
It says much for the speed with which aircraft are developed in the United States and the slowness with which they are developed in this country and France that, although work started so much later, the first American jet airliners will be in service before the Comet IV, which is identical to the Comet III that first flew in 1955, or the Caravelle, which has been flying roughly as long. The Russians, whose jet engines tend to be a good deal bigger than those of the West, seem to have had their Tu 104 in regular service since 1956; comparisons, however, are difficult, since Western engineers think its operating costs are higher than a Western airline would tolerate.



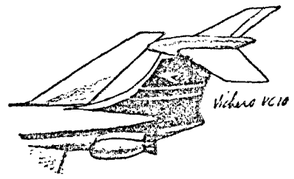
Within a matter of weeks, Pan-American World Airways expects to get delivery of the first batch of eight Boeing 707 jets (early version) that it has on order; it should be able to put them into regular service on the North Atlantic in October. Towards the autumn,

BOAC expects to get delivery of enough Comet IVs (it has 19 on order) to put them into service on the heels of Pan-American. Neither of these aircraft is strictly suitable for operating on the North Atlantic. They have not the range to do the journey non-stop in both directions as can many of the aircraft now on this route, including the turbo-prop Bristol Britannia. So if both airlines go ahead with their plans, they will have to whittle down payload by discreetly juggling with the numbers of first and third class seats. Paper studies suggest that the two aircraft might then be able to fly east from New York to London without a stop in six hours and fly west from London to New York in 7½ to 8½ hours, depending on how often headwinds force them to land and re-fuel at Gandar. Airliners with engines big enough to make the crossing non-stop in both directions in all weathers will not be delivered to either airline until late next year.

Between them, BOAC and Pan-American will have an edge for 12 months or more, and Trans-World Airlines one of about six months, over their jetless competitors on the North Atlantic. These competitors are waiting for the high-powered Boeing and Douglas airliners: none has taken the gamble on the smaller machines. At present a typical, fast crossing in a piston-engined airliner takes about eleven hours flying west and 13 to 14 flying east. The Britannia, in service only with BOAC and the Israeli airline, El Al, clips about 2 hours off the journey in either direction. The jet services come close, therefore, to halving the average crossing.



With fares internationally controlled, airlines believe that traffic will flow automatically to the fastest service—and they measure differences between schedules not in hours but in minutes. So strongly do they hold this view that their plans for all the more important routes by-pass the cheaper turbo-prop aircraft almost entirely in favour of jet airliners, of which there are now about 600 on order. The swing to jets has taken place not only on the North Atlantic, the richest route of them all, and inside North America, but also in and around Europe.



Provided that the Russians can fulfil their promise to silence the two roaring engines of the TU 104, various marks of this aircraft are likely to be in regular service to the major European capitals, London included, before the year is out. By early next year, Air France and the Scandinavian airline

S.A.S. will be operating a network of jet services with the Caravelle right across Europe and into North Africa.

Nothing has been said here about the operating economy of the new aircraft, because so much is still speculative. A jet airliner starts off with a certain disadvantage over a piston-engined or turbo-prop airliner, particularly in its fuel consumption, but in theory these handicaps can be offset by careful design. Only experience in regular passenger service will show how successfully in each case the balance has been struck. The Comet and the Caravelle have both been flying for several years, but the American jets are still much of an unknown quantity—the bulk of orders are for the high-powered versions that have not yet flown. On paper all these aircraft should make money, with the palm for economy going to the Caravelle and the big versions of the American jets. But this assumes to some extent that the present fare structure remains unchanged with one range of fares for all types of aircraft.

If the airlines, under pressure from operators with large fleets of still airworthy but obsolete piston-engined aircraft were to press, as some are already doing, for one fare for the fast service and another for the slow, then the pattern of flying would be changed overnight, particularly as it affects the turbo-props. Some designers, who still stake their money on the slower turbo-props, believe that airlines will become disenchanted with jet operations, which have some of the nerve-racking qualities of scheduling a milk delivery round with Hard Ridden in the shafts. But the last word is with the passengers, and if they like jets—presuming that they even notice what aircraft they fly in—then the jets are here to stay.

BUSINESS NOTES

GOLD RESERVES

Over $3,000 Million

The gold and dollar reserves recorded another fine increase in May, of $125 million, though the month's transactions through the European Payments Union produced a deficit, of £13 million, which will involve a gold payment of $27 million to EPU this month; the "true" gold balance for May, deducting this payment and also the receipts of $4½ million in respect of the EPU balance in April and of $5 million of defence aid, has thus fallen to $88 million. As the table shows, this is the smallest gain this year. It is still a very good one by the standards of recent years and in the circumstances of last month. The favourable seasonal influences for sterling are now due to tail off; in addition, sterling had to contend in May with the strikes and wage uncertainty at home. As the movements on the exchange market suggested and these figures now confirm, these disturbances caused more nervousness on the Continent than in the dollar area. Another influence in Britain's unexpectedly large EPU deficit may have been the French crisis. France incurred a deficit of $76 million with EPU in May; Germany's surplus disturbingly rose to $70 million.

RESERVES SINCE THE CRISIS

	True dollar balance in period*	Actual change in reserves $million	Reserves at end of period
1957 :—			
August	−300	−225	2,142
September	−296	−292	1,850
October	+141	+243	2,093
November	+ 71	+ 92	2,185
December	+ 86	+ 88	2,273
1958 :—			
January	+166	+131	2,404
February	+206	+135	2,539
March	+148	+231	2,770
April	+137	+144	2,914
May	+ 88	+125	3,039

*Adjusting for one month lag in EPU settlements, for $250 million drawn from Export-Import Bank in October, and for small receipts of US aid.

Last month's gain brought the reserves to $3,039 million. In September last they stood at $1,850 million; the rise includes $250 million drawn from the Export-Import Bank. The level of $3,000 million, which at one time had an important psychological significance, was last exceeded in mid-1954, for two brief months, and in 1950-51, at the time of the treacherous Korean boom. The reserves now include also $561 million drawn from the International Monetary Fund at the time of the Suez crisis.

In the exchange markets, sterling showed little reaction to the gold figures, the spot rate holding firm at $2.81⅛. Rates against the D-mark and other Continental currencies have continued to be weak. The franc has been steady at 1179, and the discount three months forward has narrowed from 40-50 francs in the middle of last week to 20 francs.

THE ECONOMY

Output Dead Level

Stability or stagnation, label it how you choose, the impressive thing about the British economy is that according to the official indicators, up to a month ago, total industrial production had still not yet started going down. In April, with construction slackening, several of the plant

industries recording not merely lower orders but lower output, steel production significantly down and soft goods recording little recovery, output of durable consumer goods, and primarily cars, was still buoyant enough to keep production level. In some of the capital goods industries, and in steel, the early indications are that production went down again in May, when motor output was affected by the Pressed Steel strike; this month, again, the dock strikes may already be affecting export production in general. These may blur the real balance of industry for another couple of months, though the Federation of British industries may have some supplementary impressions to announce in the meantime.

THE SHIFTING PATTERN OF PRODUCTION
(1948=100)

* Deliveries, Jan.–March. † Jan.–March.

The current level of total industrial production, 137-8 per cent of the 1948 average, allowing for seasonal variation, was first touched in the second quarter of 1955; it went a few points above that at the end of 1955, and during certain months of last summer, but soon came back onto the trend—which is still horizontal. The manufacturing index, in June last year, did again touch the peak of 1955—147 (1948=100) seasonally corrected. This hardly changing total volume of production (according to an index which it is fair to say seems likely to have a downward bias if any) has masked fairly considerable changes in the fortunes of a number of industries. In motors and in some durable goods this has been simply the effect of Government restrictions, by hire purchase regulations and purchase tax changes, which for a time pushed them into recession; most, but not all, have come out since (furniture deliveries are still depressed). Otherwise, the changes in pattern have not been anything surprising. Electricity, the strongest growth industry, has hardly faltered in its expansion; but chemical output, which formerly matched its progress, has levelled off. Production of soft goods has remained low or sunk lower. Mining ceased to expand before demand for coal did; now it is producing less for a lower demand. Construction, and some plant and machinery industries, rose with the investment boom and have now passed their peak.

Employment Down?

RUMOURS of a large rise in unemployment last month were not substantiated by the figures published this week, which show a total of only 447,600 in mid-May against 443,700 in mid-April, although there was a rise of 22,000 in the numbers temporarily stopped—reflecting among other things repercussions of the Pressed Steel dispute? Thus there was actually a decline of 18,000 in the number wholly unemployed, to 389,000, though not as much as would be expected at the time of year: a rough seasonal correction shows the number "wholly unemployed" rising by about 8,000, and nearly 100,000 upon May last year. Many firms have cut out overtime completely and are working short-time: now, but still gradually, they may be letting their labour forces run down.

This thinning out of the labour force, while total production remains unchanged, must broadly tend to stabilise labour costs in spite of rises in wage rates: since raw material costs are stable and much lower than a year ago, operating costs in industry must have levelled out. In practice, the savings are often being realised where industries that have been working at more than "rated" capacity for years have had the chance (indeed, no alternative but) to bring their output down, and by stopping recruitment have let their labour forces decline significantly more. Mr John Reiss of Associated Portland Cement Manufacturers, mentioned this week that the quite marked fall in demand last year had enabled cement manufacturers to take out of service overage plant where running and maintenance costs were exceptionally high.

Cement is a highly capital-intensive industry, where savings in labour may not be very significant: at the other end of the scale the same thing, much more recently, has been happening in coal. Though labour costs rank very high in the mines, a large proportion of these, maintenance, "other underground" work, and haulage, would ordinarily not be expected to vary very directly with output In fact, since the National Coal Board stopped most of its recruiting in mid-February, its labour force has wasted away by nearly 11,000: with this saving and the suspension of Saturday working, it has been able to achieve some rather startling economies in cost.

IN THE MARKETS

Gilt Edged in Demand

THE new Stock Exchange Account opened on Wednesday without fireworks. In terms of the *Financial Times* indices, government securities that day remained unchanged at 83.47 and industrials unchanged at 168.1. Those figures do rather less than justice to the strength of the market. Over the full week ended on Wednesday the Government stock index shows an advance of 0.45. The *Financial Times* industrial index shows a drop of 0.6, while *The Economist* indicator shows a rise of the same fraction at 184.2, the divergence between *Financial Times* industrials and *The Economist* indicator reflecting mainly the fact that the oil shares which have risen are included in the latter.

The verdict must be that cautious markets have made little response to the further gain in the British gold reserves, or to the modest advance on Wall Street. But it has not been a bad market. Investment demand for gilt-edged, even on Wednesday when prices seemed stagnant, had not disappeared. Fairly large buyers were operating and were concentrating on the longer dates, so that official funding by sales through the market of such stocks as the Funding 5½ per cent 1982-84, the "tap" price of which was raised by ⅛ to 101, continued.

So the background for the important new issues now in

progress is not unfavourable. City of Birmingham's cash and conversion offer of £5 million 5¾ per cent stock 1974-76 at £99 for which cash lists opened and closed on Thursday was well received, and if the terms due to be announced almost at once are right, the outlook for Associated Electrical Industries' £25 million debenture issue looks reasonably good. Applicants for the Birmingham stock will have to wait until Wednesday of next week, when the conversion offer to holders of the City's £3,946,116 3 per cent stock 1956-58 closes, to know their fate which detracts from the issue's popularity. But if market conditions remain unchanged a moderate success and a modest premium are possible.

In view of the higher investment status of Birmingham than either Hull or Swansea (which both issued 5¾ per cent stocks in April) the yield on the Birmingham stock of £5 16s. 2d. flat and £5 16s. 10d. to redemption at latest date is judged about right. It will be surprising if this turns out to be the last of the 5¾ per cent corporation issues. But investors who like high coupons are becoming aware that the number of further issues with so high a coupon must now be limited.

BANK FIGURES

Which Sanction on Advances?

THE Chancellor's renewed reference this week to preparations for expansion has encouraged speculation about an early lapse of the official directives on bank advances. Nothing would be more popular with the banks, for the directive inevitably stultifies competition and stifles initiative. Moreover, there is now the strongest of all arguments for the authorities to drop their unorthodox sanction: the market sanction is working. The latest statements of the clearing banks give further evidence of the success of funding policy. In the five weeks to May 21, the banks again bought gilt-edged. The total portfolio rose by £27 million, following the purchases of £43 million in the preceding four weeks, and bringing the total purchases since the beginning of the year to £115 million. The sales of stock by the Government broker to the banks and to others reduces to a corresponding degree the Government's need for finance from Treasury bills, thereby curtailing the liquid assets available to the banks and exerting the traditional *banking* restraint on bank lending. In the May period, the banks' liquid assets again declined, against the seasonal trend; and since advances fell a little, confirming the downward trend that has been apparent for many months, deposits also declined. The seasonally adjusted index compiled by Lloyds Bank dropped sharply by 0.6 to 109.3, neatly reversing its jump a month before.

† Ratio of assets to gross deposits.

As a result of these movements, the banks' average liquidity ratio, which at this season usually begins to rise, showed its second successive contra-seasonal fall, to 32.4 per cent—now below its level a year before. One bank, Lloyds, has to sell a small amount of investments to stop its ratio falling below the conventional minimum of 30 per cent; this bank was among the first to re-enter the gilt-edged market. Last month's chief buyers were again Barclays and the Midland, each of £10 million; Barclays' investments now represent 37½ per cent of deposits, compared with an average in all banks of 33.7 per cent. The only bank among the big seven that has not added to its portfolio in the past year is Martins, which still has an investment ratio of less than 30 per cent.

STRIKES

What's the Damage?

LONDON'S bus stoppage, soon to enter its sixth week, has so far noticeably affected only certain stores and places of entertainment in the West End and in parts of London south of the Thames where the tubes do not run. The impact upon London Transport's finances is rather more severe however—a net loss to the tune of about £300,000 a week. The month-long Pressed Steel strike, now finally over one hopes, denied motor manufacturers of roughly 10,000 cars, almost an eighth of the industry's output while the dispute lasted and, as a dying convolution, it managed to put 500 workers at Standard's Vanguard assembly line on short time this week. Stocks of body panels finally gave out before Swindon could resume its normal flow of deliveries.

A more serious dispute for the economy in general is the present stoppage of work at the London docks. By Thursday 118 ships were idle, three were undermanned, and only 22 were being worked, and some 20,000 tons of perishable cargo were in danger of being lost. Included in this total were 8,000 tons of imported meat. Meat distribution, which has been progressively interrupted now for eleven weeks by the strike of the London meat drivers, the Smithfield bummarees, and the Thames cold storage workers, is very much on a hand-to-mouth basis. Fortunately, perhaps, this is "in-between" time of the year, after the bulk of meat imports have arrived and a little before the home-killing season normally starts. Stocks were high at the outset and higher prices have encouraged farmers to send some of their pigs, sheep and cattle to market a little earlier than usual. By privately improvised transport, too, most of the smaller butchers have been able to keep their shops adequately stocked with English lamb and pork, with some imported lambs from the cold stores, and some home-killed beef, though the larger retail organisations have not found it as easy to cope with their transport needs. However, shoppers have not had as wide a choice of cuts or as good quality as they normally expect at this time of the year, and prices have been rising.

But the London docks handle about a third of the country's imports and a similar proportion of exports. For some goods, the proportion is even higher—in vehicle and electrical goods exports and in meat and dairy produce imports for example. Past experience suggests that a dock

New Light on Sterling Balances

THE Treasury has at last moved to supplement the scanty information hitherto available on the sterling balances; and it has at last produced figures of outstanding acceptance credits, which have been collected since the publication of the Macmillan report in 1931 but have previously been published only in that report. This week an article in *Economic Trends* inaugurates a new series of quarterly figures of the balances and the credits to be published each February, May, August and November, and gives a useful run of figures for past quarters; further, the Treasury now also gives two important sidelights, showing the division between official and other funds, and the form in which the official holdings at end-1956 were invested.

As is to be expected, central banks and other official agencies of the colonies and independent sterling countries hold a considerably larger portion of total sterling funds of those countries than is the case with the non-sterling countries, whose balances are kept largely for the working needs of commercial banks and other financial institutions. Tantalisingly, the holdings of official funds are detailed for end-1956 but not end-1957. On the unreal assumption that the percentage distribution of the funds was unchanged through 1957—in practice, it seems probable, there will have been a switch out of gilt edged—these overseas official bodies would have held last December some £1,500 million (nominal) in gilt edged securities, nearly half of them with less than five years to final maturity; some £800 million of Treasury bills; and some £200 million deposits, including deposits with the Bank of England.

The new figures permit a far closer analysis of last year's sterling crisis and the subsequent recovery than has been possible from the half-yearly figures available hitherto from the balance of payment white papers. In the third quarter of 1957 the withdrawals of working balances by non-sterling countries—which are obscured in these figures by the effect of the special German deposits and by a distortion resulting from the inclusion of the balances cleared through the European Payments Union—coincided with the peak quarter of withdrawals by sterling area countries. Moreover, outstanding acceptances, extended mainly to countries outside the sterling area, were at a peak in June last year, at £184 million, compared with £108 million a year before and £94 million in June, 1954. By March this year they had fallen to £140 million; it is a clear inference that the rise in 1957 reflected the speculative use of these facilities to create bear positions. The figures are of the total of sterling acceptances given by banking offices in the United Kingdom for account of residents abroad; all but about £10 million of these short term credits are extended to residents outside the sterling area.

In the first quarter of 1958 the sterling balances of non-sterling countries have been replenished (though the balances of all the main groups save OEEC are still lower than a year before). But drawings by the sterling area, or rather by the independent sterling countries, have continued, despite the fact that seasonal influences have turned favourable. In the year to end March, the balances of all sterling countries fell by no less than £289 million; India has been by far the largest spender, but New Zealand and more recently Australia have also gone into the red. In aggregate, Britain's sterling liabilities were reduced by £251 million in the year to end-March, a rate of repayment that seems to be unprecedented.

THE SEASONAL SWING

The sterling holdings of the overseas sterling area show a marked seasonal variation, with drawings concentrated in the third quarter:

Sterling Countries
Changes in sterling balances (£ million)

	First quarter	Second quarter	Third quarter	Fourth quarter
1954	+98	+28	− 44	+44
1955	−11	+23	− 79	+22
1956	+25	− 4	− 9	−35
1957	+61	+ 8	−136	−90

No such pattern is apparent in the holdings of the non-sterling countries, which are governed to a greater extent by world confidence in sterling.

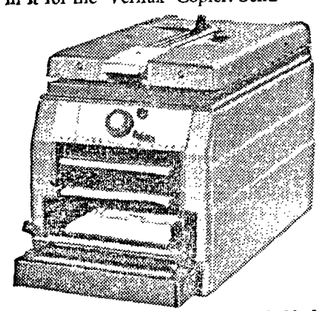
This copy typist never makes a mistake



THE secret of this copy typist is that she never types any straight copy work. She uses the Kodak 'Verifax' Copier. It's not only seven times faster than typing, it is always accurate to the last detail. There's no need for checking.

Copies made with the 'Verifax' are facsimile copies, made on inexpensive paper. In normal use the 'Verifax' can save its cost in as little as two months.

Anyone can learn to use the 'Verifax' in five minutes. It is clean, self-contained and takes up little more desk room than a typewriter.

Whatever your business—no matter how big or small, there's room in it for the 'Verifax' Copier. Send for details today.

strike, even one involving other ports, has to last a considerable time before industrial production is affected and food supplies, in general, are not yet in jeopardy. But shipping delays, and the practice of diverting goods to other ports if dock labour allows this to be done, are immediately expensive. No exports are now moving down to London's docks by road and only negligible quantities are arriving by rail.

STOCK EXCHANGE REFORM

The Election Issues

A CONTESTED election to the Stock Exchange Council is not unusual. Often some new blood chooses to joust with those of the retiring members who seek re-election and often new blood finds its way onto the Council. This year's election for which nominations close on Tuesday and for which voting takes place on Friday, June 20th, is not quite like that. Twelve vacancies on the Council of 36 occur; seven of the retiring members are up for re-election and at the moment of writing eleven others have been nominated. These include a group of six reformers with a common policy that they have set before their fellow members—a policy that they challenge to the established order. These are fairly direct challenges to the policy:

the heads of the House to be under a paid

1. Day to day running of the House to be under a paid general manager with paid managers for each principal branch.
2. Reduction of the 36 member Council to 12 or 15, with a reduction in the detailed work they do.
3. Rebuilding or reconstruction of the Stock Exchange with an increased rent from office accommodation.
4. Revenue to be drawn from an annual charge for quotations and increased agency fees.
5. Reducing the cost of capital transactions by more efficient notification of prices and more efficient clearing of securities.
6. Examinations to be passed by intending members before election to the house. Proper arrangements for the audit of the accounts of all firms and the financial soundness of members to be established not only on entry, but thereafter.
7. More ample public relations and advertising.

Of this ambitious programme more will be heard, for some of those six candidates may quite possibly secure election. They are—Mr L. V. Chater, Mr J. H. Drew, Mr H. J. Enthoven, Mr D. H. Le Roy-Lewis, Mr A. D. McKechie and Mr P. E. M. Shaw. The list is drawn from both large and small firms and from both brokers and jobbers. There is certainly no general acceptance of their programme, but most thinking members would accept some part or other of it. Hardly any would claim that there is no case for reform. At present a conscientious member of the Council needs to spend most of his working week on the affairs of the subcommittees to which he is allocated, so that his election involves a real sacrifice both to himself and to his firm, and it is difficult except in big firms to make that sacrifice.

The real answer to the reformers—if answer there is—must be that they are using a battering ram to open a door that already stands ajar. The present chairman, Sir John Braithwaite, has never been a reactionary and throughout his period of office he has pressed for reforms that edge the Stock Exchange gently nearer to Royal Charter status. Some of the reforms now demanded are already gradually being achieved. A Charter but in much quicker time is apparently what the reformers also desire. But they may have some hard thinking still to do. Just how effective their proposals would be in reducing the cost of doing business is far from clear, and they will have to make it clear if they wish to enlist the support of members in small firms where the bargains tend to be small and the cost per £1 of stock turned over therefore high. The case for a paid chairman, as in New York, is strong, though the reformers have not proposed exactly that, and the case for a smaller council with less detailed work is even stronger.

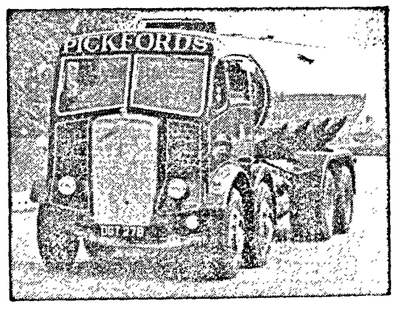
RAYON

Courtaulds Takes the Strain

FEW people expected the trading results of Courtaulds for the year ended March 31st to be anything other than much worse than those of the previous year. They are bad, but they are not shocking, and on the announcement of a final dividend of 5 per cent, making 8 per cent for the year against a final of 6 per cent making 10 per cent in the previous year, the £1 ordinary units rallied 2s. 6d. to 22s. 3d. It is permissible to doubt whether the first hurried reaction of the jobbers was the correct one.

This happens to be the first year in which the Courtauld group includes the profits of British Celanese, so that exact comparison is difficult. But the company gives some clues. At £13,918,669 the group profit shows a fall of about £1,240,000, but as this year's figures include £666,000 from British Celanese and its subsidiaries, the true fall in the earnings of Courtaulds alone must have been of the order of £1,900,000. The sharper fall, as might be expected, comes on the weaker half of the combine—British Celanese, where the net profit before tax a year ago was £1,615,733, implying a decline of the order of £950,000. It appears, therefore, that the combined net profit of what are now the two wings of the Courtauld combine has dropped by something over £2,800,000. After tax the group profits for the current year appropriate to Courtaulds were £6,271,044, compared with £8,135,706 in the previous year before the merger with Celanese. The shortfall results in a reduction in the amount transferred to capital reserve from £3,250,000 to £1,300,000.

In explaining the results, the directors state that "virtually the whole of the reduction in profit can be ascribed to the deterioration in trading results on viscose and acetate textile fibres in both home and export markets allied to a further rise in production costs generally." They add that the deterioration was to some extent offset by improved results in certain subsidiary companies—an allusion presumably to British Cellophane—and by an increased dividend from British Nylon Spinners. The textile results of Courtaulds have thus been unhappy. They could hardly be otherwise in so adverse a market, but the non-textile applications of rayon and the nylon investment have done something to offset the impact.



Short Time in the Factories

RAYON production was in difficulties long before Courtaulds put their weaving mills on short time last week. Some are working a four, some a three-day week; at the root of the trouble lies a simultaneous fall in raw material prices

Don't let your efficiency slip – B.R.S. will have the answer

Circumstances may be against you. But British Road Services are on your side – always. A telephone call to your local B.R.S. depot quickly brings you a helping hand from a nationwide organisation with a willing and experienced staff and a vast fleet of vehicles of all kinds, regularly maintained, and ready to tackle any job, at any time. Modern methods and equipment ensure careful attention to every load, and the B.R.S. teleprinter network provides the means for rapid transmission of your special instructions.

A B.R.S. (Pickfords) maximum capacity 8-wheeler for liquids in bulk. Within their diverse fleet B.R.S. have a full range of tank vehicles suitable for a wide variety of liquids in quantities from 600 to 4,000 gallons – just one of the many and varied services British Road Services render to Trade and Industry.

If you find transport something of a problem

– the best link between dispatch and delivery

and in retail clothing sales. Rayon has for many years held pride of place as the cheapest of all textile fibres; now the claim does not look as strong as it was. After a brief revival early in the year, prices of American middling cotton, for example, have fallen to a point where they are only 2d. a pound dearer than the cheapest rayon viscose staple fibre, which has cost 24 pence a pound since early last year. Wool prices have also dropped sharply, particularly the prices of carpet wools. Medium qualities of carpet wools now sell at 40d. to 45d. per lb clean at the London sales and this has affected the demand for rayon which is extensively used in the manufacture of cheaper carpets and is also mixed with wool when prices are high. Meanwhile retail sales of clothing have bumped along sometimes slightly higher, sometimes lower, than they were the year before and the London bus strike must be eating alarmingly into metropolitan summer trade; many retailers would normally start holding their end of season sales next month.

Output of synthetic yarn for the four months to the end of April was 12 per cent lower than in the same period last year, but the infuriating tendency to lump all synthetic yarns together makes it impossible to say what proportion consisted of rayon. Oddly enough, this marks a slight improvement because March output had been 18 per cent below that of the same month last year while April output was only 14 per cent below the corresponding levels of 1957. Much of the cut is being borne by filament yarns, demand for which has been declining for several years. It is in this field that rayon feels most severely the competition from other synthetics; many of the cloths once made of filament rayon have gone out of fashion and no revival seems possible. Fashion has proved a fickle friend to rayon, the fact that the picture is no worse today is due entirely to a faithful and steadily expanding industrial demand, which includes tyre cords. Figures for staple deliveries are not available, but a good third of all the filament yarn sold in April went to industrial users.

OFFICE EFFICIENCY

How Far to Chase a Penny

"TAKE care of the pence and the pounds will take care of themselves," may be a valid motto in personal saving: in business, a report* of the Office Management Association suggested this week, many pounds are often spent looking after the pence too assiduously. In the factory, business accepts reasonable tolerances both quantitatively and qualitatively, according to the nature of the work being done. But in the office, there is still a traditional insistence on 100 per cent accuracy. No matter how many checks are applied, complete accuracy can rarely be guaranteed, so the disproportionate expense often incurred in offices in trying to get it hardly seems sensible. In fact a substantial part of the work done in offices, the report states, is taken up with this checking and correction of errors.

The Association's report proposes what might be done to reconcile this office tradition with the need to improve the quality and efficiency of clerical labour and reduce the office overheads of business. Broadly, it suggests that the problem can be handled in two ways. By analysing the errors that are committed—and found—according to incidence, type, and seriousness, it should be possible to modify working operations so as to reduce the chances of errors happening and the need for checks; secondly, analysis should reveal where quality of output ought to be raised and where checking is really necessary. The report suggests that, instead of routine 100 per cent checks, sampling methods might be developed and quotes a case study of how this has been done with success in raising the quality of work and cutting the amount of checking work in a large typing pool. As an example of how to save by modifying working methods it cites the instance of costing records where, because of the built-in inaccuracies deriving from the need to allocate common costs to individual activities, amounts might well be rounded off to the nearest shilling or pound.

There are more ways than one in which office productivity ought to be improved: another possibility lies in standardising forms and conditions of trading. The Purchasing Officers Association, which has become concerned at the surfeit of conditions of sale suffered by both buyers and sellers, has just issued a model set of these. Its report† speaks of the growth in the postwar sellers' market of widely varying sets of conditions drawn up and adopted first by sellers and their trade associations and, later, by the larger buying organisation. Each set of conditions, printed in the customary 5-point type in wide lines on the back of grubby documents, has to be scrutinised for unwanted and sometimes onerous stipulations and is then often argued about before agreement is reached—all of which takes time. The Association would like to see an attempt made, now that buyers are able to be more selective, to bring these disparate practices together: the model set of conditions of sale it is now proposing, it thinks, would be reasonably fair to buyer and seller alike and should be able to straddle, in general terms, the particular needs of individual trades.

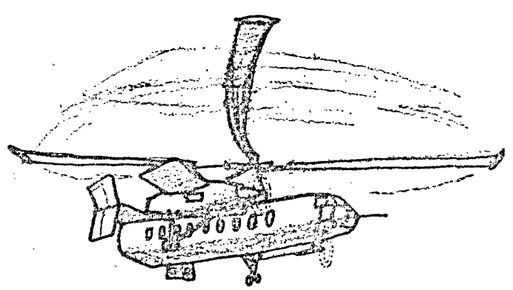
AIRCRAFT INDUSTRY

£10 Million for the Rotodyne?

THE first applicant for a share of the research funds earmarked by the Ministry of Supply for civil, as opposed to military, aircraft development was not Dr Barnes Wallis and his flap-winged Swallow, but the chairman of the Fairey Aviation Company, which has built one of the strangest-looking machines now flying. The Fairey Rotodyne has the rotor of a big helicopter sitting above the wings and engines of a small airliner, and the spectator's first impression as this contraption rises vertically with rotor whirling and propellors idling is one of frank incredulity—like seeing a cricket through a magnifying glass.



A helicopter rotor will lift and lower considerable weights very neatly; it does less well in forward flight. An aeroplane uses its wing surface to provide lift, and its propellors for forward propulsion; the helicopter's rotor has to do both jobs by assuming an ungainly forward tilt that sets up mechanical stresses which put limits on the speeds that can be reached and adds considerably to operating costs. The Rotodyne is intended to combine the best of both worlds—rising and landing under the power of its rotor, but flying forward on its conventional wings and engines while the rotor windmills idly on top.

Driving power in the Rotodyne comes from the two 3,500 horse power turbo-prop motors designed by Napier. When the rotor is in operation, these engines drive air compressors immediately behind them, which pump compressed air back down the wing, up the rotor pylon, along the rotor blades and out to small ram-jet motors at their tips, where it is burnt with kerosine. As the Rotodyne picks up forward speed, the engine drive is gradually switched over from the rotor ram-jets to the propellors on the wings.

While the Rotodyne was being built it was possible to reserve judgment about the soundness of the concept around which it was designed. But it is now flying. This week the company publicly demonstrated how smoothly and easily the transition can be made backwards and forwards from one way of applying its power to the other. It estimates tentatively that it could deliver in three years' time, for £375,000, about the price of a small Viscount, a vertical take-off airliner capable of carrying up to 48 passengers (according to distance) at 4d. a mile between city centres up to 400 miles apart. Alternatively, it could handle freight loads of anything up to eight foot by six across.

This last measurement is an important one because if the Rotodyne fits the army's requirement for a heavy-lift helicopter, its future is safe. If not, it raises a number of difficult problems. The first is a practical one. Interested civil airlines such as British European Airways would hesitate to put such a radically new machine immediately into passenger service without any previous operating experience.

The second stumbling block is that on which the whole of the aircraft industry is stubbing its toes—finance. The company estimates that a further £8 to £10 million needs to be spent on Rotodyne development and this week loudly demanded Government support. Some it will certainly get, but equally certainly not as much as it would like.

RADIATION

The X-Ray Hazard

NO one will ever accuse the government of over-hasty action over the X-ray machines fitted in shoe shops. It is two years since the Medical Research Council, asked to investigate the increase in radiation due to bomb tests, came up with the disconcerting answer that far more radiation had been added to the world by the slap-happy use of X-ray machines than all the bombs put together. The MRC pin-pointed in particular the routine use of X-rays in hospitals for diagnosis—and by shops for fitting shoes. But the Home Office has only just decided on regulations controlling the use of shoe-fitting X-ray machines, and these will not become effective until next month, nearly two years after the publication of the original report.

These lay down the maximum dose for men, women and children, also for the assistants working the machines. They provide for a timing device on every machine to cut off the X-ray after 5 seconds and to prevent the tube from re-starting for another 30 seconds; also for some rudimentary training to be given to at least one member of the staff. A warning notice over the machine advises customers to put their feet under the X-ray no more than 12 times in any one year. This itself is an indication of the extreme reserve with which these machines need to be treated; a conscientious customer would test several pairs of shoes at a single shopping expedition, not to mention a single year. The regulations do not, however, go as far as the Medical Research Council. The amount of radiation added to the world as a whole by these machines, said the MRC, "contribute only very small amounts, . . . which cannot be disregarded. The practice of routinely examining the feet by X-rays when fitting shoes is of dubious value and in view of the possibilities of multiple exposures to children, may even be dangerous. . . . We hope that the procedure will be abandoned except when prescribed for orthopaedic reasons." But the Home Office did not take the hint.

HOTELS

69 Feet Too Tall?—No

A NOTE in these columns two weeks ago commenting on the decisions of the Minister of Housing to grant permission for a 305-ft hotel to be erected on a site in Bayswater but refusing approval for another one, 374-ft high, in Park Lane criticised the Ministry on the assumption that the reason for withholding permission for the second project was that the building would be too tall. This was quite wrong. The actual phrase used in the announcement of the decision was that "it would constitute a serious overbuilding of the site." Instead of a plot ratio (the ratio of floor space in a building to the area of the site) of 2:1 prescribed in the London Development Plan for that area, the scheme proposed one of 8:1. But a plot ratio can be reduced, for example, by designing for the same site another building just as high but with upper floors less wide and deep. The Ministry did not state that the hotel would

FREER TRADE IN EUROPE

have been too high. It recognised that "high buildings must be allowed and that the neighbourhood of Hyde Park is particularly suitable for hotels which . . . may need to be built high": it accepted the case for a plot ratio substantially above 2:1 and hoped, quite reasonably, that a design would be produced which would present a less massive appearance viewed from the Park.

SHORTER NOTES

United Drapery Stores has issued £1.3 million 6 per cent Unsecured Loan Stock, 1978-83 as consideration for the acquisition of Allders Limited. Philip Hill, Higginson and Company has agreed to purchase £1,223,504 of the stock from the vendors of shares in Allders Limited at 98, and will place it at 96. United Drapery will pay a commission of 1¼ per cent and meet the difference between the prices.

* * *

In response to the one for three rights offer to shareholders in Fisons, all but 31,751 shares were taken up. Excess applications totalled 1,815,804 shares. Excess applications for up to three shares were allotted in full, applicants for up to 19 shares received four, larger applications below 10,000 received five and applications above received 10 shares.

* * *

Shareholders in British Relay Wireless took up approximately 99 per cent of the 900,000 5s. shares at 12s. offered to them through the agency of Philip Hill, Higginson and Company. Excess applications for up to eight shares were met in full, larger applicants were limited to nine shares, but holders of less than three shares in the company received no allotment.

* * *

The Colonial Development Corporation is to subscribe up to £450,000 towards the cost of a tea development scheme being carried out by Bird and Company (Africa). A sum of £300,000 will be subscribed against a non-convertible debenture repayable in 1967-72; £100,000 will be subscribed against a 7½ per cent convertible debenture dated 1973, of which a further £200,000 will be offered to shareholders of Bird and Company, CDC underwriting £50,000 of the offer.

COMPANY AFFAIRS

ANGLO AMERICAN

THE gold producing industry in South Africa moves forward on an impetus that must carry it some way yet. In 1957 the South African mines raised a record quantity of 16.5 million ounces of gold. Working costs advanced again from 42s. 11d. per ton to 45s. 4d. per ton but the profit from gold nevertheless advanced from £48.4 million to £57.8 million. And that useful by-product, uranium, brought in £33.3 million (against £24.7 million) to build up a record profit of £91.1 million, against £73.1 million. In that total the biggest of the mining groups—Anglo American Corporation of South Africa—produced 4.5 million ounces of gold (against 3.7 million) at a below average working cost of 44s. 3d. (against 42s. 6d.); its gold profit was £22.0 million (against £16.5 million), its uranium profit £6.9 million (against £5.0 million). So its total working profit from the goldmines was £29.0 million (against £21.4 million).

Investors should understand the nature of the impetus that scores these records, why they must go on occurring even if the gold miners' hopes of higher gold price are never fulfilled, and why despite fine total figures there must always be losses as well as profits to be taken in the gold share market. The answer is not simply that prospecting, despite the geologists' science, is still a hazardous affair, it is that gold mining in South Africa is both young and virile and seventy years old at the same moment. Failing profitability in many of the older mines of the Rand is being masked in the totals by the rich returns of the newer mines of the Orange Free State, which can sustain a higher working cost (and which for geological reasons incur one). The grade of ore milled by the Anglo American group at 5.816 dwts per ton compared with 5.0 dwt for the whole of South Africa and with 5.231 for the Anglo American group last year, reflects the fact that Anglo American is well represented in the new areas.

GROUP OUTPUTS

	1957 ('000)	1956 ('000)	1955 ('000)
Gold (oz.)	4,513	3,750	2,959

* Not published.

The investor may guess that the total dividend of 80 per cent (against 70 per cent) is unlikely to be reduced come what may. The yield of 5.8 on the 10s. shares at 134s. 6d. suggests that they do. But they must also look far beyond gold in making their assessment. The Anglo American group investments in terms of market value have risen from £61.6 million to £71.7 million, largely as a result of the offer to African and European (which has made the group an 87 per cent shareholder in African and European). This is a vast and variegated enterprise. What of the other products of the African soil? Uranium production in the life of the present contracts may have reached its peak and the outlook beyond 1962 may be for stiffer competition. Copper, lead, zinc, and diamonds may all have tougher times to face. The directors' report, studiously factual as ever, gives no hostages to fortune. It does leave the reader with the impression of an immensely powerful and vigorous group tied of course to the fortunes of Southern Africa, but able better than any other to follow those fortunes and to profit from them wherever they may lead. If it involves the building of a financial centre in South Africa, Anglo American is in the front of it; if it lies in industry Anglo American holds the door open.

METAL BOX

THE directors of Metal Box Company have left the total ordinary dividend unchanged at 11 per cent for the year ended March 31st, and on the announcement the £1 units gained a further 1s. in addition to the improvement which preceded the announcement. The cause is to be found in the exceptional trading performance of the last half of the year. Sales have risen, but, contrary to the experience of other groups in the last year, margins have risen too. A breakdown of the figures shows that overseas sales and investment income made the greatest proportionate gain in the last six months, but the striking improvement in profit margins was achieved at home. There has thus been a steady recovery since the set-back in the latter half of the previous financial year. Total revenue for the year rose from £68.67 to £73.62 million and the trading surplus jumped from £5.7 million to £7.1 million. New factories and equipment completed during the year have added to these swelling totals. Production had already begun before completion, and these resources have now been brought into fuller and more economic production. Other economies and improved techniques also buttressed the margin of profit. Capital expenditure for the year exceeded £4 million. Metal Box is rated a growth stock by the market, the £1 units yielding 4⅜ per cent at the current price of 50s. 4½d., but the growth this year seems to have outstripped market expectations. The ploughing back of profit continues; £834,000 is paid out on the ordinary stock, £1,749,000 goes back into the business.

	Half-year ended Sept. 30, 1956 (£'000)	Mar. 31, 1957 (£'000)	Sept. 30, 1957 (£'000)	Mar. 31, 1958 (£'000)
Home group:				
Sales, etc.	27,325	25,805	25,991	29,399

Gross profit	1,002	860	815	1,328
Gross profit/ sales	12·4%	11·5%	11·5%	11·9%

GUEST, KEEN AND NETTLEFOLDS

FROM pins and buckets to bridges and steel buildings Guest, Keen and Nettlefolds makes something for every industry, and when the economy balances between expansion and decline the group inevitably finds trading conditions patchy. Some of the group companies are now drawing on their order books. Last year a satisfactory increase in profit was achieved and, although the early months of 1958 have seen an overall weakening in trading conditions, the chairman, Mr K. S. Peacock can still describe results to date as "satisfactory." Certainly he is not deterred from a vigorous investment policy. Almost £12¾ million was spent in 1957 and £33 million was due to be expended over the following three or four years. The rights issue last year has strengthened the group's liquidity, cash assets rising £7½ million to £19 million, and last year depreciation allowances and retained earnings were both in the region of £7 million. To finance the investment programme should not therefore be beyond the company's reach.

	Years to end-Dec., 1956 £	1957 £
Consolid. earnings:		
Trading profit	27,052,187	30,564,584
Depreciation	5,742,880	6,614,364
Taxation	11,085,379	13,255,574
Net profit	9,185,738	10,287,980
Ordinary dividend	1,796,071	2,620,147
Ord. dividend (per cent)	*13¼*	*15*
Retained earnings	7,033,603	7,311,769
Cons. balance sheet:		
Net fixed assets	59,087,098	66,957,361
Stocks	42,331,753	50,307,720
Liquid assets	11,508,931	19,084,815
Net current assets	54,398,980	71,151,562
Loan capital	19,691,856	17,264,392
Reserves	48,927,162	66,587,416
Ordinary capital	23,137,790	30,378,515

£1 ordinary unit at 53s. 3d. yields £5 13s. per cent.

It is not possible in the monetary conditions of 1957 to deal with the unsecured loan from ISHRA to John Lysaght's Scunthorpe Works, of which £6 million is outstanding. The agency is therefore being asked to continue the loan pending more favourable market conditions.

This problem has one root in the threat of renationalisation. The problem of nationalisation for Guest, Keen and Nettlefolds, however, is not the problem that the steel industry as such faces. The company is primarily an engineering business and in 1951 it was not taken over. What must now be worrying the board is that in order to assure raw material supplies the group has extended vertically into steel. Any new nationalisation programme might cut it in two.

SHELL

IF there were any doubts that the oil industry is facing harder times the figures of the Royal Dutch/Shell group of companies (60 per cent Royal Dutch and 40 per cent Shell Transport) should settle them. Sales proceeds and other income dipped from £644 million in the first quarter of 1957, which was exceptionally favourable, to £613 million in the first quarter of this year. The net income is down from £51.7 million in the first quarter of 1957 to £38.7 million in the first quarter of 1958. The ratio of net income to sales thus fell from 8.0 per cent to 6.3 per cent. The decline can scarcely be comfortable for a group so large that it has to look to its own retained profits—to the consumer in other words—to finance a large part of its heavy capital programme.

In practice the tax gatherer has absorbed part of the decrease in profit as he must to the extent that taxes are based on income, but the companies with increased capital now ranking must also perforce show a heavy drop in earnings per ordinary share outstanding. In Royal Dutch the earnings per share for the quarter are down from Fl4.83 to Fl3.61 and in Shell from 4s. 7d. to 3s. 5d. The companies have the satisfaction that their refinancing operation is behind them and that they hold £451.7 million of cash and shorts towards their programme, against £328.0 million a year earlier. But the capital expenditure itself has been mounting, and in the first three months of 1958 was £92.6 million against £82.2 million. The figures have had little effect on the market, where Shell transport has advanced to 149s. 4½d. this week.

BICC

WITH a final dividend of 8¼ per cent (again making 12½ per cent for the year) British Insulated Callender's Cables has maintained the distribution at the level fixed two years ago when profit before tax was £9,967,000 and the net profit available to the parent company after tax £4,502,000. For 1957, after two years of steeply falling copper prices, the group profit before tax was £5,452,000 and the net available to the parent £2,486,000. The distribution, however, is easily maintained and more than half of it is ploughed back into the business. The maintained dividend makes sense provided that the directors do not see the decline of the last two years as a continuing trend. They do not. The Chairman, Mr W. H. McFadzean sums up the prospects like this. Three factors made 1957 a particularly difficult year:

(1) Intensified competition.

(2) Dislocation caused by the group's major replanning and re-equipment.

(3) The fall in the price of copper.

The reorganisation says, Mr McFadzean, is now "definitely over the peak". As to copper, he feels that he can "surely confidently hope that the immediate position . . . will be easier". Competition will remain and is accepted as a spur. That justifies the Chairman's confidence on the medium and the long view. BICC, investors may think, should still be something of a growth stock as the yield on the ordinary stocks of 5.7 per cent at 43s. 9d. per share suggests. Mr McFadzean seems less certain that the immediate prospect will not be clouded by a recession in the volume of world trade, though 1958 has made a good start.

The impact of the copper market on the cable maker is complex. Mr McFadzean explains that no efforts to keep purchases and sales in balance can be entirely effective. The stock loss last year was however a "very moderate figure." Part of this trouble is the small hand-to-mouth orders that the group experiences when the market is falling. Nevertheless, the lower copper price is a cloud with a silver lining. It does release capital from stockholding. The accounts show stock down from £27.6 million to £25.6 million and debtors and bills down from £24.8 million to £22.4 million. The cash and near cash assets will obviously need to be reinforced when business expands for they amount to a mere £335,000 compared with £2,249,000 a year earlier.

"BLUE CIRCLE" GROUP

SLACKENING building activity late last year embarrassed the Blue Circle group of cement companies but little. Several old and costly kilns were closed and others operated at more efficient levels. This rationalisation and other savings, for example on fuel costs by pre-heating the clinker, and by the new "dry process" of cement production at the Caudron Works, enabled the group to secure higher margins on a lower tonnage of home deliveries. Direct exports were highly competitive but considerably higher profits from the group's

overseas manufacturing interests. The final result was that the consolidated trading surplus rose from £13,672,867 to £14,628,129. Depreciation is up slightly to £3,422,825, as is the transfer to fixed assets replacement reserve which this year absorbs £935,306. The net surplus was £814,093 higher at £4,223,515. The parent company is paying the same dividend of 9 per cent on its ordinary shares, and the group is putting £2.9 million to reserve against £2.2 million in 1956. At 36s. 3d. the parent company's £1 ordinary shares yield almost 5 per cent.

But the present building recession has left marks on the consolidated balance sheet. Stocks are up from £9.6 million to £11.9 million, while net cash assets shrank from £15.4 million to £13.4 million. This year, the Blue Circle group hopes to limit the inevitable fall in home deliveries to about 5 per cent and it may be able to keep its home prices level after the present period of "stability" ends this month. But export prospects are less sanguine: a further decline in margins is expected though only a small loss in volume.

J. AND P. COATS

SHAREHOLDERS of J. and P. Coats, the sewing cotton group, will search the speech of their chairman, Mr Robert Laidlaw, for an interpretation of the facts they already know—that the trading profit fell from £11.9 million to £8.3 million, and that the dividend for the year has been maintained at 8¾ per cent. Mr Laidlaw explains that the company has suffered three blows: with the fall in price of the long staple cottons it has had to write down stock by £1¼ million; the writing down applying to raw materials and process stocks only; the company suffered a loss in exchange of £568,000 whereas in the previous year there was an exchange gain of £125,000; lastly, trading conditions have been depressed and more highly competitive. The weakness of world markets, says Mr Laidlaw, has continued in the first quarter of 1958, though he notices a slight strengthening in certain countries more recently.

This may be cold comfort for the 56,896 shareholders, most of them small investors who regard J. and P. Coats as a "blue chip" of the industrial market. But although this is the second successive year in which the company's profits have dropped, it is the first year since 1952 in which there has been a decline in the volume of the group's sales throughout the world and the 8¾ per cent dividend is still very handsomely covered by earnings. The shares stand at par.

LONDON AND OVERSEAS FREIGHTERS

THAT London and Overseas Freighters should show sharply lower profits for the year ended March 31st causes no surprise. The company adopts standards of financial candour that leave little room for the unexpected. Never since the shares first came into public hands in 1951 has the camouflage of the shipping Companies Exemption Order been called in aid, and the company issues quarterly earnings statements. Now this predominantly tanker company that recently decided to re-enter the dry cargo shipping market shows a decline from £2,671,670 to £1,957,841 in its profit for the year ended March 31st and the Exchequer which can claim only £534,544 in tax, against £1,110,760, is the main loser: the net profit fell only from £1,560,910 to £1,423,297. For holders of the 5s. ordinary shares, which stand at 15s. 6d. to yield almost 6½ per cent, the result is reassuring. The financial year ended March 31st must have felt some at least of the impact of depressed freight rates and the final dividend is maintained at 6d. per share again making a total distribution of 1s. (20 per cent) and on a capital increased by last year's 25 per cent capital bonus. The future seems at least partly assured by the fact that part of the company's building plans are tucked away in the breeding grounds of Bermuda through the associate company, London and Overseas Tankers, but as freights, and taxable profits, fall, the advantages of Bermuda as a breeding ground grow less.

LAST DEALINGS:	June 3	June 17	July 1
ACCOUNT DAY:	June 10	June 24	July 8

LONG-DATED Government stocks and the irredeemables improved steadily throughout the week; 3½ per cent Funding 1999-2004 gained a point to 72¾ and 5½ per cent Funding 1982-84 ⅝ to 101 while 3½ per cent War Loan rose ⅞ to 66⅝ and 3½ per cent Conversion, after 1961, rose ¼ to 66¼. Short-dated stocks were neglected, but high-coupon Dominion and corporation loans made considerable gains.

Though industrials were subdued by the threat of labour disputes, prices improved in some sections, especially on Wednesday on the first day of the new account. The strength of Wall Street helped the recovery. Brewery shares were very firm, Whitbread "A" gaining 2s. to 87s. 6d. Motor shares rallied after early losses; Ford was outstanding with a rise of 3s. to 39s. 3d., but Rolls-Royce fell 1s. 7½d. to 83s. 6d. xd and ACV declined the same amount to 27s. 6d. xd. Hawker Siddeley lost 9d. to 26s., but Fairey Aviation rose slightly to 14s. 9d. though most aircraft stocks declined. Textile shares were weaker, J. & P. Coats, and Crosses and Heatons fell a few pence but despite the reduction in the final dividend, Courtaulds rallied on Thursday. BAT rose 1s. 6d. to 46s. although other tobacco stocks were often lower on balance, despite a late rise. A decline in steel stocks was reversed. Finance house shares strengthened and Hudson's Bay jumped 13s. 9d. to 181s. 3d.

A sharp rise in oil shares and copper mines was helped by the strength of American markets and the firmer copper price. Kaffirs responded to plans for an American investment trust formed to buy gold mines. After slackening earlier prices recovered, particularly those of the finance houses. Riebeeck gained 2s. to 13s. under the influence of good borehole results. Consolidated Zinc improved to 42s. 9d. after touching its lowest point this year of 41s. 6d.

(1) For a rough conversion to basis of June, 1947, multiply throughout by 1·534. (2) The interim index of retail prices has been linked back to 1938 with the aid of calculations made by Professor R. G. D. Allen for the London and Cambridge Economic Service. (3) For a rough conversion to basis of June, 1947, multiply throughout by 1·561. (4) Surveys made twice a year; annual figures relate to October survey. (5) Revised figure for fibres on May 6th was 78·4.

THE MONEY MARKET

THE Treasury bill rate was little changed on Friday last, at the second tender following the ½ per cent reduction in Bank rate. The discount houses maintained their common bid at £98 15s. 11d., but as outside applicants adjusted their bids to the unexpectedly large increase in the market's bid the week before, the average rate of discount on the whole allotment fell by 2d. to £4 16s. 3.84d. per cent. The allotment rate at the markets common bid fell from its high level of 61 per cent to 49 per cent. Total applications rose by £4 million to £416 million. At yesterday's tender the offer was stepped up by £10 million to £70 million.

Credit conditions in Lombard Street have remained taut in the past week, but except on one occasion the market has been saved from further recourse to the Bank at the penal rate. Market supplies of funds were just adequate on the first two days of this week, and on Wednesday the Bank gave large and sufficient special aid. But on Thursday of last week, heavy tax transfers and influences associated with the month-end (including some calling by French banks in *ratissage* operations) caused an acute stringency, and despite very large special help two or three houses had to take a small amount at Bank rate. Throughout the past week, August maturities have changed hands at 4⅝–4½ per cent.

At this week's Treasury bill tender in New York, the bill rate rose from 0.635 per cent to 0.723 per cent.

COMPANY MEETINGS

UNION CORPORATION LIMITED

(Incorporated in the Union of South Africa)

Extract from the Speech by Mr T. P. Stratten at the Annual General Meeting, held in Johannesburg on May 27, 1958

Mr T. P. Stratten, who presided in the absence of The Right Honourable The Viscount Bracken, who was not able to be present, said:

Before dealing with the formal business of the meeting I should like to refer to the loss we have sustained by the death in September last of Mr Eric Fraenkel, who had been a member of the Management in London since 1930 and a Director since 1944. We shall miss his counsel, especially in matters financial.

In 1956 we enjoyed an exceptional increase in our income from base metal interests, particularly Tsumeb Corporation, but since that time world demand for base metals and consequently prices have fallen drastically. Thus the consolidated profit after taxation for 1957 was £1,578,000 compared with £2,093,000 in 1956.

The net profit of the Corporation itself was £1,465,000. To fulfil our policy of setting aside funds for the future development of our business your Directors have appropriated £350,000 to the General Reserve Account which now stands at £2,650,000; £300,000 has also been appropriated to the Exploration Reserve Account which, after deducting expenditure on exploration during the year, amounts to £1,053,000.

Dividends of 3s. per share less United Kingdom income tax were declared (the same as for the previous year), leaving a consolidated balance to be carried forward of £846,000, compared with £712,000 at the end of 1956.

Since the end of the financial year arrangements have been made for the provision of additional finance for the Corporation's business by raising privately in the Union of South Africa £2 million against the issue during 1958 and 1959 of 6½ per cent Unsecured Notes to be redeemable 1974/83. The Corporation has the first right to purchase and simultaneously redeem any Notes offered for private sale.

UNITED KINGDOM TAXATION

The recent Budget in the United Kingdom contains proposals to abolish the present system of differential rates of profits tax on distributed and undistributed profits and to substitute a flat rate profits tax of 10 per cent on profits whether distributed or not. If these proposals are accepted by Parliament they will result in some companies paying less tax than hitherto; others will pay more. Fortunately we will benefit from the change in this tax.

GOLD MINING INDUSTRY

Our principal interests continue to be in gold mining in South Africa. It is appropriate, therefore, before turning to the affairs of the Gold Mining and other Companies under our administration and to our various other interests that I should briefly review the affairs of the South African Gold Mining Industry as a whole.

The tonnage milled in 1957 was 66,114,400 tons, representing a decline of just over 2 per cent., as compared with 1956, but as the average yield improved by 0.447 dwt to 5,000 dwt per ton the gold output increased by over 7½ per cent to 16,540,816 ounces fine, which constitutes a record for the Industry.

As a result of the greater output, working revenue increased by £14,491,000 to £207,706,000. Working costs absorbed £149,872,000, leaving a working profit from gold of £57,834,000, which is £9,383,000 more than in 1956. The estimated profit from production of uranium increased by £8,646,000 and amounted to £33,308,000, so that the total working profit for the industry was £91,142,000 or £18,029,000 more than for the previous year.

Provision for capital expenditure, loan redemption, including loans made available for uranium production, and for other items amounted to just over £36 million, of which nearly £23 million was for shaft sinking, plant and equipment and development charged to capital account, and approximately £7,675,000 was for interest and redemption on uranium loans. Taxation and Government share of profits is estimated at £17,548,000, which is somewhat more than in 1956. Net dividends declared by the Industry increased by over £8,500,000 to £36,699,000.

At previous meetings the Chairman has commented on the increasing contribution to the Industry's output and profits of the new mines of the Orange Free State and the Transvaal, that is to say, mines which have come into production since 1951. In the year under review, while the tonnage milled by these 17 mines was less than a quarter of the total for the Industry, because the grade of ore which they treat is much higher they accounted for over 42 per cent of the total gold output, and their combined gold and uranium profits at £52,791,000 were just under 58 per cent of the total for the Industry. In 1957 the new producers for the first time accounted for more than half the dividends declared by the industry. Clearly the vast capital investment in the postwar years in development of the Orange Free State and Western Transvaal goldfields is now beginning to bear fruit. At a time when the diminution in the Union's reserves of gold and Foreign Exchange is causing concern it is important to note that the value of the gold output of the new producers in 1957, at about £87 million, is in excess of the total Foreign Exchange and gold holdings of the Union of South Africa today. It is salutary to reflect on what the financial position of the Union would be at this moment but for the foresight and courage of those who invested their capital in those new fields.

The level of working costs of most of the new producers is much above that of the older mines. The increasing tonnage contributed by them inevitably raises the average figure for working costs of the Industry as a whole. Thus in 1957 working costs of the whole Industry averaged 45s. 4d. per ton milled, being an increase of 2s. 5d. over the previous year. The older producers, however, showed an average increase in working costs of only 1s. 9d. per ton milled, much of the balance of the average increase for the Industry being apparently due to the inclusion of a larger proportion of high cost tonnage treated by the new producers.

In the year under review considerable attention has been focused on the problem of the so-called vulnerable or marginal mines on the Witwatersrand, that is to say mines where the cost of producing an ounce of gold is close to the price realised for it.

There is no easy solution to this problem. Some of these mines will close soon because their ore is almost exhausted. In many of the others, however, there are still large tonnages of marginally payable or low-grade ore which could be mined but for the present unfavourable ratio of the price of gold to the level of working costs. However, any measures designed to afford special assistance to these latter individual marginal mines can only be at the expense of other mines or other sections of the community. Moreover, such measures would only be temporary palliatives unless coupled with sustained and successful efforts to reverse present inflationary trends since the fundamental reason for the imminent closure of many of these mines is the progressive erosion of ore reserves and profit margins by the continuing rise in costs.

The South African Government has shown itself keenly aware of the dangers of inflation to the economy of the country and has made strenuous efforts to combat it. Nevertheless, the official retail price index for the Union of South Africa has risen from 103.7 in 1949, the year in which devaluation took place, to 143.5 in 1957, and the wholesale price index has risen even faster. In other words, an ounce of gold had by 1957 lost nearly 70s. of the purchasing power which it had immediately after the 1949 devaluation. Thus, whatever advantage accrued to the Industry in September, 1949, from the increase in the official Sterling price of gold from 172s. 6d. to 248s. 3d. per ounce fine has been virtually wiped out by the fall in the value of money which has taken place since then.

Having reviewed the progress of the Companies under the Corporation's administration, Mr Stratten continued:

EXPLORATION

We have continued to be active in the search for new mineral deposits both in the Union of South Africa and elsewhere. We believe that it is essential to follow such a policy if we are to discover and develop new mines and thus create profitable new investments to maintain and expand our business.

While we are also investigating a number of other mineral occurrences or prospects a large proportion of our exploration work is still directed towards the further development of the Kinross area and it may be appropriate at this stage briefly to review the history of our work in this field. We secured our first options over mineral rights in this region in December, 1948, and began drilling in 1950. In the eight years since then the Corporation's subsidiaries have drilled over 200 boreholes totalling 615,000 feet of diamond drilling. At its maximum

the area held under option amounted to approximately 215,000 morgen (over 700 square miles) stretching some 50 miles from East to West. Inevitably as work proceeded and the picture became clearer large areas were discarded as being of no economic interest. The holdings of the remaining subsidiary Companies operating in this region have been narrowed down to the area mentioned to you last year, amounting to about 26,000 morgen, which contains a smaller core of approximately 10,000 morgen of more particular interest.

This has been a vast exploration programme, and our discovery of this new field has involved the expenditure of large amounts on prospecting and the purchase of mineral rights and freehold. At present, as mentioned in the Directors' Report, the drilling work in the Kinross area is largely confined to obtaining further information to enable us, as soon as we can, to frame an application to the Mining Leases Board for the next mining lease.

Shareholders will appreciate that we are in the process of delineating a new goldfield. The profitability and the timing of the exploitation of this is vitally linked to the relationship between the price of gold and the level of capital and working costs in the years ahead.

I know you would wish me on your behalf to thank the staff of the Corporation in South Africa and London and the managers, staff and employees of the Companies under our administration for the past year's work.

The Report and Accounts were adopted and the retiring Directors re-elected.

RUBBER PLANTATIONS INVESTMENT TRUST

INCREASED REVENUE

The forty-ninth Annual General Meeting of the Rubber Plantations Investment Trust Limited, will be held on June 25th, in London and the following is an extract from the circulated address by the Chairman, Sir Eric Macfadyen:

The Accounts before you show gross revenue of £292,006, being an increase of £19,844 on that of the previous year and represented a gross yield of 16.89 per cent (15.74 per cent) on the Trust's issued Capital. After providing for taxation and expenses our net revenue is £149,133 (compared with £147,842 a year ago). £25,000 has been transferred to General Reserve and we recommend a dividend of 12½ per cent (the same).

One notable feature during the year has been the receipt of approximately £169,000 in the form of Capital repayments by Rubber Companies included in the Trust's portfolio of investments; this sum was applied in writing down the book cost of the particular holding affected. These funds have now been invested in Commercial and Industrial shares, the book cost of which has increased from £354,723 to £541,395 in the twelve months; this group in our portfolio now represents 28.8 per cent (18.5 per cent) of the total cost of all investments.

At the balance sheet date the net cost of our investments was £1,733,109 (£1,826,491) and their valuation at £1,850,411 shows a surplus of £117,302 (£78,289). The net asset value per 2s. Stock unit at the year end has improved to 2s. 6¼d. (2s. 6d.).

We have continued our policy of maintaining a strong liquid position in the form of Treasury Bills and short-dated Government Securities, which have yielded a satisfactory return during a year of mainly falling prices for equity shares.

NATIONAL BANK OF NEW ZEALAND

FUNDAMENTAL SOUNDNESS OF COUNTRY'S ECONOMY

MR ARTHUR H. ENSOR ON AN OVERALL SATISFACTORY YEAR

The eighty-sixth annual general meeting of the National Bank of New Zealand Limited will be held on June 26th in London.

The following are extracts from the circulated statement of the Chairman, Mr Arthur H. Ensor:

I am able to report another reasonably satisfactory year. Profits at £275,000 show a modest increase of £6,000 over the previous year, which must be regarded as satisfactory bearing in mind the rising costs of providing an adequate banking service. In the current year, with the severe import restrictions in being, the volume of trade is likely to be lower than that during the period under review, and to a limited extent, this may affect our current earnings.

The Directors now recommend a final dividend of 5 per cent actual less income tax at 8s. 6d. in the £, making a total distribution of 9 per cent for the year.

BUSINESS DEVELOPMENT

Our business throughout New Zealand has continued to expand and there has once again been a very satisfactory increase in the number of our customers. This has necessitated an extension of our banking facilities and during the year we have opened five branches and four agencies, making a total of ninety-four branches and sixty-two agencies in New Zealand.

BALANCE OF PAYMENTS AND OVERSEAS TRADE

In my Statement last year I referred to some of the principal elements of strength and weakness in New Zealand's economic situation. During the past year events have conspired to focus attention almost exclusively upon the weaknesses, notably the vulnerability to sharp price fluctuations of some of the Dominion's exports.

The balance of payments crisis, which led the newly elected Government to introduce a comprehensive and severe system of import controls at the beginning of this year, was the result of a substantial increase in the value of imports which was not matched by a comparable rise in current receipts.

On the one hand, the market value for New Zealand butter in London was falling to the lowest level reached for ten years, average wool sale prices were down some 18 per cent on the previous year and the seasonal fall in lamb values was somewhat earlier and sharper than usual, whilst on the other hand, total payments for imports into New Zealand by the end of the year had increased by 16 per cent over the 1956 value.

Thus, the movement in the terms of trade, together with the increase in the volume of imports, was having a very adverse effect on New Zealand's net overseas assets, which had fallen to dangerously low levels, and the fall has not yet been arrested. In this situation determined action was undoubtedly necessary, particularly as it was essential to check the excess stock building by way of imports which, to a considerable extent, was the result of the political uncertainty of the time.

In these circumstances, New Zealand's protest against the placing of large quantities of dairy produce on the United Kingdom market by foreign suppliers at a price below that charged to their own domestic consumers warranted careful consideration. The recent decision of the British Government to impose quotas on butter imported from a number of foreign countries is expected to restrict imports from these sources by some 40,000 tons per annum.

It is difficult to forecast the likely effect on the United Kingdom butter market of these proposals and the arrangement has not been too well received by New Zealand. It is to be hoped, however, that the measures now being taken will be effective in affording some assistance towards resolving the problem, as it would be a misfortune if New Zealand's highly efficient dairy industry was impaired by what may prove to be temporary marketing difficulties.

In spite of these uncertainties, there are aspects of New Zealand's trading position which taken together are gratifying features. The first is that New Zealand's principal market, the United Kingdom, has so far shown a notable resistance to the possible extension of an economic recession from across the Atlantic. Secondly, after years of intensive capital investment and the continued application of improved farming methods, New Zealand's primary industries are now among the most highly productive in the world, and this fact emphasises the urgent necessity for seeking new markets.

Furthermore, there are many examples, although relatively small in volume, testifying to the success of the efforts to diversify export products and markets.

Trade with Australia remains heavily unbalanced, although from time to time attempts are made to reduce the discrepancy between imports and exports. In the past year significantly larger receipts have been earned by New Zealand's timber products, pulp and paper, and there has been an overall increase in the export trade to Australia.

Shipping services play a vital part in the successful marketing of New Zealand's products, and it is very satisfactory to see that these services have been extended in the past year, particularly those to the Far East.

Within New Zealand constant endeavour is being made to exploit the country's natural resources to the utmost.

After outlining various development projects, the Statement continued:

In order that all these opportunities may be successfully utilised and the many claims of a highly organised welfare state met, a considerable degree of self-discipline will be necessary, otherwise inflation will undoubtedly endanger the continued development of New Zealand's economic foundations.

RESPONSE OF SMALL INVESTORS

While recourse to overseas loans can afford some short-term relief to the immediate balance of payments problem, it is to be hoped that the steps necessary to restore a proper equilibrium in the economy will not be neglected. It is appreciated that

New Zealand is a young and vigorous country and that many of the projects now under construction are worthwhile, but the problem of discriminating between the necessary and the merely desirable must be faced if the Government is not to spend too large a proportion of New Zealand's export receipts in advance.

Nevertheless, within the economy there have been several encouraging signs, including a better balance in the labour market and relative stability of the consumer price index. There has been a gratifying increase in the amount of private savings, and the importance of the small investor was demonstrated by the response to the internal loan of £20 million issued in June, 1957.

The various encouraging features which I have mentioned in this brief survey can be taken as indications of the fundamental soundness of New Zealand's economy, and I have no doubt that the existing difficulties will be successfully overcome by the resourcefulness of the people of New Zealand, once the requirements of the present situation are fully appreciated.

MIDDLE WITWATERSRAND (WESTERN AREAS) LIMITED

(Incorporated in the Union of South Africa)

CHAIRMAN'S REVIEW

This review of the company's affairs by Mr S. G. Menell, chairman of Middle Witwatersrand (Western Areas) Limited, has been circulated with the report and accounts for the year ended December 31, 1957:

The new gold and uranium mines which your company's pioneering efforts have helped to establish during the last decade have resulted in your company now having in its portfolio substantial holdings in the Hartebeestfontein, Buffelsfontein and Stilfontein mines in the Klerksdorp area, as well as in the Virginia, Merriespruit, Free State Saaiplaas and Riebeeck mines in the Orange Free State. Members were given rights to subscribe for shares in a number of these companies.

Your company's growth is illustrated by the increase in dividend income from £7,495 in 1948 to £354,376 in 1957. This has enabled your company to resume the payment of dividends. Your company's shareholdings in mines in the Klerksdorp area which had a market value of £4,836,595 on December 31, 1957, contributed a dividend income of £328,094 for the year under review. It is expected that your company's subsidiary, New Klerksdorp Gold Estates Limited, as a result of its uranium operations will resume the payment of dividends during the current year.

The market value of the company's shareholdings in Orange Free State mining companies at December 31, 1957, was £1,563,198. It will probably be some years before a substantial return can be expected from these investments. The Virginia mine is now milling at the rate of 100,000 tons per month. During 1957 the mine made a working profit of £3,192,421, all of which was appropriated to meet interest payments, the cost of increasing the pumping capacity, the expansion programme and uranium and acid loan repayment instalments. The Free State Saaiplaas mine in the Virginia area and the Riebeeck mine in the Odendaalsrus area are still in the shaft sinking stage. As has been announced, both these mines, before production can be undertaken, will require further capital funds, to which your company will be called upon to contribute.

DEVELOPMENT

In continuation of your company's exploratory work plans are under consideration for the development of the Zandpan mining area which adjoins the Hartebeestfontein mine on the west and the Vaal Reefs mine on the north. Furthermore, a prospecting programme is being carried out, in conjunction with other parties, in an area to the east of the Hartebeestfontein and Buffelsfontein mines. Your company is also participating in the investigation of various base metal prospects in the Central African Federation.

During the year your company raised the sum of £1,250,000 by means of an issue of 6½ per cent secured debenture stock. Anglo-Transvaal Consolidated Investment Company Limited and your company's subsidiary, Virginia Land and Estate Company Limited, have guaranteed the capital sum and interest on the loan. Virginia Land and Estate Company Limited, which is developing the town of Virginia, has passed first mortgage bonds over certain of its township property in Virginia, having an appraised value of over £2,500,000 as security for the debenture stock.

The town of Virginia, which caters for the housing requirements of Harmony, Virginia, Free State Saaiplaas and Merriespruit mines and for the non-mining population, now has a total population of approximately 38,000, which figure includes approximately 13,000 African mine workers who are resident in single quarters on the four mines. The rateable value of property in the town now exceeds £13 million. The Harmony, Virginia and Free State Saaiplaas mines propose to increase their mining activities during 1958. This should lead to an increase in population and to a resultant increase in the demand for property in the town. A number of prominent business and financial organisations have already erected buildings and established branches in the civic centre and others are at present engaged in doing so.

During the year Virginia Land and Estate Company Limited acquired 432 houses and a block of flats from Merriespruit (Orange Free State) Gold Mining Company Limited for the sum of £1,700,000, of which £1,200,000 is payable in twelve monthly instalments and the balance when the Merriespruit mine resumes production for gold. Of the finance required for this transaction £1,150,000 has been provided by the passing of mortgage bonds over the housing concerned, these bonds being guaranteed by Anglo-Transvaal Consolidated Investment Company Limited and by your company. All these houses have now either been let to mining companies and to private individuals or reserved for occupation during this year.

In conclusion I desire to place on record your Board's appreciation of the services rendered by our secretaries and technical advisers, Anglo-Transvaal Consolidated Investment Company Limited, both at the head and London offices, and also by the managers and staffs of our subsidiary companies.

The annual general meeting of members will be held at Anglovaal House, 56 Main Street, Johannesburg, on Friday, June 27, 1958, at 11.00 a.m.

RELAY EXCHANGES

CONTINUING GROWTH

The Thirteenth Annual General Meeting of Relay Exchanges Limited was held on June 5th in London, the Chairman, the Right Honourable Sir Walter J. Womersley, Bart., presiding. The following is extracted from his circulated statement:

The Directors recommend a final dividend of 25 per cent making with the interim dividend of 15 per cent already paid a total for the year of 40 per cent.

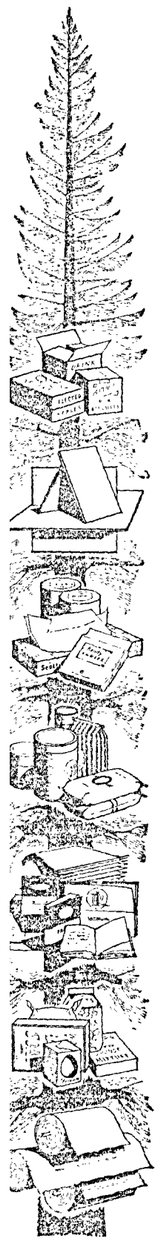
Trading profit has increased from £1,441,313 in 1956 to £1,613,267 for 1957. £933,272 has been set aside for depreciation and replacement against £822,958 for 1956. This provision amounts to about 60 per cent of the profit earned. Net profit before taxation is £345,398 against £478,546 for 1956 and £330,537 in 1955.

The provision for taxation—£309,110—includes £214,457 added to taxation equalisation reserve which now stands at £588,891. After providing for taxation the profit for the year is £236,288. To this has been added the balance brought forward of £114,783 which with the provision for accruing maintenance no longer required now added back amounting to £62,915 makes a total of £413,986. Of this sum the Directors considered it advisable to transfer £40,000 to General Reserve, so building that reserve up to £340,000, and to create a new Reserve for equalisation of maintenance charge in the amount of £85,000.

The total dividend charge for the year will absorb £141,593, leaving £147,393 to be carried forward.

All the Loan Stock Holders of the first series had exercised their right to convert 25 per cent of their holdings into Ordinary Shares. Conversion rights of the second series were being exercised and those rights remained available until December 31, 1958.

NEW ACQUISITIONS



Several businesses had been acquired in Kent, Bedfordshire and Hampshire in 1957, and as a result of these purchases, carried through on a Share issue basis, considerable additions had been made to the Share Premium Account which now stood at £256,529 against £55,516 at the end of 1956.

The full effect of these acquisitions would not appear in the Accounts until 1958, and it was expected additional profits would justify the decisions taken.

A development programme has been planned for the next two years which visualises a steady continuing growth in resources and the Directors are confident of being able to meet very keen competition with low attractive rental charges and a high standard of maintenance service. They are satisfied there is still a large reservoir of potential customers to be drawn upon.

Reference was made to the appointment of Mr G. Gamble as Joint Managing Director and to the strengthening of the Board by the addition of Mr J. W. Kinsman, FCA, Mr E. F. Hancock, and Mr J. W. Field, each of whom has had long experience in the industry. Appreciation was also expressed of the loyal service rendered by all members of the staff who by their tactful treatment of Subscribers have contributed much to the ever growing good name of "RENTASET."

A vote of thanks to the Chairman concluded the Meeting.

"It is a sign of the efficient organisation that it endeavours to see things both as they are— and as they will be."

SIR ERIC BOWATER

Extending a welcome to a well-attended meeting of shareholders held on May 29 at The Royal Festival Hall in London, Sir Eric Vansittart Bowater, the Chairman, said: I believe our decision to hold the Annual General Meetings of The Bowater Paper Corporation Limited and of Bowater-Eburite Limited on the same day and in the same building will commend itself to you, for the interests of these two entities, and therefore of their respective shareholders, are closely interwoven.

Commenting on the "almost revolutionary change" which had taken place in the economic climate of the world, Sir Eric said that the Bowater Organisation had not escaped the consequences of the adverse influences. Despite that, the account of the year's operations might perhaps be regarded by the shareholders of both their great companies as being gratifying in the circumstances.

NO CHANGE OF PLANS

He continued: It is not our intention to abandon any of our carefully planned development projects, for it remains our firm belief that the products they are planned and designed to manufacture will be required towards meeting the demand from our customers, present and prospective, throughout the world, which increased demand we are confident will certainly develop. Our development programmes have been rephased and retimed to fit more nearly into the forward position as we see it today.

The merger with Bowater-Eburite Limited is a matter of the greatest possible moment in the history of the several interests now happily united. That company now clearly emerges as an industrial enterprise of first-class standing in the fast-growing packaging industry.

Bowater's United Kingdom Pulp and Paper Mills Limited aggregate production was the highest so far attained; nevertheless, the continued upward trend of costs of production and shrinking profit margins had their adverse effect.

SALES AT RECORD LEVEL

After reviewing the group's overseas interests, the Chairman continued: The Organisation recorded in 1957 its highest level of production and turnover. Sales were at the record level of one hundred and two-and-a-half million pounds and trading surplus exceeded seventeen million pounds, approximately one million pounds above the previous record level achieved in 1956.

Reviewing items in the Consolidated Balance Sheet, Sir Eric said: The cumulative total expenditure incurred at the date of the accounts on capital investments none of which had then been completed, and, therefore, had not reached the revenue-earning stage at that date, was nineteen million pounds. At the year's end outstanding capital commitments were estimated to amount to eighteen million pounds. The completion of some of these projects will be spread progressively over the next five or six years.

In the course of his comments on world affairs generally, the Chairman said: I am of the opinion that the boom which, since the war, the Western world has enjoyed almost continuously is over, and in my belief we must regard the present as being a return to more normal times and conditions of trading, and perhaps this is not all to the bad. It is a sign of the efficient organisation that it endeavours to see things both as they are and as they will be.

THE CENTURY OF INTERDEPENDENT MAN

We must remember that the activities of a big corporation are set in a world scene that comprises eighty nations ranged in competing groups, and that British and American industry in general, of which we form an integral part, is dependent upon the whole world. We live in the century of interdependent man. Surely the technical resources of the West, which have already done much for underdeveloped countries, should be applied with even greater vigour and leadership if our equipment, materials and know-how are permanently to raise the standards of living of the uncommitted peoples. It is an old British belief that it is better to flourish goods than guns, and in the present struggle of conflicting ideas paper is one of the vital weapons against ignorance and poverty.

COMPLETE CONFIDENCE IN INDUSTRY'S FUTURE

In our belief the present slackening in the growth in demand is of a temporary nature. Nothing that has occurred in recent times gives grounds for supposing that the long-term outlook for paper and board is anything but good. Over the long term the demand for these products has shown a steady upward trend, resulting from increasing populations, higher level of literacy and ever improving standards of living throughout the world, together with the constant development of new uses for paper.

I am no pessimist in regard to our affairs or those of our industry generally, nor would it seem, judging by their recent statements, are the leaders of our industry in North America.

I hope I have succeeded in making it abundantly plain that we continue to have complete confidence in the future for our industry, and, therefore, of your Corporation.

The reports and accounts were adopted.

VICKERS LIMITED

GROUP SALES ADVANCE TO £203 MILLION

A YEAR OF CONSOLIDATION

VISCOUNT KNOLLYS' REVIEW OF EVENTS AND DEVELOPMENTS

The ninety-first annual general meeting of Vickers Limited was held on June 2nd in London.

The Viscount Knollys, GCMG, MBE, DFC (the Chairman), presided and, in the course of his speech, said:

Group sales increased from £163 million to £203 million divided roughly as follows:

	1957 £mn.	%	1956 £mn.	%
Aircraft	70	34	64	40
General Engineering (including Accounting Machines)	55	27	42	25
Shipbuilding and Ship Repairing	40	20	24	15
Steel	38	19	33	20

The main changes were the lower proportion of Aircraft and a sharp rise in Shipbuilding. I think the interests of Vickers Limited as a holding company are thereby better balanced. Shipbuilding sales are always liable to fluctuate because a large ship completed just within the accounting year can stultify the appearance of the regular flow of work which is in fact going on all the time when the Yards are fully occupied, as they are now and will remain for several years to come.

Our trading profit on sales actually completed and delivered within the year—which is all we take credit for in the Accounts—together with investment income, was considerably higher at £15.2 million compared with £13.4 million in 1956. This was after providing £3.1 million for development expenditure, mostly in respect of aircraft, £1 million more than in 1956, and after allowing for losses arising out of the strikes last year. Profits arising out of deliveries of *Viscounts* and *Valiants* were brought in, and much of the expenditure on the development of the Vanguard was provided out of such profits.

All our major interests contributed to the increased trading profit, except for tractors, which continued to show a loss, as we must expect them to do during the difficult and expensive development period.

After tax the profit at £6.4 million showed an increase of £200,000 over the previous year. We are glad we are able to recommend the final dividend of 7½ per cent on the whole of the new capital, though less than half of it had been paid up before the end of the year.

Last year I referred to 1956 as a year of expansion for the Vickers Group. 1957 can perhaps best be described as a year of consolidation.

The policy of your Board has, therefore, been further to diversify our existing commercial products and, at the same time, to add to the range wherever possible in order to spread our interests more widely over the commercial field and thus to offset the inevitable reduction in armament work which, fortunately, is gradual in its effects.

AIRCRAFT

We have been fortunate in having had a good share of the aircraft manufacturing business of this country. It is particularly satisfactory that with the successful *Viscount* and the new *Vanguard* and *VC.10* our aircraft interests are so largely in the civil field at a time when military orders have almost disappeared—though perhaps not for all time. But I feel that it is equally important to ensure that in a Group such as ours the stake in various fields of engineering should be as well balanced as possible. Therein, in my opinion, lies the strength of the Vickers Group. We can, with well spread investments, afford to accept the fluctuating results which are inherent in the aircraft industry as it is today and also to develop new businesses either at home or abroad which may not give an immediate return, because we know that we have a steady foundation in generally stable interests such as general engineering, the steel products of English Steel Corporation, transportation products of Metropolitan-Cammell and, for most of the time, shipbuilding and shiprepairing. That is why I believe that the rather lower proportion which our aircraft interests now bear to our total turnover is not a bad thing.

With that general policy in mind we have felt it was justified and right to develop as private ventures new airliners for the future.

SHIPBUILDING

Although in the Shipbuilding industry of this country substantial orders were received in 1957, there was a marked falling off in the last quarter which continues up to the present time.

It is gratifying to record that orders on hand, represented by two passenger liners, nine cargo liners, and thirteen tankers, as well as submarine, destroyer, frigate and aircraft carrier contracts, will keep the Yards fully occupied at their present level for several years to come.

With our three Yards in this country, Cockatoo Dockyard in Sydney and Canadian Vickers' Yard at Montreal which is recognised as the "lead yard" for naval construction, we are in a unique position in providing world-wide shipbuilding facilities.

GENERAL ENGINEERING

Our General Engineering business expanded during the year and produced a fair profit, which would have been much better if it had not had to suffer the substantial loss incurred on the tractor operations and development.

Though competition is keener than ever, our drive for new lines and the attack we have made on costs, indicate that the volume of work and employment should be almost maintained in 1958.

The sales of *Powers-Samas Accounting Machines Group* in 1957 increased but the cost involved in the development of their highly promising new machines limited the profit they were able to show.

English Steel Corporation, with its own special steel products and its interest in Firth-Vickers, is really an engineering company using forgings made from its own steel. It had a successful year.

Metropolitan-Cammell continues its successful record and the orders received so far this year are maintaining its full order book in a highly competitive field.

OVERSEAS INTERESTS

In Canada, Canadian Vickers with its two Subsidiaries—George T. Davie & Sons, a Quebec, and Montreal Dry Docks—has had a successful year in the latter part of which however, more difficult conditions became increasingly apparent.

In Australia, two old established Subsidiaries—Cockatoo Docks & Engineering and Vickers Ruwolt—had a successful year in 1957.

In India plans for our proposed new Company to be formed with the Associated Cement Companies and Babcock & Wilcox as partners have proceeded steadily during the year.

EUROPEAN TRADE

We have been watching carefully the new and important developments in European affairs. The Common Market of the Six Countries by itself would undoubtedly prejudice some of our sales in that area. A European Free Trade Area would tend to even out any disadvantage for us, and is in its broader aspects bound to be desirable in unifying Europe.

We have in Vickers set up a special team to study the probable effects on companies in the Group and to see what we may have to do to be equipped to deal with these.

EDUCATION AND TRAINING

Recently we have been reviewing our arrangements for developing and training the managers of the future. Our aims are, first to recruit the best material, then to provide well thought out training for promising young men and to let them know what it is all about, and finally to give a wide all-round experience with special internal and external courses which will equip them for management.

The material is there. It is up to us, as well as to them, to see the best use is made of their abilities.

THANKS

I should here like to express on behalf of the Board and also of the Stockholders our appreciation of the efforts of management, staff and workpeople which have made the results of the past year possible. I should also like to acknowledge the co-operation received from the representatives of the Trades Unions in the Works of the Group.

PROSPECTS

It is harder than usual to assess the prospects for the remainder of 1958. All our markets have become more competitive. By and large it looks at this moment as if 1958 profits will almost certainly not come up to last year's level (which itself, however, was rather better than I anticipated a year ago) though I hope they will not be too far below. I do not think you would expect me to be more definite than that.

The report and accounts were adopte

SPILLERS LIMITED

SATISFACTORY OUTCOME OF A DIFFICULT YEAR

FURTHER CONSOLIDATION AND EXPANSION OF BAKING ACTIVITIES

FLOUR MILLING: EFFECTS OF CHANGED CONDITIONS IN WHEAT MARKET

FACTORS AFFECTING RESULTS OF ANIMAL FOODS SECTION

MR WILFRED D. VERNON'S REVIEW

The seventy-first annual general meeting of *Spillers Limited was held on May 30th* at the Abercorn Room, Great Eastern Hotel, London, E.C., Mr Wilfred D. Vernon, Chairman of the Company, presiding.

Mr H. Reeve, MC, FCA, of Messrs Impey, Cudworth and Company, read the auditors' report.

The following is the Chairman's statement circulated with the report and accounts for the year to January 31, 1958:

FINANCIAL RESULTS

The profit for the year after providing for all charges other than taxation was £3,767,000. Although this was some £450,000 less than for the preceding year I consider it a satisfactory outcome in light of the difficult trading conditions which existed both for flour milling and for animal foods manufacture. *There was, in consequence, a reduction* in the earnings from these sections of our activities which was offset in some measure by an increased contribution from the expanded baking section.

After providing for taxation of £2,275,000 there is £1,492,000 available for appropriation. On the basis of the directors' recommendation that the distribution on the Ordinary Stock should be maintained at the same rate as for last year total net dividends will absorb £730,000, leaving £762,000 to be retained in the business in addition to £1,600,000 set aside for depreciation and obsolescence before arriving at the trading surplus.

The Consolidated Balance Sheet shows that the total capital employed in the Group has risen to approximately £25 million of which the nominal value of the issued capital of the parent company represents only just over £10 million. In order to bring the latter more into line the directors are recommending to the stockholders at the General Meeting that some £4,375,000 of the reserves of the parent company be capitalised by the issue as fully paid up of one Ordinary Share of £1 (to be subsequently converted into Stock) to the holders of each existing £2 of Ordinary Stock.

FLOUR MILLING

While there was little variation in the quantity of flour sold there was a sharp reduction in profit largely due to the changed conditions in the wheat market. During the year there was a dramatic fall in ocean freight rates from the high levels reached after the Suez crisis at the end of 1956. This fall was not continuous in the sense that there was a *rally in mid-1957 which, however, was not* sustained and the drop continued thereafter. There were other matters which had a minor effect such as a small reduction in the f.o.b. price of Canadian wheat at Fort William and some fluctuation in the value of the Canadian dollar in terms of sterling. The price of homegrown wheat fell in sympathy with the reduction in the landed cost of imported wheat. The impact of these factors on the value of the heavy working stocks we have to carry had to be met out of the profit margin because of the highly competitive conditions prevailing in the industry. These derive from the current level of demand being significantly lower than available productive capacity. Meantime the industry is doing what it can to promote increased consumption of flour and as a company we continue to take all possible steps to maintain our efficiency and competitive power in the market.

ANIMAL FOODS

For the first time for some years there was a small reduction in our sales of compound feeding stuffs. This combined with falling values in the maize and barley markets brought about some reduction in earnings.

This interruption in the steady progress made in this field was experienced by most of the large manufacturers and was due to several factors. The abnormally mild weather in the earlier part of the year reduced the overall demand and there was in addition a growth in the proportion of feeding stuffs made either on the farm or by relatively small compounders.

It is obviously right that farmers should utilise their own produce to the best advantage, but I must emphasise that the feeding of livestock to produce the best results both for the farmer and for the country is in reality a complex scientific problem. We have applied considerable resources over many years to the evolution of the best balanced foods for each type, grade and age of cattle, pigs and poultry and the process is a continuous one as experience suggests improvements and new ideas emerge from research. Behind the production of our range of foods is our own research establishment with its highly qualified team of scientists working in conjunction with agricultural specialists who have both academic and practical training together with the technical management at the factories. They have available to them the facilities of our own experimental farm where products are tried out and tested under normal field conditions. We are sure that it is only by these means that compound foods likely to produce the best results can be developed.

Animal feeding stuffs should not be judged by the standard of their immediate cost. What the cost of feeding and the value of the end product on the farm. I am in no doubt that on this test our foods are second to none.

We have every confidence in the future of this trade and believe that we are in a good position further to expand our business. To this end we are continuing to increase our manufacturing capacity and are now about to build a new factory at Gainsborough in Lincolnshire.

BAKING AND OTHER ACTIVITIES

On the baking side the year has been one of further consolidation and expansion. Good progress has been made with modernising plant and equipment at some existing units and in increasing capacity at others. Some additional units have been acquired. This is now an important section of our business and it is gratifying that the overall result of the year's working has justified our investment. It is our intention that in this new field United Bakeries and its underlying units should enjoy the same reputation for high standards of quality and service which has been built up over many years with our other products.

In the sphere of proprietary goods our packed products such as Spillers Self-Raising Flour, Spillers Plain Flour, and Dog Foods sold under the name of Spillers Shapes, Winalot Meal and Saval Puppy Food, continue to command a ready market and show satisfactory results.

GENERAL

Trading during the early months of the current financial year has compared favourably with the corresponding period of last year. It is too early to speak with assurance about the final outcome as there is always the possibility of some upsetting factor, especially in these times. But subject to that I am hopeful that the results for the year will reflect the continued growth of the business.

Each year I acknowledge the hard work and loyalty of the whole personnel throughout the Group. This is no mere formal tribute and once again I wish to say how appreciative the Directors are of the part which the staff and workpeople have played. I am particularly gratified by the ready way in which the managements of the newly acquired subsidiaries have co-operated and I hope they will continue to be happy in their association with us.

The report and accounts were adopted; the proposed dividend was approved; the retiring directors, Sir Archibald F. Forbes, GBE, and Mr R. A. Twomey, were re-elected; a resolution regarding the remuneration of the Auditors, Messrs Impey, Cudworth and Company, and Messrs Deloitte, Plender, Griffiths and Company, was passed.

Resolutions for the capitalisation of reserves and scrip issue and for the amendment of the Articles of Association, having been passed, the proceedings terminated.

DR. ADLER, Certified Auditor — PROF. DR. BIRCK, Certified Auditor

Frankfurt-on-Main, 24th March, 1958.

MINERALS SEPARATION, LIMITED

MR J. N. BUCHANAN'S STATEMENT

The fifty-third Annual General Meeting of Minerals Separation, Limited will be held on June 25th at the offices of the Company, 82 King William Street, London, E.C.

The following is the Statement by the Chairman, Mr J. N. Buchanan, which has been circulated with the Report and Accounts for the year ended December 31, 1957.

Colonel A. C. Howard, DSO, MC, retires from the Board this year by rotation and does not seek re-election. He first joined the Company in 1908 and was Managing Director for the years 1924 to 1951, when he retired from the Executive on pension. During his long service to the Company he saw many changes in our activities; in earlier days he was most active in the exploitation of the Company's processes in many parts of the world, on which a great part of the Company's present prosperity was originally built. He will be gratefully remembered by us all and we wish him continued health and happiness in his retirement.

At this meeting we propose the election to the Board of our Secretary, Mr C. J. Dorman. In the last few years owing to the growth of our subsidiaries and other investments, the responsibility falling on his shoulders has increased greatly. He has met this challenge with an ease and efficiency that command our grateful respect. We are confident you will endorse our proposal with a warm welcome.

ACCOUNTS

The past year has seen another record established in our profits. As appears in the Consolidated Profit and Loss Account, the Group gross profits rose from £693,000 to £740,000 and the net, after tax, from £305,000 to £342,000. While the results of the Foundry Services Group showed little change from that of 1956, the figures of both Jackmans and Howard Potteries showed considerable improvement. As was to be expected, our income from other investments was down, but by less than we expected, having regard to the substantial fall in dividends received from our Rhodesian investments.

During the year we sold a substantial amount of our investments with the result that our cash at the end of the year showed a considerable increase. The higher rates obtainable on short term deposits during the closing months of last year and earlier months of the current year, relieved us of any immediate pressure to reinvest our funds, giving us a welcome liberty of action.

Since the turn of the year we have acquired control of Angel Hill Investments Limited, a private company which holds all the capital of Modern Engineering (Bristol) Limited and ATA Industrial Company Limited. These Companies offer a wide service in the planning, design, fabrication and erection of modern industrial buildings, both in steel and concrete. In addition the licence is held for the construction of the well-known Silberkuhl composite steel and concrete roofs, a number of which have been built or are under construction in this country. These roofs are of exceptional strength and provide clear spans ranging from 80 to 210 feet.

We have other opportunities for investment under consideration. To meet these and other expenditure, such, for instance, as the continuing expansion overseas of Foundry Services, we propose to raise £250,000 by an issue of £100,000 nominal ordinary stock (400,000 5s. units) ranking in all respects *pari passu* with the existing capital of the Company. This issue will be available to existing shareholders in the proportion of one new unit at 12s. 6d. per unit for every 10 units held. Consent has been obtained from the Capital Issues Committee. A Resolution for increasing the Authorised Capital will be submitted at the Annual General Meeting and the documents will be issued as soon as the necessary formalities have been completed.

TAXATION

Over the past few years, as our accounts have shown, we have realised considerable capital gains from the sale of some of our investments. The Taxation Authorities have from time to time made inquiries into these transactions and full information has always been supplied to them. No definite action had, however, been taken by them until in April this year assessments in respect of these gains for the years 1954, 1955 and 1956 were made upon the company. Confident as we were and are of the strength of our case, we were faced with—at the best—a long delay involving expense and risk of litigation before we could hope to establish our right to exemption from such tax. We therefore deemed it prudent to offer to compromise by agreeing, without prejudice to our future position, that the Company should pay tax on the balance of gain and loss on certain agreed transactions on which there was some risk that we might be held liable to tax. Our offer has been accepted in principle by the Authorities and it now remains for detailed figures to be worked out to ascertain the amount for which the Company is liable. Our calculations indicate that, if 1957 be included with the three preceding years, the resulting liability to tax need cause shareholders no serious concern.

As explained last year, the dividends we received from our Rhodesian holdings in 1956 were exceptional and, as expected, were not repeated in 1957. In the current year we must again expect lower dividends than last year. We have a long experience of copper and know that it is a commodity which has always indulged in extremes of price, both up and down. We know enough never to attempt to forecast the near future trend of the metal. Nevertheless, as our history shows convincingly, an investment in well-managed copper enterprises such as we hold, has been in the past most remunerative and we are confident that in the future we shall not regret retaining a substantial holding in Rhodesia. This holding represents, on the basis of present market values, less than 10 per cent of our total investments.

FOUNDRY SERVICES

Over all, this Group's profits were maintained, in the more difficult trading conditions of 1957, at about the same level as for 1956. The United Kingdom turn-over and profit increased. A further major extension has been made to the Drayton Manor factory to cater for the expanding market, especially in the steel industry. Due to the increasing activity of our manufacturing companies abroad there was a reduction in the volume of goods exported from this country. All overseas interests and activities are still expanding. Royalty income was maintained but over-all there was some reduction in the profits of the overseas subsidiaries. This was mainly due to the decision to enlarge our facilities and increase our staff with the definite purpose of achieving steadily increasing returns in the future. This particularly applies to the United States where Mr Dave Morgenthaler has been appointed President, and with the active co-operation of our partners, Messrs J. H. Whitney and Co., the re-organisation is being planned on a footing which should enable it successfully to develop the great potential for our products there. Plans are well forward to transfer our activities from Columbus, Ohio, to Cleveland, Ohio, where a new and larger factory of suitable design to meet our specific requirements will shortly be erected.

In Canada results were satisfactory in spite of the reduced industrial activity. In Europe, all the four operating companies made profits. In South Africa, both turnover and profits were increased. The associated Japanese company consolidated its position and had a successful first year.

Since the turn of the year new companies have been formed in India, Switzerland and Australia. In India we are working in close association with Messrs Greaves Cotton and Co., Limited, of Bombay who formerly acted as our Agents.

Increased attention is being given to research and development both to ensure an ever-expanding market for the Group and to strengthen the leading position in this field.

JACKMANS

J. W. Jackman and Co., Limited had an exceptionally good year. The large Automatic Moulding Machines built by Jackmans at Manchester to the designs of the Osborn Manufacturing Co., Cleveland, Ohio, USA, were completed and put into successful operation at the new Thames Foundry of the Ford Motor Co., Limited, where Osborn Automatic Core Blowers were also installed.

Jackmans, having represented Osborn in this country for more than forty years, are able to offer American proved equipment of a wide range including the latest in automation, in addition to their own wide range of manufacture. An export order for similar Moulding Machines was obtained from France and one for Multiple Station Automatic Core Blowers for Russia.

The demand increased for Combined Shot Blasting and Decoring equipment in foundries, Dust Filtration plant of the wet type and a new system of Fume Removal from Foundry Shake-outs. The order book at the end of the year was well spread and the prospects are satisfactory, but it is not to be expected that the exceptional results of last year will be repeated in the current year.

As a result of the return to control of Mr D. K. Bailey, as reported last year, the Howard Potteries Group's loss for 1956 was turned into a welcome profit for 1957. Increased orders are materialising from sales reorganisation which now covers the whole of the British Isles. Export business is not easy and we must expect some delay before orders for North America resume their old level. Nevertheless, the order book is healthy and we hope for a greater increase in profit.

Last, but by no means least, we wish to record our sincere gratitude for the continued loyalty and diligence of all those throughout the varied group activities whose labours have achieved the successful year's results.

UNION MINIÈRE DU HAUT-KATANGA

FUTURE VIEWED WITH CONFIDENCE

REVIEW OF COMPANY'S ACTIVITIES

The annual Meeting of Shareholders of the Union Minière du Haut-Katanga was held in Brussels on May 22, 1958, Mr P. Gillet, Chairman of the Board of Directors, being in the chair.

The Meeting approved the accounts for the financial year ending December, 1957. The Profit and Loss Account for 1957 showed a gross profit of 3,862,782,874 Belgian francs. Taking into account the amortisation of the year, the provision for taxation on profits and the sundry charges, the available profit balance, including the amount brought forward, totalled 2,562,317,864 Belgian francs.

Out of this balance, 71,429,781 and 100 million Belgian francs have been allocated respectively to the Reserve Fund and the Special and Contingencies Fund; a sum of 28,174,070 Belgian francs was carried forward. The amount left being immediately available for distribution.

Accordingly, the Meeting fixed the net dividend for the year 1957 at 1,500 Belgian francs net per share (or 150 Belgian francs per tenth part of a share). Taking into account the interim dividend of 750 Belgian francs paid in January, 1958 (75 Belgian francs per tenth part of a share), this entails a complementary dividend amounting to 750 Belgian francs net per share or 75 Belgian francs net per tenth part of a share.

Messrs J. Cousin and R. Hutchinson, Directors whose mandates had come to an end immediately after the Meeting, were re-appointed. Mr L. Helbig de Balzac was re-appointed as auditor of the Company.

MR SENGIER'S STATEMENT

After drawing the Shareholders' attention to the importance of the hydro-electric power plants completed during the past years, Mr E. Sengier, KBE, Chairman of the Executive Committee, pointed out in his address the building, at the Luilu site in the Western region of the Union Minière's concession, of an important group of automatic electrolytic copper and cobalt plants.

Our plants, said Mr E. Sengier, have produced 240,000 metric tons of copper this year. We have had no difficulty at all in selling the whole of this production despite the deep fall in prices which occured at the end of 1957 and at the beginning of 1958 and despite the applying of contracts with purchase guarantee granted to new mines by the American Government. These contracts, as well as other measures contemplated in the United States, are not of a nature, Mr E. Sengier added, to balance World production and consumption, which seems to be an essential condition to restore the stability in the metal prices.

According to approximate figures, the world production of copper in 1957 slightly exceeds the 1956 production. Consumption in the United States decreased but on the other hand, outside of the United States it increased by approximately the same quantity. In the aggregate, consumption has increased slightly.

Speaking of surplus, if the stocks on hand with the producers are still important, those of the consumers are very low.

In the world prospect, the Union Minière's particular situation is a relatively excellent one explained Mr E. Sengier, thanks to long-dated programmes and a cautious management during the years of prosperity.

The State remains the main beneficiary of this situation, as again this year, it draws directly from the Company's activity a total amount of 2,524 million Belgian francs, to which figure must be added the tax levied on the amount distributed to the shareholders.

In taking into account the world economical situation, the Union Minière, as well as a certain number of other important producers, has decided to reduce momentarily its production of copper in order to place it in better relation with the sales possibilities, but, considered at a long distance, pointed out Mr E. Sengier, the future of copper seems favourable.

A brief outline of the Company's report justifies, concluded Mr E. Sengier, the confidence expressed in the course of the preceding meetings, as to the future of the Company.

POINTS FROM THE BOARD OF DIRECTORS' REPORT

The Board of Directors' report draws attention to Union Minière's participation in several sections of the 1958 Brussels World's Fair, especially in the Belgian Congo and Ruanda-Urundi section and in the "Atomium."

This year, for the first time, the figures given for excavated ores (10,047,907 tons) include those of the Shinkolobwe uranium-mine.

Copper production continues to be mostly furnished by the mines of the Western region and by the Prince Leopold mine. The Kamoto opencast mine is also taking an increasing part in this production and Kolwezi mine has been reopened after being closed down for more than three years.

In order to achieve the cuts in production figures decided upon in 1957, the Furnaces of the Lubumbashi Smelting plant have been slowed down on Sundays and holidays during the second semester. On the other hand, at the electrolysis plant of Shituru, production has increased. The manufacture of scalped wire-bars has been organised. The final aggregate of copper production in 1957 was 240,280 metric tons as against 247,452 in 1956. Other company's productions were cobalt, zinc concentrates, germanium, cadmium and precious metals.

Due to a limitation of the Cobalt selling possibilities, its production has been reduced to 90 per cent of the 1956 figures (i.e., to 8,115 tons).

Since February, 1957, the price of this metal has been reduced to $2 per lb. in order to encourage its use. The Cobalt Information Center, established in 1957, developed its function of popularising new uses of the metal.

The Shinkolobwe concentration plant treated 311,373 tons of uranium ores. The uranium concentrates produced, continued to be exported in conformity with the existing agreements between Belgium, the United States and Great Britain. Orders for radium remained satisfactory. 89 gr. 313 of contained radium were furnished.

With its present production of Germanium (13,064 kg of oxide) the Company appears as one of the world's most important producers of this metal for which the demand is in regular progress.

117,250 kg of cadmium have been produced in 1957. 94,706 kg of silver and 85 kg of gold have been recovered through refining of products.

In order to spread costs over a longer period of time, programmes of works already under way have been revised and redistributed over the forthcoming years.

As for example in the case of the preparatory works at the Kamoto open mine, the general equipment at the West-Kambove underground mine and the construction of the new automatic electrolytic copper and cobalt plant at Luilu. The opening date of this plant has been put back to 1960.

In 1957 the hydrological situation appeared particularly good. A total of 1,916,763,021 kWh has been produced by the four hydro-electric power plants operated for the Company against 1,292,940,500 kWh in 1956. These results have allowed the company to increase to 612 million kWh its power supply to Northern Rhodesia. Supply of energy to the public distribution centres has shown an increase of 27.5 per cent over last year's figure.

The company has unceasingly carried on its social programme. Achievements in the fields of Health, Education, Housing, Recreations, etc., have developed continually.

At the beginning of 1957, the general salary level was raised and the replacement of various advantages by their cash equivalent was extended to a higher number of beneficiaries. The re-engagement rate of workers is particularly high this year. It reaches 93 per cent against 89 per cent in 1956.

OLYMPIC PORTLAND CEMENT

RECORD SALES

The forty-seventh annual general meeting of the Olympic Portland Cement Company Limited was held on May 28th in London. The Honourable Gerald H. G. Williamson, chairman, presiding.

The following is an extract from his circulated Review of 1957:

In view of the negotiations, of which you were first advised on April 14th, I feel it advisable this year to circulate in advance the Statement which I would normally make at the Annual General Meeting.

In the summer the Cement Industry was hit by a nationwide strike which affected about three-quarters of the country's plants.

Sales of "Olympic" cement for the year, benefiting from the strike and unusually good weather from April onwards, reached an all-time record volume of 1,081,731 barrels, of which 821,265 barrels were shipped from Bellingham and 260,466 barrels from the Distributing Plant at Seattle. In addition we purchased and resold a further 21,437 barrels, so that our total deliveries for the year were actually 1,103,168 barrels, of which 1,015,072 barrels went to the State of Washington and the balance to Alaska and British Columbia.

Trading Profits in the United States amounted to £253,128 compared with £153,247 for the nine months to December 31, 1956. Net Profits amount to £178,995 for the year compared with £45,701 for the previous nine months.

The Company is financially strong.

The report and accounts were adopted.

DAVIS AND TIMMINS

CURRENT TRADING IMPROVEMENT

The fifty-ninth annual general meeting of Davis and Timmins Limited, was held on June 3rd in London.

Mr. F. Le Neve Foster (the chairman) presided and, in the course of his speech, said:

1957 has been a difficult year for your Company and the adverse factors affecting our trade are reflected in our results. The Group Trading Profit for the year is £240,363 as compared with £352,424, while the Net Profit as shown by the Consolidated Profit and Loss Account, after charging Depreciation, Taxation, etc., amounts to £103,791, compared with £136,694 for the previous year. The profit figure includes £32,000 transferred from Stock Contingency Reserve.

The Directors recommend a final dividend of 12 per cent, making a total of 18 per cent for the year on the Issued Ordinary Capital, as against 22½ per cent for the previous year. The appropriation for dividends and other items leaves the sum of £297,413 to be carried forward, as against £301,158 brought in.

Cash and Tax Certificates are up as much as £78,021, while Creditors and Current Taxation are down by £161,137. The cash and liquid position is, therefore, particularly strong and should form a firm base on which to meet the present situation and also provide resources for developments in the business.

Our subsidiary, Datim Machine Tool Company, in addition to making a nice contribution to the Company's profits, provided valuable technical assistance to the Parent Company by the way of developing and making new Automatic and Special Purpose Plant and attachments, which has improved production methods on a variety of products.

Our Sales turnover for the year, although lower than the records achieved during the year 1955 and 1956, still exceeded the figures for any previous year in the history of the Company, notwithstanding the lower level of prices which were effective.

During the year particular attention has been paid to the development of new Stock products and to the introduction of additional lines to our already extensive range. Energetic steps are being taken in these directions, with promising results, which should favourably influence sales and profits in the future, as well as thus reduce overall selling costs.

During the year there was a heavy fall in the price of Brass, following the price of Copper, of over 6d. a pound, and it was inevitable that this must cause a loss on stocks of metal and finished goods.

The recession in our trade as yet shows no signs of lifting. During the past eighteen months we have done a great deal in the Company to meet the pressures of economic circumstances. Substantial economies have been made in general expenditure and much replanning work is in the process of being achieved to give maximum production at lower costs. The real measure of the steps already taken in increasing the Company's efficiency will be realised when I tell you that for the current year the results so far show a marked improvement over those for the same period of last year. This improvement, achieved against the background of continuing business recession, is encouraging for the future, and the increased efficiency on which it is based should bring further rewards when there is a general expansion in Industrial activity.

The report and accounts were adopted.

BRITISH TIMKEN LIMITED

CONSIDERABLE INCREASE IN TOTAL TURNOVER

SIR JOHN PASCOE ON PROFITS TAX AND INFLATION

Sir John Pascoe, Chairman and Managing Director of British Timken Limited, at the Thirty-Eighth Annual General Meeting of the Company held in Birmingham on May 29, 1958, said:

Since the last Annual Meeting, Mr W. R. Timken found it necessary to resign from our Board owing to his heavy commitments in the USA. We accepted his resignation with much regret and I should like to place on record our thanks for the valuable services he has rendered to the Company. I am pleased to report that Mr R. L. Frederick of The Timken Roller Bearing Company accepted our offer to join the Board to fill the vacancy and later I shall have much pleasure in asking you to confirm his appointment.

The Consolidated Net Profit of British Timken Limited and its wholly owned Subsidiaries for the year 1957 after taxation amounted to £872,681 compared with £779,541 for 1956.

This Net Profit was arrived at after charging £520,921 for Depreciation which exceeded last year's provision by £53,074.

The Net Profit of British Timken Limited including the Profits of our Subsidiaries only to the extent of dividends declared, was £802,738 against £709,685 for 1956.

With the amount brought forward, we have a disposable balance of £1,040,950 against £943,896 last year.

We propose to deal with this balance by transferring £435,000 to General Reserve, £100,000 to Contingency Reserve, confirming the payment of the dividend on the 1 million £1 4 per cent Cumulative Redeemable Preference Shares, amounting to £23,000 net, confirming the payment of the interim dividend of 5 per cent less tax on 3 million £1 Ordinary Shares which required £86,250, paying a final dividend of 5 per cent less tax on the 4 million Ordinary Shares of £1 each absorbing £115,000 and carrying forward to the 1958 Accounts £281,700.

CAPITAL EXPENDITURE

During the year, Capital Expenditure amounted to approximately £1 million and in addition, you will see from the report that at the end of the year, we had outstanding Capital Commitments of £800,000. By the end of 1958, we shall have incurred Capital Expenditure over six years of approximately £5 million.

This very large amount has been and is being used on extensions and equipment of our various factories and the expenditure has enabled us to increase considerably our total turnover, which for 1957, was some 16 per cent to 17 per cent higher than for the previous year, and further to increase our net profits by the modest amount of some £90,000.

Looking to the future, our rate of Capital Expenditure may slow down although, in our Industry, with the almost phenomenal development of machine tools, we shall still be faced with considerable expenditure in order to maintain our competitive position as one of the largest bearing manufacturers in the world.

ORDERS AND OUTPUT

Our sales of bearings for original equipment during 1957 showed an increase in every department, the decline in deliveries to the motor car trade during the first three months being more than made up during the latter part of the year when our deliveries to that trade were at a higher rate than ever before.

With our increased turnover, the percentage of direct exports was maintained at the same level and we still estimate that between 40 per cent and 50 per cent of our home sales is for equipment which is eventually sold overseas.

TECHNOLOGICAL DEVELOPMENTS

Technological developments in the bearing Industry in methods of manufacture are increasing rapidly, and this in itself, as I have previously stated, necessitates the provision of large amounts of capital year by year.

Last year, I reported on our fully mechanised automatic lines and I would add that the new lines which we are now in process of installing, show very considerable development over those already in operation.

Great efforts are being devoted by our Sales Staff towards inducing the motor car manufacturers in particular, to use exactly the same type of bearings for the same application which, if successful, will enable us to increase our fully automatic manufacture and to offer more attractive prices for bearings which are manufactured on these lines.

PROFITS TAX

The unfair nature of this tax is well shown by the fact that its simplification is now penalising just those Companies who followed the Government's request to maintain a conservative dividend policy. Nevertheless, we welcome its simplification as being a recognition by the Government that the making and distribution of Profits are the very foundation of a free enterprise system. It is perhaps possible to hope that the present or a future Government, recognising that on Industry depends our economic strength, our standard of living and indeed, our very existence, may one day decide that economic conditions alone call for the abolition of Profits Tax entirely.

FUTURE PROSPECTS

Our turnover and profits for the first four months of the current year compare favourably with the same period of last year. There are however, plentiful signs that a recession is approaching, if not already here, as is shown by a reduction, although at present small, in orders received in almost every department with the exception of that which supplies the passenger motor car manufacturers, whose present brilliant performances have meant a greatly increased demand for the types of bearings they use.

On looking further ahead, it is becoming increasingly clear that this country is unable to isolate itself from the recession in the USA, which, should it develop further here, must affect the operations of this Company.

This recession may well deepen during the coming months and we shall only be able to hail a revival when the laid-up ships sail

from our estuaries and when the prices of primary products start to rise.

INFLATION

In its battle to preserve the standard of living of the people of this country, which is the correct way of looking at what is known as the battle against inflation, the Government has just concluded an indecisive engagement with one section of Industry. There is now perhaps a greater realisation in the country that any increase in wages unaccompanied by an increase in output per man-hour, would definitely be inflationary. It must be remembered however, that any increase in productivity over the whole country can only be a matter of a small percentage per annum, possibly under 5 per cent. Nevertheless, a rate of 3½ per cent would easily enable us to double our output and so our standard of living well within the suggested 25 years. A point to be borne in mind if inflation is to be avoided is that it is questionable whether a given percentage increase in productivity would justify an equal percentage rise in wages as there are other factors to be taken into consideration.

FISCHER BEARINGS COMPANY LIMITED

The turnover and profit figures of our main Subsidiary, Fischer Bearings Company Limited, for 1957 were very similar to the corresponding figures for 1956. Although the turnover in our special bearings supplied to the Aircraft and Associated Industries was appreciably higher, this market is at the present time in a state of some uncertainty owing to the transitional stage through which the Aircraft Industry is passing.

WORKERS AND STAFF

On your behalf, I would like to express thanks to all our staff and workpeople at home and abroad for the support they have so ably given to us during the past year.

The report was adopted.

ELLIOTT-AUTOMATION

SUBSTANTIALLY INCREASED TURNOVER

MR RUDOLPH E. F. DE TRAFFORD'S STATEMENT

The annual general meeting of Elliott-Automation Limited will be held on June 27th in London.

The following is an extract from the statement of the chairman, Mr Rudolph E. F. de Trafford, OBE, circulated with the report and accounts:

Your Company represents the amalgamation of Elliott Brothers (London) Limited and of Associated Automation Limited. The Elliott-Automation Group is today the largest and most broadly based organisation in the automation field outside the United States of America.

The Consolidated Profit and Loss Account for 1957 shows the results of the two main constituent Companies for the whole year, although the amalgamation was in effect only from August 1st. The results also incorporate the profits of "Rotameter" for the three months from October 1st last.

The profits for the year before depreciation and taxation, after deducting minority interests relating to the manufacturing subsidiaries of Associated Insulation Products Limited, amount to £1,139,934. After depreciation but before taxation they are £910,331 and thus show a satisfactory advance on the combined figure for 1956 in respect of "Elliotts" and "Associated" which was £854,014.

After deducting tax the Group Profit for 1957 is £411,651. The dividends paid and recommended in respect of the year are in accordance with the terms of the circular issued last August and are equivalent to 5½ per cent on the Preference capital of your Company and 10 per cent on the Ordinary capital. The net cost of the dividends was £196,375. The balance of profits after tax for the Group as a whole, namely, £215,276, has been retained in the business.

Last year your Company paid approximately 13½ per cent of its profits in Profits Tax and therefore stands to gain from the new flat rate of 10 per cent now being introduced.

SALE OF ASSOCIATED INSULATION PRODUCTS

I would like to refer to the sale of the undertaking of Associated Insulation Products Limited to Associated Electrical Industries Limited for 1,155,555 shares in that company which have since been sold. The capital of "AIP" was acquired in November 1956 in exchange for "Elliott" shares. The principal assets of "AIP" were a large holding of cash (which, after the acquisition, was employed in the automation business of "Elliotts") and a majority holding in The Micanite and Insulators Company Limited.

The Group's expanding activities in automation call for substantial funds and your Directors concluded that it would be wise to dispose of the undertaking of "AIP" whose business did not constitute an integral part of the Group's main activities. Allowing for the repayment of loans made by "AIP" to "Elliotts" the net addition to the Group's cash resources as a result of the sale is of the order of £1,700,000. In addition, as one of the terms of the transaction, the Group has received from "AIP" a dividend equivalent to the estimated earnings of "AIP" applicable to the Group for the first four months of the current year.

EXPANDING ORDER BOOK

Both the turnover and the orders taken last year have shown a substantial increase over the preceding year and the orders in hand at the end of 1957 (excluding "AIP") were some £2½ million higher than at the beginning of the year. Orders for electronic computers form an important percentage of our expanding order book. Our increased requirements for manufacturing capacity in this field have necessitated the provision of new factory space, which "Elliotts" were able to secure on a site adjoining their present Borehamwood establishment.

I am glad to report that for this year to date the over-all volume of orders received is satisfactory and the profits of the business as now constituted continue their upward trend. Although the profits from the "AIP" Group will accrue to your company for only the first four months of the year, the proceeds of the sale will save substantial interest charges pending their more direct investment in the business. All in all, I am confident that subject to unforeseen circumstances we shall again have satisfactory results to report to you in respect of the current year.

JOHN BRIGHT AND BROTHERS

The thirty-fifth annual general meeting of John Bright and Brothers Limited will be held on June 25th in London.

The following are extracts from the circulated statement by the Chairman, Dr E. P. Andreae, for the year ended March 31, 1958.

The total profit available for distribution is £531,134. Your Directors recommend a final dividend of 15 per cent on the Ordinary Stock, making a total for the year of 25 per cent, as for a number of years past.

TRADING CONDITIONS

For the past two years I have had to report on the very drastic contraction in the Textile Industry generally and on the secondary effect this had on our own rather specialised Industry in heavy Canvas and Cord Fabric. During the year now under review there has been no improvement in general trading conditions affecting our Industry. The handicap from which our Trade is suffering today is due, not so much to a general falling off in demand from customers, but to a productive capacity far in excess of their needs. Such conditions inevitably lead to price cutting which, if not checked, could well degenerate into an irresponsible struggle for survival and might even prove disastrous to some of the weaker producers whilst certainly adversely affecting our profits for the ensuing year.

In times like these, of course, the problem of reducing costs and overheads assumes exceptional urgency. In the Cord Fabric Section, for instance, a number of new "twister-cabler" machines to our own design are now running and more are being installed. They are showing marked economic advantages as a result of increased output per spindle as well as an improvement in quality. In addition plans for a far-going rationalisation of the productive capacity of our various Mills made possible by the inclusion of those of our subsidiary James Stott Limited, allow us to envisage still further economies.

EUROPEAN COMMON MARKET

The proposals for the inauguration of a European Common Market and the implications of a Free Trade Area have been received with misgivings in many quarters. With so many divergent conditions and national customs to contend with, it will undoubtedly take a long time before the various authorities and expert Committees who are devoting so much energy to the achievement of this ideal, can reach a measure of agreement which can be translated into practice. At this early stage it is difficult to assess the reactions on our particular business, but in principle we favour the proposals. Technically we are already equipped to hold our own against foreign competition, but economically a prerequisite to fair competition would involve acceptance in this country of multiple shift working as is customary to varying degrees in other countries. It stands to reason that a manufacturing unit, no matter how efficient, employed only eight hours a day, is hopelessly outclassed in competition with similar installations working sixteen hours a day or even, as in some countries, twenty-four hours a day.

This, of course, is only one of the many problems, but an important one, for which a solution will have to be found before the Free Trade Area ideal can be realised.

BICC

AN EVENTFUL BUT DIFFICULT YEAR

The 13th Annual General Meeting of British Insulated Callender's Cables Limited will be held on June 25th at the Adelphi Hotel, Liverpool.

The following is an extract from the circulated statement of the Chairman and Managing Director, Mr W. H. McFadzean, CA, Companion IEE:

Although the monetary value of Group sales shows a decrease of some 14 per cent on 1956, this is more than accounted for by the lower prices ruling for our principal raw materials, the physical volume of sales having been well maintained. The fall in Surplus on Trading from £9,445,363 to £7,832,872 is not therefore due to any decrease in our overall activity but to a combination of several adverse factors, and in particular to (1) a fall in profit rates; (2) the dislocation caused by our major re-planning and re-equipment schemes; and (3) the effect of the falls in the prices of our principal raw materials, especially copper.

In the Profit and Loss Appropriation Account, the main items are the transfer by the Holding Company of £500,000 to General Reserve: £500,000 to the Reserve for Replacement of Fixed Assets; and the payment of a Final Dividend of 8½ per cent making, with the interim Dividend already paid, a total distribution on the Ordinary Stock for 1957 (as for 1956) of 12½ per cent less income tax.

The Group Balance Sheet is a strong one with Fixed Assets and Investments both shown at very conservative figures and disclosed Reserves now totalling over £30 million.

Sales amounted to £111 million as compared with £129 million for 1956.

Of the total Sales, some £71 million (last year £82 million) comprised sales at home and £40 million (last year £47 million) represented direct exports from this country and the turnover of our Overseas Subsidiaries.

In 1957 we traded through our world-wide organisation in some 130 countries.

The outstanding progress made by British scientists towards harnessing thermo-nuclear energy for domestic and industrial purposes has been aided by BICC capacitors. The achievements of the "Zeta" and "Sceptre" equipments have already aroused world-wide interest.

No one doubts that the demand for electricity for its numerous purposes must be upward requiring more and more cables but, with the present almost world-wide shortage of capital and restriction in purchasing power, one may well question whether from the short-term aspect there is not some surplus capacity existing for certain products of the cable industry. Of one thing there can be no doubt—that prices for what might be termed the "bread and butter" products were extremely keen in 1957 and are likely to remain so.

From the medium and long-term aspects, I have every confidence. From the shorter term viewpoint the main problem is whether there is going to be any severe recession in the volume of world trade for, like any other large international concern, we could not escape the adverse effects of that. All I can say at this date is that we have made a satisfactory start to 1958 and that the results for the rest of the year must depend on the volume of business available.

DICTAPHONE COMPANY LIMITED

SATISFACTORY PROGRESS

MR C. KING WOODBRIDGE'S STATEMENT

The Annual General Meeting of Dictaphone Company Limited was held on May 29th at 17 Stratford Place, London, W.

Mr Charles King Woodbridge, chairman of the Company and chairman of the board of the Dictaphone Corporation of the United States, presided.

In the course of his address he referred to the results of the corporation's overall activity which continue to expand.

SALES AND EARNINGS

From all sources he recorded a grand total sales volume in excess of £12,857,143 for 1957. Regular product business showed an increase, defence contracts were less.

The net earnings for the year were £908,818, compared with £985,868 for 1956.

During the year manufacturing facilities were rearranged for greater effectiveness by integrating the manufacturing and office space acquired in 1956. This has reduced material handling costs by making possible a better flow of material and parts through the various manufacturing and assembly departments.

The manufacturing division has continued its record of cost reduction through improved methods, new electronic techniques, a higher degree of training and advanced tooling.

ENGINEERING AND RESEARCH

Engineering and research have continued their electronic and electro-mechanical developments. A substantial amount has been spent in this department to assure Dictaphone Corporation's position as a leader in its field. During the year, the engineering and research department increased its personnel and moved its chemical research and commercial engineering groups into new and larger quarters.

HOME AFFAIRS

I will now refer in some detail to this Company's activities during the year under review. I am pleased to report solid progress has been made in all directions.

Sales have reached an all-time record and represent an increase of 22 per cent over the previous year. Our trading profit in spite of the overall increase in materials and wages, shows a modest increase.

We are proud of the fact that our standard Dictaphone Time-Master equipment is now sold at a price lower than in 1950, despite the fact that during this period wages and salaries have increased, material costs have risen as have rates on our properties.

OVERSEAS MARKETS

We are planning to register a new company to conduct this activity, under the title of Dictaphone European Exports Limited, which will concern itself with the development of the sales of Dictaphone Time-Master Dictating machines and our associated products in those countries where opportunities for progress present themselves by reason of the establishment of the European market embracing those countries which may join with Great Britain in abolishing tariff and other restrictions, thereby sponsoring a wide movement for freer trading opportunities than has been possible heretofore.

A NEW PRODUCT

The Dictet is a portable tape recorder that can be used anywhere. What the Dictaphone Time-Master does for a man in his office Dictet does everywhere else.

Primarily an on-the-spot recorder, Dictet makes it unnecessary for anyone on the move to rely on memory or scribbled notes. Dictet is as portable, it weighs only 2 lb 11 oz, and is as self-contained as a movie camera, records for one hour on magazine loaded magnetic tape. Mercury batteries power its motor and all-transistor amplifier.

A MAJOR TRIUMPH

Dictet has applications as varied as man's need to record what he thinks, observes or hears—wherever he may be. Anyone whose work takes him out of the office can accomplish more with Dictet as his travelling companion and "portable memory." This new product is another major extension of Dictaphone's ability to serve in the vital area of business communication.

OUR OBJECTIVES

Dictaphone Corporation the world over has as its objective: service to men and women in business, the professions and in government through the introduction and maintenance of Dictaphone dictating machines to increase productivity and effect economies.

Our sales organisation throughout the entire world is composed of highly trained, skilled men who have made a profession of selling, headed by a strong sales management group of executives. Our selling programmes have been backed up by advertising in national media, direct mail and other means, and we can point with pride to the skill and the material execution of our advertising associates.

STAFF RELATIONSHIP

Our relationship with our employees is excellent, and we are proud of the fact that those who work with us are dedicated to providing service to their customers and developing this business according to our objective.

I am sure you would wish to join the members of the board in expressing to our managing director, Mr Donald MacPhail, and our staff both at head and our branch offices, and at our factories, our sincere thanks for their loyal work and devotion and their co-operation in dealing with our problems during the year. We, on our part, continue to strive to increase the amenities within the business. Our factories are being extended and are well equipped for staff welfare purposes.

I now beg to move the adoption of the accounts and the directors' report which have been in your hands for some time.

I shall ask Mr C. Harold Vernon to second this proposal. This was put to the meeting and carried unanimously. The retiring directors were re-elected, and Mr F. Graham Maw proposed a vote of thanks to the chairman for presiding. This terminated the proceedings.

THE CHLORIDE ELECTRICAL STORAGE COMPANY

TOTAL GROUP SALES AGAIN INCREASED

The sixty-seventh ordinary general meeting of The Chloride Electrical Storage Company Limited, was held on June 4th at Exide Works, Clifton Junction, near Manchester. In the absence of the chairman and managing director, Mr A. W. Browne, the chair was taken by Mr H. V. Schofield, MC, MIEE (director).

The following is an extract from the Chairman's circulated Statement:

Throughout the year under review the trading activities of our Group were at a level which may be considered satisfactory when taking into account the many difficulties encountered.

The sales picture generally is a small reduction in the turnover of the home battery companies and a continuance of the increase in the sales of our overseas battery companies and in the sales of our home companies concerned with products other than batteries. The net result is an increase in the total Group sales.

Income from trading, however, has fallen from £3,160,396 to £2,845,720. The net income amounts to £756,231, which is some £275,000 less than last year.

Your Directors have decided to pay to the ordinary stockholders a dividend of 12½ per cent, which with the 5 per cent paid last October makes 17½ per cent for the year.

The continued expansion of our manufacturing activities overseas, as referred to in my statement last year, has inevitably reduced the export demand on our home factories, and this factor coupled with the increasing efficiency of our major United Kingdom factories has enabled us to rationalise our production in this country. After considerable investigation and planning a decision has been taken to cease production at two of our smaller factories and transfer this production to the remaining companies of the Group.

This improved efficiency in our manufacturing processes in this country, while helping us to concentrate production in fewer factories, has also played an important part in enabling us to keep prices stable and maintain the competitive position of our Group in the United Kingdom and the export markets served from here.

Our turnover in the stationary battery market improved, as did the contribution to our sales from that substantial class coming under the heading of "miscellaneous batteries."

The demand for automotive batteries was depressed considerably during the first three months of the year as a result of petrol rationing following the Suez crisis. Once that trouble was past the demand for our automotive batteries went steadily ahead. On the other hand, a direct result of petrol rationing was an increase in the demand for battery electric vehicles and trucks of all descriptions to the benefit of our Group traction battery turnover.

In the aggregate the overseas companies have expanded their sales during the year, but, as with the home battery companies, the trading results have not kept in line.

As I have already indicated in this statement, steps have been taken to improve our efficiency in this country. Similar work is being undertaken overseas, particularly in Australia, Canada and New Zealand. Our object is to ensure our ability not only to maintain prices at their present level, but whenever possible to reduce them, at the same time improving the quality of our product.

Competition is intense, but in the knowledge of the improving efficiency of the Group both economically and technically, I feel justified in concluding on a note of measured optimism.

The report and accounts were adopted.

GOPENG CONSOLIDATED

The forty-fifth annual general meeting of Gopeng Consolidated, Limited, was held on May 28th at Redruth.

Major W. E. Hosking, a director, presided in the absence by reason of illness of Mr D. W. Thomas (Chairman).

The following is an extract from the Chairman's circulated statement:

The Accounts for the year ended September 30, 1957, show a profit of £175,198, after payment of £74,294 for Royalty on Ore Sales and the provision of £90,193 for UK and Malayan Taxation. Four dividends, two each of 6d. per 5s. Unit of Stock and two each of 9d. per 3s. 6d. Unit of Stock, were paid in respect of the year.

Production of tin-ore from October 1st to December 31, 1957, was 243½ tons, of which 175½ tons were produced between October 1st and December 14, 1957, before Restriction of production and sales became operative. From December 15, 1957, to March 31, 1958, Ore Sales under the Tin Control Regulations totalled 118½ tons.

The International Tin Agreement came into force on July 1, 1956, and the Tin Control (Buffer Stock) Regulations, 1956, became operative in September, 1956. During the period under review your Company's compulsory contributions to the Buffer Stock—a total of £41,535—were made from the proceeds of current production.

The International Tin Council decided in December, 1957, to restrict tin exports from those countries which ratified the International Tin Agreement by imposing a cut of 28½ per cent in the estimated annual rate of production for the period December 15, 1957, to March 14, 1958, and to call up the second contribution to the Buffer Stock. In January, 1958, the Tin Council extended the first quota period from March 14th to March 31st with no increase in permissible exports. It was also announced that permissible exports of the signatory countries during the quarter, April to June, would represent an over-all cut of approximately 40 per cent of estimated normal annual rate of production. The call up of the third contribution to the Buffer Stock was also announced.

The effect of restriction varies considerably as between the producing countries. For the producers who have yet to pay to the Malayan Government the second and third contribution each of 5,000 tons metal, or cash equivalent, the cost, both in reduced output and in cash, of maintaining the restriction scheme is very considerable. Although the full repercussions on your Company's affairs cannot yet be fully assessed, nevertheless it is thought that they will inevitably be serious, and may necessitate periodic cessation of mining operations. Your Directors will, however, do everything to ensure that the effects of Tin Restriction are minimised as far as is possible.

Stockholders have already been advised that consideration will be given to the dividend position at the end of each quota period.

The report and accounts were adopted.

AGRICULTURAL MORTGAGE CORPORATION, LIMITED

HELP FOR SMALL FARMERS

The annual general meeting of the Agricultural Mortgage Corporation, Limited, will be held on June 11th in London.

The following is an extract from the circulated statement by the Chairman, Mr E. J. Bunbury, CBE, MC:

The Farm Improvement Capital Grants Scheme introduced by the Agriculture Act, 1957, has been well received. This measure was designed to encourage the improvement of fixed equipment with a view to improving efficiency and lowering production costs. It was not to be expected that the large number of applicants for Grant would be made to the Ministry without careful planning and timing by farmers.

The Corporation is anxious to play its full part in providing long-term finance required to enable the approved improvements to be undertaken, and there are signs today that farmers are going ahead with their improvement projects.

Credit Position: I referred in May last to the growing restrictions on credit as part of the anti-inflationary Government measures to meet the threat to the economy of the country from within and without. In July the Corporation's lending rate of interest was raised from 5½ per cent to 6 per cent. The rapid deterioration in the country's Reserves during August and early September reflected the growing anxiety throughout the world regarding the course of wages and prices in the United Kingdom and the international position of the £ sterling. On September 18th Bank Rate was raised from 5 per cent to 7 per cent and other measures were taken which left no doubt of the serious nature of the threat to our National economy. The Corporation's rate was raised in October from 6 per cent to 7 per cent as a necessary defensive measure pending the possibility of making a further issue of Debenture Stock.

GOVERNMENT ACTION WELCOMED

There is some evidence to indicate that nett farm incomes again declined in the past year, and the reductions within the 2½ per cent permissible in the 1958-59 Price Review aroused some anxiety in farming circles. But taken as a whole in a period of world-wide price falls, it may reasonably be held that the pinch is likely to be felt mainly by the small farms of 100 acres or under, which constitute the largest category of units throughout the country.

It is therefore gratifying to note that the Government have in mind certain measures to assist these small farmers, and details of the proposed measures will be awaited with considerable interest. The repeated assurances given by Ministers of the Government's determination to maintain the requisite support for Agriculture enshrined in postwar policies of all political parties, should encourage the industry to maintain the steady rise in productivity achieved to date.

I think it is not unsatisfactory that we have completed just over £4 million of new mortgage loans during the year—only £94,000 less than the total for the previous year. The average of loans granted was £4,723, which compares with an average of £3,826 of overall loans outstanding. Loan repayment instalments continue generally to be met promptly and arrears at March 31, 1958, represent only 4.1 per cent of the amounts due.

THE CONSOLIDATED ZINC CORPORATION

REDUCTION IN TRADING PROFITS

DECLINE OFFSET BY LOWER MINING ROYALTY AND TAXATION

The ninth annual general meeting of The Consolidated Zinc Corporation Limited will be held on June 24th at 37, Dover Street, London, W.1.

The following is an extract from the circulated statement of the Chairman, Mr L. B. Robinson:

The severe fall in the prices of lead and zinc during the last eight months of the year caused a substantial reduction in the trading profits for 1957.

The Zinc Corporation Limited again increased ore production and achieved a lower cost per ton of ore at Broken Hill than for the previous year. Nevertheless, the reduced average prices realised for lead and zinc concentrates resulted in a much lower profit than in 1956.

Consolidated Zinc Proprietary Limited had a satisfactory year and showed a considerably increased profit.

Imperial Smelting Corporation Limited had a lower output of zinc but deliveries of alloys were considerably greater than in 1956. Profit margins on most products were reduced and, overall, the profits from trading for the year in the United Kingdom were somewhat less than in 1956.

Income from trade investments at £941,688 showed an increase mainly due to higher dividends from New Broken Hill Consolidated Limited and British Titan Products Company Limited. Interest on Government securities and other interest and miscellaneous income, at £325,135, was also higher than in 1956.

The consolidated profit of the Group, before mining royalty and taxation, amounted to £4,322,442, compared with £6,123,432 for 1956.

Due to the considerably reduced charge for royalty and taxation, the consolidated net profit for the year, at £1,769,986, was only £274,397 lower than the net profit for 1956.

Proposed final dividend of 2s. 6d. per share, compared with 3s. last year, giving a total of 3s. 9d. compared with 4s. 6d. last year.

In the prevailing conditions of world markets in which, in common with many other commodities, a surplus of lead and zinc has developed, both the Zinc Corporation and New Broken Hill Consolidated have budgeted for a reduced production of ore and recoverable metals during the current year.

ZINC SMELTING

The operation of the Imperial Smelting process on the Avonmouth site made further satisfactory progress during the year.

A decision has recently been taken to replace the horizontal retort zinc distillation plant at our Swansea Vale works with the installation of an Imperial Smelting process plant.

BAUXITE

Commonwealth Aluminium Corperation Pty. Limited, in which the British Aluminium Company Limited will be associated with us, has during the year made substantial progress in its investigation and planning for the development of the bauxite deposits at Weipa on the west coast of Cape York peninsula.

In December a comprehensive agreement was negotiated with the State of Queensland providing for the development of the field. A feature of the agreement is Commonwealth Aluminium Corporation's undertaking to establish an alumina plant in Queensland as soon as practicable after the Company has completed its investigations.

CANADA

In Canada, our subsidiary, Consolidated Zinc Corporation of Canada Limited, has continued to be active in the search for minerals both in association with Yukon Consolidated Gold Corporation Limited and with others. As a result of negotiations concluded towards the end of the year, we have acquired a shareholding in Siscoe Mines Limited and assumed the management of that Company.

RESEARCH AND DEVELOPMENT

The research and development departments have carried out a vigorous programme investigating means of improving the efficiency of existing processes and seeking new outlets for our products. In addition, examination has been made of a number of new processes and materials in the continued search for opportunities of widening the base of our activities.

THE OUTLOOK

In the current year our earnings must be seriously affected by the present low level of prices. However, in spite of the unfavourable features in the immediate outlook for commodity prices and in the statistical position of the metals which at present provide our main source of income, we remain confident that the world will continue to progress to higher standards of living and that not only demand will increase, but that the prices of the metals in which we are interested will, in time, return to more remunerative levels.

Meanwhile, we consider the projects in hand to improve the efficiency and economic return from our existing operations are essential, even though the timing and rate of progress of these projects must necessarily be governed by our financial resources.

THE DRAYTON REGULATOR AND INSTRUMENT COMPANY

RECORD RESULTS

The ninth annual general meeting of The Drayton Regulator and Instrument Company Limited was held on May 29th in London, Mr P. H. Lloyd, TD, DL (the Chairman), presiding. The following is an extract from his circulated report:

It is gratifying to report further expansion of trade with a record profit of £253,717, this being an increase of approximately 18 per cent over the previous year.

Whilst recognising that trading conditions are likely to be affected by the Government's recent tight-money policy and that profit margins may contract, your Board nevertheless, recommend a final dividend of 15 per cent making 20 per cent for the year.

The Board recommend a transfer of £50,000 to General Reserve and after making the foregoing provision and deducting taxation on profits for the year the balance carried forward will be increased from £76,424 to £86,619

PRODUCTION AND SALES

The Company's production facilities have continued to expand as the new buildings and machinery have come into use. This has had the desirable effect of reducing outstanding orders and enabling the Company to give better service to its customers.

The Sales and Development Departments have been strengthened and close attention is being given to the extension of our export markets.

With regard to the future, it would be a bold man who was prepared to express an opinion beyond very broad generalisations, because Government policy can have such an enormous effect on the trading conditions of the day. During the first three months of the present year orders have contracted slightly and the trading results for the present year may not be equal to those of the past year.

I feel that the activities in which the Company is engaged have yet to come to their zenith. As technical developments advance within industry, particularly in so far as they affect the automatic control of processes, there is little doubt that companies such as yours who keep abreast of such technical developments are likely to prosper in an expanding market. Taking a long view of the situation, there is certainly no need for pessimism. The report was adopted.

BENGUELA RAILWAY COMPANY

At the Annual General Meeting of the Company held in Lisbon on 31st May, 1958, the following distribution of profits for the year 1957 was approved :—

		Comparative Figures 1957 Escudos	1956 Escudos	1955 Escudos
Net Revenue		194,846,285	221,811,508	146,093,217
Deduct :—				
Percentage to Portuguese Government	20,668,627			
Deductions in accordance with the Articles of Association	14,614,866			
		35,283,493	41,478,629	22,118,155
Balance available for distribution		159,562,792	180,332,879	123,975,062
Distributed as to :- Debenture Service :—				
Redemption of 4% Debentures		16,264,810	46,216,200	48,850,200
Interest on 4% Debentures for year 1957		9,605,413	11,603,245	13,688,915
Interest on 5% Debentures for year 1957		16,100,000	16,100,000	16,293,622
		42,058,223	76,981,635	77,771,737
Dividend of 33 Escudos per share on Share Capital		99,000,000	49,500,000	33,000,000

THE UNITED SCOTTISH INSURANCE COMPANY

A DIFFICULT YEAR

The annual general meeting of The United Scottish Insurance Company Limited was held on May 30th in London, Mr R. H. McLeod (the chairman) presiding.

The following is an extract from his circulated statement:

The year 1957 has been an unprofitable one for the Company. Departmental figures reflect the unfortunate loss experience we have had in all fields.

In the Fire and Accident Accounts there is a decrease in premia from £567,887 to £553,910. This is due to curtailment of certain unprofitable Accident business in Europe offset to some degree by increased premia in the United Kingdom. Accident results generally have been unfavourable but particularly so on our business in Europe and Canada. The Fire Account has been affected by an unfavourable loss experienced in all fields. To meet the loss in these Departments £56,795 has been transferred from Profit and Loss Account.

The 1955 Marine Account is closed and the sum of £2,500 transferred to Profit and Loss Account. Rates have been cut drastically of recent years and this has had its inevitable result. The Marine Fund is considered sufficient to care for the running off of the 1956 and 1957 Accounts.

The Balance of the Profit and Loss Account reflects the transfer to the Fire and Accident Department of £56,795. No dividends can be recommended on the figures disclosed.

The report was adopted.

LONDON ASIATIC RUBBER

SIR ERIC MACFADYEN'S ADDRESS

The annual general meeting of the London Asiatic Rubber and Produce Company, Limited, will be held on June 23rd, in London.

The following is an abstract of the address of the Chairman, Sir Eric Macfadyen, circulated with the report and accounts:

Following the reduction in the issued capital the capital ranking for dividend has been reduced from £1,169,514 to £877,135. The Capital General Reserve now stands at £1,180,000 and Replacement Reserve at £315,000.

The market price of all grades of rubber declined during the year, with the result that our crop of 15,009,873 lb (inclusive of 48,403 lb purchased) realised an average of only 24.80d. per lb net compared with a net price of 27.16d. per lb for the previous year (13,657,800 lb). The increased crop compensated for the lower average price, and the 1957 net sales proceeds of £1,550,893 slightly exceeded the previous year's.

The profit after taxation, £439,023 together with £98,801 brought forward from the last accounts, provides us with an available balance of £537,824. We transfer £279,759 to Capital General Reserve and £6,039 to Replacement Reserve, and then recommend the payment of a final dividend of 25 per cent, less tax, making a total of 30 per cent for the year.

The organisation of our Estates is efficient, and we expect to harvest a crop of, say, 16 million lb during 1958.

NEW BROKEN HILL CONSOLIDATED

MR L. B. ROBINSON ON NEED TO CONSERVE CASH RESOURCES

The twenty-second annual general meeting of New Broken Hill Consolidated Limited will be held on June 24th at 37 Dover Street, London, W.1.

The following is an extract from the circulated statement of the Chairman, Mr L. B. Robinson:

In 1957 the output of ore and the lead grade in ore produced were both appreciably higher than in 1956. A reduction in the average cost per ton of ore of approximately 18 per cent, compared with the previous year, was achieved, and the tonnage of lead realised in 1957 was 57,617 tons, compared with 44,044 tons in 1956.

Despite these achievements the mine trading balance for the year amounting to £1,904,035, showed a decrease of £418,369 compared with 1956, due to the severe fall in the prices of lead and zinc during the last eight months of the year. The profit before taxation amounted to £1,591,313, compared with £1,991,129 for 1956.

The company has obtained recognition as an Overseas Trade Corporation as from April 6, 1957, and derives a substantial benefit from the reduction in United Kingdom taxation. The provision for Australian and United Kingdom taxation on the profits for the year amounts to £534,217 compared with £1,116,600 for 1956. The result is a net profit for the year of £1,057,096, an increase of £182,567 on the figure for 1956. The change of status to that of an Overseas Trade Corporation as from April 6, 1957, has also released provisions made in previous years for UK taxation amounting to £750,000.

The amount available for distribution including the above provision for taxation no longer required and the balance of £339,635 brought forward from 1956 is £2,146,731. As indicated in the announcement for the interim dividend, the directors are recommending a final dividend of 3s. per share making a total distribution of 5s. for the year which is the same as for 1956.

OUTLOOK ON PRICES

The directors have given very careful consideration to the disposal of the large balance available for appropriation. The prices of lead and zinc have remained at very low levels throughout 1958 to date, and the outlook shows little promise of an early improvement. Further it has been necessary not only to budget for a reduced production of ore at which it will be difficult to maintain last year's level of cost, but also to transfer part of the labour force to additional development work entailing the use of further capital funds. These factors will all mean a considerable drain during 1958 on the Company's cash balances and the directors consider that it is essential to conserve resources to the utmost. Accordingly the directors have not felt able to recommend a larger total distribution than 5s. per share for the year and have transferred £750,000 to general reserve and £350,000 to a mine amortisation reserve.

The immediate outlook is of necessity overshadowed by the statistical position of base metals and in common with other producers our earnings are bound to reflect the current level of prices for lead and zinc.

INTERNATIONAL PAINTS

A SATISFACTORY ACHIEVEMENT

The fiftieth annual general meeting of International Paints (Holdings) Limited, was held on June 4th, in London, Mr Charles R. Petrie (Chairman and Managing Director) presiding.

The following is an extract from his circulated statement:

Profits have almost been maintained at the record level achieved in 1956. After providing for taxation there is a net profit of £801,672 attributable to the shareholders of International Paints (Holdings) Limited. This figure is £9,000 higher than for 1956.

Your directors recommend a total distribution of 6 per cent on the Preference Shares and 22½ per cent on the Ordinary Shares. There is retained in the Group Companies £395,678, namely £41,591 by way of reserves and £354,087 added to the Profit and Loss Account Surplus carried forward.

General exports were well maintained in 1957 against increased competition.

In the United Kingdom the Inland Division, covering sales of Industrial and Decorative Finishes, has handled many interesting projects during the year and has steadily developed its retail distribution. Our Marine Division made its customary substantial contribution to the year's result.

The report was adopted and at a subsequent extraordinary general meeting the proposal to capitalise £534,500 of reserves and profits, to be distributed on the basis of one new Ordinary Share of 4s. for every four Ordinary shares of 4s. each held, was approved.

RAMBUTAN RUBBER ESTATES

A GRATIFYING ACHIEVEMENT

The twenty-seventh annual general meeting of Rambutan Rubber Estates Limited was held on May 30th in London, Mr R. F. Burt (the Chairman) presiding.

The following is an extract from his circulated review:

In spite of a larger crop and a small drop in cost of production, the decline in our selling price of 2¼d. per lb has more than counterbalanced it, resulting in a decrease of £5,601 in our working profit. Nevertheless, substantial sums accrued in respect of previous years' cesses and the 1957 Budget gave us a very welcome release under the Overseas Trade Corporation enactment. In consequence we have a final profit figure for disposal some £11,500 in excess of the previous figure. We cannot distribute all this, however, for we have considerable capital commitments in the shape of the planting and upkeep of our extensions.

It is interesting, perhaps, to look back ten years to the year 1948, when we started our postwar development. Up to the end of 1957 we have added 596 acres to our planted area, and replanted 679 acres, a total of 1,275 acres. In the same ten years we have paid in dividends totalling 98 per cent on the Issued Capital, while our net current assets have been reduced by under £4,000. This is no mean achievement, considering that this has been a period of stress, terrorism, labour shortage, and postwar staff problems.

The report was adopted and the dividend of 10 per cent was approved.

CITY DEEP LIMITED

MR P. H. ANDERSON'S STATEMENT

The Fifty-seventh Ordinary General Meeting of shareholders was held in Johannesburg on May 27, 1958. The following is an extract from the circulated statement by the Chairman, Mr P. H. Anderson, dated May 20, 1958:

WORKING RESULTS

During the year under review 1,780,000 tons of ore, giving an average yield of 3.909 dwt per ton, were milled, and 347,907 ounces fine of gold were recovered. In the previous year the relative figures were 1,851,000 tons milled, with an average yield of 3.862 dwt, and a recovery of 357,427 ounces fine of gold. The working revenue for the year was lower by £122,898, but working costs decreased by £229,204, with the result that the working profit rose by £106,306 to £196,486.

ACCOUNTS

To the working profit of £196,486 was added £71,725, which represents the difference between sundry items of income and expenditure, giving a total profit of £268,211. The addition thereto of the unappropriated balance brought forward of £699,170 gave a total of £967,381, against which deductions totalling £186,925 were made in respect of taxation, two dividends and a transfer to Capital Reserve. This latter transfer of £74,125 to Capital Reserve was in respect of the net amount expended on Mining Assets less realisation of Trade Investments. The resulting balance of the Income and Expenditure Account was £780,456, which was carried forward to 1958. This unappropriated balance, together with revenue reserves totalling £223,123, was represented by current assets of £1,548,458, less liabilities and provisions amounting to £544,879.

OPERATIONS AT THE MINE

The South and Main Reef Leader Reefs continue to provide the main sources of ore, but on the former reef development was limited by the natural difficulties of opening up and equipping old areas in the upper sections of the mine. Development on the Main Reef Leader, which is being carried out almost entirely at great depth from a limited number of possible points of attack, was somewhat disappointing but the relatively few exposures made are not necessarily representative of future possibilities. The ore developed at 598,000 tons was lower by 273,300 tons but the value remained unchanged.

Last year it was stated that in view of the possibility that payable values may persist beyond the present southern boundary of the Company's mining property, the permission of the Government had been sought and received to prospect the area. The work done has justified an application for the renewal of the prospecting permit and also for an application for a mining lease over an area of approximately 313 claims in the prospecting area.

ORE RESERVE

The available ore reserve recalculated at the year-end at 3,302,000 tons, was 448,000 tons lower than at the end of 1956. The average value and width decreased by 0.1 dwt and 0.8 inch respectively.

CURTAILMENT OF OPERATIONS

Shareholders will recall that over the past two years reference has been made to the reorganisation of the hoisting and pumping arrangements between the City and Nourse Sections of the mine with the object of closing down certain high cost Nourse shafts as soon as possible. With this plan in view and as a precautionary measure, notice was given to the Government in July, 1956, of the Company's intention to curtail materially its operations by closing down the Eastern Section of the mine. Since that date operations have continued in this section, but only on a marginal basis, and the stage has now been reached where losses will be incurred there and the mine as a whole will be endangered. In view of this serious position your Directors have agreed to the recommendation of the Company's Technical Advisers that operations in the upper portion of the Eastern or Nourse Section be curtailed from June 1, 1958, by confining work to reclamation and shaft pillar extraction. The Government has been advised of your Board's decision and an announcement to this effect was made in the press on April 26, 1958.

Although it is anticipated that the rate of milling will be reduced to about 110,000 tons a month as a result of this reorganisation, the balance of operations should be considerably improved with beneficial effects on the profit position.

UNIVERSAL PRINTERS LIMITED

(Controlling Bemrose & Sons Ltd., Derby, Alf Cooke Ltd., Leeds, and Norbury Printers Ltd., Manchester)

RECORD SALES

The thirty-seventh annual general meeting of Universal Printers Limited was held on May 29th in Derby, Mr J. M. Bemrose, MA (the chairman), presiding.

The following are extracts from the Directors' Report:

The profit of the Group for the year before providing for taxation amounted to £392,938 compared with £458,766 last year. Provision for Taxation absorbed £259,264 compared with £320,412 leaving a net available profit of £133,674 compared with £138,354 in 1956. The Directors recommend a final dividend of 7 per cent, less tax, making a total distribution on the Ordinary Shares of 11 per cent less tax.

Having regard to the announcement by the Chancellor of the Exchequer that a Profits Tax at the rate of 10 per cent on all profits is to be substituted as from April 1, 1958, for the present Profits Tax of 3 per cent on retained profits and 30 per cent on distributed profits, it is anticipated that the sum of £246,683 which has been set aside to meet the possible future liability to Profits Tax on undistributed profits, will be set free for transfer to Revenue Reserve at December 31, 1958.

The net amount of the Preference and Ordinary dividends provided in the Accounts represents 4.02 per cent of the Shareholders' funds employed in the business at December 31, 1957, i.e., the total of the Capital and Reserves, £1,740,938.

During the year the Letterpress Department of the Derby Works has been extended and reorganised, and a considerable amount of new machinery installed. In addition, the building of an extension to the factory at Spondon has been commenced. At Leeds improvements have been carried out to facilitate output and new plant has been added. An extension has been made to the buildings at Manchester to accommodate new photo-litho process equipment.

The sales of your Companies for the year 1957 exceeded £3½ million, a record for the Group, but profit margins were less.

The value of orders received to the end of March this year compares favourably with that for the corresponding period last year, but as a result of the present state of industry, lower prices are ruling. Everything possible, however, is being done to achieve economy and improve productivity.

The report was adopted.

COSTA RICA RAILWAY COMPANY LIMITED

MR ROBERT W. ADEANE'S SPEECH

The annual general meeting of the Costa Rica Railway Company, Limited, was held on June 3rd in London.

Mr Robert W. Adeane, OBE, chairman, in the course of his speech, said: The Costa Rica Railway Company leased its line in 1905 to the Northern Railway Company (of Costa Rica). That Company's profit on working, after slightly higher depreciation, was £146,360.

The adverse consequences of the poor 1955/56 crops were deferred until the year under review, when the most paying traffic, particularly imports, became affected. Revenue therefore decreased but the volume of traffic was actually higher, so there was no related saving in running costs. Only six diesels were in operation for the full year, resulting in only limited economies during the gradual retirement of the remaining steam locomotives.

The dieselisation programme was virtually completed by June 30, 1957, by putting into operation 15 additional units. That naturally limited the cash available for remittance as rental to the parent company.

The parent company received £85,000 on account of Rental; total gross income was £99,728, compared with £93,767. After charging First Mortgage Debenture Interest, etc., net revenue was £41,068.

SCHEME OF ARRANGEMENT

We have been considering our possible O.T.C. status which has raised most complex problems now under examination by experts. Pending a decision and also because of recent abnormal money market conditions, your directors have taken no further steps regarding a Scheme of Arrangement. The matter is very much in our minds, but I cannot be more definite at this stage.

At the Presidential Election held last February the Conservative Candidate was elected by a considerable majority. He will hold office for four years. With your new Director, Lord Broughshane, I visited Costa Rica just after the Elections and had the pleasure of again meeting the outgoing President, Sñr. don Jose Figueres, and the new President, Sñr. don Mario Echandi. Our traditional friendly relations have been well maintained.

Together with Lord Broughshane and our Resident Manager, Mr Averre, I made a thorough inspection of the line and visited the Standard Fruit Company's new planta-

tions which are on the Estrella branch, and found there evidence of the tremendous fertility of the soil in the area which was selected by the Standard Fruit Company.

THE FUTURE

The price of Costa Rican coffee has held up reasonably well in the face of world over-production and unsettled markets. The excellent coffee movement in 1956/57 was followed this year by another record crop. While it is too early to be certain about the coming coffee harvest the increased acreage and intensive use of fertilisers in Costa Rica should result in expanding production and the coffee there, a high-grade blender, should continue to command above average price. It must be remembered that Brazil is the big producer and much must depend on the policy of that country.

The Standard Fruit Company has pushed ahead with its planting of bananas within our Railway zones. The first fruit should be marketed on a limited scale in 1959, but large scale crops should not be expected until 1960. The Northern has the exclusive transportation rights. Oil prospecting continues but still without significant results.

Altogether I formed a favourable opinion of the economic state of affairs in the Republic and I believe the Railway will share in the prosperity of a gradually broadening economy.

For the first ten months of the current year both gross and net revenue of the Northern show considerable improvement, which should help to restore the Northern's cash position. As, however, the annual diesel payments have to be met and some further capital works are contemplated, increases in rental remittances to this Company should not be expected to be immediate.

The report and accounts were adopted.

THE SEA INSURANCE COMPANY LIMITED

MR A. REITH GRAY'S STATEMENT

The eighty-second Annual General Meeting of The Sea Insurance Company Limited was held on June 3rd at the Exchange Hotel, Liverpool. A statement by the Chairman, Mr A. Reith Gray, had been circulated with the Report and Accounts for the year ended December 31, 1957.

Before dealing with the Accounts the Chairman referred to the loss the Board had suffered in the death last year of Mr John Hunter, who was a Director for nineteen years.

Mr A. Reith Gray reported the acquisition of a new London Office at No. 7 Lothbury, and stated that during the year the amalgamation of the activities of the Sea Beacon Group had continued, including the setting up of a combined Superannuation and Widows Fund for the Staffs of the two Companies.

The difficult underwriting conditions experienced in the Fire, Accident and Marine Departments in 1956 had continued in 1957, and the Chairman mentioned the heavy loss which the 1956 Marine Account had suffered when the *Andrea Doria* was in collision with the *Stockholm*. This Account was closed by the transfer of £53,754 to the Profit and Loss Account which was slightly less than half the transfer made on closing the previous year's underwriting. Despite this, the Marine Fund at £2,909,820 represented 160 per cent of the premium income, which had increased during the year by about £77,000.

The Fire Department Funds were also strong with an increased premium reserve of £59,000. Although in the USA reported fire losses reached an unprecedented level, experience at home was better than in 1956, and a profit of £29,150 was earned, compared with a loss last year.

In the Accident Department premium income increased by £229,000 but the Account showed a loss of £114,743 due to many factors. Both the American and Canadian automobile business ran badly and the costs of third party claims and repairs to vehicles had continued to rise, together with the expense of operating the Account. Serious efforts were being made in Canada to introduce a more realistic scale of rates but any improvement would be a slow process owing to the incidence of long term business.

The Beacon Insurance Company Limited, whose dividend was maintained at 2s. per share, had reported another good year in its Life Department with an increase in the Life Fund from £9,221,643 to £9,709,850 and Mr Reith Gray expressed his appreciation of the results achieved by this Department.

The Chairman concluded his statement with a reference to certain changes made in the form of the accounts, with the intention of making the allocation of expenses to the various departments more realistic.

A Final Dividend of 3s. per share was approved, making 6s. per share for the year, the same as for the previous year.

The Accounts were adopted.

BARRY AND STAINES LINOLEUM

IMPROVED RESULTS

The annual general meeting of Barry and Staines Linoleum Limited will be held on June 26th in London.

The following are extracts from the circulated statement of the chairman, Mr T. J. Cavanagh :

The trading results for the year are better than we had reason to expect from the results of the first half of the year and from the restriction of credit facilities. In consequence the Board has decided to recommend an increase in the final dividend to restore the precautionary cut that was made in the interim dividend.

Linoleum is our main product, and the turnover of our British manufacturing subsidiaries increased slightly, though overhead costs also increased. Nevertheless, these subsidiaries were able to show improved results partly by more economical working and an easing in some raw material costs; partly through more favourable trading experience in the very competitive and exacting dollar markets, and partly by a small increase in some selling prices made in the home and certain export markets last November. Competition continues to keep linoleum prices at a level which makes the return on capital employed in the industry a low one by comparison with many others.

Our export trade is substantial and I am glad to say that our products continue to hold the highest reputation in world markets. This year we hope to extend our activities to the cheaper end of the printed felt base floorcovering trade by the introduction, through our subsidiary, The Corticine Floor Covering Company, of a range of goods under the name of Corfelt.

BUSINESS AND PERSONAL

A NEW SERVICE FOR INDUSTRY

To meet the changing requirements of industry in the European Common Market, and free trade zone, a large and well-established engineering group in the London area offers a complete consultancy service to firms who may be faced with increasing development and marketing difficulties. Having ourselves been faced with the necessity of providing facilities for market research, design, development, model shop, tool making, type testing, etc., we are able to offer a complete consultancy service backed by all necessary engineering and marketing facilities to assist firms requiring it, and we work closely with American Associates specialising in placing U.S. patents in this country and can, therefore, help in finding new production items. This offer is primarily directed towards firms requiring it for a limited period in order to find new lines and develop them to full production scale. The total available capacity of this service is estimated at £250,000 per annum, of which approximately £100,000 will become available to firms outside the organisation, in whatever amounts are required. Principals please write to Box No. 891. All correspondence will be treated as strictly confidential.

VENEZUELAN AND CARIBBEAN AREA Economic Consultant, now in London, is willing to do surveys, market research, introductory work and arrange for suitable representative for British firms.—Write Box 938.

APPOINTMENTS

SALES VICE PRESIDENT
FOR EUROPE

AMERICAN NON-FERROUS METALS COMPANY

THE EMPLOYER IS A COMPANY WITH AN ANNUAL SALES VOLUME OF $500,000,000 DOING BUSINESS ON A WORLD WIDE BASIS.

An excellent opportunity for an executive with broad experience in the management of sales to large European industrial customers. Background in high-level sales of metals essential, preferably in non-ferrous metals. Should be age 40-50, university graduate (degree in metallurgy preferred). Fluent French desired. Will reside in New York, travel one third of the time. Compensation high. Qualified candidates will be interviewed in London, Paris, Zurich, or New York, at their convenience.

Respond with curriculum vitae and full details of work history to Box 944, *The Economist*, London, S.W.1.

INTERVIEWERS.—Vacancies occur in a large Market-ing Research Company for full-time women interviewers who would be required to travel over a wide area of the country but who would be based in Newcastle-onTyne, Leeds, Sheffield, Nottingham / Leicester, Birmingham and Cambridge. Applicants should be preferably under 35, intelligent and adaptable, of good general education, in good health and able to drive a car. No previous interviewing experience is necessary. The training and probationary period is 6 months, after which there is the chance of increasing responsibility and variety of work for the most suitable trainees.—Box 941.

MARKETING RESEARCH ADVISER

We market on a large scale a range of food products, and are constantly widening our interests as part of a substantial development programme.

Over the last few years we have built a virile and competent marketing management team here in Birmingham, which is organised mainly on a product basis and works in the closest co-operation with our advertising agencies. To this team we are now proposing to add a Marketing Research Adviser.

We should like him to advise us in defining research issues, and on techniques; to commission the work; and authoritatively to interpret the results. In short, we want a man—preferably in his early thirties—who can translate marketing requirements into research issues, and turn figures into pointers for marketing action.

Starting salary £1,500 per annum or more, dependent upon qualifications and experience. Pension and Life Insurance included.

Please write to our Personnel Manager, Alfred Bird & Sons Ltd., Deritend, Birmingham, 12. Complete confidence will be observed.

ALFRED BIRD & SONS LIMITED

D.S.I.R. HQ., London, requires Scientific Officer for patents duties including selection of inventions for patenting from work of the Department's research stations, liaison with N.R.D.C., and dealing with patents questions in contracts. Quals.: 1st or 2nd Hons. degree in Physics, Chemistry or Engineering, with interest in legal matters (especially Patents) necessary and reading knowledge of French and German desirable. Salary: £635-£1,110 (men). Good prospects of promotion with salary up to £2,050, and if under 31 prospects of establishment. Five-day week.—Forms from M.L.N.S., Technical and Scientific Register Ltd., 26 King Street, London, S.W.1 (quoting A.186/8A).

WOLVERHAMPTON & STAFFORDSHIRE COLLEGE OF TECHNOLOGY

Principal: Robert Scott, M.A., B.Sc.

DEPARTMENT OF PRODUCTION ENGINEERING AND MANAGEMENT

Two Lecturers in Management Studies required for September 1st. Candidates must be professionally qualified in at least one of the following: Work Study, Management Accounting, Personnel Administration, Factory Management.

Salary (Burnham scale for Lecturers) within range £1,200-£1,350; superannuation scheme.—Further details and application form (to be returned within 14 days) from the undersigned.

G. W. R. LINES,
Clerk to the Joint Education Committee.
Education Offices,
North Street,
Wolverhampton.

MARKET RESEARCH

British-American Tobacco Co. Ltd., 7 Millbank, London, S.W.1, have an interesting vacancy for a graduate, preferably in a social science, aged about 35, with sound statistical and market/consumer research experience, to develop with direct responsibility to a Director, a reorganised department dealing with market/consumer research. The post, which will involve travelling abroad in an advisory capacity, at top level, offers excellent opportunities for the future and an attractive salary, commensurate with qualifications and experience. An effective personality is essential in view of the contacts which the position requires.

Applicants should write, in confidence, to Personnel Department at the above address.

COMPUTER PROGRAMMERS.—Littlewoods Mail Order Stores Ltd. have recently installed an Elliott 405 data processing system in their Head Office at Liverpool, and have a number of vacancies for experienced Programmers.

The successful applicants (ages not over 40) will be competent to work as members of a team responsible for the investigation and programming of large scale commercial problems.

These are senior appointments within the Head Office, offering exceptional scope for progress in a rapidly expanding organisation, and candidates must be prepared to live in the Liverpool area.

Commencing salaries £1,000-£1,500 per annum according to qualifications and experience. Life Assurance and Pension Scheme. Five-day week.

Letters of application, giving age, details of education, qualifications and experience, to The Employment Manager (EC/6), Littlewoods Mail Order Stores Ltd., Kershaw Avenue, Endbutt Lane, Crosby, Liverpool, 23.

MARKET RESEARCH

Precision engineering company in West London require senior research officer for expanding Market Research Dept. Preference will be given to graduates in economics, with statistics as special subject, and some industrial or commercial experience, aged 25 to 35. The post calls for analytical skill in handling statistical material and relating the company's activities to trends in the national economy, and offers excellent opportunity to build a career in a progressive firm. Pension scheme, excellent sports and social facilities.—Write, giving full details, to Box No. 943.

FEMALE Personal Assistant/Secretary required for Managing Director of British Agency of major German Industrial concern. Must be of British origin but fluent German speaker and able to take charge during Managing Director's extensive business trips. Good salary for suitable applicant for this permanent position.—Write Box 945.

WANTED, for West Riding, Sales Manager, preferably aged 40/50, for large Group with distribution and retail turnover. Must be hard worker with initiative and able to control sales staff.—Apply by letter to Lupton & Fawcett, Solicitors, Bond Street, Leeds, stating full qualifications.

UNIVERSITY OF EDINBURGH

DEPARTMENT OF POLITICAL SCIENCE

Applications are invited for the post of Assistant in the Department of Political Science. Salary scale £700 x £50 to £850 per annum, with superannuation benefit and family allowance where applicable. The person appointed will be expected to take up duty on October 1, 1958. The successful candidate will be required to conduct tutorials in the History of Political Theory, and also in Modern Government.

Further particulars may be obtained from the undersigned, with whom applications, giving the names of two referees, should be lodged not later than June 30, 1958.

CHARLES H. STEWART,
Secretary to the University.

May, 1958.

HASTINGS & ST. LEONARDS TECHNICAL COLLEGE

(Vacant from September 1, 1958)

Assistant Grade A required for Commerce Department. Ability to teach at least 3 of the subjects—Economics, Geography, Government, History, Commerce and Book-keeping.

Assistant Grade A required for General Studies Department to teach Mathematics to Ordinary level G.C.E. Ability to assist with general work in the College an advantage.

Application forms, obtainable from Chief Education Officer, 20 Wellington Square, Hastings, should be returned within 14 days of the appearance of this advertisement.

MATHEMATICAL STATISTICIAN required at National Coal Board's Research Establishment, Stoke Orchard, Nr. Cheltenham, Glos., to work mainly on the design analysis of laboratory and small scale plant experiments. 1st or 2nd class honours degree in Statistics or Mathematics with Statistics is required. Appointment (superannuable) according to qualifications and experience as either Scientist, Grade 2 (£975-£1,360 male, £931-£1,294 female) or Grade 3 (£630-£1,110 male, £618-£1,059 female); at least three years' post-graduate experience required for appointment to Grade 2.—Write to Personnel Officer (S.1103/2) at above address for application form, which must be returned by June 20, 1958.

THE LONDON SCHOOL OF ECONOMICS AND POLITICAL SCIENCE

(UNIVERSITY OF LONDON)

One Research Assistant and one Junior Research Officer are required to work on a national study of housing and rents, and a local study of these problems in the London area. Applicants should have good degrees preferably in Sociology, Public or Social Administration, or Economics, and if possible research experience in these fields. Salary scales £450 x £25—£675 and £650 x £50—£900 plus £60 London Allowance respectively.—Further particulars may be obtained from the Secretary to the Social Research Division, London School of Economics and Political Science, Houghton Street, Aldwych, W.C.2, to whom applications should be sent by June 30, 1958. All envelopes should be marked "Housing Study."

THE UNIVERSITY OF MANCHESTER

Applications are invited for the post of ASSISTANT LECTURER in ECONOMICS in the Faculty of Economic and Social Studies. Preference will be given to candidates with interests in mathematical economics and/or econometrics. Salary on a scale £700 to £850 per annum. Membership of the F.S.S.U. and Children's Allowance Scheme.—Applications should be sent, not later than June 14, 1958, to the Registrar, The University, Manchester 13, from whom further particulars and forms of application may be obtained.

UNIVERSITY OF GLASGOW

DEPARTMENT OF SOCIAL AND ECONOMIC RESEARCH

Applications are invited for an Assistantship and a Lectureship to conduct research in the above Department. Some teaching duties may also be involved. Preference will be given to candidates interested either in problems of labour economics or in econometrics and national accounting. Salary scale—Lecturer: £900-£1,650; Assistant: £700-£850. F.S.S.U. and family allowance benefits.

Applications (8 copies) should be lodged, not later than June 21, 1958, with the undersigned, from whom further particulars may be obtained.

ROBT. T. HUTCHESON,
Secretary of University Court.

EDUCATIONAL

UNIVERSITY OF GLASGOW

CERTIFICATE IN INDUSTRIAL ADMINISTRATION

A course in Industrial Administration is to be instituted in October, 1958, intended for men in their middle and late twenties in junior managerial positions, and for men who have not yet entered industry but have taken a degree in Arts, Science or Engineering. In special circumstances, officers from the Forces may be admitted.

The course will cover the academic session October to June, the first two terms being given over to full-time teaching, concluding with an examination in the following subjects: Economics, Industrial Accountancy and Finance, Industrial Relations, Industrial Law, Production engineering and Industrial Psychology.

During the third term candidates will be required to undertake practical study of an industrial or commercial problem.

Matriculation fee £3 3s. Class and examination fees £35. Syllabus and application forms may be obtained from the Registrar of the University. The last date of entry is June 30, 1958.

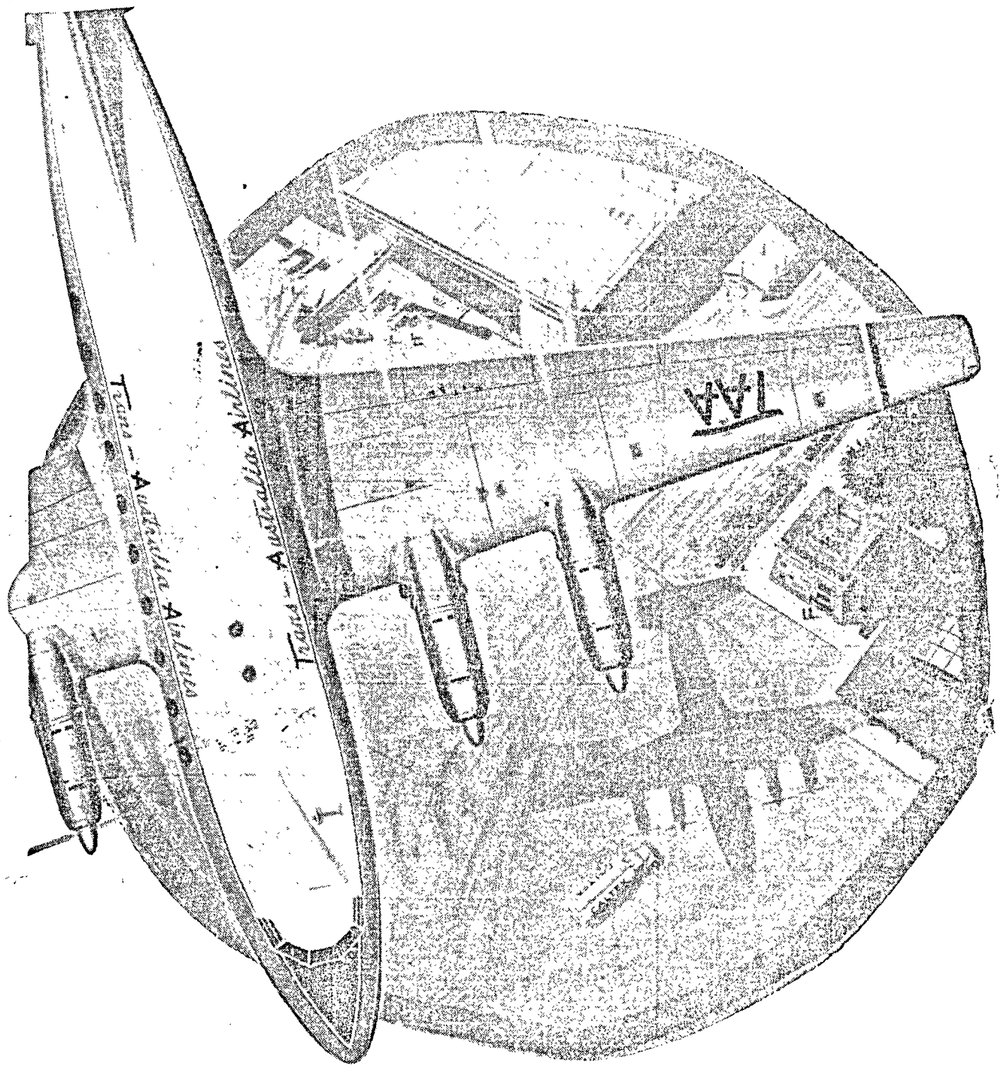
SECRETARIAL TRAINING, especially for university graduates and older students. Six-month and intensive 12-week courses.—Write, Organising Secretary, DAVILSS, 2 Addison Road, W.14. PARK 8492.

EXPERT POSTAL TUITION

for Examinations—University, Law, Accountancy, Costing, Secretarial, Civil Service, Management, Export, Commercial, General Certificate of Education, etc. Also many practical (non-examination) courses in business subjects.—Write today for free prospectus, and/or advice, mentioning examination or subjects in which interested, to the Secretary (G9/2).

METROPOLITAN COLLEGE, ST. ALBANS

or call at 30 Queen Victoria Street, London, E.C.4.



ORDERS for advertisements in *The Economist* are accepted on condition that they are liable to rejection at the discretion of the Editor.

AIR SUBSCRIPTION RATES

Subscriptions to many countries can be sent either by direct second-class airmail or in bulk by air freight for onward posting from central distribution points. Airmail is invariably more expensive but usually quicker by about 24/48 hours. Where only one service is shown this is because the alternative is either not available or not recommended.

Do you get a kick out of your desk?

A kick of inspiration—
that comes to those who work in
really well-planned offices?
Or a smart crack across the shins—
because you forgot to sit the
special, twisted way in *that* desk?
If all's *not* well, *ring* Catesbys
Contracts at Museum 7777
(a letter, if you're abroad).
They'll put things right—make
the office the right shape, decorate
it, put a new carpet here, more
chairs there, and replace *that*
desk with a new one that's almost
a second secretary. Time and cost?
Quick and low! You'll soon make
both up in that spanking new
office, where work's a pleasure
and profits are, somehow,
easier to coax.

When Geigy was 101 years old

The Industrial Revolution was in full swing. Napoleon III was Emperor of France. Queen Victoria was on the throne of England. Abraham Lincoln was about to become President of the United States. Italy was in process of unification. The first transatlantic cable had been laid, the first railway sleeping cars were running. Darwin had written The Origin of Species; Karl Marx was writing Capital. Two years earlier the first all-steel ocean-going liner had been built; two years later the telephone was invented. Gounod's opera Faust was being staged. Walt Whitman, Dickens and Flaubert were writing. Pasteur was working on bacteria, and Perkin had recently discovered the first synthetic dye.

1859

In 1859, only three years after Perkin's discovery, Geigy, one of the oldest chemical firms in the world, began to manufacture coal tar dyes.

Thus Geigy was in at the start of the new era of chemistry which began with Perkin's discovery. For dyes were only a beginning: the next fifty years were to see a profusion of new organic compounds.

This was the starting point of Geigy's expansion. The Geigy Group of Companies today make and sell dyestuffs and tanning materials, industrial chemicals, plasticisers, pesticides and pharmaceuticals. In the field of organic chemicals the name of Geigy is a mark of quality.

Three 2 stage compressors each with 870 c.f.m. displacement discharging at 100 p.s.i.g.

Rotary Compressors and Vacuum Pumps

The Hick Hargreaves Rotary Compressor is of the eccentric rotor type, with sliding steel blades which are prevented from making contact with the cylinder walls by restraining rings. High rotational speeds can thus be achieved without great frictional losses.
Hick Hargreaves Rotary Compressors have many other advantages—easy and cheap installation; retention of initial high performance; regular air flow and low noise level; easy maintenance due to the absence of moving valves, and the reduction of wear to a minimum by the use of roller bearings.
A comprehensive range of both single and two stage compressors and vacuum pumps is available with capacities up to 2,000 c.f.m.

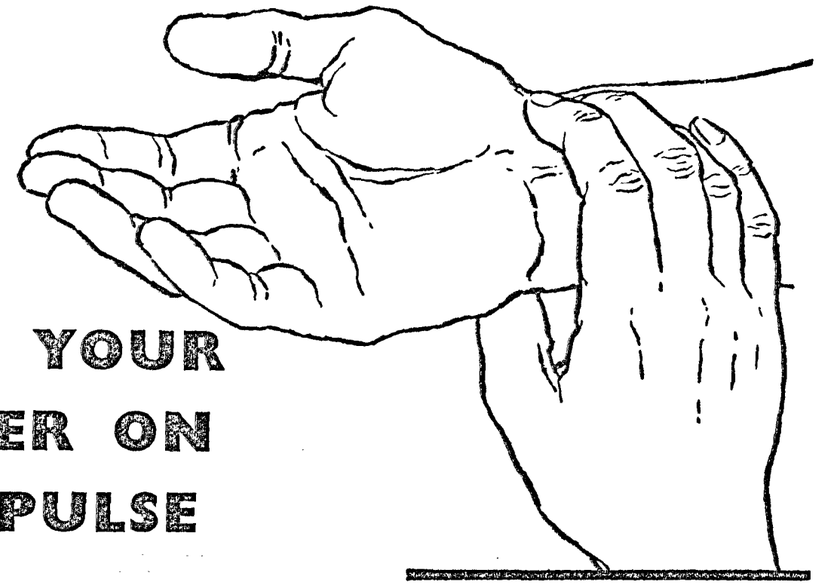
Nine questions before the Board—**THE CHOICE OF THERMAL INSULATION**

1 How much will it cost?
2 How much will it save?
3 How long will it take to amortize?
4 How long will it last?
5 Can you install it and forget it?
6 Will it increase or reduce FIRE RISK?
7 Can you change your production processes below it?
8 Will it be harmed by steam, condensation or a corrosive atmosphere?
9 Will it comply with every possible regulation of the Act—FOR EVER?

If you would like nine straight answers to the above questions write to the Sales Director, Cape Building Products Limited. In the meantime, you may like to note that an Asbestolux Thermal Insulation lining specification cannot be improved upon so far as Thermal Insulation, Fire Protection and durability are concerned —whatever the conditions may be.



FIRE will not hurt it **TIME** will not harm it **WATER** will not damage it **VERMIN** will not touch it

Spicers 'Carbion' a new process applied to protective packaging materials, has great functional and decorative excellence. One of its merits in flexible sleeve form is its ability to adapt itself to the shape of the object it protects. The examples above show its application to a radio valve, a motor-car universal joint and a cider bottle. Carbion itself is an excellent example of Spicers own competence to size up any problem of packaging or paper and provide an efficient, economic answer.

*All the best**

Sales of Leyland's 'Titan' outstrip by far those of any other double-decker in the world. Here is one of a big Madrid fleet.

An Albion 'Chieftain' operating in Southern Rhodesia for Caltex (Africa) Ltd. A Leyland 'Beaver' tractor unit is in the background.

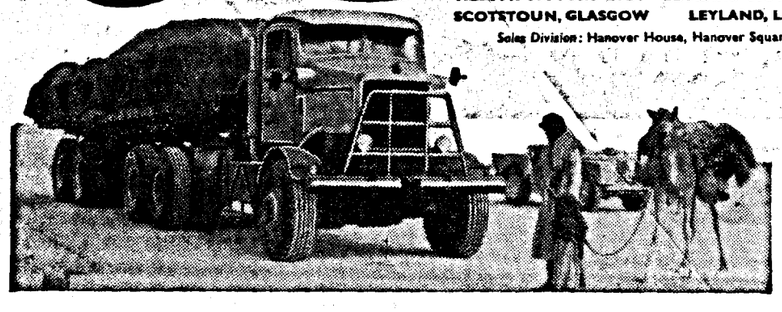
Working in temperatures varying from 100° to below zero, this Leyland 'Hippo' is seen in action in the Southern Alps of Australia.

The moment you buy from

Albion Leyland Scammell

...you inherit a service unique in this world

If you use road transport, Leyland and its associated companies, Albion and Scammell, can offer you everything from 3-ton short-haul trucks to giant 150 tonners . . . and well over 100 models in between. They also make buses and coaches seating from 25 to 78 passengers, which are to be found operating in all five continents. People who really know the transport business pay tribute to the superlative efficiency, economy and reliability of any vehicle made by the Group. That's why they lead in world sales!



But when you buy from Leyland-Albion-Scammell, their experts follow you around, wherever you operate, to see you get the last pennyworth of performance from your purchase. They've got branches and depots in 60 countries stocked with spares and replacement units. Resident and mobile engineers in these countries are on call to help and advise. To cap it all, a team of specialists will fly from Britain to your assistance when necessary.

And where in the world can you equal service like this!

Excelsior!

MAY was a cruel month for those still anxious that East and West should meet at the summit. It began with the conference of Nato foreign ministers at Copenhagen, where the gradual cooling of popular interest in western Europe about such a meeting could be felt in the chill clauses of the ministers' final communiqué. It ended with France giving birth to a new regime, and with French ability to get smartly from the accouchement room to the conference table seriously in doubt.

It would be idle to pretend that these events have made it easier for the West to persevere in what should be its chief preoccupation, the search for a safe accommodation with the Soviet world. Mr Macmillan has stoutly assured the electors of Argyll—and now the Americans—that he still hopes to get to the summit this year, but it does not take a very canny Highlander to recognise that the device on the banner which the Prime Minister so bravely carries looks increasingly strange to some of his allies. Mr Dulles, never an enthusiast, told the Senate foreign relations committee last week that so far he had found nothing in the preliminary talks of the ambassadors in Moscow to justify calling the heads of government together. Mr Macmillan, asked whether he agreed with Mr Dulles, said that he always agreed with Mr Dulles—especially when Mr Dulles agreed with him.

Has the summit lost its point ? It is certainly necessary, in the sharp air of summer, to qualify some of the winter's mistier impressions. Unless the West is willing that President Eisenhower should go to speak on the common behalf *tête-à-tête* with Mr Khrushchev (which would be the most sensible way of doing business, if the President were fit enough) it will be advisable to wait until France is ready to take its place at the conference beside its partners. Again, so long as General de Gaulle's attitude towards Nato (and towards France's own membership of the atomic club) stays undefined, there will be a strict limit to the suggestions which the West could put forward at the summit about the future of central Europe. Any proposals for thinning out the forces there, or putting limits on the introduction of nuclear weapons, depend on the possibility of keeping an adequate deterrent, in the shape of both men and missiles, in western instead of central Europe. If France remains still a reliable base, this may yet be possible ; if not, then a powerful garrison in Germany is all the more necessary.

Indeed, all the interminable preliminaries of the last half year, from Mr Khrushchev's bombardment of letters to the reconnaissance patrols now going in and out of the door of the foreign ministry in Moscow, have simply had the effect of confirming that the list of subjects that can fruitfully be discussed at the moment is very short. From the reports of Mr Gromyko's meetings with the western ambassadors, it seems that Russia is still claiming the wholly unacceptable right to demand the winding-up of Nato and the evacuation of Europe by the

Americans; while the West still wants to bang the table, fruitlessly, about free elections in eastern Europe. There is little profit here. The two sides may settle the argument about an agenda either by taking off all restrictions and permitting a verbal free-for-all, or else by letting each other impose a veto on subjects which they think it pointless to discuss (what neither can reasonably claim is a monopoly of the veto power). But it is clear that the only part of the agenda to offer any hope of doing serious business now must concern a first step, however small, towards a system of international inspection of arms. In fact, this narrowing of the possible scope of a summit conference may have strengthened the chances that a conference will eventually take place.

ONE of the motives behind the Russians' earlier enthusiasm for the summit was undoubtedly the hope that by calling loud and long for a meeting they would undermine those west European governments that stoutly recognise, and insist upon, the need for a strong defensive alliance, and would cause them to be replaced by others more pliant. Once it became apparent that public opinion in the Nato countries could not be led in this way, an important element was removed from Soviet calculations. If that was all the Russians had in mind, the prospect would be dismal; you might lead Mr Khrushchev to the summit, but you could not make him do anything except throw snowballs at the other mountaineers. The encouraging thing is that the provisional ideas now being put forward by the two sides in Moscow are reported to coincide on at least the desirability of making a start on an arms inspection system. The Russians have made remarkably few bones about Mr Eisenhower's request for technical talks on the means of policing a nuclear test suspension; and it is highly likely that they are still blushing at the world's pained disapproval of their brusque rejection of his plan for an Arctic inspection zone. Can they be willing, on this one subject, to bring out their long-hoarded supply of brass tacks?

But is it a big enough subject to trouble presidents and prime ministers with? Could it not satisfactorily be left to the technicians and, when it came to putting signatures on the dotted line, the foreign ministers? The answer is that it might; but there are three good reasons why it would probably be better to link it to a renewed attempt to get to the summit. The first is that, however technical most of the discussion may be, it is bound to require some politically important steps—such as the number of international police stations Russia is prepared to tolerate on its soil—which may well have to go to the heads of government for a decision; and there may be a slightly better chance of overcoming Mr Khrushchev's qualms if he is directly exposed to persuasion instead of being left alone to brood.

The second is that it is in the interest of the West, and of everyone who trembles at the possibility of atomic war, to extend the principle of arms inspection as widely as possible. A supervised suspension of nuclear tests would be good; it would be better if some other experiment in international control could be added to it. Mr Dulles is reported to favour an attempt to add the Arctic inspection scheme to the package. It might also be possible to set up some kind of rudimentary system of supervision in central Europe which would establish the truth of Russian claims to be cutting down the size of their conventional forces there. To draw these threads together into a single pattern is likely to be beyond the capacity of technicians or junior ministers.

The third reason, however, is the most powerful one. It arises from the phenomenon that might roughly be described as the "consensus of world opinion," which embodies the views of the uncommitted nations and which even the Russians are increasingly reluctant to defy. It was this opinion which in 1950 almost unanimously condemned the communists for violating the demarcation line between their world and the West's by invading South Korea. Its crude but unmistakable voice is now beginning to articulate another tenet of its belief: that the great powers must show themselves willing to submit their armed forces to some kind of international inspection. The growl of displeasure that ran round the world when the Russians vetoed the Arctic inspection plan gave them warning that they will ignore this consensus to their cost. It is clearly to the West's benefit to take advantage of the surge of opinion. It can do so by stating its demand for inspection as distinctly, loudly and forcibly as possible; and the best way to do this is to put it prominently on the agenda for the summit. There is nothing to lose. If the Russians accept, a first crack will have been opened in their wall of secrecy; if they do not, they will suffer a propaganda defeat.

IF these arguments are valid, advocates of the summit need no longer feel so much like footsore and busless Londoners who have made a mistake in the Tube and find themselves trying to climb the down escalator. Admittedly, the kind of summit conference which seems possible this year is not the grand and general survey of world problems on which Sir Winston Churchill once cogitated. One day, when conditions are more propitious, the West can return to his concept. When the western alliance regains the flexibility, and decision, which over a wide field Mr Macmillan has been pursuing in Washington this week, it may be possible to contemplate a whole series of summit conferences —where failure to agree will not necessarily mean the failure of the conference, and where a renewed effort can be made to loosen the military straitjackets on the two halves of Europe. Meanwhile, in the comparatively modest sort of meeting which present circumstances allow, priority ought to go to the elements of arms control.

Time for a Stitch

The Chancellor of the Exchequer has expressed the desire to resume "a steady rate of expansion." On likely trends the need may be at least as much to avoid contraction

IN managing an economy, what every government dreams of being able to do is to correct the adverse trends before they really set in; oddly enough, this Government this summer has a chance of doing just that. What is impressive about the economy in mid-1958 is not simply that after three years' disinflationary policy (with the little bit of luck of a fall in import prices) the Government has at last held wage increases to a level that promises relative price stability—as once the bus strike is over it may have done. It is that this has been managed, almost to the last, without running production down. Only now are the signs accumulating that production may be turning downwards with the British economy, nine months behind the American, entering upon an inventory recession; and now the Government, too, is ready to turn.

It is reasonable to talk of this, as the Chancellor is now doing, as "resuming expansion." Certainly it is reasonable to qualify it as "a steady rate of expansion, not so fast as to push up prices again." Nor will anyone be surprised that the Chancellor's emphasis, "when the time comes we must see that industrial investment in the widest sense has a very high priority," suits *The Economist*. But it is as well to face the fact that for the next twelve months or so this may be a matter of holding production up, rather than of promoting expansion; in mid-1958 Britain may not succeed in laying on neatly just the precise amount of reflation it would choose, of just the kinds it likes.

Exports are a priority as well as investment, and here the Government has already shown willing. Clearly, there is now nothing coming quickly from Washington that will significantly strengthen international liquidity. There have been solemn affirmations from Venice this week about toeing the line on export credits and insurance; so there should be. They make it no less likely that major exporters, this winter, will be cutting the corners here and there to win any plum contract that some underdeveloped, uncommitted, unwilling-to-pay-on-the-nail nation waves in front of their noses. Nor should Britain always be left at the tape. But it would be over-optimistic to reckon that anything we can do to stimulate demand abroad, even in the Commonwealth, can prevent our exports from declining this year. Reflation begins at home.

Where it could begin certainly and fairly quickly is where the Chancellor would probably not be anxious to start—in public investment. If he were to remove the restrictions which Mr Thorneycroft imposed in September, there would be no shortage of candidates eager to invest public money. Some would be deserving: it is difficult to think of any road investment project near the top of the pile that would not be a good one for the country, though those easiest to start by ministerial fiat are likely to be the grandiose ones and not the myriad smaller improvements that might pay off most in easing traffic. And it would surely not take as long now to alter the pace of nationalised investment as it did in the early postwar years; much of the slack in the economy today is, after all, in the capital goods industries. The Government has already restored cuts in railway investment; it might be able to satisfy itself that the case is no worse for more investment again in gas, electricity, or coal. Unfortunately, outside observers—particularly overseas—might not be easy to satisfy (in Zurich it might look like more socialism). It is arguable that the most impressive increase in nationalised investment that the Government could announce, with the most far-reaching effects, would be a decision that Richard Thomas and Baldwins should go forward with plans for a fourth strip mill at Newport; but that might look like more socialism nearer home as well.

CLEARLY, however, it is private investment that the Chancellor will most want to stimulate; this is the boom that is passing (though as this week's figures of manufacturing investment show, it is an unconscionable time a-dying). The question is whether, and where, he can act before the downturn really sets in. Where he should start admits of little argument; how much such a beginning will achieve is less clear. Stalwarts alike of selective or of general economic controls can join hands in advocating withdrawal, at the right moment, of the directive to hold bank advances (which are almost certainly already below the ceiling) and on relaxation of the Capital Issues Committee's stranglehold on new issues: either canon would dictate that these discouragements to private investment should come off first.

How much more private investment they would then encourage is anyone's guess. There must, no doubt, be a layer of investment projects that have been shut out during the last two years by these restrictions: Lord Piercy sounds as if he has a filing cabinet full of good small ones. But private industrial investment is now very heavily concentrated into the hands of a few large companies, most of which have been spending very heavily since 1954. These take long views; that has

indeed proved a real safeguard against panic cuts in investment during the years of disinflation. But those long views, in 1954-55, may have glimpsed a level of demand in, say, 1959-60 which they now reasonably may not expect the economy can (afford to) reach for a couple of years longer. Their underlying confidence is not easy to shake; but it is perhaps not easy to boost suddenly, either. Besides, industry has now installed and paid for the capacity to meet that higher level of demand, whenever it can be reached; it has yet to see the return.

It may be, therefore, that we are witnessing the close of a secular investment boom that will hardly be revived simply by the Government ceasing to try to discourage it. If so, switching the fiscal gimmicks—say from initial to investment allowances—could not be expected to have much more prompt effect either. It may be that private investment will not surge forward again until industry tastes the flavour of expansion in total demand —which means consumption too, investment's stimulant as well as its inexorable rival.

Any reflation of demand in general must be careful and cautiously timed. It could hardly come before the season of strain upon sterling, and it must depend on how the American and German economies are looking by autumn, and on what their governments are disposed to do about them. But the psychological moment for the first relaxation of the credit squeeze, sweetened perhaps by some "incantational" half per cent or so (which can always be explained as vital for perfectly good technical reasons, such as *sauter pour mieux reculer*) may be nearly upon us.

France's New Regime

General de Gaulle governs by grace of the army; now that the parliamentary regime is dead, is it possible for him to create a new force to fill the political vacuum?

THE storm-troopers of revolution, when their leaders civilly thank them in the hour of success, are not always very ready to take the hint and go home. More often there is an embarrassing pause while the storm-troopers consider whether to notice, or to overlook, that the warm words of appreciation have been framed in the past tense. Just so must the wordy warriors of the committees of public safety have caught their breath when they heard from General de Gaulle in Oran (June 6th): "One cannot have a revolution every day. . . . Your work *was* sound"; or when General Salan told them (June 8th) that their work *had been* crowned by General de Gaulle's visit; not to speak of their feelings when General Massu, remarking that the revolution was over, added a hint about the Forum being wanted for parking-space. The moment of embarrassment has come quicker for M. Delbecque than it did for Garibaldi or even for Captain Roehm.

Indeed, the May axis of civil conflict has turned into a triangle: the settlers, the Army, and what is left of the civil government of the Republic. Of these three, there can be no doubt that the Army is the apex. As the piecemeal facts come to light that indicate how the May revolution was carried out and why M. Pflimlin and his colleagues gave way before it, it becomes clear that the settlers' part in the revolution, while it was not immaterial, was secondary. They provided the army with the necessary pretext for seizing power in Algiers —the first step in what is now seen as a planned programme for the seizure of power in Paris—and with the useful simulacrum of a mass movement with which to confront the wavering Republican leaders. But the Republic did not surrender to the settlers (whose following in France was inconsiderable); it surrendered to the Army.

It was when M. Pflimlin and his colleagues found the armed forces in France equally resolved with those in Algeria to refuse obedience that they decided to throw in their hand. When President Coty told the Assembly on May 29th that it had to choose between General de Gaulle and civil war, he meant, and was taken to mean, that General de Gaulle was the only prime minister whom the armed forces would tolerate. The Republican parties then invested General de Gaulle with the powers of government and the prerogatives of parliament. But they did not take this step until effective authority had in fact passed from them; they had nothing to transfer but legality. The reality of power was by then wholly in military hands; it is from those hands that General de Gaulle has received power, and on them that he depends to get done anything that he may decide to do, even on the home soil of France.

In Algeria, the army is not merely the source of power; it has also become the executant—a little-noticed change from before the revolution, when the machine of civil government there was directed by a civilian resident minister. The commander-in-chief of the forces, General Salan, has now been appointed the government's delegate-general as well; he has full power in all branches of government, including, as General de Gaulle's letter of appointment makes clear, the power to ship any or all of the civil servants back to France, provided only that he consults Paris about their replacements.

It can be said that this step has merely legalised what was done arbitrarily in Algiers by the sack of the seat of government on May 13th, and on the following days in the other Algerian departments, when most of the prefects were forced out of their offices. But, while the gains of the army have been legalised, those of the committees of public safety have not. True, the committees threw their weight about during General de Gaulle's visit last week, physically preventing two of his ministers from appearing with him on the balcony, stopping mayors whom they disliked—including the mayor of Algiers—from seeing the general at all (which means that they also stopped the general from seeing his mayors), and keeping the Paris radio reporters out of their own radio building. But General de Gaulle and General Salan have told the committees what their place in the new scheme of things is to be, and that it allows them none of the attributes of sovereignty which they had claimed for themselves. Naturally they are using their elbows to keep as much of a privileged position as they can, and it may very well suit the soldiers' book to humour them. As pressure groups, blocking innovations, they may be influential; thus they succeeded in forcing M. Chevallier, the mayor of Algiers, out of office even after General de Gaulle's visit. They can still do a lot of harm, but it is the armed forces, not they, that hold power.

CLOTHED in white samite as they were, General de Gaulle's policy statements on his Algerian tour fitted the Army's requirements, and not the settlers' requirements, for an Algerian policy. Equal French citizenship for all; the end of social privilege and under-privilege; elections, without waiting for the end of the war, to produce some kind of indigenous representatives with whom some form of discussion of the Algerian future is contemplated; clemency for those rebels who lay down their arms; but no hint of a concession on the French character of Algeria, and no hint of any negotiation with the rebels as an organisation.

It is a programme that General de Gaulle can sincerely reconcile with his own principles of decency and justice—the "generosity," to use one of his favourite words, of France; it is also a programme in front of which the Army can fight. It is not what the settlers would have chosen, though in a tight corner they may swallow much of it. The general's promise of local elections within a month seems to them to be going too far too fast, and in this it does appear that they have found some sympathy with the soldiers, since their protest of Tuesday could hardly have gone forward at all without the first assent of General Massu and General Salan. All that is wrong with the de Gaulle programme in general is that it comes a generation or two too late and is by now completely unrealistic; it implies, when all its implications have been weighed by all Algerians, the indefinite continuation of the war.

Although the Tunisians, the Moroccans, and the FLN have at least as much respect for General de Gaulle, and have been in the past at least as disposed to think of him as a possible saviour of the situation, as have the French people themselves, they have straightaway perceived that this is what the policy he has announced must be taken to mean. If they prove to be right, it is well to be clear that it rules out any early improvement in the political state of France itself; if the Algerian problem continues unsolved, then the French problem will continue, too.

To say this is not to attack General de Gaulle, or to underestimate his great personal qualities or to cast aspersions on his character. If he had come to power in other circumstances, he might have been able to offer the brighter prospect—reconciliation abroad, social and political reconstruction at home—for which many Frenchmen, and not a few people outside France, are desperately pinning their faith on him now. But where now are the sources of political strength in France on which he can draw for the pursuit of such a programme? General de Gaulle has been put in power by an army convinced, naturally and humanly no doubt, that its bloody failures in successive colonial wars were the result of irresolute parliamentary government. In fact, the real reason for the failures is that France has been fighting the kind of wars that it is impossible to win; the irresolute governments were to blame not for losing the wars, but for letting them be fought. But the deficiencies of the French parliamentary system concealed this fact, so that only a few civilians in France, and very few soldiers indeed, have begun to understand it. In this state of mind the army has overthrown the parliamentary system and has put General de Gaulle in. The parliamentary parties are left without a shred of credit, unable to give the new prime minister any effective support even if they wished to do so. (The tenuous function of the parliamentarians in the new government is discussed on page 1001.)

In this predicament—without political allies of any consequence, because none exist; dependent on the support and approval of the army; having no choice, as it seems, but to go on with the war—General de Gaulle is preparing for a constitutional referendum to be followed by elections for a new parliament of some kind. Anyone is entitled to hope, and to pray, that by an act of creation, in this short summer that lies between France and its new charter, he may call a political force into being which can give a firm, yet not a military, base for authority in France. Frenchmen of good will have little choice but to hope that this will be so; they have no longer in the background the alternative of de Gaulle to whom they can turn when things come to a deadlock. Yet if it happens it will be nothing short of a miracle. France at the moment is in a strange transitional phase, a free society in which responsible government has been suspended; yet, the suspension having been done with all legal form, the authoritarian regime continues to tolerate personal and political freedom. It is not a state of things that can last; but what, without the miracle, can General de Gaulle put in its place?

A Bill for Trade Unions?

Parliament should pass legislation to protect the individual's right to choose to abstain from striking

THE Inns of Court Conservative Society, a group of influential Tory lawyers, has produced a pamphlet* which is extremely timely and could be exceedingly valuable. It makes detailed suggestions about how the trade union movement, like many an earlier estate of the realm "which was at its inception not amenable to any law, save the law that might is right," could be gently subjected to its own equivalent of Magna Carta and the Parliament Act and "brought in turn under the rule of law."

The great advantage of this pamphlet is that it is likely to get considerable publicity by being violently attacked. Trade union leaders are going to say that its proposals unmask the real, sinister Conservative design behind this year's wage struggle, now at an acute stage. They will point out that three senior members of the Conservative Cabinet are vice-presidents of the Inns of Court Society; and that prominent Tory MPs are active members of it. The Conservative high command can respond to these attacks in one of two ways. Either it can point hastily to the usual saving clause that the views in the pamphlet do "not necessarily express the opinions of those members of the society who have joined the Government." Or else it can face the attacks boldly, grasp at least part of the nettle, and introduce legislation on some of the lines suggested, preferably in the next session of Parliament. This would be much the better course. The Government would be unwise to implement some of the legislative proposals which the society recommends; but it will be even more unwise if it ignores all of them.

THE proper object of a reform of trade union law is surely simple to state. In a free society no private citizen should have the unfettered power to compel another private citizen to do something that he does not want to do. Down the centuries in British history legislation has been brought into effect to protect the right of the individual to have different politics from the squire; to have a different religion from the established church; to do things that would annoy the barons and the King. The individual right that most patently needs to be protected by new legislation now is the right not to strike. If a man wants to withdraw his labour or to take some other restrictive industrial action, either because he thinks that this is in his interests or because he is willing to accept a majority decision of his workmates, then he should be allowed to do so. But if he does not want to strike, nobody should have massive powers to force him to. Least of all should those powers be exercisable by using sanctions of industrial life and death.

The sanctions of industrial life and death used to lie far too much with employers. This has been gradually mitigated by law, custom, full employment, and the existence of free trade unions. Perhaps the process of mitigation by legislation, which began with the Factory Acts, should now be still further extended (the Inns of Court Society suggests that, to prevent a man from being suddenly thrown on the scrapheap, all employees should statutorily have a right to a longer period of notice and to higher severance pay). Certainly, the existence of free trade unions is still essential as a counterweight to the power of the industrialists' long purse. But nobody who has any acquaintance with the present industrial scene can doubt that the unions have now, in their turn, become very much more than a counterweight of this sort. They have taken over far too many intimidatory powers themselves. As one trade union leader admitted last week, there is now in some factories an "atmosphere of fear" that anybody who gets on the wrong side of the shop stewards "is for the high jump." It lies in the logic of Britain's history that controversial legislation will eventually have to be introduced to curb this new despotism; the sooner the better.

THE bill to curb these powers would not be very difficult to draw up. A first practical step was suggested by *The Economist* last February, and our proposal is now seconded (although in a somewhat too extreme form) by the Inns of Court Society. Its pamphlet argues that the trade unions have acquired their present dominant position largely because of the considerable legal privileges accorded to them. These are, mainly: (a) the freedom of all concerned with a trade dispute from being sued for civil conspiracy even if they combine with the intention of deliberately harming another person; (b) trade unionists' freedom from being sued for inducing a breach of contract by an individual; and (c) the protection given to trade unions from actions in tort. These and other privileges are given to trade unions and persons engaged in a trade dispute under the trade union acts of 1871, 1875, 1906 and 1913. The Conservative lawyers now suggest that all of these powers (*The Economist* would say only some of them) should no longer be given automatically under these acts. Instead, they should be given only to "trade unions that have been registered with the Registrar of Friendly Societies and to their members acting as such." And the registrar should be empowered to make conditions that must be obeyed by the rules of all trade unions which are accorded this privilege of registration.

The Conservative lawyers have two aims here, in one of which they seem to be misguided. Their misguided aim is that they think that the new powers of registration should be used directly to limit strikes. They think that strikes called by a union should be covered by present legal privileges only if the strike "has been preceded by an inquiry by an independent tribunal into the facts and issues of the dispute," and that "a period of fourteen days" should elapse between the publication of the tribunal's report and the posting of strike notices; there is something to be said for encouraging cooling-off periods of this sort, but little—at the moment—for legislating about them. The pamphlet also says that one very "beneficial effect" of its proposals would be virtually to prohibit "unofficial strikes." By definition, it points out, any unofficial strike "would be organised by those who had not become registered as a trade union. They would therefore not have the privileges conferred on workmen by the various trade union acts, and would run the risk of civil or criminal proceedings." This distinction between the official and unofficial strike, a distinction which is as beloved at Transport House as it is by Tory lawyers, is very dangerous. Although many unofficial strikes are admittedly organised by communists or other congenital malcontents, some of them are still impromptu expressions of protest against some local *sottise* by an employer, unpopular foreman, or the like.

As a cold matter of experience, these unofficial strikes sometimes deserve much more sympathy than strikes called by Mr Cousins or some other potentate at Transport House. The supposition that an unofficial strike is always a bad one (like the supposition that an official strike is always a good one) is based on an unfounded glorification of trade union officials.

BECAUSE of these complications, the right course, surely, would be to reject any idea that new legislation should seek directly to limit strikes, and to concentrate instead on legislation to safeguard the freedom of individual workers. Strikers' freedom from being sued by employers should remain generally intact as now, and still covered by the trade union acts; the proposed machinery of registrar's rules should be designed to protect not mainly firms, but individual workpeople who prefer to be non-conformist. To some extent, what is wanted now is a charter for breakaway unions (the pamphlet recognises that minority groups of workers should be much freer than they are now to form unions of their own choice); but, in much bigger part, the need is for what union leaders will no doubt call, indignantly, a charter for blacklegs.

Briefly, a man who is hounded out of a job by fellow trade unionists should have the right to sue for civil conspiracy those of his fellows who have been active in this hounding, unless the dismissal from his union and his industry has been effected according to rules registered with, and accepted by, the registrar of friendly societies. Here the Inns of Court Society's pamphlet suggests an admirable formula.

Where a union does not operate a closed shop, it says in effect, rules about expulsions need be little changed from what they are now; voluntary unions of this sort are genuinely comparable with any other voluntary society. But where a union does choose to operate a closed shop, then—if it is to continue to be free from the threat of suits for civil conspiracy—it should be obliged to agree that "no person of good character who genuinely desired to carry on an occupation covered by the union was prevented from joining the union"; in addition, expulsions should be valid only "in cases of serious misconduct," and they should be effected only through proper and formal administrative machinery with provisions for appeal to an independent body.

IF these reforms could be put on the statute book, the only strikes that would be at all effective would be those which a large number of the union members concerned genuinely wanted to join. The worst sorts of unofficial strikes would disappear if ordinary workers no longer felt that those who got on the wrong side of the shop stewards "were for the high jump"; and some people may doubt whether, under these conditions of legal security for their jobs, the London busmen would have responded to Mr Cousins's official call in much greater numbers than the underground railwaymen responded on Monday to the call of unofficial militants (who, the tube workers knew, could not get them the sack). If the busmen had still come out under the reformed system, then that would have been a sign that Mr Cousins was undoubtedly right in his claims that the busmen are "united in their resolve"; nobody could then complain that he was guilty of intimidation.

What possible objection, in the ethics of democracy, could there be to the Government introducing this limited and strictly libertarian reform of trade union law? The answer, of course, is that there is no objection in ethics, but that there is conceived to be one in politics. If legislation of this sort were introduced in the parliamentary session starting next autumn, it would cause a major political row, which might swamp all other issues in the general election that will follow soon after. But this is not an objection; it is an advantage. The coming general election, instead of being one between vaguely defined Conservative ins and still vaguer Labour outs, might then be a really historic contest, fought largely on one crucial test issue: it would determine whether the British people prefer to accept, as a continuing feature of their industrial life, the present (perhaps convenient) despotism of the trade unions, or whether they would opt for freedom. Both parties might be surprised at the result.

Close Shave in Rhodesia

With the federal elections due in the autumn, the rise of the Dominion party overshadows Rhodesia's future

To the relief of almost everybody in Britain, the moderates have won the day in the Southern Rhodesian general election. Yet such a narrow electoral victory, in a contest fought on the life-and-death issue of black-white relations, comes perilously close to being a moral defeat. Mr Todd, the prime minister until the cabinet crisis of last April, has been hurled into the wilderness, partyless and seatless; Sir Edgar Whitehead, who supplanted him, has had the government's majority cut from 18 to four; and, above all, the moderates won only because of Southern Rhodesia's peculiar voting system. The best that can be said of such a result is that it gives both black and white Rhodesians a little time to think where they are going. But not much time; in the autumn Sir Roy Welensky, the federal prime minister, will have to face the Rhodesian electorate as a whole on almost the same issue in the federal elections, and without the same voting system to help him. Fortunately, because of the strength of his support in Northern Rhodesia, Sir Roy can probably still expect to win. Our correspondent in Salisbury, in a despatch on p. 1002, certainly gives a very confident prediction to that effect. But, looking at the results of last week's voting in the most important of the three territories of the federation, liberals here should recognise that the principle of partnership in central Africa is engaged in a stern struggle for its life.

The United Federal Party, which is Sir Roy Welensky's party as well as Sir Edgar Whitehead's, won 17 of the 30 seats in the territorial Southern Rhodesian house. But it won them on a minority of votes. Southern Rhodesia has plumped for the optional alternative vote; and this three-cornered contest between Sir Edgar's middle of the road party, Mr Todd's breakaway liberal party and the Dominion party opposition affords a case history in its operation. On the first preference voting, the Dominion party, which detests Mr Todd, Sir Edgar and Sir Roy indiscriminately, came comfortably home, winning 18,142 votes to Sir Edgar's 16,840 and Mr Todd's 4,663; this would have represented 17 seats to Sir Edgar's 13 and Mr Todd's none. On the British system, Mr Stockil, its leader, would now be forming the government.

The alternative vote saved the day for the moderate men. When the second preferences were counted in those constituencies where the winner had not an absolute majority over the other two (or three) candidates the position was exactly reversed, and gave Sir Edgar 17 seats to Mr Stockil's 13. (Mr Todd still got none.) There is no alternative vote in the federal constituencies. Admittedly Mr Todd may not split the poll there. But if the swing against the government of the day goes further—and if it shows anything like the same strength in Northern Rhodesia as well—Sir Roy Welensky will face defeat. Mr Winston Field, on these figures alone, would stand a chance of finding himself federal Prime Minister in a few months' time—pledged to wrest independence for the Federation from Britain as he is pledged to arrest the pace of African political and social advance.

It is not unreasonable to see in the Southern Rhodesian election something of the federal shape of things to come. Ranged with Sir Edgar were Sir Roy Welensky and Lord Malvern, who threw the whole weight of his unique authority in Rhodesia into the scales. On the other hand, all the anti-liberal forces coalesced under Mr Stockil, who fought side by side with Mr Winston Field, leader of the federal Dominion party. The issue was African advancement, which, it should be said, is largely a territorial responsibility; but the electorate was passing judgment on Mr Todd's "ultra liberal" decision to extend 20 per cent of the franchise to Africans, as it will shortly pass judgment on Sir Roy's broadening of the federal franchise—which was so bitterly criticised in Britain for not being liberal enough. Mr Field, though he has many planks in his platform, came out bluntly for the reversal of both franchise reforms, by means of tests of African "franchise-worthiness." Mr Field attacks anyone who implies that his party stands for apartheid—for South African *baaskap* under the Union Jack. But his party contains sufficient extremists, who openly proclaim that Rhodesia must follow the "southern African pattern," to justify Mr Todd's warning that, behind the specious formulas of its manifesto, Mr Field's party is essentially opposed to any genuine racial partnership.

YET the federation of three such diverse territories as Northern and Southern Rhodesia and Nyasaland, with the immense and unredressable preponderance of blacks over whites, can only stay viable if the centre party is strong: if, above all, the innate tendency in multiracial territories for the white settlers to move to the right, as the black citizens awake politically and begin to flaunt an aggressive black nationalism, is contained. Clearly that tendency is not being contained in Central Africa at the moment, on either side of the colour bar. From the inception of federation, the African National Congresses in the two Northern protectorates, fearful of the settlers' power, have indulged in extreme language by way of protest at their lack of real and reassuring political influence; while the whites' growing fear of black intransigence has deepened opposition to the very measures intended to conciliate the blacks. The revolt against Mr Todd was only the latest manifestation of this erosion from the central party of its white—and black—supporters. It may not be the last.

It is too soon to assert that this erosion will go so far as to make federation untenable—that it will end, as Sir Edgar Whitehead in a moment of desperation warned his countrymen it might, in the loss of the two Northern territories to black nationalism and of Southern Rhodesia to Messrs Strydom and Verwoerd. But, if this is not to be the end of the great experiment of central African federation, strenuous efforts must be made to halt the process; for Sir Roy to scrape in with as narrow a majority as Sir Edgar would indeed be a pyrrhic victory for the principle of partnership in the long run. Clearly Sir Roy and Sir Edgar must work with Mr Todd to reunite the liberals. They must also somehow hold out a more friendly hand more convincingly to the African moderates, whose failure in Southern Rhodesia to register in the numbers to which they were entitled (because the African National Congress held them back) lost Mr Todd, their champion, all voice in the house. Mr Samkange has made a moving appeal for more understanding of moderate African leaders' difficulties. On their side the Africans ought to see that with so close a balance between the two opposed European groups they have a unique chance to influence events by playing their full part under the reformed federal franchise—even though it has not been reformed as liberally as they and some other people would like. Boycotting the federal elections may merely hand power to those who would deprive them of their newly-conceded power to play an increased parliamentary role.

Now is the time for all wise men to give something up—the Africans their dream of secession, the United Federal party its dream of "throwing out the Colonial Office", the Todd liberals their eagerness to split the vote, and the British Labour Party its hope of forcing the pace too fast. If the friends of progress in Central Africa will not make these concessions to political realities, they may merely fulfil the dreams of the apartheid-minded extremists instead.

NOTES OF THE WEEK

DISARMAMENT

The Caravan Moves On

"CERTAIN elements, one might almost say, of the party knock-about"—to use Mr Selwyn Lloyd's words—played a sadly large part in Tuesday's House of Commons debate. Disarmament is such an unwieldy topic that it always tempts people to over-simplify; and this temptation is too often reinforced by the urge to score party points. Mr Bevan's indignation with the Government led him to say that the Russians could not be blamed for boycotting disarmament talks in the United Nations. Mr Sandys, in turn, was provoked into accusing Mr Bevan of arguing "that everything the Russians do is right and everything we do is wrong." Later in the debate, Mr Denis Healey crisply remarked that the Prime Minister was in Washington trying to "persuade the Americans not to agree to a ban on atomic tests being separated from other measures of disarmament."

Mr Philip Noel-Baker's new book (a review of which appears on page 987) was cited by many speakers. But even those who had been favoured with advance copies did not seem to have read, marked, and inwardly digested them. Mr Bevan, for one, in spite of having such a useful compendium to hand, got unhappily mixed up between the events of 1955 and those of last year; and his praise for Mr Noel-Baker, whose main thesis is that partial disarmament measures will not do, did not prevent him from concentrating on partial measures and turning a jaundiced eye on Mr Sandys's exposition of the need for a strong world authority to enforce general disarmament.

What Mr Sandys said on this crucial point was hailed as a spectacular new departure by some members, as he intended it to be; others derided it as a mere diversion. The Foreign Secretary did not respond to Mr Henderson's plea for more light on the subject—nor to his suggestion for making a start towards a world peace-keeping authority by placing a UN force in central Europe to facilitate disengagement. Even Mr Noel-Baker seemed more interested in wrangling over the past than in setting out the essentials for the future.

This disappointing debate does not obscure the week's indications of modest progress on the international plane. The dogs may bark, but the disarmament caravan seems to be in motion—though admittedly slow motion. Mr Eisenhower's latest letter to Mr Khrushchev appears to remove the last obstacles to the proposed meeting of experts to discuss the supervising of a suspension of nuclear tests. And on Wednesday Mr Khrushchev was reported as saying that Russia did not intend to resume its tests, despite the fact that America and Britain had not yet suspended theirs. It is much to be hoped that he was reported correctly.

SOVIET UNION

Dollar Aid for Moscow?

INTERRUPTING the series of summit exchanges, Mr Khrushchev has now sent a trade invitation to Washington. In a letter addressed to President Eisenhower, he points out that the United States is the only important country not to have a trade agreement with Moscow. The Soviet Union, he argues, can be an extremely useful trading partner. The new drive to develop consumer industries, chiefly the chemical branches, makes Russia particularly

interested in foreign supplies. Within the next few years, he claims, it could absorb goods from the United States to the tune of "several billion dollars". If the American market does not at present want a corresponding volume of Soviet commodities, the Russians will be happy to buy on credit.

After the communist strictures on Jugoslavia for its dependence on American aid, this bid for credits is bound to raise a laugh. The fact that Russia, the apparently generous creditor of the East, has joined the queue of borrowers in Washington will also provoke amused comments. The proposal, however, cannot be dismissed so lightly. The timing is excellent, for in the present state of world business nobody will turn down a possible outlet in foreign markets without a pang. Mr Khrushchev is not asking for strategic goods, but chiefly for equipment for light industry. He also asks for an exchange of information and welcomes the prospect of American consultants in Soviet firms. Finally, the clause about credits is introduced by the sentence that "many American firms are interested in getting orders now"—the only gentle hint about the recession.

Mr Khrushchev, when he outlined his plans for the development of Soviet chemical industries, last month said that some of the necessary equipment should be ordered "in capitalist countries". He recalled that in the early thirties Russia had been one of the best customers of the United States. Conditions today admittedly are different: American production is not paralysed by a slump, and Russia is no longer in the early stages of its industrial revolution. Nevertheless Moscow now seems in real need of foreign supplies and, if the American deal does not come off, some of the orders may go to British or German firms. Russia's gigantic initial proposals usually end with the striking of a few concrete bargains.

Musical Chairs

BECAUSE Beria had no ear for music, and because Mr Molotov and Mr Malenkov were dreadful philistines, injustice was done to such prominent Soviet musicians as Shostakovich, Prokoviev and Khachaturian. Such is the conclusion of a surprising statement in *Pravda* last Sunday. For some unknown reason the party's central committee decided to turn its attention to music and to revive a ten-year-old affair. In 1948, it will be recalled, the Soviet communist party, under the late Zhdanov's guidance, was reasserting its full control over the arts after a period of wartime relaxation. The new statement endorses the broad lines of the Zhdanovist policy, its condemnation of the twin sins of "modernism" and "formalism." It adds, however, that though the campaign was correct it was marred by unjustified and unduly harsh attacks on prominent Soviet composers. This was due to Stalin's subjective judgment, evilly influenced by Mr Khrushchev's three fallen rivals mentioned above.

Any loosening, however slight, of the Zhdanovist straitjacket must be welcome. But it is odd when musical criteria change with the fluctuations of political fortune. In the same issue of *Pravda* there is a long article on music, quoting Mr Khrushchev. But will Mr Khrushchev's own aesthetic reputation survive if one day, in this deadly game of musical chairs, he loses, like Mr Malenkov before him, his seat of power?

STRIKES

Underground Movement

THE main interest in the strikes this week has shifted from the high places of the TUC to the far underground. The story of the unsuccessful one-day stoppage on London's tube railway on Monday deserves to be closely studied, not least by the editors and industrial correspondents of some national newspapers, who must carry a considerable share of the blame for such dislocation as occurred.

The facts of this curious affair appear to be these. On Thursday of last week, the day on which negotiations between Sir John Elliot and Mr Cousins broke down, a room full of union militants, said to "represent" 11 out of the 38 branches of National Union of Railwaymen tube workers, met to consider taking sympathetic action with the busmen. Their leader was Mr Tom Doubtfire, described (but see below) as an £11 6s. a week motorman. This entirely unofficial meeting "decided unanimously" to call a strike every Monday until the bus dispute was settled. Ten thousand leaflets had been printed (financed by whom?) dressing up this decision as having been taken by "the chairman and secretary of the conference of the London Transport Executive's NUR branches," and these were distributed up and down the lines and put on union notice boards in underground depots. Further publicity was secured by contacting the press, where—no doubt much to the organisers' delight—the "threat of tube chaos" made front-page news.

On the same evening, the NUR itself sent round other notices which were substituted for the unofficial ones in the depots, telling the men not to strike. But throughout the next two days the press carried stories of meetings of "delegates"—said in total to represent some 800 men (principally at Fulham, Ilford, Leyton, Earls Court and Covent Garden)—which "passed resolutions approving strike action." The barrage of words was carefully built up, and many underground men must have supposed that if they turned up for work they would make themselves very unpopular with some elusive but newspaper-suggested mass movement of their mates. Presumably because they could not find out exactly where this mass movement was, most of them fortunately had the good sense to disregard this scare technique. On Monday only 230 underground drivers and conductors failed to report for duty, which makes some of the press reports about the numbers who had previously voted for a strike look rather odd.

Mr Doubtfire's own job is interesting. He is paid by London Transport as an underground train driver, but he has not driven one regularly for quite a time past; he seems to have been employed, in effect, as a full-time shop steward for some years. To whom is Mr Doubtfire supposed to be responsible, and—if, in fact, he is carried for this full-time job on London Transport's payroll—why?

Other Small Back Rooms

THE technique of stimulating strikes from a small back room has been used with equal enthusiasm, but greater effect, by the 25 self-appointed "dockers' leaders" on the unofficial port liaison committee at London docks: 3,500 men have been on strike at Tooley Street for a month in support of strikers at Smithfield meat market, and they were

joined during the following fortnight by 16,000 other dockers who had been led to believe, by rumour spreading and suddenly convened meetings, that the employers were using clerks' labour in the docks on a large scale. In fact, "black" workers had until then been confined almost entirely to Tooley Street, where employers were bound to let goods be moved out of cold store because they had already been bought; in many cases the buyers had always moved their own goods anyway. Enthusiasm for the strike outside Tooley Street has from the start been lukewarm, but the efforts of Mr Fry, the London dock secretary of the TGWU, to get the men back to work have been hampered by widely broadcast unofficial resolutions taken by small groups to continue the strike. The motion in favour of a return to work next week, carried by a large majority of union delegates on Tuesday and supported on Wednesday by dockers in every port area except Tooley Street, gives some hope that the strike will soon be over. But the return is to be conditional on "all black labour being withdrawn"; it would be nonsense to allow food to rot at Tooley Street, and purchasers must be able to take their own goods away from the warehouses; so long as Smithfield, and thus Tooley Street, stays out the position throughout London docks will therefore remain precarious.

Meanwhile, the London bus strike drags on. Last Friday the 131 busmen's delegates decided unanimously to support Mr Cousins in turning down Sir John Elliot's latest offer. In contrast to the leaders of the dock strike, these delegates are at least properly elected; they took office in January for a two-year spell after a ballot vote, characterised by the usual small polls. But their militancy is buttressed in many cases by political fervour (at least one of their leaders was at one time removed from the union for Communist activities). It was to these men that Mr Cousins was referring when he said last week that there had not been one word among the busmen of "wavering or fear or desire to go back. Their talk is only of the justice of their claim." The ordinary rank and file busmen, with small savings, a family to support and hire purchase instalments to pay—and with £7 a week less money coming in—are by no means so unanimous. And some people in the Labour movement should be letting Mr Cousins know it.

BY-ELECTIONS

Bogeys for the Five

FIVE by-elections were taking place on Thursday. Two of these were in Labour's grimy Lancashire strongholds of Wigan (where unemployment has recently risen to 4.7 per cent of the insured labour force) and St Helens (Sir Hartley Shawcross's former seat). The interest in these two constituencies will be (a) how large the swing to Labour is; and (b) how small the poll is, with no Liberal intervening. The other three by-elections are in three formerly safe Conservative seats, scattered at the three corners of this triangular country of Britain. In each of these a Liberal candidate is standing. The *News Chronicle* Gallup poll has been active in two of these constituencies, and the interesting thing—compared with recent by-elections—is how favourable to the Conservatives its findings were:

(1) In the London suburb of *South Ealing*. The 1955 result here was: Conservative (Mr Angus Maude) 59.6 per cent of the poll, Labour 30.9 per cent, Liberal 9.5 per cent. In the recent county elections (and to a lesser extent in the borough elections) the swing away from the Conservatives in London suburbs was very large indeed; in straight fights in the county elections the swing away from the Tories in London was 9 per cent, and with a Liberal intervening one would expect the swing to be much bigger. Yet the latest Gallup poll in South Ealing (allowing for redistribution of the doubters' votes) suggested that the Liberal might pick up rather over 10 per cent of the poll compared with 1955, of which only just over 9 per cent would come from the Tory and the other 1 per cent from Labour. If this really is the result, it must represent a Conservative recovery since the county elections in April. The main event in the constituency since the Gallup poll was taken has been a BBC television programme, in which—purely to cite our own opinion—the Liberal candidate appeared rather more impressive than the newspapers have recently suggested and the other two candidates rather less so.

(2) In the Somerset holiday resort of *Weston-super-Mare*. The 1955 result here was: Conservative (Mr Ian Orr-Ewing) 62.7 per cent, Labour 37.3 per cent. But the last time a Liberal stood at Weston, in 1950, he got 15.6 per cent of the vote. Using the "Torrington formula" suggested in *The Economist* on page 485 of our issue of May 10th—that a Liberal might now expect to pick up 15 per cent more of the total vote than the last time a Liberal stood in a particular constituency, all his votes coming from the Tory—Weston was therefore one of the last of the 39 Conservative seats which, we suggested, a Liberal intervention might make vulnerable to Labour. But the latest Gallup poll figures suggest: Conservative 44 per cent, Labour 28 per cent, Liberal 28 per cent. That would represent only the "pre-catastrophe" rate of loss to the Tories; they would be losing two votes to the Liberals for every one lost by Labour.

(3) The third constituency, the Scottish county of *Argyll*, is a very tricky one for the electoral statistician. The 1955 result, in a straight fight, was: Conservative (Major McCallum) 67.8 per cent, Labour 32.2 per cent. No Liberal stood, even in 1950. But Argyll is a very similar constituency to Inverness, where the Scots rugby football international, Mr J. M. Bannerman, has since roused the clans in the Liberal cause—to within an ace of Liberal victory. Mr Bannerman has been active again in Argyll, but newspapermen on the spot—*The Economist* has not sent a correspondent to these wild reaches—are still forecasting a Tory victory.

The votes in these five constituencies have now been cast. The results are awaited as we go to press. But if the Gallup poll in South Ealing and Weston has been even approximately correct, it indicates a significant Conservative recovery since the county elections in April. If this is confirmed by the voting, what will have caused it? Anger with Labour about the strikes? The results will deserve to be closely analysed by all three parties.

CYPRUS

Ankara Turns on the Heat

THE long-awaited and elusive British statement on Cyprus is promised by next Tuesday and this time, it seems, there will be no backing out of it. Relations between the Greek and Turkish Cypriot communities, which used to be able to live together amicably, have deteriorated to a condition that is almost intolerable. As usual, the

prospect of change has provoked disturbances; but this time it was the Turks who sparked them off, and there is plenty of evidence to indicate that they did so in accordance with a pre-arranged plan that was almost certainly known in Ankara even if it was not actually drawn up there.

It was therefore distinctly disingenuous of the Turkish government (even though some Turkish Cypriot lives were lost) to demand on Tuesday that these "deplorable incidents" must cease. (In Cyprus the British authorities have been criticised for their alleged failure to clamp down as vigorously on rioting Turks as on rioting Greeks.) But Ankara, believing, perhaps, that the British Government has set its face against partition, is clearly determined to bring every possible pressure to bear in favour of the only solution that it says it will accept. There has been an energetic pro-partition campaign in the Turkish press, and last weekend there were anti-Greek and anti-British demonstrations in Istanbul that could not have taken place without the Turkish government's permission. It is a great pity that at this critical juncture the Turks should have chosen to commit themselves even more deeply to an impracticable solution.

It would, however, be quite wrong for the British Government to be deflected now from its course by any last-minute alarums and excursions. Whatever the exact details of that course, the present inflamed atmosphere makes it certain that when they are announced they will meet with violent opposition.

Algérie Française

THE policy of integrating Algeria and France started in 1834 when northern Algeria was first declared French territory, a governor-general was sent from Paris, and new colonists, mainly from among the unemployed in the south of France, were recruited with promises of free land and state subsidies. In 1848, the colonised territory was given the status of a group of French departments, a status which it still retains (though the Saharan part of Algeria is treated differently). The integration movement was briefly interrupted during the Second Empire: Napoleon III, who had his own ideas of Algeria as a dependent Arab kingdom, protected native ownership of land and stopped official colonisation. This trend was later reversed and in the eighties the Arabs lost nearly half their property, mainly through forced sales.

The policy of bringing Algeria ever closer to France ran into special problems because of the difficulty of reconciling French civil law and Moslem law. In 1865 a senate decree gave highly qualified Algerian Moslems the chance of adopting French citizenship if they agreed to abandon their personal status under Shariah law; in practice, this meant conforming to French laws concerning marriage and inheritance. The handicap remained when the basis for French citizenship was extended in 1919. In 1936 the French assembly rejected a proposal put forward by Léon Blum and Senator Viollette which would have conferred French citizenship on a tiny and highly qualified élite of Moslems without forcing them to renounce their status. At that time only a fraction of the Algerian Moslems had opted for French citizenship, and the assembly's intransigence inflamed Algerian Moslem feeling against France and against integration.

After the allied landings in North Africa, Moslem nationalist groups began for the first time to put forward claims for Algerian autonomy. The committee of national liberation under General de Gaulle tried to quieten these dissident voices by resurrecting the Blum-Viollette proposals in a slightly wider form, and by promising various social and economic reforms. Eight years earlier these measures might have given satisfaction; in 1944 they struck the Moslems as wholly inadequate. Nationalist groups intensified their campaign against integration, and in May, 1945, serious rioting broke out and was severely repressed.

A year after the establishment of the Fourth Republic, Algeria got a new constitution. The 1947 Organic Statute opened the road to integration by extending French citizenship to all Algerians while maintaining a distinction between French and local *statut civil*. As a gesture to nationalism, the statute introduced a degree of local autonomy. The governor-general was given complete control of all public services, with the exception of justice and education. The consultative assemblies established at the end of the last century were replaced by a single assembly which, theoretically, had the power to initiate some domestic legislation. Half of the assembly's 120 members were elected by an electoral college consisting of all the citizens of French civil status and a few citizens of local status (Moslems) distinguished by military, educational or administrative qualifications; the other 60 members were elected by a college consisting of the remaining Moslems.

The two electoral colleges each sent 15 deputies to the French assembly. French citizens in Algeria have been represented in Paris since 1848, and Moslems, representing a handful of highly qualified co-religionists, have sat in the French parliament since the nineteen-thirties.

From 1947 until the nationalist rebellion began in November, 1954, political developments in Tunisia and Morocco distracted attention from Algeria. In 1955 the governor-general, M. Soustelle, was given special and sweeping powers. In the same year a majority of the deputies elected by the second college, who had previously tended to favour assimilation, declared themselves for the idea of Algerian nationality. The elections due in 1956 were postponed and the assembly was dissolved. With the appointment of M. Lacoste, the office of governor-general was renamed that of minister for Algeria, and its holder became a member of the French cabinet.

After three years of cruel and expensive fighting, the government of M. Bourgès-Maunoury introduced in September, 1957, the outline (*loi-cadre*) of a new constitution for Algeria. The French assembly rejected the proposals and turned out the government, but subsequently endorsed a second version containing more safeguards for the European minority. The effect of the new constitution would be to divide Algeria into a number of territories each endowed with two organs of government: an elected assembly and a council of communities, consisting of an equal number of representatives from French and Moslem communities. Should the two bodies disagree, the minister for Algeria might refer the dispute to the French council of state. Federal bodies, on the same pattern as these territorial ones, would be superimposed on them after a delay of two years; and, as a further check on the Moslem majority, the departments of education, justice, currency, power resources and public services would remain under the control of the French government and its minister in Algeria. How far these proposals are still a point of departure after last month's *Putsch* is, to say the least, obscure.

LEBANON

Nasser's Price for Peace

THE Lebanese have been given every opportunity to settle their own troubles. The United Nations Security Council, to save itself and Lebanon embarrassment, passed the Lebanese complaint to the Arab League. Though it offered a useful resolution on the stopping of anti-Arab propaganda from all Arab radio stations, the Arab League has failed to convince the Lebanese that the resolution was adequate for their purposes. With everything to gain and nothing more to lose the Lebanese government would have done well to accept the recommendation. Instead, it allowed the question to go back to the Security Council, which on Wednesday voted (the Soviet delegate abstaining) to send neutral observers to ensure that men and arms do not cross the border illegally. The wisdom of the plan is questionable. It will not be acceptable to the Lebanese opposition; the Syrians can, and quite possibly will, keep the observers away from their side of the frontier; and elsewhere in the Middle East it will be regarded as concrete evidence of western interference in Arab affairs.

The Lebanese government blames all its troubles on the United Arab Republic; in fact, it might reasonably blame some of them on the stubbornness of President Chamoun. President Nasser makes no secret of his attitude towards the Lebanese imbroglio. He would like to see the insurrecton come to an end. Even his prestige cannot hold up while people are being blown up in his name. As far as he is concerned he has already won the victory which, in the beginning, he regarded as necessary: Mr Camille Chamoun will not again be president of Lebanon. What more can Nasser want? He wants some guarantee that, between the end of hostilities and the end of Mr Chamoun's term in September, the opposition leaders, particularly Saeb Salam, will not be hanged, shot, or otherwise disposed of. Nasser recently told a friend that he wished he had never heard of any Lebanese politician. Many friends of Lebanon who do not ordinarily see eye to eye with the president of Egypt will share his feeling.

ADEN PROTECTORATE

Catching up with History

NOT all visiting Arab rulers stay in London's most expensive hotels. A group that cannot afford luxury arrived this week. They are the Amir of Dhala, the Sharif of Beihan, and the Fadhli Sultan, three out of 17 from the western Aden Protectorate. They have no oil to give them added power or income, and they come laden with problems. The three rulers (a fourth is expected to join them on June 17th) arrived in London to present a common case to the British Government. They share a background of treaty relations with the British Government and they fear the incursions of the Imam of Yemen and his Egyptian and Russian friends. They need military assistance to cope with the immediate problem of Yemeni border violations and economic help to enable them to catch up with a world that long ago left them behind.

To achieve protection for their borders and prosperity for their people the rulers propose to offer a plan for the federation of the states of the western Aden Protectorate. Such plans have been ventilated before, but there has never been a moment when all the rulers agreed on what should be done. Unlike the Sultan of Lahej, who would prefer to see the British Government and the Yemenis settle matters between themselves, these rulers believe that they must first put their own houses in order. They believe that a lasting peace can come only if they are secure and if they can arrange, in some way, to improve their communications and establish projects for economic and agricultural development.

Every effort is being made to show that the sudden appearance of the south Arabian rulers is entirely their own idea. The Colonial Office, while not denying the possibility of talks with the rulers, emphasises the private nature of the visit. If all this delicacy is intended to keep Cairo Radio quiet about the goings on between the British Government and its friends, then it is probably a waste of time. The mere fact that the rulers are here is enough to enable President Nasser's propaganda machine to brand them as tools of imperialism. If, however, the visit results in a satisfactory determination of the future of the protected states, then there should be no reason to fear the ambitions of the Imam or the propaganda of Cairo.

PARLIAMENT

Dog Days

THIS is not the most effervescent of Parliamentary terms —the weeks from now to the beginning of the summer recess will be largely occupied with the dreary grind through the Finance Bill—but the Commons' resumption on Tuesday was even more than usually lacking in sparkle. Mr Swingler and Mr Zilliacus made a brief splutter of showy protest over Mr Macmillan's friendly message to General de Gaulle, but the main point of interest was inevitably Mr Macleod's statement about the bus strike, and the Labour party's reaction to it. Mr Macleod's refusal to be stampeded into intervening was expected, but although Mr Robens lumbered in to express "extreme disappointment," it was possible to detect a little more caution in Labour MPs' support for the busmen's cause. This may have been caused by contact with their constituents during the brief recess, or it may merely have reflected the changed attitude of the TUC.

One of Parliament's domestic problems was left unsettled when this week's honours list emerged without any life peers, and with the only item of passing parliamentary interest the ennoblement of Mr Poole. It is now believed that the first list of life peers under the new system will be published separately, later in the summer, but in time for the new lords and ladies to take their seats when Parliament reassembles in the autumn. Labour's official attitude is still unknown, but MPs will be surprised if there are not some Labour names in the list—whether officially nominated by Mr Gaitskell or picked in some less formal way.

PORTUGAL

Queasy Triumph

PROFESSOR SALAZAR'S candidate for the Portuguese presidency has won his election by a thumping majority. General Delgado, the challenger, has been relieved of his post as director-general of civil aviation.

His campaign chairman, Professor Viera de Almeida, has been arrested together with at least a hundred others. The censorship, which had been temporarily modified during the election campaign, has now resumed its sway. On the surface, all seems as calm as before. But it is now a queasy kind of calm.

A contested presidential election was in itself a new phenomenon in Salazarian Portugal. The casting of a quarter of the votes for a candidate pledged to dismiss the prime minister and institute political freedom was a further shock to the government. Nor was this all. Although the final totals must await the reporting of votes from Africa and other overseas territories, it looks as if only about half of the qualified electorate voted for the government candidate, Admiral Tomaz; and it should be remembered that the electorate is at present limited, in ways that give the government plenty of scope to discriminate against malcontents, to only an eighth of the population.

More State Aid for Students

THE Minister of Education made some useful concessions last week to parents whose children hold awards at universities. Many families will find themselves some £60 or £70 a year better off. Mr Lloyd's main concessions are fourfold:

(1) *He has increased the maintenance grant for students by about one-seventh all round.* The new maximum scales at Oxford and Cambridge and at provincial ("redbrick") universities are shown in Table I; he has also increased other students' allowances.

(2) *He has increased the allowances which may be deducted from gross income in order to determine "scale income" on which the parental contribution is assessed.* In particular, he has increased these allowances for parents with more than one child to support. These go up: (a) from £150 to £170 for each dependent child; (b) from £150 to £180, in addition to (a), for children whose school fees the parent is paying; and (c) from £300 to £350 *in addition to* (a), for a dependant taking a university or professional course at parental expense. Table II shows the deductions from scale income that might now be secured by a fairly typical professional family with one child at university and two others at fee-paying schools.

(3) *He has revised the increments by which "scale income" rises.* Formerly it rose progressively, thus reinforcing the penalising effect of progressive taxation on the better-off. Now it will rise by £14 per £100 of scale income over £525 indefinitely. Table III shows how much the "typical professional family" (described above) could now expect to get, at different levels of income.

(4) *He has wisely made some big increases in the grants for students at technical teacher training colleges.* These are designed to meet the needs of the older students (some of whom may be married with children) whom it is hoped to attract.

One additional point should be remembered in reading the tables. Since 1955 special arrangements have been made for parents two or more of whose children hold awards simultaneously in institutions of higher education. In this case, which is often represented as actually stopping children from taking awards, no deduction is made for either child in arriving at scale income, but the parental contribution is not made for each child, but only once. For example, a parent on £1,500 a year with twins at Oxford, with no mortgage or insurance allowances, would have a scale income of £1,500. But from this only *one* contribution of £147 would be demanded, while the twins would get allowances which might total £530 or more each. The way in which allowances are calculated are, however, complex; may we now have a parents' full handbook, please?

★

What more could be done for parents?

(1) Allowances could be further increased—they do not meet the National Union of Students' demands, and are purely nominal for vacation living expenses which must be defrayed by the parent or earned by vacation employment. As more children from less well-off homes reach the universities this may become a grievance.

(2) It has often been suggested that the means test should be abolished and full awards paid to all parents, but counted as additions to parental income—and taxed as such. If this system were adopted, many professional families would be worse off than they will be under the new scale. A parent earning £1,500 a year, paying £206 in income tax, with the twins at Oxford, might be credited under such a system with an aggregate income of £2,560, attracting additional tax of £367. This exceeds the contribution of £147 he is now expected to pay.

(3) The question may now properly be raised, however, whether the means test should be abolished altogether, and students' allowances be given automatically to award winners as their own, not their parents', income. In April the minister, in answer to a parliamentary question, said that the cost to all public authorities of waiving the means test would be about £4½ million a year. The new concessions are to cost the Exchequer £1.9 million and local authorities perhaps £1 million more. Most of this addition, however, is to be caused by the higher allowances for students rather than by the lower parental contributions. The total cost of abolishing parental contributions would probably still be as much as £3 million a year.

EXAMPLES OF UNIVERSITY GRANTS

(For professional families with three children—one award-holder, two at private schools)

TABLE I
Students' Allowances (maximum)

	£
(a) At Oxford/Cambridge :—	
Tuition fees	150–180
Maintenance grant	325
Vacation grant	30
Travel, union subscription, instruments, etc., say	15
Total	520–550
(b) In lodgings at "Redbrick" :—	
Total	335

TABLE II
Parents' Allowances

Deductions allowed from gross income :	£
Mortgage, say	150
Insurance and superannuation, say	150
Two dependants	340
Two private school fees	360
Total allowances	1,000

TABLE III
Parents' Contributions and Grants

Admittedly, abstentions do not indicate positive support for General Delgado. Nor, indeed, do the votes actually cast for him. The bulk of these represented a protest against the regime, not an approval of a candidate whose programme was far from clear and whose record made him suspect to many of the opposition. But the scale of this protest evidently surprised the prime minister and his followers. They now face the inevitable prospect that if opposition candidates are allowed to stand at future elections—parliamentary as well as presidential—they will be taken seriously by a public that has hitherto seemed largely apathetic. The certainty of a government victory will never again be taken for granted in advance. Professor Salazar will have to make a painful choice: either to tighten the screws and convert his quaintly restrained despotism into a frankly ruthless one, or to let the tide sweep him and his country forward in the direction of the democracy which he has always abhorred. If he hesitates too long, he may not even have a choice.

GERMANY

Surplus Jitters Again

THE news that west German exchange reserves are growing again has once more raised the bogey of a chronic German payments surplus. From the September watershed, gold and reserves flowed out of Frankfurt for six months. Since March, however, the tide has been reversed. In April and May the German Federal Republic piled up large surpluses in the European Payments Union; and by the end of May reserves were back at the November level.

There is no reason yet to get too excited about this. It is not surprising that some of the reserves which France has been spending with such zest and some of the gold leaving the United States have ended up in the vaults of Frankfurt. But Frankfurt has not been gaining reserves as fast as London has. And when credits to the European Payments Union and other non-liquid assets are deducted, the influx to Germany assumes modest proportions.

How far the underlying factors in the German economy inducing a payments surplus are being modified is difficult to judge. The record trade surplus in April was a disquieting sign. Germany's industrial expansion has certainly slowed down, with its production still running only about 2 per cent above last year's level—a bad sign for imports. But some of Herr Erhard's hopes for continuing growth are being realised. Some seasonal recovery has set in this spring. Home orders to the investment industries are still growing faster than orders from abroad. It may not be long, either, before the Germans are asked to dig into the cash-box once more to help France out. And the talks which Mr Eugene Black, chairman of the World Bank, is having in Frankfurt and Bonn may lead to new long term arrangements for the export of German reserves.

JERUSALEM

Patience on the Mount

MR HAMMARSKJÖLD is having yet another shot at disentangling the situation on Mount Scopus. His executive assistant, Dr Cordier, is the fourth United Nations high official to have tackled the problem in the last six months. The killing of Colonel Flint, the Canadian chairman of the Jordan-Israel mixed armistice commission, on Mount Scopus last month when he was trying to rescue some wounded Israeli policemen, has made the UN more than ever anxious to find a compromise; but to judge by the number of skirmishes on the hill since then, it has not jolted the Jordan or Israeli governments into a more amenable frame of mind.

No sector of the frontier is more brittle: the hill is partly Israeli, partly Jordanian, but the Israelis can reach their section only across Jordanian soil. By agreement, an Israeli convoy is allowed every fortnight, but from time to time, notably last November, the Jordanians refuse to let it through. The hill commands the main roads into Arab Jerusalem, and each side suspects the other of fortifying its sector.

After the trouble in November Dr Francesco Urrutia was given the job of re-negotiating the 1948 demilitarisation agreement which provides for "visits" by United Nations officers to both sectors. Early this year he managed to wring signatures out of the two governments; only afterwards did it turn out that they each interpreted the agreement differently. The Jordanians claim that the Israeli garrison should be thrown open to inspection by the United Nations; the Israelis insist that the 1948 agreement was automatically superseded by the armistice of 1949 and that they are therefore entitled to come and go freely to the deserted hospital and university in their sector. This the Jordanians would never allow.

GHANA

Doomsday for the Chiefs

THE announcement of the Ghana government that it will not restore recognition to Nana Ofori Atta II, paramount chief of Akin Abuakwa state, marks the turning-point in Accra's relations with the traditional tribal forces. From its earliest days Dr Nkrumah's Convention Peoples Party promised to reform these almost, if not entirely, out of existence. It back-pedalled this part of its programme in the final stages of achieving full independence, but the day of reckoning has now come. A formal commission of enquiry by one of Ghana's remaining British judges has investigated the affairs of Akin Abuakwa state, and the report has just been published. Before the setting up of the commission Nana Ofori Atta was suspended, and he will now remain suspended. The government cannot destool him: this can only be done by his own people—but the government probably feels confident that the final humiliation will follow. Nothing is now clearer in Ghana than the anxiety of local communities to be on good terms with the central government, dispenser or withholder of so many important services.

Nana Ofori Atta is almost the embodiment of the chieftaincy tradition as it was built—or bolstered—by British colonial ideas. It is perhaps ironic that it is being so simply deflated by the use of a British device—the judicial commission of enquiry. It is, however, a deadly weapon, for few chieftaincies can stand a searching enquiry into their affairs, conducted on a high plane of British administrative standards. The chiefs have now clearly understood their powerlessness and are hastening to make peace with their masters. Not a squeak issued from them when they discovered that the government's new table of precedence places paramount chiefs below judges and members of parliament, while mere chiefs have no place at all. The

paramount chief of all, the dignified Asantehene himself, must see in this process the destruction of his own once-impregnable position; and it will be a bitter day for him if, as has been rumoured in Accra, Mr Krobo Edusei, his usefulness in Dr Nkrumah's cabinet exhausted, is made Regional Commissioner of Ashanti and therefore his direct boss. But the lesson should be learned far beyond Ashanti. It should be learned by chiefs and kings all over emergent Africa, however exalted: they are likely to be no match for the intellectuals, been-to politicians, and "verandah boys" whom they so despise but to whom Britain in the end always gives the key to power. In just the same way, the maharajahs proved to be no match for the Indian Congress. To hold any power the tribal potentates must—like some maharajahs and, for example, the western Nigerian chiefs—go through the parliamentary party turnstile themselves.

TOURISM

Manners Abroad

THE squib set off in the correspondence columns of *The Times* by that experienced travel agent Miss Erna Low—who complained that the English abroad are becoming notorious as non-tippers, bargain-maniacs, and general penny-pinchers—has touched off a sequence of vindications and counter-criticisms. Three points deserve to be made. First, the English hotel guest abroad, particularly the English skier, now often is poorer than his foreign counterpart. A new clientele of horribly hard-up students has taken over from the mythical Milords with purses of lordly depth. The boarding-house-hunting or digs-hunting in which they would indulge for a holiday at home—and in which the German student, for example, can indulge in Austria and Switzerland—is not easily manageable for the inexperienced from across the language barrier and across the Channel. Many of them therefore go to slightly more expensive accommodation than they can really afford, and annoy waiters by skimping on the extras.

Secondly, the British travel agencies are in some ways themselves the real villains of the piece. Travel agencies do not much like the job of explaining to their clients the two-tier continental system of legal service charge plus conventionally compulsory tip; that "all tips included" can mean "all tips except those generally so called." Were this particular convention in force here it would certainly be regarded as a prize sample of British illogic; the fact remains that the supplementary tip is often as certainly expected on the Continent as the larger single tip in Britain, and travellers should be told as much. They might also be warned that the calls on their purse for such "essential extras" as tea and (a great source of British indignation) baths are likely to be much heavier than on an English holiday of otherwise similar cost. Agencies should resist the temptation to make continental holidays look cheaper than they are. Unfortunately, it is this illusion of cheapness that is the agencies' main competitive stock in trade; this may explain why some people professionally interested in encouraging British tourism abroad have hastened to deny all Miss Low's allegations.

There remains, however, a third point. Some blame must be laid on British tourists themselves for a modern failing in national psychology, which seems to be related to recent deprivations and to the English love of sport. At the nadir of the foreign currency allowance a foreign holiday was a game of skill in itself: a round of golf, each day a hole, with a formidable par set by the currency limit and hazards provided by cake-shops and ski-lifts, the price of baths and the exactions of porters. Victory in the most squalid piece of bargaining was regarded as being as properly to be applauded as a brilliant recovery from the rough. The taboo which once debarred the well-bred English from publicly discussing their monetary problems crumbled apparently beyond recall; nor, it seems, has it yet been replaced by the recognition that a budget-bore is even more agonising than a golf-bore. About this modern peculiarity of the English abroad there is probably nothing to be done—except trust to the beneficent influences of a hundred-pound allowance.

THE HOSPITAL SERVICE

The Medical Staffs

THE plight of the hospital senior registrar has been aired periodically ever since the health service began. The post of senior registrar is primarily regarded as the top of the training posts held by doctors in hospitals before they can apply for a post as consultant. Competition to obtain a job as senior registrar is fairly severe, especially in a teaching hospital, for by no means every registrar—the post immediately below—*can expect to obtain* one.

But, having gained his promotion, the senior registrar's worries are only beginning. The longest period that he can normally expect to hold the post is four years. At the end of that time he is probably in his thirties, has a family, and is as highly qualified in his specialty as he can be. But, except in a few specialties, there are far more senior registrars than vacancies in consultant posts, and the problem of the surplus registrar has been a constant source of anxiety to himself and of friction between his representatives and the Ministry of Health.

A senior registrar does not now have to give up his post automatically when his four years are up; but he receives no increase in pay, and the extension of tenure in this grade tends to push the promotion blockage farther down, to the registrar grade. So a working party, whose membership was announced this week, has been set up by the health departments, the royal colleges and the British Medical Association. It is to study "the principles on which the medical staffing structure in the hospital service

FREER TRADE IN EUROPE

For those wishing to keep continuously informed of free trade and other developments in Europe we provide two subscription services:

*A four-page bulletin devoting each week a full page to European free trade developments:

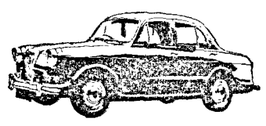
THE NEW Riley Two-Point-Six



with fully Automatic Transmission

The clean-cut elegance of continental lines combines with superb six-cylinder power and luxury equipment in the new 'Two-Point-Six'. And with fully Automatic Transmission, driving is effortless and safe.

The new six-cylinder engine gives its willing power with hardly a murmur. An entirely new suspension adds still further to Riley's traditional excellence in road-holding harmony. Brakes are power assisted. And there is comfort for six in rich two-tone leather seating surrounded by such top quality features as polished walnut veneer instrument panel and door cappings.

Three transmissions to choose from. A synchromesh gearbox with short sports type manual gear shift is standard. Optional equipment, at extra cost, includes overdrive or a completely automatic transmission.

Basic Price **£940** *plus £471.7s. P.T.*

The new Riley One-Point-Five — a compact 4 seater with brilliant performance, and low running costs. Price £575 plus £288.17s. P.T.

Riley for Magnificent Motoring

should be organised." Pending its report, a few senior registrar posts are to be designated, at a higher rate of pay and with security of tenure, which will be available to doctors who have completed their normal four years as senior registrars. A permanent and wholesale solution on these lines would justify the medical profession's fears that such posts would enable hospital boards to get consultant services on the cheap. On the other hand, a drastic curtailment of appointments to the senior registrar grade, to a number more in keeping with the consultant posts that will arise and can be afforded, would gravely affect the running of the hospitals. It remains to be seen what long-term solution will come from the working party.

COAL AND EUROPE

Protectionist Temptations

THE background of recession, tempting everyone towards protectionism, lends special importance to the meeting this week of the council of association between Britain and the European Coal and Steel Community. In the Ruhr and Belgium coal stocks are still piling up. As a result, Belgium has banned all coal imports from outside the community. Britain normally exports small coal to Belgium. The Ruhr miners, as well, have been demanding control of imports.

Herr Erhard, backed, so far, by Dr Adenauer, has hitherto succeeded in resisting their demand. But his position is not easy. With freight rates low, imported American coal continues to keep a hold on some parts of the north German market. Herr Erhard's informal urgings have apparently persuaded American exporters to keep deliveries down for the moment. But if the market remains weak, he may have difficulty in avoiding more drastic action. Long-term contracts with America and the generous estimates of European needs on which they were based may have to be reconsidered.

However, the slackening of the market may also have some salutary effects. In Britain, the last few months have brought a modest yet important improvement in mining costs. In Belgium, recession may at least hasten the death of the uneconomic marginal mines—the lame ducks of the coal and steel community—whose preservation has cost the sister coal industries endless subsidies. Certainly, if recession cannot do this trick, nothing can.

WORLD POPULATION

Busting Out All Over

WITH 47 million people a year being added to the world now—nearly a whole new Britain—and given the normal compound interest calculation, the planet's total population is liable to double itself in the next forty years, before the end of this century. This is the prospect implicit in the latest United Nations Demographic Yearbook.* It is sobering, but quite sober; it has nothing in common with the fantasies recently publicised in the correspondence columns of *The Times*, and it does not postulate a population "explosion." The estimated world population of about 2,830 million today already represents an increase of well over half on the 1920 estimates, and this increase has come about despite a uniquely destructive world war and a succession of famines and calamities. If peace prevails and preventive medicine continues to beat back the great killing diseases, the figure of well over five billion for world population by 1999 may prove a conservative estimate.

There will still be room to sit down; but what will be on the table? To reply that modern science and technology can perfectly well double the world food supply is no full answer. Science may propose, but man disposes. Conservative man clings to familiar methods of cultivating, storing and distributing food regardless of low yield or waste. Impatient man—revolutionary, nationalistic, or just plain hasty—frustrates or discourages the farmer, by methods ranging from the throwing up of new tariff barriers to the liquidating of kulaks and the forced levying of grain. Stubborn man finds the strongest political reasons for rejecting the most promising economic opportunities, as witness the deadlocks over the Jordan, Nile and Punjab river projects. Easy-going man finds it easier to learn to eat more than to produce more: Argentines and Danes, to name only two groups, have improved their diet in the past generation and are unlikely to welcome any suggestion that they ought, in the common interest, to revert to frugality. It will take more than a scientific miracle to provide loaves and fishes for our five thousand million grandchildren.

The Economist

JUNE 12, 1858

THE GOLD RUSH

"Gold discoveries have become so common of late years, that we often forget in England what it is that constitutes their real significance. The news received last week that gold had been discovered in considerable quantities in the British North American territory opposite Vancouver's Island, has called forth scarcely a word of remark from the English press. Now no doubt the discovery of the gold itself is sufficiently unimportant. The only fear in the present condition of the gold-fields, is that the value of gold may be greatly depreciated whenever the process by which it is now to a considerable extent displacing silver on the continent of Europe comes to an end,—and this depreciation is in every way an event to be dreaded, at least by countries whose legal standard is gold. But the value of the gold discoveries is not in any way to be measured by the value of the gold. It is a very curious fact, that the one product whose value in exchange is everything, should have been discovered chiefly in regions where there was at the time of its discovery no wealth at all to exchange, and no inhabitants to exchange it. The effect has been that the rich medium of exchange has acted as a magnet on the populations of the world, which would have been attracted far more slowly to the same regions simply for the sake of their natural productiveness, and has created a world of industry and real wealth where none would otherwise have grown up. The costly medium of exchange, which was first adopted in order to render the spread of real wealth more easy and equal, thus seems to be further effecting the same purpose—of equalising the distribution of wealth—by the mere law of its distribution *beneath* the ground. . . . It is a very remarkable aspect of the recent gold discoveries, that they have peopled with the most enterprising and skilled industry of the most civilised kingdoms in Europe, countries which might otherwise have waited for centuries to be peopled,—and then, when the true and permanent resources of these countries are once fairly brought to light, a great portion of the labour drawn thither by the gold is enlisted in these really productive undertakings.

LETTERS

Inflation

SIR—When I was a boy, economics was known as the dismal science. From this it was rescued by the humane exposition of my dear old teacher Alfred Marshall and later by Pigou, Maynard Keynes and other distinguished economists. Will you forgive me if I suggest to you that some of your recent articles are likely to reinstate the old depressing epithet? In particular many people will draw the inference from your comments in your issue of May 24th on the settlement of the rail dispute that you are biased against the wage earner and that you would have preferred a fight to a finish with the unions concerned to a negotiated settlement. Personally as a regular reader of your paper I think this criticism would be unjust. I believe that your sole purpose is to set out what you believe to be the naked ineluctable facts. Where I differ from you is that I think your facts are not the only facts and that other facts of equal, and perhaps of even more, importance have to be taken at the same time into account.

I believe that nearly all economists would subscribe to the following propositions: that inflation is inherently evil as it unjustly distorts the basis of a society resting on a monetary economy; that rising prices, though not synonymous with inflation, are closely associated with it; that a nation whose prices are rising faster than those of other nations with whom it trades is in serious danger; that since the great war prices have risen in Britain to an alarming extent; and that among the many causes for this are: the internal pressure to expand faster than resources of capital and labour permit, the external demand of other countries for financial assistance, the Korean war and defence expenditure generally, restrictive practices by both sides of industry, the removal of food subsidies and rent control, the competitive struggle of every section of the community in a free-for-all economy to get a larger slice of the cake.

Opinions no doubt differ as to the relative importance of the above factors and also as to the net effect of dear money and other acts of deliberate policy. But I suggest that to single out one factor alone, such as that of wages, and to expect one set of workers not only to forgo a rise in its standard of living in a rising economy but to suffer an actual reduction, owing to a stationary wage with rising prices, is unrealistic.

Limits of space prevent me from relating these general principles to individual cases. But I have enough faith in the fairmindedness of the British people to believe that when all the relevant facts are placed before them they will generally arrive at an equitable settlement. In the few deplorable cases when they do not, good sense will, I am convinced, after an interval, prevail.—Yours faithfully,

London, WC2 PETHICK-LAWRENCE

De Gaulle

SIR—Referring to the article "The General's Hour," and to the previous ones, I am very much surprised by the unfair attitude of *The Economist* towards General de Gaulle and the biased presentation of the situation and even of the plain facts.

De Gaulle is very definitely no more a dictator than is the American President during his term of office. From a legal point of view, his powers are limited by our constitution and by the terms of reference of his assignment. From the human point of view, the thought that he might become a dictator cannot be entertained, because of what he said, of how he acted in 1945 and 1946 and of his personality and age.

If the animosity, which as a red thread goes through nearly all *The Economist's* articles about de Gaulle, is due to the ill feeling he might have created in Britain by his attitude in the period between 1940 and 1944, this feeling should not now be held against him. His attitude in those years is understandable: co-operation with such a masterful partner as Sir Winston Churchill, backed by power, resources and an army, was not an easy task for a man who had nothing to support him. Perhaps a man with a personality like, say, Talleyrand would have been "nicer" to work with, but de Gaulle did what he could, given his background and character. In the final analysis he did well for the common cause and has the full support of a very great number of French people. In any case this was long ago. The questions and the partners are different and letting bygones be bygones, de Gaulle should today be looked at by British people in a new light.

I should add that I write in my personal name and am in no way connected with the General or with his supporters, political or otherwise.—Yours faithfully,

Paris TH. TATISTCHEFF

[*General de Gaulle's position is discussed on page 968.*]

Liberals

SIR—In your issue of June 7th you ask *the Liberals a question*—"Balancing on which fence?" May I give you an answer.

The Liberal party is not balancing on any fence. Such a feat is not only dangerous, but also completely pointless. It means handing over the initiative to the other parties, and allowing them to build a fence when and where they choose. It implies a total lack of principle and a straightforward reliance on expediency. If this was really Liberal policy then the Liberal party deserves extinction. History shows that there is no political future for any party which tries to hold a balance of power.

The Liberal party today is a party of radical reform. It describes itself accurately as the only progressive non-socialist party in the country; and it is this message which is finding such a wholehearted response in the country today.

The long term aim of the Liberal party is to form a government: and that government will be a progressive alternative to the Tories. Your own article in this week's issue, The Alternative Government, foreshadows the path which the Liberal party must follow if it is to obtain power; but you assume in your article that only the Socialist party can follow this course. True, you have some serious reservations, and Liberals will agree with you.

You say truly that Labour appears to be "more firmly committed than ever to support the sectional interests of trade union leaders as distinct from the real interests of all citizens. Until it can escape from this appearance it will not deserve the Radical vote."

This is the crux of our political problem today. You assume that the Labour party can escape from this appearance. I doubt it. Why separate trade union leaders from their followers? And what is left of the Labour party when it is stripped of its trade union following? It is precisely this dilemma which has brought about the crisis in the two-party system today. So long as there was a radical alternative to the Conservative Government, the system worked. But the Labour party has ceased to be a radical alternative. It cannot help "supporting sectional interests." It is a sectional interest itself.

The Liberal party is either a radical alternative or it is nothing. It will either trample on the toes of sectional interests or it will quietly disappear into limbo.

If you attended Liberal meetings, listened to Liberal speeches and read Liberal election addresses, you would find that this is exactly what we are doing.—Yours faithfully,

PATRICK LORT PHILLIPS

London, SW1

Gas

SIR—The economic and other possibilities of fully integrated gas and electric power stations in the coalfields do not seem to have been investigated in your recent articles.

A high-pressure grid for mains gas would take many years to construct, but a high-voltage electricity grid is already in existence; and local distribution networks run in parallel would ensure against power failures causing industrial and transport stoppages and domestic inconvenience.

The extra cost (at present) of using only electricity in the home is more than compensated for by its greater convenience, cleanliness, and safety; and one meter instead of two reduces administrative costs. (Heating from under the floor by electricity has proved in practice to be cheaper than was previously thought.)

Integrated power stations at the pitheads would introduce into the coalfields a welcome diversity of employment. They would help to speed the creation of the projected smokeless zones. And to rely for our power on better use of home resources is only common sense.—Yours faithfully,

Glasgow A. W. MORRISON

Scottish Nationalists

SIR—Whilst welcoming the general argument in your article "Towards a Hotter Air" in your issue of May 24, I must strongly protest at your suggestion that Welsh and Scottish nationalists should be segregated in any political freak show along with "the gentleman who stands at Penrith and the Border on the platform that cock-fighting should be made legal."

The Welsh National Party and the Scottish National Party are responsible political bodies, putting forward constructive policies for Wales and Scotland respectively. The nineteenth century English parties which still dominate British politics are at one in supporting the proposition that Scotland and Wales should be increasingly incorporated into the English body politic. Are they right to seek to submerge the "minor partners" of the UK, or are the national parties of Scotland and Wales right in urging that their countries should survive? This is an important question—far more important fundamentally than any question that arose at the last general election: far, far more important than the question of how many seats will separate the recently discredited Tory party from the previously discredited Labour party at the next election.

The Scottish National Party stands for the survival of Scotland. Plaid Cymru (the Welsh National Party) stands for the survival of Wales. The Tory and Labour shadow-boxing teams stand for the submergence of both. In Scotland and Wales, therefore, the national party should have the same broadcasting facilities as the other political parties.

We want to be given a chance to debate with spokesmen of the "major parties," to cross-question ministers, to expose inconsistencies and demand explanations, as well as to state our own policy. The issues we wish to raise are amongst the most relevant that exist today. As Robert Burns wrote "There's nane ever feard that the truth should be heard, but them that the truth wad indite."—Yours faithfully,

JOHN B. SMART

Glasgow National Secretary, SNP

BOOKS

All or Nothing

The Arms Race

By Philip Noel-Baker.
Stevens. 579 pages. 25s.

IT is unfashionable nowadays to be a frank partisan of total disarmament. In this respect Mr Noel-Baker comes out in bold opposition to all the champions of disengagement, of zones free from nuclear arms, of unilateral nuclear disarmament, of "limited war," and of all the other modish doctrines whose common factor is an admission that nothing more than partial disarmament can be hoped for. He quotes with approval Mr Thomas Finletter's plea for "a grand design . . . a first-stage plan in detail, and then, in the same document, a specific description of each of the successive steps down through the final one. . . ." He laments the Soviet rejection of the misnamed "Baruch plan" for total internationalisation of atomic resources, a plan which, he points out, "was in fact chiefly the work of Dr Oppenheimer's bold and generous heart and brain." And he tellingly quotes both Mr Macmillan and Mr Sandys as advancing the argument that nothing less will do than a world authority able to enforce its control of national armaments.

Thirty years of practical experience of the intricacies of the disarmament problem have armoured Mr Noel-Baker against the inevitable accusations of woolly idealism. His new book takes full account of those intricacies. He gives deserved credit to Miss Elizabeth Furlong for assembling and arranging the mass of material that is here reduced to manageable proportions, set out with admirable clarity, and helpfully indexed. He records the prewar disarmament negotiations and their still relevant lessons; the evidence for the existence of terrible new gases, and the reasons why the Nazis did not use them; the numbers and classification of nuclear tests up to the end of 1957; the powers entrusted to the new International Atomic Energy Agency, and the ways in which these might serve as the basis for a complete arms control system. He deals with such questions as the "clean" bomb, "limited war," budgetary control of defence efforts, and bacteriological weapons which, he recalls, M. Moch and Mr Malik once publicly recognised as more appalling weapons than the H-bomb. Among the many striking reports here assembled is one of a statement by Mr Khrushchev last year to the effect that Mr Dulles was right in believing that Mr Molotov had tried for months to "torpedo" the United Nations disarmament talks.

Perhaps for dramatic effect, Mr Noel-Baker has taken the Soviet *volte-face* of May 1955 out of its context and placed it at the beginning of his narrative under the heading "The Moment of Hope." He certainly achieves his effect, but at some cost to the accuracy of his analysis; and later on in the book he again seems to be straining too hard to insist on the reasonableness of the Soviet attitude since 1955, for he slides very gently over the boycott of UN talks, which the Russians have maintained ever since they tested their ICBM. One may respect his argument that the degree of inspection and control accepted by Russia is adequate (and certainly the western governments ought to have done more to probe Soviet thinking on this point). One may also wholeheartedly agree with him about the quite new horizons that would be opened up if a large number of international inspectors were allowed to move about freely inside the top-secret communist world. But what leaps to the eye is his very cursory treatment of the question of bases. The 1955 Soviet concessions left intact the Russians' insistence on the liquidation of all military bases on foreign soil. Such whims of geography as the Atlantic and Pacific oceans have made it impossible for the western democracies to operate a defence system without such bases—whereas to Russia they are of only marginal value. Mr Noel-Baker's relegation of the question of bases to a brief section near the end of his book, and failure to link it with the other events of 1955 to 1957, seems a serious flaw in what is for the most part a well-ordered arrangement of the issues.

The Fog of War

War and Society in the Seventeenth Century

By George Clark.
Cambridge University Press. 157 pages. 18s. 6d.

IN these six lectures Sir George Clark considers a problem that has always interested him in relation to the period on which his energies have always been concentrated. It is in such lectures that historians often produce their most stimulating work; and the prospect of watching Sir George's refreshingly sceptical approach and his formidable learning applied to so major a theme is enlivening. Sir George's description of part of his work as offering "only a programme for further investigation, and a number of disconnected queries" may be attributed to caution and modesty. Unhappily the programme is unclear and the disconnections apparent, while the "three definite conclusions and possibly even a fourth" come as anticlimaxes.

His first conclusion is that war in the seventeenth century was an institution,

so much so that economists took war for granted and did not treat it as a subject for separate study. His second conclusion, also reached in the first chapter, is that war "cannot be understood except as part of a general mêlée." He fears that the reader may see a contradiction here, but promises to resolve it by the third conclusion. Bewilderment is increased when the author immediately turns to consider the analogy between war and the duel. After much erudition has been displayed, it appears after all that the parallel to the duel is not war but a "limited social evil like juvenile delinquency or road casualties."

The third conclusion is that as the states of Europe came nearer to a monopoly of force, the European community became more ordered; that "the destructive institution of war had a constructive international value." Sir George does not believe that warfare was effectively restricted or humanised in the seventeenth century; and it is odd that he should support this third conclusion with the argument that dynasties, aristocracies and soldiers had international connections. Nor does it seem relevant to point out that cultural relations continued between warring powers, since it can hardly be argued that such relations were the product of war. Sir George's last conclusion, compressed into half a page and given in a quotation from Stubbs, is even more questionable. Stubbs, considering why men fought, concluded that "the real motives of religious action do not work on men in masses; and that the enthusiasm which creates Crusaders, Inquisitors, Hussites, Puritans, is not the result of conviction, but of passion provoked by oppression or resistance, maintained by selfwill, or stimulated by the mere desire of victory." This Sir George does not quote. What he does quote is Stubbs's consoling qualification that it can be said of the best men in such conflicts that they "perished in arms against one another whose hearts were set on the same end and aim; and that good end and aim which neither of them had seen clearly was the inheritance they left to their children, made possible and realised not so much by the victory of one as by the truth and self-sacrifice of both." It would be interesting if Sir George had told us which of these two quotations he considers the more applicable to the Thirty Years War.

There is much learning here, and much wise criticism of easy generalisations and crude determination. Nevertheless Sir George's evasion of the major and obvious questions about the social consequences of war is almost perverse. He nowhere considers, for example, how changes in weapons affected the nature of wars and the scale of destruction. He has some shrewd comments on the economic consequences of war, but quickly turns aside to plant some darts in the flanks of Schmoller and Heckscher. He is half attracted, half repelled by general speculative theories, and this continuously distracts him from the evidence. His last chapter is devoted to destroying the foolish notion that war and peace follow each other in a regular cycle; and yet he himself earlier offers the generalisation that "there was a continuous rhythmic movement in which predominantly international wars alternated with predominantly civil wars."

Tanneries and Tired Feet

Collins Russian Phrase Book
128 pages. 3s. 6d.

Collins Russian Gem Dictionary
768 pages. 5s.

"WE can put your carriage (kheridz) in the mews (mjus). . . . Do you learn fencing now? . . . We dine usually at (ui dajn juzuely) five o'clock. . . ." As recently as 1938, phrase books, for the Slav languages were still reflecting this bygone tranquillity. In the one quoted, only at one point is there the slightest delicate suggestion of the hazards of the police state: "Do you like a frontroom or a backroom? I'll give you one, where nothing will disturb your sleep."

Times have changed, and phrase books with them. Mr Maximilian Fourman of Kiev University, who has compiled Collins new Russian phrase book, has a firm grasp on the problems that may face the traveller today. As early as his fourth page, he shows how to say: "to be in difficulties . . . for reasons not depending on me." Prudently, his traveller inquires: "Is one allowed to take photos?" With an optimism doomed to encounter disenchantment, he learns to say: "Is there a wireless in the hotel? . . . Tune in to London. . . . There is much interference."

Undaunted by this, when asked "Which papers do you wish to have?" he replies without batting an eyelid: "*The Times* and the *Daily Telegraph*." Good luck to him. This is the spirit that eventually breaks the spirit of the Continental café proprietors and makes them lay in stocks of unbagged tea for the stubborn Briton—the spirit that may some day win the American visitor a glass of cold water on his London restaurant table.

Sometimes the spirit flags, as Mr Fourman knows.

> In the first place we went to see the monument to V. I. Lenin. . . . Tomorrow and the day after we shall take part in the afternoon excursions arranged by the Intourist. . . . I have seen enough for today. . . . We ought to turn back. . . . I am too tired to walk. . . . My feet are sore. . . . My foot hurts. . . . When will the doctor come? . . . What is your fee? . . ."

But, as the weaklings founder, sturdier enthusiasts swarm in to take their place.

> I am the leader of a mixed delegation of businessmen from Great Britain. . . . Can we avail ourselves of the services of persons familiar with ironworks, tanneries, machine-building plants, oil refineries, glass works, iron foundries, chemical factories? . . . You will see the club, the crèche, the kindergarten, the library, the health services, the restaurant, etc. . . . The collective farm has a permanent agronomist, stockbreeder, veterinary surgeon, soil expert. . . . We are interested in matters concerning irrigation, water supply, drainage. . . . We hope that our visit to the Soviet Union will be very fruitful."

May it indeed be fruitful. This little phrase book, one of a new series which also covers French, German, Italian, Spanish and Portuguese, in fact gives all the essentials that a pocket will hold, with the Russian phrases both in Cyrillic script and in a simple romanised form with the stresses clearly shown. For the other pocket, Mr Schapiro's new dictionary can be strongly recommended. Less concerned with stern realities, he finds no space for agronomists, five-year plans, co-existence or revisionism. But even a lexicographer cannot altogether avoid politics. In this case the fatal moment comes when two different Russian words have to be given for "popular"—one for use in such phrases as "popular democracy," the other distinguished as meaning "generally liked."

Comedian Patterer

Letters of John Cowper Powys to Louis Wilkinson

Edited by Louis Wilkinson.
Macdonald. 400 pages. 30s.

THESE letters are overwhelming. The most exuberant of authors writes constantly to his oldest friends, spluttering out words and ideas, always at top form. They are delightful to dip into, exhausting in bulk. Up to about his eightieth year, Mr Powys displays the continuous high spirits of a healthy and intelligent boy. New books, old friends, private language, old shared jokes tumble out pell mell from the pen of the comedian patterer, as he once describes himself.

The oddest thing about them is that they are unrevealing. A few hints emerge of deeper and not always pleasant feelings, but they are so rare that the one letter in which he talks of his not very unusual troubles of spirit has been published three times already. The one reiterated confession is that he is a born actor and self-conscious; and this is the persona that appears in the letters, together with the admirable but wholly open side of his character—a man devoted to his friends and to his writings, who faces ill-health and poverty without a hint of self-pity or complaint. But what lies beneath? Mr Wilkinson, who has known him for forty years, does not need telling; and it is not revealed by his letters to the new reader, who pieces together what he can from a collection of quirks: he hates Browning and vivisection, is bored by Tolstoy, seems curiously indifferent to deaths, and loves Henry James.

So far till about eighty; and then the note suddenly changes. He moves house to Blaenau Ffestiniog, and simultaneously drops all the schoolboy exuberance. He writes in a plain and unaffected style. His physical power begins to diminish; but not his force of mind or his interest in all about him, old or new. The last instalment is the best.

Father to the Fuehrer

Hitler's Youth

By Franz Jetzinger.
Hutchinson. 200 pages. 16s.

HERE at long last is an authentic account of the first nineteen years of Hitler's life. No one was sufficiently interested in the subject while the facts were still more or less accessible. When everybody had become mightily curious to know more, the obscure youth of Linz and Vienna was already in a position to foist on the public his own misleading portrait of the child that had fathered the Fuehrer. He presented it, very sketchily, in "Mein Kampf," and millions reverently accepted the proffered likeness. Would-be debunkers, operating for the most part in exile and ignorance, had a shot between them at drawing an injurious picture, complete with a drunken father and a Jewish ancestor in the background. Their uncertain touches were unconvincing.

Dr Jetzinger, himself an Austrian from the Linz district, has spent much of his spare time during ten years marshalling from contemporary documents and eyewitnesses pretty well all the evidence available today concerning Hitler's early years. Since the German edition of his book was published, copies of all the documents consulted by Dr Jetzinger have been deposited in the Upper Austrian provincial archives at Linz and may be seen there by any qualified investigator.

One of the episodes of his salad days which Hitler later was anxious to hush up was his dogged evasion of military service between 1909 and 1914. Dr Jetzinger reproduces the relevant official records, including the long letter which Hitler wrote to the Linz police from Munich in January, 1913, explaining his failure to comply with the call-up. The outbreak of war in 1914 eventually closed this correspondence, and Hitler turned his back on Austria for the time being by enlisting in the German army. When the Germans occupied Austria in 1938 Hitler tried to get hold of the Linz documents, but failed. In short, Dr Jetzinger had already been at work.

Did Hitler try to destroy evidence that might have proved he had some Jewish ancestors? Dr Jetzinger tells us how, after the annexation of Austria, orders were given for the conversion of the neighbourhood of Döllersheim, where Hitler's father was born and his grandmother was buried, into a battle-training area for the Wehrmacht. All residents were compelled to leave, and the area was subsequently razed by gunfire. This could not have happened without Hitler's knowledge. Why did he permit it? Was it because the illegitimate baby to which his grandmother gave birth at Döllersheim on June 7, 1837—Hitler's father—was a child of her former employer at Graz, a Jew named Frankenberg or Frankenreiter? Dr Jetzinger discusses this possibility, but cannot give a positive answer.

An Adaptable Industry

The Chemical Industry During the Nineteenth Century

By L. F. Haber.
Oxford University Press. 292 pages. 45s.

DURING the second half of the nineteenth century the principal factors that were to shape the future pattern of the chemical industry were already emerging. An examination of those formative years is therefore likely to be of value and interest to both economists and technologists. Such an examination has not hitherto been easy, even for the specialist, because the relevant literature is so scattered. Dr Haber's book is all the more welcome as providing an authoritative survey that is also of value to the general reader. The author concentrates on alkali, chlorine and sulphuric acid among inorganic chemical manufactures and on the early development of applied organic chemistry as embodied in the dyestuffs industry and, by so doing, is able to present a clearer picture of the interrelation of the principal economic and technical characteristics of the industry.

The potential flexibility of the chemical industry in the utilisation of by-products and its adaptability to changes in consumer needs and to the availability of raw materials became apparent in the period under review, particularly as a result of the increasing application of new science. In this context the competitive struggle between the ammonia soda and the Leblanc processes had a significance beyond the alkali industry itself. The fight for lower manufacturing costs in the Leblanc process stimulated new processes for the recovery of chlorine from waste hydrochloric acid. Moreover, sulphuric acid production, originally very much an adjunct of the Leblanc process, continued to be of growing economic importance after the death of that alkali process. Such rapid shifts in the importance of particular products or processes continue to be characteristic of the chemical industry and, since it is so adaptable, a source of its economic strength.

The salient technical facts underlying these and similar changes are accurately reported by Dr Haber without obscuring the economic and social perspective of the survey as a whole. The rise in the earning capacity of the German dyestuffs industry during the nineteenth century, a period of intense technical and commercial competition, is documented, as also is the impact of the spate of chemical invention on patent law and practice in various countries. Here indeed were the trends and events that were to determine the comparatively weak condition of the British chemical industry at the outbreak of the first world war.

Information is also given about some of the leading personalities in the nineteenth century chemical industry and their social background. This leads appropriately to a consideration of some of the changes that were taking place in

Parkinson

C. NORTHCOTE PARKINSON, M.A., PH.D., *Raffles Professor of History, University of Malaya,* and author of PARKINSON'S LAW, has now written

The EVOLUTION of POLITICAL THOUGHT

which is a closely reasoned and scholarly contribution to the application of scientific method to political theory. It is a provocative book, as shrewdly aimed and as penetrating as *Parkinson's Law.*

Just published, 18s. *net*

UNIVERSITY OF LONDON PRESS LTD

AUSTRALIAN HOPES AND FEARS

Colin Clark

'For the serious would-be immigrant as well as the student of Commonwealth economic affairs generally, Colin Clark's latest book performs an immensely useful service. No one could be better qualified to write on this subject.'—*Daily Telegraph.*

'He is chiefly interested in the contemporary problems, on which he has a great deal that is interesting and challenging to say . . . The best chapters are those devoted to his own subjects—the populating of Australia, Australian agriculture and grazing, and Australia's economic problems.'—JOHN PRINGLE in the *Observer.*

HOLLIS & CARTER

company management and structure. The early steps taken by the chemical industry towards the evolution of the larger industrial unit can be understood from Dr Haber's review, although this change did not fully take place until the twentieth century.

This subject does not lend itself to a simple chronological treatment. On the whole, however, the difficulty of keeping the main outlines clear has been well handled and the chapters are logical enough in sequence and sufficiently self-contained. Perhaps a brief appendix in the form of a tabular summary of salient dates might further help the reader to correlate events in different countries and different branches of the chemical industry.

Royal Rotundity

The Royal Albert Hall

By Ronald W. Clark.
Hamish Hamilton. 263 pages. 25s.

WHO would have thought that a book about the Royal Albert Hall could have any dull passages in it? As a building it is, to say the least, striking and compelling. In its rotund interior all sorts of excitements have erupted. The whole conception, as well as the building itself, speaks of Victorian enterprise, ruthlessness and culture-hunger. Yet Mr Clark finds it hard to strike a spark out of it all.

Still, not to be ungrateful, this is at least a good reference book. It shows, for instance, how at one time the hall was a favourite arena for rabble-rousing meetings, some of which reached the lowest depths, for instance, Mrs Dacre-Fox's Anti-Aliens meeting in 1918. Yet by 1938 it is recorded that bookings were refused from the League of Nations Union, the British Youth Peace Assembly, the Russia Today Society and a Captain Reavely who wanted to hold a peace meeting. In search of a policy which would make it an orderly house, the trustees of the hall banned all public meetings during the Munich crisis—a curious outbreak of obscurantism.

Through the book there runs a theme of hostility from the London County Council, which resented such a huge building being outside its control as a result of the royal charter. There must have been some sniggers at County Hall when somebody there had the duty of passing on to Kensington a letter from an angry lady who sharply said:

> At a recent . . . Chelsea Arts Ball women were openly mixing with the throngs *quite naked* [her italics]. I have always understood that this sort of thing was an offence against the Law . . . will you kindly forward my letter to the right quarter?

Queen Victoria is supposed to have said that the Royal Albert Hall looked to her "like the Constitution." There is one way in which Mr Clark demonstrates this to be true: it has always been possible to adapt the uses of the hall to the needs or demands of the day. When the Royal Festival Hall was opened (by the traditional, watchful enemy) it was supposed to be the end; but the Royal Albert Hall still prospers and it requires a lively imagination, plus some knowledge of stresses, strains and material fatigue, to realise that some day—however far ahead—it will no longer sit so tight and right in Kensington Gore.

Small Country Administration

Bureaucracy in New Zealand

Edited by R. S. Milne.
Oxford University Press. 137 pages. 20s.

NEW ZEALANDERS are showing themselves admirably critical about their system of government; this is the fifth of a series of books issued by the New Zealand Institute of Public Administration, in each of which some aspect of state action has been appraised in a number of papers. In this book the subject is called "bureaucracy" but is really a narrowed-down form of that phenomenon: "administrative discretion" is what most of the writers call it. They include two civil servants, one minister, two lawyers and a professor. Their main concern is whether civil servants have too much power in New Zealand; on the whole their answer is in the negative.

What has the book to teach people in Britain? Very little. The New Zealand system of government is shown as being heavily derivative from the British, but adapted to suit the special conditions, and especially the small population, of New Zealand. It is plain that a Minister in New Zealand has far more detailed initiative than in Britain, simply because the population is small, the departments are small, and there is a persistent habit—common to all backblocks communities—of local and special interests going direct to the minister when they want something. Ministers still go for long trips through the country, taking credit for what the government has done and asking what it ought to do next. This is ministerial responsibility with a vengeance; what scope remains for civil servants to wield power is little indeed, compared with the situation in Britain.

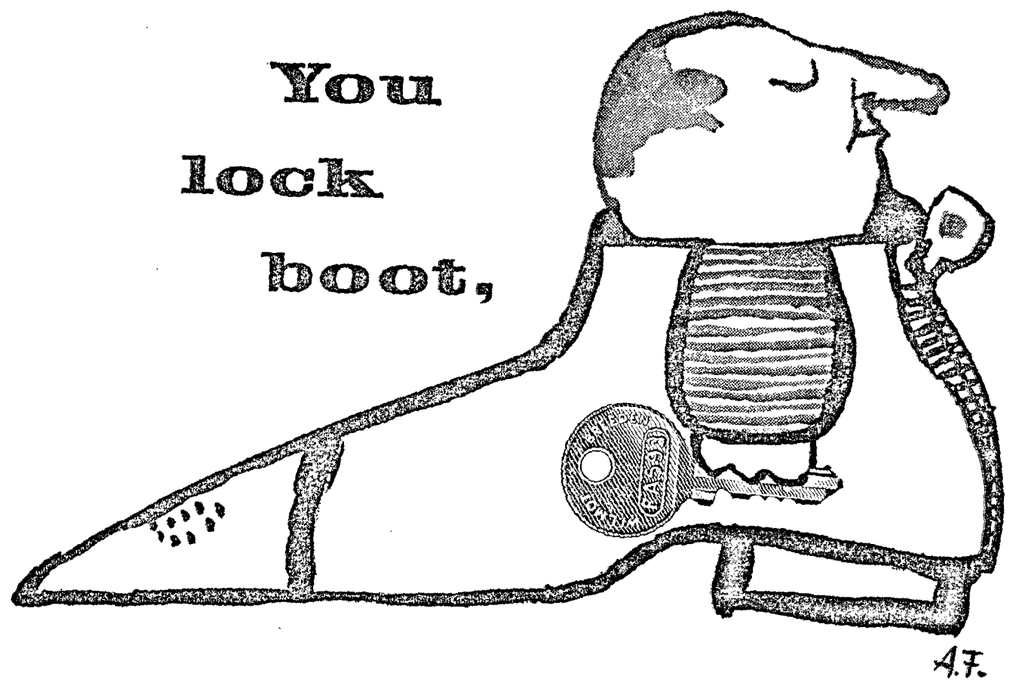
Nevertheless, New Zealanders like to be thought more British than the British; and so the book contains a certain amount of discussion of British controversies about administrative law, and a suggestion that whatever remedies are adopted here to deal with administrative discretion will probably be adopted before long in New Zealand. The book would be more interesting, in fact, if less space had been devoted to British examples and more to New Zealand. In particular, it would have been worthwhile to have devoted more to the peculiar system whereby certain boards have both ministers and permanent heads as members; and overseas readers would have benefited from more information about the structure of the civil service. But the book does contain a good deal of information about decision-making in New Zealand, and is more enlightening than comparable works about Australia. This is encouraging, if only because of the surprising allegation (surprising and wounding to New Zealanders) that New Zealand derives its governmental practice from Australia as well as from Britain. The clarity and sensibility of these writers suggest that influence might with profit go the other way.

OTHER BOOKS

CONVOCATION IN THE UNIVERSITY OF LONDON. By Percy Dunsheath and Margaret Miller. *The Athlone Press.* 204 pages. 15s.

Dr Percy Dunsheath (Chairman of Convocation since 1949) rightly claims that in many ways—including their part in the admission of women to degrees, securing the University Parliamentary vote (between 1868 and 1950), the founding of the Students' Union and the University Athletic Union, the negotiations leading to the reconstruction of the University in 1898 and 1926—London University graduates in Convocation (now numbering 35,000) have contributed very greatly to the development of the university. Nevertheless it remains true that a large proportion even of the teachers and of the graduates and undergraduates of the university remain extremely vague about the history, structure and problems of that extraordinary hydra-headed octopus, the University of London, and, still more, about the functions and proceedings of Convocation.

This volume, admirably presented and illustrated in the best tradition of the Athlone Press, which has been produced as one means of commemorating the centenary of Convocation, provides a most interesting (and commendably concise) means of gaining some insight into some of the most important aspects of the university's record and problems, as well as into the proceedings—and controversies—of Convocation. It is, however, a pity that the appendix, which contains lists of the chancellors of the university, members of Parliament, chairmen of Convocation and clerks of Convocation, has not found room for a list of the vice-chancellors.



THE BRITISH BANKING MECHANISM. New edition. By W. Manning Dacey. *Hutchinson.* 200 pages. 18s.

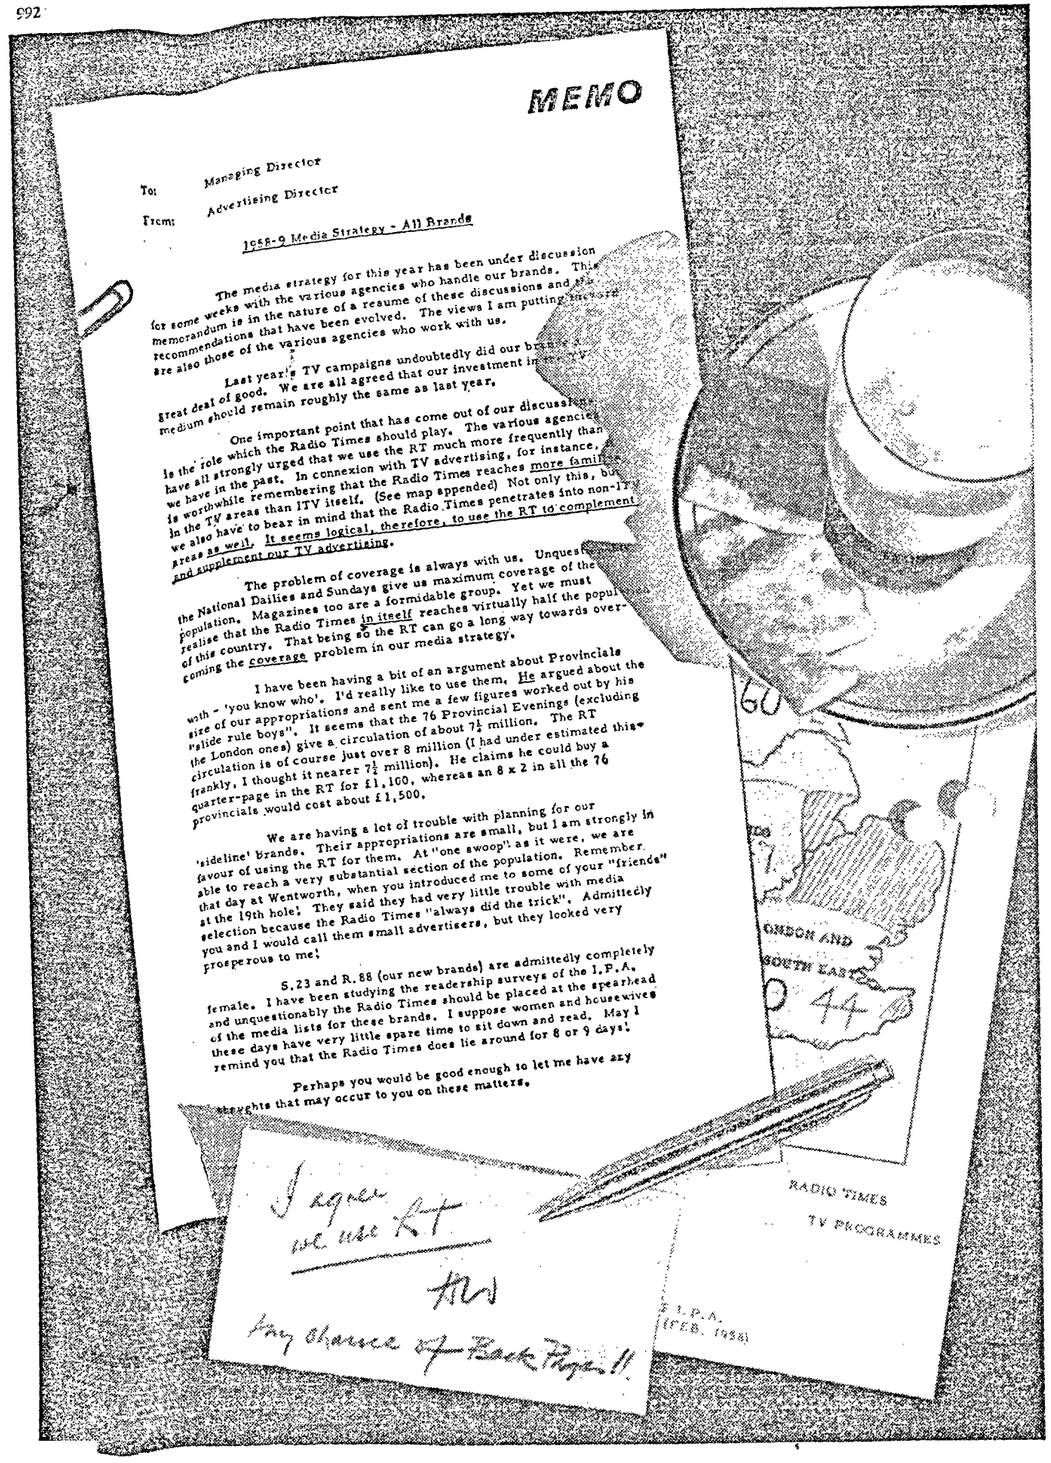
Mr Dacey's book is probably the best available to the student and observer of high finance: it is readable and concise, yet the essential points of theory are never skimped. Its publication in 1951 happened to coincide with the re-introduction of a positive monetary policy. This gave the book added interest, but naturally "dated" the descriptive material. This limitation is made good in the new edition, which discusses monetary experience since 1951 and refers to recent changes in monetary theory. In a new final chapter, Mr Dacey recalls the sequence of the monetary measures and asks why they have failed to halt inflation. His conclusion is orthodox, attributing the central failure to insufficient vigour in funding bank deposits.

THE CHANGING POPULATION OF THE UNITED STATES. By Conrad and Irene B. Taeuber. *Wiley and Sons,* New York. London: *Chapman and Hall.* 357 pages. 62s.

ELEMENTS OF INDUSTRIAL ORGANISATION, 6th edition. By T. H. Burnham and G. O. Hoskins. *Pitman.* 330 pages. 21s.

CHRISTIANITY AMONG THE RELIGIONS OF THE WORLD. By Arnold Toynbee. *Oxford University Press.* 116 pages. 8s. 6d.

hop into driving seat, self-starter, goodbye wife,
and off. All well.



What if boot wouldn't lock properly? All not well.
Niggling doubt. Somebody pinch golf clubs . . .

Blasted boot can't trust with golf bag? What use car with boot
like that? Liability. Get rid of. Discard. Do without. Walk.
Healthy? Bus queues. Drizzle. Miss appointments.
Lose hope. Lose wife. All up.

Ah! but Wilmot Breeden made boot-lock! Made boot *lock.*
Sound design, infinite patience, metallurgy,
research, brutal testing, photo-micro-scrutineering.
Safe now. For ever.

Not only boot-lock. Door locks, door handles, window-winders,
bumpers rear, bumpers fore, ignition key, steering wheel, likely.
Virtually every British car roads today carries some components
Wilmot Breeden. Reason why. Hurray.

WILMOT BREEDEN are at Birmingham: also at *London, Manchester, Bridgwater, Glasgow, Melbourne, Toronto.*

AMERICAN SURVEY

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Mr Macmillan in Washington

WASHINGTON, DC

WHATEVER Mr Macmillan has achieved in Washington—and this will emerge more clearly over the coming weeks and months—one thing is certain: he will never again be a shadowy, indistinct figure to the American press. His performance at the National Press Club on Wednesday was a personal triumph of no mean order. He was urbane, witty, robust and immensely well received—the Oxford Union style at its very best. Even though the Prime Minister wandered into Washington in a manner both calculated and casual, his presence there has received plenty of flattering recognition. Nevertheless, he has succeeded in emphasising the private nature of his visit and the informal character of his talks and has eliminated much of the fuss and feathers that go with conferences between heads of governments.

This is, of course, very much part of the Macmillan method. The emphasis which he repeatedly places on the personal relationship that he established with President Eisenhower when the two were working together in North Africa is linked with the vehement manner in which Mr Dulles told the Senate Foreign Relations Committee last Friday that a Germany united but not institutionally incorporated in the West would be a menace again to everybody and that Dr Adenauer's genius lay in his recognition of this. The leading men in the North Atlantic Treaty Organisation are obviously racing against the time when they will no longer be in office to establish patterns of conduct for their successors; whether or not these patterns will then be followed is another question. Mr Macmillan also numbers himself, with some feeling, among the select band of Mr Dulles's European admirers and this sentiment was strengthened by the very helpful references which Mr Dulles has made during the past week to the need to strengthen international economic institutions.

The trick, as both British and American leaders recognise, is to establish close routine relationships between their officials at the working level and yet not to arouse the jealousy of America's other allies at the same time. The British profess to view the months since the Prime Minister first launched the idea of "interdependence" with some satisfaction. The economic knights, Sir Leslie Rowan and Sir Robert Hall, have slipped over twice; a scientific trio, Sir Edwin Plowden (who is in Washington so frequently that scarcely any public note is taken of his comings), Sir William Penney, and Sir Frederick Brundett were already there when the Prime Minister flew in. But the British regard it as absolutely essential to this increasingly cozy relationship that the idea should not get around that whenever they turn up they will have requests for which the United States will ultimately be obliged to foot the bill. Otherwise they fear an old tag will be twisted to read: "Beware the British bearing plans."

It is for this reason that Mr Macmillan and his advisers are somewhat uncomfortable about the form in which recent ideas for improving the liquidity of the sterling area have been unofficially presented. Of the three logical propositions advanced recently in *The Economist*, for instance, he has not pressed either the idea of an increase in the dollar price of gold or, even more prudently, that of a device specifically for underwriting the sterling system. The Americans, as *The Economist* has indeed always very explicitly recognised, are quite exceptionally sensitive to any mention of the gold price—partly because they object to giving incidental assistance to the Russian trade offensive, but also because they have an unholy dread of stirring up the various currency cranks in their own country who are still only just dormant. Nevertheless, Mr Macmillan is particularly, and rightly, concerned about the liquid reserves of all the western allies, and has been talking at large with the President and Mr Dulles about the significance of the Russian economic advance and the need to co-ordinate steps to meet it by nourishing the expansion of western output and trade. After Mr Dulles had complained that the earlier sessions on this subject had been "rambling"—"I thought this rather harsh," gaily observed Mr Macmillan—the Secretary of the Treasury and Mr Dillon, the economic head of the State Department, were brought in to try and impale the Prime Minister on the horn of decision.

It is not clear what success they achieved, but one question he certainly raised was that of West Germany, which has been "collecting all the chips" in international trade and failing to redistribute them by investment so that the game can go on. Mr Macmillan has been explaining to his American friends that, while the British would prefer to play the game in the old way in which wealth was simply poured over the world by private investors, the British themselves, although they have the know-how for doing this, simply do not have enough funds; the Germans claim that they do not have the know-how to operate a capital market of this kind; and the Americans, although they have done a good deal, are also not accustomed to playing the creditor through private markets. Therefore Mr Macmillan's argument means that the job will have to be done (as *The Economist's* third proposition suggested) through international institutions.

THE Prime Minister's method, in short, is to apply gentle massage in the hope that this will lead to a flow of ideas to the American brain. There is a real danger that this process may not work, though there is evidence that the special problems of the sterling area are being more fully appreciated in some quarters in the United States. Two leading Democratic intellectuals, Mr Dean Acheson and Mr

Adlai Stevenson, have both referred to the inadequacy of the sterling reserves in recent speeches—Mr Stevenson pointing out that they are about the same size as those of the Ford Foundation. Mr Acheson is planning to devote one of the ten pamphlets on foreign policy, which he is bringing out on behalf of the Democratic party, to this and related topics. Mr Stevenson, in the less political context of a university address, suggested a committee of experts from the free world to discuss the best methods of financing an adequate level of international trade.

But in any case there must inevitably be a large amount of finessing on both sides in these matters. The British must not appear to be asking for anything for themselves, nor must the Americans appear to be doing anything for the sake of the British. British officials are especially sensitive to the danger of doing, saying or appearing to be saying anything that would prejudice the passage of the Reciprocal Trade Agreements Act, particularly when Congress is also considering the amendments to the Atomic Energy Act which will permit a broader exchange of information. The Prime Minister appears to be attaching supreme importance to a triangle of coming events—this hoped-for extension of the President's powers to negotiate tariff reductions, the meeting of the Commonwealth Finance Ministers, and the convention of the World Bank and International Monetary Fund at New Delhi. He evidently feels that if a big demonstration can be made that there is a general desire to foster increased trade, then minds will be carried logically to the problem of financing it.

But although these economic questions were the main, they were by no means the exclusive, topics of conversation. Mr Macmillan apparently threw in his word in favour of holding a summit meeting without the West making too much fuss about preparations, although he conceded that the President's status as chief of state created special problems. Mr Macmillan also lent weight to that faction in the Administration which favours a suspension of atomic tests if this would enable a proper inspection system to be tried out. However, with atomic matters and disarmament, as with international trade, the British are being understandably cagey and a trifle vague about future commitments until Congress has passed the pending legislation which would equip the President with fuller powers and more independence in negotiation than he has at present.

Trade with Flying Colours

WASHINGTON, DC

THE House of Representatives has not let the free world —or the Prime Minister—down. He must have been immensely heartened during the last few hours of his talks with the Administration by the news from Capital Hill, the seat of the second American government which has the last word in so many vital sectors of western policy. On Wednesday morning the House voted overwhelmingly to continue for the unprecedented period of five years the President's powers to negotiate reciprocal trade agreements and to allow him to cut some American import duties by as much as 25 per cent. Previously it had rejected by 268 votes to 146 a crucial motion to send the Bill back to committee. Three years ago, when the measure was last up before the House, a similar motion was repelled by only 206 votes to 199. Yet this time protectionists had approached the battle with even greater confidence because of the recession and most observers, until the last few days at least, had felt that this confidence was entirely, if regrettably, justified.

The form of the debate offered the House a clearcut choice between a mildly liberal Bill and a frankly protectionist alternative. The first, proposed by the Administration and with minor refinements approved by a majority of the House Ways and Means Committee, had been

"We Like It So Well, We Want To Sail It For You"

described by the President, in a speech to Republican candidates for Congress, as one of the three pending measures which it was most essential to enact. Its opposite bore the name of Representative Simpson who, as chairman of the Republican Campaign Committee, is the man chiefly responsible for getting a majority of those candidates elected. But the Simpson Bill's sting lay less in the discounted votes of so many of the President's fellow Republicans than in the fact that its backing, like that of the Ways and Means Committee's Bill, was bipartisan.

In 1954, as he never hesitates to point out, Mr William Jennings Bryan Dorn of South Carolina was the only southern Representative to vote against reciprocal trade. In the interim more and more Southerners have been deserting their traditional internationalist camp and joining midwest Republicans in this as in other brands of conservatism. Partly this can be accounted for by the spreading influence of the textile industry. But it owes something to the delayed effect of an agricultural price support system which loosened almost to the point of disconnection the tangible link between the cotton farmer and his markets abroad. Furthermore, at the psychological level the all-absorbing race issue undoubtedly has some influence. The constant emphasis of Northerners on the need to speed racial integration in order to make a good impression on foreigners has turned

many Southerners in upon themselves in a resentful mood of neo-isolationism.

The opponents of lower tariffs had long been looking forward to this debate with eager anticipation, as their greatest opportunity to reverse the course of American policy. The celebrated right-wing wireless commentator, Mr Fulton Lewis, proclaimed gloatingly :

> It's time for the showdown. . . . The swaggering, arrogant ruthless high-handed little glassy-eyed Gattmen who bartered away the jobs of the American workers, while they sat in the plush of plushy surroundings for six months every summer in Geneva, Switzerland—they are Daniels come to judgment.

With this sort of opposition in prospect it was not exactly a bold measure which the Administration put up to Congress. America's trade partners will look in vain at the text of the Ways and Means Committee's Bill to find relief from the uncertainty and harassments of current American law. In particular the "escape clause" procedures are not only still there but the changes made in them are all directed towards weighting the decisions on tariff changes a little more in favour of the complaining domestic industries. Some of the concessions originated in the Administration, others resulted from the tactics of Mr Wilbur Mills, the new Democratic chairman of the Ways and Means Committee, who held meticulously elaborate hearings and turned no major grievance away without adding some mollifying language to the draft Bill, however far short it might fall of what had been sought.

THESE concessions were, of course, directed at the waverers. There was no hope of converting the hard-core protectionists to a Bill which gives the President power to negotiate tariff concession for five years, so as to overlap the early stages of the European Common Market. Moreover there was no gainsaying the fact that, although the procedures for giving the President advice and the remedies he might be advised to employ were to be tightened up, he would still have the right to over-ride the advice. Under the Simpson Bill, in effect an attempt to give the tariff-making and breaking powers back to Congress, the Tariff Commission, a purely technical body which is officially an arm of Congress, would have become almost all-powerful, with the President acting merely as its agent. But Mr Simpson's attempt at infiltration was repulsed by the surprisingly large majority of 234 votes to 147 before the House came to the committee's Bill.

All these very satisfactory majorities were achieved in part because the southern revolt did not amount to as much as had been feared and because many Democratic votes elsewhere were switched, even some from states such as Massachusetts which have high unemployment. Dramatically, Representative Green, the Democratic boss from Philadelphia, carried three more votes with him when he crossed over to the side of reciprocal trade. Twenty more Democrats supported the Bill than had done so in 1955, but the most remarkable contrast was in the behaviour of the Republicans. Three years ago, the President's party voted to kill his bill by 119 votes to 66 ; this time they voted the opposite way, by 108 votes to 85.

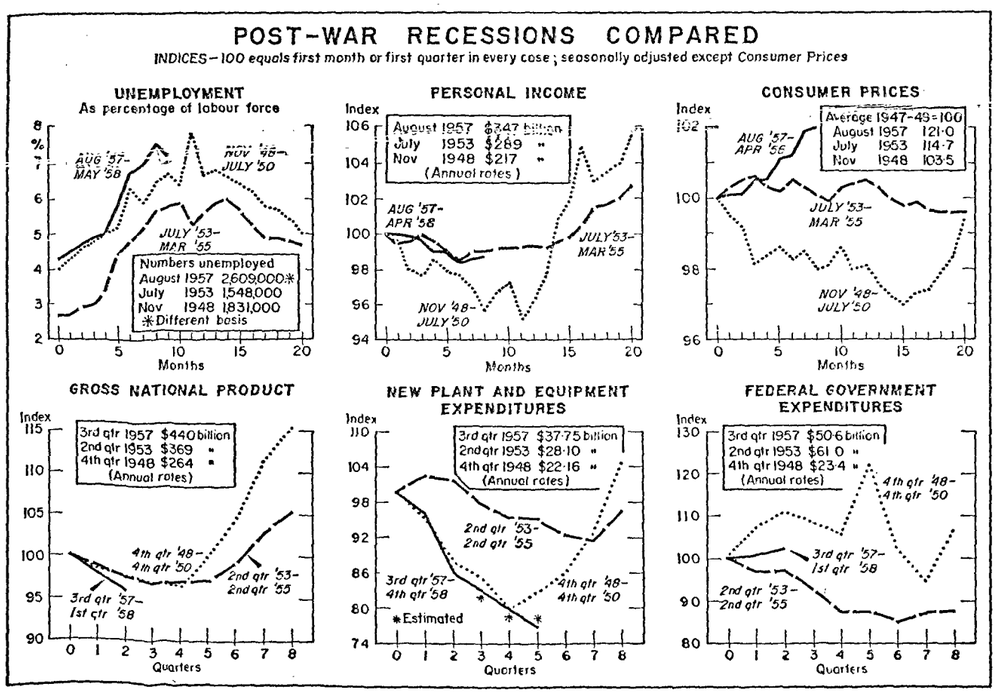
All this was because, for once, strong leadership was being tried out in Congress. The White House really worked hard at disciplining and cajoling the Republicans, the two leaders of the two parties operated hand in glove and, perhaps most important of all, a bipartisan campaign outside Congress was skilfully co-ordinated with tactics inside. Organisations like the American Farm Bureau Federation and the Chamber of Commerce, which were called in to help, laboured in the grass roots to produce local pressures on Congressmen to counteract those brought by protectionist interests. The highest credit for the victory is due to Mr Wilbur Mills and to his assistant, Mr Hale Boggs. Their approach was faultless : they held long, courteous hearings, granted concessions which did not alter the main lines of the Bill but enabled Congressmen to show they had achieved some recognition for their constituents' special problems, gave ample opportunity to the opposition to advance its own Bill, which thereby became the target of ridicule and attack, and presented their own brief impressively and concisely. And, of course, when it came to the point there were many worried Congressmen with honest doubts about the legislation who would not vote to embarrass the President at this critical moment in international affairs.

It is too early for friendly foreign observers of the ways of Congress to relax. The Reciprocal Trade Bill still has to face the Senate Finance Committee, which includes many protection-minded conservatives, and the Senate itself. But so far this year Congress has once again disproved those who have despaired of it in the field of foreign affairs.

How to Lose Friends

THE Senate has already demonstrated its responsibility by passing, by 51 votes to 17, a foreign aid Bill which authorises the spending of $3.1 billion in new money, $109 million more than the House was prepared to authorise and only about $200 million less than the President asked. But unlike the foreign trade debate in the House, the Senate debate on foreign aid provided a sorry example of how the Administration, through a combination of spinelessness and ineptitude, can lose battles and offend its best friends. The only new issue of policy involved was provided by Senator Kennedy's amendment to permit aid to Communist satellite countries when the President felt that it would increase their independence of Moscow or Peking. Only the Soviet Union, China, and North Korea would have remained wholly outside the pale. The Battle Act, which was passed in 1951, has not made it impossible to help countries such as Poland and Jugoslavia, but the process is time-consuming and rigid : the President must declare that such aid is in American interests and that the country involved is not Soviet-controlled. Mr Dulles welcomed Senator Kennedy's proposal to make it easier to widen the cracks in the Soviet empire and the State Department actually helped with some of the drafting.

At the eleventh hour, however, Senator Knowland, the leader of the Republican minority, and Senator Bridges, both conservatives who are members of the Appropriations Committee, threatened that, if the amendment were passed, they would retaliate by cutting to shreds the appropriation for foreign aid, which is considered separately from the authorisation. The State Department beat a hasty retreat to an ill-prepared verbal position ; it would support the amendment in principle, but take no stand on whether it should be included in the foreign aid Bill. There is some question whether the President failed to grasp this fine-drawn distinction, or whether he simply failed to express it plainly. But Senator Knowland emerged from a meeting



with Mr Eisenhower proclaiming that the President opposed the inclusion of the Kennedy amendment in the present Bill, and would like to see it dealt with separately.

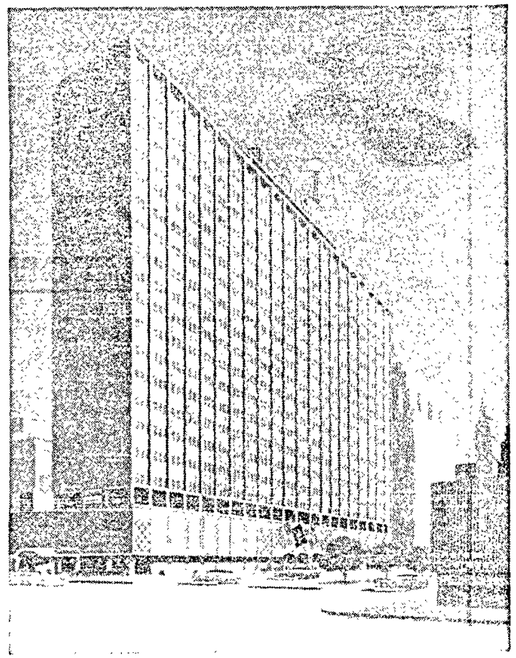
This was a death sentence for the Kennedy amendment, since the Senate has no plans for discussing the Battle Act during this session. Senator Knowland won his point by one vote, a clear proof that the Administration could have carried the day if it had not surrendered to panic. The Senate's decision that most of the money cut from foreign aid should be subtracted from military assistance was an equally clear expression of Democratic disgust with the Administration's weakness. The real disaster, however, is that forward-looking Senators of both parties will think three times—they already think twice—before they risk much for an Administration which succumbs so easily to threats from Republican conservatives.

Which Figures Do You Use?

With steel production up from 48 per cent of capacity in April to 62 per cent last week, higher than it has been this year, with unemployment falling in May for the first time in months and employment rising more than seasonally, with good reports on retail sales and building activity, last week provided a whole flock of statistical swallows to make it look as if the winter of recession was over. But unfortunately hovering over them was the ominous shadow of the latest figures for spending by business on new plant and equipment, which suggest that the summer will not last long. The sharp decline in these capital outlays, which followed the over-expansion of industrial capacity during the 1955-57 boom, is a basic cause of the present economic difficulties. Now the official survey shows that these outlays were cut back more than had been realised during the first quarter of this year, and that business plans for such spending in the future have also been cut back more, and will continue to decline for longer, than had been forecast; this year capital outlays are now expected to be over $6 billion less than last year, instead of $5 billion less as was estimated only a few weeks ago. Even this was depressing enough and there may well be further revisions downward before the year is out. The only comfort in this report is that the rate of decline seems to be slackening, so that the drop in business spending may soon be offset by the rise in government spending, now the only really expansionist factor in the economy.

These discouraging new estimates do much to explain why the staff of Congress's Joint Economic Committee, unlike the Administration's official optimists, sees no prospect of any genuine recovery beginning until late this year, if then, or of anything approaching full employment returning before the middle of 1959—and maybe not before the end of 1960. In February the committee's experts valued the gross national product this year at $429 billion, compared with the President's January estimate of $445 billion; now they think that even their figure is too high. They expect that about 5 million persons will be unemployed on an average all this year and that there may be as many as 7 million out of work early next. The committee's staff base their calculations about the course of the recession on

Based on charts prepared by the Committee for Economic Development.



Quaglino's

FOR THE BEST IN BANQUETING

QUAGLINO'S will open London's newest Banqueting Suite on October 1. Here will be provided the good food, good wine, and good service which have made Quaglino's famous. The accommodation available ranges from rooms suitable for small business luncheons up to the spacious ballroom holding 400 guests for a dinner and dance.

Please write or telephone:-
THE BANQUETING MANAGER, QUAGLINO'S,
BURY STREET, LONDON, S.W.1. WHITEHALL 6767.

SHERATON
A family of 47 famous HOTELS in the United States and Canada

THE SHERATON HOTEL
welcomes you to PHILADELPHIA

The Philadelphia Sheraton, the newest hotel in one of the oldest cities in the United States, is your introduction to modern American living. Here, and in all 47 Sheraton Hotels, you will find luxuriously furnished bedrooms, distinctive restaurants, and an open-hearted welcome. Sheraton Hotels are first choice of international visitors for many reasons: Here are a few:

- Reservations held if ships or planes are delayed
- Facilities for banquets, business meetings and conventions
- Sheraton's Family Plan:
No room charge for children under 14 in room with adults (except in New York, Syracuse, Atlantic City and French Lick)

For reservations see your travel agent, or write Mr. Albert de Leon, Director, International Department, Sheraton Hotels, Sheraton-McAlpin, Broadway and 34th St., New York 1, N. Y., U. S. A.

FAST,
EASY
AUTOMATIC
ACCOUNTING

The Burroughs Sensimatic brings unrivalled speed, accuracy and flexibility to modern machine accounting. Whatever your business, whatever your accounting system, a Burroughs Sensimatic can be geared to your special requirements. At one stroke it will streamline your office operations, bringing you increased efficiency and lower costs. The Sensimatic control unit permits each job to be individually programmed and four or more programmes may be incorporated in ONE unit. Maximum automaticity and economy are ensured and varying combinations of memory units are available. Automatic features simplify the operation of the machine, and up-to-date Management reports are provided as a by-product of routine accounting applications.

BURROUGHS SENSIMATIC

London, W.1.

the patterns of the other two postwar recessions and these projections are confirmed by Dr Moore of the National Bureau of Economic Research. He finds that the sharper the economic decline, the longer it takes for complete recovery to develop. Everyone now agrees that the current recession is deeper than those of 1948-50 or 1953-55, although it is not—nor is it likely to become—as serious as those of 1929-30 or 1937-38.

Atoms without Strauss

ALTHOUGH the President offered him another five-year term as chairman of the Atomic Energy Commission, Mr Strauss, whose name inappropriately rhymes with applause, has decided that it would be a mistake to perpetuate his feud with the Democratic majority on the Joint Atomic Energy Committee. This has already lowered morale among the senior staff of the commission—a number of whom are looking for other jobs—and almost certainly would have become more acrimonious next year when the committee's chairman will probably be Mr Strauss's severest critic, Senator Anderson of New Mexico. Had Mr Strauss accepted the reappointment, he would have faced a rough going-over by the Senate. To succeed him, the President has chosen Mr John McCone, a Californian businessman who, although he is a Republican, was Under Secretary of the Air Force in the Truman Administration. He is a close personal friend of Mr Eisenhower and his reputation of being able and easy to work with has made a favourable first impression on the Senators who will have to approve his nomination.

The departure of Mr Strauss does not necessarily mean that the Democrats have won their battle for more rapid development of nuclear power through government construction of the plants; with commercially competitive power from the atom still ten years off in the United States, private electricity companies are naturally reluctant to assume the heavy cost; but so is the Bureau of the Budget. With a new man in Mr Strauss's place, however, the dispute will be less bitter. No one questions that he was a dedicated and conscientious public servant whose foresight in pressing for the development of the hydrogen bomb and of detection systems for nuclear explosions deserves lasting praise. But he did offend many by his extreme concern with secrecy and security, his rigidity and his intolerance of disagreement. Mr McCone will be questioned closely to see if he is a "Strauss man."

The fact that Mr Strauss, besides being chairman of the commission, was special adviser to the President on nuclear matters gave him the President's ear and enabled him—or so the Democrats feel—to ride roughshod over other members of the commission and to frustrate the committee. Mr McCone's succession to both these influential posts may provoke congressional criticism. However, since the appointment of Dr Killian as the President's scientific adviser, Mr Strauss's influence at the White House has been declining. One factor in his decision to resign may have been the fact that two of the three experts who are to discuss systems of inspection with the Russians next month favour, while Mr Strauss opposes, suspension of nuclear tests. But to the irritation of some Democrats, Mr Strauss will still have a base in the White House as Special Assistant in charge of promoting the international atoms-for-peace programme.

Seasick

SHIPOWNERS are having a queasy time this summer. The sharp fall in freight rates since the re-opening of the Suez canal, and the consequent laying-up of idle ships in port, have sent them sliding down into the trough of the recession; and now the Supreme Court is rocking the boat. By a 6-to-3 vote, the Court decided last month that the "dual rate" system of fixing charges is illegal, if it curtails competition. The practice has been adopted by about half the world's shipping conferences, the groups of shipowners of various countries whose vessels ply between the same ports. It enabled shipowners belonging to these conferences to offer cut-price rates to shippers who undertook to use only the conference's vessels for transporting their goods.

Although the Federal Maritime Board gave its blessing to the system, the Court has now upheld the protests of the Isbrandtsen line, which operates between Japan and a number of American ports and has for years been waging a lonely price war against the conference to which all its competitors belong. The more gregarious American shipowners now declare that, because their costs are so high, the Court's decision will make it impossible for them to compete with foreign lines. They are cheering on the Federal Maritime Board which has asked Congress for legislation explicitly permitting the "dual rate" system; prophets in the House of Representatives think that Congress will comply.

There is also some uncertainty about the future of the subsidies which fourteen shipping lines get from the government. Both Houses of Congress have now passed a Bill authorising the construction of two new passenger liners for the Atlantic and Pacific routes with the aid of abnormally large subsidies. Whether Congress will be as helpful about the humbler freighters is another matter. In return for the operating subsidies they receive, the fourteen lines undertake to replace their ships every twenty years (also with substantial financial aid from the government). But President Eisenhower said in his budget message at the beginning of the year that the government was considering a reduction in subsidies, and suggested that the replacement period might be lengthened to 25 years or even longer. Pessimists suspect that the economisers in Congress may take this as a hint to trim the amount of aid the shipowners get in the future. For the present the House of Representatives has appropriated substantially more money for construction subsidies in the coming fiscal year than it granted a year ago. But if doubts should grow about the strategic value of the merchant fleet (which is the theoretical justification for the subsidies) in the event of a nuclear war, then they may be increasingly hard to come by.

Still Suspect

IT is two and a quarter years since Dr Galíndez, a lecturer at Columbia University in New York and a bitter critic of General Trujillo's iron dictatorship over the Dominican Republic, was last seen in a snowstorm outside a New York underground station and thereafter disappeared without trace. Nearly a year ago the Dominican government hired Mr Morris Ernst, a New York lawyer, and Mr William Munson, a former state judge, to investigate the

widely believed accusation that Dr Galindez was kidnapped, flown from the United States to Dominican soil, and there disposed of on General Trujillo's orders. The two investigators have now declared that they find no evidence "connecting the Dominican Republic or any of its officials with the disappearance of Galindez." Instead, they suggest that Dr Galindez may still be alive and that his vanishing may somehow be connected with his work as a collector of funds for an anti-Franco organisation of Basques in exile (though they say roundly that there is no reason to suspect Dr Galindez, himself an exile from Spain, of using these funds to enrich himself).

The report deserves attention because Mr Ernst is a respected lawyer with a reputation for defending liberal causes. Nevertheless, it amounts to no more than a finding of "not proven" on the allegations against General Trujillo. For instance, the pilot of the plane which is thought to have taken Dr Galindez to the Dominican Republic—a young man called Murphy who later died in equally mysterious circumstances on Dominican territory—told friends that he had transported the missing man; Mr Ernst suggests that he was an unstable young man who simply made the story up. One of Mr Ernst's main points is that Murphy could not have flown from the airfield in Florida, where he is last known to have touched down, to Dominican territory and back in the time suggested by witnesses' statements; but the time of his return is not exactly established and the later estimate would have left him long enough for the trip. Mr Ernst also calls on some very dubious pieces of evidence, such as an "affidavit" from the Trujillo authorities that the Dominican airfield where Murphy is thought to have landed Dr Galindez was in fact closed at the time.

The Ernst report is not likely to satisfy those who accepted the State Department's judgment last year that "sufficient evidence" suggested that Murphy may have been linked with Dr Galindez's disappearance. Nor is it likely to do much to sweeten the name of Trujillo in the United States. The dictator's son, who has a well-publicised generalship in the Dominican air force and a less well-publicised wife and six children, has recently been spending much time and money on some of Hollywood's female stars. General Trujillo's regime stands high on the list of dictatorships on which the United States, since Mr Nixon's disastrous trip to Latin America, is learning to look with a colder eye.

Atomics Unlimited

FEW people have cared to speculate on the state of the world by 1970 if governmental spending on nuclear weapons continues at the present rate, unchecked by disarmament or any other international agreement. This useful though sombre projection has now been made by a special expert committee of the National Planning Association,* which estimates that, even if nobody helps anybody else, there will be eight atomic powers by 1970, and 15 to 20 if a real effort is made, by military assistance, to enlarge the membership of the nuclear club. Assuming that there is no war by 1970, it is no longer an academic question to ask how many bombs—or nuclear warheads—there will be in the respective national stockpiles of missiles. The answer seems to be that there will be more than enough to ensure not merely the mutual destruction of the belligerents but also the poisoning of a high proportion of the neutrals, should war break out. Even now, according to the pamphlet, an additional 5 to 10 per cent of the casualties which warring atomic powers would inflict on each other would be suffered by neutrals.

It is therefore a matter of some interest to the neutrals to know how many bombs would be detonated. Ultimately, this will be a matter of the number of the enemies' own launching sites, multiplied by the degree of inaccuracy of the attacking missiles and by a factor representing the possible percentage of interception by anti-missile missiles. As "hard" or underground missile sites would present difficult targets for attacking missiles, it is estimated that to destroy 4,000 sites would require the firing of 50,000 to 60,000 missiles. But interception would pose a still more difficult problem: to limit to 100 the number of superbombs which were effectively delivered out of every 1,000 launchings would require 9,000 interceptors; to reduce 10,000 launchings to 100 deliveries would require the detonation of 99,000 anti-missile missiles.

This, from the calculations of those responsible for the pamphlet, might cause, through radiation alone, a world-wide casualty rate comparable to Europe's in the last war. But it would, apparently, take ten million explosions to destroy half of mankind—with the inevitable concomitant "damage" to half the next generation born to the survivors. Possibly, a stockpile of this size may not have been amassed by 1970 (though the committee doubts if the military authorities would feel safe with less). The NPA, nevertheless, seems gloomy about the prospect of achieving disarmament or even control through such statistics as these, based on sober projections of programmes for developing and producing weapons. It holds out hope, however, that attempts to colonise the planets may divert some effort and ultimately some fissile material from the atomic stockpiles on earth.

* "1970 Without Arms Control"; Planning Pamphlet 104; NPA, Washington, D.C.; 72 pages; $1.25.

SHORTER NOTES

President Eisenhower has responded warmly and promptly to the suggestion of the President of Brazil that inter-American relations should be reviewed to put them on a happier footing. Brazil was not one of the countries visited by Mr Nixon on his ill-fated tour, but as one of America's oldest and most reliable allies—and a sufferer from the glut of coffee—it has undertaken to repair the damage. To the satisfaction of the Brazilians, the President's reply to Dr Kubitschek was delivered by Mr Roy Rubottom, the Assistant Secretary of State for Inter-American Affairs. Presumably Mr Rubottom had his bag packed; he had expected to accompany the President's brother, Dr Milton Eisenhower, on a Central American visit which has now been postponed.

* * *

The Dodgers, the professional baseball team which recently decided to leave New York and seek its fortune in Los Angeles, are settling in nicely. They have beaten the Milwaukee Braves five times running, attendances are soaring at games in their temporary stadium, and in a referendum voters in Los Angeles have approved the city's agreement to make over 300 acres of land in Chavez Ravine as a site for the stadium which the Dodgers hope to move into by 1960.

THE WORLD OVERSEAS

The Army's Choice

FROM OUR PARIS CORRESPONDENT

GENERAL DE GAULLE'S brief tour of Algeria has thrown a great deal of light on the balance of power in the new French situation. It has also shattered illusions that the Algerian conflict can be brought to a rapid conclusion. Before his visit, the general, though carried to power by the staunchest partisans of a policy of force, retained with many people the reputation of being the only man capable of bringing the war to an end by negotiation—promising Algeria a form of independence within a broader framework which would include Tunisia and Morocco. In other words, it was claimed that only a man of his stature could achieve what M. Mollet and his successors so patently failed to accomplish.

The general was not expected to proclaim Algeria's "right to independence" on his tour, but the partisans of a liberal solution expected him not to say anything that might jeopardise such a solution; and "liberal gaullists" in Paris were encouraging this expectation. Even after his inaugural speech in Algiers, and in spite of his blessing for the settlers and soldiers in revolt, the advocates of a negotiated settlement clung to their hopes: there were some of the settlers' formulæ which the general had not repeated. Yet at each stage in his journey the liberal argument wore thinner. When he got to Oran the general stated that Algeria must show "that it is a French land today and for ever." Finally, at Mostaganem he ended his last speech before he left for Paris with the cry: "Long live French Algeria." For the settlers, the army, the FLN and President Bourguiba the doubts were over. The general, in their opinion, had chosen the path of integration, and rejected that of independence.

The previous illusions sprang from an initial misunderstanding. General de Gaulle's trip was described in Paris as a journey to reassert the authority of the state over a recalcitrant army and insubordinate settlers. The description would have been accurate if anyone else had been attempting to reassert this authority: M. Pflimlin, say, or M. Mitterrand, whom many had considered the most likely candidate to lead a resolute republican government, willing to stand up to the men of Algiers. But for General de Gaulle it was misleading. He was the army's choice; its spokesmen had stated plainly that they would accept no one else.

Admittedly, the French army (or rather its officer corps) was merely united in its refusal to obey the civilian authorities in Paris and in its determination to bring de Gaulle back. Within its ranks there was—and still is—a wing that wants to take things entirely in its own hands. The paratrooper officers, the colonels who after years of fighting against national revolutionary movements in Indo-China and Algeria have developed a thirst for direct political action, first set the pace. They found numerous allies in the committees of public safety, and together they urged that the first victory—the return of General de Gaulle—should be followed immediately by a wholesale purge of the politicians and the rapid establishment of a single-party, totalitarian regime. The risks of a considerable fascist movement in the home country are limited at this stage in the absence of unemployment and mass social unrest for it to feed on. Its only possible recruits on a considerable scale are the small men squeezed by the industrial revolution who had flocked to M. Poujade's banner. But changes in the economic situation might increase this threat.

The general has refused to become the leader of the extremist faction, but he has come to a compromise with it. The committees of public safety have been ordered to submit themselves to the public authorities, which, incidentally, are the military, since General Salan has been entrusted with civilian powers. But the committees were not dissolved. They were merely told that the aim of their revolution was achieved—the general being now in power—and that they should concentrate on the rather nebulous task of "integration of the souls."

Encouraged by this recognition, the Algerian committee has tried to force the general's hand. On Tuesday it sent a message, sounding like an ultimatum, urging him to hold no elections in Algeria before the referendum; to announce plainly his approval of integration; and to get rid of the party system in France. The committee has overreached itself and General Salan received a rebuff from General de Gaulle for his part in this threatening message. The general, though banking on the army, does not want its most extreme elements to run his show.

When a provisional balance-sheet of the new Algerian policy is being drawn up, the deadweight of army investiture becomes apparent. Most of the recent moves point in the direction of integration. Algerian Moslems have been promised "equal rights and duties" (a term that still needs definition). They have been assured that they will vote on equal terms with Frenchmen in the referendum and in the elections for a legislature which are to follow. Since then it has been announced (though M. Malraux, as chief government spokesman, has already denied this) that municipal elections will be held in Algeria within a month and that the government will guarantee complete freedom of choice throughout the territory. It is difficult to see how either of these pledges can be kept. The elections may have to be delayed if only because, as the settlers claim, no machinery for them exists. More important, with the army committed to integration and the committees still in action, would the Arab nationalists favouring independence have a real chance of presenting their case? The FLN has answered not only by announcing a boycott but by launching a new military offensive. President Bourguiba, who had pinned some hopes on General de Gaulle, has expressed his disappointment that another opportunity has been missed. The war goes on and the armed forces are apparently asking for another £100 million.

Yet let us assume for a moment that the French would be willing to accept all the political sacrifices involved in

genuine integration—the settlers agreeing to Moslem predominance in all the elected offices in Algeria ; and metropolitan Frenchmen agreeing to a proportionate Moslem representation in the Paris parliament, whatever its future functions may be. The fact remains that to stand a chance of success the policy of integration would involve even greater economic burdens than those already carried by France in Algeria. Equal family allowances and other social benefits are only the beginning. To provide the population with a livelihood would require agrarian reforms and rapid industrial development, creating threats to many vested interests in Algeria and at home. Further tremendous investments would be required to keep pace with the soaring Moslem birth-rate. The loans which M. Pinay proposes to raise cannot possibly pay for this ; it will be surprising if the American taxpayer will pay for it, either.

The magnitude of this economic task leads French opinions to exactly opposite conclusions. The settlers think that the new plan will go the way of its stillborn predecessors. It is their hope that General de Gaulle has been as effectively stifled with laurels as M. Mollet was silenced with rotten tomatoes. Liberal gaullists, on the other hand, claim that, in spite of appearances and concessions, the general will opt for a form of independence and will reveal his plans in his forthcoming constitutional project.

Could he carry the army with him ? A few weeks ago it would have seemed strange to apply to sophisticated France a question that is usually asked in a Latin American context. But the details of General Ely's resignation, for instance (he has now returned to his post as chief of staff of the armed forces), show convincingly that military disobedience was not limited to the paratroopers or the troops in Algeria ; it was general and systematic. The soldiers having won their political battle, what alternative source of political strength is available to the new prime minister ? The government was enlarged on Monday. Of its 21 members, 14 are parliamentarians. With parliament in recess, however, they are neither responsible to the assembly nor can they exert influence through the parliamentary support which they can muster for the government. They are the general's counsellors, whose advice he may follow or not, as he thinks fit. The constitutional projects will show how the general intends to fill the parliamentary vacuum. In Paris, in the meantime, a ten-year-old saying of M. Malraux, the minister of information, has once again become fashionable: " In France there are the communists, ourselves (that is, the gaullists) and nothing." Only, it is added, the gaullists have changed ; most of them are now in uniform.

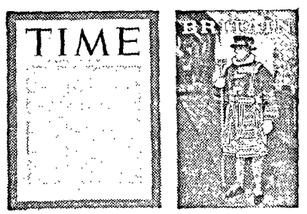
Mr Todd's Defeat

FROM OUR CORRESPONDENT IN SALISBURY

MOST Rhodesians are thankful that the Dominion party, which has thriven on the internal troubles of its opponents over the past five months, did not, as so many had feared, win a small majority in the Southern Rhodesian House and take over the government. Considering Sir Edgar Whitehead's embarrassments he has done well (even though with the aid of the alternative vote) to win the election with a majority of four in a House of only thirty members. At the dissolution of the last parliament, the Dominion party held five seats with one anti-government Independent. The opposition has increased from six to thirteen, but this represents a swing of only five per cent compared with the last Southern Rhodesian general election of 1954. The swing has taken place almost entirely in rural areas ; the government vote in the four main centres of Salisbury, Bulawayo, Umtali and Gwelo remains virtually unchanged at 57 per cent.

The complete elimination of Mr Todd's United Rhodesia party (whose second preferences turned the scale against the Dominion party) was not a great surprise to close observers who have felt all along that Mr Todd's expectation of winning six or seven seats was wildly optimistic. When Sir Edgar Whitehead was elected as leader instead of Mr Todd at a special congress of the Southern Rhodesian division of the United Federal party in February, Mr Todd received 129 votes against 193 for Sir Edgar. From this some observers deduced that the Todd group had at least two-thirds of the strength of the Whitehead group. In fact all it has proved is that the Todd group was more active and took more trouble to get its supporters elected as Congress delegates.

Throughout the Federation the African reaction has been unfavourable. In Southern Rhodesia itself, Mr Todd stood higher than any other European political leader in the opinion of Africans and they are bitterly unhappy at his defeat. The Southern Rhodesian African Congress claims that, as a direct consequence of the election, it has had a large number of applications for membership from Africans who were formerly supporters of Mr Todd. There is little doubt that the immediate African reaction has been a swing towards nationalism and the Congress, but just how far this swing will go or how long it will last has yet to be seen. When the dust created by the Todd crash has settled, some African leaders will realise that the Congress road of racial politics can lead only to disaster, and they will no doubt once again seek a place in one of the established political parties. In Southern Rhodesia this can only mean the United Federal party.



*

In the northern territories the European reaction to the election has been largely favourable. Mr Todd's party made the issue of Southern Rhodesia's sovereignty within the Federation part of its election platform ; it has always emphasised that it is a Southern Rhodesian party and as such it does not have many friends in the northern territories. The Dominion party is also regarded in the north as essentially a Southern Rhodesian group. It has no support whatever in Nyasaland and very little in Northern Rhodesia.

Sir Roy Welensky and the Federal government leaders are satisfied with the results ; they have reason to be, since it should now be a good deal easier to win a reasonable majority in the forthcoming Federal elections in September or October. The Dominion party is weak in Northern Rhodesia primarily because Northern Rhodesians regard it as a collection of Southern Rhodesian politicians with little in common except their dislike of the Federal leaders, especially of Sir Roy Welensky and Lord Malvern. In Northern Rhodesia it has not hitherto been considered altogether " respectable " to belong to the Dominion party, but if the party had won last week's election and become the government party in Southern Rhodesia, this situation would have changed overnight. The party's strength north of the Zambesi would have increased considerably, which might well have allowed it seriously to challenge Sir Roy

Sir Arthur Morse, Chairman of the British Travel & Holidays Association, welcomes the world to Britain. In the company of other leading Britons—selling products and services abroad—he recognises the role of international advertising as an integral part of every sales programme. As an export trade, tourism was one of the major dollar earners in 1957.* TIME, The Weekly Newsmagazine, New Bond Street, London W.1.

TRAVEL IN BRITAIN ... SOLD AROUND THE WORLD ... *advertised in TIME!*

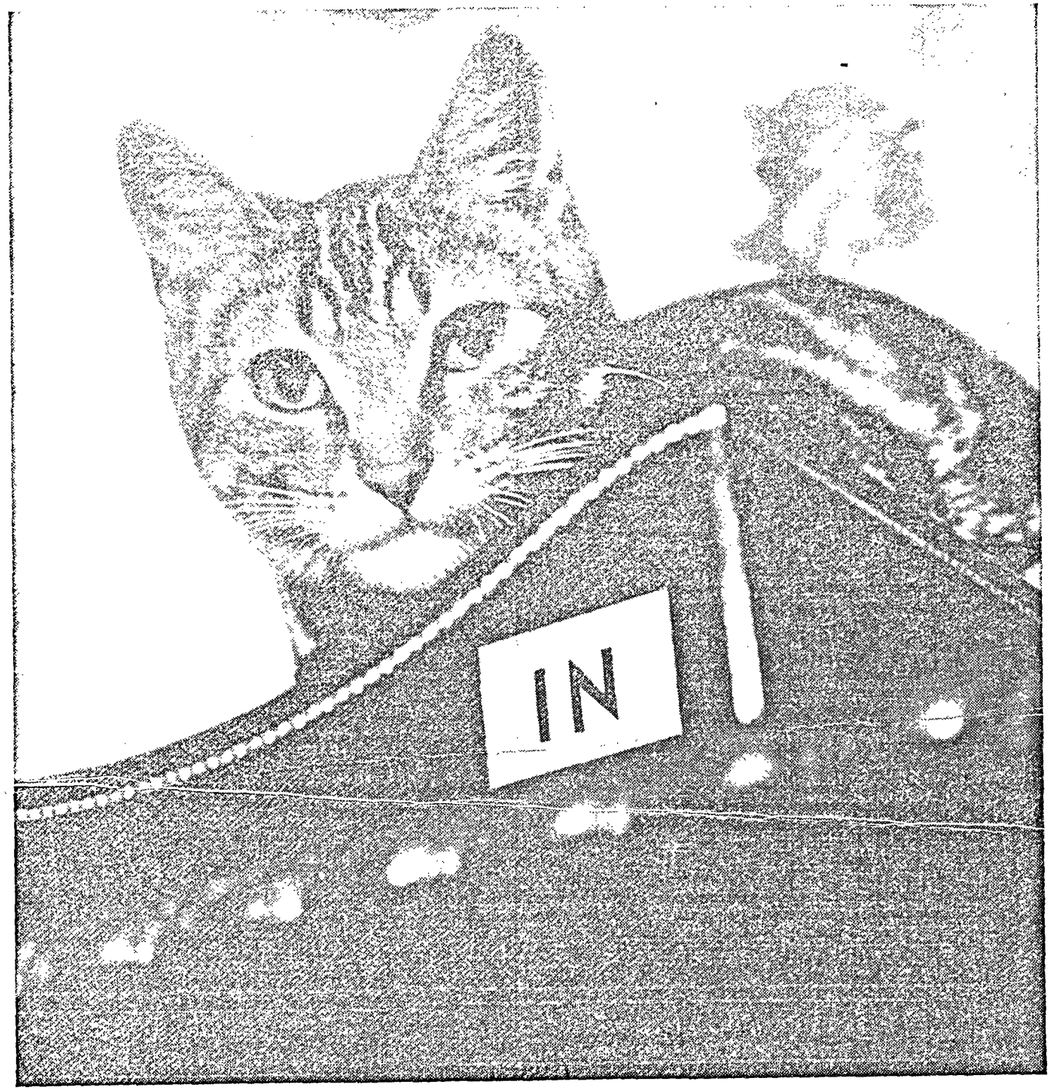
Welensky for control of the Federal parliament. As things stand at present, in the coming Federal elections Sir Roy seems assured of a small majority in Southern Rhodesia, a substantial majority in Northern Rhodesia and all six of the seats for ordinarily elected members in Nyasaland. By the time the elections are due, the memory of the past five months of squabbling inside the United Federal party should have become less vivid; and without Mr Todd's group attacking on one flank while the Dominion party attacks on the other, the United Federal party might do better than it did last week.

One question still unanswered is what is to become of Mr Todd. When asked his intentions immediately after the result was announced, he would say no more than that he intended to retire to his farm. But whatever his personal inclinations, it seems unlikely that he will be able to take no further part in political life. The future of the United Rhodesia party will be decided at a special congress in two weeks' time. A number of its supporters are known to favour keeping the party alive, but it is difficult to see how this will be possible, since even before last week's crushing defeat, the party had stated that it was most unlikely to contest the Federal elections. It must be even more unlikely now. In this case, the party is faced with the prospect of trying to keep alive for five years until the next Southern Rhodesian general election without any representation in parliament. It seems more likely that many of the party's supporters, although not Mr Todd himself, will now return to the United Federal party, although a few may join the ultra-liberal Constitution party founded recently in Northern Rhodesia and now attempting to establish itself south of the Zambesi.

New Zealand and Butter Dumping

FROM OUR CORRESPONDENT IN WELLINGTON

NEW ZEALAND reactions to the Board of Trade's decision on butter dumping are thoroughly mixed. Leaders of the dairy industry, with a strong seasoning of politicians, both government and opposition, have expressed disappointment of various sombre shades. Outside those immediately affected, opinion has been less vocal and more apprehensive than reproachful. Most New Zealanders understand that their prosperity is closely bound up with that of their great primary industries. They may come no closer to the farm than their Sunday afternoon motor trip but there is still a widely held conviction that when the "cocky" is in trouble, everyone else, sooner or later, will also be in trouble. The non-farming New Zealander is, therefore, distinctly worried about the drop in the dairy farmers' earnings just as he has been more than a little envious of the dairy farmers' obvious prosperity. But he is not moved to any paroxysms of indignation and indeed, behind the privacy of his afternoon newspaper in the bus, may be heard expressing the view that the fall in butter prices and its effects are strictly the dairy farmers' problems—an attitude of mind which the farmers' leaders have publicly deplored.



It is doubtful whether the British Government's difficulties in applying, or even discussing, countervailing duties against good customers and friends are understood here, although the British High Commissioner, Sir George Mallaby, and others have done their best to enlighten people, and although a good deal of New Zealand newspaper comment has been sympathetic and understanding on this point. New Zealanders, however, tend to feel emotional about even such prosaic matters as trade with Britain and the Board of Trade's decision has been construed by many of them as an indication that Britain, or undefined interests there, are more sympathetically disposed towards foreigners than to the welfare of its Commonwealth brethren. But many New Zealanders winced when the president of the New Zealand Federation of Labour, Mr F. P. Walsh, in his message to the Trades Union Council inviting its support for the New Zealand application, referred to their country's support for Britain during the war and even to food parcels sent to Britain. New Zealanders are not, as a whole, the sort of people who remind others of past favours when they are in a fix and in any case most of them realise that New Zealand wholeheartedly backed up Britain in two world wars because the British peoples were all in one boat together.

★

If facts and figures are produced a good many New Zealanders, and a good many New Zealand farmers, are also prepared to admit that in matters of trade the bulk selling agreements between this country and Britain during and after the last war operated fairly enough, and that New Zealand had the benefit of a lot of price rises authorised under those agreements. On the other hand, a good many people here also point to the worsening terms of trade *vis-à-vis* Britain and maintain that New Zealand could have abandoned the bulk selling agreements earlier than it did. Without doubt the New Zealand dairy farmers were wholeheartedly in favour of abandoning bulk purchase in 1954. At that time, New Zealand butter was bringing about 355s. a cwt in London. At present it is bringing about 206s. a cwt and second thoughts on the matter have been busily at work for some time. At this price New Zealand butter is selling in London at about 136s. a cwt below the guaranteed price paid to the producers here and the industry is only too well aware that this cannot continue for very much longer without completely wiping out its accumulated reserves. These amounted to over £27 million at the end of the 1955-56 season, but had been run down to £14,700,000 at the beginning of this year.

The industry now faces the prospect of accepting a substantially lower guaranteed price, or going to the government for a subsidy or some other type of support. The government has already been told quite bluntly by Mr Walsh, who is influential in its councils, that there is no justification whatever for asking the taxpayers as a whole to subsidise the incomes of the dairy farmers at their present level. Mr Walsh has made no secret of his belief that his trade unionists are not getting enough of the national cake and the dairy farmers too much. He talked recently of the danger that New Zealand's standard of living would be reduced to two thirds of its present level unless the loss in dairy income could be made good by increased production. He was taken up on this point by one of New Zealand's leading economists, Professor H. Belshaw, who said that this was an exaggeration and that the probable fall in New Zealand's income, based on the present terms of trade, would be about 10 per cent.

The government has so far stood aloof from the argument. It sent the deputy prime minister, Mr Skinner, to London to put the case for anti-dumping duties, not with any great optimism, but because it was convinced that it must back

up the farmers and that the case should be put. Now that the decision has been announced the prime minister, Mr Nash, has made it plain that the farmers must accept an overhaul of the basis of the guaranteed price and that, at the least, the legislation passed by the previous government (at the dairy industry's instance), which prevents changes greater than 5 per cent up or down in the annual level of the guaranteed price, must be revoked.

A number of dairy industry spokesmen are contesting this hotly but their heat is not likely to make any impression on the facts. The final result will unquestionably be an overhaul of the guaranteed price structure, an intensified effort to diversify New Zealand's overseas marketing and ultimately a much closer attention to salesmanship and better packaging of dairy products. The immediate uncomfortable prospect is that New Zealand's earnings from sales of dairy products this year will be down by about £26 million compared with last year.

Spain and Morocco

FROM A CORRESPONDENT

SPAIN and Morocco form a geographical unit, not altogether European nor altogether African, limited to the north by the Pyrenees and to the south by the Atlas Mountains. The Muslim attempt to make the area a political unit as well was abandoned centuries before the final retreat of the Muslims south of the Straits. The corresponding Christian attempt, at the time of the Reconquista, left Spain with several presidios, or garrison cities, in north Morocco ; for these it now feels a strong sentimental attachment because of the many generations of Spaniards who have been born and died there. Modern colonialism also gave it a portion of the Moroccan Sahara, while the 1912 protectorate added the enclave of Ifni, occupied only in 1934. To the Moroccans these foreign intrusions are a provocation ; with the coming of independence they feel very strongly about Ifni, less strongly about the Sahara, and remotely about Ceuta and Melilla.

Although the two countries have every interest in co-operating together, these old issues keep alive a feeling of resentment which periodically becomes acute. Relations oscillate, according as resentment or the sense of common interest prevails. At the end of the protectorate, common disapproval of the French conduct of Moroccan affairs led to an approximation of outlook which extended to Spanish relations with the rest of the Arab world. Spain's delay in handing back the arid little territory of Tarfaya, which was part of the protectorate, and its reluctance to give up Ifni led to a rising in Ifni last November by local irregulars, no doubt with encouragement and support from Moroccan territory. A number of Spanish outposts were lost and a number of Spanish soldiers are still prisoners. The Caudillo characterised the attack as treacherous and ungrateful.

The deterioration in Spanish-Moroccan relations had, however, begun earlier as a result of Spain's reconciliation with the Nato powers and of the more European policy of the new Spanish foreign minister who, in a speech of welcome to Mr Bourguiba last year, mentioned that Spain could not forget that it was a daughter of Rome. There followed his meeting with the French foreign minister in San Sebastian last summer, leading, it is said, to substantial French economic aid, and certainly to Franco-Spanish military co-operation in the Sahara. After the Ifni rising, the Moroccan government realised the folly of bringing a united Spanish-French front into existence, while Spain began to appreciate the dangers of involving itself in the French dilemma in North Africa. The pendulum began to swing back again. Tarfaya was rather ungraciously handed over, with Spain insisting that its troops must remain for the present, as in the former northern protectorate. But a week or two later it announced that they would be withdrawn. Clearly the Spanish government might have got much greater credit with the Moroccans by speedier and more generous action ; but the Caudillo is, to some extent, the prisoner of the patriotic sentiments of an officer corps that has not forgiven him for his pro-Arab sentiments and for the abandonment of the protectorate.

Spain's greatest material interest in Morocco today is the safeguarding of the Spanish residents and interests in the northern zone. These have suffered considerably from integration into the larger zone and the inevitable frenchification which this entails. If officials from the north are to serve in the south, they must learn French, and the French language has therefore taken its place beside Spanish as a subject of instruction in the northern schools. Moroccan government officials, nine-tenths of whom are from the former French zone, tend to look at all things Spanish with predominantly French eyes ; though against this the asylum given to Moroccans in Spain during the struggle for independence has left many of them, including such influential figures as the prime minister, Mr Balafrej, and the president of the Istiqlal party, Allal al Fasi, with grateful memories of Spanish hospitality.

The transference of the northern zone from the peseta to the franc area was the greatest, if inevitable, blow on the material side. Thanks to excellent Spanish-Moroccan co-operation the actual change-over was carried out with remarkable smoothness and efficiency. The exact date remained a secret till the moment came and the rate of exchange, which was ten francs to one peseta and thus favourable to the Spanish currency, rendered the operation easier and has made it possible for the northerners to continue to quote prices in pesetas, though the actual transaction is now made by paying ten times the number of francs. Since local industry was integrated with the peseta area, exports, such as cement, had hitherto gone principally to Spanish markets in Ceuta or Melilla, Malaga, or the Canary Islands. Since there is now a system of import and export licences in both countries and foreign currency is required, this trade has come to a complete stop, while the internal market is now more cheaply supplied from the south. This has led to increased unemployment, made still worse by the application of labour legislation from the south which has involved more than doubling wages and so led to many dismissals and to short time working. There are said to

be now 7,000 Spanish unemployed, as well as the more numerous unemployed or underemployed Muslims. Spanish-Moroccan differences in the south tended to make things worse for the moment, since they did not dispose the Moroccans to be particularly obliging, though there was fortunately no disturbance of order in the northern area. The transference to the franc zone has also involved the cessation of substantial Spanish subsidies, leaving a deficit which has now to be filled from the Moroccan budget.

In spite of these difficulties, the northern zone does not impress the casual visitor as unduly depressed. In Tetuan there are many signs that horizons have been widened and that life is coming in from new sources. Tourists are beginning to come to Shauen and Tetuan from Fez and Meknes, and even to Alhucemas from Oujda. French and English newspapers are now on sale as well as Spanish ones; and new air services have been started. In time merchants and industrialists will adapt themselves to the new orientation of trade and should profit from the new opportunities. The technically successful change-over reflected credit on the finance minister, Mr Bouabid (now also deputy prime minister), who stated frankly that mistakes would no doubt be made, but that the government would learn by experience and remedy its mistakes. His promise has been kept; and the readiness of the authorities to acknowledge and correct their errors in this case, as in others, is one of the most encouraging signs of the new Morocco.

Israel Learns to Pay its Way

FROM OUR CORRESPONDENT IN TEL AVIV

ISRAEL appears to be less concerned about the American recession than are many European countries. This seems strange in view of the amount of foreign currency that it gets from the United States. The bond drive, the United Jewish Appeal, the American grant-in-aid and various loans all help to fill the balance of payments deficit, which this year is estimated at $250-$300 million. Why, then, this apparent calm?

There are two answers: first, many people agree with the governor of the Bank of Israel that the recession will be short-lived and that Israel therefore will not suffer much. Second, the Israeli economy has a safety belt: in addition to German reparations, which have passed their peak payments and will come to an end in 1962, there are the personal restitutions paid to people who suffered from Nazi persecution and who now live in Israel. These payments are expected to reach between $90 and $100 million in 1958: a considerable sum in a foreign currency budget of roughly $560 million. What is more, personal restitution payments are likely to continue for a number of years, either in the form of old age pensions or in the refund of confiscated property.

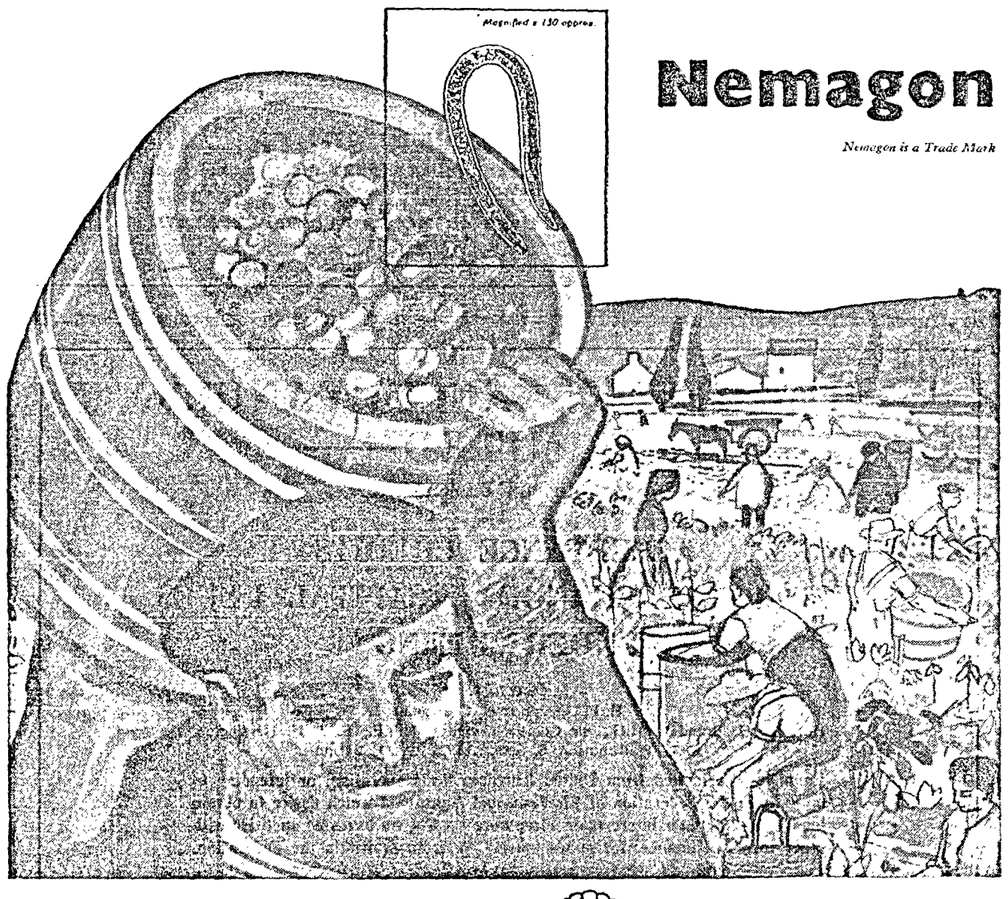
There is a strange discrepancy between the minister of finance's warning that the country will have to choose between "exports and unemployment" and the outward appearance of prosperity. Tourists have been coming in for the tenth anniversary celebrations, not as many as were expected but still in considerable numbers. They fill hotels and speed up business all round. The shops are full; the streets, cafés, and cinemas are crowded; unemployment is kept down, if necessary by emergency jobs.

Under the surface, however, there is uneasiness and the warning of the minister of finance is believed justified. Present prosperity is still a result of generous outside help. Building, which served as a very important source of employment, is to be curtailed this year because the Treasury cannot afford to invest as much as before. Agricultural settlement, pushed vigorously for the last ten years, has reached a natural limit, as available water resources become scarce, and interest has now begun to focus on industrial development.

Despite attempts to attract foreign investors by various privileges, the government's development budget has become the main source of investment capital. Sometimes a new "private" enterprise is set up for which the development budget provides 80 per cent of the capital. This trend grows stronger as reparations goods, which are controlled by the government, account for an increasing share of investments and as more people put their savings into government securities. Mr Lavon, the general secretary of Histadruth, the labour organisation, said recently that by now 60 per cent of the economy was controlled by public and semi-public bodies. The government and Histadruth have pushed development projects where private investors have hesitated. Until now the results of public management have not been encouraging. The potash works near the Dead Sea ran up a huge deficit and is only now struggling back painfully to normal production. The new copper works in the south calculated on a fairly high copper price during a boom period, and must now begin to use up the best ore available in order to keep down the threatening deficit. Histadruth leaders are beginning to look into the profitability of the dozens of enterprises which have grown up under the giant umbrella of Solel Boneh, the contracting company which controls industrial plants through its "Koor" company.

★

There is something almost revolutionary about Histadruth leaders paying attention to profits. For years they have been castigating private employers for the way in which their concern over profits has prevented them from venturing into pioneering fields. Moreover, in many cases the cart was put before the horse; the trade unions decided what standard of living was due to the worker and did not bother whether the enterprises were able to pay for it. Differences could always be made up in various ways, by subsidies for goods on the domestic market or differential dollar rates for exports. Now that exports have to pay for an increasing part of Israel's dollar needs—next year the target is to cover half of them—the problem of profitability looms even larger. At present Israeli exports are not cheap enough and the government comes to the help of exporters with a premium added to the official dollar rate.



It will be interesting to see how Histadruth tries to solve these problems in its own enterprises. It has to speak with two voices; the co-operative employer who must pay heed to the balance-sheet, and the trade union which is pledged to keep up the standard of living of the worker. Experiments are being made to let workers' representatives participate in the management of the plants so that they should see production issues from the management viewpoint. Optimists are tempted to believe that the Histadruth may take a leaf out of the capitalists' book in order to make its enterprises pay.

Vintage unlimited

Grapes for the winepress, grapes for the table. Grapes from the Côte d'Or and the San Joaquin Valley, from Barossa and Almeria and the Paarl River. Grapes blue black and ruby red, amber and green and purple. A sun-rich, pearl-bloomed harvest gathered gratefully from the vines—for few crops face heavier odds. Hail and late frost: drought and downpour and tempest: ten, twenty, thirty different pests of leaf and bud, flower and fruit and cane. And one at least, microscopic and unseen in the warm soil, which attacks the roots themselves.

Nematodes, voracious eelworms of many species, swarming in untold billions, unseen in the earth. *Nematodes*, insatiable scourge of almost every important world crop, one-time problem pest—yet which, it is now believed, may soon be brought under control. For already, Nemagon, developed by Shell, is showing positive results. In California, vineyards are being successfully treated with this advanced soil fumigant against root-knot nematode (*Meloidogyne incognita* var. *acrita*) and root-lesion nematode (*Pratylenchus vulnus* Allen and Jensen) and tests in process in Australian vineyards promise success there also. In Jamaica, trials with Nemagon are in progress on sugarcane, and in the Far East on papaya and pepper. In Mexico, test crops include cotton and melon; in French West Africa, bananas.

Strawberries, citrus, peaches, tea . . . the indications are that high-value cash crops of many kinds will be made secure from the danger of eelworm attack. Through Shell Nemagon to-day comes promise of a new world of productivity to-morrow — and a vintage year every year for many important crops.

THE BUSINESS WORLD

House Reform

STOCK EXCHANGE reform is a continuous process and the London Stock Exchange holds its place as one of the world's two foremost free markets in securities not because there has been no change but because change has been accepted as necessary. Compared with the years between the wars almost every relevant feature—the clientele, the kind of stocks favoured and the methods of handling the business—has changed. Those whose memories stretch back some way can count the good as well as the bad in the changes. Each year takes its toll of the number of members, clerks and firms; each casts aside some small unwanted enterprises because available investment business has become concentrated in the few hands of the pensions funds and the insurance companies. Almost every year brings down in particular the total of jobbing firms and gives public warning that the jobbing system, the London Stock Exchange's speciality, has been put under severe strain by a tax system that practically inhibits the unlimited partnership from accumulating reserves. On the other hand, the lounge lizards, those half commission men of the West End, largely uncontrollable by the firms that used them, no longer urge the wealthy into stocks of which they know nothing.

No doubt next week's election for the Stock Exchange Council does raise the issue of reform much more sharply than for many years past. But the issue upon which members will vote is not whether there is to be reform, but what is to be its pace and shape. Big reforms have been accepted, and deliberately sought, during the postwar years; the disappearance of the ridiculous dyarchy between the Trustees and Managers (landlords of the building) and the Committee (responsible for the conduct of business) is one; the starting of a guarantee fund for the public is another; the adoption of a policy of public relations, with a quarterly journal, a contract to a leading advertising agency, and a public gallery is one more. There have been two major reforms of the rules governing the grants of quotations. The present chairman, Sir John Braithwaite, has had a hand in nearly all of these reforms, and now, in his seventies, must be approaching the end of a memorable and progressive chairmanship. The fact that reform will in any event occur does not make matters easier for the six reformers who come forward next week among the nineteen candidates for twelve vacancies on the 36-member Council. But certainly it does not prove them wrong in their ideas. They may still be right to press for stronger and more frequent doses of reform.

On no point is the clash between the progressives and the old guard sharper than on the question of rebuilding the Stock Exchange. All agree that the present building, despite its valuable three-cornered site bounded by Throgmorton Street, Bartholomew Lane and Threadneedle Street, is scarcely adequate for its job. It is overpopulated with bustling clerks, because it is of necessity undertelephoned; and, because of the same lack of communication, London is at times "scooped" by provincial exchanges by up to three minutes on dividend announcements. Given up-to-date facilities other important reforms could follow. These could include the centralised clearing of stock by Stock Exchange staff which the reformers have demanded, and which would

mean economies to the broker in the cost of each bargain. That in turn ought to pave the way to a reform which the ginger group, strangely, has not mentioned—recorded figures of market turnover.

All agree that the "House" ought to be rebuilt. The Council seeks to do so about twenty years hence out of a fund to be gradually built up. The ginger group says "do it now," either on the present site or elsewhere; it leaves the voter to guess that a modern building on perhaps half the present site financed by the sale or letting of the rest is what is envisaged with the prospect of an improved rent roll from a many-storied building. The Council believes that is impracticable, because of rights of ancient lights that would prevent the Stock Exchange building rising further towards the sky. But it seems worth a closer look.

Two other main types of reform are suggested. The first is the streamlining of the Stock Exchange Council. Most members of the present Council spend most of each working week on the affairs of the Council; and the burden of their preoccupation has to be carried by their partners. The reformers, recognising all the dangers of bureaucracy, still feel it right to urge that the Council should be cut down to twelve or fifteen members, leaving day to day administration to a paid general manager with a strengthened team of departmental heads. They have not so far suggested, as many members seem to suppose they have, a paid (non-member) chairman as in New York. They think in terms of a member chairman who would still of necessity be largely a "front" man, eating public lunches and making public speeches, but serving like the other members of the smaller Council only for, say, three years. The chairman would be supported, too, by a full time public relations officer, for the reformers argue that to pay a substantial fee to a firm of public relations experts and then to tell those experts what to do combines the worst of two systems.

This group of proposals has many attractions, but the sponsors need perhaps to give more thought to what can, in fact, be delegated to permanent officials.

The Ginger Group's Programme

1. Day to day business in the hands of a paid General Manager with heads of departments under him.
2. Council to be reduced from 36 to 12-15 members concerned with major policy and retiring after a specified period.
3. Rebuilding or reconstruction of the Stock Exchange on the existing site or elsewhere, bringing additional rent income.
4. Increased agency fees.
5. More efficient clearing of stock and notifying of prices.
6. Examinations for election to membership.
7. "Proper arrangements" of the audit of accounts of member firms.
8. Financial soundness of members to be established not only on entry but afterwards.
9. More steps to improve public relations.

For example, when a firm breaks the rules—and a surprising number of the very best of them do make occasional slips—it is right that the offender should be called to order by his peers; and when a new member is elected, the present process of examination by a group of members and a final welcoming interview with the chairman seems right.

The final group of proposals—better control of the audit of firms, the right to test for solvency not only on first election to the House but at any time, together with the suggested examination before admission to membership, would command the support of very many beside the present reformers. These are all simple methods of raising the status of the profession. But they are essentially long range proposals and they will not be without difficulties in application: just what, for instance, are the qualifications making a good stockbroker that the examination ought to reveal?

THE reformers are not a group of irresponsible young men plunging recklessly. Thought has been given to their programme for more than a year, and they claim that it is because of their intervention that the Council already has a policy sub-committee. Several of the biggest firms on the Stock Exchange wholly or partly share their views. Indeed the problem is to convince the voters that this is not a plot to take a rise out of the small fellows. That is one reason why the candidates are drawn from both large and small firms and from jobbers as well as brokers. But the doubts are hardly justified. The big firms with a good institutional business and with a good new issue business will survive anyhow. It is the small firm with small clients that finds it hard to make both ends meet; and the reformers believe that the economies of their programme would enable some small and medium sized firms to survive that might otherwise go under. The issues that would really divide the large firms from the small—for example, any suggestion that firms individually might advertise or that branch offices might be allowed—have not been raised.

A property owning democracy needs an efficient market in documents of Title. Radical reform, the ginger group says, is more likely to achieve that than crude attempts to put the clock back such as the proposed revival of option dealings. But what if despite all efforts business cannot be spread and if the number of Stock Exchange firms goes on contracting? On the New York Stock Exchange as well as in London there is a tendency to lose business to outside bodies. Reform will surely still be needed, if business does not expand, but the reformers have not thought out its shape. They see that, unless the present concentration into fewer hands can be arrested, the jobbing system will wither away (except presumably in gilt-edged, where the Government Broker is in effect a bigger jobber behind the jobbers). But they have not faced up to what will follow if much of the jobbing system does collapse.

It is a fair criticism that at many points the proposals do not go to the heart of the matter. The reformers see the paramount need to provide finance for modernisation, but their methods for raising it are crude. The proposed increase in the three guinea agency fee which merchant banks, solicitors, Stock Exchange clerks and a few others sharing commission pay, and the proposed annual charge for quotations have been looked at by the Council and found to be inadequate. Specifically, the reformers do not say whether or not they would, if need be, face up to a sharp rise in subscriptions.

Nor do they face at all the need for a radical overhaul of Stock Exchange commissions. It costs the investor much more to take home 1,000 shares at 2s. than 100 shares at £1, but it costs his broker no more to buy them. The complex schedule of Stock Exchange commissions cries out for replacement by a simple commission based on money turnover, subject no doubt to a minimum, and subject also to a lower scale on Government stock and to a differential in favour of the big buyer (since it is no more laborious for the broker to buy £1 million of War Loan than to buy £100 of it). The only argument against a simplified commission scale is the convenience of the provincial broker who likes to be quoted a net price, but London is the real market and can fix its terms. The fact that the largest item in dealing costs is Government duty is no argument at all against making the other items rational.

The reformers in office, as they would admit, would surely find some of their proposals impracticable and some reforms that they have not mentioned might be pressing. If, as may happen, some of them do reach the Council Chamber, they will find their colleagues more evenly divided on their proposals than is generally known. If they should fail, the members will still owe them a debt of gratitude for bringing reform into the limelight. The need for it is evident and great.

The Candidates

For 12 vacancies on the Council, 19 candidates, including 7 retiring members, have been nominated. Each member has 12 votes, but many maximise their voting power by voting for only one candidate of the 24 Council members not retiring this year. The Government broker sits ex-officio and there are 17 other brokers and 6 jobbers.

Retiring Candidates seeking Re-election :—

F. R. Althaus (*Pember & Boyle*) (B)
W. G. Barron (*Francis & Praed*) (J)
A. B. Floyd, (*Ricardo, Isaacs & Bray*) (J)
G. H. Greenwell (*W. Greenwell & Co.*) (B)

BUSINESS NOTES

IN THE MARKETS

Bank Rate Hopes Deferred

ONLY by the skin of its teeth was the City of Birmingham's cash and conversion offer of £5 million 5¼ per cent stock 1974-76 at £99 a success. It was fully subscribed and the underwriters were relieved but cash applicants received full allotment. Dealings in the new stock started on Thursday at around the issue price. The City of Birmingham thus has the satisfaction of knowing that it has borrowed on the most advantageous terms possible.

The wicket thus remains sound for the next batsmen in the new issue match and the scoring should be good, for investors are under the impression that this is one of those periods when a reduction in Bank rate has again become an interesting possibility. Both the gilt edged and industrial sides of the market have been rising on Bank rate hopes. The *Financial Times* index of Government securities has risen over the week ended on Wednesday only from 83.47 to 83.52 and there has been a steady absorption of stock by some big buyers. But more than the whole of the advance occurred on Wednesday just in front of the Bank rate decision when smaller buyers came in and the index jumped 0.29 in one day. Prices did not fall back when the buyers' hopes were dashed. For the same reason there was some fairly heavy buying of Treasury bills on Tuesday and Wednesday, three months' bills being bid down from 4 23/32 per cent to 4⅞ per cent. On the Industrial side *The Economist* indicator rose by 3.8 to its highest point of this year—188.0. The inspiration behind the buying movement was the same—the feeling that the time for some further relaxation of the credit squeeze must be near.

Those Bank rate hopes have for a week at least been deferred. But buying may recur so long as operators judge that the climate is favourable for relaxation—that is until either their hopes are realised, or the autumn pull against sterling has made a reduction in interest rates unlikely. But experience shows that operators are seldom right in guessing the timing with which the Bank of England will play its

hand. This is partly because the Bank frequently does aim at tactical surprise, and partly because the weight of the other forces that the Bank has to consider, for example the movement of short term money, cannot be assessed by the outside public. On purely tactical grounds there is an argument in favour of further delay: funding by sales from the Government broker's supply are normally bigger in anticipation of a Bank rate move than when hopes have been realised. But tactical considerations are seldom decisive.

AEI Plays Safe

With old Consols yielding a few pennies under 5 per cent, a first class industrial debenture with a running yield of £6 1s. 10d. looks sure of a royal reception. That is the running yield (and a redemption yield of £6 2s. 4d. to the latest date) offered in the public issue by Associated Electrical Industries of £25 million of 6 per cent debenture stock (1978-83) at 98½. The institutions which always seem to have room for good industrial debentures in their portfolios cannot fail to find the terms attractive. Though profits have fallen slightly in the first months of this year, the AEI group has plenty of orders on hand and the cover on the debenture interest is of the order of seven times.

Part of the proceeds of the issue will be used to repay before September 30th the £4 million of 3¼ per cent notes due for final redemption in March, 1959. Holders of £3,450,000 of these notes have agreed to surrender them for repayment at par and to apply for a like amount of the new debenture. The remaining £21,550,000 of the issue has been underwritten by Morgan Grenfell at a commission of 2 per cent (including 1¼ per cent sub-underwriting). The new money accruing to AEI from the issue amounts to about £20.4 million and it will be used to extinguish £9 million of bank overdrafts; the issue proceeds, AEI's retained profits and loan and banking facilities available to the AEI-John Thompson Nuclear Energy Company should be enough to cover the group's three years' capital programme, estimated to cost £22 million. Preferential treatment will be given to shareholders in AEI who apply on special forms for the debenture and though £20 per cent is payable on application the stags are likely to come in. If so, that will be a good augury for the pending cash-cum-conversion debenture offer by Associated Biscuit Manufacturers.

STERLING

Hints of Autumn Pressure

First hints of the customary autumn pressure against sterling have come rather earlier than usual to the foreign exchange market through substantial buying of dollars by the tobacco companies. This buying in anticipation of the American auctions which have not yet begun suggests that some of the leads and lags in payments are still pulling against sterling, but that is not surprising while the rate of exchange remains near the upper range of sterling's permitted fluctuation. In the official market against dollars sterling has weakened since the beginning of this month from $2.81¼ to $2.81⅛, though it showed some signs of recovering at mid-week. The oil companies have also been buyers of dollars from London. But, fortunately, there has also been a fairly persistent commercial demand for sterling from New York, so that commercial supply and demand have remained nearly in balance without any intervention by the authorities.

The most marked weakness of sterling has been in the transferable market where the rate has slipped away to $2.7890. The main factor in this market has been the arbitrage transactions that normally occur when dollars are firm in Germany. The dollar rate in Frankfurt has risen from DM4.18¾ to DM4.19½ and German dealers have found that their cheapest route into dollars was by selling marks against sterling and then selling their sterling in the transferable market against dollars. French francs, helped by the seasonal tourist demand, have made an appreciable recovery this week, the rate against sterling improving at one time to Frs. 1177½. There has also been some covering of "bear" accounts in francs following the more reassuring political developments and in anticipation of the well advertised launching of a new gold loan in the French market.

STEEL

An Inventory Recession?

Figures of steel deliveries for April gave the first indication that consumers were beginning to run down their stocks; the figures for May clinch it. Production dropped by nearly 29,000 tons a week, or 7 per cent, from the April level, which had itself been 6 per cent down on March; it was nearly 15 per cent below the level of May 1957. It seems doubtful whether actual consumption of steel has dropped as much as this, though it has come down since the autumn peak. What has happened is that consumers have decided that stocks equal to four months' consumption are more than they need afford today.

Consumers of steel are spread widely round the economy, and steel is not the only thing they have in stock: but whether liquidation of stocks is beginning to occur generally in the economy is not clear yet. In the first quarter of the year manufacturers' stocks did not show the rise that they usually have done over the last few years (though steel stocks, it may be noted, were still rising slightly, mainly because customers were getting delivery much faster than they expected). Stocks held outside manufacturing fell; but not as much as in the first quarter of 1957. But there is obviously room for the same thing to happen to stocks of other things as to stocks of steel. Stocks have not ceased rising in volume since 1953; and as production levelled off after 1955, they have steadily continued to increase, relative to production, during a period when the credit squeeze must have been making them more expensive to carry.

The recession in steel demand—still manifested by a low rate of re-ordering, and very rapid deliveries for a wide variety of products—has caused short-time working in several steelworks, and quite large dismissals in others, such as Dorman Long. Building demand has dropped off sharply, particularly affecting Dorman Long, which has encountered rather unfortunate circumstances to bring in its new universal beam mill, and Stewarts and Lloyds, for which building tube is usually a good slice of bread and butter demand. But it is not easy to find any section of the industry where demand, from home or abroad, is really still strong except for sheet and strip. Continued high activity in motors is putting a good deal of pressure upon

Free Market in Coal

For years past, every time that the Government was asked when it would abolish rationing of domestic coal, it answered that there might not turn out to be enough large coal to meet free demand fully. This week, nearly nineteen years after rationing went on at the outbreak of war, the Minister of Power has taken the plunge: from about the middle of July, the "34 cwt in the South and 50 cwt in the North"—and retail price control as well—will be a thing of the past. In doing so, the Minister seemed confident that the National Coal Board will be able to supply all the large coal consumers demand, without importing any. But he was not prepared to express any opinion about what would happen to prices.

Last year, nearly all the coal that domestic households used was large coal—about 28 million tons out of the 49 million tons that the Coal Board supplied. This spring, the Coal Board "opened its concertina" of industrial prices, making large coal dearer and small coal cheaper to try to shift industrialists using large coal to smaller sizes.

Moreover, it hopes, for the 1958-59 coal winter, to get 2 million tons more large coal from its output. Shifts in the marketing pattern may give it another million tons. That extra 3 million tons has first to make up the 2¼ million tons imported in 1957-58; and there will not be much more than half a million tons of large coal in the industry's unsold stocks. But so far this year, the country has used nearly a million tons less large coal.

If the end of rationing should nevertheless boost demand for house coals, prices may well rise: indeed, they seem on balance rather likely to go up anyway. The Ministry, since April, has had a report from a committee headed by Sir Thomas Robson recommending that distributive margins in the controlled price should be raised by 6d. a ton in the North and 1s. 6d. a ton in the South of England. The Ministry preferred to act on the committee's general conclusion that more competition would be desirable in this market—and to let coal merchants find out whether a free market would afford them prices enough to provide the return on capital that the committee thought they ought to be getting but weren't.

On present indications, the Coal Board will not wish to increase its prices this summer: most of the trade associations in coal distribution, blinking somewhat under the light of freedom, this week said that next month increases in their margins would be "inevitable." It may be that the merchants will open the price concertina more. Their freedom will blunt one of the arguments that successive governments have used to deny the Coal Board the commercial freedom it is guaranteed by statute: its pithead prices will no longer settle precisely what changes in coal prices may do to the cost of living.

THE GOVERNMENT AND THE COAL DEFICIT

In six out of the eleven years that the National Coal Board has been running Britain's mines, it has shown annual deficits, and these exceeded its profits in the five good years by an accumulated deficiency of £29·1 million.

In evidence to the Select Committee on Nationalised Industries last year, it was shown that since November 1950, losses on buying imported coal at foreign prices and selling it at British, which the Government has obliged the Coal Board to carry, totalled over £70 million up to the end of 1957. In addition, under the "gentleman's agreement", the Government has refused one application by the board, and granted four for less than the board requested; five price increases were granted from later dates than was suggested.

In 1947, the delayed and reduced price increase accounted for about £7–8 million of the board's £23·3 million deficit. In 1951 the increase granted was again slightly later and substantially smaller: once more this may have lost the board £7 million, and the board showed a deficit of £1·8 million. In 1955 the Government delayed an application for an 11 per cent increase in prices for 3½ months, but when it did allow the increase made it 18 per cent: the board nevertheless showed a deficit of £19·6 million (it bore a loss of £27·6 million on coal imports). Last year the Government again granted the price increase from July for 1s. 4d. a ton less than the board requested: this would account for more than the £5·3 million deficit the Board showed.

FROM MINE TO GRATE: How the Coal Moves

Roughly 200 million tons of coal are despatched from Britain's mines and opencast sites each year on the way to more than 17 million customers. Some of this coal is made into coke, briquettes, and ovoids: in 1957 about 29 million tons of these had to be distributed too.

Solid fuel is bulky, and it has often to be moved a considerable distance; distribution is a costly process. Out of the national average price of house coal at the beginning of 1958, £7 13s. 2d. a ton £2 16s. 11d. or 37 per cent was accounted for by transport and distribution charges; in London distribution charges made up 47 per cent of the price, and in areas as remote from the coalfields as Barnstaple, for £4 15s. 8d. out of the retail price of £9 0s. 11d. a ton, or 53 per cent.

Domestic consumers, under rationing, bought only 31 million tons of coal last year, no more than two-thirds of what they had bought in 1938; they supplemented this with the equivalent of another 30 million tons in gas, electricity, coke and other fuels made out of coal, and about a million tons of petroleum products.

Three-quarters of the house coal domestic consumers buy is in Groups 3, 4 and 5, which last group is the "datum" for NCB prices; Group 1 coal now costs about £3 a ton more than this, and one can get Group 7 coal for about 25s. a ton cheaper. They buy it from 16,778 retail coal dealers, delivering from 5,800 depots. Behind these, in the wholesale coal trade, are the NCB, the Gas Boards, the CWS, and 600–800 significant private traders, with about 150 traders in the seaborne coal trade.

Physically, most of the coal comes by rail; about 14,800,000 wagons arrive at the mines each year, or 60,000 each working day, taking away about 12 tons each. Three-quarters of the coal is hauled more than 30 miles; a third more than 100 miles. The Transport Commission handled about 168 million tons of solid fuel in 1957 (including coke, other manufactured fuels, and some coal for coastwise shipment and export). A growing proportion—33 million tons in 1957—goes by road: 56 per cent of this is coal moved less than 30 miles. In 1957 28 million tons was moved by coastwise shipping; only about 3 million tons by canal.

—Or Not Quite Free?

For Government control of the Coal Board's prices, which rests on no statutory sanction, is to continue. This control is based upon the "gentleman's agreement" which the board took over from the private coalowners on nationalisation and accepted again at the end of 1953. It obliges the board to consult the Minister about any change in the price of coal that it proposes, and to "pay regard to" (in practice, to accept) his judgment of "where the national interest should be deemed to lie in relation to such proposals."

This informal but extremely onerous form of price control was investigated in some detail by the Select Committee on Nationalised Industries this year. The committee recommended that it should be replaced by a statutory arrangement under which the board should consult the Minister as to the public interest but having done so, determine its own prices. The Minister should be able to over-rule the board by direction; but his directions should be laid before Parliament and published.

In the Commons this week, Mr Maudling replied blandly to a questioner that "The recommendations of that Select Committee were carefully studied": the use of the past tense may indicate that the Government has decided not to accept them. At a meeting of the Select Committee in January the Permanent Secretary to the Ministry of Power Sir John Maud (no whit less blandly, one imagines), observed, *inter alia*, "Clearly no Minister can under a 'Gentleman's Agreement' compel the Board to disobey what Parliament has told it to do. There is a clear statutory obligation on the board to acquire such revenues as will be sufficient to balance its accounts taking one year with another." Nobody had the indelicacy to put to him the point that in certain single years, at least, the "gentleman's agreement" has in effect done just that—prevented the Board from breaking even.

certain of the strip mills that had in any case planned to cut production somewhat, for reconstruction purposes, this year. The motor companies, indeed, are still importing a substantial tonnage of sheet.

SMALL SAVINGS

The Rate for the Job

THE Treasury last week-end cut the rate on new tax reserve certificates from 3¼ to 3 per cent; interest on certificates bought before June 7 remains unchanged. Tax reserve certificates were introduced in 1941 as a savings security for persons and companies wishing to provide for future tax liabilities; principal and interest are accepted in payment of tax, and since the interest (paid for a maximum of two years) is itself tax free the certificates are very attractive to surtax payers. Despite the evident possibility in recent weeks of a cut in the rate, there has been no rush to buy as there was between March 20th when Bank rate was cut from 7 per cent to 6 per cent and March 29th when tax reserve certificate interest was cut from 3½ to 3¼ per cent; net sales of the certificates since the beginning of the financial year have reached £53 million, almost exactly the same as those a year before.

The cut in the rate marks an adjustment to the fall in other short-term interest rates. It stands in contrast with the increase since the beginning of last month in the coupon on defence bonds from 4½ to 5 per cent, and with the increase in the limit of holdings of the high-yielding savings certificate. In this contrast may be seen another manifestation of the new emphasis in monetary policy, to keep long-term rates high even though short term rates are cut.

The new defence bonds have been selling modestly well; in the first four weeks of issue, gross sales reached £18 million, and making allowance for encashments (excluding repayments on maturity) net receipts were £10½ million. In the same four weeks, sales of savings certificates jumped to £34 million, and the net intake to £16 million. Nevertheless, net receipts from all forms of "National" savings in the financial year to date are still, at £24 million, a little smaller than at the corresponding stage of 1957-58. The improvement in savings certificates, defence bonds and premium bonds has been a little more than offset by a deterioration in saving through the Post Office and Trustee savings banks.

NON-FERROUS METALS

Copper on the Turn?

THE improvement in copper prices gathered speed this week when the one year stockpile programme was announced in Washington on Wednesday. Both cash and forward metal rose strongly in London, and at £202 the spot price touched at its highest since last September. The price later fell back to just below £200 a ton. The stockpile programme permits the purchase of up to 150,000 tons of domestically mined copper at market prices not exceeding 27½ cents a lb. Mr Fred Seaton, the Secretary of the Interior, will put this plan to the Senate Minerals Sub-Committee later this month. Under his earlier price support proposals US producers would have been paid the difference between the market price of copper and 27½ cents on an output of one million tons a year for five years. In announcing his latest scheme, Mr Seaton said his decision was made after assurances were received from industry and from members of Congress that a one year purchase programme would effectively stabilise the US domestic copper industry. The cost is put at $82 million, the 150,000 tons representing about 12 per cent of last year's US domestic copper output.

The maximum of 27½ cents compares with a market price of 25 cents just before the announcement. Even before it was made copper prices were hardening on both sides of the Atlantic. In America the customs smelters' price was raised to 25 cents to bring it into line with the domestic producers' level. Lower consumption of copper has reduced the supplies of scrap, the main material used by the customs smelters, while demand for customs smelter metal was stimulated so long as the discount on the producers' prices existed. How much of the recent American buying has been genuine and how much purely speculative is difficult to assess, but evidence of sustained recovery in consumer demand is hard to find and this stockpile scheme appears to be a substitute for it. In London the market had an additional boost from the dock strike with its implied threat to supplies. This has also prompted the Board of Trade to announce its willingness to sell up to 2,000 tons of British stockpile copper to consumers who can show that production would otherwise suffer. While some copper has been diverted to the Continent, most consumers here still have fair stocks. And there are 5,000 tons in a Liverpool warehouse, unaffected by the dock stoppage.

Can Lead Be Far Behind?

PRESIDENT EISENHOWER and his Administration have dragged their heels on the proposal by the Tariff Commission that United States lead-zinc producers should be granted a higher tariff. A month ago Mr Fred Seaton put forward a price support scheme (which in effect would subsidise US domestic production) which embraced lead and zinc as well as copper. The new stockpile proposals for copper suggest that he may have had second thoughts on the merits of this scheme. Can he possibly suggest a stockpile scheme for lead and zinc, similar to his proposals for copper? That might be an effective alternative either to price support or to a tariff.

Such a scheme would help to underpin the price of lead, and that vague possibility has sent the spot price of lead up to £72¾ and of zinc to £64⅝ a ton. But until industrial production revives, it is difficult to see how lead will be really rescued from the doldrums. There is still an abundance of supplies. In the United States the slump in the motor industry has led to a sharp cut-back in the production of batteries and in this country the battery industry is now entering the slack season. The building trades are less active and are habitually using less of the metal. Stabilisation Mr Seaton may help to secure, but not a cure.

AIR TRANSPORT

Opening Gatwick

THE re-built airport that the Queen opened at Gatwick on Monday bears much the same relation to London Airport as Charing Cross station does to Victoria or Waterloo. It will filter off some of the airline equivalent of rush-

Power to cleanse our cities

It is paradoxical that, in the creation of our industrial wealth, we have choked ourselves with smog. One reason why we need new sources of power is to lessen the grime of our cities.

Nuclear energy promises such power. At Berkeley, the nuclear power station being built by the AEI-John Thompson Company is making rapid progress. When complete, it will generate electric power in plenty for home and factory. And it will not pollute the air or blacken the landscape.

The skill of such mighty firms as BTH, Metropolitan-Vickers and John Thompson is making possible a more wholesome Britain. Now the experience of this great consortium is at the service of the world.

A·E·I
JOHN THOMPSON

Get down to the brass tacks of COMPUTERS

Ordering a computer is relatively easy. Choosing the right one, understanding its use, harnessing it to specific problems, is quite another matter. It is a long process. It needs much probing into the fundamental organisation of your business. Only people who are both computer men and business experts can help you. These are at your service at the Hollerith Computer Centre.

At 36 Hertford Street the Hollerith Computer Centre provides a convenient forum, round a working computer, for the exchange of ideas and results. There are several ways of making use of the Centre. Here are two examples:

Higher Management Courses—which provide a concise appreciation of computers in business, with maximum emphasis on case studies of computer usage. These courses last 4 days.

Study Teams from individual organisations come to discuss their own specific problems with our computer experts—production control, for example. These courses last from 1 to 5 days.

If you want to see how a computer could solve your particular problem, come and make use of us, come and pick our brains.

at the

HOLLERITH COMPUTER CENTRE

36 HERTFORD STREET, W.1 GRO 1765

The British Tabulating Machine Co. Ltd. Head Office: 17 Park Lane, W.1

hour suburban traffic—holiday flights across the Channel—and on occasions, mainly in winter when fog closes London Airport, its single runway will be pressed into the service of London-bound long-range aircraft. The seasonal pattern of air transport makes it possible to dovetail these two functions fairly satisfactorily. When Gatwick is busiest with summer holiday traffic it is unlikely to be needed as a diversionary airport, and in winter the number of regular services operated from it are likely, at the start, to be relatively few. In the words of the 1953 White Paper that announced the development of Gatwick, "its principal purpose will be to receive aircraft diverted from London Airport . . . and this purpose could not be achieved if too many regular services were based at Gatwick."

This explains the strikingly high standard of technical equipment that has been installed at the airport, contrasting oddly with the modest passenger amenities. The one 7,000 foot runway is able to land any airliner now in service or on order, the big jets included, though not all could take off from it with a full load. Lying directly in the path of the two main air lanes across the country, the traffic control system at Gatwick must be as precise and strict as that of any big railway junction and pilots in the area will, for the first time, be obliged to obey the instructions of the traffic controllers whether the weather is clear or cloudy. But the passengers will find themselves subject to less monitoring than they receive at any other British airport. They will have to find their own way to the airport, either by the newly diverted London-Brighton road or by fast train from Victoria; they will have to find their own way to the aircraft parked at ticketed gates, as air passengers inside the United States have been doing for years.

Gatwick remains, however, a controversial project. The best that could be said for its winter weather at the public inquiry held before it was built, was that fog did not usually occur at London and at Gatwick on the same day at the same time. It is built on heavily waterlogged ground that drove away the original users before the war and it has still to be seen how satisfactorily the new runway has been drained. Its cost, always high, had risen well above the original estimate of £6 million to £7.2 million when it came under the gimlet eye of Sir Frank Tribe, the Comptroller and Auditor General, early this year; and the figure has been held at this level only by cutting out much of the original plan. To provide one diversionary runway at Gatwick has cost between one quarter and one-third of the sum paid for the whole of London Airport. And on the day of the opening itself, British European Airways referred to the plan for developing Southend, which many airlines seem to prefer to Gatwick, as yet a third major airport for the London area.

FILM FINANCE

New Powers: Old Weaknesses

In April last year the life of the National Film Finance Corporation was extended for another ten years and its powers to lend "end money"—the riskiest kind of finance in film production—were widened so that it could make loans even if finance could be obtained on reasonable terms elsewhere. It was also given the duty of paying its way: it was to act as a specialised bank rather than purely as a distributor of a barely disguised subsidy to British film production. The report that it has now published, for the year to last March, covers therefore the first in its new role. But it also covers the period when cinema admissions dropped drastically and the mark of this on NFFC's results is plain.

The Corporation lent more money, nearly £2 million, to more films than in any previous year with the exception of the time when it put £3 million into the old British Lion Corporation—and lost virtually the lot. To do this it borrowed from the bank last year £729,000 of the £2 million that it has power to borrow (on Treasury guarantee) in addition to the £6 million advanced by Board of Trade advance, which it has now fully committed. But it also lost £116,000 last year, more than in any single year since "Group 3" went out of continuous production in 1954-55. Its receipts from the share of profits of successful films were bigger, reaching £185,000: the report speaks of a more discriminating public still ready to fill cinemas for the films it likes and make them profitable. But mediocre films are suffering heavily and most of the films the corporation assists seem to fall into this category. It was obliged to write off nearly £300,000 for losses on loans, including the whole of the money that it had put up for nine films. Of the 31 films it had assisted that were released during 1957, only nine are expected to be profitable, the lowest proportion of the smallest number of new assisted releases since the corporation started. The combined earnings from all 31, including receipts from the revised Statutory Levy, are expected to fall short of their combined costs by about seven per cent, which is rather worse than for the past nine years.

Strangely, last year saw signs of private firms being more ready to lend risk money to British film production. The corporation assisted fewer of the quota first features shown on the three major circuits in 1957, but those made without assistance also included the growing number of American productions made here with British companies. Overseas earnings showed signs of improving, rising from a quarter of the total earnings of NFFC-assisted productions the year before to a third last year. But average production costs rose too, mainly because of a substantial increase in the cost of making the most expensive type of film, and costs exceeded budgets by more, too. The corporation was not able to make any further headway in disposing of its shares in the new British Lion Company. That company, which previously had shown small profits, lost nearly £300,000 last year from unsuccessful films and from the closing of a large part of its studio subsidiary for extensive repairs and re-equipment

BANK LENDING TOMORROW

Banks and Hire Purchase

The question of whether the big deposit banks should one day participate directly in hire purchase finance is increasingly exercising the minds of thoughful bankers; but, hitherto, little of the discussion has emerged into the open. This week the nettle has been firmly grasped by Mr W. R. Ballantyne, general manager of the Royal Bank of Scotland, in his presidential address to the Scottish Institute of Bankers; and Mr Ballantyne comes out boldly in favour of HP. The time for decision, he argues, will come as soon as the authorities lift their restrictive directives on bank lending—and Mr Ballantyne refers to the recent suggestions that the Treasury's failure to close the gaping loop-

holes in the control of capital issues could foreshadow an impending relaxation of the direct restrictions on market and bank credit.

What will the banks do when that happy day arrives? Mr Ballantyne points to the recent slackening in the demand for advances; it is by no means certain, he says, that in "the less inflationary conditions of today the demands of those to whom we would be prepared to lend would raise our total loans to the level that we might wish to see." It might be found that the long reign of credit restriction had resulted in a permanent loss of business diverted to other financial institutions. "For this reason, if for no other," bankers must consider whether or not they should enter the field of hire purchase. Mr Ballantyne will not accept the contention that this is not legitimate banking business. He "endorses" the view that "a form of loan which is essentially short-term by nature, which is regularly and systematically reduced and which, over a fairly long period now, has shown only a fractional ratio of losses, conforms very well indeed to the traditional canons of bank lending." Mr Ballantyne adds: "The question to my mind, therefore, becomes not so much whether the banks will enter this field but what form their participation will take when they feel free to act."

A Separate Business?

UNLIKE many of his colleagues Mr Ballantyne is not convinced of the virtue of establishing a clear and formal division between hire purchase business and traditional banking. The one venture into hire purchase by a bank in Britain, that of the Commercial Bank of Scotland, has been through subsidiary companies, whose business has been kept separate; and those subsidiaries unlike the bank itself do not enjoy the right to create hidden reserves. This is also the form adopted by the Australian banks, each of which has now a direct though usually a minority stake in a hire purchase company; on the other hand, the American banks arrange instalment loans at their own counters.

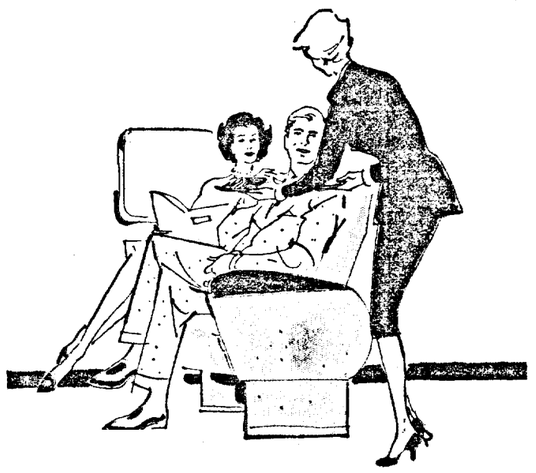
Mr Ballantyne recognises that working through a subsidiary has the advantage of providing ready-made routines of administration and connections with borrowers, and that it avoids the embarrassments inherent in offering two forms of advance at very different rates of interest. But he asks his fellow bankers to weigh these considerations against the major disadvantage of duplication of facilities—of bank premises and of bank personnel. "One of the great hidden costs of the credit squeeze has been the under-employment of the skill of bankers." That skill, Mr Ballantyne urges, can be put to very good use in the guidance of hire purchase customers; and by attracting those customers into the bank branches, the banks may ease the way to attracting this new class as depositors. It will be surprising if these hares started from Scotland do not rouse some hounds in the south.

THE BERNE UNION

Credit Insurers Meet

ANNUAL gatherings of the Berne Union—the group of bodies engaged in credit insurance—serve the useful purpose of comparing information and techniques. They have also led to the informal agreement not to insure credits for longer than five years from the date of shipment even for transactions in large capital goods. The main achievement of the conference of the Union that has just been held in Venice has been to reaffirm that five year maximum "even in cases where governments decide to use credit insurance machinery in an unorthodox way for declared political purposes."

Does the diplomatic communiqué with which the conference ended mean that the five year rule is universally effective? Apparently not. There seems to have been some discussion of the new German facilities which some critics allege allow credit insurance for periods of eight to ten years. The German delegates gave an assurance that the German Federal Government had no intention of initiating a race in the field of export credit terms. It is apparently the German view that their plan does not exceed a five year post-shipment or post delivery credit because the whole period of the transaction, including the time taken in manufacture, is covered under the German scheme.



Naturally, some of the actions of the American Export-Import Bank have also been discussed, Ex-Im being an associate member of the Berne Union although its main business is the provision of credit and credit insurance is only a by-product. The American point of view is that only a small part of the bank's dollar loans in recent years have been to finance export sales of American capital equipment on medium term credit, and that of that small part more than 80 per cent has maturity dates within three years of date of shipment. Ex-Im strongly supports the principles of the Berne Union, but it does not appear to have climbed down over the small number of its credits which do exceed the five year maximum.

EXPORTS

Trading with the Middle East

LIKE its counterpart the Dollar Exports Board, the Advisory Council on Middle East Trade has been formed to stimulate British exports to peculiarly difficult markets. Both "ginger groups" face the same problems. The market for British goods in the Middle East, like that in the United States and Canada, is potentially very large, but in both areas there is keen competition from other imported goods, a strong disposition to protect local manufacturers and merchants, and an urgent need for more imaginative sales promotion for British products. In the short run, at least, the risks and costs of developing these export markets are such that many British firms prefer to go on earning easier, and possibly higher, returns in softer markets in the British Commonwealth while they can. The task of both groups of advisers, therefore, is to show that the long run prospects of difficult markets are so attractive that the high initial costs of developing them are well worth while.

The oil producing countries of the Persian Gulf—Persia, Iraq, Kuwait, Saudi Arabia, Qatar and Bahrein—offer to British exporters one reasonably sure safeguard: a steadily rising foreign exchange revenue from oil, which can be spent on imports. They may not be fully free from balance of payments crises, but they are certainly much less vulnerable than other countries in the area that have no steady supply of foreign currencies and are apt to impose drastic import restrictions to protect their balance of payments. Despite the lingering effects of Suez, British goods have a good reputation for quality in these oil pro-

SAS fly superbly all over the world

Technical efficiency and reliability second to none . . . such meticulous maintenance, such strict schedule-keeping . . . more care for the comfort of passengers (such as the new Royal Viking lounges for trans-Atlantic travellers at no extra cost) . . . famed Scandinavian hospitality, wonderful cuisine —that's why SAS hold their foremost position in World air travel.

SCANDINAVIAN AIRLINES SYSTEM

Mechanised Muscles

Cheap and speedy materials handling in many industries owes not a little to Simon developments in mechanical, pneumatic and fluidised conveying and in automatic process control. A Simon plant on Tyneside, for example, bunkers a million tons a year of iron ore from ocean vessels, and at the touch of a button on a control panel loads 500 tons into rail wagons in five seconds. Simon equipment loads flour from the mill into Simon bulk flour wagons and discharges it into Simon bulk bins at the bakery. Simon plants load, unload, handle and store a multitude of materials in countries all over the world. Simon engineers welcome industrial handling problems on anything from a factory to a national scale.

ENGINEERS, DESIGNERS AND CONTRACTORS TO WORLD INDUSTRY

HS297/PS

There she goes! *H.R.H. The Duchess of Gloucester names her 'British Duchess' and down the slipway and into the Clyde moves the first of BP's 42,000-ton tankers.*

Full steam ahead. *This funnel will be fitted to 'British Duchess' just as soon as they start work on her again; which will be only minutes after she is launched.*

Clydebank's first 42,000-ton tanker

At 1.14 p.m. on Monday, 2nd June, with a roar of hawsers, and a great cheer from the hundreds thronging Clydebank, the first 42,000-ton tanker ever built by a British firm for a British fleet slid gracefully down the slipway. H.R.H. The Duchess of Gloucester had launched—BRITISH DUCHESS.

Built by John Brown of Clydebank (they built both the Queen Mary and the Queen Elizabeth) this ship, on order to The BP Tanker Company, is the biggest tanker yet to be built in Britain to sail under the British flag.

Second only to the Queen Mary

The British Duchess is a mighty ship indeed. In fact, as Sir James McNeill, Managing Director of John Brown & Co. said at her launching, *"When she is completed, her displacement tonnage for vessels under the British flag will be second only to the Queen Mary"*.

But BP plans far bigger ships than this. Others now building or on order include six 42,000-ton sister ships to the British Duchess, 12 other vessels of 50,000 tons and 7 giants of 65,000 tons.

Oil supplies doubled?

Within the next 10 years Britain may have to double her oil supplies. The British Petroleum Company is making sure that not only is the oil found and brought to the surface and refined, but that there are the ships to carry it. Ships like the British Duchess are even further proof of how confidently BP plans for the future.

THE BRITISH PETROLEUM COMPANY LIMITED

ducing countries. The other side of the coin is that the oil revenues come in dollars as well as sterling, so that although many of the countries in the Persian Gulf are in the sterling area, there is no shortage of dollars, and British exporters have to compete with dollar goods on equal terms. British goods must therefore sell in the Middle East in direct but fair competition with Japanese, German and American goods, on a basis of price, quality, delivery dates (both offered and met), credit terms, and after sales service—and on the appeal of sales promotion campaigns prepared with an understanding of the desires and prejudices—political as well as economic—of the consumers in each country.

Although the demand stimulated by rising oil revenues first benefits suppliers of capital equipment, the markets for consumer goods in the Middle East must be expected to grow rapidly, too. With rising standards of living the potential market for air conditioning equipment, for example, might well justify heavier selling expenditure by British firms in creating goodwill now. Another development is the tendency of the oil companies to follow a policy of buying a larger part of their supplies from local merchants, even when those supplies have to be imported, rather than buying in bulk in Europe or the United States and by-passing the local merchants. This illustrates a fundamental proposition: that higher British exports to the Middle East can best be promoted by nationals of the country where the goods are consumed.

MILFORD HAVEN

Terminals Under Way

THE news that the proposal of the Angle Ore and Transport Company, a company formed by the Steel Company of Wales and Guest Keen, to establish an iron ore stocking ground near Angle Point, Milford Haven, has been given planning consent by the Minister of Housing, means that all four of the more definite projects for revitalising this quiet natural harbour in south-west Wales are now well on the way to completing their legal preliminaries. The private bill to authorise the building of a jetty and other seaward facilities for this deep water ore terminal is now before Parliament, and the 41¼ acre site for the project was bought some time ago. Once the bill has gone through, the detailed engineering planning and costing can start for a terminal capable of off-loading some 3 million tons of ore annually for subsequent shipment to other South Wales ports in smaller vessels. The largest carrier that can at present be comfortably taken in a British port is one of somewhat less than 16,000 tons deadweight: Angle Point should be able to cater for much larger carriers than that and any larger ones likely to be launched for some considerable time ahead.

This natural depth of the haven at low tide and the ease with which it can handle really large ships were the reasons for two of the other projects—the British Petroleum oil terminal, to be linked by a 59-mile pipeline with the company's refinery at Llandarcy, near Swansea, and the Esso scheme for a terminal and refinery on the north side of the haven, opposite the BP and Angle Ore sites. The Esso project will go ahead once agreement has been reached with the Crown Estate Commissioners over the rental the company should pay for the sea-bed, which is "owned" as is most of the sea-bed around the British coast by the Crown. The refinery will have an initial capacity of 4½ million tons of crude oil a year and it is hoped to have it in operation by about 1960. The total cost, of refinery and terminal, will be some £18 million. Work on the BP terminal, which cleared its legal preliminaries last year, has already started. It will be able to handle 5 million tons of crude annually when it is opened at the end of 1959 and will cost £5 million. The fourth scheme, the two dry docks, five wet repair berths, and an oil discharge pier capable of accommodating really large super-tankers that the Milford Docks Company has said it intends to build a little to the west of the present harbour, is designed to cater for the substantial traffic of ocean-going vessels that is now likely to use the haven. This scheme, too, has now received the blessing of a parliamentary act.

RAILWAYS

End of One More Line

THE closing of the Midland and Great Northern Joint Line, which runs from the east Midlands across the northern part of East Anglia, between Edmundthorpe and Peterborough in the east to Cromer, Yarmouth and Norwich, will be a real measure of railway rationalisation—the first in recent times involving the closing of a whole section of this order of size. It was built in unco-ordinated sections by a number of small independent companies between seventy and a hundred years ago and, since these were amalgamated to form the M & GN in 1893 and operated as a competitive penetration from the Midlands to east Anglia, it has rarely paid its way. It largely duplicates the parallel Great Eastern line that is also worked by British Railways Eastern Region, and closing it down should help improve the financial results of that line as well as saving the railways the £500,000 or so a year that the M & GN loses.

Closing down branch lines that would still be uneconomic even with new equipment such as diesel rail cars—which British Railways say would not save the M & GN as the traffic is simply not there—does not bring enormous savings. The 155 branch lines that have been closed down since nationalisation, involving a route mileage of about 1,770 miles, are estimated to have saved the Transport Commission less than £1¼ million a year. But it is only by achieving many small economies of this kind that the railways can hope to improve their revenue position this year by the £25 million, at least, that are needed to pay for the recent wage increase and keep the total loss within reasonable bounds. The M & GN runs to about 180 route miles, of which at least 165 miles (the possible exception being the 15-mile spur from Melton Constable to Cromer) will cease operations from the end of this year onwards. Recently, this line has been carrying an average of about 140 passenger trains a day (12 on Sundays) with some 40-50 passengers apiece, and some 80 freight trains on week-days. The Transport Commission say that the Great Eastern line, which is never more than a few miles away, and the local networks of bus services should be able to cater for this traffic.

MUNICIPAL FINANCE

A Borrower Dissatisfied

FROM the Institute of Municipal Treasurers and Accountants considered views and sober thought are normally expected. But the presidential address by Mr W. O. Atkinson, the County Treasurer of Middlesex, delivered to

the annual conference of the Institute at Eastbourne on Wednesday, contains some strange misconceptions about interest rates. Mr Atkinson contrasts the success of the five 6 per cent local authority issues made on the London market since last autumn and heavily over-subscribed with the more modest success of the two 5¾ per cent issues (he was referring to Hull and Swansea and writing before the Birmingham issue was announced). Has Mr Atkinson really forgotten that the 6 per cent issues were made when Bank rate was 7 per cent and the 5¾ per cent issues when it was 6 per cent. And does he really fail to recognise that Hull and Swansea are less popular with investors than Newcastle and the London County Council?

If the local authorities have been charged too much for the money they have raised through the machinery of the Stock Exchange, how comes it that there is a queue of eager borrowers, not all of whose needs will be satisfied within two years? How comes it that even now after two Bank rate reductions, those who have to go out into the mortgage market are paying at least as much and often a little more than Newcastle and London paid on their 6 per cent coupons, borrowing through the Stock Exchange? Mr Atkinson knows that a Stock Exchange issue is the best bet, for in the next breath he complains that it is difficult to obtain reliable information about one's position in the queue of potential borrowers. But he is not quite right about that either. The next ten at least in that queue have been warned and are stripped to the waist waiting for the starter's word.

The hard truth is that recovery from the crisis of last September was at first a tender growth and it was not worth risking a failure, for that would have jeopardised the chances of all the local authorities and all other gilt-edged borrowers for weeks. But the 6 per cent issues were not vastly over-subscribed by genuine investors. They were "stagged" with money that went in search of a quick profit only after its owners had made up their minds that the issues were going to succeed.

INDUSTRIAL FINANCING

ICFC Squeezed

INDUSTRIAL and Commercial Finance Corporation of which Lord Piercy is chairman and in which the banks are the shareholders, exists to fill the "Macmillan Gap" by providing finance for small and medium sized industrial enterprises whose needs can with difficulty be filled elsewhere. It is a thriving corporation earning a regular profit and paying its banker shareholders a regular 5 per cent dividend, that could without difficulty be increased if dividend had been their main desire. But when credit is squeezed the banks are squeezed, and the Banks in turn keep ICFC short of money.

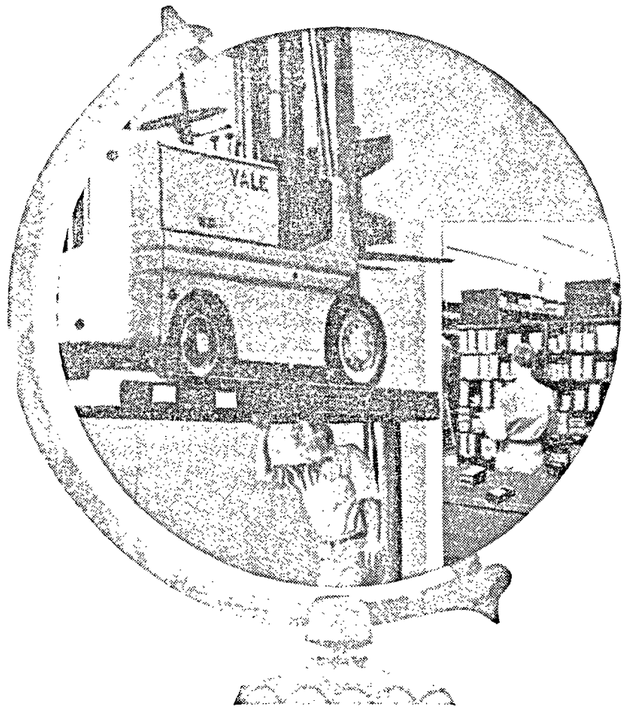
In the Corporation's latest year ended on March 31st, the turnover—new money paid out, less commitments at the beginning of the year, plus commitments at the end of it—was £3.8 million, a modest recovery on the £2.5 million of the previous year. But the corporation's heyday ended in 1951, when the instrument of credit restriction and of control by interest rates was called into being. The Corporation could, in its chairman's view, usefully advance at least double the finance available to it and to spread its activities it likes to find partners in its ventures among the big insurance companies and others that have money.

Naturally, Lord Piercy is not among the unqualified admirers of the credit squeeze. The run of applications which has come before the corporation suggests to him that stringency for the small medium sized company and for new ventures has come at a period when there are new springs of enterprise among small concerns. "It has made more difficult the lot of quite an interesting crop of new ventures." Lord Piercy mentions the electronic field as one such field of enterprise. What he would obviously wish to do now is to call up from the banks the remaining uncalled £500 per £1,000 share—a total of £7½ million of new capital. But that does not seem to be what the banks wish.

TRANSPORT

The Framework of Control

THE air in Dublin is not renowned for its bracing qualities, especially if the Liffey is in one of its effluvious moods. But the paper that was delivered on behalf of Sir Brian Robertson to the Institute of Transport there last week on the subject of co-ordination of transport was as refreshing to his listeners with their own particular national transport problems as it probably was for the chairman of the Transport Commission to sit back for a short while from his own troubled desk. After tracing the development and gradual acceptance of the idea of co-ordination, with its varied forms of application in this and other industrialised countries (in France by "promoting the utilisation of the means of transport entailing the lowest true economic cost," which Sir Brian remarks is an impeccable but elusive principle; and in this country since 1953 by letting co-ordination work itself out through competitive processes), he has some comments to make about how well the principle is currently borne out in practice in Britain—without, he is careful to emphasise, intending any conflict with present Government policy.



Since the idea of competition cannot be pushed to extremes, the question becomes one of how far government should intervene in order to secure co-ordination and what controls it should use. Too often it is hesitant and spasmodic. Sir Brian does not favour "mathematical solutions," favoured by the Salter report a quarter of a century

A NEW SERVICE
OF ECONOMIC AND MARKETING RESEARCH

DURABLE CONSUMER GOODS

A series of continuous comprehensive surveys are now being prepared to assist manufacturers and others to estimate the future market for the following goods: Electric washing machines; Tyres; Refrigerators; Car heaters; Vacuum Cleaners; Cycles; Electric fires and convector heaters; Gas and electric cookers; Car radios; Radios and radiograms; Record players and Gramophones; Sewing machines; Television sets; and Passenger cars.

These surveys are being prepared jointly by
THE ECONOMIST INTELLIGENCE UNIT LIMITED
and
THE BRITISH MARKET RESEARCH BUREAU LIMITED

Licensed Manufacturer: FENWICK SAINT-OUEN, SEINE, FRANCE • MILAN, ITALY and BARCELONA, SPAIN

"ALL THESE FIRES must be costing the country a terrible lot, in capital, lost production and so on. Can't anybody do anything about it?"

"Well, we reckon our new factory's about as safe as possible, you know."

"Special design and materials, I suppose? Our place was built too long ago!"

"Not only that. We've also installed one of those A.F.A. automatic fire alarm systems, whereby any fire sets off a little detector and calls the brigade automatically. You can do the same, however old the building."

"You're satisfied it really works?"

"Oh definitely. What's more, before we bought it we consulted our architect and the local fire brigade chief and they were all for it. All the best people have it, you know—like I.C.I., Metal Box, Cadbury's—and the Insurance Companies like it, too. We get a rebate."

"Do you now? Then I *must* look into it."

TAS/AF 116

ago, by which each form of transport is given a handicap, usually by fiscal means, so that it may play its correct part in transport operations. The conditions under which each form of transport operates vary from one part of the country to another. He prefers the present broad system of control of investment, licensing, fares, and charges. But, of these, the control of fares is the least satisfactory. It ought, as others before him have suggested, to be undertaken by the same body for all forms of land transport (air is not a very significant competitor over much of Britain). At present anomalies can arise and co-ordination impeded because the ultimate authority on fares and charges is the Minister of Transport for road passenger services while the Transport Tribunal covers the rest. Licensing of capacity is in the hands of the Tribunal already, and Sir Brian would like to see the Tribunal as the top co-ordinating body for price and capacity, acting under policy directions from government.

His own commission has a role to play. But Sir Brian feels that it has not achieved as much as it should have done:

> I am bound to admit, for example, that our rail passenger services and provincial omnibus services are not as well co-ordinated as they should be. I must also confess that our railway freight services and our road haulage services should be geared into each other much more closely than they are at this time.

Much work has been done to dovetail the use of the commission's road, rail, and shipping freight services by developing the container system, but Sir Brian dearly hopes to do much more by improving the facilities at his depots for the receipt, handling, and dispatch of freight by either of these three means of transport. The commission's Area Boards, too, were meant to be an instrument of co-ordination of local transport facilities, including those not owned by the commission: of these, Sir Brian remarks that he "hopes progressively to work towards a position in which the name Area Transport Boards would be appropriate."

MOTORING ABROAD

GB to the Continent

NEARLY 100,000 British motorists took their cars and families to the Continent last summer, and even more are expected to be driving on the right this year. Each summer more attractive rail, sea, and air services are inaugurated to speed them on their journey, and in several countries in Western Europe their cars will require no Customs papers. Those cautious motorists—the great majority—who pay their £3 for the AA touring services could therefore dispense with their "*Triptyques*" and "*Carnets de Passages*," though they would then have to pay Customs clearance charges on leaving Britain.

Last year nearly half of all these holiday motorists used the British Railways car ferry boats from Dover to Boulogne; the other popular sea routes were the Belgian Marine ferry to Ostend and the British Railways ferries to Dunkirk and Dieppe. More striking is the growth in the air ferry traffic. Last year Silver City Airways, which specialises in carrying cars, flew the equivalent of 16,000 cars on round trips, or some 16 per cent of the total cross-channel car traffic. After a sharp cut in air fares this season, air ferry from Lydd in Kent to Le Touquet near Boulogne (a route which takes about four-fifths of the air ferry car traffic) now costs only £9 10s. each way, compared with £6 6s. each way on the boat for a medium-sized car (say, a 14-foot-long Sunbeam Talbot). Accompanying passengers pay £3 single by air and £1 17s. by boat. On the Ostend run, which is also served by both sea and air ferries, the air fares are less competitive. But it is not surprising that Silver City expects to do nearly twice as much business this year, and claims that no less than a quarter of all GB cars will use its service to reach the starting line.

Most attractive of all, especially for motorists with well-lined pockets and a short Italian holiday in mind, are the car-sleeper express trains run by the French and Belgian railways. The French service from Boulogne (where it connects with either sea or air ferries) to Lyon, takes only a night and saves some 450 miles each way. Its main attraction is that two days of a short holiday, which would otherwise have to be spent driving through northern and central France, can be spent on the Riviera or in Italy. For the same medium-sized car, the round trip from Boulogne to Lyon with the driver and one passenger, including couchettes on the train, costs £32.

A smaller Belgian service has been running from Ostend to Munich during July and August for the last two years. This year it will be supplemented during the same two months by a second service, which may prove more popular—a car-sleeper express from Ostend direct to Milan. The motorist arrives in Milan less than 23 hours after leaving Dover, and saves the drive, not only through France, but over the Alpine passes as well. The cost for a medium-sized car is only £32 10s. return. But the passengers have to be paid for separately, and second-class return sleepers from Ostend to Milan cost £42 14s. for the driver and one passenger. By that time one begins to compare the cost of hiring a car in Italy, but with a wary eye on the airline's baggage allowance.

SHORTER NOTES

In the formal offer of three 5s. ordinary shares in Standard Motor plus 2s. in cash for every four 1s. ordinary stock units in Mulliners (Holdings), Lord Tedder revealed that the profits before tax of Standard Motor for the year to August 31st next would not be less than £2,250,000 (against £878,000) and the ordinary dividend would not be less than 8 per cent.

* * *

Holders of 2½ per cent defence bonds bought between October, 1948, and March 31, 1949, and therefore maturing between October 1, 1958, and March 31, 1959, are offered conversion into 5 per cent Defence Bonds on terms the same as those applicable to 5 per cent defence bonds currently on sale. Holders who accept the offer will receive their maturity premium of £1 per cent on the date of maturity. Holders of the 2½ per cent Defence Bonds (conversion issue) maturing on November 1, 1958, are offered similar conversion rights: their £1 per cent maturity premium being payable on November 1, 1958.

* * *

Final agreement between the Suez Canal Company and the Egyptian Government on compensation for the Company's expropriated assets is reported to have been reached in Paris. Details have not been announced.

COMPANY AFFAIRS

STEWARTS AND LLOYDS

CAUTION or downright pessimism? That must have been the question in investors' minds when they read the interim report of Stewarts and Lloyds, the steel giant specialising in tubes. Leaving the interim ordinary dividend unchanged at 3 per cent, the directors say that their decision must not be taken to indicate that the final dividend (8 per cent for the year to September 28, 1957) will remain unchanged. Last year the total payment of 11 per cent was covered nearly seven times by earnings, but the directors now report a falling off in home demand and in exports, particularly to the oil industry. With practically all the group's works on short time, they predict lower profits.

But with so much earnings fat around the dividend, can the payment possibly be reduced? The danger is not simply the fall in profits, but the fact that Stewarts and Lloyds is short of cash and has a big capital programme to finance. That programme must be financed from retained profits as no steel company is now likely to risk a dusty answer from the capital market. Steel shares are in the doldrums and after the interim report the £1 units of Stewarts and Lloyds fell 1s. 1½d. to 20s. 10½d., to yield 10½ per cent on the assumption—and it is only an assumption—of a total dividend of 11 per cent.

METAL INDUSTRIES

FOR one British industrial company to offer its shareholders shares in another public company by way of rights is a new departure. So new, indeed, that the proposal, as now made by Metal Industries, required permission from the Board of Trade as well as the consent and co-operation of British Oxygen, the company whose shares Metal Industries is putting on sale. Metal Industries' investment in British Oxygen's ordinary stock dates from before the war. It never added up to a controlling interest and the links between the two boards of directors have been severed for some time, so that when Metal Industries needed new money the obvious course was to sell the investment.

Metal Industries has had a chequered history and in January, 1956, the company, in need of fresh capital, placed privately £600,000 of its British Oxygen holding, bringing its investment down to £1,000,000 nominal. The directors said at the time that if further money were needed this holding would be sold. A scrip issue by British Oxygen raised Metal Industries' holding to £1,500,000 nominal. This stock Metal Industries now proposes to sell, but not through the stock market—because the sale of so large a block might make the price move against the seller. Instead, the £1 British Oxygen units are offered at 30s. free of stamp to stockholders in Metal Industries as rights in the proportion of one British Oxygen unit for every three ordinary units of Metal Industries held. Preference as well as ordinary stockholders in Metal Industries will be able to apply for excess shares and the issue should bring in about £2,100,000 net to Metal Industries. On the eve of the offer the British Oxygen units stood at 34s. and they have now been adjusted to 33s. The reason given by Sir Charles Westlake for the sale is the need to have the company's funds readily available so as to expand Metal Industries' interests "as and when opportunities occur."

OLYMPIC PORTLAND CEMENT

STOCKHOLDERS in Olympic Portland Cement, a British company controlled by United Molasses but operating in the United States, have known for some time that a bid was in the wind and its £1 stock units have risen to 57s. 6d. (to offer on a 10 per cent dividend a yield of no more than 3½ per cent). Terms of the offer for the 1,000,000 ordinary units have now been published. Permanente Cement Company of California, an associate company of Henry J. Kaiser Company, will pay, subject to a 90 per cent acceptance, $8.57 in cash for each £1 unit. The total bid is worth $8,570,000, or about £3 million. These switch dollars are available for reinvestment in North America or accepting shareholders can gain the benefit of the dollar premium by taking sterling through Helbert Wagg, the merchant bankers, who guarantee such stockholders not less than 61s. 3d. per share.

The directors of Olympic Portland Cement recommend acceptance and United Molasses will do so. Stockholders in United Molasses will hope that some part of the cash proceeds of the deal will be distributed to them: their hopes may not be in vain, for United Molasses has made a habit of making distributions arising out of capital accretions.

CANADIAN EAGLE

LIKE the big oil groups, Canadian Eagle has reported a sharp increase in net profits—which rose from £9.3 million in 1956 to £11.5 million in 1957. Like them, it finds the outlook for 1958 "uncertain" and suggests that this year profits may not be maintained. But despite the strain on liquid resources which contractual obligations for capital expenditure of nearly £12 million imply, the board increased the dividend from 2s. to 2s. 3d. on the no par value shares. For a British resident 35/100ths of the dividend is free of British tax, so that at 57s. 6d. the effective yield on the bearer stock is 4.9 per cent.

The strength of Canadian Eagle—apart from its special appeal to British surtax payers—is that it will be well placed both for oil supplies and for markets, when the upward trend in oil demand is resumed. Most of this strength is derived from Canadian Eagle's close association with the Royal Dutch-Shell group, which owns about 20 per cent of the ordinary stock. Canadian Eagle has a long-term contract to buy at cost, through Shell Venezuela, one-twelfth of the output of Mene Grande Oil, the Venezuelan subsidiary of Gulf Oil; and although Mene Grande, like other Venezuelan producers, has been forced to reduce output below last year's record levels, it has ample scope for expanding again when the market can take the oil. In the Middle East, Canadian Eagle has extended its participation in the Shell group's long-term contract to buy a large part of Gulf Oil's share of the Kuwait output. It lifted a total of nearly 16 million barrels of Kuwait oil in 1957, an increase of over 5 million barrels over 1956.

More important, while the present surplus of oil lasts, is Canadian Eagle's association with the Royal Dutch-Shell group in marketing in Britain and in South America. South American markets are beset by foreign exchange shortages and government restrictions; but in Britain, where Canadian Eagle's interest in Shell Mex and B.P. (which substantially increased its share capital last year) has been reduced from 27½ per cent to 20 per cent, there are now welcome signs of a vigorous recovery in demand, especially for fuel oil. The earnings of Eagle Oil and Shipping, the important tanker subsidiary, have been affected by the slump in tanker freight rates, and no early recovery is expected, but the whole of the Eagle fleet remained employed in 1957; three old ships totalling 42,389 deadweight tons were sold, but they were replaced by the new 31,910-ton *San Gregorio*, with a carrying capacity 30 per cent greater than the three old ships combined.

ULTRAMAR

SPECULATORS in Ultramar stock have been guided in the past by their views on the group's production prospects; for the immediate future they are more likely to be guided by its prospects of finding markets. Ultramar owns Caracas Petroleum, which in turn has a half interest, with the Texas Company, in a Venezuelan oil producing company, Mercedes. Mercedes' net income rose by $920,974 in 1957 to $2,798,070, enabling it to repay $2,371,953 of the sums owing to Caracas (which are now reduced to $13,217,239). Caracas, in turn, repaid $1,010,000 to Ultramar, leaving outstanding $21,433,491 of the dollar advances originally made by Ultramar. Because Ultramar carries these dollar advances at a sterling equivalent of $3.89 to £1, this repayment produced an exchange surplus of £101,277, on the basis of which Ultramar proposes to make a third capital surplus distribution of 1s. 6d. per 10s. stock unit. The exchange surplus, which stood at £1,203,883 at the end of 1957, could benefit by a further £2,142,000 if all outstanding advances were repaid.

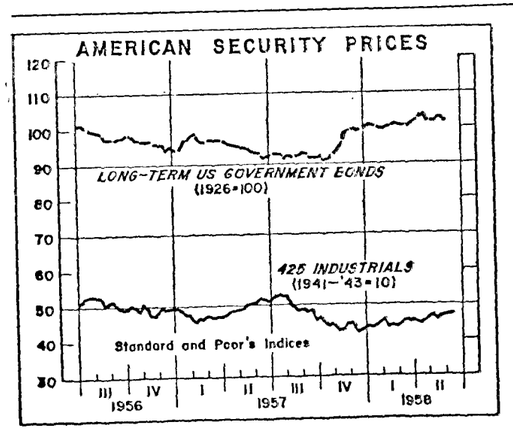
Production from the greater Mercedes area in Venezuela, in which Ultramar has, through Caracas, a half interest with the Texas Company, was maintained throughout 1957 at a rate of just over 24,000 barrels a day, but in the first quarter of 1958 marketing difficulties forced a cutback of nearly 17 per cent compared with the first quarter of 1957. This oil is sold to the Texas Company, under an agreement which runs until June 30, 1959. In the Oritupano Pooled Area, in which Mercedes has a half share with Venezuelan Atlantic (giving Ultramar indirectly a 25 per cent interest) output rose sharply from under 3,000 barrels a day in the first quarter of 1957 to 12,575 barrels a day in the last quarter, but this rate of increase could not be maintained into 1958, again for lack of market outlets. The combined potential of the various fields in which Ultramar has an interest is now over 30,000 barrels a day—not a huge quantity, but output during the first quarter had to be held about ten per cent below it. Much importance attaches, therefore, to the short-term marketing arrangements, additional to the minimum take under the oil sales agreement with the Texas Company, which "will enable Mercedes to produce at a higher average rate for at least the second and third quarters of 1958." Prospects after that depend on the timing of the eventual recovery in demand which all oil companies expect.

ENGLISH SEWING COTTON

HIGH yields among cotton textile shares are common and, some would say, inevitable. The £1 ordinary units of English Sewing Cotton at 24s. yield 10.4 per cent on the maintained dividend of 12½ per cent. This company's full accounts for 1957 will hardly persuade investors to modify that assessment. Last year, though the group achieved record sales in this country, the continuing pressure on margins brought the consolidated trading surplus down from £3,022,634 to £2,909,495. Within this total the profits of American Thread moved up from £1,502,874 to £1,534,157. Unfortunately this is not the complete story; the consolidated balance for 1957 is struck after writing £198,000 off stocks in Britain (as a result of the fall in the price of long stapled cottons), but after crediting £340,107 from the release of stock reserves by American Thread. The pressure on trading margins has thus been especially big in the United States and American Thread, in an attempt to reduce costs, has had to accelerate its plans to modernise and improve its plant and equipment. That added to the financial strain and last year the group's bank overdrafts rose from £1,627,055 to £1,927,402. There may be some financial relief this year with the reduction in capital commitments, but the trading outlook is not encouraging. The chairman, Mr Leslie Shaw, says that "the year 1958 has opened on a depressing note with reduced activity in a number of mills. The principal cause is a reduction of stocks in the chain of distribution."

BOVRIL

IN 1956 the Bovril group achieved record sales only to suffer a decline in profits. Last year gross profits recovered from £695,762 to £864,536, though the latest figure includes a credit of £52,250 arising from transactions in previous years. The net profit has risen from £298,596 to £386,125, but the dividend on the deferred ordinary capital has been left unchanged at 16 per cent, the rate paid in the two previous years. The group's interests outside the Argentine and outside the meat trade may have played some part in bringing this recovery about. But no investor can ignore the trade and exchange risks of business in South America and that is reflected in the yield of 7.2 per cent offered by the £1 units at 44s. 3d.



London Stock Exchange

FIRST DEALINGS:	June 4	June 18	July 2
LAST DEALINGS:	June 17	July 1	July 15
ACCOUNT DAY:	June 24	July 8	July 22

MARKETS have been firm but the improvement in prices has been small while a settlement to the labour disputes has been awaited. Prices eased on Tuesday when a settlement seemed farther away, but rallied on Wednesday. Gilt-edged showed a further overall improvement in the week, and corporation and Dominion stocks were well supported; 6 per cent Newcastle 1973-76 moved up ⅜ to 102⅞, and 5¾ per cent East Africa 1977-83 gained ¼ to 94 xd. The gilt-edged market held firm on Thursday even after Bank rate was left unchanged.

Except for a slight weakening on Tuesday, industrial shares showed small but persistent gains and *The Economist* indicator passed its previous peak for the year, rising 3.8 to 188.0. Brewery shares improved once more, Bass rose to 36s. while Whitbread "A" gained 2s. to 89s. 6d. Stores strengthened on Wednesday and GUS made rapid progress after the capitalisation; over the week the GUS ordinary shares jumped 3s. 4½d. to 26s. British Motor gained 7½d. to 7s. 9½d., Rolls-Royce recovered 3s. 6d. to 87s. xd, and Rover advanced 1s. 10½d. to 15s. 7½d. Paper shares also rose, Bowater gaining 2s. 9d. to 32s. 3d. Unilever rose 3s. 3d. to 77s. Steel shares lost part of their earlier gains on the interim statement from Stewarts and Lloyds. Considerable gains were made by shipping shares; British and Commonwealth rose 2s. 9d. to 34s. 9d. xd.

Among oils, BP improved to 105s. 7½d. and after fluctuating violently TPD closed 7s. 6d. higher on balance at 65s. xd. Kaffirs were mainly dull. Diamonds strengthened up to the announcement of lower diamond sales and then declined. Tins were depressed but copper mines made large gains on Wednesday following the announcement of the US stockpiling scheme; Rhokana jumped 1½ to 28.

(1) Employment figures relate to June of each year; other figures are monthly averages. (2) Engineering, shipbuilding, electrical goods, vehicles, metal goods, precision instruments and jewellery. (3) Textiles, leather goods, clothing, food, drink and tobacco, manufactures of wood and cork, paper and printing. (4) Number registered as unemployed expressed as a percentage of the estimated number of employees. (5) From June, 1956, onwards, comparison with earlier figures is affected by the revocation of the Notification of Vacancies Order, 1952. (6) United Kingdom. (7) Figures have been revised back to July, 1956, on the basis of mid-1957 count of National Insurance Cards.

(1) Electricity production in New Zealand represents deliveries only and in Canada, prior to 1957, excludes industrial generation for own use. (2) Copper and tin refer to metal production. (3) General trade (*including* re-exports) except for Canada, which is special trade only. Imports are cif except for Australia, Canada and S. Africa which are fob; exports are fob. Trade for India includes that going by land; annual figures for India are for 12 months beginning April 1st of year stated and for Australia 12 *months* ended June 30th. (4) Gold and foreign exchange holdings are those of the government and central bank; only figures for Australia include holdings of commercial banks. Cost of living for S. Africa and S. Rhodesia relates to Europeans only and for S. Africa includes direct taxes. (5) Including *foreign investments*. (6) Including semi-processed gold. Beginning January, 1955, including South-West Africa. (7) In July, 1948, part of holdings was transferred to the State Bank of Pakistan. (8) April, 1948—March, 1949. (9) Including some long-term securities. (10) Prior to 1957, excluding industrial generation for own use. (11) Average for fourth quarter.

THE ECONOMIST JUNE 14, 1958

Financial Statistics

EXCHEQUER RETURNS

For the week ended June 7, 1958, there was an above line" deficit (after allowing for Sinking Funds) of £24,990 compared with a deficit of £6,207,000 in the previous week and a deficit of £6,163,000 *in the corresponding period of last year.* There was a net expenditure "below-line" of £11,936,000 leaving a total deficit of £109,249,000 compared with £45,289,000 in 1957-58.

THE MONEY MARKET

HOPES of a reduction in Bank rate on Thursday stimulated demand for bills in mid-week. Not only the big banks but also United States and Continental investors were substantial buyers from the discount houses, and August and early September maturities were bid up from discount rates of 4⅛-4⅜ per cent to 4⅛-4⅛ per cent. These purchases gave the discount market adequate funds to meet its needs; but before the week-end, on Thursday and Friday, very small amounts had to be taken at Bank rate, despite fairly large special aid on Friday.

The Treasury bill rate fell by ⅜ per cent at the tender on Friday last week. The discount houses raised their common bid by 6d. to £98 16s. 5d. per cent, an adjustment apparently a little larger than that made by outside tenderers. Accordingly, although competition for the bills was very keen—total applications for the unchanged allotment of £270 million rose by nearly £30 million to the high figure of £445.4 million—the proportionate allotment at the common bid rose from 49 to 59 per cent. The average rate of discount on the whole allotment fell by 1s. 10d. per cent. to £4 14s. 5.72d. per cent. At yesterday's tender, the offer remained at £270 million.

The Treasury bill rate in the United States edged up again this week, to 0.84d. per cent, compared with the four year low point of 0.63d. per cent a fortnight ago.

Continued Development and Progress

The following are extracts from the statement by **Sir Brian E. S. Mountain, Bart.** (the Chairman), circulated with the Report and Accounts for the year ended February 1, 1958.

The Report and Accounts for the year ended February 1, 1958, are submitted herewith. During this period our main efforts have been directed towards consolidating and developing the businesses already owned by the Group but towards the end of our financial year the share capital of three new subsidiary companies was acquired.

Consolidated Profit and Loss Account

The Group Trading Profit of £7,131,877 shows an increase of £836,938 over the corresponding figure of the previous year.

This satisfactory increase is due to a further substantial rise in Group turnover, which has accrued, partly from existing businesses in which the comparative increase has exceeded the national average, partly from new branches opened in the year 1957/1958 and partly from a full year's trading from the additional branches opened in the year 1956/1957. The increase in turnover has more than compensated for the increase in expenses arising mainly from higher wages and salaries.

Our reconstruction programme is now nearing completion and less than 70 shops remain to be converted. Our total charge for repairs, renewals, general maintenance and depreciation this year is less by approximately £200,000 than the figure which we had to provide last year.

The total charge for Taxation of £3,588,775 has increased by £313,854 which amounts to more than three-quarters of the increase in Group Profits before Taxation. The Chancellor's new proposals in regard to the charge for Profits Tax are welcome, and will result in a decrease in this charge, based on this year's profits, of approximately £210,000 in the current year and £250,000 in a full year.

The improvement in Profits has enabled your Board to recommend maintaining the rate of last year's total Ordinary Dividend of 32½% on the Capital as increased by the Bonus Distribution made last year. This rate is equivalent to 35¼% on the old Capital.

Reserves

The amount allocated to Reserves out of Revenue under the various headings is £1,280,408 and is slightly less than a year ago. In addition, General Capital Reserve has been increased by £128,934 arising from the surplus on the realisation of a few properties, which were surplus to our requirements. It is noteworthy that all the properties we have realised since the revaluation made in January 1956 have been disposed of at prices in excess of those valuations.

Consolidated Balance Sheet

The total assets of the Group after deducting Mortgages and Debentures amount to £24,307,497, an increase of £1,450,146. Our net Fixed Assets which now stand at £16,561,734 have increased during the year by £668,609.

Current Assets have also increased by £1,051,786 to a total of £16,275,654. Total Current Liabilities and Provisions are higher than a year ago by £531,149.

To summarise, the Balance Sheet shows a strengthening of the financial position under almost every heading which is a reflection of the continued development of all the businesses which comprise our Group.

Future Prospects

The turnover of our Group since 1st February has been well maintained. Our fashion business was adversely affected by the exceptionally bad weather since the turn of the year which continued until after Easter, but this was more than offset by increases in our other businesses.

We are in a good position to take advantage of all available opportunities, and given reasonable trading conditions, I am hopeful that your Company will continue to make satisfactory progress.

The Chairman addressing the Meeting made reference to the recent acquisition of Allders Ltd., an old established departmental store in the centre of Croydon; he felt that this would prove to be a satisfactory acquisition to the Group.

At the same time £1,300,000 6 per cent. Unsecured Loan Stock 1978/83 had been issued and placed privately.

CEREBOS LIMITED

FURTHER EXPANSION IN ACTIVITIES AT HOME AND OVERSEAS

GROUP'S CONTRIBUTION IN CHECKING THE RISE IN COST OF LIVING

MR W. ARNOLD INNES ON UNIVERSAL RECOGNITION OF QUALITY PRODUCTS

The Fifty-Fourth Annual General Meeting of Cerebos Limited was held on Thursday, June 12, 1958, at The Hyde Park Hotel, Knightsbridge, London, S.W.1. Mr W. Arnold Innes, the Chairman, presided.

The following is his Review which has been circulated with the Report and Accounts for the year ended December 31, 1957.

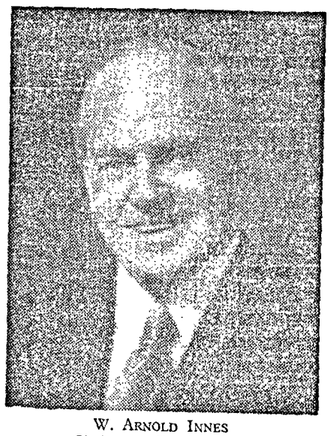
"Before proceeding with my Review of the Accounts I regret to have to report the death of Mr R. V. Townsend. Mr Townsend had served the Cerebos Group for 39 years —first as Export Manager and since 1940 as an Executive Director. I speak for us all when I say that in his passing we have lost a most valued colleague and friend who was highly respected by those who had the privilege of working with him.

I also wish to record that Mr F. N. Patterson, who has been an Executive Director since 1939, relinquished his executive duties at the end of 1957. Over a period of 26 years Mr Patterson has been responsible for the operation of our Distributing Division and it is largely due to his energy and foresight that the Group is so well equipped in that section of the business which provides an essential service to our customers. He takes with him our best wishes for a long and well-earned retirement. I am glad to say that, at the unanimous invitation of his colleagues, Mr Patterson, who retires this year by rotation, has agreed to offer himself for re-election and, subject to your approval, will remain on the Board as a non-executive Director.

ACCOUNTS AND DIVIDEND

I have pleasure in presenting the Accounts for another successful year for the Cerebos Group of Companies.

The Consolidated Balance Sheet and Profits Statement clearly set out the position of the Company and its Subsidiaries as at December 31, 1957, but for the reason given below a straight comparison between the years 1956 and 1957 is not possible. The Assets, Liabilities and Profits of the Northern Enterprises Group of Companies are included in the 1957 consolidation for the first time.



As the result of the merging of the Northern Enterprises Accounts, the revaluation of the Fixed Assets of a Subsidiary and the additional expenditure incurred by the Middlewich Company, Crampton's and Scott's on buildings and plant in furtherance of their reconstruction and re-equipment programmes, the Fixed Assets of the Group, after depreciation, together with the premium paid on the acquisition of Shares in subsidiary undertakings and the investment in the French subsidiary at its written down value, now amounts to £3,784,909 as compared with £3,174,793 as at December 31, 1956.

Productive capacity and the trend of Group sales have again been upward and this position is reflected by the increase in Stock in Trade and Trade Debtors. It is satisfactory to note that the sound liquid position has been well maintained and shows an excess of Current Assets over Current Liabilities of £2,506,744, an increase over the corresponding figure for 1956 of £437,960.

Reserves and surplus have this year been increased by the inclusion of the premium of £343,575 obtained on the issue of £76,350 Ordinary Stock in Cerebos Limited in exchange for the equity shares of Northern Enterprises Limited and the sum of £137,442 being the surplus on the revaluation of the Fixed Assets of the subsidiary previously mentioned. Both these items are included in the Balance Sheet under the heading CAPITAL RESERVES. CAPITAL and REVENUE RESERVES, with the sum set aside out of profits in cover of the deferred liability for taxation at £874,000, now aggregate £4,025,291.

Outside interests in Consolidated Subsidiary Companies at £190,012 represent the Share capital not held within the Group and reserves and undistributed profits attaching thereto.

Group Capital Commitments as at December 31, 1957, amount to approximately

W. ARNOLD INNES
Chairman, Cerebos Ltd.

£333,000—some £77,000 less than was reported last year but substantial new commitments for buildings, plant and machinery have since been undertaken.

The Trading Profit of the Group for the year is, as shown by the Directors' Report, £1,894,572, an increase of £193,232 over the 1956 figures. The estimated liability for taxation thereon, including Profits Tax at £247,000, amounts to £1,065,075.

The net profit for the year, after providing for taxation and making due allowance for outside interests in the profits of Subsidiaries, therefore amounts to £822,180. To this must be added £374,847 brought forward from 1956, making a total sum available of £1,197,027, out of which the following appropriations in the accounts of Cerebos Limited are recommended to the Stockholders for approval:

(1) To write off £30,453 from Investments.
(2) To Increase the General Reserve to £2,000,000 by the transfer of £500,000.
(3) DIVIDEND:

Your Directors feel that the expansion in the Company's business and the results achieved justify a higher overall return to Stockholders and therefore recommend the payment of a Final Dividend of 22½ per cent (less tax) of £268,628 which, with the Interim Dividend of 10 per cent (less tax) paid in November last, makes 32½ per cent (less tax) for the year.

These appropriations amount in total to £918,471 and will leave £278,556 to be carried forward to the credit of Consolidated Profit and Loss Account next year.

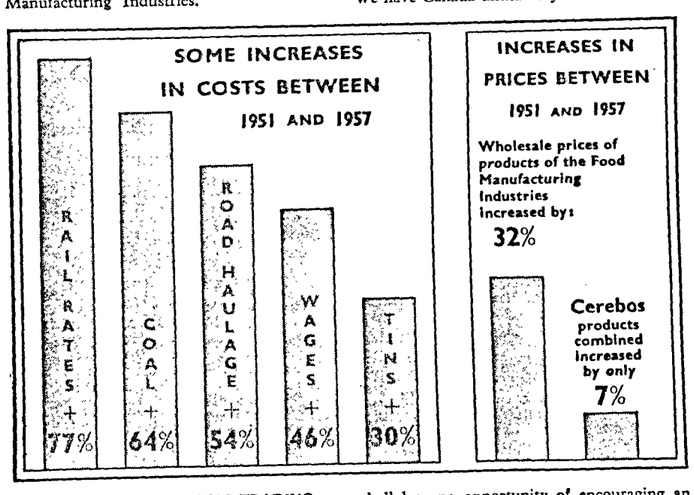
The attention of Stockholders is drawn to the reference in the Directors' Report to the application which has been made to the Capital Issues Committee for the capitalisation of certain Reserves.

HOME SALES, MARKETING AND ADVERTISING

I am glad to report that Home Sales in 1957 exceeded those for 1956, which up to that time constituted a record year.

In view of the continued upward trend in retail prices of some consumer goods, however, references to increased turnover and record trading results could be misleading unless it is made clear that they have been achieved without the assistance of increased retail prices, and do in fact reflect the all-important measurement of real progress, namely, expanding consumer demand. I would like you to know, therefore, that our Home Sales in 1957 exceeded 1956 in both tonnage and value and the number of packages purchased by consumers was higher than in any previous year. Further, with only one very minor exception, there was no increase in the retail prices of our products during 1957.

This further evidence of the popularity of our products and universal recognition of the high standard of quality maintained augurs well for the continued prosperity of your Company. It also reflects the effectiveness of our overall selling, marketing and advertising policies. I should like to acknowledge with thanks the work of all those engaged in these arduous and responsible tasks from which there can be no respite if the flow of our goods from our Factories is to be maintained at the highest possible level to ensure economic production and the lowest possible prices to the consumer. It is of interest to record that with a view to developing the opportunities for further expansion in the marketing of certain of our products, two of our principal selling teams were reorganised during the year, the effect of which has been



most beneficial. Today even more shops are stocking our products than was the case a year ago, and I wish to acknowledge and pay tribute to the splendid co-operation your Company receives from its many friends in the Distributive Trades who receive our Representatives in such a courteous and friendly manner.

Special mention should also be made of the substantial increase in sales achieved during their first year as a member of the Cerebos Group of Companies by Stamina Foods Limited, the principal operating Company in the Home Market of the Northern Enterprises Group. I must also mention the excellent contribution to our results made by Crampton's and Scott's during the year under review.

You may be assured that subject to any adjustment necessary to meet changing conditions we shall pursue most energetically the selling, marketing and advertising policies which, as I have indicated, have proved so successful in the year under review.

In previous reports we have emphasised the principle which we follow of endeavouring to keep prices down and we are proud of the measure of success which we achieved in our efforts to combat the continual rise in costs.

The increased efficiency following our substantial Capital Expenditure during the past few years, together with efficient management at our Production Centres, have played their part in absorbing the major proportion of increased costs. The chart reproduced herewith does indicate that the average adjustment in our prices of 7 per cent over the past six years is well below the average increase of 32 per cent in the wholesale prices of products of the Food Manufacturing Industries.

EXPORT AND OVERSEAS TRADING

Our Export Trade continues to be dominated to a marked extent by the Import Licensing Restrictions which many countries find it necessary to apply, in varying degrees, in order to aid their economic policies. There are, unfortunately, some pre-war markets which, for economic or political reasons, still remain virtually closed to us, but, nevertheless, our trade retains a world-wide character although the tendency for countries to foster local production becomes ever more marked.

It is, therefore, very satisfactory for me to be able to record, in spite of attendant difficulties, an increase in our export trade for the year.

Turning now to particular markets I would like to remind you that we have always attached great importance to our trade in the Dominions. In my Review last year I referred to progress in the construction of our new Australian factory and I am pleased to report that this factory is now in production, manufacturing Bisto and Gravox, and packing domestic salt. I was able to attend the opening ceremony performed by the Premier of Victoria, the Honourable H. E. Bolte, at Melbourne in January last, and there is no doubt that, subject to the interests of a minority holding of Australian Shareholders, we now own a model factory in excellent surroundings from which to supply the requirements of a growing Australian market. During my visit to Australia I had the honour of being received by the Prime Minister, Ministers and Government officials. I also had the great pleasure of meeting many of our principal customers. I am most impressed by the prospects for our investment in this virile country.

I also spent a few weeks in New Zealand and there I met several of our customers. Unfortunately, this Dominion has recently found it necessary to bring import restrictions into force which have severely restricted our trade, which up to then had been making steady progress. I am optimistic, however, that the economic situation of this essentially sound country will soon permit the resumption of free access to our products.

From New Zealand I went to Canada in order to examine the progress of our trade in that Dominion. In crossing the country from Vancouver to Montreal I consulted many of our customers and was most impressed by the general picture of an expanding economy. We have Canada under very close review and shall lose no opportunity of encouraging an increasing demand for our products and strengthening our association in this swiftly expanding market.

Before leaving specific markets, I would like to mention that our South African and Rhodesian trade continues to show a steady expansion and is making an important contribution to our export business.

In other markets, sales have, with certain exceptions, been satisfactory but in some countries conditions are such that further restrictions may result. In this respect the business of manufacturers of pre-packed foodstuffs is particularly vulnerable, as it is in the import of such products that the first economies are apt to be made. It cannot be denied that the difficulties confronting the export side of our business are very real, but I do not think there is reason to be unduly pessimistic about this important section of our business.

PRODUCTION

The ever increasing sales of the Cerebos Group as a whole are evidence not only of good salesmanship, but also of continuously good quality. In fact, it may be said that the policy of the Group Production Department can be summed up in the words "quality and quantity at economic prices."

With this object in view all our older factories are being maintained at a high level of efficiency. New machinery is being installed where old machinery has become inefficient, as, for example, at Middlewich, where, during the year, a completely new Bisto Manufacturing Plant has been erected. This plant is now in operation and is working to our entire satisfaction.

In the case of more recently acquired factories, installations and the methods of operating them are being brought up to standard as quickly as possible, as, for example, in the case of the dog and cat food cannery owned by Northern Enterprises Limited at Bootle. The factory is cramped for space and suitable land for extension is unobtainable. We have, therefore, built a new cannery at St. Helens, adjacent to the factory which produces dog biscuits, dog meal, etc., and it is in process of being equipped with the most up-to-date machinery obtainable, including a large cold store to enable us to carry adequate quantities of meat. The premises at Bootle will be sold as soon as production of "Stamina" products at St. Helens reaches a satisfactory level. The operations of this unit of the Cerebos Group will then virtually be concentrated under one roof.

The concentration of the production of Porage Oats by A. & R. Scott in the two Mills at Edinburgh and Cupar is now complete, as is also the extension to Crampton's premises in Manchester referred to in my last Review.

The Animal Feeds Division of Scott's has made substantial progress during the year in the production and sale of "Hy-Line" products, and new and additional machinery is being obtained to equip the Mill at Mid Calder, acquired during 1956, to deal with these products on a full commercial basis.

Quality control is a matter which we deem to be of paramount importance and it is, therefore, our policy that every factory of whatever nature shall have a fully equipped and well staffed laboratory. With this object in view, new laboratories have been opened at both Manchester and St. Helens. A model kitchen has also been opened in Manchester under the control of an expert who is fully qualified to give instruction and advice on the manufacture of foodstuffs from Crampton's range of products.

The question of research has been referred to in previous Reports, and recognising as we do the importance of this aspect of the business, we have decided to open a Central Research Laboratory in Edinburgh in premises already in our ownership and eminently suitable for the purpose, which are adjacent to the Colinton Mill of A. & R. Scott Limited. A Chief Research Chemist has been appointed who is now selecting his staff and we fully anticipate that the unit will be in operation by about the middle of this year. We already enjoy close relations with Edinburgh University, a factor contri-

buting to our decision to establish this Department in Scotland's delightful capital.

DISTRIBUTION

In my Report last year I referred to the construction of a depot in Nottingham and the procuring of a site for a new depot near Glasgow. The building of the Nottingham depot has been completed and is now in use providing a distribution service to our customers in Nottinghamshire, Leicestershire and Lincolnshire.

Construction of the new depot at Chapelhall, near Glasgow, has commenced and it is anticipated that it will be completed in September of this year. This depot will provide first class storage accommodation for distribution over a large area in Scotland.

We also propose to enlarge the warehouse accommodation in our Middlewich factory for the purpose of increasing the area of distribution and absorbing two depots in the Lancashire area. Economies and more efficient operation will result.

The wide coverage of our distribution system provides a facility in the development of our newly acquired animal food business and considerable benefit is already being experienced.

Probably the most important change in transport is the freeing of British Railways from the old method of rate charging. They are now able to enter into keen competition with other forms of transport. The situation which has presented itself is well before our Traffic Department. So also is the development in the mechanical handling of goods for transit and warehousing. We have for some time now within the Group palletised our products, but this method of materials handling continues to expand and we are now co-operating with depots and customers who are equipped for palletisation.

STAFF AND EMPLOYEES

I welcome this opportunity of expressing once again our appreciation of the loyal and valuable services rendered by our Executives, Staff and Employees. We are grateful to all, for without their continued and untiring efforts we could not have presented such successful results.

The welfare of all employees is a matter which we deem to be of the utmost importance and our various schemes for their well-being continue to make progress.

The continued expansion of the Group's activities naturally results in increased burdens of responsibility being borne by Members of the Parent and Subsidiary Boards and I should like to express my thanks for the whole-hearted and enthusiastic support of my colleagues during the past year."

The Report and Accounts were adopted.

Mr L. H. McRobert and Mr F. N. Patterson, the Directors retiring by rotation, were re-elected.

ADDITIONAL REMARKS BY THE CHAIRMAN

"On completion of the formal business of the Annual General Meeting may I be permitted to enlarge on one aspect of your Company's activities of which we are particularly proud. It is the part which the Cerebos Group has played in keeping down the cost of living.

You will have seen in my published Review a reference to the fact that over the past six years the combined prices of Cerebos products have increased by only 7 per cent against 32 per cent for the wholesale prices of products of the Food Manufacturing Industries.

There is one even more striking feature in the Cerebos price structure which I should like to bring to your notice. Of all foodstuffs none is more indispensable than salt and one or other of the brands manufactured by the Group is to be found in almost every household in Great Britain.

Many of the factors governing the price of salt have gone up considerably between 1951 and 1957 and details of certain of these items are shown in my published Review. During the same period the retail price index has gone up by 30 per cent. Nevertheless, throughout these six years the prices of two of the Company's principal salt lines have remained unchanged. One of these lines is "Saxa" which enjoys the largest sale of packet salt in the world.

This achievement has been possible only by increased efficiency in production and efficient advertising, marketing and selling—all of which contribute to keep down the cost of living. We expend large sums on advertising because, as you will readily appreciate, it is virtually our only means of contacting the consumer of household products. The result of this policy confirms our belief that carefully planned and economically realistic advertising makes its own important contribution in keeping retail prices down and so helps the householder on whose continued patronage the success of this business depends."

EXTRAORDINARY GENERAL MEETING

At the subsequent Extraordinary General Meeting the proposal that the sum of £1,038,175, being part of the Company's reserves be capitalized, was adopted.

The proceedings terminated with a vote of thanks to the Chairman.

SOCIÉTÉ ANONYME DES AUTOMOBILES PEUGEOT

(Paris)

At the Annual General Meeting held on May 28th in Paris with M. Jean-Pierre Peugeot in the Chair all the resolutions were unanimously adopted.

The gross dividend for the financial year 1957 was fixed at Frs.1,750 per share of Frs.16,500. This will be payable at the rate of Frs.1,412 net at a date to be decided by the Board of Directors.

The turnover for the year reached Frs.111 milliard—an increase of 18 per cent on the previous year—with a total production of 166,521 vehicles against 141,616. The sales in France have increased by 12.7 per cent, in Algeria and the Union Française by 15.51 per cent and overseas by 43.48 per cent.

The net profit for the year after deduction of Frs.5,268 million for tax and Frs.3,578 million for depreciation, amounts to Frs.2,980 million, which is 2.68 per cent of the turnover.

At the Extraordinary Meeting it was decided to increase the Capital from Frs.13,200 million to Frs.16 milliard by capitalising the reserves and increasing the value of the shares to Frs.20,000 each. It was also decided to double the bearer shares, which at present are Frs.10,000, and to authorise the Board of Directors to increase the Capital to a maximum of 30 milliard either by the issue of shares against payment or by the capitalisation of reserves.

GUARDIAN ASSURANCE COMPANY LIMITED

Annual General Meeting, June 11, 1958
(Chairman: The Right Honourable Lord Blackford, DSO, DL, JP)

EXTRACTS FROM THE DIRECTORS' REPORT

During the year the Company acquired the Share Capital of Caledonian Insurance Company and the figures of that company are included in the Accounts.

LIFE DEPARTMENT

Net new sums assured increased by £11,957,294 during the year to £39,043,952. Immediate Annuities securing £115,665 per annum and Deferred Annuities securing £1,540,337 per annum were issued. The gross rate of interest earned on the Fund was £6 1s. 5d. per cent per annum and the Fund increased during the year to £57,684,208.

REDEMPTION ASSURANCE ACCOUNT

The Fund at the end of the year after making a transfer of £30,000 to Profit and Loss was £5,775,189.

FIRE DEPARTMENT

The net premium income increased during the year by £2,532,698 to £8,957,534. The loss ratio was 50.38 per cent and after providing for unexpired risks on the usual 50 per cent basis the surplus transferred to Profit and Loss was £278,254.

ACCIDENT AND GENERAL DEPARTMENTS

The net premium income increased by £6,620,677 to £18,124,150. The loss ratio was 60.85 per cent and after providing for unexpired risks on the usual 45 per cent basis the deficit in the account of £479,805 has been transferred from Profit and Loss.

MARINE DEPARTMENT

The net premiums amounted to £3,317,901 against £2,499,345 in the previous year. After a transfer of £312,987 to Profit and Loss the Marine Fund was £3,857,241 representing 116.25 per cent of the premium income.

PROFIT AND LOSS ACCOUNT

The interest revenue before deducting tax amounted to £1,695,565. Transfers of £24,812 to the Investment Reserve and £91,443 to the General Reserve of Subsidiary Companies were made and provision for the final dividend recommended by the Directors of 1s. 1½d. less tax on each 5s. ordinary share (making 2s. 3d. per share, less tax for the year).
The balance carried forward was £369,851.

BALANCE SHEET

A valuation of Stock Exchange Securities was made at December 31st last and disclosed a surplus over the total value as shown in the Balance Sheet. The total assets of the Company and its subsidiaries increased during the year to £127 million.

ALL THE PRINCIPAL CLASSES OF INSURANCE TRANSACTED

The Company undertakes the office of Trustee, Executor and Administrator.

Head Office: 68 King William Street, London, E.C.4.

CANADIAN EAGLE OIL COMPANY LIMITED

(Incorporated under the laws of Canada)

The Thirtieth Annual General Meeting of Canadian Eagle Oil Company Limited will be held in Toronto, Canada, on Wednesday, June 25, 1958

The following is the Report of the Directors which is being circulated with the Report and Accounts for the year to December 31, 1957:

THE BOARD OF DIRECTORS

In July, 1957, Mr H. S. M. Burns resigned from the Board and subsequently Jonkheer J. H. Loudon was elected to fill the vacancy. Your Directors have passed a by-law increasing the number of the Board from eleven to twelve and this by-law will be submitted for your consideration. If sanctioned, you will be asked to elect a Director to fill the vacancy caused by the increase in the Board, and the Board puts forward the name of Mr I. D. Davidson for your consideration.

Last year the Board was elected for a period of two years and, except to elect a Director to fill the vacancy mentioned above, no election will take place this year.

ACCOUNTS

The profits for the year have been applied as follows:

	1957 £	1956 £
The consolidated profit for the year was	£11,505,490	£9,341,672
Dividend paid by Eagle Oil & Shipping Company Limited on its 5½ per cent Preference Stock..	14,420	33,252
Dividend of 2s. 3d. for the year on the Ordinary Shares of the Company.	3,389,640	3,013,013
Earnings retained in subsidiary companies	6,203,873	4,016,057
Earnings retained in Parent Company	1,897,557	2,279,350
	£11,505,490	£9,341,672

Consolidated Balance Sheet.—The combined assets and liabilities of your Company and its wholly owned subsidiaries, Eagle Oil & Shipping Company Limited, Venezuelan Eagle Oil Company Limited, Eagle Tanker Company Limited, Eagle Petroleum Company (Overseas) Limited and Eagle Petroleum Company (Kuwait) Limited are shown in the Consolidated Balance Sheet.

As pointed out last year, the accounts of Epic Limited are not consolidated because of the nature of its business (marine and general insurance). While it is still too early after only two years of operation to forecast the future of this company, the operations to date have been quite satisfactory.

Capital Assets.—Trade investments and net advances to allied companies have increased from £37,385,957 to £40,807,305

There has been no change in the more important of the trade investments during the year, with the exception of the change in the shareholding in Shell-Mex and BP Limited, which is referred to under the heading of Marketing, and that the investment in Shell Colombia SA has been written down by £390,878 as a result of the devaluation of the peso.

Payments in advance and other outlays for crude oil represent the investment of Venezuelan Eagle Oil Company Limited in rights to acquire Venezuelan crude oil production under a long-term purchase and sale of oil agreement.

Consolidated Profit and Loss Account.—The consolidated Group trading profit for 1957 was £13,911,770 compared with £10,428,460 for 1956.

The improved trading profit again resulted largely from increased accruals of crude oil, both from Venezuela and under the contracts for the purchase of Middle East crude oil

Profits on marketing in the United Kingdom were slightly less favourable than in the previous year, but those in Central and South America improved a little.

Profits on shipping improved substantially, although the prospect at the end of the year was somewhat uncertain.

Dividends and Interest on Trade Investments.—Dividends and interest on trade investments increased from £855,505 to £1,572,977. Included in the last figure is a dividend of £602,739 received from Shell Condor SA (formerly Concesionaria de Petroleo Shell-Condor SA), which was paid entirely out of profits for the years prior to 1953; the amount of this dividend should accordingly be excluded when comparing the 1957 results with those of the previous year.

In addition, dividends were received from Shell-Mex and BP Limited, Shell-Eagle South America Limited, Compania Distribuidora Guatemalteca Shell, Lubricants Producers Limited, The London and National Property Company Limited and Cia. Mexicana de Petroleo "El Aguila" SA.

LISTING ON TORONTO STOCK EXCHANGE

Since the close of the year the Ordinary Shares of the Company have been listed on the Toronto Stock Exchange. This had become desirable largely because of increased interest shown in the shares of the Company by investors in Canada and the United States.

Also because of such increased interest, arrangements have now been made whereby holders of shares on the Toronto Register will be paid their dividends by Canadian dollar cheques and any bearer coupons which are presented in Toronto for payment will be paid in Canadian dollars.

DIVIDEND

While the profits continue to be very satisfactory, it will be noted that the cash position has been somewhat reduced this year and continued expansion of the business will require further large expenditures in the future.

The outlook for 1958 must be regarded as uncertain. The rate of increase in the world demand for oil has not been maintained and, particularly in the United Kingdom, has not regained the buoyancy which existed before the Suez emergency arose in 1956. Problems caused by devaluations and governmental restrictions in certain South American countries have not yet been materially alleviated, and with the present subdued position in the tanker market, freight earnings seem unlikely to improve in the immediate future.

In short, it cannot be anticipated that profits for 1958 will show any improvement over those of 1957, and it cannot, in fact, be assumed that the 1957 level can be maintained.

Notwithstanding the uncertainties of the future and the desirability of conserving the Company's liquid resources your Directors have felt justified in increasing the dividend from 2s. to 2s. 3d. The dividend will be payable on July 1, 1958, in the case of registered shares by warrant to the holders appearing on the register at the close of business on June 2, 1958, and in the case of bearer shares against surrender of Coupon No. 28. As mentioned above, holders of shares on the Toronto Register will be paid by Canadian dollar cheques at the rate of exchange current on the record date and bearer coupons presented in Toronto will be paid in Canadian dollars at the rate of exchange current on the date of presentation.

Under Section 201 of the 1952 Income Tax Act of the United Kingdom, relief from United Kingdom income tax is given to shareholders who are subject to such tax on 35/100ths of the dividend and income tax at the standard rate will be deducted from 65/100ths thereof. There is no deduction of tax from dividends to shareholders who are not subject to United Kingdom income tax.

EXPLORATION AND DEVELOPMENT

Venezuela.—Under a long-term purchase and sale of oil agreement, Venezuelan Eagle Oil Company Limited has rights to acquire from Compania Shell de Venezuela Limited a share of the crude oil production which accrues to the latter from a number of concessions operated by others in Eastern and Western Venezuela.

The search for new reserves from these concessions was continued throughout the year and 27 exploration wells were drilled; of these 16 were completed as oil producers, 2 were gas wells, 4 were suspended and the other 5 abandoned. Development of the proven fields also continued and 353 wells were drilled of these, 334 were oil producers, 1 was a gas well, 7 were suspended and the other 11 abandoned. In addition, 110 stratigraphical test wells were drilled during the year, of which 55 were subsequently completed as oil wells

During the year greater effort was directed to the exploration and development of the concessions in Lake Maracaibo with encouraging results. With the recent completion of a pipeline to a Lake shore terminal, increased quantities of oil from these concessions can be expected to become available to Venezuelan Eagle.

Under the stimulus of the Suez Canal emergency, production reached a peak in February, but had to be curtailed somewhat in the second half of the year as a result of a return to normal conditions which coincided with a slackening in world demand for petroleum products.

Nevertheless, average production during the year from the concessions concerned was again substantially higher than in the previous year and Venezuelan Eagle's share amounted to 12,141,576 barrels, which compares with 11,068,952 barrels in 1956—an increase of nearly 10 per cent. Liftings 11,673,525 barrels compared with 11.7[illegible] barrels for 1956.

Colombia.—One seismic [illegible] the Lower and Mid[illegible] throughout the ye[illegible]

surveys were carried out. The first exploration well at Las Garzas, in the San Pablo concession some 10 miles north of the Yarigui field, was completed in August for an initial production of 600 barrels per day, and testing continues.

Another exploration well, Cristalena 1, some 4½ miles northeast of Las Garzas 1, was abandoned as no oil traces were found.

Interspace development drilling in the Casabe field continued throughout the year, 28 producing wells being completed, which to some extent offset the natural decline of the field. In the Yarigui field development wells drilled raised the potential from 4,500 barrels daily at the beginning of the year to some 6,500 barrels daily at the end of the year.

Production from the Cantagallo and Dificil fields of 2,500 and 1,100 barrels daily respectively at the end of the year showed a slight reduction compared with the previous year.

Your Company's share of the crude oil produced during the year amounted to 5,926,728 barrels, as compared with 5,935,818 barrels in 1956. Liftings at 5,787,919 barrels were slightly lower than those of 1956.

Cuba.—Drilling activities were recommenced during August, 1957, after an interval of ten years, and a marine deep test well, Manuy 1 No. 1, is being drilled off the north coast of the Camaguey Province.

Middle East Crude Oil.—Negotiations for additional long-term supplies, referred to in last year's report, were successfully concluded, and during the year 11,009,456 barrels were lifted under the first contract, while 4,943,984 barrels were obtained under the new contract.

In spite of the long haul necessary at the commencement of the year, due to the Suez crisis, sufficient tanker tonnage was available to lift the whole of the contractual requirement.

REFINING

United Kingdom.—The extension of contractual arrangements for processing followed the increased availability of Middle East crude oil already referred to, and this still further increased the proportion of products for the market met from this source.

The plants of Starhaven Refineries Limited, at Stanlow, Ardrossan and Shell Haven have continued to operate satisfactorily in meeting their contribution to the United Kingdom and Eire bitumen trade. There was a decrease in the total output, however, since the consumption of the country fell by approximately 10 per cent.

Eire.—The Group is participating with Shell, British Petroleum, Esso and Caltex in the ownership of a refinery at Whitegate Bay, County Cork. Preliminary construction was begun in July and it is expected that operations will commence by the end of 1959. With a capacity of 40,000 barrels daily the plant should be capable of meeting the whole of the gradually expanding local demand.

Cuba.—The refinery near Havana came on stream in January, 1957, and has operated satisfactorily throughout the year. By processing crude oil at a level of 22,000 barrels daily, the refinery has provided all the major product supplies to meet the company's requirement for the local market, so that importations have been confined to aviation gasolines, lubricating oils and chemicals. A considerable surplus production of gas oil and fuel oil has been available for export.

TRANSPORTATION

General Conditions.—While the Suez emergency continued during the early months of 1957, demands for tanker tonnage exceeded supply, and rates for single voyage charters, which account for some 10 per cent of the world's commercial tanker tonnage, remained at exceedingly high levels. However, with the reopening of the Canal, there followed a persistent falling-off in demand for tonnage, reflected in a sharp drop in single voyage rates which, before the end of the year, had reached levels at which many owners found it uneconomical to trade for any sustained period at such rates.

The worldwide tanker tonnage fixed on long-term charter of 5 years or more during 1957, although amounting to as much as 2 million tons deadweight, was appreciably less than that fixed in 1956, when the chartering of some 7 million tons was reported, and with the falling-off of demand very little long-term chartering took place in the second part of 1957. The few fixtures made reflected the weakening market, but not to the same extent as the single voyage charter rates.

The second half of 1957, with the continued falling-off in demand for tonnage, saw the laying-up of a number of tankers, which by the end of the year had increased to over 2 million deadweight tons, or about 4½ per cent of the world's total tanker fleet.

The whole of the Eagle fleet remained employed during 1957, except for the temporary laying-up and subsequent sale of three old ships mentioned below. These ships would in any case have been disposed of as obsolete but for the Middle East crisis, and impending heavy survey costs would in any event have made their continued trading uneconomical.

Although 5½ million tons of new tankers were delivered during the year, new orders placed brought the world's total of new and projected building tankers to a figure of 33 million tons deadweight, and despite the lapse in tanker rates relatively few cancellations of new orders had been recorded.

Eagle Fleet Tonnage.—As mentioned above, during the second half of 1957, three old tankers—the *San Felix*, 36 years old; the *San Adolfo*, 22 years old; and her sister ship, the *San Ambrosio*—totalling in all 42,389 deadweight tons, were sold by Eagle Oil and Shipping Company Limited to shipbreakers in the United Kingdom. In November Eagle Tanker Company Limited took delivery of the *San Gregorio*, of 31,910 deadweight tons. Improvement in design, speed, and pumping, is such that the *San Gregorio* has 30 per cent greater carrying capacity per annum than the combined carrying capacity of the three old vessels now sold.

At the end of 1957, the combined fleet of the two tanker-owning companies totalled 22 ships of 339,319 deadweight tons. Additionally, Eagle Oil & Shipping Company Limited had on period charter 22 tankers aggregating 418,632 tons.

New Tonnage.—With the slowing down in the rate of increase in world demand for oil, which became apparent in the second half of 1957, plans were under consideration at the end of the year for adjusting the tonnage to be built for the Group.

MARKETING

The upward trend of sales volume in post-war years was somewhat retarded in 1957, and the sales effected through joint marketing associates amounted to 8,255,057 tons (60,646,211 barrels) representing an increase of only 3 per cent on the volume achieved during the previous year.

In the United Kingdom and Eire the marketing of petroleum products was carried out against the background of the difficult supply situation arising from the closure of the Suez Canal and the shut-down of the pipelines from Iraq to the Mediterranean. The sales restrictions necessitated by these events were progressively lifted during the Spring (motor spirit rationing in the United Kingdom ended in May and the 10 per cent restriction on fuel oil consumption at the beginning of June), but the pre-Suez tempo of the rate of increase in the consumption of petroleum products was not to be regained by the end of the year.

In South and Central America the economies of most countries did not advance during 1957 at the rates they had achieved in recent years. Inflationary pressures resulting mainly from Government budgetary deficits were accompanied in some cases by lower industrial production which, together with import restrictions designed to conserve foreign exchange holdings, caused the consumption of petroleum products in most territories to show little, if any, increase over the levels of the previous year.

Although trading returns in the United Kingdom and Eire were slightly less favourable than in 1956, better results for South and Central America and the Republic of Cuba produced an overall improvement in the Group's trading profit for the year. In South America the selling prices of most products have continued to be subject to official control and do not at present enable a satisfactory return to be obtained overall on the capital invested. Moreover, as in the previous year, depreciation of most local currencies affected adversely the value of profits remitted in terms of sterling and of local working capital.

United Kingdom and Eire.—Compared with 1956, inland trade in the United Kingdom and Eire during 1957 showed a decline of 3.4 per cent, reflecting the effect of rationing and the check which events had given to schemes for the conversion of industrial plants to the use of fuel oil. However, it is not considered that the long term growth prospects of the petroleum market in the United Kingdom and Eire have been impaired. The development of higher performance engines for motor vehicles is being assisted by the greater availability of high-octane motor spirit, and public demand for the highest quality fuel has been encouraging; additionally, the widespread demand for domestic heating oils has been well maintained.

While during the earlier part of 1957 the shortage of supplies and resultant rationing prevented the further spread of price-cutting competition which had prevailed in this market for some time, extremely keen trading conditions were intensified by the end of the year.

In all the circumstances, the slightly lower profitability from the United Kingdom market which materialised, as compared with 1956, was not surprising or unexpected.

Further considerable injections of capital during the year were, however, again necessary, not only in the short term (for example to finance the additional duty on motor spirit imposed by the Government during the Suez emergency), but also for the modernisation and improvement of marketing facilities. These injections of capital were reflected to some extent in the substantial raising of Shell Mex and BP Limited's share capital in the first half of 1957. When subscribing to the increased capital, Eagle Oil and Shipping Company, Limited, your Company's subsidiary, took advantage of the opportunity to adjust its percentage holding of the share capital of Shell-Mex and BP Limited to 20 per cent, thus bringing its share holding to correspond with the contribution it makes to the oil supply requirements of that company.

Argentina.—Despite the country's political and economic difficulties during the year, the joint marketing company increased both its volume of sales and its trading profits. Sterling remittances in payment for oil cargoes were made regularly. Most of the previously unremitted profits in respect of the years 1953-56 were also received in London.

Brazil.—Lower coffee exports, uncertainties in domestic business and continuing inflation contributed to a slight reduction in the demand for petroleum products. Local currency profits showed some improvement following a more realistic appraisal by the authorities of the selling price formula, but results in terms of sterling were affected by the depreciation in the rate of exchange During the year the joint marketing company was faced with a steep increase in its requirements of working capital resulting from the introduction by the Brazilian Government of new exchange regulations and higher customs duties and excise taxes. The company took all possible steps to raise the required cash locally, but some funds had also to be remitted in to assist the position.

Chile.—The credit restriction introduced by the Government to check inflation, coupled with a decline in world copper prices, caused industrial production to fall behind that of 1956. Sales of petroleum products showed a slight increase, and profits continued to be reasonably satisfactory. Agreement was reached with the authorities regarding the release of exchange to amortize the balance of the company's cargo debt with suppliers previously incurred.

Uruguay.—Local trading results were satisfactory, but the joint company was for a time unable to remit sterling against cargo imports owing to a shortage of foreign exchange which developed in the country towards the end of the year following a fall in wool exports. It is hoped that negotiations at present being conducted with the authorities will enable cargo payments to be resumed shortly on a satisfactory basis.

Colombia.—In Colombia the military government of General Rojas Pinilla was replaced in May by a new all-party administration and the peso was devalued and imports discouraged. The consequent reduction in economic activity led to a decline in the sales of motor gasoline by the joint marketing company there, although satisfactory headway was made in the market for kerosine and diesel fuel which had only been entered in the previous year.

An agreement was made with the authorities for the settlement of cargo outstandings which had accumulated owing to the scarcity of foreign exchange.

In Ecuador, Paraguay and Peru, the other South American countries in which your Company has joint marketing interests, results were satisfactory.

Cuba and Central America.—Total sales by the joint marketing companies in Cuba, British Honduras and Guatemala were higher than in 1956, and trading returns were satisfactory. With its new refinery at Havana the Cuban company is well placed to serve the needs of the island's expanding economy.

STAFF

The continued success of the Group is very largely due to the efforts, loyalty and application of the shore and marine staffs of the Company and its subsidiary and affiliated companies, and the Board desires to extend its thanks and appreciation to all staff members.

G. LEGH-JONES, Chairman of the Board. ROBERT B. F. BARR, President.

ASSOCIATED NEWSPAPERS LIMITED

SATISFACTORY PROGRESS

LORD ROTHERMERE'S STATEMENT

The Fifty-third Annual General Meeting of Associated Newspapers, Limited, will be held on Thursday, July 3, 1958, in the Memorial Hall, Farringdon Street, London, E.C.4. The following is from the statement by the Chairman, Lord Rothermere:

Looking back on the statements I have made over the last few years, I see that invariably my comments have started by mentioning the difficult conditions affecting the Newspaper Industry. Regrettably this last year has proved no exception. In fact, at one time it even appeared possible that one national and one London evening newspaper would be compelled to close down owing to the high cost of production. However, I am more than glad that such a catastrophe was avoided.

The termination of the stabilisation period with our Unions was followed by a further increase of wage rates and these in a full year will cost this Company more than £300,000. As a result of this and other rising costs all national newspapers and the London evening newspapers were compelled to increase their price by ½d. from October 7th last. The effect of this price increase on sales varied considerably in relation to each particular newspaper, but I am pleased to tell you that so far as the newspapers of your Group are concerned, they came through this price increase with less loss of circulation than most other newspapers and now they have re-established themselves at net sale figures very little different from those before the increase.

INDUSTRIAL RELATIONS

Every effort must be made between Management and Unions to produce newspapers more efficiently. Any further rise in wages without economies in production would, in my view, create serious unemployment in the newspaper industry. It would not be out of place for me to say that I think it is essential for the Unions to change their attitude towards any development which means increased efficiency of production.

I have in mind the instance, which in fact I mentioned last year, that for over two years the newspapers have been trying to negotiate the introduction of a very efficient machine which would pack and tie our parcels automatically in our Publishing Departments. These departments are the one part of the business which has remained unmechanised since newspapers began to be published. The prolonged negotiations with the Unions concerned have resulted in no progress, and although the Managements have offered to deal with any redundancy in a way which would create no hardship at all for staffs, it has not been found possible so far to overcome their resistance. I do urge that those concerned should get down to a final settlement on this matter. Every possible development that can increase the efficiency of newspaper production should be seriously discussed with a view to its introduction, for the result can only be beneficial to everybody concerned.

THE PLACE OF TELEVISION IN COMMERCE

The other development which has affected newspapers during the last 12 month has, of course, been the fact that Independent Television has been operating at full strength in the main populated areas of the country. It was natural that at first commercial television should divert considerable revenue from newspapers to its own channels. However, I think there is every sign that advertisers have realised that television advertising is no substitute for advertising in newspapers. It is indeed a very valuable adjunct to newspaper advertising, and in my view the two will advance side by side, television very largely being a stimulant for the more permanent newspaper advertising.

ACCOUNTS

The profit on trading is slightly lower this year at £2,176,957. The increased revenue flowing from the autumn price increases was operative for less than six months of our year. This fact, coupled with a deliberate policy of publicity, both in newspapers and on television, to regain the sales of our papers lost through the price increases, and which has proved well worth while, accounts for this slight reduction.

Our dividend from Anglo-Newfoundland Development Company Limited has been markedly reduced by more than one-third. Trade investment income has risen by virtue of the full receipt of interest on our loans to Associated-Rediffusion Limited. Other investment income includes that derived from Treasury Bills and other short term loans, the increase in which has been due to the higher rates of interest received during the year.

There are three points in the Balance Sheet to which I would draw your attention. First, the increased investment in subsidiaries arises mainly from the acquisition of the remainder of the interest in the *Daily Sketch* just over a year ago. Secondly, the termination of our interest in Associated-Rediffusion Limited was not complete until after the Balance Sheet date; trade investments therefore reflect only the first moves in that direction, mainly repayment of loans; our new investments in Southern Television Limited also included under this heading will, of course, increase during this year as the new station is completed and goes on the air. Thirdly, there has been during the year a substantial increase in our cash holdings, arising in considerable degree from two sources, the liquidation of the loans by Associated-Rediffusion Limited and the reduction in the capital tied up in stocks of newsprint. Your directors naturally have the more permanent investment of a considerable proportion of this money much in mind; in the meantime we have been able to obtain the benefit of the high interest rates through the winter and spring.

It must not be forgotten that the prosperity of your company is founded on the diversity of its operations and the strength of its liquid resources.

DAILY MAIL

The *Daily Mail* amongst all national papers was least affected by the increase of price and the circulation is steadily increasing again. During the last 12 months the *Daily Mail* has had the highest advertising revenue in its history, which has made it possible for the paper to provide its readers with even more news and features. *Daily Mail* enterprise is typified by Noel Barber's arrival at the South Pole a month before any other newspaper was able to get a representative there. This is the kind of enterprise that makes the *Daily Mail* so popular with those who want their news to be presented accurately and views to be sound and well reasoned. It is well said that when there is important news people say, "Let us see what the facts are in the *Daily Mail* and what the *Daily Mail* has to say about it."

THE EVENING NEWS

The evening papers, of course, are in a very vulnerable position with the intensified competition from television advertising in the London area, but here again *The Evening News* has this year had, like the *Daily Mail*, the largest advertising revenue in its history, which has enabled the production of consistently larger papers with more news and features than its rivals. *The Evening News* carried more than 200,000 classified advertisements last year, a truly amazing figure, and with its sale again rising *The Evening News* now sells 47 per cent of the combined circulation of the three London evening papers.

SUNDAY DISPATCH

The *Sunday Dispatch* has now been reorganised under an editorial team the match of any in the country and they are producing Britain's brightest and best-informed Sunday newspaper. Sales have begun to rise again and advertisers have confidence that the *Sunday Dispatch* is appealing to that vast section of the British public who want the best in popular Sunday journalism.

DAILY SKETCH

Before the price increase the *Daily Sketch* had reached the sale of almost 1,340,000 copies. It was, however, by its nature affected more than our other papers by the price increase but the sale has begun to rise again and is now very little below what it was before the increase. I am also very glad to tell you that the paper has now started to become a satisfactory investment. I am sure you will agree that the support we have given it for five years has been well justified. In view of this, we have now been able to admit members of the staff of the *Daily Sketch* to the Associated Newspapers Pension Funds.

WEEKEND

Weekend has now been printed in four-colour gravure for over a year and it has the third largest sale of any gravure magazine in this country, an achievement one could hardly believe possible in so short a time. *Weekend* is now contributing once more to the profits of your Company.

TELEVISION

Last year I told you that we had reduced considerably our holding in Associated-Rediffusion. As the Independent Television Authority require that no contracting company nor its shareholders may have any other interest in commercial television in the United Kingdom, the granting of the licence to Southern Television Limited was dependent upon your Company ceasing to be a shareholder in Associated-Rediffusion. Accordingly we have now completed the disposal of our remaining interest in Associated-Rediffusion. We are thus able to obtain a third interest in this new important television station in the South which opens at the end of August.

In Australia the operations of the Sydney and Melbourne stations are very encouraging, and we hope to be further interested in stations in Adelaide and Brisbane.

NORTHCLIFFE NEWSPAPERS GROUP LIMITED

Our provincial newspaper companies have had another successful year despite increased costs. Our policy of giving each provincial newspaper complete editorial autonomy free from London control is one which we are resolved to maintain. We feel strongly that only by this arrangement can the local newspaper truly reflect the character of the locality it serves and the variety of views held by the readers. The prestige of these newspapers stands very high indeed, and comments from all parties are frequently made on the fairness of treatment which they receive.

MECCA LTD.

	1956 £	1957 £
Trading Profit	494,540	555,464
Tax Provision	215,901	260,622
Profit after Tax and Minority Interests	194,361	199,358
Paid in Dividends (less Tax)	83,959	117,535
Retained	110,402	81,823
Dividends paid gross on Ordinary and "A" Ordinary Shares	25%	22½%
(1957 final, 12½% on Capital doubled by scrip issue)		
Fixed Assets	3,079,880	3,437,208

Salient points from Joint Chairmen's Review
Annual General Meeting, June 10, 1958

The record Trading Profit, despite ever increasing costs, shows an improvement of £60,924, which is largely absorbed by increased Taxation. If the changes in Profits Tax proposed in the Budget had been in force in 1957, there would have been a reduction in the Tax Provision of £27,000.

Three Catering Establishments, One Dance Hall, and a Tobacco Shop, were opened during 1957, these have all done very well so far this year. We are well satisfied with the increased Trading Results for the first thirteen weeks of 1958. Most of the operating Subsidiaries are being wound up and their activities transferred to the Parent Company, to effect administrative economies.

The Palais de Danse, Dennistoun, Glasgow, was acquired recently by an exchange of Shares, and we hope to open this year new Restaurants and Banqueting Suites at Bucklersbury House, a new Restaurant in Gresham Street, both in the City of London; and subject to necessary finance, to build one or two Dance Halls. Recent acquisitions have provided additional cash resources of £400,000, utilising most of the Un-Issued "A" Ordinary Shares, hence the reason for the Extraordinary General Meeting to increase the Capital by a further 2,000,000 "A" Ordinary Shares.

CAPITAL:
Authorised—£2,300,000
Issued—£1,631,838
5% £1 First Cumulative Preference £145,000

WEBB'S CRYSTAL GLASS

CURRENT TRADING IMPROVEMENT

The thirty-eighth Annual General Meeting of Webb's Crystal Glass Company Limited was held on June 11th in London, Mr R. E. N. d'Abo, the Chairman, presiding.

The following is an extract from his circulated statement:

The Group Profit for the year amounts to £53,294 as compared with £93,030 for the preceding year and the Net Profit, after Taxation, to £23,655 as against £44,118.

The Balance Sheets of the Group and the Parent Company show a strong financial position.

The results for 1957 are disappointing. On the home market, largely due to credit restrictions, the turnover was lower, in addition, your Company had to bear heavy increases in the cost of fuel and raw materials and an addition to the wage rates. Apart from a few minor price adjustments these increased costs had to be absorbed.

The Profits for the first three months this year show a slight gain over last year and provided there is no serious recession in trade or major wage increase, I am reasonably confident that the 1958 results will show an improvement.

On the home market our high quality hand-made cut lead crystal glassware continues to sell well. We have formed a Subsidiary Company, Webb's Crystal Glass Inc., to act as our selling organisation in North America. This Company will in time make a useful contribution to our turnover.

The report was adopted and the dividend distribution of 10 per cent approved.

WORTHINGTON-SIMPSON LIMITED

A RECORD YEAR

The sixty-seventh annual general meeting of Worthington-Simpson Limited was held on June 11th in London, Sir Samuel R. Beale, KBE, MIMechE (Chairman of the company), presiding.

The following is an extract from his circulated statement for the year 1957:

I am pleased once again to be able to submit the results of a record year. The trading profit of £1,125,640, shows an increase of £74,669 over last year's figure of £1,050,971 and, after making provision for all charges, including taxation, the net profit for the year under review is £493,095 as against £478,700 for 1956. The increase in the trading profit is, I feel, most satisfactory when consideration is given to the fact that, in order to avoid raising prices, your company decided to absorb the full effects of increased production costs brought about by recent National Awards.

Your Board recommends that the final dividend on the Ordinary shares be 20 per cent, less tax, making a total of 30 per cent, less tax, for the year.

It is proposed that a free issue of fully paid shares shall be made to the Company's Ordinary shareholders in the proportion of one new 10s. Ordinary share for every one Ordinary share held. The consent of HM Treasury to the proposed issue has already been obtained. Your directors see no reason why at least the same total distribution should not be maintained.

The report and accounts were adopted.

NORTH MALAY RUBBER ESTATES

CAPITAL DISTRIBUTION APPROVED

The twenty-sixth annual general meeting of North Malay Rubber Estates Limited was held on June 6th in London, Mr R. F. Burt (the Chairman) presiding.

The following is an extract from his circulated review :

The decline in output is, I hope, at an end and has been caused by the continuance of our replanting while our wholly replanted estate, Kuala Dingin, is slow to come to full maturity. We are expecting for 1958 a crop approaching 3¼ million lb.

With a lower crop and wage rates about the same as the previous year, our cost of production has inevitably increased, and with net proceeds of sales down by 2½d. per lb. it is no wonder that our working profit (before replanting) is substantially below that of the previous year. We have, however, received the benefit of refunds of cesses, largely the Anti-inflationary cess levied in 1955/56, and that fully justifies a total dividend for the year of 15 per cent.

In addition there has been the Taxation relief afforded in last year's Budget, to Overseas Trade Corporations. This has reduced the liability reserved in last year's accounts by over £34,000, and your Board considers that, unless a prolonged and severe period of a much lower price of rubber sets in, the Company has considerable funds in excess of its requirements. We therefore propose a reduction of capital of 4s. in the £.

The report was adopted and the proposed capital distribution was approved.

ODHAMS PRESS LIMITED

POPULARITY OF PUBLICATIONS

The thirty-eighth annual general meeting of Odhams Press Limited, was held on June 6th, in London. Mr A. C. Duncan, FCA (the chairman), in the course of his speech, said:

Consolidated gross revenue amounted to £35,190,705, an increase of £826,805 over the previous year. Production costs and overhead charges, however, increased by £932,478. After providing £1,145,301 for Taxation, there is a net profit of £1,058,978, a reduction of £74,434.

The company now owns or controls 80 publications, an increase of 12 during the year.

The People has maintained its popularity and place among the great national Sunday newspapers.

The *Daily Herald* has developed a new editorial vitality and is attracting to its readership a thinking and responsible public.

Woman maintains its premier position, with the largest net sale in the world in its field. We have recently launched *Woman's Realm*, in a different price range and all indications are that it will take its place as one of the leading periodicals of its kind.

The sales of our newspapers and periodicals are still well maintained at, approximately, 22 million copies a week. The circulations, in terms of readership, are many times greater.

With regard to the current year we are making every effort to increase the popularity of our products.

The report was adopted.

THE INSTITUTE OF COST AND WORKS ACCOUNTANTS

The thirty-ninth annual general meeting of The Institute of Cost and Works Accountants was held on June 7th at The Connaught Rooms, London, W.C.2. Mr James Borsay, FCWA, President of the Institute, was in the chair.

Mr Stanley J. D. Berger, MC, FCIS, the Director and Secretary, read the notice convening the meeting and the auditors' report. The annual report showed that at the end of 1957 there were 5,758 members and 14,464 registered students in various stages of qualifying and that 9,332 candidates sat in the 1957 examinations. Over 500 branch meetings were held in the centres throughout the United Kingdom, Eire, Southern Rhodesia and South Africa.

The Institute was strongly represented at the international congress of accountants in Amsterdam and at other conferences held abroad. Many members gave papers at meetings of kindred professional bodies. Research activities had continued. Special attention had again been given to the training of registered students; the Institute was in touch with over 80 companies having schemes of practical training in cost accountancy for registered students: details of schemes were published in *The Cost Accountant* from time to time. The lease of the adjoining premises had been acquired to meet the needs of the expansion in the Institute's work.

After the adoption of the report and accounts the President invested Mr H. J. Furness, FCWA, the new President, with the badge of office.

CREDIT RESTRICTION

In his address at the twenty-ninth national cost conference the previous day, the retiring President, Mr James Borsay, FCWA, said that restrictions on credit had forced industry "*to consider its investment policy* in the light of present restrictions rather than that of its future needs." In the search for liquid resources attention must be directed to the efficient utilisation of cash within a business; the accountant in industry should carry out an intensive campaign to reduce inventories *to their lowest possible level* compatible with efficient production in order to free money otherwise locked up. *The cost of under* utilisation of plant, he added, can be "extremely serious." The slowing down of wage increases in the past year, Mr Borsay held, "has contributed in no small measure to winning the fight against inflation." Further increases could come only from increased *productivity.*

THE ELECTRONIC *COMPUTER*

The Institute had particular interest in the field of integrated data processing. Many members were playing an active part in the introduction of electronic computers and the Institute was providing sufficient information to enable them to appreciate the uses to which the computers could be put. The *machine* "should be considered as a tool which will enable management to do a better job than heretofore by speeding up existing procedures and providing more useful types of information." The management accountant's place in the national economy was becoming one of increasing importance—the accountancy practised by the *members* of the Institute was that of "looking ahead with a *view to safeguarding the future.*"

PHILLIPS RUBBER SOLES LTD.

The 31st Annual General Meeting was held on 12th June, 1958, the Chairman, Mr. Peter Pettit, presiding.

THE ACCOUNTS for the year ended 28th February, 1958, showed :—

GROUP PROFIT for the year	£200,786
Add brought forward	86,914
	£287,700
Income Tax and Profits Tax	£117,000
Transferred to Reserve	26,220
Net Dividends	51,750
Amount carried forward	92,730
	£287,700

The Chairman's Review included the following points :—

RESULTS. *Group profit prior to taxation was £21,000 higher; after substantially higher provision for Taxation net profit was £4,000 above last year's figure.*

SALES. *Credit restrictions made trading more difficult during the last four months of the financial year but the demand for* PHILLIPS Soles and Heels continued strong. *A small decline of less than 2 per cent was largely due to loss of Export markets by import restrictions in the Middle East and other overseas territories.*

PRODUCTION. *Output continued at a very high level throughout the year and* Stocks are now higher than normal to ensure full service to customers during the rebuilding programme which may involve some temporary dislocation.

REBUILDING AND RE-EQUIPMENT. This proceeds steadily and the new Mill and Press Room are expected to be in operation towards the end of the current financial year.

PROSPECTS. *Sales to the Trade must, to some extent, be affected by the prevailing* economic conditions, but in times of financial stringency the virtues of PHILLIPS Soles and Heels are even more appreciated by the wearer and demand from the Public continues to expand.

The final Dividend of 15 per cent (making 20 per cent for the year) was approved and the Report and Accounts were adopted.

UNION INSURANCE SOCIETY OF CANTON

The Annual Meeting of the Union Insurance Society of Canton Limited was held on May 23rd in Hongkong, Mr J. F. Macgregor, the chairman, presiding.

The following are extracts from the report and accounts and his circulated statement:

Marine. The net premiums for the year amounted to £4,303,113.

Fire. The net premiums for the year amounted to £4,097,994.

Accident and General. The net premiums for the year amounted to £5,565,645.

The year 1957 continued the general pattern of the previous year in its difficulties for the insurance business particularly in the North American Continent, though there are signs that rate structures for certain classes of business there are undergoing some improvement which, given time, should prove beneficial.

In the Marine Department claims paid during the year improved from 77 per cent of premium in 1956 to 75 per cent of premium for the year under review.

In the Fire Department, premium income continues to expand although the margin of profit is less than for the previous year.

The premium income in the Accident Department increased by over one million pounds during the year.

The progress evidenced by the substantial increase in our total premium income by £1,877,509 to £13,966,752 is a matter upon which I congratulate the staff and agents of the Society and its subsidiary companies everywhere. The report was adopted.

F. FRANCIS & SONS (HOLDINGS)

BOARD'S EXPANSION POLICY

The fifty-seventh annual general meeting of F. Francis & Sons (Holdings) Limited was held on June 10th in London, Mr Frank Fox (Chairman and Managing Director) presiding. In his circulated review, the Chairman, having commented on the financial results, said:

The interests held by your Company comprise the Tin Box and Metal Container interests of F. Francis and Sons, Ltd., the Closure and Cork interests represented by The Defiant Crown Cork Co., Ltd., Newbury Cork Co., Ltd., Robinson Bros., Cork Growers Ltd., and Marwood and Co. (Blackburn), Ltd.; the interest in the manufacture of Electrical Lifts by Keighley Lifts, Ltd., and the Vitreous Enamelling interest of The Defiant Enamel Co., Ltd.

After reviewing the activities of the Group's various interests, the Chairman continued:

This Board of Directors is expansionist minded and should opportunities arise to expand our activities by the absorption of firms within our spheres of activity, this will be done.

Over the whole Group production for the first four months of this year is higher than last year. We hope that no international complications upset this.

In conclusion, I would like once again to say "Thank you" on behalf of the Board and myself to all those who have worked so hard for your Group. The efforts that have been made are indeed very much appreciated.

The report was adopted.

WILMOT-BREEDEN (HOLDINGS) LIMITED

The following information is condensed from the Annual Report for 1957 considered at the Ninth Annual General Meeting in Birmingham on 11th June, 1958.

	1957	1956
	£	£
Net Income from all sources	1,129,518	777,239
Taxation	747,231	561,438

The issued Ordinary Capital in both years was £3,150,000.
The Group has 6,000 *shareholders and* 6,600 *employees.*

MOTOR CAR DIVISION, TYSELEY. In spite of the recent investment of over £1 million in new plant and buildings, the Company's resources are now fully utilised in meeting present demand. Accordingly, new capacity is being created at Camden Street and Bridgwater.

FLIGHT PRODUCTS DIVISION, CAMDEN STREET. Notwithstanding serious reductions in Government orders to the aircraft industry, the Company's problem is still one of satisfying current demand.

AUSTRALIA. The Australian subsidiary has developed into a supplier of some importance, and substantial new contracts have been obtained from the Australian motor industry.

ELECTRONICS. The Board considers this industry to be one of the principal growth industries of the next decade. A controlling interest has been obtained in two companies established in this field : Wright & Weaire Ltd. and The Wayne Kerr Co. Ltd.

FUTURE OUTLOOK. The present position is extremely satisfactory—sales and future orders are rising—although the Company must be prepared to meet more competitive trading conditions.

APPOINTMENTS

MANAGEMENT CONSULTANCY

URWICK, ORR & PARTNERS LIMITED invite applications from men of personality and ability for appointment to the Administration and Accounting Division of their Staff of Management Consultants. Applicants should hold a professional qualification in Accountancy, and should have held responsible executive appointments in industry or commerce for at least five years since qualifying. Capacity for dealing with people at all levels is a strong recommendation.

Successful candidates will be given special training to equip them for Consultancy at the Company's own Training Centre and later in the field. Applicants should be aged 30 to 37 and should be reasonably mobile within the British Isles. Remuneration is high and a profit sharing scheme is in operation. The appointment is pensionable and there are good prospects for advancement. The Company is developing overseas and opportunities will present themselves for working in other parts of the world if desired.

Please address applications, in confidence, to the Company at Urwick House, 29 Hertford Street, London, W.1, quoting reference C/1111/8 on the envelope.

CLERICAL WORK STUDY OFFICERS, I.C.I. Ltd., Paints Division, has vacancies for Clerical Work Study Officers, aged 28-33, for the investigation of clerical procedures and methods in use throughout the organisation. Previous experience in clerical organisation, methods investigation and clerical work measurement is desirable. A good degree in Commerce, Economics, or a good accountancy qualification is required together with sound commercial experience since qualifying. Training in Clerical Work Study will be given to candidates who are otherwise suitable. Previous experience of the application of electronic computers to commercial procedures would be an advantage. Assistance with house purchase and removal expenses in approved cases. Canteen and recreational facilities. Pension scheme.—Apply to Box 954.

BRITISH NYLON SPINNERS LIMITED

has vacancies in its expanding Market Research Section shortly to be transferred to London for WOMEN UNIVERSITY GRADUATES under 26 years of age.

The work, which is in the new and interesting field of synthetic fibres and clothing, involves interviewing members of the public and assisting in the analysis and reporting of the data collected. Retail surveys are also undertaken.

Interviewing both in London and in the provinces will take up a good deal of the successful applicants' time. An initial training period of several months will be spent at Pontypool.

—Written applications should be sent to the *Personnel Manager, Pontypool, Mon.*

UNIVERSITY OF ABERDEEN

Applications are invited for a LECTURER IN POLITICAL ECONOMY. Salary scale £900 to £1,650, with appropriate placing. F.S.S.U. and child allowance. Particulars from the Secretary, The University, Aberdeen, with whom applications (eight copies) should be lodged by June 25, 1958. Applicants outside the British Isles may submit one copy of application.

CHEMICAL SALES

A British Pharmaceutical Company situated in Southern England, member of a large International Group, with considerable chemical interest ripe for development, seeks a

TECHNICAL REPRESENTATIVE (CHEMICAL)

Suitable applicants should be about 28 to 35, and have had some years experience in the United Kingdom chemical industry, possibly in technical sales, where managerial experience would be an advantage.

This is an exceptional opportunity to obtain wide managerial responsibility, with *commensurate* salary, for a man with ability, determination and ambition.

The Company operates a non-contributory Pension Plan with Life Assurance cover and Removal expenses will be paid. All applicants' details will naturally be treated in confidence.—Write Box 952.

THE LONDON SCHOOL OF ECONOMICS AND POLITICAL SCIENCE

(UNIVERSITY OF LONDON)

OPERATIONAL RESEARCH

The Research Techniques Unit invites applications for a post as Research Officer in the field of Operational Research with special reference to Production and Inventory Control. The holder of this post would study problems of individual firms, and would have the opportunity of extending his research to the formulation and testing of wider dynamic models relating to the regulation of the economy as a whole. He would be a member of a research team which is currently engaged on a long-term project dealing with theoretical and practical problems of economic regulation.

The applicant should have mathematical *or statistical* qualifications. Experience in the fields of Operational Research Control System Analysis, or Stochastic Processes would be an advantage. The salary would be in the range £700 to £1,100, according to qualifications and experience.—Applications should reach the Director of the Research Techniques Unit, London School of Economics and Political Science, Houghton Street, London, W.C.2, by July 1, 1958.

THE UNIVERSITY OF MANCHESTER

Applications are invited for the post of INVESTIGATIONAL OFFICER in the Department of Agricultural Economics. Candidates should have academic qualifications and/or practical experience in Agriculture, Economics or Accountancy. Salary scale: £525 x £25 to £650 x £50 to £850 per annum with membership of the F.S.S.U. and Children's Allowance Scheme; graduates would have an initial salary of £600 per annum. Investigational duties may be combined, on reaching a salary of £700 per annum, for promotion to the grade of Senior Investigational Officer (salary scale: £900 x £50 to £1,350 per annum).—Applications should be sent not later than June 30, 1958, to the Registrar, The University, Manchester, 13, from whom further particulars and forms of application may be obtained.

UNIVERSITY OF EDINBURGH

DEPARTMENT OF POLITICAL SCIENCE

Applications are invited for the post of Assistant in the Department of Political Science. Salary scale £700 x £50 to £850 per annum, with superannuation benefit and family allowance where applicable. The person appointed will be expected to take up duty on October 1, 1958. The successful candidate will be required to conduct tutorials in the History of Political Theory, and also in Modern Government.

Further particulars may be obtained from the undersigned, with whom applications, giving the names of two referees, should be lodged not later than June 30, 1958.

CHARLES H. STEWART,
Secretary to the University.

May, 1958.

THE UNIVERSITY OF LEEDS

DEPARTMENT OF ECONOMICS AND COMMERCE

Applications are invited for appointment as temporary Lecturer or Assistant Lecturer in Economics for the session 1958-59. Salary within range £900-£1,650 for a Lecturer or £700-£850 for an Assistant Lecturer. Candidates with predominant interests in any of the main branches of economics or economic statistics will be considered. Duties will consist of tutorial teaching of largely, though not entirely, first-year students in small groups.—Applications (three copies) stating date of birth, qualifications and experience, together with the names of three referees, should reach the Registrar, The University, Leeds, 2 from whom further particulars *may be obtained* not later than June 20, 1958.

APPOINTMENTS

CHIEF ACCOUNTANT

THE DISTILLERS COMPANY LIMITED

The Company wishes to appoint a Chief Accountant to be responsible for all financial and cost accounting at the Barry, Glamorgan, factories of its Plastics Group, where a wide range of raw materials for the Plastics industry are manufactured in bulk.

The Chief Accountant controls a staff of about fifty. Standard costing is in operation throughout the factories and punched card equipment is in use. In addition to *the normal* accounting duties, the *Chief Accountant is* also responsible for ancillary office services.

Candidates for this appointment, aged between 30 and 40, must be Chartered Accountants, and should also be members of the Institute of Cost and Works Accountants. They should have at least two years' professional experience as qualified accountants, and at least five years' broad experience in manufacturing industry; familiarity with standard and marginal costing is essential, and experience in devising procedures is desirable. Practical experience of the chemical or plastics industry would be an advantage, but is not essential.

Salary according to qualifications and experience; non-contributory pension scheme.

Write:
Staff Manager,
THE DISTILLERS COMPANY LIMITED,
21 St. James's Square,
London, S.W.1.

Quote Ref. 47/58 EC.

UNILEVER JUNIOR TRAINING SCHEME

APPLICATIONS ARE INVITED FROM YOUNG MEN AGED 20 AND 21 FOR THE UNILEVER JUNIOR TRAINING SCHEME

*Opportunities available are for potential man*agers on the production, marketing and general commercial sides of the companies in the Group. *Those interested in production should have* reached Advanced Level of the G.C.E. in three science subjects. They will be afforded every opportunity to continue their scientific education, and those who really do well will be given full-time release to help them achieve their final qualifications.

In fields other than production, Sixth Form experience, while not essential, is still an asset, and candidates must certainly possess a good G.C.E. at "O" Level.

All candidates should have been active in the non-academic sides of school life, and special regard will be paid to *commissioned experience during* National Service.

The starting salary is £520 with increases at the end of the first and second years for those *who continue* to show promise, and a chance to enter Unilever Companies' Management Development Scheme within 3 or 4 years.

Those who are interested should send a postcard for an application form to:—

PERSONNEL DIVISION (MWG 40),
UNILEVER LIMITED,
UNILEVER HOUSE, LONDON, *E.C.4.*

THE ORGANISATION FOR EUROPEAN ECONOMIC CO-OPERATION has two vacancies for *economists*. One is in the Economics Division, where the person appointed would participate in studies relating to the industrial and agricultural, trade *and payments problems* of the European *economy*; help prepare the Annual Reports and Organisation; and analyse current *economic developments in Europe and the rest of the* world. The other vacancy is in the National Accounts Division, for which post familiarity with national accounting problems and statistical *methods in economic research* is desirable. *Applicants* should have a good honours degree in economics and experience in applied economics. The basic starting salary will be 1,800,000 francs free of tax, with extra allowances for marriage and children.—Applications to Personnel Division, O.E.E.C., 2 rue André Pascal, Paris, XVIème, by June 30, 1958.

UNIVERSITY OF CAMBRIDGE

SCHOOL OF AGRICULTURE

Applications are invited for the posts of Research Officer and Junior Research Officer in the Farm Economics Branch. Duties may include research into aspects of agricultural policy, farm production, the use of labour and agricultural work. Qualifications should include an honours degree in economics, statistics or agriculture with economics. Salary scales are: Research Officer £950 x £50—£1,250. Junior Research Officer £650 x £25—£850. These posts are eligible for superannuation (F.S.S.U.) and *family allowances. Applications for the post of* Junior Research Officer from candidates who will graduate in the next three months will be considered.—*Further details are obtainable from the Secretary, School of Agriculture*, Cambridge. Closing date for the receipt of applications is July 11, 1958.

STATISTICIAN

Our Statistics Section does a large, *varied and interesting* range of work.

It includes statistical investigations of sales, sample surveys and the forecasting of future electrical development.

To help maintain our standards in serving *over 600,000* customers, we need at our Headquarters another Statistician with a degree in statistics or other suitable qualification.

The salary will be £1,035 to £1,125, and applications to our Establishments Officer (Econ.), St. Mellons, Cardiff, will receive careful and prompt consideration.

THE SOUTH WALES ELECTRICITY BOARD

(Closing date for applications—Tuesday, *June 17, 1958*).

MARKET RESEARCH

Lady Assistant required at Head Office of large Public Company in London to carry out and report on surveys and to undertake research work in this field. *Preference* would be given to applicants aged 21-25 years, educated to degree standard and with approximately two years industrial experience for whom the commencing salary would be in the region of £600 p.a. Applicants without these qualifications would be considered at a lower salary. Salaries are progressive with lunch vouchers and a contributory pension scheme.—Applications to Box 949.

UNIVERSITY OF GLASGOW

DEPARTMENT OF SOCIAL AND ECONOMIC RESEARCH

Applications are invited for an Assistantship and a Lectureship to conduct research in the above Department. Some teaching duties may also be involved. Preference will be given to candidates interested either in problems of labour economics or in econometrics and national accounting. Salary scale—Lecturer: £900-£1,650; Assistant: £700-£850. F.S.S.U. and family allowance benefits.

Applications (8 copies) should be lodged, not later than June 21, 1958, with the *undersigned*, from whom further *particulars may be obtained.*

ROBT. T. HUTCHESON,
Secretary of University Court.

THE NEW SOUTH WALES UNIVERSITY OF TECHNOLOGY

VACANCIES FOR SENIOR LECTURER AND LECTURERS, SCHOOL OF ACCOUNTANCY

The University invites applications for the position of SENIOR LECTURER in ACCOUNTANCY at the NEWCASTLE UNIVERSITY COLLEGE and for the positions of LECTURER in ACCOUNTANCY at SYDNEY.

Applicants must possess a degree or diploma or equivalent qualification and will be required to undertake lecturing and research work in the School. Practical experience in the accountancy field is desirable and lecturing experience will be an advantage.

Salary: Senior Lecturer—£A2,211 range £A2,561 per annum.

Lecturer—£A1,511 *range* £A2,111 per annum.

Commencing salary will be determined according to *qualifications* and experience.

Appointees will be eligible, subject to medical fitness, to contribute to the State Superannuation Fund.

First-class ship fares to Sydney of successful applicants and their families will be paid.

Four copies of applications (including the names of two referees) should be lodged with the Agent General for New South Wales, 56 Strand, London, W.C.2, and a copy forwarded in an envelope marked "University Appointment" by airmail to the Bursar, University of Technology, Box 1, Post Office, Kensington, New South Wales, Australia, before July 31, 1958.

THE NEW SOUTH WALES UNIVERSITY OF TECHNOLOGY

The University invites applications for appointment to a newly created ASSOCIATE PROFESSORSHIP IN ECONOMICS. The appointment will be tenable in the School of Economics at Kensington, Sydney.

Salary is £A2,861 per annum.

Preference will be given to a candidate whose special field is either econometrics or economic statistics but candidates whose special field of interest differs from these will not be excluded from consideration.

The successful applicant will be eligible, subject to *passing a medical examination, to contribute to the State* Superannuation Fund providing for a pension of £A1,400 per annum on retirement.

Associate Professors are eligible for six months' study leave on full salary after three years of service, or twelve months after six years of service. Subject to the consent of the University, Associate Professors may engage in a limited amount of higher consultative work.

The University reserves the right to fill the position by invitation.

First-class ship fare to Sydney of appointee and his family will be paid.

Four copies of applications (including the names of three referees) and supporting documents, should be lodged with the Agent General for New South Wales, 56 Strand, London, W.C.2, and a copy forwarded in an envelope marked "University Appointment" to the Bursar, University of Technology, Box 1, Post Office, Kensington, New South Wales, Australia, by airmail, before July 31, 1958.

THE ECONOMIST INTELLIGENCE UNIT LIMITED

will be making a number of appointments to its research staff to assist in meeting the increasing demand for the Unit's services in the fields of economic and market research. Candidates for these posts must have very good academic qualifications and experience of work in industrial, commercial or financial companies or organisations, or of work on the economics of agriculture.—*Applications* should be accompanied by full particulars of age, academic and other qualifications, including knowledge of foreign languages, experience since leaving university, and present salary, and should be sent to reach "Research," 22 Ryder Street, St. James's, London, S.W.1, not later than July 28.

AN old-established manufacturing Company marketing nationally advertised products through grocery and allied channels offer outstanding opportunities to ambitious young men to train for a *progressive* career in Selling and Sales Management. Progress in the Company depends solely on merit and a programme of expansion affords excellent prospects of *promotion* to men capable of assuming management responsibility.

Applications will be *considered from* men in the age group 22-34 who possess a School Certificate or higher educational qualifications.

A good salary *plus bonus* and lunch allowance is paid from the outset, and a Company car is provided.

Arrangements will be *made to meet successful* applicants at *local centres*, but in the first instance a full letter of application stating age, history of education, Service and business *career to date, should be* sent to Box 953.

THE NEW SOUTH WALES UNIVERSITY OF TECHNOLOGY

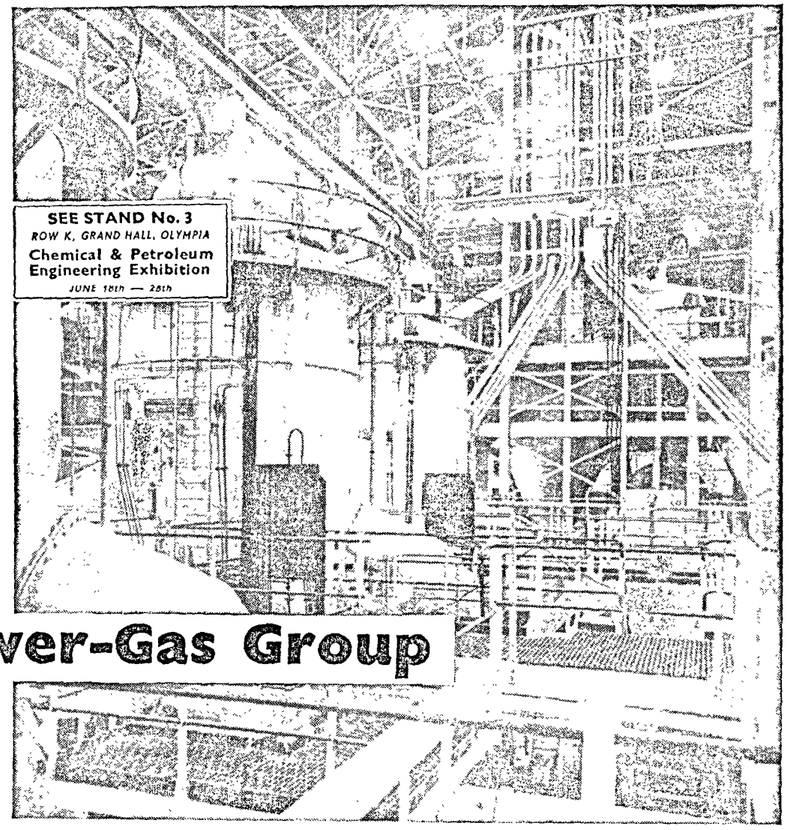
Picturesque and Practical in East Africa

Some of the most important developments in East Africa in recent years have taken place near the great lakes—several hundred miles from the coast and regarded as being amongst the most picturesque inland waters in the world. Cultivation of the land has been intensified and the rich mineral resources exploited to repeat the picture of what is taking place all over the three mainland territories—Kenya, Uganda and Tanganyika. As these developments have increased the country's exports, so have they increased its spending power in the world markets, and today East African trading figures (inclusive of approximately £6½ millions of re-exports) amount to a total of £254,600,000.

Parallel with the development of the export and import trade is the establishment of local industries to meet increasing demands for many types of goods, particularly from the African population, which numbers nearly twenty million. Already factories in East Africa are making a long list of commodities—from cement to cigarettes—and accommodation is being prepared for more factories on expanding industrial sites.

The provision of transport and goods handling services for these industrial sites—and throughout the territories—is the responsibility of the East African Railways and Harbours. Altogether they operate over 12,000 miles of rail, road and inland water services, and four principal sea ports.



For details of the industrial areas now being established in East Africa, and of other business opportunities, write to the Commissioner, East African Office, Grand Buildings, Trafalgar Square, London, W.C.2.

The Power-Gas Group

Designers, manufacturers and erectors of heavy capital equipment

This expanding group of companies, employing over 6,000 people provides engineering services for the chemical, gas, iron-making, nuclear energy, petroleum and oils and fats industries.

In the last decade, 30 blast furnaces have been ordered, the largest fertiliser factory in Asia has been built and the largest cyclic catalytic oil gas plant in the world is at present under construction.

Since 1951, new works have been built on an unrestricted site and by the end of this year these fully integrated and efficient workshops will have increased capacity for the manufacture of high quality, heavy welded fabrications and for machining up to 100 tons.

Success at home has encouraged expansion abroad and the establishment of subsidiaries in Europe, America, Africa and Australasia, has extended the group's activities in these important markets.

a unique FLOORING SERVICE

• for business and industry

Semtex Limited is very much more than a company manufacturing flooring materials. It is an organisation devoted to the creation of the best type of floor to meet every purpose. You see illustrated Semastic Decorative Tiles at Lederle Laboratories Division, *Cyanamid of Great Britain Ltd.*, and Vinylex Tiles in a continental showroom. But these are just two Semtex products. Others include luxurious, extra-strong Dunlop Rubber Flooring; Semflex, ideal for domestic use; jointless Fleximer flooring; decorative linoleum and cork. Semtex, with over 25 branches, operates a complete laying service throughout the United Kingdom, including technical and design advice. There are also independent approved laying facilities in the majority of the principal towns.

For full information write or telephone to the address below:

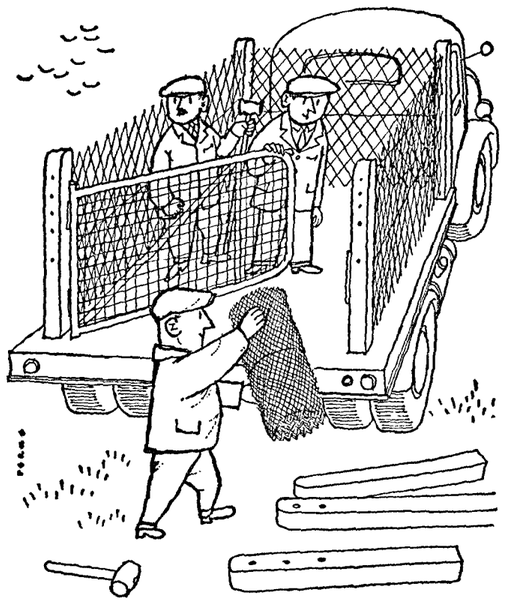
Can you call yourself an E-PLUS* EXECUTIVE?

Question: You have almost clinched a valuable contract with a client. He is about to sign when he sees your quotation and falls into a dead faint.

Should you

1. Rush out to borrow your secretary's smelling salts?
2. Hurriedly delete an "O" from the figure in the contract?
3. Call up on your intercom the First Aid Team which you have standing by for such emergencies?
4. Sign the cheque for him while he is still cold?



Answer 3 gains full marks. You have organising ability and an efficient intercom system. If you haven't the latter, get in touch with Communication Systems Ltd *immediately*. They are the acknowledged experts in this field and their quotations have never been known to cause fainting fits.

*** E-plus stands for Efficiency Plus. You can only call yourself an E-plus executive if you can call up any member of your staff without leaving your desk. Otherwise it's time you called in**

AN EXPORT OPPORTUNITY

In the

average household spends £27 a week

THE HIGHEST STANDARD of living means the biggest spending power. During 1956 each household spent on average $4,110: about £27 a week. And exporting to the U.S.A. *is not only* good business, but good for Britain. British exports to the American market have risen steadily from £37.6 million in 1949 to £257.8 million in 1956. British exporters have, in fact, kept pace with the general growth of business activity in the U.S.A.

Good! But the British share of America's total imports is still only about 6.1%. There is much scope for expansion.

Reaching the leaders

This is where The Reader's Digest can help you. Its circulation in the U.S.A. (11,500,000, including a special West Coast edition of 2,000,000) is almost twice that of any other magazine, and it reaches one in four of all American families. The Digest is not bought to be flicked through and thrown away. It is passed from hand to hand, read many times, *and kept!*

Who are the Digest readers in the U.S.A.? This large slice of the market includes the leaders – those with college education, the most cars, the latest appliances in their homes. *They are the people who buy* —both consumer goods and the tools of industry.

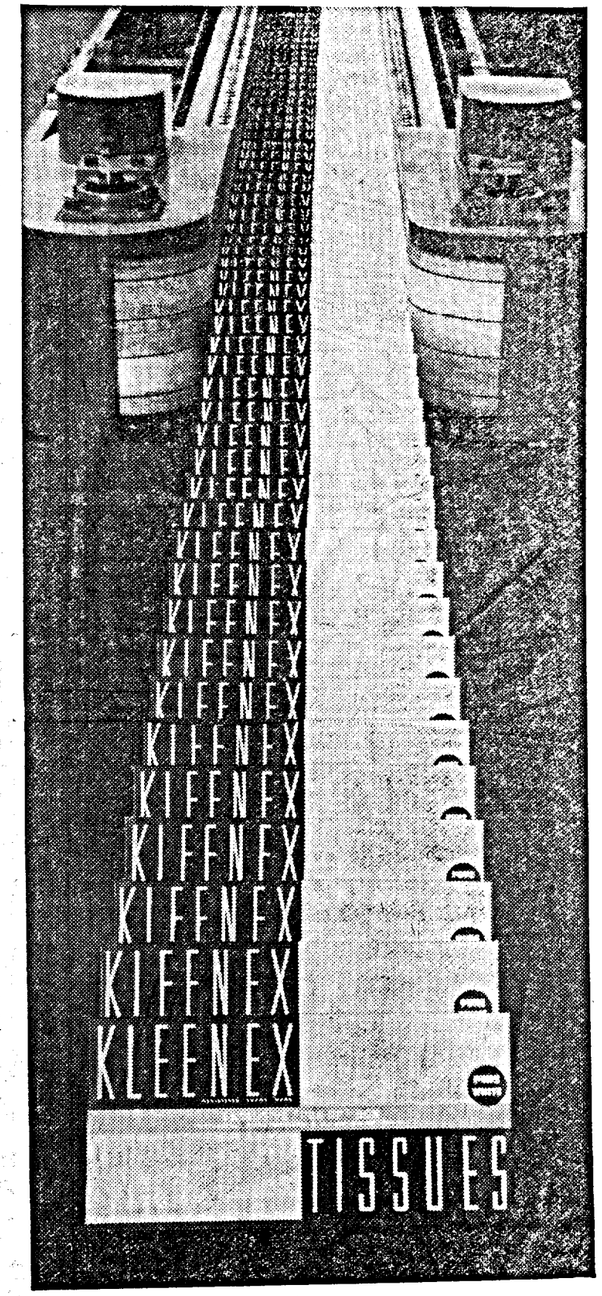
All over the free world, such people read the Digest in its various overseas editions. In most countries, the Digest reaches the most people *and* the best prospects at far lower cost than other magazines. *Everywhere, The Reader's Digest speaks to your customers in their own languages.* It has international stature—yet keeps the *local touch.*

We can help you plan— here in London

If you consider advertising in the U.S.A.— or elsewhere overseas— we shall be glad to help with facts, surveys, figures and information.

Here in London you can book space in one or any combination of our 30 editions, to cover your best markets without waste. You can avoid the uncertainties of remote control, and be sure of full value for what you spend. A further convenience: in most cases you can pay in sterling.

If you'd like an analysis of how The Reader's Digest covers *your* areas of interest, just write or telephone: The Advertisement Director, Reader's Digest, 25 Berkeley Sq., London, W.1. (MAYfair 8144.)



30 Editions... 13 Languages... 20 million copies sold every month

The Reader's Digest has separate editions covering the following markets in their own languages. (Monthly circulation in brackets.) **U.S.A.** (*11,500,000— including West Coast edition, 2,000,000*). **Commonwealth:** U.K. (*1,100,000*); Canada (*English and French editions— 925,000*); Australia (*450,000*); New Zealand (*75,000*); South Africa (*140,000*); India (*in English – 60,000*). **Latin America:** Brazil (*400,000*); Spani-h-speaking countries (*4 separate editions—1,175,000*). **Western Europe:** France (*1,050,000*); Belgium (*200,000*); Switzerland (*German and French editions—105,000*); Holland (*130,000*); Germany (*800,000*); Austria (*100,000*); Italy (*500,000*); Spain (*150,000*); Sweden (*300,000*); Denmark (*235,000*); Norway (*185,000*); Finland (*135,000*). **Middle East** (*in Arabic—50,000*). **Japan** (*450,000*).

The Reader's Digest

How a 19-company team puts paper to work for you

Look carefully at these cartons for facial tissues. There is a story behind them! They have been designed to meet a particular manufacturer's requirements for high-speed mass production and effective shop display. To achieve this, they have to be exactly right in shape, size, strength, protective qualities and suitability for printing.

Cartons such as this are but one example of the vast range of paper and paperboard products for packaging, printing and building which are made by the Reed Paper Group—a 'go ahead' team of 19 major companies.

Whatever a customer's requirements, Reed teamwork ensures that the best use is made of the Group's unrivalled *collective* skills and resources. In packaging, for example, this has made possible a complete, nation-wide service to industry. Equally important, each Reed company is free to make its own *individual* contribution by taking the initiative in thinking and acting for itself *and for its customers*. Reed company representatives take pride in their close personal understanding of each client's needs.

"YOU profit from the initiative of each Company backed by the resources of the Group"

East-West Recession

THE sounds from within the communist world are ominous. The Soviet ambassadors have been summoned home in haste; whether they are wanted for their reports or for their central committee votes is not yet known. The Chinese ambassadors also have been recalled to Peking. Mr Krushchev has peremptorily demanded of the West if it wants a summit conference or not; in the same breath he ordered immediate publication of the confidential papers on the talks so far. Each day, from Peking to Tirana, the denunciations of Marshal Tito grow shriller and more threatening. The bloody word of the execution of Imre Nagy and Pal Maleter has come simultaneously from Moscow and Budapest. All these are signs of tension, and of decisions taken under tension. None of these signs is hopeful for the peace of the world, or for the peace of mind of the non-communist world. That all have become apparent in a single week does not look like coincidence.

The news from Moscow is bad for many men: for the Hungarians who must await fresh horrid acts of repression and revenge, for the liberal revisionists in China and the east European satellites who are now being pushed to the wall, for Marshal Tito in person who has seen the Hungarian hostages, in whose cause he had interceded, contemptuously done to death. It may be bad news for Mr Suslov, the incorruptible, lately bathing (Mr Khrushchev said) by the Black Sea. If the central committee of the party is meeting again Mr Suslov will recall that just a year ago Mr Khrushchev, with Marshal Zhukov then at his elbow, used the committee's vote to banish his opponents in the presidium to provincial oblivion. It may equally be bad news for Mr Malenkov, one of those past opponents, sitting by his hydro-electric turbines. Imre Nagy was his man. When Russians think of revisionism they think of Mr Malenkov. The battery of Soviet publicity still rakes the failings of his rule; even his musical taste has been dragged in now to prove his evil influence on Stalin. Tension within communist society brings dark and hidden perils to all those who differ, or might one day differ, from the faction in power: the oppositions of left and right are confused and then struck down together. It is still too soon to guess whether this crisis concerns Marshal Tito alone, and the effects of his rebellious intransigence, or whether it spreads wider and deeper throughout the Soviet system. It is the nature of the regime to conceal its decisions until the events they prompt are already in train.

The new climate within the communist world is of crucial concern to the West. In the past it has been conditions inside the Soviet Union that have customarily prompted the initiatives of Soviet foreign policy; and, equally, the Russian attitude to the Jugoslavs has mirrored, in some sense, Soviet policy towards the West. Before the last summit meeting at Geneva in July, 1955, Mr Khrushchev went to Belgrade as if to Canossa. Now what is most ominous is that Mr Khrushchev, while assailing Marshal Tito, and even hinting sympathy with the

Cominform's excommunication of him in 1948, has at the same time seemed to call a halt to the progress towards a new summit meeting with the West. His accusations of western insincerity have become acrimonious. He has reverted, at a British Embassy party in Moscow, to personal attacks on Mr Dulles. Soviet comments on Mr Macmillan's talks in Washington chorus the strange belief that their purpose was to delay the summit meeting ; and the Prime Minister's diplomatic remark that the British position is very close to that of the United States has been treated as a confirmation of these suspicions. The sudden Soviet publication of documents on the ambassadorial meetings may now imply, as Mr Dulles has pointed out, that Mr Khrushchev means to break off. Even if it does not, the action itself reduces the hope that an eventual meeting would be more than idle display. What hope is left rests on the outcome of the experts' conference on stopping nuclear tests which opens at Geneva on July 1st.

The rulers of the Soviet Union are not the men to plunge themselves into an internal crisis solely through the exigencies of foreign policy. It is entirely possible that such matters as the decentralisation of industry and the future of the machine tractor stations are the effective terms in which an internal debate is being conducted. But the communist outlook on the rest of the world has a direct bearing on communist policy as a whole. In the past months that outlook has become increasingly careless of even the appearance of an honest effort to achieve an east-west settlement between governments. The Russian veto in the United Nations on aerial inspection of the Arctic was cast in the face of neutral opinion. The Russians' latest refusal to combine agendas for the summit, or to diverge in any way from their own, speaks for itself. It is possible to interpret this growing acerbity as governed by new internal tendencies toward Stalinism. But the West has to remember that its own actions and reactions, by influencing the play of Russian domestic forces, may have some part in triggering off the Russian decision.

There was evidence to suggest that in the beginning the Russians did want some agreement on certain issues, principally disarmament and the stopping of nuclear tests. The propaganda proclamations after the sputnik successes and the development of a Russian strategic missile made western reaction understandably wary. But there were certain evident points to grasp. One of these, as the Rapacki plan showed, was that the Russians meant the prevention of any nuclear rearmament of west Germany to be the condition on which their own ideas of disengagement and a general relaxation depended. Up to the time of the Nato meeting in Paris last December, when it was agreed to accept American missiles in western Europe and to open negotiations with the Russians simultaneously, this condition could be met. But the increasing belief that the West meant to give nuclear weapons to the Germans, together with the outright western refusal to explore the Rapacki plan, could have helped to tilt the balance in Moscow in favour of those Russian communists who expect nothing from the summit and who would make Russian terms very stiff. The isolationists have, it seems, prevailed.

Since the West stood, and would still stand, to gain by pressing the disarmament issue in particular to an effective discussion at the highest level, whatever the outcome, this prospect is vastly disheartening. The advantages of being able to attempt such a discussion have not become invalid, but the opportunity to seize upon a more forthcoming Russian mood while it lasted now seems to have gone. The tide is on the ebb, within the communist block and beyond its borders. What is in the Russian mind today has still to be revealed. But there should be no easy fatalism about all the reasons why the chance of disarmament or of disengagement may be slipping away.

Cyprus on the Brink

The Government's plan for Cyprus sketches out an adventurous road. But it is likely that Greek and Turkish antagonisms have gone too far for the road to be taken

EIGHTY years ago, the Sultan Abdul Hamid II leased Cyprus to Britain as a *place d'armes* (in other words, a base) in return for a British guarantee of Asiatic Turkey against Russian attack. Today the fear of Russian penetration in the Levant remains; but Cyprus, instead of adding to the region's defences, is more likely to disrupt them. The problem that three years ago was still regarded primarily as a rather tiresome and complicated variation on the classic postwar theme of the gradual emancipation of Britain's dependent territories, has now set two Nato members in the eastern Mediterranean so seriously at odds that hostilities between them cannot be ruled out. It was in order to stop this rot in the defence arrangements on Nato's eastern flank, by persuading Greece and Turkey not to turn the new British plan for Cyprus down flat, that M. Spaak intervened on Monday to ask the British Government to postpone its long-awaited statement for forty-eight hours. It was an appeal the Government could not ignore, in spite of the risk that postponement might provoke violent reactions in the island.

Now that the proposals have at last been revealed, in one vital respect they do not prove to be a move in the direction in which official British policy had been thought to be turning. No indication is given that the British Government has any intention of surrendering its sovereignty over Cyprus—only perhaps, of sharing it. Nor is there any suggestion that the people of Cyprus might themselves be at any time allowed to choose their future status—even to the limited extent of a choice between independence within or outside the Commonwealth, or a Greco-Turkish condominium. The only definitive status that is envisaged for them is under a tripartite condominium of Greece, Turkey and Britain that the British Government would be prepared to set up " at the appropriate time " (but, apparently not in less than seven years). Under this regime it is envisaged that whatever base facilities Britain then feels it necessary to retain should remain under sole British sovereignty.

This proposal in effect rules out enosis and partition equally. It is a pity, perhaps, that the exclusion of both alternatives is not stated more categorically, instead of being merely implied. The Government might have argued that to be more positive might only make the present tension worse. It can, however, equally be argued that so long as the extreme advocates of both enosis and partition believe that their own particular door has not been slammed in their faces, they will continue to hammer on it and refuse to consider any alternative. In that case the hope must be that the agitation of the two sets of extremists will, as it were, cancel out by making it overwhelmingly clear to a growing body of opinion in the island, as well as in Athens and Ankara, that the middle road of partnership is the only sane road to take.

THUS for the next seven years the British Government proposes that the Cypriots should undertake a limbering-up exercise in order to get them used to what Mr Macmillan calls " the new principle of partnership." For the first time Greece and Turkey are offered a chance of association in (and responsibility for) the administration of the island through the appointment of accredited commissioners. These will have a considerable say in the island's affairs. They will be consulted by the Governor on the matters specifically reserved to him—external affairs, defence and internal security. They will have the right to require any legislation that they consider discriminatory considered by a special tribunal. Finally, they will sit on the Governor's Council, which will also include six elected Cypriot representatives four of them Greeks and two of them Turks. Under this council, two elected assemblies, one for each race, would be concerned with communal matters. All Greek and Turkish Cypriots would be allowed to opt for Greek or Turkish citizenship as well as for British. Thus the Greeks are offered better opportunities of expressing their Greekness, while the Turks are offered what they might well consider more satisfactory recognition of their identity, and guarantees of their minority rights, than were provided under the Radcliffe proposals.

THERE is this to be said for the new proposals, that they are unconventional and must have taken the opposing parties, stuck in their attitudes of mutual defiance, by surprise. But are they unconventional enough to work the wonder of reconciliation that is needed? An offer to share sovereignty today, or even tomorrow, would make an impression ; but an offer to share after seven years is not the same. Which of the three governments, the British, the Greek and the Turkish, knows where it will stand in seven years' time? The interval for limbering-up is very long—and even to enter upon it requires an act of faith and of renunciation from the other governments and from parties in Cyprus which have almost forgotten any speech but the heady language of absolute national claims.

And have the two communities become too embittered against each other to make the journey amicably together? On this last and crucial point, the Turks insist that they have; but having put all their money on immediate partition, they have an obvious interest both in saying that this is true and in making it so. As a report on page 1092 indicates, it would be very foolish indeed to make light of the tragic communal bitterness that has arisen in Cyprus. But it would surely be an unnecessary motion of despair to assume at this stage that the armed clashes of recent weeks must completely obliterate the long years—nearly four hundred of them—when most Greeks and Turks lived perfectly amicably together, when in fact the ordinary members of both races usually had far more in common with each other than with either Turkish pasha or Orthodox bishop.

The Greeks, while sticking to their ultimate goal of self-determination (by which they must be taken to mean enosis) have never imagined that it would be reached immediately and have kept to a fairly flexible attitude about what to do in the meantime. On one vital point, however, they have maintained an uncompromising—and thoroughly unrealistic—stand; that is their refusal to acknowledge Turkey's right to play any part in the settlement. To retreat from this stand is doubly difficult now that relations between Athens and Ankara are so bad; it can only be hoped that Greece will at last realise that Turkey's stake in the island cannot be made to disappear simply by ignoring it, any more than enosis can be brought about by means of terrorists' bombs.

The Turks have an even more difficult reappraisal before them if the British plan is to be put into force. Their interest in the welfare of the Turkish minority in Cyprus is acknowledged ; so is their anxiety for their country's security should Cyprus fall into un-

friendly or neutral hands. But they have chosen to insist that, unless the whole island is annexed to Turkey, these legitimate aims can only be furthered through its immediate partition—although the two races are so closely intermingled that the Turkish authorities themselves have failed to produce any practical proposals for putting partition into effect. When pressed on this point last week, Mr Zorlu, the Turkish foreign minister, said blandly that it would be premature to consider the details of partition before the idea had been accepted.

The Turkish government has, however, committed itself so thoroughly and so demonstratively to partition that it must now be hard put to it to find any means of manœuvre that is not an undignified retreat. For this it has only itself to blame—and one suspects, its increasing domestic difficulties from which attention must somehow be diverted. But it is an added reason for heeding Nato's good offices. Cyprus is worth more than a little face saving; and it will clearly be easier for the Turks—and for the Greeks, even though at present they deny Nato's right to intervene—to bow gracefully to the combined representations of the Nato powers, than to back down at the request of Britain alone. What happens if Ankara (and Athens) refuse after all to co-operate in the British plan remains obscure. Presumably Britain will either have to continue governing the island as at present, or else to introduce a measure of self-rule, even against opposition. What is important, especially in the event of failure, is that the new initiative should not be regarded as the last chance for a satisfactory Cypriot settlement. The plan could hardly have been introduced under less auspicious circumstances; and so long as armed conflict between Greeks and Turks, inside and outside the island, can be fended off, there will always be room for another attempt.

THE ALTERNATIVE GOVERNMENT—II

A Party of Educational Reform?

There is much sense in Labour's new educational plans. But there is also much nonsense which a wider and rightly radical vision should sweep away

IN the first of these articles, which appeared in *The Economist* two weeks ago, it was suggested that the Labour party could best equip itself with a truly national policy by taking one bold central decision: by deciding to stand out for a high level of investment against trade union pressure to dissipate gains in productivity by immediate consumption. To this proposition the publication of the party's educational programme "Learning to Live" is most apt. Here are set out pre-eminently the things, and not purely material things, which Labour most wants to do: here is the great aim of achieving the fullest educational self-realisation "from nursery school to university" for all British children, irrespective of origin or income. Yet they are things which can emerge only from large investments sustained over a considerable period—and uninterrupted by sudden cutbacks to help the economy through crises produced by overspending elsewhere. Educational reform is a policy to which Labour should be traditionally and temperamentally well fitted to call the nation. But it demands of the nation the economic policy which will make it possible.

The noticeable moderation and good sense shown in "Learning to Live" indicates that the group of Labour politicians which drew it up, under the chairmanship of Mr James Griffiths, is well aware that investment in education is an exercise in scarce resources; and that a Labour Minister of Education would have to fight hard for his share of money, manpower, and constructional output. Accordingly, and realistically, the policy planners have trimmed Labour's dreams at both extremities—postponing, for example, both more nursery schools (which so many mothers would vote for) and the raising of the school leaving age to 16 (in favour of the halfway house of making it compulsory to complete the fourth year of secondary education, which is not expected to inflate the demand for teachers).

They have made no wild promises even in setting out what they propose that the next Labour government should do: which is to put first the reduction in the size of classes, the modernisation of slummy school premises, the drive to develop technical education and the fringe of minor but important reforms in part-time education, youth services, the education of handicapped children and so on. Though they are determined to return to the "principle" of the percentage grant, they are cautious even about that— as well they might, for a Labour Chancellor of the Exchequer is likely very quickly to see the advantage of the block grant system. They leave the way open to ensure that the new percentage grant system which they will introduce will be less wasteful and more closely tailored to specific educational objectives than the old one.

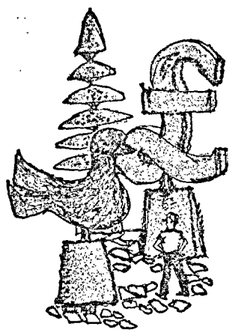
Unfortunately, just as Labour's chances of becoming a true "high investment party" are undermined by its enslavement to trade union policy, so its prospects of becoming the party of educational reform are vitiated by its obsession with social equality. This may seem a rather ungrateful judgment on a document which does set out clearly and explicitly the right of a parent to send his child to a private school, and of private individuals to run a school for fee-paying pupils, outside the state system. Coming from Labour spokesmen, that is a large advance, even though it is still open to a future Labour government to reverse this declaration of the rights of parents. The Labour programme does not even suggest (as some had expected) that a Labour chancellor should persecute the public schools by tax adjustments in their disfavour. It turns down the Fleming proposals to spend taxpayers' money in sending state scholars to the public schools (probably rightly, for the £18 million that it would cost to send 45,000 can be far better employed to improve state education); but it leaves the public (and the peculiar) schools to go their own way, admitting by implication that in a period when all school places are desperately scarce, they make a handsome contribution without costing the nation a penny. For all this, the group must expect a pasting from the party's Robespierres at Scarborough, and should be undeterred by it.

BUT, while conceding the right of top people (including top socialists) to send their sons to Winchester at their own expense, the group who wrote the programme felt obliged to insist that the state system itself must be forced into the procrustean bed of egalitarianism, labelled "the comprehensive principle." This is a great pity, for, if it is pressed, the "principle" will do great harm. Luckily—or cannily—it may not be possible to press the comprehensive system too hard in the first five years after the next election, should Labour then come to power. Difficulties will be created (although they have not been admitted) by the way in which the party's other priorities have been set. To achieve Labour's "first objective"—the reduction of all classes to 30, both in primary and secondary schools—will by itself tax the teacher-training system to the full. To estimate the number of teachers that will be needed at any time ahead is like doing one of those examination sums about a tank which is simultaneously being filled by a series of pipes of different diameters and being emptied by another lot of pipes of other diameters. But it is clear that the Labour group has got the sum wrong.

The Central Advisory Council for Education has said that 90,000 more teachers will be needed by 1970; given present trends in the birthrate (the "pimple on the bulge") and the teachers' rising marriage rate, in addition to any extra educational commitments, the need could be higher still. To recast all the schools in a comprehensive mould would certainly put new strain on the teachers (besides extinguishing many desirable headships) and thus diminish the supply. In practice, therefore, events may well draw the teeth, temporarily, of Labour's pledge to order all local authorities to draw up plans to "comprehensivise" their schools—which, incidentally, would require new legislation.

Even so, whether or not it can be implemented in the five years of a Labour government, the "comprehensive" blanket has been adopted; it is sure to be approved at Scarborough; and it should be firmly resisted. The comprehensive school is not proven by experience; it has not had time to show even its ability to produce good sixth forms; and schemes to apply the principle by grouping existing schools without building huge new ones are less proven still. What is quite certain is that such schemes will make away with schools which are proven and which, once, were the apple of Labour's aspiring eye: that is, the grammar schools. With all their shortcomings from Labour's ideological standpoint, the grammar schools do produce in quantity (and inexpensively) sixth formers capable of going to university and getting a good degree in three years of further education. They produce, in partnership with the public schools and the direct grant grammar schools, the professional and technological cadre on which Labour governments utterly depend to fulfil their hopes —and indeed which they propose urgently to expand in pursuit of a higher living standard for all. It is simply not known if "the comprehensive principle", universally instead of experimentally applied, can possibly produce this cadre in such quality or quantity. In time it might; but it is very sure that wrecking the grammar schools meanwhile would cause an expensive falling-off.

To wreck, or even at this critical time in education to damage, these grammar schools, which for two or three generations have provided the rungs in the "educational ladder" to which Labour owes so much—simply because "down with the eleven plus" is a good political cry—would be irresponsible folly. There was a time when Labour cried "secondary education for all," and meant by secondary education these same grammar schools; and now they want to kick away the ladder by which they came up. It is idle for them to deny that these schools would be damaged. Some have already been seriously damaged by the more fanatical local authorities; this document may encourage more of them to get to work to reduce their schools to a dead level of mediocrity which perfectly mirrors the approach to education of the county councillors themselves.



TO say this so strongly is not to deny its virtues to the comprehensive experiment, or to defend uncritically the tripartite system set up—very much *faute de mieux*—by the 1944 act. But why cannot the Labour party see the obvious way out of the new difficulty over segregation, grammar school snobbery and the eleven-plus? It stares them in the face. It is to bend all their efforts to providing all children—whether they go to grammar schools, modern schools, comprehen-

sive schools or any other schools—with the opportunity to go to the university or to an equivalent place of higher education, if they desire it, and are ready to stay in school to be suitably prepared for it That is the right comprehensive solution.

It is the higher education bottleneck that puts the non-grammar school child at a disadvantage. The Labour party cannot cure snobbery any more than it can cure adultery; there can always be a U comprehensive school at one end of the town and a non-U one at the other end. Nor can it cure the mathematical fact that half the population has an IQ below average; nor can it raise that average by Act of Parliament. But it could, if every reasonably intelligent child could get its appropriate higher education, dissolve the "class-difference" between grammar and modern schools and free all schools to develop in their own way.

Admittedly, this can only be a long term aim. It means waiting until provision for higher education can be greatly expanded. On this the Labour document is prudent and cautious; but it is here that sights should be set high. What one would like to see in the policy statement of a progressive party is a firm determination that, by the mid-1970s, all British children—including those who today fail the eleven plus—should have at least as much chance of going to a university or other course of higher education as American children do. The right choice for Labour is to work towards that sort of ideal. To turn aside from it, to push through the egalitarian doctrine for its own sake, would not only damage the present hard-pressed educational system, but also jeopardise Britain's chance of getting one that would challenge comparison with anywhere in the world. At present it does so only in spots. It is tragic that these seem to be just the spots that Labour has decided to hate.

Down the Crazy Paving

The amateur gardeners of Britain—19 million of them according to a recent survey—do not count the cost, but the economics of gardening deserve investigation.

FOR the millions of gardening amateurs, the annual match against the short and treacherous English summer has begun in earnest. Britain is at least as much a nation of gardeners as of shopkeepers, as visitors, flying low into Britain on a clear day, have remarked. Yet economic studies of gardening are sparse; though a major activity, it seems to slip through all the statistical nets. The classification of the land use of this small island, for example, does not separate gardens from smallholdings. The Ministry of Housing does not know how many gardens there are, or their sizes, or their standard of upkeep. Estimates can be made only by indirect, not to say devious, means.

One may begin with a recent Gallup poll into British recreations, which found that 52 per cent of the adults questioned had done some gardening during the past month (compared with 78 per cent who had watched television, and 53 per cent who had been to the pub). This 52 per cent, grossed up, would suggest that there are some 19 million spare-time adult gardeners in Britain, including 7.5 million who only garden "occasionally." In how many gardens do they work? A survey made by Research Services Ltd. in 1956 suggests that there were some 6 million lawn mowers in commission. This is clearly the lower limit: not all gardens have lawns, or lawns large enough to warrant a mower being kept on the premises. Still a lawn is the standard feature of a real English garden, and a mower is the badge of garden ownership. It might not be far out to put the number of warrantable gardens at perhaps something slightly over ten million, ignoring the fringe of front plots and backyards which may or may not reward the annual expenditure of a shilling or two on packets of seeds or a dozen bulbs.

Gardens, however, are increasing. So, to judge from the trend between previous public opinion polls and the most recent one, are the number of amateurs who work in them. The whole process of city redevelopment means gardens. Indeed, the housing boom of the thirties might be described equally as a garden boom. It is almost as if it was national policy to saddle as many people as possible with gardens. For that reason it would be unwise to assume that all gardening is willingly done. Many people have to buy or rent a garden to get the house which goes with it; and since for social reasons they cannot allow the garden to fall below certain minimum standards they are forced to work in it. This captive gardener force cannot be measured, but it is by common observation considerable. Some of it is no doubt concealed in the 7.5 million who garden only "occasionally."

But there are probably more than 40 per cent of adult men and perhaps 25 per cent of women who garden regularly and enthusiastically. The Hulton Readership Survey of 1952 suggested that they come from all classes. In the professional and business class, it found,

44 per cent of men and 34 per cent of the womenfolk garden "regularly"; in the lower income brackets only 40 per cent of the men and 20 per cent of the women. In between 45 per cent of lower middle-class men garden, and 30 per cent of the women. Older people, up to the age of 65, garden more. Fifty per cent of those between 45 and 65 garden, whereas only 20 per cent of men up to 24, and 40 per cent of those over 65, do so. Only very few in any class have allotments—relatively twice as many in the working class (9 per cent of the total) as in the upper classes.

IN the upper classes it used to be possible to own and enjoy a garden without doing the work oneself. This is possible now for very few. The occupation census gives 127,000 full time gardeners, but clearly most of these work for municipalities or large institutions (for example the London County Council alone employs 450 and the Ministry of Works 283). But the better-off certainly get some help. How much may perhaps be very shakily deduced from the basic figures about lawn mowers. While 77 per cent of upper class people own lawn mowers, only 62 per cent reveal that they garden either regularly or occasionally. If—it is a very big if—this indicates that perhaps ten to fifteen per cent of them pay someone else to do all the work this would amount to 200,000 to 300,000 regular-gardener-employing families (though not that number of gardeners since an average for even a "regular employer" would be only about 4 hours a week). Many other families, of course, must have an occasional part-time man in to help.

But though such figures may provide some basis for a very rough and ready guess at the manpower which may be diverted into gardening, they give no idea of the nation's investment in it. Here figures are even scantier. The Household Survey in 1953 revealed that the average expenditure of a British household on such gardening requisites as seed, bulbs, plants, bagged composts and fertilisers, etc., was 1s. a week, compared with 1s. 4d. spent on pets. This is £39 million a year, and spread over those who actually have gardens, gives an expenditure of perhaps £3 to £6 per year per garden. But, of course, this covers the range of gardens on which much less than £3 is spent as well as those where far more is spent; moreover it entirely omits the purchase of capital items.

For this reason it would certainly be wrong to compare any such figure with average expenditure on motoring for pleasure, which was £130 per motorist in both 1953 and 1957. The cost of keeping the ready-made garden going is often a very small part of total cost. To begin with, the capital cost of the garden area ought to be taken into account. For example, a man buying a suburban house for £3,000, may reckon the land alone worth £500, of which (under the bye-laws) the house occupies less than half. The cost of the garden area cannot be reckoned at much less than £250. But this is the mere cost of the unbroken land. The garden itself is worth more—as anyone who has a garden made by a contractor out of a field on which he has built a new house will soon discover. In a good garden, the lawns at cost are worth 7s. the square yard, crazy paving 50s. the square yard, oak fencing £1 the foot run, and herbaceous borders (planted with quite ordinary varieties) 10s. the square yard. Ornamentals will be £4 each; a modest rockery can hardly be had under £50, and lily ponds are far more. A mere sprinkling of gnomes, pergolas, birdbaths, Grecian urns and rustic furniture quickly add up to a fair sum. After adding some allowance for the amateur gardener's own backbreak, a modest quarter acre garden might well contain £500 and more of horticultural stocks at replacement cost.

THEN there are the tools, an important item since all tools, and especially powered ones to save labour, are expensive. A small outfit will cost £15, say £7 for a lawnmower (of which 430,000 are sold on the home market every year), £3 for a wheelbarrow (to remove grass-cuttings, leaves, children, etc.) and £5 for a minimum of cultivating implements. But one large store put the average investment of a keen gardener in tools at £50—including a power mower, hoses, secateurs and sprayers. "Gardeners with new gadgets are becoming like women with new dresses," one dealer said. "They can't resist them." Larger outlays, such as a minimum of £20 for a greenhouse, may well follow as enthusiasm grows. Since the more mechanised tools require more upkeep, and have a shorter life, than the traditional fork, and spade, costs will continue high; they may already involve an annual expenditure by the nation's gardeners of perhaps £20 million a year.

Mechanisation of the home, in fact, is bound to be steadily paralleled by mechanisation in the garden. The fresh-faced country girl, ready to work in the house 14 hours a day for £30 a year, vanished long ago, to be replaced in these last twenty years by the vacuum cleaner, the refrigerator and the washing machine. With her has also gone that earthbound worthy ready to come in for three half days at 1s. 6d. an hour. He is likely to be gradually replaced by electric mowers, chemical weed eradicators, herbicidal flame-throwers, even plastic sheeting (which, laid on flower beds, and punched through in the right spots, allows only domesticated plants to come up).

There is not yet a real mass-market in Britain for wholly mechanised trouble-free gardening. Many gardeners still rely on the itinerant boy-scout for portable power on the bob-a-job tariff. Others, particularly city dwellers, pay very much more to local gravediggers or to boilermen from nearby blocks of flats. Many garden-proud housewives rely on their husbands for forced labour. But some of this may be on the way out. Your correspondent was told recently in Bronxville, New York State, that two high-school students, offering to put half a day into "fixing" one's garden, charged $30 using their own equipment, $25 using the client's. This, in an enrichening community of tidy-minded garden owners, may be the shape of things to come.

NOTES OF THE WEEK

FRANCE

The Neighbours Call

GENERAL DE GAULLE is now ready to receive visitors, and the neighbours are hastening round to call and look about them. Mr Macmillan arrives in Paris with Mr Selwyn Lloyd on June 29th, Mr Dulles on July 5th, and Dr Adenauer is expected to be only a short step behind. Mr Macmillan's talks are said officially to be informal (if that word can be applied to the general at any time), just as his visit to Washington was ; the Algiers acquaintanceships of 1943 are turning out to be more consequential than he can ever have imagined then. The idea that the general should see Mr Macmillan before he sees Mr Dulles comes, apparently, from Paris. Between the two visits there is to be another quick sortie to Algiers.

Although the general's visitors have already been assured that he intends to abide by Nato, there are still qualms about how he means to fill the vacant chair. His radio and television address last weekend had some nuances which the allies will want to clear up. France, he said, belonged to the western world but ought not to be "confined" to it. France should have its "own" place and carry out its "own" policy. This reassertion of great-power status can disrupt western plans arranged earlier with more pliant men in Paris. What are the general's ideas on the summit ? Is he so bent on a French nuclear bomb that he will reject any negotiated suspension of tests that may come out of the experts' conference at Geneva on July 1st ? Will he back Mr Dulles into a corner by demanding atomic secrets which Congress is reluctant to release, or by insisting on tough conditions for missile bases on French soil ? Does his vision of the future Europe really coincide with Dr Adenauer's ?

But France's place in Nato and its claim to be a great power depend on a settlement in North Africa. General de Gaulle's visitors will expect to be told more of his plans than the settlers in the Algiers forum have heard. And, in turn, they must make clear that the support they have been promising him in their congratulatory messages depends on his ability to take the political decisions in Algeria which his predecessors were powerless to do. This is the rub, and goodwill tours by the general's itinerant ministers of state cannot remove it. The issue will arise urgently when France asks for American and German aid in the autumn. It is better to give notice of what is expected of the general now.

NORTH AFRICA

Orders from the General

THE overtures which General de Gaulle made to Tunis and Rabat immediately after his accession to power have been followed up by effective diplomacy. Performance has overtaken promise. The general's readiness to order the withdrawal of French troops from local posts in both countries makes a flattering contrast to the dilatoriness of republican prime ministers who quailed at the thought of the Assembly's reaction to pulling back to Bizerta and Agadir. President Bourguiba has professed himself impressed. The Moroccans, too, are relieved to see the end of ten French posts, each one of which might have prompted serious trouble at any time in the long Algerian crisis. It is a good beginning.

For France the diplomatic gains are immediate. The acrimonious post-mortem on the bombing of Sakiet has been cut short. The Algerian rebels (FLN) who have been attempting to turn the present Tunisian-Moroccan talks in Tunis into another Tangiers conference are finding their allies even more reluctant than before to provoke the general. It looks as if the French have, in fact, staved off the formation of a rebel government for some months. The disillusionment in Tunis and Rabat after General de Gaulle's speeches in Algiers, Constantine and Oran has again lifted. Even so, distrust is likely to remain until the future status of Bizerta has been decided and either the last French soldier has left Tunisian and Moroccan soil or France's retention of specific military bases is formally recognised.

The general has made a sensible gesture to his North African neighbours ; his latest gesture to the army in Algeria is more ominous. The installation of army commanders in the prefectures of Algeria (General Massu himself taking over Algiers) without previous approval from Paris suggests again that the intention is not to negotiate a political settlement but to impose a military one. General Salan has sounded the tocsin vigorously. The FLN, he has reported, have increased their activity since General de Gaulle's visit, and he is anxious for reinforcements. When General de Gaulle returns to Algiers on July 2nd he will have to take a hard look at the policies of the army leaders ; his influence in modifying them is still in doubt. It would be no less intriguing to know what reception Algiers is preparing for the general's travelling companion, M. Guy Mollet, on his first appearance since the luckless day of rotten tomatoes in February, 1956.

LEBANON

Limitations of Brinkmanship

THE outburst of mortar fire in central Beirut last weekend falsified the belief that the Lebanese troubles were grinding to a compromise. Mr Hammarskjöld has gone in person to Beirut to see how his small corps of observers, under their Norwegian commander Major-General Odd Bull, can carry out the Security Council instruction "to ensure that there is no illegal infiltration of personnel or supply of arms or other material across the Lebanese frontier." He has made it very clear that the observers, as their name implies, are only there to report ; before they could do anything more effective they would need substantial reinforcement and a new United Nations resolution.

Even before the secretary-general arrived in Beirut, President Chamoun had appealed for a bigger international force with a bolder brief. But Mr Hammarskjöld may be pointing out that the United Nations would be reluctant to assemble and dispatch a force to hold the land frontiers against rebel supporters while the government remained free to receive American arms, and possibly units, from the seaward side.

President Chamoun is presumably calculating that his army can deal with the insurrection so long as the rebels are isolated from foreign sources of supply. But frontier supervision may no longer be the decisive factor if, as has been suggested, the Opposition already have all the arms they need. And the army, although it had to turn out against the rebel attack last week-end, is still somehow contriving to give the appearance of being outside the quarrel. As the fighting goes on, it will become more and more difficult for the commander-in-chief, General Shihab, to avoid commitment.

The further the Lebanese seem from settling their differences themselves, the greater becomes the temptation for outsiders to intervene. The Arab republic could be drawn into the conflict by its Lebanese partisans, even against its better judgment. Mr Dulles has spoken of the need to protect American lives and property, and this need might carry him well over the brink. The presence of the Sixth Fleet, and the piling up of British forces in Cyprus, may be a moral support for President Chamoun, but it is far from clear whom they are intended to inhibit, or how they could be used in Lebanon except at heavy cost to the West in the Middle East.

STRIKES

Mr Cousins Seeks the Exit

MR COUSINS went back to London Transport on Wednesday to ask for a straw to clutch on, for a rearrangement of terminology rather than of terms. He got precisely that. It may, of course, have been an unnecessarily large straw ; the negotiations about not leaving the country busmen "in an unfavourable position" will show whether it was. But, whatever its size, Mr Cousins is certainly, as we go to press, trying to sell it to his delegates as looking larger than life. For the principal feature of the industrial scene this week has been the spectacle of Mr Cousins trying strenuously to get out of a strike.

There need be no surprise about this. Mr Cousins has always been some sort of a calculating machine (not perhaps a particularly desiccated, but by no means necessarily a wet one). By Friday of last week he had very sensibly calculated that his interests would be worse served by a continuation of the strike than by a quick cutting of his men's losses. In part, this was because the strike was building up a very uncomfortable situation for all busmen, by steadily reducing the number of buses that Londoners would want when it was over ; in greater part, it was because he felt that his offensive had struck bone. There is a moral in this. It had been said that Sir John Elliot's fighting attitude after his now famous press conference on June 1st would, by antagonising Mr Cousins, prolong the strike ; in fact, this new attitude was the turning point in persuading the TUC and (more gradually) Mr Cousins that the strike had better be ended. The principal reason for Mr Cousins's apparent *volte face* last week was his shrewdly tactical recognition that nothing more of substance was likely to be wrung out of London Transport. It was for this reason that he recommended the men to go back to work, and asked them to confirm this by garage vote. He must have been as surprised as anybody else—although he absorbed the shock with aplomb—when a narrow majority of the garages voted instead to continue the strike.

Half-Disinterested

THERE were several curious features of that garage vote. Not the least curious was that, in the minority of garages for which detailed figures are readily available, only just over half the men turned up to vote. There were wide variations around this extremely rough average. At the very tough and trouble-making East London garage of Dalston, for example, only 194 out of 656 men turned up. Undoubtedly, in some garages, the low turn-out reflected the feeling of many rank-and-file busmen that their local trade union affairs are a matter run by militants whom it is exceedingly imprudent to rile, especially in an open vote made by show of hands. But other garages, such as Hertford, where there was a virtually full turn-out, accompanied Dalston in voting against a return to work. Equally undoubtedly, voting in these garages reflected the Englishman's inborn unwillingness to surrender, in a doughty fight to which he has been committed and which he has therefore taught himself to regard as just. Perhaps the fairest summary of the voting—and of the abstentions—is that although the active vote in favour of staying out was cast by possibly little more than a quarter of the men (compared with nearly three-quarters who either voted against or abstained), yet those who really wanted to come back showed precious little determination to do so.

A contributory factor is that many busmen have now got other casual jobs, and are reasonably happy in them, while drawing Mr Cousins's constantly increasing strike pay to boot. This generalisation conceals a lot of real hardship in individual cases ; so, on the other side of the strike barrier, does the generalisation that the stoppage has caused remarkably little annoyance to London's commuters. But the broad and rather ridiculous facts remain: that the struggle which Mr Cousins had meant to be an epoch-making one has degenerated into an affair about which singularly few people feel passionate, and which the union executive itself now does not want ; that it has demonstrated, as signally as anything could do, that the dislocation liable to be caused by strikes has been grossly overestimated since the war, just as the damage wrought by easy wage inflation has been consistently underestimated ; that it is going to have as its most lasting consequence an economically useful cut in London's unprofitable bus services ; and that the sorcerer's apprentice who started the flood has been finding it singularly difficult to stop it now that he wants to.

Others Coming Back

THERE has been a turn for the better in the other strikes this week. As a postscript to the unsuccessful unofficial stoppage on the tubes, Mr Doubtfire, the gentleman whom London Transport paid as an engine driver but who had for long acted as a full-time shop steward instead, has been told that he must go back to driving trains ; as it has been discovered that he has not driven one regularly since 1949, he is attending a motorman's school for a

refresher course first. More important, after a show of hands more successful than that at the bus garages, 1,500 meat drivers at Smithfield decided on Wednesday to end their nine week strike. This gives hope that by next Monday both the market and the docks may be working normally. The Smithfield drivers have been on strike since April 19th; their strike spread first to the other 6,500 men employed at the market, then to Tooley Street (where most of London's imported meat is handled) and eventually, over the issue of employing unregistered dock labour, to the whole of the Port of London. A well-entrenched group of troublemakers was running all these strikes; but during the past week their position was weakened by the success of union officials in the docks in persuading 12,000 strikers to return to work, and by the feeling that was growing among the Smithfield men that, while many of them had lost well over £100 each in pay, the shops continued to have meat in nearly as great a quantity as ever. The decision of the Minister of Labour to set up a committee of investigation into the dispute provided the peg that the strikers were looking for to agree to return to work.

Unfortunately, however, if this committee does its job properly, its report may well bring some Smithfield men out again soon. The committee has been given terms of reference wide enough to enable it to consider the whole question of labour relations and organisation in the market, and it certainly ought to use them. For, apart from the immediate issues, there is much that needs to be done at Smithfield. The 10,000 tons of meat passing through there each week is handled by a labour force notorious for its restrictive practices. There is the problem of the free-lance bummarees, for example, whose tight and illegal monopoly of carrying meat to retail vans brings them in £25 a week and more, while causing endless delays. Then there are the 200 pitchers, another self-employed group who carry meat from lorries to the wholesale stalls, and who are also a law to themselves. The position has even been reached where a lorry driver is not allowed to take meat from the front of his vehicle to the back because a separate "puller back" has to be employed. Professor Jack and his two colleagues should be urged to be courageous and not unduly hurried in their investigations, and to make recommendations for a thorough labour reorganisation in the market.

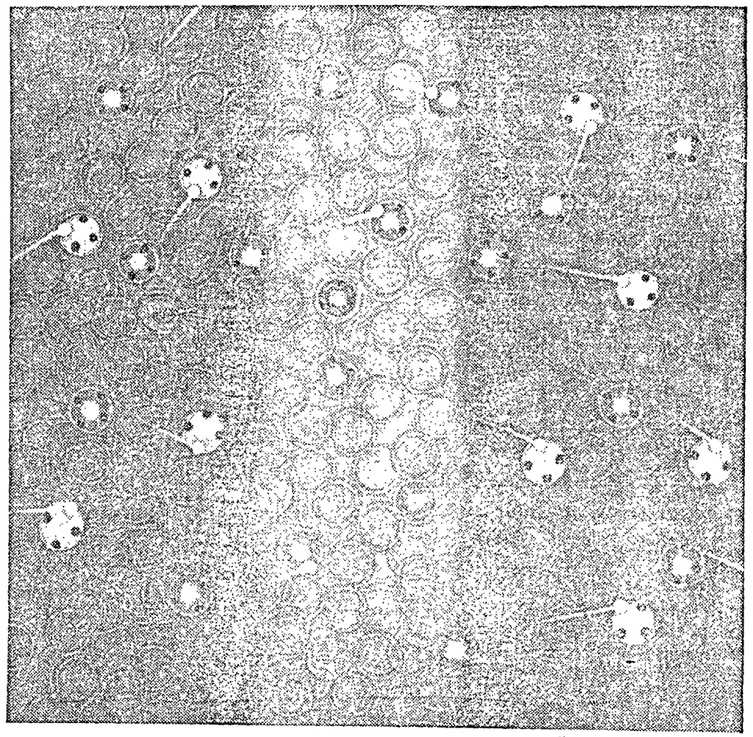
While the Smithfield decision should lead to a full resumption at the London docks next week, 8,000 men are still on strike there at present, half of them workers at Tooley Street. During the last few days, the tactics used by the unofficial portworkers' committee to keep the strike going have reached new heights. After all the dockers except those in Tooley Street had voted last week to return to work, the committee called sudden meetings to endorse strike action, heckled union speakers, and spread what the union called "wilful rumours" (others would use a shorter word) that unregistered labour was being used. Small, militant bands of strikers even went from one group of docks to vote outside others in the hope of helping to outnumber the men there who wanted to continue working. At Tooley Street, on Monday, one union official demanded that men be allowed to vote without being "coerced"; after this particular speech, perhaps significantly, men there voted in considerable numbers for the first time to end the strike. It is not only Smithfield which needs an overhaul of its system of labour relations.

EASTERN EUROPE

Murder in Budapest

IMRE NAGY is, and probably will remain, unique among Communist leaders of recent times in that he has gone to his death respected and mourned throughout the non-communist world. He considered himself a sincere follower of Marx and Lenin; but he was a moderate, he was humane, and he was first and foremost a patriotic Hungarian. The three associates executed with him include General Pal Maleter, who organised the resistance to the Russian army in October, 1956; Geza Losanczy, whose name has always been closely linked with that of Mr Nagy, is stated to have "died of illness" in prison.

The manner in which Mr Nagy came to his end is, even by communist standards, particularly cynical and sordid. In November, 1956, the Russians got hold of him by means of trickery and false promises. He was tried in secret—exactly when, is not known—by an extra-legal body that has already been denounced by the International Commission of Jurists for its failure to provide "minimum safeguards of justice," on charges that are either false or, where true, not criminal.



Mr Kadar and his colleagues have been responsible for plenty of secret trials and executions since they came to power. But they can hardly feel comfortable about Mr Nagy's fate. A potential rallying-point for popular discontent has, it is true, been removed; but they must know that nothing is more likely to cement the implacable hostility of the Hungarian people to the present regime than the secret murder of the man who, although at the time of the revolution tragically misunderstood by many Hungarians, is now recognised as a patriot. Moreover, Mr Kadar was a member of Mr Nagy's government in the crucial month of October, 1956. What is to prevent the charges on which Mr Nagy was sentenced to death from being levelled against him, too, when Moscow chooses?

Anger in Belgrade

BUT it was the Russians, not their puppets in Budapest, who were responsible for Mr. Nagy's death. Their motive for taking a step which they must have known would shock the whole of the non-communist world and arouse all its old suspicions of Soviet Russia must have been very compelling. Presumably it was a desire to serve notice on "revisionists"—in Belgrade, Warsaw or anywhere; no doubt in Russia, too—that Moscow has lost patience with them and intends to root them out.

In particular, Mr Nagy's death is a heavy blow by the Russians in their campaign against Belgrade. Not only was there considerable similarity between Mr Nagy's ideas on the proper development of communism and those put forward by the Jugoslavs; but his execution is a calculated insult to the Jugoslavs under whose protection in Budapest he had put himself in November, 1956. Mr Khrushchev would not have permitted it while he still intended to remain on friendly terms with Marshal Tito.

It may or may not be a coincidence that Mr Nagy's execution was announced less than forty-eight hours after Marshal Tito had roundly denounced the communist campaign against Jugoslavia in a speech larded with excellent

"Transistors" by Roy Nockolds

Gazing into the crystal

Modern crystal gazers can now foretell the future with some accuracy—if the crystals into which they are gazing are those of germanium or silicon.

These two substances—known as semiconductors—are the basis of Electronics' newest and perhaps most significant development—the transistor.

This device, which fulfils a similar function to a radio valve, is beginning to revolutionise electronics in many of its applications. Unlike the valve, the transistor needs no filament and operates at very low voltages and currents. Another advantage is its minute size—in some cases no larger than the head of a match. The transistor, in a variety of forms, is already being used in hearing aids, computers, instruments for nuclear power stations, portable radios and record players, and future applications will include radar, submarine telephone repeaters, and V.H.F. mobile radio.

The Mullard Company has played a leading part in the development and production of transistors, accumulating a great wealth of know-how on which you, as a designer or user of electronic equipment, are free to draw.

Mullard

Technical Information Services

Mullard Technical Information Services cover almost every field of electronics. If you have an applications problem, write to the address below.

comebacks and palpable hits at Mr Khrushchev. The speech also included, for the first time, an outspoken attack on the Chinese. He told them that Marx, Engels and Lenin would turn in their graves if they knew how their thought was being treated in Peking, and suggested that the Chinese were trying to solve their internal difficulties by hostile attacks on Jugoslavia. Marshal Tito also pointed out that the Chinese had especially "pounced upon" the Jugoslav foreign policy of peaceful co-existence. He will not have been surprised to learn that in the indictment against Mr Nagy particular exception was taken to his known approval of peaceful co-existence, the abolition of the power blocks and Hungarian neutrality.

LABOUR PARTY

Mr Gaitskell in Command

THE struggle for power in the Labour party is in some ways even more interesting when rows are not in progress than when they are. Whatever may have happened to his standing in Parliament and the country in the last few weeks, there are intriguing signs that Mr Gaitskell has recently strengthened his personal control within Labour's citadel. This process of strengthening began when he made his (at the time distinctly brave) decision to strike out against the wave of H-bomb pacifism in his party three months ago. To protect himself from the Swinglerites he whistled up his trade union bodyguard on the national executive, and it was surprising how quickly it rallied to him, uttering threats of proscription against all active unbelievers. The recent split within that trade union bodyguard itself also seems to have strengthened, rather than weakened, Mr Gaitskell's personal position. The union leaders' famous "recommendation" to Mr Cousins not to spread the bus strike showed that the TUC is still a preponderately orthodox body, and orthodoxy means support for Mr Gaitskell. At the same time Mr Cousins, although he is cross with his fellow trade union general secretaries, is not cross with his party leader; he has no other leader to whom he can turn, and he does not at present want to

The Little Election

A student of electoral statistics writes:

VOTING in by-elections and local elections over the last two months now seems to fit into a reasonably clearly discernible pattern.

Dissatisfaction with the Government reached its highwater mark in the county council elections on and around April 16th last. For those who had eyes to see—and it is surprising how many people hadn't—the tide had already turned by the time of the borough and urban district council elections on and around May 8th; the most obvious emotional event in the intervening three weeks was anger with the trade unions—and with Labour—about strikes and the threat of them. The Conservative recovery appeared to have been turned back when North Islington went to the polls on May 15th, and, in one of the lowest votes on record, returned a 10.4 per cent swing against the Conservatives (nearly as big as the swing it had recorded against them in April's county elections). But the Islington by-election took place on May 15th, two days after a railway strike had been averted on terms that seemed to some Conservatives to spell surrender—and when other strike settlements were believed to be imminent. By the time of last week's five by-elections, Mr Cousins was again a bogeyman; and the Conservative recovery shown in these by-elections was of the same general order as had been observable in the borough results. To take the elections in the two safe Labour seats first:

(1) In *Wigan*, the swing away from the Conservatives towards Labour, compared with 1955, was 5½ per cent. That swing, repeated in straight fights right across the country at a general election, would give Labour a majority of around 100 in the House of Commons. But Wigan—an area of relatively high and recently rising unemployment, with a very good Labour candidate in the field—might well be an area of above-average swing to Labour *just now*.

(2) In *St. Helens*, on a much lower total turn-out, the swing from Conservative to Labour was only 0.4 per cent. That swing, repeated right across the country, would leave the Government in power at a general election. But St. Helens—where the new Labour candidate, chosen after some local contention, was no Sir Hartley Shawcross—was certainly an area where the swing to Labour was expected to be below-average.

One's own guess is that, if there were an immediate general election, the swing to Labour might now be of the average order of 4 or 5 per cent compared with 1955, giving a Labour majority of between 60 and 90 in the House—as a result of straight fights only. That would represent a considerable Conservative come-back since mid-April; if the come-back has been due to temporary indignation with the trade unions, it remains to be seen whether it may not be evanescent.

The other three by-elections last week saw Liberal interventions and (as at Wigan) remarkably high polls. The Liberal candidates at South Ealing, Weston and Argyll secured, respectively, 17.2, 24.5 and 27.5 per cent of the poll; these are being called disappointing results for the Liberals, but only a short time ago they would have been regarded as quite remarkably good. It is true, however, that they are not as good for the Liberals as Torrington and Rochdale—nor, certainly, as bad for the Tories. On the Torrington-Rochdale scale of desertions from Tory to Liberal, and counting only seats for which a Liberal candidate has been adopted, it was suggested in *The Economist* of May 10th that Liberal interventions might lose the Tories an extra 39 seats (30 of them to Labour and the other 9 to the Liberals). On the basis of last week's results—two of which showed defections to the Liberals coming from Labour as well as from the Tories—the Conservatives might hope to have cut that scale of additional losses about in half. The swings in detail were:

(3) In *Ealing South*, the Conservatives lost 9.3 per cent of the poll compared with 1955, of which 7.7 per cent went to swell the Liberals' share and 1.6 per cent swelled Labour's. But during the county elections and—even during the borough elections—the direct swing from Conservative to Labour in these inner London suburbs had been much bigger.

(4) In *Weston-super-Mare*, the Liberal secured his 24.5 per cent of the poll by drawing 13.4 per cent away from the Conservative and no less than 11.1 per cent away from Labour. This was a considerable knock to Transport House.

(5) In *Argyll*, the Liberal secured his 27.5 per cent of the poll by drawing 21 per cent away from the Conservative and 6.5 per cent away from Labour. The total poll here was actually slightly higher than at the general election.

form (nor probably could he form) anything approaching an independent Cousinsite political wing.

Now, in these last few weeks, a series of possible storm clouds for Labour have blown up in foreign skies. There have been four recent issues about which Mr Bevan might have been expected to belch smoke: General de Gaulle's accession in France, disarmament, the American attiude to Lebanon, and Cyprus. On the first two of these Mr Bevan may in fact have shown some signs of emotional disturbance (there is dispute about what his rather turgid speech in last week's disarmament debate was meant to mean). But certainly the storm clouds have not broken. Whenever a really important statement has had to be made, on Cyprus on Tuesday at the dispatch box or on general foreign policy in a weekend speech, it is Mr Gaitskell who has turned up, softly purring. There can be dispute whether Mr Bevan is showing loyalty because he wants to, or because he has to, having lost the support of many of his Bardolphs and Pistols from his Prince Hal days. Perhaps the two explanations of his quietude are so complementary that Mr Bevan cannot disentangle them himself. But Mr Gaitskell's recent skill in party bossmanship has been remarkable. More than in almost any other period in Labour's history—not excluding the greater part of the Attlee era—it is what the leader says, on any important matter, that now usually goes.

NIGERIA

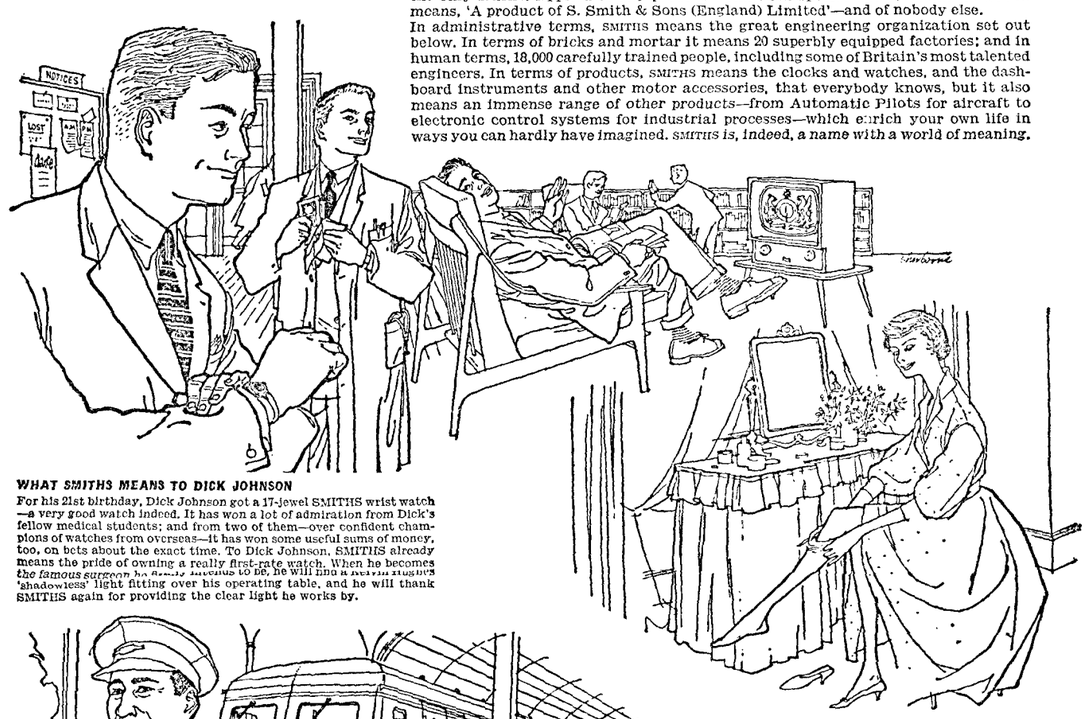
Premiers in Conflict

As plans go forward for the Nigerian constitutional conference in London next September, signs multiply in Nigeria that it will be marked by none of the amity which distinguished the previous conference last year. As last year's formula was that all the questions which divide Nigerians should be passed to commissions to examine, while attention was concentrated on the simple theme which unites them—independence by 1960—this should surprise nobody. Now the Nigerian leaders have the commissions' reports before them: on the problems of the minorities and the desire to carve separate "tribal" states out of the existing regions, on the allocation of finance between federation and regions, on the federal boundaries of Lagos and on police and the judiciary. On all these questions they clearly remain as divided as ever. In fact, it is doubtful if they can agree even about the number and composition of the delegations to come to London. It may be that, once again, all the parties will send representatives, whose voices will be as diverse as fifteen months ago. But this time decisions cannot be handed back to commissions again.

Already the prime minister of Western Nigeria, Chief Obafemi Awolowo, has left in dudgeon the brief premiers' preparatory conference in Lagos complaining that there is no agreement on the provisions of the constitution on basic rights and liberties, and protesting at the privileged position proposed for the "hereditary rulers." His complaints are clearly aimed at the North, which will achieve regional independence next year, no doubt with institutions that will define the powers of the emirs not too circumspectly. Meanwhile Dr Azikiwe, the prime minister of the Eastern Region, has suppressed yet another revolt in his own party, the National Council of Nigeria and the Cameroons; but he has done so at the heavy cost of having to expel from it two federal ministers, Chief Kola Balogun, its only Yoruba leader, and the redoutable Dr Mbadiwe, federal minister of communications. Dr Azikiwe has also postponed an early trip which he was to have made to London, to discuss the comparatively pacific question of a new university; he had better be watched, for when in difficulty he generally finds it useful to twist the lion's tail. Meanwhile the "all-party government of unity," which the federal prime minister, Abu Bakr Tafawa Balewa, formed at the end of the last constitutional conference, is fast breaking up. Mr Lennox-Boyd must be thankful that he refused last year to promise full independence by 1960. But this still leaves him in trouble, for Nigerian nationalism has not abated. It by no means follows that Nigerians will say to Mr Lennox-Boyd in September: "You were right; we are still divided; we must keep the British a little longer lest we lose the real prize of independence, Nigerian unity itself." The air is more likely to darken with accusations of imperial perfidy, as poor Mr Lennox-Boyd still struggles manfully towards the singularly non-imperialist policy of "unite and let them rule."

SOVIET UNION

Moscow's Thoughts on Nasser



ARE the Russians losing some of their enthusiasm for Colonel Nasser? The question arises because of their handling of the Lebanese crisis, in the first weeks of which Moscow talked of the events in Lebanon almost as if they were a repetition of the Suez crisis. The Soviet government in a special statement, the Russian press in numerous articles, harped on the theme that the Soviet Union could not remain indifferent in the face of an American threat of intervention in an area so near to its southern frontier. For a time the accent grew daily shriller.

From May to June a subtle change took place. The Moscow newspapers progressively switched the emphasis of their anti-American campaign to such topics as the preparation of "biological warfare." More important, in the Security Council on June 11th Mr Sobolev, while he repeated all the Soviet charges, did not vote against the Swedish proposal to send observers to the Lebanese-Syrian frontier; he merely abstained.

Too much should not be read into this trend. Moscow has certainly no intention of abandoning its Afro-Asian offensive. The increased volume of broadcasting to these areas, and the preparations now going forward for a congress of African and Asian writers at Tashkent, are sufficient proofs of that. At the same time, the communist rulers may well have begun to permit themselves doubts about President Nasser's future attachment to their interests. The association between Moscow and Cairo has had no more solid basis as yet than the immediate common hostility to the West. If they look further ahead, there are really no grounds of substance on which the communist rulers can persuade themselves that the two movements which President Nasser leads (the Egyptian officers' revolution and the pan-Arab movement) will in fact play the communist game. Moscow may not choose to back President Nasser in every adventure he may become involved in—particularly when it brings the danger of a head-on collision with a united Anglo-Saxon block. One problem for Moscow—just as for the western governments—is to assess the size of the risks in the Middle East, and to guess which are worth taking and which are not.

The meaning of SMITHS

In the world at large, there are probably more than two million people bearing the English name Smith; but in the world covered by our own business activities we are the only SMITHS. Applied to any product within our special world, the name SMITHS means, 'A product of S. Smith & Sons (England) Limited'—and of nobody else.
In administrative terms, SMITHS means the great engineering organization set out below. In terms of bricks and mortar it means 20 superbly equipped factories; and in human terms, 18,000 carefully trained people, including some of Britain's most talented engineers. In terms of products, SMITHS means the clocks and watches, and the dashboard instruments and other motor accessories, that everybody knows, but it also means an immense range of other products—from Automatic Pilots for aircraft to electronic control systems for industrial processes—which enrich your own life in ways you can hardly have imagined. SMITHS is, indeed, a name with a world of meaning.

WHAT SMITHS MEANS TO DICK JOHNSON
For his 21st birthday, Dick Johnson got a 17-jewel SMITHS wrist watch—a very good watch indeed. It has won a lot of admiration from Dick's fellow medical students; and from two of them—over confident champions of watches from overseas—it has won some useful sums of money, too, on bets about the exact time. To Dick Johnson, SMITHS already means the pride of owning a really first-rate watch. When he becomes the famous surgeon he firmly intends to be, he will find a Kelvin Hughes 'shadowless' light fitting over his operating table, and he will thank SMITHS again for providing the clear light he works by.

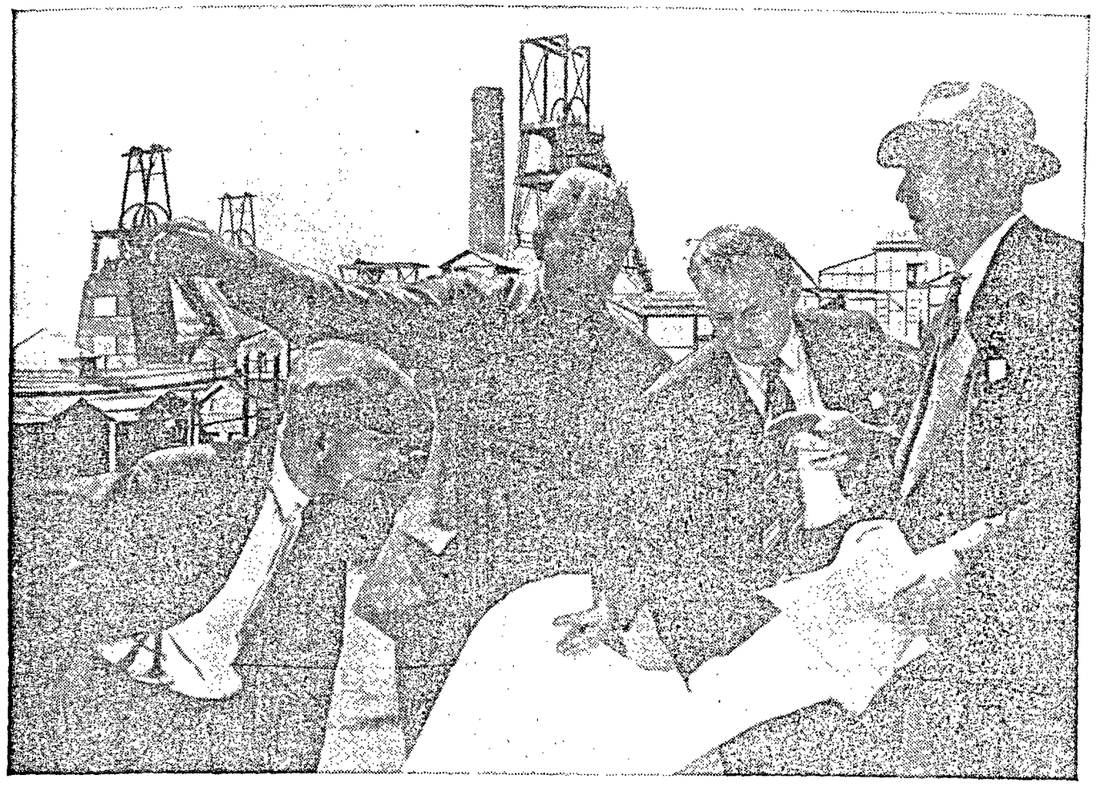
WHAT SMITHS MEANS TO BERT HANDLEY
SMITHS make instruments that help Driver Handley to control his 'Inter-city' diesel train; instruments such as speedometers and mileage counters, and brake-vacuum gauges. And the train has some interesting SMITHS automatic control equipment, including devices that shut down the engines automatically if they exceed their safe maximum revolutions per minute, and shut down the engine and apply the brakes if the train exceeds its safe track speed. In ways like this, SMITHS means easier work for Driver Handley and safer, more reliable transport for his passengers. SMITHS means comfort, too, for everyone who travels on these new diesel trains: there's no steam heating from diesel motors—so SMITHS provide special combustion heaters which warm the whole train.

WHAT SMITHS MEANS TO ANN MARSDEN
Synthetic textiles provide Ann Marsden with clothes that are gay-looking, yet serviceable; expensive-looking, yet blessedly modest in price. SMITHS, who do a number of interesting jobs for the textile industries, have made two small but important contributions to the cheapness and serviceability of synthetic textiles: K.L.G. use Hylumina—the gem-hard, fused-alumina insulating material they developed for K.L.G. sparking plugs—to make thread guides that resist the fierce abrasion of fast moving synthetic yarns and threads in spinning and weaving processes; and Kelvin Hughes make yarn-tension recorders which record, electronically, changes in yarn tension from instant to instant. These sudden tension changes weaken the yarns or may even break them. The records help designers and operators to remedy the trouble by modification or adjustment of the machines. To Ann Marsden, SMITHS means cheaper nylons—and fewer ladders in them.

a name with a world of meaning

MOTOR ACCESSORY DIVISION
The average British car probably uses between six and a dozen different SMITHS accessories, which have won their place in it by their excellent design and workmanship. The motor industry's demand for SMITHS accessories is immense, and the immense production resources of Motor Accessory Division work at full stretch to keep pace with it.

CLOCK AND WATCH DIVISION
Clock and Watch Division is, without any doubt whatever, the most completely equipped organization in this country for the development, design, and manufacture, of clocks and watches of every kind. In all important respects it is the most completely equipped organization of this kind in the world, and its supremacy is demonstrated by the supremacy of its products in every price range.



INDUSTRIAL INSTRUMENT DIVISION
Industry already has a great need of instruments, to indicate or record such matters as speed, time, distance, quantity, pressure, or temperature; and the need grows at an increasing rate as Industry becomes more automatic. A notable proportion of Britain's industrial instruments are made by SMITHS Industrial Instrument Division.

AVIATION DIVISION
Aviation Division employs some of Britain's finest engineering and scientific talent, and most potent research facilities, in the development and commercial production of aircraft instruments of the utmost accuracy and reliability, and autopilots and complete flight systems which provide the safest possible navigation for nineteen air lines, including some of the biggest in the world.

KELVIN HUGHES
Though the name 'Kelvin' has been famous for over 50 years in the scientific instrument field, and the name 'Hughes' in the nautical instrument field for over 200 years, the two came together as recently as 1947 in the Kelvin Hughes organization, which joined the SMITHS group very soon afterwards. In their own fields, which have now widened considerably, Kelvin Hughes products are second to none.

S. SMITH & SONS (ENGLAND) LIMITED

Britain builds its future on coal

...and there's a whole new wealth of opportunity for career-minded young men... as Britain's coal industry pushes ahead with vast reconstruction and development programmes...

Exciting things are happening in Britain's new coal industry. New collieries are being opened. Large-scale mechanisation is the order of the day. Engineering and scientific research teams are busy exploring new ways to get coal and to make it work harder for the future wealth and welfare of the nation. The men who make their careers in coal will find the rewards measure up to the responsibilities. The money is good. The prospects are excellent. Not only is there a fascinating variety of problems; there is the satisfaction of knowing that this is one of the most vital careers Britain has to offer.

University Scholarships: Do you realise that the National Coal Board offers a hundred University Scholarships each year to school-leavers and young men already in the industry? This fact alone gives you some idea of the need for highly-trained people. Most of these Scholarships are for mining engineering, but some are given in mechanical, electrical, civil and chemical engineering and fuel technology. The parents' income makes no difference to the value of the Scholarship.

Apprenticeship Schemes: If you come into the industry direct from school, you can enter Student Apprenticeship Schemes in mining, mechanical and electrical engineering; or you can enter Engineering Craftsmen or Mining Surveyors Apprenticeship Schemes. These Schemes co-ordinate technical college study (day release and sandwich courses) with planned practical training.

Management Training: An excellent prospect for those who have obtained technical qualifications, either through University or through part-time study at a technical college, is the Board's Scheme of Management Training. This lasts for two to three years and trainees often work on development and reconstruction schemes, getting their training today at mines in which they may hold responsible posts in the not too far distant future. For example, the chances of a mining engineer becoming, between the age of 26 and 30, a colliery manager (with a salary of £1,400 to £2,100) are good.

"The Many Careers in Coal": This is the title of a free booklet you can write for if you are interested in making your career in this vital industry. You will read what prospects there are, for example, in mining engineering, mining surveying, mechanical, electrical and civil engineering and in the Scientific and Carbonisation departments. Men studying physics and chemistry should note that there are opportunities to do interesting and original research and scientific control work.

FREE TRADE AREA

A Time for Compromise

NEGOTIATIONS on the European free trade area may soon come to life. In March, the French government under M. Gaillard laid a memorandum strongly critical of the British concept before the five other members of the European economic community. They and the community's executive commission have since devoted a good deal of thought and effort to evolving new common proposals acceptable to France, which yet go some way to meet the very different British view. Now that there is a French government—a government, too, which is likely to have a clearcut policy—the six hope to complete the formulation of their common stand. Serious negotiations with Britain and the other countries outside can then begin.

The proposals of the six are likely to be constructive. Not only the free-trade-minded Germans and Dutch, but the executive commission of the six appreciate the necessity of finding a *modus vivendi* with the rest of western Europe. On agriculture; on the notion that members should commit themselves to the five-day week, equal pay and equal holidays in industry; and even on the request for a share in the benefits of imperial preference, practical study and cool consideration on both sides of the Channel have cut down the giant differences to man-size. But the gap will not be closed without real concessions from Britain. The vexed issue of the external tariff which the free trade area is to maintain is still unresolved. Institutions may also raise more difficulties than appear at first sight. Between the federal aspirations of the European community and the more limited purposes of the free trade area scheme there is a significant political distinction. The commission of the six has been much preoccupied with the need to preserve the community's unity and political initiative within the broader scheme. It will take time, patience and perhaps a period of active working partnership before a satisfactory political relationship is established between the six and the rest.

Mr Maudling's hope of having a free trade area in the bag by the end of the year can hardly be realised now. It is hard luck on Mr Macmillan's government, which could do with the fillip of a grand European treaty. For a time earlier in the year, Mr Maudling's vigorous diplomatic pressure did succeed in forcing the pace—spurring France and the six to think actively about the free trade scheme. But the time for pressure alone seems past. The six appear prepared to show goodwill and overcome the urgent practical danger for the countries outside—that tariff discrimination against them might set in on January 1st—by a provisional 10 per cent tariff reduction on that date throughout western Europe. If the more lasting arrangement, so much in Britain's interest, is to be achieved, the British Government on its side has to appreciate that the time has come for compromise.

HOUSE OF LORDS

Backwoodsmen on their Honour

THE House of Lords is not taking too kindly to the Government's proposals for trying to keep out the backwoods peers, even though the Government's requirements are becoming increasingly modest. The new standing order of the House, as finally debated this week, merely empowers the Lord Chancellor to write to every peer, asking whether he wants to apply for leave of absence. Any peer who does not reply within a month is automatically to be given leave of absence and from then on he will be "expected" not to attend the House until he has given notice. The use of the word "expected" dispels any suggestion of legal compulsion, but even this was too strong for some of the peers, notably for Lord Salisbury.

Although not able to be present for the debate, Lord Salisbury took the unusual course of letting his always influential views be announced by another peer. Lord Salisbury argued that the writ of summons sent to a peer at the beginning of each Parliament cannot be set aside by any action of the House, and that even if a peer had been given leave of absence, he ought still to be free to attend in an emergency without any "moral stigma" attaching to him. The Government's answer to this was that 300 or so peers (more than one in three) had never felt compelled, by any crisis, to come to Westminster.

It was no doubt a tribute to Lord Salisbury's persisting influence, at least on the House's domestic arrangements, that a proposal to remove the "expected" stigma was only defeated by 52 votes to 36. A typically woolly Labour motion to adjourn the debate so they could all think again was beaten more easily. The debate confirmed, however, that the Government's tentative, piecemeal efforts to reform the Lords are falling between two stools of criticism. Creating a few life peers (and peeresses), putting backwoodsmen vaguely on their honour not to attend, and giving peers who do attend a small allowance, adds up to more than the diehards would like, but is not nearly radical enough for those who want to see a streamlined and invigorated House of Lords. As the number of people who want to see a really invigorated Lords is strictly limited, however—it is not only Labour which thinks that such a thing could be dangerous—the new and undoubtedly illogical system can now be expected to pass peacefully towards its inauguration.

NATIONAL INCOME

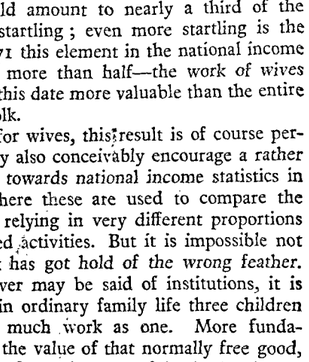
What Price Home Cooking?

MR COLIN CLARK has always brought to the study of national income statistics an ingenuity worthy of the naturalist Cuvier, who could reputedly deduce the whole bird from a single feather. In the current Bulletin of the Oxford Institute of Statistics* he tackles a long-standing paradox: that of the unpaid household services whose quantity and quality are obviously all-important to the national standard of living supposedly measured by national income, but which, being unpriced, are excluded from all official totals. (As Professor Pigou has put it, if a number of bachelors employing paid housekeepers decided to marry them then the national product as officially measured would fall.) What, Mr Clark asks, is the proper value to set on unpaid housework? And how has that value changed over the last seventy years or so?

The feather from which he reconstructs his domestic

* Bulletin of the Oxford University Institute of Statistics, Basil Blackwell. 215 pages, 10s. 6d. Vol. 5, No. 2.

fowl is the cost of local authorities' institutional domestic services. Duly analysed, these show that the annual cost of attending to a child of under five is £330, while for older children the corresponding figure is £182 and for adults £112. Applying these figures to the population statistics, he discovers that in 1956 the value of housework amounted to just over £7,000 million—which compares with just under £16,000 million for the national income as generally reckoned. That the home-cooking element in the real national income should amount to nearly a third of the whole is sufficiently startling; even more startling is the calculation that in 1871 this element in the national income came to considerably more than half—the work of wives and mothers being at this date more valuable than the entire output of their menfolk.



As a talking point for wives, this result is of course perfectly splendid. It may also conceivably encourage a rather warier public attitude towards national income statistics in general—especially where these are used to compare the outputs of economies relying in very different proportions on priced and unpriced activities. But it is impossible not to feel that Mr Clark has got hold of the wrong feather. For one thing, whatever may be said of institutions, it is simply not true that in ordinary family life three children make three times as much work as one. More fundamentally, to calculate the value of that normally free good, a housewife's services, from the cost of institutional care is like calculating the value of that normally free good, breathable air, from the cost of pumping it down a mine-shaft, or the value of a hand or foot from that of an artificial limb.

To reckon up all the free goods normally enjoyed at the value of their nearest market-price substitutes would make us all multimillionaires. This is a thought conducive to a certain Victorian-moralistic contentment, but not really very illuminating to the economic scene.

INDONESIA

The Last Phase

THE Indonesian rebellion, several times declared by foreign journalists and Jakarta spokesmen to be over, may now indeed be entering its last phase. The central government has landed forces near Menado, the rebel "capital" in the extreme north of Celebes, and has announced that "large-scale landings" are to follow. A number of islands, including Lembeh, have been seized. On Celebes itself, central government forces have been advancing towards Menado from their beach-head at Gorontalo.

The fighting, so far, has been on a small scale, but the fact that there has been any fighting at all tends to confirm the impression that the going will be harder in north Celebes than it was in central Sumatra, where the invading force met virtually no resistance. A central government communiqué, for instance, speaks of a rebel counter-attack on Lembeh island, launched from a port opposite, though it claims that it was defeated. Rebel spokesmen say that they have 10,000 men under arms in north Celebes and that their orders are to meet the attacking forces and fight. Guerrilla action is not, apparently, contemplated. The rebels are believed to include tough Ambonese soldiers—whose martial qualities are traditional.

In the long run, the scales are heavily weighted in the central government's favour. How long a run may, however, be of more than academic interest. The financial situation in Jakarta must be alarming to President Sukarno's advisers. The prime minister, Dr Djuanda, said in a speech earlier this month that "if the rebellion had not been suppressed" the government would have had to stop paying its armed forces and to close its diplomatic missions abroad. The rebellion, however, is evidently not over yet, and unless President Sukarno's men score a rapid success, the hazards of which Dr Djuanda spoke may reappear.

The prospect of a decline into further chaos in Indonesia is not one that can bring pleasure to anybody outside the communist block; nor would it necessarily further the rebels' aims.

GERMANY AND THE WORLD BANK

A Mite from the Great Provider

MR EUGENE BLACK has once more succeeded in persuading the West Germans to dip into their ample reserves to lend to the World Bank. The new $75 million loan brings Germany's total lending to the bank in the past eighteen months to $250 million. In its annual report the Bundesbank takes pains to point out that this contribution to the liquidity of the World Bank's clients does not show up in the figures of German reserves. The short and medium-term dollar certificates from the World Bank which the Bundesbank has bought, like the credits Germany grants to the European Payments Union and the special account for arms which it has opened in London, appear as assets in the balance sheet of the Bundesbank lumped in with the pile of foreign exchange reserves. At the end of last year £540 million of the £1,940 million of reserves in Frankfurt consisted of assets of this kind, where the cash in fact remained in other hands, financing world trade. Well over half the £435 million increase in German reserves last year and a fair proportion of the new accretions since March were accounted for in this way.

Even if these tied assets are left aside, however, the reserves of gold (nearly £900 million) and foreign exchange (over £500 million) in Frankfurt are comparable in scale with the gold and dollar reserves held in London—nearly £1,100 million. West Germany has no such accumulation of dollar securities as Britain has; but its overseas liabilities are also far more slender. True, in the next few years some £680 million will have to be paid out under the London debt agreement of 1953; reparations to Israel may take another £140 million and compensation to individual victims of nazism a further incalculable sum—perhaps several hundred million pounds. But obligations to holders of marks abroad are negligible beside the £3,200 million of overseas sterling holdings.

A new peak figure for German currency reserves was announced at the same time as the World Bank loan. The trade figures for May show a record surplus. Continuing internal expansion has increased the volume of German imports this year as Professor Erhard hoped it would; while the growth of exports has been halted and turned back by recession abroad. But all the gain—from a foreign point of view—has been wiped out by an improvement in Germany's terms of trade as raw material prices have fallen. The Germans will evidently have to find more lavish ways of exporting capital and reserves. But cast as they are (by other people) in the part of great provider, they are very much aware not only of the inflationary risks but of the tremendous political significance of the various projects to increase international "liquidity."

FREER TRADE IN EUROPE

For those wishing to keep continuously informed of free trade and other developments in Europe we provide two subscription services:

*A four-page bulletin devoting each week a full page to European free trade developments:

WORLD BUSINESS SPOTLIGHT

*Our three-monthly reports on business conditions and prospects in the countries concerned grouped in two new REGIONAL SUBSCRIPTIONS at specially reduced rates:

BRITISH GUIANA

Money from Somewhere

NEXT week quite an important little meeting behind closed doors will take place in the Colonial Office about the finance and development of British Guiana. It will consist of Dr Jagan, the Minister of Trade and Industry, Mr Beharry, the Minister of Natural Resources, the Governor, Sir Patrick Renison, the Financial Secretary and the Colonial Office experts. In the last elections, for the new but limited constitution, Dr Jagan made the pledge that if he and his People's Progressive Party were returned to power—or rather to partial power—he would make a world tour to find money for a much accelerated development of the territory. He is now short of cash, and there is every reason to believe that he wants to do this—and some reason to think that the Colonial Office wants to head him off. The Colonial Office has two lines of argument. The first is that the current five-year development plan is already costing £20 million, exclusive of Colonial Development and Welfare funds and some Commonwealth Development Corporation projects; the other is that Dr Jagan would merely cause fresh trouble if he asked Russia for money. He certainly would, and especially trouble with the United States, which is why, needing dollars most of all, he probably would not try.

But the principle—that poor colonies should try to raise money in any capital market throughout the world in which they can get it—is a good one. The Colonial Office knows Britain has not enough money to develop all the colonies. Let Dr Jagan shop round for more by all means. It would even be interesting to see if he could get any Russian funds—very few underdeveloped territories have. British Guiana is probably one area that could absorb more capital fairly promptly—if investors will risk it. Let Dr Jagan try to find them and to coax them, without too heavy a restraining hand from here.

MR TROLLOPE'S NEW NOVEL

DR THORNE. *A Novel.* By Anthony Trollope. In Three Volumes. *Chapman and Hall.*

It is very refreshing in the present day to read a love story of the good old sort,—to follow the course of an affection that finds its reward, not in poverty, high-mindedness, and content, but in a comfortable legacy of £300,000. Such is the pleasure that Mr Trollope offers in his new novel. . . . Having expressed our first emotion of gratitude, and recovered our sober reason, we begin to think, however, that Mr Trollope has not done as well for us as he might have done,—not half as well as he has done on former occasions. When "The Three Clerks" appeared, we noted the carelessness of style and want of finish of that tale in comparison with "Barchester Towers," and expressed a hope that Mr Trollope would in future allow his pen time to do its best. Six months have scarcely elapsed, and three more volumes are published. The faults that we noted in "The Three Clerks" are still more prominent in "Dr Thorne." The story is thin and flimsy in the extreme. There are evidences of no grasp, no care, no forethought. We drift on pleasantly without any effort of mind either on our own part or that of the author. It must not be understood that "Dr Thorne" is an inferior novel. We believe it to be impossible for Mr Trollope to perpetrate such a thing. With all its carelessness, it contains more good points than the majority of first-rate novels. But we feel that more care might have made it infinitely more telling, might have filled every page with really good writing, as is the case in "Barchester Towers." There is a freedom, an easy savoire faire about all that Mr Trollope writes, which convinces us that the most rapid composition would not reduce him to actual inferiority. . . . As to his characters, they could never be artificial or wanting in verisimilitude. His keen perceptions would always save him from creating an impossible or an exaggerated character. In the present work we do not remember one that is not sketched with spirit and truth. . . . But, when we think of the Warden, Bertie Stanhope, and the Proudies, we are inclined to be dissatisfied. The question is, not whether we are to have a true or an indifferent likeness, but whether we are to have a finely finished work of art, the result of a hundred delicate and subtle perceptions, or a rough, spirited daub, thrown off in a few touches.

BOOKS

Early Days in Israel

The First Ten Years: *Israel Between East and West*

By Walter Eytan.
Weidenfeld and Nicolson. 219 pages. 21s.

ON May 14, 1948, the independence of Israel was proclaimed in Tel Aviv. At that time the United Nations in New York were still debating the relative merits of partition and trusteeship; Jerusalem was cut off from food, water and electricity, and the guerilla battles of Arab irregulars became war in earnest. Mr Walter Eytan, who formed Israel's foreign office and directed it from the beginning, is admirably placed to tell the story of those fantastic early months. His careful understatements do not altogether conceal the excitement, the emotional turbulence and the amazing determination of the Jews who, against all the auguries, established their state.

Mr Moshe Sharett, Israel's first foreign minister, began work by sending cables to other governments informing them of the establishment of the state and asking for their recognition. Without recognition a new state must stifle—for a year it was headline news whether Honduras or Liechtenstein had decided to give theirs. Mr Sharett's staff were stranded in Jerusalem, and he was assisted only by two secretaries and a gazetteer for difficult spellings like Reykjavik. The swiftness with which Mr Truman recognised Israel seemed a near-miracle to the infant state—and startled the American delegation at the United Nations, which was still arguing for trusteeship. Guatemala followed suit and then—a second miracle—the Soviet Union. Meanwhile in Jerusalem the siege had started in earnest. Two separate United Nations commissions were caught there (their members had been too busy foraging for food and drink to attempt their unrealistic assignment) and Mr Eytan has an amusing memory of a distracted Frenchman disgusted with the calmness of a Spanish colleague shouting "that man—he calls himself a Spaniard!". Jerusalem withstood the siege and the commissions faded away.

By the beginning of 1949 the war had stopped and the armistice negotiations with individual Arab states had begun. Here Mr Eytan, who took an important part in the discussions, could tell us a great deal, but he is often tantalisingly reticent. The Israeli and Egyptian delegations met at Rhodes and under the smooth mediation of Dr Bunche, the United Nations compère, apparently got on splendidly. One of Mr Eytan's vivid recollections is of Dr Bunche offering the delegates decorated ceramic souvenirs if they agreed, but threatening to break the plates over their heads if they failed. The plates remained unbroken. The subsequent negotiations between Jordan and Israel, however, soon got stuck, and behind the official front of sterile discussions in Rhodes, Mr Eytan and some colleagues fixed the armistice agreement by slipping across the Jordan frontier and having secret all-night talks with King Abdullah at his Winter Palace.

The argument that emerges clearly from Mr Eytan's narrative is that in those days the situation between Israel and individual Arab countries was still pliable; piecemeal discussions could and did have results. But when the United Nations tried to sponsor a package deal for "permanent peace" between Israel and all the Arabs, the position froze into its present deadlock. The later conference at Lausanne was a fiasco: at Rhodes the delegates had stayed under one roof and became friendly in the corridors; at Lausanne the Israeli and the Arab delegations stayed at opposite ends of the town and officially never talked directly to one another. As Mr Eytan laconically points out, the armistice agreements would have been phrased more carefully if it had been suspected that they were not to be supplanted by more permanent treaties.

Mr Eytan goes on to tell of the later frustrations and achievements of the Israeli state, but his material here is, on the whole, less original and consequently often less interesting. He has one particularly informative section on the relations between Israel and Asia, showing how the initial goodwill that many Asian states felt towards Israel was smothered by their nervousness of Arab pressure. His story of the endless notepassing between the United States and the Soviet Union after the Sinai campaign is bogged with detail, and he only skates the surface of the relations between Israel and the Jewish diaspora. But his eye-witness account of Israel's early months is enthralling and one wishes that he had made it fuller.

Russian Radical

Mikhailovsky and Russian Populism

By James H. Billington.
Oxford University Press. 217 pages. 30s.

THIS is the first study to appear in English of one of the most original and attractive of the Russian nineteenth century radicals. His work is as yet very little known in this country. Some attention has been paid to the earlier figures, the men of the forties and fifties who appeared at the dawn of Russian radicalism: Belinsky, the incredible Bakunin, the noble Herzen. The futile and brave terrorists of the late seventies have caught the imagination of many western writers. During the last decade of the century the tide of Marxism began to sweep all before it. In Russia today Mikhailovsky is remembered, if at all, in the contemptuous phrases that the young Lenin flung at him for daring to oppose this tide. Since the history of ideas is poorly served by those who view it in terms of the victorious and the defeated—or those who at any moment are accepted as the victorious and the defeated—Mr Billington has done well to introduce Mikhailovsky to the English-speaking public. He has moreover produced a first-class piece of work—scholarly, sober, clearly written, sympathetic and at the same time critical. He skilfully traces the evolution of Mikhailovsky's thought, scattered in the articles and reviews that form the corpus of his work. He enables us to see through the prism of Mikhailovsky's sincere and searching mind the elements that went to the making of the Russian radical movement in the last four decades of the nineteenth century.

It cannot be said, and indeed Mr Billington does not suggest, that Mikhailovsky developed any complete sociological or political system. His influence was rather that of a publicist, illuminating with his comments the problems that agitated the Russian radical intelligentsia. Yet there is consistency in his judgments. In the forefront of his thought there was always the human personality: its free development was his first, indeed only, criterion. Proudhon and Herbert Spencer were the earliest influences upon him in this direction. But he rejected Spencer's view of society as an organism, just as he rejected thereafter all "total" systems and "scientific" doctrines of human development because they seemed to him to ignore or to sacrifice this paramount claim of the individual.

His repudiation of Marxism was in line with this belief in the primacy of the individual. To Mikhailovsky more than to anyone else, as Mr Billington shows, belongs the credit for developing the main trends of those populist ideas which subsequently formed the basis of the socialist revolutionary movement in the twentieth century. Herzen before him had already urged that salvation lay with "the people." But what in Herzen's case was an almost emotional counsel of despair—despair at the sordid features of capitalism—became in Mikhailovsky's hand a well argued doctrine. Mikhailovsky believed that, without rejecting economic progress, Russia could avoid the western form of capitalism by developing its economic organisation around the co-operative traditions of the peasant commune.

It was perhaps a forlorn hope. Turgenev may have been right in urging that Russia had no choice between sinking into a native barbarism and adopting what was best in European civilisation, and that it should not pursue the chimera of some "separate path" of its own. For Mikhailovsky this "separate path" always remained the lodestar of Russian radical policy. His influence, though great at the time, was perhaps transitory. But no one whose criteria transcend material progress alone can fail to be moved by the sincere passion to save the individual from annihilation in society that animated this noble and generous mind.

Surprising Professor

The Life of Knut Wicksell

By Torsten Gårdlund.
Almqvist and Wiksell. 354 pages. 30 kr.

THE biography of an eminent Swedish economist, the father of modern monetary theory, the scarcely less direct inspirer of Swedish social democracy, might be expected to be a useful, enlightening, worthy volume but, on the whole, rather dull. In Mr Gårdlund's "Life" this expectation is resoundingly falsified. For Knut Wicksell was not only an eminent economist and influential social thinker and teacher. He was also—so his biography reveals—a collector's specimen of indomitable, admirable, pathetic and hilariously comic crankery, a rebel with half a dozen causes, a rationalist version of Ibsen's Brand. In a society no less stuffy and shockable than that of contemporary Victorian England, he irrepressibly pamphleteered, journalised and lectured on free thought, pacifism, feminism, and worst of all and most frequently on the necessity of contraception—a topic to which he brought all the strong personal feelings derived from a long celibacy which he was both too fastidious and too high-minded to mitigate. The results, in opprobrium, notoriety, professional frustration and minor *contretemps*, were what might be expected. All things considered, it is to the credit of the Swedish academic world that he ever got a university post at all. Reforming zeal does not necessarily make a crank, but Wicksell had, in addition, the crank's unmistakable earmark—a total lack of any sense of proportion or gift of diplomatic compromise. This lack evidently did not spring, as it does in most cranks however philanthropic, from a complete and incurable egotism; on this point the testimony of his friends and his much-loved wife is unmistakable. But it produced all the usual farcical effects both in his private and his public life—including a jail sentence for blasphemy which, as an already elderly man, he endured with the utmost composure.

It is a pity that with such a hero Mr Gårdlund should not have let himself go a bit. His "Life," which includes a competent appreciation of Wicksell's economic achievement, presents a clear picture; but it is photography where, on the very evidence of the photograph, the subject cries out for truthful but creative portraiture. Perhaps the proper biographer for Knut Wicksell would be a consortium (advised, certainly, by a competent economist) of C. P. Snow, Kingsley Amis, Samuel Butler and James Joyce.

Built on Wheat

The National Policy and the Wheat Economy

By V. C. Fowke.
Toronto University Press. London: *Oxford University Press.* 312 pages. 45s.

A HUNDRED years ago Captain Palliser, commander of the British North American Exploring Expedition, reported that "the time has now for ever gone by" for establishing through the prairies "a line of communication . . . across the continent to the Pacific exclusively through British territory." Within fifty years, despite all obstacles and the competition of easily accessible American centres, the western plains had become the crux of the new Canadian nation, attached by the transcontinental Canadian Pacific railroad to the financial, commercial and manufacturing centres of the St. Lawrence. Settlement of the Canadian wheat lands provided "investment vitality" for the entire economy. The westward flow of settlers and supplies and the eastward flow of grain established Canada's political and economic unity and confirmed the transatlantic connection with Great Britain. In this important study of the dynamic role of prairie wheat in the first and formative phase of Canadian national development, Professor Fowke has drawn on the work of a whole generation of scholars and on his own intimate knowledge of the Canadian west.

His analysis embodies a searching examination of the position of the wheat grower within the framework of national development policy. Paradoxically, though the grower was the focus of the whole process of national expansion and consolidation, he remained throughout the victim of "the competitive disabilities of agriculture within the price system." Selling his wheat in competition with hundreds of thousands of other wheat farmers, he has had to buy the supplies, equipment and services he needs in markets characterised by monopoly of varying degrees and protected by tariffs. From the beginning of prairie settlement, farmers have struggled to correct these disabilities. Their initial attack was on railway monopoly and inadequate shipping facilities. They have gone on to the promotion of provincially owned and farmer-owned elevator systems; of farmer-operated selling organisations, culminating in the great co-operative pools; and finally to strong support of central government marketing through the Canadian Wheat Board and of such international agreements as the postwar United Kingdom Wheat Agreement and successive International Wheat Agreements.

Started, ironically, to curb rising prices, the Wheat Board has normally handled western grain on a commercial basis. Almost alone among the grain growers of the world, the Canadian wheat farmer had not had the protection of a systematic subsidised price support scheme until the proclamation of this year's Agricultural Stabilisation Act, which perhaps marks the beginning of the new phase in Canadian national policy foreshadowed in the conclusion of this book.

Pronouns in Poetry

Poets' Grammar

By Francis Berry.
Routledge and Kegan Paul. 190 pages. 21s.

THE young, for thirty years and more, have been taught to read poetry with a scrutinising eye and an intelligence alert to the choice of word and the pattern of imagery. It is therefore not surprising that critics brought up in this discipline should become fascinated by the less conspicuous but vitally important linguistic elements that poets make use of. Mr Donald Davie's "Articulate Energy" demonstrated, not long ago, the advantages of looking closely at the syntax of a poem in order to discern its meaning; and now Mr Francis Berry is urging us to attend to the way in which individual poets employ such grammatical forms as the personal pronoun, the future tense or the subjunctive mood.

It proves to be quite an exciting line of investigation, for the good reason that Mr Berry writes with the insight of a poet rather than the patient accuracy of a grammarian. If this pioneering sortie were followed up by the systematic investigation of the whole territory by teams of research students, the result would be devastating. A niggling preoccupation with prepositions is as

EUROPE:
FAITH AND PLAN
by
OSWALD MOSLEY
A Way Out from the Coming Crises and an Introduction to Thinking as a European
12s. 6d.
Euphorion Distribution (England) Ltd.

some a way as any of killing the enjoyment of poetry. Mr Berry, however, is not systematic, and the best comments in his book spring from his realisation that to understand the language of literature some experience of life is requisite.

His remarks on what the subjunctive mood meant to Keats and to Shelley are peculiarly illuminating, and no less good is his examination of the intricacies of tense-usage in King's *Exequy* and Marvell's *Coy Mistress*. An inquiry into Shakespeare's use of "Thou" in some sonnets and "You" in others yields some rather unexpected results, and Donne's use of personal pronouns also proves to be well worth watching.

A great number of poems and poets are brought into this survey, which, though sketchy, does stimulate. Perhaps the least satisfactory chapter is the last, in which the huge question of verse translation is raised. The difficulty of finding the right prepositions and tenses to correspond with the originals is illustrated by what Mr Berry calls a "para-translation" of his own from a Swedish ballad; but in some instances he has badly diminished the effect of his original, and in any case the topic deserves a far longer and more thorough treatment than it gets.

A Democratic Socialist

The Chartist Challenge

By A. R. Schoyen.
Heinemann. 300 pages. 25s.

GEORGE JULIAN HARNEY, one of the most intelligent as well as one of the most advanced leaders of English Chartism, was born of working-class parents in 1817. He was first imprisoned, for selling illegal newspapers, before his eighteenth birthday, and reached the summit of his career as a radical before he was thirty-six. He taught himself, by observation as much as by reading, and developed powers as a speaker that were remarkable even in an age of great orators; he also wrote, with fervour and pungency, for Feargus O'Connor's *Northern Star*.

Harney was a thoughtful man; and his reflections early led him to conclude that nothing short of social violence could bring about the social revolution that justice seemed to him to demand. But he did not let either the enthusiasm of his audiences, or the ingenious syllogisms of his friends Marx and Engels, delude him into the belief that social violence could bring success, or be achieved at all, without careful and intricate planning and a firm base in nationwide support. When it became clear that the nationwide support would be given to foreign adventures instead of domestic improvement, when O'Connor and Engels alike had turned against one who would be no man's disciple, he retired to Jersey and then to Massachusetts, returning at last to settle in England at the end of the eighties, and to die in 1897. He opposed Disraelian Toryism and Gladstonian Liberalism alike; he detested the plan of home rule for Ireland. Democracy alone, he judged from his American experiences, was an insufficient creed; Marx's brand of socialism he thought undemocratic. He preached, all through his political life, the creed of democratic socialism that can still warm radical hearts:

> It is not any amelioration of the condition of the most miserable that will satisfy us; it is justice to *all we demand*. It is not the mere improvement of the social life of our class that we seek; but the abolition of classes and the destruction of those wicked distinctions which have divided the human race into princes and paupers, landlords and labourers, masters and slaves.

He does not figure in the *Dictionary of National Biography*. Dr Schoyen has written a clear and valuable life of him—a difficult task, for much of Harney's work was done in secret with men anxious to leave no clues for hostile policemen behind them. The author has taken pains to clear his hero from the charge of being a police spy; has elucidated his relations with Engels, much obscured by Marxist writers; has brought out the charm of his character; and set him in his leading place among the English radicals who assisted persecuted continental refugees. To only one point does exception need to be taken; it introduces a needless complication for students of history if the current custom of calling men by their first names is carried back from the present into a past that would have disapproved it.

British Rule

The Necessary Hell

By Michael Edwardes.
Cassell. 213 pages. 25s.

MR EDWARDES'S aims, as set forth in his introduction and epilogue, are high indeed: to avoid alike the propaganda of the imperialist and the apologia of the defeated, and to set forth the true tragedy of British India, the "necessary hell" of which (he argues) led to the freedom of India. The conception is grand, the theme noble. Unfortunately, Mr Edwardes has neither the experience of men and affairs nor the breadth of vision to fulfil it. He is incomplete, elliptical and impressionistic, in a manner that must occasionally make the story difficult to follow for the reader who is not already familiar with it. On the other hand, to those well versed in Indian affairs, Mr Edwardes's failure to give source references for his many (often admirable and potentially enlightening) quotations must be a cause of exasperation. Mr Edwardes has an arguable theme, with which many will sympathise but, precisely because it is not as yet widely accepted, it will arouse hostility from the established authorities; it is, therefore, all the more regrettable that he does not pinpoint his sources so that they may be verified *in their context*.

In his final sentence, Mr Edwardes quotes Sir Herbert Edwardes, of North-West Frontier fame, as having said in 1860 that the "fitting of India for freedom" was "a thing worth doing and a thing that may be done," and he reasonably claims that in the final analysis it was done. It is, however, difficult to tell from his pages exactly how it was done, since his space is primarily taken up with the story of how British rule was consolidated. But a substantial part of the preparation for independence came after that, between 1883 and 1947, six decades which Mr Edwardes seems to regard as the twilight of, in his words, a "somewhat tarnished" empire. He makes no mention of the rise of the Congress party or the Muslim League, of Ripon, Irwin, Curzon, Gokhale, Jinnah or Gandhi, all of whom constituted part of the "necessary hell" and made their contribution, positive or negative, to the fitting of the people for independence.

If Mr Edwardes's high-falutin introduction and epilogue are ignored, the chapters in between fall into focus as a well-written history of the crucial years that culminated in the Mutiny, told from an unjingoistic and compassionate viewpoint that takes both British and Indian feelings into account. They were worth writing, and nothing in this criticism should dissuade the general reader from enjoying them.

Parliament Modernised

Parliament: *2nd Edition*

By Sir Ivor Jennings.
Cambridge University Press. 574 pages. 60s.

THE classic works on Britain's governmental institutions are few in number. Among the very foremost of those few are Sir Ivor Jennings's two great works. "Cabinet Government" is perhaps the more important, but "Parliament" also is indispensable for any serious student of politics, both as a work of reference and as a major statement of principle. It was first published in 1939 and the time was more than ripe for the second edition that has just appeared. Yet although there are many changes it is surprising how little fundamental rewriting has been required. The footnotes pay tribute to recent studies—to Herbert Morrison's "Government and Parliament," and to the work of R. T. McKenzie, J. F. S. Ross, and the Nuffield psephologists. The chapters on the Opposition, on financial control, and on the House of Lords have been especially modified and a new one has been added on the nationalised industries.

Some may feel that the modernisation of this major book has been too much a matter of patchwork. The different dates of writing and types of illustration mingle awkwardly in places, and there are themes, such as the operations of pressure groups and the nature of elections, where the findings of recent research have not been fully digested. Other critics will argue that Sir Ivor is too optimistic about the vitality and excellence of our parliamentary institutions in their present state. But none will deny that this is, as its blurb proclaims, "the standard work on Parliament for the ordinary citizen"—a comprehensive, meticulous, readable examination of the way in which the most famous of all legislatures operates.

Background of Management

Managers: *A Study of Their Careers in Industry*

By R. V. Clements.
Allen and Unwin. 200 pages. 20s.

A FEW years ago nothing was known of the background and career history of the men who run British industry. The fact that Mr Clements's book is the third to be published on this subject in the last three years is yet another indication of the recent interest in management in this country. However, these three books, Dr Copeman's "Leaders of British Industry," the Acton Society Trust's "Management Succession" and Mr Clements's book are slight compared with their American counterparts, particularly the extensive study by Lloyd Warner and Abegglen of "Occupational Mobility in American Business and Industry," covering 8,000 top executives.

Mr Clements's lucidly written study is based on his interviews with 646 managers at different levels in 28 private manufacturing companies, selected to give a varied sample of size and industry. The firms were situated in the north-west of England, mainly round the Manchester area. Managers were asked about their age, family background, education, salaries and career history, and nearly all were willing to co-operate. The interesting numerical results are given in the appendices, while the bulk of the book is concerned with their interpretation. Six basic career patterns are distinguished and the changes in their relative importance during the last thirty years are discussed. The career patterns are illustrated by case studies. Mr Clements rightly handles his results with modesty, in contrast to other studies that are too ready to make generalisations from tiny samples.

Mr Clements suggests that, by studying individual managers, it may be possible to make the discussion of management problems more concrete and theories of management more exact. His most significant contribution is the suggestion that there is no one type of manager and that "industrial management appears to be a host of diverse jobs, entailing diverse techniques and experience, different standards and types of education, and different attitudes and sets of principles." These practical differences are so great that, so far at least, Mr Clements sees little foundation for the idea of a "profession" of management. Managers, he suggests, form many non-competing groups, since a man who is only selling his managerial skill, as distinct from a professional training like accountancy, often has difficulty in persuading another firm that he has much of value to offer. This lack of competition is likely, he thinks, to be one explanation for the low level of mobility among managers.

LETTERS

Borrowing by Local Authorities

SIR—I read with interest in your last week's issue that Birmingham "has the satisfaction of knowing that it has borrowed on the most advantageous terms possible."

This comment seemed to be so much in harmony with what I had said in my presidential address to the Institute of Municipal Treasurers and Accountants that it was with some consternation that I read your criticism of what I said in your later Note, "A Borrower Dissatisfied."

The point I was seeking to make in my address was simply that what the market regards as an overwhelmingly successful issue may from the borrower's standpoint be one which is slightly undervalued. I most certainly did not say (as you seem to suggest) that the 6 per cent issues were more successful than the 5¾ per cent issues. Indeed, it is surely obvious that in my view the 5¾ per cent issues did better than the others—not (for my purpose) because the yield to the investor was lower, but because they attracted, as did the Birmingham issue, a satisfactory but not an overwhelming response. Would you not say of Hull and Swansea, as you said of Birmingham, that they had "borrowed on the most advantageous terms possible" at the time?

This is not a matter of jobbing backwards, a practice which I deplore. I sought to emphasise that the settlement of terms for an issue of stock is "an operation of a delicate and difficult character" and I have the utmost sympathy for those who have the immense responsibility of taking the crucial decisions.

I repeat that my main purpose was merely to express a view, based on experience since October, 1957, about the characteristics of a successful issue from the local authority's standpoint. Levels of Bank rate have no relevance to this point.

As to the question of popularity, let me assure you that I do recognise that some borrowers are less popular with investors than others. But this time the less popular borrowers seem to have had the better of the argument—not because the rate of interest they offered was lower, but because (applying your own Birmingham judgment) they got nearer to achieving "the most advantageous terms possible" at the time of issue.

Of course I know that "a Stock Exchange issue is the best bet." I said so in rather less racy language in my address.—Yours faithfully,

W. O. ATKINSON
County Treasurer

Middlesex County Council
Westminster, S.W.1

Inflation

SIR—Surely Lord Pethick-Lawrence misses the point. It has become patently obvious that when costs rise faster than output over the whole economy prices rise. We then have what we have learned to think of as inflation. When output rises faster than costs prices tend to be stable or to fall. These things are likely to be true irrespective of the other factors he mentions.

This does not mean that, because wages are so significant a factor in costs, the "dismal science" decrees there can be no wage increases or that a certain set of workers must forgo a rise in their standard of living. For one can gain a better standard of living in a dozen ways, combined with stable or falling costs—for instance, by more work, or better work (productivity), or promotion, or profit-sharing, or saving, or through steady wages and lower prices.

But it does mean that everyone must be careful at this moment not to contribute to another cost-push even if it would seem only justice to do so. If, for instance, when prices rise all wages rise, then politics, not economics, will have proved itself the dismal science—Yours faithfully,

JOHN ALLAN MAY

London, W.C.2

The Rhodesian Election Results

SIR—In your issue of June 14th your Salisbury correspondent says:

"When dust created by the Todd crash has subsided, some African leaders will realise that the Congress road of racial politics can lead only to disaster, and they will no doubt once again seek a place in one of the established political parties. In Southern Rhodesia this can only mean the United Federal party."

Is not this going rather far in the direction of "loaded" reporting? Could your correspondent give some evidence that Congress (which has a carefully multi-racial constitution) is indulging in "racial politics": and that it is "leading to disaster"?—Yours faithfully,

ANTHONY SAMPSON

London, S.W.3

Peking's Plans for Korea

SIR—I am afraid your article, "A Finland in Asia," reflects too much wishful thinking. There seems to be no doubt that giving up any "popular democracy" would be against communist dogma. What the Peking Government has most certainly in mind is a solution on the Laos pattern. That, as you are certainly aware, would be extremely dangerous and perhaps fatal.—Yours faithfully,

A. ROMER

London, S.W.1

(ADVERTISER'S ANNOUNCEMENT)

In the new and changing times...
a new look at an old truth:

Business men can no more afford to go to market with second-rate advertising than they can afford to go to market with second-rate products.

Business men have accepted the fact that advertising can pay.

To-day, they are saying that advertising *must* pay.

When the changes in the marketing picture are added up, this much is realistic:

If all advertising agencies were the same —if all copywriters and research men and merchandising men were of equal ability —a client would be foolish to bother his head about where his advertising originates.

But, if agencies are different in ability and service—if some agencies deliver better advertising and more sales to clients—then the advertiser cannot afford anything but the best advertising.

Marketing records plainly show the differences that advertising alone can make.

In many cases, all the factors in selling—from product quality to packaging to pricing—have remained the same and only the advertising has been changed.

And sales of products have reflected (sometimes for the better, sometimes for the worse) the changes which have been made in advertising appeals.

There are differences. There is such a thing as poor and ineffective advertising. There is such a thing as mediocre advertising. And there is such a thing as the best advertising.

In the new and changing times, it is the responsibility of business men to find it.

It is the responsibility of their agencies to deliver it.

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Republicans in Decay

WASHINGTON, DC

PRESIDENT EISENHOWER told the press on Wednesday that his Chief Assistant, Mr Sherman Adams, had been "imprudent" but that "I need him." No one aware of the extent to which Mr Adams has been doing the daily work of the presidency for these last five and a half years doubted that Mr Eisenhower spoke from the heart. And the Republican politicians who face elections in November took the hint; they scurried for cover at once, trailing statements suggesting that Mr Adams's usefulness was over. In a week which was full of grave international issues, the whole country was absorbed by the startling discovery that the austere little New Englander who had come on to the scene six years ago as a scourge to flay Washington's prevailing political morality was, after all, a Savonarola with feet of clay. To be more precise, Mr Adams, as he conceded to a congressional committee on Tuesday, is a man with a coat of vicuna. This garment, made supposedly of the hair from twelve hundred Peruvian goats, was given to him, together with a very expensive rug, a suit of clothes, a couple of mats and free hospitality in the plushiest hotels in Boston, New York and Plymouth, by his good and generous friend, Mr Bernard Goldfine, self-made multimillionaire. Mr Adams explained that the gifts were just normal exchanges between families and that the enquiries he made on Mr Goldfine's behalf from independent government agencies who were handling his legal problems were just a routine service that the White House would provide for any citizen with any problem.

Hardly anyone believes that Mr Adams is a man who could be "bought" in any crude sense. But most political observers are astonished that a man with his political *savoir faire* should be caught out by lack of sensitivity on such a matter. This was especially the case in that the allegations against Mr Adams and his explanation of his behaviour paralleled in so many ways the episodes involving members of Mr Truman's entourage which Mr Adams, of all people, had done most to blow up into a major campaign issue in 1952. His appearance before the congressional committee was in itself a sensation since, although he is often written up as the most powerful man in Washington, he is not, on account of his confidential relationship with the President, normally accessible to either Congress or the press. The total impression he made was rather better than that of the individual, and sometimes lame, items offered in his defence. He showed deference and even a wintry charm which contrasted with his notoriously curt manner when behind the rampart of his White House desk. But although, unless there are further revelations, the President can probably get away with keeping Mr Adams, the latter's credit with Republican party leaders, with whom he has never been popular, has been severely weakened and Republican orators from Mr Nixon downwards will have to delete from campaign speeches that familiar line about the Administration having "restored integrity to the government."

Although even so there are many Republicans of a vindictive nature who are rejoicing in Mr Adams's discomfiture, many others, especially those who are up for election this year, must be reflecting on the old political adage that, when a party has started on the road downhill, it never rains but it pours. As Mr Adams was making his way up to Capitol Hill to testify, the forty-eight Republican state chairmen were arriving in Washington to attend a campaign school, in preparation for next November's congressional elections, and to report on the sad state of their party. The news they brought, combined with recent events in Congress, confirmed that Mr Eisenhower and his political backers, such as Mr Adams, had signally failed in their great effort to remake the Republican party.

IT is not just that after five years in office there is normally a swing of the pendulum against the party in power. In contrast to the more usual pattern, according to which a freshly victorious party has tended to maintain its momentum for several years before beginning to decay, the Republicans began losing their grip, even on the strongholds they had held during their long exile, from the moment when Mr Eisenhower first swept triumphantly into the White House. New Jersey crumbled as early as 1953, when the Democratic Mr Meyner captured the governorship; in Oregon, where the Democrats were a small and despised minority in 1952, they now have almost a monopoly of office; Wisconsin has its first Democratic Senator in a great many years and Maine, Iowa and Kansas their first Democratic Governors since the New Deal. In 1952 in Michigan the Democrats held only the governorship among the many offices whose holders are elected by the voters of the whole state; now the Republicans have nothing left there except one Senate seat which is in dire peril.

Thus, during the Eisenhower Administration, the Republicans have failed to use their possession of office in Washington to consolidate their position in the country, while the Democrats have used every capture of local office to spread their tentacles throughout the politics of a state. In many instances it has been the governorship from which they have worked, an admirable vantage point from which a minority party can undermine the position of its decaying rivals. In Michigan this has succeeded spectacularly and the demonstration will be complete if Governor Williams's close collaborator, Mr Hart, succeeds in bringing down the remaining Republican incumbent, Senator Potter. There is a similar situation in Minnesota, where the Democratic candidate for the Senate, Representative McCarthy, one of the most intelligent men in politics, will, if he is elected, restore lustre to this tarnished name.

In Maine, the Democratic Governor himself, Mr Muskie, is, after two popular terms, challenging the Republican Senator. In three closely grouped eastern states with upstart Democratic Governors where there were enormous Eisenhower landslides in 1956—New York, New Jersey and Connecticut—there could be no greater demonstration of the evanescence of the President's personal success than the fact that the Governor of New Jersey has already been re-elected and that the other two, Governor Harriman of New York and Governor Ribicoff of Connecticut, are, by general prediction, almost guaranteed another term. Moreover, in all three, thanks partly to the presence of Democratic Governors, the party stands an excellent chance of replacing Republicans in the Senate.

This process can work in the opposite direction, from the Senate back to the State Capitol. In Oregon it has already done so, with two Democratic Senators bringing in a Governor in their train. In Wisconsin, Senator Proxmire, who so unexpectedly won a recent by-election, hopes to earn not merely a full four-year term for himself but a firm Democratic base in his state by capturing the governorship for his colleague, Mr Gailord Nelson. Meanwhile, in California and Maryland, two states in which the Democrats have by bad leadership forfeited the fruits of power for many a long year, in spite of having large majorities among those registered as party voters, this seems to be the year in which sooner or later they were bound to pull themselves together. Democratic morale across the country has shot upwards since the spectacular success of the party's candidates for Governor and Senator in the Californian primary election, while in Maryland the Democratic "harmony ticket" was safely nominated without the savage intraparty struggle which normally clears the way for the Republicans to be elected by the disgusted voters.

WHILE the Republicans fear that they may lose anything from four to nine seats in the Senate their greatest concern is about the House of Representatives. It is calculated that if the Democrats can win an extra forty votes in the House the conservative coalition of Republicans and southern Democrats will be broken and that Congress will be able to impose a liberal domestic programme on an unwilling President.

In foreign affairs, this might make the President's task easier in some respects. Recent events in Congress have demonstrated yet again the embarrassment that flows from his failure to deliver results as a party leader. If modern Republicanism had really taken hold of the country many more fresh Republican faces would now be in the Senate and there would not be the same need to appease the conservative Senators, such as Messrs Knowland and Bridges. But as the day of an election that threatens disaster to the Republican party draws nearer, the old leadership of the party continues to demonstrate its unsuperseded influence. Both over Senator Kennedy's amendment favouring a more flexible economic policy towards Russia's satellites and over his trade union Bill, the White House behaved with extraordinary obtuseness and ill grace, letting down its loyal modern Republicans for the sake of making Senator Knowland happy. But the Senator is a man of surly principle. No sooner had the President genuflected towards him than he announced that he was going to fight to amend the Administration's most cherished project—the extension of the Trade Agreements Act—so that it would last for only three instead of five years.

As Vice President Nixon watches the manner in which the President and Mr Adams have mismanaged his inheritance, he must be wondering anxiously how he can best dissociate himself from them without making things worse. His only comfort must be that, according to the public opinion polls, he himself would still have a slightly better than even chance of being elected President, if the election were held now, for all the woes of his party.

Labour's Love Lost?

WITH only one opposing vote, the Senate this week passed the well-balanced Kennedy-Ives Bill to curb the abuses of power by trade union officials which had been uncovered by Senator McClellan's special investigating committee. The Bill falls far short of the straitjacket for labour which Senator Knowland, the leader of the Republican minority, had in mind last month when he forced out of the Democrats a promise that the Senate would act at this session. But a harsher Bill would stand no chance at all of being passed by the House in a year when all its members, except those who are retiring, must seek re-election. As things are, it is unlikely, although not impossible, that the House Democrats will risk incurring the displeasure of labour in order to win for their party the credit for curbing trade unions.

It was the sight of the Democrats in the Senate making off with one of the conservative Republicans' favourite campaign issues which led the Administration, through Mr Mitchell, the Secretary of Labour, to denounce the Kennedy-Ives Bill, at the eleventh hour, as "completely ineffective"—ignoring Senator Knowland's own experience in California, which seems to show that an extreme anti-trade union stand is poor politics. In fact, Senator Kennedy, who must stand for re-election this year and who as a would-be Democratic presidential candidate must look to the trade unions for support, apparently took a leaf out of his own best-seller, "Profiles of Courage"; perhaps he reasoned that the nettle, if firmly grasped this year, would cease to sting by 1960. Less stout-heartedness was required of Senator Ives, a friend of labour who is retiring this year, but as a Republican he felt even more keenly the Administration's betrayal of his non-partisan approach.

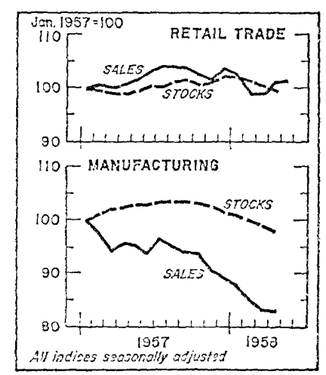
Most of Mr Mitchell's complaints, though couched in intemperate language, turned out to be technical matters rather than ones of principle and many of them were met by redrafting. Senators Kennedy and Ives were almost wholly successful, however, in repulsing by votes of 50 or so to 30 the harsher penalties for transgressions by trade unions sought by the Administration on the floor. One of their strengths was the approval of the Bill by Senator McClellan himself; another was the support of the handful of "modern" Republicans. In its final form the measure would combat corruption by requiring public financial reports from all trade unions, including details of loans to their officers, and by making embezzlement of trade union funds a federal crime; it would promote democracy in the unions by requiring elections at regular intervals, making it easier to upset crooked elections and get rid of corrupt officers and limiting the practice of controlling local unions from headquarters by the use of "trustees." This is at least a promising beginning.

Organisational Matters

AFTER rewarding the President so handsomely for his efforts on behalf of the extension of the Reciprocal Trade Agreements Act, the House of Representatives slapped him down sharply when it came to his next "must" measure, the Defence Reorganisation Bill. But for this Mr Eisenhower was himself largely to blame, since he had begun by giving the impression that he was prepared to accept the Bill as it came from committee and then suddenly and intemperately reversed his attitude, condemning three clauses on the grounds that they put a premium on intransigence by defence officials, allowed the heads of the individual services to hold up needed improvements and encouraged inter-service rivalries. Since the main effect of the changes which Mr Eisenhower then demanded would have been to weaken still further congressional authority in defence matters, an authority of which Congress is rightly jealous, it is not surprising that the President was rebuffed. He did succeed in inducing members of his own party to come over to his side, but the Democratic majority remained faithful to the Bill as it had come out of committee; substantial concessions had in fact been made to Mr Eisenhower there, and the Bill as it stands provides for a much stronger and more effective military chain of command than exists at present.

The President is now pressing his demands on the Senate, but he cannot have been much encouraged by its action this week on the Bill establishing a civilian agency to organise activities in outer space, which slipped through without debate, in interesting contrast to the urgent controversy around this matter only a few months ago. It is true that the Senate Bill apparently gives more space in space to the Defence Department than does the House version, by reserving to the department all purely military developments there; the House only said that the new space agency was to co-operate with the Defence Department in military matters. But instead of the centralised control under a single director for which the President originally asked, the Senate wants all matters of policy to be the responsibility of a seven-member board; only two members would be from the Department of Defence, and the civilian majority would include the Secretary of State and the chairman of the Atomic Energy Commission. Finally, instead of a separate space committee in each House, the Senate advocates a joint congressional committee like the one which has been so influential in the development of atomic energy.

Receding Inventories



POSSIBLY the feature of the current recession that has been least explained is the liquidation of business stocks by manufacturers, wholesalers and retailers; this is understandable, since figures for changes in stocks are slow to be published by the Department of Commerce and their interpretation is complicated by time-lags and fluctuations in price levels. Both of the earlier postwar economic declines were vaguely labelled in retrospect "inventory recessions" and the term is now being used again; in all three of these recessions, business disinvestment in stocks has certainly been a highly important, although by no means the only, cause of the drop in economic activity. Broadly speaking, stocks are reduced because sales fall, because they are expected to fall, or because the prices at which future supplies can be bought are expected to fall. Normally stocks are maintained in a fairly constant relationship, or ratio, to sales; but if businessmen's expectations change, then their view of what is the most desirable ratio will also change.

During the 1955-57 boom stocks were accumulated at a record rate and by October of last year were clearly excessive, particularly for manufacturers of durable goods; when business failed to pick up in the autumn, a sharp liquidation of stocks naturally began. As a result the total drop in demand since the beginning of this recession has been at an annual rate of $8-$10 million, enough, according to the Chase Manhattan Bank, to account for about half of the recent decline in industrial production. The ratio between stocks and sales went on rising until March, but in April the increase in wholesale and retail sales, coupled with the continued liquidation of stocks, brought the ratio down again. Most of this liquidation was being done by manufacturers, chiefly by lowering their rates of production to reduce their stocks of goods-in-process. Retailers' stocks have now been largely run down, including those of car dealers, whose showrooms are emptier than they have been for three years. Retail sales continued to rise encouragingly during May; if this goes on, first retailers, then wholesalers and eventually manufacturers will soon find it necessary to build up their stocks again to keep them at the required levels in relation to sales.

This rise in stocks will, however, probably continue to lag somewhat behind that in sales, since manufacturers, particularly of durable goods, may decide to carry proportionately lower stocks, for the present at least, even after business turns upward. However, once the ratio of stocks to sales has reached what is regarded as a satisfactory level, and one to be maintained, then any increase in the dollar value of sales will mean a greater increase in the dollar value of buying for stock. Supposing, for example, that both retailers and wholesalers want to maintain a ratio of 1.50: then an increase in monthly retail sales of $100 million brings an increase of $150 million in retail stocks and therefore in sales by wholesalers; wholesalers in their turn will then increase their purchases from manufacturers by $225 million in order to restore their ratio. Thus the ratio, with its multiplying effect, accelerates recovery once recovery is under way.

declines, although industrial production has declined more, is a combination of reviving prosperity on the farm and larger "transfer" payments by the government to exservicemen, the unemployed and other beneficiaries of social insurance. Higher incomes from these sources have made up for three-quarters of the $8 billion drop in wages and salaries—at annual rates—since last August.

Now the government is to pour another $2 billion or so into the stream of incomes. Congress has just passed a Bill to give civil servants a 10 per cent increase in salary, partly to prevent them being enticed away by private enterprise, partly to make up for the rise in the cost of living. This will cost $542 million in a full year; a similar increase for employees of the Post Office will cost another $265 million and the rise in military pay $668 million. Moreover, civil servants and postal workers are to share a $370 million bonus, for their pay increases are retrospective to last January. Next month, these lump sums will begin to be translated into down payments on motor cars and air-conditioners, or so it is hoped, and not only in Washington; many states have large numbers of federal employees. Finally, there are also to be increases in pensions for retired civil servants or their widows. If the economy has at last come to rest on the bottom, consumers, with more money in their pockets, may conceivably give it the timely upward push which is needed to bring recovery. Already the steadiness of their incomes has prevented a much dreaded development: a recession which, "feeding upon itself," snowballs into something worse.

Schools for Executives

FROM A SPECIAL CORRESPONDENT

THIS is the first year since the war in which employers have not been bidding against each other for the students graduating from schools of business. However, one group of students will have no trouble finding jobs. These are the "advanced management" trainees who have been sent by their employers to attend graduate schools of business administration in various parts of the country. They have been back to school (at company expense) not to learn the fundamentals, but to develop their managerial abilities, and they will return to strengthen the managements of their respective corporations—at least, this is the hope.

The trainees are all executives of proved ability. Their ages range from 35 to 55, and usually they have been responsible for running either a small business or some division of a large one, perhaps as sales managers or chief accountants. The purpose of the courses is to give the man with experience in one phase of business the broader perspective that will fit him for the highest posts.

The first such course was given during the war at the Harvard Graduate School of Business Administration to retrain executives from "non-essential" firms for jobs in war industries. This idea quickly broadened out to include training that would increase managerial skills in general and was continued after the war at the request of companies that had participated. Harvard now has two courses in advanced management running simultaneously and still cannot take all those who apply. Stanford, Cornell and Columbia also train large numbers, and smaller programmes are carried on at many state universities.

Altogether, there are now over eighty schools offering courses of some kind in advanced management. Those at the large eastern universities are attended chiefly by executives of the big national corporations. But at state universities in the West and South the studies are often adapted to meet regional needs. For example, the University of Virginia co-operates with the Virginia Bankers Association to give rural bankers a one-week course in their special problems. All the universities place emphasis on the inter-relations of different departments in the conduct of a modern business. Case studies of actual problems of management illustrate the importance of finance or production to the man who, for example, has made his career in sales. There is also strong emphasis on human relations, both in dealing with personnel and with other executives—and in the arts of oral and written communication.

Perhaps the most useful part of the training—especially to men who specialised in engineering at college—deals with the political and economic climate in which the modern corporation operates. Legal problems such as anti-trust cases are discussed and the regulations which govern the issue of securities. But the trainees also study economics and the social problems of local communities in which business firms may become involved. The schools recognise that executives today must deal not only with "big business," but also with big labour and with government on both the federal and local levels.

Since the men who participate hope to reach the top, their incentives to study are very great, and staffs find them stimulating to teach. In fact, the varied experience of these men is itself an aid to teaching through group discussion. To encourage this the schools keep classes small, usually under fifty. Those who take part are generally required to live and study together. Executives attending the courses are paid their usual salaries and are required to attend full-time, so that they will not be distracted by problems arising from their regular jobs. Many report that they have derived the greatest benefit from intimate contact with managers of other industries and men from other parts of the country.

This is the main advantage of management studies at universities compared with the training programmes conducted by an individual company for its own executive personnel. The disadvantage is that sending men away from their jobs is expensive, for companies must pay their full salary while they are studying, the cost of instruction and their living expenses. The last two come to $1,000 for 4½ weeks at the University of Virginia, $1,500 for 6 weeks at Cornell, $1,750 for 6 weeks at Columbia and $2,300 for 12½ weeks at Harvard.

Does such training really turn out better managers? It may be 1965 before it is proved, for most of the graduates have still some way to go before they reach the top. Meanwhile, some large companies still prefer to run their own training schemes. The General Electric Company and the Bell Telephone System, for example, have complete schools of their own. But the increasing popularity of the university courses in management shows that most companies find them helpful. And most of the men who have gone "back to school" agree that their outlook has been broadened—even though some wonder whether they might not have done better to stay on the job and cultivate their chances of promotion.

HOW TO CUT COSTS AND PLEASE CUSTOMERS

3M helped Vim...

Why aren't they helping us?

"Yes, 3M! Minnesota Mining & Manufacturing to you! It's their 'Scotch Boy' tape seals this New Blue Vim canister. Housewife peels it off a pre-punched top, sprinkles right away. Tape carries a Vim message, too—in a mighty smart new blue.
"Here's my point, Tom: it pleases the customer, it saves Vim's time. I hear 3M's taping machinery tackles around 300 tops a minute, gives Vim a brand-new plus.
"Now, Tom: *where do we come in?* Yes . . . I know we don't make Vim! But look here: 3M have tapes strong enough to tow a lorry, tapes that stick both sides, coloured tapes, printed tapes. What do we do about masking? Banding those special offers? Reinforcing cartons? Tape in the office? Money's tight now, Tom; customers are choosy. So do something, Tom! And put a bit of new blue vim into it—phone 3M today!"*

B T-H A.C. DIRECT-ON-LINE CONTACTOR STARTER

Type DOC 71 for three-phase or single-phase non-reversing squirrel-cage induction motors.

This starter is sturdy in construction, elegant in appearance and dependable in operation. It is available for motors up to 5 horsepower, and complies with BS. 587.1957 for "Frequent Duty", i.e. forty starts per hour.

The starter, comprising a triple-pole contactor with normally-open auxiliary switch and triple-pole hand-reset thermal overload relay, is enclosed in a distinctive die-cast aluminium case with integral START-STOP push buttons.

of free trade as though it were an improper suggestion. The Canadians have not yet digested Mr Macmillan's pointed and twice-repeated declaration that the proposal "lies on the table for consideration either in whole or in part." On present form, the Diefenbaker government will again pretend, ostrich-like, that he never said it.

Since trade and tariff policy are still left completely indeterminate by the budget speech, with some things for all men, Canadian attention is more attracted by the size of the deficit. Even that is not genuine. Mr Fleming declared it to be $648 million, with additional new financing to cover loans and advances amounting to $1,400 million in the fiscal year. This is by long odds the largest programme of public financing undertaken by Canada since the war. $350 million of new money has already been raised in connection with the refunding operation on May 1st, and none of it has come out of public savings. It is fully covered by the increases in bank deposits which the Bank of Canada has engineered. In the experts' view, "it is a matter of nice judgment how much of the remaining financing should be achieved by expanding bank deposits," or—as one investment dealer remarked—by the modern and sophisticated method of printing new money.

The reason why the deficit figure of $648 million is not genuine is that Mr Fleming has laid hands on a nice little nest egg which the Liberal government had preserved since 1950. It is known as the "National Defence Equipment Account." It consists of credits given to the armed forces for the replacement of equipment left over from the second world war that was given to Nato countries. It gives Mr Fleming an additional $165 million which he does not have to show in the budgetary accounts, and helps to conceal the full extent—more than $800 million—of the expected gap between revenue and expenditure this year.

The D-Mark's Tenth Birthday

FROM OUR BONN CORRESPONDENT

On the evening of June 21, 1948, Dr Ludwig Erhard, then director of the Economic Council of occupied western Germany, and a shade slimmer than the present economic minister of the sovereign Federal Republic, broadcast to an audience still critically fingering its new money. "It is indisputable," Herr Erhard concluded,

> that the current purchasing power of our nation can be covered and satisfied only out of current work and production; and consequently that the nation may perform only work that is economically useful and approved by the community. I know of no economic system that fulfils this demand better than the market economy, in which every individual for good or ill is dependent on the consumer's grace; and which, therefore, in contrast to all forms of state control, is the best safeguard against the misuse of a nation's honest work. That is the certain guarantee for the stability of our new currency.

The ten succeeding years of toil and recovery have so substantiated Herr Erhard's faith that it has not been surprising to find him assisting with a proud, parental air at this week's celebrations of the D-Mark's tenth birthday. There have been, literally, several parties; and the occasion has been considered worthy of commemoration by postage stamp. Only a few seem to have been taking a peep at the birthday child's reverse side. But *Simplicissimus*, that professional iconoclast, continues unabashedly to lampoon the Deutsche Mark as a golden calf in whose assiduous worship the nation is neglecting to cultivate its own soul.

The tangible everyday blessings of the D-Mark are for all to see and count. It took a year or so for them to germinate. Then from 1950 to 1957 national income rose by 112 per cent, and net wages and salaries by 119 per cent. The cost of living rose by only 14 per cent in the same period. The average working-class family of four which spent DM 285 (roughly £23) a month on primary living costs in 1950, today has DM 538 (£45) to manœuvre with, a large part of the increase being allotted to clothes and to getting about. During the same period imports of fruit, wine, coffee, tea, and raw cocoa have more than doubled. So has the consumption of cigarettes, beer, and champagne. In 1950 there were eleven cars to every thousand persons; on January 1, 1958, there were 52. Similarly, the 19 motor-cycles and scooters to every 1,000 persons have become 45. Since 1953, houses and flats have been going up at a rate of more than half a million units a year (215,000 in 1949, and between the wars, in the same area of Germany, never more than 200,000 a year). While 2,150,500 houses and flats were built in federal Germany between 1953 and 1956, only 132,600 went up in eastern Germany. The golden West . . . and throughout west German industry, the prospective east German fugitive can tell himself, there is still a shortage of good skilled workers.

As last week's visit to Germany of Mr Eugene Black, the president of the World Bank, testified, the aspect of the D-Mark in which the outside world is naturally rather more interested is its penetration of world markets with such effect that Germany's gold and foreign exchange reserves have now reached a total of very nearly DM 24,000 million. But, notwithstanding Mr Black's modest bag of a new $75 million loan, there is little inclination in the German financial world to respond to Mr Macmillan's invitation to join the United States in more ambitious capital investment in the under-developed countries. The bulk of opinion that matters maintains that present appearances deceive—that in truth Germany is short of capital, that most industries are insufficiently protected against hard times, that the consequences of the war have not yet been overcome, and that the cost of recreating the armed forces has as yet been scarcely felt. No voices can be heard opposing this line of argument. And it is amplified by statistical testimony that the pace of economic development is slackening. There has been an appreciable decrease in orders from abroad. In April the index of industrial production per working day (1936 = 100) rose to 234, which was only two per cent above the 1957 level. Steel mills are working at eighty per cent of capacity, or roughly thirteen per cent below last year's level; and in other industries, notably the textile industry, production is markedly slowing down. The competition of the European common market lies ahead. Would it not be more prudent to hold the foreign exchange surplus in readiness to promote exports?

But as yet there is no general foreboding that leaner times are round the corner. The uneasiness that marks so many Germans has another cause. As is only natural, they feel, perhaps still rather vaguely, that they have been missing something while playing their part in establishing the D-Mark. One manifestation of this is their renewed demand through the trade unions for shorter working hours. The employers are warning them that they must not expect

to be able both to have more leisure and maintain their present standard of living. The discontented are being reminded that the six-day-week worker, taking the usual bank holidays and an 18-day annual paid holiday, already has altogether two months and 22 days of the year free. The worker with a 45-hour week has as much as a third of the year free. But the restlessness has not been allayed. A smaller group, who are probably nearer the heart of the matter, are concerned at the neglect of education, scientific research, and the arts. Schools remain for the most part shabby and overcrowded. There is a scarcity of teachers and nurses. Shortly there will be one of scientists and technicians. And where are the writers, painters, and musicians? The arid state of the arts in contemporary Germany should not, however, be attributed entirely to ten years' national pre-occupation with the pursuit of creature comforts. The trouble goes farther back than that.

"Operation Napoléon"

FROM OUR PARIS CORRESPONDENT

French savers have been invited this week to take part in a first vote of confidence in the Gaullist regime. Throughout the country they are urged, by posters of Marianne with the proverbial woollen stocking, to subscribe generously to the new state loan, thus showing their faith in the general. General de Gaulle himself is reputed to find economic problems boring. But he has chosen his minister of finance shrewdly. In the eyes of many investors the general stands for order and authority, M. Pinay for financial stability and the defence of their interests.

Economics is not an easy field in which to perform miracles. But a happy coincidence can give a minister the reputation of a prodigious financial wizard. M. Pinay became prime minister in 1952 at a time when world prices were falling while France was still in the final stages of galloping inflation. He launched a successful loan—tying the bonds to gold—and combined this with a campaign of "persuasion" to keep prices down. French prices fell in keeping with world trends—and a myth was born. For millions of Frenchmen the small industrialist from St Chamond is still the man who brought postwar inflation to an end.

It is only natural for M. Pinay to apply his old treatment once again. His new loan is a repetition of its predecessor (indeed the former shares can be freely converted to the new). Once again the bonds are tied to the "napoléon"—the 20 franc gold coin. If the value of the coin (that is, of gold) goes up, so will the value of the bonds, but bondholders will not lose if the napoléon falls below its present price of 3,600 francs. The link with gold is thus the guarantee of security. The rate of interest is only three and a half per cent. The bonds, however, are tax-free and exempt from death and transfer duties, so that the rate is really equivalent to about 6 per cent. M. Pinay also wants to seize this chance to get at individual gold hoards and foreign currency holdings. For this reason the banks have been asked to close their eyes to the calling home of illegal hot money.

Whether the French savers' faith in the general is sufficiently strong to be expressed in gold subscriptions to his loan remains to be seen. But it is very likely that M. Pinay, who has set a target of some 200 milliard francs, has floated a second successful loan and that he has again a fair chance of stabilising prices, at least temporarily. In the past year or so France has been the odd man out in the western economy. While other countries were worried by prospects of recession, France was still in the throes of an inflationary boom (output last month was still 12 per cent higher than in the corresponding period of the previous year). Its problems were rising prices, shortage of labour and, above all, a yawning gap in foreign payments. There are signs, however, that the French inflation, too, may now be due for a halt.

From June, 1957, to January of this year wholesale prices of foodstuffs rose by nearly a quarter; prices of manufactured goods increased by 7 per cent. Since then the pace has slackened. With crop prospects fair, it is thought in Paris that food prices may be kept at their new high level. As to manufactured goods, after the recent increases many sellers have reported consumer resistance. Finally, credit restrictions introduced last year are beginning to have an impact and are expected to affect the boom in capital goods later in the year. Altogether, the climate seems once again favourable for M. Pinay. One unknown factor is the mood of labour. Over the last twelve months wages have not kept pace with retail prices and their purchasing power has dropped by about six per cent. On the eve of the political crisis, the unions, particularly in the civil service and the nationalised industries, were going to strike for higher wages. Will they now accept the pledge of stable prices or will they fight to make up the loss?

On the foreign front M. Pinay can hope for a respite. The loan, even if it does not bring in much gold and foreign currency, should at least halt speculation against the franc and thus make the slender reserves last a bit longer. The situation was becoming alarming. The French deficit in the European Payments Union rose in May to $76 million. The money borrowed in Washington at the beginning of the year was running short. The gold and dollar reserves—excluding the last-resort stock of the Bank of France—have fallen below $250 million. Admittedly there are some hopeful signs. The drop in world freight rates and an expected tourist surplus should reduce the French deficit on invisibles. Until very recently, however, it looked as if the economy might not get through the autumn without another dollar shot in the arm. Now, with the travel allowance cancelled, new import restrictions in store and the prospect of a favourable current in hot money toward Paris, M. Pinay may hope to postpone the day of reckoning to the beginning of next year. In the meantime, the appearance of stability and financial recovery should help the general to win his electoral battles in the autumn.

Victories at the polls do not eliminate economic problems. The problems facing France are so well known that they need only be restated briefly. There is the question of excessive home demand. In 1957 the defence bill amounted to 1,482 billion francs or 29 per cent of total state expenditure. This year it was to be slightly cut, but actual expenditure exceeds the estimates and General Salan is asking for more. Even a modest implementation of the promises of integration will heavily increase the Algerian bill. The general has social ambitions as well, and the plans for reform in health and education with which he is credited are likely to be costly. Finally, the gaullist desire to enter the atomic club involves a high entrance fee and heavy membership dues ever after. It is difficult to see how the bill for all this can be met. For the moment the choice

seems to lie between a combination of severe controls with heavy taxes, and still more inflation.

Any new rise in prices would price France completely out of world markets. The 20 per cent devaluation of last August is only now being made official. Whether or not it was ever sufficient to close the gap between French and foreign prices, most of its benefits have been swallowed up in the meantime by internal inflation. A study by the Organisation for European Economic Co-operation at the close of last year showed that French wholesale prices were the highest in western Europe and one-fifth above the British level. This week the French government was compelled to report to the OEEC that it was unable to take the first step back to the road of trade liberalisation. In the present circumstances, "European" prospects look dim and M. Pinay's professions of devotion to free trade have a quaintly platonic air.

Speculative trends change, the balance of trade remains. The French trade deficit is running at a higher level than the official experts had forecast and in the present state of world trade there is little scope for a rapid expansion of exports. A cut in imports—through restrictions or a further devaluation—seems unavoidable. The French National Accounts Commission, in a gloomy report recently, warned the government to prepare the country for the shock so that France would not wake up in 1959 with a major economic crisis precipitated by a shortage of imported materials. Something more than a second dose of M. Pinay's confidence pills will be needed to get France out of its financial difficulties.

Cyprus Waits

FROM OUR CORRESPONDENT IN NICOSIA

Wednesday

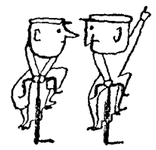
ANKARA'S apparent rejection in advance of the British plan for Cyprus has, of course, meant that the Turkish interest in Mr Macmillan's actual statement is much less than that of the Greeks. All that the Turks are interested in is partition, which they know beforehand they are not going to get; most of them are in any case unable to appreciate the constitutional niceties reportedly attributed to the new plan in order to ensure the impartial treatment of the two communities. The big tragedy of recent months is, of course, the way in which the Turks have taken up such an advanced position over partition that they now have nothing to fall back on. A very small minority of the more intelligent Turks realise that they have hopelessly overplayed their hand, but even they feel that they are in Ankara's hands.

Most of the ordinary Greek Cypriots are now gasping to accept anything within reason; the business community in particular is strongly in favour of accepting the British plan. The tribulations that all Greeks have undergone in the last few months have been grim; Turkish violence last week was the last straw. It is thought that Archbishop Makarios has come to appreciate the strong feelings of the Greeks and does not want a civil war with the Turks. The right-wingers and the Greek press may vehemently condemn the plan on the ground that it includes no commitment to self-determination. There may be a trial of strength on this question between Archbishop Makarios and Grivas; but the Archbishop is probably strong enough to prevent a major outbreak. In official quarters a mild degree of optimism about the attitude of the Greeks can be detected, although their first reaction may be negative; allowance must, it is felt, be made for the Greeks' tendency to say no when they mean yes.

A new factor which may complicate Cypriot reactions is the last-minute intervention by Nato. The first local comment was confused and conflicting. Mr Zhiartides, the left-wing leader, took the line that if Nato's action helps to promote the interests of the Cypriot people, the Left will agree to it, much as it dislikes Nato. The big fear in the minds of the Greeks is that the Nato action may lead to another long delay. All sides, indeed, agree that this would be disastrous. It is felt that the Government must declare itself this week and let Nato's back-stage pressure go on afterwards.

Whether or not the Greeks and Turks can again settle down together is a conundrum. Both sides tend to pessimism after last week's events. But the tragic irony and basic weakness of the Turkish case is that when left to themselves Greeks and Turks get on perfectly well together. Since, however, passions have become so inflamed, it would obviously be wise to have a period of separation in which each side runs its own affairs. After seven years, perhaps, the ordinary people of the two communities might settle down again—provided that the Turks were left undisturbed by demagogic rabble-rousers and the Greeks were not whipped up by the ultra-nationalist mayors who are determined to take it out of the Turks. An enormous amount of harm has been done by the extremist leaders on both sides, such as the Greek mayor of Nicosia, Dr Dervis, and Dr Kuchuk, the Turkish leader. Moreover, the Greeks unfortunately cannot see that, although they have never attacked the Turks (Eoka's campaign has always been directed against the British or their own "traitors"), their attitude of superiority towards the Turks breeds as much bitterness as do Eoka bullets. These psychological undercurrents operate powerfully among the educated men in each community whose co-operation will be essential to the success of any plan for Cyprus.

Hedging in the Maghreb



FROM A CORRESPONDENT IN TUNIS

THE top three leaders of the Algerian rebel organisation (FLN), MM. Ferhat Abbas, Boussouf and Krim Belkacem, arrived in Tunis from Cairo at the beginning of the week. A few hours later M. Balafrej and M. Bouabid, the prime minister and deputy prime minister of Morocco, arrived from Rabat by way of Paris. The first three were met by the Neo-Destour party without ceremony; the second group was received by members of the Tunisian government, headed by M. Ladgham, President Bourguiba's senior colleague.

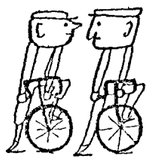
There could be no clearer way of showing that the FLN is not yet a government and that the discussions in Tunis will take place at two levels. First there will be talks between the Tunisian and Moroccan government representatives, and only after that, a meeting of political leaders from the three North African countries to follow up the resolutions made at the Tangiers conference and to demon-

the things they say!

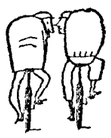
This is the Age of the Common Man, all right!

Maybe, but even today I doubt if the worker gets a proper stake in industry.

Things are changing, though.



Not that I've noticed.



Well, quite a number of concerns now have profit-sharing schemes, and some—like I.C.I.'s—also enable their employees to become stockholders.

Yes, but these schemes are only smokescreens. The bosses simply depress wages to find the money to pay for them.

That's where you're wrong. I.C.I. workers get the wages that have been negotiated on their behalf by seventeen Trade Unions. Any benefits they receive under the Company's profit-sharing scheme are over and above what they get in their pay envelopes.

Yes, but I.C.I. isn't Santa Claus. If the wages don't suffer, something else must—amenities or something.

Wrong again, friend. I.C.I.'s policy has led to a steady improvement in the service conditions of its employees, and the profit-sharing scheme is just another example. From now on, the employees are going forward with the stockholders as joint partners in their own efficient and expanding business.

I C I

strate to France and Cairo the solidarity of the Maghreb.

At the beginning of the conference the positions were as follows. The Algerians, after deliberations in Cairo, decided, by way of reply to General de Gaulle, to try to press forward with the formation of an Algerian government-in-exile. They arrived in Tunisia in force in order to convince M. Bourguiba and M. Balafrej of the need for such a government, and to announce that they intended to intensify their struggle against the French army and the French community in Algeria, especially in the towns.

The Moroccans clearly have two contradictory worries: they want to show that, compared with Tunisia, they are not dragging their feet over the Algerian question and that they intend to apply both the spirit and the letter of the Tangiers resolution recommending help for the FLN; they equally want to do nothing that might lead to a breach with France.

On this second point, the Moroccans found that the Tunisians share their concern. M. Bourguiba cannot contemplate a rupture with Paris just when he is engaged in securing the final evacuation of his country by negotiation. The agreement between Paris and Tunis stipulates that the French forces leave all their bases in Tunisia and regroup in Bizerta before October 1st. Negotiations will then begin for a "provisional agreement" on the use by France of the Bizerta base. Of the 22,000 soldiers, marines and airmen now in Tunisia, 15,000 will remain at Bizerta. This is only two-thirds the present force; on the other hand it is twice as large as the Tunisian army.

The Tunisians are bound to consider this proportion a continuing threat to their security and independence. In the next few months they will try to redress the balance by increasing their forces and buying more arms. President Bourguiba has declared himself ready to buy arms from anywhere, if need be from Czechoslovakia, if the Anglo-Americans continue to refuse to supply him. In recent weeks he has had to procure arms from the Algerians.

As neither Tunis nor Rabat is ready to agree to its formation, the Algerian government-in-exile will not see the light of day for several weeks, perhaps several months. The Americans will not be displeased; they have lately been pressing the Tunisian and Moroccan governments to persuade the FLN to leave Cairo and to abandon, for the present, the idea of forming an Algerian government in circumstances that would force everybody to choose immediately between France and North Africa. The French government, for its part, has made concessions to Tunis and Rabat in the hope of gaining a respite. This respite seems to have been secured, at any rate on the diplomatic level. Governing circles in Tunis and Rabat think that it will last three months.

Mr Kishi's Potted Plants

FROM OUR TOKYO CORRESPONDENT

An industrious Cabinet-maker, Mr Yoshida hired and fired ministers as rapidly as a Tokyo *kamikaze* taxi-cab company hires and fires drivers. Mr Kishi has hitherto been much more gentlemanly, but has just succeeded in demonstrating that he can be equally drastic, when he chooses. Of his first cabinet, the sole survivor in the second is the foreign minister, Mr Fujiyama—whom most political observers had regarded as the one most likely to be dropped. The next most important post, the finance ministry, goes to Mr Kishi's own younger brother, Mr Eisaku Sato. It was expected that, if the finance minister were changed at all, the job would go either to Mr Hayato Ikeda, or to Mr Takeo Miki. In the upshot, though neither got the coveted post, both are in the new cabinet. This shows remarkable persuasive powers on the part of Mr Kishi (and also of Mr Sato, who had a leading role in persuading both of them to play in his brother's team)—all the more remarkable in view of the fact that Mr Ikeda especially is regarded as an expert on finance, whereas Mr Kishi with his usual frankness has cheerfully admitted that Mr Sato is an expert politician but only an "amateur financier." The other members of the new cabinet are of relatively small importance, but all, or nearly all, are believed to be loyal to Mr Kishi.

★

Mr Kishi has called his major reshuffle "obeying the voice of heaven," by which he means that it is his response to the need, long recognised by everyone as overdue, to end the faction fights within Japan's ruling Liberal-Democrat party. It may even work, for hitherto the chief faction leaders have been Mr Ikeda, Mr Miki—and Mr Kono, who has been as ruthlessly dropped from the new cabinet as all the others, though he now becomes chairman of the party's "executive board." Mr Ikeda and Mr Miki would not have entered a cabinet which also contained Mr Kono; Mr Kono may hesitate to challenge a cabinet that now contains all the important factions save his own. However, lest any would-be saboteurs have succeeded, despite his vigilance, in getting into his new cabinet, Mr Kishi has seen fit to utter a thoughtful and typically phrased word of warning. Asked how his new line-up would be regarded by factionalists, the prime minister retorted: "What factionalists? Factions have now ceased to exist." Then, with his well-known smile, he drew his interrogator's attention to a row of potted plants, and murmured: "All of these were carefully selected by a master gardener, yet some—one or two—are not perfect, under the surface; the same may be true of my new cabinet." Any bad plants that are discovered will, he implied, be tossed out. Mr Kishi has obviously strengthened his own position, and does not mind who knows it.

Before he could announce his new cabinet—or even secure the Diet's formal approval of his own reinstallation as prime minister—Mr Kishi had to suffer some tedious filibustering by the Socialists. The opening Diet session scenes recalled the robust hours of June 4, 1954, when the Socialists assaulted the Speaker, and some thirty Dietmen were injured in a mêlée which 200 policemen were called in to subdue. On this occasion, the Speaker escaped manhandling, but the Diet secretary, whose presence in the chamber was required before the Diet could be declared in session, was kept confined to his office by Socialists blocking the corridor. After this display of belligerency, the Socialists succeeded in dragging out the elections of standing committee chairmen, a process which normally takes ninety minutes, to two full days. They were protesting that Mr Kishi's insistence that all sixteen committee chairmen as well as the Speaker and the Deputy Speaker should be Liberal-Democrats; in the pre-election Diet, the Socialists held the deputy speakership and were chairmen of five committees. Mr Kishi argued that the Socialists had abused their positions, by pulling out their chairmen each time they wished to stall the work of the committees, which happened frequently. Over the Socialists' protests, he has reverted to the pre-1953 situation, when the Yoshida Government agreed to an Opposition proposal to divide committee chairmanships approximately in proportion to relative party strengths. Mr Kishi has now warned the Socialists, with an eye to their future Diet behaviour, that while he is prepared to negotiate differences "amicably" with them, "there is a limit to our amicability."

Mr Kishi claims that despite his cabinet reshuffle, his basic policies will remain unchanged. This means that he will continue to have close and cordial relations with the West, will seek ever closer and more cordial ties with the other countries—those which are "free"—of Asia, and will "oppose" (as distinct from being neutral towards, which is what the Socialists advocate) what he follows Mr Dulles's example in calling "international communism." Nevertheless it is possible to detect in Mr Kishi's most recent statements a distinct hardening of attitude towards Communist China. He insists that, despite Peking's harsh words about himself, he still favours increased trade with China; but it is plain that he is now considerably less hopeful about this than he was (he never was very), and, if only America will play, is much more interested in both expanding Japanese exports to the United States and expanding Japan's trade with South-east Asia: but, for the latter, more American aid dollars are, he says, indispensable. Does he perhaps calculate that a proper display of coolness towards Peking may help to bring them forth? To Communist China, he addressed the following pointed rebuke: "My China policy has now received the overwhelming support of the Japanese people; I hope Peking will understand this."

Two Views of the World Economy

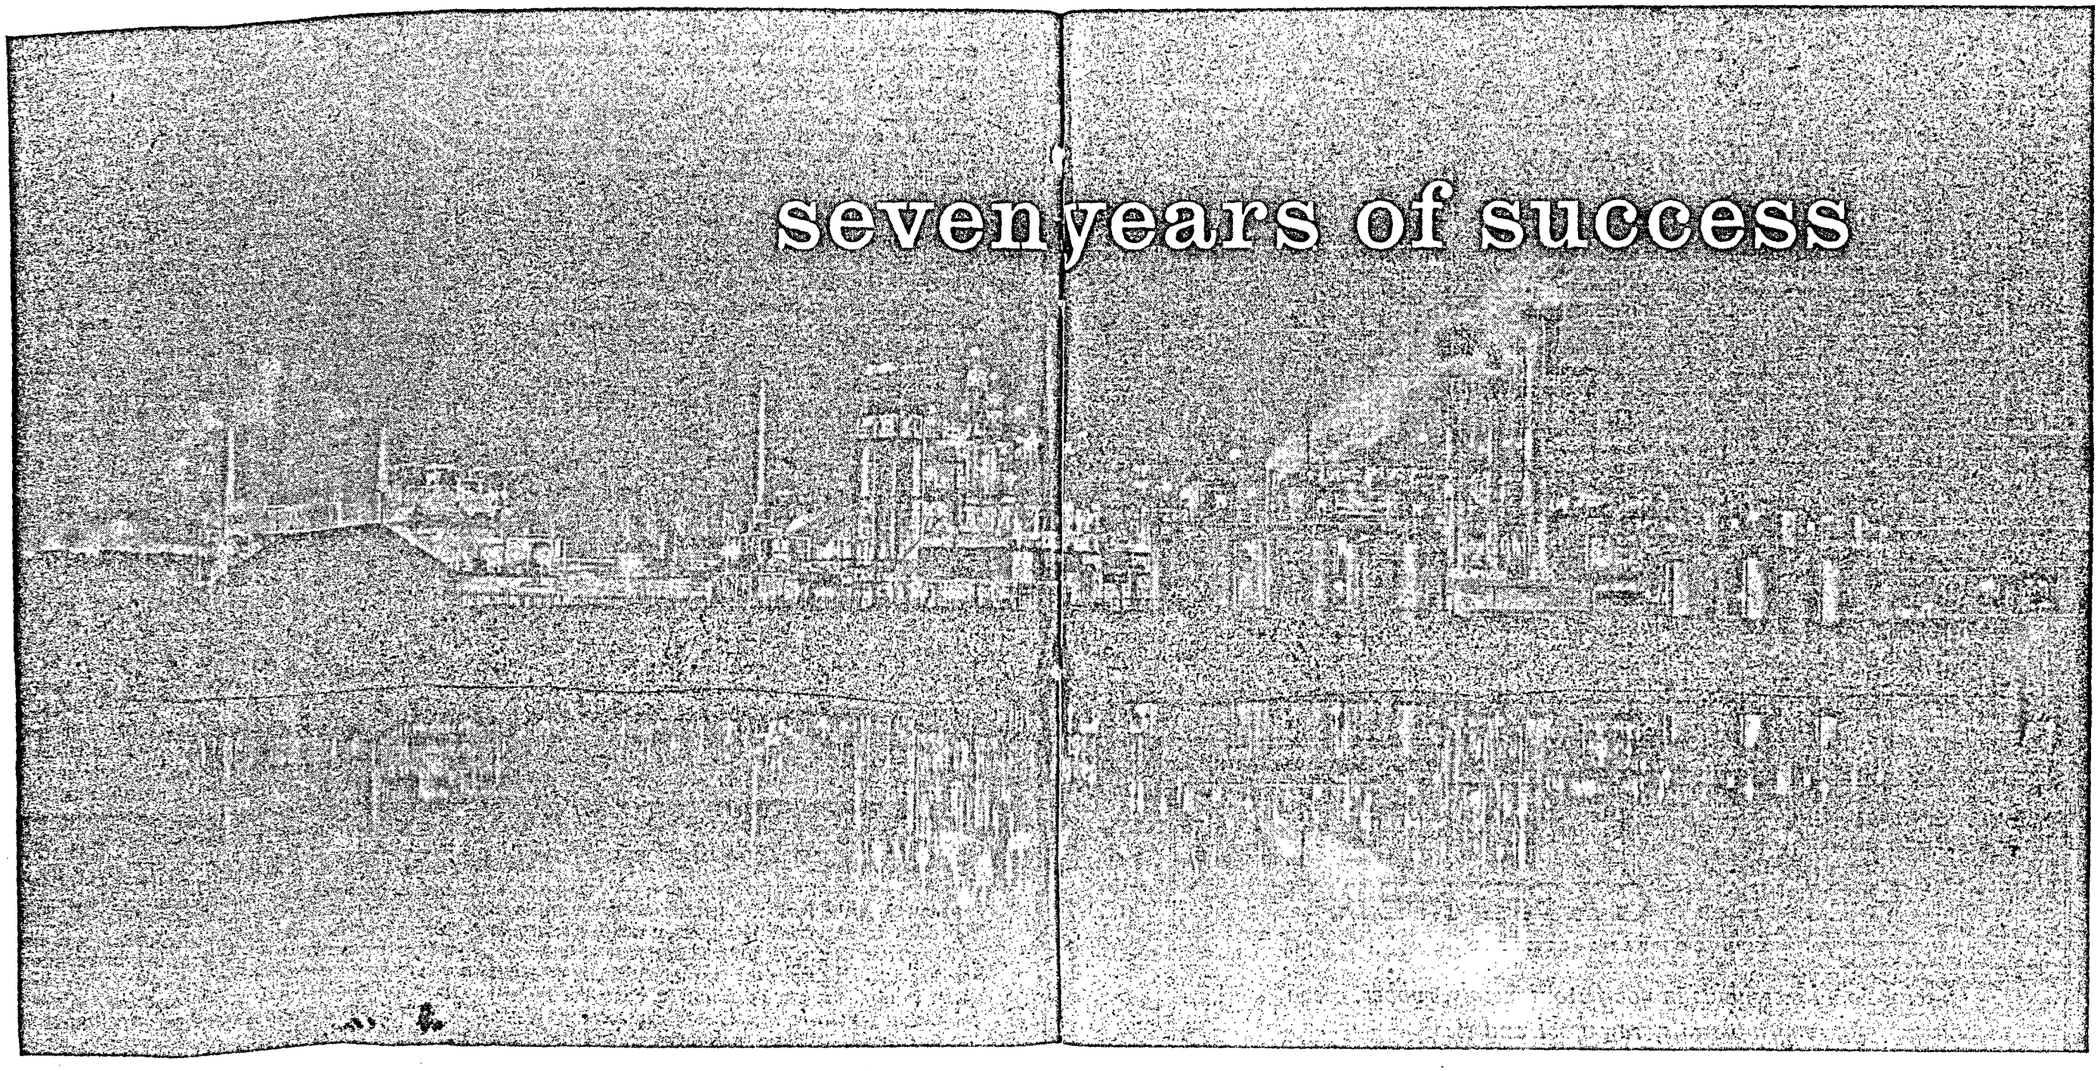
From Basle the Bank of International Settlements looks down in its annual report on a world economy in a shaky state. Recession in America, slowdown in Europe, and the resulting drop in the incomes of primary producers seem to mark not a mere short-term check but the end of the long postwar expansion of the economy of the western world. "There was, however, one economic indicator which did not behave according to the usual pattern," the report comments on the American economy: prices have gone on rising despite recession. With more urgency perhaps than at any other time since the war economists and politicians are taxed by the crucial problem how to achieve further economic expansion without inflation.

The bank's report throws useful light on the argument. One chapter is a study of the relationship in certain countries between savings and investment—the key to the problem. As solutions, the sturdy bankers' recipes are put forward: freer trade must stimulate productivity, hold down prices and shift resources to where they are needed most; monetary inflation must be stamped out before healthy growth can be resumed; a pause, like the present one, loosening the stretched muscles of the economy, is a precondition of further sound expansion. But there is not much in the report to suggest how expansion is to be resumed.

★

A rather different philosophy inspires the first part of the World Economic Survey for 1957 just published by the United Nations. Its authors, who were specifically commissioned by the Economic and Social Council to study the problem of world inflation are plainly concerned lest the attempt to curb inflation by restrictive policies should slow down economic growth in the long run.

Their study provides a good deal of evidence to support the depressing now-fashionable view that a measure of inflation is inherent in modern industrial economies. There is some interesting analysis of what one may perhaps call "Cousins-inflation," the refusal of wages to fall, or to stop rising, despite credit squeezes and slackenings of demand. But the survey does bring out some constructive points too; it suggests lessons that may help to ensure that the next phase of economic growth is as free as possible from the fears of inflation and the slowing of growth which tend to follow. The survey shows how shortages in certain key sectors of industry—steel, capital goods—played a significant part in the inflation which crept up on Europe in 1955 and 1956. With coal piled up at the pitheads, steel output down, and order books shortening in the capital goods industries, it is a good thing to be reminded that lack of capacity in industries like steel and machine tools has helped in the past to stifle expansion.



Some intriguing morals can perhaps be drawn from the section of the survey on inflation in the communist economies. Communists, after all, are even more apt than capitalists to try to suck too many goods from too few resources. The frail economies of the satellites have suffered from inflation pretty badly. Russia, however, does present the spectacle of remarkable growth side by side with considerable price stability. Its bureaucratic economy has certainly not benefited from the bankers' recipe of free trade, but it has gone flat out for stern monetary deflation, strong incentives to individuals to earn and save, and massive investment in the basic industries as the prerequisite of growth.

A NEW SERVICE
OF ECONOMIC AND MARKETING RESEARCH

DURABLE CONSUMER GOODS

A series of continuous comprehensive surveys are now being prepared to assist manufacturers and others to estimate the future market for the following goods: Electric washing machines; Tyres; Refrigerators; Car heaters; Vacuum Cleaners; Cycles; Electric fires and convector heaters; Gas and electric cookers; Car radios; Radios and radiograms; Record players and Gramophones: Sewing machines; Television sets; and Passenger cars.

These surveys are being prepared jointly by
THE ECONOMIST INTELLIGENCE UNIT LIMITED
and
THE BRITISH MARKET RESEARCH BUREAU LIMITED
Further information from:
THE ECONOMIST INTELLIGENCE UNIT LTD.,
22 Ryder Street, London, S.W.1. Whitehall 1511. ext.13

For over seven years, the distillation towers of British Hydrocarbon Chemicals have been a part of the industrial scene at Grangemouth. They symbolise the successful fusion of engineering and other scientific skills in an enterprise of national significance. Jointly sponsored by The British Petroleum Company and The Distillers Company, British Hydrocarbon Chemicals and its subsidiaries are firmly established in a new British chemical industry supplying basic raw materials for conversion to many products which are or will soon become household names.

The expansion of the project on a scale notable in Scottish industrial history is a tribute to imaginative planning. Further plants are now under construction at Grangemouth to increase production still more—bringing the total capital investment to more than £25m and assisting the development of many important industries throughout Britain designed to exploit the great potentialities of petroleum chemicals.

B.H.C. Products . . . . . and some of their end uses

Ethyl Alcohol	Raw materials for textiles; synthetic fibres; plastics; paper; leather and food processing industries; pharmaceuticals and fine chemicals. Solvent for industrial finishes. Methylated spirits.	Diethyl Ether	Solvent for extraction of oils and alkaloids in the Pharmaceutical Industry. Anaesthetics.
Isopropyl Alcohol	Acetone (solvent for rayon, explosives, lacquers, aircraft dopes and adhesives). Intermediate for pharmaceuticals and other fine chemicals.	Butadiene	Synthetic rubbers and rubber-like plastics. Boot and shoe soles.
Tetrapropylene	Household and industrial synthetic detergents.	*Polyethylene	Household, medical and laboratory articles; piping; cable insulation.
		*Cumene/Phenol	Phenol (resins; insecticides; herbicides; synthetic fibres; lubricating oil additives). Intermediate for dye stuffs, pharmaceuticals and other fine chemicals.

*PLANTS NOW UNDER CONSTRUCTION AND DUE FOR COMPLETION IN 1959

THE BUSINESS WORLD

The Thaw

"I ALSO made it clear in my Budget statement that, while our objectives are fundamental and unchanging, we are determined to keep our policies flexible and to adjust them promptly whenever our assessment of the situation suggests the need for that," said the Chancellor of the Exchequer this week. Clearly the Government's assessment now does suggest it is time to alter course. And so it is. And so it has.

Only second to our export trade, Mr Heathcoat Amory again nominated industrial investment as a part of our economy "in which we must make sure, in particular, that we go ahead as fast as conditions allow." This week he has increased the dosage of fiscal encouragement to private investment that he gave in the Budget, and the cost of money to invest has been brought down. But bringing Bank rate back to 5 per cent will reasonably be interpreted more widely than that: as a formal recognition that the economy can now safely, albeit cautiously, begin to take up some of its slack. "It is still the main aim," the Chancellor was concerned to remind the Commons, "of the Government's economic policy to put the strength of sterling, the soundness of our international financial position and price stability as our first objective," and in his explanation of the changed proposals for initial allowances he did not in fact use the term "expansion." But clearly it is no longer going to be a dirty word.

Whether the reality will follow the rehabilitation of the word very quickly remains to be seen. As was said in *The Economist* last week, this shift in policy may be no more than is required to prevent production drooping significantly during the rest of this year. The private investment boom is passing; there are signs that certain stocks at least are being run down; most of the impressions one can glean of forward orders in industry continue to suggest slackening ahead. This has been the cost, deliberately accepted, of somewhat greater stability in home prices, of significantly moderating increases in wages, of making British industry a good deal more interested in export markets than some of it was three years ago—and hence, largely as a reflection, of achieving greater strength for sterling and the reserves. But that cost, remarkably enough, has so far been reckonable only in terms of what might have been, for production—and investment—have hardly declined until now.

"WHILE one cannot suppose that initial allowances are by themselves often likely to be a determining factor in investment plans when they are under consideration, I believe that they nevertheless exert a positive influence," said the Chancellor. In the Budget, initial allowances on new plant and machinery had been raised from 20 to 25 per cent, and those on new industrial buildings from 10 to 12½ per cent: the figures will now go up instead to 30 per cent and 15 per cent respectively. The concession will cost nothing in the current fiscal year but will double the cost of the original Budget relief to £32 million in 1959-60 and to £46 million in the following year. The allowance of 40 per cent on mining works remains unchanged: so do the investment allowances still allowable on ships, new research assets and certain fuel-saving equipment. Initial allowances constitute an interest-free loan over the depreciation life of a new asset, by increasing the proportion of its cost that can be written off for tax purposes in the year of acquisition, but require "repayment" later in higher tax liability: investment allowances are a straight subsidy for new assets, enabling the investor to write off more than their whole cost for tax purposes. Both, in varying strengths, offer incentives to invest (and in some degree investment allowances have been interpreted as an indirect contribution from the Revenue to the problem of buying plant at modern prices to replace old upon which depreciation has been allowable only at historical costs).

It is not surprising that the Opposition, in its guise

of a "high-investment party," should have advised the Chancellor to use investment allowances in stimulating investment, not merely to put up initial ones; and that on this, at least, the Federation of British Industries should be staunchly behind the Labour Party. What is perhaps surprising is that Mr Amory has not yet chosen to back these selective and general "selective" encouragements to private investment in preference to relaxing the slightly more generalised discouragements to it represented by his formal directive to limit bank advances and by the currently restrictive rules of the Capital Issues Committee.

FIVE per cent by itself is not a Bank rate that of itself signifies either expansion, or renewed restriction. But a reduction from 7 per cent to 5 per cent in just three months made in three stages two of which were made in an atmosphere of strikes says a great deal. For once neither the Bank of England nor the Treasury has "let it be known" that this week's reduction marks no change in policy. It patently does mark one. It proclaims the end of the 7 per cent chapter. After three reductions Bank rate is back again to where it was in the summer of last year. The autumn drain against sterling is again just beginning; the mark is again strong and sterling is again being sold as its best route into it.

But with what reserve must the comparison with a year ago now be coupled. The present slight weakness of sterling (the rate against the dollar slid further to $2.80\frac{3}{32}$ after the Bank rate announcement but quickly recovered to $2.81) worries no one, for sterling has had six months of a remarkably good run and formidable strength has been built up. The Bank may have cut Bank rate with the feeling that it is convenient to have a rate from which the next move might with equal probability be in either direction. But it certainly did not—as is sometimes crudely suggested in the market—come down in order to go up when the seasonal pull reaches its peak.

If this is the end of the 7 per cent chapter, then although the initial allowance concession happened to precede Bank rate because of the accident of the timing of the Finance Bill, that concession must be regarded as the beginning of the next chapter—the chapter that will include the review of the instruction to the Capital Issues Committee and a review of the ceilings on bank lending (both by now pretty ineffective). On that hypothesis Bank rate might now be allowed to rest on the 5 per cent platform for a little while. What will happen in that interval depends partly on the guess that investors make about the timing and direction of the next move.

FEW Bank rate changes have been as widely and as accurately forecast as last Thursday's; so the immediate move in the market, except naturally for short-dated gilt-edged which rose in heavy buying, was small. Long-dated gilt-edged rose only by about $\frac{1}{32}$, for the official funding policy is keeping some long-dated stocks cheap. Seven day money in the local authority market came down by a little over $\frac{1}{4}$ per cent to $5\frac{1}{4}$ per cent or a little less. Leading industrial shares closed a few pence higher. The market's true reaction will become clearer in succeeding days but a first glance suggests that the "bulls" are in the ascendant and that Bank rate may still be talked down further.

One consequence of having no further move in Bank rate clearly in sight could conceivably be to take some of the steam out of the gilt-edged market and to reduce the rate of funding by the Government brokers' sales through the market. Funding at the long end should still be able to continue and if the rate of funding is reduced it should be remembered that funding is not an end in itself. It is an efficient means of imparting a tautness to the credit system, the need for which has become less imperative.

IN the money market, the Bank's move had generally been expected, and had been largely discounted. Bills have been in keen demand, partly from overseas sources, and on a number of occasions discount houses have taken small seven day loans at Bank rate rather than sell their bills. At the preceding Treasury bill tender on Friday last week the discount rate had been cut by no less than $\frac{5}{16}$ per cent, a quite unusually large step except in anticipation of a Bank rate change. At just over $4\frac{1}{2}$ per cent, the rate was a full

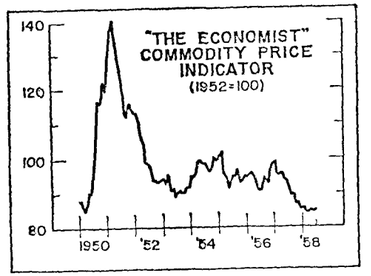
1 per cent below Bank rate, and was thus already $\frac{1}{2}$ per cent below the new Bank rate. The scope for further reductions in the bill rate will be set by the wider view of the trend of monetary policy. If the market should still fear that the next Bank rate change may be an upward one, bill rate will obviously be nearer Bank rate than it has been in past months.



The adjustment of fixed rates in the money market again has been exactly in line with the Bank rate change. Thus the clearing banks' deposit rate falls to 3 per cent, and the minimum rate on money lent to discount houses at call to $3\frac{1}{4}$ per cent. The new spread of rates on overdrafts is from $5\frac{1}{2}$ per cent that blue chip companies are charged to $6\frac{1}{2}$ per cent, for some personal borrowers.

"The foot off the brake, but not yet on the accelerator" is the metaphor in which the present stage of credit policy is being described. If that analysis is right, there must remain some doubts whether this will be enough to retain momentum in the economy; but the power to touch the accelerator remains unimpaired. There is plenty of time for debate over the duration, the techniques, the incidentals, and the success of disinflationary policy. But there was no time to waste in adjusting it once evidence began to accumulate that its objects, within limits, had come to pass.

Turning Point for Commodities

Whether the halt in the fall in commodity prices is a pause or an upward pointer depends upon the prospect of renewed American industrial demand.

ONE general precept urgently needs to be recommended to those preparing for the Commonwealth economic conference at Montreal next September. It is to talk about liquidity, and not about commodities. The way to advance everybody's standard of life—including that of producers of primary materials—is to work for a general increase in international trade and production. Once that happens, demand will rise for all primary products that are really wanted. The way to risk impoverishing the whole Commonwealth is to arrange a host of specific agreements about particular commodities: that is, to say that Commonwealth countries will not buy cheap commodities from outside, but will chummily agree to buy dearer commodities from each other.

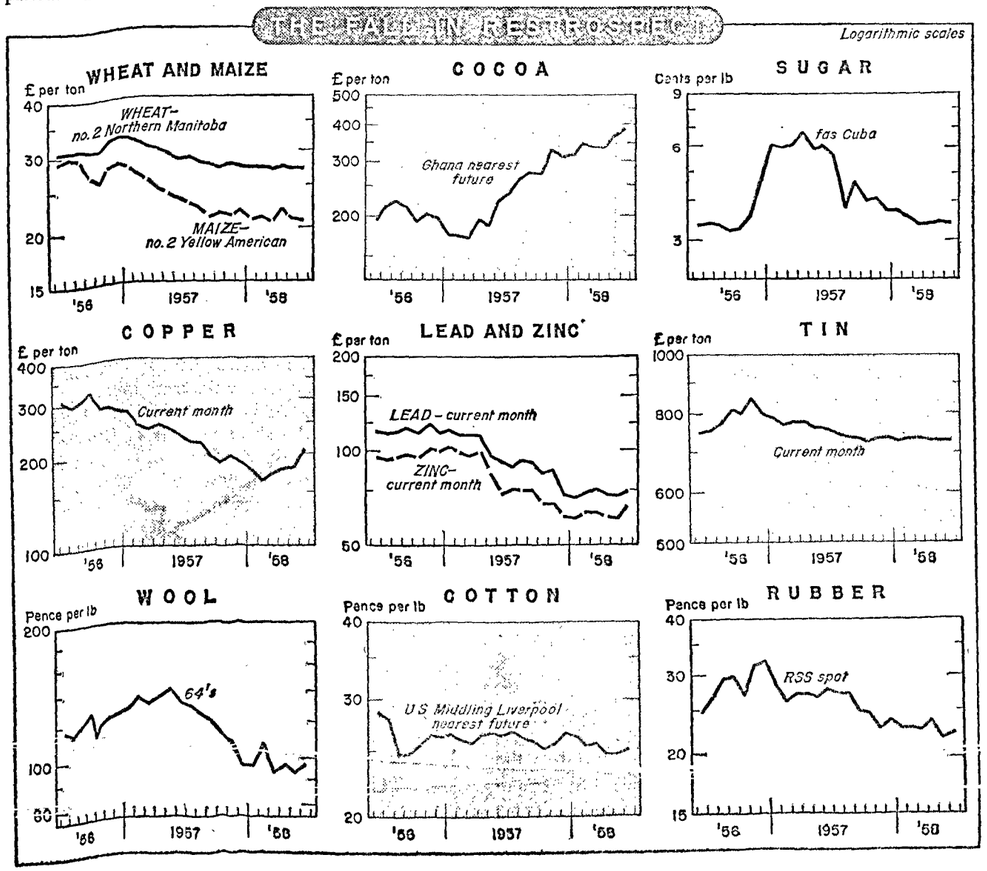
Unfortunately, there are signs that the Commonwealth officials who have spent the last two weeks in London, preparing a preliminary agenda for the Montreal conference, may have got off on the wrong foot. They are reported to have enmeshed themselves in detailed discussions of about seventeen different commodities in which Commonwealth countries are particularly interested. And, while they have been talking, the slump in commodity prices has in fact been halted. *The Economist* commodity price indicator, also by a strange coincidence composed of seventeen commodities, shows quarter by quarter these percentage changes:

	1956	1957	1958
First quarter	+0·34	−3·26	−1·40
Second quarter	−5·23	−1·37	+1·07
Third quarter	+4·41	−4·16	...
Fourth quarter	+3·70	−4·79	...

It would, of course, be foolish to suggest that the troubles of the primary producers are over just because the fall has stopped. This could be a pause in a longer decline; or it could be the beginning of the end of the "bear" market. But, if it does presage recovery, recovery will take off from a level of prices that already embarrasses many of the producers. Almost every overseas member of the sterling area will probably draw down its sterling balances—its London bank account—this year.

Fortunately a healthier British economy can support a moderate drawing down of sterling balances. But the primary producers of the world will have problems of internal adjustment to face. *The Economist* indicator stands about 13 per cent below its early 1957 peak. That bell-wether of the commodity markets—copper—is at much less than half its March 1956 peak of £435 per ton. How fervently Rhodesia must hope that the modest rally in copper will persist—and how thankful Rhodesians ought to be that £400 a ton copper did not last another year or two. If it had done so their standards of living and their costs of production might have reached a height from which it would have been perilous to fall.

Thus far the world has stood up remarkably well to the impact of recession in America. It is useful now to bring that recession into proper perspective. The American recession did not start the fall in commodities; it is nearer to the truth to say that it was started by that fall. And the fall naurally had imporant repercussions on the share markets of London, New York and Toronto. But the future of industrial activity in the United States will now decide whether what is happening to commodities is a pause or the beginning of a rally.



The immediate reason why commodity prices broke was the backwash that followed the ending of the Suez crisis; war fears and war buying stopped; commodities piled up in a longer supply line were drained out: shipping tonnage was released from the long journey round the Cape of Good Hope and freight rates fell. In the accompanying charts, a freight element is included in most of the commodity prices used.

But a fall in commodity prices—possibly with a different timing—would have occurred, Suez or no Suez. This was made inevitable for metals particularly, but for some agricultural commodities as well, by the large capital investment that stockpile buying had called into being. Sometimes actually aided by Government

investment, the productive capacity created still existed when the American stockpile programme was substantially completed and when, with little thought about the example it was setting, the British Government began to unload its stock. This was the basic cause of the crack in the commodity markets. It will not be mended until industrial demand expands sufficiently to take care of the productive capacity that was created. Meanwhile, each country thinks that the commodity which it exports is a special case ; one rolls dairy products on to the agenda, while another claims that its lead and zinc mines ought to have prior treatment.

Circumstances differ widely from commodity to commodity (cocoa, revelling in a West Africa crop failure, rose steeply throughout the slump). But over a large part of the commodity field, stability has been brought about by deliberate temporary curtailment. By tightly controlled international agreement as with tin, wheat and, to some degree, sugar, or by much looser arrangements, as with copper, producers have managed to hold supplies off the market. Their capacity to produce again when the climate is more favourable is unimpaired. The American government with its stockpile scheme for copper, has co-operated, but industrial demand has not yet expanded.

That must limit the scope for any sustained recovery. Nevertheless the turnround, when it comes, could be sharp. Producers of several commodities, tin and copper among them, have cut back to below the current estimated true rate of consumption, to make allowance for the fact that the consumer, the merchant and even the speculator (though there are few speculators in commodities now) would wish to reduce their holdings. When buyers come in again, they will find stocks limited ; and they will have to come in, even at today's reduced rates of consumption. There seems to some market experts to be already a little evidence that buyers are coming in. Significantly the customs smelters in the United States were able to raise prices before the announcement of the new American stockpile programme, which looks as though they had orders and no great stock. If a little buying occurs at the right moment it could breed confidence and more orders. But whether buyers will behave like that—and whether they will stay long when they do come in—depends on American industrial recovery.

BUSINESS NOTES

NEW ISSUES

Sinews of Re-expansion

BEFORE the reduction in Bank rate investors were already poised for a new and more expansive period in the markets. During the week ended on Wednesday, and especially on Wednesday when the new Stock Exchange Account opened, industrials and gilt-edged were bought. *The Economist* indicator rose 3.7 to 191.7 ; the *Financial Times* index of Government stocks rose from 83.52 to 83.62. The big AEI debenture issue had been steered to a safe harbour and other issues had been set on their way. The Bank rate reduction merely reinforced their chance of a happy landfall. Success was expected for the issue of the £25 million of 6 per cent debenture stock (1978-83) at 98½ by Associated Electrical Industries. The degree of success was hardly expected. The stags applied heavily and with about £100 million of stock applied for the allotment committee has a tough problem: it will not be possible for dealings to start in the new stock until Monday. With the demand for industrial debentures by the institutions so good, the prospect for two other industrial issues seems bright. Associated Biscuit Manufacturers, in a cash-cum-conversion issue, is offering £3.8 million (of which £2 million will be new money) of a 6 per cent debenture also dated 1978-83 and also priced at 98½. Davy and United Engineering is offering £1.6 million of a 6¼ per cent debenture (1978-83) at 97½ ; agreement has been reached with the holders of the £700,000 of unsecured loan stock and of the mortgage of £266,000 on the terms on which they can convert into the new debenture and they and other investors have agreed to subscribe in cash for the balance of the debenture. Later in the year Davy and United hopes to raise £500,000 by a rights issue.

★

Much more difficult to arrange, given the depression in shipping freights, must have been the placing of £10.6 million of loan stock to help to finance the tanker building programme of the Caltex oil group. A group of stockbrokers and merchant bankers, however, have arranged this financing with the institutions by the issue of two stocks, neither of which is to be quoted. Tanker Finance (UK) has been formed as the finance company and it has placed £7.6 million of "A" secured loan stock (repayable by a cumulative sinking fund between 1968-83) with insurance companies, pension funds and other institutions and £3 million of "B" secured loan stock (repayable over eight years in equal annual instalments) with Overseas Tankship (UK), a member of the Caltex group which will charter the tankers until 1983. As with similar schemes for the Shell and BP groups the security for the money borrowed is the tankers now being built and the charter parties that precisely cover the cost of servicing and repaying the loan.

Rhodesian Dollar Loan

RHODESIA'S first loan on the New York market has also been arranged during the week. With the object of raising about $25 million, the Federation has sought to split its requirements between the International Bank and the New York market, and found the amount that American private investors are prepared to put up in overseas loans was limited. So the International Bank lends the Federation $19 million tied to railway development (and in addition to the Kariba Loans already made) and $6 million has been raised in 5¼ per cent external loan bonds dated May 1, 1973, issued at 97½ to yield 6.01 per cent to maturity. It is believed that in fact of the $6 million market loan a fair proportion is coming not from American private investors but from holders of dollars in countries like Holland and Switzerland. Application is to be made for the bonds to be listed on the New York Stock Exchange.

INDIAN ECONOMY

Payments Crisis

LOOMING over this week's London meeting of the Commonwealth officials preparing for the Montreal Conference there has been increasing realisation of a fast approaching external payments crisis in India. India's payments difficulties have recently been heightened partly by a loss of export income and partly by an acceleration of deliveries of capital goods. This last is a product of change in world economic climate and of the increasing slack in the economies of industrial countries. The deficit which India has to meet over the remaining period of the second five-year plan—that is, up to April, 1961—is of the order of £420 million. Of this rather more than half has to be found before April of next year. These sums are arrived at after allowing for all promises of credits.

India has in hand £177 million of sterling balances which obviously cannot be drawn down to zero. In addition there is about £80 million of gold in the Reserve Bank which must be regarded as a last ditch reserve. The need for a massive credit operation is therefore desperately urgent. India has recently obtained an Export-Import Bank credit of $150 million, but this is tied to future purchases of capital goods (in the United States and at prices which are now between 20 and 30 per cent higher than the prices at which these goods could be purchased in Germany or Britain). This Export-Import credit is therefore useless to meet the urgent problem of filling the payments gap. The debts owing by India in respect of capital goods ordered under the second five-year plan amount to some 880 crores of rupees—say £670 million sterling—of which it is probable that half is owing to the United Kingdom, with Germany and Japan next in order of importance. The bulk of the amount owing to the United Kingdom is covered by the Export Credits Guarantee Department. The efforts that must be made by India to meet the payments due over

the next few months will quite clearly occupy the attention of London, Washington and perhaps Frankfurt over the next few weeks.

THE FRENCH LOAN

Interest Bearing Gold

As a first instalment towards France's financial regeneration M. Pinay, Finance Minister in the de Gaulle government, has announced in effect a repeat performance of his gold loan of 1952. His new loan issued this week for an indeterminate amount and open to subscription for an unspecified period, bears interest at 3½ per cent. This seemingly modest rate is generously embellished by a variety of extra benefits: interest is exempt from income tax and the capital from estate and transfer duty; security of capital against inflation or devaluation is in part at least secured by indexing the repayments which begin in 1970 to the market price of the gold Napoleon, which for this purpose has been given a base value of Frs. 3,600. Subscriptions are invited in francs but it is the hope of the Government that a substantial proportion of the application money will come from sales of gold or even foreign currencies on the part of the French public thus offered an inducement to repatriate their capital. To encourage that repatriation the law of 1948, which prescribes a 25 per cent fine on reimported capital, is being abrogated.

In the main, however, the loan is an appeal to the gold-hoarders of France. They are invited to sell their gold for francs and invest them in the Government's gold loan on terms that, it is claimed, amount to earning interest on the gold instead of paying for its safe keeping, and yet retain much the hedge against inflation that the possession of actual gold would give. It remains to be seen whether Frenchmen do indeed regard the promise of repayment on a gold basis from 1970 onward as the equivalent of holding physical gold now. The response to the last Pinay gold loan was not encouraging.

It may, however, be significant that on the day before the opening of the lists a considerable increase in the turnover of gold in the Paris bullion market occurred. There has also been a demand for French francs on the foreign exchange market which on Monday caused the rate in London to improve from Frs. 1,176 to Frs. 1,173, an advance that has not been wholly held. The main factor in the French franc market this week has been the continued evidence of an extremely short technical position in this currency. The world has sold the franc short and the bear accounts cannot be financed by overdrafts in Paris with the result that when francs are needed for remittance to France the impact on the rate is inclined to be severe. Short-term confidence in the franc has also been improved by the proposal at long last to acknowledge and regularise the veiled devaluation of the franc of last August. This has helped to dispel fears that M. Pinay might be considering another exchange "adjustment" comparable to that of last year.

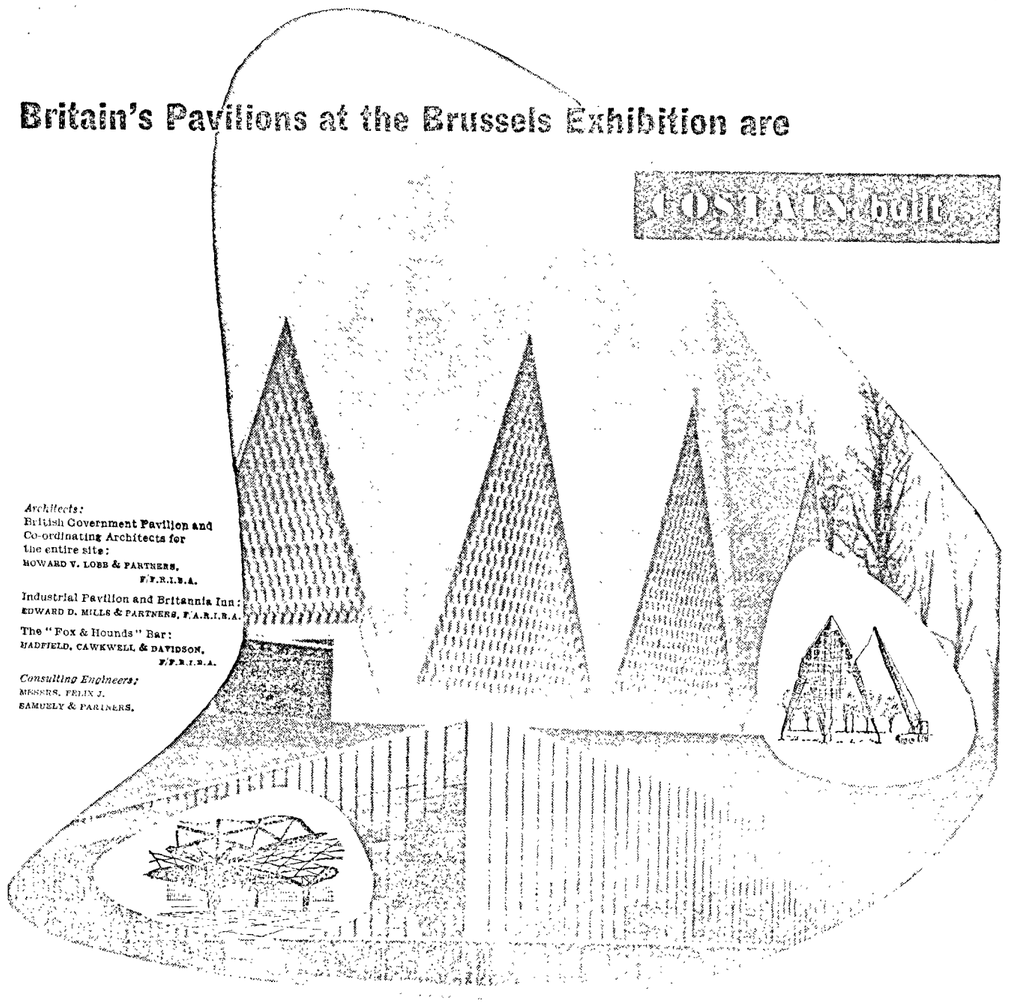
COAL IMPORTS

Double-headed Penny

Considerable, and expensive, efforts are at present being made by the National Coal Board to ensure that 24 per cent of the coal it mines this year is large coal, as against roughly 23 per cent last year. Even with a designedly smaller tonnage, this higher yield of large coal should, the board hopes, give it enough large coal to supply all that domestic consumers from next month will be free to demand. In the Commons this week Sir Ian Horobin, Parliamentary Secretary to the Ministry of Power, refused to contemplate imports of house coals from Poland, which a Conservative member said could be landed in British merchants' yards at £1 a ton cheaper than British. The end of rationing, Sir Ian said, was based on the industry's expectation that sufficient supplies of coal would be available without imports. Besides, "a large part of this Polish coal is almost certainly dumped, and that raises questions of its own."

Consumers cannot import coal without an import licence from the Board of Trade, which would require approval from the Ministry of Power. It is fair to add that while foreign coal cost more (and most foreign coal does still) they never showed any desire to: it was always cheaper for the Government to make the Coal Board carry the loss on importing it and selling it at British prices. Since the war, the Coal Board has been obliged to lose about £70 million (nearly 2½ times its present accumulated deficit) in this way. On short-term considerations at least, it might quite logically itself prefer to save money and effort by bringing in large coal cheap today, rather than strain to keep its proportion of large coal up: but it is not likely to be allowed to consider these. There is no more real reason why the Coal Board should be allowed a monopoly of importing cheap coal than why it should be forced to import all that the economy wants when coal is dear. In practice it will probably not be allowed the one and it will be forced to accept the other. This is not simply Conservative Ministers' insistence that heads a nationalised industry shall not win and tails it shall lose as much as can safely be heaped upon it: the doctrine of cheapness for indigenous basic materials had once a little more intellectual integrity than that. But recently great care has been taken not to think it through.

BRITISH TRADE



Exports Rise Seasonally

On the face of it the May trade returns would have looked good without the help they received from the London dock strike. The strike had the effect, it is reported, of reducing imports by some £10 million or £15 million, but even if that sum is added to the recorded trade gap (the excess of imports valued cif, over exports and re-exports valued fob), the gap still only amounted to around £20 million, which is below the average for the preceding four months and much lower than the sort of figure we have grown accustomed to in the postwar world. The fall in import prices is still bolstering up the British balance of payments.

Dock troubles hamper, of course, both loadings and unloadings, but in May the export figures were unaffected because exports get recorded more tardily than imports and are not related strictly to the calendar month; they cover a few days in the preceding month and exclude the last few days of the month. And the dock strike did not start until towards the end of May. May is a good month for shipments and this year was no exception; exports rose to their highest figure since the previous May, but the

Britain's Pavilions at the Brussels Exhibition are

At the great Universal and International Exhibition in Brussels British constructional industry is represented by these two striking pavilions. The contract for constructional work on the entire British exhibit—which includes also the Britannia Inn and the Fox & Hounds Bar—was awarded to Richard Costain Ltd. and has been completed in association with the Belgian firm of Blaton-Aubert.
Between 35 and 50 million people are expected to visit the exhibition. This important British exhibit is another example of the Costain combination of technical skill, experienced organisation and versatility.

Colour Commercials NOW!

when you advertise through the cinema

WHEN YOU ADVERTISE THROUGH THE CINEMA

During the last two years advertisers have learnt the power of audio-visual selling: how product demonstration creates impact, and how sound and vision make a message stay fresh in the memory.

WHAT COLOUR CAN DO FOR YOUR COMMERCIALS

The cinema goes one stage further—it adds colour to audio-visual selling. The cinema is the *only* mass medium which gives sight, sound, movement, and colour. Colour to show your colourful pack at its best,

... for realistic appetite appeal
... to portray clothes, fabrics, household furnishings as they look in real life ... to heighten glamour
... and to add sheer colourfulness to your advertising.

NEW CAMPAIGN FLEXIBILITY WITH 44-FT. COMMERCIALS

Pearl & Dean cinemas now offer advertisers 44-ft. commercials in addition to the 22-ft. (15-second) commercials in the Filmlet section. This means that your colour commercial campaign can now be built from any combination of the following units:

FILMLET SECTION 22-ft. and 44-ft. filmlets with weekly or fortnightly frequency.

FILM SECTION 30-second, 1 minute and 2 minute films.

THE CINEMA IS THE IDEAL MEDIUM FOR REACHING YOUNG PEOPLE

Here you will find your most important customers—Young People just forming their personal brand preferences and Young Housewives beginning to choose household products for the first time. 93% of them go to the cinema—the cheapest audio-visual medium for reaching the 16-24 age group, with the great advantage of colour. And it is the cheapest colour medium for this group per thousand people reached.

The Plutonium Switch

THE MINISTRY of Defence has set in motion a chain of events of the utmost importance for the country's nuclear power programme in asking the electricity authorities to take steps that will make it possible at any time to switch the output of plutonium from four of the biggest nuclear power stations from civil to military use. The change will have little outward effect on the power stations other than the more frequent appearance of fuel lorries at their gates. But it may have repercussions at present difficult to estimate on nuclear power station economics; and it could mean potential overloading of some of the Atomic Energy Authority's already hard-pressed processing plants, including the diffusion plant at Capenhurst that produces pure fissile uranium.

The Technical Background

While reactors of the Calder Hall type are burning natural uranium as fuel they automatically produce a fixed proportion of plutonium as by-product; but whether that plutonium is suitable for weapons depends on how long it stays inside the reactor. When they first come into being—and they are always created artificially—all plutonium atoms take the form Plutonium 239, which is fissionable, but as they remain in the reactor a growing proportion degenerates into a non-fissionable and useless form, Plutonium 240. The reactor, meanwhile, does not discriminate between uranium and plutonium and burns up a fair proportion of the fissionable plutonium as fuel. Therefore the quantity of plutonium likely to be extracted from the spent fuel removed from a commercial nuclear power station is low and its quality is poor. This can be corrected by removing the fuel rods at frequent intervals of months rather than years, so that the plutonium can be extracted in a relatively pure form before it has begun to degenerate.

This is the system on which the eight electricity-producing reactors of the Atomic Energy Authority at Calder Hall and Annan in Scotland are operated: these make electricity as a by-product, but are primarily plutonium producers. With Windscale closed, these eight reactors are the country's only source of "weapon-grade" plutonium. With three of the eight reactors finished and working, the present rate of output is probably about 120 kilograms of plutonium a year; the total capacity when all eight reactors are operating—again very roughly—might be in the region of 300 kilograms a year.

Output from these eight reactors will be adequate while nuclear weapon production is restricted to atom and hydrogen bombs. This type of weapon is not stockpiled in quantity and does not usually require more than 5 kilograms of pure plutonium or uranium for its basic charge. But if it is decided to produce, in addition, tactical atomic weapons, and to give nuclear tips to anti-aircraft missiles (which is an essential part of such air defence as exists today, particularly against ballistic rockets), then the capacity is inadequate.

The Generating Board has therefore been asked by the Ministry of Defence to modify the equipment for loading and unloading fuel from the reactors of three of the nuclear power stations in its present and forthcoming programme so that the fuel can be removed, if necessary, while the plutonium that it contains is still fit for military use. The capital cost, which is small, is being met by the Ministry of Defence. The three stations affected will be Hinkley Point in Somerset, where work has already started, and stations to be built in Wales and Kent, where contracts have not yet been awarded. A fourth station, at Hunterston in Scotland, already has suitable equipment.

The cost of modifying the stations now, before they are built, is relatively small compared to what it would cost to switch them over once they have been commissioned. For this reason the Ministry of Defence defines its policy as an "insurance" and for the same reason no attempt has been made to modify the two partially built nuclear power stations at Bradwell and Berkeley.

The Economic Effects

The four stations concerned, if they were all pressed into service, could produce perhaps 1,800 kilograms of weapon-grade plutonium a year by the mid-1960s, bringing the country's total capacity to well over 2 tons a year. But the first of them, Hunterston, would not start to deliver any before 1962.

The effect of this change on the running cost of nuclear power stations is likely to be considerable. The output of plutonium from the civil power programme, when all 6,000 megawatts of capacity had been installed some time in 1966, was originally put at 4 tons a year of low-grade plutonium with a purely civil use, expected to be substantially lower in value than earlier, optimistic estimates had suggested, because its quality was so low. On the day that the Ministry of Defence made its announcement, Sir Christopher Hinton happened to be delivering a paper explaining that the "plutonium credit" that is effect against the gross cost of generating nuclear electricity had already been sharply scaled down from the fairly fat figure of 0.35 pence per unit sent out to the fragmentary one of 0.07 pence per unit. But where reactor running costs are concerned, plutonium burnt on the spot inside the reactor is much more useful than residual plutonium extracted by an expensive chemical process from spent fuel, and the higher the rate of burn-up the better.

The new dispensation will alter gross costs for the worse. The output of plutonium can be expected to go up sharply, probably by about 50 per cent, because less is burnt inside the reactor. This high-grade plutonium could also be expected to command a much higher price—but it is a bill that the taxpayer must foot as part of the defence budget. The fuel, costing £10 million upwards, may all have been removed at the end of one year, long before more than a tiny fraction has been burnt, instead of remaining inside the reactor for about five years until fully exhausted.

Implications of the Change

This is a grossly uneconomic process. The semi-depleted uranium is not thrown away, but it cannot be reworked into fresh fuel rods without a "topping-up" process designed to replace its depleted atoms. And until a technique has been developed of "spiking" this with plutonium the only way to do it is to put the uranium through at least some of the stages of a gaseous diffusion plant—an operation, ironically, that consumes vast quantities of electricity.

Manufacture of fuel rods, and their chemical decomposing to extract plutonium, are neither very costly processes if they occur only once every five years or so. But constantly repeated as would need to be under the new plan, they could add significantly to total generating costs at nuclear power stations, even though the extra cost would be met by the Ministry of Defence and not by the electricity consumer. Moreover, neither the diffusion plant at Capenhurst, which is a small one, nor the chemical treatment plant at Windscale could handle the work involved in switching four huge power stations of this size over to military plutonium production. No help can be expected here from the United States so further capital investment by the Atomic Energy Authority seems inevitable if only as part of the "insurance."

And if a claim is ever made against this policy, as it well might be, there will be two further consequences. Atomic engineers are going to lose a great deal of valuable and essential experience about the probable life of fuel elements (they hope for 3,000 MW days of heat per ton of uranium now and 5,000 MW days in the future). But with little or no "civil" plutonium on the market, engineers will at least be temporarily relieved of the embarrassment of finding how to use this singularly unco-operative metal as a commercial nuclear fuel.

Continued from page 1104

seasonal rise was still less sharp than last year and exports were 5 per cent lower in value than at that previous peak, with prices virtually unchanged. In the preceding three months the average drop from a year ago was nearer 4 per cent, but allowing for the different incidence of the Whitsuntide holiday in the two years, export trade is probably not deteriorating in comparison with last year.

* Excluding repayments of silver bullion to the United States amounting to £7 million in 1957. † Provisional.

Rejoicing must be subdued. Except on one count: in spite of the American recession, dollar exports are buoyant. Excluding from last year's accounts the unrequited silver bullion repayments to the United States and also excluding the delivery of the liner *Empress of Britain* to Canada, exports to the United States in the first five months of this year were 9 per cent up in value and exports to Canada were 5 per cent higher.

EPU RENEWED

A Year of Grace

THE Managing Board of the European Payments Union has recommended a year's extension starting from July 1st. This recommendation needs to be endorsed by the Ministerial Council of OEEC when it meets in Paris on the 27th of this month, but endorsement is a foregone conclusion. Thus the storm of protest that arose earlier this year and the threats by EPU members outside the Common Market that they would not renew EPU unless a Free Trade Area were formed is now decently forgotten. Its solitary echo is a reservation by Switzerland which has claimed the right to leave EPU unilaterally on January 1st next if it so desires. All other members have accepted the renewal of the Union, subject only to the now usual break clause which would operate if one or more EPU currencies become convertible, thus causing EPU to be dismantled and replaced by the European Monetary Agreement.

Opposition to the renewal of EPU has died down partly because of growing indications that France may not be able to fufil its full obligations as a member of the Common Market at the end of this year, so that the element of discrimination involved in the first tariff and quota dismantling within the Common Market (which is due on January 1, 1959) may not be as clearcut as had at one time been feared. The fact that France has applied to the OEEC Steering Board to be released from the obligation to liberalise 60 per cent of its OEEC trade by mid-June, bears with it a possible indication that France will also be unable to reduce its tariffs by 10 per cent or increase its import quotas with its Common Market partners by 20 per cent at the end of this year. There is still hope in OEEC that, despite the delay in the Free Trade Area negotiations that the French crisis has caused, it will be possible for potential members of a Free Trade Area to behave as though a Free Trade Area had been negotiated, and at the end of this year to reduce tariffs and increase import quotas in accordance with the Rome Treaty provisions. It is that possibility that would have made a failure to renew EPU, or a renewal for six months only, an unhelpful action.

FUEL OIL

Back on Trend

WITH deliveries of fuel oil during the first quarter of 1958 over 44 per cent higher than in the first quarter of 1956, and deliveries in April (now published in the Monthly Digest of Statistics) no less than 65 per cent higher than in the corresponding month two years ago, the marketers can fairly claim to have made up most of the momentum they lost when supplies from the Middle East were interrupted. Over a third of the increase is due to the commissioning of new oil-fired generating stations, which now take four times as much fuel oil as they did two years ago; but excluding them, fuel oil deliveries still rose by about 30 per cent over the two-year period. A further reduction last week of about ten shillings a ton in the scheduled prices for fuel oil delivered to industrial consumers in Britain gives industry slightly cheaper oil than it could buy before the Suez affair began. Allowing for the slump in tanker freight rates, and for the many special price-cutting deals by which surplus fuel oil in the Caribbean and US West Coast is now commonly disposed of, the current price paid for fuel oil by British industrial consumers is probably still roughly in line with the delivered cost of Western Hemisphere fuel oils.

In the South of England, and at any point reasonably near a port and distant from the coalfields, fuel oil has now become a cheaper fuel than most grades of coal—if due allowance is made for its higher thermal value, some measure of convenience and efficiency in use, and the quantity discounts allowed to large oil consumers, which may be supplemented by special rebates where competition between the oil companies is particularly keen. Small coals, delivered in bulk to large generating stations, are still much cheaper to use than fuel oil, especially as in this use the technical advantages of fuel oil compared with coal tend to be less marked than they are in other industrial steam-raising plants. The one power station where fuel oil is supplied on a coal-oil price parity basis is the exception. Outside the field of electricity generation, the slight opening of the Coal Board's price "concertina" last March, which was intended to induce consumers of scarce large coals to switch to the more plentiful and cheaper small coals, may have had the unintended effect of persuading them to switch to fuel oil instead. Any rises in the price of coal to domestic consumers, which may follow from the removal of rationing and price controls, are, however, more likely to benefit gas and diesel oils and kerosene than fuel oil.

But if the fuel oil sales are back on the postwar trend, which implies a continued rise in fuel oil consumption of some 20 per cent a year, the industry is also coming back to its problems of refinery balance. When crude oil costs considerably more than fuel oil sells for, it cannot pay the oil companies to produce more and more fuel oil unless the lighter and traditionally more profitable products, which have to be produced jointly with the fuel oil, can be sold. But the disparity between the rate of growth of fuel oil

Quaglino's

FOR THE BEST IN BANQUETING

QUAGLINO'S will open London's newest Banqueting Suite on October 1. Here will be provided the good food, good wine, and good service which have made Quaglino's famous. The accommodation available ranges from rooms suitable for small business luncheons up to the spacious ballroom holding 400 guests for a dinner and dance.

Please write or telephone:-

Ever stopped to consider what goes into a 'FIBERITE' packing case—besides your product? A lot of hard thinking, based on immense experience, to give you the best protection at the lowest cost. We of Thames Board Mills—the only manufacturers of 'FIBERITE' cases—keep costs down by making the best use of materials. Some goods need the sturdy protection of solid fibreboard, others demand the shock resistance of corrugated. Some need both, and as we are the largest manufacturers of board in the country, we can advise with an open mind what is best for the product. Perhaps that's why so many manufacturers rely on 'FIBERITE' packing cases.

'FIBERITE' PACKING CASES

sales and that of petrol and other light products has grown larger than it was two years ago, rather than smaller. Companies selling fuel oil must be glad to feel its former competitive strength again; but refinery economics may pull them up short well before they reach the limit of the market for fuel oil at present prices.

BANK ADVANCES

Rise in Lendings

THE detailed analysis of bank advances for the latest quarter, the three months February-May, reveals, as expected, the first major reversal of the downward movement that set in last summer. Aggregate advances made in Great Britain by members of the British Bankers' Association rose during the quarter by nearly £91 million, to £2,032 million, whereas in the preceding quarter they had risen by only £10 million and in the six months to November last had fallen by £147 million. This increase exceeded the corresponding movement last year by £13 million, but that margin was attributable to bigger demands from the public sector—the nationalised industries and local authorities. Loans to all other borrowers rose during this latest quarter by £76 million.

Nearly two-thirds of the expansion was attributable to two major groups, both of which made much bigger demands than in the corresponding quarter of 1957—food, drink and tobacco, up by £31 million (compared with £18 million), and retail trade, up by £18 million (compared with £10 million). Several of the smaller groups also increased their share of the total. In contrast to the declines shown by wool and cotton, other textiles expanded by £5 million (11 per cent) and leather and rubber by nearly £4 million (21 per cent). Agriculture rose seasonally, by £5½ million, but this was slightly less than in 1957, and the total of £212½ million is £10 million down on the year. This total is again exceeded only by that of the big engineering category, the advances of which have been virtually unchanged in the latest quarter, at £228½ million, but are £14 million down on the year.

All the financial groups increased their borrowings, stockbrokers by £2.2 million to £10.2 million, hire-purchase finance houses by £0.9 million to £31 million (they also rose fractionally in the preceding quarter), and "other financial" by £4½ million to £176 million. The personal and professional group rose £4.3 million, to £324 million, or by slightly more than in the similar quarter last year, but the total still shows a slight decline on the year. Since last August, the date nearest to the starting-point for calculating the "ceiling" imposed by the Chancellor, total advances have contracted by £23 million, whereas in the corresponding nine-month period of 1956-57 they expanded by £76 million. If the public utilities are left out of the reckoning, the nine-months fall becomes £34 million, in contrast with an expansion of £151 million.

AIR TRANSPORT

Controlling the Traffic

THE public inquiry into the crash of a chartered Bristol Wayfarer aircraft in the Pennines has once again demonstrated in a tragic manner how little the air traffic controllers in parts of the country know about the actual position of an aircraft within their zone and their inability, therefore, to advise a pilot when he is dangerously off course. The radar cover around southern England, centring on London and Gatwick airport, a necessity in a region of such dense air traffic, functions so effectively that it is not always realised that the rest of the country is not as well covered. Yet it was only on Wednesday that the Minister of Transport announced that radar surveillance was to be extended along the whole length of the country's main airways so that ground controllers could keep their own continuous check on all the aircraft using those lanes. This long over-due modernisation is expected to take as much as five years to instal, at an estimated cost of £5 million.

Mr Watkinson hinted in passing at one of the biggest difficulties in designing a traffic control system, the rapid rate of obsolescence. Technical developments are barely managing to keep pace with the rising volume of air traffic and its increasing speed; even at London Airport, where the equipment is among the finest in the world, most of the installations covering the airport and the southern region are due to be replaced by the "semi-automatic control equipment" mentioned by the Minister just as soon as it has been developed. The biggest problem in air transport today is not in aircraft design, or even in providing runways long and strong enough to carry new machines, but in shepherding them safely along invisible airlanes with the limited help of instruments all too many of which still date from the string and sealing wax days of flying.

NUCLEAR POWER

Atomic Ententes

THE atomic energy agreement signed this week between the British and Japanese governments is cut to the same pattern as that reached with Italy shortly after Christmas: it confirms the belief that the British Government is prepared to be as generous towards countries that intend to buy nuclear power from British manufacturers as it is cool towards those that do not. Three features stand out in these agreements. The first is the willingness of this country to sell nuclear fuel outright. Admittedly the Japanese agreement gives the UK Atomic Energy Authority first option on any plutonium produced in Japanese reactors burning British-supplied fuel, but only "on any such materials which the Japanese government does not need for its own peaceful purposes"; and this agreement states flatly that all this material is in any case "at the disposal of the Japanese government." Secondly, Britain is prepared to give Japan any technical help needed to build fuel manufacturing and processing plants in Japan so that the latter would become independent of foreign suppliers. Thirdly, it is prepared to guarantee the quality and performance of any fuel supplied.

To put it crudely, the British Government offers atomic power without strings, a card that has now twice trumped the formidable American ace of atomic power at cut prices, once in Italy and once in Japan. Both these countries intend to buy at least one nuclear power station from Britain, and some people believe that the attitude of the British Government has weighed almost as heavily in the scales as the technical advantages of the plant.

It is possible that the American government will eventually adopt the same pattern of nuclear trade, but to date it remains remarkably reluctant to lose control of any fuel

that it supplies. Arrangements, for example, to help out Britain's limited supplies of enriched, as opposed to natural, uranium do not seem to be working out as well as expected. But there is, however, a good chance that Congress will approve next week the sale of a submarine reactor to the British Navy. The Admiralty would actually like to buy several reactors of this kind to instal in British-built submarines, since it will plainly have to wait many years before the Dreadnaught submarine project in this country reaches the stage where it can be put into production. Whether Congress will go that far remains to be seen.

TIN

The Russian Threat

THE International Tin Council is still in session in Paris in an atmosphere of some secrecy as this edition of *The Economist* goes to press. But there is little doubt that discussion has centred on the continuing Russian, and to a lesser extent Chinese, tin offerings. Market behaviour since the Council last met in London six weeks ago has been less favourable than was hoped when the Council cut production below estimated consumption so as to empty the supply pipeline. Prices have remained near the floor level of £730 a ton despite the extension of the 40 per cent export restriction until the end of September. Even so, the buffer stock has had to buy, and is now believed to hold in cash only the undisclosed sum received under the special fund recently set up. If the buffer has indeed exhausted its three contributions due under the scheme it must now hold upward of 23,000 tons of metal. An indication of market uncertainty has been a sudden widening this week of the discount on three months forward tin which has, however, since recovered to near parity.

In the metal trade it is believed that discreet approaches have already been made to Russia to see whether that country would consider joining the Agreement. But little is known about the size of tin output in Russia, so that it is difficult to assess whether current Russian sales are from accumulated stocks or from production in excess of domestic consumption. The fact that neither Russian nor Chinese tin is allowed to be imported into the United States, the biggest market, is an additional complication.

FUEL AND POWER

New Chances for Coal

DEVELOPMENTS in complete gasification of small coals under pressure, recently discussed in these columns, offer the chance of much wider commercial horizons for the gas industry: they would also offer the coal industry a developing market for the small coals that it cannot help producing as and when power station demand for these levels off and begins to decline. In the W. M. Thornton lecture this week on "Developments in the Use of Coal," Mr A. H. A. Wynn, scientific member of the National Coal Board, was naturally concerned with this possibility—and with another associated development which depends upon development of cheap gasification, leading him to the conclusion that "there is no more important development project in the fuel and power industries." This second development is the synthesis of oil from coal.

This sounds a tall order: nobody in the world has yet managed to do it economically, not even SASOL in South Africa with coal at about five shillings a ton. But if pressure gasification is on at the cost that the gas industry will certainly need, oil synthesis would automatically become much nearer to a commercial proposition: the high cost of existing processes comes more in making the coal into synthesis gas, than in the synthesis of liquid fuels from the gas. A design study made for the Minister of Power by "a chemical engineering contractor" (known to be Constructors John Brown), said Mr Wynn, postulated a big plant that would convert 2,300,000 tons of East Midland coal into 630,000 tons of oil products (premium grade motor spirit and diesel oil) a year plus 56 million cubic feet of town gas a day at a pressure of 25 atmospheres. From coal taken at 3.1d. a therm (about £3 a ton) the plant could make the petroleum products at commercial prices and the gas at 7d. a therm; and give a gross return of 20 per cent on a fixed and working capital of about £35 million. This figuring would mean far cheaper oil synthesis than anyone else has ever proposed, let alone achieved: it depends, crucially, upon the performance obtained from the "slagging gasifier" pilot plants being tried out by the British Coal Utilisation Research Council, the Gas Council and the contractors. The economics of such a process would finally depend upon the cost of coal, possibly upon the relative price structure of oil products, and most of all upon the relation between coal and oil prices. By the late sixties, which is as early as any of these developments could possibly reach a commercial prototype stage, this relationship could look somewhat different from what it does today and appears likely to over the next five years or so.

*

Even in the meantime, Mr Wynn was prepared to be confident about the gas industry's chances in competition with electricity and oil: here, some of his figures seemed optimistic. He said that gas sold at 19d. a therm, and coke at 7d a therm were "much cheaper forms of energy than electricity" at 44d a therm. For the real conditions of competition at present, ought not one to take "follow-on" electricity at about 34d. a therm, since people have to pay the basic charge for lighting anyway? With electric heaters that are 100 per cent efficient and gas heaters with flues that are about 60 per cent efficient, gas is no cheaper. Coke competes in a different league, general heating, where it is sometimes marginally cheaper than oil but less convenient. On current figures, neither of the products of carbonisation seem to be competing very well: the genuine opportunities before the gas industry require major technical change.

COLOUR TELEVISION

The BBC's Trials

THE report on its experiments with colour television that the British Broadcasting Corporation has sent to the government's Television Advisory Committee simply indicates that the BBC is satisfied that a colour service on American lines would also be technically suitable for this country. The American system was worked out by the National Television Systems Committee which was set up to bring about some agreement between the warring colour systems developed by competing manufacturers. The BBC have taken that system, modified it, re-engineered it and experimented with it using the same 405-line system as the

KEMSLEY REGIONALS FOR WEIGHT AND weight

Nimble Bread helps to control the individual's avoirdupois. But then Nimble Bread's media plan includes one important factor—weight. Kemsley Regionals give weight *and* flexibility when and where the advertiser most requires it. Regular insertions give extra selling punch in Britain's most important marketing areas and even the most conservative sales resistance is soon broken down by concentrated local advertising. Regional newspapers are trusted by readers and found fully effective by advertisers. For minimum wastage and maximum weight—use

present British black-and-white services; and its engineers have satisfied themselves that pending a new discovery, this is probably the best available method of transmitting colour pictures.

The corporation has also, however, learnt much in the process about the cost of providing such a service. Receivers designed to take colour pictures are about three times as expensive as a normal receiver, because they are three times as complicated. But the equipment needed to transmit the colour picture is even more complicated, and is likely to cost a good deal more than three times that of the installations now in use. No way has yet been discovered either of transmitting or of receiving colour television pictures without using what amounts to a separate camera in the studio, a separate channel in the transmitter, and a separate tube in the receiver for each of the three primary colours that make up the picture. The fact that all three are installed together in the same piece of equipment, and have to be optically aligned with reasonable accuracy, merely adds to the complications. The BBC experiments, and the "promising results" achieved, do not mean that a colour service is round the corner or that the BBC would be anxious to introduce it if it were.

And in this matter, if in no other, the ITA is content to follow the lead of the BBC. After several years of colour transmission in the United States, the best estimate suggests that only a handful (by American standards) of colour receivers have been sold, probably no more than 200,000. The importance of the BBC's report is, however, that it gives the electronics industry a guide to the type of transmission that the Corporation, and presumably also the Post Office, would accept as the basis of a colour service. It is then up to the industry to see what can be done to bring costs down to a reasonable level. The striking improvement that colour brings to a television screen, not only because it is colour but because it appears to affect the whole texture of the picture, makes this an economic target well worth seeking.

FOREIGN EXCHANGE

The Tourist Season

City interest in the foreign exchange market has been concentrated on a slight weakening of sterling caused by a rather earlier than usual seasonal demand for dollars and a little selling in anticipation of a Bank rate reduction. The rate, though not seriously weak, dipped to $2.81 to the £ before the Bank rate announcement. The public at this time of year may be more interested in the market in foreign bank notes than in these usually quoted telegraphic transfer rates. The table compares the two markets at current rates and should be read subject to the warning that the bank note rates are wholesale, quoted by a firm of merchant bankers specialising in this business. The tourist's individual bank will require a modest turn for its trouble and risk in holding a stock of foreign currency.

	Bank Note Rates	Current Telegraphic Transfer Rate
	Mid-June	
Belgium (fcs. to the £)	138⅜–139	139·37½–139·42½
France (fcs. to the £).....	1257–1261	1174½–1174½
Germany (Dm. to the £)	11·67–11·72	11·70–11·70½
Holland (guilders to the £) ..	10·55–10·60	10·58½–10·58½
Italy (lire to the £)	1734–1740	1743–1743½
Norway (kroner to the £)...	19·92–20·00	20·01½–20·01⅜
Portugal (Escudos to the £)..	79·48–80·00	80·00–80·15
Spain (pesetas to the £).....	151⅛–151⅝*	117·60–118·60
Sweden (kroner to the £) ...	14·42–14·50	14·46⅜–14·47
Switzerland (fcs. to the £) ...	12·15–12·20	12·23½–12·23⅜

* Large denominations; small denominations are scarce and slightly dearer.

The main feature with tourist demand expanding and after the instalment of General de Gaulle in power has been the improvement in the quoted rate for the French franc note from around 1,300 to the £ to its present level of around 1,260.

TANKER TERMINALS

Super Tankers for the North-West

Some ingenious new features are incorporated in the design of the super tanker terminal now being built at Tranmere, on the Cheshire side of the River Mersey, to supply crude oil to the Stanlow refinery of the Shell Refining Company. A single approach road from the land divides at the river into two jetties, like the prongs of a pitchfork. At the end of each jetty is a floating stage, 362 feet long and 60 feet wide; each stage can accommodate a fully loaded tanker of up to 65,000 deadweight tons, and even larger vessels on a restricted draft. Because such super tankers are 700 feet or more in length, they jut out at each end of their floating stages, and to enable them to be moored safely special floating mooring "dolphins" will be provided ahead and astern of each stage. By this means two super-tankers will be able to be moored and to discharge their cargoes simultaneously, with a considerable saving in construction costs as against with one long, continuous stage.

When in full operation the Tranmere terminal will be able to handle up to eight million tons of crude oil a year for Stanlow refinery. The cost is being shared by the Mersey Docks and Harbour Board and Shell Refining Company; the Board, which will own the stage, will bear the major part of the expense.

COCOA

A Squeeze that Continues

The squeeze in the cocoa market continues with the price of around £400 a ton at the second highest level in cocoa history. The West African Marketing Boards have little cocoa left to sell from the current crop and Brazil will be the major source of supply over the next few months. The Brazilian crop is reported to be good and early estimates for the next West African crop are also favourable. High prices are also helping to reduce consumption. First quarter grindings of raw cocoa in the UK were 13 per cent down on last year and imports of cocoa butter were also lower in the first four months of this year. Imports into the US and most European countries have also been lower. The effect of declining consumption should progressively make itself felt and should the new West African crop prove to be average or better prices are likely to ease.

PETROL

Untied Service Stations

A decision by the Minister of Transport, which could have far-reaching effects on the tied service station networks created by the major oil companies, has received its first publicity in the annual statement of Mr L. W. Farrow, the Chairman of C. C. Wakefield and Company, the independent distributors of Castrol motor oils. "Stockholders will welcome," Mr Farrow says, "the attitude of the Government towards the tied station system as applied to the new motorways, the Ministry of Transport having decided not to allow exclusive trading thereon." The Ministry, which had made no prior announcement of this policy, confirms that it is the Minister of Transport's intention that every service station on the new motorways shall sell more than one brand of motor spirit—and presumably more than one marketing company's brands—in order to give motorists greater freedom of choice. The oil companies will not welcome this enforced return to "mixed sites"; but if the Minister carries out his intention he will give motorists more opportunity than they have at present of demonstrating to the oil companies which system they really prefer.

Service station building will also be affected by the revised planning directives sent by the Ministry of Housing and Local Government to all local planning authorities. The grounds for objecting to the erection of a new service station—its effect on the traffic flow, road safety, amenity, agricultural land, and so on—have been set down in greater detail than before. And where a proposed site offends against these principles, but only to a minor degree, then the planning authorities are to take into account the need for a new station. Commercial considerations, therefore, may in future play a bigger part in the granting of planning permission than they have in the past.

SHORTER NOTE

The main weakness of the radar speed checks now in use in various parts of the country is their tendency to give confused readings in heavy traffic when the beam cannot distinguish individual vehicles. Marconi have now applied the "Doppler" principle that is becoming widely used in air navigation to the design of a radar speed check that can provide separate readings for vehicles in traffic—eight feet is said to be the minimum effective distance—and will lock on to any one of them. Since radar is being used as the basis for a steadily growing number of speeding prosecutions, any increase in the accuracy of readings is to be welcomed.

COMPANY AFFAIRS

STEEL RESULTS

Apart from sheet and strip the demand for steel is not strong and this is reflected in the interim statements recently issued by some of the leading steel companies. Steel shares are depressed, but more because of the possibility of re-nationalisation than because of the industrial prospect. Profits, however, have fallen and this year shareholders can hardly expect another loosening of the purse strings. The cover on the dividends remains high, but the need to retain money to complete development programmes remains pressing.

Steel Company of Wales reports an increase in production (from 1,376,000 tons to 1,405,000 tons) and "higher" profits (though how much higher is not specified) in the six months to March 31st. The directors say that "the demand for steel sheets continues at a high level, and in recent months there has been some improvement in the demand for tinplates. Conditions in the export markets, however, are very much more competitive than a year ago." In declaring an interim dividend of 3 per cent and reporting "good progress" in the third stage of the development scheme, the directors say they see no reason to amend their prospectus forecast of a total dividend of 8 per cent for 1957-58. On that dividend the £1 ordinary units at 15s. 9d. xd yield 10.2 per cent.

Colvilles has left its interim dividend unchanged at 5 per cent and on the assumption that the 8 per cent final will be repeated, the £1 ordinary units at 24s. 9d. xd yield 10½ per cent. At the issue price the first option on the convertible debenture issued in January is equivalent to 27s. 6d. per £1 ordinary stock unit. In the six months to March 31st, the group's production of steel ingots and castings dropped slightly (from 1,079,810 tons to 1,051,488 tons) and its net profits fell from £3,021,000 to £2,646,000. The directors say that "although the demand for plates continued, there has been a recession in the demand for certain of the products of the group, especially in the lighter ranges. This has led to a reduction in the activity of the semi-finishing mills and in the need for pig iron. The opportunity has been taken to concentrate production in the more efficient units."

Hadfields does not publish half-yearly figures with its announcement of an unchanged interim ordinary dividend of 4 per cent. But the comments of the directors are gloomy. They say that "there has been a marked falling off in the volume of orders," a tendency which they believe to be general throughout the industry. Certain sections of foundries, forging departments and steel melting plants are, they say, temporarily operating at a reduced capacity. Production of pulp and paper making machinery in this country has been "maintained at a good level," but the trade recession in Canada has had "an adverse effect" on the profits of the group's subsidiaries in that country. "Falling demand at home, the growing competition from overseas and other economic difficulties . . . might well influence the rate of the final dividend." Last year the final payment was 5 per cent, making a total dividend of 9 per cent. If that could be assumed again this year the £1 units at 15s. 7½d. would yield 11½ per cent.

United Steel: By recommending a payment of 4 per cent on an ordinary capital recently increased to £30 million by a 50 per cent issue, United Steel has effectively left its interim dividend unchanged. The directors say that results in the first 36 weeks of the financial year ending on September 30th, next, "show an improvement over the corresponding period of the previous year." But "there has been some decline in certain sections of the business." The full year's earnings will, they hope, "be little, if any, less" than those recorded in 1956-57. If the final dividend is repeated at 7½ per cent, the £1 units at 18s. offer a yield of 12¼ per cent.

BOOTS PURE DRUG

Yields offered by the ordinary stocks of almost all the big multiple store groups are slender. The 5s. units of Boots Pure Drug fall into this category: at 21s. 7½d. they yield 4.2 per cent. The yield has the justification that Boots is the biggest of the manufacturing and retail chemists, a trout among the minnows. For evidence of that actual and potential strength, investors have only to look at the full accounts for the year to March 31st and the statement of the chairman, Mr J. P. Savage.

The financial structure of the group has been tidied up, the preference shares of subsidiaries being replaced by a loan stock of the parent company; the group's

properties have been revalued, creating a book surplus of nearly £13½ million, and putting a value on the group's total assets of £51 million; a more up-to-date method of calculating depreciation has been adopted; small changes have been made in presenting the accounts, so as to aid shareholders' comprehension; and a scheme has been devised to link the employees' bonus with the company's profits. This modern look is also apparent in the group's policy on capital development. Last year, spending £2,400,000 on capital account, Boots closed 20 uneconomic shops, opened 12 new ones, and extensively altered 43 others. The programme is not complete and Mr Savage describes an increase in capital expenditure as inevitable. Presumably the group will continue to rely on retained earnings to cover it, but investors will note that the net cash balance of £757,000 of a year ago has been turned into a net debit of £262,000.

It is by policies such as these that the multiples have grown and so far there is no cause for complaint in the results they have produced for Boots. Sales rose by nearly 9 per cent, from £72½ million to £78½ million, and gross profits by nearly 14 per cent, from £4,553,998 to £5,178,510. The group was actually able, in a year when practically everyone else complained of rising costs, to reduce its expense ratio, and Mr Savage says "the increase in the profit has been due, not to putting up prices, but to a healthy increase in sales and a determined effort by everyone to keep operating expenses down." The ordinary dividend has been raised from 16 to 18 per cent, and though it carries "no implications as regards future dividends," a 25 per cent scrip issue is proposed. All this would seem to justify the slender yield. But the earnings cover on the dividend is not extraordinarily high and all development programmes have a big money cost.

BRITISH NYLON SPINNERS

NYLON is a fibre the demand for which is still increasing. British Nylon Spinners—in effect a monopoly in this country—has fashioned its price policy with an eye on the future, so that all its growing output finds a ready market, though the actual figures of production are not disclosed. Sales increased last year as the factory at Doncaster reached its planned capacity; work began here on a £3 million extension due to be completed in 1959. In Australia the company's subsidiary started up its process machinery in the first month of 1958. Capital commitments at the year's end were again just over £3 million, though commitments in Australia are now negligible. The group is in good shape for a further leap forward in productive capacity. Over £17 million of quick assets have been built up out of retained earnings. Based on capital and reserves at the end of the year, last year's net profit of £5,199,233 represents earnings of just under 20 per cent; in 1956 the position was virtually the same with net earnings of £4,630,308. But this figure shrinks to 15½ per cent when account is taken of present-day values of fixed assets, which a recent revaluation has shown to be about £7 million in excess of book values. The dividend paid to the equal partners in the venture, ICI and Courtaulds, has been raised 2 per cent to 18 per cent on a ranking capital of £18 million. For Courtaulds this meant approximately an extra £100,000 net in a year when other sources of income were shrinking. Courtaulds' half share of the total profit (if it were fully divisible, which obviously it is not) more than covers that company's total dividend, now reduced to 8 per cent.

HOUSE OF FRASER

THROUGH a series of take-over bids Mr Hugh Fraser has built up an empire of drapery stores. His name is as familiar to investors as Mr Clore's or Mr Wolfson's. The real test for the House of Fraser, as for Sears or Great Universal Stores, is not the number of businesses acquired or the skilful techniques used in making the bids but whether the new management is more efficient than the old. But statistically this litmus paper test is hard to apply, for the continuous process of acquisition makes it impossible to compare one year's results with another. In the year to January 31st the House of Fraser acquired Carswell Ltd., John Barker and Company and Wylie and Lochhead; pre-acquisition profits amount to as much as £398,253 in the latest accounts.

Excluding these pre-acquisition profits, the group's profit before tax amounted to £2,271,385 (against £1,972,498), that figure being naturally swollen by the earnings of the new subsidiaries after the date of their purchase. It is thus possible that earnings have done little more than to mark time; after tax net profits at £800,825 compare with £765,739 in 1956-57. That is not an exciting result. At the same time the equity capital has been enlarged by the issue of House of Fraser shares in exchange for the shares in the companies which have been acquired. The ordinary dividend on the increased capital has been left unchanged at 35 per cent. The asset backing for the 5s. ordinary units is good, for the acquisition of new businesses and the revaluation of certain of their assets has boosted the book value of the group's issued capital and reserves from £5,798,762 to £18,687,942. But investors are interested in the House of Fraser as a going concern and it might be advisable for them to reserve any decisive judgment until, for example, it can be seen how the John Barker business is developing under new management. The yield of 8 per cent at the current price of 21s. 10½d. on the 5s. "A" units suggests that that is what investors are doing.

WIGGINS, TEAPE

THE problem for all the paper makers, as Mr L. W. Farrow, the chairman of Wiggins, Teape, recognises, is to sell the extra output coming from newly-installed machines at a satisfactory margin of profit. Last year Wiggins, Teape produced and sold more paper than ever before but intensive competition between the paper-makers (most of them bringing new capacity into production) kept prices down while costs were rising. Wiggins, Teape's consolidated trading profit fell from £5,850,187 to £5,353,716 and its net profit came down from £2,111,423 to £1,479,236. Mr Farrow refers to the reduction in the cover on the dividend and says that the directors' decision to leave the ordinary dividend unchanged at 17½ per cent was influenced by the fact that "the company has been carrying such large capital expenditures on units which have only recently commenced production." The inference seems to be that the directors hope that the new capacity will boost profits; sales and profits in the first three months of this year were indeed better than those recorded in the first quarter of 1957. But in the paper industry there is a surplus of capacity—Wiggins, Teape's new machine at Dartford alone, for instance, adds 10 per cent to the group's productive capacity—and this year cannot but be difficult. The yield of just under 8 per cent on Wiggins, Teape's £1 units at 44s. recognises this fact.

J. LYONS

AFTER many years of dividend restraint stockholders of J. Lyons are now tasting the first fruits of their endurance. And those who did not have the patience to wait for years must now be wondering whether to put the stock back into their portfolios. The recent rise in the "A" stock to 60s. 6d. xd (at which price it yields 4.7 per cent) suggests that some of them are buying. But Mr I. M. Gluckstein's review of the year's trading to March 31st gives few firm facts on which to make their decision. He reports that some part of the increased earnings arose from favourable circumstances, "the continuance of which it would be unwise to count upon." Gross profits increased from £5,781,668 to £6,623,622 and net profits rose from £1,144,123 to £1,395,592, out of which ordinary dividends absorb only £512,430, so that the dividend now increased by 1½ per cent to 14½ per cent is in little or no danger.

During the year some prices were adjusted following reductions in the cost of raw materials, but this movement was short-lived. The group has transferred £350,000 to stock reserve mainly because of a rise in tea and sugar prices. The "speciality" restaurants which have been appearing at the Corner Houses under such titles as "The Chicken Fayre"—the latest addition at Coventry Street—have satisfied their founders. During the year the new ice cream factory at Greenford was brought into full operation. A second of the group's computers, called the Lyons Electronic Office, which shortens appropriately into "LEO," has been in full operation for some time, and through a subsidiary which has been formed, this service is now available to other companies. The J. Lyons group is meticulous, but few figures break surface. Under the heading "Catering" the chain of tea shops is not mentioned. Competition, however, is severe in all branches.

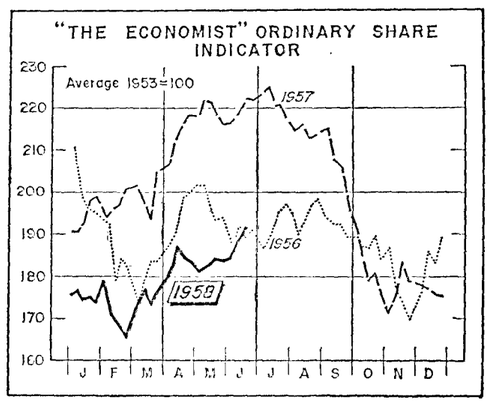
LONDON & OVERSEAS FREIGHTERS

A YEAR ago Mr Basil Mavroleon, chairman of London and Overseas Freighters, declared his faith in consecutive voyage charters linked to the current market level. Would he, with the freight for oil from the UK to the Caribbeans and back down to 14s. 8d. a ton, and sometimes even to 9s. 6d. a ton, still maintain his distaste for long-term time charters judiciously made when freights are high? Mr Mavroleon in his annual address does not discuss the point, but it is only fair to add that the company's financial results, already discussed in these columns, showing an operating surplus only half a million down on the year to March 31st and a dividend maintained at 20 per cent (giving a yield of 4.7 per cent at the current price of 19s. 3d. xd) on the larger capital, were surprisingly good in a surprisingly bad year.

"The present depression in tanker freight rates—however acute and prolonged—can," says Mr Mavroleon, "relate only to a fraction of the life of a ship." So the company has been "in no way deterred by the present adverse conditions from carrying out a policy of planning for future expansion—though there have been "some adjustments" in the building programme affecting tonnage and delivery dates. Having taken delivery of two new tankers in November, 1957, and January, 1958, the company now has on order six tankers and four dry cargo vessels—a combined total of 259,700 deadweight tons, due for delivery between March, 1961, and December, 1962. Mr Mavroleon's decision to trade in Bermuda through an associate company and his decision to re-enter the dry cargo freight market were both long-term decisions taken when freights were far higher than they are today. He is entitled to long views while he can draw satisfactory profits from lean years.

C. C. WAKEFIELD

"CASTROL" products occupy a special corner of the oil market. Competition from the oil giants forms an unchanging background for C. C. Wakefield and only last year the restrictions on motoring that followed the Suez crisis were an added difficulty for the company. But in the second half of 1957 sales recovered so well that throughout the world the group suffered an overall decline in turnover of less than 3 per cent for the whole year. Gross profits fell £255,459 to £3,098,423. The devaluation of the French franc and weakening of the Brazilian cruzeiro also involved the group in an exchange loss of £105,313, so that the net profit was cut by £214,677 to £906,560. The ordinary dividend was left unchanged at 27½ per cent, which put the 10s. ordinary units on a yield basis of 6.4 per cent at the current price of 42s. 9d. A one for three scrip issue has been recommended, and it has been accompanied by the warning that future dividends will depend upon future profits. The first four months of this year are reported to have been most encouraging, and if margins are maintained, favourable results are forecast for 1958. Another favourable development is that with the acquisition of Fletcher Miller at the beginning of this year a considerable proportion of the country's output of production oils will be handled by the group. This highly specialised market might prove a useful support for future profits.



London Stock Exchange

FIRST DEALINGS:	June 4	June 18	July 2
LAST DEALINGS:	June 17	July 1	July 15
ACCOUNT DAY:	June 24	July 8	July 22

POISED for a new period of industrial expansion the market continued firm throughout the week and prices responded sharply on Wednesday to the increase in initial allowances and in anticipation of the Bank rate decision. The number of bargains marked was higher than in recent weeks; almost 10,000 were recorded on Wednesday. Small gains were made by gilt-edged before the change in Bank rate and gains after the announcement were small, but persistent buying of corporation and Dominion stocks continued to raise prices. The general advance in industrial stocks on Wednesday carried *The Economist* indicator to a fresh peak of 191.7 for the year, a gain of 3.7 in the week. The *Financial Times* industrial index rose 2.6 to 177.0 and the Government securities index 0.06 to 83.68, both being high points for this year.

Stores advanced strongly; Woolworth rose 2s. 1½d. to 42s. 1½d. and GUS "A" rose a further 1s. 7½d. to 24s. 6d. xc. Among electrical stocks, GEC gained 2s. 6d. to 33s. 6d. and C. A. Parsons gained 3s. 6d. to 50s. Motor shares strengthened and component manufacturers often showed good gains, Dunlop rising 1s. 1½d. to 18s. 7½d. Wiggins, Teape led a broad advance in paper shares, Bowater rising 3s. 3d. to 35s. 6d. in the week. Property shares resumed their upward movement on Wednesday. The revival in shipping stocks gathered momentum; Furness Withy and P & O deferred both rose 2s.

Oil stocks remained quiet due to the Middle East disturbances. Lead-zinc producers rose on hopes of an American stock-piling programme. Consolidated Zinc jumped 7s. 3d. to a peak of 51s. 6d. Copper mines were quieter, but Bancroft hardened 1s. to 17s. 10½d., and Rhodesia-Katanga 1s. 6d. to 16s. 3d. Tins weakened but recovered.

(1) Athens and Piraeus only for Greece; Ireland from 1955 onwards are for home-produced goods only; Germany, F.R. are producers' prices of industrial products; United Kingdom are prices of basic materials in non-food industries only. (2) July-December. (3) In capital cities only for Austria, France, Greece and Turkey; Austria and Belgium exclude rent; Denmark includes direct taxes; Ireland based on August, 1953=100. (4) Including direct taxes. (5) Including trade with Faroe Islands. (6) Index numbers of unit value which compare the current average value of trade with its value in 1953; they are influenced by changes in the composition of trade as well as price movements. Export prices in Ireland are adjusted for seasonal variations. (7) Deposit money and notes and coins held by business, individuals and foreigners. Except for Greece, holdings of the issuing authority and other banks are excluded. (8) Holdings of the government and central bank at end of period. Foreign exchange figures for Norway exclude government holdings; Netherlands, Norway and Sweden include foreign investments. Ireland includes some long-term securities. (9) Beginning May, 1954, a new drachma equal to 1,000 old drachmas was introduced. (10) May, 93. (11) May, 120. (12) April, 98. (13) April, 109. (14) May, 3,039.

Financial Statistics

EXCHEQUER RETURNS

For the week ended June 14, 1958, there was an "above-line" deficit (after allowing for Sinking Funds) of £12,302,000 compared with a deficit of £24,990,000 in the previous week and a deficit of £33,828,000 in the corresponding period of last year. There was a net expenditure "below-line" of £10,887,000 leaving a total deficit of £132,438,000 compared with £94,787,000 in 1957–58.

THE MONEY MARKET

FOLLOWING Thursday's ½ per cent reduction in Bank rate, to 5 per cent, fixed rates in the money market fell correspondingly. This brought deposit rate at the clearing banks and the discount houses to 3 per cent, and the clearing banks' minimum rate on the "good" portion of short money to 3½ per cent. On Thursday afternoon, when credit conditions were rather difficult, September bills were sold at 4⅛ per cent and 4 5/32 per cent.

For once, the timing of the Bank rate change was in line with the market's expectation. At the Treasury bill tender on Friday last week the discount rate dropped by 1/32 per cent, to just over 4½ per cent, plainly in anticipation of an early move. Demand for bills this week and last has been very strong, some of it coming from overseas sources. In the week to Wednesday, the Bank return shows a rise of £11.3 million, to £30.9 million, in discounts and advances; on Thursday of last week most of the houses were "in" the Bank, for a moderate amount.

The discount houses led the way in the fall in the bill rate at last week's tender, raising their common bid by 1s. 1d. to £98 17s. 6d. per cent, just 4½ per cent. They thus succeeded in raising their proportionate allotment rate from 59 per cent to the high figure of 65 per cent. The average rate of discount fell by 4s. 4d. to £4 10s. 1.77d. per cent.

Looking ahead to

CANADA · 1980

- **Mining and smelting industry output to increase 3½ times**
- **Secondary manufacturing to grow almost 3 times**

In studying the future of Canada's economic growth, the Royal Commission chose the year 1980 as a milestone. To achieve the growth predicted by that time the economy of the country will automatically undergo constant changes. And because we already have more than 480 branches spread across Canada we are in constant touch with those changes, year in year out. We will be happy to assist any manufacturer planning market expansion in Canada with such information as:

- **market statistics**
- **corporation procedure**
- **information on plant sites**
- **advice on customs problems**
- **data on market distribution**
- **incorporation procedure**

District Head Offices: London, Liverpool, Birmingham, Leeds, Manchester, Newcastle upon Tyne

BEFORE **AFTER** ***—and the difference?***

What Vulcan insures, Vulcan inspects—thoroughly and *regularly*. As a result our clients have made us one of the largest engineering insurance companies in Europe.

Maybe £5,000

How?
Faulty water gauges were spotted, and an accident costing £5,000 or more has been prevented.

Spotted by whom?
By a Vulcan Engineer-Surveyor during his regular inspection of the boiler. Experience gives him almost second sight into the accidents that are waiting to happen.

Are his services expensive?
Not at all. Your broker will tell you that, though the Vulcan man is a specialist, his services cost no more than insurance and inspection by general practitioners.

FREE
"Vulcan"—a journal of absorbing interest to all users of plant and machinery, with reports of accidents and safety hints. For a year's subscription—free—write now to Dept. 17

AN EXCEPTIONALLY FAVOURABLE YEAR

BRITISH GUIANA—A TREMENDOUS INVESTMENT IN HUMAN RESOURCES

SIR JOCK CAMPBELL ON IMPORTANCE OF FLOURISHING ECONOMIES IN THE COMMONWEALTH

The fifty-eighth Annual General Meeting of Booker Brothers, McConnell & Company Limited, will be held in the Library of the West India Committee at 40 Norfolk Street, London, W.C.2, on Tuesday, July 8th, at 12 noon.

The Report and Accounts for the year 1957 were posted to Shareholders on June 14th together with the Statement of the Chairman, Sir Jock Campbell. The following is a shortened version of the Chairman's Statement:

Bookers had an exceptionally good year in 1957. The Group's net trading profit after tax was £1,084,343 against £787,349 in 1956, and there were Capital Profits of £32,441 against £47,192 last year. This year, £146,210 for Amounts Written Off unlike as in previous years, has not been deducted before striking the year's profit. Instead, these charges have been treated in the same way as Capital Profits.

Mr D. Powell, Finance Director of Bookers, and Chairman of our Shopkeeping Group, has been appointed Deputy Chairman of Bookers.

Your Directors are recommending the payment of a final Ordinary Dividend of 6d. per share, free of Income Tax, maintaining, in effect, at 9d. last year's ordinary distribution, plus a cash distribution of 2d. per share from Distributable Capital Profits not subject to UK tax. This total distribution of 11d. represents a return of 3.2 per cent on the shareholders' total investment in Bookers. I am sure shareholders are wholeheartedly grateful for these results which represent the work and achievement of all the men and women in the Booker Group in the UK, British Guiana, The West Indies, Canada and Central Africa.

Those who work for Bookers also share in the benefits of our progress—employment costs increased by more than £1,400,000 during 1957 to over £8 million; nearly half the increase was due to Companies having newly joined the Group, and nearly £150,000 was a special bonus to our sugar workers in British Guiana. To add perspective: Bookers' 4,500 shareholders will receive £64,000 more than in 1956; ten years ago there were only 851 shareholders in Bookers.

DISCRIMINATORY TAXATION

Taxation has gone up by more than £600,000 in 1957 to over £2 million. Bookers' liability to tax has not been reduced by the Overseas Trade Corporation provisions of last year's Finance Act which, in fact, discriminates against such businesses as Bookers.

A business operating overseas, but with its residence and control in the United Kingdom, is relieved by the Act of both United Kingdom Income Tax and Profits Tax. However, the United Kingdom holding company which operates overseas through subsidiary companies controlled and resident in the country of operation has to continue to pay United Kingdom Income Tax and Profits Tax on profits remitted to this country. This puts a premium on Boards of Directors in London managing companies operating overseas without identifying nationals of the countries concerned with their direction. And it penalises companies, like Bookers, who have tried to create a partnership in overseas countries between United Kingdom capital and local direction and management. Overseas investment—and particularly colonial development—through United Kingdom holding companies seems to your Directors to be politically by far the best way of achieving the right objectives. Investors in this country want Boards of Directors and Annual General Meetings accessible to them; they understandably hesitate to invest directly in companies wholly resident abroad. On the other hand overseas territories, equally understandably, want to see management of companies set fairly and squarely in the local environment; and their own nationals directing them. Investment through a United Kingdom holding company combines both these aspirations. United Kingdom investors have the holding company Board accessible to them; overseas people direct and manage the operating companies.

While we recognise in the Overseas Trade Corporation provisions of the Finance Act a real attempt to solve a real problem, they seem to have been specifically designed to penalise this partnership between the United Kingdom investor and overseas direction and management; and to encourage the politically undesirable—and I thought thoroughly old-fashioned—system of absentee proprietorship.

This year's Budget has done nothing to put this right. The change in Profits Tax will bring some relief, but the extent will depend on the amount of overseas profit remitted to the UK.

SUGAR OUTPUT AGAIN A RECORD

Sugar output achieved another record of 236,677 tons, an increase of 23,574 tons over the 1956 record. Factory improvement over the last ten years has doubled, on average, the tonnage of sugar our factories can process in a year. These agricultural and industrial achievements are directly due to good management and work, good planning and research, assisted by unusually good weather. Extraordinarily high world prices for sugar, combined with human achievement and good weather, produced these exceptional profits in sugar. We cannot expect to see them again soon, sugar and molasses prices having tumbled. Moreover, British Guiana sugar production is limited by the capacity of the present export markets and quotas, and our efforts must now be directed towards maximum efficiency at the present level of production rather than aiming at higher production. While resourceful management and workers in British Guiana cannot affect the price of sugar or the weather, they can control production costs.

Great and imaginative new strides have been taken towards creating more constructive understanding and working relationships, and so making our Sugar Estates better and happier places for the men and women who work on them.

SHOPKEEPING

Our Shopkeeping Group earned about the same profit as in 1956. Our Companies in British Guiana, Trinidad, Saskatchewan and Nyasaland did very well, but those in Alberta and the Rhodesias had rougher passages. In the UK our newly acquired wholesale and retail grocery group of Alfred Button made a thoroughly good starting contribution. Vigorous thought is being given to its modernisation and development. UK shopkeeping should not only be profitable; it will enable our overseas shopkeepers to gain valuable experience. As with sugar, the profits and successes of the Shopkeeping Group represent considerable achievement in human terms. I am continually exasperated by people who superciliously suppose that shopkeeping is non-U; I believe it would be hard to find businesses requiring more skill and imagination, or doing more to serve the community.

Our export, shipping and confirming business, Campbell Booker Carter, had a record turnover of £7,750,000 in 1957.

RUM

Our Rum Group had a difficult year in the UK. In a warm winter, they did well to keep sales of rum only slightly below the high peak of 1956. **Lemon Hart** Jamaica and **Lamb's Navy** Demerara brands continue to lead the field. In Canada our rum business went from strength to strength. In British Guiana our local sales were disappointing. Their sales should gain tremendously, as indeed should the whole Rum Group, from the completion of our new up-to-date distillery in British Guiana.

In 1957, in partnership with the Hiram Walker Group of Companies, we bought the controlling interest in Estate Industries Limited in Jamaica. This Company, with its model factory, makes the delectable and popular coffee-flavoured liqueur **Tia Maria.**

SHIPPING

Our Shipping Group had mixed fortunes, but all Companies kept up a high level of

perational efficiency. Just after Suez, there ere peak freight rates. By the end of the ear there was a slump, and it is difficult to e how there can be much improvement in te near future. We are proud of the way ur Shipping Group meets the perpetual nallenge of the economic vagaries and hysical hazards of shipping.

All our companies in the Investment Holdings Group had a successful year. Our Manufacturing Drug and Petroleum Marketing Agencies in British Guiana, and our Carpet wholesaling Company in the UK did outstandingly well.

ENGINEERING

Our Engineering Group had a most encouraging year. In February 1958, they acquired the sugar machinery business of Duncan Stewart & Company in Glasgow. This will be complementary to George Fletcher's, and the two businesses, independently managed, should together greatly strengthen our strong position in this important industry so closely allied to Bookers' origins. Our small electrical engineering company, Reliance, did well too. This Engineering Group has laid the firm foundation of a sound new Booker structure.

FINANCE

All these operations make money but they also take money. Last year I told you that we expected soon to have to find three sums of about one million pounds each. First, the one million of ten-year unsecured Notes borrowed at 3¾ per cent in 1948 which we repaid this February. Secondly, the million pounds we needed for plant to store and handle sugar in bulk in British Guiana; this, thanks to the co-operation of the Government of British Guiana, is to be provided through a contribution from the Sugar Industry Rehabilitation Fund (a Fund built up by levies on sugar and jointly administered by Government and the Sugar Industry) who will invest the money in debentures, repayable over twenty-five years. Thirdly, we are still considering building one or two ocean-going ships to carry sugar in bulk; but the scope and time of this development cannot be unaffected by present low world freight rates.

The exceptional profits of 1957, the new arrangements for financing the bulk sugar plant, the postponement of our investment in bulk sugar ships and the present recessionary tendencies, have combined to reduce our immediate need for new funds but that is not to say that we will not decide to raise them when we consider it advisable.

BRITISH GUIANA

So many of our eggs still remain in British Guiana—despite the success of our hedge-building policy—that shareholders will want to know briefly the present political and economic outlook there. On the 12th of August last year the General Election under the revised Constitution resulted in Dr Jagan's Party winning nine out of the 14 elected seats in the Legislative Council. That Council now comprises Dr Jagan's nine; two Members of Mr Burnham's People's National Congress; one Member of the Guiana Independence Movement; one Member of the National Labour Front; one Member of the United Democratic Party; together with three Official Members and six Members nominated by the Governor—including Mr Tasker, our Director of Public Relations. Dr Jagan is now Minister for Trade and Industry; his wife is Minister for Labour, Health and Housing. While constitutionally Dr Jagan's majority Party is not the Government but is sharing in a Government led by the Governor, his Party have an *effective* majority in the Legislative and Executive Councils; and the present Constitution *certainly presents no* obstacle to imaginative and progressive Government. Last year I unreservedly pledged Bookers' intention to do all we could to serve a properly elected and responsible Guianese Government. The present Government, and the majority Party, have done nothing to *lessen our faith in the rightness* of this policy. Public confidence is growing. Although there are disquieting signs of *racial conflict* and bitterness between Indians and Africans, the community and industry are being positively encouraged by the Government to work together for the good and the prosperity of *the country*. This is certainly the only way in which Guianese can make the most of the limited natural resources with which Nature has endowed their country; and only by giving evidence of constructive co-operation will British Guiana be able to raise the capital which she so desperately needs for *development* to maintain, let alone increase, the standard of living of her fast-growing population. *There are* healthy signs throughout The West Indies and British Guiana that Governments and people, *in their rising* self-confidence, are adopting a far more robust and realistic attitude towards Capital than *in the past*. In short, they are learning to live with Capital. And Capital, which must *equally learn to live* with them, is showing increasing adaptability towards the evolving economic, social and *political* pressures of these countries.

Princess Margaret's visit to British Guiana was a *tremendous* success—as shareholders may have gathered from the exhilarating reports of it in the *British newspapers*. The people of British Guiana excelled themselves in their wonderful welcome, and in the admirable arrangements they made to do their Princess the honours of their country. *Incidentally*, these arrangements included an Agricultural and Rural Display in the grounds of the *fine new* community centre at Lusignan sugar estate. There will be community centres at all the big sugar estates by the end of this year—planned in partnership by Government, Sugar Industry, and Trade Unions, and paid for by the Sugar Industry Labour Welfare Fund.

British Guiana has not decided to join the new Federation of The West Indies, but even had we no investment in Trinidad and *Jamaica*, we would wish to pay Bookers' respects to the new nation and to all those whose *vision and courage* have created it. This new nation and its people wholly deserve all the goodwill and assistance that it is equally wholly in the interests of the United Kingdom and the rest of the Commonwealth to give them. Great Britain, dependent as it is on export markets, has everything to gain from flourishing economies in the overseas members of the Commonwealth, and everything to lose from neglecting them. In Great Britain we are better off paying relatively high prices for imported primary products and so stimulating our export markets, than depressing our export *markets with low prices* for these imports.

GROUP'S RESPONSIBILITIES

Bookers stands for far more than a number of industrial and commercial undertakings, making profits for Shareholders. We are generating wealth and employment; we are distributing goods and we provide services. In countries like British Guiana, we have a tremendous investment in human resources. *Thus we are spending much time* and money on education and training. Scholarships at home and overseas, Management Courses and apprenticeship schemes; all these are designed to the end that we may better fulfil and balance our responsibilities to shareholders, fellow employees, customers and communities where we operate. In the United Kingdom and British Guiana, Canada and Central Africa, we have appointed Booker Group Committees, who have been charged with the duties of making sure that the operating efficiency of the Companies is matched by the realisation of our ideals and that the unity of the Group is not shattered by the diversity of its functions.

PROSPECTS

About 1958. At the present stage of Booker development, 1957 profits were really exceptional owing to high world sugar prices, and I am sure that 1958 trading profits will fall to a more normal level.

NEW OFFICES

In June, this year, our Headquarters move to Bucklersbury House, Cannon Street, where we will be joined by all our other London Companies, except United Rum Merchants and our Produce Companies. Our Travel Department is having new premises designed by Sir Hugh Casson. Any Shareholder who would like to come and see us in these Offices will be welcome.

ISRAEL DISCOUNT BANK LIMITED

TEL AVIV, ISRAEL

The Annual General Meeting of the Israel Discount Bank Limited was held in Tel Aviv on April 8th, and the following are details of the report presented by the Board of Directors:

The total of the consolidated balance sheet of the Israel Discount Bank Limited and its fully-owned subsidiary, the Mercantile Bank of Israel Limited, increased from IL149.6 million at the end of 1956 to IL170.3 million at December 31, 1957. Total deposits, according to the same consolidated balance sheet, advanced from IL101.3 million to IL119.1 million. This includes a rise of savings deposits under the "Premium Savings Plan" providing for tax-free interest on funds remaining on deposit for at least three years.

Owing to credit restrictions, the rise in "Loans, Bills Discounted and Other Accounts" was slight during 1957. A high rate of liquidity was maintained, with "Cash and Banks, Government Securities and Government Guaranteed Securities" totalling IL52.9 million as at December 31, 1957.

The Bank's Foreign Trade Department developed a satisfactory activity throughout the year. "Documentary Credits, Acceptances, Rediscount at Bank of Israel, etc.," amounted to IL48.3 million.

The Israel Discount Bank Limited is to issue bonus shares at the rate of ten shares of IL1—each for every IL100—p.v. of shares held, with shareholders having the option to receive a cash payment equivalent to the nominal value of the bonus shares. The dividend declared by the Mercantile Bank of Israel Limited for 1957 amounts to 8 per cent less taxes.

Four new branches were added to the Israel Discount Bank's network of branches in 1957, bringing their number up to 43, including the six branches of the Mercantile Bank of Israel.

The report and the accounts were adopted.

DUNLOP RUBBER COMPANY

A MARKED IMPROVEMENT

MR G. E. BEHARRELL'S SPEECH

The fifty-ninth annual general meeting of Dunlop Rubber Company Limited was held on June 16th in London.

Mr G. E. Beharrell, chairman, in the course of his speech, said: It is very gratifying to your Board, and I am sure it must be to all shareholders, that the Group results show such a marked improvement after the unfortunately low figures for 1956. The recovery, you will remember, commenced in the second half of 1956 and continued throughout the year under review, with the results for the second six months of 1957 showing a very satisfactory increase over each of the two previous half years. Our Group Trading Balance for the year 1957 at £19.86 million was the highest we have yet recorded.

Generally speaking the improvement during the year was due to two factors. In the first place we have been much less affected by inventory adjustments, which in 1956 had a very serious effect on the Group, particularly as far as the United Kingdom trading results were concerned. It is true that there have again been movements in the price of natural rubber over the year, but these have been much less violent than in most recent years. In addition the effect of these movements has been cushioned to a greater extent by our increasing use of synthetic rubber at a stable price.

The other factor which has improved our position in 1957 has been the remarkable recovery in the British motor industry from the recession of the winter of 1956-1957. During 1957 the industry produced 1.15 million vehicles compared with 1 million in 1956 and 1¼ million in the record year of 1955. Largely due to a substantial increase in shipments of cars to the United States, exports of cars in 1957 were the highest ever achieved while exports of all types of vehicles and components reached a record value of £447 million, £50 million more than in 1956.

EXPANSION OF TURNOVER

Our turnover for the year increased by 3 per cent in value and by approximately 4 per cent in volume; so that taking the Group business as a whole, selling price levels were slightly lower than in 1956. Nevertheless we improved our margin of profit to turnover before tax from 3.6 per cent to 5.4 per cent and in the second six months of the year the percentage was 5.8. Satisfactory though these increases are, your Board does not consider the margin of profit to be other than modest, particularly having regard to the fact that such a very large proportion of the profit is subsequently absorbed by taxation. In the year 1957 the total provision for tax represented no less than 60 per cent of the total profit compared with 56 per cent in 1956. Certain countries have increased their taxation rates during the year and these with the excessive burden of Profits Tax here at home are largely responsible for this increase.

On many occasions in the past reference has been made from this Chair to the unfair burden placed on British industry by United Kingdom Profits Tax which was aggravated by increased rates introduced in 1955 and again in 1956. It is gratifying that the representations we and other sections of British industry have made over the years have at last resulted in the structure of this particular tax being altered to a flat rate of 10 per cent on all profits instead of the previous 3 per cent on undistributed profits and 30 per cent on distributed profits. On the basis of our 1957 figures this change will benefit the Group to the extent of about £300,000 per annum. The increased rates for Initial Allowances announced by the Chancellor in the recent Budget are also welcome but I regret that he did not think fit to restore the former Investment Allowances which provided such a valuable incentive to industry to modernise capital equipment. The Initial Allowances give little or no ultimate financial benefit to industry.

EXPORTS

The Dunlop Group, of course is particularly concerned with Overseas business and even though our United Kingdom trading position has improved substantially during 1957 the greater part of the Group turnover and profit continued to be derived from exports from the United Kingdom and from our activities in Overseas markets. If we add to this our indirect exports of tyres on vehicles exported, the total Overseas contribution is 70 per cent of our total turnover, namely about £161 million. We consider this to be no small achievement because competitive conditions in most Overseas markets are becoming increasingly severe, and there has also been some slowing down in the growth of world trade particularly towards the end of 1957. Industrial activity began to slacken in the countries of Western Europe, and this pattern is even more noticeable in North America. Import restrictions and decreased purchasing have also been evident in the countries producing primarily raw materials and thus trading conditions with them are likely to become increasingly difficult.

During 1957 we continued with our policy of expansion, modernisation and re-equipment, and although our total expenditure was lower than in 1956, we nevertheless spent £9.1 million of which £5.6 million was incurred in our Overseas Companies. At the end of 1957 the original cost of the Group Fixed Assets amounted to over £99 million and the written down book value was under £47 million. It is interesting to note that over 50 per cent of our Fixed Assets are situated Overseas and during 1958 we are building and equipping three further Overseas factories in Rhodesia, India and France. As an indication of growth I would like to mention that in the last 10 years the number of separate Dunlop Subsidiary and Associated factories has increased from 53 (28 of which were overseas) in 1947 to 102 (56 overseas) in 1957.

PERSONNEL

The Company is very much aware of the need to maintain a high standard of management and very careful attention is being devoted to the recruitment and training of suitable young men from schools, universities and from within the Dunlop Organisation. A number of these trainees are now spending periods in Overseas Companies to widen their experience. All our employees are encouraged to study for higher qualifications to help fit them for greater responsibility. Much of this training is carried out internally within the Organisation, but considerable use is also made of suitable external courses. Without a progressive policy of this kind, it would not have been possible to provide competent staff to establish and operate the many new or expanded factories which we have started up here and abroad during the last ten years. We realise that many young people have little knowledge of the careers which industry can offer to them and to assist in bridging this gap in their knowledge we offer short vacation courses to schoolboys and undergraduates and in our careers booklet—"Careers with Dunlop"—we set out the opportunities for employees which exist within the Dunlop Group of Companies.

During the next few years industry will have to face the problem of employing and training an increasing number of young people. This problem has received considerable publicity through the report by the Carr Committee—"Training for Skill," published early in 1958—which has urged industry to absorb these young men and women and to provide suitable training for them. The Company is very much alive to this challenge and, in the light of the Report, our existing employment and training arrangements for young people have been reviewed to ascertain what readjustments are desirable.

I am sure you would wish me to include in this review of our affairs a message of congratulation and thanks to all Dunlop employees in all the countries in which we operate for their part in the greatly improved results for the year. My colleagues on the Board and I greatly value the opportunity which you thus afford to us of expressing directly to all employees the appreciation of the shareholders. I will, accordingly, send to them all on your behalf a message of warm appreciation and thanks for their continued efforts towards the successful conduct of the Company's affairs.

EUROPEAN TRADE

Last year reference was made to the increasing competition which will arise as a result of the closer integration of the six major countries of Western Europe in a Common Market. We must not overlook that this Common Market is now in being, having come into existence on January 1st this year. So far as the Dunlop Group is concerned we have large factories in both France and Germany and selling Companies and branches in the other participating countries. We are confident, therefore, that we shall be able to obtain a reasonable share of the benefits which should accrue from this new conception of European Trade.

The outcome of the negotiations to associate Britain and other members of the Organisation for European Economic Co-operation with these six countries through a Free Trade Area remains in doubt, and at this stage it is not possible to forecast whether, or on what terms, this association will eventually take place. The present uncertainty thus makes it impossible, as yet, to forecast the impact of these developments on the fortunes of the Dunlop Group as a whole, but studies on the many different and complex aspects which are likely to be involved have been and are continuing to be carried out energetically. We are making our own examination of these problems and have also taken advantage of the facilities in market and economic research available on this subject.

The report and accounts were adopted.

MARKS AND SPENCER LIMITED

SALES ADVANCE TO OVER £130 MILLION

SUCCESSFUL CAMPAIGN FOR LOWER PRICES

POPULARITY OF "ST. MICHAEL" BRAND

99 PER CENT BRITISH GOODS

The thirty-second Annual General Meeting of Marks and Spencer Limited was held on June 16th at 82 Baker Street, London, W.1.

Sir Simon Marks, DSc (Chairman and Joint Managing Director), who presided, said:

Ladies and Gentlemen, may I take it that in accordance with our customary practice, the Directors' Report and Accounts may be taken as read?

PROFIT AND LOSS ACCOUNT

Our net profit for the year after tax amounts to £6,193,000 compared with £5,606,000 last year, an increase of £587,000.

We have provided £7,950,000 for Taxation against £7,200,000 last year, made up of £5,925,000 for Income Tax compared with £5,350,000 and £2,025,000 for Profits Tax compared with £1,850,000.

With £1,762,000 brought forward from last year, there is a total of £7,955,000 available for distribution.

The Board recommends a Final Dividend on the Ordinary and "A" Ordinary Shares of 22½ per cent, making with the interim Dividend of 10 per cent, a total of 32½ per cent for the year against 30 per cent.

As in previous years we have allocated £150,000 to the Staff Benevolent and Pension Fund.

We have written off the sum of £250,000 from the item Trade Investments. The value of our interests in textile weaving mills has been affected by the changed pattern of trade.

RESERVES

We have transferred £1,900,000 to the General Reserve which now stands at £8 million. With the balance of the Profit and Loss Account at £2,213,000, the Revenue Reserves amount to £10,213,000 compared with £7,762,000 last year. The Capital Reserve remains at £19,323,000.

PROPERTIES

We have spent over £3 million during the year on the development and modernisation of our Stores; £2 million has been on Capital Account and £1,063,000 has been charged as Repairs and Maintenance compared with £744,000 last year.

After providing Depreciation of £904,000, the Freehold and Leasehold properties appear in the Balance Sheet at £41,259,000 and the Fixtures and Equipment at £4,620,000.

STOCK

The Stock in Trade of this Company stands at £10,488,000 against £11,123,000 last year.

In the item of Advances to Subsidiary Companies of £2,046,000, stocks of materials account for £1,602,000 compared with £1,192,000, so that the total Stockholding is £12,090,000 against £12,315,000.

CASH

Cash balances and our holding of Tax Reserve Certificates total £6,778,000 compared with £4,730,000 last year.

Bank and other interest received during the year was £175,000 against £25,000.

GENERAL SURVEY

I am glad to inform you that the turnover last year exceeded £130 million compared with £125 million in the previous year. Our report once again indicates the continued growth of the Company. At the end of the war, in 1946 our turnover was just over £19 million, and in twelve years it has risen to over £130 million. The net profits after tax in that period have risen from £1,052,000 to £6,193,000.

The factors responsible for the remarkable advance of the Company have formed the major part of my annual addresses to you. In the course of the years we have built up four great assets; firstly, the goodwill of our customers and their confidence in the quality and character of "St. Michael" goods; secondly, the splendid co-operative spirit between suppliers and ourselves; thirdly, the loyalty and devotion of our management and staff, and lastly, by the investment of £31 million, drawn from profits since the war, we have achieved a radical and striking transformation of many of our Stores.

THE COST OF LIVING AND THE CAMPAIGN FOR LOWER PRICES

The cost of living has always been present in our minds. Our policy, at all times, is directed to making such contribution as we can to this problem by providing goods of quality at prices within reach of the public's purse.

With the fall in the price of raw materials, and especially wool of which we are large users, we felt that the moment was opportune to study, with our suppliers, the possibility of an early reduction in prices without, of course, sacrificing quality.

We had numerous discussions with our friends who appreciated the importance of our policy which was to take the lead in the country in bringing down prices to the public as soon as possible. I am glad to say that this policy met with their approval. The spirit of co-operation has never been better exemplified than in this action. Prices have been brought down over a wide range of goods. The campaign caused great public interest and it met with considerable success, for the public is sensitive to price and most discerning in regard to values. In this way we have made a definite contribution towards the lowering of the cost of living. Thanks to this combined effort on the part of our suppliers and ourselves, we proved once again the efficiency and the flexibility of our methods of trading.

We were gratified with the publicity which followed in the national and the local press. We were particularly pleased that it had fallen to our lot to break through the price barrier in the public interest.

A further contribution towards lowering the cost of living was made by the Chancellor of the Exchequer in his Budget, by the reductions in Purchase Tax on a number of important items. In line with our policy we immediately brought down our prices to the appropriate levels.

"ST. MICHAEL"—A HOUSEHOLD WORD

Our policy on quality goods is unchanged, and we shall still seek for improvements in values. It is only by service to our customers that our business can prosper. The proof of this policy can be found in the volume of business we now report, and in the fact that an average of six million customers throng our stores each week of the year.

Our brand name, "St. Michael," for the garments we sell, stands not only for quality, but is the hallmark of exclusive goods at inexpensive prices. We attach the greatest importance to the control of quality and to styles which conform with the prevailing fashion trends. The quality and style of "St. Michael" garments are the product of close collaboration between the Buying Executives, Stylists and Technologists. The Technologists study the development of fabrics and man-made fibres with special standards of performance. We have in mind the need to ease the work of the housewife by introducing drip-dry and easy to launder garments. I can do no better than to quote from my speech at the last meeting of the shareholders:

"Much of the progress we have made in the improvement of our goods stems from the systematic and continuous work of our scientists and technologists. Their task is to study ways and means of up-grading our goods, always bearing in mind value and price. Their duties are to keep abreast of any interesting developments in the textile field which can be speedily incorporated in our goods."

FOOD DIVISION

Although textile goods form the main part of the business, the Food Division is becoming increasingly popular and important. In particular, our bakery products are making remarkable progress in variety and quality; the volume of sales is rising steadily. This again is due to the close co-operation between our Buyers, Food Technologists, and a number of leading, well-known suppliers. In order to deal with the expanding business, our friends have re-equipped, enlarged and modernised their bakeries. Production has been regionalised to enable us to provide the public with oven-fresh goods by speedy and frequent deliveries.

We are specialising in selected and graded

Fruit which is a substantial portion of our food sales. We work closely with a number of growers and packers of fruit at home and throughout the world, with most interesting results.

DEVELOPMENT PROGRAMME

The transformation of our Stores proceeds apace, and the development programme is progressing systematically. We are concentrating on enlarging our existing Stores where we have successfully traded for many years.

In the past year we put in hand 24 important extensions and completed thirteen. The present programme calls for six further extensions, to which will be added others as soon as final plans are approved. The time needed for the completion of many of our important projects is considerable, and some of them in hand will not be available for business until late 1959.

In the past year we expended the sum of £3 million on expansion and modernisation, and this year we have allocated a similar sum for this purpose. We are operating some 300,000 feet of counters and racks, and are continually adding to the selling space necessary for the proper presentation of our goods and for the comfort and convenience of the public.

We have available a large area of selling space which has yet to be developed. The considerable finance required for this purpose will be found from profits ploughed back into the business year by year.

COSTS OF ADMINISTRATION

I spoke to you last year of our successful efforts in reducing the costs of administration. In simplifying methods and procedures we eliminated a great deal of unnecessary paper work on which large numbers of our staff had been engaged.

There is a constant examination of our present methods and we are continuing to find ways and means of cutting out unessential work and of further simplification. In this way we have been able to maintain the overall costs of operation on about the same level as last year, although our turnover has increased.

We are in the process of transferring the administration to new and spacious offices in Baker Street. Our Head Office organisation had hitherto been housed in seven different offices in various parts of London. Operational control under these conditions was naturally not easy. Our work in streamlining the organisation will be facilitated when the central administration comes together under one roof.

TRIBUTE TO MANUFACTURERS

I have, earlier in my speech, expressed my appreciation of the invaluable co-operation which we have enjoyed with our manufacturers over the years. This year, in particular, it is with pleasure that I acknowledge the close collaboration which has made it possible for us to move swiftly and effectively in our campaign to lower retail prices. I thank them for their part in the implementation of our policy. It reflects the understanding relationship which exists between us.

In my first speech to the Shareholders of Marks and Spencer as a public company in 1927, I said:

"We purchase in this country practically 90 per cent of our requirements. It is our aim and object to get as much produced in this country as possible, and the efforts of our buyers are constantly being directed to this cardinal principle of our business. This achievement can only be effected by a closer co-operation between the manufacturer and ourselves, by the adaptation of his manufacture to our needs, and by the elimination of unnecessary intermediaries and charges."

We have followed these principles ever since, so that today we can state with pride that over 99 per cent of our manufactured goods are still made in this country. This is a high tribute to our manufacturers who, by their skill and experience, have enabled us to bring this policy to fruition.

TRIBUTE TO STAFF

It is with pleasure that I pay tribute to the work of the staff. The Board is justly proud of the high quality of service given by members of the Company, and of the fine spirit in which this service is carried out.

Although we attach great importance to a progressive wage policy, we are equally concerned to create a happy working atmosphere throughout the business, and to encourage by every means a genuine sense of belonging, and of fellowship within the organisation.

In the past year we spent over £800,000 on the provision of a wide range of amenities for the well-being of the staff. The cost to the Company works out at £35 for each member, which is, of course, additional to wages. As is well known, these amenities include well-appointed staff quarters, excellent meals at nominal prices, extensive advisory health services, and opportunities for sports and social activities.

We operate two important funds for the benefit of the members of the Company. The Benevolent Fund to which we make an allocation of £150,000 per annum from Profits, and the Pension Scheme which, in the past year, cost the Company £300,000 which is a charge included in the operational expenditure. Since the inception of these funds the Company's contribution totals some £3,750,000, made up as to £1,275,000 to the Benevolent Fund, and £2,500,000 to the Pension Scheme.

We thank each and every member of the staff for their loyalty and devotion to the interests of the business.

The report and accounts were unanimously adopted.

VOTE OF THANKS

Mr L. Brown (Prudential Assurance Company Limited) in proposing a vote of thanks, said: I count it a privilege to be entrusted for a second time with the pleasant task of proposing a vote of thanks to our chairman and our board of directors. As always, Sir Simon has given us a concise review of the events of the year, concise but interesting and indeed exciting. He has referred to the increased turnover, larger profits, the continued development of the branches and further plans for development.

Even more profit has been ploughed back to finance that development, after providing for a larger dividend. What more could shareholders ask for? Perhaps the most interesting and most important item from the National point of view is the re-organisation of methods which enabled substantial reductions in prices to be made, thus providing an important contribution to the National problem of keeping down the cost of living and checking inflation, and also providing an example to other large organisations, including perhaps Government Departments.

Mr G. Seebohm seconded the vote of thanks, which was unanimously accorded, and the chairman suitably replied.

ÖSTERREICHISCHE LÄNDERBANK AG.

(Vienna, Austria)

FAVOURABLE UPWARD TREND

ANNUAL REPORT 1957

The Annual General Meeting of Österreichische Länderbank was held in Vienna on May 14th this year, and the following are details of the report presented by the Board of Directors:

The business of the bank in the past year showed an extraordinary favourable upward trend. The turnover, which had increased by 12.3 per cent in 1956, rose by 21.9 per cent in 1957. The balance sheet total on December 31, 1957, amounted to S5,600 million, nearly S1,000 million higher than in the previous year, which means an increase of 21.3 per cent as compared with an increase of 9.4 per cent in 1956. In accordance with the general expansion of the business, revenue was S325 million, while it had been S296 million in 1956. Expenditure rose likewise primarily for salary payments. The favourable business results made it possible to increase the reserves by S47.7 million, which is about equal to 1956.

STRONG LIQUID POSITION

Particularly remarkable is the high liquidity ratio. Cash liquidity amounted to 18.3 per cent and first and second degree liquidity to 61.9 per cent (56 per cent on December 31, 1956), while the minimum requirements are only 40 per cent. The capital and reserves of the bank including the pension fund reserve (S150 million), which has to be taken into account as pension payments are actually made out of current revenues, are given as S600 million, which represents 13 per cent of deposits. The development of deposits shows clearly the excellent reputation of the bank among the public. Deposits during 1957 rose by S800 million (21 per cent) to more than S4,500 million including a rise of savings deposits by S259 million (37.6 per cent). The latter, which amounted to S946 million on December 31, 1957, have since increased to over S1,000 million. Other deposits rose by S536 million (17.4 per cent) to S3,607 million. These additional funds were primarily used for the acquisition of short-term bills of exchange, the total of which rose by S749 million to S1,600 million. Treasury bills increased by S156 million while advances rose by only S96 million.

Bank premises, real property as well as fixtures and fittings retained their nominal book value of S1 each.

PROFIT AND LOSS ACCOUNT

The profit and loss account shows an increase in expenditure from S278 million to S307 million, which was mostly due to increase of salaries and higher taxes. The revenue increased from S296 million to S325 million, which is about equivalent to the rise experienced in 1956. Accordingly, there was a net profit for the year of S17.7 million, which, added to the balance of S1.6 million brought forward from the previous year, produced a total of S19.3 million available for distribution.

It was proposed to pay a dividend of 7 per cent, equal to that for 1956.

The report, the accounts and the proposals put forward by the Board of Management at the General Meeting were adopted.

C. C. WAKEFIELD & COMPANY

SATISFACTORY GROUP TRADING IN A DIFFICULT YEAR

GROUP SALES OF CASTROL CONTINUE AT HIGH LEVEL

MR. L. W. FARROW'S STATEMENT

The Forty-first Annual General Meeting of C. C. Wakefield & Company Limited will be held on Friday, July 11th, at Winchester House, Old Broad Street, London, E.C.2.

The following is an extract from the Statement by Mr L. W. Farrow, CBE, the Chairman, which has been circulated with the Report and Accounts for the year ended December 31, 1957.

As Stockholders will be aware, on January 1, 1958, in pursuance of your Board's established policy of expansion, the Company acquired the entire share capital of Fletcher Miller Limited. This important acquisition brings into the Group a company eminent in the manufacture of production oils, particularly for the Engineering Industry and Leather Trade, and thereby considerably strengthens our position in the field of industrial lubricants. Having regard to the date of this transaction, the Accounts now before you do not include any figures relating to Fletcher Miller Limited. Your Directors are confident that this new subsidiary company will add to the Group's earning power and spread of trading goodwill.

GROUP TRADING

The Suez crisis imposed petrol rationing in the United Kingdom and other countries for some five months of 1957 and this enforced restriction of motoring and road transport, combined with rising costs, had an adverse effect upon the sales and profits of the Group. I am pleased to be able to say, however, that in the second half of the year our motor trade resumed its normal buoyancy, with the result that the total volume of sales throughout the world for the whole of 1957 showed a decrease of less than 3 per cent in comparison with the record figures of the previous year. Moreover, Castrol continued to enjoy the largest share of the United Kingdom motor market for branded lubricating oils, with even more motorists asking for Castrol by name.

The Group trading profit of £3,098,423 is £255,459 less than in 1956, a result that I think Stockholders will agree is satisfactory having regard to the unfavourable trading conditions referred to, the deepening effect of credit restriction and the fact that it has been achieved in the face of continued intensive activity on the part of our main competitors.

With regard to competitive activity in the United Kingdom, there is increasing evidence that many aspects of the tied service station system are unwelcome to the garage trade and to the public. The aims of your Company in this matter are those of all independent suppliers to the motor and garage trade. To further these aims your Company remains in membership of the Motor Accessories Manufacturers Association and is in full sympathy with its activities.

Stockholders will welcome the attitude of the Government towards the tied station system as applied to the new motorways, the Ministry of Transport having decided not to allow exclusive trading thereon.

WAKEFIELD-DICK INDUSTRIAL OILS LIMITED

I am pleased to report that this subsidiary has again had a most successful year and has achieved a higher profit than in 1956, which was its first year of trading following the merging of the Group's United Kingdom marketing activities in industrial, marine and electrical oils. The sales gallonage of Wakefield-Dick Industrial Oils Limited represents a large proportion of the Group's total volume of sales in the United Kingdom.

The business of this subsidiary company is closely allied to that of Fletcher Miller Limited and Stockholders will be interested to learn that a considerable proportion of the country's output of production oils will now be handled by the Wakefield Group.

CHEMICAL PLANT

In my Statement last year I referred to the decision to market our surplus production of chemical additives through our subsidiary, Edwin Cooper and Company Limited. Although the extensions to our chemical plant at Stanlow are not yet complete, the increased production already achieved has enabled that subsidiary to commence limited trading as from January 1, 1958. The activities of Edwin Cooper and Company Limited will not necessarily be confined to the sale of chemical additives for lubricants but will include the marketing of such other chemical products as can be manufactured by your Company and for which a demand is found to exist.

RESEARCH

In the technical field, research is proceeding with undiminished intensity and embraces every facet of the Group's activities. The research work of our chemists and technologists must keep abreast, if not ahead, of developments arising out of new industrial techniques so that our lubricants and other products may continue to give satisfactory service under changing conditions.

At the same time it is the constant endeavour of our research staff to ensure that the technical supremacy of Castrol is maintained.

OVERSEAS TRADING

With regard to the overseas operations of the Group, I am pleased to report that the aggregate volume and value of sales during 1957 was maintained, notwithstanding the widespread effects of Suez, intensified competition and strained economic conditions in a number of territories. Overall profit margins were reduced, however, owing to continued increases in costs coupled with rigid price control in certain of our more important overseas markets.

During the year your Directors have continued their policy of investing further capital overseas where this had been deemed necessary in the trading interests of the Group.

I regret to say that our subsidiary company in France suffered a setback in profits in 1957, chiefly as a result of the economic crisis through which that country has been passing.

In certain of the more difficult overseas markets operated by new subsidiary companies profitable trading has not yet been achieved. These are long-term projects and the territories concerned are engaging the constant attention of your Board.

Although a year ago it seemed that the taxation provisions in the 1957 Finance Act relating to Overseas Trade Corporations might be of benefit to the Group, subsequent investigation has disclosed that little or no financial advantage would result from hiving off all or part of our overseas business to a separate Overseas Trade Corporation. However, having regard to the expansion of the Company's direct overseas trading interests in recent years and in order to set up a more representative overseas Management Board, a new company, C. C. Wakefield (Overseas) Limited, was registered in the United Kingdom on April 1, 1958, the main objects of which are to promote, develop and extend our business abroad. At the present time it is not the intention to disturb the ownership of any of the Parent Company's overseas assets and C. C. Wakefield (Overseas) Limited is, therefore non-trading, but it can be readily converted into a trading organisation should future circumstances show that this would be financially beneficial to the Group.

NEW HEAD OFFICE PREMISES

Stockholders will be interested to learn that the Company has entered into a contract to take a lease of a new office building, to be named "Castrol House," fairly near our existing Head Offices. This new building which is now in the course of construction should be completed by the end of 1959. It will be of contemporary architectural design and should provide ideal working conditions for all members of the staff, with a consequent all-round increase in efficiency, combined with a saving in maintenance charges.

ACCOUNTS AND DIVIDENDS

The Consolidated Profit and Loss Account of the Group shows a net profit, after taxation, of £906,560, a reduction of £214,677 in comparison with 1956. Of this reduction, £105,313 is accounted for by a difference on exchange arising chiefly out of the devaluation of the French Franc and a fall in the value of the Brazilian Cruzeiro in terms of sterling.

The interim dividend on the Ordinary stock in respect of 1957 was raised to 10 per cent in order to spread the total dividend more evenly over the year, and it was announced at the time that this did not foreshadow an increased distribution for the full year. Your Directors now recommend the payment of a final dividend on the Ordinary Stock, as increased by £175,000 on January 1, 1958, on the acquisition of Fletcher Miller Limited, at the rate of 17½ per cent, less Income Tax, making a total rate of 27½ per cent for the year, the same as for 1956. Preference and Ordinary dividends will, therefore, absorb a total net amount of £447,817 as compared with £430,207 last year. The sum of £459,557 has been transferred to reserves in the Group Accounts, and this includes £419,719 set aside to General Reserve (Parent Company, £375,000) to provide for future

development and expansion. After allowing for these appropriations the balance of Group profits carried forward is £653,180, virtually the same amount as for the previous year.

For the interest of Stockholders, I am again producing a table showing approximately how the Consolidated Net Profits of the Group for the year to December 31, 1957, have been dealt with as compared with 1945 and the years 1953-56.

	1945	1953	1954	1955	1956	1957
	%	%	%	%	%	%
Taxation	58	62	53	52	56	59
Retained in the Group	16	26	35	34	27	21
Net dividends	26	12	13	14	17	20
	100	100	100	100	100	100

The Consolidated Balance Sheet of the Group again records the results of a year of expansion, mainly in our overseas interests, and confirms the sound foundation of the business. Fixed assets again show an increase as does the excess of current assets over current liabilities. However, since the close of the year our liquid position has undergone a change by reason of the acquisition of the capital of Fletcher Miller Limited to which reference is made in the Directors' Report.

At the end of 1957 total stockholders' interests stood at £9,704,950, an increase of more than £400,000 over the previous year.

I am sure you will agree that these Accounts show a very satisfactory financial position.

PROPOSED CAPITALISATION OF RESERVES AND SCRIP ISSUE

The issued Ordinary Capital of your Company is now substantially exceeded by Reserves, which is indicative of the extent to which profits have been ploughed back to finance the growth of the Group, and a considerable proportion of these Reserves is now permanently invested in the business. In order, therefore, to bring the issued Capital more into line with the actual Capital employed, your Directors propose to capitalise £892,500 of Reserves, and application has been made to the Capital Issues Committee for permission to issue one bonus Ordinary Share of 10s. for every three Ordinary Stock units of 10s. each now in issue.

PROSPECTS

Having regard to the adverse economic conditions prevailing in most parts of the world, it is again difficult to attempt any forecast of trading results for the current year. I can state, however, that before taking the figures of Fletcher Miller Limited into account the volume of Group sales throughout the world for the first four months of 1958 is most encouraging.

If this trend continues and the margins between cost and selling prices can be maintained, it is reasonable to hope that the Group will achieve favourable trading results in 1958.

Since the last Annual General Meeting it has again been rumoured that your Company is negotiating or considering an amalgamation with or absorption by one of the major petrol companies. I wish to repeat my previous statements to the effect that this rumour contains no element of truth. I would add that the strength of your Company lies in its independence coupled with the high quality of its products and service.

AMALGAMATED DENTAL COMPANY

SATISFACTORY RESULTS

The fifty-third annual general meeting of The Amalgamated Dental Company Limited was held on June 13th in London.

Opening the proceedings, the Chairman, Mr Aiken Watson, QC, said:

I am happy to inform you that the consent of the Capital Issues Committee has now been given to the issue of bonus shares referred to in the Directors' Report circulated with the Accounts.

The following are extracts from his circulated statement for 1957:

The year 1957 has been one of sustained effort and satisfactory results.

The dental industry in common with others, is today faced with rising costs coupled with demands to reduce or at least maintain current prices. The policy of your Company has been, and continues, to endeavour to keep prices stable. But that policy cannot be maintained indefinitely if wages and costs of raw materials and components continue to rise.

THE COMMON MARKET

The Common Market in operation as distinct from formation has still to overcome many difficulties. In regard to certain dental lines your Company, by reason of its manufacturing interests within the area, is well placed to share in the advantages to be expected to arise from its creation.

In other dental lines, however, your Company faces the problem common to many British Industries which will arise if the Common Market is not tied to a wider Free Trade Area to which Britain is a party.

From the point of view of your Company, the risks expectant on greater competition in the home market by the creation of a Free Trade Area are to be preferred to exclusion from the prospective share of the trade expansion arising from the creation of that area.

Our active research in the important field of consumable products continues unabated.

OVERSEAS INVESTMENTS

Our overseas investments, while subject largely to the same economic forces as those at home, continue to provide a satisfactory revenue.

In a world where the word recession has become more than usually topical, trading forecasts invite the character of prophecies. Trading to date, however, in the absence of any major set-backs, promises a satisfactory result in the current year.

With a sincere sense of obligation I offer in your name to our Management and Staff at home and abroad grateful thanks for another year of work well and faithfully accomplished.

The report and accounts were adopted, and the proceedings terminated with a vote of thanks to the Chairman, Directors and Staff.

THE INDUSTRIAL AND GENERAL TRUST

REVENUE REACHES NEW PEAK

SIR EDWIN HERBERT ON A CREDITABLE ACHIEVEMENT

The seventieth annual general meeting of The Industrial and General Trust Limited was held on June 12th in London.

Sir Edwin Savory Herbert, KBE, LLB (the Chairman) presided and referring to the offer made last December to Ordinary Shareholders by way of Rights of 1 million new 5s. Ordinary Shares at 20s. 6d. per Share, said: It was gratifying to find that 96.36 per cent of these Shares were taken up by Shareholders. The total proceeds of the issue, amounting to £1,025,000 was received by us in the middle of January last, so that we had the use of the new money for rather less than three months of the year under review. The current year will reflect a more adequate return, but it may well be a year or two before we derive the full benefit from these funds.

Our revenue from all sources reached a new peak at approximately £1,727,000 being some £108,000 more than last year. Our net revenue after tax and all expenses, was £815,000, an improvement of about £36,000. This sum, with £367,241 brought forward gives a total of £1,182,748 to be dealt with. After various appropriations including an interim dividend of 12½ per cent, we are left with £505,498, and we now recommend a final dividend of 16½ per cent on the Ordinary Capital as increased from £3,500,000 to £3,750,000, leaving £321,469 to be carried forward.

There are only two points on the balance sheet on which I will comment. The first is the valuation of our investments which shows an appreciation of 130 per cent, against an appreciation, at the same time last year, of 161½ per cent. This fall arises principally from the steep adjustment of interest rates in September last and the uncertainties which are besetting the business world. It is, I think, creditable that our portfolio should still show such a high level of appreciation.

The second point concerns the short term loans and cash shown in the balance sheet amounting to over £1 million. We are in no hurry to invest this money, which arises from the recent issue. We are, however, investing it, as opportunity offers, in first-class securities at prices which would have been difficult to visualise twelve months ago.

As to the future, there is little I can say which would be helpful to you, but I would emphasise that our faith in the future of this country is unshaken.

It should not be forgotten that, in the years since the war, this country has been passing through a tremendous social revolution. It is not surprising if the labour unrest, which naturally has accompanied it, breaks out from time to time in the form of strikes, either official or unofficial. If one views dispassionately what this country has accomplished in the years since the war, one can look back with pride and forward with hope.

The Chairman commenting on the recession in North America concluded his remarks by saying: There is, however, an undercurrent of confidence which augurs well. And the refusal of Stock Markets to lose their heads is encouraging.

The report was adopted.

At a subsequent extraordinary general meeting the proposed scrip issue of one new 5s. ordinary share for each two ordinary shares held was approved.

J. LYONS AND COMPANY LIMITED

MR I. M. GLUCKSTEIN'S STATEMENT

The Annual General Meeting of J. Lyons and Company Limited will be held on July 8, 1958, at the Trocadero Restaurant, Piccadilly Circus, W.1.

The following is the Statement by the Chairman, Mr I. M. Gluckstein, which has been circulated with the Report and Accounts for the year ended March 31, 1958:

The accompanying Report and Statement of Accounts are for the sixty-fourth year of the Company which ended on March 31, 1958.

Since the close of the financial year the nominal capital of the Company has been increased to £16,070,342 by the creation of 3,145,342 "A" Ordinary shares of £1 each which have been issued as fully paid in accordance with the Resolutions of the Extraordinary General Meeting held on April 9th. The shares, which have been converted into stock, were allotted to the holders of the existing Ordinary, "A" Ordinary and Proportional Profit stocks and "B" Proportional Profit shares who were on the registers at the close of business on March 20, 1958.

THE YEAR'S TRADING

It will be seen from the Company's Profit and Loss Account that the balance from trading account is £5,304,150 compared with £4,685,571 for the previous year, an increase of £618,579. The net profit for the year is £1,143,111 which compares with £871,767 for the previous year.

As was anticipated at the time of the capitalisation issue, we propose final dividends of 1/10d. per unit on the Ordinary and "A" Ordinary stocks (including the new issue) and of 4.4d. per unit or share on the Proportional Profit capital.

These final dividends, together with the interim dividends paid in December last will absorb £512,430. The dividends paid and accrued on Preference and Preferred Ordinary stocks amount to £288,266. The balance of the net profit for the year is £342,415. From the amount of £409,886 brought forward from last year we have transferred £250,000 to a Reserve for stock and price fluctuations leaving £159,886. This amount added to the balance of net profit gives a total to be carried forward of £502,301.

The results of the year's trading, I think it will be agreed, are satisfactory; the Company has had a good year. But some part of the increased earnings arose from favourable circumstances at home and abroad, the continuance of which it would be unwise to count upon. During part of the year some raw material prices were in our favour and we were glad to make a beginning with some reductions in our prices, but this downward tendency seemed likely to be shortlived, as in fact it turned out to be. Sugar for example, of which we are one of the biggest users in the country, rose sharply again before the end of the year and is still up. The cost of tea, especially the better qualities, was also rising during the second half of the year. It is in consequence of these conditions that we have thought it prudent to make the transfer to reserve that I have referred to above. A similar policy has been adopted in one of our subsidiary companies which has set aside £100,000 in like manner.

We should, of course, like to see raw material prices reduced so that we can reduce our prices, but failing that we hope that any fluctuations will be gradual so that we can make our readjustments smoothly, which is not possible when changes come in rapid succession.

We are having to fight harder for business; competition is severe in all branches, but we do not complain of that.

THE BOARD

In February Mr Mark Bogod, the Manager of our Ice Cream Department, was appointed an Employé Director. He joined the Company in 1922, coming direct to us from the Royal College of Science. After eleven years in our Laboratories he was transferred to the Management of the Ice Cream Department. We welcome him as a colleague on the Board.

Almost without exception, each Director manages one or more Departments or sections of the business and has spent the whole of his working life with the Company. Our policy is that a seat on the Board, with its added responsibilities, shall be a recognition of services rendered; at the same time, the Board benefits from the wide experience in management which the new member brings to it. We feel that this is the right policy even though it results in a large Board and a commensurate figure for Directors' emoluments. If we changed the policy and restricted the number of Directors, we should not have fewer Managers and the cost to the Company would not be less.

NEW FACTORY AT GREENFORD

Since the close of the financial year the new Ice Cream Factory at Bridge Park, Greenford, which I have mentioned before, has been brought into full operation, but with provision for further expansion. In May, Her Royal Highness the Princess Margaret graciously honoured us by visiting it and was good enough to express her keen interest in what she saw. It incorporates much that is entirely new and is, we believe, technically the most advanced ice cream factory in the world. As in the case of our other factories at Cadby Hall and Greenford, visitors are welcome, though, of course, both for their comfort and to avoid interference with the production, it is necessary to ask that dates and times be arranged beforehand. We particularly welcome visits from stockholders.

PRODUCTIVITY IN THE OFFICE

We regard our office organisation as a productive unit and not the "necessary evil" that it is sometimes supposed to be. We believe that our offices should not only be efficient in themselves, that is to say, in their machines and procedures, but that they should contribute a great deal towards the productivity of the business by feeding creative information to all levels of management.

We have travelled a long way from the days when the office was expected to be a mere keeper of passive historical records. The general management has always made use of the information that the office can provide, both as to what is past and, by means of techniques like budgetary control, as to the future. More recently, however, we have come to the conclusion that this is not enough. With the increasing complexity of business and speed of change in these unsettled times, junior management are being called upon to play a more important role. The office organisation is following suit. At the present time we are engaged on bringing our records into still closer relation to the detailed operations of the business and making them reflect with greater clarity the overall position in the Company.

Our belief is that, while it is imperative that top management should be properly served, it is nowadays just as important that the most junior ranks of responsible management should be served, and served first, with the information they need to discharge their respective responsibilities effectively. It is through them that the business is actually conducted and, unless they have the best information that is available, the business cannot be as productive as it should be, whatever may be the ability and knowledge of the men at the top.

This is not to add still further to the flood of figures which already threatens to overwhelm management. On the contrary, by ensuring that information is supplied to the most junior level of management which can use it, and by the proper use of new tools like the electronic computer, we are confident that the outcome will be a substantial reduction in the sheer volume of figures produced by our offices. And those that remain will be much more meaningful and useful to the people who use them.

This is the service which we expect from the productive office. This is the attitude of mind which has led to our becoming pioneers in the field of electronic computers in business and which produced LEO, the Lyons Electronic Office, the first computer to be designed, built, and regularly used in industrial and commercial clerical routines.

LEO has now reached a further stage in its progress. We have for some time had a second computer in full operation, and now that we have achieved success in the use of computers both in our own business and in other companies, our subsidiary company, Leo Computers Limited, is addressing itself to the marketing of them. It has supplied a computer to one eminent company (where it is working to their satisfaction) and in a few months will be supplying further installations to others. These are developments of the first LEO, which has been operating on office and other work for nearly five years, and they are the fruits of that experience. When we embarked on this project we had the great advantage of our practical experience of commercial and clerical systems. From the beginning we knew what we wanted to achieve, and we have therefore been able to design and build computers which have industrial and commercial clerical work as their primary function. We have now gained invaluable knowledge of the practical use of computers in a variety of clerical operations, and as a result of all this experience our LEO staff are heavily engaged in providing two kinds of service for other companies, one advisory and the other a computing service, for both of which there is a great demand.

CATERING

At our Corner Houses we have been well satisfied with the speciality restaurants which we have been opening in recent years and at Coventry Street we have opened a further one, "The Chicken Fayre." The widening of the Strand necessitated alterations to the Strand Corner House which we opened in 1915. Fortunately, before the building was then started, the widening was foreseen and the building was so constructed that the upper floors conformed to the new building line. We built the ground floor, however, to the old building line so that we should not be trading in a recess. We have enjoyed the occupation of that projection for many more years than was expected and we have now been able to set back without substantial work being necessary to the upper floors. Whilst the alterations were in progress we took the opportunity of installing a "Wimpy" similar to those at the other Corner Houses. There has also been further development of Wimpy in various areas of the country by way of licensing other caterers to serve this product.

OVERSEAS

Although our overseas business does not approach the scale of that at home, our activities overseas show some increase. We have tea blending and packing factories in Canada, South Africa, Rhodesia and Eire. One of our subsidiary companies centred in Jersey sells tea to some sixty different countries of the world. Much of it is packed in Jersey and exported from there, but it has been necessary to set up some local packing factories in countries which have imposed prohibitive duties on imports of packaged tea.

Coffee is another important item in our overseas business. We roast, grind and pack it, with "aroma" seal, in Canada and South Africa and have arrangements for it to be roasted, ground and packed under licence in Germany. Elsewhere it is distributed either through our own Export Department here or through our subsidiary companies. Confectionery and other foodstuffs are also exported.

In 1924 we acquired the Lujeri tea estate in Nyasaland where we now have 1,250 acres in production. It has been an interesting and successful venture and has proved that tea of a good medium quality can be grown in that country. The whole production is sold at the Auctions in London and realises prices above the average for Nyasaland teas. We have recently built a second factory on the estate. Philatelists may be interested to know that this is the Tea Estate which was illustrated on some of the Nyasaland postage stamps for many years.

Once again we wish to convey to the Company's 31,000 employees, in all sections of the business, our thanks for what they have done and are doing to maintain the continued progress of the Company; without their sustained efforts and loyalty such progress would be impossible. But that, of course, is not to imply that they alone achieve it; we have over 35,000 stockholders, who have provided the means with which the Company can purchase, build and equip. And there are our customers, numbering millions, whose continued support is also vital. The unity of interest of the three groups, employees, stockholders and customers is evident. In referring to customers, we of course include the many thousands who purchase from us to sell again. We greatly value their trading activities and seek to maintain for them a service which will enable them also to progress and to prosper.

CRÉDIT LYONNAIS

At its session on June 4, 1958, the Banks Control Commission approved the accounts for the year 1957 and the Board of Directors' proposals for the distribution of profits. The dividend on the shares (parts bénéficiaires) is Frs 175 gross, being the same as that paid for 1956; it comprises the minimum guaranteed interest of Frs 69.63 and additional interest of Frs 105.37. This dividend will be paid as from July 4th at Frs 156 net.

The Board's report says that in 1957 the trend of the world economy was at first towards expansion, but was marked by a recession in the later months.

In France, however, the various industries maintained a high level of activity, although it is true that this was threatened by the budget deficit.

The report next draws attention to the crisis in foreign payments. It expresses the view that the countering of inflation and the search for equilibrium must be done methodically and with care, with the object, in particular, of not hindering productive investment.

After dealing at length with the state of the money, capital and security markets in 1957 the report concludes with an account of the Bank's business during 1957 in metropolitan France, in the overseas territories and in the many foreign countries where the Bank operates either directly or through numerous associated banks and institutions.

As to London in particular, the report says that "the steady increase in our resources, the maintenance of high rates of interest and the growth of documentary business have enabled our London Office to look back on a satisfactory year, even though its costs rose, and fresh official measures of credit restriction were adopted during the last quarter."

The Crédit Lyonnais' net profit is Frs 673,179,641, of which Frs 300 million go to the State and roughly Frs 287 million to the shareholders.

AB GÖTAVERKEN

(Shipbuilders and Engineers)

GOTHENBURG, SWEDEN

The fifty-second Annual Meeting of AB GÖTAVERKEN was held in Gothenburg on May 16th, Mr A. Gabrielsson, Chairman, presiding. The following is an extract from the report circulated with the accounts:

Throughout 1957 and particularly during the latter half of the year the demand for new tonnage was slight. Only three new ship building contracts were signed, two with Swedish owners and one with a Norwegian. Orders at the end of the year amounted to 1,176,015 dwt, plus naval orders with a total displacement of 7,000 tons. In addition there were orders for ship repairs, diesel engines, turbo-compressors and high-pressure steam boilers.

PRODUCTION

During 1957 twelve merchant vessels with a combined tonnage of 234,200 dwt were delivered, viz:

Four motor tankers of 30,020, 19,260, 19,250 and 17,250 dwt, respectively.

Four motor cargo vessels of 13,480, 13,480, 13,380 and 12,140 dwt, respectively.

Two turbine tankers of 34,000 and 33,850 dwt.

Two bulk carrying motor freighters of 14,070 and 14,020 tons.

In addition, eleven merchant vessels of altogether 223,070 dwt were launched during the year.

DIESEL ENGINES

The main machinery and auxiliaries delivered from the engine workshop in 1957 had a combined rating of 203,630 hp. The total value of diesel engines of Götaverken design delivered during the year to other shipyards amounted to Kr 56,750,508.

OUTLOOK

The demand for large tankers has declined to the vanishing point, but the European ship building industry is nevertheless confronted with the problem of taking the steps needed for the construction of vessels of this size previously ordered.

Götaverken is equipped to build the large tankers of up to 40,000 dwt already booked, but in order to be able to build such ships more efficiently in the future heavy new investments will be necessary.

At the beginning of 1957 steel prices were well maintained, but they weakened as the year progressed and were in decline at the end of the year when steel production exceeded the demand. The supply of skilled labour remained short and the company maintained its training programme at the same scale as in previous years.

Wage earning employees averaged 5,349 (as against 5,073 in 1956) and salaried staff 1,324 (1,234). Wages, salaries and directors' fees amounted to altogether Kr 102,565,080, as against 90,239,295 in 1956.

RESULTS

The company's net profits for 1957 amount to Kr 8,826,300, which added to Kr 3,551,529 carried over from the previous year makes a total of Kr 12,377,829 available for distribution.

	Kr
Liabilities adjustment fund	1,000,000
Benefit funds	100,000
Dividend of Kr 8:—per share	3,520,000
Balance carried forward ...	7,757,829
Total Kr	12,377,829

GROUP ACTIVITIES

The following are wholly owned subsidiaries of the company:
Öresundsvarvet AB,
AB Göteborgs Skeppsdockor,
Rederi AB Zenit,
Götaverkens Fönster AB
in addition to three wholly owned housing associations.

From Öresundsvarvet were delivered two motor tankers, each one of 19,100 dwt and four motor cargo ships of 12,700, 9,300, 6,600, and 4,000 dwt, respectively, or all told six vessels of altogether 70,800 dwt. Six additional merchant vessels representing a total of 66,100 dwt were launched during the year.

Group profits totalled Kr 9,972,010, of which it is recommended that Kr 1,181,150 shall be set aside for reserves and contingencies.

The report and accounts were adopted.

THE CENTRAL PROVINCES MANGANESE ORE

RESULTS AGAIN SHOW IMPROVEMENT

MINES IN SATISFACTORY CONDITION

MAJOR A. C. HERRING ON CURRENT AND FUTURE OUTLOOK

The fiftieth annual general meeting of The Central Provinces Manganese Ore Company Limited, was held on June 13th at Winchester House, Old Broad Street, London, E.C.2, Major A. C. Herring, VC, ACA (the Chairman), presiding.

Mr T. D. de Deney, FCIS (the Secretary), read the notice convening the meeting and the report of the auditors.

The Chairman said: Ladies and Gentlemen,

The Report and Accounts for the year ended December 31, 1957, have been in your hands for some time and, with your permission, I will take them as read. (Agreed.)

TRIBUTE TO MR H. R. HOLMES

Shareholders will have seen from the Report that Mr Holmes has retired from the position of Chairman and that I have taken over that responsibility. This took place in August last at his request, but I feel I should be lacking in my duty if I did not give you some idea of the outstanding work which he has done for this Company. Mr Holmes joined the Company in 1905 and after 17 years in India where he was for some time the Company's Agent and General Manager, he came to the Head Office in London as Managing Director and later became Chairman. He has served the Company in all for some 53 years and held the position of Chairman for 13 years. I have been a Director now for some 20 years and during that period it has been my pleasure to meet him at the office most days of the week. I therefore know him very well and I wish to say that in my opinion no Company has ever had a more devoted servant, and that it is largely due to his untiring efforts that the Company has had such a successful history and is held in such high regard. Although he has retired as Chairman it is a source of great satisfaction that he remains on the Board and is still at the office most days of the week. We therefore still have the benefit of his knowledge and advice, and I only hope that we have relieved him to some extent from his former heavy responsibilities.

A SATISFACTORY YEAR

From an examination of the Accounts you will have gathered that the year 1957 was a satisfactory one. The balance on trading for the year is £3,046,635 as compared with £1,695,935 for 1956, and on this occasion the Trading Profit is arrived at after transferring £200,000 to Ore Stock Reserve. The total value of our stock at December 31, 1957, showed an increase of some £400,000 to the figure of £2,120,820. I may say that the tonnage in hand was very similar to that held at December 31, 1956, the increase in book value being due to two factors—firstly a somewhat higher cost of production, and secondly a larger proportion of our stock being at port at the end of 1957 had therefore to bear the cost of transport from the Mines. In view of this increase in book value we have thought it prudent to increase our Ore Stock Reserve by £200,000 to a total of £700,000.

The only other item which calls for comment in the Profit and Loss Account is the small charge of Indian Estate Duty £3,401. By 1956 there was an accumulation of £42,091 for Indian Estate Duty which was not charged against Profits, but was deducted from our Contingencies Reserve, which to some extent had been provided for this purpose. Under the provisions of the Estate Duty (Amendment) Bill 1958 it would appear that in the course of two or three years there should be no further liability accruing to the Company in respect of Indian Estate Duty.

BALANCE SHEET FEATURES

Turning to the Balance Sheet, you will notice that we no longer hold any Shares in the United Kingdom Ferro Manganese Company Limited. In his speech in June last the Chairman mentioned that in the early months of the year we had disposed of these Shares and gave the reasons for doing so.

We have been advised that it would be in the best interests of all concerned if the Staff Benefit Fund was transferred to a Staff Benefit Trust with independent Trustees. This has been done.

Our cash and gilt-edged investments together total £2,190,521 being an increase on the year of £1,170,320. This no doubt sounds very satisfactory, but it should not be overlooked that our Reserve for Future Taxation amounts to £1,334,000 an increase of £720,000 over the previous year. The net profit for the year after providing for taxation £1,925,000, depreciation, etc., comes out at £1,010,345, compared with £451,756 for 1956. The Directors propose that of this amount £100,000 be transferred to General Reserve and that £250,000 be transferred to Mines Development. During recent years a great deal of money has been spent on the equipment and the development of the Mines and this course we intend to pursue so that we may be able to meet any likely demands for Ore which may be made upon us. This expenditure we plan to finance out of our accumulated resources.

An Interim Dividend has already been paid of 1s. 2d. per unit, free of tax, and it is now proposed that there should be a Final Dividend of 1s. 8d. per unit and a Bonus of 1s. 4d. per unit, both free of income tax. This will absorb £625,000, leaving £313,537 to be carried forward as compared with £281,197 brought in.

I have no doubt that many of you are wondering whether we shall benefit materially from the change which has been made as regards Profits Tax. I regret to say that the benefit which we may derive will be insignificant owing to the fact that Indian Taxation is very high and practically all our taxes accrue to India.

BASELESS RUMOURS

During the latter months of 1957 and early in this year there were many rumours prevalent in India as regards take-over bids for the Shares of the Company and as these rumours might have created an air of uncertainty and so damaged our relations with our customers and indeed with the Indian Government, we inserted a notice both in the English and Indian Press stating that no negotiations were taking place in this connection and that any suggestion that the Board was seeking a change of ownership of the Company was entirely without foundation. We hope that anybody who may have heard these rumours will now appreciate that they are baseless.

Mr Hardy, one of our Joint Managing Directors, visited India in January when he had important discussions with officials of the State Trading Corporation and other Central Government officials. I am glad to say that our relations with the different Authorities in India continue on a satisfactory basis.

Mr Hardy also visited the Mines in India and submitted full and informative reports to the Board. I am pleased to say he found the mines in satisfactory condition.

DIAMOND DRILLING PROGRAMME

Our Diamond Drilling programme has continued and drilling has taken place at Kandri, Ukwa and Sitasaongi Mines. This work has indicated considerable tonnages of good quality ore at Kandri and Ukwa Mines.

We have recently been connected to the Government Electricity grid supply at our Balaghat Mine and we hope to hear shortly that a full supply has been made available at our Tirodi Mines. There has been considerable delay in the supply of power as we mentioned last year, but in the meantime we have been able to complete most of our construction work at these two mines. Shaft sinking was suspended at Balaghat Mine whilst the permanent headgear was erected, and the two electric hoists are now available for work in Holmes Shaft, where sinking has been resumed.

We hope that the financial stringency in India will not prevent us from maintaining our equipment in good condition, and in extending it wherever mechanised operations can be used successfully. We have drawn the attention of Government to the necessity of granting Import Licences expeditiously for essential equipment for our mines.

The increase in profits for 1957 was due entirely to the improved railing facilities which prevailed, and which we very much appreciated.

PROSPECTS

As regards the prospects for the current year the position is that at the end of December, 1957, the amount of ore at ports was quite satisfactory and railings this year up to the moment have continued to be good. Consequently it would be right to say we have made a good start, but on the other hand we cannot overlook the fact that the Steel Industry of the United States is passing through a difficult period. How long this will last and how far it may spread, we cannot tell, but there are definite signs that the demand for our ore during the coming months of this year will not be as heavy as usual. Should the position deteriorate no further I trust that the results for 1958 will

not be found unsatisfactory. Looking further ahead, 1959 must depend upon the activity of the Steel Industry generally and competition which may arise from new sources of supply. However, our mines are in good shape, our ore has an excellent reputation, we have a very good and long standing connection with the principal buyers in the United Kingdom and the United States of America and our relations with the State Trading Corporation of India—with whom we are working in close co-operation—are very good: consequently I feel that we can look to the future without undue apprehension.

TRIBUTES

I am sure you will wish me to express our thanks to all our staff at home and in India, also our shipping agents in India, Messrs. James Finlay & Company Limited, for their loyal and continued efforts on behalf of the Company.

In particular, in a business such as ours, success depends to a large extent on the ability and integrity of all our engineers actually on the spot at the Mines. We are fortunate in the men whom we have and who have carried out their duties very efficiently. I am also glad to report that our relations with our Trade Union and with our labour generally remained satisfactory throughout the year. For them we have provided a scheme of retirement gratuities in addition to our other Welfare activities.

I personally would like to thank my colleagues on the Board for their never failing co-operation.

I now beg to move: "That the Report of the Directors and Statement of Accounts as at December 31, 1957, be and are hereby approved and adopted and that the profits be appropriated as recommended by the Directors." I will ask Mr Holmes to second the Motion and before putting it to the Meeting I will endeavour to deal with any questions which the Stockholders may wish to ask.

Mr H. R. Holmes seconded the resolution which was carried unanimously.

The Board's proposal of a final dividend of 1s. 8d. per unit, free of tax, and a bonus of 1s. 4d. per unit, free of tax, was also approved.

The retiring director Mr H. R. Holmes was re-elected and the remuneration of the auditors, Messrs W. A. Browne and Company, having been fixed, the proceedings terminated with a vote of thanks to the Chairman, Directors and Staff at home and abroad.

RHODESIAN CORPORATION LIMITED

MR F. R. PETERS' REVIEW

The thirty-second annual general meeting of Rhodesian Corporation Limited was held on June 18th at Chartered Insurance Institute, London, E.C.2. Mr F. R. Peters, Chairman, presided, and said:

The accounts for the year ended September 30, 1957, show that the balance on Profit and Loss Account is £132,252 against £71,106 for 1956. With the balance brought forward from 1956 the amount available is £169,496 and the Board took the opportunity to write down certain Quoted and Unquoted Investments, an amount of £34,025 being appropriated for that purpose.

A Dividend of 4d. per Unit (10 per cent), less Tax, has been paid for the year. Warrants were posted on April 9th.

The amount of unappropriated profit carried forward is £68,321.

FALCON MINES LIMITED

The anticipated increase in through-put at the Dalny Mine to 20,000 tons per month has now been reached, and should be maintained. Up to May 31st, current year's operations show an estimated total working profit from the three Mines of £85,387 which is equal to an annual rate of over £128,000. A Dividend of 4½d. per share (7½ per cent) has been paid on account of the current year.

RHODESIAN BRICK AND POTTERIES CO., LTD.

This company has paid a Dividend of 6d. per share (10 per cent) in respect of the year ended September 30, 1957, the same as for 1956. The net profit amounted to £61,582, after providing £27,000 for taxation. £25,000 was transferred to General Reserve (which now stands at £170,000), the amount carried forward being £17,952 against £16,170 brought in.

In his Review accompanying the Report and Accounts, the Chairman said that the order position was strong and building activity remains at a high level.

A programme to increase the output at the Salisbury Works has recently been completed, and a reserve production capacity has been secured.

Modifications and additions to the Bulawayo plant to improve flexibility of production and to provide an increase in capacity are in hand.

TOBACCO

So far, we have sold 84,700 lb of the current year's crop of tobacco at prices averaging 36d. per lb. As is usual the first sales are of poorer quality leaf. Sales are now being made at much higher prices. It is estimated that a total crop of 305,000 lb will be reaped from 313 acres planted, an average yield of 974 lb per acre.

WILLSGROVE ESTATE

Rapid progress is being made in the development of this Estate, and houses are being erected for sale.

YORK HOUSE

Good progress has been made with the erection of this important block of offices. The estimated date of completion is November 30, 1959, but the indications are that this will be improved upon. The ground floor accommodation which will be occupied by Rhodesian Corporation and its Associated Companies is expected to be completed during 1958. Encouraging enquiries for letting-space are being received.

GENERAL

You will be aware of the financial stringency which has developed in Southern Rhodesia. So far as the Corporation is concerned I am pleased to tell you that the position is such that we shall not be affected by this present state of affairs as we are quite able to carry through our various development programmes from our own resources.

I take this opportunity to express our appreciation of the work done by our colleagues and the staffs in Rhodesia and South Africa.

The report and accounts were adopted.

THRELFALL'S BREWERY COMPANY

A GRATIFYING ACHIEVEMENT

The seventy-first annual general meeting of Threlfall's Brewery Company, Limited, was held on June 12th in London.

Mr F. Cornwall (Chairman and Managing Director) presided and, in the course of his speech, said: During the year under review the financial state and over-all strength of the Company has not only been maintained, but has been considerably improved.

The profit from trading and other income of £1,075,220 is the highest ever achieved, which enables your Board to recommend an increase in the dividend of 1 per cent. This figure has been arrived at after all charges have been met in working the business, which, of course, are heavy and continue to increase. Out of this profit, however, £536,221, approximately 50 per cent, has been reserved for Income and Profits Tax.

Purchase Tax on Hotel requisites is another oppressive feature; bed linen, crockery, carpets, curtains, cutlery and many other items have to be frequently renewed, with the result that either guests have to pay more for their accommodation, or the Company's profits have to bear this exorbitant taxation. I do feel most keenly that some Tax concession should be made on these items at least to owners of residential Hotels who are providing amenities both for our own and overseas visitors.

Undoubtedly, if I may say so, a great deal of the success and standing of your Company is due to the prudent policy which has been adopted for many years in the conservation of part of the profits made and ploughing them back into its properties. In this connection, I would point out that since 1943, i.e., within the last 10 years, more than £2½ million have been spent on properties, plant, furnishing, etc. Your Directors are firmly of opinion that this policy has been a wise one, and the results of trading produced today show ample justification for it.

NEW HOTELS

Since our last Meeting, 8 new Hotels have been opened, including one to which I specially desire to refer—the Strand Hotel at the Pier Head, Liverpool. This venture was the most ambitious project ever undertaken in regard to our licensed properties. I think I am justified in saying whilst at the moment it is not residential, it is one of the finest licensed properties which has been erected of recent years, not only in the City, but in the whole country.

During the current year we expect to commence the erection of three further new Hotels, and also re-build two existing establishments. Whilst these new projects are in progress, considerable reconstruction of some of our other properties will be carried out.

As I have already mentioned, the profit from trading and investment income is £1,075,220, an increase on last year of £72,282. The net profit is £388,148, to which should be added the balance brought forward from last year of £171,525, giving a total of £559,673. After various adjustments, the profit is £439,673, out of which Interim Dividends have been paid amounting to £114,358. The Directors now recommend the payment of final Dividends totalling £149,937, which, with the Interim Dividends already paid, makes £264,295 for the year, leaving a carry forward to next year of £175,378.

The report and accounts were adopted.

CHAIRMAN'S STATEMENT: ANGLO AMERICAN CORPORATION OF SOUTH AFRICA LIMITED
(Incorporated in the Union of South Africa)

ANGLO AMERICAN CORPORATION'S STRENGTH BASED ON COMBINATION OF GOLD, COPPER AND DIAMOND INVESTMENTS

IMPORTANCE OF GOLD FOR STABILITY

TRIBUTE TO SIR ERNEST OPPENHEIMER'S ACHIEVEMENTS DURING HIS FORTY YEARS AS CHAIRMAN

The following are extracts from the statement by the Chairman, Mr H. F. Oppenheimer, which has been circulated to members:

MY father founded our Corporation in 1917 and was chairman until his death on November 25th last year. During these 40 years he built up the company from small beginnings and through many vicissitudes to a position of great size, strength and stability. And yet, at the beginning the prospects of the new company seemed very limited. The leading South African mining houses, as they still exist today, had, with one exception, been founded many years earlier and it appeared that the opening up of the Witwatersrand goldfield was almost complete. But my father was convinced in 1917 that South Africa was a land of unbounded opportunity, and that conviction was undimmed on the day of his death.

To me it has always seemed that my father's greatest achievement was in bringing us safely through the economic storms of the 1930s, when our preference dividends were at one time nearly four years in arrear. Yet at that time we already held the majority of the copper and diamond assets to which so much of our subsequent prosperity has been due.

One lesson of those years was the paramount importance of a sound cash position, and as a necessary corollary, a conservative dividend policy. The other great lesson we learnt from the depression was the importance for the stability of the Corporation of large gold shareholdings. Our holdings in producing gold mines at that time were relatively small. During the 1930s, however, we took a prominent part in the expansion of the Far East Rand and participated with New Consolidated Gold Fields Limited in the development of the West Wits line. Most important of all for our future, however, was the development of the Western Reefs Mine near Klerksdorp. This was a vital step towards the discovery of the new Orange Free State goldfield, in the eventual development of which our Corporation came to play a leading part.

OFS GOLDFIELD

The opening up of the Orange Free State goldfield has been one of the greatest developments in the history of mining, and in all its aspects my father took a close personal interest, not least in the provision of housing, hospital and other amenities of the highest standard for both European and African employees.

The steadily increasing profits now earned by our mines in this field have amply justified my father's faith. These profits rose from £7,143,839 in 1955 to £11,525,230 in 1956, and to £16,749,783 last year. We have become, as a Group, the largest producers of gold in the world, and the annual gold profits of the mines under our control exceed £24 million, with a further £7 million from uranium.

Our large investments in gold are of particular importance at periods such as the present when the world economy, after years of boom, appears to be entering more difficult times. When there is a seller's market and costs are continually rising, the fixed price for gold can seem a grave disadvantage. But when commodity prices are falling, one appreciates the advantages of a product with a fixed price and unlimited market. The combination of gold on the one hand and copper and diamonds on the other, reacting, as they must, in opposite ways to the general condition of the economy, gives our Corporation an exceptional degree of stability.

During the year 1957, which is now under review, my father gave further proof of his faith in the South African gold mining industry by making a start with the opening up of Western Deep Levels.

The economic recession that has occurred in the United States has inevitably affected adversely our diamond and copper investments. Although sales of diamonds by the Central Selling Organisation in 1957 reached the record total of £76,772,112, there was a distinct decline in demand both for gem and for industrials towards the end of the year. This decline was met by smaller offerings of diamonds to the market, thereby maintaining stable prices.

The strong co-operative organisation of the diamond trade and the financial strength of De Beers have maintained stability and confidence in this industry in the face of the American recession. Unfortunately, no such organisation exists to protect the copper industry. After many years of prosperity, a comparatively small excess of production over demand caused the price of the metal to fall from the exceptionally high levels of 1956 to £180 per ton by December, 1957, and to £160 per ton in March of this year. This is a level at which, in the long run, the world's requirements of copper cannot be profitably produced. In an endeavour to meet the situation, most of the leading producers throughout the world decided to reduce production.

In common with other African producers we decided to cut the group's production by 19 per cent, or a total of 27,000 tons. It seemed to us that our objective must be to cut expensive production, not to cut all mines pro rata to their production. We therefore arranged to cease production at Bancroft for one year, but to increase production slightly at Nchanga and Rhokana, thus achieving an overall curtailment of 27,000 tons.

During this period development will be concentrated at the No. 1 Shaft area of Bancroft, and we anticipate that the mine will be able to resume production at costs comparable with those of other mines on the Copperbelt. In due course Bancroft will take its place as one of the great copper mines of the world. Meanwhile, at Rhokana and Nchanga everything possible is being done to reduce costs to a minimum. The spur of necessity has helped to speed these measures of economy, which should permanently strengthen the competitive position of the Northern Rhodesian producers.

AFRICAN AND EUROPEAN

Additional stability and strength have been given the Corporation as a result of our offer made to ordinary stockholders in African and European Investment Company Limited last December to purchase their stock. The offer was widely accepted and African and European, which for some years had been closely associated with us, is now owned as to 87 per cent by our Corporation. Apart from increasing our total assets and our investment in first-class gold mines, the acceptance of the offer has resulted in a large increase in our stake in the South African coal industry.

At the same time as our offer to African and European ordinary stockholders, the Corporation over the year-end raised £6 million by an issue of convertible notes, which has put us into a sound position to follow our policy of expansion when opportunities arise. This policy includes the acquisition and development of interests outside our primary sphere of mining.

Up to the day of his death my father continued to direct the affairs of the Corporation with the same ability, energy and optimism which characterised his entire career. Only last year he said in a message on his 77th birthday: "I am confident that the next fifty years will see progress in South Africa just as spectacular as I have seen in the fifty or more years that I have been a South African."

I share my father's confidence, and I believe that Anglo American Corporation will take its rightful place in the progress he foresaw. In doing so, our policy will remain, as my father stated it in 1954, "to earn profits, but to earn them in such a way as to make a real and permanent contribution to the well-being of the people and to the development of Southern Africa."

THE WIGGINS TEAPE GROUP

(Wiggins, Teape & Co. Limited)

ANNUAL REPORT AND ACCOUNTS OF THE WIGGINS TEAPE GROUP FOR 1957

PRODUCTS

THE GATEWAY RANGE of :
(*a*) Watermarked papers for commercial use—Writing Ledger, Air Mail, Index Board, Blotting, Cheque, Stamp, Office Systems, etc.
(*b*) Printing and Drawing Papers—Coated Art Paper and Board, Chromo, Gummed, Cartridge, Detail, Tracing, Chart and Recording, etc.

BANKS, BONDS, MANIFOLDS AND CONTINUOUS STATIONERY PAPER.
"NO CARBON REQUIRED PAPER"
The Time-Saving Copying Paper.

PACKAGING PAPERS
Glassine Greaseproof, Pure Vegetable Parchment, Glazed Imitation Parchment, Tissue, M.G. Sulphite, Foil Backing, etc.

TISSUES

INDUSTRIAL BASE PAPERS
Photographic, Dyeline, Ferro Prussiate, Plastic Laminate, Abrasive, Oil and Air Filter, etc.

COMMERCIAL AND PERSONAL STATIONERY AND ENVELOPES

DISTRIBUTION CENTRES
(*a*) At Belfast, Birmingham, Bristol, Cardiff, Edinburgh, Glasgow, Leeds, Liverpool, London, Manchester, Newcastle, Nottingham.
(*b*) Dublin, Capetown, Port Elizabeth, Durban, Bloemfontein, Johannesburg, Salisbury, Ndola, Nairobi, Lagos, Karachi, Bombay, Madras, Calcutta, Singapore, Kuala Lumpur, Hong Kong, Tokyo, Melbourne, Adelaide, Sydney, Perth, Wellington, Auckland, Christchurch, Buenos Aires, and AGENCIES throughout the World.

SALIENT POINTS

Net Profit (including adjustments in respect of previous years £155,884) after taxation and Minority Interests	£2,127,670
Debenture Interest	215,352
Preference Dividend	89,006
Ordinary Dividend	830,194
Net Profit retained in Group	993,118
	£2,127,670
Net Current Assets	11,943,705
Fixed Assets	18,938,767
Trade Investments	809,510
Total Capital Employed (including Debentures and Loans)	£31,691,982

EXTRACTS FROM STATEMENT BY MR. L. W. FARROW, C.B.E., CHAIRMAN

STATE OF TRADE AND SALES : In view of the highly competitive trading conditions arising out of the additional manufacturing capacity of the paper industry, it is with a sense of pride that I inform you that with the exception of one small mill, our mills have not only run full time throughout the year 1957, but many have worked a fair measure of overtime. In fact, the orders for some grades of paper have been beyond our capacity to fulfil and we have had to supplement our own production by ordering paper from mills outside the Group.

Sales in several of the overseas markets were again adversely affected by the imposition of import quotas but owing to the opening up of new markets and intensified sales efforts in those markets available to us, we have been able to increase our overseas sales.

Last year I had to report a drop of nearly 6 per cent. In the volume of the sales of paper manufactured by the Group, compared with the sales for 1955. I am glad to state that the sales of these papers for 1957 not only enabled us to overtake the recession of 1956 but to exceed the sales of 1955 and thus constitute an all-time record in the history of the Group.

PRODUCTION : I had to report last year that the volume of production of paper at our Group's paper mills during 1956 showed a decline on the 1955 record production. I am pleased to say that the volume of production for 1957 exceeded that of 1955 and thus constituted a new record.

SELLING PRICES AND COSTS OF PRODUCTION : I am not so happy when referring to selling prices and costs of production. The average cost of production and distribution for 1957 showed an increase of £11 19s. 5d. per ton on that of 1955. The average increase of the selling prices was not sufficient to cover these increased costs. I have taken the year 1955 as it was the last year when prices were raised sufficiently to compensate adequately for increased costs.

NEW DEVELOPMENTS : The new paper machine which has been erected at our Dartford Mill began making paper in April of this year and we are very pleased with its initial performance.

The woodpulp mill which has been erected at Sudbrook, South Wales, also commenced production in April and our mills are now taking the woodpulp manufactured there. The quality of the pulp is fully up to our expectations.

The fourth machine, at our Bridgend Mill, to which I referred last year, started up successfully in January of this year and is producing to its designed capacity.

The new coating plant which has been ordered for the Treforest Coating Factory for the production of N.C.R. paper should be in operation early in the Autumn of this year.

PROSPECTS FOR THE CURRENT YEAR : I am pleased to tell you that sales for the first three months of the current year show an increase over those for the year 1957. The profits for the same period also show an increase. Trading conditions, however, are very difficult for the reasons I have already indicated. The production of woodpulp at Sudbrook does not present any sales problem as the output will be absorbed by our own mills, but with the starting up of the new machine at Dartford we are faced with having to sell a larger volume of paper. Altogether, unless conditions deteriorate further, your Directors are hopeful that the results for 1958 should not be unsatisfactory.

BOOTS PURE DRUG COMPANY LIMITED

ANOTHER RECORD YEAR DESPITE DIFFICULTIES

FURTHER FALL IN EXPENSE RATIO

MR J. P. SAVAGE ON PURCHASE TAX AND THE RETAILER

The seventieth Annual General Meeting of Boots Pure Drug Company Limited will be held on July 16, 1958. The following, in abridged form, is a statement by the chairman, Mr J. P. Savage, which has been circulated with the report and accounts for the year ending March 31, 1958.

SALES AND PROFITS

Our sales have exceeded £78½ million, an increase of nearly 9 per cent on the previous year. The profits for the year amount to £5,178,510 compared with £4,553,998, an increase of nearly 14 per cent.

In arriving at this year's profit we have charged depreciation on our freehold and leasehold properties amounting to £576,865. The corresponding figure for the previous year is £312,379. The big increase in the charge this year is a reflection of the revaluation of our properties. But for this our profits would have shown a correspondingly greater increase.

In the past we charged depreciation on our leasehold properties in arriving at the amount of our published profits but in the case of freehold properties no charge was made for depreciation but a sum was appropriated out of profits to Freehold Property Reserve. We have decided in this year's accounts and for the future to charge depreciation on freehold as well as leasehold properties in arriving at our profits. We have made this change in the method of computing our profits as it gives our shareholders a more accurate picture of the true profits which have been made. For purposes of comparison we have adjusted last year's figures by treating the amount then appropriated to Freehold Property Reserve as a charge against profits.

The provision for tax has increased from £2,643,671 to £3,013,667. The net profit of the Group attributable to the Parent Company amounts to £2,095,176 compared with £1,990,828.

DIVIDENDS AND RESERVES

We propose paying a final dividend of 12 per cent, making a total of 18 per cent for the year compared with 16 per cent last year. Of the £2,095,176 profit attributable to the Parent Company, dividends (on preference and ordinary shares) absorb £1,115,471, goodwill written off accounts for £11,850, leaving a balance of £967,855 profits retained in the business.

The whole of this sum has been transferred to Revenue Reserve. The dividends paid in the previous year amounted to £997,711, goodwill written off to £16,500 and profits retained to £1,045,181. At first sight it would appear that more profit has been distributed and less put to reserve this year than last. This is not so. The profits put to reserve this year are calculated after deducting £264,000 additional depreciation on freehold and leasehold properties ; on the other hand last year's figure included the payments of £135,869 under the National Health Service which related to previous years. On a strictly comparative basis the funds retained in the business are substantially greater this year than last.

SCRIP ISSUE

The Revenue Reserve of the Parent Company now amounts to £5,944,526 and for the Group as a whole to £9,887,084. These represent profits belonging to the shareholders which have been ploughed back into the business. The Board have now received the permission of the Capital Issues Committee to capitalise £2,560,000 standing to the credit of the Revenue Reserve and to make a scrip issue of one new share for every four existing shares.

PROSPERITY BONUS

Our appreciation of the efforts of the staff is expressed by the payment of a prosperity bonus which in the year under review amounted to £415,000. This is considerably higher than last year because long-service employees who have served the Company for 20 years or more have been paid at higher rates than for previous years. It is now proposed to put this bonus on a permanent basis and a scheme is being devised to link this bonus specifically to the profits of the Company. We are doing this in order that the staff may feel they have a live interest in the future prosperity of the business.

EXPENSES AND TAXATION

Despite many increases in expenses over which we have no control, our expense ratio has shown a further fall in the past year. What is particularly gratifying is that although wage and salary rates have increased considerably, expressed as a percentage of turnover they have gone down. Our expense percentage shows a reduction of 0.4 per cent and while this may seem a small figure, on a turnover of £78 million it represents £300,000 in terms of profit. The increase in our profit this year has been due not to putting up prices but to a healthy increase in sales and a determined effort by everyone to keep our operating expenses down.

The changes proposed by the Chancellor in the structure of the Profits Tax are welcome as they remove an unnecessary and possibly damaging curb on the discretion of Boards of Directors in deciding what dividends to pay and what sums to place to reserve. Nevertheless the general burden of taxation on the profits of industry remains at an excessive level. On profits of just over £5 million we are having to provide £3 million in taxation or nearly 60 per cent. One reason for this is that while we have charged depreciation on our freehold and leasehold properties in arriving at our profits the allowance which may be claimed for taxation purposes is limited to industrial buildings despite the recommendations of both the Tucker Committee and of the Royal Commission on the Taxation of Profits and Income that the allowances should be extended to commercial buildings as well. The general level of taxation in this country is too high already without it being inflated further by a refusal to recognise proper deductions in computing profits.

CAPITAL EXPENDITURE

Our capital expenditure for the year under review has amounted to a little under £2,400,000, approximately the same figure as in the previous year. The modernisation programme to which I referred in my speech last year will inevitably lead to some increase in the level of capital expenditure, particularly on the retail side of the business.

REVALUATION OF PROPERTIES

During the year our freehold and long leasehold properties in Great Britain were independently revalued. After making various adjustments which are set out in the Notes to the Accounts, the surplus revealed on the revaluation was £13,425,018. As a result of the revaluation the total assets of the Group now amount to more than £51 million.

PURCHASE TAX

Within 48 hours of the Budget announcement, all our retail prices reflected the full concessions in Purchase Tax made by the Chancellor of the Exchequer. This is the answer to the critics who say that retailers failed to realise their responsibility to the shopping public. Our Company paid to the Government in Purchase Tax a sum exceeding £350,000 which can never be recovered and will have to be borne in this current year's trading.

We are all in favour of continued reductions in Purchase Tax, but it seems quite wrong to expect the retailer to finance these operations.

RETAIL PROGRESS AND DEVELOPMENT

The year was chiefly remarkable for the steady progress we were able to maintain in the face of somewhat abnormal conditions. The influenza epidemic in September hit our own people as well as the rest of the community. The depleted staff in our shops, warehouses and factories, coped magnificently with the increased demands made upon them, and many customers were good enough to express their appreciation of these efforts.

The bad weather continued right into the Christmas shopping period and upset the pattern of trading quite considerably. In spite of this we enjoyed good business in all our Gift Departments and finally achieved another record Christmas. Since then, trading conditions have not been easy, but it is in just such circumstances that our customers appreciate the quality and value they can get at Boots. By emphasising this in our Press and Television advertising and thanks to the wholehearted co-operation of our selling staff, we were able to maintain

our increase of over 9 per cent right to the end of the financial year.

During the year we have opened twelve branches in new locations, closed twenty unprofitable shops and completed forty-three major alterations, extensions, or transfers to bigger premises. We are extending our experience in self-selection and visual selling, moving gradually but definitely towards a new pattern of shopkeeping in line with today's needs and conditions. We are studying what is now known as Retail Productivity in all its aspects with the aim of running our shops more efficiently and economically and of providing a quicker and better service for our customers—always remembering that we are Chemists first and endeavouring at all times to provide the highest possible standard of pharmaceutical service.

COMPANY MEETING REPORTS

INTERNATIONAL AND WHOLESALE

I am very pleased to report another year's substantial progress in the International Division.

Despite import *restrictions* in various countries, our exports to our agents and to our Subsidiary Companies have *increased* by over 18 per cent. Following a large increase in the previous year, we believe this to be a creditable performance. Our general wholesale business has continued to grow.

An important part of *our wholesale* turnover consists of special contracts for the Government and Companies *who have no* manufacturing facilities of their own. As Government policies change and as Companies decide to erect their own plants in this country, our turnover fluctuates and we have to find new markets. I am glad to say *that* the considerable increase in sales of our fine chemicals and medical specialities have *largely offset* any reduction in turnover we may have suffered as a result of change of policy of the Government or of other Companies.

PROSPECTS

It is too early in the new financial year to make any forecast of profits, particularly *in view of the unsettled conditions* we have already experienced both at home and abroad.

I have told shareholders of the loss we have to meet on Purchase Tax and there are *many* other difficulties we must face, but I am satisfied they will be met with resolution and *determination*.

EVER READY

THE EVER READY COMPANY (GREAT BRITAIN) LIMITED

(Manufacturers of Dry Batteries)

ANOTHER RECORD YEAR

REDUCED SELLING PRICES

STATEMENT BY THE CHAIRMAN MR E. N. ROWBOTHAM

The Annual General Meeting of The Ever Ready Company (Great Britain) Limited will be held on July 9th at the head office, Hercules Place, Holloway, London, N.7.

The following is the statement of the Chairman, Mr E. N. Rowbotham, which has been circulated with the Report and Accounts for the period from March 3, 1957, to March 1, 1958:

Before commenting on the Accounts, I must refer to Mr W. H. Lawrenson, who retired from the Board with effect from July 31, 1957, having reached retirement age during the year. Mr Lawrenson joined the Company in 1924 and has been a Director since 1943. In 1949 he became Chairman and Managing Director of Eveready South Africa Limited, Port Elizabeth, South Africa. Your Directors wish to place on record their appreciation of the services rendered to the Company by Mr Lawrenson during his term of employment with the Company and his service as a Director and they hope he will have good health and happiness in his retirement.

Mr W. S. Giles was co-opted to the Board in August 1957. Mr Giles joined the Company in 1937 and has for many years been engaged in factory administration.

RECORD PROFITS AND DIVIDENDS

I am glad to be able to report to you once again on another year of successful and satisfactory trading. Earnings have increased and constitute yet another record in the history of your Company.

The sales of your Company's products on the Home Market were maintained very steadily during the year and although certain of our export markets were adversely affected by political and economic considerations, particularly in the Middle East, nevertheless our figures were maintained with some difficulty. I am glad to be able to inform you that these setbacks were only temporary and our export sales are currently well above those for last year. It would, I think, be appropriate to tell you that over recent years the dry battery industry of this country has regularly increased its share of world exports.

As Stockholders are aware Resolutions increasing the Issued Ordinary Capital of the Company out of the Reserves, by the issue of one new stock unit for each unit held were passed at the Annual General Meeting held last year, and in consequence of this doubling of the Ordinary Capital the rate of final dividend had it been maintained on the same basis as last year would have amounted to 13¾ per cent. In view of the very good results achieved *this year the Directors* recommend that a final dividend of 15 per cent be paid, *making 20 per cent for the* year on the Ordinary Stock as increased by the Scrip Issue, which compares with a figure equivalent to 18¾ per cent paid last year.

I am pleased to tell *you that the change in* the Profits Tax which the Chancellor of the Exchequer has *made in the Budget* this year, although it does not affect the present final dividend, will give a considerable advantage to your Company in the future.

REDUCED SELLING PRICES

The improved earnings which I have reported to you have been due not only to the continued increased efficiency of our production methods, but also to reductions *in the* prices of some of our major raw materials. This latter was offset *in some measure by a* substantial increase in the price of manganese. In view, however, of the *overall* savings in cost and in accordance with the policy which your Directors have pursued for many years they decided to make reductions in the retail prices of most of our Radio and Transistor Power Pack batteries in the home market as from March 10th last. Your Directors are *confident that these* reductions will further stimulate sales and will therefore be of advantage to Stockholders as well as to the trade and consumers. We shall continue our endeavours to reduce costs of manufacture by efficient and economic production methods so as to be able to offer to our customers, both at home and abroad, a first-class product at a fair and attractive price.

PROGRESS OF SUBSIDIARIES AND TRADE INVESTMENTS

Our subsidiary companies, both at home and abroad, have all experienced satisfactory trading and profits have been increased.

Eveready South Africa Limited, in which we have a large investment, has pursued a policy of ploughing back a substantial part of its profits year by year for the purpose of enlarging its business and increasing its *efficiency* and has recently announced a Capitalisation Issue of one share for each *share held in order to* bring its Issued Capital more into line with the present-day values of its assets. In connection with this Issue the Chairman of Eveready South Africa *Limited* recently informed the shareholders that their sales for the first nine months of the current year show an increase of over 20 per cent compared with the same period of last year. We look forward to further improved results *from this Company.*

FINANCIAL POSITION STRONG

The Consolidated Balance Sheet shows that the Company's financial position has again been strengthened during the year. The *surplus* of Current Assets over Current Liabilities (including the Deferred Liability for future taxation) has increased by £302,077 from £2,951,085 to £3,253,162. The Stock-in-Trade is higher at £2,385,651 compared with £2,189,084. Trade Debtors have fallen from the high figure of last year of £1,569,374 to £1,443,045. Creditors also show a reduction from £1,439,039 to £1,353,669. Cash, *Treasury Bills* and Tax Reserve Certificates amount to £2,137,536 against £1,854,413. After providing for Taxation your Directors have allocated £553,555 to Reserves and the Carry Forward in the Consolidated Profit and Loss Account is £230,246 compared with £223,791.

Three hundred and fifty-five members of the organisation have now received their gold watches for over 25 years' continuous service with the Company and on behalf of the Stockholders and Directors I thank all employees of the Company who have contributed to the success of our Company during the past year.

CURRENT TRADING SATISFACTORY

Your Company has been at the forefront of all important developments in the dry battery field. In 1941 we were the first to develop and manufacture in this country the layer type of dry cell which has proved of such benefit to the users of dry battery radios and hearing-aid apparatus.

During the war, of necessity our production of the layer type dry battery was almost exclusively for the Government but after the war we successfully introduced this type of construction on to the domestic and export market available to us, *with the result* that today the layer type of construction has largely superseded the old type of round cell high tension battery.

Needless to say we have imitators, both in this country and abroad, but the quality of our product so far exceeds that of our *competitors* that we have established supremacy in the manufacture and sale of this type of battery.

In recent years I have referred from time to time to the use of transistors. The use of equipment employing semi-conductors is developing steadily and the Company recently introduced a completely transistorised radio set which has been extremely well received. This set, like a great deal of other equipment employing transistors, is powered by one of our range of "Power Pack" batteries especially developed for use with transistors.

There are many other interesting developments of a highly technical nature taking place today in the dry battery and allied fields, and you may rest assured that as and when commercial exploitation is possible, then this Company will be in the forefront.

I am glad to be able to tell you that the current year's trading has started well, sales to date being in excess of those for the corresponding period last year.

AMALGAMATED METAL CORPORATION

MR WALTER GARDNER'S REVIEW

The twenty-ninth Annual General Meeting of Amalgamated Metal Corporation Limited will be held on July 10th at *Princes House*, 93 Gresham Street, London, E.C.

The following is an extract from the Statement by the Chairman, Mr Walter Gardner, which has been circulated with the report and accounts for the year ended December 31, 1957:

The profit for 1957 before providing for taxation is £1,023,375 compared with £1,388,605 for 1956. Trading in metals and other commodities was well *maintained* but in many cases, particularly in the second half of the year, at lower prices, which had the effect of reducing commissions received.

The net charge for taxation is £590,472 and after also deducting *minority interests* the group profit after taxation is £430,109, compared with £584,398 for 1956. The proposed final dividend of 6 per cent on the ordinary shares brings the total up to 9 per cent, against 10 per cent for the previous year. The preference and ordinary dividends absorb in total a sum of £260,602.

The Chancellor's new proposals regarding profits tax are welcome, and should result in a decrease in the effective rate of this tax on the company's future profits.

OVERSEAS ACTIVITIES

Since my last Statement, the business of Wolverhampton Metal Company (Australia) has been disposed of, since, for a number of reasons, it was found to be impossible to operate it at a satisfactory profit.

During the year the considerable activities of the former branch of the British Metal Corporation (Australia) in Perth, Western Australia, have been transferred to a separate company called The British Metal Corporation (WA) Pty. Limited.

Henry Gardner & Company, in conjunction with its wholly-owned subsidiary companies (Sandilands Buttery & Company in Malaya and Drew Brown Limited in Canada) and allied companies, has been active in metals, rubber, cocoa and other produce as well as in general merchandise. Relations with its producer principals have remained cordial.

In Malaya some interesting arrangements have been made which include the fusion of the John Buttery Rubber Estates Agency business with that of Boustead & Company Limited, in the formation of a new company registered in Malaya under the name of Boustead-Buttery Estates Agency Limited. This has resulted in a powerful combination designed to provide an active and efficient service to the Malayan rubber-growing industry.

We are pleased that Sandilands Buttery & Company were presented by the Committee of Lloyd's with a silver plaque to mark the centenary of Lloyd's Agency at Penang.

In the course of the current year Henry Gardner & Company acquired a substantial interest in the well-known firm of Rayner & Stonington, Incorporated, New York, dealers in cocoa and other produce.

FALL IN METAL MARKETS

The fall in metal prices, which had started early in 1956 when, generally speaking, world supply overtook world consumption, continued throughout 1957. The main feature was the further slide in the markets in the second half of the year, due to the poorer *US business outlook*.

Cash copper had fallen from £436 a ton in March, 1956, to £267 at the start of 1957 and it dropped to £171 at the end of 1957. World mine output reached 3,400,000 tons in *1957 which, despite some* first steps taken to restrict production, was a little higher than in 1956. During 1958 several further announcements of cuts have been made; these should reduce total world output for this year below 3,200,000 tons and should suffice to eliminate the copper surplus.

The market seems poised to respond well if US business activity should pick up in coming months.

The lead and zinc markets broke sharply at the end of April, 1957. The barter purchases of the metals, against farm produce, largely stopped from that time. Buying for the permanent stockpile was kept going, but with its end in sight and now, by mid-1958, this too has been terminated.

The two markets are also restrained by uncertainty over the recent US import tariff, quota and production subsidy proposals. Spot lead fell from £116 15s. a ton at the beginning of 1957 to £69 5s. in December. Spot zinc fell from £101 7s. 6d. a ton at the start of 1957 to £61 2s. 6d. in December.

The tin market was weighed down in 1957 by *the combination* of a very low rate of buying in the US and by fairly heavy selling, for the first time, by the USSR. Prices were prevented from falling more than they did only by, first, large-scale purchases for the Buffer Stock at the cash price of £730 a ton and, secondly, by restriction of output *which was introduced on December 15, 1957.*

It would seem that it cannot be much longer before the effect of this drastic curtailment becomes more apparent in the market. The cash price of tin has been held at around £730 a ton since October, 1957.

RECORD RUBBER CONSUMPTION

The average price for spot rubber in London during 1957 was 26½d. as compared with 28⅞d. during 1956. The highest price reached was 32½d. during January and the lowest 22½d. during November.

World consumption of natural and synthetic rubber combined reached the record total of approximately 3,133,000 tons, showing an increase of about 100,000 tons as compared with 1956. Natural rubber accounted for 1,870,000 tons.

The price of natural rubber is at a fully competitive level with the price of synthetics.

The cocoa market was very active during 1957. The lowest price for Accra was £170 per ton early in March, and the highest price recorded during the year was £335 in mid-November.

PHILIP HILL INVESTMENT TRUST

The twenty-sixth ordinary general meeting of Philip Hill Investment Trust Limited was held on June 16th in London, Sir Brian Mountain, Bart. (the chairman), presiding.

The following is an extract from his circulated statement: I am pleased to report that the year under review has again been a satisfactory one for the Group.

Dividends and interest from investments (gross) have risen from £617,829 to £707,622. Taxation absorbs £262,727 (£208,678). The net profit of the Trust, without taking account of profits retained in the Subsidiary Companies, is £380,246 (£329,909).

The Board *recommend* a final dividend on the Ordinary Share capital of 11¼ per cent, less tax, making a total distribution for the year of 17 per cent less tax.

During the year, the opportunity arose for the Group to make a substantial minority investment in the well-known American investment banking house of Harriman Ripley & Company Incorporated. Your Board is confident that this will prove to be not only a very profitable investment but also a great source of strength to Philip Hill, Higginson & Company Limited.

The operating Subsidiary Companies' profits are, by the nature of their business, liable to fluctuation, and the results for the past year should be regarded as very favourable. The current year has, however, started well, and, subject to unforeseen circumstances, your Board expect that the results will be satisfactory.

The report was adopted.

CHIEF ACCOUNTANT

THE DISTILLERS COMPANY LIMITED

The Company wishes to appoint a Chief Accountant to be responsible for all financial and cost accounting at the Barry, Glamorgan, factories of its Plastics Group, where a wide range of raw materials for the plastics industry are manufactured in bulk.

The Chief Accountant controls a staff of about fifty. Standard costing is in operation throughout the factories and punched card equipment is in use. In addition to the normal accounting duties, the Chief Accountant is also responsible for ancillary office services.

Candidates for this appointment, aged between 30 and 40, must be Chartered Accountants, and should also be members of the Institute of Cost and Works Accountants. They should have at least two years' professional experience as qualified accountants, and at least five years' broad experience in manufacturing industry; familiarity with standard and marginal costing is essential, and experience in devising procedures is desirable. Practical experience of the chemical or plastics industry would be an advantage, but is not essential.

Salary according to qualifications and experience; non-contributory pension scheme.

Write:
Staff Manager,
THE DISTILLERS COMPANY LIMITED,
21 St. James's Square,
London, S.W.1.

Quote Ref. 47/58 EC.

DEPUTY HEAD of small information department required. Economics or science degree desirable, experience of handling special subject enquiries essential. Languages useful.—Apply, with details of age, experience and salary required, to Box 957.

MARKET RESEARCH

Textile organisation in Manchester requires the services of a young man to initiate and undertake a market research programme in the home market. He should preferably possess a degree in economics and have had several years' practical experience in market research. This post calls for diplomacy, initiative, vigour and the ability to lead a small team of specialists, to design and carry out inquiries and to write lucid reports. Commencing salary will be in the range of £1,600 - £1,800. Contributory pension scheme. Write Box 960.

THE UNIVERSITY OF MANCHESTER

Applications are invited from graduates for the post of ASSISTANT CATALOGUER in the University Library. Library experience is desirable but not essential. A degree in Economics, Politics or some other branch of social study would be an additional qualification. Salary scale £700-£850 per annum with membership of F.S.S.U. and Children's Allowance Scheme.—Applications should be sent, not later than July 5, 1958, to the Registrar, the University, Manchester, 13, from whom further particulars and forms of application may be obtained.

RESEARCH ASSISTANT wanted by American Professor of Economics for one year. Salary about £1,000 (depending on qualifications and experience), plus travelling expenses. The work will be centred in Lausanne and will require a keen interest in mathematical economic theory and its history, and also a good knowledge of French. Reply before July 2nd to: Professor Jaffe, c/o Mrs. Hackel, 10 Grafton Mansions, Duke's Road, London, W.C.1.

ECONOMIST, MINISTRY OF AGRICULTURE, NORTHERN NIGERIA

To organise and take charge of the economic section of the administrative division of the Ministry of Agriculture, Kaduna.

Candidates must have a good honours degree in Economics. A post-graduate qualification in agricultural economics or experience of field research in agriculture an advantage.

Appointment on probation to the permanent establishment with pensionable emoluments in scale £804-£1,680 per annum or on contract/gratuity terms if preferred. Outfit allowance £45. Free passages on appointment and leave for officer and wife. Assistance towards cost of children's passages. Furnished Government quarters at moderate rental normally available. Generous leave.

Apply, giving brief particulars, to Director of Recruitment, Colonial Office, London, S.W.1, quoting BCD. 63/408/07.

THE UNIVERSITY OF NEW ENGLAND

NEW SOUTH WALES, AUSTRALIA

SENIOR LECTURER AND LECTURERS IN ECONOMICS

Applications are invited for the positions of Senior Lecturer and Lecturers in Economics.

The Senior Lecturer will be expected to assist in the administration of the Department and in both internal and external teaching. Lecturers in the first year will be primarily concerned with work with external students but thereafter will be expected to participate in internal teaching as well. Grants to assist research of both Senior Lecturer and Lecturers are available.

Salaries: Senior Lecturer £A2,220 x £A80—£A2,500; Lecturer £A1,500 x £A90—£A2,050. In addition a cost of living allowance at present amounting to £A11 (males) and £A9 (females) is payable.

Provision is made for superannuation, travel and removal expenses and assistance in buying or building a house.

Further information and the conditions of appointment may be obtained from the Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1.

Applications will close on July 31, 1958.

LONDON COUNTY COUNCIL

LONDON SCHOOL OF PRINTING AND GRAPHIC ARTS

Two part-time Senior Lecturers, or one full-time Senior Lecturer, with qualifications and experience in two or more of the following: Work Study, Factory Management, Personal Administration, Salesmanship required in the Department of Administrative Subjects for teaching and research duties. Salary in accordance with Burnham Scale, £1,386 by £50 to £1,598. Starting salary may be above minimum if justified by experience and present position. (The salary to be divided in the case of two part-time senior lecturers being appointed.) Application forms and further particulars from the Principal, Back Hill, Clerkenwell Road, London, E.C.1. (1187).

WEST MIDLANDS GAS BOARD

CHIEF ACCOUNTANT

Applications are invited from qualified accountants for the above appointment at Board headquarters in Birmingham.

The appointment carries full responsibility direct to the Chairman and the Board for the finance and accounts of a large organisation with 13,000 employees and a turnover of £40 million. Candidates must be well qualified professionally and have had extensive experience in industrial or public financial administration.

The post is pensionable and the successful candidate may be required to pass a medical examination.

The commencing salary will not be less than £3,000 per annum.

Applications, with the names of two referees, should be addressed to the Chairman, West Midlands Gas Board, 6, Augustus Road, Birmingham, 15, to reach him within seven days of this advertisement. Applications already submitted in response to the original advertisement need not be renewed and will be taken into account before the appointment is made.

Envelopes should be marked "Chief Accountant" in the top left-hand corner.

THE UNIVERSITY OF MANCHESTER

Applications are invited for the post of INVESTIGATIONAL OFFICER in the Department of Agricultural Economics. Candidates should have academic qualifications and/or practical experience in Agriculture, Economics or Accountancy. Salary scale: £550 x £25 to £650 x £30 to £850 per annum with membership of the F.S.S.U. and Children's Allowance Scheme; graduates would have an initial salary of £700 per annum. Investigational Officers may be considered, on reaching a salary of £700 per annum, for promotion to the grade of Senior Investigational Officer (salary scale: £900 x £50 to £1,350 per annum).—Applications should be sent not later than June 30, 1958, to the Registrar, The University, Manchester, 13, from whom further particulars and forms of application may be obtained.

GRADUATE ECONOMIST required by West Riding of Yorkshire Engineering Company for already established Economic Research and Intelligence Department. Work to include long-term forecasting. Previous business experience not essential.—Apply, stating qualifications, experience (if any) and indicate approximate expected salary to Box 956.

BEDFORD COLLEGE (University of London), Regent's Park, N.W.1. Applications are invited from Honours graduates in Economics (men and women) for the post of ASSISTANT LECTURER in the Department of SOCIOLOGY, vacant October 1, 1958. Salary range: £700-£850 p.a., plus £60 p.a. London Allowance. Closing date for applications: July 4, 1958. Further particulars from the secretary.

THE UNIVERSITY OF LEEDS

APPOINTMENTS BOARD

Applications are invited from graduates for appointment as an Assistant Secretary to the Appointments Board at a salary on the scale £900 x £50-£1,350 (efficiency bar) x £75-£1,650 a year. The appointment may be made above the minimum salary on the scale. Candidates should preferably have had several years' experience in teaching or in industry. Applications (three copies) stating date of birth, qualifications and experience, together with the names of three referees, should reach the Registrar, The University, Leeds, 2 (from whom further particulars may be obtained) not later than July 21, 1958.

THE NEW SOUTH WALES UNIVERSITY OF TECHNOLOGY

VACANCY FOR ASSOCIATE PROFESSOR OF ACCOUNTANCY

The University invites applications for the position of Associate Professor in the School of Accountancy.

Salary £A2,861 per annum.

Applicants must possess a University degree and be members of a recognised professional Accountancy Institute or Society.

The appointee will be responsible to the Head of the School and will be expected to assist in the development of research programmes and in the supervision of post-graduate students.

The appointee will be eligible, subject to passing a medical examination, to contribute to the State Superannuation Fund for a pension of £A1,400 per annum on retirement.

Associate Professors are eligible for six months' study leave on full salary after three years of service or twelve months after six years of service.

Subject to the consent of the University Council, Associate Professors may engage in a limited amount of higher consultative practice.

The University reserves the right to fill the position by invitation.

First-class ship fare to Sydney of appointee and his family will be paid.

Four copies of applications (including the names of three referees) and supporting documents should be lodged with the Agent General for New South Wales, 56 Strand, London, W.C.2, and a copy forwarded in an envelope marked "University Appointment" by airmail to the Bursar, Box 1, Post Office, Kensington, New South Wales, Australia, not later than July 31, 1958.

APPOINTMENTS

I. & R. MORLEY LIMITED

seek an experienced and fully qualified

COMPANY SECRETARY

for appointment to the company's head office in the City of London. This vacancy occurs due to the retirement of the present Secretary who has reached the age limit.

The salary for this post, which carries with it a seat on the Board, will be £3,500.

Responsibilities will cover the whole range of Secretarial duties including administration of central accounting.

Preference will be given to Chartered Secretaries aged 36-43 with a breadth of experience that will enable them to make a positive contribution to general company management.

Write briefly with the assurance that applicants' identities will not be disclosed without permission.

The Managing Director (RM : 89),
EXECUTIVE APPOINTMENTS LIMITED,
67, Wigmore Street, London, W.1.

ACTUARIAL OPPORTUNITIES IN USA

The Equitable Life Assurance Society of the United States has several openings at its Home Office in New York for men interested in an actuarial career in the United States. Candidates should be up to about age 30 and have passed some or all of the examinations of the Institute of Actuaries, or of the Faculty of Actuaries.

Those interested should write to Mr. Harry Walker, Second Vice President and Associate Actuary of the Equitable, at 393 Seventh Avenue, New York 1, New York, U.S.A., stating their qualifications, including age, education and experience. Interviews with Equitable representatives will be arranged in Edinburgh on July 21 and in London on July 22nd and 23rd.

SENIOR CONTRACT ACCOUNTANT, preferably single, required for West Africa. Applicants must have had previous experience in Civil Engineering, possibly on overseas contracts, and be capable of controlling the accounts and administrative section of a large contract operating independently of, but responsible to, head office. Duties include preparation of full accounts, including monthly contract profit and loss accounts, cost analysis accounts, together with responsibility for stores and financial control and ancillary duties. Free accommodation with hard furnishings. Salary £1,200-£1,500 p.a., according to capabilities.—Please apply in writing, stating age and full experience, to Keir & Cawder, Ltd., 9 Upper Grosvenor Street, London, W.1.

SECRETARY FOR NATIONAL TRADE FEDERATION

The National Hosiery Manufacturers' Federation must replace its Secretary, who retires in December. Applications are invited from candidates, 30/45 years, of good education and wide commercial knowledge. Experience of trade association work would be an advantage but is not essential. The post offers a lively and interesting occupation, good salary, expenses, contributory pension scheme.

Applications, including salary required, in strict confidence, to The Director, 104 Regent Road, Leicester.

THE REPUBLIC OF SUDAN

The Department of Statistics, Ministry of Social Affairs, has the following vacancy:—

ASSISTANT DIRECTOR (Technical). Candidates must hold an Honours Degree in Economics and Statistics, should have a sound knowledge of sampling theory and fully capable of planning and undertaking social surveys. A knowledge of national income statistics is required. Candidates must be fully literate in Arabic or English. Age 35-45. Appointment will be on contract for a period of three years. Salary range from £S2,180 to £S2,360. Starting point will be fixed according to age, qualifications and experience.

A cost of living allowance which is reviewed every two months is payable and an initial outfit grant of £S80 on appointment. Annual leave accrues at the rate of 7 days per month. Free air passage on appointment and leave.

Applications by letter in the first instance giving particulars of qualification, age and experience with copies of recent testimonials, to be submitted to Sudan Embassy, Personnel Section, Cleveland Row, London, S.W.1. Quoting reference 4/914.

UNIVERSITY OF BIRMINGHAM

FACULTY OF COMMERCE AND SOCIAL SCIENCE

Applications are invited for the post of TEMPORARY ASSISTANT LECTURER IN ECONOMICS.

Applications (three copies), with the names of two referees, should be sent by 15 July, 1958, to the Registrar, The University, Birmingham, 15, from whom further particulars can be obtained.

THE RUBBER RESEARCH INSTITUTE OF MALAYA, KUALA LUMPUR, FEDERATION OF MALAYA

VACANCY FOR STATISTICIAN

The Board of the Rubber Research Institute of Malaya invites applications for the post of the Head of the Statistics Section of the Institute at Kuala Lumpur, Malaya.

Applicants should have high academic qualifications and considerable statistical research experience. The duties will include design of field and laboratory experiments and the conduct of research in statistical matters relating to all branches of the Institute's work.

The appointment will be made on the Research Officers scale, the point of entry being according to age, qualifications and experience. A suitable candidate with the required qualifications will be appointed in the upper half of the salary scale, which is:

Time scale: Basic salary, £1400-£2660 per annum, with annual increments of £70/-.

Super scale (by selection): Basic salary £2870-£3080-£3290 per annum.

Inducement allowances, £630 per annum; additional allowance per child, £140 per annum; salaries and allowances are paid in Malayan currency.

Quarters with heavy furniture, medical attention and passages for wife and two children under 18 years of age are provided.

Application forms and more detailed information may be obtained from the Secretary, London Advisory Committee for Rubber Research (Ceylon and Malaya), Commonwealth Institute, Imperial Institute Road, London, S.W.7 to whom completed applications should be sent by July 31, 1958.

MATHEMATICS OR ECONOMICS.—Graduates are invited to apply for a new appointment to be made by ILFORD LIMITED in Production Statistics. The work will involve the collection and analysis of statistics and the application of operational research techniques. Applicants should hold a degree in Mathematics or Economics and have specialised in statistics. This is an excellent opportunity for graduates between 21 and 25, although candidates outside the upper age limit will be considered. Salary will be in accordance with qualifications and those interested should write to The Education and Training Officer, Ilford Limited, Ilford, Essex. Quote Ref. HO/11/V.

BRITISH NYLON SPINNERS LIMITED

has vacancies in its expanding
Market Research Section
shortly to be transferred to London
for
WOMLN UNIVERSITY GRADUATES
under 26 years of age.

The work, which is in the new and interesting field of synthetic fibres and clothing, involves interviewing members of the public and assisting in the analysis and reporting of the data collected. Retail surveys are also undertaken.

Interviewing both in London and in the provinces will take up a good half of the successful applicants' time. An initial training period of several months will be spent at Pontypool.

Written applications should be sent to the Personnel Manager, Pontypool, Mon.

THE UNIVERSITY OF NEW ENGLAND

NEW SOUTH WALES, AUSTRALIA

ASSOCIATE PROFESSOR OF STATISTICS

Applications are invited for appointment as Associate Professor of Statistics in the Faculty of Agricultural Economics.

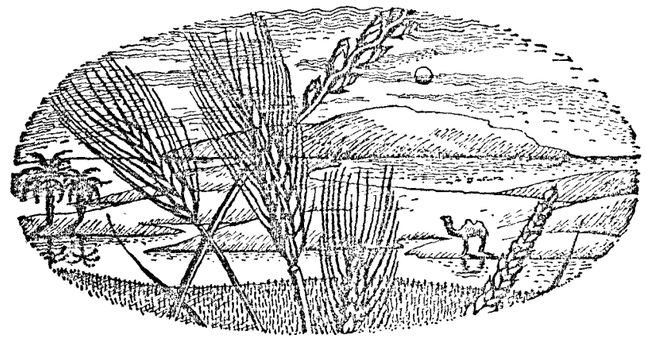
Applicants should possess qualifications in economic statistics or econometrics, although specialised experience in the field of agricultural economics is not essential.

The successful applicant will be expected to commence tuition of a course in statistical methods for undergraduate students in March 1959 and to offer in later years a more advanced course embracing the theory of statistics. The duties will also include some tuition of graduate students.

The salary for an Associate Professor is £A2,750 plus cost of living allowance at present amounting to £A11 (males) and £A9 (females).

Further information and the conditions of appointment may be obtained from the Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1.

Applications will close on July 31, 1958.



AIR SUBSCRIPTION RATES

Subscriptions to many countries can be sent either by direct second-class airmail or in bulk by air freight for onward posting from central distribution points. Airmail is invariably more expensive but usually quicker by about 24/48 hours. Where only one service is shown this is because the alternative is either not available or not recommended.

RITCHIE CALDER'S *Signposts to the Atomic Age...*

A Harvest for the Desert

"IN A CAVE ON MOUNT CARMEL, in the Holy Land, Dr. Dorothy Garrod unearthed flint sickles, set in carved bone handles—proof that eight thousand years ago, men harvested grain. On Mount Hermon, to the north, Aaronsohn found the coarse grasses—wild wheat and barley—which these early men had recognised as food.

All those thousands of years ago, long before Abraham and the Patriarchs, these ancestral men realised the virtues of grain. They nibbled the seeds in the ears. They discovered that from those seeds more grasses and more seeds grew; that if they scratched the ground the seeds grew better, and, then, if they chose well-watered soil, as in the river valleys, the grains were more plentiful.

That, not the domestication of animals for pastoral herding, was the beginning of civilisation. When men tilled the ground, they became settlers. Their primitive homesteads grew into villages, villages into towns, and towns into cities. Agriculture led to culture.

Grain husbandry spread up the Danube into Central and Western Europe. Rye and oats began their careers as the weeds in the Levantine wheat and barley fields. By climatic selection, they prevailed as the hardy crops of Northern Europe.

Bread-grains and rice are the world's staple food. With the world's multiplying population, we shall have to double the yield in the next twenty-five years. There are two ways of doing that—by getting bigger crops from existing acreages or by increasing the acreages. The first means better seeds and the second means overcoming the limiting factors of climate.

Plant breeders have known since the beginning of the century how that could be done. The science of genetics has taught how, by patient selection and breeding for the characteristics required, crops can be produced for what would seem impossible conditions. The wheats of the Prairie Provinces of Canada abound in what, sixty years ago, was regarded as a belt too arid for cereals. The climate has not changed. The cereals have been man-adapted.

Now, with the help of atomic energy, the crop map of the world can be revolutionised. Crops can be "tailor-made" to grow in the Arctic or in the hot deserts and in inhospitable soils.

By putting seeds in atomic reactors, or placing a radioactive source (such as Cobalt 60) in the centre of a field and planting crops in concentric circles round it, plant-breeders can produce in two to five years, the desired qualities which, by normal plant-breeding, might take 25 or even 50 years. The secret lies in the effect of the nuclear rays on what are called 'chromosomes', which are packages of 'genes', or hereditary traits. The packages can be broken up and reassembled by radiation. The changes are random but one in five hundred, will provide the plant-breeder with a particular quality for which he is seeking.

Natural radiations probably produced the changes from grass to grain, which Ancestral Man found foodworthy. Now, with atomic energy, we can decide the types of crops we want and where we want them". [R.C.]

CAN A HOLIDAY AT SEA HELP YOU IN YOUR BUSINESS?

YOU'RE TRAVELLING TO THE STATES? A business trip; not your first perhaps. Important people to meet, a big deal to arrange; this visit *must* be a success.

The British often expect Americans and Canadians to be just like themselves. A sudden discovery that they are quite different in behaviour and background can be a considerable setback in business relationships.

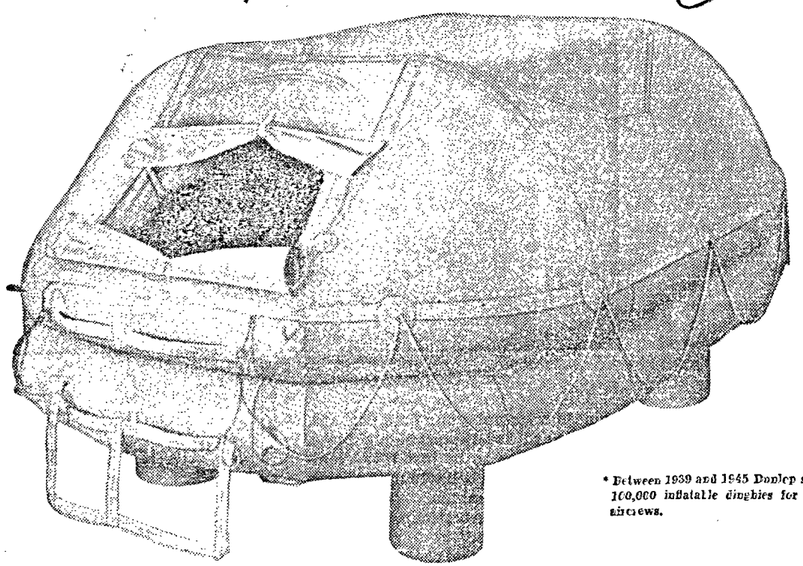
The easiest way to overcome this problem is to travel American, on United States Lines ships, the "United States" and the "America."

On the pleasant journey you will be close to Americans and their opinions—much more close in the friendly holiday atmosphere on board than in a business office.

Apart from that, these magnificent ships are two of the world's best hotels. You and your wife can settle down to enjoy yourselves; choose amongst the best Continental, English, or American food, and superb wines. You will be able to swim in the beautifully equipped swimming pool, or keep fit in the gymnasium. There is a lively social life, with cinemas and dances. You can relax in the library, or in your own splendidly furnished stateroom or suite; or simply enjoy the fresh air.

And, who knows, on board this American ship you may meet the man who can influence a final decision in your favour.

9 pointers to luxury travel



- Superbly furnished staterooms and suites
- Internationally inspired food and wine
- Famous dance orchestras
- CinemaScope theatres
- Full "keep-fit" facilities
- Dictaphone and typewriting services
- Ship-to-shore telephones
- 25 cubic feet or 275 lb. FREE baggage allowance
- Gay informal CABIN and TOURIST CLASS—to beat that for fare per person

On-board expenses and fares to destination in Canada or U.S.A. payable in sterling for you and your family, single or return.

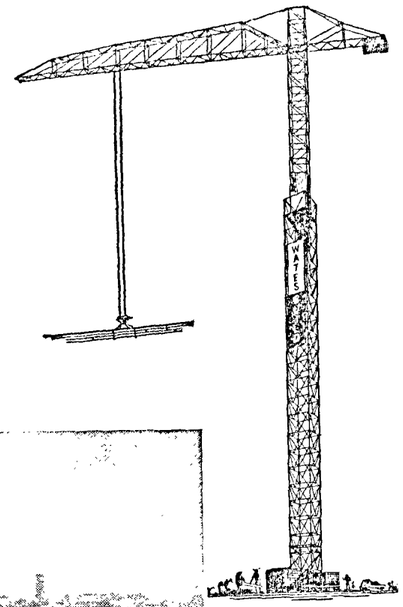
When Geigy was 175 years old

It was the period between World Wars. Remember? Repercussions of the Wall Street crash were being felt all over the world. Roosevelt was President of the United States. Europe was under the dictators. In Germany the first autobahns were built. Gandhi was active in India. Bernard Shaw was writing political satires. Modern painting meant Picasso. Great hopes were built on the Zeppelin airship as a means of travel. Walt Disney had invented Mickey Mouse. It was two years since the completion of the Empire State Building in New York. Ortega y Gasset had published his Revolt of the Masses. The first synthetic textile fibres had been invented, the first radioactive substances were soon to be artificially produced. Professor Piccard reached the stratosphere in his balloon.

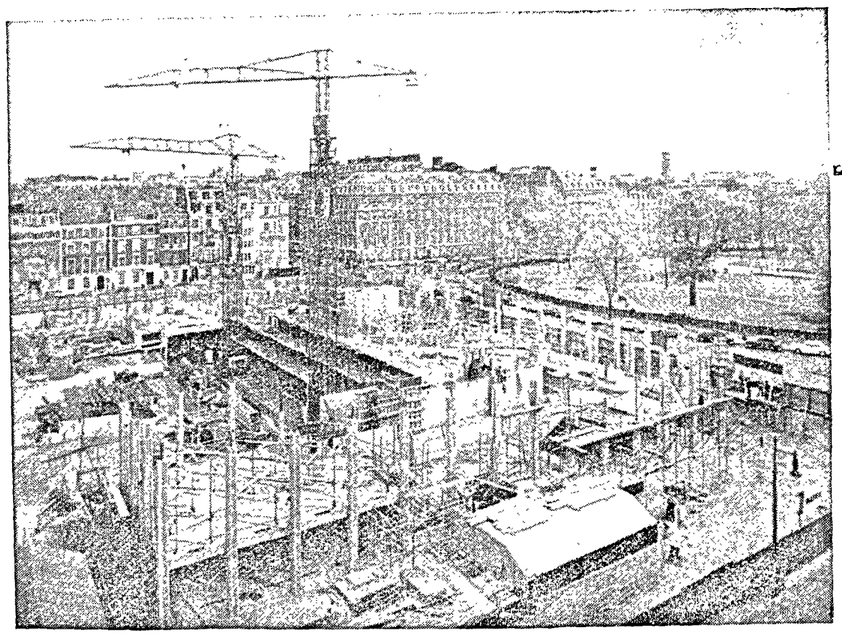
1933

In 1933 Geigy, one of the oldest firms in the world, was entering an entirely new field of research.



The way led from synthetic dyes to textile finishes and so to mothproofing. From there it was a short step to pesticides in general – and the world-famous DDT insecticides in particular. Out of biological and medical problems involved came the first Geigy pharmaceutical specialities.

As an international organisation Geigy today sells dyestuffs, industrial chemicals, plasticisers, pesticides and pharmaceuticals in most countries of the world. In the field of organic chemicals the name of Geigy is a mark of quality.



200 years Geigy

"Talking of Sound Barriers...."

"The Works Doctor came to see me the other day and put forward a strong case for some form of insulation to protect employees from excessive noise. Apparently most of the absenteeism and nervous illness in the place is due to sound irritation, although I believe he had another word for it. I must admit our re-equipment scheme has increased the noise level considerably—and absenteeism has increased likewise. Anyway I'm recommending to the Board that we call in Newalls to see what can be done about it. It will be a worthwhile investment to get back to something like peak efficiency."*

Americans face the longest night on earth

One of the most important contributions to the International Geophysical Year has been the establishment by the U.S. Navy and Air Force of the first-ever scientific station at the South Pole. This project was aptly named 'Operation Deep Freeze'. The base, manned and operating since November 1956, stands on a high, featureless snow and ice plateau. Its object: to study some of the worst weather in the world—blizzards, 'white-outs' and temperatures of 102° F. below—all through the long six months of the Antarctic night.
For anchoring wireless masts and other drilling jobs it was essential to use a rock drill that was portable, reliable and easy to maintain—as well as being able to operate in the Antarctic cold at a height of 9,200 ft. The expedition chose the Atlas Copco 'Cobra', using Sandvik Coromant drill steels. The 'Cobra' is the lightest self-contained rock drill in the world. Weighing only 53 lb., with a built-in gasoline engine, it can drill up to 26 ft. per hour through granite.

Drilling at the South Pole, with Radar Dome in background

Blowing out oil fires

Compressed air is versatile. Atlas Copco provides the means for all its many applications. When the vapour on the surface of an oil tank catches fire, Atlas Copco compressors are used to pipe air into the bottom of the tank. This forces the cooler oil to the top, lowering the temperature at the surface and bringing the fire under control.
The Atlas Copco Group of Companies is responsible for the manufacture of compressed air equipment and its distribution and servicing in 90 countries throughout the World. Group H.Q: Atlas Copco AB, Stockholm I, Sweden.

Atlas Copco puts compressed air to work for the world

Whose Hangover?

SO they rode back, but not quite the 50,000. Some 1,500 busmen, in strikebound quiet, decided that there was no future for them in busmanship and moved to other industries. They emerge from this humiliating episode—humiliating alike to the busmen, to London Transport, to the Government, and to the public which had helplessly to walk—as perhaps the most sensible and forward-looking of all. Now, in this moment of industrial peace, with not only the busmen but also the dockers and the Smithfield men and drivers back at work, it is worth asking a few questions that go a little deeper than "who won?" What will be the consequences of the peace we have got? Who has the hangover?

Everyone, of course, is claiming some sort of a victory, but into the perfunctoriness of Mr Cousins's paean of triumph, for instance, and in the half-hearted insistence of the Government that they did not give way, can be read everyone's self-searching. Mr Cousins may claim that he won his point by forcing London Transport in the end to promise an upward wage review to the country busmen who in April had been promised nothing. London Transport may insist that, by not naming any figure for an increase, it has upheld the award of the Industrial Court and thus the principle of arbitration—but the country busmen are to get an increase next month all the same. The Government may claim to have held its ground—and so it has since the rail settlement taught it to insist that rises in wages must be met by economies in the service—but the public will pay more.

What are the really important principles in the settlement? The first is that, though London Transport may be criticised for weakening to end the strike, it was completely right not to compromise at the start. Its case against the union's demands for a flat rate increase for all London busmen was unassailable. Bus receipts had been falling; the Industrial Court had found unanimously against the country busmen's claim; any general increase then would have spread to all other busmen throughout the country even more quickly, and even more completely, than it will now do on the settlement finally reached. A settlement in April would have promptly become the minimum for wage increases in other industries. As it is, the time period between the last two awards to the busmen has been extended to eighteen months; the miners have agreed to forgo a rise this year, and other unions are proceeding at any rate more cautiously.

To put its achievement at the lowest, London Transport has helped to slow down the pace of wage inflation. At best, by showing the public that a strike, though unpleasant, is not bound to be a disaster or lead to all-out industrial warfare, it may have done something to alter the fatalism towards leapfrogging wage demands which has been at the root of this country's economic problems since the war. More specifically, the strike may have given London Transport the chance to

reappraise its illogical system of operating public vehicles. The first sign of new thinking was Sir John Elliot's statement that more people should be diverted to the underground. The Government's insistence that wage claims should be absorbed by efficiency must be the spur to drastic changes which will use carrying capacity more fully, irrespective of the busmen's preferences. Thinking along these lines leads logically, as Sir Brian Robertson said in April, to the idea of a fares differential between peak and off-peak hours; passengers demanding peak-hour transport should pay the marginal cost of the equipment required to carry them though it is partly idle for the rest of the day. The Government would be quite wrong if, in its anti-inflationary zeal, it ruled out such increases.

For Mr Cousins, the post mortem on his generalship should be sobering. The plain fact is that, at a cost of £1,600,000 in union funds, and £3,500,000 in wages forgone by his troops, he got terms on June 20th almost identical with those he rejected on June 1st and not really so different from those offered just before the strike began. This should be made clear: it was not the bus strike which won the men their concessions; these were given after the settlement had been made on the railways to avoid another strike there. The temporary withdrawal last week of the 10 per cent cuts in services was deplorable; but this cannot be counted a gain to the union from the strike. The cuts were announced only after the strike had been going for a month and the Minister of Transport, at any rate, insists that they will still be made. If they are made, as by every economic test they should be—indeed, the eventual cut should be nearer 15 than 10 per cent—then they will represent the busmen's long-term losses from the strike.

These thoughts may spur Mr Cousins to rethink his union policies. During the strike there was no hint of strike breaking by the members of his union, but there was widespread apathy; it was the militants who forced the pace. And in the later stages of the strike this brought him near to challenging the Government, a folly from which only the sensible intervention of other union leaders saved him. Something substantial could be put on the credit side if Mr Cousins would have another look at his union, at the relations between himself, the officials and the rank-and-file, and consider just how far he upholds its real interests.

THE wage pattern of the year has emerged tolerably clearly after the strike. The busmen and railwaymen have been given increases corresponding to an annual advance of slightly less than 3 per cent. In building and electrical contracting, the workers have got 4 per cent and in electricity supply, rather less. This is likely to be the increase which the engineers will settle for in the autumn when bargaining for their claim made this week for 6 per cent comes to a head. These increases look inflationary enough. The hangover may yet be everybody's. But the calculation that will matter is the comparison between these wage increases and any offsetting fall in production costs, either from lower import prices or higher productivity, before the end of the year. Here the picture may be more encouraging. If the Chancellor's new stimuli to expansion take effect and import prices do not go up there is some hope that most of the wage increases might be absorbed without inflation. At the best, Government policy this year could perhaps for the first time since 1951 keep the rise in the wage bill roughly in step with the actual expansion of output.

This would indeed be a reprieve for the old age pensioner, the retired and the other people who live on fixed incomes. But for it to be more than a reprieve, the strike this year will have to have some effect on the country's archaic system of wage bargaining. Now that even the middle classes are getting organised to join in, the annual wage fight has become a fatuous caucus race which nearly everyone seems to win but nobody in fact does so. The dual role of the Government as employer and policymaker has accentuated the difficulties, rather than changed the nature, of the competition to stake claims. The ball now lies at the feet of the unions, who will not want to play it; but they may be forced to do so if the public were to decide that facing strikes is a lesser evil than endless inflation. Whether and how soon the public will be generally prepared to do this is not easily to be fathomed. It can only be said that it is sometimes the last, quite small, melting of the under-surface that causes the visible tenth of the iceberg suddenly to turn over.

The Economist

JUNE 23, 1858

THE EVIL OF REGULATION

It is many years since Mr Cobden spoke of the "*tedium* of a free-trade argument." Yet it is even now periodically necessary to enforce the grounds on which that argument rests. The fundamental principle that every regulation by Government on commercial affairs is in itself objectionable, and only to be tolerated when conclusively shown to produce much more good than evil, is now everywhere conceded. But principles of this sort are exactly those most likely to lie in the "dormitory of the understanding," and require to be aroused continually by pointed argument. The natural tendencies of human nature—and not the least of the best human nature—are in favour of regulation. A distinct evil is perceived; a plausible remedy is proposed. Persons of influence can hardly be blamed if they are biassed in favour of that remedy; they wish to do good, and this seems to them a way of doing good. Experience, however, has shown that few malevolent propensities are so pernicious as this interfering benevolence. On the continent of Europe every detail of human life is regulated by usages, of which it has dictated very many; the result is, that all the active part of human life is in those countries hampered and impeded, and that the facility of suggestion and liberty of invention which are essential to industrial progress do not there exist. In England we have much fewer unnecessary formalities, but those which we have are proportionately more mischievous.

How Deep a Freeze?

Agriculture was not the only topic in Moscow last week. Has the Soviet central committee come to the conclusion that the summit expedition was a fruitless idea?

MOSCOW, it seems, couldn't care less. Its attempt, by a sudden change of front, to dodge next week's Geneva talks on means of supervising a suspension of atomic tests, is merely the latest in a series of moves that indicate a mood of total unconcern for world opinion. The economic and political campaign against Jugoslavia; the breach of faith involved in the sudden one-sided publication of confidential papers about the ambassadors' talks in Moscow; above all, the ostentatious announcement of the execution of Imre Nagy and his fellow victims—all these things already seemed to suggest that the Soviet rulers have had enough of the interminable game of preparations for the summit, and that the post-Stalinist period of wooing has been succeeded by one of contemptuous indifference to adverse reactions abroad.

The abrupt volte-face on the Geneva talks—which is further discussed on page 1167—fits into this sombre pattern. Mr Dulles has rightly announced that the United States, for its part, will not yet abandon its preparations for the talks but will give the Russians "a *final, last chance*"; but there seems at the moment little chance of the Geneva meeting actually taking place next week, or indeed at any early date. As if to underline the revival of the Soviet brand of isolationism (isolationism, that is, within the wide frontiers of the block), the central committee of the Soviet Communist Party, summoned for a plenary meeting last week, made no mention of foreign affairs or of the implications of the Nagy case in its final statement. To judge by that document, the committee simply gathered to endorse Mr Khrushchev's further plans for agricultural reform.

THE Soviet leaders knew that the execution was bound to revive western memories of the Hungarian rising, to increase the isolation of communist parties in the West, to weaken popular pressure for talks with Russia, and to provide the opponents of such negotiation with fresh ammunition. The effect was immediate. In Italy, the Nagy verdict was one of the reasons used by Signor Nenni to reject the communist offers of common action. In France it provided a welcome replenishment to M. Mollet's arsenal of anti-communist propaganda. Throughout the western world the executions gave rise to a violent anti-Soviet campaign. In the uncommitted countries of Asia, the news had a strong impact too, on the political leaders at least. The *men in Moscow* presumably discounted all these setbacks in advance for the sake of the struggle against the Titoist heresy. For the message of the execution squad is simple and it is aimed at eastern Europe: "revisionism" is no longer a sin to be deplored, it is a crime punishable by death.

IN seeking the reasons why the Russians have changed their course one theory must be dismissed outright—the supposition that Mr Khrushchev had it all planned from the start. Mr Khrushchev's earlier solicitous efforts at reconciliation with Belgrade, and the risk he then took of a complete disruption of the communist empire, would have been totally senseless if he had intended finally to get back to the point of departure. Indeed, there are signs that the decision to hang Mr Nagy was neither unanimous nor taken well in advance. Only a day or two before the execution *Pravda* reprinted a lengthy article from the Hungarian *Nepszabadsag* which, while criticising the Jugoslav programme, warned Hungarian communists that the discussion should not degenerate, in manner or in method, to the level prescribed by the Cominform resolution of 1948. Mr Kadar thus implicitly dissociated himself from the murder of his fellow-Hungarians. And the opposition to the crime was not likely to be limited to Budapest and Warsaw.

The trial of Mr Nagy marks the victory in the Kremlin of the view that it does not pay to keep smiling at the West. For the last five years, in spite of waverings and hesitations, the Soviet Union has been run by flexible men, believing in the profitability of change. They set about reforming the communist block in the hope of making it more efficient. This policy fitted into the broader plan of a possible bargain with the West. Such a bargain—involving a measure of disarmanent and disengagement—would not only preserve peace. It would, so the argument ran, hasten the ultimate victory of communism. The opponents of the new flexibility at first concentrated their attacks on the great risks of such a policy, and they raised their voices at the time of the Hungarian insurrection. In recent months, however, they rewrote their indictment, substituting the reproach that the policy had brought no results. The American troops are still entrenched in Europe; the Rapacki plan has been turned down; nuclear tests go on; nuclear rearmament of the west German army is a settled thing. Foreign communist parties have made no spectacular headway. The West, it is argued, is as little attracted by the "European" face of communism as it was by the Asiatic face that

Stalin gave it. Jugoslavia has not rejoined the block and stands as a heretical pole of attraction on its frontiers ; " revisionism ", though driven underground in most places, is far from dead ; intellectual ferment persists, even in Russia itself.

The balance-sheet is not as negative for the Russians as the Stalinists would make out. But in communist councils the diehards can rely on the powerful backing of Mao Tse-tung. The part played by China in this whole affair should not be underestimated. When, at Stalin's death, Moscow turned reformist, it still seemed logical that Peking should remain the fountain of Stalinist orthodoxy. China is at a stage of economic development comparable to Russia's in the early days of Stalin. Then, for a period, it looked as if Mao were seeking a short cut to industrialisation. He restrained the Russians in their conflict with the Poles, and his " hundred flowers " campaign was greeted enthusiastically by anti-Stalinists throughout eastern Europe. Realism, however, rapidly reasserted itself. The tending of blossoms was replaced by the extirpation of weeds: the Chinese launched their own attack on revisionism. Serious economic difficulties inside China prompted the intensification of this campaign. China has been the undisputed leader, both in timing and in violence, of the anti-Jugoslav drive, and the weight of its prestige could have tipped the balance in the Kremlin.

WILL the execution of Imre Nagy—like the hideous trial of Laslo Rajk—inaugurate an era of complete subservience to Moscow's wishes throughout eastern and central Europe ? The offensive against Jugoslavia is bound to gain in strength. In Prague and Sofia the hostile chorus is growing louder. The test, however, will be in Poland, where the reaction against Stalinism had gone much further than anywhere else. Ten years ago Moscow's orders were enough to remove Mr Gomulka from power to prison. Now Mr Gomulka can put up a fight if he chooses. He has curbed many of the rebellious intellectuals in his country, but Poland still remains, by comparison with the rest of the block, a hotbed of " revisionism." Official Warsaw received the news from Budapest in stunned silence.

Changes in foreign policy and in the control of the block were only part, and a minor part, of the movement initiated by Stalin's successors. The biggest changes took place at home ; and there Mr Khrushchev, so far, shows no sign of altering course. On the contrary, the Tass announcement about Imre Nagy was followed shortly after by the central committee's proclamation of new concessions for the peasantry, which still forms nearly half of the Soviet population. The abolition of all compulsory deliveries of foodstuffs to the state is a step in the direction outlined by Mr Khrushchev in March when he foreshadowed the dismantling of the machine and tractor stations. It is an important step and one that will greatly please the collective farmers. The state will now have to rely entirely on purchases from the farms to maintain food supplies for the towns. Purchasing prices will naturally vary from region to region ; in principle, they should only fluctuate from year to year according to the general state of the harvest. Admittedly, the state also controls the price of all the goods supplied to the countryside. Nevertheless, this appeal to the peasants' property instinct (through the transfer of the tractors and machines) and to their taste for profits (through the substitution of purchase for forced deliveries) may lead to deeper social changes than Mr Khrushchev imagines. For the moment, however, he is mainly concerned with winning over the peasants and getting them to increase supplies. With more food and agricultural raw materials, he can also hope to please the rest of the population. The Russians have been promised more industrial consumer goods, too, from the expansion of synthetic chemical production. At home, therefore, the Soviet antidote to the revisionist disease is not terror but a rise in the standard of life of the population ; or so, at least, it looks at the moment.

MR KHRUSHCHEV has managed to project himself before the Russian public as the author of popular reforms at home, which are a success, and not of the plan, which has failed, for a more flexible and vigorous structure for the Soviet block. As to his peace-making efforts, after the publication of the ambassadorial documents and Mr Khrushchev's commentary on them in his letter to President Eisenhower, most Russians will be convinced that they did not fail for lack of trying. Mr Khrushchev's agricultural programme has been endorsed and is now being praised throughout the country. The small reshuffle in the party presidium (discussed on page 1171) has, if anything, strengthened his position. Yet there is a strong feeling that the game is not at an end. The central committee did not meet merely to talk about agriculture. And should Russia settle down to isolationism, the communist block may be shaken by greater tremors yet.

For the West, the easiest conclusion to draw from this would be that it is now safe to return to a posture of moral disapproval and not worry any further about what to do ; heaven knows there is cause enough for moral censure, but this will not be the most fruitful conclusion, or the most honest. Those who think that the cold war is the most comfortable climate for the West (and are thus the unwitting allies of the intransigents in the Kremlin) can logically use the Nagy murder as a pretext to break off all east-west discussion. But it would only be a pretext, since a *modus vivendi* could never have been based on moral union, but at the most on a limited community of interests. Those who believe that the West can still benefit from an east-west agreement, if such an agreement is at all possible, may be disconcerted by the hardening of the Soviet attitude, but they must not desist. The pursuit of negotiated disarmament and disengagement is still the one purposeful way to sustain the democratic hopes of the peoples of central and eastern Europe.

Suez Beneath the Cedars

Lebanon's crisis endangers western interests in the Middle East but armed intervention offers no solution.

MR HAMMARSKJÖLD having visited the Lebanon and Cairo and returned to New York to report, the Lebanese conflict is still for the present in United Nations hands. But will it remain there ? President Chamoun's two most powerful friends, the American and British governments, are still taking pains to express their own interest in the conflict in terms of support for whatever the United Nations may do ; and this was the gist of Mr Selwyn Lloyd's answers in the Commons on Wednesday. But when the Foreign Secretary pledged British support to the United Nations " operation," he appeared to mean no more than the attempt to seal the Syrian frontier with neutral observers or a neutral non-combatant force. Is this the limit of what is intended ?

President Chamoun's statements in Beirut do not suggest that it is. He wants military support—as he puts it, to seal the frontier ; but in fact it is not likely that sealing the frontier would be enough. Certainly the Lebanese opposition shows no alarm at that prospect. Much reference is being made to Article 51 of the United Nations Charter, according to which Mr Chamoun, as head of the legitimate government, has the right of self-defence and the right to call on friends to help him. He appears anxious to get the required number of troops from the United Nations if he can ; but in all his utterances he has reserved his right to call for help from the United States and Britain, the countries most friendly to him. Thus, while the western world desperately hopes for a solution through the United Nations, the danger remains that if the United Nations fails to fulfil the desires of President Chamoun, he can call on the United States and Britain to act instead.

FOR six weeks since the revolt broke out in Lebanon, the western powers have appeared to base their attitude to the crisis there on the premise that Lebanese independence is inseparable from Mr Camille Chamoun's presidency. Mr Chamoun and his foreign minister, Dr Malik, have encouraged them in this assumption, but it has been seriously challenged by a large portion of the Lebanese people who are now engaged in a dangerous, perhaps suicidal, struggle to prove it wrong. It is true that Lebanese politics are largely a matter of personalities, not parties, but there is no reason to believe that if another president were chosen, as is customary, from the largest single sect in the country, the Maronite Christians, he would be inclined to submerge the Lebanon in the United Arab Republic. The irresponsible behaviour of all Lebanese leaders may have convinced even President Nasser that the acquisition of Lebanon would provide him with more headaches than glory.

At the beginning of the insurrection President Chamoun uttered a warning that the opposition leaders were bent on upsetting the delicate balance between Christians and Moslems in Lebanon. Since that time the balance has been upset by the president's stubborness as well as by the opposition's determination to unseat him. In any case, the lines are not so clearly defined. There are anti-Chamoun Christians, and pro-Chamoun Moslems. There are the Druses, a dissident and heretical Moslem sect, who ordinarily play both sides of the confessional fence ; but since Mr Chamoun allowed their leader, Kamal Jumblatt, to be defeated in last year's elections, Mr Jumblatt has become the darling of the opposition. The whole intricate pattern of Lebanese personal ambition, graft, religion and politics has never before been so exposed, or so hard for people outside to understand.

WHAT began, and in many ways continues, as an outburst of domestic feelings has been elevated to the status of an international crisis by each of the contending parties. The opposition has received important support from Syria and Egypt in the form of arms and propaganda. The government has received the token support of the United Nations Security Council in the form of neutral observers who are expected to outwit the smugglers bringing the arms across the border from Syria. Further assistance for the government has been suggested, but not given, by the sustained British airlift to Cyprus and by the presence of the American Sixth Fleet in the eastern Mediterranean. The British concentration of forces on Cyprus has looked bigger than is necessary for use in Cyprus alone. The Sixth Fleet has just finished landing exercises on the Turkish coast. Its presence in the area need not mean intervention at all ; in quieter times it is not uncommon for units of the fleet to pay calls at Beirut where the sailors are welcomed with great enthusiasm by Lebanese who are anxious to sell them things. But the United States government is taking care not to give the impression that a landing is ruled out. Even the French, invited or not, and suspicious as ever of Britons and Americans at large in the Levant, appear anxious to join in any western intervention. The Russians are in the comfortable position of savouring the western discomfort, and have had the pleasure of sternly warning the Americans against intervention—thus deriving an

advantage for themselves whether there is a real intention to intervene, or not.

It is hard to see how a western intervention could do anything for Lebanon; it clearly could do nothing for western interests anywhere else in the Middle East. There is, for instance, nothing to be gained by protecting the oil terminals at Sidon and Tripoli as long as the pipelines from Iraq and Saudi Arabia still have to run across Nasser's Syrian province. Warships are not needed to evacuate civilians as long as the Beirut airport continues to function normally. The security of western interests in the Middle East has not been assured, or even increased, in the recent past by pacts, treaties, doctrines or armed adventure. Perhaps it is time to urge again that the West come to terms with Arab nationalism. The question is what "coming to terms" would mean in practice. Probably the first step ought to be the re-establishment of diplomatic relations broken by the Suez crisis. The second step would be for the western powers not to appear over-anxious about the recent Arab inclination to be friendly with the Soviet block. It is true that the Arabs do not seem to realise the real dangers involved in these flirtations with communism, but they will insist on finding out for themselves; they are not content to be told by a West whose motives they are apt to regard with suspicion. Arab nationalism is a local growth, fertilised almost entirely by western ideals learnt in western schools. It is not communism, and it is not directed from Moscow.

What would be the purpose of an armed intervention in Lebanon? It is hard to think of any convincing reason, in their own interests, that the western powers could give. It is perfectly true that the American government is in the embarrassing position of being committed by the terms of the Eisenhower doctrine to support the Lebanese government. If that government did ask the Americans to intervene, presumably they would feel they had to do so, lest they lose face with other friendly governments. The British government has even less motive for intervention—so long as there is little evidence that British life or property is in danger. Why should the western powers decide to stake their future in the whole Middle East on an issue as complicated as the internal politics of Lebanon? Intervention there would weaken, it might even bring to an end, the friendly governments of Iraq, Jordan and Saudi Arabia by convincing their people of the justice of Nasser's imputations against the western powers.

ONE is almost led to believe that the whole crisis, so far as it is international, is factitious, and that it has been precipitated by President Chamoun's failure to play the game of Levantine politics according to locally understood rules. For all the international rumblings, the Lebanese will have to settle their own quarrel, even if they need help from outside to choke off the importation of arms and troublemakers from over the border. Mr Hammarskjöld may have visited the scene in time to rescue the West from making a grave mistake. An armed intervention with an undefined purpose against an undefined enemy, without any long-term objective, would surely bring misfortune to all concerned.

TEN YEARS OF THE NATIONAL HEALTH SERVICE—I

The New Panel Patient

This first article examines critically the physiology—the growth and functioning—of the health service and prepares the way for a second article on its pathology—its weaknesses and malfunctioning.

TEN years ago, a week before the "appointed day" for the introduction of the welfare state, a big question mark still hung over the future health service. Doctors, temporarily reassured by the concessions that ended Mr Bevan's long struggle with their leaders, were fast signifying their willingness to work in the new service; no doubt the stipulation that only doctors in the service on the appointed day could be compensated for the loss of their right to sell their practices spurred them on. The unknown factor was the reaction of the middle class—of those people whose income or occupation had kept them out of the scope of the old national health insurance scheme. These were the people who had always been accustomed to pay their private doctor; who expected him to visit them; who, if they attended his surgery, went in by appointment and by a different door to a different waiting room and possibly a different surgery from his panel patients; who would have been shocked at the suggestion that if they needed specialist treatment, they should enter the general ward of their local hospital or attend its outpatient department.

These people had been drafted into the national insurance scheme willy-nilly. When taken ill they were now faced with the totally unaccustomed procedure of sending the right certificate at the right time to the right place or else forfeiting their sickness benefit (the value of which many employers were now likely to deduct from salaries). It was not the need to get medical certificates, however, which itself forced middle-class people into the service. Certification had not been

linked by legislation to the health service. It could—and still can—be undertaken by a doctor for a private patient. Nor were people forced to join because their doctor had done so. He was, and is still, free to have both health service and private patients.

Thus, on July 5, 1948, it was still an open question what the middle class would do. Would they treat the national health service as they had treated state schools, as something providing a distinctly inferior form of treatment and care in not very pleasant surroundings? Would they, for instance, while paying their national insurance as they paid their local rates, refuse to change the doctor/patient relations to which they were accustomed, but, when the expensive bills for consultant and hospital treatment arose, get the state to pay, as they did for so much university education?

Within a few weeks, it was clear that the middle class saw medicine as quite a different issue from education. By July 10, 1958, in England and Wales, 16,208,000 people, apart from the 19,500,000 covered by the old national health insurance scheme, had applied to be placed on general practitioners' lists for health service treatment. By September, the number of people on doctors' lists, including former panel patients, was 39 million out of a total population of 42,750,000. After nine months the figure had grown to 41,650,000. Doctors' lists, especially in those early years, were inflated by large numbers of duplicate entries, which are still in process of being eliminated. But even if allowance is made for this, and for the fact that some people have two doctors—one health service and one private—it is nevertheless a matter of statistics that the service proved immediately popular and has become increasingly so. The latest official figure is that 97 per cent of the population of Great Britain is using it.

MIDDLE class willingness to use the health service has had a decisive influence upon its growth. Neither then—nor now—were there two standards of treatment, one for private patients and one for the panel. People may believe that if they pay for their children's education, their children will be better taught. But they do not have to pay their doctors to be sure of getting penicillin. What they obtain from private practice is more attention, and more time and space, which were as rarely found in the old pre-1948 panel practice as in the despised primary school.

But as a result of the entry of the middle class, these somewhat elusive qualities have been injected into the health service. Not in every practice by any manner of means; but it can fairly be said that as a whole general practice within the health service is nearer to the standards of private practice than the pre-1948 panel practice was. This has enormously improved the service to the former working-class panel patient. Doctors have been constantly exhorted, officially and unofficially, to improve their surgeries and waiting rooms, and even to see by appointment health service patients who need more time than the few minutes which is all that ordinary surgery hours allow. At first, when both doctors and patients were still adjusting themselves to the new service, and when complaints on both sides were at their height, a survey carried out by the British Medical Association showed rather over half of the general practitioners reasonably contented in their work. Only a minority (15 per cent) would have preferred a practice consisting wholly of private patients. Two-thirds of those asked preferred a mixed practice—mostly health service but with some private patients as well to vary the routine grind of health service practice and to sharpen their professional standards.

For the health service this is one of the main justifications for the continuance of private practice. It can be argued that if the health service were all it should be, private practice would have withered away. As it is, some 600 general practitioners out of some 24,000 in the country as a whole, are able to make a living solely from private patients, quite apart from the much larger number for whom the health service provides their bread and butter and private practice their jam. Nobody is, of course, satisfied with the standards of the service; but the cost of raising them, even to the level of private practice, is a budgetary—and therefore political—issue. In the meantime, the existence of private practice should help to keep doctors' sights high.

THE effect of having two types of practice, private and health service, can best be seen in the hospitals. By electing to be treated as a health service patient, a person who has, for instance, a coronary thrombosis, or has his gall bladder removed, will save himself about £150—the cost of treatment in a pay bed of a general hospital (in a teaching hospital he may pay much more). Although the health service was not designed to save the middle classes from being overtaken and ruined by the leaping costs of the new era in medicine, which calls for a host of ancillary professional workers behind the clinician, it has had exactly this effect.

Yet, contrary to original expectations, it is in the consultant and hospital service, rather than general practice, that private practice flourishes most—largely because of the financial support provided by the provident associations. The membership of some of these is inflated by people who are nominally in them but are insured on too low a scale for their benefits to be any use for inpatient hospital treatment; even so, it is extensive and increasing enough to show that the demand for private consultation and private treatment is strong.

By private purchase the middle class patient obtains the time, space (which includes privacy) and attention that are denied him in the outpatient department or general ward. The health service patient receives

medical attention in plenty. Indeed, some will complain that they get so much attention that hospital is the most tiring time of their lives. But the attention is too often to the case, not to the person. Space and privacy can be bought within the health service by the patient lucky enough to obtain an amenity bed. But an amenity bed cannot be booked in advance; it is a matter of chance if one is vacant when a health service patient enters hospital; and some hospitals reserve them entirely either for their own staffs or for patients who need privacy on medical grounds. Time, for an acutely ill person, is irrelevant; a health service patient will be admitted to hospital as quickly as a private one. But a great deal of the investigation and treatment undertaken by hospitals are for conditions that can wait; and the middle class patient is not prepared to wait indefinitely for a bed or an outpatient appointment that may turn up, when it does, at a highly inconvenient moment. He is not prepared to spend a whole day being herded from one department to another. His time is as valuable as that of the other professional people looking after him, and if he can buy his right to time, either directly or through insurance, he will. And this is a good bargain for him, his employers and the economy.

Dealing with such large quantities of totally unpredictable raw material, the hospital service cannot be expected to achieve middle class desiderata in these three respects of time, space and attention. But it can uphold them as an ideal, and although the exceptions abound, the hospitals have gone a long way towards such things as an appointment system for outpatients and even the provision of an evening meal to the patients in the wards. Looking back to the outpatient queues of the old voluntary hospital and to the general wards of the municipal hospital, anyone will be convinced that big improvements have been secured. Looking at the by-passing and short cuts that are obtained by payment, one sees how much has still to be done.

"NOT just a glorified poor law, but a full health service for all the people"—such was Lord Attlee's conception of the service when it was still in the blueprint stage. The Labour party can fairly be proud both of the aim and of the extent to which it has been achieved. But the Labour planners did not foresee the effect of adding to all the other commitments of the welfare state a service whose cost was quite impossible to estimate because it was governed by a quite incalculable public demand. The cost nevertheless has had to be counted and kept in check, with the result that some demands, some needs, have not been met. This spreading of limited resources over the whole population has also meant that some people may be worse off than they were under the old system, which gave a certain priority to the underprivileged. These weak spots in the health service will be examined in a second article.

Decisive Pause in Cyprus

The first hostile reactions to the British plan for Cyprus need not be taken too tragically. But if it is ever to get a fair trial, both Turkey and Greece will have to abandon their extreme demands

IN Athens, Ankara and Cyprus a chorus of disapproval—vitriolic, reasoned or simply pained—has been provoked by the new British plan for Cyprus. Any other first reaction would have been surprising. No one, least of all Mr Macmillan or Sir Hugh Foot, supposed that the proposals were a magic formula that would immediately dissolve Cypriot discontents and launch the island on a new era of peace and reconciliation. Indeed, enthusiasm might have been dangerous; for if one side had welcomed the plan the other would have turned it down flat. As it is, both Greece and Turkey have rejected it (the Turks less decidedly than the Greeks), but both in reasonably moderate terms which do not rule out further negotiation. Moreover, in the island itself, while the air is full of verbal protests, the sounds of gunfire, bombs and breaking windows have been muted; there have been some scattered incidents, but so far the proposals have not sparked off renewed terrorism or fresh outbreaks of communal violence.

Perhaps inevitably, the first instinct of both Greeks and Turks has been to judge Mr Macmillan's "adventure in partnership" by the likelihood, or lack of it, that it can be made to advance their mutually incompatible ideas on the final disposition of the island. By this yardstick, the plan for an interim period of self-government on communal lines, under British sovereignty but with Greek and Turkish participation, appeals more to the champions of partition than to the defenders of enosis—even though it was the Greeks who used to be willing to contemplate an interim period (of fixed duration) of self-government under British sovereignty, while the Turks have lately clamoured for immediate partition. The Turks entertain the hope that what is, in a sense, political partition can pave the way to geographical partition. The Greeks fear that the Turks may be right. In fact, both are wrong. The British plan, whatever its imperfections of detail, is put forward as the best way of getting two temporarily hostile communities to settle down side by side to govern themselves, and as the most certain method of guaranteeing

the rights of the Turkish minority. Above all, it was designed to prevent, not to facilitate, the disruption, hardship and probable strife of a geographical partition. According to a report from our correspondent in Nicosia on page 1192, Sir Hugh Foot has been making great efforts to get this across.

Unless the Turks realise this, there is a danger that they may conclude from the provisions of the British plan that their policy of intransigence has opened the door to partition and that with only a few hefty heaves they can burst right through. The Greeks, for their part, feel, naturally enough, that far too much has already been conceded to the Turkish point of view. They should, however, remember that they themselves bear a good share of responsibility for the state of affairs that makes something like the British plan seem the only practicable way out of the deadlock. If they had been prepared, in the relatively calm atmosphere of three years ago—as their prime minister, Mr Karamanlis, says they are now—to agree to an interim solution of self-government under British sovereignty, while postponing the issue of self-determination to "a more appropriate time," the present crisis might have been avoided. It is a tragic paradox that in rejecting the British plan today, the Greeks should have made the concession that once might have made all the difference to the peaceful evolution of Cyprus. But they cannot now turn back the clock several years and ignore what has happened in between.

NOR can the Greeks continue to ignore Turkey's legitimate stake in the island. They would be short-sighted to refuse to have anything to do with the British plan merely because it acknowledges, and provides for, Turkish interests in Cyprus. Those interests are a reality, whether the Greeks accept them or not, and it is one of the advantages of the British plan that, while providing for them, it also confines them within reasonable bounds. Enosis, by excluding the Turks altogether from any sovereign status in the island, might provoke them into seizing the whole—and they are only forty miles from Cyprus, while the mainland of Greece is 500 miles away. Partition, too, to judge by the unofficial plans that have been put forward (and it is hard to conceive of any very different) would end by giving the Turks a disproportionate share of the island.

It is quite plain, however, that no arguments in favour of giving the British plan a fair trial, whether addressed to the Greeks or to the Turks, will make any effective impression so long as each side still insists that the ultimate goal of Cyprus must be either enosis or partition. The Greeks will not try to make communal autonomy work so long as they believe it to be the first step to partition; the Turks will continue to insist on partition so long as they believe the alternative to be enosis. For this reason the Labour party's attitude, which is being unfolded in the Commons as we go to press, may be of paramount importance; the plan will be a lost cause if hopes or fears are fostered that a Labour government would settle for enosis.

Neither side in the quarrel need necessarily beat a public retreat from its present advanced, and indefensible, position. Necessary or not, a public retreat now would probably not be possible either for the Turkish or for the Greek government; they are both, for different reasons, in trouble on their domestic fronts. Mr Karamanlis, it must be remembered, who is easily the best Greek prime minister we have, is under heavy fire from the Opposition for what appears to Greeks to be the moderation of his Cyprus policy. (The British Government should sympathise with these difficulties. Its own Cyprus policy has been persistently hamstrung by sensitivity to its Suez rebels, who have decided this week that the Government's policy towards Cyprus shows sufficient regard for British prestige and power to allow them to return to the fold.) But what is essential is that each side should in fact privately give up its extreme demand (for enosis or for partition) and above all that each should convince the other that its renunciation is genuine. This is indeed a tall order, perhaps too tall. But with the help of the British Government and with the good offices of the Nato powers as a group, the Greek and Turkish governments could just conceivably be persuaded first to discuss the plan as a practical proposition and later to join in, at least experimentally.

The plan, it is true, has disadvantages. Its provisions for self-government over the next seven years are complicated and will be far from easy to put into practice. It departs from the British tradition of giving dependent peoples a free and open choice of their future status. The seven-year trial period seems excessively long. But it does offer both Greek and Turkish Cypriots genuine links with their respective mother-countries. It does give them an opportunity of living in peace. And, although the Cyprus problem has grown into a major international issue, this, after all, is what it ought really to be about.

A NEW SERVICE
OF ECONOMIC AND MARKETING RESEARCH

DURABLE CONSUMER GOODS

A series of continuous comprehensive surveys are now being prepared to assist manufacturers and others to estimate the future market for the following goods: Electric washing machines; Tyres; Refrigerators; Car heaters; Vacuum Cleaners; Cycles; Electric fires and convector heaters; Gas and electric cookers; Car radios; Radios and radiograms; Record players and Gramophones; Sewing machines; Television sets; and Passenger cars.

These surveys are being prepared jointly by
THE ECONOMIST INTELLIGENCE UNIT LIMITED
and
THE BRITISH MARKET RESEARCH BUREAU LIMITED
Further information from:
THE ECONOMIST INTELLIGENCE UNIT LTD.,
22 Ryder Street, London, S.W.1. Whitehall 1511, ext.13

NOTES OF THE WEEK

FRANCE

Capital of Curiosities

FRANCE has settled into an uneasy calm. Discussions on constitutional reform continue in Paris; the first anecdotes of General de Gaulle's personal conduct of affairs have entered into circulation. The progress of M. Pinay's loan suggests confidence, although it is still uncertain how much French money it will eventually lure back from abroad. Political life is trying to pick up again as best it can. Not the least curious performance of the past week was the evasive press conference called by M. Soustelle, the self-styled "witness" of recent events in Algiers. General de Gaulle's personal spokesman and Minister of Information, M. André Malraux, also contrived to meet the press and to avoid the main point. The literary committee of inquiry, including MM. Mauriac and Camus, which it is proposed to despatch across the Mediterranean promises to be a curiosity in itself. Apparently undismayed by their public eclipse, the Fourth Republicans are still exhorting each other to close ranks and fall in behind whichever of the old parties they themselves belong to. Upon this strange capital Mr Macmillan and Mr Selwyn Lloyd will descend on Sunday, to learn what is to be learnt.

Not all the news is frivolous. The general's government, which lifted the republican censorship as soon as it was installed in office, has now resorted to seizing the current issues of Paris's two liveliest political weeklies. From the provinces, particularly the south-west, where many of the French exiles from North Africa have settled in the past three years, there have come ominous straws in the wind. The poujadists have been busy, staging rallies where the name of the general has received the reverse of acclaim. At Pau and Auxerre there have been clashes between soldiers and left-wing demonstrators during ceremonies to mark the anniversary of General de Gaulle's first appeal from London on June 18, 1940. In Toulouse the editor of the Radical newspaper, the *Dépêche du Midi*, has reported attempted interference by members of the local committee of public safety, and the sale of the newspaper in a barracks nearby has been forbidden by the army commander. These are ugly signs of a spreading state of mind. The men who seek to profit from the weakness of French democracy are taking up their stations.

NORTH AFRICA

The General's Return

GENERAL DE GAULLE returns to Algeria on Wednesday; his purpose this time will not be served by oratory alone. Policy talks with the army's leaders, who still show every sign of preferring an intensification of the war to the search for a negotiated settlement, will provide an early test of his influence and political strength. Algiers itself seems to have become nervy at the thought of the approaching decisions. Voices have been raised within the Committee of Public Safety against the withdrawal of French troops in Tunisia into Bizerta, and against recognising the general's republican travelling companions, particularly M. Guy Mollet. The committee's last secret conclave emitted cries and sounds of forceful disagreement, but no communiqué. Its temper cannot have been improved by the knowledge that a band of Moslem women, whose emancipation is, according to M. André Malraux, one of the greater glories of *l'Algérie française*, had decided to demonstrate in front of General Massu's prefecture for the release of imprisoned rebels. The promise of a limited amnesty appears to have been taken literally.

The outcome of the Maghreb conference in Tunis showed a net gain for General de Gaulle's diplomatic concessions to the Tunisians and Moroccans. The Algerian rebels have not been able to announce their allies' approval for the formation of a government-in-exile, although FLN spokesmen in Cairo promptly affirmed that this was only a matter of time, and issued a ministerial list. This Cairo cabinet, however, does not include a prime minister; M. Ferhat Abbas, who might have been thought a strong candidate, is made responsible for the press and information. The Tunisians, to whom the French ambassador has now returned after a five-months' disapproving absence, emphasised that section of the communiqué which seemed to suggest a renewed effort by Tunis and Rabat to mediate between the French and the FLN, a step back from the unqualified support given to the FLN by the Maghreb parties at Tangier.

A correspondent in Tunis reports that a suggestion by General de Gaulle for a meeting between himself, the King of Morocco and President Bourguiba in Paris next month has already been accepted in principle by the North Africans. This initiative, which has American support, may not be unknown to M. Ferhat Abbas himself. Clearly it might bring to a head the decisive unresolved question between General de Gaulle and his supporters in Algiers: is an Algerian settlement by negotiation to be sought or not?

PARLIAMENT

No Dissent on Cyprus?

THE new Cyprus plan has set the Labour party a genuine problem to which its leaders seem to be reacting responsibly. The debate on the plan was taking place while this issue of *The Economist* is going to press. At the preceding meeting of the parliamentary party it was decided not to force a vote; but a minority of backbenchers may make trouble. Labour's difficulty arises from the fact that their official party policy calls for self-determination, and this is firmly excluded from the new plan. One section of the party has argued from this that Labour should flatly oppose the new plan. But the party leaders recognise that, whatever they may think is the ideal solution, the present one is probably the only hope in the situation which has developed both on the island, and between Greece and Turkey. They still think that had the Government acted more generously in the past, the present deadlock need never have been reached, but they agree that, given the deadlock, the only alternative to the present plan, or something like it, is chaos and bloodshed—for which they would share responsibility if it was felt they had either encouraged the Greeks, or provoked the Turks, by holding out the prospect of self-determination the moment Labour achieved power. The mood of the Labour leaders, therefore, is to dwell at length on what they regard as the Government's past shortcomings, but broadly to accept the present plan as an interim compromise. In taking this stand, they are fortified by their respect for the present Governor.

Labour backbenchers have not been made better disposed towards the new plan, however, by the fact that it has so pleased Lord Hinchingbrooke's little band of Tory Independents that they have chosen this moment to apply to have the whip restored to them. No doubt Mr Macmillan wishes they could have chosen a less embarrassing occasion to be reconciled to him, but the group is probably anxious to take the first reasonable excuse it can. Of the original group of eight, only four were of any weight, and three of these have since left it, isolating Lord Hinchingbrooke with four nonentities. The rebels save their faces with the formula that in the Oman affair last year, the Yemen affair this year, and now the retention of colonial status for Cyprus, they feel the Government is going "some way to halt the decline in Britain's prestige, influence and power, so manifest since the war." Mr Macmillan will hardly thank them for this pathetic little rodomontade, but for the sake of party peace they doubtless will be taken back.

EASTERN EUROPE

Warsaw's Deafening Silence

ALMOST throughout the satellite world the murders of Mr Nagy and his associates were greeted with a sickening chorus of approval and gratification. Only in Warsaw were they met by a deafening silence. No doubt the silence stimulated the rumours which have been going the rounds of the Polish capital. The most spectacular one—that Mr Gomulka is about to be replaced by a Stalinist because of his refusal to welcome the Hungarian murders—seems highly improbable. Mr Gomulka may well be under some pressure from the Stalinists within his own party. But the Russians cannot treat him in quite the cavalier way in which they deal with those of their east European puppets who completely lack any popular support.

Mr Gomulka, however, will lose his popularity among the Poles if he knuckles under to the Russians in an obvious way; his problem is to judge how far he can safely go in his independence. Mr Nagy's execution, which arouses strong feelings among the Poles generally (as well as, presumably, in Mr Gomulka himself), raises the problem in a particularly tricky form. Only in May Mr Gomulka went to Budapest and in effect gave his blessing to the Kadar regime; he is believed to have been given some assurances about Mr Nagy then. Reports from Warsaw now indicate that he has spelled out his attitude in a letter to his regional party organisations. In this he apparently said that he had no previous knowledge of the Hungarian executions; that he had not changed his views on Mr Nagy (which probably means that he still does not think Mr Nagy organised a "counter-revolution"); that he does not approve of the executions; but that they are to be treated as an internal Hungarian affair. Thus he maintained his independent attitude towards the Nagy affair while indicating that he did not intend to embarrass Moscow. Presumably he calculated that he could go thus far; a rather surprising article on the Polish Communists in the latest number of the Moscow *Kommunist* suggests that he reckoned he could count on Russian tolerance in one quarter, at least.

Marshal Tito Pulls No Punches

MARSHAL TITO is lucky enough not to have to make these careful calculations. No punches were pulled in the Jugoslav Note delivered in Budapest this week. It protested strongly against Mr Nagy's treatment and against the breach of agreement involved in his seizure in November, 1956; questioned the validity of the charges against him; expressed the suspicion that the Hungarian government was not a free agent; and rejected Hungarian allegations that Jugoslavia had helped to instigate the Hungarian rising. As the Note points out, similar allegations were made against Jugoslavia at the time of the Rajk trial and were later admitted to be a pack of lies.

The Jugoslavs have been suggesting in their press that the attacks on themselves and the fate of Mr Nagy are both really a part of a Stalinist campaign that is raging throughout eastern Europe. To the Jugoslavs their "revisionism" is a "more comprehensive and freer socialist development." At last week's Czechoslovak party congress it was flatly equated with treason, and the Jugoslavs found themselves competing with western imperialists as the chief target of abuse.

DISARMAMENT

No Summit for Boffins?

UNTIL Tuesday it seemed reasonable to expect that talks would duly begin at Geneva next week on means of supervising a suspension of atomic tests. A confrontation of boffins at the highest level was in the last stages of preparation. Sir John Cockcroft and Sir William Penney, flanked by distinguished American, Canadian and French nuclear experts, and supported by a squad of seismologists, stood ready to meet their Soviet and satellite opposite numbers. Admittedly the Russians had been dragged to this particular summit protesting all the way, but they formally agreed to come to the proposed rendezvous, and had even nominated some of their team.

On Tuesday *Pravda* suddenly declared that the refusal of the United States and Britain to suspend tests now made the talks futile anyway; and this utterance confirmed the fears of those western observers who had forecast that the Russians, even if they came to Geneva, would at any rate see to it that nothing useful was done there. But later the same day the Soviet government confirmed arrangements for the meeting, specifically agreed to Canada's participation, and nominated further representatives. Not until Wednesday did a shock wave, in the form of an official Soviet aide-memoire, hit the western capitals and confirm the political seismologists' gloomy interpretation of the meaning of the remote and obscure rumblings that had originated from Moscow earlier.

Mr Dulles quickly (and wisely) announced that American preparations for the Geneva talks would still go ahead, just in case. The Russians do not seem to be asking, in so

many words, for a suspension of tests in advance of the talks. They have asked, in rather obscure language, for a pledge linking the talks to a suspension, apparently regardless of what the experts' findings may be. This topsy-turvy tortuousness may very well, of course, be no more than a device for evading a discussion which might focus embarrassing attention on the fact that the biggest single obstacle to disarmament is the top-secret nature of the Soviet system. It is this difficulty that makes it vain to expect any practical progress in the general field of disarmament until the question of inspection has been properly explored. In view of the lack of exploration by the governments, it is perhaps the more heartening to be able to record that private initiative has been seeking to fill the gap. A detailed examination of some of the most vital aspects of inspection for disarmament has already been made by groups of scientists and other informed persons in America and Britain, and their findings, which will be published next month, may provide at least a starting point for talks at a higher level.

THE DRUGS BILL

Doctor and Manufacturer

In spite of all the concern that has been expressed about the rising national drugs bill, the truth is that the total (excluding the cost of drugs dispensed in hospitals) accounts for about the same proportion of the total cost of the health service now as in 1951-52. When the general rise in prices in this period is taken into account, as well as the rapid developments in drug therapy which have often been a means of saving hospital beds and medical and nursing time, it is perhaps surprising that the expenditure per head has not risen more. The interim report of the Hinchliffe committee on the cost of prescribing, which was published this week (HMSO, 9d.), says that "the increase in the total cost of drugs to the national health service is proportionately less than in other countries of Europe and the Commonwealth which have similar (but usually more restricted) systems of insurance." Nevertheless, the committee agrees that economies are possible, and its recommendations on how to achieve them fall into two groups—those aimed at the doctor and those aimed at the manufacturer.

So far as the doctor is concerned, the committee proposes that, first, information on the comparative costs of standard and proprietary drugs should be more readily available; second, more emphasis should be placed on instructing medical students in economical prescribing; and, third, more use should be made of the Ministry of Health's regional medical officers in advising established doctors on developments in drugs and in comparing one doctor's prescribing habits with another's. No one is likely to object to these recommendations.

More controversial is the proposal that drug manufacturers should be compelled by legislation to show the price of their products in the advertising literature sent to doctors. The industry's association already recommends this to its members, but some firms fail to do so, with the result that doctors cannot know the cost of some of the new drugs. The committee's other main recommendation for the industry is that the British Pharmacopœia Commission should give an "approved name" to a new drug before it is marketed. At present a year or two may elapse before it does so, by which time doctors have got so used to the proprietary name that when a similar but cheaper drug becomes available they may not prescribe it. If a doctor is familiar with the approved name from the beginning, he is more likely to use it on prescriptions. Most drug firms already apply immediately for an approved name. But they will not accept willingly the further proposal that the approved name should be given on all the literature and labels as prominently as the trade name. They will regard it as asking them to cut their own throats.

DOWNING STREET

Propping Up the Past

The report of the Committee on the Preservation of Downing Street has given cartoonists hostile to the government an excellent theme at an arid time, and everyone else seems to have accepted its recommendations with little comment. Presumably, therefore, they correspond to the country's predisposition to embalm its political institutions in historic edifices however obsolescent. After making what on practical ground seems an overwhelming case for demolishing Nos 10, 11 and 12 Downing Street and replacing them with a good modern structure adequate to the needs of a type of modern cabinet government which pivots on the life and routine of a hard-working well-organised chief minister, it comes down firmly and inevitably for modernisation behind a costly underpinning of the eighteenth-century exterior. The hull and historic rooms of these three houses, in no way architecturally remarkable and run up without the restraint of LCC regulations by a speculative builder over 250 years ago, are to be preserved; the upper storeys of No 12 which were lost in a fire in 1879 are—to put the matter frankly—to be faked on again; the rooms hallowed by tradition are to be preserved but given safe floors, and the rest is to be modernised so that the prime minister's staff will have something approaching tolerable offices to work in, in the numbers needed, with mod. con. which are modern, not circa 1880.

It was high time, of course, that something was decided. Aside from the fact that it costs £8,000 a year to keep these houses from falling apart, and even this will not keep them standing much longer, they are at once pitifully inadequate to a prime minister's needs, and fairly heavy on his private purse. There are not enough offices for staff, and any overflow pushes them into gilded but dust-sheeted bedchambers or embarrassing proximity to the prime minister's family's private life. The prime minister's wife, cabinet ministers, friends of the family, journalists on their lawful occasions all use the same front door, and sometimes become involved in comic contretemps in the vestibule. The place is a fire trap, and the size of parties must be tailored to the floor joists as carefully as making up an airliner's load. For £400,000 much of this can perhaps be remedied, as the committee proposes, but the result is unlikely to be really satisfactory, and it is a fair guess that it will quickly become inadequate again. A new house, combining cabinet offices, labour saving official residences, self-contained suites for guests, and preserving historic interiors *à l'américaine*, would cost little if any more and be far more comfortable and efficient for everyone. But it would not be Downing Street as the world knows it, and in the present condition of British architecture, it would probably be an eyesore too. In such an instinctive process as British party government it may be right to

WARNING

There may be a fire TONIGHT

As we are the largest and most comprehensive manufacturers of *automatic* fire alarms in U.K. and our A.F.A. early detection system already protects hundreds of important buildings throughout the country, we may be of service to you, too. In an average year, A.F.A. installations save more than 50 buildings from the terrible effects of fire.

May we send you full details of the A.F.A. system, with comments from users, fire officers and insurance companies (who give premium rebates in many cases)?

Please write to us *now*, or use the coupon if convenient.

Send for full details of

Automatic Fire Alarms

to: ASSOCIATED FIRE ALARMS LTD
Claremont Road, London, E.17

Please send me full details of the A.F.A. system of *automatic* fire detection

Move hundreds more yards daily!

WITH THE Big, New

International BTD-20

CRAWLER TRACTOR 124 B.H.P.

HERE IT IS! The entirely new International BTD-20. It's sensational—an even greater performer than the famous TD-18!

The BTD-20 is powered by a Rolls-Royce 6-cylinder diesel engine, and designed throughout to set new standards in flexibility and productive capacity. Besides hydraulic power steering and numerous other advanced features, it has new, work-boosting *Full Reverse Transmission*, giving the advantage of instant selection from a range of six forward speeds *and* six reverse. The BTD-20 is the only crawler tractor of its size with this feature!

THIS GREAT NEW TRACTOR IS GOING TO BE AVAILABLE LATER THIS SUMMER! Contact us now for the name and address of the International Construction Equipment Dealer for your area, who will gladly give you more facts and keep you posted with the latest news.

SIX-SPEED, FULL REVERSE TRANSMISSION CAN DOUBLE 'DOZING-CYCLE SPEED!

With the BTD-20 you can change gear *and* direction with a single sweep of your arm—go forwards or backwards in any one of six speeds! You can 'doze at 1.5 m.p.h. with 25,400 pounds of push, then back out as fast as 8.4 m.p.h. You'll work *faster*—move hundreds more yards daily with the BTD-20.

preserve the sense of the past and premises which echo ancestral voices; but let nobody think it particularly pleasant for the residing prime minister.

SOVIET UNION

Two Newcomers

THE presidium of the Soviet Communist party, successor to the better known *politburo,* is the leading party organ in the Soviet Union. Its size and shape change frequently nowadays. Two years ago, after the party's twentieth congress, it comprised eleven full and six alternate (or "candidate") members. Now, after the expulsion of some old-timers and the wholesale inclusion of Mr Khrushchev's colleagues from the secretariat, the figures have risen to 15 and 10. Last week's reshuffle, bringing in Mr Podgorny and Mr Polansky as alternate members, is relatively minor. Alternate members attend meetings in a non-voting capacity; they also deputise for absent members.

Both newcomers owe their promotion to the offices they hold. Mr N. V. Podgorny is first secretary of the Ukrainian party (a post he inherited from Mr Kirichenko in December). He is thus an addition both to the number of Ukrainians, and to the number of Mr Khrushchev's former associates, in the top leadership. Mr Khrushchev was head of the Ukrainian party until 1950. Mr D. S. Polansky has been a party member for only 19 years, but he was promoted in March to the premiership of the Russian Republic—a job which has changed hands several times since Stalin's death—and this function has carried him into the presidium.

Loyalty to Mr Khrushchev, national representation, and the holding of certain important offices seem to be the criteria for promotion to the presidium. But more sweeping changes are likely. The new agricultural reform was probably not carried without opposition and the critics may soon pay for their attitude. The apparent switch in foreign policy and in policy for the Soviet block will not be complete without a much bigger shake-up in the Soviet leadership. The latest reshuffle is not the last.

GHANA

Uncrowned Republic?

DR NKRUMAH'S announcement that Ghana would become a republic within two years, and probably very soon, will not occasion much surprise, and perhaps there is not much point in taking offence at his selection of Cairo as the place in which to give the Crown notice to quit. This merely suggests that he has little else of interest to his hosts to talk about. His idea of the status of the Crown, or rather the dangers of its ancestral associations for Africans, was shown clearly enough in the early days of independence, when his treatment of the governor-general's office and dignities and of the British national anthem, and the appearance of his own effigy on stamps and coins, made many people wonder what sort of a governor-general he would get in succession to Sir Charles Arden-Clarke. But it ought to be recorded that since that period, which after all merely tele-

Elegance on Show

THIS week one of London's most sumptuous annual trading fairs, that of the antique dealers at Grosvenor House, came to an end. Eighty firms have vied for the attention—and the purses—of some 24,000 visitors, competing not only in the rarity of their wares, which include jewellery and paintings, but also in the subtleties of stand-lighting and exotic flower arrangements in wine-coolers and magnificent silver and gilt bowls. The fair's turnover is not known: a piece, when sold, is replaced by another, but nobody encourages statistical busybodies to record the deal.

A visitor who was heard by your correspondent to inquire, of some jewellery which seemed to sparkle too much, "Is it real?" produced a stunned silence. For this is the world of genuine antiquity, to the best ability of a committee of experts who vet each exhibit and concur that it was made before 1830. Genuineness, needless to say, has its price—over £200, for example, for a small kettle table (a reproduction sells for £3 to £4), and £1,250 for a George II desk on which only a year ago a cook had made pastry in one of the stately homes.

Business at the fair was apparently quieter than last year but by no means catastrophically so. American dealers were fewer and more cautious, partly because of the recession and partly because Americans can buy nowadays more readily at home as sales there multiply. But the American market is not as dominating throughout the trade as is popularly supposed: one of the top West-end dealers in antique furniture reckons that it accounts for only one-sixteenth of his turnover. Another commented that in the last two years the transatlantic demand had been overshadowed by the continental market. But the trade this year has missed the French custom, cut off by import restrictions and exchange control. The Italians, however, seem to have bought much as usual, as also—on a smaller scale—have the Portuguese and Spanish.

It is the trader in the ordinary run of unexceptional antiques that has felt the draught. This, however, is the bread-and-butter trade of the majority of dealers in the country. The mark-up which one dealer can hope to make in buying from another has almost certainly been reduced. To many of the smaller dealers, stock-carrying has been a serious problem on a reduced turnover. The cut in overdraft charges will have given them some relief.

But fine antiques are still considered a good hedge against inflation and the market for the rarest seems as firm as ever—"flourishing," is how one dealer described it. The difficulty these exclusive dealers have in finding the goods continues to grow and although their agents scour the countryside, sales of the kind they want are getting fewer. This has its advantage: within the category of fine antiques there are many distinctions of grades and the shortage now in this country of the most distinguished pieces has appreciated the value of the next best thing. This week, however, the dealers have been kept busy at Christie's auction-rooms where treasures of all kinds from the world-famous Chatsworth Collection came on the market.

At the first day of this sale, which was said to have gone well, fifty-eight lots of silver fetched £36,628. The experts usually find some surprise in big sales of this kind, an unexpectedly low or unexpectedly high price—such are the vagaries of the antiques world. According to the auctioneers, such ups and downs cancel each other out in the long run and sales have been averaging out year by year much the same. There is no sign of weakness in this top market.

ceped into a few weeks the treatment meted out to the Crown by the South African government over five years, Dr Nkrumah has been meticulous in ensuring that the governor-general shall be accorded the respect due to his office as the Queen's representative and as head of state; nd during the recent conference of independent African tates in Accra, he insisted that the governor-general should grace all the state occasions and take the salute at the eremonial march past. He made no secret of Ghana's ies with its British past, nor any excuses for his intention o keep British advisers, officials and technicians in his ervice. In Cairo this week he has emphasised that Ghana vill stay in the Commonwealth, like India; and like Mr Jehru, he is known to value his many personal friendships n Britain. He certainly hopes the Queen, either as Queen if Ghana or simply as "Head of the Commonwealth," will ome to Ghana next year.

But he has always insisted that respect for "African ersonality" requires a break with the imperial tradition. He may, too, be thinking in terms of an *Anschluss* with French Togoland, and of election cries for the future. But t is now more to the point to ask what sort of a republic ie will set up when the constitution is reviewed (which can ie done now the five provincial assemblies are being ormed). Will it be on the American model, which in Liberia, as in Latin America, tends to exalt the office of he chief executive towards dictatorship, benevolent or otherwise? Such a change would be drastic; and Ghana, like India and the other Commonwealth republics, is more likely to end with a parliamentary system of the British type, crowned by a presidential top hat. This is quite a symbol of authority in Africa, anyway. But if it confers dignity without power, it is an open question what eminent Ghanaian will want to wear it.

DEFENCE

Mobile Reserve

THE services' long-heralded mobile reserve, or "bushfire force," was set in movement last week. The 16th Independent Parachute Brigade Group and the Royal Artillery Field Regiment were moved from Britain to Cyprus with their ancillary troops in four phases spread over six days, followed by the 1st Guards Brigade who were delivered in Cyprus in four days. The Parachute Brigade and ancillaries consisted of approximately 3,000 men and 181,000 lb of baggage, a total airlift of about 380 tons; the 2,000 guardsmen and their 172,000 lb of luggage weighed 280 tons. The operation was not a "crash" one; it was no doubt phased to be as economical as possible and to take account of the limited airfields in Cyprus. It required, over the ten-day period, 5 Comets, 22 Hastings and 7 Beverleys of Transport Command (the first two lifting about 4½ tons per trip and the latter about 8 tons) and 20 Shackletons of Coastal Command carrying 3 tons per trip, England-Cyprus. It therefore in no way took up all the aircraft available, since RAF Transport Command has a squadron of Comets, i.e., ten of them, fifty Beverleys and a greater number of Hastings.

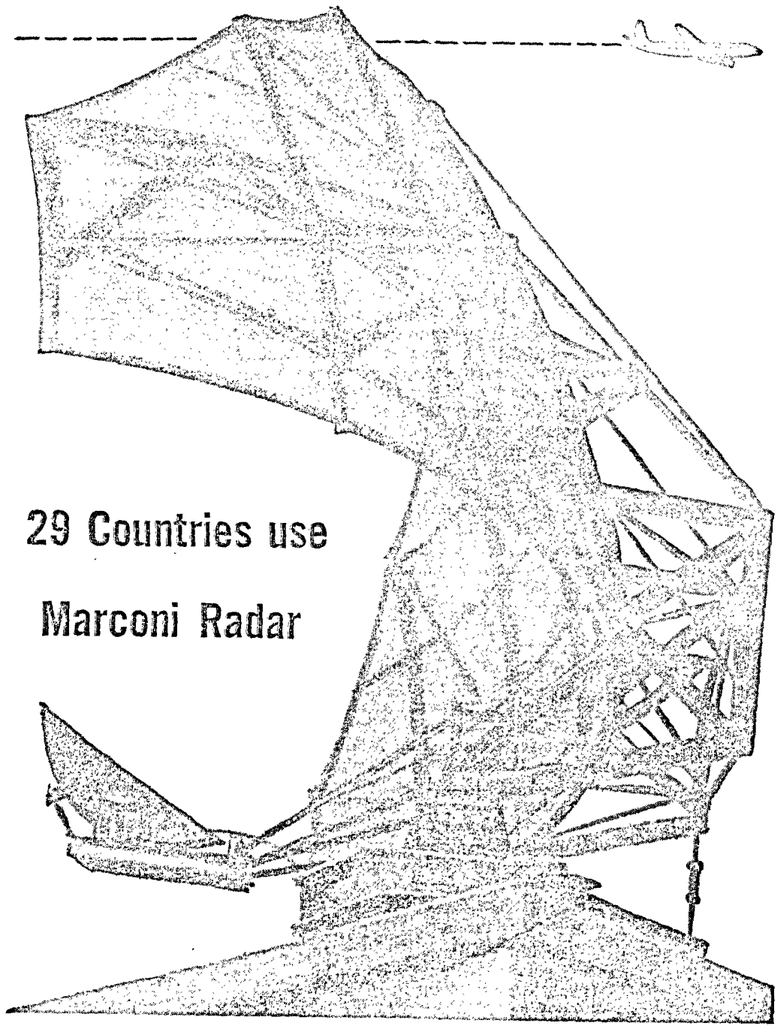
Since the troops were being moved to bases where equipment is stored, however, it was not necessary to fly their heavy equipment with them, as it might be to areas where no such dumps exist. Thus they did not take with them their 3-inch mortars which weigh 136 lb each, with 74 lb in addition per four-shell pack. Again, all the planes, other than the Comets, broke their journey at Malta, which reduced the proportion of their payload required for fuel. The Beverleys, for example, were carrying 80 men to Cyprus with two refuelling stops (France and Malta); on an uninterrupted flight they would only carry 30 to 40. It is therefore not possible to read off from this experience exactly what, if pushed, Air Transport Command is now capable of landing in the way of a fully equipped force at any trouble spot. The answer must depend on the distance of the area from Britain, the degree of full equipment, the rate of delivery, the use to which the force would be put, together with other independent variables. Five days' rations for the paratroops moved this week would weigh nearly 30 tons or 7 Comet-loads, and 200 rounds of small arms ammunition per man another 18 tons or 4 more Comet-loads. Working back from a brigade's vocabulary of stores it is clear that Transport Command with its present planes would have its hands full in landing even the paratroop brigade anywhere that lacked stockpiles large enough fully to receive, provision and equip it. Military logisticians, playing war-games with the aid of computers, are far from thinking that the age of the big airborne force has arrived. But in terms of short distances, such as between Cyprus and Lebanon, it is clear that Transport Command is in a position to act far faster than at the time of the Suez crisis.

BELGIUM

Moving Out of Stalemate

THE political air of Brussels has been lightened by two events this week. The assembly of the three European communities has voted for Brussels as seat of the new institutions, favouring it by a narrow margin over Strasbourg or Milan. Belgium, too, now has a government, after four weeks without one. The political stalemate left by the elections on June 1st has been resolved for the moment by the formation of a Christian Social (Catholic) cabinet under Mr Eyskens.

Uncertainties surround both developments. The elections, which brought down Belgium's previous coalition of Liberals and Socialists, gave the Catholics a majority in the senate, but in the lower house they are still in a minority. Their new government will be opposed by the Socialists. It will depend for its survival on Liberal abstentions. A broader coalition still seems necessary to give stable government.



The final choice of "capital" for the European communities still has to be made by the ministers of the six member countries. The odds certainly favour Brussels; and the executive bodies of the communities, which are to merge closely together, are already settling there.

MY FAIR LADY

Under the Counter

WHEN *My Fair Lady* opened at the Drury Lane Theatre on April 30th it was the immediate success which had been expected of a show that had grossed $7.3 million in a two-year run in New York—and that may bring in only a little less here. The value of tickets sold before the play even opened was estimated at over £350,000; and the most popular seats, the stalls and grand circle, are now sold out until next January. With luck, of course, it is

M.5.

possible to get returned seats at the official prices, especially from agents in the provinces; and this week some tickets for matinée performances were still available from the theatre for late July. But for people who want to make sure of an evening ticket in the near future, what is pejoratively called the black market has moved in.

It operates through two main channels: by advertisements in the papers, and by pedlars outside the theatre door. Since April 29th the personal columns of *The Times* have carried notices to sell 315 seats, to buy 665 and to exchange 364. A typical notice in *The Times* to sell four seats would cost 35s. to insert; the original price of the seats would probably be £5 for the four; and the average price being secured seems to be around £5 each. Thus, against costs of £6 15s., the lucky advertiser would get receipts of £20, a profit of 200 per cent in a few months.

Who are the men engaged in this lucrative trade? An idea of this can be gained from a talk with the groups of men who sell seats outside the theatre before every performance. They are barrow-boy types, asking ridiculous prices (£12 10s. a stall) at first, but ready to bargain. They had little difficulty in evading the quite stringent limits imposed by the theatre on the number of seats which could be bought by any one person from the box office or by post; a number of accomplices applied for the tickets and these were pooled later. The market has become uneasy recently because of rumours about forged tickets, but one man indicated that, nevertheless, business was excellent. He had been selling hard and still had over 100 seats left for June and July performances, while some of the profits were being re-invested in tickets for later in the year. Moreover, the willingness of some of these sharpers to offer a "package deal" of seats for *My Fair Lady*, Wimbledon and Covent Garden make it clear that the market is organised on a substantial scale.

Many may think this unethical, but it is not illegal. And the really surprising thing that emerges is that more people have not tried to make more money out of a play that was, on American experience, assured of an overwhelming success (in New York the open market price for a good seat was around $50 for much of the first year). Drury Lane did raise its prices slightly for this show; but it is quite clear that it could have aimed much higher and, for the first three months, say, have doubled the prices of some seats for evening performances. Would people have found this more "shocking" or "unfair" than the present inevitable unofficial transactions? Why is it that all branches of the entertainments industry, much of which is in severe financial straits, are so averse to moving their prices competitively both down and up to what the market will bear?

Justice in Moscow

SOVIET justice grinds exceeding sure; its purpose is the protection of the state interest, not least in issues of trade relations with the outside world. A reminder to western governments dallying with the idea of improving east-west trade, and to the companies who sign contracts with Soviet trading corporations, of the remorseless state mechanism to which they must entrust themselves has just come from a decision by the Soviet foreign trade arbitration commission in Moscow. Last week, in the most important case to come before it in its twenty-five years' existence, this Soviet tribunal rejected an Israeli company's claim for more than $2 million damages for breach of contract by Sojuz Neftexport, the Soviet trading corporation for oil.

★

In November, 1956, immediately after the Israeli invasion of Sinai, the Soviet oil corporation told two Israeli companies that export licences for the remainder of the year had been cancelled by the Soviet Ministry of Foreign Trade, which had also refused to grant licences for 1957 and 1958. In a diplomatic note Russia said the cancellations were a direct consequence of the aggression against Egypt. The original agreement under which Israeli companies imported Soviet oil was signed in 1953; the contract was renewed in the following two years, and earlier in 1956 agreements were signed for the three years 1956-58. In all, Israel was receiving some 30 per cent of its oil supplies from the Soviet Union at the time of the rupture. The seriousness of the loss and the difficulty of replacement from other sources at that time meant considerable damage to the Israelis. Their total claim against the Russians has not been made known. In the one contract fought as a test case before the Soviet court, the claim for over $2 million concerned some 131,000 tons of fuel oil, one-tenth of the total quantity to be replaced.

The Israeli decision to take the Soviet trading corporation to law was an unusual step (whether or not any Jugoslav concerns that may have suffered as a result of the present breach of relations between Moscow and Belgrade will think of doing the same remains to be seen). The Israelis were no doubt aware of the implacable nature of the Soviet system, but they clearly believed they had a case in Soviet law, and that the testing of the Soviet arbitration tribunal in a major dispute was well worth while. The Soviet argument seems to have relied on the *force majeure* clause in the contract. To this the Israelis replied that the Soviet corporation was, in fact, no more than a branch of the Ministry of Foreign Trade, directly controlled by the Ministry and transferring any surplus directly into the state budget. Hence it could be argued that because an organisation cannot exercise *force majeure* against itself, the corporation's claim that it had been compelled to break its contract must be invalid.

★

The case illustrates the rigid principles on which Russia's foreign trade is conducted. The Soviet constitution lays down that foreign trade is a monopoly of the state, a monopoly conducted through the Ministry of Foreign Trade. Some twenty monopolistic state trading corporations exist. Primarily for accounting purposes, each has been given separate identity, but it has no legal will of its own and takes its instructions from the state authority. In addition, Soviet policy has been directed towards ensuring that arbitration in Moscow should be part and parcel of any contract signed with a foreign firm; Sweden is the one admitted exception.

To ensure favourable arbitration the Russians insist that contracts be made and signed in Moscow, that acceptances be received in Moscow and that payment be made within the Soviet Union. Only in exceptional circumstances, when the Russians want something badly enough, is this rule broken. If one trader digs his heels in, a competing trader can usually be found to accept the Soviet terms. Last year, when the Japanese tried to take a leaf out of the Russians' book and say that their trade would be conducted by a single corporation, the Russians replied that this was discrimination and wholly unacceptable. At the same time the Russians' publicity machine has steadily tried to build up a reputation for their own arbitration tribunal.

The Israelis found, however, that while their case was given a fair trial on the face of it, much was left to be desired in terms of western legal practice. There were twelve full sessions, argument was lengthy, Soviet lawyers gave full assistance and even voiced the Israeli case fearlessly in court. The introduction of expert opinion from distinguished western advocates was admitted. But when the Israelis demanded the calling of Soviet witnesses on questions of fact, the request was refused. On this much depended.

The case was thought at one stage to offer the Russians an opportunity to encourage trading relations with the free world by demonstrating the fairness and legality of their tribunal. But it seems that its reputation hitherto has been based on minor points, such as the quality of goods, responsibility for delays in shipping, and not on questions of legal principle. The puzzle remains whether the Soviet decision in the Israeli case was made as a matter of policy or whether, in fact, the Soviet legal system itself inevitably produces such a result. In either case the warning is plain enough.

CEYLON

An Island at Loggerheads

DEMOCRATIC liberties have now been suspended in Ceylon for a month. On Tuesday the Commonwealth Press Union was moved to protest to the prime minister, Mr Bandaranaike, against a total censorship of both news and comment "almost without precedent in a Commonwealth country in time of peace." On the same day, when the governor-general read the Speech from the Throne in Colombo, only the officially approved accounts of the parliamentary proceedings were allowed to be published in Ceylon or transmitted abroad. The government argues that freedom of the press might rekindle the communal passions which led to bloody clashes between Sinhalese and Tamils in late May, before the present state of emergency was imposed. But the lowering of this curtain of silence has inevitably produced a crop of wild rumours and almost equally alarming but apparently well-founded reports.

Since the troops were called out to restore order, the wave of murder, looting and arson that was sweeping the country seems to have abated, but there is no way of verifying the official claims that calm now prevails. And whatever the government's real intentions may be, the effect of its actions (and inactions) has undoubtedly been to spread such fears in the Tamil areas that many people there have looked upon the army as one of occupation rather than protection. Mr Chelvanayakam and the other Tamil parliamentary leaders of the Federal party have been kept under house arrest, and the party itself has been banned. Despite Mr Bandaranaike's appeals for restraint on all sides, the Tamil minority seems unhappily convinced that his government is either unable or unwilling to curb the militant partisans of Buddhism and the Sinhalese language.

Now two further disquieting developments are reported. European residents in Ceylon, and members of the Moslem and Burgher communities (the latter trace their descent from early Dutch and Portuguese settlers), have been receiving threatening leaflets which warn them to leave the island to save their lives. And in southern India, in the Tamil state of Madras, separatist groups whose activities were already worrying Delhi have taken up the cudgels on behalf of their fellow Tamil speakers in Ceylon. Agitation has even been started for the carving out of a new sovereign state embracing the Tamil areas of both India and Ceylon. Mr Nehru's government has reacted to this inflammable situation with praiseworthy caution. Mr Bandaranaike's might be well advised to follow suit.

EURATOM

Marriage of Convenience

THE infant European atomic energy authority has been given a start in the world by the proposed agreement with the United States announced on June 24th. It provides for a joint ten-year programme of research and reactor development costing $100 million in the first five years and financed on a fifty-fifty basis; and for the construction in Europe of about a thousand megawatts of power capacity by 1963 at a cost of $350 million. America will contribute $135 million towards this programme in the form of credits which Euratom will re-lend to the power or construction companies which are doing the work. The supply of fuel—at the low American domestic price—is guaranteed for twenty years; and America will buy up any surplus plutonium which is produced as a by-product. Most important, the Americans have agreed to leave to Euratom itself the task of inspection to ensure that fissile material is not used for warlike ends.

A fair assessment of what the agreement may mean in practice requires a good deal of imagination. It has not yet been ratified by Congress. Since the reactors using enriched uranium which are envisaged are not yet commercially viable, it is not very easy to tell what part they will play in the end in the supply of power to Europe. A thousand megawatts of capacity seems a meagre figure beside the 15,000 megawatts set as a target for Euratom by its three wise men last year. The community has in any case announced that that target will probably not be realised by the date they suggested—1970.

★

Yet the new partnership has great potentialities. The agreement may well be ratified by Congress within the next two months. And both the research programme and the pilot plan for nuclear power could expand in time into something much bigger. The agreement should give Euratom a capital fund of cash and know-how enabling it to exert a powerful formative influence on the power programmes of member countries. America, for its part, would gain a testing ground for its reactors on a commercial scale as well as a foothold in the European market. Common commercial interest as well as political sympathy has inspired the agreement.

It is good news that friendly contacts have been made in London with Euratom representatives—the first step towards the negotiation of an agreement between Britain and the new community. As the only country that can offer atomic power stations over the counter today, Britain is at present in a strong position to dictate commercial terms to European countries that want atomic power soon. But Euratom's officials, fortified by the American agreement, believe that they too will soon have something to offer. In negotiating the terms of a lasting association with Britain, they feel that time is on their side.

LETTERS

Higher Education

SIR—Your recent articles on education show clearly the urgency of providing adequate facilities for higher education in the United Kingdom. In an examination I have made of the economics of this subject (shortly to be published) I have reached the conclusion that a comparatively large number of people are given higher education of a sort, but much of it is of a distinctly low quality. There has grown up a deep division between "university-type" institutions and the others—especially training colleges—which is not found abroad, and which cannot be justified by its results. The pressure to take up the small number of university places puts tremendous pressure on the grammar schools, with the narrowing and overburdening of the curriculum that all of us—schoolmasters and dons—lament. Those who do not go to universities have to take up a heavily vocational and restricted kind of course. This is especially the case in teacher-training colleges.

For men, the establishment of Colleges of Advanced Technology marks a break in this tradition of separation between universities and the other institutions. For women, however, who form over three-quarters of training-college students, the division still exists. In 1944 Professor Lauwerys suggested that the time was at hand to break the tradition for them. Let us abolish teacher-training colleges altogether, and replace them with liberal arts colleges catering for men and women and linked to the Colleges of Advanced Technology, providing a broad course for two years, and a vocational course in the third year for intending teachers, secretaries, social workers and other specialists. This policy would be little more expensive than adding to the number of teacher-training colleges, and it would open them up enormously.

The provision of adequate facilities for higher education is the most exciting social prospect in Britain today. It is one worthy of close attention. The Labour party, for example, has suggested a royal commission on universities. Surely, this should be on higher education as a whole. Further, the Labour party has decided to leave technical colleges in the hands of local government. This is a sure way of preventing the growth of the academic freedom which the University Grants Committee fought so hard to obtain for "civic" universities in the early nineteen twenties. A grants committee for Colleges of Advanced Technology and Liberal Arts could achieve wonders, and the cost would not be great.—Yours faithfully,

Oxford JOHN VAIZEY

Why Prices Rise

SIR—I am sorry to disagree with my old friend Lord Pethick-Lawrence, but his letter supports the mistaken Socialist view that higher prices are not mainly due to the action of trade unions in raising wages. No one wishes the wage-earner "not only to forgo a rise in his standard of living in a rising economy but to suffer an actual reduction owing to a stationary wage with rising prices."

In the ordinary way prices fall after a war, because people get back to productive work, instead of destructive. After the Hitler war prices have continued to rise because the trade unions have demanded annual increases of pay. In the world as a whole prices have risen less than here; indeed we are warned of the effect of lower prices on the primary-producing countries.

Surely everyone can see that higher wages for miners mean higher cost of nearly everything which has to be made or transported, with dearer coal, gas and electricity. Note, too, that a grant of higher pay to any large body of men means more money in the market competing for goods, with a consequent demand for higher pay all round.—Yours faithfully, J. E. ALLEN

Cambridge

Household Economy

SIR—My experience as a mother of two children below the age of three suggests that Mr Colin Clark, in one respect at least, is not so wide of the mark in his discussion of the value of housewives' services as your comment suggests.

You dispute whether the amount of work varies with the number of children. It seems to me that on the contrary something like the electoral cube root law holds—work increases faster than the number of children.

The wear and tear through attempting the impossible task of dealing simultaneously with the needs (real or fancied) of a child in the near crawling stage, and circumventing the malevolent designs of a toddler upon the herbaceous border or the dining-room wall-paper is a good deal greater than the mere sum of the work entailed by dealing with these problems separately. Economies of effort through scale are hard to achieve because the children's wants are often different, if not opposed—except for the major instance when they enter upon an unspoken (and unspeakable) alliance against their mother.

One of the principles of management, not unchallenged it is true in its most rigorous form, refers to a man's "span of control"—the number of subordinate managers he can competently supervise, said normally to be only five or six. In the case of children, less inhibited by convention or fear of the sack, the rot sets in far earlier, in fact as soon as there are more than one. With children, too, the usual device of delegation is ruled out as the solution.

On the other hand, one must agree with your general point. Who ever thought that rates of pay even roughly indicate the value of work done?—Yours faithfully, MAUREEN CRAWFORD

Bristol

Banking Unions

SIR—Your issue of June 14th refers to the booklet "A Giant's Strength," a study by the Inns of Court Conservative and Unionist Society, and your article refers particularly to strikes and the closed shop.

The National Union of Bank Employees has a strike clause which precludes such action without a ballot of the whole of the membership and although the clause is there, such action has not been contemplated. It is however a protection for the members, for the banks and the public. This union believes in 100 per cent organisation, but not the "closed shop" as usually understood; though some banks have in the past practised the closed shop in relation to their own internal staff organisation and, indeed, practise it now in respect of any change of employment as between banks.

Your article, however, did not touch upon recognition about which thoughts appear in the booklet referred to, and in which splinter unions are said to be the main cause of the problem of non-recognition. That cannot be said to be the reason for non-recognition of the National Union of Bank Employees by the banks, for we have been in existence for over forty years and have a substantial proportion of bank employees in our members and, indeed, in some banks a majority of the staff. Apart from Barclays Bank—the biggest of those which recognises the union—let us look at the Midland Bank where, after the formation of the trade union, an internal staff association was formed and dissolved by a vote of its membership in 1951. But in 1953 with the bank's endorsement another internal association was formed and recognised at once. It still has less members than NUBE in the Midland Bank and yet the injustice of non-recognition of the union still persists.—Yours faithfully, T. G. EDWARDS

National Union of Bank Employees, S.W.1

British Drivers Abroad

SIR—Your suggestion that British motorists who take their cars to the continent may be able to dispense with their "triptyques" will cause dismay. One of the reasons for continental travel will vanish. The removal of this evidence of their "U" standing would leave unexplained the arrogance and bad driving so prevalent among them.—Yours faithfully, L. S. DAWSON

Bramhall

BOOKS

Financing the Bolsheviks

Germany and the Revolution in Russia 1915-1918

Edited by Z. A. B. Zeman.
Oxford University Press. 157 pages. 25s.

THIS volume contains a selection of a hundred and thirty-seven documents extracted from the German archives which were captured during the war. Mr Zeman's aim is to give a picture of the policy of the German government towards the Revolution and of some of the information available to it on what was happening inside Russia. Since the documents here reproduced form only a small fraction of the total contents of the relevant files, it is unfortunate that Mr Zeman gives no indication of the basis on which he made his selection or of the contents of the remainder. The second criticism that can fairly be made is that Mr Zeman tells us virtually nothing about the Russian background in his introduction and notes. Yet without some knowledge of this framework the significance of these documents—which is immense—may largely be lost so far as the non-specialist reader is concerned.

These criticisms apart, the book deserves high praise. The translation seems excellent, the annotation useful without being tedious, and the editing meticulous. The real addition to knowledge which these documents provide is on the extent to which the bolsheviks were financed by the Germans. The source of the considerable funds over which the bolsheviks disposed in 1917 has hitherto been a matter for conjecture. All available evidence suggests that the party cash box was empty by the beginning of 1917. Yet a vast propaganda effort was launched between May and October, 1917 (under the direction of Molotov) which was probably one of the most effective causes of the disintegration of the army, and hence of the fall of the Provisional Government. Kerensky's government claimed to have evidence that the money came from the Germans, but failed to pursue its charges to the point of proof. The accusation was indignantly, and emotionally, denied by Lenin (who, however, went into hiding to avoid its investigation) and by his supporters at the time and thereafter. The famous Sisson Documents, all forged according to Mr George Kennan (and "partly forged" according to Weissman, the German State Commissar for Public Order, as we now know) did much to obscure the issue.

This collection at any rate establishes three facts. The first is that up to the February Revolution the Germans were attempting to subsidise the bolsheviks and defeatist socialists generally, but that, though they paid money over to their own agents, it is not clear how much of it, if any, reached Lenin. Secondly, after the February revolution the Germans were indirectly in touch with Lenin and "a steady flow of funds" was fed to the bolsheviks "through various channels" for their propaganda work. This appears from a dispatch of December 3, 1917, from the German State Secretary Kuehlmann to the Emperor. (Incidentally, this, one of the most informative documents in the collection, was published two years ago by Dr G. Katkov.) Thirdly, after the seizure of power substantial sums (forty million marks are mentioned, but it is not clear that all this money was in fact transferred) were paid to Lenin by the Germans in an effort to keep the destitute and precarious new government in power.

Since the continuation of these payments was clearly dependent upon Russia remaining out of the war, the whole question of Lenin's motives in forcing the peace of Brest-Litovsk on his reluctant party will now require reassessment by historians of this event. None of them so far has even considered this aspect of the matter.

Disappointing Empress

My Dearest Louise: *Letters of Marie-Louise and Napoleon 1813-14*

Edited by C.-F. Palmstierna.
Methuen. 267 pages. 25s.

ALTHOUGH the heavy Hapsburg face in the frontispiece seems hardly likely to launch a mighty host against the onion domes of Muscovy, yet, in a sense, it did. But it was not so much Marie-Louise's teutonic charms as the dynastic and strategic potentialities of the marriage that hypnotised Napoleon into the belief that with a Hapsburg-Bonaparte dynasty assured, and his right flank covered, he could quickly eliminate Russia. His success would have given fresh meaning to the old tag *Bella gerant alii, felix Austria nube.*

The marriage might then have been domestically felicitous too. Marie-Louise had offered little resistance to Napoleon's proposal, and none, apparently, to his premarital advances. In her cowlike way, she seems fond of him. Her long letters from Paris, sometimes wrongly dated, answered by his brief scribbles on the battlefields of his brilliant 1814 campaign, are jumbles of devotion (short-lived but possibly sincere), gossip about palace quarrels with which she is clearly incompetent to deal, and hypochondriacal descriptions of her ailments. His notes are telegraphically brief propagandist appreciations of the military situation, combined with advice to her—for he patiently clings to the illusion that she is a capable reigning consort. He writes affectionately, even after he is virtually certain of her adultery with Count Neipperg whom she eventually married. She wept angrily when Napoleon escaped from Elba and refused to read his letters. Inconstant wife, ineffectual mother, she bitterly disappointed him.

Most of Napoleon's letters in this volume were bought by the French government in 1934 when the great-grandson by the marriage unsentimentally auctioned them. But hers were missing until they were discovered in 1945 in the possession of the Swedish royal family, to whose ancestress, Désirée Bernadotte, Joseph Bonaparte had entrusted them. Désirée-Eugenie Clary (as she was before her marriage to Bernadotte) had been Napoleon's first love. He ends a letter to her in 1795 "yours for life." Only calf-love perhaps—but if he had not soon afterwards met Josephine he, and history, might have developed differently.

Such speculations, however, demand historical help which is lacking. Gratitude to Baron Palmstierna for editorial industry, to M. Jean Savant for biographical sketches, and to their translator must be tempered by sympathy for non-specialist readers who may need information about the forces arrayed against Napoleon, their motives and differences in the fateful year 1813-1814: it is not provided under "Historical Background" (jottings on Marie-Louise's household arrangements) or, in any coherent sense, by the scraps of narrative linking the letters.

The Prince Reassessed

Machiavelli and the Renaissance

By Federico Chabod. Translated from the Italian by David Moore, with an introduction by A. P. D'Entrèves.
Bowes and Bowes. 258 pages. 30s.

THIS volume of essays by the Professor of Modern History at Rome University forms a most welcome addition to Renaissance studies available in English. The first of them, an introduction to "The Prince," was originally published more than thirty years ago but is still indispensable: the last, a comprehensive and up-to-date bibliography of Renaissance studies, will be a useful working tool for present-day students. Together with the review of Renaissance historiography which the volume also includes it provides an excellent starting point for anyone about to plunge into this complex field of inquiry, and a signpost for those in danger of getting lost in the controversies that still swirl about the concept of the Renaissance.

On Machiavelli himself the author has many perceptive comments. Standing aside from the romantics who originally saw in him the advocate of liberty, or the incarnation of the "divine spark of patriotism," and critical too of the exaggerations of the followers of Croce, Professor Chabod carefully elaborates his own distinctive position.

For him the solution put forward by Machiavelli for Italy's political ills was a "vain dream," and its author a bad historian. Nevertheless, "The Prince" stands out both as "a synthesis and a condemnation of two centuries of Italian history" and a perceptive and valid comment on a historical development which Machiavelli clarified with certainty and precision. Absolute rule did not prove the immediate answer to Italy's problems, but its author saw the trend clearly enough. "The Prince," Professor Chabod points out, therefore "rightly became a subject of the most acute controversy and the Koran of the rulers of nations."

Newman's Answer

Newman, His Life and Spirituality

By Louis Bouyer.
Burns and Oates. 391 pages. 30s.

From Bossuet to Newman: *The Idea of Doctrinal Development*

By Owen Chadwick.
Cambridge University Press. 254 pages. 25s.

THE fascination of the life and thought, the character and, now, the spirituality of John Henry Newman seems to be perennial. The latest addition in English to the already enormous literature about him is a translation of a biography by the distinguished French Oratorian, Father Bouyer. The work claims to be "for the first time a study devoted equally to Newman the Anglican and Newman the Catholic." That part of the book which deals with the Oxford leader seems at times to the English, and more especially to the Anglican, reviewer rather laboured, as Father Bouyer is necessarily at pains to explain and interpret the history and customs of the Church of England to his French readers. Sometimes, for instance in the description of the boyhood "conversion," he makes heavy weather of this task, but on the whole his judgments are markedly just and sympathetic, even if in point of fact his historical detail is not always impeccable.

When he comes to write the painful story of the Birmingham Oratorian and his truly disgraceful treatment at the hands of his new spiritual leaders, Father Bouyer is more at home; here the work is obviously a labour of love, for the biographer feels that "in our perplexities, in our hopes, in our unshakeable trust in the Church, no voice from beyond the grave speaks to us like his, for there is none other that speaks so clearly to our hearts, none other that comes so directly from his own." Clearly Father Bouyer is in general sympathy with the task that Newman set himself as a member of the Roman Catholic communion, but for which he was time and again treated with suspicion both by the authorities and by many of his fellow converts—

> for me conversions were not the first thing, but the edification [building up] of Catholics. . . . I am afraid to make hasty converts of educated men, lest they should not have counted the cost, and should have difficulties after they have entered the Church. . . . The Church must be prepared for converts as well as converts for the Church.

As part of this task of preparation Newman felt he must provide for Roman Catholics a philosophical and historical justification of the process by which the doctrines of the church develop. In his important book on this subject, Dr Chadwick shows that, though Newman wrote the "Essay on Development" to satisfy himself about his change of allegiance and also to meet his ever-present fear of "liberalism" (a topic ignored by Father Bouyer), he defended it, in face of a very hostile reception in Rome, because he believed that some sort of rationale of doctrinal development was of critical importance to a church that was soon to define the doctrine of the Immaculate Conception. How far and in what way can newly defined or explicated doctrines be said to be adding to the body of revealed truth? That is the question which Newman set himself to answer. It will probably come as a surprise to most of the readers of Dr Chadwick's book that his answer was not accepted in the church of his adoption, and that in fact no answer to the question has yet been given. *Per contra,* in so far as in the Papal decree *Lamentabili* it was said that revelation must be held to have ended with the death of the last apostle, the theory put forward by Newman, along with the logical solution advanced by the Spanish Thomists Suarez and Lugo in the seventeenth century and brilliantly described by Dr Chadwick, seems to be ruled out of court: new definitions cannot be said to be "equivalent" to revelation.

It would not be surprising if Dr Chadwick's book causes nearly as much of a stir in the Roman dovecots as did Newman's rather over a hundred years ago. The twin problems of historical change and doctrinal authority, which the one recognised and the other analyses, are as alive today as they were then.

Prison Pioneer

John Howard Prison Reformer

By D. L. Howard.
Christopher Johnson. 186 pages. 18s.

IT is many years since a life was published of John Howard, eighteenth century pioneer of prison reform; it seems particularly appropriate that one should appear now, since prison and penal problems and reforms are receiving so much public attention.

Mr D. L. Howard's book is very readable and not too long, and gives a fascinating account and thoughtful appraisal of John Howard's work and influence. The portrait of a very remarkable man emerges from its pages; courageous, sincere, persistent and sensible. All his energies appear to have gone into his work as a reformer, whether of his own estates, prisons or lazarettos. Of his private life we know little; even the date of his birth is in doubt.

Howard was the first to undertake a factual and dispassionate piece of social research, a model of its kind to this day. He visited many prisons, both in this country and on the continent, gave a minutely detailed account of conditions in each, and added simple practical suggestions for their improvement. The accuracy of his observations was never called in doubt; it is surprising that he always managed to gain entry in view of his wholesale condemnation of the management. He later paid return visits, and when, as was too often the case, none of his suggestions had been implemented, he stated this also dispassionately and without apparent despondency.

Most of his suggestions have now been carried out, or are accepted as canons of prison reform: that prisons should be corrective rather than punitive; that they should have proper sanitation, fresh air, and that medical treatment should be available; that men, women and children should be segregated and lodged in individual cells; that chaplains should be appointed to give religious and moral instruction; that prisoners should be set to work; that the gaoler should be a salaried official, not dependent on his extortions from the prisoners for his livelihood; that justices should inspect prisons regularly.

Mr D. L. Howard thinks that many of these reforms might have come about sooner, had John Howard not lacked organising ability and the power to work with others. Nevertheless he made a real contribution to the increase of the sense of social responsibility, and his influence caused others to carry on

WORLD PEACE through WORLD LAW

Grenville Clark & Louis B. Sohn

'... one of the most valuable contributions that has been made by any book at any time—a considered design for what a world authority should be and how it should be constituted, and every practical question arising from that.... I ask every person who takes this problem of war seriously ... to study this book and to make up their mind what they will accept or what they will not accept in what it says, or whether they have an alternative.' LORD BEVERIDGE speaking in the House of Lords on 14 May 1958

'This is a courageous book, a blue-print for perpetual peace.... The new Covenant of the new United Nations is given clause by clause. Here is the text all ready for Mr Krushchev and Mr Eisenhower to consider if they ever mean business when they talk of peace and disarmament.' LEONARD WOOLF in the NEW STATESMAN

(Harvard University Press) 60s. *net*

OXFORD UNIVERSITY PRESS

where he left off. If reform has gone farther in many respects than he could have envisaged, there is little in modern thinking about it that is not a logical development of his thought.

The Dollar Shortage

International and Interregional Economics

By Seymour E. Harris.
McGraw-Hill. Economics Handbook Series. 564 pages. $7. 52s. 6d.

THIS is a very useful, if not entirely satisfactory, book. It is not entirely satisfactory because Professor Harris, as he admits himself, was not sure when to stop—or rather where to start. He wrote the final and longest section—"a fairly thorough study of the postwar disequilibrium in the first postwar decade"—first and then, working backwards, added four more sections, beginning, in the end, with a summary of the views of the classical economists. The trouble with the result is that a student—the series to which the book belongs is intended for students—who needs to read Part One will probably find Part Five too much for him, and anyone who can get full value from Part Five will surely have Part One in his blood.

That Professor Harris devotes the whole of a book with this title to the dollar shortage shows that he is not one of those who believe that it would disappear if the non-dollar countries would only take a few nineteenth century measures which are clearly politically impossible today. But he is not without hope. He examines all the solutions that have been offered and discusses the contribution each can make. Much will depend, he says, on trends in the cold and hot wars, and he is prepared to accept as fairly permanent such "temporary" contributions as military and economic aid from the United States and the expenditure of American forces overseas. This is, of course, an important assumption, as such unilateral transfers have closed more than 70 per cent of the gap since the war.

He thinks that the dollar problem has been greatly eased since the United States has used its rapid gains in productivity to increase incomes rather than to lower prices. And, writing before the Eisenhower Administration became more afraid of inflation than of fear itself, he counts on this being continued as a conscious policy, maintaining that imports have been increasing because American incomes have risen and not because of any lowering of prices caused by reductions in tariffs. He does not in fact believe that much good would come of further reductions in the American tariff and, with his special knowledge of the problems of New England, argues that the trouble caused by dislocation would outweigh the advantages. And, he asks, why should the industries threatened by imports carry the whole burden? Why should not the export industries take their share?

Indeed Mr Harris clearly thinks that the single most important factor in solving the dollar problem will be "the success of the non-dollar countries in capturing third markets from the United States." "We must depend," he says, "on their doing so." It is a pity he did not devote more space to this subject and particularly to the obstacles in the way of their doing it—particularly to the role of the Export-Import Bank in a world in which competition is so often in terms of length of credit rather than price. It is no simple matter to capture a market from a country rich enough to finance its exporters on the scale of the United States.

Vitai Lampada

The Social History of Lighting

By William T. O'Dea.
Routledge and Kegan Paul. 254 pages. 42s.

MR O'DEA, electrical engineer and keeper in the Science Museum, has produced an omnium gatherum of archæology and physics, sociology and chemistry, palæanthropology, and antiquarianism. He has handled his dauntingly miscellaneous theme as tidily as possible by dividing it into aspects—any attempt at historical sequence would have resulted in chaos—under such headings as "Light for Travel," "Light for Work," and so on. His survey begins about 15,000 years back, but he permits himself passing reference to yet earlier periods, as, for instance:

> Oakley, from archæological reasoning (see *Antiquity, No.* 118, *June,* 1956), places the earliest fire-makers at 350,000 years ago in China, 250,000 years ago in Europe, 50,000 to 100,000 years ago in Africa and West Asia.

Mr O'Dea declares that "the object of this work is to indicate the usage of light rather than to catalogue the vast variety of shapes that lamps have assumed." There emerges from his vastly ramified study recurrent evidence in support of the following generalisation: "From fifteen or more millennia before Christ to AD 1782 there was practically no improvement in lighting at all." A great step forward was the Argand lamp, 1782-4.

The book abounds in fascinating scraps of information, and the author exhibits a happy turn for illuminating comment derived from wide knowledge and reflection. It seems invidious to call attention to omissions from so rich a book, but Gerard ("Candlelight") van Honthorst deserves mention among painters of artificial light. Quotations from Greek and Latin—there is a section on torches—might have included Lucretius's: *quasi cursores vitai lampada tradunt.* It seems safe to anticipate a reprint, for which some small corrections may be noted. Gilbert White's Selborne appears as Selbourne (under White) in the index. A quotation from Daudet describes the sides of a lighthouse lantern: *les unes rampliés* [*sic*] *par une énorme lentille de cristal.* Horace Bénédict de Saussure appears as Henri Benedict de Sassure.

Mr O'Dea's accomplishments comprise a draughtsmanship adequate for illustrations in the text, which are additional to a series of admirable plates.

Dabbler in Inventions

He Lit the Lamp: *A Biography of Professor A. M. Low*

By Ursula Bloom.
Burke. 209 pages. 18s.

IF "Professor" Low had followed any other calling he would have been accepted as an amiable eccentric, but he chose to be an inventor, and the standards by which he is judged are correspondingly harsh. Miss Bloom sorted her way through 2,000 unnumbered pages of autobiographic notes found on Low's death in 1956 and used these to put flesh on the bare bones of her narrative. She, for one, believes Low was a failure and so does Lord Brabazon, who writes the bitter-sweet preface. But were they right?

A. M. Low was the child of a strong-minded mother, who hid her stays behind the piano and encouraged his noisy and sometimes noisome experiments. He was lighthearted, gregarious, with a roving eye and an abiding fear of poverty. For a clever, versatile engineer, inventions meant easy money, and he turned them out in prodigious variety: guided missiles, bombs, boxes for pigeons, whistling kettles, spark plugs, audiometers, X-ray plant, deaf aids and, in 1914, a crude form of television. If they did not find a ready market, he lost interest in them. Not for him the grinding hard work and the ultimate heartbreak of a Frank Whittle, and, equally, not for him the public recognition.

Miss Bloom has not attempted a critical assessment of Low as an engineer, but of the man himself. She condemns him for remaining all his life a dabbler in things scientific instead of the great man he might have been. With the cold eyes of friendship she criticises him for a congenital lack of application that made him flit from invention to invention, from woman to woman, never finishing anything, dissipating immense energies at motor race meetings, public dinners (which he loved), writing books like Professor Low's Book of Tricks (professor being a title which was not justified), while other men rediscovered principles that he had patented twenty years before. She judges the man from a faintly puritanical standpoint, which presupposes all work is good and hard work best of all. Low, the wide boy of science, would not have agreed.

Arab Development Bank?

Doubts and Dynamite

By Emile Bustani.
Wingate. 159 pages. 18s

MR BUSTANI has written a brisk account of the problems of the Middle East as seen by a successful Arab business man. His energy and imagination are to be admired. The Arab world could do with a dozen like him.

Britain, the United States and France are asked to recognise the strength of Arab nationalism and to make the arrangements necessary to live with it if the West is to continue to receive Middle East oil. Mr Bustani proposes an Arab Development Bank, which would be owned by the foreign oil companies and the oil-producing Arab countries. The chief purpose of the bank would be to lend money to the have-not Arab states for development purposes. The idea is a good one, but it is doubtful whether it would work as long as the Arabs are still divided among themselves. Would it not be better for, say, the governments of Iraq and Jordan to form a development bank and allow others to join if they are attracted by its success?

The oil companies are best left out of such an arrangement. Their activities are limited by concessions and parent company relations, and the American ones are fearful of banding together in any way lest the suspicions of the US Department of Justice are aroused.

The Grey Flannel Suit

The American Business System: *A Historical Perspective, 1900-1955*

By T. C. Cochran.
Harvard University Press. London: *Oxford University Press.* 227 pages. 38s.

IT is arguable whether the mid-twentieth century businessman is indigenous to America; certainly he is not found there exclusively. But his historical development parallels that of the United States, and there has often been a close causal relationship between the two. It is this relationship which the author, an American university professor, traces in this brief but interesting book. In the first half he illustrates the rise of American business and businessmen from their ethical and historical origins, noting carefully the technological, sociological, geographical, and political elements of their environment, which brought them to the apotheosis of their power in 1929. The remainder of the book deals with their fall from grace in the years of depression, and with the subsequent subtle changes wrought during the war and the years of postwar prosperity, both in small business and in the giant corporations with their hierarchy of professional managers.

The author takes no sides; he merely closes with a gentle reminder of the new responsibilities of ethical and cultural leadership which American business has often shirked in the past, and must meet in the future. Presenting a very broad perspective, he has not written at great depth; the reader already familiar with American economic history may find too much narration and documentation, too little speculation. For instance, while the influence of his environment on the American businessman is fully described, there is much more to be said on the obverse relationship, that is, the influence of the American businessman on his country's society and technology.

OTHER BOOKS

INVESTMENT FOR THE ORDINARY MAN. By Mortimer Langton Warren. *MacGibbon and Kee.* 135 pages. 15s.

INVESTOR'S PROGRESS, *from Money Box to Stocks and Shares.* By A. G. Ellinger. *Bowes and Bowes.* 158 pages. 10s. 6d.

YOUR GUIDE TO STOCKS AND SHARES. *Stock Exchange Precedents for the Public.* By "Nedlaw." *Nicholas Kaye.* 96 pages. 12s. 6d.

Why with one accord the publishers should have chosen this moment to launch a spate of books, all initiating the novice into Stock Exchange investment, is not clear. But the publishers know their market and these books fulfil a useful function. Mr Warren, who writes "Investment for the Ordinary Man," is secretary to the Church Commissioners for England. The Commissioners, with the advice of two top stockbroking firms, have trodden the path out of property and fixed interest stocks into equity investment with great benefit to church funds. The author has an experience to share with the uninitiated public. He is at pains to explain not only how investment works, but also that there is no moral wrong in it. "If I am accused of having oversimplified . . . I have done so deliberately." He has oversimplified at times, particularly in the extent to which he has played down the thought of investing for capital gain and of cashing capital profits. But it is a good book, if highly priced.

Mr Ellinger, an independent investment adviser by profession, has written "Investor's Progress" not for the beginner but for those who have not yet begun to invest. It is well and simply put, though naturally it is not his most serious work. Parts of it show signs of having been written some time ago.

"Your Guide to Stocks and Shares," though also written for beginners, is not on a par with the other two books. It is really a glossary of financial terms and of investment procedure. "Nedlaw" is a stockbroker of thirty-five years' experience and a lecturer on Stock Exchange problems.

NEW WAYS IN MANAGEMENT TRAINING. By *Geoffrey Hutton* and Cyril Sofer. *Tavistock Publications.* 127 pages. 15s.

There are over 500 technical colleges in this country, yet the part they play in the community has received little critical attention. This book describes a two years' study by the Tavistock Institute of Human Relations of the management and production engineering department at Acton Technical College and its relations with local industry. The conclusions are disquieting: first, that students' contact with each other was minimal and that there was very little spontaneous discussion of the course material, although the interchange of opinion is often said to be one of the valuable features of outside courses; second, that firms tended to regard the technical college as something that they service by providing students, part-time teachers, donations and members of the governing body, rather than as an institution which exists to help them; third, that the addition of management training to the curriculum of technical colleges has brought a new kind of subject in which the imparting of knowledge is of much less importance than the growth of understanding of one's own personality and of the personality of others. This kind of training requires a more experimental approach than is likely to be achieved under the present regulations governing technical college teaching or with the existing relations between technical colleges and firms.

This book should be read by those concerned with technical college policy and teaching and by social research workers in industry. A few enlightened top managers, if they read it, may be stimulated to try to build up a more effective collaboration with local technical colleges. Those concerned with management training in companies will find little to help them here unless it is the illuminating, if discouraging, account of the ambivalent attitude to all teaching—even if it is only how to drive a car.

ELIZABETHAN LITERATURE. By Helen Morris. Home University Library. *Oxford University Press.* 289 pages. 7s. 6d.

RESTORATION LITERATURE. By K. M. P. Burton. *Hutchinson University Library.* 240 pages. 10s. 6d.

Although both these surveys belong to series that incorporate the word "university" in their titles, they are not aimed at identical sections of the reading public. Mrs Morris assumes that her readers have virtually no knowledge of the period, which she proceeds to introduce to them with conspicuous verve and competence. She brings to her formidable task wide reading and a lively style; but, of necessity, her book is too sketchy for those who are not beginners.

Miss Burton, on the other hand, has produced a survey of English writers from 1660 to about 1700 at a level that should make her study genuinely useful to undergraduates and to readers familiar in a general way with currents of thought in the seventeenth century. The epoch has become far too closely identified with the frivolous heartlessness of Restoration Comedy; but Miss Burton demonstrates that it was, in fact, a time of serious readjustment; not a period when the imagination was much esteemed, and consequently not propitious for poets, but nevertheless worthy of far more attention than it commonly receives. The outstanding merit of her book is that it gives much greater weight to the philosophical, religious, scientific and political writers than to the entertainers.

APPLIED STATISTICS FOR ECONOMISTS. By P. H. Karmel. *Pitman.* 463 pages. 65s.

This text-book provides a preliminary course of statistical methods and applications to economic problems, based on lectures given in the University of Adelaide; examples and illustrations are drawn from Australian data.

COMMUNITY CHEST: A Case Study in Philanthropy. By John R. Seeley and others. *Toronto University Press.* London: *Oxford University Press.* 594 pages. 60s.

The community chest is a device much favoured in the United States and Canada for making charity more efficient; instead of scattering gifts of money over a large range of charitable objects, the public is encouraged to make gifts to the community chest from which the trustees make grants at their own discretion. This book describes the working of a community chest in Indianapolis where for some time the chest had been failing "to meet its goal."

PRINTERS AND TECHNOLOGY. *A History of the International Printing Pressmen and Assistants' Union.* By E. F. Baker. *Columbia University Press.* London: *Oxford University Press.* 545 pages. 55s.

A documentary history of an American union. The pressmen broke from the International Typographical Union in 1889 to form their own organisation, and the book analyses and appraises its progress.

AMERICAN SURVEY

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Democrats Look for a President

WASHINGTON, DC

WITH the economy still in recession and Republican candidates behaving, as Vice President Nixon unkindly remarked, "like a bunch of cannibals" in their dread of being carried out of public life on Mr Sherman Adams's vicuna coat-tails, the Democrats are pardonably smug on the surface. But just below the surface they have plenty to worry about—especially the shortage of really convincing talent at the top and the gloomy prospect of another split along the colour bar which divides their party.

Most of the voting figures since 1954 suggest that the political tide turned in that year and is now strongly Democratic. But political tides have been arrested before now, notably by Mr Truman in 1948. Many observers feel that, although the odds in 1960 will probably be against Mr Nixon, who is almost certain to be the Republicans' presidential candidate, he could well overcome them by a strenuous attempt to seize his great opportunity. So, while the thorough trouncing of the Republicans which is expected in November may make the victory of almost any Democratic candidate in 1960 seem inevitable, the Democrats would feel much happier if they could point with assurance to a plausible likeness of a President among their politically eligible leaders.

The popular favourite, Senator John Kennedy of Massachusetts, has been keeping up a killing pace of speaking engagements throughout the country ever since the last election and has received a quite exceptional amount of personal publicity in all the widely-read news magazines. He will certainly be well known two years from now, when the Democrats choose their presidential candidates. He suffers, however, from some substantial handicaps: he is a Roman Catholic, rich, a Senator and extremely youthful in appearance, whereas the most eligible presidential candidate is supposed to be a Protestant, a man of the people, a State Governor and a symbol of assured maturity.

Moreover, some influential people on the left wing of the party have not forgiven him for being equivocal over the late Senator McCarthy, who was popular with Mr Kennedy's Irish constituents in Boston, and for making conciliatory gestures to the South, which supplied him with a substantial part of the vote that very nearly won him the vice-presidential nomination in 1956. Some of these handicaps may be discounted. The very extent of the support he received from the South may indicate that the religious issue, which delivered part of that region to the Republicans in 1928, when Democrats chose the only Catholic presidential candidate ever to stand, might not be nearly so significant now. On the other hand, strong feeling against Roman Catholics is not only confined to the South—it persists also in important areas of the Middle West—and the extent of Mr Kennedy's southern support in 1956 may have been misleading. It was thrown to him as the likeliest candidate to block the ambitions of Senator Kefauver, who was detested as a renegade southerner.

Still, in a contest of youthful, vigorous and photogenic personalities, Mr Kennedy might not be a bad entry to back against Mr Nixon, provided he can match the impression, which the Vice President has assiduously created about himself, that maturity is fast setting in. Neither man has had any executive experience. Both are earnestly preparing themselves for the possibility that the highest conceivable responsibility might fall to them by holding long sessions with academic authorities and men of affairs. Mr Nixon has the advantage of having been longer in the national eye and of being familiar with the work of the Presidency, at least as an exceptionally privileged observer.

Mr Kennedy had not until this year any very solid achievement to his credit in his present job, which is that of legislation. But in this session of Congress he has emerged as a skilled craftsman and conciliator, rather in the manner of Senator Lyndon Johnson. He piloted two important labour Bills through the Senate and showed some considerable capacity for leadership in inducing the heads of the trade union movement to reverse their opposition to the second and more controversial measure. Although he was unable to produce results from his attempt to use the emergency needs of the recession as a lever for overhauling and extending the entire system of unemployment insurance, he got credit, in some liberal quarters which view him with suspicion, for having captained a good fight in the direct tradition of the New Deal. With his controversial riders on economic aid to India and to communist satellites as evidence of independence of mind, he has made himself felt on the Senate Foreign Relations Committee.

NEVERTHELESS, there is a persistent feeling in the bones of many Democrats that Senator Kennedy will not quite do. But apart from him, who is there? The traditional training school for Presidents is a governorship, which gives experience of administration and political management, though none whatever of defence or foreign affairs, which are likely to be the two biggest problems facing a President. Mr Harriman had international experience before he became Governor of New York, but for all his strenuous physical exertions and the resolute heartiness with which he pursues partisan politics in the state capital, there are probably too many people who think he is too old and is playing a part which is out of character. This leaves Governor Williams of Michigan, who is intimately associated in the public mind with the controversial economic ideas of Mr Walter Reuther, the trade union leader, and Governor Meyner of New Jersey, who is a pleasant enough man who wins state elections and administers capably, but who seems out of his depth with the broader issues.

When they have run through this short list the Democratic talent spotters usually turn back with a sigh to the Senate. They give a curt nod of recognition to such old familiars as Senators Kefauver and Symington, whose names always get included, and their eyes linger for a moment on Senator Humphrey of Minnesota. This Senator is youngish, phenomenally energetic, and possesses an extraordinary grasp of a wide range of issues on the domestic and the international scene. On most of them he has enlightened and far-sighted views, which he expresses with felicity and a dash of originality. What then is wrong with Senator Humphrey? The answer is a little difficult to pin down, though more easily understandable when he is seen in action. Perhaps he talks too often for too long about too many subjects in too aggravating a voice, so that he gives an impression of superficial smartness which greatly belies his talents. At any rate, he did poorly when he tried for the vice-presidential nomination in 1956—although he was said to be Mr Stevenson's favourite—and it is thought that he could not win the presidential nomination in 1960.

Often enough, as the result of this kind of a review of current form, Democrats come back to the name of their most distinguished figure, Mr Adlai Stevenson, who lies under the curse of the two-time loser. He has said that he will not be a candidate again and he would certainly not agree to undergo, yet again, the punishing ordeal of fighting presidential primaries, the preliminary elections at which party members indicate their preferences. But the impression is growing that Mr Stevenson's arm could be twisted if the party were really hard put to find a candidate who would strike the public as being a manifestly greater figure than Mr Nixon.

Moreover, by 1960 a "big name," however tarnished by prior defeat, may well be needed to rescue the party from another crisis over its relations with its southern anchor. With the postponement of racial integration at the high school in Little Rock and the major confrontation of irreconcilable federal and state law which is scheduled for September in Virginia, the question of the federal government's part in implementing the Supreme Court's decisions will probably become again the most explosive one in domestic politics. If so, dangerous disagreements are likely at the next Democratic nominating convention between the southern leaders who dominate the party in Congress and the northerners whose numerical strength is only truly shown when it comes to selecting a President.

Little Rock Overturned

LAST year, in Little Rock, Arkansas, federal troops upheld the order of a federal judge that Negro children should be admitted to the white high school. Now his successor on the bench, a southerner with a reputation for fair-mindedness, has decided that the remaining Negro children should be sent back to the coloured school next autumn. The school board is to be granted a 2½-year respite before it is required to make a new start on its plan to abolish racial segregation by stages.

On the evidence of the school board, which last autumn was prepared to play its part, Judge Lemley had good grounds for turning back the clock. Unquestionably, education has been gravely impaired by the constant harassment of the Negro students by some of the white ones and by the presence of soldiers. In February the school board, lacking any support from the federal government to set out against the opposition of the state government, decided to surrender and ask the court to withdraw the Negro children until 1961 when, unless he is granted an unprecedented fourth term, Governor Faubus will no longer be in a position to interfere.

For the moment, at least, Governor Faubus, who encourcouraged defiance of the original court order to win segregationist votes, has cause to rejoice. Even if the Court of Appeals eventually over-rules Judge Lemley, it can hardly do so before July 29th, when the voters go to polls to decide whether Mr Faubus is to have a third term. Throughout the resistant and now jubilant South, the retreat at Little Rock will be read as an invitation to violence as the approved way of frustrating the Supreme Court's decision. In beleaguered Little Rock itself, even the *Arkansas Gazette*, which has supported racial integration, welcomes a breathing space. But even in Little Rock there is no guarantee that in 1961 the new Governor, or public opinion, will be more compliant. And the South has had a breathing space ever since 1954 and has used it, not to prepare for peaceful change, but to throw up legal barricades.

The Administration itself has frittered away these years, without bestirring itself to prepare or lead public opinion. The visit of four outstanding Negro leaders to the White House on Monday for an audience with the President which they had been seeking for a year provided, by accident, a timely platform, but Mr Eisenhower refused to take advantage of it, although among the proposals which were laid before him was one for a White House conference on ways and means of securing peaceful compliance with the Supreme Court's rulings. What is being watched for now is the decision of the Department of Justice on whether it should ask to be heard, as a friend of the court, so that the wider issues involved in Judge Lemley's decision can be considered by the Court of Appeals.

Self-help for Filipinos

AMERICANS have a soft spot in their hearts for the Philippines which they launched as an independent republic in 1946 and which is an outpost of democracy in the Far East, as well as being the firmest of their anti-Communist allies in Asia. President Garcia had no shame about appealing to that "soft spot" when he spoke to a joint session of Congress last week about his country's need for American loans if it is to continue to be the show-case of democracy in the Far East. But while Congress applauded this well-worn theme, the Administration has been guided by its head rather than its heart, and Mr Garcia left Washington after his three-day official visit with no more than a first year's instalment of the $350 million in long-term loans which he sought for his five-year scheme to industrialise the islands and exploit their undoubted resources.

Too rapid an attempt to raise the standard of living, along with corruption and gross abuse of the foreign exchange regulations, have promoted inflation and reduced the republic's reserves to $140 million from $356 million in 1950; last year the deficit on foreign account amounted to $125 million. The austerity instituted last January by Mr

Garcia, but soon relaxed, has not righted the balance of trade against the pull of recession abroad and a bad drought at home ; in the first quarter of 1958 exports were lower and imports higher than they had been in the first quarter of 1957.

Mr Garcia has tried to save his face by adding up his chickens before they are out of the egg. He claims that he has been virtually assured of $289 million in aid. But all he can really count on is a $75 million line of credit from the Export-Import Bank which can only be spent in the high-priced American market. The Philippines already had a $46 million credit—now extinguished—which they had not used for this very reason. Mr Eisenhower has also promised that, if Congress passes the appropriation for the Development Loan Fund, careful consideration will be given to Filipino projects amounting to not more than $50 million. A $74 million loan from the Export-Import Bank for a steel mill and a $24 million one from the World Bank for hydro-electric projects are also possible. Economic aid, that is, will be forthcoming only for projects which seem reasonably certain to contribute to economic progress, and only if the Philippine Republic puts its finances in order —a measure of supervision for under-developed countries which others in the queue for aid would have resented all the more if an exception had been made for the Filipinos.

Sweets for the Miners

THE Administration succeeded in inducing the House of Representatives to extend the Reciprocal Trade Agreements Act for an unprecedented five years without additional protective devices by plying members with a mixture of pressures and concessions to the interests opposing the Bill. Particular attention was paid to the metal mining industry, which was first offered a new stabilisation plan, at which it turned up its nose, and then given a more acceptable sweetener at the last minute by a special scheme for stockpiling copper. As the Senate, where this industry is even more influential, began its work on the trade Bill, the Administration added some sugar to the stabilisation programme on whch Senators plan to vote before taking final action on reciprocal trade.

What the Administration Proposes

Copper :—stockpiling for one year.
Amount to be bought ..... 150,000 tons
Maximum price a pound ..... 27½ cents
Present market price a pound ..... 25 cents

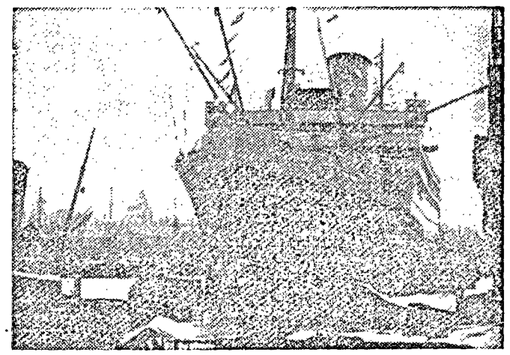
Lead :—stabilisation for five years.
Yearly limit on amount bought ..... 350,000 tons
Support price a pound :—
On first 500 tons sold each quarter .... 17 cents
On additional sales ..... 14⅜ cents
Present market price a pound ..... 11½ cents

Zinc :—stabilisation for five years.
Yearly limit on amount bought ..... 550,000 tons
Support price a pound :—
On first 500 tons sold each quarter .... 14½ cents
On additional sales ..... 12⅜ cents
Present market price a pound ..... 10 cents

Similar stabilisation schemes are proposed for **fluorspar** and **tungsten** and last year's unsuccessful proposals for production bonuses to encourage the output of **beryl, chromite** and **columbium-tantalum** have been reintroduced.

The programme seems almost certain to come out of the Senate committee with stockpiling proposals for lead and zinc as well as copper. The Secretary of the Interior, Mr Seaton, is now understood to be ready to accept this government purchasing of lead and zinc, even though it will be in addition to his price support proposals, not an alternative as is his own scheme for stockpiling copper. This is intended to remove from the market the troublesome surplus which has accumulated during the current recession and Mr Seaton has been assured by the copper industry that government buying will only be needed for one year. The lead and zinc industries can hardly give him similar assurances since their surpluses are of long standing and since the government was in fact stockpiling both these metals from 1954 until last month.

In an attempt to enlist small mining companies on the side of his original proposals, Mr Seaton has now offered higher price supports for the first 500 tons to be sold each quarter. The Senate committee is also considering raising the levels at which the prices of any subsequent output would be supported and the limits on the amount which the Administration would be prepared to subsidise by paying producers the difference between the market price and the support price. To producers the great advantage of tariffs and quotas as a form of protection is their comparative permanency, while the stabilisation plan, temporary in itself, is rendered even more uncertain by the habitual reluctance of Congress to provide the necessary funds each year. Various ways around this difficulty have been suggested and the Senate committee is reported to be leaning towards one which would allow the Interior Department to finance the programme by direct borrowing from the Treasury.



What will come of all this in the Senate itself and subsequently in the House of Representatives is very uncertain but meanwhile the President has been able to postpone his decision on the Tariff Commission's recommendations that higher duties should be levied on imports of lead and zinc—a decision which would inevitably have offended either domestic producers or foreign allies ; but next week the duty on copper, suspended almost without a break since 1947, will automatically be reimposed.

Opportunity Still Knocks

FROM A SPECIAL CORRESPONDENT

ONE advantageous point from which to observe the recession is that comparatively new adjunct of higher education, the college placement office. These agencies exist to help graduates to find the right jobs, and employers to find the right graduates. They have certainly felt the recession. But the picture for this year's graduates is not uniformly gloomy, and all concerned—graduate, prospective employer, and placement officer—have been almost as careful to hedge against the bulls as against the bears.

For the placement officer, the present slump has provided the first serious check since the war. His work has grown amazingly, largely because of the increase in the sizes of graduating classes, but also because of the tendency for American business firms to become national in scope. Hiring employees, like selling a product, is increasingly done on a national or at least a regional, rather than a local, basis. A student's invitations to interviews with prospective

employers are said to diminish by three-fourths if he writes on his application, "will not relocate."

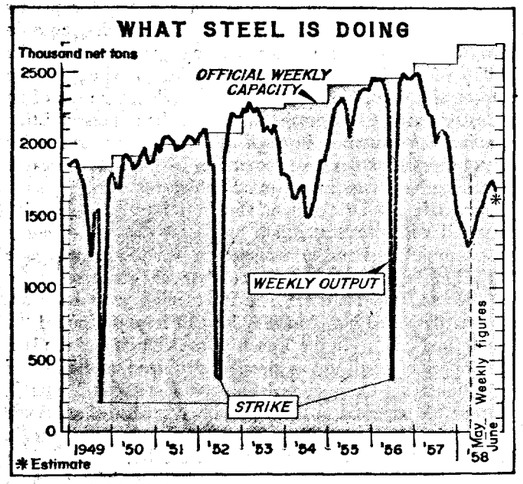
The colleges, faced with annual invasions by recruiting teams from industry and business, have set up teams of their own to receive, classify, and make available to companies the records and desires of their graduates, to assist in bringing prospective employer and employee together, and to help the student to find the right job. Last year, about 3,500 companies were engaged in recruiting at the colleges; and being interviewed was beginning to take so much of a prospective graduate's time that at least one university simply set aside a three-day period for this purpose, so as to minimise the distraction from studies.

The recession has, of course, done something to restore a buyer's market in talent. Some companies have privately admitted that their main reason for sending their representatives to the colleges this year is to keep in touch with their friends in the placement offices. Many report reduced needs, compared with 1957. But a survey by the Midwest College Placement Association indicates that last year companies managed to fill only about two-thirds of their vacancies in technical jobs, and four-fifths of their non-technical ones, so that although the sights are lower this year, there may be little or no reduction in the numbers actually hired. The major companies, who tend to fare best in this new national competition for talent, did relatively well in 1957; hence their demand has fallen off the most. The non-technical areas have suffered; management's enthusiasm for the graduate in the arts has proved somewhat fragile, although there are still appeals for "the well-rounded specialist." Most vulnerable are women without technical specialities, and men subject to conscription.

On the other hand, even the University of Detroit, in what should probably now be termed a receded area, reports that recruitment is close to normal, despite the automobile makers' woes. The existence of the national market for talent softens the blow in such places; besides, there are the arrears of the past still to be made up. Last year at Rice Institute in Texas there were said to be an average of fourteen offers of jobs for each graduate. It is quite typical of this rather eccentric slump that, for all the outcry over reduced opportunities for employment, starting salaries for both technical and non-technical graduates have once again risen on the average, although by only 4 per cent, the smallest increase since 1951. Inexperienced engineers are beginning at $470 a month, and non-technical men at $415, as against $250 and $221 a decade ago.

THERE has been much speculation about the effect of the slump upon the attitudes of employers and prospective employees. Until recently, the competition for bright young graduates has been strenuous indeed. Last year the General Electric Company spent on recruitment some $750 for each graduate hired. Now that the shoe is at least partially on the other foot, have the students become less *blasé*, more eager to please, and perhaps more careful about their choice of jobs? Students' attitudes are difficult to assess. When they are asked how they weigh offers of jobs, most students talk of "opportunities for advancement" and "interesting, challenging work," leaving such mundane considerations as salary to the last. Yet, as one placement officer somewhat cynically put it,

> When it comes to the matter of deciding which job offers the greatest opportunity for advancement, it always turns out to be the one that offers the highest starting pay.



Much has been made of today's security-minded undergraduate, whose opening gambit to a prospective employer is to ask about the company's pension plan. But there are grounds for suspecting that students ask recruiters about such fringe benefits mainly because they feel that they are expected to show an intelligent interest in the company's policies. Nor are such long-range concerns necessarily excessive, given the strong tendency nowadays for the major companies, at least, to engage no one more than five years out of college, and to fill vacancies in the higher ranks entirely by promotions from within the company. At any rate, there is general agreement that this year's graduates show more interest than last year's in relatively low-paying but secure posts—in banks, insurance companies, even in government—and are asking searching questions about the ability of particular firms or industries to withstand the impact of a depression. However, a student's notion of an industry's nature and prospects tends to be impressionistic; genuine opportunities in such generally depressed fields as railways or textiles have sometimes gone begging because of a negative image in the minds of graduates.

A decade ago Dr Seymour Harris, a Harvard economist, attracted widespread attention by predicting that openings in the professions and in management would not keep pace with the rapidly expanding number of graduates from colleges and universities. The intervening years have not necessarily belied him, but they have at least postponed the anticipated crisis. In fields such as the church and the law, the supply of graduates is already adequate; as the federal government's "Occupational Outlook Handbook" puts it, the bar "is expected to remain highly competitive and some law school graduates may have to seek employment in related work"—as indeed lawyers have been doing since Cicero. Yet in this year of the sputnik, the chief fear seems to be that American institutions of higher learning may not be training enough first-rate minds for the job market. For such graduates, there is not yet any real dearth of opportunity.

Steel Has Second Thoughts

LAST week Mr Clifford Hood, president of the United States Steel Corporation, cryptically announced that, as a result of present conditions in the steel industry, his company intended to postpone the increase in its prices, which had been expected to be general throughout the industry on July 1st, until the situation had "clarified" itself. Mr Hood's unusual statement served to cloud the situation further for the moment. Earlier several steel companies had claimed that they could not afford to absorb all, if any, of the higher costs arising out of the increases in steelworkers' wages, averaging 20 cents an hour, which are due on July 1st under the 1956 contract. Prices had therefore been expected to go up by an average of from $4 to $6 a ton; but US Steel, the largest firm in the industry, traditionally leads the way in major price changes, and the other companies are now obediently considering whether, with about one-third of their productive capacity idle, there ought in fact to be a price increase at all. Nevertheless, though the actual date is now uncertain, it still seems likely that prices will be raised sooner or later; they went up by approximately $6 a ton last July, when there was a similar addition to wages, and the steel companies have since then absorbed a further cost-of-living rise in wages without increasing prices.

Steel production has climbed satisfactorily during the last eight weeks. The improvement in demand was partly in anticipation of higher prices in July, but current demand has also increased slightly, particularly from the construction industries and agricultural users. In addition, metal fabricators' stocks of steel are now at their lowest point in nearly three years and must soon be replenished. Even so, production is declining this week and July is customarily a slack month for the steel industry. It is therefore possible that prices will stay at their present levels until mid-August, when substantial demand should

at last be forthcoming from the motor industry, in preparation for its 1959 models. Thus the outlook is not very hopeful for the materialisation of the signs of recovery recently stipulated by Dr Arthur Burns, formerly chairman of the President's Council of Economic Advisers. He holds that steel operations during the summer will provide the first real key to the economic future. In his view, as reported in *Newsweek* magazine, if the present rate of output is maintained or increased during the next two months, then the recession can be considered to be nearly over; if, on the other hand, steel output falls back to around 55 per cent of capacity, then the improvement of the last few weeks will have been "just a flurry."

Challenge to America

THE third of the studies on the problems Americans face today and tomorrow, now being produced under the auspices of the Rockefeller Brothers' Fund, offers a solid and stimulating background, provided by experienced and practical laymen, for Washington's current rethinking of how to put the country's approach to its modern international responsibilities on a permanent and long-term basis. Like Mr Macmillan, this report on America's foreign economic policy emphasises the importance of America's own economic growth and stability to the progress of the whole free world, but the experts argue that this progress is being held up by the failure to develop a framework within which "industrialised and newly developed regions can co-operate in fulfilling the aspirations of their peoples." The free world needs to organise itself to withstand the impact of the Soviet trade offensive and can best do so, according to the report, not by world-wide agreements, but by regional groupings through which trade barriers could be lowered and other forms of economic, social and political co-operation could be fostered. Such arrangements are one of several ways advocated in the report for encouraging more American private investment abroad. This, in the authors' view, is the most effective means of exporting the dynamism that characterises the American economy, yet private investment, they believe, has been seriously neglected as a constructive force.

Thinking that the best way to make the American people, and perhaps their leaders too, understand what ought to be done and how to do it is to begin work on their own doorstep, the report considers in some detail how such a regional system might be organised for the western hemisphere. This would also be the easiest place to begin, since there has already been a good deal of practice in co-operating with Latin Americans and Canadians, and since recent newspaper headlines have made it clear to everyone that something needs to be done urgently. The report recommends, as an example of what the experts have in mind for other regions, that an Inter-American Economic Conference should at once be called to consider how to moderate fluctuations in commodity prices, how to promote genuine economic growth and development in the hemisphere, how to establish a common market and an inter-American payments union, how to work together for better housing, education, health and for other social improvements, and how to promote high levels of multilateral world trade and economic growth while doing all this.

Threat to Co-operation

FROM A CORRESPONDENT IN COLORADO

EVEN in the unlikely event that the Administration finds an acceptable answer to the problems of farm prices and acreage controls, it has stored up another agricultural difficulty for itself, one which has been much less widely publicised—that of the Rural Electrification Administration which enables electricity to be supplied to farmers on a co-operative basis. Originally, in the early New Deal days, the Administration offered low-cost, long-term loans to private electricity companies if they would extend their power lines into the countryside to serve the farms, of which only about 10 per cent were then supplied with electricity from a central generating station. The companies thought that this was bait to tempt them into a money-losing business, and practically all of them refused. Only then, in 1936, did Congress create the REA with President Roosevelt's backing. It was to extend long-term loans at attractive low rates of interest to farmers who would organise co-operative companies to provide their own electrical service.

This was one of the New Deal's most successful social measures. More than 1,000 of these co-operatives were organised and, by its twentieth anniversary in 1956, REA systems were serving nearly 90 per cent of all farm families. By then even more farms had electricity, since the private companies, goaded by competition from the co-operatives, had also spread out. The co-operatives have borrowed some $3.5 billion at the low standard interest rate of 2 per cent; a few have failed, but the overwhelming majority are repaying on time or ahead of it, and their total repayments to the Treasury are now more than $500 million, or about 15 per cent of the amount borrowed, plus interest. Loans to permit farmers who co-operate to supply themselves with telephone service—a later addition spurred by the discovery that in 1940 only 25 per cent of farms had such service—have shown almost as good a record of repayment.

The private electricity companies have never ceased to fight the co-operatives, and have succeeded in buying out a few. The majority of local REAs, except in the West where most of the federally-owned generating stations are found, have had to buy their electricity from private companies, and have never ceased to agitate for the next logical step—co-operation by co-operatives to build generating facilities of their own. Moreover, most of the first networks were built to standards which would only permit the minimum supply of power to farms; since farms, like other industries in America, are entering the age of automation, their demands for electricity have multiplied. It is estimated that the co-operatives will need at least $1 billion a year of additional capital for an indefinite period if they are to bring their systems up to modern standards and supply the ever-increasing demand for electricity.

Meanwhile the farmers who head the co-operatives have become steadily more disaffected with the policies of the Eisenhower Administration which, in this area as in some others, has been trying to draw back from the social measures of the Democratic New Deal and, it is charged, has shown increasing friendliness toward the private electric industry. Mr Clyde Ellis, a fiery ex-Congressman, who heads the national Association of REA Co-operatives, insists that the Administration is secretly hostile to any further expansion of the REA, something which is of course denied. Now the dispute is coming into the open through two Bills backed by the Administration.

THE first would abandon the traditional interest rate of 2 per cent on future REA loans, and would compel the co-operatives after this to pay, in effect, the going rate of interest for government borrowing. Spokesmen for the REA argue firstly that, because of the low interest which the government has had to pay in the past, the co-operatives piled up a "credit" of about $50 million, the excess of the interest which they have paid to the government over the amount which the government had to pay for the money they borrowed. Secondly, since so much of the cost of electricity consists of the repayment of loans and interest, it is argued that higher interest rates would make current too expensive for most farmers, particularly now that their incomes have gone down, and might mean that many local co-operatives would fail—and private companies are usually waiting nearby to snatch up the wreckage at a bargain price.

The second Bill, one which has heated the wrath of REA supporters almost to incandescence, would create a "revolving fund." One feature of this system would be that co-operatives might borrow from private sources; thereupon the federal government would surrender to the private lender the first lien which it holds upon the facilities of the local co-operatives. The REA leaders say that this is merely a roundabout way of delivering the co-operatives into the hands of the private companies; Mr Ellis indeed calls the Bill "another salvo by our enemies to destroy our programme" and many farmers agree with him. Further, the Bill is criticised as stripping the independent head of the REA of virtually all his authority and vesting it instead in the Secretary of Agriculture, a political appointee. Actually the chances of both Bills are slim at this Congress but both will be remembered by voters in the farm states next November.

Analysing both Bills, REA supporters point out that since the REA was a social as well as an economic programme the co-operatives had to undertake to supply whole areas, instead of just groups of easy-to-serve, neighbouring farms, so that the cost of transmission lines has been extraordinarily high. Secondly, with many farms now being deserted, there has also been some abandonment of REA services, so that the capital and service costs are becoming proportionately higher for those still supplied; in Illinois, with 140,000 people in co-operatives, some 11,000 individual services have been abandoned, representing an original capital investment of about $7,000,000. Thirdly, schedules for servicing and repaying debts were written so as to increase slightly with the years, with the idea that the REA's would be able to repay more as they became more solidly established. In Illinois, for example, it is said that such costs will mount to $3.7 million a year within a decade, as against about $2.2 million now, in addition to new financing that will be necessary to rebuild much of the system in order to meet growing demands for current.

Finally, the present Administrator of the REA, Mr Hamil, a former ranchman from Colorado who helped to establish one of the country's first—and largest and most successful—co-operatives, which serves an area larger than the state of Connecticut, finds himself in an increasingly uncomfortable position, with much of his authority to approve large loans having been taken away from him. He recently said that sooner or later the REA co-operatives must change over to a totally self-supporting status but that a private electricity company feels uncomfortable unless it maintains an equity of 50 per cent in its property, while the national percentage for electricity co-operatives is now about 15 per cent. So the change cannot come yet, nor for a long time.

SHORTER NOTES

The House faithfully honoured the promise of congressional leaders not to cut taxes when it extended the present rates of excise and corporation taxes which otherwise would automatically drop on June 30th. But by big bi-partisan majorities the Senate has voted to repeal the wartime federal taxes on transport, a concession to the railways which may help to bring down prices all round, and which would cost the government $700 million a year of the $2.6 billion the Treasury hoped to retain. The House is expected to stand firm for a more modest measure of relief or none at all.

* * *

Beginning on August 7th, summonses will be served on pedestrians in New York who cross streets against the traffic lights. Laws to protect pedestrians against themselves are enforced in many American cities, particularly in the West.

Middle Westerners who want to lose weight have a choice at their supermarkets of eight low-calorie frozen dinners; these cost from 99 cents to $1.50 cents each and contain fewer than 275 calories.

FIRST LINE OF DEFENCE

"... America is pinning her faith to piloted planes as her first line of defence for a considerable number of years ahead."

Sir Roy Fedden: 'Daily Telegraph', May 28

The use of guided missiles is limited to a type of war which all the powers are anxious to avoid. As a result it is in the minor local conflict that major issues could be decided.

A strong air component has been proved to be the most economical means of resolving these local conflicts, rapidly and effectively. For all powers, great or small, this "first line" is an essential means of safeguarding vital interests.

The Folland GNAT makes a decisive fighter and ground attack force a sound economic proposition. Decisive because it has a transonic performance with a unique rate of climb and the most advanced armament and equipment—and better manoeuvrability and a higher ceiling than any conventional British fighter in service. Economic because it has reversed the trend to greater size, complexity and cost in fighter design; its simplicity makes it extremely easy to maintain.

THE WORLD OVERSEAS

No Showdown in Lebanon

FROM OUR CORRESPONDENT IN BEIRUT

THE struggle drags on in Lebanon without a glimmer of hope for a compromise solution. Both sides remain as firmly as ever entrenched in their political and military positions. The stalemate is due partly to the even balance of forces in the country, partly to a reluctance to shed blood, and partly to the essentially negative positions that both sides have adopted. President Chamoun refuses to resign until the expiry of his term of office on September 24th. The opposition refuses to accept any other solution. "Supposing the President persists?" your correspondent asked Abdullah al-Yafi, leader of the opposition National Front and Sami Solh's predecessor in the prime minister's office. "Then the present situation will persist," was the unhesitating reply. One must concede, with the appropriate shades of gloom, that the opposition seems quite strong enough to keep the country in a state of more than semi-paralysis until September 24th, if not longer.

Abdullah al-Yafi, and those around him, insist that their only immediate aim is the resignation of the President. Beyond that all is fluid. The President's departure, in their view, would permit a return to calm, in which atmosphere the future of the nation could be debated without acrimony. All the opposition leaders have nailed their colours to the mast of Lebanese independence. But, in the view of Yafi and his friends, it is still too early to speak of such matters as future foreign policy. Commenting on the recent declaration in favour of neutrality put out by Charles Helou, a leading contender for the presidential succession, Yafi said that the subject should be reserved for the Great Debate. It seems that the possibility of closer alignment with the United Arab Republic is being kept in mind, though it must be stressed that alignment does not mean fusion.

Middle-of-the-road Lebanese are looking forward with misty hopes to July 24th. The Speaker of the Chamber, Adel Osseiran, has summoned the deputies to assemble on that date to elect a new president. Yet even there the outlook is fuzzy. Since the crisis began, the government has twice asked Parliament to convene; each time it failed to muster a quorum. Will it fail again on July 24th? Apart from that dismal possibility, the opposition maintains that the present Chamber was rigged, and is therefore totally unrepresentative of the true state of public opinion. It seems distinctly possible, therefore, that any candidate approved by the Chamber would be unacceptable to the opposition.

If anything, the position looks more hopeless today than a fortnight ago. The president was incensed at the fighting that broke out round his house during the Beirut fighting, in which he himself took a sportsman's part. The prime minister was indignant at the sacking of his residence and the wholesale destruction and removal of his personal belongings. Warrants have again been taken out for the arrest of opposition leaders, this time to the number of fifteen, including Saeb Salam and Abdullah al-Yafi. But one has heard that one before. Certainly, the arrest of Saeb Salam could only be effected by bloody battle, since his fortress house in the Basta quarter of Beirut is the heart and symbol of resistance. Doubtless the army could do it. But does it want to fight?

All the evidence is that nobody wants a serious showdown. The two-day fighting in Beirut, which was magnified by enthusiastic story-tellers into a series of pitched battles in the streets, died down without the slightest change in the situation. It is probable that it broke out accidentally, though there is also support for the suggestion that it was deliberately provoked to impress the newly-arrived United Nations observers with opposition strength. Once shooting begins, it is always fun to continue, with only mildly lethal intent, until fatigue supervenes. That is perhaps the fairest comment on the so-called "battle of Beirut."

The army, under General Chehab, has been the embodiment of caution. It has been content to hold the ring in the bigger towns, and to chivvy the bands in the countryside with a view to reducing their nuisance value. This quiescence can be attributed to two considerations. In the first place, the struggle now transcends legalistic forms. It has become a political struggle, and the general has always insisted that he, and his army, are outside politics. In the second place, nearly half the troops are Moslems and Druses. The opposition claims that desertions have taken place on a large scale. There is no substantial evidence to support the claim. But the cohesion of the army is due largely to the discretion with which it has been committed. Its reaction to an order to storm, say, the Moslem quarter of Tripoli is necessarily unpredictable; and General Chehab must have serious qualms about any action that might undermine the discipline of the only force standing between the country and total anarchy.

Meanwhile, the United Nations observers are touring the country in their white jeeps, enjoying cordial receptions wherever they go. In the event of their finding contraband in arms, they are supposed to observe, report and perhaps try to cajole the muleteers into retracing their steps. There is reason to suppose that their presence will discourage smuggling, of which, in any case, there have been very few published reports in recent weeks. The opposition dismisses the activity of the observers as "irrelevant" to the situation. It already has enough arms to go on with, as the waste of ammunition during the Beirut firing amply demonstrated.

Has the government, in calling in the observers, shot its bolt? Has it any other measures up its sleeve for dealing with the situation? "Govern or get out"—in those words a leading Beirut daily lectured the authorities. It went on to say that governing meant, in effect, either working towards a compromise solution or crushing the opposition by force. The first alternative is unacceptable to president and prime minister. The second is unacceptable (apparently) to the commander-in-chief. It is against a background of

despairing thoughts such as these that supporters of the government began to canvass suggestions of intervention from the West, either under article 51 of the United Nations Charter or under the terms of the Eisenhower Doctrine.

Various more or less delphic utterances by President Eisenhower, Mr Dulles, the commander of the Sixth Fleet, and Mr Selwyn Lloyd have been scrutinised hopefully by those who favour Anglo-American intervention. It is to be hoped that they are living in cloud-cuckoo land. The only useful purpose that British parachutists and American marines could serve would be to crush the centres of opposition. This they could easily do. But such action would provoke a storm of Arab hate, reaching far beyond the borders of Lebanon, matching in intensity that which followed Suez. How long could the Arab Federal State of Iraq and Jordan last? And what price Arab oil?

Cyprus Looks at the Plan

FROM OUR CORRESPONDENT IN NICOSIA

THE events of the past week—the policy statement from London, the talks in Athens with the Greek Cypriot mayors, the Governor's sudden visit to London and the news of his offer to meet Grivas—have left the average Cypriot more confused than ever. Yet the week has not been without its positive features: the British plan has not caused the explosive reaction that many had feared and the security authorities, who were being criticised two weeks ago as ineffective, now have some reason to congratulate themselves that they have the situation in hand.

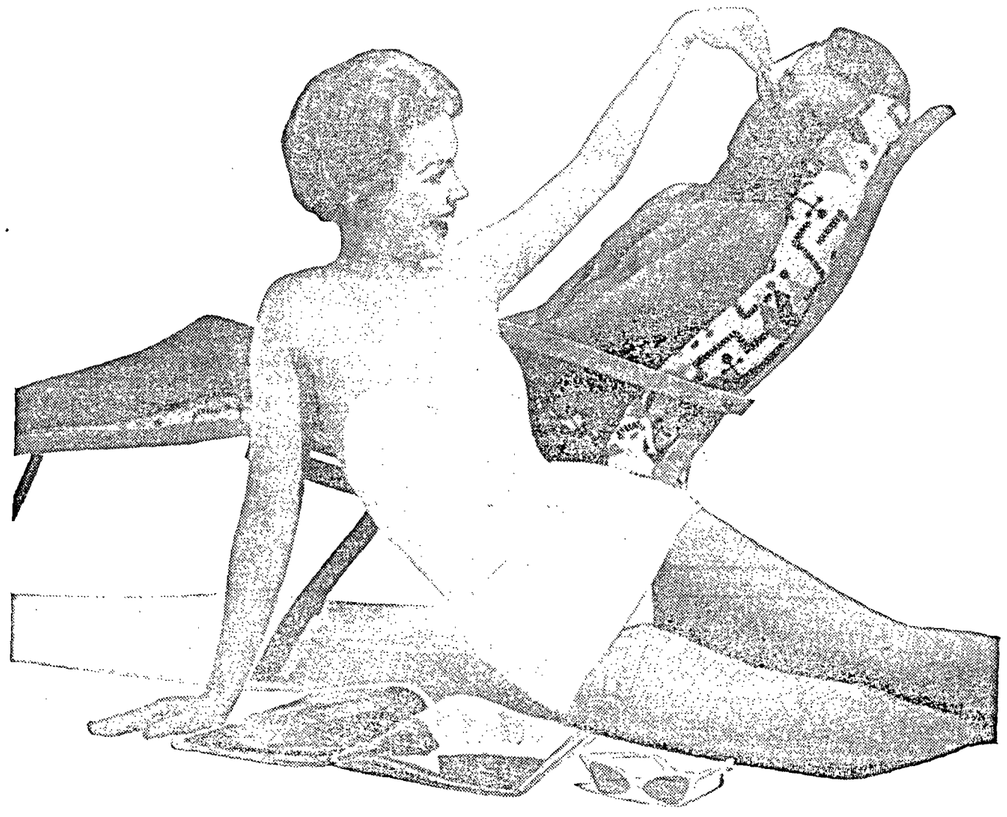
But if violence has for the moment been checked, the air has been rent by voices inveighing against some new-found flaw in the British proposals. On the Turkish side, the theme is, of course, simple; the monolithic adherence to partition shows no sign of weakening. The local Turkish leaders are making the maximum propaganda capital out of their scheme of setting up separate Turkish municipalities. In Limassol this week they had their first ominous (though minor) clash with the Greeks over municipal sovereignty. But the municipalities scheme may possibly have a certain face-saving value at present for the Turks who have thundered "partition or death" so fortissimo in recent weeks that some quick propaganda action is necessary for their own followers. If Ankara were prepared to accept the British plan, which most people here consider treats the Turks generously, the Cyprus government would probably not stand in the way of setting up separate municipalities.

Among the Greeks, certain definite issues are emerging from the controversy over the British proposals. Inevitably it is charged that the formation of two separate legislatures means a kind of partition in disguise. The Governor himself has gone to great pains to correct this impression, and has stressed to the Greeks that no geographical division of the island is envisaged. But the Greeks are not yet convinced. The plain truth is that in the present temper of the island it is hard to see any Turkish minority getting very generous treatment from a Greek majority if both were in the same assembly—despite the facile assurances of the Greeks over the years that they have "no quarrel with the Turks."

The Greeks are also perturbed about the budgetary arrangements. They want to know who is paying for what—and how. This is one of many points left open, although if general principles were agreed to, they should doubtless be capable of solution. But a major grumble of the Greeks for a long time has been that in various ways they are made "to subsidise the Turks," and the whole question would have to be thrashed out in considerable detail. The Greeks are also suspicious of the proposed arrangement whereby the Greek and Turkish commissioners would join the Governor in the executive triumvirate. This device is seen as a sinister manœuvre to enable the Turkish government to have an unwarranted say in the running of the island. It has been suggested in one influential quarter that it would be better to have a Greek Cypriot and a Turkish Cypriot alongside the Governor—though it is hard to envisage any of the present leading personalities fitting into this role. Despite all that has happened in recent months, to the Greek Cypriots the Cyprus problem is still a "simple" issue—between the British Government and the people of the island.

But by far the most serious criticism concerns the final section in which Britain expresses willingness, at an appropriate time, to share the sovereignty of the island with the Greek and Turkish governments. The Greek Cypriot takes this to mean that self-determination is for ever excluded and that the island will be a colony for ever. Thus what has won praise outside the island as an eminently sensible suggestion is arousing alarm and anger here.

Despite all this criticism an optimistic feeling can be detected among ordinary people that in some mysterious way things are getting better and that a settlement will be found. The grim shadow of Eoka, however, is still in the background and none of the moderates, who see some merit in the plan will openly support it, if only as a basis for discussion; for they fear that if things should go awry, the day might come when their "moderation" might be remembered and they would be branded as "traitors."



Germany's Railway Optimists

FROM OUR BONN CORRESPONDENT

IN Germany full-blown engine-drivers, guards, and signalmen are civil servants; their assistants live in hope of one day qualifying likewise for the security and prestige of the *Beamte*. This is a consoling thought to the management of the federal railways (the Bundesbahn) as they contemplate a scene of debt and deficit as sombre as that confronting British Railways. For in Germany the law forbids civil servants to strike, and consequently it is most unlikely that in the foreseeable future there will be any really awkward demands from the key west German groups of railwaymen for higher pay. The sixty per cent of the staff who do not rank as civil servants seem to be content for the time being with the 46-hour week introduced for them on June 1st (though not for the civil servants) along with the promise of a 45-hour week to begin on October 1st, even though not a single extra man is being taken on to make good what was originally estimated to be tantamount to the loss of 29,000 workers, whose replacement would cost an additional DM181 million (about £15.3 million) a year.

Their nerves are good and their hopes high at Bundesbahn headquarters in Frankfurt. They need to be. The deficit of 515 million marks (£43.7 million) in 1956 rose to one of 750 million marks (£63.7 million) in 1957. And the

"Wake up—you're not at the office!"

From Southampton or London, there's always a Union-Castle passenger ship leaving for South or East Africa in the next few days: into the Atlantic or through the Mediterranean, in southern sunshine and through calm seas. Every Thursday a ship leaves Southampton for the fourteen day run to Cape Town. About twice a month a ship sails from London for a round voyage: nine weeks of warmth, well-being and perpetual change of scene round the coast of Africa. For business, for holiday, for honeymoon, or even on doctor's orders, many fortunate people have made these journeys, to their great pleasure. May we send you our booklet, 'Colourful Africa', to show you pictures of our glistening ships, of the friendly life on board, and the many adventure-story ports of call?

expectations of higher revenue from the increased charges that came into force last February—8.7 per cent more for passengers, and in general 14 per cent for freight—are not being fulfilled. There has been a notable decrease in goods traffic, which normally accounts for roughly two-thirds of Bundesbahn revenue. This is due in part to anticipatory stockpiling. But everywhere less coal, ore, and steel are on the move. Some six million tons of coal are banked at the pitheads waiting for orders. In spite of this considerable disappointment, there is scarcely a wisp of doubt at Frankfurt that the Bundesbahn, which has not showed a profit since 1951, will sooner or later pay its own way again. One ground for optimism is that it is saddled with a unique, but temporary, burden—that of the refugees. As successor to the Reichsbahn, the Bundesbahn is obliged either to employ or to pension all railwaymen fugitive from eastern Germany or former German territory beyond the Oder-Neisse line. The bill runs to some 200 million marks yearly, roughly a third of the total deficit.

But optimism flows just as vigorously from renewed confidence in the commercial indispensability of railways. In spite of the incomparable Autobahn network, the federal railways were still carrying 54.7 per cent of western Germany's goods traffic in 1957. (As much as 30 per cent went by water; less than 15 per cent by road, some of it in Bundesbahn lorries). The Bundesbahn believes steadfastly in its own future, and in dark moments cheers itself up by thinking, if not of the Swiss railways with their fabulous operating surplus of approximately £64,000 a kilometre, then at any rate of the Netherlands with one of £425 a kilometre. But first, modernisation, upon which 20 billion marks (£2,000 million) is to be spent over a period of ten years.

Modernisation means chiefly electrification, automation, and rationalisation. Altogether 1,800 miles of track, approaching a tenth of the whole network, have been electrified. This summer the electrifiers are moving down the left bank of the Rhine towards Cologne and their advance party has already reached Bonn. Locomotives of the long-electrified southern network, which is linked with the Austrian, Italian, and Swiss systems, can now operate as far north as Remagen. (Wine-growers along the Rhine between Mainz and Remagen are said to be deploring the prospective loss of the free fertiliser of which nearly a ton has been falling daily in this area in the form of soot from the coal-fired steam locomotives.) The Bundesbahn will not commit itself about the pace of further electrification.

But no more steam locomotives are being built. The 9,500 now in service are to be replaced gradually by electric and diesel locomotives, which have been found to be respectively 35 per cent and 25 per cent cheaper to run than their obsolescent stable mates. Already 615 electric and some 500 diesel, diesel-electric, and diesel-hydraulic locomotives are in service. There are also 925 diesel coaches and petrol-driven rail buses. The first of the Bundesbahn's own power stations—cheap power is one of the secrets of the Swiss railways' success—is in operation in Upper Bavaria. Others are projected.

Automation, particularly through application of electronics, is a newer field of hopeful and vigorous enterprises. The Bundesbahn's special pride of the moment is the signal box at Frankfurt station, from which only ten men control all the points and signals throughout the complex six miles approach to this very busy terminus. This installation, the range of which is to be extended to 18 miles, cost 20 million marks (about £1.7 million), but it is proving so remunerative that similar arrangements are to be introduced elsewhere. The number of permanent-way inspectors is being reduced by the use of electronically controlled testing coaches. Electronic devices regulate what it is believed will prove to be an economical two-direction single-track system now being tried out on 25 miles of line near Bebra. Hopelessly unprofitable lines are being allowed to run down and will presently be abolished. The post office's yellow mail buses continue to relieve the railways of the responsibility of carrying passengers and parcels in some of the remoter parts of the country.

So far the railwaymen have nowhere shown any serious resentment of the processes of automation and rationalisation. It is for the sake of safety, not of labour relations, that two men man the electric or diesel locomotive hauling a passenger train. On similarly hauled freight trains one man does the job, with an initiated guard in reserve not far from the locomotive. The average German railway worker is remarkably proud of his firm and likes to see things going well. The guard-cum-conductor (*Schaffner*) of a long-distance passenger train (who, let it not be forgotten, is a civil servant) considers it his business to ensure that every traveller not only has a ticket but is also comfortably seated. He has something of the avuncular omnipotence of a ship's captain. The punctuality of the German trains is a product of pride and teamwork all along the line. One of the Bundesbahn's significant little pleasures is to hand on punctually to the next country an international through train that arrived late at the German frontier.

Brave Egyptian World

BY OUR SPECIAL CORRESPONDENT

PRESIDENT NASSER'S preoccupation with the paraphernalia of diplomatic buccaneering, such as armaments and broadcast propaganda, diverts attention from the revolutionary government's successes—and flops—at home. One of the successes is the completion this year of the land reform programme. All estates of more than 200 acres (or 300 acres if the landowner has children) have been sliced into allotments for smallholders, and although the scheme barely takes the crust off Egypt's overwhelming problem of having too many people on too little fertile land, it has made landowners out of some 200,000 families who previously were underpaid labourers or insecure tenants. It has also confuted those who say that whatever the social arguments in favour of carving up big estates, the economic answer is always a drop in production. The land reform areas are run on a co-operative basis: the smallholder has two or three separate plots of about an acre each, but every plot is part of a large area entirely devoted to a single crop, and output is at least as high as it was before.

Now that all the land within the scope of the scheme has been distributed, the initiators of land reform are left with a certain amount of time on their hands. This forceful group of youngish men is headed by Sayed Marei, who at first worked under the minister of agriculture but before long was minister himself. With land reform out of the way, Sayed Marei and his ministry are ready for new battle against any slower-moving, woollier-minded civil servants who might stand in the way of agricultural development.

The scope of new projects is necessarily restricted until Egypt can squeeze some more water out of the Nile. There are experiments with drainage water and artesian wells, and

from time to time small areas are won from the desert. Serious reclamation schemes are in cold storage with the hopes for the High Dam. Meanwhile, the ministry of agriculture has fought and won a battle for control of some of the land that the Waqf ministry used to hold in trust for the upkeep of hospitals, schools and mosques. On top of this it has taken over the running of the Liberation (Tahrir) province, and is now turning ambitious eyes towards the programme for rural welfare.

Liberation Province is Egypt's showpiece oasis. It was also, before the ministry of agriculture cut it down to size, one of the government's most expensive miscalculations. About 40,000 acres are being reclaimed from the desert between Alexandria and Cairo, with water diverted from land in the delta to the east. The scheme has had spectacular success in showing what can be grown on sand: a bleak stretch of desert has blossomed into a garden of oranges, melons, strawberries and roses. As window dressing it is a fine display; as a practical experiment for a country that is badly off it is lamentable. It was administered by a more or less autonomous organisation in Cairo whose directors made some crashing blunders, including the building of a citrus canning plant long before there was a chance of the orange trees bearing fruit, and the creation of factories churning out retail goods which no one in the area could possibly afford to buy. A new village was built beyond the limits of the irrigated land apparently in the hope that once the buildings sat there fair and square, nobody could refuse them water. These extravagances are now being lopped off one by one. The Cairo office has been disbanded, the factories closed down, and all agricultural luxuries severely pruned by the no-nonsense methods of the ministry of agriculture. But its experts are more perplexed when they come up against the provinces' involved plan for social welfare.

Ideas of social responsibility came late to Egypt, but since the revolution a handful of pioneers have by their enthusiasm tried to make up for the wasted years. The universities are turning out doctors and teachers in encouraging numbers; the buildings for them to work in are more difficult to produce because there is always some other use for the money. Although schools and hospitals have shot up, there is still only accommodation for half the children who should go to elementary school, and only 7,000 beds for 300,000 tubercular patients. Liberation Province provides an egregious example of social planning run wild.

In one area four hundred families were chosen to cultivate the new land. To qualify, the parents have to be between 23 and 30, have two or three children, and pass rigorous tests on health and social habits. They are not allowed to bring any relations or dependants. On arrival they are provided with a house, a uniform—and a dossier. Every month or so, the social workers fill up lengthy forms on the villagers' general behaviour, hygiene and marital relations. Every cupboard and cooking pot has to be open to inspection, and every villager to have a clean and smiling face—or the social worker wants to know why. Theoretically the land belongs collectively to the families but since there is far too much work to do, some 10,000 labourers have to be imported from nearby delta villages. The labourers have no dossiers and can wear what they like, but otherwise do much the same work as the selected few.

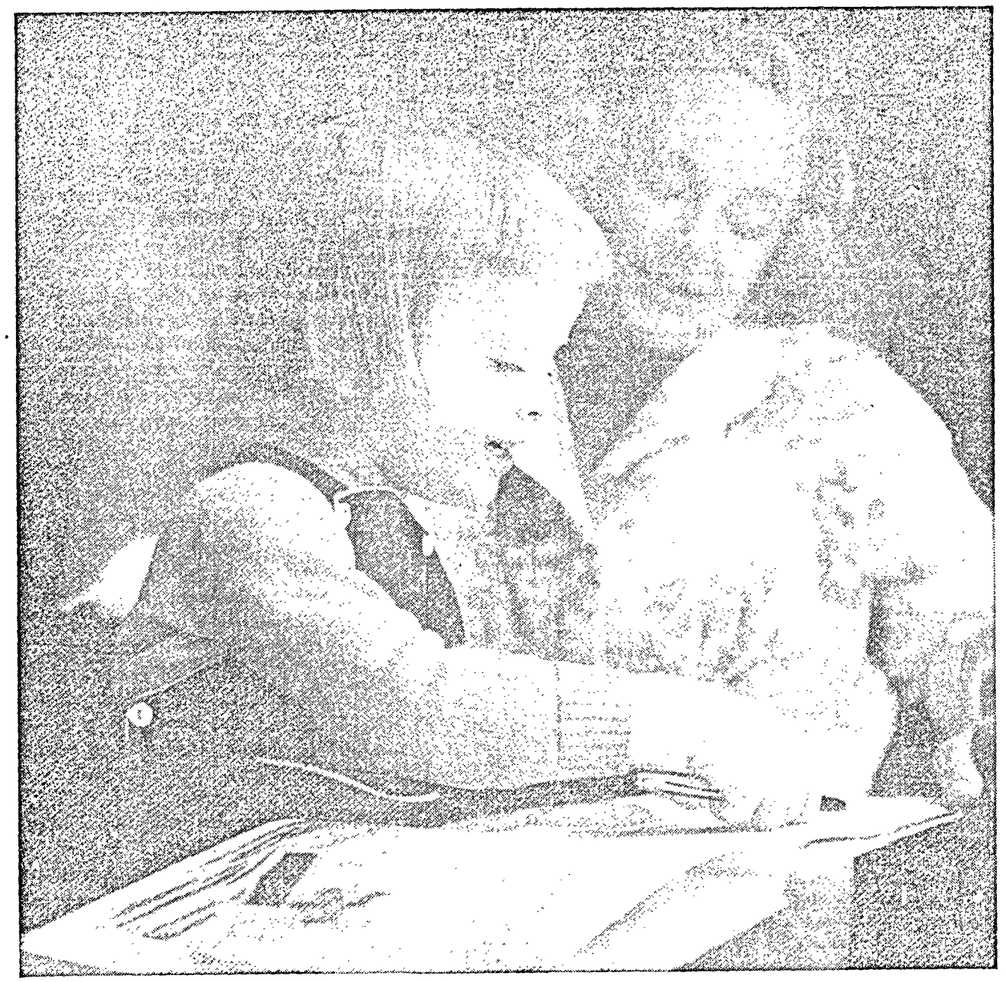
The experts from the ministry of agriculture are a bit dumfounded by this other kind of brave new world. They object to it partly because they suspect that the social theories are a waste of time and money, partly because they dislike the system of hierarchy. But what to do with the 400 families? They cannot be given the land and told to get on with it; it will still be years before the desert crops start to bring in a fair return. On the other hand the ministry does not want to snatch away their privileged status by turning them back into labourers.

The next conflict between the pragmatic approach of the ministry of agriculture and the idealism of the social pioneers will be over the rural community centres. This is a bigger battlefield: the plan is to have 864 of these centres all over Egypt, each covering four or five villages and serving 15,000 inhabitants. So far about 260 have been established. Each centre consists of a hospital, school and meeting place and is run jointly by a doctor, headmaster and social worker. Doctors, nurses and teachers are desperately needed; most of them are devotedly working twenty-five hours a day. But the function of the social worker is less obvious. He advises the peasants on seed and stock, he is in charge of co-operative marketing schemes; in some of the centres, he tries to ease the pressure on land by teaching local crafts and trades. The theories are first class; so often, is the practice. But sometimes money or enthusiasm seems to have run out before the schemes can be completed. Incubators that were to have provided the peasants with Rhode Island reds are shown off proudly, but they are empty of eggs or chicks; carpentry, pottery or weaving workshops are splendidly equipped but have as yet no students.

The administration of the rural welfare schemes is now to be centralised under some kind of national planning board. Sayed Marei's ambition is to have the final say on this board. He contends that the hit-and-miss methods of the ministry of social affairs are a luxury that Egypt cannot afford, and that the running of each centre must be tied more strictly to what is agriculturally and economically feasible. According to the ministry of agriculture the cart has been put before the horse, social services must wait on agricultural profits, and the pioneering experiments of the community centres are not much more than well-meaning

FREER TRADE IN EUROPE

For those wishing to keep continuously informed of free trade and other developments in Europe we provide two subscription services:



*A four-page bulletin devoting each week a full page to European free trade developments:

WORLD BUSINESS SPOTLIGHT

*Our three-monthly reports on business conditions and prospects in the countries concerned grouped in *two new* REGIONAL SUBSCRIPTIONS at specially reduced rates:

Whitehall 1511, Ext. 144.

New readers begin here

There are more readers in the world than ever before. And their number continues to grow. An increasing proportion of the 90,000,000 children born into the world each year will grow up to learn how to read and write. That is the measure of the growth, in quantity and responsibility, of the world's Press. That, too, is why the paper maker must take the long view. He is concerned not only with the immediate tomorrow but also with a future five, ten, twenty years hence. To meet the challenge that will arise then he plans now, supported by long-term arrangements with publishers, equally confident of the future. Bowaters, with their resources and skill already established in equal strength on either side of the Atlantic, are building, as always in their history, for a clearly visible future – a future in which there are more readers than ever before.

To any town thinking of drinking sea water—

Mad idea? Not a bit of it. Go mad if you drink it? Nonsense. Not today; not with modern evaporators; certainly not with the newly developed Richardsons Westgarth evaporator. This tidy and compact piece of plant will distill for you—from sea water—anything up to 250 tons of fresh water every hour. And by fresh we mean crystal clear, far purer and softer than good drinking water supplies. Of course, large sea water evaporators are not, in themselves, anything new; Richardsons Westgarth and many other people have been building them for years. But this latest R.W. evaporator is the result of a radically different approach in design. It is indeed something quite new in its simplicity of operation, relatively low first cost, and ability to go on delivering full output—without having to be shut down for cleaning—for months or years on end and with almost negligible attention and maintenance. Fresh water from sea water now becomes feasible economically where cost had hitherto put it out of court.

fuddy-duddy idealism. Who will win? The odds are on Sayed Marei, for Egypt cannot indeed afford many social services when foreign adventure makes so insistent a call on limited funds.

Danube Blues

FROM A CORRESPONDENT

For more than a century the traffic on the Danube has reflected the political tensions more than the economic prosperity of Europe. The international tug of war on the river started in the second quarter of last century, with Russia pulling strongly at the delta end. Nowadays the game is still played; but it has lost much of its 19th-century vigour. Though the Danube is the longest river in Europe and the only natural link between the West and the East, it is depressingly free from shipping. The difference between the stream of traffic on the Rhine and the solitary boats making their way up and down the Danube is striking.

Russia established itself on the sand-logged Danubian delta in the eighteen-thirties. Russian interest in the river's shipping was small: the occupation of the Chilia arm, and later of the delta to the south, was, for Russia, another step in the advance towards Constantinople. The Crimean war and the subsequent treaty of Paris put a stop to this. The European Danube Commission, created by the powers at the Paris conference, was made responsible for the regulation of shipping on the lower reaches of the Danube. Under the auspices of the commission the sand was cleared from the delta and Russia was kept at a safe distance from it. Shipping between the West and the Black Sea increased considerably in the eighteen-seventies and eighteen-eighties; the growing economic expansion of Europe along the Danube was regarded, by successive Russian governments, as a "serious limitation of our freedom of movement."

At the Versailles conference in 1919, the Danube was declared an "international waterway" and the European Commission was replaced by the International Commission. In spite of the changes brought about by the war, the peace treaty, and the erection of assorted economic barriers by the successor states of the Hapsburg Empire, the Danube remained, in the period between the two wars, a European waterway.

By the occupation of Bessarabia, and with it of the Chilia arm of the delta, in 1940, Russia became a Danubian country again. For Germany, this was another concession calculated to ensure Russian neutrality, so precious at the time; for the Soviet Union it was the first step into Central Europe. In the same year, Germany summoned a conference to Vienna to deal with the inheritance of the deceased International Commission. Although this conference was expected to discuss purely technical questions concerning the stretch of the Danube between Ulm and Braila, Mr Vyshinsky asked Schulenburg, the German Ambassador to Moscow, for an invitation to the conference for the Soviet Union, "as we are interested in all Danubian problems."

In 1945 the Russians controlled the best part of the river as far as Linz, the limit of the Soviet zone of occupation in Austria. A year later the grandiose project of the Black Sea canal—still not completely realised—was put forward. The Rumanians were made to join the Sovromtransport, the Soviet shipping company, with all their fleet. When, however, the company went into liquidation shortly afterwards, they were able to buy their ships back. For several years after the war, most of the shipping companies of the east Danubian countries had to carry two managing directors, one of them Russian. In spite of their war losses, the Jugoslavs managed to retain the largest Danubian fleet; but soon a rivalry developed between them and the Hungarians who, helped by Soviet subsidies, took the first place as the largest Danubian shipbuilding country. After the Hungarian revolt there were some signs that the Jugoslavs intended to use the respite from Hungarian competition to forge ahead with their own shipbuilding and investment programme. The Jugoslav government granted a credit of about £20 million to its Danubian shipping company; of this sum, 12 per cent was planned to provide ships for passenger traffic. The investment was also intended for the building up of the Belgrade wharf into the largest transit station in south-eastern Europe, designed to handle 2,200,000 tons in a year.

This side of the curtain, the boats of the two Austrian companies, DDSG and Comos, and of the Bavarian Lloyd mostly ply their trade on the Vienna-Linz-Regensburg route. The DDSG lost four-fifths of its property, mainly to the Hungarians, after the war. When it first resumed its activities in 1947, it operated from Linz and only upstream

from there; five years later the company was allowed to return to Vienna. Austrian and German Danube shipping are faced with similar problems. The companies are private, but the state is the principal shareholder. This makes for difficulties as far as capital investment is concerned, and investment is what they badly need. Most of their cargo ships were originally built for a waterway of 1,750 miles; on short routes they tend to be uneconomical. And yet less than 5 per cent of the shipping they carry ever crosses the eastern frontier of Austria. The companies also have to compete with the artificially low freight charges of the shipping companies of the people's democracies. But as it is impossible to insure a cargo carried by a Jugoslav, Hungarian, Rumanian or Bulgarian ship, business men are not tempted by lower shipping costs. The first glimmer of hope for the DDSG, as far as its eastern trade is concerned, is the contract with the Soviet Union, which came into operation at the beginning of April this year, to carry 100,000 tons of coal and the same amount of iron ore along the whole length of the Danube into Austria. The contract is renewable annually and the Austrians believe that the quota will be increased in the future.

At present the Russians hold all the trump cards. Their control over the Danubian delta is firmly established. Through the Permanent Danube Commission, constituted in Sofia in 1956, and through the Belgrade Convention, they exercise a high degree of influence over the Danubian

shipping of south-eastern Europe. Yet at the Belgrade conference there were indications that the Jugoslav government regarded the Convention as a first step towards a Danubian confederation: a programme which had often figured in political discussions before the war. Although the Austrians were invited to Belgrade, they could hardly have negotiated from their uncertain position before the conclusion of the State Treaty in 1955. Now they are free to do so, and if there is ever to be a wider Danubian agreement, it will be Jugoslavia and Austria who will have to take the lead. Both countries enjoy special international positions, and it might be easier for them than for any other Danubian government to steer clear of complications arising from the chronic tension between eastern and western Europe. The settlement of the fortunes of the whole Danube might be a step towards easing the tension.

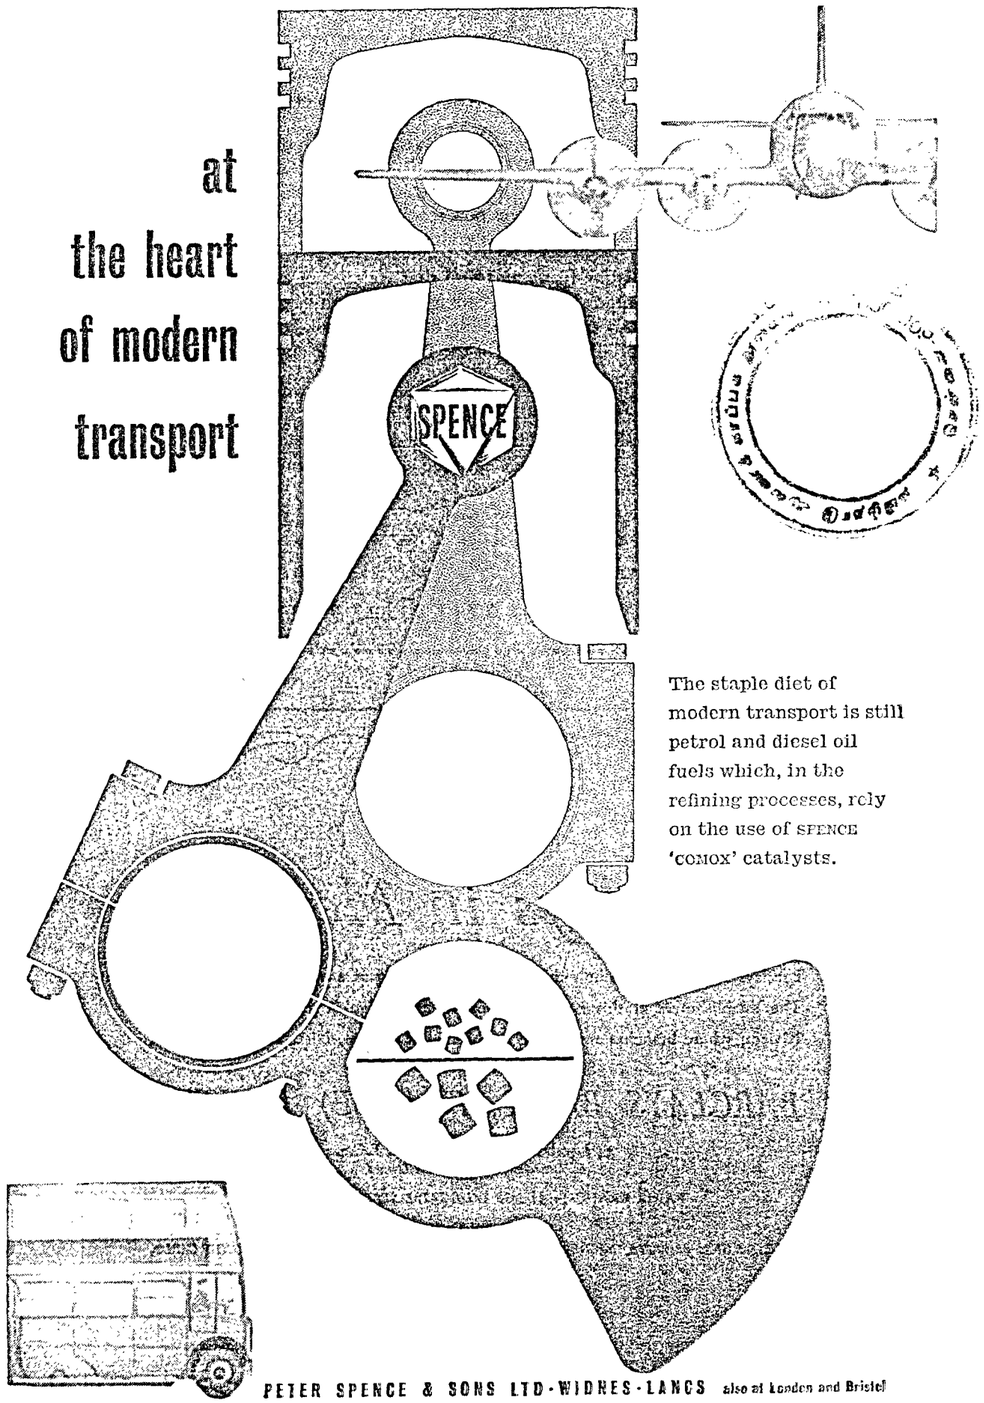
Mexican Opportunities—I

FROM A CORRESPONDENT

But for the sale of two Britannias, the British share in Mexico's foreign trade in 1957 would have amounted to only 1.9 per cent. Even with the sale of the two aircraft (which have both encountered mechanical difficulties), Britain's part in Mexican imports totalled less than 3 per cent. The reasons for this poor showing are tiresomely classical: an unwillingness on the part of British manufacturers to acquaint themselves with Mexican needs and realities; a vague presupposition that Mexico is just another of those Latin American republics in which men with large hats drowse in the sun or fire old rifles in the air; and, above all, a lack of interest in following up business opportunities when they do arise. Britain's competitors—leaving the United States aside—are not committing the same errors. The German presence in Mexico is making itself felt: in a Volkswagen assembly plant, set up as a result of a barter deal in cotton, in a large new fertiliser plant, in the readiness of a leading German electrical firm to open a permanent office in Mexico City.

But why should the British manufacturer, whose order book may be comfortably filled, pay any particular regard to the Mexican market? The answer is two-fold: the Mexican economy is, in the words of one expert observer, "not expanding but exploding"; and this explosion is taking place against a background of fiscal and political stability which sharply distinguishes Mexico from the rest of Latin America.

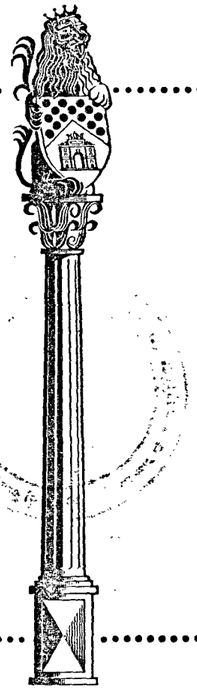
In nearly every sector, the economic indicators yield the image of immense progress and of a business boom sustained at an extraordinary level since early 1955. The population, now put at about 33 million, is expanding at an annual rate of 3.1 per cent—the second highest rate in the world. By 1960, Mexico City is expected to have a population of 5.3 million (not a wholly comfortable prospect to a city where more than half the inhabitants live in substandard dwellings). The rate of industrial progress is similarly impressive: adjusted for price changes, national production rose 7 per cent in 1957 as compared with the previous year. The sale of electrical energy has been increasing at an annual rate of more than 12 per cent. This is nearly twice the world's average rate of growth. The gross national product, which amounted to some 56 billion pesos in 1953, exceeded 100 billion in 1957. Even allowing for devaluation, for the rise in prices and for the high birth-rate, these figures point to an incontrovertible increase in prosperity. To receive graphic confirmation of the general trend, one need only walk through Mexico City as it builds and rebuilds after last year's earthquake, or travel on one of the new highways into the interior.



The American recession is providing a searching test at the basic soundness of the Mexican economy. Mexico's principal industry is, by a substantial margin, the tourist trade. More and more visitors from all over the world are discovering each year what this land with its fierce beauty, radiant climate and low prices has to offer them. Some 576,000 tourists visited Mexico in 1957; net earnings from the tourist trade during that year totalled $361 million. The immense majority of visitors come from the north. Will the American recession interrupt this vital flow of dollars? So far, there are no real indications of a decline. But it is too early to tell. The winter tourist tends to be well off anyway. What will happen to the summer tourist who comes from the middle and professional classes and who comes across the border by car? No one knows the answer. But there are people who believe that the American recession will bring more tourists to Mexico rather than less. They contend that many Americans who feel the pinch, but who none the less want to take their holiday abroad, will cancel projected trips to Europe and come to Mexico instead. Mexico is nearer, cheaper and yet as foreign (to all but southern Californians) as any land can be. But even the most convinced supporters of this theory concede that they are thinking of a limited recession. A full-scale American depression could, for a time at least, destroy the tourist trade.

The second and related problem is that of the *braceros*—the Mexican agricultural workers who are annually contracted, under international agreement, by North American planters and fruit growers. In 1957, 436,000 *braceros* went to the United States for periods varying from six weeks to six months. Their work contributed $34 million to the Mexican economy—a figure which does not include dollar earnings deposited by individual labourers in American banks. There are already strong hints that fewer *braceros*—perhaps 150,000 to 200,000 fewer—will be allowed across the border this year. This may, however, be no more than a temporary result of abnormal rainfall and late crops in the southern and southwestern United States.

Mexico is, generally speaking, well placed to ride out an economic crisis. Monetary reserves in hand stood at $439 million on April 11th. In addition, the government disposes of the usual drawing rights on the International Monetary Fund as well as of the possibility of obtaining $75 million from the United States Treasury on the basis of the United States-Mexican Stabilisation Agreement. This agreement was renewed for a two-year period on December 30, 1957. For reasons of its own security, the United States is committed to the support of the peso. Even during times of domestic economic difficulty, Washington cannot afford a really severe crisis in Mexican affairs. With subtle insight, Mexicans keep alive in the minds of American businessmen and diplomats the old phantom of a left-wing Mexico, faintly Trotskyite and openly "anti-Yankee." Mexicans have found that in negotiations with the United States Treasury such phantoms have their uses.



(To be concluded)

at the heart of modern transport

The staple diet of modern transport is still petrol and diesel oil fuels which, in the refining processes, rely on the use of SPENCE 'COMOX' catalysts.

THE BUSINESS WORLD

Courtaulds after the Merger

WHAT has induced the sharp recession in the rayon industry throughout the world? What has put Courtaulds on short time and cut the combined profits of Courtaulds and of British Celanese by £2½ million in the year to March 31st? Why is Japanese rayon filament production cut by half, European output by up to 40 per cent and output in Canada and the United States far below capacity? Since the merger with British Celanese the directors of Courtaulds are masters of nearly the whole British rayon industry, as well as of large empires overseas. Their report attempts an historical answer to these questions. In the post-war years Courtaulds expanded its productive capacity to catch up with a world textile shortage. Against a background of rising costs for new plant, for raw materials and for labour, the shortage was overcome and prices were held low. In this country man-made fibres secured a larger share of the textile trade. But in the same period the true synthetics, of which nylon and Terylene are examples, have made even faster strides and output of them is now large. When they observe that nylon has virtually eliminated viscose filament yarn from the hosiery trade, the directors record what every woman knows.

So the present plight of rayon arises from a surplus of capacity now that the world shortage of textiles has been overtaken and from the penetration—partly temporary—of rayon's former markets by other fibres. In dress goods, the pendulum of fashion has swung in favour of cotton. In hosiery, underwear and corsetry the newer synthetics have been ousting rayon; even the development of warp knitting in which both Courtaulds and British Celanese played a leading part in this country has been helpful to the newer synthetics.

Though the directors admit it only by implication, one can presume that there is a price incentive in these changes. Viscose filament rayon, though still the cheapest textile raw material, offers less inducement on price to manufacturers now either in mixture with or in substitution for other fibres. It seems to have been direct competition with cheap cottons to which the directors referred when they complained of "imports of cotton piece goods from India, Pakistan and Hong Kong which are completely unrestricted by way of quota or duty." But it is curious that the directors of a great international business living by foreign trade and overseas investment see nothing odd in demanding both protection against Commonwealth goods in Britain and still higher protection against British and other goods in Canada.

The "most difficult year for the rayon industry not only in this country but throughout the world," had little to relieve its starkness. The directors offer no forecast about the end of these troubles. Shareholders will hope that the chairman, Sir John Hanbury-Williams, will have more to say about the outlook and about the current trading, at the meeting on July 16th. Meanwhile there are two aspects of the company's business that offer a little more encouragement. The non-textile activities of the group—British Cellophane, Colodense (which converts cellulose films into bags), and the whole plastic and chemical sections—have continued to prosper. So did British Nylon Spinners in which Courtaulds and ICI are equal partners. It is now disclosed that British Nylon Spinners (whose accounts for the year 1957 were reviewed last week), not only paid an increased dividend, but this year has lent £4 million to each of its shareholders. The loans are free of interest and nominally repayable at three months' notice and they seem to have

been made out of money surplus to any foreseeable requirement. The Nylon company must have retained about £10 million of quick assets, and its projected expansion at Doncaster is to cost only between £3 million and £4 million. Courtaulds has put its £4 million loan mainly into short-dated gilt-edged (nothing longer dated than 1965 is held in the parent company's accounts and nothing longer than 1967 in those of British Celanese). So the two parent companies have paid themselves the nearest thing to a non-taxable dividend that the law allows, and in doing so Courtaulds has managed to make itself look more than ever like a gilt-edged trust with holdings up from £12.4 million to £18.4 million. At present Courtaulds clearly has no work for reserves on this scale. The climate is hardly favourable for investment in rayon, and there are at present only two major developments (both outside the rayon field) in progress —the "Courtelle" acrylic factory at Grimsby and a new factory for British Cellophane at Barrow.

To be over-supplied with cash and under-supplied with business is not a happy state as many a small rubber company could tell this textile giant. It is a symptom of middle age and it produces restive shareholders. They will expect of Sir John Hanbury-Williams next month an estimate of the outlook and a statement of Courtaulds' plans. Already loss of cachet by the company's ordinary stock has been marked—as the chart shows. Some of the events recorded in the present balance sheet—notably the maximum loss of £536,000 on the sale of FNF Machinery Manufacturing to the Thomas Tilling group are also irritating.

Most important of all, will stockholders share their chairman's confidence that the timing and the terms of the merger with British Celanese were right? By the end of the past financial year, the chairman asserts, "the concept of two groups had itself disappeared . . . a new tightly knit group was functioning satisfactorily and . . . the expected benefits of the merger were already being felt." It may be noted that the combined pay roll has been reduced from 38,593 to 31,481, though that is the result of trade recession as well as of the merger. But after this bold claim, the next sentence records that "in recent years the profitability of the operations of British Celanese has been falling steadily and sharply." The benefits already being felt last year must have accrued chiefly to former ordinary stockholders of Celanese who accepted the exchange into Courtaulds; they get an 8 per cent dividend, although British Celanese (with net income down by £280,000 to £370,000) pays nothing to its new parent.

For the holder of the ordinary stock, now standing at 23s. 3d. xd against last year's peak of 37s. 9d. and yielding 6.8 per cent, the future is less easy to assess. It is obviously not rosy, but much of the bad news and some of the fears must by now be discounted in the price. The over-strong cash holdings and current development plans suggest that a liberal dividend policy ought to be possible even in lean times. Courtaulds' share of British Nylon Spinners' profits alone would cover last year's dividend, so that there is time for new ideas and new vitality to show themselves. A new policy, it seems, must put less emphasis on the cheap end of the trade.

Secondly, hard times for viscose and acetate rayon—Courtaulds' basic products—will enforce still more diversification upon the group, as is happening to other textile companies. A large slice of the business already is non-textile and a large slice non-rayon, and these slices are now paying best. With the basis of a chemical industry in its control and research and experimental facilities firmly established, the temptation to seek for new products and new outlets must be strong. Such a radical change of emphasis in a company largely geared to the cheap end of textiles must take time to achieve. But diversification may still be the best long-run answer.

Testing Time for British Diesels

Diesel engine manufacturers are exporters *par excellence*. Of the total output of the British industry a good three-quarters is exported, either directly in the form of separate engines and parts, or indirectly when already installed in other machinery or vehicles. Without this export trade the industry could not achieve the volume of output it needs to bring unit costs down to economic levels. It therefore watches the graph of its export sales with an exceptionally keen eye; and when a consistent rise begins to level off, or even in some lines to begin to fall, as it did in 1957, the industry's self-analysis may have to be uncomfortably rigorous. Some of the blame can be fairly put on external factors beyond the industry's control, such as the recent upheavals in the Middle East, the growth of local manufacture in export markets, and the acute balance of payments difficulties which forced India, for example, to make drastic cuts in imports. But Britain's main competitors in this field—Germany, the United States, and, on a smaller scale, Japan—suffered from the same difficulties. Why then were they able to maintain their rapid growth in export sales in 1957?

Part of the answer may lie in the differences in the structure of the industries manufacturing diesel engines in these three main producing countries. Broadly speaking, the business of making compression ignition engines falls into three main groups: industrial (including locomotives); marine (including both propulsion and auxiliary equipment); and road vehicle (including agricultural tractors). To some extent firms tend to specialise in one or other of these groups and, within any group, on engines of a certain size range—heavy marine engines for example, or light vehicle diesel engines. But the boundaries are very blurred. According to the figures published by the Board of Trade, those makers in the United Kingdom whose primary concern is with industrial engines turned out £31.4 million worth of industrial compression ignition engines in 1957 (of which over £21 million were exported, directly or indirectly); but the same firms also made £7.4 million worth of marine diesel propulsion units and £4.3 million worth of marine auxiliary diesel units. Similarly, several makers of diesel vehicle engines, such as Perkins, whose fortunes are linked closely with the motor vehicle and tractor industries, are also important suppliers of industrial and marine engines. Some engine makers make nothing but engines; others make engines mainly to fit them into their own machinery; others, like the diesel engine makers in the Hawker Siddeley group, are part of a highly diversified complex of companies with common capital resources.

For these reasons it is very difficult to establish the degree of concentration of ownership and the degree of specialisation amongst the British makers of diesel engines. But even a cursory comparison with the German and American industries shows up important differences. The key fact of American competition in this field is the dominance of the General Motors Corporation. Outside the vehicle field it probably accounts for three-quarters of the total diesel engine business in the United States, and a somewhat smaller proportion of exports. Its strength in export markets lies chiefly in the smaller sizes of engine which are produced on such a large scale in Detroit that export prices fully reflect the benefits of mass production. In other fields, such as heavy marine diesels, which are more or less custom-built, American prices are rarely competitive in export markets—except with the assistance of Export-Import Bank loans which are tied to American equipment. In Germany, two firms, Klöckner-Humboldt-Deutz and Maschinenfabrik - Augsburg - Nürnberg (MAN), dominate the industrial diesel business. Between them they are responsible for perhaps 50 per cent of the total output, and a similar proportion of German exports.

In Britain, by contrast, the major part of the industry's output is provided by about a dozen competing firms or groups, no one of which stands head and shoulders above the rest in capital resources or range of output. There are many small firms in all three countries, and the total number of firms engaged in diesel production is surprisingly similar—about 50 each in Britain, Germany and the United States—but in the export markets in particular, British makers are usually competing with fewer but large German and American firms. There tend, moreover, to be more overlapping and competition between British exporters to any one market than between German exporters to the same market. German firms tend to concentrate their bids on particular lines; it is rare, for example, for Deutz and MAN to be found bidding against each other. But three or more British makers may be found bidding against each other on the same foreign tender.

There is a feeling in the industry that this wider competition among British makers may have two undesirable consequences. When a British firm gets a contract, it may have been forced down to a much less remunerative price than it would have needed to quote to beat only the German and American competition. And when several competing British firms are in the field no one firm, nor the group collectively, will be able to count on the official support which the single German bidder can expect from his government's overseas trade representatives. More individualist than the German producers, British diesel makers do not co-ordinate their export bidding in any way through a trade association; nor

have any export consortia been formed. But there are, very obviously, offsetting advantages to this keen competition between British firms in overseas markets—and complaints that this internal competition squeezes profit margins unduly make little sense when the contract is lost to German competition because, as has often recently been the case, the British price is too high. The main causes of the decline in British diesel exports in comparison with German must surely be looked for elsewhere.

TECHNICAL factors clearly play some part. As the table shows, the decline in exports of industrial compression ignition engines in 1957 was concentrated mainly in the smaller sizes—under 50 bhp—and was largely offset by gains in the larger sizes. To some extent this reflects the continued success of German air-cooled engines, which were first developed during the war for service in North Africa and which gave Germany an important technical advantage in the civilian market when it came back into world competition some time after the war. The air-cooled diesel engine is not particularly cheap, but it has distinct operational advantages in cold climates (though it is by no means confined to them) and low maintenance costs. About 15

BRITISH EXPORTS OF INDUSTRIAL DIESELS

	Direct Value (£'000)		Indirect Value (£'000)	
	1956	1957	1956	1957
Up to 50 bhp....	8,037	6,814	2,528	1,926
51–300 bhp	3,204	3,512	2,469	2,035
301–1,500 bhp ...	2,834	2,670	1,044	1,215
Over 1,500 bhp..	1,880	2,509	929	461
Total	15,955	15,506	6,970	5,687

German firms make air-cooled diesels, in ranges up to 300 hp, and although eight British makers have now entered the field, with engines up to 110 hp, they have much ground to catch up.

In other respects, the technical advantage probably lies with Britain. No German maker can produce high speed diesels as light and as compact as some of the British models. And in the heavy supercharged marine diesels up to about 12,000 hp, British makers have an enviable reputation—though the main weight of the research effort on the largest marine diesels of all, up to 22,000 hp, seems to be in Switzerland and Germany. The advantage may also lie with Britain, rather than with Germany, in the production of injection apparatus for diesel engines, which form a substantial part of the cost, especially of the smaller engines. Technically, therefore, with the exception of its belated start on air-cooled engines, the British industry should not be at any disadvantage. Price, rather than quality, may be the deciding factor in meeting German competition.

During the early postwar years, when German industry was only slowly being reconstructed, the British and American diesel makers had the field to themselves. When the Germans first came back they had one disadvantage—the difficulty of breaking into markets in which British and American firms had become established—and two advantages: new plant and equipment, laid out for mass production of a wide range of engine sizes; and short order books which enabled them to offer much quicker delivery than their British competitors. In time, as the British order books shortened, and the German books lengthened, this last advantage has lessened. But the aggressive selling techniques developed by German firms to break into new markets have persisted, and part, at least, of the recent German success is due to a willingness to quote very low prices, as a form of loss leader, in order to secure a foothold in new markets hitherto supplied by British or American diesels. The same principle has been applied to credit terms, though the advantages gained by German exporters may have been exaggerated, and however generous the institutional arrangements, some part, at least, of the cost of providing long credit must fall on the exporter.

More significant, but more difficult to establish, is the extent to which lower German prices reflect lower costs of production. Germany has an advantage in wage costs, and Britain in materials costs, but both gaps are narrowing. Many British makers too have re-equipped their factories and changed production layouts in order to take advantage of mass production methods. But, partly because of the dominant position of Deutz, Germany seems to have secured the benefits of large scale production over a wider range of engines. Further, there tend to be less frequent changes in the design of German engines. Models that are substantially the same as those marketed in the early postwar years—though sometimes cunningly masked by some new frills—are still selling well. By this means, German firms may be able to spread design and heavy tooling expenses over a longer run of output than their British competitors and, after the plant has been fully written off, cut prices sharply without making a loss.

This is fair competition and the British industry must look to its guns. Japanese competition too is becoming increasingly important, especially in Asian markets with the help of easy credit terms, and the Japanese might well spring some technical surprises on the West before long. Research into industrial gas turbines, which has been disappointing in Europe and America, has been given priority in Japan. Another dark horse, the free piston engine, is being backed by a research effort in Britain which, although not very large, is probably better co-ordinated than any abroad. But for the immediate future, the industry's success will be determined more by its organisation in production and in selling abroad than in research. There have been some attempts to rationalise production within several large groups of diversified producers. But in seeking fresh capital resources for re-equipment and expansion, and in spreading the risks by diversifying, the industry has still not been able to achieve the concentration of research and production effort that it will need to meet its competitors on equal terms.

BUSINESS NOTES

IN THE MARKETS

Settling Down at 5 per cent

MINIMUM reactions in the markets have followed the reduction to 5 per cent in Bank rate. Compared with the day before the announcement, gilt-edged were by the middle of this week a fraction lower, the *Financial Times* index of Government stocks standing at 83.25 on Wednesday, against 83.62 a week earlier. Industrials have advanced a fraction, *The Economist* indicator showing a rise of only 0.8 at 192.8 on the week. For the last few days the movement of the industrial market has on the whole been downwards. Few Bank rate changes have produced smaller movements in the market. That was only partly because few have been so accurately foreseen. It also reflects the fact the authorities have decided to remain seated firmly on the long-term rate of interest. It reflects also the repercussions on the market of troubles in the Lebanon, of a little weakness in sterling, and of the market's inferences from the Federation of British Industries' latest economic poll.

Holding the long-term rate of interest steady means in practice continuing to offer the Funding 5½ per cent stock (1982-84) at an unchanged price. The price was raised just before the stock went ex interest, which happened to be a few days before the Bank rate decision. There has been little change since; the current price of 99¾, if allowance is made for accumulated interest, shows hardly any change compared with Wednesday of last week. The policy of holding the price down, however, presents some problems of adjustment to those who have to plan other gilt-edged issues. Just what is the right price now for a first quality home corporation issue? This week the occasion of the lower Bank rate was used to break away from the 5¼ per cent series of corporation issues. Liverpool came to market for £6 million on a 5½ per cent stock, 1974-76, offered at 97½ to give a gross redemption yield of £5 14s. 6d., but lenders did not like the terms and 82 per cent of the stock was left with the underwriters.

Only the shortest sighted of City Councils can rejoice at getting its money on terms so finely drawn. Presumably there must now be an interval to be filled with other kinds of borrowing before corporation borrowers can come forward again. The real problem here is to establish a differential between corporation loans and a British Government loan whose status is slightly higher and which happens to be on continuous offer; the investor's answer seems to be that about two points is barely enough. The facts that the new AEI debenture, planned before the Bank rate decision, got off to a fine start and at once established a premium of 1½ points, while the Associated Biscuit Manufacturers' debenture was heavily over-subscribed, hardly affect the argument. Investment demand for sound industrial debentures largely exceeds the supply, and there is no continuous flow of new issues of them—as there will be with the home corporations if the market can accommodate them.

The Seasonal Swing

THE market is not now talking Bank rate down further. Guesses about interest rates can be quite hopelessly wrong, but the assumption of those who have to assume something is that interest rates might now be on a plateau on which they could with luck remain for some time. If, the argument runs, the autumn pressure on sterling is no more than seasonal, then the Bank of England must have taken it into account in the latest Bank rate reduction and might therefore be disposed to hold the present rate through the autumn. In that event there would be good prospects of some further reduction at the end of the year when the pendulum begins to swing back. A more than normal seasonal pull against sterling, forcing Bank rate up this autumn, would obviously be a danger sign.

Already the seasonal pull against sterling, though not heavy, is in evidence and the theory is being put to the test. Sterling held firm just after the reduction in Bank rate, at over $2.81, but this week it has touched $2.80½, while rates against Continental currencies, and notably against the mark, have also weakened. But the authorities have given no significant amount of support. The main cause of the recent adverse movement has been the seasonal demand from purchases of oil and tobacco. There has been little evidence of secondary psychological strain, and the forward rates have held firm. The forward discount against New York is a little below the interest parity.

These movements may suggest to some investors that an immediate further move in interest rates need not be expected and that it might pay better to wait and see how long the authorities remain seated on the long term interest rate. But some interest rates have still needed adjustment and others have probably still to come. The rates that local authorities pay in the mortgage market have moved slightly as the table shows:

	Before Bank Rate per cent	Now per cent
Seven day loans.....	5½–5⅝	5⅛
2–5 year mortgages	6⅛	6⅛
10 year mortgages	6⅛	6–6⅛

The Public Works Loan Board has not yet revised its rates but it would cause little surprise if it did so soon.

Bill Rates Now

LAST week's reduction of ½ per cent in Bank rate was followed by a cut of less than ¼ per cent in the Treasury bill rate at the Friday tender. The common bid submitted by the discount market "syndicate" was indeed adjusted by a fraction less than at the preceding tender, the increase of 1s. (compared with 1s. 1d.) bringing it up to £98 18s. 6d per cent; but as outside tenderers made rather larger increases in their bids, which at the previous tender had been outpaced by the syndicate, the average rate of discount fell by almost exactly the same amount, ½ per cent, to 4⅛ per cent. This is a shade above the rate immediately

before last September's increase in Bank rate from 5 to 7 per cent. At this level, as will be seen from the table, the margin below Bank rate, at nearly ¾ per cent, is notably wider than it was just after the previous reductions in Bank rate; yet now, at last Bank rate is at a level from which its next move could be in either direction. The market will certainly keep a close watch on sterling through the summer months of seasonal strain, and on the trend of money rates overseas. On both these counts, the latest portents argue against the likelihood of a further early reduction in Bank rate. This week the Treasury bill rate

BILL RATE AND BANK RATE

Bank rate	Treasury Bill Rate *before* and after change	Margin *before* and after change
5½—5 per cent, Feb., 1957	4·54 4·23	0·96 0·77
5 —7 per cent, Sept., 1957	4·23 6·60	0·77 0·40
7 —6 per cent, March, 1958	6·03 5·56	0·97 0·44
6 —5½ per cent, May, 1958	5·20 4·82	0·80 0·63
5½—5 per cent, June, 1958	4·51 4·29	0·97 0·71

in the United States showed its fourth successive rise, to a shade above 1 per cent, following the low point of 0.63 per cent at end-May. A Washington rumour that the policy of the Federal Reserve had switched from "increased ease" to maintaining "existing ease" was subsequently denied. But these uncertainties suggest that the scope for a further fall in London bill rates in coming weeks may be smaller than after the earlier Bank rate reductions.

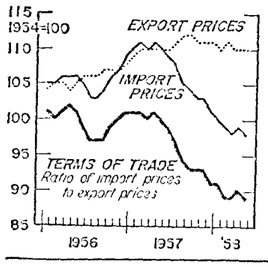
The table brings out some interesting historical correlations. On each of the three recent occasions on which a cut in Bank rate has been widely expected and "discounted"—in February last year, in March this year, and last week—the margin of bill rates below Bank rate has been nearly the same, at between 0.96-0.99 per cent. And the level of Bill rate before and after the latest change in Bank rate from 5½ to 5 per cent happens to have been almost exactly the same as on the occasion of the similar change in February, 1957—when the general atmosphere was quite different.

MIDDLE EAST OIL

"Participation"

THE concession agreement announced this week between the National Iranian Oil Company and a small Canadian concern, Sapphire Petroleums, is the third in succession—following those between NIOC and the Italian ENI group last year, and between NIOC and the Standard Oil Company of Indiana last month—to include the principle of the equal participation by the host government not only in the profits but also in the ownership of the operating company. Persia's new Petroleum Law does not preclude other arrangements, but the government has now made it clear, both in commenting on the law and in awarding new concessions, that participation in ownership is what it wants. The recent agreements between the governments of Saudi Arabia and Kuwait and a Japanese consortium also provide for government participation in ownership, but only in the more limited sense that each government may subscribe at par for ten per cent of the share capital of the operating company if it wishes to after oil is struck.

If one host government in the Middle East is offered better terms or receives a higher revenue per ton from one company, consultations between other companies and their host governments usually have to follow. With the full force of publicity—including as a novel feature the publication of each new agreement in full very shortly after it has been signed—to spur it on, it is not surprising that the Iraq government, for example, is already reported to be considering making new demands on the Iraq Petroleum Company. Any talks Nuri es Said, the Prime Minister of the Iraq-Jordan Federation, may have during his visit to London this week may well turn on what is meant by "better terms." To secure the political attractions of "participation," the Persian government has deliberately forgone much larger cash bonus payments and the security of the world-wide marketing outlets offered by the major integrated groups; the Saudi Arabian and Kuwait governments have done the same. But the real problem for Iraq, even more than for other Middle East producers, especially now that world demand is rising less rapidly for a time, is to find more outlets for its oil—and for a crude oil that contains a relatively large fraction of naphtha when most marketers want primarily fuel oil. Clearly the revenues earned by host governments in the Middle East are now more than ever dependent on the marketing facilities of the major oil groups. And in those circumstances the logical thing for a host government to do would be to make its oil less costly, and not more costly, than that of its neighbours. But at the same time the major oil groups cannot afford to ignore the real attractions to Arab nationalism of a partnership which extends beyond a share of the takings to a share in the ownership of the production facilities. This form of partnership does not upset the fifty:fifty profit-sharing principle. And it could have the advantage of showing host governments, even more clearly than does the "royalty oil" that they have been unable to sell on their own, just how important market outlets are in determining the maximum revenue their country can earn.



MOTORS

Still Breaking Records

IN spite of the Pressed Steel strike, which probably cut output by the British Motor Corporation and Rootes to the extent of some 10,000 vehicles, the motor industry was still producing at record levels in May. Its weekly output of 21,851 cars and 6,395 commercial vehicles was a record for any May in the industry's history, and the weekly average for the first five months continues to be a record: and in fact, though the weekly rate last month is still rather below that of March, in terms of unit output per working day it may well have been higher. This is extraordinarily impressive: the industry continues to do far better than most observers in other industries, and some inside it, expected could last.

Moreover, it is not catering for the powerful home demand at the expense of exports. The home market is obviously taking a bigger proportion of output than in the depressed first half of last year; but exports of cars in May were in fact a record, 47,892 for the month, and the United States is still the biggest overseas market. Neither at home nor abroad are commercial vehicles selling as well as cars: though output and exports are better than they have been for a couple of years, they are still markedly below the peak levels of 1955-56. Of the major companies, Ford is now working to more than its rated capacity. Vauxhall production is building up towards full capacity on its extended car plant, and the other "big three," BMC, Rootes and Standard, are all producing well above last year's levels.

IMPORT PRICES DOWN AGAIN

Import prices fell slightly again in May, after the previous month's seasonal rise. Export prices were unchanged, bringing the terms of trade back to their March level.

Wool, metal ores and scrap, and softwood were the main imports that became cheaper

Interim Report from the Railways

THE eye of vision was always needed to see the distant fruits of modernisation on British Railways. It still is. When the Transport Commission claim that their results in 1957 were not far short of expectations, they mean that the loss on their total operations was not painfully bigger than they had bargained for. They see the need to get on faster with modernisation and to secure further economies. Their confidence in the commercial future of British Railways "and indeed of their whole undertaking" is unimpaired. Some interim evidence is offered to support this dictum, and at this early stage of modernisation, the general public could not expect much more. It must dig into its pocket to meet last year's deficit of £68.1 million—and go on hoping.

Together with the 1956 deficit, that makes £125.6 million out of the £250 million that the commission can borrow from the Exchequer to meet the deficits accruing up to 1962. On present guesses, the deficit for 1958 might be a bit lower, but it could easily be that by the end of this year three-quarters of the borrowing powers had been used up—with another four years of potential deficits to go. The total of the Special Account set up a year ago to remove the red figures from the commission's revenue account is already £202 million. It amounts to a rescue operation on the grand scale.

Fuel rationing greatly helped the commission in the early months of 1957; but by the early summer that stimulus had been lost, costs of wages and coal increased again, and by the time fares and charges had been increased in the late summer, freight traffic was no longer expanding. Rising costs and falling turnover are no recipe for making railways pay. But on the passenger side, British Railways did well, and particularly where the services had been modernised. The commission are entitled to make much of this. They talk of "excellent financial results" from new capital expenditures; these "fine results" show that the customers will use the railways if the service is right and that diesel trains produce a quick return on capital.

This air of discovery of things that other countries seem to have proved long since is engaging. But the headaches will come in fitting a modernised freight service into an economy that has more transport than it needs, and in making the buses pay. It is futile to cavil at the uneconomic nature of much truck operation under C licence or of private motoring—and much wiser to concentrate, as the commission insist that they must, on getting their own costs down. Diesel locomotives, vacuum brakes, automatic coupling (work on which is described as "promising" with the answer "now in sight," so that we may presently see here the operating standards that prevail on such advanced railway systems as that of Iraq), new lay out at goods yards and better terminal handling—all these are the condition of making freight services pay. Getting them will be a much harder slog than installing a batch of bright railcars and smartening up the local timetables to fit them. Not until a lot more capital has been spent on these things will there be any prospect of marked reductions in costs and an opportunity for aggressive selling of railway freight service. One cannot build 53 new or modernised marshalling yards overnight, even though they may be well worth their capital cost, for they will allow 190 yards to be closed or partially closed.

Year after year the commission's reports have shown how the fall in the value of money affects their costs while their charges lag behind. The commission's own part in this process through its wage agreements would make a nice subject for side argument. But in real terms railway transport is among the better bargains that depreciated money can buy. An average hour's work last year bought 42 miles of train travel against 25 miles in 1948, and something of the same advantage is enjoyed by freight and bus passengers. Politics as well as economics affect the commission's power to match their charges to current levels of cost. They have a bigger interest than any other major industry in stable money values, for only with stable money can they entertain any serious hope of improving their revenues by 5 per cent and cutting their costs by 5 per cent and so getting rid of the annual deficit.

But there are no signs of pessimism in the latest report and no wish on the part of the commission to be relieved of any part of the discipline imposed on them by the special Act of February last year. In an economy no longer buoyantly expanding, BTC must naturally be worried about the volume of transport service that it can profitably sell. On the evidence of the 1957 report, however, any doubts on this score have not been allowed to get in the way of technical improvement and management reorganisation. The railways could have spent a good deal more on capital last year than they were allowed to do—but they did spend £137 million, which was one-third more than in 1956, and they have got another £25 million back from last year's cut to be spent on diesel locomotives and rolling stock in 1958-59. In the changed economic atmosphere, they may find that more investment money will presently be on offer, and they should be ready to make quick use of it while the signal is still green.

Meanwhile, the general public can welcome the first sign that new capital for the railways is being made to pay, and to that extent can be encouraged to expect well of the rest. There is no firm ground for rosy optimism about the future of the railways but at least there seems to be enough encouragement from the results of this early stage of modernisation to suggest that the sourer pessimists might be wrong.

THE STOCK EXCHANGE

Only a Little Ginger

A LANDMARK in stock exchange history comes with the announcement of the chairman, Sir John Braithwaite, that he will not seek re-election in a year's time. He will then have completed ten years of a notable chairmanship and the members, whatever their views on stock exchange reform, will have cause to be grateful to him. But the ginger group, campaigning for stock exchange reform, must have been disappointed with the results of the voting last week. Only two of their six candidates, Mr McKechnie and Mr Shaw, were among the successful twelve. All seven of the retiring members up for re-election were elected and the remaining three vacancies were filled by "independents" belonging to no group. The cause of reform naturally has not died with this election. Nor did these reformers first bring it to life. The point has been fairly made that many of their proposals had been raised by the late Mr Hargreaves Parkinson more than twenty years ago. In a heavy poll the reformers polled roughly as expected: they felt sure, it is believed, of at least 900 votes; their most successful candidate, Mr Shaw, polled just over 1,300, which was still far behind the head of the poll, where Mr Knox drew just over 1,800 votes. Mr Knox after the election was appointed joint deputy chairman with Lord Ritchie of Dundee.

The two successful candidates of the ginger group will find fellow spirits on the Council though they will be far from dominating it. It is odd that the defeat of their colleagues should coincide with the visit to London this week of the chairman and the non-member president of the Toronto Stock Exchange, where much that the London ginger group campaigned for is already in force. The president, Mr A. J. Trebilcock—a lawyer by training—can claim that thanks to a ginger group the Toronto Exchange has already been rebuilt once and a further rebuilding to take care of needs expected in a few years' time is in contemplation. The recording of prices at Toronto is fully electronic.

DRY DOCKS

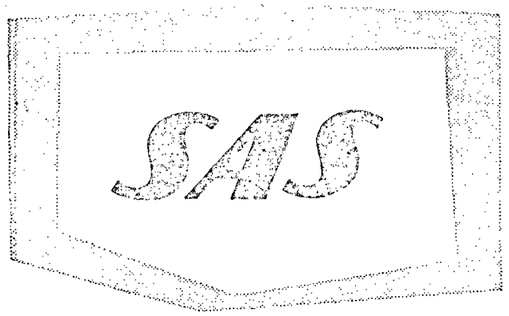
Room for the Big Tankers

OF the thousand or so tankers now on order throughout the world, more than 600 will be vessels larger than 30,000 tons deadweight, and more than 90 of these will be larger than 50,000 tons. Meanwhile, there are already in service over 150 tankers larger than 30,000 tons. This actual and anticipated increase in the number and size of tankers has revealed a shortage of dry docks large enough to accommodate them for essential surveys and repairs. Only seventeen commercial dry docks in the United Kingdom are capable of docking a 30-000-tonner, which requires a length of about 670 ft. and a width of 85 ft. Only three, at Tilbury, Southampton and Liverpool, could take vessels of 65,000 tons, and these are fully occupied with large passenger liners for most of the year. A new dry dock shortly to come into use at Falmouth has a length of 820 ft. and a width of 120 ft., which will accommodate a 65,000-tonner; and Vickers-Armstrongs have just announced that they are to build a new dry dock on the Tyne which will be 850 ft. long and 145 ft. wide.

The new Vickers yard will be able to take vessels of 80,000 tons, and it will be capable of being later extended to 1,000 ft., so that it could cater for tankers of up to 120,000 tons. Under construction at Newport and Birkenhead are docks that will go up to 50,000 tons, one at Swansea for 30,000-tonners, and there are schemes in hand for large docks at Milford Haven (1,000 ft. by 150 ft.) and Greenock (1,200 ft. by 120 ft.). This last proposal may qualify for the Government financial assistance offered in the last Budget to anyone building large dry docks in areas where there is unemployment.

PLUTONIUM

Mr Maudling Half Explains



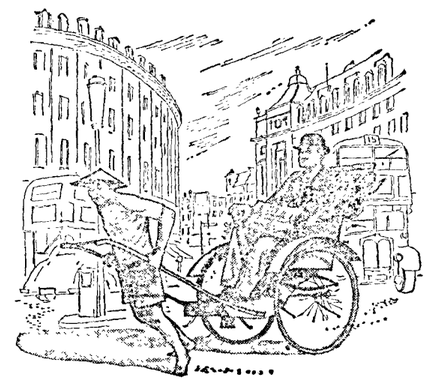
THE first government statement about the decision to equip four nuclear power stations so that they can, if need be, produce weapon-grade plutonium was made by the Paymaster General on Monday. He asserted that the addition of this equipment would "not in any way impair the efficiency of the stations." In essence, however, the difference in technique between running the stations at optimum efficiency for generating power and of running them for optimum plutonium output (as is now the case at Calder Hall) makes it impossible to tell whether the reactors are operating efficiently or not. One of the stations affected is the 500,000 kW station at Hinkley Point, which is nearly twice the size of the first two stations now under construction for the Generating Board. The design of Hinkley Point is a considerable advance on these and the guesses are that it could produce electricity at less than ½d. per unit compared with rather more than ½d. per unit for earlier stations. Whether such a reduction in costs can be achieved depends on the amount of work that the reactor can get out of each ton of fuel. After capital costs, the rate of "burn-up" of fuel is the most critical factor in the cost of atomic power.

If Hinkley Point is used to manufacture plutonium of weapon grade, this expectation about costs will never be put to the test for the compromise between producing power and plutonium will call for the more frequent removal of the fuel elements in order to extract the weapon grade plutonium built up in them during the process of reaction, and there will be no datum of performance from the running of the reactor flat out for power.

OIL REFINERIES

Esso at Milford Haven

EVEN those to whom it will bring new trade and employment must be saddened by the thought of a large oil refinery at Milford Haven. But in its announcement last week that work on the site is to start immediately, the Esso Petroleum Company gave specific undertakings to mitigate its effect on the beauty and amenities of the Haven and the surrounding countryside. As one of the few remaining sites for a deep water terminal capable of berthing the largest super tankers Milford Haven probably has no peer in Britain. Because of this Esso is prepared to incur the heavy "private" costs of elaborate measures to control pollution in an attempt to reduce the "social" costs



From Pole to Pole and meridian to meridian SAS service is supreme. SAS Global Network includes the two pioneer trans-Polar short-cut routes to California and Japan . . . regularly serves N. and S. America, the Middle and Far East, Africa, India . . . flies to 84 cities in 42 countries on 5 continents.

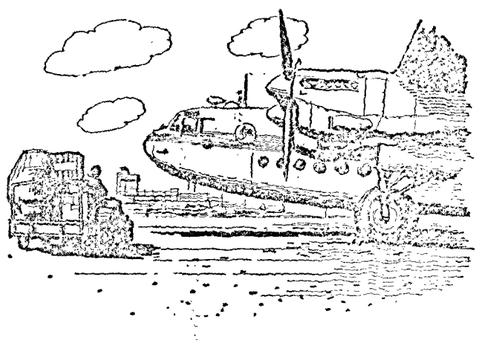
SCANDINAVIAN AIRLINES SYSTEM

Rickshaw in Regent Street

On your way to the Far East? Then make 9 Gracechurch Street, E.C.3, your first stop. Here you will find a mine of information on matters oriental. Wherever you may be bound – Colombo or Rangoon, Manila or Calcutta – we can give you an up-to-date picture of local conditions. We can brief you on such things as currencies and monetary regulations, and provide you with credit information. As the biggest British bank established by the Far East for the Far East, with branches in thirteen Asian countries, we are in a unique position to advise and help you. You are welcome to draw on our knowledge and services.



THE HONGKONG AND SHANGHAI BANKING CORPORATION

HEAD OFFICE: HONG KONG

LONDON OFFICE: 9 GRACECHURCH STREET · EC3

Offices in Europe and the United States and throughout the Far East

Distributors gain — and you profit

AFRICARGO pays off

Rapid, reliable air delivery means real cash gains to your dealers and distributors in Africa. They can carry very much less stock—so they save capital, save on storage and insurance, don't risk goods deteriorating or becoming out of date. Naturally, they prefer to order from firms who freight by air—and that's where you profit.

You gain even more when you use Africargo. As the only *all-cargo* air service to Africa, we can guarantee absolutely firm bookings, specialist care and handling for your products, expert advice on packaging, routeing and insurance. And our aircraft can carry freight whose bulk or tonnage would otherwise make air shipment impracticable.

Expensive? Not at all. Packaging is usually much cheaper than with sea transport—often a dust cover alone is quite enough. Insurance, too, is cheaper—because there's much less risk of damage or pilfering. So total air freighting costs compare very favourably with those of sea shipment.

A few of the many firms who use Africargo

Citroen Cars Limited · Vauxhall Cars Limited · Coty Limited
Kodak Limited · Rank Precision Industries · Rootes Limited

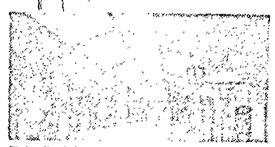
Quaglino's

FOR THE BEST IN BANQUETING



QUAGLINO'S will open London's newest Banqueting Suite on October 1. Here will be provided the good food, good wine, and good service which have made Quaglino's famous. The accommodation available ranges from rooms suitable for small business luncheons up to the spacious ballroom holding 400 guests for a dinner and dance.

Please write or telephone:-
THE BANQUETING MANAGER, QUAGLINO'S,
BURY STREET, LONDON, S.W.1. WHITEHALL 6767.

If you are *considering factory premises* study the advantages of Tyler Pre-Cast Reinforced Concrete Buildings. Tylers are specialists in this field, and the skill and experience of many years of development and research is self-evident in every structure they produce. Design is practical, finish is clean and "marble" smooth, and erection—by Tylers' own skilled teams—speedy and simple.

The swift expansion of premises with the minimum of inconvenience for saving of time and money, for a really well-designed building—you cannot do better than get in touch with Tyler. *Please write for literature.*

Tyler Buildings are manufactured in accordance with current British Standard Specification Code of Practice C.P. 111/57.

incurred by the refinery and to preserve the goodwill of consumers.

Tankers arriving to load finished products from the refinery must carry some ballast, but this will be discharged, as happens at the Fawley refinery on Southampton Water, into special shore tanks, from which it can be passed through separators to remove any oil from the water before it is returned to the sea. Air cooling systems will be installed—again on the Fawley model—rather than salt water cooling which, by its tendency to cause corrosion and leaks in the oil pipes, might have discharged polluted water. Again, as at Fawley, the Milford Haven refinery will have extra high stacks to reduce the air pollution in the immediate neighbourhood. And like almost all modern refineries, it will also incorporate plant to reduce the sulphur content of the distillate fuels it makes. At Fawley refinery some £750,000 had to be invested in anti-pollution equipment and on top of that it costs £100,000 a year to prevent pollution. Milford Haven's refinery is smaller and less complex, but the cost of anti-pollution measures there is unlikely to be much lower. It would be surprising if oil refineries and chemical plants on the Continent accepted legal or moral obligations to pay as much to reduce social costs as they do in Britain.

COAL

Mining by Water

One of the technical developments in Russian coal-mining that most impressed a National Coal Board team that toured the Kuzbass, Donbass and Rostov coalfields in mid-1956 was "hydraulic mining": the board is now going to try out this technique at a drift mine at Trelewis in Glamorgan. Essentially, this is a further development of NCB experiments with the hydraulic transport of coal by pipeline: here one uses high-pressure jets of water to break down coal from the face, to wash it away through a screen into a sump at pit-bottom, and then to pump-up the slurry of very small coal and water into setting tanks, from which cleaned water comes to the hydraulic system.

At Trelewis, where the coal is of medium hardness in a rising seam, it is expected that the jets of water at pressures from 600 to 1,200 lb per square inch will be enough alone to bring down the coal: in the experimental mine in Russia that the team saw in 1956 the coal was sometimes loosened first by the established technique of "pulsed infusion" (itself a kind of hydraulic "shot-firing" by which shocks are directed into the coalface through water). The British hydraulic mining will begin at the top of headings driven to the higher edge of the seam at Trelewis and "retreat" downwards, which should help the water flow to wash the broken coal down. At the outset the larger coal will be screened out of the water above the sump and hauled to the surface by conveyor: later, the mining engineers hope to pump up this "lump" coal too.

In Russia, productivity three to five times as high as in conventional mining had been achieved with these methods (3½-4½ tons per manshift "overall" in an experimental mine and 12-15 tons per manshift underground in part of an existing conventional mine): power consumption for compressing the water was about 32 kwh per ton in mid-1956 but was hoped to come down to 26 kwh, and the power can be generated on the surface without the usual coalmining expense of flameproof equipment. There is virtually no danger of conventional explosion (though water at 20-40 atmospheres with a velocity of say 300 feet per second could have some lethal qualities all its own if a pipe or manifold were to burst): the underground equipment is fairly simple and easy to move. For the operator, this sounds to be a pretty messy and uncomfortable job, though not a laborious one: but the output per manshift could turn out to be as great as in opencast mining, so that the miner should at least be paid well for his soaking labours.

ATOMIC ENERGY

OEEC Takes Stock

The OEEC's European Nuclear Energy Agency came officially into being in February of this year and the steering committee that drafted its policy has now published a first report on plans for the new agency. These prompt the suspicion that in spite of protestations to the contrary, the OEEC organisation is more likely to be competitive with, than complementary to, the Euratom organisation of the six Common Market countries. Like Euratom, OEEC has spent a great deal of time discussing the need for nuclear power in Europe, but the ultimate purchasers of power stations are the electricity authorities of different countries and the OEEC agency's practical work to date has been concerned not with present but with future forms of power.

It is building in Belgium—a country that belongs to Euratom—a chemical plant for the small-scale treatment of used fuel elements. The plant itself is a pilot venture with a capacity sufficient only for Europe's research reactors. A few days ago OEEC completed the formalities by which it will actively sponsor in Norway—a non-Euratom country—the building and testing of a Norwegian-designed boiling water reactor, the first heavy water reactor to be built on this system. This could be the prototype of future power stations, and the Norwegian effort will be helped by financial contributions from other OEEC members who will have access to the results of the work. A similar arrangement has been under discussion with Britain, which again does not belong to Euratom, but the reactor first considered has now been dropped from Harwell's programme. A small reactor of the tricky "homogeneous" type was built at Harwell, and it was thought that Harwell and OEEC between them might build a bigger version at the new research station at Winfrith Heath. But the results at Harwell were not encouraging; the plan for a big reactor was dropped and OEEC support is now likely to be switched to the high temperature version of the classic Calder Hall reactor that is now being built at Winfrith Heath in two sizes, one very small "zero energy" plant and a second much bigger reactor of perhaps 10 MW.

RUBBER

Supplies in Balance

This month's meeting of the International Rubber Study Group in Hamburg has produced useful additions to the fund of knowledge available to the rubber market. The Study Group's estimates of production and consumption of natural rubber come out almost exactly in balance; production is put at 1,920,000 tons and consumption at 1,915,000 tons. The market had been assuming that there would be a surplus this year though not a large one. These figures

suggest that there need be no problem at all. Such estimates, however, are always exposed to wide margins of error: no one knows what the Russians will consume. The best that can be said about the estimate is that the Russians, whose consumption is estimated from exports to them and is therefore in effect calculable two months in advance, have already contracted for a high proportion of the tonnage they are expected to consume this year, so that the possible margin for over-estimating is not enormous. There must always be some doubt about any Indonesian estimates of production but the latest news, particularly from Sumatra, does not suggest to market people that the estimate of Indonesian output this year—680,000 tons—is likely to be exceeded.

There is also a big doubt about the future of consumption of natural rubber in the United States this year. That is estimated at 482,000 tons, it being argued that consumption in the early part of the year has been so low and stocks run down so sharply that it was right and necessary to allow for some recovery towards the end of the year. A little recent buying by the United States of July rubber suggests that this may already have started. The Americans, much more readily than usual, have also given an assurance that they are not about to dispose of rubber from their strategic stockpile. "The present disposal policies remain unchanged. . . . Materials in the United States stockpile in excess of objectives are not to be disposed of if disposal would disrupt the market." With that assurance the rubber trade is feeling that a firmer basis has been established at the Hamburg meeting and a firm price for spot rubber at around 23d. per pound has followed.

TIN

USSR—RSVP

PERTURBED by Russian and, to a lesser extent, Chinese sales of tin, the International Tin Council, having made discreet approaches as long ago as April, has taken the obvious step of officially inviting Russia to join the International Tin Agreement as a producer member. How will the Russians reply? The Council seems to believe its invitation to be a test of whether the Russian self-professed interest in the well-being of the underdeveloped countries is genuine. The marxist counter is obvious: the Russians might talk of a cartel of exploiters. But that would be mere word play. Looking to her own economic self-interest, why should Russia join in the agreement and voluntarily curtail her exports when without joining they can use the control to provide them with a guaranteed minimum price for an unrestricted output? So long as the buffer stock scheme does not collapse, it pays, though it may be uncooperative, to remain an outsider.

The Council's resolution to invite Russian participation is to be accompanied by a fresh approach to the United States, the world's biggest consumer of tin, Western Germany and Japan. Should the United States change from benevolent neutrality towards the agreement to active participation within it, Western Germany and Japan would probably follow suit. But the American contribution—the fact that it refrains from selling its formidable stock—is already worth having.

At last week's meeting, the voting power of the members of the agreement was slightly changed, with the United Kingdom's votes being raised from 370 to 388. The Council also agreed in principle to quota restrictions for the last quarter of the year, though details of permissible exports will not be fixed until the next meeting at the end of July. Until the end of September the 40 per cent export restrictions will remain in force.

OIL RESERVES

No Widow's Cruse?

FEW statistics are subject to as much misinterpretation as the figures of "proved" oil reserves. The common fallacy is to relate these proved reserves to current world consumption of oil and deduce that the reserves will be exhausted in so many years' time. This calculation made in 1951 would have given the oil industry a 24-year life; the same calculation made in 1957 raises its life expectancy to 40 years—and in the meantime no less than 4,558 million tons of oil have been produced and consumed. The answer is that many more reserves are "proved" every year than are produced and consumed—and only about one per cent of the sedimentary basins of the world have been intensively explored for oil so far.

A more sobering comparison was made by Dr Schumacher, the Economic Adviser to the National Coal Board, in which he related "possible" reserves—the highest possible figure of the reserves that might be "proved" in future—to the consumption of oil on the assumption that consumption continues to rise at a cumulative rate of over 6 per cent a year, as it has for the last fifty years. This gave him a life expectancy for the oil industry of only about 35 years, up to the early 'nineties, unless either the figure of possible reserves were too low or the consumption of oil rose less rapidly than in the past. Dr Schumacher anticipated criticism of his "possible" reserves by using the highest figure he had ever seen published, including natural gas, and also including oil from shale and tar sands which are at present far too costly to exploit. But even on this basis the total recoverable world oil reserves, which Dr Schumacher quoted as 200,000 million tons, would be less than six times the total of the world oil reserves already proved—without counting proved reserves of natural gas or oil from shale or tar sands.

The geologists have accepted this challenge. In a recent article in the Bulletin of the American Association of Petroleum Geologists, Mr Lewis Weeks, the chief geologist of Standard Oil (New Jersey), puts the world's potential recoveries of oil and gas higher than his more conservative colleagues—although he still regards his own estimates as conservative. Mr Weeks estimates world potential reserves, both proved and unproved, of crude oil and natural gas liquids that could be recovered by conventional primary producing methods under today's economic conditions at 1,425 billion barrels—about 200,000 million tons, or roughly the same as the estimates quoted by Dr Schumacher. But in addition to these primary resources, Mr Weeks thinks, secondary recovery methods may eventually produce as much oil again; natural gas reserves with a calorific equivalent of another 1,000 billion barrels of oil have also to be taken into account; and as Mr Weeks allows for no rise in the real cost of finding and producing oil he has not included oil from shale, tar sands, lignite or coal. The oil industry's "actuaries" have no reason to be Jeremiahs.

HELICOPTERS

Landing in London

TWO Government departments, two local authorities and a public corporation have approved Westland Aircraft's application to build a helicopter landing platform on the south bank of the Thames not far from Battersea Park and rejected a similar application from Rotorports to erect a platform near Vauxhall Bridge. The scheme will cost Westland £60,000; if work starts in August the station should be ready by the end of the year.

Who will use it? Westland, as helicopter manufacturers, have enough evidence to show that a good many helicopters, military as well as civil, would make flights to London if a landing site was available. Since the helicopter station on the South Bank was closed the one site in fairly regular use has been the lawn of Buckingham Palace. The amount of traffic that might come into a public station is put at

HOW INDUSTRY SEES IT

Below What Capacity?

MORE than three-quarters of the 554 firms that replied to a questionnaire from the Federation of British Industries about their state of business at the end of May said that their present level of output was below capacity. This would be undoubtedly the most striking result of the survey (the second that the FBI has carried out this year) if anybody knew quite what it meant. The federation's economic policy committee wrestled with definitions of capacity to advise its industrial respondents, and decided finally to suggest none (and its deadpan question "Is your present level of output below capacity?" was perhaps less than ideally "neutral").

Capacity is often virtually impossible to measure in many complex manufacturing plants, and in practice not at all accurately measured in most others. The FBI would hope that its member companies, in replying, were thinking of "capacity" as the utmost that they could comfortably and profitably maintain from existing plant: but it does not know how they reckoned it. Nor does this form of questionnaire offer quantitative answers on this or any subject. All one can deduce is that at face value, most concerns in this cross-section of big industry and small, in Britain in mid-1958, think they could reasonably be doing more business than they are. It is best considered alongside another key question: "Do you feel more, or less, optimistic about the general business situation than you did three months ago?" Most of the "top people" in business replying felt just about the same: but more than 30 per cent were more pessimistic, and less than 20 per cent were more optimistic.

The FBI's chosen form of questionnaire simply asks businessmen to record how a variety of factors have changed during a given period: up, down, or not at all. Its sample is not a bad one of the whole of industry, in terms of size of firm and broad divisions of activity, reckoned by the share of employment and production these different categories represent. But in terms of numbers, big firms are far more adequately covered and these tend, as in the first survey, to be on the whole more pessimistic, and reporting more adverse trends, than small firms. As between industrial groups, the companies in food, drink and tobacco seem to be strongly up from the average on output and orders, and those in textiles, clothing and footwear to be markedly down. The "voting" is as in the United Nations, every answer counting one: Imperial Chemical Industries (except when its divisions, big firms in themselves, may answer separately in different industrial groups) ranks no more than equal with any of the 144 firms replying that have less than 200 employees.

A large proportion of the answers to any of the questions in the table so far have been, and perhaps would always be, "No change." With this as a proviso of which one cannot yet assess the importance, one is inclined to look for trends in the balance of answers between "up" and "down." In February, the balance was slightly "up" for output and on work in progress and stocks of finished goods (which may or may not suit a firm at any given time): on home and export deliveries, hours worked, numbers employed and new orders, more firms were reporting "down" than "up," and the same applied to profit margins. At the end of May, the picture was a little gloomier: on almost every factor surveyed, the balance showed more firms "down" than "up," with the probably unwelcome exceptions of unit costs and stocks of work in progress and finished goods. But as the FBI comments, there were still an encouraging number reporting higher home and export deliveries, and new orders still increasing.

The mirror-image of this effective disinflation was reflected in the labour market: with the most decided "majority" in the whole survey, 59 per cent of firms found it easier to get the labour they needed at the end of May than three months before, and only 2 per cent of them were still finding it harder. On this year's key question of investment, with five months of the year gone, businessmen were still on balance expecting to authorise less capital spending in 1958 than in 1957 (which means to do less construction in 1959-60, say than in 1958-59), but this number of voices at any rate, is no greater than four months ago.

THE SUPERLATIVE CITROËN D.S.19

You've only to drive it to appreciate why it's ten years ahead of its time

Words are worthless when you're trying to describe the D.S.19. For this is the car that's *ten years ahead of its time;* only through driving it are you able to appreciate the amazing hydro-pneumatic suspension . . . the tenacious road-holding . . . the ease of handling . . . the braking . . . the cornering . . . the completely new kind of motoring it offers. These things, any Citroën owner will tell you, spoil you for any other kind of car . . . but, go on, try it just the same!

D.S.19 performance is *proved*—not only by first-time success in the Monte Carlo Rally but by thousands of owners all over the world. Get one of the 100 Citroën dealers in this country to give you a demonstration. For the name of your nearest agent and full details of the D.S.19 and other Citroën models write to the address below.

ONLY IN A CITROËN D.S.19 CAN YOU ENJOY ALL THESE ADVANTAGES—
no other car has more than two of them

- Hydro-pneumatic suspension — the most advanced in the world—keeps car at same height and on even keel giving unbelievably smooth riding whatever the load, camber or surface. *Exclusive to Citroën.*
- Power-operated front-wheel disc brakes (standard brakes for rear wheels) with twin pedals—hydraulic and mechanical—for instant halting always. *Exclusive to Citroën.*
- Hydraulically-assisted rack and pinion steering feather-touch, finger-tip control. *Exclusive to Citroen.*
- Front wheel drive, low centre of gravity give maximum road-holding . . . high-speed cornering.
- Hydraulically-operated gearbox. Clutch automatically disengages below minimum r.p.m.—*engine cannot stall.*
- Single spoke steering wheel and new-angle steering column minimise danger to wrists and chest—make Citroën safest to drive. *Exclusive to Citroën.*

Plus (amongst other things)

- Seating for six—in comfort. Oversize boot—17 cu. ft.
- The best all-round visibility of any production saloon.
- Genuine top-speed of 87-90 m.p.h., 28-30 m.p.g. at 45 m.p.h.

Price—£1,150 plus £576. 7. p.t.

Don't just keep up—get 10 years ahead with a CITROËN

NOW! also available: the New I.D.19 £998 plus £500.7 p.t.

CITROEN CARS LIMITED · Trading Estate · Slough · Telephone: Slough 23811

20 helicopters a week carrying perhaps 100 to 125 passengers. Once the platform is built, no elaborate facilities are needed and the company intends to charge a low landing fee of 25 shillings for a 4-seat helicopter.

Westland's licence runs for seven years. The first users are expected to be private and chartered helicopters; these are not burdened with requirements about carrying floats and anchors that were imposed on BEA's regular helicopter services. Chelsea may have its own views about the prospect of helicopters drumming their way along the river. Yet Westland's experiment deserves to be welcomed on the grounds of its modest cost and of the opportunity it provides for assessing the value of helicopters for inter-city travel.

SHORTER NOTES

British shipping companies wishing to raise capital in this country, though they will have to continue to apply for consent from the Capital Issues Committee, will now find it easier to secure short-term loans from the banks to finance their shipbuilding programmes. That much was revealed by a Treasury spokesman when, in amplifying a statement by the Minister of Transport, Mr. Harold Watkinson, he said that "applicants will now find that, whereas consent may previously have been given on condition that the finance was raised from non-banking sources, no such conditions will be attached to consents given in the future." The concession is smaller than shipowners had been led to expect by Mr Watkinson's original statement.

* * *

The Government is to build a new factory at Swansea to house the Prestcold refrigeration division of Pressed Steel, Ltd., which will move there from the company's Cowley and Theale factories when the factory is completed early in 1960. This will be a factory of 600,000 square feet floor space, costing up to £2 million: Pressed Steel will take a 21-year lease on it with an option of renewal. Eventually the plant will employ 4,000 people: only key people, on a voluntary basis, will be transferred from the existing factories, and the company expects to transfer the rest of their labour force on to motor body manufacture.

* * *

The lawsuit over Sir Charles Colston's proposal to wind up a £300,000 trust for Hoover employees and ex-employees was settled last week. The £300,000 paid to Lady Colston is to be repaid and held on the trust under the original and supplementary settlements; the three existing trustees are to retire, and Sir Charles is to appoint three other trustees nominated by Hoover Ltd., and to thereafter release his power of appointment of new trustees. As a result of the action certain educational charities will be somewhat disappointed: but the six employees of Hoover Limited have agreed that on the termination of the trust in 1968, £100,000 shall be distributed between New Hall, Cambridge; Bristol University; Colston's School, Bristol; and Stowe School.

* * *

The American Northeast Airlines is not expected to take delivery of the six Britannia airliners that it has on order, in spite of the fact that the Bristol Aeroplane company has met all the conditions laid down. Northeast may instead buy 10 Vickers-Armstrong Viscounts, the smaller aircraft being better suited to the limited traffic on Northeast's routes. Five of the Britannias may be taken by BOAC on terms that have yet to be decided.

* * *

Mr Graham Page last week withdrew his private Wages Bill. This bill would have permitted, within rather narrow limits, the payment of wages by cheque, which at present might be held to contravene the Truck Acts. The Parliamentary Secretary to the Minister of Labour said he would "consult" the Minister about the matter, but gave no further undertaking.

COMPANY AFFAIRS

ROLLS-ROYCE

"THE Government White Paper on Defence altered the whole future of the aircraft and aero engine industry, and finally defined the change of emphasis from the provision of equipment for the fighting services to the fiercely competitive business of selling aircraft and engines in the international markets." This is how Lord Kindersley, the chairman of Rolls-Royce, describes the malaise of the British aircraft industry. He does so as the spokesman of the strongest unit within that industry. That strength, recognised in the yield of 4.6 per cent offered by the company's £1 ordinary stock at 87s. 6d., goes beyond figures, though these must be judged satisfactory with sales rising last year from nearly £80 million to over £91 million, with profits, after charging more for depreciation and development, edging up from £4,605,000 to £4,701,000 and with the ordinary dividend left unchanged at 20 per cent on the increased capital. Such figures meant that Rolls-Royce could come successfully to the market and raise £10 million by the rights issue of ordinary stock last year, with the result that the spending of nearly £6 million on capital account last year and outstanding commitments of nearly £3½ million can be faced with equanimity.

The real strength of Rolls-Royce lies in the technical qualities of its aero engines for its interests in motor cars, oil engines and nuclear reactors can be looked upon as useful sideshows. Rolls-Royce supplies engines to almost every aircraft manufacturer in this country and to a great number in other countries as well. Hence it is in Rolls-Royce's interest to see, first, a growing international market for aircraft and, secondly, a strong British aircraft industry. Rolls-Royce has already geared itself to an international market for last year the increase in sales, Lord Kindersley explains, was "almost entirely attributable to deliveries of aero engines for civil airlines and overseas governments" and over the year its order book

grew from £90 million to £112 million, again "attributable to work for civil aircraft and foreign governments including a substantial order from the German government for 'B' range petrol engines for army vehicles."

As for the need for a strong domestic aircraft industry Lord Kindersley argues: "A sound aero engine business demands a comprehensive range of engines. The cost of maintaining the kind of development organisation and facilities for this purpose can only be defrayed from a very substantial turnover, of which only a small proportion can be expected to come from the nationalised corporations and the British

independent operators. Even with our military programmes today we are dependent upon exports for more than 50 per cent of our total engine production, and a substantial part of this is represented by sales of military equipment to foreign governments. If the domestic effort on military types is to decline, this market will inevitably go to the USA."

He adds: "If our stockholders are to be asked to carry an increasing share of the substantial cost, they are entitled to expect the Government to give some practical demonstration that they are wholehearted in their desire to see the industry succeed in its task."

HANDLEY PAGE

WHEN an investor turns from the accounts of Rolls-Royce to that of any other aircraft company he must be struck by the contrast. Defence orders are running down, the Government has cut its development aid, and the "rationalisation" of the industry is noised abroad. All the British aircraft companies have to ask themselves: where do we stand? Investors in aircraft shares ask themselves the same question and one of the answers is that the 5s. ordinary shares in Handley Page—one of the oldest companies in the industry—stand at 6s. and on the repeated dividend of 15 per cent yield 12½ per cent. What reassurance will they draw from Sir Frederick Handley Page's statement accompanying the full accounts for 1957?

The fall in the group's profits from £680,546 to £316,707, Sir Frederick says, is largely attributable to delays in the production and delivery of "Victor" bombers, caused by the demand from the Ministry of Supply for extensive modifications. But, he adds, "we are likely to continue to function at full capacity on the production of the Victors and on their maintenance for several years to come."

But, outside these military orders, what are the prospects? The group, like other aircraft companies, is short of money: its stocks have risen from £4,505,700 to £5,917,383 and its bank overdrafts from £220,759 to £1,385,837—a high figure to set against net assets of £3,710,448. Moreover, the group itself has had to pay for the development of the short-ranged civil aircraft, the "Herald"; last year it spent £518,698 on the development of this aircraft, changing its engines from pistons to turbo-props and bringing the total expenditure up to £2,003,360; in addition the group has invested £1,005,882 in jigs, tools and production facilities for this venture. Over £3 million on one aircraft is a big investment for a company of the size of Handley Page and investors must wonder what number of "Heralds" the directors hope to sell. They will note that Sir Frederick also says: "It is foolhardy to put all eggs in one basket. For that reason and in the light of the present condition of the aircraft industry, the nucleus of a commercial division, newly formed by us, is actively investigating the possibility of broadening the basis of your company's production."

FINE SPINNERS

YIELDS of 12 per cent are now common on cotton shares, so that the shares of the big combines have to be looked upon as income stocks, with a big risk element appended. In the year to March 31st, Fine Spinners earned enough to repeat its ordinary dividend of 10 per cent for the third consecutive year. This payment was made but short-earned in 1955-56, in 1956-57 it was barely earned, but in 1957-58 the cover on the dividend was slightly improved. The group's trading profits advanced from £1,864,048 to £2,102,787 and the net profit rose by £95,103 to £509,256. The ordinary dividend costs £321,424, and the amount retained has almost doubled from £69,059 to £127,358. Unfortunately this is not quite the unbroken improvement it appears to be: last December the directors said that the results in the first half of the year reflected a period of good trading, but that conditions had since deteriorated. At 16s. 6d., the £1 ordinary units yield 12.1 per cent. That does not look far off the mark, for Fine Spinners, which has not been slow in rationalising its production, specialises in the better quality cotton yarns least affected by the inroads of cheap imports from the East.

BLEACHERS' ASSOCIATION

BLEACHERS' 12½ per cent ordinary dividend for the year to March 31st was subjected to "very careful consideration" before it was decided to maintain it, for profits continued to slip downwards. In the latest year the fall was slight; gross profits declined by £34,216 to £1,246,106 and net profits by £15,521 to £337,122. The dividend, which has now ruled for four consecutive years, absorbs £137,236, while £175,000, including £50,000 arising from an unused tax provision, is put to reserve. Mr Philip Wright, the chairman, explains that since last July order books in the producing sections of the cotton industry have contracted steadily. Imports from the Commonwealth continued to increase in 1957. Bleachers' Association continues to finish much of this cloth, but Mr Wright thinks that it is only a matter of time before the finishers too, including Bleachers, lose the trade. Exports from Britain were affected both by the growth of local production and by balance of payments difficulties which compelled primary producing countries to cut down imports. In the chairman's view "the contraction in the cotton industry which is already taking place will continue," and like others he hopes for a solution by diversifying the business. That at best is a long-term hope. For this year, though the immediate prospects are most discouraging, the weakness in demand, he believes, is partly transient and he hopes that the current year's results will not be too far below those of the past year. At 11s. the 10s. ordinary units yield 11.4 per cent.

LAND SECURITIES INVESTMENT TRUST

MR HAROLD SAMUEL, the chairman of Land Securities Investment Trust, describes the policy of this property group as "one of continued expansion." The expansion is not based on anticipated benefits from the Rent Act, for Land Securities has little rent controlled property on its books. It is based on redevelopment—the building of blocks of offices and shops. These are let at up-to-date rentals. In the year to March 31st the book value of the group's freehold and leasehold properties rose from £29.8 million to £31.9 million and the way was prepared for further expansion by the issue of £3.5 million of debenture stock.

The net rent roll of the group expanded from £1,357,325 to £1,437,713 and its net income from £222,812 to £253,673. That was sufficient to allow payment of a 7 per cent ordinary dividend (against 5½ per cent); the new dividend, absorbing £181,125, and the preference dividend, absorbing £71,156, take nearly all the net earnings. Distribution policies so far up to the hilt will benefit from the change to a single tier profits tax and Mr Samuel, though he admits "the difficulties of forecasting future profits," feels able not merely to predict an improvement in net earnings but to forecast a dividend of not less than 12 per cent for the year to March 31, 1959. The 10s. ordinary shares now stand at 21s. so that the projected dividend yield is 5.7 per cent.

BRITISH AND COMMONWEALTH SHIPPING

SINCE the end of May, when the directors of British and Commonwealth Shipping announced an ordinary dividend of 20 per cent (against 17½ per cent) and another 5 per cent scrip issue, the company's 10s. shares have risen 7s. to 37s. 9d. (to yield, assuming 20 per cent again on the increased capital, 5.6 per cent). That is a big rise when freight rates are low and tankers and dry cargo vessels are laid up. It is a big rise, too, when it seems unlikely that British and Commonwealth Shipping will be able this year to hold its trading surplus at the 1957 level of £11,994,000 or even the 1956 level of £11,053,000; in both these years the company gained from some months of high freight rates and in 1957 from the carry-over of uncompleted voyage accounts.

But the recent buyers of the shares may find some justification for their venture in the accounts for 1957. On earnings, they will note the directors' comment:

"Essentially, this is not a tramp business; in the main we provide regular services, and it is this regularity of service which attracts a regular volume of cargo and passenger trade. . . . Accordingly, while high rates and other favourable factors may provide the cream, the bread and butter depends on our ability to keep our liner services fully employed."

Nor is the group heavily committed to tankers, and it has now decided not to build three tankers scheduled for delivery in 1959, 1961 and 1964 and to use the berths thus made available to build three dry cargo vessels. The group's capital commitments amount to nearly £38 million, of which nearly £16 million is covered by net current assets. To cover the rest of the programme, the directors say, "earnings must be maintained at a reasonably high level but not one which should be beyond our capacity to achieve." These are refreshing words from an industry which, even with investment allowances of 40 per cent, has often made much of its problem of financing replacement.

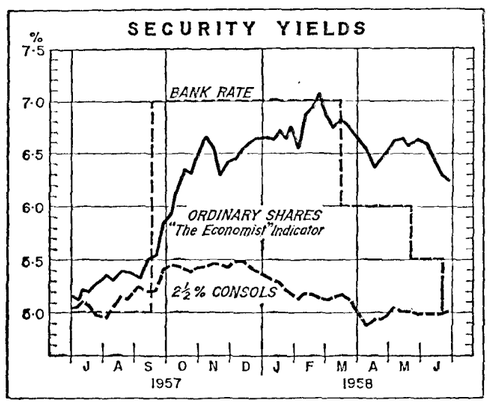
LORAINE-RIEBEECK

LORAINE was one of the big disappointments among the Orange Free State gold mines. But no finance house closes down a mine if there is a chance of getting some return on its investment. Anglo American, the finance house for Loraine, has now used the surgeon's knife.

The plan is to merge Loraine with the contiguous Riebeeck from the Anglo-Transvaal stable. Riebeeck is still some time away from production and the merger should save capital expenditure by making use of some of Loraine's assets, including underground and surface equipment, a reduction plant, offices, workshops and houses. Development of the southern section of Loraine will continue on a reduced scale and will be linked with the development of the northern section of Riebeeck. If the merger is approved by shareholders, the new combined area will be managed by Anglo-Transvaal. Between them, Anglo-Transvaal and Anglo American will own the dominant shareholding.

To effect the merger, the share capital of Loraine in 10s. units will be reduced from £8,226,686 to £1,645,337, and the reconstructed Loraine will buy all the assets of Riebeeck in exchange for 9 million of its 10s. shares. Riebeeck will distribute these shares to its shareholders in the proportion of nine new Loraine shares in exchange for every seven Riebeeck shares. At the same time Anglo American will waive £711,000 of its loan to Loraine, reducing that loan to £3,446,000, and will lend the newly merged company another £1 million. The Anglo American loans will be free of interest until one year after production starts at the Riebeeck Number 1 shaft. Another £3 million will ultimately be raised by a rights issue. Not until that issue is made can Anglo American exercise its rights to convert 25 per cent of its loan of £3,446,000 into shares in the new company. The merger caused a flurry in the price of the shares; Loraine's 10s. units went up from 2s. 1½d. to 3s. before coming back to 2s. 6d.

London Stock Exchange



FIRST DEALINGS:	June 8	July 2	July 16
LAST DEALINGS:	July 1	July 15	Aug. 5
ACCOUNT DAY:	July 8	July 22	Aug. 12

INTEREST in gilt-edged stocks slackened after the reduction in Bank rate. Prices improved slightly up to the end of the week but reacted to show small losses in the week to Wednesday's close. The rise in industrial shares carried the "Financial Times" index of ordinary shares to a peak of 179.6 on Monday, when the number of bargains marked rose to 11,761, but the whole of the rise was not held; the troubles in the Lebanon restrained investors and the results of the latest FBI survey were a depressing influence. Over the week *The Economist* indicator showed a fractional rise of 0.8 points to this year's peak of 192.5.

Bank stocks improved by 1s. in some cases and insurance stocks made considerable gains on balance, though they reacted later. Among breweries, Tennant Brothers gained 3s. to 49s. following the higher dividend. After rising to their best levels this year, a reaction in leading store shares left few gains and occasional losses on balance. The May production figures failed to help motor shares, which declined. Paper shares were irregular, Bowater falling 1s. 3d. while Wiggins Teape gained 2s. 6d. George Newnes jumped 5s. 6d. to 56s. 6d. on the increase in dividend. Property shares rose again; Bell London rose 8s. 9d. to 57s. 9d. on the merger proposals.

The new 6 per cent debenture of Associated Electrical Industries quickly established a premium of about 1½ points and the 6 per cent debenture of Associated Biscuit Manufacturers was stagged and heavily over subscribed, but the £6 million 5½ per cent issue of Liverpool Corporation failed to attract investors.

Oil stocks weakened, Shell Transport falling 5s. 9d. to 143s. 1½d. Kaffirs revived, especially the new mines among which Western Holdings and Free State Geduld were prominent.

Mining, manufacturing, electricity and manufactured gas with the following exceptions: Denmark excludes mining; Greece, mining and manufactured gas; Ireland and Sweden, electricity and manufactured gas; and Austria, manufactured gas. Germany excludes West Berlin. (2) Special trade (excluding re-exports) with the exception of Ireland which covers general trade with exports seasonally adjusted. Belgium includes Luxemburg. Italy includes Trieste. (3) New drachma introduced May 1, 1954 (1 new drachma = 1,000 old drachmas). (4) Thousand million drachmas. (5) Bizonal area. (6) Average for fourth quarter. (7) April, 111. (8) April, 298·8; May, 233·8. (9) April, 265·5; May, 237·3. (10) April, −33·3; May, −5·5. (11) April, 114. (12) April 116. (13) Average for first quarter.

Financial Statistics

EXCHEQUER RETURNS

For the week ended June 21, 1958, there was an "above-line" deficit (after allowing for Sinking Funds) of £42,936,000 compared with a deficit of £12,302,000 in the previous week and a deficit of £26,462,000 in the corresponding period of last year. There was a net receipt "below-line" of £21,376,000 leaving a total deficit of £153,998,000 compared with £124,951,000 in 1957–58.

THE MONEY MARKET

THE Treasury bill rate just after last Thursday's reduction in Bank rate fell by ⅜ per cent, to 4⅜ per cent. The discount market raised its common bid by 1s., marking a reduction in its discount rate of 4s. per cent, while outside applicants made a rather larger adjustment; the upshot was that the average rate of discount on the whole allotment of £260 million dropped by 4s. 4d. per cent, and the proportionate allotment of tenders at the common bid fell from 65 to 42 per cent. Making allowance for individual bids submitted by discount houses, the market's total allotment rate may have been about 50 per cent. At yesterday's tender, the offer was cut by £10 million to £250 million—which for the first time for some weeks is below matching maturities.

Following the reduction in Bank rate, demand for bills from overseas and domestic sources has abated; and twice in the week to Wednesday the authorities have had to give large special assistance to Lombard Street, by buying bills. On Thursday last, one or two houses nonetheless found themselves in the Bank at the new rate. Dealings in September maturities have generally been at 4⅞ per cent, though on Wednesday, when credit conditions were comfortable, some banks conceded 4¾ per cent. Call money rates have ranged from the new clearing bank minimum of 3½ per cent to 4⅛ per cent at times for "overnight" money.

ROLLS-ROYCE LIMITED

TOTAL REVENUE REACHES NEW RECORD OF £91 MILLION IN YEAR OF MANY PROBLEMS

SUBSTANTIAL CONTRIBUTION TO EXPORT TRADE

CONDITIONS REQUIRED FOR SUCCESS OF BRITISH AERO ENGINE INDUSTRY

LORD KINDERSLEY ON ESSENTIALS FOR MEETING CHALLENGING AND CHANGING TIMES

The fifty-first annual general meeting of Rolls-Royce Limited will be held on July 15th at the Midland Hotel, Derby.

The following is an extract from the statement by the Chairman, The Right Honourable Lord Kindersley, CBE, MC, which has been circulated with the Reports and Accounts for the year ended December 31, 1957:

INCREASED TURNOVER

The total revenue for 1957 increased by £11 million to a new record of £91 million. This increase is almost entirely attributable to deliveries of aero engines for civil airlines and overseas governments—the result of orders taken in prior years and of research and development originating many years ago.

YEAR OF MANY PROBLEMS

1957 stands out as a year which has provided a series of problems in all branches of the engineering industry in which your company is concerned. The Government White Paper on Defence altered the whole future pattern of the aircraft and aero engine industry, and finally defined the change of emphasis from the provision of equipment for the fighting services to the fiercely competitive business of selling aircraft and engines in international markets.

Our motor car and oil engine business has been more immediately affected by other events. The aftermath of Suez, the credit squeeze, the September balance of payments crisis accompanied by the rise to 7 per cent in Bank Rate, the measures adopted by the government to stem inflation and restore confidence in sterling, and the creeping paralysis of the American recession with its worldwide effects, have all called for adjustment of thought and of policy to meet the changed and still changing circumstances. One cannot blink the fact that such a formidable list of events points to a period of uncertainty ahead of us, which is a challenge to meet the situation with cool judgment and with increased vigour and determination to secure a full share of those markets where our products can be sold.

It is in the nature of the products with which we are concerned that our business must increasingly depend upon exports. It is of paramount importance to the exporting industry as a whole that the government should prove successful in its efforts to bring stability to our national economic scene and enable exporters to compete in international markets in the knowledge that they are working from a firm base. It is also important to press for the opening of markets at present closed to us—I have in mind particularly China—who could become important customers for engineering products and transport equipment.

In our motor car business we have jealously guarded the quality of our cars

The Rt Hon Lord Kindersley

at the cost of much money spent on development, and we may justly claim that our cars are among the best ambassadors for British engineering in general. But it cannot be said too often that a healthy export business in cars can, in the long run, only be sustained from the firm base of a healthy home market. Our attempts to develop export markets are hampered not only by the restrictions imposed by foreign governments, but also at home by the imposition of purchase tax at its highest rate—a tax which may be defensible in relation to imported goods but which can hardly be defended when it strikes at the stability of a product of the most skilled engineering talent of this country.

The success of our oil engine business lies largely in our own hands. It is a highly competitive business, and only the maximum efficiency leading to competitive prices will secure for us a share of those markets from which the volume of our business must come.

FUTURE OF AERO ENGINE BUSINESS

But it is with the future of the aero engine business that I particularly wish to deal. I said last year that we had embarked on a task which virtually amounted to creating a new business, and I think that the nature of that business should be more widely understood. I believe it to be a basically sound business for this country because it is technically difficult; the market is world-wide but the competition is likely to remain restricted for some time to those industrialised countries with large technical resources.

As time goes on an increasing proportion of the turnover will be derived from the sale of spare parts which should provide a stable base, but this position can only be reached if we first sell our engines. We must offer products which are both technically and commercially competitive. If we are to be technically competitive, and to remain so, we must be in a position to match the Americans and the Russians in essential development facilities and be able to keep these continuously up to date.

A sound aero engine business demands a comprehensive range of engines. The cost of maintaining the kind of development organisation and facilities for this purpose can only be defrayed from a very substantial turnover, of which only a small proportion can be expected to come from the nationalised corporations and the British independent operators. Even with our military programmes today we are dependent upon exports for more than 50 per cent of our total engine production, and a substantial part of this is represented by sales of military equipment to foreign governments. If the domestic effort on military types is to decline, this market will inevitably go to the USA. The total output of British civil aircraft must therefore be encouraged to grow considerably if it is to provide the turnover to sustain an adequate programme of engine development. It is hardly necessary for me to draw attention to the advantages enjoyed by our American competitors who have a vast home market and government support for transport and large military aircraft on a scale unheard of here.

CONFIDENCE IN ABILITY TO MEET COMPETITION

This then is the nature of our problem, and our own accounts already show the impact of the change. We are encouraged to know that the government are giving the subject their earnest consideration. The task of competing technically does not daunt us—the current achievements of our engineering teams give us every confidence in their ability to meet the future. But if our stockholders are to be asked to carry an increasing share of the substantial cost, they are entitled to expect the government to give some practical demonstration that they are whole-hearted in their desire to see the industry succeed in its task. The maintenance of basic aerodynamic research, the fostering within the engine companies of research on engines aimed at extending our knowledge of the art, co-operation from Transport Command in the flight testing of new products—these are but a few examples of the kind of support which should not be in doubt, and indeed there are many other arrangements which must be the subject of review in the light of the changing circumstances.

During this transition period it is surely not a question of whether the country can afford the comparatively small costs involved in support of this nature, but rather whether the country can afford to run the risk of forgoing its share of this growing

market—a share which has been hard-won and which it would be tragic to lose for the sake of some temporary economy.

AERO ENGINES

The Avon engine in its many versions has remained the principal engine in production for the British Government during the past year. The installation of this engine in four continuing aircraft projects—the English Electric P1B, later version of the English Electric Canberra, the Supermarine Scimitar and the de Havilland Sea Vixen—makes it probable that the Avon will remain in production for some time to come.

Another military project upon which work is continuing is the Conway engine for the Handley Page Victor Mark 2, and during the past year this engine has passed a 150-hour type test at a rating of 17,250 lb thrust.

The Dart engine was again the backbone of our civil engine production programme in 1957. Deliveries of the Avon engine for civil aircraft also commenced. Your company's reputation for building civil gas turbine aero engines of the highest quality has been founded and upheld on the world's air routes by the Dart engine in the Vickers Viscount, but our representation is now widening as other projects which have been under development for some time approach their introduction to airline service.

The first Conway engines will be delivered this year to the Boeing Airplane Company for installation in Boeing 707-420 aircraft and to the Douglas Aircraft Company for the DC-8 aircraft. In the case of the Boeing aircraft your company is supplying not only the engine, but also thrust reversal and noise suppression equipment together with the "pod" in which the whole power unit is housed. The continuation in production of the Conway engine for some years has been ensured by the order placed by British Overseas Airways Corporation for 35 Conway-powered Vickers VC-10 airliners. By this addition to the wide range of aircraft types in which our engines are installed we have further extended the field of civil aviation in which we are actively competing.

The sales department and our engineering teams have been extremely active throughout the world, and the result of their work is reflected in an increased order book. This has been achieved in spite of keen competition and the fact that many airlines have found trading conditions extremely difficult; indeed, some have had to abandon their previously announced plans for further purchases of British equipment. Your company's engines are now in service with or on order by 56 airlines and 18 other operators in all parts of the world.

After outlining the orders for Commonwealth and Foreign Governments, Lord Kindersley continued:

DEVELOPMENT

The programme of development has in recent years involved substantial capital expenditure of which the high altitude test facility is the largest single item. This is now operating and will make a valuable contribution to the development of both civil and military engines. It is the only privately owned facility of its kind in Western Europe and we look forward to seeing it used in support of the continuing requirements of the NATO countries.

The size of our engineering organisation is probably equalled only in America. I have already referred to the fact that our business demands a comprehensive range of engines. The mere names Avon, Dart, Conway and Tyne give little clue to the extent of the work involved in developing each of these engines for particular aircraft installations as distinct from the task of achieving technical excellence. In addition to the list of engines which I have just named we are continuing an interesting programme in connection with our light-weight jet engine, the RB 108, which is being developed for further experimental work on vertical lift.

The year closed with considerable public attention being focused on the choice of aircraft and engine to meet the requirements of British European Airways for a short-range jet liner. The choice of a Rolls-Royce jet engine of the by-pass type was further confirmation of our technical judgment in pursuing this line of development.

ROCKET MOTORS

Considerable progress has been made on this work during the past year. Engine testing is being carried out on temporary facilities. The construction of the Spadeadam engine test site in Cumberland by the Ministry of Works is well advanced and it is expected that if the present progress is maintained the first portions will be handed over for use during the next year. With the completion of these facilities the development of our motors will proceed more rapidly and in close association with de Havilland Propellers Limited who are developing the missile.

NUCLEAR ENGINEERING

Much useful collaboration has taken place with Vickers Limited and Foster, Wheeler Limited in connection with the Admiralty project for the design of nuclear machinery for installation in a submarine.

In addition to the studies which we have been doing for the Admiralty, during the year an experimental reactor known as "Neptune" was designed by the company and erected at Harwell. This is now in commission and is providing valuable information on the nuclear problems associated with the reactor for HMS Dreadnought.

MOTOR CARS

During the first three months of 1957 motor car sales at home were acutely affected by the petrol rationing which was a consequence of the Suez crisis. Thereafter the factory worked to capacity until the latter part of the year, when production was again curtailed because of the normal seasonal decline in demand, aggravated by credit restrictions. There has since been an improvement in home demand, but at the time of writing the motor car factory at Crewe is still not working to capacity in all sections and it would be unrealistic to expect any significant change for the better until the general economic conditions of the country become more favourable.

HANDICAP OF PURCHASE TAX

In this connection I have to refer once again to purchase tax on motor cars which remains at the highest rate of 60 per cent and which is the biggest single factor in limiting our home market. I have already pointed out that in the long-term home trade is the foundation on which the overseas business is based.

Overseas markets have been energetically attacked, but a variety of restrictions—often unpredictable—imposed by certain overseas governments continue not only to limit immediate sales, but create an unstable background against which it is difficult to build up a satisfactory distributive organisation.

OIL ENGINES

Oil Engine Division. — Continuous development has improved the reliability and durability of the product and at the same time it has been found possible to increase the horse-power output of the range. A turbocharged version of the engine has been developed and is now being marketed.

Orders have been secured from a number of new customers in the earth-moving field.

RAIL TRACTION ACTIVITIES

During the last two or three years the company has been energetically pursuing the application of its oil engines and transmissions to rail cars and shunting locomotives. We feel we have the knowledge and experience to be able to make a contribution in this important field. I am glad to be able to report considerable progress.

PENSION POINTS: 2

Plans for a higher standard of state pensions and how this can best be achieved are being widely discussed. In this series of advertisements the Life Offices' Association and Associated Scottish Life Offices draw attention to some aspects of the problem which they believe to be important.

Pension rights of nine million workers

There are now some nine million workers in occupational pension schemes. Every one of them has a direct interest in any proposal for an extension of the National Pension scheme because of the effect that this might have on his individual pension rights and future benefits.

Increased state pensions might lead to reduced private benefits because if employers had to make bigger contributions to the state they might not be able or willing to continue with their own schemes even on a reduced scale. The impact of an extended state scheme might be such as to make other schemes unworkable.

Even if occupational schemes were permitted—on conditions—to operate as alternatives to any extended state scheme benefits, there would be serious financial and administrative difficulties which for many schemes would probably prove to be insurmountable.

Occupational schemes could also be prejudiced indirectly by the introduction of an over-ambitious state scheme which would add to inflationary pressure and so reduce the real value of benefits.

COMPANY MEETINGS

THE BRITISH PLASTER BOARD (HOLDINGS) LIMITED

LESS FAVOURABLE CONDITIONS SATISFACTORILY MET

DIVERSIFICATION AT HOME AND EXPANSION OVERSEAS

SIR GRAHAM HAYMAN ON GROUNDS FOR CONFIDENCE IN THE FUTURE

The forty-first annual general meeting of The British Plaster Board (Holdings) Limited will be held on July 18th at Bath House, 82, Piccadilly, London, W.1.

The following is the statement of the Chairman, Sir Graham Hayman, which has been circulated with the report and accounts for the year ended March 31, 1958:

Mr R. G. Forsyth retired in May of this year after twenty-six years' service with the Company. He served first as Secretary and was appointed a full-time executive Director in 1947. Mr Forsyth has thus been closely concerned with the growth of the Group from the time we became a public company in 1932. I would like to pay special tribute to his excellent work during his many years of service and to wish him, on behalf of all his colleagues, happiness and good health during his retirement.

In June of this year Mr N. M. Barrow, our Group Secretary, was appointed a Director of the Company. Mr Barrow has readily and ably assumed increased responsibilities in our central management, and I am confident that his experience and ability will be of value to your Board. I strongly recommend your confirmation of this appointment.

I would like to record our sincere congratulations to Mr G. S. Thorvaldson, QC, the Chairman of our Canadian subsidiary, Western Gypsum Products Limited, on the honour conferred upon him on his appointment as a Senator of Canada.

Since my last statement we have learned with great regret of the death of Mr F. W. Anthony, who, on his retirement in 1952, had been a Director of the Company for seventeen years, and remained a Director of several subsidiary companies up to the time of his death in February last. I have also to record with regret the sudden death in November last of Sir Harold Cartmel-Robinson, who was one of the most valued Directors of our Rhodesian subsidiary.

REVIEW OF ACCOUNTS

I mentioned in my last statement that the companies in the Group supplying material for the British building industry were, at that time, suffering from the general contraction of trade. This trend continued for the remainder of the year under review and it was, therefore, not unexpected that the overall group profit would be lower than the year before. On the other hand, the policy applied over recent years of diversifying our interests in this country and of expanding abroad has enabled us to meet the less favourable conditions in the British building industry and to produce results for the year which are better than might otherwise have been possible, the Group total profit for the year being £2,280,000, which is £300,000 lower than the record results of the previous year.

After providing for taxation and adding items totalling £58,000 which relate to adjustments in respect of prior years, there remains £958,000 available for appropriation by the Group, compared with £1,143,000 last year. Subsidiary companies have retained £190,000 as reserves or unappropriated profits, and £250,000 has been added to the General Reserve of the Holding Company.

The Directors recommend the payment of a final dividend on the Ordinary Stock of 7½ per cent, which, together with the interim dividend of 5 per cent paid in January, 1958, makes a total for the year of 12½ per cent.

TRADING ACTIVITIES IN UNITED KINGDOM

Our plasterboard companies in particular experienced some reduction in turnover during the year, and since then the seasonal rise in demand for this product has been a little below normal and conditions are less buoyant than usual. This falling off in sales was to be anticipated in view of the marked reduction in building programmes. Sales of gypsum plasters, however, were good, in spite of the less favourable conditions prevailing.

In the roofing felt industry, trade was active though keenly competitive conditions continued to operate. During the year, D. Anderson & Son Limited completed the installation of a high speed roofing manufacturing machine of most modern design and large capacity which is now operating satisfactorily. To obtain increased benefit from this machine, Andersons have taken over the production of a range of felts for our other roofing subsidiary, Blackwells and National Roofings Limited.

The general pattern of trade of C. Davidson & Sons Limited and its subsidiaries was one of increasing competition for the available business. Improved productivity enabled profits to be maintained almost at last year's level. Generally, customers have been running down their stocks, but the Group is well placed to take advantage of more normal trading conditions when they return.

There has been a steady improvement in the turnover of the steel drop forgings produced by our engineering subsidiary. In the case of our brass stampings and valve-making units, the continued uncertainty about the price of copper during the year tended, however, to make customers unwilling to hold stocks and has resulted in difficult trading conditions.

OVERSEAS

In my statement last year I reported the acquisition of a substantial gypsum deposit by our Canadian subsidiary and the purchase of Westroc Industries Limited, a company producing rock-wool insulation products in Vancouver. Our new acquisitions are being integrated with the activities of Western Gypsum Products Limited, and the whole output of our Calgary plasterboard and plaster plant is now based on the new gypsum deposit. Quite apart from our participation in the general industrial development, present indications are that there should be an increase in the number of houses to be built in Canada during this year, which should benefit our plants considerably. The trend of sales of all our products in Canada is encouraging. In view of the importance of our growing investment in Canada, the Board decided to appoint Mr D. V. Damerell as resident Parent Board Director in charge of our interests in that country.

Our South African associated company, Gypsum Industries Limited, is obtaining an increasing share of the building trade market which has suffered some curtailment through credit restrictions, but earnings continue to be satisfactory.

In Rhodesia, our sales from the small paper board plant were making good progress in the second half of 1957, but this has been temporarily checked by the restrictive credit policy adopted as a result of the Rhodesian Government's financial measures which compelled customers to reduce stocks and order only for their immediate requirements.

In Sweden, our associated company, Svenska Aktiebolaget Gyproc, has quickly reached full scale operation at its new plasterboard plant at Varberg and plans have been prepared to increase productive capacity to meet the growing market in Scandinavia.

The plaster mill of SA Gyproc-Benelux, our Belgian associated company, is now in production and the plasterboard plant is expected to be in operation by the end of 1958.

In France, plasterboard is now recognised as a standard building material, and a substantial extension to the factory of Placoplatre SA, one of our associated companies, has become necessary. Trading results are favourable.

I reported last year that your Company had acquired a substantial minority interest in Platrieres Modernes de Grozon. The capital of this concern has now been increased, enabling the company to carry out a programme of mechanisation and improvement which will increase productivity and reduce costs generally.

EXPORT TRADE

In normal conditions the volume of exports by our Group from the United Kingdom is small in relation to our home sales, since by their nature the transport costs of many of our products are heavy in relation to their value. Thus, whilst the effect on our earnings is not large, I think I should draw attention to the fact that during this year, balance of payment difficulties have had an adverse effect on our exports to the Commonwealth and particularly on the export of plasterboard and plasters to New Zealand.

As indicated in my last statement, there is a growing tendency for European countries to develop the use of gypsum materials, and your Company's policy is to participate in these projects involving local manufacture whenever desirable and practicable. Obviously this policy will tend to reduce opportunities for export to those countries, but the establishment of the Common Market in Europe, and the probable creation of the European Free Trade area give added justification for the policy we have adopted, which up to the present has produced satisfactory results.

FUTURE PROSPECTS

Efforts are continually being made to create new outlets for this Group's products, and our reorganised and expanded research facilities are expected to make a valuable contribution to our general development. The Company is also making a special effort to demonstrate the value of its products in the more modern building designs, such as dry construction, prefabricated components and gypsum concrete roof decks. The Group should also benefit from the growing awareness of local and other authorities of the value of gypsum plasterboard having regard to its excellent fire resisting and thermal insulation properties. Nevertheless, in view of the present contraction in building programmes, I do not foresee any substantial improvement in trading conditions in the building materials industry in this country in the immediate future, but with a relaxation of the present restrictions, our prospects should be encouraging.

It is heartening to see, at last, some results of the determined efforts being made by the Government to arrest the trend of increasing costs and prices. If these efforts are supported by each section of the community, of which there has been some evidence, conditions may soon be reached in which the brakes can still further be taken off the economy, thus enabling industry as a whole to resume a policy of expansion without the excessively inflationary conditions which have obtained in recent years.

So far as your Group is concerned, it is considered that the spread and diversification of our activities overseas, combined with what we believe are the long term prospects for the Home market, give good grounds for our confidence in the future.

PERSONNEL

Throughout the year our relationships with the various Trade Unions of which our employees are members have continued to be friendly and constructive, and in the few cases where redundancy has arisen through the need to reduce production, our plans have been recognised by the Unions concerned as being eminently fair.

I am sure you will wish to be associated with the Board in thanking all employees throughout the Group for their continued loyalty and co-operation.

THE ASSOCIATED PORTLAND CEMENT MANUFACTURERS LIMITED

EMINENTLY SATISFACTORY RESULTS

OVERSEAS WORKS ACHIEVE RECORD PRODUCTION

MR J. A. E. REISS ON GROWING IMPORTANCE OF THE DEVELOPMENT OF SPECIAL CEMENTS

The Annual General Meeting of The Associated Portland Cement Manufacturers Limited was held on June 25th in London, Mr J. A. E. Reiss, B.E.M. (Chairman and Managing Director) presiding.

The following is an extract from his circulated statement which accompanied the Report and Accounts sent to Stockholders:

VAST CAPITAL EXPENDITURE

The total capital expenditure of our Group during 1957 was £5,776,944 and during the 12 years since the last war we have expended on capital account no less than £42,369,525 —this has been done without our issuing fresh capital.

The Associated Portland Cement Manufacturers Limited holds over 80 per cent of the equity of The British Portland Cement Manufacturers Limited and 100 per cent of the Alpha Cement Limited equity, so a clearer picture of our past year's working in the United Kingdom is produced by combining the results of these three Companies than is shown in the Consolidated Accounts which include our overseas interests.

The trading surplus increased by £136,000 to £11,027,000. We set aside for depreciation £2,436,000 which was £98,000 more than a year ago and the allocation for replacement of fixed assets of £725,000 was the same; the total provision under these headings was £3,161,000. After providing for depreciation and replacement we were left with £7,866,000. Provision for Taxation decreased by £107,000 to £4,263,000.

Directors' and Trustees' emoluments, Debenture Service, Subvention payments to Subsidiary Companies and transfers to General and Contingencies Reserves together absorbed £2,298,000—an increase of £267,000, leaving for distribution £6,000 less than last year. It is proposed that the dividends to be paid shall remain the same as those paid in respect of 1956.

These results can be considered eminently satisfactory in view of the falling off in the Home Trade market in the second half of the year and I am sure you will wish me to send your congratulations to all who are working for the Group.

PAST YEAR

The goodwill enjoyed by your Company with its customers was decisively proved by the fact that we were able to increase our share of the trade under these changed and more difficult conditions.

In my last statement I reported on the undertaking that the Cement Industry had given not to increase Home prices for the 12 months ending June 30, 1957. At that date an increase of just under 7s. a ton had to be made in the Home price to meet additional costs, principally those of fuel and power.

A further undertaking was given by the Industry to maintain the new prices for another 12 months period unless there was an increase in the cost of coal or unless something unexpected or exceptional happened during that period.

Once again we had a difficult year in the Export Trade. Competition from eastern Europe was not quite as severe as in the previous year but a great deal of new production was started up in different parts of the world with the result that total world exports showed a decrease.

Despite these factors and increasing Japanese competition aided by subsidised freight rates, we exported over a million tons, albeit at substantially decreased prices, and thus maintained our share of world exports.

THIS YEAR

Estimates for the falling off in the Building Industry this year are as high as 20 per cent. Owing to the very mild winter last year it was expected that deliveries at Home would fall very considerably below those of the first few months of 1957. However, in spite of some quite bad weather the forecasts have proved to be pessimistic and on present indications it would be reasonable to assume that deliveries in the Home Trade will not be more than 10 per cent down on last year.

The impact of this loss of tonnage may well not be unduly severe because it must be remembered that your Company has been producing since the war at a rate considerably in excess of the design capacity of its works. When every ounce of cement is needed some sacrifice in efficiency is inevitable particularly in regard to fuel consumption, and a large amount of night and week-end work at penal overtime rates becomes necessary in order to process the raw materials.

The present trend of trade is, therefore, giving our works the opportunity of returning to more normal operating conditions, and since the middle of last year very satisfactory savings in fuel consumption have been achieved, whilst several old and uneconomical kilns which were pressed into service during the period of peak demand have once again been closed down.

This has inevitably meant that there has been a certain labour redundancy but happily this has been on a small scale. I am sure you will be glad to hear that those for whom work could no longer be found, generally had no difficulty in obtaining other employment.

DEVELOPMENT OF SPECIAL CEMENTS

A great deal of attention is being paid to the production of types of cement for specialised purposes as it is felt that there is a great field open for such products which has not been satisfactorily catered for in this Country up till now.

During the year we introduced a new type of Oil Well Cement, as well as a Hydrophobic Cement sold under the name of "Hydracrete," which can be stored for long periods in damp climates without deterioration—this has been very well received in some of our principal export markets and is now being delivered in large quantities to the new Royal Air Force base in the Maldive Islands.

Our Research Department continues to be actively engaged on new developments of this kind from which we expect to receive an increasingly good return in future years.

CONFIDENCE IN 'PLYMOUTH' INVESTMENT

Negotiations are at present in hand to acquire the cement works of the Amalgamated Limestone Corporation Limited, at Plymouth and it is expected that these will be brought to a successful conclusion in the near future.

We have great confidence in our Plymouth investment which will place us in an unassailable position in that part of the Country.

EXPORTS

So far as exports are concerned we expect another difficult year with decreasing profit margins. On the other hand we are supplying certain large contracts abroad, and expect only a small decrease in volume.

OVERSEAS WORKS

Since the end of the war our interests overseas have been greatly expanded and the works achieved a record production of over 2 million tons last year which is more than three times as much as the overseas production in 1948.

These interests make a growing contribution to our profits and, while there are indications of an easing in the demand for cement in some countries, prospects generally are regarded as satisfactory.

CONCLUSION

The Blue Circle Group of Companies has for many years been the largest cement manufacturing and distributing organisation in the world and I am sure it is your wish that it should remain so. To achieve this your Directors attach great importance to the maximum possible expansion abroad where big possibilities are still open to us as you will see from my remarks on our overseas operations.

The greatest prospects at the moment lie within the British Commonwealth, but we shall keep a close watch on opportunities arising in other parts of the world.

The Report and Accounts were adopted.

PLATT BROTHERS AND COMPANY (HOLDINGS) LIMITED

MR K. H. PRESTON'S REVIEW

The sixtieth annual general meeting of Platt Brothers and Company (Holdings) Limited was held on June 24th at Oldham.

The following is an extract from the circulated statement of the Chairman, Mr K. H. Preston:

Important changes, as you will know, were made in the structure of the Company and the Group during 1957. Your Subsidiaries—Textile Machinery Makers Limited, Tweedales & Smalley Limited and Prince-Smith & Stells Limited—became wholly owned by the purchase of the minority shareholdings, and the capital of your Company was reorganised and increased as you will see from the Balance Sheet. In addition, controlling interests were acquired in the three new Subsidiaries referred to in your Directors' Report.

I am pleased to tell you that the profits for 1957 of the Subsidiaries included in the Group Accounts for 1956 show a considerable improvement over that year and the new Subsidiaries which are included for the first time in the Group Accounts have also made a worthwhile contribution to the improved results.

The Group profit for 1957, after charging taxation and deducting the share of the profit attributable to minority interests, is £796,054 and your Directors are recommending a final dividend of 11 per cent which, with the interim dividend of 4 per cent already paid, will make the total distribution 15 per cent as compared with 12½ per cent paid for the previous year.

TEXTILE MACHINERY MAKERS LIMITED

I referred last year to the noteworthy business which we were developing through the manufacture of machinery for the brewery and soft drinks industry at the Bolton works of Dobson & Barlow Limited. We first made this machinery under sub-contract to Barry-Wehmiller Limited of the UK, an offshoot of the Barry-Wehmiller Machinery Company which manufactures at St. Louis, Missouri, and is one of the leading producers of machinery for the brewery and soft drinks industry in the USA.

Barry-Wehmiller of the UK holds the selling and manufacturing rights from Barry-Wehmiller, St. Louis, for all the latter's products covering a large part of the world: the shares in the UK Company were originally held in equal proportions by the American Company and by English interests. As we are anxious to expand even more actively than at present this line of business, in February of this year Platt Holdings acquired the English shareholding in Barry-Wehmiller Limited of the UK, and look forward in close conjunction with our American partners to the further development and growth of the Company and its products which will now all be manufactured at Bolton.

During the year the Company introduced a new ring spinning frame, the MR3, judged by many competent authorities to be the best machine of its sort in the world.

A new type of spinning ring has been developed which gives a better performance on the spinning frame, and many thousands have been supplied. Arrangements have been made for two firms of specialist ring makers, one in America and the other in this country, to make these new rings under licence.

In addition, a new high production comber, known as the Hartford Comber, was put on to the market. This machine has a production rate more than twice that of the machine which it replaces and is already operating with success in a number of English and Continental mills.

In collaboration with John Bright & Bros., Limited, the well-known manufacturers of tyre cord, the company has produced a new machine for the tyre cord industry known as the Platt/Bright twister cabler. This machine performs the work which has hitherto been done on two separate twisting and cabling frames, with a consequent saving in materials, handling, floor space and labour requirements.

Orders have now been received for a number of the new Platt-Josephy high production woollen carding sets: this set has recently undergone prolonged and highly successful operational tests in a well-known Yorkshire mill.

TWEEDALES AND SMALLEY LIMITED

During the year this subsidiary produced the first units of the new "Clean-o-Matic" blow-room machinery for opening and cleaning of cotton. This line of equipment, much of which has been developed in close liaison with the British Cotton Industry Research Association, incorporates the new "Tweedales-Shirley" hopper opener, which together with the "Shirley" opener, forms the basis for a highly efficient opening and cleaning line. Many spinners, both at home and abroad, have expressed great interest in this development and a number of lines are now being delivered.

PRINCE-SMITH & STELLS LIMITED

For the third year in succession the output of your subsidiary constituted a record. Notwithstanding this high level of activity the Company's order book at the end of the year stood higher than at the beginning.

Since the introduction of the Raper Autoleveller at the last Manchester Textile Machinery Exhibition, over 5,500 Raper Autoleveller units have been installed in 36 different countries.

A new system of carpet yarn production has been evolved and, in conjunction with Textile Machinery Makers Limited, machinery production will shortly commence. This system, which is based on the direct coupling of the woollen Card with the PSC ("Prince-Smith's Centrifugal") Spinner, comes within the general meaning of "automation", and has been welcomed by a number of leading carpet yarn spinners.

HAYWARD TYLER & COMPANY LIMITED

I regard the profit of this new Subsidiary for 1957 as very satisfactory and a great credit to the Board of Directors.

The Company has received orders for pumps for all of the new atomic power stations being built or to be built in this country.

A licence to manufacture steam turbines for use with the Company's centrifugal cargo pumps has been arranged with Aktiebolaget de Lavals of Stockholm, and these will be manufactured in the Scottish factory at East Kilbride.

LE GRAND, SUTCLIFF AND GELL LIMITED

The profit of this Subsidiary is substantially higher than for the previous year, a very creditable performance.

During the period under review this Company has been passing through a stage of re-organisation and development which has resulted in a considerable addition to its strength and potentialities. New products have been developed, the range of customers has been increased and additional plant and equipment has given more effective and greater capacity for manufacture.

EPSYLON INDUSTRIES LIMITED

In November, 1957, your Company acquired a controlling interest in Epsylon Industries Limited of Feltham, Middlesex, designers and manufacturers of electronic equipment.

This Company specialises in magnetic recording equipment for the Armed Forces, for Government Departments, for industry and for the entertainment world. Amongst its products are computer stores for use in connection with electronic brains, tape recorders for commercial and private use, and high fidelity equipment for recording and re-transmitting both speech and music. This Company, which has hitherto been mainly concerned with research and development in instrumentation, has a substantial forward order book and it is the intention to develop and expand its manufacturing activities.

GROUP FUTURE PROSPECTS

The forward order books of your subsidiary companies are, in general, satisfactory.

Although orders for textile machinery for the Home market have been disappointing, the reduction in Home orders has been more than offset by orders for export.

Whilst there has been a curtailment of purchases by the oil industry, I consider this is a temporary phase and I am confident about the future prospects.

Orders for pumps for atomic and other power stations are very satisfactory and already it is clear that production in 1959 will exceed that of 1957 and 1958.

Unless there is a sudden and pronounced falling off in orders in the immediate future, I anticipate that the turnover of the Group for the current year will equal that of 1957, and I look forward to another year's satisfactory trading results.

The report and accounts were adopted.

ST. JOHN D'EL REY

The Annual General Meeting of the St. John d'el Rey Mining Co. Ltd., was held on June 25th in London, Mr Leo Model, Chairman, presiding.

The following is an extract from his circulated statement:

In February this year the M.A. Hanna Company acquired along with me and my associates a controlling interest in St. John d'el Rey. Due to compulsory wage increases decreed by the Brazilian Government in 1956 a very serious deterioration in the operating position of the Company had been reached by October last, when £600,000 cash was thereafter subscribed by me and an equivalent amount of Debenture Stock issued. The Managing Director and I visited Brazil for the purpose of opening new discussions with the Brazilian Government. As a result, a Government Commission was formed in the early part of December last to inquire into the national gold industry as a whole. Subsequently, the Council of SUMOC decided to grant emergency financial assistance to the gold mining industry in Brazil, until June 30, 1958, with a possibility of extension for a further period of six months. Discussions have been entered into with the Brazilian authorities towards renewal.

The new board has begun plans to explore the Company's large iron deposits with a view to creating an important iron ore export operation which is of vital interest to the economy of Brazil. The Hanna Coal & Ore Corporation are undertaking detailed exploration of the iron ore reserves. This investigation will take at least one year before further definite decisions can be taken.

A technical appraisal of the future prospects of the Company's gold mines is being carried out and will it is hoped point a way to the more economical operation of the mines.

The General Manager and Staff in Brazil have done excellent work in the past year under very difficult conditions.

The report and accounts were adopted.

THE SANDVIK STEEL WORKS COMPANY LIMITED

Sandviken, Sweden

PRODUCTION AND SALES REACHED A NEW HIGH BUT PROSPECTS FOR 1958 LESS ENCOURAGING

COMPANY CELEBRATES CENTENARY OF FIRST BESSEMER PRODUCTION BLAST

The ninetieth annual meeting of The Sandvik Steel Company was held on May 3rd at Sandviken, Mr K. F. Göransson presiding. The following is an extract of the report circulated with the accounts:

The results for the year were eminently satisfactory and the sale of iron, steel and coromant manufactures amounted to Kr.244,629,664, a record in the company's history. Orders remained high at the beginning of 1957 and production was maintained at a high level throughout the year and about 61 per cent of the output was exported.

However, as the year progressed the world-wide decline in the demand for steel began to become reflected in diminishing orders for all of the company's lines of manufacture. The orders on hand at the end of the year were less than at the beginning, resulting in materially reducing the time of deliveries. Prices remained stable throughout the year.

Wage earning employees averaged 5,136 (5,152 in 1956) and salaried staff 1,726 (1,726). Wages, salaries and directors' fees amounted altogether to Kr.87,891,737 as against 83,135,088 the previous year.

The supply of labour remained good throughout 1957.

RESULTS

The company's net profits for 1957 amount to Kr.5,767,546 which added to Kr.3.5 million held in [illegible] over from the previous year makes a total of Kr.17,810,118 available for distribution as follows:

	Kronor
Reserve fund	3,500,000
Statutory reserve	660,000
To the disposition of the Board	300,000
Dividend of Kr.8:—per share	4,800,000
Balance carried forward	8,550,118
Total	Kr.17,810,118

The report and accounts were adopted.

CAPITAL ISSUES

At an extra meeting held on November 22, 1957, a recommendation of the Board was approved to increase the share capital from Kr.60 million to Kr.80 million by the issue of 200,000 new shares at a nominal value of Kr.100: The issue was offered to old shareholders at the rate of Kr.120 per share. The new issue was fully subscribed and paid in at the end of January this year.

The new capital will be used for expanding the facilities of the company's Coromant factory at Västberga, in Stockholm, and for new plant at Sandviken.

The UK subsidiary Sandvik Swedish Steels, Limited, also increased its equity by £98,998 during the year.

The capital of the Finnish subsidiary OY Suomen Sandvik was increased by Mk 10 million by utilizing frozen Finnish assets.

The Brazilian subsidiary Acos Sandvik AS also increased its share capital by 8 million Cruzeiros for the purpose of financing a new plant for local manufacture of Coromant drill steel.

The company also invested Kr.1,184,100 in new shares issued by the Norberg Grufaktiebolag.

BESSEMER CENTENARY

The meeting was also informed of the plans for celebrating the centenary of the successful adaption of the Bessemer process in regular steel production achieved by the founder of the company Mr G. F. Göransson in the summer of 1858.

Newly discovered documentary material in the company's archives, as well as in the British foreign office, throws a fresh light on the weekly developments leading to the successful blow in the morning of July 18, 1858 which turned the frustrating invention into a stabilized process for mass producing steel.

Briefly, the records show that Mr Göransson had purchased one-fifth of the Swedish rights to the Bessemer invention in May 1857, when the reputation of the process was at its lowest ebb. After installing two tilting convertors at his small blast furnace at Edsken he began experimenting on November 3rd, but throughout the winter he experienced the same failures as the British licence holders.

After [illegible] disappointing weeks the original converters were discarded and a new fixed vessel was installed, based on drawings obtained from Bessemer. Tests with the new converter began on March 4th and gave the same negative results whereupon, in collaboration with the Swedish Iron Masters Institute, a number of important changes were successively made on the converter until in the summer the roof had been considerably lowered (to save heat) and the total area of the tuyeres gradually increased to twice their original size and, in consequence, the air pressure reduced and the volume of air in the blast greatly increased.

After having been provided with a new lining and tuyeres the converter was put back into service in the morning of July 18, 1858. From the very first blow the converter proved eminently successful. The time of the blast was reduced from 25 to 10 minutes, the temperature of the charge remained satisfactory and the output of useful ingots rose to 70 per cent. In the following weeks the output of excellent steel ingots rose to 80 per cent and remained at this level for the duration of the Edsken plant. The Bessemer process had been turned into an economically successful method of mass producing steel.

Steel production at Edsken ceased in 1865 and the blast furnace was shut down in 1879, after which the plant was allowed to fall into ruin. In connection with the centenary The Sandvik Steel Works, Limited, which was formed as a consequence of the successful pilot operations at Edsken, has restored the remains of the old plant as a monument to the birth of the steel age.

THE AUSTRALIAN ESTATES COMPANY LIMITED

COMPANY'S STEADY GROWTH AND RECORD YEAR

SIR DENYS LOWSON ON CURRENT AUSTRALIAN PROBLEMS

The Annual General Meeting of The Australian Estates Company Limited will be held on July 9th in London

Sir Denys Lowson, Bart, the Chairman, in the course of his remarks, which have been circulated to stockholders, says:

ACCOUNTS

Stockholders will have seen from the accounts that the gross trading profit amounted to £1,405,866, which is nearly £200,000 more than in 1956, and is the second highest in the company's history. It has only been surpassed by the trading profit for the year 1951, when the average price of wool was about 50 per cent higher than in 1957.

The dividend proposed on the Ordinary stock requires £102,862, which will allow the carry forwards of the parent company and subsidiaries to be increased by no less than £240,869.

The total dividend recommended is in fact less than one-quarter of the total amount actually available for the ordinary stockholders in respect of 1957; before the allocation to reserves, etc., and the increased carry forwards.

Your Company has provisionally qualified as an Overseas Trade Corporation. The main effect of the OTC legislation is that the Company's trading profits overseas are taxable in this country only to the extent that they are distributed in the form of dividends, etc. Unfortunately, this OTC legislation does not at present extend to overseas subsidiary companies. The taxation liability arising in this country is therefore [illegible] affected by whether the Company's business overseas is run through branches as is much of our business, in which case full relief is available, or by means of local subsidiary companies.

For many reasons the latter is often the preferable method today of carrying on business in a country overseas. There is a strong tendency for this method to be accentuated, and in many cases to become essential, particularly if it is desired at any time to secure local interest or participation.

Unfortunately, in spite of considerable pressure on the British Government when the 1957 Finance Bill was being debated in our House of Commons, the Government were not prepared to extend the benefits of the OTC legislation to OTC subsidiaries. In our case a considerable and increasing part of our business is in fact controlled and operated by our Australian subsidiaries. It is therefore my earnest hope that, when the Government have had a chance to see how the present legislation works out, they will find it possible to carry their policy to its logical conclusion, and treat overseas subsidiaries as entitled to the same benefits as overseas trading branches.

PASTORAL

The season in Victoria was affected by a rainfall which was generally below average, but there were no undue difficulties. In New South Wales an unusually low rainfall was experienced; while in Queensland widespread drought conditions ruled for most of the year, except in the far north Gulf Country.

Although for several years past the Company has been making extensive additions to its more permanent water supplies, tank water was seriously diminished, since throughout the year insufficient rain fell to give a good run-off in the creeks and thereby to replenish the tanks. The additional bores which we have put down in recent years have therefore been of great assistance.

Owing to the indifferent season, it was necessary to sell an unusually large number of wethers, and also old ewes; and our sheep numbers at the end of the year fell by about 15 per cent, compared with the end of 1956. However, the number of our breeding ewes is only slightly down, and their low average age of from one to five years is appreciably better than what has been normal in the past.

SUGAR

Raw sugar produced in Australia in 1957 rose by about 82,000 tons to 1,290,000 tons, the second highest output on record, being exceeded only by the 1954 season's outturn. Queensland production was 1,254,000 tons compared with 1,184,000 tons in 1956.

A somewhat higher proportion of the raw sugar output was exported; the figures for 1957 being approximately 57 per cent for export and 43 per cent for Australian consumption.

The British Commonwealth Sugar Agreement has again been extended for another year; and it will therefore continue in operation to the end of 1965.

Our Kalamia Mill crushed just over 380,000 tons of cane, compared with 353,000 tons in 1956. Another mill crushed 390,000 tons of cane compared with 339,000 tons during the previous year. There was a substantial increase in the average crushing rate per hour at both mills; the result of plant improvements during recent years, and the better condition of the cane supplied. The total sugar produced by our two mills together was approximately 113,000 tons; or more than one-twelfth of the total Australian production.

The Mackay bulk sugar terminal opened on schedule, and operated smoothly throughout the season. Ships were loaded at an average rate of 576 tons per actual loading hour; and the average time a ship was in port was reduced from three weeks to under three days. Two more ports, Lucinda Point and Bundaberg, are being converted to bulk-handling of sugar. Both are expected to be in operation during the 1958 season; with Townsville, possibly, next year.

AGENCY

Our wool stores at Melbourne and Brisbane handled a record quantity of wool during the year; the latter partly as a result of an accumulation of wool carried forward from 1956 owing to industrial trouble in Queensland. The sales of stock were high; partly due to the season, and growers' desire to lighten their properties.

We have continued our policy of rebuilding and modernising in turn our various agencies, and expanding the services which we offer to our clients.

RESEARCH

During the year the Company held useful instruction schools for station managers and staff, for both sheep and cattle properties; and we again acknowledge gratefully the valuable assistance we received both in Queensland and New South Wales from the Departments of Agriculture and Stock, the universities and the CSIRO. With increasing knowledge from research, the holding of pastoral schools is, we think, the best way in which to acquaint our staffs with the progress of science, and to improve our management.

Owing to the dry season, little progress was made with our agricultural projects for growing sorghum; but further experimental work is being carried on, and the stocks of sorghum which are held at Terrick, in Central Queensland, are likely to be most useful if drought conditions continue in 1958.

WOOL

The effect of the poor season in 1957 was a fall in the volume of the Commonwealth wool clip of about 370,000 bales, or about 8 per cent, as compared with the quantity received into Australian brokers' stores for the year July, 1956-June, 1957.

A comparison of the number of bales actually sold in Australia and the proceeds of the clips over the last five years is as under:

Season	Bales	£ (A.)	Average per lb. Pence
1953/54.....	3,846,212	390,622,263	81·97
1954/55.....	3,955,601	352,814,670	71·28
1955/56.....	4,297,338	333,834,936	61·23
1956/57.....	4,836,897	483,020,133	79·93
1957/58 (est.):	4,466,000	340,000,000	61·50

Great Britain was again the largest buyer at the Australian auctions, although they took fewer bales than in the previous year. They were followed by France, Japan, Italy—in that order.

GENERAL

It is expected that the income from wool for the 1957-58 season will be lower than in the previous year by some £A140 million; but it will still contribute the major part of the export income of Australia.

Industrial and manufacturing activity continued to grow throughout the year; and the number of workers in secondary industry now is well over one million, as compared with about 530,000 some 15 years ago. It is estimated that secondary industry now produces goods to the value of nearly £3,800 million per annum, as compared with £500 million 15 years ago, or nearly eightfold. The population of Australia is now almost 10 million.

The whole of our staff has merited our thanks and appreciation for their continued good work; and of course in particular our Australian director and general manager, Mr G. S. Colman. For many years past he has given of his best without stint. His wide knowledge and experience, extending over more than three decades with the Company, allow him to anticipate many of the problems which are bound to occur from month to month in the running and ordering of a great pastoral agency, and sugar organisation.

FUTURE PROSPECTS

I regret to say that it is unlikely we shall be able to show in 1958 the same good results as in 1957. After many years of good seasons, we are now encountering adverse ones; such as have occurred in Australia from time to time in its past history. While some of our properties have had fair rains since January, many of them have only had falls below the average, and will need good relief in the next six months. An unfavourable season, when pastures are bad, must naturally affect adversely the growth of the wool clip; and also cause lambings to fall.

However, the history of the pastoral industry in Australia has shown that the whole situation can change in 24 hours if good rains come. The sugar outlook appears favourable; and we look forward to presenting you in 12 months' time with another sound balance sheet, a reasonable return and a year of continued solid progress.

SAUNDERS VALVE COMPANY LIMITED

LARGER TURNOVER BUT SMALLER PROFIT

EFFECT OF RISING COSTS

MR J. C. BILLINGHAM ON THE OUTLOOK

The annual general meeting of Saunders Valve Company Limited, will be held on July 17th at 23 Blomfield Street, London, E.C.

The following is an extract from the circulated statement by the chairman, Mr J. C. Billingham, FCA:

As we expected, the past year has not been without its trading difficulties, and these are reflected to some extent in the profit results now before Shareholders. In fact, turnover showed a modest increase as compared with the previous year, but as I warned Shareholders last year, reduced profit margins, arising from a studied policy of holding prices overseas and a continued tendency for costs of manufacture to rise at home, have taken their toll. In the second half of the year there was an appreciable falling away in export orders which was the principal factor responsible for the diminished rate of profit.

The consolidated Profit and Loss Account discloses a trading profit of £269,901 compared with £317,110 for the previous year. Taxation requires £124,528, leaving an amount available for appropriation of £145,373 compared with £165,598 for 1956-7. We are asking you to approve a distribution of 11 per cent, as in the previous year, as a Final Dividend, absorbing with the Interim Dividend of 4½ per cent and the relevant profits tax £65,488, thus leaving £79,885.

TEN YEARS' EXPANSION

The Company has now completed over ten years' operations since its incorporation in January, 1948, and we have included in this year's Statement comparative figures covering the period from May 1, 1947, to March 31, 1958. These figures indicate not only the steady growth of the Company's profits over this period but also the build-up of its resources.

Since April 30, 1948, there has been an increase of £411,905 in the book value of fixed assets and of £503,414 in the working capital necessary to carry on the business, whose turnover has in this time increased no less than fivefold. The net assets of the Company have advanced over these years by £801,130 as against an amount subscribed by Shareholders of £141,250 as a consequence of the rights issue in 1955. Clearly it would have been difficult during these years to have provided adequately the steady additional capital needs of this growing business in any other way than by retention of profits on the scale indicated.

EUROPEAN COMMON MARKET

Turning to the future, we are watching with particular interest the Trade Area surrounding a European Common Market. Exports of Saunders Diaphragm Valves remain at a remarkably high level—58 per cent of total Diaphragm Valve sales—and an increasing proportion of these go to European users. Naturally the inclusion of Britain within the proposed area would bring advantage to the Company, enabling it to retain and further to extend and consolidate its existing European business. On the other hand, should Britain stand aloof we should probably be faced with new difficulties to overcome.

Our policy towards those countries which are not susceptible to sales from the United Kingdom has been to arrange for local manufacture through foreign licensees. During the past year further additional arrangements of this kind have been made. It may similarly prove necessary in the coming year to extend such arrangements for foreign manufacture under licence. In order that shareholders may appreciate the relationship between the amount of our income from this source and the rest of the Company's profits I can report that during the past year our gross income from foreign licences amounted approximately to £30,000.

INCREASING WORLD-WIDE DEMAND

Taking the long view, there seems no doubt that world-wide demand for industrial valves in all their ramifications is a steadily increasing one, and it is the responsibility of your Board to see that Saunders Valve Company Limited secures its fair share of this increasing world consumption. For the immediate future home demand is well maintained up to the present time and export business should improve.

Our aircraft branch at Hereford has experienced a difficult year endeavouring to satisfy an industry which has on the whole been more immediately concerned with development changes than with volume production; however, we have a substantial head of orders at this centre and we have no reason to doubt that satisfactory profits will flow therefrom.

It is always difficult to attempt to forecast the future of a business whose interests are so widespread, but that spread has been shown in the past to be in itself a stabilising factor in our affairs.

In the absence of a general recession of major proportions or of substantially increased costs, your Directors have no reason to expect any appreciable decline in the Company's prosperity. When demand increases the Company is now well placed to meet it and benefit accordingly.

SUMMARY OF PROFITS AND GROWTH OF NET ASSETS 1st MAY, 1947-31st MARCH, 1958

	1947/48	1948/49	1949/50	1950/51	1951/52	1952/53	1953/54	1954/55	1955/56 (11 months)	1956/57	1957/58

	£85,327	£96,825	£138,745	£148,721	£211,114	£229,603	£218,527	£256,031	£311,461	£317,110	£269,901	£2,283,365

ARTHUR BALFOUR & COMPANY

FACTORS AFFECTING TRADING

The fifty-ninth annual general meeting of Arthur Balfour & Co. Limited was held on June 23rd at Sheffield, The Right Honourable The Lord Riverdale of Sheffield (chairman and managing director) presiding.

The following is an extract from his circulated statement:

I have to report results less favourable this year than for the year 1956, but in doing so I consider these results to be not unsatisfactory and indeed better than might have been the case in an atmosphere of still rising costs, narrowing margins and tougher competition at home and overseas.

All the manufacturing divisions worked at levels which were not markedly dissimilar from those of the previous year.

Alloys, ever a serious factor, moved downward in price with no shortage of supply and in so doing had an adverse effect on the values of stock and work in progress.

Subsidiary Companies' results have fluctuated, but in total contributed less to the Group results. The profits of the Group at £349,621, before taxation but after exchange adjustments, compare with £526,853. Taxation absorbs £169,189.

Export trade has tended to become more difficult. As an example, severe restrictions on Indian imports were imposed for balance of payment reasons. I have no good news from South America, and in North America and Canada recessions have commenced. The tendency to narrower margins also applies to our Australian business.

During the year, our financial and engineering resources have been concentrated on a project to modernise and increase the capacity of our high frequency melting end and all the ancillary processes. By the frequency melting unit be operating a high power per ton in the world, backed by modern handling techniques. It is our hope and belief that this will enable us to meet competition with increasing confidence.

RENATIONALISATION

I may be expected to refer to the possibility of renationalisation of the steel industry in certain eventualities. No unit of this Group of Companies was previously nationalised. It is difficult to see how, in the case of this Company and your stake in it, nationalisation could be of any benefit to our operations or the results of the Group, or in turn to the nation. Surely it is possible to hope that common sense and business judgment may be applied to this question and so avoid the risk of grave damage to the whole economy of the country that might follow political and doctrinaire proposals.

On the present and future outlook I have never found it more difficult to forecast. In the early months of this year the plant has been operated at reasonable levels though deliveries have exceeded orders. Margins are if anything tighter. There are so many factors in world as well as domestic affairs which can affect us, many of them beyond our control, some of them likely to be adverse rather than favourable. It is difficult therefore to be optimistic. It is our challenge to make the best and the most of the opportunities and I have never been happier about the quality of our products and the service we can give.

The report was adopted and a total distribution of 8 per cent approved.

LONDON TIN CORPORATION

CHAIRMAN'S STATEMENT

The thirty-second Annual General Meeting of London Tin Corporation Limited will be held on July 15th at The Chartered Insurance Institute, 20 Aldermanbury, London, E.C.

The following is the statement by the Chairman, Mr J. Ivan Spens, OBE, which has been circulated with the report and accounts for the year ended March 31, 1958.

ACCOUNTS

The net profit for the year, after providing for taxation, was £644,768, which compares with £714,726 for the eleven months ended on March 31, 1957.

The dividends totalling 30 per cent, less Income Tax at 8s. 6d. in the £, already paid in respect of the year took £624,146 and left a balance for the year of £20,622 to be added to the carry forward which now stands at £310,212.

Although the gross income from investments was a little lower than for the previous period the important item in the Accounts is taxation which this year takes £686,000 (after allowing for £75,000 no longer required in respect of previous years) and compares with a total of £652,000 for the previous period. This increase is due in the main to the incidence of the Finance Act, 1957, whereby a part of our income from Overseas Trade Corporations had to bear the Profits Tax of which it was formerly relieved. The flat rate of Profits Tax proposed in the Finance Bill, 1958, will mitigate this situation in the current year so far as the actual tax liability is concerned but the Bill still makes no provision to restore relief from Profits Tax in respect of income from investments in Overseas Trade Corporations. Shareholders were informed during the year that the Finance Act, 1957, would adversely affect the distributable profits of this Corporation and that representations were being made to the Re- taken up during the [illegible] Parliament of the Finance Bill, 1958.

CONTROL OF TIN EXPORTS

Control of exports of tin from the six countries contributory to the International Tin Agreement was introduced by the International Tin Council with effect from December 15, 1957, and has since been extended to September 30, 1958. Meantime, the Council will decide what measure of control beyond that date is necessary.

Since December 15, 1957, the overall cutback in production for export has been approximately at the rate of 40 per cent per annum based on the total production of the contributory countries for the twelve months ended September 30, 1957, but the actual rate applicable in each individual country varies.

PRICE OF TIN

The average London cash price of tin metal during the year under review was £743 per ton. The highest price reached was £782 per ton and the lowest £730 per ton which is the Buffer Stock floor price. The International Tin Council has authorised the Buffer Stock Manager to operate, should opportunity offer, within the middle price range of £780 to £830 per ton until September 30, 1958. This authority, however, is subject to review by the Council at its regular Meetings.

MALAYA

Malaya achieved independence at the end of August, 1957, and the sympathetic consideration and good will of Government previously enjoyed by the tin mining industry continues under the new Constitution.

At the close of the year under review there were 36 dredges in Malaya under the management of Anglo-Oriental (Malaya) Limited. Of these 27 were in operation, one was being reconstructed and eight were idle. The idle dredges included three closed down because of export control, two scheduled to be dismantled and sold, and one hitherto idle for security reasons which can be overhauled and recommissioned when convenient. The other two will be kept for the present in case any suitable shallow areas become available for them to work. Every opportunity of further prospecting continues to be taken as the security situation improves.

The total output of tin concentrate from the mines managed by Anglo-Oriental (Malaya) Limited during the year under review was 13,740 tons which compares with 16,346 tons in the previous twelve months. The greater part of this output was exported during the year but the balance was produced for permitted stock after the inception of export control in order to keep the dredges as far as possible in continuous production.

THAILAND

The output of tin concentrate from the mines under the management of Anglo-Oriental (Malaya) Limited in Thailand during the year under review was 1,413 tons compared with 1,762 tons in the previous twelve months. This fall was due, in the main, to the low rate of quota allocated to dredges by the Thai authorities during the first quota period to March 31, 1958.

BURMA

The general conditions in Burma are unfavourable to mining although the security position has to some extent improved. The [illegible] which I reported last year to be on trial have since been brought into production but their output is small and probably it will not be possible to maintain them in continuous and economic operation.

NIGERIA

The mines under the management of A. O. Nigeria Limited produced 4,397 tons of tin concentrate and 576 tons of columbite which compares with 4,529 and 758 tons respectively for the previous twelve months. The mining of primary columbite having been suspended during the previous year because of the poor demand for the product, the output for the year under review arose entirely from the treatment of tin-bearing alluvial. This, together with the enforced cut-back in tin production, necessitated a considerable retrenchment of Staff which is much regretted. Prospecting and research, however, are both being actively continued.

DIRECTORS

It is with deep regret we record the death of Mr Richmond Temple on March 13, 1958. He had devoted his energies to the affairs of this Corporation and of the tin mining industry for a long period of years and we remember him with esteem and with gratitude for his work.

Mr J. L. Farrington, who is Chairman and General Manager of A. O. Nigeria Limited, and is at present in Nigeria, was recently appointed to the Board. In accordance with the Articles of Association he retires at the Annual General Meeting and offers himself for re-election.

GENERAL

During the year under review Lord Colyton accompanied me to Malaya and Nigeria where we were able to visit mines under our management and to have discussions with the Directors of our management Companies. The objects of major importance to the tin mining industry in both these spheres are, on the one hand, intensive prospecting to endeavour to find fresh ore reserves, and, on the other, research to improve the methods of mining and the processes to make possible the profitable exploitation of ore deposits which may be found at greater depth. The work is costly and much of it can prove abortive but it is imperative to provide for the future, and Governments can and should assist by a liberal policy of alienation of land for mining. Our managements are alert to these important objectives and will continue to pursue them. I am pleased to record the impression we gained of the efficiency of our organisation in each of these countries and the loyalty and energy of Chinese, Malayan, Indian and African senior staff and employees.

The prospects for the current year must be influenced by the price of tin and the rate of cut-back in production. If both these factors continue throughout the year at their present levels our income from our large portfolio of tin mining shares will certainly be much lower than last year. It is unfortunately impossible at this early stage to indicate to what extent the Corporation's dividend for the year will eventually be affected although some reduction is probably inevitable.

LONSDALE INVESTMENT TRUST LIMITED

GROUP EARNINGS AGAIN INCREASED

The eleventh annual general meeting of Lonsdale Investment Trust Limited will be held on July 15th in London.

The following is the statement of the chairman, Mr T. L. McC. Lonsdale, circulated with the Accounts:

The Report and Accounts show that the Group's earnings again increased. The gross income from the Trust's general investments increased by £34,954 to £323,827, due partly to dividend increases and partly to additional funds employed as a result of the Debenture issue made in July, 1957.

The same gross dividend as last year, £120,000, was received from Robert Benson, Lonsdale & Co. Limited, and after deducting expenses, interest payable and taxation, the Net Profit of the Trust amounted to £206,639, compared with £193,208 in the previous year.

The Board now recommend payment of a final dividend of 11 per cent, making with the interim dividend of 4 per cent already paid, a total dividend of 15 per cent for the year against 14 per cent for the previous year. The amount carried forward will then be increased by £42,322 and will amount to £298,341. Of the proposed total dividend of 15 per cent nearly 12½ per cent was covered by the Trust's revenue other than the dividend received from Robert Benson, Lonsdale & Co. Limited.

In order to lessen the disparity between the interim and final dividend payments, the Board intend in the current year to increase the interim dividend from 4 per cent to 5 per cent, but this must not be interpreted as signifying the likelihood of an increase in the total dividend.

ROBERT BENSON, LONSDALE & CO. LIMITED

As regards Robert Benson, Lonsdale & Co. Limited, the consolidated profits after taxation amounted to £188,601, of which £90,601 was retained in that Company and its subsidiaries. This compares with £153,447 and £84,447 respectively for the previous year. The attached ten-year statement of earnings and reserves shows the cumulative effect of retentions on the reserves of the main subsidiary and of the Group.

Reflecting the generally lower prices for equity shares in this country and the USA, the valuation of the Trust's general investments, though substantially above book value, shows some reduction in the appreciation as compared with last year and this applies also to the valuation of the investments held by Robert Benson, Lonsdale & Co. Limited.

CLASSIFICATION OF INVESTMENTS

This year a schedule of the classification of investments according to the nature of business has been attached, which is in more detail than the statement which was in previous years included in the Directors' Report; from it you will see that the Trust's industrial and commercial investments are well distributed with no great concentration in any particular field. You will also note that a considerable proportion of the Trust's general investments in North America consists of holdings in Banks, Financial Institutions and Public Utilities, from which the income during the current year has continued to be very satisfactory in spite of the recession there.

The recent proposed change in the basis for charging Profits Tax and the removal of the contingent liability attaching to undistributed profits is a great improvement, although the new rate is high. The new method is simpler, and [illegible] the problems of new financing to be approached with greater flexibility. Further, the reserves to be retained in a business can now be decided by a realistic appraisal of its probable requirements and not by reference to a criterion which is irrelevant to its efficiency.

THE CURRENT YEAR

So far in the current year dividend reductions, which have been mostly in dollar investments, have been more than offset by dividend increases on other holdings, mainly British. Indeed, in view of the recession in the USA, the major falls in commodity prices and the contraction in international trade and credit restrictions here, the recent results and performance of British companies have been heartening; the testing time, however, may lie ahead of, rather than behind, us. Unless the rather sanguine expectations of a substantial upturn in industrial activity in the USA in the autumn are realised, it seems optimistic to expect the overall results and dividends of British companies to continue to be so favourable.

With regard to Robert Benson, Lonsdale & Co. Limited, the activity which produced such satisfactory results last year has continued since the year end and the Company is currently interested in, or has under consideration, a number of projects both at home and in various parts of the Commonwealth. However, the prevailing uncertainties both at home and abroad in the fields of politics and economics make it difficult to forecast the results for the current year.

BRAZILIAN TRACTION, LIGHT AND POWER COMPANY LIMITED

(Incorporated under the Laws of Canada)

At the Annual Meeting held on June 24th in Toronto Mr Henry Borden, CMG, QC, presided. Dr R. L. Hearn, a former Chairman of the Ontario Hydro-Electric Power Commission, and Monsieur Pierre Ansiaux of Brussels, Belgium, a member of the Supreme Court of that country, were elected for the first time. All other Directors were re-elected. The President announced the appointment of Mr Mitchell W. Sharp, formerly Deputy Minister of Trade and Commerce in the Canadian Government, as Vice-President of the Company.

The shareholders confirmed the By-laws providing for the appointment of Honorary Directors, increasing the number of Directors to twenty-two and renewing the authority for the payment of dividends in shares. In presenting the latter By-law to the meeting the President stated that confirmation will not necessarily mean that the Directors would act on the authority given by it.

The President referred to the preferred rate of exchange which by the law of Brazil is applicable to certain transactions of public utilities and stated that recently the overall cost of the dollar for service of registered debt had been increased from 51.32 cruzeiros to 58.82 cruzeiros to the dollar while the payment of imported equipment considered essential for the economic development is now 70.00 cruzeiros to the dollar. Referring to the prospective financial picture for 1958, the President said that, in spite of higher cruzeiro earnings resulting primarily from increases in the amounts of electric energy and gas sold and expanded telephone facilities, there will inevitably be a further reduction in the Company's earnings in 1958 when expressed in dollars.

The President [illegible] Brazil [illegible] exchange owing to decreased coffee exports and an increase in total imports, but stated that there were factors working to improve the overall exchange picture, including the establishment of local industries in Brazil, development of its petroleum resources and increases in certain exports other than coffee.

The President referred to the effect of inflation in Brazil on the Company's operations in increased costs of construction, in steadily increasing wages, in increasing costs for all local material purchased and in the increased cost of foreign exchange. In addition he said in the electrical services the operating Companies are restricted by the provisions of the Brazilian Water Code which limits them to a ten per cent rate of return and, moreover, ten per cent on investment computed at historical cost in cruzeiros, and continuing he said, "The local investor nowadays in Brazil finds ten per cent a wholly unacceptable rate of return and in our case this ten per cent, by the application of the principle of historical cost, is reduced to something like five per cent of book value, which represents a still lower rate of return on present-day fair values." The President added that "In Brazil today short term Government loans yield up to ten per cent and equity stock demands a fifteen per cent dividend. It will be seen, therefore, how essential it is to have some new legislation in Brazil applicable to public utilities providing for an upward revision of the rate base and an increase in the allowable rate of return."

As to telephones, he said that, while the Water Code did not apply to the Telephone

Service, the rates for such service were inadequate and the Telephone Companies would not really be successful in raising local money for much needed expansion until rates are very considerably raised to a point where they represent a reasonable rate of return on the fair value of the plant in service.

The President reported on the appointment of an Administrative Council in the São Paulo Light Company consisting of distinguished Brazilian citizens who will give advice and help in connection with the affairs of that subsidiary. The President stated that he should not like to leave the shareholders with the impression that the future is unrelievedly gloomy. "The immediate difficulties," he said, "that Brazil must overcome are formidable, but there are signs of future developments holding great promise." He referred to the recent exchange of letters between the President of Brazil and the President of the United States and added that out of this exchange will come solutions for some of Brazil's economic problems.

In conclusion the President referred to the fantastic rate of growth in Brazil and said that the Company had no choice but to exert every effort to expand the essential services for which it is responsible in Brazil and thereby continue to make these services available to an ever increasing number of Brazilians.

ISTITUTO MOBILIARE ITALIANO
"IMI"
Italian Finance Corporation, Rome, Italy

The Twenty-sixth Annual General Meeting of *Istituto Mobiliare* Italiano (IMI) was held in Rome on May 20, 1958, under the chairmanship of Mr Stefano *Siglienti*.

The Board of Directors in its Report described the Italian economic position as satisfactory and made a very detailed survey of the activities of IMI for the fiscal year April, 1957-March, 1958. It stressed the great volume of IMI operations carried out during that period and the good results achieved.

New applications received amounted to more than Lit.221.450 million, up to the same record level registered for the fiscal year 1956-57. Credits granted reached the amount of Lit.92.038 million due to ordinary loans for Lit.86.439 million—a 3.7 per cent increase over the fiscal year 1956-57—and accounting for only Lit.5.599 million to the special loans made by means of Government funds and on the behalf of the European Coal and Steel Community.

A very encouraging feature was the export credit operations of IMI, which deserved special mention. The 1957-58 figures (over 15.028 million lire) showed a rise of 49.7 per cent over the previous year.

The Report also underlines the important measures the Authorities have assumed to support transactions on capital goods exportation and expresses the hope that benefits already acquired by the export credits measures should not be impaired in the future and that the Authorities would make further advances out of the funds provided for by the law and budget allocations.

Outstanding loans at March 31, 1958, show a 5.3 per cent rise over the corresponding period of 1957 up to the material amount of 642.758m. lire. Ordinary loans increase largely offset the reduction noted in the special loans transactions.

New bonds issued during the fiscal year 1957-58 amounted to Lit.63.927m., so that by March 31, 1958, the total of outstanding bonds reached the amount of Lit.326.008m. showing a net increase of Lit.41.933m.

Reserve funds and net profits again showed a net increase and went up respectively from 25.722 to 30.269m. lire and from 1.557m. lire to 1.647m. lire. As a result the General Assembly approved the resolution submitted by the Board of Directors for the distribution of a dividend of 8 per cent on the paid-up capital and a contribution of a sum of 1.168m. lire to the reserves, which have thus risen to Lit.31.437.

FORSTER'S GLASS CO. LTD
HIGHER SALES

The Thirty-ninth annual general meeting of Forster's Glass Company Limited will be held on July 16th in London.

The following is an extract from the circulated Statement by the Chairman, Colonel Sir Charles Ponsonby, Bart, TD, DL, on the report and accounts for the year ended March 31, 1958:

The year's profit of £171,209 compares favourably with that of last year, having regard to an increased provision for depreciation of £12,235, a provision of £5,000 for obsolescence and an additional £8,743 for pension benefits.

In my last report I told you that we had been reluctantly compelled to increase our selling prices on June 24, 1957, by approximately 7½ per cent. During the nine months of the year in which these higher prices have operated, costs have continued to rise. The result as far as profit and sales are concerned has therefore followed the same pattern as the previous year, the volume of sales being again slightly higher but the profit lower.

In all the circumstances I consider this result to be not unsatisfactory. It has been achieved in the face of intensified competition in the expanding field of packaging, which includes containers made from plastics, metal and paper in addition to glass. We are confident that the glass bottle and jar will more than hold their own in this field.

There is a possibility that the trade recession or "levelling out" which the United States is undergoing may be reflected in this country. There is, however, no sign of this happening at the present time in the glass container industry, and demand for your company's products is running at a higher level than last year.

BUSINESS AND PERSONAL

NEWPORT, ISLE OF WIGHT.—Finest Multiple position: Freehold Business Premises, 129 HIGH STREET, three floors, extensive shop, store and workroom accommodation. Frontage 28 ft. 8 in., depth 240 ft., site area 7,000 sq. ft., floor area 10,000 sq. ft. Vacant Possession. Auction Sale Newport, Wednesday, July 16th. Auctioneers: Way, Riddett & Co., Newport, I.W.

EDUCATIONAL

COLLEGE OF TECHNOLOGY
Portsmouth

FULL-TIME COURSE FOR THE B.Sc.(ECON.) DEGREE OF LONDON UNIVERSITY

Enrolments for this three-year Course can now be accepted for the Session 1958/59. Applications should be addressed to the Head of the Commerce Department. Entrance requirements are:

G.C.E. passes in any five subjects, of which at least two must be at Advanced level
OR G.C.E. passes in any four subjects, of which at least three must be at Advanced level.

SUCCESSFUL TUITION FOR THE B.SC.(ECON.) DEGREE

Wolsey Hall (Est. 1894) provides Postal Courses in a wide range of subjects for the examinations for Lond. Univ., B.Sc.Econ. [illegible] Moderate fees, instalments. [illegible] Wolsey Hall students passed Lond. Univ. B.Sc.Econ. exams. 1951-57. Prospectus from C. D. PARKER, M.A., LL.D., Director of Studies Dept. P.16, WOLSEY HALL, OXFORD.

SECRETARIAL TRAINING especially for university graduates and older students. Six-month and intensive 14-week courses.—Write, Organising Secretary, PITMAN'S, 2 Addison Road, W.14. PARK 8392.

EXPERT POSTAL TUITION

for Examinations—University, Law, Accountancy, Costing, Secretarial, Civil Service, Management, Export, Commercial, General Certificate of Education, etc. Also many practical (non-examination) courses in business subjects.—Write today for free prospectus, and/or advice, mentioning examination or subjects in which interested to the Secretary (G9/2).

METROPOLITAN COLLEGE, ST. ALBANS
or call at 30 Queen Victoria Street, London, E.C.4.

ORDERS for advertisements in The Economist are accepted on condition that they are liable to rejection at the discretion of the Editor; that while every effort will be made to publish an advertisement on a specified date, no guarantee is given; and that white on black, reverse blocks, or large sizes of black-faced type may be supplied or used at the Editor's discretion.

APPOINTMENTS

MSL have been retained to advise on the appointment of a

CHIEF ACCOUNTANT

for one of the leading textile organisations in São Paulo, Brazil. The Chief Accountant will be responsible to the Financial Comptroller for financial costing and management accounting and will control a department of about 190.

Candidates between 35-45 must be qualified accountants, (preferably Chartered) and have at least five years' experience of manufacturing industry as chief or assistant chief accountant. They should have first hand knowledge of standard costing and budgetary control. They must be prepared to learn Portuguese.

Initial salary will depend on age and experience but will be about the equivalent of £4,000 to £5,000 in Brazilian currency. This is a permanent post in South America, but home leave of 4 months will be granted every 4 years and passages for wife and children will be paid.

All information will be disclosed to our clients until candidates know their identity and have given permission after personal discussion. Please send brief details in confidence, quoting reference S.934, to D. M. Sidney.

MANAGEMENT SELECTION LIMITED
17, Stratton Street, London, W.1.

ECONOMIST

Male graduate in Economics or Statistics required as no senior assistant in a new department of an old established international food manufacturing company in headquarters in London. The person appointed will be expected, after collation and analysis of relevant material, to make market appraisals for many products both in the United Kingdom and overseas. Age limits 25-33 years. Previous experience in this type of work and a knowledge of French are desirable. The salary and [illegible] are good and a Pension Scheme is in [illegible]

[illegible] Ltd., Thames Road [illegible] Street, Hull.

[illegible] SUCCESSION

[illegible] ON

[illegible] FOR THE POST OF SECRETARY

[illegible] Panned by certified copies of at least two testimonials. Applicants should have general scientific experience, rather than specialised experience, with administrative ability and some administrative experience in research institutions. They should be between the ages of 35 and 45.

The duties involved will cover the general administration of the South African Forest Association's Experiment Station at Mount Edgecombe, Natal, and its branches, including staff control and the direction and supervision of [illegible]

THE UNIVERSITY OF MANCHESTER

Applications are invited from graduates for the post of ASSISTANT CATALOGUER in the University Library. Library experience is desirable but not essential. A degree in Economics, Politics or some other branch of social study would be an additional qualification. Salary scale £[illegible]-£850 per annum with membership of F.S.S.U. and Children's Allowance Scheme.—Applications should be sent, not later than July 5, 1958, to the Registrar, the University, Manchester, 13, from whom further particulars and forms of application may be obtained.

ACTUARIAL OPPORTUNITIES IN USA

The Equitable Life Assurance Society of the United States has several openings at its Home Office in New York for men interested in an actuarial career in the United States. Candidates should be up to about age 30 and have passed some or all of the examinations of the Institute of Actuaries, or of the Faculty of Actuaries.

Those interested should write to Mr. Harry Walker, Second Vice President and Associate Actuary of the Equitable, at 393 Seventh Avenue, New York 1, New York, U.S.A., stating their qualifications, including age, education and experience. Interviews with Equitable representatives will be arranged in Edinburgh on July 21 and in London on July 22nd and 23rd.

THE FOREIGN OFFICE wishes to appoint a TUTOR for discussions on British policy and international relations with leaders of European public opinion at Wilton Park, Steyning, Sussex. Bilingual French essential, German desirable. Degree in History, Economics or other Social Sciences also required. The post is unestablished. Accommodation. Salary £1,140 x £30-£1,170 x £35-£1,310 x £40-£1,430. APPLICATIONS BY SEPTEMBER 15th, to Ministry of Labour and National Service, Professional and Executive Register (Reference P.E.1325), Atlantic House, Farringdon Street, London, E.C.4. Only those selected for interview will be informed.

AN ASSISTANT FOR THE INVESTMENT MANAGER is required by a substantial Insurance Company in the Midlands. Age range 26-30. Commencing salary not less than £850 per annum with non-contributory pension scheme. Replies, which will be treated as confidential, stating age, experience etc., to Box 962.

SALES AND SALES MANAGEMENT

An OPPORTUNITY which offers more scope and potential than the one offered now by a NATIONAL COMPANY would be difficult to find.

Several able men of ambition are sought to be trained in the North of England for future SALES MANAGEMENT positions.

Our training methods are renowned for both their thoroughness and success. We have a remarkable history of expansion which is still continuing. Our business is in the Grocery and Allied Trades and we are leaders in our field. Conditions of work are comparable with the best. We offer a career with a future, all promotion being from within our own organisation. If you are 21-33 physically fit, mentally agile, well educated and believe in your own ability—and can quickly prove your worth—please reply, stating preference for interview at Nottingham, Leeds, Newcastle, Glasgow or London, to Box 964.

THE ASSOCIATION OF UNIVERSITY TEACHERS

APPOINTMENT OF EXECUTIVE SECRETARY

Applications are invited for this newly established post. The Executive Secretary will be responsible for the general administration of the work of the Association and particularly for the carrying out of its policy, which involves high level negotiation and some public relations work.

Salary within the range £1,750 to £2,500 according to qualifications and experience, plus children's allowance and superannuation.

Further particulars may be obtained from the Honorary [illegible] Secretary, A.U.T., Laurie House, 21, Dawson Place, London, W.2., to whom applications (8 copies) should be sent before 24th July, 1958.

THE Pig Industry Development Authority require a statistical officer to provide the Authority with appreciations of the statistics of pig production, processing and marketing and to assist in the examination of the economic aspects of the industry. The officer will be [illegible] secretary to the Authority's Distribution, Marketing and Economics Committee.

Candidates should have a good background knowledge of agricultural economics and hold a degree or professional qualification preferably in economics with statistics [illegible] in statistics.

The appointment will be on the scale £1,475-£2,000 and will be subject to the provisions of a contributory pension scheme. The initial salary will be fixed according to [illegible] e and experience.

There is no form of application. Applications should be submitted to the Chief Officer, Pig Industry Development Authority, 30, Chester Terrace, London, N.W.1, not later than Wednesday, 9th July, 1958.

CITY OF LIVERPOOL EDUCATION COMMITTEE

QUARRY BANK HIGH SCHOOL FOR BOYS.
Headmaster: W. E. Pubjoy, M.A.
REQUIRED IN SEPTEMBER, 1958.

Graduate Master to teach Economics to Scholarship level, with some History. Graded Post £325 available for suitably qualified applicant. A temporary appointment would be considered.

Application form (s.a.e.) from H. S. Magnay, M.A., Director of Education, Education Offices, 14 Sir Thomas Street, Liverpool, 1.

THOMAS ALKER,
TOWN CLERK AND CLERK TO THE LOCAL (E.5240) EDUCATION AUTHORITY.

CENTRAL ELECTRICITY GENERATING BOARD

COMMERCIAL AND OPERATIONS DEPARTMENT

ASSISTANT STATISTICIAN required in the TECHNICAL ENGINEERING and STATISTICS SECTION at BANKSIDE HOUSE HEADQUARTERS, London, S.E.1. Candidates should hold a University Degree in statistics or mathematics, or should have wide experience of the application of the theory of the most advanced techniques of mathematical statistics. A background of engineering experience is also desirable. The successful candidate will be required to work in a Sub-Section dealing mainly with research investigations of a mathematical or statistical nature into problems arising out of the operation of conventional and nuclear power stations, the duties including the development of methods of analysis, assessing the implications of the results, and presenting them in the form of reports. He will be required to develop computational procedures, and will have opportunities to develop the use of an electronic computer in the work of the Section. Salary will be within the scale, £1,105 to £1,315 per annum. Applications, stating age, present position and salary, and giving full details of experience, should be forwarded to S. S. Scott, Chief Personnel Officer, 24/30, Holborn, London, E.C.1, by 11th July. Envelopes should be marked "Confidential" Ref. T/178.

THE ECONOMIST INTELLIGENCE UNIT LIMITED

will be making a number of appointments to its research staff to assist in meeting the increasing demand for the Unit's services in the fields of economic and market research. Candidates for these posts must have very good academic qualifications and experience of work in industrial, commercial or financial companies or organisations, or of work on the economics of agriculture.—Applications should be accompanied by full particulars of age, academic and other qualifications, including knowledge of foreign languages, experience since leaving university, and present salary, and should be sent to reach "Research," 22 Ryder Street, St. James's, London, S.W.1, not later than July 28.

GRADUATE APPRENTICESHIPS AND MANAGEMENT TRAINEESHIPS

GLACIER METAL COMPANY LIMITED

This Company, the largest manufacturer of Plain Bearings in Europe, announces four vacancies in each of the following courses for the current year:—

GRADUATE APPRENTICESHIPS

This course has two objectives:

(1) A practical training in engineering during which the Graduate "learns his tools", has actual experience of setting and operating machines, operates production procedures, and covers all kinds of engineering and the principles of workshop practice. Modern activity methods of teaching are used i.e., to the maximum extent possible Graduates carry out the operations they are learning.

(2) Theoretical training in industrial organisation, within a syllabus based on research work carried out by the Company.

The course is based on London and normally lasts two years, although Graduates making good progress can expect to finish [illegible] time. Selection takes into account both academic level and all-round personal qualities.

Salary from £550 to £800 p.a. according to qualifications, age and experience.

MANAGEMENT TRAINEESHIPS

The object of this course is specifically to provide recruits for eventually filling senior posts in the Company. It covers some two years of general training, of which a part is spent abroad. As well as formal training events, the course consists of a number of periods during which Trainees carry out actual jobs of work in the main areas of Company activity. Each period is centred around a project during which the trainee is expected to study some particular aspect of the job in hand. Regular career discussions are held with Trainees.

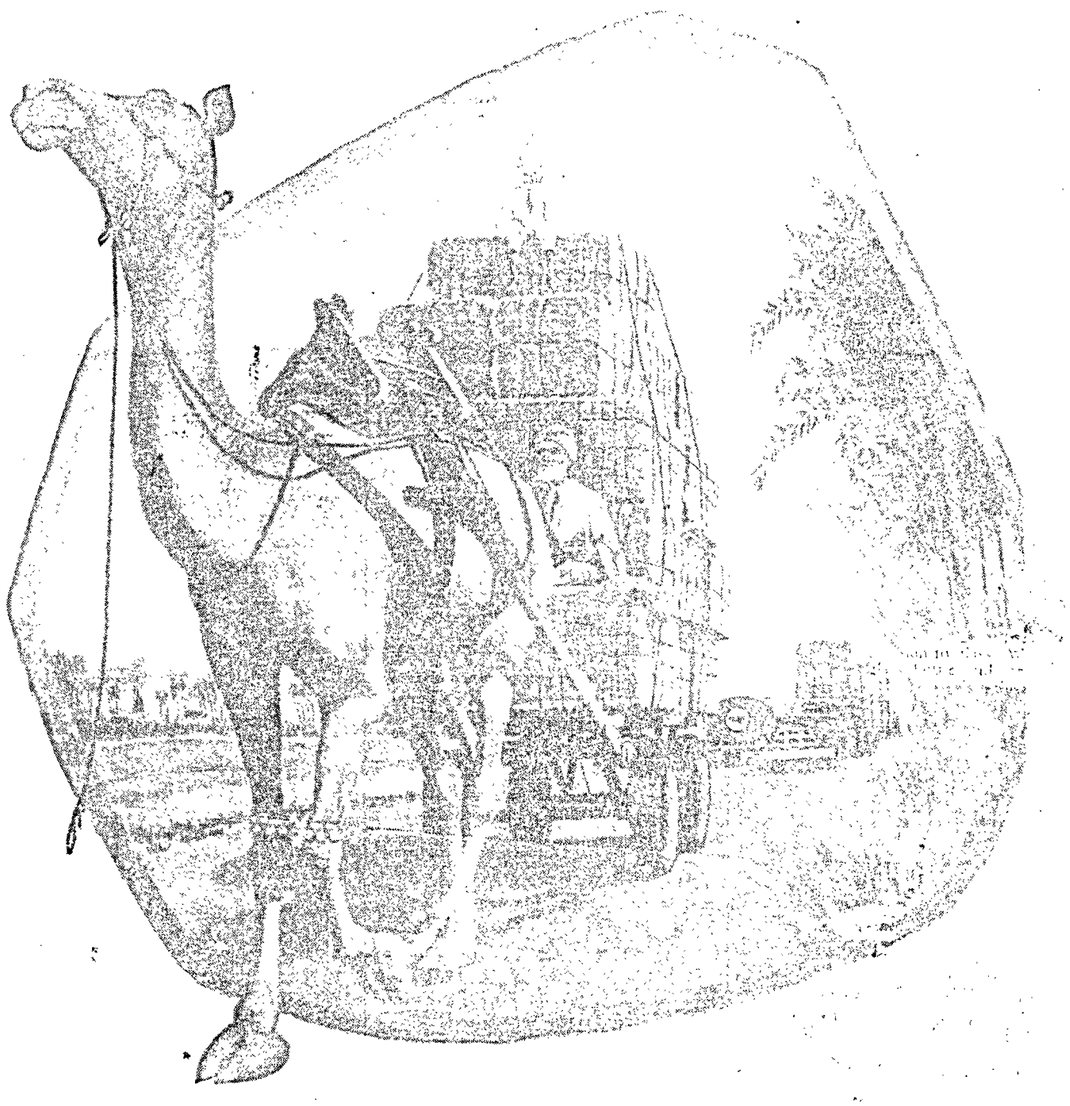
Entrants should have a University degree and should have completed a recognised apprenticeship.

Selection will be based on both an academic record and personal qualities.

Salary varies from £650 to £900 p.a., according to qualifications, age and experience.

Applications from young men who wish to be considered for one of these appointments should be sent to the

Personnel Director, (Reference G/TD),
GLACIER METAL CO.,
Ealing Road, Alperton,
Wembley, Middlesex.



GALLUP POLL: Male Research Assistant required. Write in own handwriting giving qualifications, experience, etc. Excellent prospects. 59 Brook Street, London, W.1.

AIR SUBSCRIPTION RATES

Subscriptions to many countries can be sent either by direct second-class airmail or in bulk by air freight for onward posting from central distribution points. Airmail is invariably more expensive but usually quicker by about 24/48 hours. Where only one service is shown this is because the alternative is either not available or not recommended.

	Airmail	Air Freight
Australia	£10 6s.	—
Canada	—	$25 or £9
Ceylon	£9 0s.	—
China	£10 6s.	—

Plessey

Pioneers of Reactor Control Instrumentation

The greatest single factor influencing designers of nuclear reactor power plant is the problem of guaranteed safety. In conjunction with the U.K.A.E.A. Plessey have designed and installed at Calder Hall all the relevant equipment for continuously monitoring the 1,696 fuel elements used in the reactor, namely:

Burst Fuel Element Detection Equipment

Similar equipments by Plessey have now been adopted for future reactors by designers in Britain and overseas. Fuel element monitoring systems for water cooled reactors, designed by Plessey, are in production for eventual installation in reactors outside Great Britain.

Plessey are also engaged in the original design of neutron detectors for reactor control. Of robust construction these detectors include compensated and uncompensated ionisation chambers and fission counters, and are suitable for use through a wide range of temperatures and conditions.

Among an ever increasing Plessey product range are included flux scanning detector units and complete systems, health instrumentation, including reactor effluent monitoring equipments. Instruments for reactor control include pulse amplifiers, D.C. amplifiers, shut-down amplifiers, ratemeters, reactivity meters, installed test equipment and power units.

Japan's Shipbuilding Industry:

Japan retained its lead as a major shipbuilding nation of the world by launching a total of 2,421,433 G/T in 1957, according to the Lloyd's Register of Shipping.

Animation of Japan's shipbuilding industry in 1957 was largely attributable to active exports. Exports of ships in that year reached 1,433,500 G/T, topping in value the list of major export items and contributing markedly towards the nation's balance of international payments. Japan's shipbuilding industry owes its energetic recovery after the war principally to various liftup measures taken by shipbuilders, such as modernization of welding processes and transportation equipments, increased production of larger-type diesel engines, expansion of stocks for building larger-type vessels and larger output of good turbines. Thus, the annual shipbuilding capacity, which slipped to only 800,000 tons immediately after the war, has recovered to well over 2.2 million tons.

The adoption of new welding processes and the use of top-quality ship plates and other steel materials have also resulted in the production of lighter hulls, the economization of labour, the elevation of operation efficiency of stocks and the shortening of construction periods. As well noted in the amount of export ships, Japan's shipbuilding technique has thus attained the highest level of international standards.

AIR FRANCE

With the strange splendour of the aurora borealis in the polar skies... windless, serene... the polar route is the calmest of airways

inaugurates its Polar route

TOKYO IN 31 HOURS FLIGHT

AIR FRANCE has waited before starting its Polar service to Japan until its fleet of Lockheed L-1649A Super Starliners—the aircraft with the non-stop range of 6,000 miles—were delivered and proved. With but one stop, at Anchorage in Alaska, passengers relax as the icecap slips away far below, whilst enjoying every refinement of Air France comfort—Epicurean cuisine, cloud-soft berths, and reclining skylounge chairs.

At 23,000 feet, the Super Starliner wings straight as an arrow between the magnetic and geographical poles. Effortlessly the 8,250 mile journey is completed—Tokyo in 30 hours from Paris.

The connecting flight from London is but a short hour—and travellers may return by the famous Eastern Epicurean via South East Asia and India, thus circling the world. Your travel agent has full details of the new service, which starts on April 10th, and will make your reservation, or you may enquire at any Air France office.

SOME NEW AIR FRANCE FEATURES THIS SPRING

NORTH ATLANTIC ECONOMY FARE

On 1st April, 1958, Air France introduces the "Economy Class" service* across the North Atlantic to the U.S.A. and Canada. Passengers can save up to 20% on existing tourist class fares, either via Paris or at a slightly lower fare, via Dublin and Shannon.
**Subject to Government approval.*

CARIBBEAN AND CENTRAL AMERICA

A new weekly service this summer via the Azores, the French Antilles, Caracas and Bogota, to Quito and Lima. The fastest and most direct service to the Caribbean.

SOUTH AMERICA

There will be a third flight weekly by Super Constellation via Rio de Janeiro to Sao Paulo, offering berths and first and tourist class accommodation.

That division of labour is an essential factor in the development of economic society is as true today as it was in the past. The prosperity of international economy is no exception. It is only with mutual economic cooperation that friendly relations between nations are expedited and the ideal of world peace is achieved.

About the time that Europe goes to bed after a hard day's work Japan rises with the bright sunrise to begin another day of healthy economic activity and Japan's high technical skills and modern production facilities start to turn out a continuous flow of superior products.

As an industrial nation in Asia we are sincerely endeavouring to contribute to world peace and the happiness of mankind. That which links Japan and the Occident (the rest of the world) is only, but only, economic cooperation.

For further information on Japan, write, preferably in English, including your age, occupation and, if possible, your comment on this advertisement, to the Trade Promotion Section, Ministry of International Trade and Industry, Tokyo, Japan. You will receive a beautiful brochure, "JAPAN AT A GLANCE, 2nd Ed." which describes Japan and her industrial activities.

Japan's Second Century

IN THE BALANCE

LOOK BACK IN YEARNING

THE HUNDRED MILLION QUESTION

MATHEMATICS AND BRICK WALLS

HEARTBREAK OF A SALESMAN

ODD TRADER OUT

SEMI-DETACHED ALLY

In the Balance

ALMOST exactly a century ago, in the early summer of 1858, the American envoy who had followed Commodore Perry's squadron into Tokyo Bay signed the trade treaty which reawakened Japan to its first intercourse with the modern world. Ninety years ago, at the beginning of 1868, the young Emperor Meiji issued the restoration edict that took control of the country out of the hands of the last *shogun*, the heir of the military dictators who had wielded power more or less since the twelfth century. The long Rip Van Winkle sleep of Japanese feudalism had ended. Since then, Japan has been first the darling and then the despair of western liberals. By intelligently copying the West, it promised to be Asia's standard-bearer on the road to western prosperity. Then, by abusing its newfound industrial strength, it very nearly succeeded in converting eastern Asia into the empire of a semi-fascist dictatorship. As their second century in the modern world opens, the Japanese are making a second—and, so far, more promising—attempt to create a new civilisation out of an old nation.

Kipling's hoary nonsense about East and West is still quoted about Japan. The two have met, and yet it occasionally seems as if, like oil and water, they have failed to mingle properly. The aerials of a million television sets now sprout on the Japanese skyline, but many of them, perched above the thatch of village farmers' huts, have a highly incongruous look to western eyes. Again, the Japanese are assiduous readers, but the language they read, with its basically Chinese script, is far too cumbersome and complex to be convenient for discussion of modern technical matters. Nevertheless, in proportion to the population, Japanese newspapers have circulations bigger than those of the United States, and not very much less than those of Britain. And, for the Japanese, "reading" is not simply a matter of skipping from pictures to comic-strips and back; some of the mass-circulation dailies (notably the commendable *Asahi*, with a readership of four million) carry a considerable number of serious articles on politics and economics, and a visit to a city bookstall will glean an impressive harvest of intelligent periodicals as well as the usual array of glossy paperbacks.

The contrast is all the more violent when the visitor turns to the life of the average countryman on his tiny smallholding of a farm—still backward, still bound to the necessity of back-breaking labour six and seven days a week, still a foreigner to western notions of entertainment and culture. Perhaps the contrast helps to explain one oddity. Like the British, but even more noticeably, the

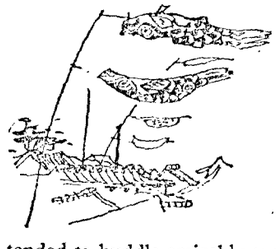
PARTIES AND POWER

At the opening of its present session, the 467 seats in the House of Representatives—the lower house of the Japanese Diet—were divided as follows :—

Liberal-Democrats	291
Socialists	157
Communists	2
Others	2
Vacancies	(15)

The Liberal-Democrats are the product of a merger in 1955 between two formerly separate conservative groups ; in the same year the right-wing and left-wing socialists reunited to form a single party. Except for two coalition governments in 1947-8, in which the socialists took part, the conservatives have been in power since the constitution took effect in 1947. The present administration, under the premiership of Mr Kishi, has been in office since February last year. The next election must be held by February of next year, and may take place this spring.

Japanese appear to keep their reading habits and their voting preferences in separate compartments ; the opinions of the newspapers they buy lie on the whole to the left of centre, but the governments they elect stand solidly on the right. The peasants, still one of the main props of the conservatives, have not yet been exposed to the impact of radical ideas as fully as the townsmen.



A similar phenomenon can be observed in the labour market, where old ways have not yet accommodated themselves completely to the usual practices of western industry. A Japanese employer is, by the standards of his colleagues in the West, both a lucky and an unlucky man. Managers who have had experience abroad say that few workers can be trained for skilled jobs so quickly as the Japanese—particularly the nimble-fingered and intelligent womenfolk, who make up a third of the entire industrial labour force and often monopolise the kind of workshop from which their British sisters would be excluded by the men. Perhaps because old habits of discipline die hard, labour relations are still relatively good, although the trade unions acquired real power for the first time after the war and are still testing their muscles. The usual pattern of events is for a rash of disputes to break out in the spring and autumn, when the more militant left-wing unions stage verbally ferocious "offensives," but for most of the disputes to be settled without any lasting bitterness. Except for the bad year of 1952, which was marred by a long and angry strike in the coal mines, the Japanese have lost fewer working days through industrial disputes in recent years, in relation to the size of their labour force, than the British.

But there is another side to all this for the employer: tradition also imposes on him obligations that his colleagues in the West do not share. Usually, when a workman has been taken on to the regular pay-roll of a company, he is regarded as having entered into a lifelong relationship with it. One consequence is that places have to be kept for the slothful and the inefficient even though better men may be available. Another is that many companies, whose wage bills would make British and American competitors green with envy, are also impelled by a sense of avuncular responsibility to spend large amounts on welfare and recreation schemes for their workpeople. In many ways this is an admirable attitude ; but it does not make for maximum mobility or efficiency of labour.

It is in the political arena, however, that the attempts of the Japanese to live up to western standards deserve most attention. The judgment must be that, on the whole, they have achieved a greater degree of stability than the pessimists might have expected, but that this stability is founded on the success of their economy since the war ; if the foundation cracks, the political superstructure may crumble as well. The occasional disorders in the Diet (which is little worse in this respect than, say, the Italian parliament has sometimes been) have been duly noted in the foreign press, but not enough credit has been paid to an equally important, and far more encouraging, aspect of postwar politics: the almost complete failure of the extremist parties on either the left wing or the right to gain any significant influence.

In the last three elections, when a consistent 75 per cent of the electorate have trudged to the polls, the communists have collected only two per cent of the votes. They now hold a mere brace of seats in the House of Representatives, although some socialists of the far left, and a few supporters of the old Labour-Farmer group, occasionally add to the number of toes on the party line. At the other end of the spectrum, the ultra-nationalism of the nineteen-thirties has reappeared in a number of ex-officers' societies. The redoubtable Colonel Tsuji, who planned the attack on Singapore in 1942, has regained a seat in the Diet, and perhaps a score of Liberal-Democrats are tinged with sentiments like his. But, except for the influence they may have exercised in the "revisionist" campaign—described in the next section—these survivals of the far right are distinguished chiefly by their bark ; and those of the wartime leaders who have returned to positions of real power in the Liberal-Democrat government—like the premier, Mr Kishi, who served in Tojo's war cabinet—appear to be making a genuine effort to accommodate themselves to parliamentary democracy.

One reason why the extremists have failed is that conditions are not propitious for them. The right wing, which before the war flourished on the powerful sentiment in favour of expansion into east Asia, now has nowhere to suggest as a possible *Lebensraum* ; and the communists have been harried by the police even more zealously than their comrades in America. But a more important reason is to be found in a peculiarity of the two democratic parties. Unlike the parties of Britain and America, which have tended to huddle amicably together on a middle ground of shared beliefs. They have their respective centres of gravity fairly far out to right and left. In the Liberal-Democrats' case, this shows itself in an enthusiasm for changing parts of the society the Americans imposed on Japan after the war and replacing them with parts copied from an older pattern ; an enthusiasm, be it noted, that is apparently not yet shared by the larger part of the population. In the socialists' case, it shows itself in the vitality of the pre-1955 leftist faction,

both within the united party and in Sohyo, the big trade union confederation which the faction dominates. The tendency to lean to the left is partly accounted for by the socialists' isolation from the mainsprings of social democracy in western Europe ; the Japanese party, asserting that its European counterparts are not interested enough in the special problems of Asia, turns back to a sterile re-reading of Marxist textbooks.

In one way, this tendency of the parties to lie away from the centre is a blessing. It means that Japanese voters who want to make a vociferous protest at the polls can find a means of expression without having recourse to the non-democratic parties. But in another way it contains the

seeds of danger. At the moment, the most striking characteristic of the electorate is the large body of moderate opinion which displays no marked zest for doctrinaire radicalism of either right or left. While this exists, it imposes a restraining influence on the centrifugal tendencies of both parties. These middle-of-the-road voters come chiefly from two groups, the farmers and the owners of the vast numbers of small businesses in the cities. The seventeen million peasants and their families, happy with the land they acquired when the Americans ordered the big estates to be broken up after the war, are still attached to the post-war reforms and, on the other side, suspicious of Marxist theories about land ownership. The small business men—and there are something like five million self-employed people in industry—still tend to give most of their votes to the conservatives, but are unresponsive to conservative wishes to change the war-renouncing section of the constitution. Thus Japanese politics are something like a see-saw, hanging in delicate balance on a central point ; if that moves, the whole balance may be imperilled.

So long as the moderates stay moderate, it seems that the conservatives will be able to remain in power for some time. In the last three elections, the socialists have slowly improved their proportion of the poll from a little over a fifth to not much under a third (though some of this represents only a recovery of support lost in the difficult years of 1947-48). They are now beginning to make inroads, in both town and country, upon the central mass of voters ; yet it will probably be two or three elections hence, even if they are able to continue their present rate of progress, before they get within striking distance of power. But it is possible to foresee that an economic crisis, by bringing distress to farmers and small *entrepreneurs*, might cause the central block to slide away from the centre ; and the volatility of the Japanese voter might then take the whole country plunging to one non-democratic extreme or the other. Which extreme it would be is anyone's guess. The odds are that it would be to the right, since a nationalist appeal is likely to find a wider audience, especially outside the towns, than a communist one. But it is difficult to forecast confidently exactly what would happen in the confusion and despair that would follow a breakdown of the economy.

This is to take the most pessimistic view. There are certain qualities in both parties that might grease the slipway to extremism if ever a movement away from democracy made itself felt. The notoriously factional nature of the Liberal-Democrats—their division into cliques based more on personal loyalty than shared beliefs, and as much on opportunism as either—might help an emergent "national saviour" of the right wing to gather round himself a cluster of parliamentarians eager for the electoral (and other) plums he could gather for them in time of trouble. The socialists also have their factions, but these are more ideological in character ; their chief weakness is their seemingly incurable readiness to turn their left ear to the delicious but dangerous siren songs of Marxist theorising. So far, however, neither tendency has gone too far. The great bulk of Japan's right and left, though the cleavage between them is wider than it is in Britain, still lie within the bounds of liberal democracy.

Whether or not they stay within these bounds depends, in the end, on whether Japan solves its economic problems. The testing time is likely to be the next eight or ten years. As later articles suggest, this is the period during which the greatest demands will be made on the economy—and during which the country's democratic backbone will still not have hardened properly. It will probably be enough if the economy does as well as it has done in the last half-dozen years, but there are signs that it will have difficulty in keeping up the pace. The Japanese might well feel rueful at the task set them ; it would test any statesman's athletic prowess to run an economic race while balanced on a political tightrope. The rest of the world, watching with critical eyes, ought at least to wish them luck.

WHO GETS THE VOTES

Since the end of the American occupation, in the spring of 1952, there have been three general elections for the House of Representatives. The proportion of the poll cast for the various parties in these elections was as follows (to the nearest decimal point) :—

	Oct., 1952	Apr., 1953	Feb., 1955	
Liberals	47·9	*47·7	†26·6	Now united as Liberal-Democrats
Progressives	18·2	17·9	—	
Democrats	—	—	36·6	
Right Socialists	11·6	13·5	13·9	Now united
Left Socialists	9·6	13·1	15·4	
Communists	2·5	1·9	2·0	
Others	10·2	5·9	5·5	

* Divided into "Yoshida" and "Hatoyama" factions.

† After the defection of a section of the party to help form the Democrats.

The percentage of the electors going to the poll was respectively 76·4, 74·2 and 75·8, with men voting rather more heavily than women.

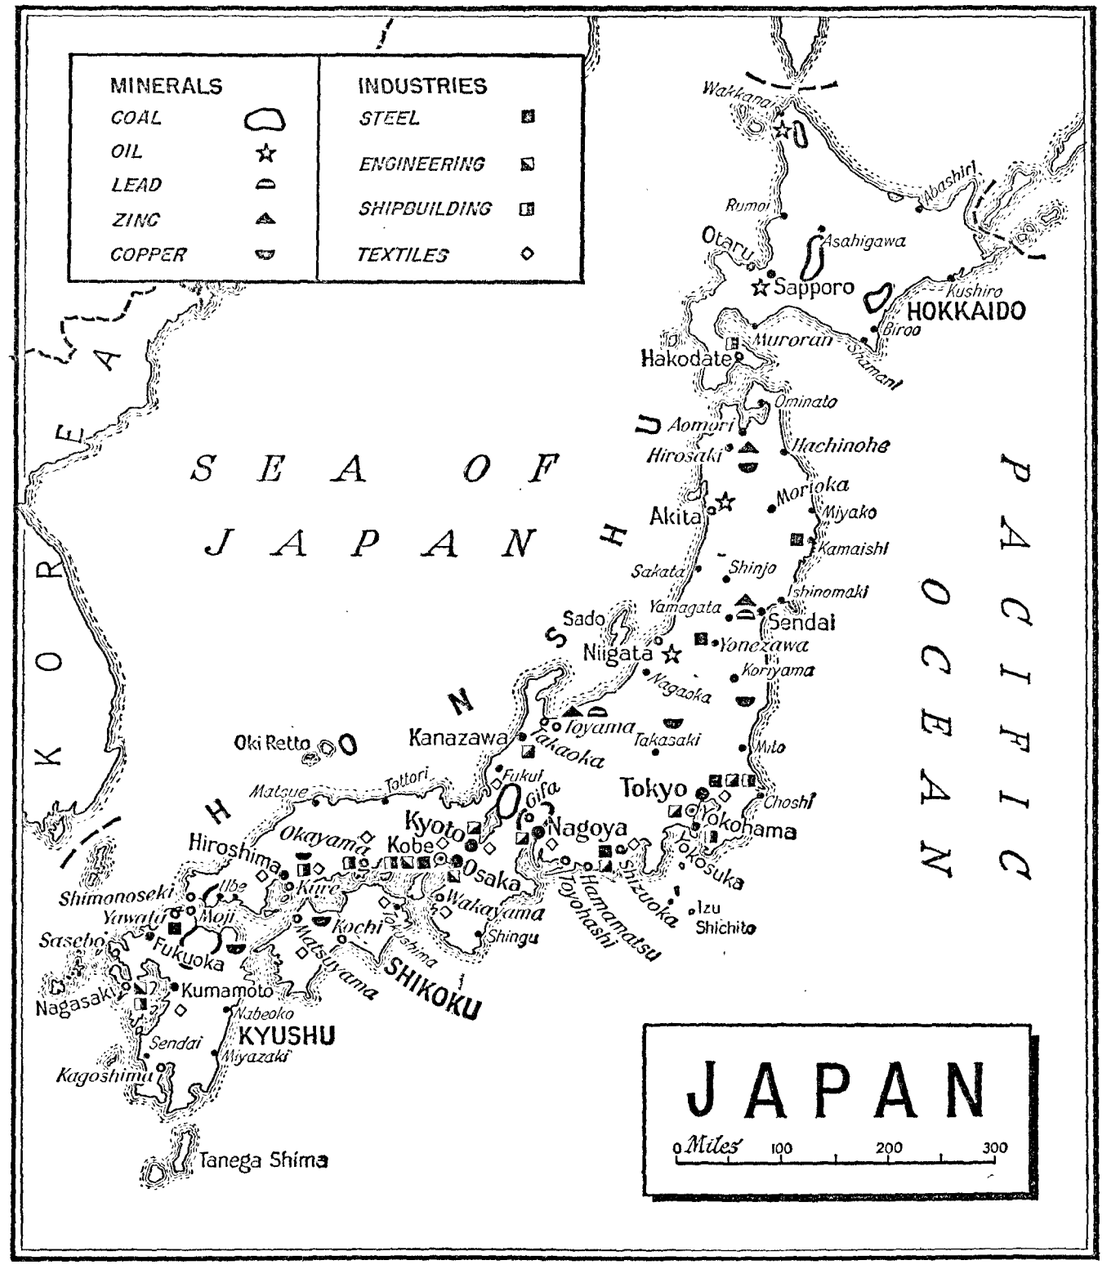
Look Back in Yearning

The government's critics say it is trying to "turn back the clock." How serious is the trend?

IN 1947, the Japanese swallowed at one gulp a constitution concocted by the Americans to cure their political ills. The "MacArthur constitution" was compiled from American and British constitutional experience, and translated from an English text; sometimes so badly translated that puzzled politicians had to refer to the original. It demoted the almost sacred Emperor to a symbol of popular sovereignty, and forever renounced war as a means of national policy. It also created an elected upper house of the Diet, and decentralised government by providing for elected prefectural governors with control over education and police.

The medicine never sat entirely easily on Japanese stomachs. Since last summer a Constitution Revision Council—set up originally in 1956 by the Liberal-Democrats but boycotted by the socialists, and now sitting without them—has been examining proposals for altering the 1947 constitution. A good many Liberal-Democrats want to change it in a number of ways. They would like to rewrite Article 9, the famour war-renouncing clause, to bring it into accord with the fact that Japan now has arms and intends to have more. They propose that the Emperor should regain a little substance as "head" of the state, not just its "symbol." Some, with an austerely conservative social philosophy, would like to tone down the references to the "rights and duties" of the people in favour of some concept like "welfare and responsibilities." The entirely elective nature of the upper house displeases them, on the ground that it simply duplicates the House of Representatives. It is also suspected of lacking tone, because 80 of its 250 seats are currently held by socialists, mostly trade union leaders, and two by communists; the reformers would like at least 25 seats, and preferably a third of the whole, to be occupied by government nominees selected not for their mass appeal but because they are distinguished citizens—and also, no doubt, solid conservatives. Outside Tokyo, the amenders would like to replace the 46 prefectures with ten large "regions," each headed not by an elected governor—as they have been since the war—but by a government-appointed administrator.

Many Japanese, not all of them socialists, regard these proposals with regret and suspicion. Article 9 may no longer accord with reality; but reality, in the shape of a defence force that not only exists, by virtue of some semantic juggling with the constitution, but is in process of being expanded, is by no means universally popular. The first, and so far the only, victims of atomic warfare, the Japanese tend to cherish Article 9 as if it were in itself a magic talisman against a repetition. The socialists, indeed, insist that it is, declaring that in the age of missiles even a conventional defence force will serve merely to "attract the lightning" without being able to ward it off when it comes.



But there is an even more immediate objection than this. A good many Japanese suspect that revision of Article 9 would be merely the first step on the road to conscription, for without conscription it is difficult to see how the defence forces could be expanded much further; and, for the present at least, the Japanese would be the world's most reluctant conscripts.

Equally pungent objections are voiced against the other proposals for constitutional revision. The idea of exalting the Emperor's status is regarded by its opponents as designed not to enhance his popular prestige, which has probably never been greater, but to re-gild the tarnished old prewar concept of the "nation-state," in the name of which so many evils were committed not long ago. Some conservatives' desire to modify the concept of popular rights in the constitution conjures up, for the nervous, the same mental image of the nineteen-thirties. A streak of firm-handed paternalism runs through Japanese conservatism; signs of it may also be detected in the proposals to deprive the Diet's second chamber of even a part of its elective character, and to put the government's men in charge of the provinces in place of elected governors.

The first two steps towards revision were taken in 1954, in the time of Mr Yoshida's government. One was directed against the teachers, a body with marked and sometimes irresponsible left-wing sympathies; in addition to being forbidden to strike, they were banned from taking part in politics. The other measure re-asserted centralised control over the prefectural police forces outside the major cities by abolishing their local autonomy. These measures were not passed without a severe struggle in the Diet. At one stage the socialists tried to throw the Speaker bodily out of the chamber, and in the end the legislation was finally approved by conservative members sitting alone after the socialists had walked out.

Since then there has been nothing so spectacular, and meanwhile the conservatives' chances of obtaining the two-thirds majority of each house that is necessary for revising the constitution seem to have diminished rather than increased. But Mr Kishi's government has in its year of office shown a taste for flank attacks in default of a frontal assault. The ministry of education proposes to devise "proficiency tests" for teachers—which the teachers' union declares are intended to root out those whose ideological inclinations the government disapproves of—as well as to revive the good old concept of *shushin*, or ethical instruction. On the labour front, the government has stretched clause 17 of the Public Utilities Labour Law (which forbids strikes by railway workers, coal-miners, power company workers, and government employees) to cover several forms of protest action besides strikes: "workshop rallies," slowdowns, and also sympathetic strikes by other workers. It proposes to increase the penalties, which may include imprisonment, for workers who act "illegally." These steps have been energetically criticised by Mr Ray Coutts and Mr Victor Feather, who recently visited Japan on behalf of the International Confederation of Free Trade Unions, and who believe that such measures violate the guarantee contained in Article 28 of the constitution, protecting the workers' right to organise and to act collectively.

In defence of their determination to have a showdown with their opponents, the conservatives assert that the socialists have allowed their politics to become dominated by Sohyo, the bigger and more left-wing of Japan's two trade union confederations, and that they are thus encouraging "violence." "Violence" is one of the three evils Mr Kishi has pledged himself to eradicate from Japanese life, along with poverty and political corruption. There is just a grain of justification in this. The socialists, despite a public renunciation of violence, have on two or three occasions shown a brawny disregard for the politer conventions of parliament, and an un-Anglo-Saxon reluctance to submit quietly to defeat because their own innings will come later. Sohyo's regular spring and autumn "offensives" on the industrial front have clearly political motives, and are regarded by many socialists as far more important for the

political education of the masses than mere debates in the Diet. Sohyo represents over three million workers, or almost half the country's organised labour ; the great mass of temporary workers, and employees of small enterprises, have not yet been reached by the unions. Two-thirds of Sohyo's members are government employees of one kind or another, and among them are the 600,000 teachers, who tend to militant Marxism and some of whom are prone to preach too enthusiastically to their pupils. In all, out of the 310 delegates at the Sohyo convention last summer, there were only a handful of known communists but perhaps 60 fellow-travellers and allies of the extreme left.

The Japanese realise that those who control the schools and the newspapers are in the end likely to control the country. The conservatives are plainly anxious to get tighter control over the former. The press is mostly edited by men of liberal sentiments who are frequently critical of the government, and who seem to receive remarkable latitude from their employers ; but some Liberal-Democrats have recently been talking rather ominously about the "violence of the press." The word "violence" may prove capable of being stretched as much as the Public Utilities Labour Law : the Japanese language has an Orwellian elasticity that is a joy to politicians.

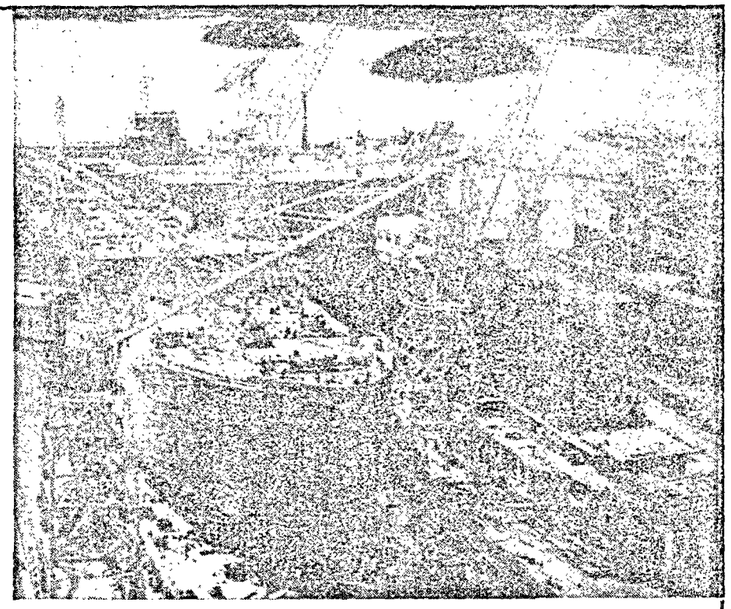
THE JAPANESE AND THEIR WORK

	(Thousands)		
Total population (1956)			*90,300*
Major cities (1955) :—			
Tokyo	6,969	Kyoto	1,204
Osaka	2,547	Yokohama	1,144
Nagoya	1,337	Kobe	979
Total labour force (1957)			*43,674*
Agriculture, forestry and fishing			17,030
Mining			593
Manufacturing and construction			10,022
Wholesale, retail and finance			7,329
Transport and communications			2,159
Others			5,996
Totally unemployed			545

It seems remarkable, and may be disquieting, that Japan's ruling conservatives should persist in their attempts to modify the postwar political structure in the face of what amounts to considerable opposition. A public opinion poll conducted by one of Japan's leading newspapers has suggested that 52 per cent of the electorate opposes constitutional revision. The Liberal-Democrats protest that they are not trying to put back the clock, but merely to set it at the correct time. The socialists, who upbraid the Liberal-Democrats for being too subservient to America, have ironically enough become the warmest defenders of the "MacArthur constitution," though they look on it merely as a convenient springboard for a leap into a kind of future the general never dreamed of. But there are many signs that a large number of Japanese want no very radical changes in either direction, towards either conservative or Marxist authoritarianism. True conservatives, they would apparently like things to stay much as they are. Such a state of affairs would put Japan among the world's most politically unexciting countries, on a level with the never-changing Scandinavians, and would not be without its own dangers.

IT would be wrong to assume that Japan was poised on the brink of black reaction. Most European liberals would agree that some repairs and alterations are needed in the political structure that the Americans slapped together with such zestful improvisation after the war. In particular, the schools and universities were infected by some of the more dubious concepts of American education, and in some places standards of higher instruction have sagged. If reform in education went no further than a tightening of standards, and a prohibition of the more outrageous forms of political proselytising by teachers, it would be respectable enough. A nominal change in the Emperor's status would do no harm if his prestige was not subsequently used for political purposes. Alterations in the system of local government are tolerable so long as they are chiefly designed to relieve the urgent financial difficulties in which local authorities have found themselves since the war.

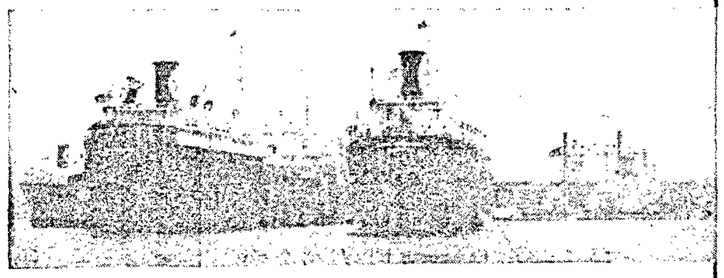
But there are so manys *ifs*. The worrying thing is that the party which wants to make the changes has so many links with the politicians who permitted reaction before the war, and the party which opposes the changes is still largely committed to the academic forms of dogmatic Marxism. Fortunately, the central mass of moderate opinion among the electorate still seems to be strong enough to prevent any disastrous plunge to the right or left. But its moderating influence might well vanish if Japan subsided into a deep and prolonged economic crisis.



The Hundred Million Question

Too many people, too little space : and the trouble will get worse before it gets better

A SUNDAY afternoon in summer is the best time to see into the heart of Japan's problems. The stranger will observe it most clearly if he approaches it in bird's eye view, from one of the airliners that ply along the country's southern coastline. Here the tangle of mountains that make up most of Japan unravel themselves towards the sea, and a few small pockets of level land, all that nature has been able to spare the Japanese in the way of plains, open on to the shore. Green and lush, and cut by handsome rivers, in the early morning they might be somewhere in Devon or Sussex, except for the peaks brooding in the background ; on a holiday, by the time the sun is well into the sky, the beaches and the river banks are transformed into the front at Blackpool or Coney Island. Japan's ninety millions are coming out to play. A population that will soon be twice the size of Britain's, packed into an island home which is only fifty per cent bigger than Britain in total area and two-thirds of which is mountain and forest, is the root of almost all the troubles that confront the Japanese.



It was once ominously prophesied that when the population climbed to 90 million it would have reached the "explosion point." The point was reached more than a year ago, shortly before greater Tokyo outgrew London and symbolically became entitled to the distinction of the world's largest, if not handsomest, city. The explosion has not yet occurred, and if it does come it will be a different kind of explosion from the one that people foresaw before the war : not an explosion outwards into renewed colonialist

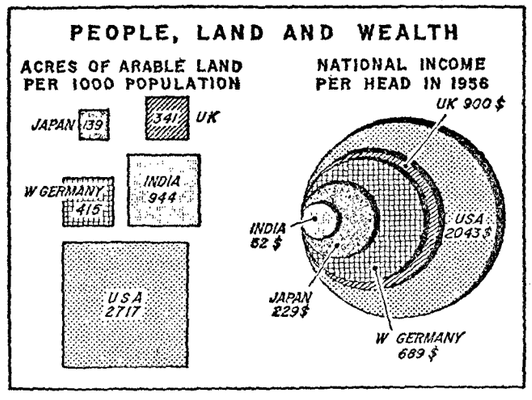
aggression—because Japan is now hemmed in by neighbours more powerful than itself—but rather an internal collapse of the economic and political system. The structure has been creaking loudly during the last year, and all the time the pressure of numbers steadily increases. This is not just a temporary difficulty, a postwar boom in babies that will fall away within a few years. Nothing, except a blight of national sterility, can stop Japan's population from rising continually and inexorably for the next two or three decades. It is calculated that mothers-to-be who are already alive will carry it past the 100-million mark in 1971, and that it will go on growing after that, though a little more slowly, until in 1990 it reaches a peak of about 107 million—two-thirds of the present population of the United States in a land less



than one-twentieth of its size. Only then, as more and more Japanese pass into old age, will it falteringly begin to turn downward again.

All this is not the result of an expansion of the classic Asian pattern, in which the vast number who die young from disease is exceeded only by the even vaster number of babies born in a society uninhibited by western breeding habits. Japan's death rate and birth rate are both low enough to place it in this respect among the world's advanced countries. Today the average Japanese baby can expect to be protected by medical science well enough to live until he is over 60, twice as long as the average Indian; his younger brother born a decade hence can expect to survive an extra six or seven years and thus live almost as long as an Englishman. The birth rate is equally "European," being roughly on a level with that of France. Indeed, the statisticians reckon that in a few years' time a Japanese will be no more apt to procreate than a Swede and no more prone to die than a New Zealander. The problem of the next three decades arises chiefly because the death rate started to fall, under the influence of medicine and better living standards, twenty years before birth control cut decisively into the rate of reproduction.

Those twenty years, particularly the few just after the last war, produced a "bulge" in the population that has yet to make its full effect felt. And the birth control now being practised is of an abnormal kind; it is largely control by abortion, not by contraception. Although the manufacture and advertising of contraceptives were made legal after the war, far fewer people seem to have had recourse to them than to the Eugenics Protection Law of 1948, which permitted abortion for any undefined "physical or economic reasons." It is calculated that for every pregnancy prevented by contraception two or more are ended by abortion; and in the last couple of years there have been almost as many abortions as live births. The risks to health are obvious. It may be that unrestricted abortion, which many people mistrust and would like to control, will not be available indefinitely as an instrument for keeping down the population.

In their struggle for a livelihood the Japanese get little aid from geography. A glance at the map of the western Pacific shows why. Four lines of mountainous vertebrae converge across the ocean like a St. Andrew's cross—the Ryukyu islands from the south-west, the Bonins from the south, the Kuriles from the north-east and the Sakhalin chain from the north—and Japan lies spreadeagled where they meet in a jumble of peaks and volcanoes and narrow valleys. Apart from the ribbon of flat land round the coast, there are only half a dozen plains as much as 40 miles across. Hence the unending pattern of the landscape: paddyfields rising in tiers like an amphitheatre, paddyfields perched in cups of the hills, paddyfields cut out of a twenty-yard patch of level woodland. Only one acre out of every seven is arable, and to this one acre eight times as many people look for food as, say, in France.

The Japanese are superb farmers. They get a higher crop yield per acre than probably any other people in the world; but now they are close up against the limit. In the good years before the war it was necessary to import only one eighth of the staple foods needed. Now, as the number of mouths keeps on growing, the proportion has risen to a fifth—although rice is still kept partly rationed—and it may well rise still further. There are schemes to open up fresh land to agriculture, which show varying degrees of wishful thinking—by cutting deeper into the forests, or (in imitation of Soviet dreams) by sprinkling the barren northern uplands of Hokkaido with dark dust to catch the sun's enlivening rays. But as virgin land gives way to agriculture on one side the crawling city suburbs encroach on it from the other. Despite the good intentions, less land is under cultivation now than before the war. In any case, the new land would be too high and too dry to make good paddyfields, and although his diet now contains a good deal

more bread than it used to the Japanese still shows a stubborn preference for rice—when he can get it. Even if substantial areas of new land can be turned over to farming, and even if the peasants on their tiny plots—two-thirds of them on less than 2½ acres per household—can be coaxed into more rational methods of agriculture, it is difficult to believe that the nation's dependence on imports of food will not go on increasing for some time to come.

Despite all this, the Japanese are still better off than their

Asian neighbours. The food supply, in terms of calories, fluctuates too much with the vagaries of the harvest, and in the cities at any rate people have not yet climbed back to prewar standards of nourishment; but the average Japanese, everlastingly pecking at his snacks of rice and fish, gets about 2,100 calories a day, which does not make him as plump as an American but keeps him alive and reasonably zestful (so long as he stays an average Japanese: he does not have to fall very far to get unpleasantly close to hunger). In terms of national income per head, the extra wealth created by industry has borne the Japanese upwards to a point where they can begin to claim a "European" standard of life. They rank, in fact, with Europe's poor peasant countries, Greece and Portugal; their average national income, measured in dollars, is four times bigger than the Indian, if only a quarter of the British or the French. The moral is plain. If the problems posed by their swelling population are to be solved, if the Japanese are to fulfil their hopes of being the first Asians to break decisively out of Asiatic poverty, it is to their industry and to their ability to export the right products of industry that they must look. A sufficiency of food, and beyond that the comforts of a decent life, can be achieved only if they find answers to the complex difficulties facing them in production and trade.

Mathematics and Brick Walls

At home, the economy has certain weaknesses; but its greatest problem lies abroad

FROM the simple fact that there are too many of them, a number of conclusions flow which confront the Japanese with the exact logic of a mathematical equation. To provide for a certain number of extra mouths, the national income has to be expanded by a known amount; this calls for a calculable increase in industrial production, which in turn demands a foreseeable rise in the amount of imports they will need. The nightmare comes when they try to put the equation into practice. The problem is not merely to provide the population with material goods. It is also to provide them with work, for the political structure is far too fragile to withstand a massive and prolonged rise in the volume of unemployment.

With a total labour force of over 43 million, the government is enabled to boast of an unemployment rate of well under two per cent by the simple device of counting as employed anyone doing more than an hour's work a week. How many men and women there are without enough work can be guessed in various ways. One of the few stable facts of Japanese life is that the country's narrow acreage of farm land can give real employment to only about 14 million people; the figure has been roughly the same since the Meiji restoration 90 years ago, and when the farm population swells (as it did after the wartime destruction of the cities) it only means that farmers' families are taking in friends and relatives more or less on charity. Add to this the number of those doing only a fragmentary week's work in factories and the mushrooming service industries, and the total of seriously under-employed probably comes to something like seven million—a sixth of the labour force.

This is not all. As the population grows, the number of people seeking jobs will grow too—by a million or more a year until 1965, then more slowly as old age takes an increasing toll. Quite simply, it is reckoned that if the national economy cannot be expanded at a rate faster than four or five per cent a year (a figure itself comfortably in excess of what Britain manages) not only will the pool of surplus labour not dry up, it will grow even bigger. Only if the pace of growth reaches six per cent a year or more until 1965 will be problem start to be solved. But a total annual expansion of this size calls for an increase of 8 per cent or more a year in industrial production—since agriculture cannot be expected to provide very much of the new growth—and that, in turn, because Japan's own natural resources are running out, demands a rise in imports at the staggering rate of about ten per cent every year.

That is the task. In setting about it, the Japanese started with some of the same advantages as the Germans. They could build new factories from scratch out of the war's ruins; they needed to divert only a small fraction of their resources into armaments; and even their fertility, like Germany's influx of refugees, gives the economy an impetus as well as a challenge. But here the resemblance ends. It is not generally realised how meagre are Japan's resources of the things that industry needs. The fast-running rivers that drop down from the central mountains yield a rich supply of hydro-electric power, more than any other country enjoys except the United States and Canada. Coal, however, is found in quantity only in the far north and the far west, and that is likely to run out after another half century. Many of the Kyushu seams in the west are desperately narrow and expensive to work, and in any case there is very little top-grade coking coal, four-fifths of which has to

JAPAN'S DEPENDENCE ON IMPORTS IN 1956

	Production	Net imports	Per cent dependence on imports
	'000 metric tons		
Rice (1951/56 average)	9,627	1,050	10·9
Wheat and barley	3,715	3,199	46·3
Iron ore	1,052	7,870	88·2
Coking coal*	8,714	3,356	27·8
Crude petroleum	77†	2,549†	97·1
Soya beans	455	717	61·2
Salt (1955/56 average)	594	2,174	78·5

* Including semi-coking coal. † Million gallons.

be imported. Cotton and wool for the vast textile industry come wholly from abroad. There is practically no oil, and only a meagre sprinkling of iron ore. In these and the other raw materials most important for industry—like rubber, zinc, bauxite and phosphates—Japan relies on foreign sources to a frightening extent; in all, between 80 and 90 per cent are imported.

A second major handicap lies in what might be called the physical and financial sub-structure of industry. The Japanese railway train, teetering primly round a bend on its unduly narrow 3½-foot gauge, is a symbol of the antique inadequacy of the country's transport system. At least the railways cover the countryside more comprehensively than

the roads, and the owner of one of the trim little Datsun or Toyopet saloons produced by the car industry, as he bumps from pothole to pothole, can envy the train traveller his relatively smooth passage. The government has been negotiating with the World Bank for a loan to construct a decent truck road from Tokyo to Nagoya, in the industrial core of the country. But one new artery will not revive the whole circulation system, and the mounting expense and difficulty of transport within Tokyo's sprawling expanse are already beginning to make manufacturers look elsewhere. There is an equally rudimentary look, to British or American eyes, about the Japanese system of financing

INDUSTRY'S POSTWAR UPSURGE

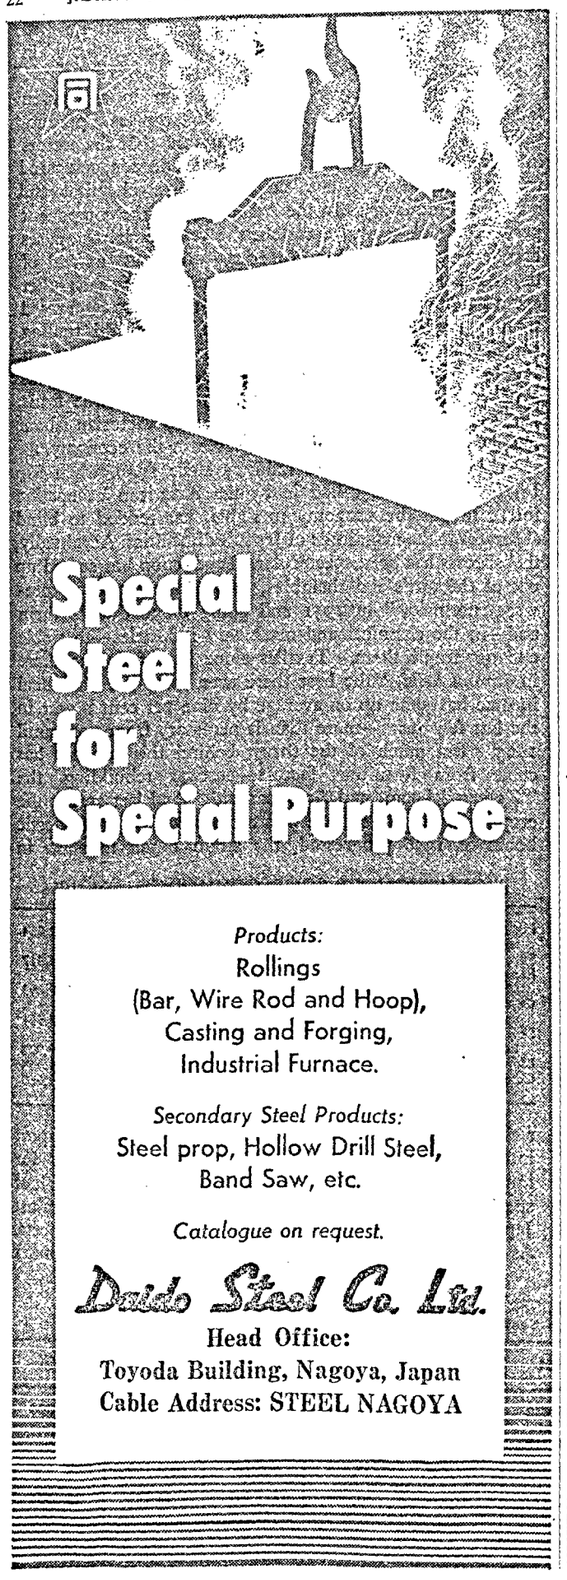
industry. With a relatively undeveloped capital market, industry depends heavily on the banks, who themselves depend heavily on the Bank of Japan. In recent years a third to a half of all industrial funds have come from the banks, and much of this has been long term loans for equipment. A more flexible and diversified method of supplying capital would be invigorating.

THE planners' greatest problem, however, is undoubtedly the division of Japanese industry into virtually two worlds: the core of glistening, large-scale modern enterprises, often fit to be compared with the best in the world, and the myriads of tiny and frequently ramshackle family concerns that cluster around them. Like the Indians, the Japanese realise that "cottage industries" are inevitable in a country where the giving of work is important as the raising of productivity; but a circus consisting largely of elephants and fleas presents some peculiar problems for the animal-trainer. As recently as 1954, nine-tenths of the total number of establishments, employing a third of the manufacturing labour force, had fewer than 20 workers apiece. At the other end of the scale, a tiny number of giants with over 1,000 men each (there was only one such establishment for every thousand with less than 20) produced a much larger share of total output with only half as much labour. In many industries the two kinds are linked together in the chain of production; a great new shining factory in Osaka or Tokyo may depend for small parts or half-finished materials on a score of primitive family firms conducted in neighbouring back-garden sheds.

Of course, the degree of concentration in any given industry varies with the advantages of large-scale production. An economist will find it significant that the sectors in which the big firms have fared best this decade, compared with the small ones, are the burgeoning chemical and machinery industries. In the last four years the component parts of the old *zaibatsu* cartels, the commercial octopuses that were chopped up on American orders at the end of the war, have been reaching out their tentacles to each other again; although the financial control is much less centralised than it used to be, the Mitsui and Mitsubishi trading empires have now regained much of their prewar pattern. Nevertheless, the degree of concentration in industry as a whole shows no signs of growing; and the little firms, with their low productivity and their early Victorian labour relations, still play a considerable role in the economy.

The phœnix upsurge of industry since 1949, when Mr Joseph Dodge was called in by the American occupation forces to put the economy to rights, has tended to blind observers to the magnitude of Japan's difficulties. Admittedly, this success has been spectacular. Production has soared up out of the war's-end shambles, passing the figures of prewar "normalcy" in 1951 and going on to double them and—in the chemical and machinery industries—to treble and quadruple them. Textiles alone have failed to share in *Jimmu keiki*, "the best there ever was"; the national income has gone up on average by nine per cent a year in the last few years—more than is necessary from now until 1965. But much of the thrust behind this advance has come from fortuitous factors—postwar rebuilding, the "Korean" boom, and American aid. And last spring the economy ran with a crash into a brick wall. As the hectic boom of 1956 progressed, the strain began to show in

PRODUCTION OF SOME COMMODITIES IN 1956



Pig iron ('000 metric tons)	5,987	Silk fabrics ('000 sq. yds.)	212,854
Steel ('000 metric tons)	11,106	Cotton fabrics ('000 sq. yds.)	3,479,617
Electrolytic copper ('000 metric tons)	126	Rayon fabrics ('000 sq. yds.)	920,693
Cement ('000 metric tons)	13,024	Spun rayon fabrics ('000 sq. yds.)	1,112,251
Sewing machines (number)	1,897,788	Machine tools ('000 dollars)	19,928

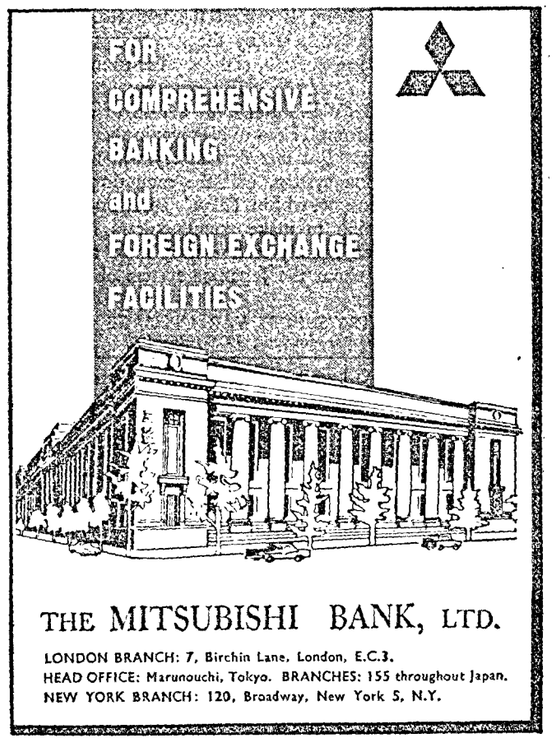
Cameras (number)	1,306,699	Elec. power (mn. kWh.)	73,560



a shortage of capacity in the coal, steel, power and transport industries. Then the swollen demands of industry for imported raw materials (made worse by a good deal of speculative buying from abroad) came up headlong against Japan's inability to pay for them by selling enough exports. As the reserves of foreign exchange fell, the government

SUPPLY OF INDUSTRIAL FUNDS

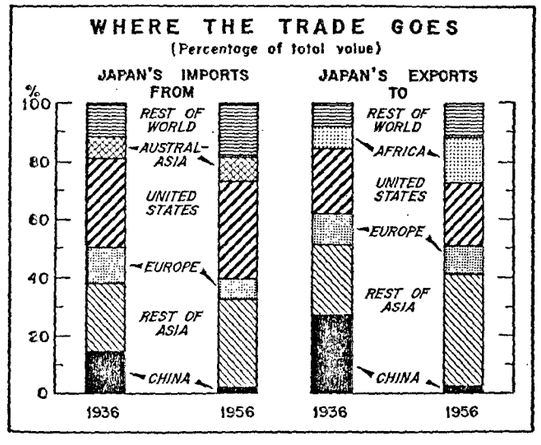
* Net decrease.



was forced to slow the economy down: bank rate was raised, a credit squeeze enforced, and restrictions imposed on the financing of imports.

By the end of last year these measures had worked well enough to bring imports and exports roughly back into equilibrium again, though by then the country had been stripped to its underclothes of foreign exchange and production had begun to fall. But this experience was a sample of the dilemma Japan faces. The nation's industry has proved in the last few years that it can produce enough to give the Japanese now living, and those yet to come, a steadily improving standard of life—if Japan can pay for enough raw materials from abroad. If it cannot, the same process may occur again and again: first an acceleration of investment and production, to keep pace with the insistent demands of the population statistics, and then a painful thud as the balance of payments runs into trouble. Britain, which has a similar problem, should sympathise; Japan suffers from it much more acutely. On the one hand, an urgent necessity to go very fast indeed; on the other, a speed limit imposed by the world's reluctance to buy enough Japanese goods. If Japan is not to bump along from crisis to crisis, it has to find new and bigger markets overseas.

Heartbreak of a Salesman

Where are the Japanese to sell their goods?
So many doors are shut to them

WHERE the boots of the Imperial Army tramped 16 years ago, the shoes of the salesmen now pad on their soft inquiring way. Their destinations are Manila and Jakarta, Peking, Rangoon and Saigon; and, beyond that, the other capitals that the soldiers aspired to but never reached. The briefcases that their wearers carry contain some awesome requirements. Last year the value of the goods that Japan sold abroad, though well above the previous year's total, fell short of the cost of things it bought by some £520 million, or 30 per cent. The gap, which would have been larger but for the deflationary measures imposed in the early summer, was partly closed by the profits on invisible trade, including the dollars spent by the American forces in Japan; but even after they were counted it cut the remaining reserves of gold and foreign exchange by a third. Somehow the difference has to be made up. In addition, in the next eight years Japan has to find a way of paying for a 10 per cent rise in imports

every year, in order to keep the economy expanding at the required speed; each million that is added to the population may cost up to an extra £14 million a year in food and textile materials alone. All in all, this means that by 1965, if American assistance stays at the same level, Japan will have to export roughly twice as much as it does now, to a world that appears to be increasingly unwilling to help it do so.

In a decade in which all other statistics have been rising triumphantly past prewar levels, trade has remained obstinately earthbound. Imports, at least, passed the 1934-36 volume a couple of years ago, but exports have yet to catch up with it. Japan's failure to share in the general expansion of world commerce has several causes. Traders, who in the nineteen-thirties were able to follow the army's bayonets into China, now have to use persuasion elsewhere. China itself is virtually closed to them by the allied embargo imposed during the Korean war. The new nationalist states of south east Asia, still mistrustful and hostile after the war, are building industries of their own to make many of the things Japan used to sell them. The result is that the Japanese now enjoy only half as large a share of the world total of business as they enjoyed before the war; they have lost their place as one of the great trading nations.

This sluggishness has been accompanied by a radical change both in trading partners and in the kind of goods exchanged. The iron ore and coking coal that flowed in from Manchuria and northern China before the war now have to be obtained elsewhere—coal from the United States, ore from Malaya, India and the Philippines as well as America. Independent Korea and Formosa are no longer willing to buy and sell as much as they were forced to when occupied. One or two other Asian countries have moved up in importance, especially Siam and Burma as providers of the essential rice supplies. But fundamentally the whole emphasis of trade has been twisted round from eastern Asia to face in new directions: towards America,

* Various items of dollar income arising from presence of United States forces plus some other small dollar items.

southern Asia and Africa (to the anguish of the business men of Osaka, whose heads were turned the wrong way). Asia as a whole, instead of taking a half of Japan's exports as it did in the mid-1930s takes only two-fifths ; simultaneously, its share of Japan's imports has fallen—and the United States, going up as Asia goes down, provides a third instead of its prewar quarter. The consequence is that, in addition to acquiring a permanent dollar problem, Japan has now become firmly plugged in to the American economy ; and, like Europe, it is exposed to any fall in voltage emanating from there.

The changing structure of the economy is reflected in the kind of shipments going in and out. Food, which accounted for only a modest fraction of imports before the war, has swollen to about a quarter of the total over the last few years. Roughly another fifth—nearly twice as much as in the nineteen-thirties—is made up of the prime requirements of heavy industry: coal, oil, ores and steel scrap. (These two items changed places in relative importance during last year's boom, since the industrialists' demand for raw materials was even more urgent than the need for food.) These are the sectors in which imports have gone up most spectacularly. The biggest drop in imports has been cotton—from more than a quarter of the total to less than a sixth—for the stagnant textile industry. Heavy industry is usurping the place of light, as the economy grows more mature. On the export side, textiles have also been the chief sufferer, since the first act of every new-born Asian nation seems to be to prove its statehood by throwing up a cotton mill as soon as it hoists its flag. In the face of this competition Japan's sales of cotton and silk fabrics have steadily dropped. To some extent they have been replaced by rayon products, and textiles as a whole still account for a third of exports. But the evidence is plain that the future lies with the new and expanding industries. Steel and other metals, machinery, ships, tools and precision instruments—by last year these had risen steadily to form a third of all exports, and there is a potentially growing demand for them in both the old and the new countries.

But exactly how and where is Japan to sell more? Except as world trade as a whole rises, the Japanese cannot hope to make very great advances in the dollar countries and in much of the sterling area, where they are confronted with a hedge of tariffs and quotas, with consumer prejudices and governments brandishing Article 35 of Gatt. Small wonder that traders look wistfully over the narrow seas to China, that once great market through whose ports only a trickle of trade now passes. China possesses many of the raw materials that Japanese heavy industry wants, and never lets a chance pass of saying how much it would love to buy the goods Japan makes. Undoubtedly the present embargo on trade with China is unreasonable, and should be amended as soon as American public opinion can be persuaded. But it is necessary to be realistic about what will then be possible. The things Japan would chiefly like from China are iron ore, coking coal and soya beans. Even if, by a miracle, it could take all its requirements of these from Chinese sources, they would still amount to little more than 10 per cent of the present total of Japanese imports. But, in view of what is known of China's production figures and the double demands of industrialisation and exports to Russia, it is virtually certain that the Chinese cannot spare as much as this. Their total output of iron ore is little more than enough for Japan's annual demand, and their own new steel mills are hungry for this. A few other things, like salt and animal feeds, might help to push up the total of trade three or four times above the present slender figures. But another calculation, by an American economist, has reinforced the belief that the Japanese cannot put too much hope in the communist segment of the world. Even if they took all the communist block's exports of the half-dozen commodities of which it has a big enough surplus to meet Japanese requirements (and this includes items like Polish coal, already committed to other buyers), they would still be doing little over a tenth of their trade with the block. This is not the Aladdin's-lamp transformation that so many Japanese dream of.

There remain the countries of south east and southern Asia, the Middle East and Africa: Japan's white hope. Last summer Mr Kishi offered a plan to President Eisenhower, by which the Americans would furnish the south east Asian states with a development fund of several hundred million dollars to spend on goods bought mainly from Japan. The idea met an equally cool reception from Congress, then in an economising mood, and from the states involved, who want the dollars but would rather spend them in America and Europe ; one of Japan's crosses is the fact that its steel and machinery prices are often higher than those of its competitors, because the competitors possess their own raw materials and have spread modern techniques more widely throughout their industries. Too often Japan is the marginal seller: the last to edge its way into many markets, it is also the first to be edged out again when things become difficult.

All that the Japanese can do, for the time being, is to make as many *ad hoc* arrangements as possible that will encourage southern Asia to buy Japanese. This is the kernel of Mr Kishi's much-advertised "economic diplomacy," a not very precise term which embraces a variety of measures but indicates the heart of the matter: that Japan's power in the world depends on its solvency. An £18 million credit has just been negotiated with India, and smaller loans are being offered to seven south east Asian countries. Mr Fujiyama, the foreign minister, has concluded a reparations agreement with Indonesia this year which may stimulate a market there for many goods. This, the last major reparations issue still unsettled, virtually winds up the unfinished business left over from the war. But Japan still faces the uncomfortable fact that most of the countries to which its chief hopes are pinned, in addition to being still suspicious of Japanese intentions, are also very poor. It looks with mixed feelings on the present world fall in commodity prices, which may bring relief to its import bill but will also tend to make some of these countries even poorer. Not surprisingly, its hopes still turn toward America, fountain-head of the dollars that could help both them and it. Without some kind of intervention, the clouds that have been threatening for the past year are liable to grow still blacker.

Trade with the East

From Cyprus and the Lebanon to Japan,
THE CHARTERED BANK
and its wholly-owned subsidiary, The Eastern Bank Limited, link East and West through a system of one hundred branches extending to most centres of commercial importance in the Middle East, South and South-East Asia and the Far East. Those branches provide complete and up-to-date banking services, sustained by wide knowledge and long experience of Eastern trade, finance and industry. In particular an effective credit information service and skilled assistance and advice are available to merchants and manufacturers seeking new business connections in Asian markets.

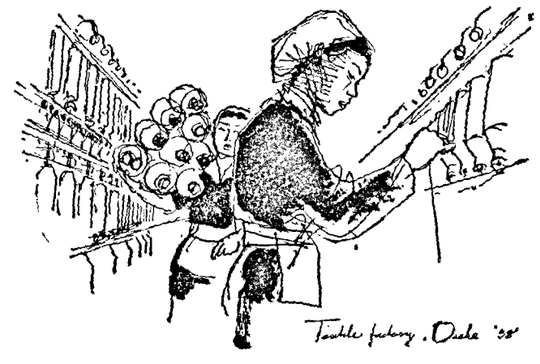
Odd Trader Out

The past still leaves its mark on Japan's commercial relations with the world



THE bogey-figure of a little yellow man from Japan in large glinting spectacles has long haunted the nightmares of the honest Lancashire weaver and the Bavarian toy-maker. After Japan burst into the white trader's preserves fifty years ago, its products came to stand in the eyes of many western traders for low price and sweated labour, for a talent and speed in imitation which outdid invention itself, and for the possession in extreme form of that quality so characteristic of developing nations, communist or free—the will to beat the West at its own game. There is no doubt that before the war there was truth behind these sentiments. Ruinous dumping of Japanese cottons, the sudden appearance in Woolworth's of a flood of cheap knick-knacks, straightforward copying of Paisley shawls and willow-pattern plates (even stamped on occasion with the insolent inscription, "Made in England"): all these posed real problems for Lancashire and Stoke in the years of depression. And war added a host of other prejudices to the commercial resentments against the Japanese.

However, the practices which aroused competitors' ire before the war have long since returned home to plague their parent. Japan's skill at imitation and its lack of commercial scruples—as well as its plain ability to make certain goods more cheaply than its rivals—have encouraged other trading nations to treat it as an economic leper, subjecting its exports to discriminatory tariffs and quotas. There is a vicious circle here. Japan's industrial revolution and soaring population compel it to find markets. But the very desperation of its efforts to sell has closed many doors in its face. Many a respectable housewife of the trading world, knowing the wiles of this importunate salesman, with his array of bootbrushes and paper clips, his tray of cheap fountain pens, has barred the door and placed a large notice outside: "No hawkers from Japan."

The removal of the stains upon its name has therefore become an urgent commercial necessity for Japan, as it has struggled painfully back into the markets of the world since 1945. In the last few years both government and business leaders have made constant efforts to curb malpractices, both through industrial federations and through statutory powers. Complaints from Britain that textile designs were being copied led to searching talks between the industries of the two countries in 1954. As a result the Japanese industry set up a centre entrusted with the registration of all designs and the prevention of imitation. The policeman has had considerable success (the British committee not long ago expressed "great satisfaction" at the results attained) and the example was followed last year by the Japanese potteries. Both centres are making useful contributions to what is perhaps the only lasting answer to the problem—the creation of lively Japanese designs which can lead taste instead of following it.

The Japanese are now losing some of the cost advantage which formerly so annoyed competitors. In large industries, where union wage rates apply, labour costs in Japan can be as much as two-thirds of those in Britain, even though the average is a good deal lower. In heavy industry—steel, and to some extent engineering—the high cost of imported materials has pushed up costs above those of western Europe. Even in cotton, though labour costs are probably still about half Britain's, Japan is no longer at the bottom of the list. Against India and China it is being forced to compete on quality instead of price; and the Japanese are now so familiar with the protective reactions which are aroused whenever they are successful in a foreign market that government and industry have combined to operate a system of "orderly marketing" quotas, limiting the expansion of exports to many areas.

BUT it is easier to besmirch a reputation than to polish it up. Lancashire is not easily persuaded that its ingenious competitor has quite given up old ways. In terms of costs, small family firms in labour-intensive industries still enjoy an obvious advantage over European competitors. Nor has imitation entirely ceased. The rough copying of a trade mark—say, some simple animal shape—and the use of "European-looking" packaging, which can easily mislead illiterate purchasers, are habits that die hard. The tiny family business in Osaka in some industry which has excess capacity—making cottons, sewing-machines, consumer oddments—cannot afford scruples; and it is not easy to catch the copycat, particularly if the imitation is rough and only partial. Willingness to learn is a great industrial asset, and even if straightforward imitation could be stopped the habit of borrowing the best ideas from advanced industrial nations seems likely to persist for many years. But is this really immoral—or confined to the Japanese? Short of capital,

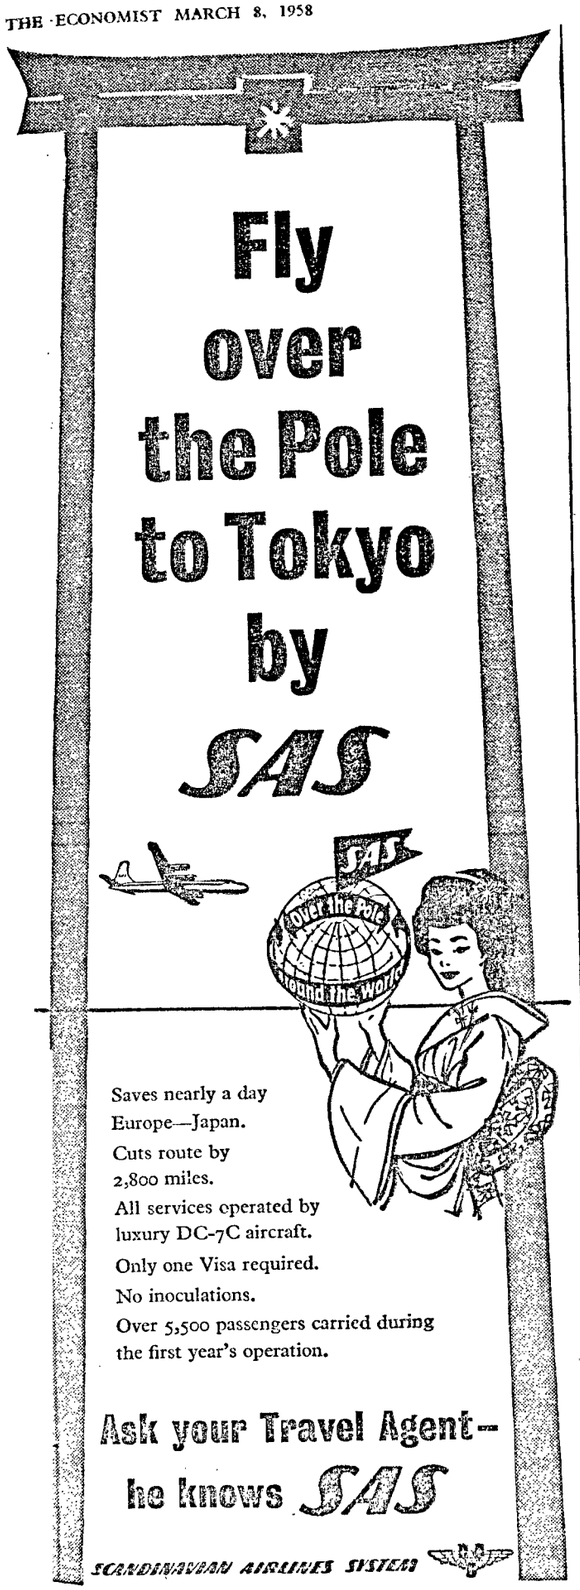
but endowed with abundant labour, many small Japanese firms find it is good business to cut spending on research and development and produce on the cheap. Two points should be emphasised. One is that the sphere in which Japan is still suspected of unfair trading is a limited one, accounting for only a small part of its total exports. The other is that low prices are not of themselves something improper; they may be merely enviable.

The responsibility for the present situation does not lie entirely at Japan's door. Its need for markets is genuine and urgent. If rough and ready trading methods have helped to raise barriers against Japan, the discrimination which its exporters encounter in so many markets has

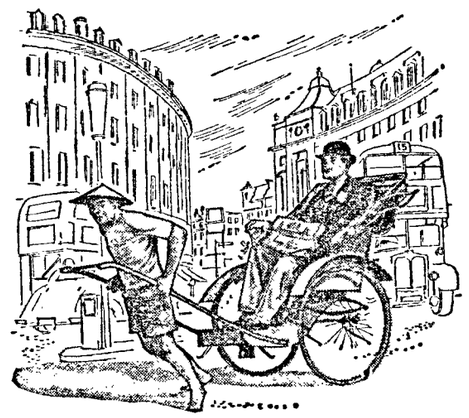
in turn forced them to adopt desperate expedients in the effort to sell. The Japanese often argue that such copying of textile designs as persists is inspired by merchants overseas. The local Indian trader in some west or east African market which has been dominated by a large British company sends a sample of Lancashire stuff to his Japanese supplier to show *him* what will sell. The British competitor may well reply that it is no defence to argue, when you burgle a house, that someone else has opened the door. Nevertheless, there are genuine problems facing an exporting nation that seeks to elbow its way into markets where not only tariffs but consumer habits and marketing channels have been made by someone else. Somehow this odd man out amongst the trading nations has to be allowed to find a place in the sun.

Japan's isolation as a trader found political expression until 1955 in its exclusion from the General Agreement on Tariffs and Trade. It was then admitted to the club, but not as a full member. A staunch group of old members, led by Britain, still refuses to grant to Japan the full benefit of the "most favoured nation" treatment which is the core of Gatt. Yet many countries of the western world have gradually been opening their markets to Japanese goods. The United States, in particular, has been fairly generous to Japan since the war, and was the first among the great trading powers to grant most-favoured-nation treatment. The population of Japanese origin scattered through California has provided a stable outlet for a few Japanese goods, such as tuna fish, and a way into the market for some other products. Japanese sewing-machines and cottons have had spectacular successes. But, even in America, Japan's success has brought the usual nemesis, an increase in protection. Under the threat of worse, the Japanese sewing-machine industry agreed to a severe "voluntary" limitation of its exports to save the American industry from collapse. And Japanese exports, of course, suffer from more general protective measures. Woollen manufacturers, like their British counterparts, have plenty of tales to tell about the absurd seasonal vicissitudes which have stemmed from the tariff quota on woollens. Rich though the American market is, it is also unreliable.

In Europe, the Belgians and Dutch have for some time been fairly liberal, and Professor Erhard has steadily broadened German import quotas on Japanese goods so that Japanese cameras and toys are offering serious competition to the powerful home industries in certain price ranges. But in very few European countries is Japan permitted to compete on truly equal terms in the sectors where its goods are most competitive. At present a new trade agreement is being negotiated with Britain. On the whole, Japan cannot yet expect much alleviation of the present restrictions, which limit its exports almost entirely to food and raw materials. If quotas were eased, the Japanese would probably gain considerably in only a few sectors. But the domestic political consequences of such a relaxation might be great, and Britain can point out that Japan for its part continues to give heavy protection to some of its own industries. Perhaps the calculation would be different if there were a greater awareness in this country of how much the people of that island on the other side of the world still tend to look to Britain for friendship and help.



SHUNNED by much of Europe, Japan is bound to look for markets mainly in the Afro-Asian world. Here the withering of commonwealth preferences is working in its favour. India, Pakistan, Ceylon and West Africa, though protecting their own industries, treat the Japanese on equal terms with other exporters as far as quota restrictions are concerned. Among the old Commonwealth countries, New Zealand and South Africa are still inhospitable to Japanese imports. But last year a major shift in Australia's policy took place. Hitherto it has allowed Japan scarcely a taste of the feast which many European exporters of consumer goods have been enjoying in the past ten years. But while Britain's limitations as a market for wool and wheat are becoming more and more evident, Japan's demands are swelling steadily. Australia has now recognised the importance of this growing market in the far East, and has virtually extended most-favoured-*nation* treatment to the Japanese. It is true that the concession is highly qualified. "Peril points" for the reintroduction of quotas have been worked out. And the principle will become permanent only if, after three years, the Australians find that their own light industries have not suffered too much. The Japanese are handling this precious gift with care, and are carefully limiting the growth of their exports.



Discrimination against Japan is on the wane in Asia and Africa; but these new markets have severe limitations. Other producers—India, the communist countries—are offering a challenge in the low-price field. Japan's low-cost industries are just those which every young developing country first sets up. For exporters of capital goods the young countries are full of promise, but it is a promise which may only be fulfilled at the price of constant credits—which Japan, poor in capital, is ill-qualified to provide. In time, the crowded Japanese islands must become a staple exporter of capital goods and of products of a high industrial technology. But Japan still has far to go in technology; and it feels painfully its exclusion from the secure, richer markets of the developed western world.

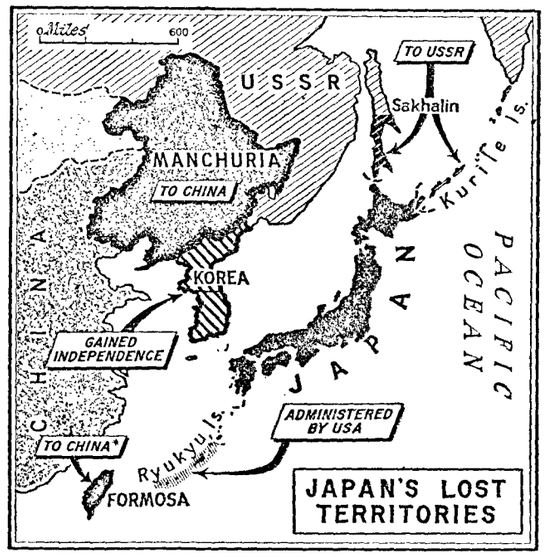
Semi-Detached Ally



Japan's foreign policy is starting to stir a little —within the straitjacket imposed by the hard facts of today's world

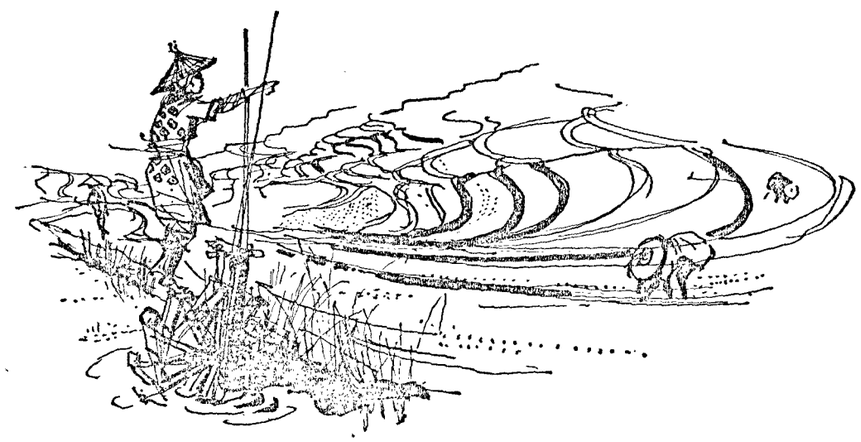
A NON-COMBATANT crouching in a shell hole in no-man's-land has few opportunities for displaying his skill at tactics. Japan's place on the map severely limits the extent to which it can pursue an active foreign policy of its own. On one side looms the vast continental bulk of the two great communist powers, China and Russia, with whom the breaches of the last war have not yet been formally repaired and whose social system is quite alien to Japanese traditions. On the other side, across the Pacific, stands the United States, which defeated Japan in the war and which now holds the power to make or break its economy. In the divided world of the mid-century, Japanese who dream the hopeless dreams of unqualified independence may be excused for picturing themselves as caught between two devils and the deep blue sea.

During the premiership of Mr Hatoyama, which lasted until the end of 1956, Japanese foreign policy consisted of three chief aims : to secure a peace treaty with Russia, to increase trade with China, and to achieve greater equality in relations with the United States. These cards remain, but Mr Kishi has added some of his own and has also reshuffled the pack. Relations with Russia and China have now moved lower down the list. At the same time, Japan has shown new initiative in two ways : in its "economic diplomacy" in south eastern Asia—a part of the world that was not neglected by Mr Hatoyama, but is being even more ardently wooed by Mr Kishi—and in its emergence in the United Nations as a spiritual Scandinavia, mediating placidly between the heated contestants of the various blocks. Although diplomatic relations with Russia were restored after the Moscow negotiations of 1956, the prospects of a complete peace treaty have receded into the distance. Mr Fujiyama, the foreign minister, has said that unless Russia hands back some of the southern Kurile islands which it gained after the war, "normal relations will be impossible"; and so far he has not been shaken by Moscow's attempts to bully him with restrictions on Japanese fishing in the seas off Siberia. An expansion of trade with China is still sought, but Japan has declared that it will not recognise the Peking government, and the premier has been briskly peddling his notion of a south east Asian development plan in a series of visits to Asian countries that pointedly included Formosa.

All this, and Mr Kishi's claim to have opened a new era in Japan's relations with the United States, have provoked the Chinese communists into accusing him of being "America's mouthpiece." Last year he went to Washington, played golf with President Eisenhower, and brought home the "gift" of a large-scale withdrawal of American troops from Japan. No matter that the withdrawal had already been decided upon in principle by the Pentagon ; the fact remains that Mr Kishi considerably impressed his hosts as a man well aware of the communist danger.

It is true that the Americans stopped well short of committing themselves to financing his south east Asia development plan. But Mr Kishi is a patient man, and he has by no means given up hope. He originally proposed that the United States should contribute upwards of $300 million to a development fund for the south east Asian countries to draw on, and that Japan's role would be to supply the capital equipment and the technical expertise to be purchased with the money. Almost everywhere he went on his travels, his plan was compared, often rudely, with the ill-famed "co-prosperity sphere" of before the war—by which, under the guise of "co-operation," Japan proposed to milk the other countries to its own advantage. Many of the nations concerned would prefer a multilateral aid scheme in which the funds were distributed by some kind of international organisation. Why, critics have also asked, should Japan be allowed to insert itself as a middleman in what would in practice be an American-financed aid plan for the rest of Asia ? In reply, Mr Kishi has once more assured his nervous Asian neighbours that the Japanese have no sinister intentions. To meet the critics' wishes, he now proposes that any development funds that are forthcoming should be placed in a common pool and administered jointly by the

* Now Nationalist Chinese government.

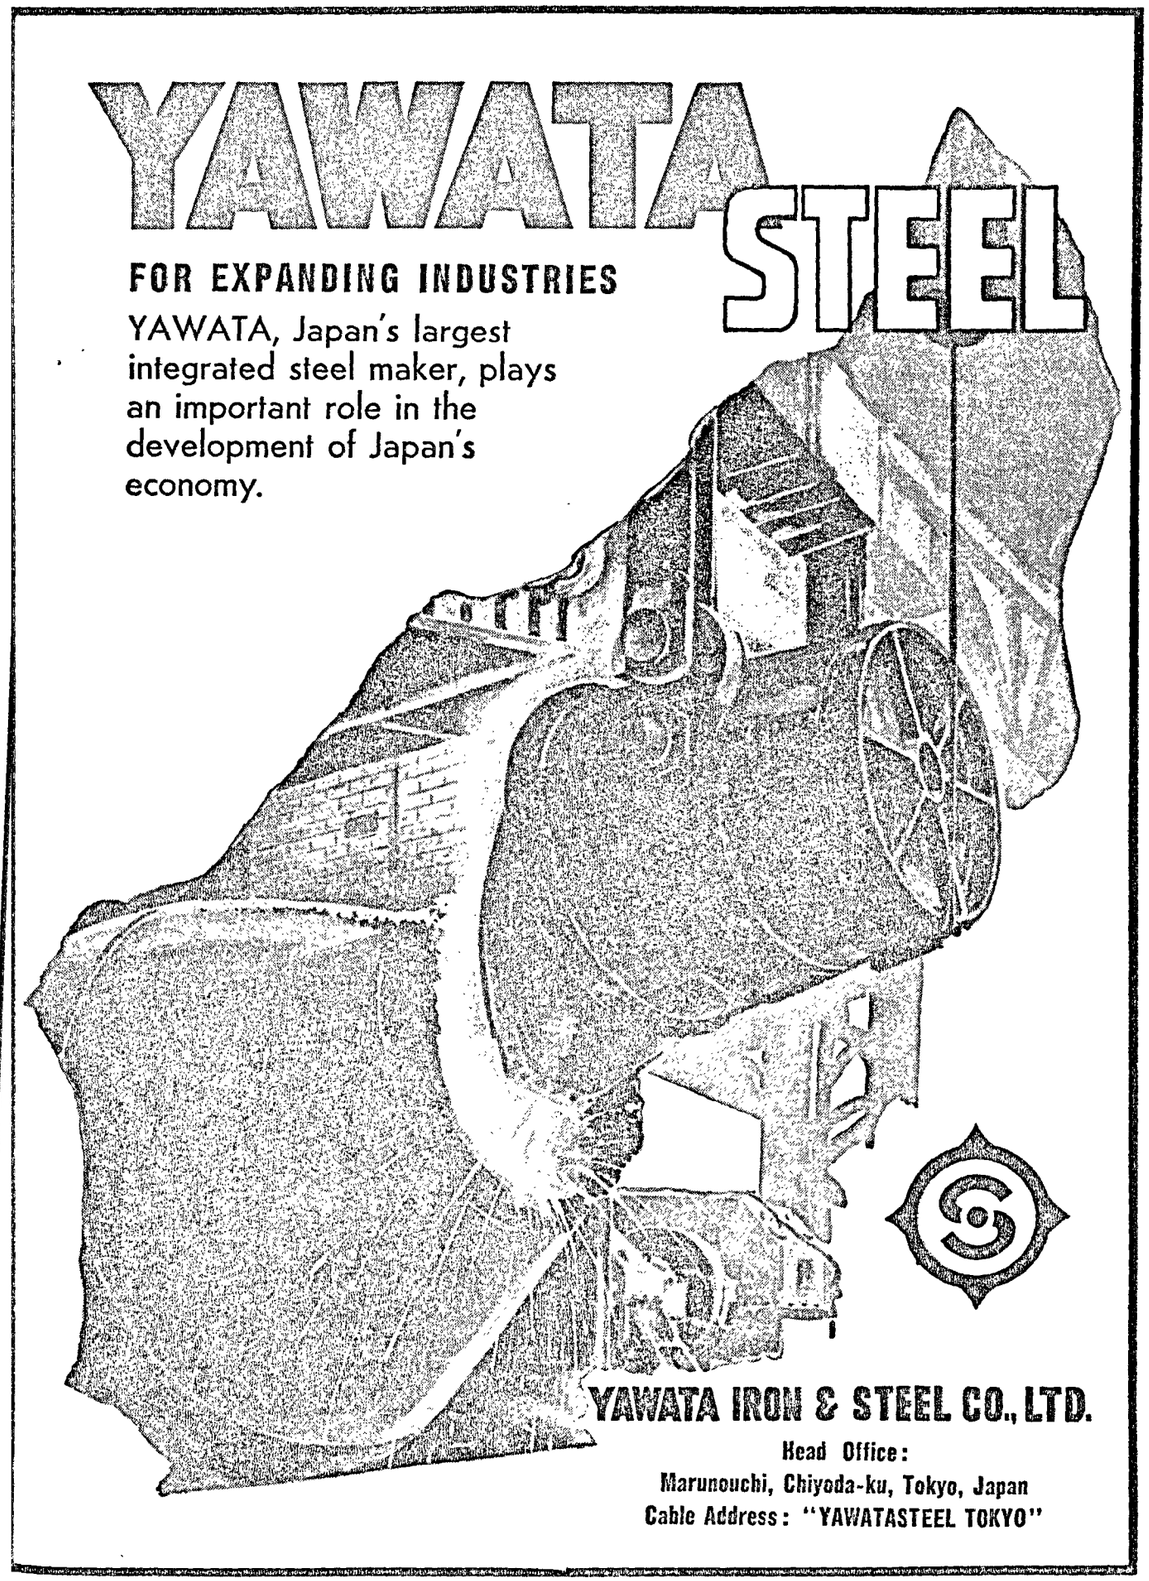


countries concerned, with all countries having an equal voice ; and Japan itself is starting by putting £5 million into the pool.

This has been christened "economic diplomacy," but the old-fashioned political variety is not being entirely neglected. Japan was admitted to the United Nations at the end of 1956, and as an American *protégé* its rise has been rapid ; this year it took a seat as a non-permanent member of the Security Council. At the same time, a degree of at least verbal independence from America is being asserted. Last year, the Japanese delegate proposed a resolution in the General Assembly, calling for the suspension of nuclear bomb tests, which was simultaneously and firmly rejected by both Russia and the United States—an uncommon

combination which the Japanese foreign office hailed with pride because it "proved Japan's impartiality." Mr Kishi has lamented both the arms race and the American yearning to "negotiate from strength." He suggests that Asia is well suited to the role of mediator between the two great blocks, and that Japan in particular, being Asian itself, has a better understanding of Asian psychology than the United States. Mr Fujiyama, echoing his leader, has called on both America and Russia to "respect the views of third countries." Japan seems to be making a bid for the halo of moral leadership in Asia that Mr Nehru has long worn. The difference—and the difficulty—is that Japan specifically eschews ideological neutrality, and 1941 is still a little too recent for the halo to sit quite straight.

THIS attempt not to appear in Asian eyes as merely an instrument of American policy has, however, to be reconciled with the necessity of keeping close ties with the West. These ties are most evident in the continuing presence of American forces on Okinawa in the Ryukyu islands, over which the San Francisco peace treaty left to Japan only a dim "residual sovereignty," and of air bases in Japan itself. These are a source of continual friction: it is easy for the government's critics to claim that the bases in Japan take land that the Japanese themselves badly need, and that if Okinawa were handed back by the Americans the Russians could be put under an obligation to do the same with some of the southern Kuriles. Mr Kishi is under constant pressure from the socialists to disentangle Japan entirely from the American alliance and to persuade the airmen to quit their remaining bases. But, if Japan is to count on any real military defence at all, it must still depend on the Americans for it. Even by 1960, its own ground forces will still number only 180,000 men; their fire-power is light, their weapons are American and not of the most modern kind, and their morale and discipline are, in many units, lax. The air force and navy are equally rudimentary. The only combat aircraft are some obsolescent Sabres; and, although the navy is relatively a little stronger—it included 16 destroyer-type vessels last year—it is doubtful whether it is yet equal to any more serious function than protecting Japanese fishing craft from the pounces of South Korean gunboats.



At the moment the army's strategy assumes that an attack, if one comes, will be directed against Hokkaido; the largest corps is kept there, and the staff has prepared a plan to reinforce it from the other islands. Since the total force that can be deployed comes to no more than about seven

divisions, this makes military sense only on one of two assumptions: either that the Americans will rush more reinforcements in, or that the Japanese forces are simply a tripwire to entangle the invaders' feet until the bombers of Strategic Air Command come into action against their bases. But perhaps, in their hearts, the Japanese leaders apply to their own country the maxim they publicly apply to the rest of Asia: that arms alone are not enough to save it from communism.

The history of Japan might be roughly summed up as ten centuries spent under varying degrees of Chinese influence, followed by two centuries of isolation dramatically ended by Japan's emergence as an armed industrial state bent on establishing its hegemony over eastern Asia. The attempt not only failed, it left Japan facing a new China that had embarked on a programme of industrialisation even more ambitious than its own. Some observers, including Professor Toynbee, believe that in the long run Japan will be unable to resist China's gravitational pull. Japanese intellectuals, who now tread the road to Peking at the rate of 2,000 a year, often come away disillusioned and muttering that "we did not escape from one well-run prison only to seek admission to another." But the old magnetism remains, and it is pulling hard on the traders. If the West were to show no response at all to Mr Kishi's ambitious plans for south east Asia, and if the lobbyists in Washington were to start tightening the squeeze on American imports from Japan, heads might begin to turn eastward again.

The policy of Mr Kishi and Mr Fujiyama embodies a very important truth: that if the Japanese cannot look to China for their economic future, they must look to the ring of countries that stretch from the Philippines and Indonesia to north and west Africa. In many ways, Japan's postwar resurgence has been as astonishing as Germany's. It has concluded reparations agreements with almost all its wartime victims, and has started offering aid to small neighbours like Cambodia and Laos. Japanese firms and technicians are busy in India, Ceylon and Pakistan. A Japanese department store is to be shipped to Teheran, complete with Japanese salesgirls. In Cairo, a Japanese mission has gravely discussed with Colonel Nasser the possibility of helping Egypt to build the Aswan High Dam, and Japan is hoping to drill for oil in the Middle East. It would be remarkable if "economic diplomacy" were not coloured by political ambition. The Japanese fully expect to play once more a leading role in Asia and the world. Less than six years after the American occupation, they are cautiously, but with increasing confidence, making their voice heard again.

Spring Books

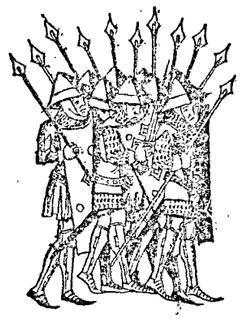
Dickens Reappraised

AFTER Easter the Oxford University Press completes* the achievement of producing all Dickens's work in a new illustrated edition. In this collection, the publishers have done all that publishers can to ensure that old lovers of Dickens return to his works and that new readers are encouraged to begin. Print and format are clear and attractive; the illustrations are the original ones; each volume has a specially written introduction. The potential reader is thus left with no external excuse to resist the books. With the appearance of this new edition, resistance must henceforth be explained only by prejudice against the writer himself.

How strong are such resistances? Dickens has no doubt recovered strongly from the falling off in public favour which, lasting over two or three generations, is often the aftermath of an artist's death. Yet there are large numbers of people who find the great man unreadable, and the reasons they give are not negligible. Some are put off by the shapelessness and careless episodic construction that are particularly noticeable in such early novels as "Nicholas Nickleby," but linger on even in masterpieces of the great period. "Bleak House," for all its power, is not without this sense of an imperfectly achieved form and structure. This weakness was, no doubt, dictated by the serial form in which the novels appeared. As Dickens developed his art, he learnt better how to maintain an underlying unity and we know from his notebooks how intricate were the themes that he attempted to weave from chapter to chapter. In the great masterpieces these themes have the consistency of the *leitmotiven* in Wagnerian opera. But in many of the novels, form escapes him and the reader loses patience amid the piling up of adventures and subsidiary characters.

Then there are those whom the mawkish sentimentality of some episodes sickens for all the rest. Dickens has real and almost unendurable pathos. The death of Jo in "Bleak House" makes a violent but legitimate assault upon the emotions. But the pathos is not always real. Even the most fervent lover of Dickens may shrink in distaste from Bella's coy domesticity in the later chapters of "Our Mutual Friend" and certainly few modern ears can tolerate the species of near blank verse into which the early Dickens tended to lapse when he particularly wanted to heighten his effects. The closing pages of "Martin Chuzzlewit" must be near the nadir of grandiloquence.

There are others again who cannot tolerate the large elements of caricature—not always successful—in Dickens's portrayal of human beings. One can leave on one side his relative failure to create any truly sympathetic younger women. What is here in question is something more gross—the total unreality of certain creations, particularly in the wealthier sections of society. A Sir Mulberry Hawke or a Lord Verisopht are as farcical as their names suggest. And no one who has read the Phineas Finn novels of Trollope can fail to be impressed by the contrast between his ability to capture the moods and manners of nineteenth century parliamentary life and the stiff stylised fooling at the expense of politics that Dickens offers us in "Bleak House."



And yet when all the weaknesses and all the unattractive features of Dickens's style and methods are admitted, what a vast and powerful work remains. The lapses fall away, the absurdities give ground. The overwhelming, teeming sense of life and creation swamps all minor imperfections. Surely no English writer save Shakespeare has brought into being so vast a world of living creatures, who grip the imagination with an authenticity that real men and women often lack. The authority of their being is achieved in print by writing them rather larger than life. There never has been unction like that of Mr Chadband or villainy to equal Uriah Heep's.

But Dickens presents us with far more subtle characterisations than these. Sir Leicester Dedlock—Dickens's only fully successful aristocrat—is more than a man of high breeding and narrow mind. His delicacy, his generosity and his agonised love for his wife make the pages of his hopeless vigil moving with an intensity that reveals to us how fully—almost without our being aware of it—the man has been drawn as a living, complex human being.

Two of Dickens's younger men stand out as equally successful characterisations in depth and without caricature. The quiet corruption of Pip's values and standards in "Great Expectations" is a full scale study in psychological development—which is precisely what the bolder method

* "Master Humphrey's Clock" and "A Child's History of England" (introduced by Derek Hudson); "The Uncommercial Traveller, Reprinted Pieces, etc." (introduced by Leslie C. Staples). Both to be published on April 10th. All the volumes are now 15s. each.

Book Society Non-Fiction Choice

The Sicilian Vespers

STEVEN RUNCIMAN

On 30 March 1282, as the bells of Palermo were ringing for Vespers, the Sicilian townsfolk, crying 'Death to the French', rose and slaughtered the garrison and administration of their Angevin king. Here is the full story with its causes and consequences told by the author of *The History of the Crusades.*

A study of the growth of the Soviet Budgetary system from the 1917 Revolution to the German invasion of 1941. *45s. net*

The Uses of Argument

STEPHEN TOULMIN

The relevance of formal logic to our everyday disputes has remained unclear. Professor Toulmin inquires why this is so, and suggests a new conception of the foundations of logic. A book for the ordinary reader as well as the professional philosopher. *22s. 6d. net*

CAMBRIDGE UNIVERSITY PRESS

of caricature lacks. In "David Copperfield," the story draws much of its colour and all its unity from the reader's awareness of the growing maturity and disillusion of David himself. These changes may not have the direct impact of, say, a Traddles or a Micawber, but they linger in the mind with the authenticity of life itself.

Yet if this sense of living men and women is the first and greatest element in Dickens's genius, it is matched by another power which is in some ways more mysterious—his capacity to fix his people rootedly in the great social organisms to which they belong. The novels portray people and they portray worlds as well. Many of these worlds filled Dickens with horror and repulsion. The blind inhumanities of nascent industrialism in "Hard Times," the ghastly labyrinths of the legal system in "Bleak House," the closed bureaucracy of the Tite Barnacles in "Little Dorrit"—all these Dickens sees with a profound awareness of their organic, self-sustaining evil and of the corruptions to which they expose both those whom they martyr and those whom they serve. Those critics who deny Dickens any claim to be thought a social reformer can perhaps point with some justice to his lack of any alternatives—the Cheeryble brothers are not the answer to the acquisitive society. But they cannot deny the passion and conviction with which he exposed the encrusted evils of his day or sought by every means to make men's consciences alive to the inhumanities they had taken for granted.

The critics of today are, moreover, less certain than some of the critics of the thirties that they see more clearly than Dickens the full and fitting answer to the problems of the huge, mass, commercialised industrialised society. Megalopolis can be reached by any route and its pressures and heartlessnesses weigh on its citizens, collective and free alike. The image of the prison which dominates "Little Dorrit" is not simply the debtors' prison. It has much more in common with Kafka's prison, the image of a faceless, inhuman social order in which prisoners and free men alike are penned. The atmosphere of the last and greatest novels is social criticism carried beyond the range of this or that institution. It achieves a psychological depth which the readers of Dickens's own time probably did not fathom. We look into the sick heart of humanity itself.

And this is probably another way of saying that Dickens is above all a poet of gigantic power. Certain evocations—the fog which opens "Bleak House," the first scene on the river in "Our Mutual Friend"—have the sombre magnificence of a great painting or a vast symphony or of epic verse. To read the last of the novels is to walk in a world magnified to an heroic degree by the scale of Dickens's poetic imagination. Behind the small human concerns we obscurely sense the struggles of titans. It is the "rulers of this world of darkness" that are in command and we come from the novels purged as by great drama or great poetry and made aware of the full grandeur of the human scene.

Irish Hurly-Burly

Himself and I

By Anne O'Neill-Barna.
Heinemann. 296 pages. 16s.

ONE'S heart sinks at the first sight of a new book about Irish life, especially when its publishers describe it as "an unabashedly honest and warmly amusing account of the Irish countryside." This, one feels, is the kind of thing that is best left to Miss Honor Tracy—and look what happened to her and she wandering the roads of Spain. So it must be said at once and quite firmly that the publishers are perfectly right. It is a thoroughly amusing book.

The writer is an American who was not content to be born in Brooklyn but insisted on being romantic about Ireland. Her attitude was pushed to the extreme of marrying the head of one of the ancient Irish clans. This seems an American compromise with the more usual descent from Irish kings; but the truth is that she seems a bit mixed hereabouts and is inclined to mix up ancient Irish and ancient Scots society. That should not be done by a writer who was once an authority on myths; it is well known that the Scots stood to the Irish as the Australians to the English. Anyhow, a combination of high romance and high descent resulted in a decision to settle down in Ireland; and the rest of the book describes the process of imposing the Irish way of life on American citizens. It appears that the old tricks of absorption, once so successful on Normans and Cromwellians, are still in working order; Mrs O'Neill-Barna will be writing to the *Irish Times* at any moment to protest against (a) the banning or (b) the unbanning of some book. After not more than the usual amount of bargaining and failures to disclose material details, a house was bought (as literary convention now demands, from Protestant Anglo-Irish; but surely not all the erstwhile Ascendancy are living in the ditches?) sixty miles from Dublin. It must be in a queer part of the country because there is never a word of a racecourse or golf links.

But it is densely populated with priests, nuns, civic guards, retired colonels (this is a mistake—rural Ireland runs to plenty of majors and captains, but colonels are rather English), female do-gooders, optimistic contractors, pessimistic farm labourers, local politicians, language revivalists, total abstainers and all and all. This sounds as if the book is awful, but in fact it is really well done. It is funny, and Mrs O'Neill-Barna (but were there Barnas in ancient Ireland?) strikes home amazingly often. To read this book is to understand why so many leave the hurly-burly of the Irish countryside for the deep peace of Birmingham.

Personality and Poet

Byron: *A Biography*

By Leslie A. Marchand.
Murray. 1,264 pages. 3 vols. £7 7s.

THIS book does what all good documentary biographies should do; it allows its subject to speak in his own authentic voice on every possible occasion. And since Byron was an exceptionally honest man, especially when it came to writing or talking about himself, Professor Marchand has shown sagacity in letting the poet's pungent, vigorous phrases do their full share of the work of establishing Byron's personality in the reader's mind. He possesses, too, that disinterested regard for truth which is an indispensable requisite of any biographer who attempts to write a "definitive" life. He is a painstaking investigator—indeed, there is something intimidating about the industry that accumulates between five and six thousand microfilm rolls of manuscript material from European sources, and over sixteen hundred from the Murray archives; and we may be thankful that, having assembled his facts, he sorts and presents them without a predetermined thesis in his mind.

This "Life" is not an "interpretation" of Byron; it is not even anything so partial as a portrait. There have been a great many partisan lives of Byron, some magnifying and some denigrating him, some slightly patronising in tone, others almost idolatrous. Professor Marchand never censures and does not comment more than is needful. Nevertheless, he has managed to condense his vast mass of material into a readable narrative; his judicious use of footnotes is especially commendable, for they often indicate facts and possibilities that he has had to refrain from developing at full length in the text. His narrative style does not compare in elegance with that of Sir Harold Nicolson, M. Maurois or Mr Quennell, but his aims are far more comprehensive than were theirs.

It is much to be hoped that a cheaper edition may soon be issued, for delightful as it is to handle these sumptuous pages, seven guineas is a lot of money and three largish volumes occupy a lot of shelf space. Incidentally it is a pity that the (rather inadequate) map of Byron's Greece should be included in the first and not in the third volume; and a few misprints and inaccuracies have somehow escaped detection.

Although no startling disclosures are made in this book, the chapters on Byron's childhood and boyhood, more amply documented than any previous account of his early years, do provide many clues to the understanding of his paradoxical character. His mother, who later became intolerable, not only to him but also to most other people, is shown in a comparatively sympathetic light during the period when she was doing her best to bring up the little boy in Aberdeen, desperately short of money and friends. But Byron's unexpected succession to the barony at the age of ten was bad for her, and very bad for him. The sudden change from the obscurity and penury of his Scottish childhood to the glamour of a title and Newstead (half derelict though it was) clearly was a factor in his later extravagances and love of display. And when we discover that his Calvinistic nursemaid, May Gray, used to read the Bible with him and surreptitiously encourage him in precocious sex-play, we have one fresh clue to his later obsessive guilt-consciousness. Small wonder that Byron so hated religious hypocrisy and cant.

Few men in the history of Europe have possessed such a power of fascination as Byron, a power that resides in his personality rather than in his poetry. Tom Moore long ago commented on the unreasonableness of trying to judge a genius by conventional standards; Lady Blessington, too, who took his genius for granted, thought him quite beyond the understanding of ordinary people. The paradox is that nowadays his poetic genius is virtually ignored; yet in spite of the fact that we do not read Byron, we love to read about him. Here is the fullest opportunity yet offered to become intimately acquainted with this strangely compounded human being, this man of extremes: excruciatingly sensitive, yet capable of coarse callousness; brave and generous, yet vain, arrogant and irresponsible; a striker of attitudes, yet one of the most devastatingly honest of men.

Kenyon Revised

Our Bible and the Ancient Manuscripts

By F. Kenyon.
Eyre and Spottiswoode. 352 pages. 42s.

NO greater tribute can be paid to Sir Frederick Kenyon's book than to recall that it was first published in 1895 and that the edition of 1939 continued to be reprinted until 1951. In the swiftly moving field of biblical scholarship this is a wonder indeed. Then came the discoveries of the Dead Sea Scrolls, the progressive decipherment of Hittite cuneiform and the solution of some of the problems raised by Minoan script. Wisely, it has been decided to re-edit Kenyon's survey in the light of these new developments rather than to attempt to cover afresh ground which he had mastered and most of which remains as he knew it. The Rev A. W. Adams has added entirely new sections in the early chapters which deal with archæology and palæography, and has included in his survey the most recent translations of the Bible in England and the United States.

As far as can be seen, his textual revisions have been done with great tact and as little actual re-writing as was possible. The illustrations include new and valuable plates. Unquestionably, this remains, or rather is once again, the best work of its kind accessible to the general reader.

The History of Fanny Burney

JOYCE HEMLOW

'There is no question that this is the richest and most scholarly biography of Fanny Burney that has ever been published . . . The work is smoothly and easily written, and can be read quickly or slowly, for study or for entertainment. And neither way can possibly be without profit.'

OXFORD UNIVERSITY PRESS

JUST PUBLISHED

WHO'S WHO 1958

Only in the current edition of *Who's Who* can be found authentic and up-to-date personal information about thousands of contemporary personalities. To know in a moment the background, life-history and interests of a person of influence or importance in any field confers an incalculable advantage, enjoyed only by those who have immediate daily access to *Who's Who*.

High executives, in private enterprises and in government and corporation service, are increasingly aware that *Who's Who* is an indispensable desk-book. The growth of inter-dependence in business life, and between commerce and industry on the one hand and bureaucracy on the other, has enormously increased the importance of personal information and reliable biographical data.

JOHN MURRAY

The Odour of Sanctity

The Sanctity of Life and the Criminal Law

By Glanville Williams.
Faber. 319 pages. 30s.

Two of the subjects Dr Williams discusses in this book—artificial insemination and attempted suicide—are subjects of current debate. This timeliness is all the more remarkable in that the book is based on a series of lectures delivered at Columbia University and elsewhere in New York City early in 1956. The date may explain the absence of any discussion of capital punishment, for prolonged argument was then about to give rise to the Homicide Act of 1957. (But in his revision of the book for the English edition he has taken account of its effects.) The place accounts for the valuable analysis of the various laws the American states possess concerning his chosen subjects.

In each section of the book—chapters are devoted to infanticide, contraception, sterilisation, abortion and euthanasia in addition to artificial insemination and suicide—Dr Williams describes the present laws, both here and in other countries, and their history. He gives a just description of the attitude of the churches and an accurate account of the *medical facts.* Old debates on these thorny matters are recapitulated and the personal, social, eugenic and demographic consequences of the law are examined. He makes proposals for reform in each case, some familiar, some less so, and tries to forecast the probable consequences—though he does not always go far enough into the practical effects.

Dr Williams's own standpoint is quite clearly that of a humanitarian reformer, which is refreshing in a lawyer, and he ruthlessly demolishes the religious and moralist arguments for leaving things as they are. Many people take hard knocks: Malthus for his pessimism; Augustine and Aquinas for their asceticism; those who maintain the doctrine of double effect for their casuistry. But the arguments of the other side are presented fairly.

The most difficult problem of all—abortion—receives the most extensive discussion. The present policy of leaving it underground where it has "the ignominy that it deserves"—to quote the Archbishop of Canterbury—results in the death of an unknown number of women in England and the United States each year. These deaths of women in their prime are largely preventible and may well exceed their deaths in, for example, childbirth—or from poliomyelitis. But to prevent them by allowing abortion to anyone who wished would impose a vast new burden on the hospitals and their staffs—one that they could not undertake with existing facilities. This is an aspect of the problem that Dr Williams does not touch on. He does point out, however, that less thorough solutions seem to be curiously ineffective. In Sweden and Denmark, where the law has been made more liberal, there has been a tenfold increase in legal abortions, but no decrease has occurred in the number of illegal ones, for it is an entirely different class of woman that is given a legal abortion. In Japan, too, where over a million legal abortions were performed in 1954, it is estimated that an equal number of clandestine abortions were done. Even a partial solution of the problem of the unwanted pregnancy will probably have to await the arrival of a really reliable oral contraceptive and its marketing free of the restraints that moralists will no doubt try to impose.

The time is ripe for fresh debates on this and some of the other problems dealt with here, and this humane, knowledgeable and very readable book will provide the reformer with some highly effective ammunition. They will not necessarily agree with all Dr Williams's arguments. In particular, his plea for euthanasia goes much farther than most reformers, other than those who belong to the Euthanasia Society, will tolerate. Nor does he distinguish sufficiently between what should be permitted by law and what should be granted as a right: if abortion, artificial insemination, sterilisation are legally permitted, does this mean that they have to be carried out on all who demand them, and at public expense? Nevertheless it is the publication of such books and the discussion they give rise to that stir up the informed opinion that is the essential preliminary to reform. The Home Secretary can then no longer say, as he so recently said in Parliament in reply to a question about suicide and attempted suicide, that he had no evidence that a change in the law would be generally acceptable.

Cabinets and Committees

Cabinet Government and War 1890-1940

By John Ehrman.
Cambridge University Press, 138 pages. 16s.

The British people are rightly proud of their parliamentary government and of the general smoothness with which cabinets work. But, as this book shows, it has largely been a matter of learning from trial and error.

Perhaps the greatest contributors to the development of the modern cabinet organisation have been the two world wars, particularly the second one. The first saw the introduction of the cabinet secretariat and the recording of cabinet conclusions. These were major reforms for which the credit must go to David Lloyd George and Maurice Hankey. The second world war—after Mr Churchill became Prime Minister—saw a development of cabinet and official committees more effective and efficient than anything that had gone before. The political credit belongs to Winston Churchill and John Anderson; but very full marks should be awarded to two civil servants—Edward Bridges and Norman Brook. Unfortunately these last three names do not appear in the index of this book. The wartime developments were carried on and improved upon by the Labour governments of 1945-51, probably the first peacetime governments to have a thought-out, effective cabinet and cabinet committee organisation.

A lot of research has gone into Mr Ehrman's excellent book. It consists of the Lees Knowles lectures delivered by him at Cambridge in 1957, though the volume reads well as a book. What is depressing is the long time it shows that governments took to learn—or was it the unwillingness of ministers to effect bold changes until an enemy was at the country's throat in 1940 and to a lesser extent in 1917?

Not until Haldane became Secretary for War in 1906 did reforms at the War Office become noticeable, despite plenty of inquiries in the nineteenth century.

> From the later sixties to 1880 [says Mr Ehrman] no fewer than seventeen Royal Commissions, eighteen Select Committees, nineteen Committees of officers inside the War Office, and thirty-five Committees of Military Officers had considered matters of policy affecting the army.

The results were small. Even the Admiralty had to be pushed and dragged along to tolerate a proper naval staff. However, early in the twentieth century the Committee of Imperial Defence was established, owing much, for its successful establishment, to Balfour and to Haldane. Even so, from the Admiralty, Fisher was able to defy it for quite a time as First Sea Lord.

For over two years after 1914 the Asquith government was in a world war with a cabinet organisation too similar to that of peacetime. Whatever his motives—still a matter of sharp dispute between their two families—Lloyd George's conception of cabinet organisation for war was superior to that of Asquith. Nevertheless, much of his cabinet committee set-up was more trial and error than plan—though much better than what had gone before. After that war, however, we largely drifted back to the old inadequate order of things. The organisation of the Chamberlain government was by no means good enough; we had to wait for Churchill and his colleagues in 1940. And it hardly needs saying that it is supremely doubtful if that organisation would be suitable for a third world war.

If the departments are badly laid out and inefficient, co-ordination alone under committees or senior ministers will not be effective. As Mr Ehrman says:

> For in fact it was useless to expect co-ordinating bodies to prove effective until the bodies to be co-ordinated had themselves been rendered so. The Departments must be remodelled before the inter-Departmental Committees could function properly.

For students of government and for politicians as well, Mr Ehrman's book is of real value.

Cross Purposes

Henry James and H. G. Wells

Edited by Leon Edel and Gordon N. Ray.
Hart-Davis. 272 pages. 21s.

Henry James and H. G. Wells met in 1898. James, always kind to young talent, took to him at once. For many years they met and corresponded. More of James's letters have survived than of Wells's, and there is no record of their meetings; but there is enough to show how their relations developed. At first all went smoothly, but as the years advanced and Wells's talents and reputation developed, it became more and more clear that they had little in common. James regarded novel writing as an end in itself; Wells regarded it as a means to an end, and, as he grew older, a less and less satisfactory means. James's letters were always kind, but more and more critical. In 1911 Wells delivered a talk on the contemporary novel, which showed how far he was from James, and soon after letters to others showed that James had given up hope of him: "He has cut loose from literature clearly—practically altogether; he will still do a lot of writing probably but it won't be that." In 1914 James wrote two long articles on "The Younger Generation," which showed how little he thought of Wells's novels; and shortly after Wells, in his curious boutade "Boon," published a funny but venomous parody and critique of James. One or two letters passed thereafter, which only confirmed their differences; and shortly after James died. Years later Wells analysed these differences in a partial but penetrating passage of his "Experiment in Autobiography."

Mr Edel and Mr Ray have edited these absorbing documents with an admirable introduction. It makes one of the most interesting books to have appeared for a long time. It illuminates the art of the novel, human nature and the passage of time. It deals most explicitly with the art of the novel; it is our good luck that two men so incompatible should have been friends for so long. The interesting thing is that, so far as one can judge, James never really understood what Wells was up to; whereas Wells, admittedly with the advantage of survival into a time when passion was spent, was much clearer, though not fair, about James. The human story is as fascinating. James comes out far better; he had the advantage of both an established position and good manners. But when Wells used his vulgarer weapons James suffered most.

Finally, there is the fascination of seeing how men reacted at the time, and how we react now. The present-day reader can afford to be eclectic and to see the virtues of both; for all their brilliance, they could not. Both stressed the wide range of the novel; but, when it came to the point, each excluded the other's talents and aims. And, just because they were writers, their differences were publicly recorded in wounding words.

Henry Miller

BIG SUR AND THE ORANGES OF HIERONYMUS BOSCH

JOHN COWPER POWYS writes: "I am thrilled to think of Heinemann publishing this masterpiece of Henry Miller's. Readers of this great all-inclusive book have only to read a few passages to get to the heart of Henry Miller's message . . . our great, unequalled Henry Miller . . ." "He is already among the greatest contemporary writers." LAWRENCE DURRELL. *Illustrated,* 30s.

Himself and I

ANNE O'NEILL-BARNA

'Tis a fact that this is one of the most remarkable books ever written about Ireland and the Irish. Wry, humorous, frequently ribald, it is a delightful account of Irish country living as experienced by an eloquent American. 16s.

The Transgressor

JULIAN GREEN

"The theme of this novel—the destruction of innocence by the stupid and vicious—is handled with Mr. Green's usual perception and the story moves inexorably to a tragic climax . . . A sad, sensitive and truthful book." W. H. HUGHES, *New Statesman.* 15s.

The Leopard

V. S. REID

An exciting, haunting and beautiful novel of a strange double chase through the African jungle. "A prose-poem of startling brilliance . . . Mr. Reid is such a remarkable writer." PENELOPE MORTIMER, *Sunday Times.* 13s. 6d.

Kate O'Brien

AS MUSIC AND SPLENDOUR

Paris, and Italy's loveliest cities, are the setting for the story of two Irish girls taken from obscure homes and flung into the fantastic and exacting world of Italian opera of the 1880's. An impressive and exquisitely written novel. *April Fiction Choice of the Book Society.* 16s.

Proustian Fantasia

Six Proust Reconstructions

By Pamela Hansford Johnson.
Macmillan. 304 pages. 21*s*.

PASTICHE can be caricature, whether broad as the starred passages of Miss Stella Gibbons's "Cold Comfort Farm" or as subtle as Max Beerbohm's "Christmas Garland." But it can also, eschewing all exaggeration, be a most illuminating form of creative criticism, interpreting, commenting, and transposing the original, and like all good criticism giving the reader the benefit of a keener sensibility and more intimate knowledge than his own. Miss Pamela Hansford Johnson's "Reconstructions" are superlative examples of this second type—which must, indeed, be very good if it is to be any good at all. To do them justice one should, no doubt, have met them first in the medium for which they were originally designed; that is, the radio. The last in particular, the scintillating "Window at Montjouvain" (in which Vinteuil's Septuor, the triumph of a life that had seemed to end in frustration and shame, symbolises the Time Regained which contains the promise of the narrator's own similar triumph) demands its musical component almost as urgently as an opera libretto. But even in cold print they are a delight.

The first, "The Duchess at Sunset," is in some ways the most ambitious; relying on the timelessness of Proust's characters it lifts them clean out of their epoch and transplants them to the occupied Paris of 1941. Here are the Guermantes cautiously freezing off Marcel (identified, in this one instance, with his creator and thus dangerously non-Aryan); Mme. Verdurin predictably filling her salon with music-loving German officers; the egregious Nornois an obvious Vichyite, Albertine perhaps—always perhaps—a double agent; while, off stage, Charles Swann broadcasts from London, St-Loup has joined the Free French, and Bergotte is in a concentration camp. And Charlus? But it would be a pity to ruin, by hopelessly crude summary, Miss Hansford Johnson's account of his behaviour and his motives.

In fact, "The Duchess at Sunset," first conceived of the "Reconstructions," is not, despite its brilliance, the most successful. The author never puts a foot wrong, but by the same token she misses a characteristic that distinguishes Proust from all other novelists except, perhaps, Mr E. M. Forster: the predilection for ambivalence, the propensity to show some astonishing unsuspected reaction, display some unsurmisable facet of character. Not that she is—it would be surprising if she were—insensitive to this trait. She is at her best in "Madame de Charlus" and "Saint-Loup," both of which, filling in gaps in Proust's narrative, reveal the underlying unity beneath just such violent inconsistencies. The first (taking an inspired line through André Gide) shows Charlus as a devoted husband; the second convincingly resolves the extraordinary discord between the early and the later Saint-Loup. "Swann in Love" comes nearest to straight dramatisation; "Albertine Regained" is pure mischief—Albertine's story told by herself, more in sorrow than in anger, probably (one understands) with incorrigible mendacity, but carrying quite as much conviction as poor Marcel's jealous reconstruction or the tainted evidence that supports it.

The running commentary that links the "Reconstructions" is acute, witty and wise. No one who has been touched by the fascination of Proust's world should miss this book; and even to those hitherto untouched it may unhesitatingly be recommended on its independent merits.

Mem Sahib

Journal of the Siege of Lucknow

By Maria Germon.
Constable. 136 pages. 15*s*.

NOTHING in imperial history captured the Victorian imagination so much as the Indian Mutiny. The well at Cawnpore became the symbol of horror, an excuse for bloody retribution. The Residency at Lucknow became the symbol of heroism, an excuse for self-satisfaction. And just as the spectators were enthralled, so the participants seemed conscious of their historic role. Few sieges have been so prolific in diaries and memoirs as was Lucknow. Recently, the recollections of a private of the line, Henry Metcalfe, were published, and now the diary of a wife of an officer, once privately printed, has been re-published. The diary is edited by Michael Edwardes, who before the war wrote a full account of the Lucknow siege, and it has an introduction by Mr Colin Welch, who was among those who tried to put the Mutiny in perspective on the occasion of the centenary last year.

Any diary turns historical events upside down. Everything is exposed in personal terms, the small tribulation looming as large as the great victory or disaster. And why not? The diarist is concerned with himself or herself. Maria Germon was certainly concerned with herself, her husband Charlie and her own small circle. Fortitude, endurance, heroism are expressed in terms of "light infantry" (a euphemism for lice) in the hair, of inadequate rations of food, of that baby dying of cholera or of that soldier decapitated by a round shot. Muddle and disorder are expressed in terms of personal fatigue and pain. Such a diary as this, plainly and clearly written, does not tell the reader what the siege of Lucknow was or what it meant to British India, but it does tell the reader what it was like. For that reason, even though it adds no new facts to knowledge, it was worth resurrecting and worth publishing, as it is, in an attractive format. It is, however, rather a pity that such a slim volume has to be so expensive.

The Rational Century

The Search for Good Sense

By F. L. Lucas.
Cassell. 354 pages. 25*s*.

MR LUCAS is a humanist, and like Johnson and Jowett before him he holds a poor opinion of useless learning. But he himself certainly possesses much more learning than he can readily use. His style has an old-fashioned air because it is based on a command of several literatures, ancient and modern, and does not hesitate to draw upon them. Moreover Mr Lucas has the learned man's indisposition to pass over even an unimportant fact if it be relevant. Thus, citing Johnson's congenial opinion that books are trash unless they help their readers "better to enjoy life, or better to endure it," he adds a footnote drawing attention to a place in Boswell where Johnson seems rather to contradict this; nor does the footnote close before we have been reminded of Dr and Mrs Kennedy, who spent some forty-two years in computing the exact season of the creation of the world. Mr Lucas, in fact, has a pleasing connoisseurship in the futile erudition he deprecates.

His main thesis is simple, and he gives it to us in eight words of Jane Austen's: "To be rational in anything is great praise." The eighteenth century subscribed to this view without at all realising how hard it is for men ever to merit that praise securely:

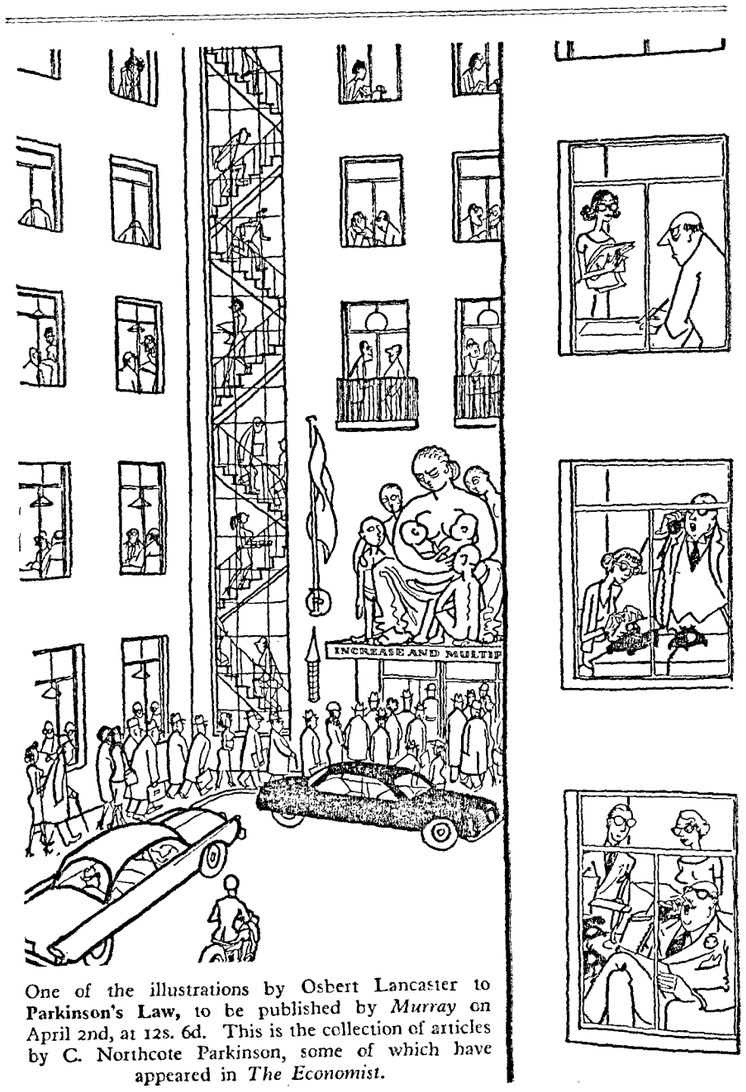
> The eighteenth century, we can see now, monstrously underestimated the difficulty of being rational. It was as if a man should attribute disturbances in his cellar to a few rats; when beneath his foundations flowed really a subterranean river, full of strange forms of life far less easy to control.

Today, when it looks as if control may break down altogether, the eighteenth century surely has its lessons for us. Even in its excess of rationality there is a lesson. "Apollo was wiser, who gave Dionysus a share—though a lesser share—in his own Delphic shrine."

Johnson, Chesterfield, Boswell and Goldsmith are the characters in whom Mr Lucas helps us to watch the struggle for good sense at work. The value of the spectacle consists in its having been so notably a struggle in every case. Johnson was passionate, bigoted and incipiently psychotic; Chesterfield was always on the verge of being a shallow and frigid worldling; Boswell was vain and dissolute; Goldsmith was uneasy and absurd. But each pursued with devotion the quest for intellectual honesty; and our instruction and entertainment arise largely from watching the governing purpose at work upon four markedly contrasting temperaments.

Mr Lucas is unobtrusively and urbanely informative, provocative of radical thought upon the purposes of literary study, and—above all—one who evidently enjoys writing for our enjoyment. His book flatly refutes Lord Melbourne's assertion, quoted on page 146, that it is boring to be educated, boring to educate, and boring to talk about education

The Extra Skin



At Home

By William Plomer.
Cape. 253 pages. 16*s*.

MR PLOMER'S second volume of autobiography, which covers his life in England since the twenties, is fascinating but rather depressing. His main interests, he says, are writing and personal relations. As a writer he has long justified himself beyond the need for comment. In personal relations, his book shows him to be a faithful and perceptive friend, whose memoirs are only limited in scope by affection and reticence. But there is more to his life than that. He was plainly born with one skin too few, and suffers intensely from many public injustices. His tastes and prejudices are not those of the surrounding bourgeoise. He has therefore, in his own words, grown an extra skin, some of whose exfoliations can be seen in his writings.

For the public, this is a good thing, since it has led to fascinating novels and poems. But the survey of its growth in his autobiography is less encouraging. Like other skins, it shows callouses where it is most rubbed. It appears to leave him insensitive about his own faults, to the point of self-satisfaction. His dislike of much that he sees around him leads to some of the vices of a private world: he shows contempt for modest and stupid virtues in human types that he does not like, and he is given to acidulous moralising, as of a spinster in a stuffy room watching the red-faced vulgarians in the street.

But even this part of his book is fascinating as *mémoires pour servir*; and when he talks of his friends one has no reservations.

One of the illustrations by Osbert Lancaster to **Parkinson's Law,** to be published by *Murray* on April 2nd, at 12*s*. 6*d*. This is the collection of articles by C. Northcote Parkinson, some of which have appeared in *The Economist*.

Capital Taxation in a Developing Economy (India)

I. S. GULATI

The first work of its kind to be published in India, this important book is of immense value especially in view of the provision for capital taxation in the budget of 1957. The comprehensive treatment of estate duty from the economist's point of view fills a gap in the economic literature on taxation. *25s. net*

LONGMANS

Poor Poll

Oliver Goldsmith

By Ralph M. Wardle.
Constable. 340 pages. 25s.

"It was Goldsmith's misfortune"—Mr Wardle tells us rather surprisingly on page 3 of this extremely solid academic study—"that he was a jigger fallen among goons." Goons—Dr Johnson, it seems, was a goon—lack the playful mind, and are baffled by the genial eye and light touch of the jigger. If a jigger is also brash—and Goldsmith was thoroughly brash—things are not at all likely to go well.

But in fact, and as Mr Wardle's book shows abundantly, many things went well enough. An Irish adventurer and vagabond, improvident, generous and with little tenacity of purpose, Goldsmith never had it in him to organise his life at a higher level than that of the hand-to-mouth literary hack. Nevertheless he enjoyed the affection and respect of some of the most eminent persons of the age.

Johnson was resolved that the young Boswell should be under no misapprehension here. "Dr Goldsmith," he announced firmly at an early meeting with his future biographer, "is one of the first men we have." And when the Literary Club was formed a few years later, Johnson, Reynolds and Burke saw to it that Goldsmith was one of the nine charter members. For had not this largely vain and absurd Irishman published "The Traveller"—"a production," Johnson had declared, "to which, since the death of Pope, it will not be easy to find anything equal"? Had he not written "The Vicar of Wakefield"—which Johnson indeed found somewhat faulty, but which Scott was to idolise, and Goethe to acclaim as a work sovereign with him at a critical moment of his mental development? Goldsmith scribbled shamelessly—it was that or go to gaol—and Mr Wardle faithfully chronicles and discusses his labours: "The History of England in a Series of Letters to a Nobleman," "The History of Earth and Animated Nature," "An Enquiry into the Present State of Polite Learning" and all the rest of them. But time and again Goldsmith's genius rose superior to his necessities, and among the best contemporary judges his reputation stood as high as it has ever done since.

It is strange, no doubt, that a man who thus wrote like an angel should talk like poor Poll; and yet stranger that admiring friends, distinguished for their politeness and humanity, should have taken so much licence to make fun of him. He was under some uneasy compulsion, it is clear, to elect discomfiture, to obtrude and burlesque his own ineptitudes. And this sort of self-depreciation, like any other, provokes ridicule and contempt far more frequently than it elicits sympathy. The great joke about Goldsmith was that all his little jokes went wrong. On the narrow stage of literary London he was all but the protagonist ("one of the first men we have") and at the same time constrained to the role of clown. Mr Wardle is aware of this personal drama and analyses it with competence. But the chief value of his book lies in its full and scholarly record of Oliver Goldsmith's astonishingly versatile literary career.

The Country Town

Where London Ends

By E. W. Martin.
Phœnix. 312 pages. 30s.

This book is a study of English provincial life after 1750, and is the complement of an earlier work, "The Secret People," which treated of the English village. It is a long book, over 300 pages, attractively produced, and is approximately divided into two: a broad study of the country town in historical terms, and a group of chapters on individual aspects—education, local government, religion, and so on. The author has clearly done an immense amount of preparation. He has assembled a great many facts, and quotes literally from a whole range of authorities, often very tellingly.

The book, however, is not so much an ordered exposition as a discussion, and a very interesting one. Mr Martin is not thinking sociologically or historically so much as philosophically. He uses his complex material in order to meditate upon the wider issues of civilisation, and to provoke thought. For this reason, the book will appeal most of all to the reader who already knows the elements of the subject, and who has a clear idea of the structure of provincial life and its historical background. He will then be adequately equipped to profit from Mr Martin's contemplative approach: for example, to assess the statement that the Nonconformists were active and successful in industry because they were denied an intellectual outlet in the universities and public services; to dispute the comment that regionalism is a psychological state rather than an economic or political fact; or to sympathise or otherwise with Berdyaev's feeling that the middle-class has become a slave to technical progress, and has not only killed spiritual values in so doing, but has actually created a destructive philosophy.

What is the provincial answer? Mr Martin does not try to be specific, perhaps wisely. He offers the generalisation of "urban-rural partnership," with the country town acting as the link between the metropolis and the true countryside, if anything remains of it. In other words, he leaves the reader to draw his own conclusions. It cannot be said, therefore, that "Where London Ends" adds much to factual knowledge of the subject. Only patient research into economic and social statistics can do that. But statistics alone do not give the whole answer; and a humanistic approach, such as is to be found in this book, is needed to interpret the facts, or to provoke others to do so.

The Gladiators

Six Studies in Quarrelling

By Vincent Brome.
Cresset Press. 198 pages. 21s.

Mr Vincent Brome, author, some years ago, of an uneven, shockingly written, but undeniably lively biography of H. G. Wells, has returned to the literary and political controversies of the period in a book which has all the qualities and defects of its predecessor. As scissors-and-paste work it is brilliant; and let no one decry scissors and paste, which, well or ill wielded, are the biographer's and critic's essential tools. As narrative, as critical comment, and as English prose, it is just plain awful. Slickly superficial portraiture and history, forcible-feeble, cliché-ridden writing, make its perusal a really painful experience; there is hardly a stylistic abomination that Mr Brome does not perpetrate, and one can imagine Henry James—whose estrangement from H. G. Wells constitutes one of the "quarrels"—revolving in his grave at the thought of being delivered over to such a chronicler. Yet the intrinsic fascination of these various clashes (Shaw-Wells; H. A. Jones - Wells - Shaw; Belloc - Wells; Belloc - Coulton; Shaw - Chesterton; Wells-James) is so great, the editing which has gone into their presentation is so competent, that in spite of everything the book is a success. Hackles vertical, teeth on edge, one reads on.

Not all the "quarrels" really deserve the name. Shaw and Chesterton never quarrelled. They disagreed, hyperbolically, vociferously, and with vast mutual enjoyment, but entirely without personal animus or the least falling off of affection. The Wells-James "quarrel" was a very one-sided affair—which is best understood by reading the collection of their letters reviewed on page 5 of this supplement.

The others offer a nice selection of ingredients. The Wells-Shaw rows—in the bosom of the Fabian Society and later over Russia—were just rows, sheer pugnacity being the prime cause, temperamental difference playing a minor part, and differences of conviction rather determining the form than providing the motive for controversy. In the Jones-Wells-Shaw campaign, which degenerated on Jones's side from rational argument to sheer screeching hysteria, it is not mere divergence but diametric irreconcilability of conviction that matters. In the long-drawn-out, unforgiving engagements between Belloc and Wells, Belloc and Coulton, an even more irreconcilable intellectual opposition is given extra edge and venom by a cat-and-dog personal dislike.

One element is common to them all; superlative gladiatorial skill and tenacity. It is in his presentation of this element that Mr Brome scores, and for his merits as an impresario of the arena much can be forgiven him.

Jove's Planet

The Planet Jupiter

By B. M. Peek.
Faber. 283 pages. 42s

For fifteen years this author of—to quote the blurb—"for the first time in a single volume a comprehensive survey of the knowledge that has been slowly accumulating about the greatest planet in the solar system" was director of the Jupiter section of the British Astronomical Association; and for thirty-five years he has been a keen student of "Jove's planet." The outcome of such a labour of love is—as is not always the case—worthy alike of author and publishers. The work is exhaustive, covering the veering satellites strung out on their apparent axis, spectroscopy, photography, "the great red spot," radio "noise" from Jupiter, and the planet's composition. From a beginner's glossary and a masterly introduction in general terms to recondite tables, records, diagrams, mathematics and measurements, the book lives up to its dust-wrapper's eulogy; and that, too, is seldom true of any work.

British astronomers have a sort of proprietary interest in the largest of the nine planets. He is above the horizon here at the time of a December opposition for about sixteen hours each night, high up, so that good viewing is possible.

Although amateurs working with small telescopes cannot "get" the great red spot, and differentiate his remarkable zones, they can know the thrill of easy discernment of his moons, strung out widely in those great spaces or dodging round him, and of the incredibly straight lines of zones across his "body." A 4-inch refractor clearly shows the satellites' shadows on this body, and (patiently tended) reveals the satellites dancing in and out of light, coming into and fading out of human vision some 4.83 x 10^8 miles from our sun. The author says that the homogeneity of the planet's chemical composition "all-through" cannot be dismissed as a possibility, though all we can see with human eyes through telescopes is the cloudy and gassy envelope. Radio-telescopy will take us further "in"; hence the intriguing chapters on the "noises" from Jupiter and on spectroscopy; and the author makes the interesting suggestion that Jupiter's massive rotation may impart much of his obvious and "inexhaustible" energy to his turbulent atmosphere, on the lines of the ebb and flow of our tides.

The plates, records of observations, tables and so on are first class. It is a pleasure to commend such a work to professional and amateur, and to congratulate a devoted author and his technically proficient publishers and printers, who have served all astronomers so well.

Documents on German Foreign Policy

SERIES C. VOLUME I
The Third Reich: First Phase

The first in a series of six volumes to cover the period 1933-1937. It opens on January 30, 1933 with the appointment of Hitler as Reich Chancellor and the beginning of the National Socialist regime in Germany. It ends on October 14 with the German withdrawal from the League of Nations and the Disarmament Conference.
47s. 6d. (*post* 2s.)

Allied Military Administration of Italy, 1943-1945

by C. R. S. Harris

Describes how the Anglo-American military arrangements helped in the rehabilitation of the Italian civil population after the collapse of the German occupying forces.
42s. (*post* 1s. 9d.)

Commonwealth Relations Office List 1958

A standard reference work, published annually, providing an authoritative source of information for anyone interested in the Commonwealth countries. 21s. (*post* 10d.)

Automation in North America

by S. B. Bailey

Report on visits to industrial, commercial, and research establishments in the U.S.A. and Canada. Illustrated. 4s. (*post* 5d.)

The West Indies: A Nation in the Making

Gives a brief description of the historical background of these island territories and outlines their political, economic, and social progress towards their ultimate goal—self government.

The Sumerians

History Begins at Sumer

By S. N. Kramer.
Thames and Hudson. 333 pages. 35s.

THE revelation of the brilliant urban civilisation of the Sumerians, which flourished in southern Iraq in the third millennium BC, must rank as one of the major archæological discoveries of our times. The earliest and most creative civilisation of Western Asia, its rise coincided with that of Egypt, which it in some degree influenced. Of all the achievements of the Sumerians, the most significant for the intellectual development of man was the invention of writing. Because they wrote on imperishable tablets of clay, much of their rich and varied literature has survived to be found by the archæologist and studied by modern scholars. In 1956, Professor Kramer, a leading American Sumerologist, gave an account of literary texts that he had personally copied and translated in "From the Tablets of Sumer," published in the United States. "History Begins at Sumer" is the British edition, with additional plates.

In this absorbing and fascinating book his aim has been to present a cross-section of the spiritual and cultural achievements of the Sumerians and to assess their contribution to the progress of human thought. To this end he has chosen documents that illustrate the origin of elements basic to civilisation: government, law and justice, social reform, education, literature, philosophy and ethics, agriculture, and medicine. In his discussion of the texts, many of which are quoted at length, he explains their significance in terms of Sumerian thought and their relevance to the development of our own civilisation. Of particular interest is his discussion of Sumerian influence on bibilical literature. The most striking parallel is provided by the story of the Flood, but Sumerian literature and myths dealing with the creation of the world and man, with resurrection and paradise, also foreshadow biblical themes.

Perhaps the most vivid impression given by this book is the essential humanity of these long-vanished Sumerians. In their proverbs and the delightful stories of their schooldays we find reflections of our own aspirations, dilemmas and foibles and we meet familiar characters: for example, the discontented wife, "a restless woman in the house adds ache to pain"; or the neglected husband, "my wife is in church and here am I starving at home."

Were the Sumerians the first people to settle in Iraq or were they preceded by some other ethnic group? In Professor Kramer's opinion the earliest civilisation was developed by Iranians and Semites and the Sumerians were comparatively late comers. The weakness of this interesting hypothesis, which is based on an analogy between an assumed Heroic Age of the Sumerians and Chadwick's Herioc Ages of European civilisation, is that it is not supported by the archæological evidence. The material culture of the earliest villages developed without interruption into the civilisation with which the Sumerians are associated when written records begin, and there is no evidence of the period of stagnation which he assumes preceded and made possible Sumerian domination. The view that the first settlers came from Iran, though often advanced, lacks proof. The archæological record also seems to require a higher chronology than that advocated by Professor Kramer.

Research

Lytton Strachey—His Mind and Art

By Charles Richard Sanders.
Yale University Press. London: *Oxford University Press.* 381 pages. 36s.

IT is not clear whether the cause is human nature or a reflex conditioned by literary weeklies, but the centenary of an author's birth seems to be the right time to relaunch his reputation. On that count Professor Sanders's book comes some twenty years too soon. It is almost certain that Lytton Strachey has found a permanent niche in our literature; and, even if this is disproved by time, it can be said now that he influenced men's minds so that some things will never again be seen quite in the same way. But it is too soon to assess his final place. Many of his original admirers are still active, and many more of the next generation who reacted against him. Before the reassessment, both sides must have withered into tolerance; and his view of life, so unfashionable today, must have become far enough removed to be judged without passion. After all, it is only forty years since "Eminent Victorians" was published; and forty years before that, Cardinal Manning, Florence Nightingale and General Gordon were all alive and kicking.

But this is a work of professional scholarship, and its value hardly depends on the opportuneness of its publication. Mr Sanders tells disarmingly how, during the war, he wanted to relax by doing some research on a light and amusing subject, which would give him opportunity for adverse comment to balance the praise, and so make him seem judicious. But the more he read Strachey's works, the better they seemed, till justice became incompatible with balance. But he was not discouraged; and his research has rewarded him with various papers and two books.

The earlier one was a readable account of the Strachey family; in this one he has analysed pretty well everything that Strachey wrote about literature and biography (including the anonymous reviews, which he has run to earth) and everything that has been written about him; he has run all this, as it were, through the punched-card machine and set it out by subjects, with a short biographical sketch and a commentary which is civilised, well written but scarcely memorable. The general reader may be put off or amused, according to temperament, by the rigour with which he follows the rules of the research game. A quotation from someone else, however dim, counts a point; influences and correlations trump direct statements; anything that can fairly be labelled "important" counts double; and the score is rung up in footnotes. If one may borrow a quotation from Strachey, *le secret d'ennuyer c'est de tout dire**, but the book will be useful to anyone who wants to rehabilitate Strachey when his centenary comes round in 1980, and it makes good browsing now.

* *Spectator*, 100 (June 6, 1908, pages 899-900.) See reference in "Lytton Strachey," by Charles Richard Sanders, 1957, page 181, footnote 37.

Pensioner's Vademecum

The £ s. d. of Retirement

By Cecil Chisholm.
Phœnix. 142 pages. 12s. 6d.

THIS admirable little book is a sequel and supplement to the same author's "Retire and Enjoy It," and is as full as its predecessor of meaty and practical good sense agreeably presented. A short first chapter recapitulates the message of the earlier book—be prepared, retire "10" rather than retire "from," beware of drifting—and adds a few unsentimental words on a topic which "Retire and Enjoy It" left untouched: that "second retirement" which must be faced when the grasshopper becomes a burden. Then follow, making up the first part of the book, a survey of pension and annuity alternatives, and chapters dealing with investment and the management of savings—a subject on which the author brings to bear a lifetime's experience as a financial journalist. (The facts of chronic inflation are faced with a realism verging on the pessimistic.)

Part II turns from the maintenance of income to its spending; its discussion of household budgets is the best thing of its kind since, over twenty years ago, Nigel Balchin wrote his "Income and Outcome." So good is it, indeed (despite one or two oddities like the treatment of purchase tax and excise) that one wishes Mr Chisholm had shifted his viewpoint and addressed, like Mr Balchin, the public in general. For virtually everything in this section—and a great deal in Part I—is equally relevant to the needs of the young couple setting up house on a shoestring, or the means-tested professional family taking the strain of higher education, or indeed anyone who, facing a change of circumstances or resolved to break out of a routine that has become unsatisfactory, must try to make every florin do the work of half-a-crown. As things are, many of the younger potential beneficiaries of Mr Chisholm's knowledgeableness and wisdom are likely to be misled by the title; or, even if not misled, quite possibly deterred by a sense of personal incongruity from asking for it in bookshop or library. Those who overcome their inhibitions will find themselves skipping surprisingly little.

Weyman's France Revisited

Assault on Olympus: *The Rise of the House of Gramont*

By W. H. Lewis.
Deutsch. 240 pages. 18s.

WE are back again among the Gentlemen of France. But they seem less gentlemanly than in Weyman's day. Among his cloaked swordsmen were a few who (perhaps under the influence of someone resembling d'Artagnan's Lady de Winter) had gone to the bad; but most of them spent their time in harmless swordplay, horseplay, and light flirtation. Mr Lewis's gallants, however, break vigorously and promiscuously through every clause in the moral code. They would regard a cry of "marked cards!" as a friendly compliment; and their ladies are "kind" or "cruel" in the most primitive sense.

The "Red Robes" are here too. Mr Lewis detests Richelieu, somewhat surprisingly believes that anyone (including Louis XIII whose throne he saved) would have gladly liquidated him; but presents a hero who, unable to subsist indefinitely as cardsharper and gigolo, remained faithful to the Cardinal. For running through the qualities that transformed Antoine Comte de Guiche (despatched to Paris at the age of fourteen with a spare shirt and little money) into a Marshal of France and Duke of Gramont was a strong thread of loyalty.

It was interwoven, however, with a shrewd discretion, and an ability to clown his way out of embarrassments that ensured his emergence unscathed from the military frivolities of the Fronde. The Regent Anne trusted him and her Cardinal Mazarin allowed his brother to cheat him at cards. The young Louis XIV always respected him, and never resented his bluntness.

But bluntness, even if flavoured with humour, would not account for Gramont's diplomatic successes; it was his patience and finesse that helped to steer Louis's marriage negotiations through the usual Spanish procrastinations, while his ability to outdrink German princelings facilitated Louis's designs on Germany. Antoine deserved his dukedom, and his place in the centre of Mr Lewis's crowded pageant, though he is sometimes elbowed out of sight by his family, whose erraticities provide Mr Lewis's liveliest stories but occasionally confuse the narrative.

As, no doubt, they confused the Duke. His relations would never have climbed Olympus without him; one or other was always in difficulties, and at times Antoine must have been tempted to cut the rope. His heir's imprudences included intrigue with a royal mistress; his daughter gracelessly refused to live in Monaco with her unattractive ducal husband and was the life and soul of almost every scandal at the French court; and his second son, who eventually carried on the hard-won title, was thrice exiled. But we must be grateful to these ambitious, reckless gascons whose adventures and memoirs have given Mr Lewis the material for the tale he tells with such enjoyable gusto.

Gone from Jericho

Given to Salt: *The Struggle for the Dead Sea Concession*

By M. A. Novomeysky.
Parrish. 286 pages. 25s.

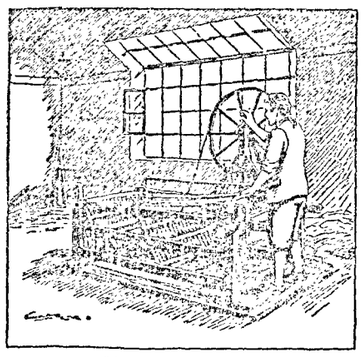
ON a broiling afternoon in mid-May 1948, your reviewer motored down from Amman to Jericho to check for himself some of the rumours that were flying round at the start of the Palestine war. One was that no one had had the time, or the men, to spare for ordering the Arab Legion to preserve a potential asset—the Palestine Potash works at the north end of the Dead Sea. It was true. He found triumphant Beduin tugging away lengths of piping made to carry potash or bromine and now destined—at best—for use as cattle troughs. So ended Chapter II of the saga of which this book constitutes Chapter I. The third, still in process and untold in English, covers the Israeli feat of precipitous road-building and persevering reconstitution of the potash works at the other end of the Dead Sea.

The story begins in 1920. Mr Novomeysky (now in his eighties and still a director of Palestine Potash Limited) was then a Siberian mining engineer in his prime. He was also a Jew and a Zionist. Versed, from experience on Lake Baikal, in processes of extracting salts by evaporation, he was undaunted by the then physical snags in working a concession in the Jordan valley—a bad climate, no transport, no fuel, no money. The handicaps he did not reckon with were psychological—handicaps that were to dog him for the whole of the nine years covered by this book. He did not get the concession until 1929.

Was it misfortune or design that produced such frustrations as to lead a Colonial Office official at one point to "wish the sea were really dead"? Each time success seems within grasp there appears either a ghost applicant waving an Ottoman *firman,* or a civil servant whispering that Du Pont is in the field, or an MP concerned to ensure that no Arab rights are promised away, or a financier back-pedalling because he is interested chiefly in profits and Mr Novomeysky chiefly in "making that salt lake serve the land of Palestine."

Throughout the drama, the principal *personæ* play their parts in character. Though it is in British interests to find potash from a non-German source, the Colonial Office moves at the pace of the nation that cannot decide whether to build a ring road round Oxford. Meantime, Mr Novomeysky inflexibly pursues —with occasional very genuine handshakes for Arabs—his objective of furthering Zionist ends, including Jewish immigration; throughout, he senses and resents British anxiety to give the enterprise a British flavour not just for national reasons but also because, without it, directors bent on furthering Zionism might gallop away with Arab rights. All comes right only when he decides to join forces with a group of peers and old blues and typically Pall Mall advocates of fair play. In the years after the book's end, it is the Arab talent for destruction that spoils this grand design. Neither the Lyttons nor the Tennants nor the Novomeyskys are accountable for a result that was meant to be just, but turns out in favour of Israel.

The book, though exciting, is for connoisseurs. Few casual readers will be interested in its wealth of solicitors' letters, passages from Hansard and drafts for concession agreements. But it constitutes required reading, and most revealing reading, to anyone interested in Zionism or the working of the British mandate for Palestine.



Who Invented What

Inventors of Our World

By Joachim Leithäuser.
Weidenfeld and Nicholson. 257 pages. 25s.

THIS is not simply a book for boys, though it has some of the extravagant gusto, free-wheeling from fact to fact, that child's guides to what makes the wheels go round often display. It is in fact concerned with who first made the wheels go round, a popular history of the origins of modern technology that is lively, journalistic, and very easy to read.

Mr Leithäuser's stated objective sounds slightly ponderous: "a simple portrayal of the true evolution of modern technology." What he has written is

James Hargreaves's Spinning Jenny

not: it is a sweeping graphic adventure tale of inventors and their achievements, essentially anecdotal, selective and fast-moving.

Compressed into a book as short as this, the history of invention simply bristles with good stories; the author sets each of his selections down quickly and neatly, then darts on to the next. It is only where he feels some grandiose generalisation or sociological comment would be in order, and composes his writing for this weighty (and windy) task, that the narrative falters. And to do Mr Leithäuser justice, he pretty soon gets impatient with the large vague generalisation himself; his odd, twinkling facts are always crowding back and leaving the high thinking suspended in mid-air.

Rowing Controversy

The English Style of Rowing

By P. Haig-Thomas and M. A. Nicholson.
Faber. 164 pages. 18s.

AT least since the beginning of the century there has developed, every few years, a controversy about the best technique of oarsmanship. Until the war, it could usually be claimed by the partisans of the classical English style of rowing that in due course they had established its supremacy. Mr Haig-Thomas was more than fifty years ago himself a most distinguished and successful exponent, and as a coach has played a leading part in re-establishing the true gospel from time to time. The younger author is a postwar president of the Cambridge University Boat Club, and now a master at Eton, which was the cradle of the classical style, developed by Edmond Warre, the famous headmaster of Eton, and by de Haviland, who for many years coached the Eton eight.

The major heresy that challenged the classical orthodoxy was the Fairbairn style. The Fairbairn school had a great deal in its favour. Its leader, Steve Fairbairn, had genius as a coach and as a leader of men. The successful development of oarsmanship according to his school demanded long hours of physically strenuous effort: great mileage of rowing and, in that mileage, emphasis always on the "natural" way of doing things. The classical school, on the other hand, demanded not so much mileage of strenuous physical effort as intense mental effort, with every stroke rowed directed to achieving the perfect co-ordination of movement into a synthesis that is much less natural, much more artificial, than Fairbairn required. The Fairbairn style required the maximum relaxation of all those muscles that were not obviously and directly essential to propelling the boat through the water. With the classical style of rowing, there was never so complete a degree of relaxation even when high proficiency was achieved; and until a fair degree of proficiency was achieved, relaxation had to take quite a secondary place. Those men who rowed well in the Fairbairn style had much satisfaction in rowing, and an excellent prospect of winning many races in any company except the highest. The devotee of the classical school spent nearly the whole of his rowing life in discontent, but might hope to find a reward in an ecstasy—lasting probably no more than a few minutes in a year of rowing in good company—when eight men, or four men, were co-ordinating their movements as they should, and making the boat travel as it should. No one who has known that rare ecstasy can doubt that the classical style at its best cannot be beaten.

Messrs Haig-Thomas and Nicholson give a clear and authoritative account of what it is to row in the classical style. They argue, convincingly, that the Fairbairn style, while it produced a plethora of crews capable of winning races against orthodox crews short of a really high standard, never produced one capable of beating a firstclass crew. They maintain that, in the present state of rowing, a style prevails that lacks the best of either school. They build up a logical case which is strong, though not quite overwhelming, for believing that the classical school offers the best hope of producing the fastest eights possible from the background of English rowing. It is to be hoped that their book will start a revival of the classic style, and that their case will be proved by a resurgence of English rowing from its present sorry state.

Bentley Boys

W.O.: *The Autobiography of W. O. Bentley*

By W. O. Bentley.
Hutchinson. 223 pages. 21s.

BETWEEN the years 1922 and 1931 the Bentley motor car gave pleasure to sportsmen and attracted a variety of financiers. Since its demise in the slump that struck Wall Street and closed the old Bentley Company, interest in this high performance car has never waned. Today the Bentley Drivers Club flourishes, its members going to great lengths to preserve examples of every version of the "W.O." Bentley and to unearth every possible fact, technical and historical, concerning them. Certainly more is known today about these great vintage cars than anyone knew of them in their production era—except their modest creator, Walter O. Bentley.

Now the designer of the Bentley car has compiled his autobiography and the truth is at long last plainly disclosed. The author describes how his early love of steam—he served his engineering apprenticeship in the Great Northern locomotive shops at Doncaster—gradually changed to an acceptance of internal combustion. Racing early motor-cycles for pleasure gave way to racing certain French cars in order to publicise them. The first world war proved W. O. Bentley to be a talented aero-engine designer, and the Armistice saw him marketing a car of his own make.

His autobiography tells the simple truth about the setbacks he experienced and the racing victories his cars achieved. He alone knows what really happened; he devotes a chapter to those legendary characters, his drivers, which is supremely entertaining because he is the only man who knew the "Bentley Boys" intimately.

During the second world war, when petrol and motor news were scarce commodities, the motor press devoted much space to the history of motoring. The result is that many books published subsequently merely repeat information that came to light weekly and monthly in the war years. Here "W.O." has an advantage; his autobiography presents the reader with hitherto unknown facts. For this reason, and because the vintage Bentley is held in such high esteem, this book will be a motoring "best seller."

Apart from going into those technical matters which put his cars first past the winning post after twenty-four hours' racing at Le Mans four years in succession and which sold over 3,000 of these costly vehicles to the public, W. O. Bentley tells bitterly of how his liquidated company was snatched from under the nose of D. Napier and Son by a "disguised" bid on behalf of Rolls-Royce. After he left Rolls-Royce the war killed his V12 Lagonda, and, later, litigation all but extinguished Bentley's 2½-litre, which he designed for the Lagonda Company. Such disappointments could well have caused the famous patron of the "Bentley Boys" to dwell on the happier days at Brooklands and Le Mans. Instead, to his credit, he has set down an impartial history of his career, told in a way that carries complete conviction.

Strange People

Kingdom of the Saints

By Ray B. West.
Cape. 389 pages. 30s.

WHICH leader told his people, a hundred and one years ago, that they should fight to the end, "in the mountains, in the canyons, upon the plains, on the hills, along the mighty streams and by the rivulets"? It is unlikely that anyone who knows the answer to this question will need to read Mr West's book. But for those to whom the Utah War and Brigham Young's role in it are shadowy recollections, if recollections at all, for those in fact who want to have the extraordinary Mormon story retold in sympathetic and lively style, "Kingdom of the Saints" is probably the best single book available. The first half, devoted mainly to Joseph Smith, is surpassed by Fawn Brodie's "No One Knows My History," but the rest of the story—the exodus, the settlement, the troubles and the triumphs of Zion—cannot be found elsewhere in so compact and reliable a form.

Mr West writes as an ex-Mormon, in the sense that he has lost his faith in the Mormon religion, but also as someone whose upbringing guaranteed, as he says, that "there was a sense in which I would forever be a Mormon." This undoubtedly helps him to portray his heroes (with all their faults they are that) comprehendingly, and frees his book from the sneers, faint or loud, which most "non-official" Mormon historians have indulged in. But the respect inherent in such an approach leaves the Mormons still remote from full comprehension; they are like creatures from some strange Far Western mythology, possessed obviously of remarkable powers, yet still somehow synthetic, like their religion and their culture. Had Mr West paused in his story-telling long enough to give his readers a generous depiction and analysis of Mormon theology and government, clerical and lay, this gap in our understanding might have been reduced. As it is he has given us Genesis, Exodus and Joshua with little Deuteronomy and hardly a word of Leviticus.

NELSON

The Great Adventurers

The World Unveiled

By Paul Herrmann.
Hamish Hamilton. 507 pages. 42s.

GERMAN popularisers sometimes put one in mind of a dance of elephants. Even when dealing with a subject that of its own nature lifts the heart with excitement, a prolix stylist, who shovels quantities of miscellaneous information at the reader, can obscure the grandeur of his theme. Some of the information given in this book at considerable length is good, some bad; but none of it is organised into a coherent scheme of presentation.

Mr Herrmann's book (apparently the second instalment of the story of man's widening knowledge of the earth which he inhabits) is sub-titled "The story of exploration from Columbus to Livingstone." Such a story was well told for the general reader in a work, also translated from the German, of Dr Leithäuser three years ago. The present book, on a more extensive though not a grander scale, in fact recounts the careers of various notable explorers chosen at random. North America, Asia and the Polar regions are not mentioned. Tasman gets one sentence, but Barth and Nachtigal get forty-two pages between them, and there is even room for the author's motor trip across the Sahara. The motives and problems of exploration are never analysed, nor the means of solving them adequately described. But for those—and there are many—who love digressions about syphilis, Easter Island, Inca customs, Heyerdahl's theories, this book will provide plenty of reading. It is handsomely produced and profusely illustrated, though some of the prints chosen are a mistake in the sense that they are neither contemporary nor accurate.

A Stage Obituary

St. James's: *Theatre of Distinction*

By W. Macqueen-Pope.
W. H. Allen. 256 pages. 25s.

SNOWFLAKES falling from a grey sky on to the proscenium of the St. James's Theatre made a sad sight in London this month to touch the hearts even of those who realised the impracticability of keeping it in being. This book is in effect an affectionate memorial to it, although it was not conceived as such, being one in a series of theatre histories by Mr Macqueen-Pope.

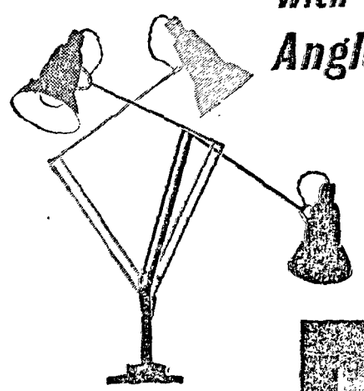
The St. James's Theatre, built at a cost of £50,000, opened in the Christmas season of 1835—not, however, with legitimate drama, then the monopoly under royal patent of Covent Garden and Drury Lane, but with comic opera or burletta as it was then called. Failure dogged the early years of the St. James's, but theatre generally was in those days at a low ebb.

We have to move forward more than half a century to the late Victorian and Edwardian days to find this theatre, with others, in its heyday. With time lending enchantment, the profusion of talent that came to the London stage in those years strikes awe. The St. James's, under its famous actor-manager George Alexander, had its own special glories. It had, for instance, the summer night in 1893 when Mrs Patrick Campbell captured her London audience with Pinero's *Mrs Tanqueray*; it had George Alexander in *Lady Windermere's Fan* and *The Importance of Being Earnest*, Forbes-Robertson in *The Passing of the Third Floor Back*. Even then there were failures: there was the unruly night in 1895 when the patrons of the St. James's booed loud and long at the author of *Guy Domville*, the astonished Henry James.

Mr Macqueen-Pope brings the story up to date with sadness only at the end. He loved the St. James's passionately and perhaps he has written his history with too much adoration for the sophisticated. Perhaps he could have included, with advantage, more excerpts from the press notices of the times. What were Mr Shaw's reactions to those late Victorian ventures? But possibly the overriding impression left by this book is the apparent impossibility of keeping a theatre for long on an even keel. Even the most prudent of managers back hopeless losers. Should we blame the dramatists for not writing good plays or the producers for not picking them or the theatregoers for a fickle taste?

UNITED NATIONS

To Be Published March 31st, 1958



STATISTICAL YEARBOOK 1957

The most comprehensive volume yet published giving authoritative international statistics on demographic, economic, financial, social and cultural subjects. A new chapter on International Economic Aid is included. More tables (191) and more statistics are contained in this ninth issue than in any of the preceding volumes; data on about 250 countries and territories; most of the tables cover a twenty-year period. Indexed. 674 pages.

Cloth 57/- (59/3 incl. postage)
Paper 46/- (48/3 incl. postage)

Canada's Money Row
The State in India's Finances

The Bank and the Public

THE one mercy about politics is that it is always in search of new middens to scratch over. It is a mere four months since the House of Commons endured one of its least appetising debates, on the Bank of England, in which Mr Harold Wilson sought both to extenuate the part that he had played in the setting up of the Parker Tribunal and also to lay down his ideas about the way in which the Bank should be run in future. In one afternoon he and his colleagues managed to jeopardise any basis of mutual respect between a future Labour government with Mr Wilson as Chancellor and the City itself. For that piece of wrecking his party—and the country—may have to pay at some future time. But the damage has been done. New sensations have replaced the Bank in the politicians' attention. And the general public is left little the wiser about the genuine case that can be made for having a Bank, as distinct from a creature of the Treasury, or about the valid criticisms that can be levelled at the Bank for its failure in the past to persuade the public at large that its viewpoint on monetary policy, as distinct from its technical expertise in carrying that policy out, is something that the country needs.

It has been said of Lord Norman that not only did he have some difficulty in explaining himself to more than one person at a time; he actually resented having to do so and avoided the necessity whenever possible. As for uninstructed opinion, he ignored it as of no account. It has long ceased to be that kind of Bank. The manifestation of a person who felt towards his decisions (and usually good decisions) had given way, years before the Bank became public property, to the exercise of central banking functions based on principle and on knowledge—what the present Governor has well described as the prime requirement of operational competence.

Yet today that competence—which even the sourest critic would not deny—is not enough. Each day, some new arcanum is broken open and it is useless to complain that the intelligent part of the public is being tiresome or impertinent in demanding to know what goes on in secret places. As for the uninstructed part, it is worth pondering the effort (and the money) that institutions, industries and companies all over the world spend in creating an acceptable aura around themselves. Not that they are unacceptable; they almost invariably are. But whereas a minority can be convinced of the fact by the evidence, the majority have to be instilled with a mental picture of what constitutes a Good Thing by the arts of persuasion rather than by any strict demonstration of reason. This may be disagreeable—even vulgar—and sincere people can easily be tempted to dismiss it with contempt. The misfortune is that these arts become increasingly necessary in the modern world; not even the most withdrawn institution can afford to ignore them.

It is not yet evident that this point is fully seized in Threadneedle Street. "Our policy," the Governor has said, "has been to move gradually in the direction of saying more about what we are doing and giving more background." That indeed is true and the Governor himself has lately been making a notable contribution to the general understanding of the Bank's actions and views in a series of public speeches that can be no light addition to his responsibilities. But there is still something very tentative about the Bank's

The growth of an Idea

For many years Barclays Bank has been building up a structure unique in world banking, a structure based upon two distinct principles. The private banks which combined to form Barclays have provided the foundation for a system of Local Head Offices which lodges in the hands of local people a broad measure of the day-to-day control of affairs; while, ranged around the English bank, there has been developed a group of associated companies which provide in Scotland, in France, in the Mediterranean, in Africa, in Canada, and in the West Indies, a banking service comparable to that of the parent company. The Englishman doing business overseas may well find invaluable this direct representation in many countries; it is of course supplemented by a network of correspondent banks throughout the world.

The system of decentralisation through Local Head Offices is not confined to this country. Branch managers can deal with practically any banking question you put to them; but if they have to refer to higher authority most of them need go only to their Local Directors in Norwich or Nairobi, in Cardiff or Capetown, rather than to a remote Head office in London.

search for a new attitude in its relations with the public. Some spokesmen for the Bank would deny that there is any change in attitude or any need for one; the Old Lady, they would say, may bow to fashion and shorten her skirts discreetly, but it would not be seemly to do more than reveal a glimpse of what goes on. The Bank is, indeed, far more approachable than it was and working journalists who do their best to interpret its viewpoint to a wider public have reason to be grateful for that. But where the Bank still shows hesitation is in projecting itself in the public mind, not indeed as "a separate, and perhaps rival empire" to the Treasury, but as a co-partner in the work of economic policy-making. The simple and only democratic principle is that in the last resort economic decision must rest with sovereign government. The point is that within that principle it is possible either for the Bank to appear as a secondary agency through which the Government exercises its policy or as a source of economic judgment formed independently and above the ruck of politics. Unfortunately, the picture that the general public has is of a subservient central bank. The late Sir Stafford Cripps's lamentable quip —"The Bank is my creature"—still strikes horribly deep.

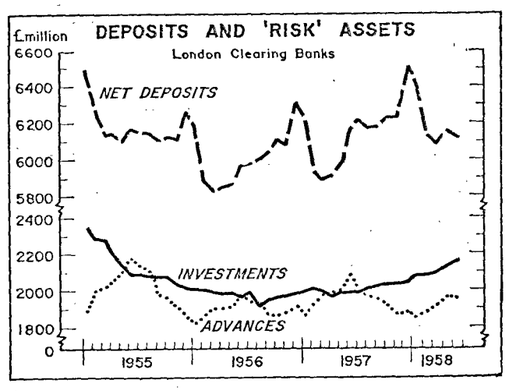
ON the broadest questions of the part that the Bank will in future play in the exercise of monetary authority, the judgment of the Radcliffe Committee will be crucial. There is no advantage to be gained in trying to draw an amateur blueprint of organisation and functions of the Treasury and the Bank when wise men are devoting intense study to these problems. "This review," the Governor has said, "will help us all to see where, without sacrificing the strength of tradition, further improvements can usefully be made." The appeal to tradition is entirely permissible, but it must not be paramount. Where, as in this country, the responsibilities for monetary affairs are interwoven, the direct impact of people's feelings about any move in economic policy falls upon the government, as it should. The Bank may feel that the move may be right or wrong; it may give the government the benefit of sage advice based on the lessons of experience and the proven instincts of tradition. But if all this is conducted exclusively behind the veil, how is the public to know or appreciate the unique value of the Bank's contribution as a source of second opinion in these matters?

So while it is right to welcome the changes by which the Bank is endeavouring to make itself better known (and even to welcome the marked impetus in that direction that has proceeded from the Parker Tribunal hearings) they represent only a beginning. The need is for a much wider understanding of what the Bank is doing and what its views are at the important points of decision on the economic trend line. This is the limit to which constructive criticism of the Bank can be pushed. To represent it as an attempt to set up the Bank as a rival to the Treasury is really something of a caricature. The only proper relations between the two were decided long before Dr Dalton nationalised the Bank in 1946. The transfer of decisions from the Bank to the Treasury that Lord Norman deplored after the suspension of the gold standard in 1931 introduced a decisive change in the balance of forces between them. By 1937 even he, edging in thought towards what Sir Stafford Cripps was to say so devastatingly more than ten years later, asked the governors of the Empire central banks meeting in London to remember that he was an instrument of the Treasury, as well as a central banker. But, he went on, "the two are not incompatible, especially in these days, and I would not say that I am in any way embarrassed by divided loyalties."

THAT might serve as a guiding principle today. The work of the Bank can only benefit from being more widely understood as the essential warp in the fabric of monetary policy. If the Bank is uncertain in explaining itself or if it supposes that the public takes a discreet reserve to be synonymous with importance, its influence is bound to be less effective than it ought to be. It may be true that the Bank of England is not invested with the same authority that some other central banks enjoy in the field of monetary policy. It is undoubtedly true that many of the public misconceptions about the Bank have been encouraged by the defensive and sometimes even negative posture that it adopted in the decade after nationalisation. In this posture there was an acceptable element of good manners, not always matched at the other end of the town. But it meant that an opportunity was being missed for preventing mischievous comments from getting an unchallenged start and for quenching many of the doubts about the relations of the Bank with the Treasury and with the City that some well-disposed people, for want of information, have come to harbour. The same point, indeed, could be directed against the City as a whole; there is no area of activity in the British economy that suffers so much from ignorance and prejudice, and not least on the part of people who would hate to describe themselves as anti-capitalist. It springs from the same cause—lack of knowledge consistently and widely imparted.

Probably the Bank is tired by now of prodding about its annual report. For years, this document has represented the negative side of the Bank at its worst. It may not wish to go in for the mass production of statistics—there are plenty of other people in that business. But there is no comparison between the bare annual account that the Bank renders of its activities and the reports of central banks in many other countries. Mr Bulganin's annual reports, one may be sure, will have more to say about the State Bank he now administers than Mr Cobbold's have so far found to say about his. It is not necessary to go to the monthly lengths of the Federal Reserve Board's distinguished bulletin to achieve the required purpose. Yet it is arguable that the need for explanation is all the greater here because there is no counterpart to the periodical explanations that Mr William Martin is called to give to Congressional Committees about the Federal Reserve Board's policies and intentions.

It should not need saying that these are intended as constructive comments, based on the belief that the Bank's role can be made more effective, even though it can never become overriding. The value of a second opinion is not less important in monetary policy than in other affairs. Popular governments have deposed central banks from ultimate power, just as they have deposed absolute monarchs. But there are moments when the decisions and the guidance of a constitutional monarch are still of critical importance—when the popular influence of the Crown becomes invested with a rare but effective authority. In some ways, that might serve as a model for the Bank. It must be non-political; it must be popularly understood; but it ought on the decisive occasions to be prepared to declare its independent views.

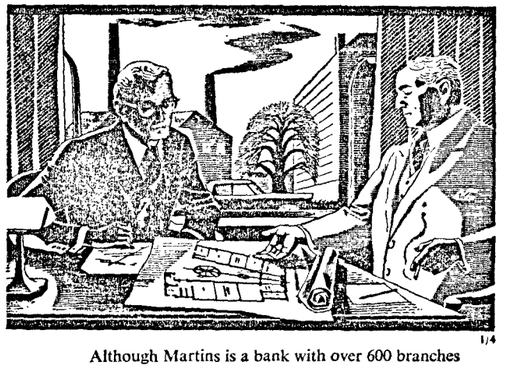


Vindicating Bank Rate

The quick success of the high Bank rate had at first a paradoxical result—it speeded up the expansion of credit. But in recent months it has gradually brought the expansionary forces under control

In the eight months following the crisis of last September, as the ensuing article spells out, Britain replenished the gold and dollar reserves to the extent of £336 million, without counting the $250 million drawn under the "Suez" credit granted by the Export-Import Bank; and during the first six months of that period—which is as far as the available statistics go—it repaid short-term external liabilities, in the form of sterling balances, to the extent of £135 million. Also during this period the big banks thought it worth while to return in force to the gilt-edged market, and towards the end of it the monetary authorities carried through one of the most strikingly successful conversions of government debt on record, securing a 96 per cent response. Shortly afterwards, on the eve of the second reduction in the Bank rate conceded this year, the Governor of the Bank of England, Mr Cameron Cobbold, affirmed that there is now a "real foundation of progress towards stable prices and a stable exchange situation." In spite of current labour troubles—or because of them—that is not an unfair assessment of the prospect. And, certainly, this is the first time since the war that such a claim can be made with any real assurance.

These three sets of facts measure the progress that has been made, by pointing the contrast between conditions now and those of last autumn, in three major spheres—the state of the reserves and sterling, the mood of the gilt-edged market, and the prospect for prices and wages. A variety of forces, not excluding such international influences as the further improvement in Britain's terms of external trade, have contributed to this transformation. But those who have consistently appealed for boldness in the use of monetary policy are entitled to point out that this dramatic change in the financial climate started from the very moment of the emergency measures of September 19th, and that the only novel device among them was the utterly unexpected raising of Bank rate by 2 per cent, to 7 per cent, its highest since 1920-21. It is not clear how far the authorities expected the resultant drastic rise in the cost of borrowing to be in itself a brake upon expenditure; nor is it possible to guess how considerable those direct effects have been. But it is certain that the 7 per cent rate was cast for a highly important psychological role; and it is equally clear that it amply filled that part—as the one means of convincing public opinion that a real stand was at last to be made against inflation. In this sense at least the claims made for the Bank rate weapon by its champions have been vindicated.



It is much less easy to demonstrate the specific mechanics by which this bold wielding of the interest rate has worked on and through the banking system so as to exert restraint upon the economy. During the first few months of the penal rate there was indeed the seeming paradox that the volume of credit as a whole was rapidly expanded. Bank advances, it is true, had started to decline several months before the announcement of the September measures, and in the ensuing three months this movement went much further. The monthly statements of the clearing banks had shown during the third quarter of 1957 an apparent decline in advances to borrowers other than the State boards by £113 million, from the mid-year peak of £2,022 million, though the true decline must have been somewhat smaller than this (because of the swelling of the end-June total by the seasonal rise in the extraneous transit items). Then, in the fourth quarter, after charges for bank advances had been raised to rates ranging up to 9 per cent, and after the clearing banks had been persuaded to work to a new quantitative limit, the published total declined by a further £107 million; that figure must have been distorted in the opposite direction, so that the true decline in the fourth quarter was probably appreciably larger than in the third. This restraint of advances was not reflected, however, in the behaviour of bank deposits: aggregate net deposits of the clearing banks rose during the first three months of the 7 per cent Bank rate much more than seasonally—by £280 million to £6,516 million, their highest for three years and only £40 million below the all-time peak touched just before this whole phase of anti-inflationary policy opened in early 1955.

The proximate cause of this steepening of the curve of credit expansion was a sharp increase in the needs of the public sector. The State boards increased their borrowings by £34 million, and a spectacular increase occurred in the demands of the central government. In spite of a decline of nearly £20 million in the banks' portfolios of commercial bills, the aggregate liquid assets of the banks showed the extraordinary rise of £386 million, which was the counterpart of an extremely steep rise in government borrowing on Treasury bills: in the three months following the rise in Bank rate, the outstanding issue of tender bills rose by £360 million, compared with a rise of merely £10 million in the corresponding period of 1956. By the year-end, therefore, a large proportion of the exceptional reduction achieved in the bill issue early in 1957 had been replaced: the reduction shown on a twelve months' comparison had

We share your problems

Although Martins is a bank with over 600 branches and world-wide connections, our system of decentralisation keeps us in touch with customers' closest problems. narrowed from £430 million in early April to only £140 million by end-December (to a total of £3,460 million).

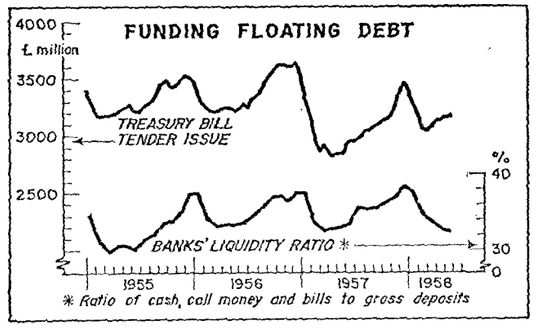
This steep increase in borrowings on floating debt was not attributable to any deterioration in the budgetary accounts: the "overall" Exchequer deficit for the fourth quarter of 1957 was little changed from that of the previous year. The major new influence was the dramatic turn-round in the exchange markets, so that the Exchange Equalisation Account, instead of being a source of finance for the Treasury by relending to it sterling received from sales of gold and exchange, became a large borrower of sterling for finance of the gold reflux. This increase in the offerings of securities on behalf of the Exchange Account was not, moreover, accompanied by any corresponding reversal of the trend of demand for such securities from external sources. On the contrary, the net repayment of overseas-held sterling balances was only moderately smaller in the fourth quarter of 1957 than in the third quarter—it amounted to £102 million, compared with £125 million.

From the point of view of the domestic banking system, therefore, the first effect of the September measures was to change the external influence upon the volume of credit from a contractionary to a strongly expansionary one, without immediately diminishing the major existing expansionary influence of domestic origin. This influence was the plight of the gilt-edged market. From the late spring onwards the flight that developed from fixed interest securities had made it progressively more difficult for the authorities to pursue their intended policy of borrowing from the public rather than from the banking system. By August, indeed, it had seemed to many people that the mechanism of credit control was rapidly approaching breaking point; although in that month, as also in September, the effects were concealed by the catastrophic rate of gold efflux, so that in spite of the difficulties of government finance, the total of bank deposits declined.

The fundamental remedy for this situation was the drastic rise in Bank rate, since that and the associated measures offered some grounds for hope that the long decline in the purchasing power of money would be arrested. It also offered even surer reasons for expecting the next movement of Bank rate to be downwards. But these forces could not be expected to restore the absorptive power of the gilt-edged market overnight. The very process by which they worked was by administering at first a profound shock, from which the market needed time to recover. Gilt-edged securities had been forced to levels that made them "historically cheap"; but the big investors still would not move until they could measure the quality of the follow-through, could judge whether the stern language of 7 per cent did indeed set the tone for government policy as a whole, especially on the wages front.

In the early phase of the high rate, therefore, all the major factors except the continuing fall in advances were making for credit expansion, for the government had also to contend with a decline in its borrowings on non-marketable securities—savings securities and tax reserve certificates. Even in this phase, however, some important restraints were at work within the banking system, quite apart from the restraints exerted through the wider capital market. The attraction of the abnormal 5 per cent paid on deposit account balances was causing a pronounced switch of funds from active to inactive accounts (a movement that continued, indeed, even after this year's first reduction in Bank rate).

Secondly, the fact that the banks were reluctant to return in strength to the gilt-edged market meant that the rise in their liquid assets involved much less than normal risk of a secondary expansion of credit. The authorities had in any event a weapon to hand for preventing any such expan-



sion, and were evidently more prepared to use it than they had been on many former occasions. The government broker, acting for the "departments," could, and did, stand ready to supply any considerable demand for gilt-edged. Any such sales, even when made to banks as distinct from the public, had the effect of absorbing bank liquidity without an associated rise in bank deposits (such as happens when the banks buy from the public) and of preventing a premature rise in the gilt-edged market.

Since the turn of the year, this seeming paradox of credit expansion at high rates has gradually disappeared. The complex balance of forces playing upon the volume of credit has been shifted. The strength of sterling and the rebuilding of the gold reserves, the restraint shown in the budget and in economic policy generally, the maintenance of a reasonably tough line in wages policy—these, and other factors, have provided a firm foundation for the gilt-edged market and have enabled the government to resume funding operations on a massive scale.

Hence a major new contractionary force has been created within the domestic economy to withstand the expansionary pressure of the big current surplus that Britain is now running on its external balance of payments and the effects of the reflux of funds. In the tax-gathering first three months of this year the contraction of bank deposits was somewhat larger than in the corresponding period last year, and in the subsequent two months the expansion of deposits was somewhat less. In May, indeed, there was a significant contra-seasonal fall, so that over the five months the total has declined by £397 million, or fully £70 million more than the decline in the similar period of 1957. The net decline of £55 million over the full nine months since the penal rise in Bank rate is, indeed, only a little short of the corresponding movement in 1956-57; but the seasonally adjusted *index of net deposits* compiled by Lloyds Bank, which rose from 107.6 to 109.9 (1948=100) from September to December, is still, at 109.3, perceptibly above its September level.

The funding operations that made this change of trend possible have been aided, of course, by a decline in short money rates and by the associated reductions of Bank rate to 6 per cent on March 20 and 5½ per cent on May 21. The banks themselves have thus become the more ready to join in the return to the gilt-edged market. Since end-1957 they have added no less than £115 million to their investment portfolios, raising them to their highest for three years. Hence the check to the growth of bank deposits has been accompanied by a drying up of the excess liquidity created at the end of 1957. In each of the past two months the liquidity ratio has fallen, when normally it would have been rising, so that since December it has been reduced from 38.5 to 32.4 per cent. This means that, so long as the gilt-edged market retains its absorptive power, the authorities should have no difficulty in preventing a resumption of credit expansion at any undue pace. But it also means that the power of the banks to give support to the market is becoming more circumscribed.

Sterling's Strength through Tribulation

The impressive recovery of the central gold and dollar reserves in the face of continuing repayments of sterling area balances has revived talk of an impending move to formal convertibility. Is this realistic?

At mid-1958, sterling enters its phase of seasonal strain stronger and better cushioned than for many years past. It has displayed in the first months of 1958 a persistent resilience against adverse psychological influences of a kind that in each of the past three years were sufficient to check and even reverse the favourable seasonal influences on commercial account. The reserves in the first five months of 1958 have risen by more than at any time since 1950; and whereas the gold then was carried in by the perilous tide of the Korean boom in commodity prices and was accompanied by a steep rise in sterling liabilities, the recent strengthening of the reserves has been achieved in the face of continuing strains from the rest of the sterling area, and in combination with large repayments of sterling liabilities. Commodity prices have been weak, and the growing development expenditures of the overseas sterling countries have increasingly been financed by drawings on London balances. It can safely be said that the total improvement in Britain's overseas monetary strength, arising from both the increases in the gold reserves and the reduction in sterling liabilities, has been without precedent throughout the postwar period.

Yet a short six months ago sterling stood shaken on the aftermath of its third major crisis in three years. Could the measures of September 19th prove effective where so many previous efforts had failed? As foreign holders of sterling quickly appreciated, there was a fundamental distinction between the September effort and its predecessors. In the autumn of 1955, Mr Butler's strong denial that no changes in the sterling parity or the sterling margins were in prospect was sufficient to check the immediate run produced by fears of a move to floating rates; but the undercurrent of foreign distrust of the pound remained. A year later, when the Suez crisis brought fears to a head, ministerial affirmations were not enough; $561 million

If you want a thing done well...

"Foundation stones" my old grandfather used to say, "are a great mistake". They were, in his view, almost invariably laid by the wrong sort of people and usually in the wrong sort of places.

Stonemasons, however, he approved of; in fact craftsmen of all kinds – "if you want a thing done well, don't do it yourself, send for a craftsman" was another of his defiant sayings. This, however, did not prevent him practising a succession of crafts as gentlemanly hobbies, among them glass-blowing (mostly wall-thermometers) and the carving of oriental temples, in ebony or ivory, for hanging gold watches in by the bedside.

John Lethbridge the local stone-cutter was a favourite of his and he often offered John the money to set himself up as a monumental mason; an unlikely project since neither of them had a head for business. 'Young Jack' Lethbridge, the son, did eventually set up – as a roadwork contractor. But by that time there was a branch of Lloyds Bank in the village and it was the Bank that enabled him to get off to a good start.

Lethbridge's is a big firm now and employs people from miles around. The village has grown into a town, and the present Manager of the Bank was telling me that he has, well, perhaps I had better not reveal how many local businesses on his books, to say nothing of his brigade (he's very T.A.) of private customers which I gather includes a platoon or two of the skilled men at Lethbridge's.

J. M.

LLOYDS BANK LIMITED

before the speculative run, reached $384 million. Simultaneously, in the year to end-March, the sterling liabilities were reduced by £251 million.

The drastic monetary measures of September, therefore, have proved far more successful than any crisis measures before. Admittedly, the central battle against domestic inflation is not won yet; and a continuation of America's recession holds obvious dangers. But the gains of the past few months have given sterling its much needed breathing space.

It is against this background that rumours have proliferated in the exchange markets of an impending move to full and formal convertibility, by a unification of American account sterling and transferable sterling. On this question, official action during the crisis phase itself is regarded by many market observers as a significant portent.

IF one looks back on the handling of the crisis by the authorities, two facts stand out. The first is that no recourse was made at the time to physical controls to protect the reserve; the second is that there was no perceptible widening of the discounts on the spot rates against dollars in the unofficial markets. The one retreat from the freedom of the London market built up over recent years was in the circumstances a legitimate one. Under notices issued by the Bank of England, banks in the United Kingdom were instructed to provide no further refinance facilities to non-residents. It was further stated that sterling credits for the purchase of sterling goods by non-residents might no longer provide for payment by the issue of usance drafts.

These refinance facilities had for some time been used to build up bear positions in sterling. A typical case would be the finance of shipments of rubber from Malaya through London to Germany. In the normal course this would be arranged by a sight draft; the shipper in Malaya would get his cash by negotiating his draft with a local bank, and the bank would then send this to London where it would become payable by the ultimate buyer against the presentation of the documents. It had been found, however, that the buyers in Germany would postpone their own payment by arranging for a three months' credit in London in order to finance the payment of the sight draft. By this "refinance credit" the need to find the sterling would be deferred for three months or, alternatively, the ultimate buyer would be given the advantage of buying his sterling at the big discount quoted in the forward market. There was nothing illicit or unusual in such transactions, since there was a genuine movement of goods behind them, but they gave merchants an easy means of speculation. The authorities have since relaxed the restrictions on these facilities; but as confidence in sterling has been re-established, demand for refinance facilities has fallen steeply away.

No other restrictive steps were taken last September, either by tightening exchange control or by reimposing import restrictions. Moreover, once the crisis was over the authorities continued their forward march in each of these fields. During the last quarter of 1957 a further liberalisation of import licensing for certain dollar goods was announced; this affected a comparatively unimportant segment of trade, but the action was significant. The relaxation in the field of exchange control was important in itself. In February of this year the Bank of England issued a notice lifting the restrictions on the repatriation of Bank of England notes into the United Kingdom. The proceeds of imports of notes may now be credited to the non-resident sterling account of the sender. Travellers leaving the United Kingdom after a temporary residence may similarly have credited to the appropriate accounts the proceeds of sterling notes up to a maximum of £50 for any one traveller, provided the notes were obtained in the United Kingdom by the debit of an appropriate non-resident account or were brought into the United Kingdom by the traveller.

This relaxation removed at one stroke the discount at which sterling banknotes had been quoted in the main overseas centres. In the most active of the foreign markets for sterling notes, that in Zurich, the rate in February was 11.64 francs, marking a discount of 5 per cent on the spot rate for funds; following the Bank of England's announcement the rate jumped immediately to around 12 francs to the pound, which, allowing for the cost of sending notes to London, is in line with the rate for sterling in the official exchange markets. This relaxation of exchange control, therefore, put an end to a formerly important variety of cheap sterling overseas.

FOR some months now indeed there has been no quotation for sterling overseas below the support point of $2.78 for officially convertible sterling. Even in the worst phase of pressure last summer there was no significant widening in the spread of the three main rates for non-resident sterling accounts, though the spread was far larger than it is today. In June of last year the spot rate in the official market, that is for American account sterling, was $2.78⅞; transferable sterling stood at $2.77¼ and security sterling at $2.60. At the height of the crisis in September, the transferable rate had slipped to $2.76¾, but security sterling had strengthened to $2.67½. By the end of the first week of November official sterling had crossed the parity of $2.80, while transferable sterling had strengthened to $2.78¼ and security sterling to $2.75. This concurrent strengthening of sterling and the narrowing of the spread between the three principal rates has continued since; for the past few months, while official sterling has been knocking against its upper limit of $2.82, both transferable and security sterling have been quoted at near $2.79.

The strength of security sterling has in part been attributable to considerable non-resident participation in large capital issues made on behalf of such concerns as British Petroleum and Shell Transport, in which there is a substantial non-British shareholding. It also reflects an increasing volume of American investment in sterling securities, including gold shares. The strength of transferable sterling has been due in part to the replenishing of working balances in London by Continental bankers and merchants who, at least until their latest doubts about labour disputes in Britain, were reversing the short positions in sterling that had been built up in last year's crisis, and before. For the most part, however, the strength of transferable sterling has been attributable to commercial demand. Far from intervening in support of the transferable rate, the Exchange Account has been selling transferable sterling against dollars in order to hold the rate down.

This conjuncture has naturally led to considerable discussion of the pros and cons of recognising the homogeneity of the two categories of sterling and, therefore, of proceeding to their formal unification. In support of such a move it has been suggested that it would secure for sterling the

stepping up of the number of cheques they pay in to their accounts.

It might be expected that the banks, at least, welcome the prospect of additional business, first from more cheques drawn upon them, and thereafter, almost certainly, in the shape of new customers from a class that so far is unfamiliar with the benefits of a banking account. In fact the banks too find the possibilities alarming. A gradual increase in the number of customers would obviously be welcome, though many bankers are not at all sure that banking in its present British shape is adapted to handling "wage-earning" business. But the issue of large numbers of wage cheques to wage-earners without banking accounts could flood some branches with encashment business on the two days—Friday and Saturday—which are already the busiest in the banking week. The banks have some experience of a peak rush of this kind, in branches where large employers pay salaries by cheque to small salary earners who have no banking accounts. The wage flood would be at once larger and four times as frequent; and for the banks to pass the cost of the extra work to the cheque-drawing employer would not always be easy. For the shopkeeper, of course, it would be impossible.

AGAINST this background Mr Graham Page, who was responsible for last year's Cheques Act, which virtually abolished endorsements (and quite incidentally nearly abolished receipts as well), has introduced his Wages Bill. The Bill provides for the payment of wages to workmen "on location" by postal order or money order, and for the legalisation of profit-sharing schemes in which the workman has a contractual right to the shares; but its main purpose is to deal with the Truck Act anomaly. Unfortunately, in the face of the opposition outlined above, Mr Page has drafted his reform so mildly that its practical use would be limited.

Section 1 of Mr Page's bill provides: "Where a workman consents to payment of his wages into a bank account specified by him, any payment so made . . . shall be valid if it is made by means of an order to a banker." This makes payment possible either by crossed cheque or by bankers' order, and of course the workman's consent is required; but the requirement that there must be an account nominated by the workman would cut almost to nothing any immediate benefit to employers from the passing of the Bill. Only a very small minority of wage-earners have bank accounts, and special cheque payments to the small section of workmen who have them might cause more trouble than economy. Whether any sizable number of wage-earners could be prevailed upon to open accounts must be a very debatable question.

It is of incidental interest that the original beneficiaries of the Truck Acts were "artificers"; the exact scope of the benefit of the truck legislation today is uncertain. Probably "manual workers" is a more accurate description of the artificers' heirs than "wage earners": the distinction is not as simple as that between workers paid weekly and workers paid at longer intervals, and the clerk who is paid weekly can probably not insist on cash. Even so, what is a manual worker? Could the bus conductors returning to work be paid by cheque without risk of adding legal complications to the other troubles of the London Transport Executive? The question turns on definition; and of course one of the odd facts in this very odd business is that some few manual workers are already, and have been for many years, paid by cheque.

One day, indeed, someone may get impatient and a test case could then conceivably produce a surprising result. A common sense ruling by the Courts, based on interpretation of the true intention of the Truck Acts, would effect a change more radical than any agreed reform is likely to do. In the meantime the cheque is being used for most of the £4,000 million a year of salary payments, and for hardly any of the £7,000 million a year of wage payments, while the provision of armoured car services for wage deliveries is a new form of business enterprise. It is an extravagant consequence of a curious and unintended twist of legal history.

Canada's Money Row

BY OUR OTTAWA CORRESPONDENT

An open clash between government and central bank took place during the recent election campaign; now the recession gives a new complexion to this unfortunate dispute

THE Bank of Canada approaches its silver jubilee while passing through the stormiest phase in its history. It has been involved in bitter public and political controversy. On a general plane, the issues that have been raised in Canada are closely in tune with the debate about the appropriate relations between government and central bank which in recent years has been heard in most of the major western trading nations. The undercurrents of Canada's controversy have some parallels in Britain, as well as in the United States, Germany, the Low Countries and Scandinavia; the heat of the controversy has rarely been equalled. Domestic politics and individual personalities have brought matters in Canada dangerously near a showdown. In the financial houses of Toronto some people have been expecting to hear almost every week since last June that Mr James Coyne, the Governor of the Bank of Canada, has resigned. Toronto newspapers have several times reported "showdown" meetings between Mr Coyne and Mr Donald Fleming, the Conservative Minister of Finance.

When Mr Fleming became finance minister last summer, he came to office, like any politician who has been long in opposition, "not in entire forgetfulness, and not in utter nakedness, but trailing clouds of" election speeches. And a principal theme of Mr Fleming's attacks on the previous government had been the evil effect of a "tight money" policy. He had insisted that the government, not the Bank, must take responsibility for the restriction of credit, which he believed—rightly—to have been unpopular. When,

Leader in Scottish Banking since 1695

therefore, he took office (to the surprise equally of himself and the country), it was popularly assumed that he must immediately reverse the course of monetary policy; and that this must result in a clash with Mr Coyne that could end only with the Governor's resignation. Some serious financial observers were so alarmed about the possibility of monetary policy being subordinated to the whims of the electors that they proposed the establishment of a Royal Commission to investigate the relations of the central bank to the government.

How the government and the Bank would have resolved their differences if the boom had kept on at the pace of 1956 and early 1957 is an interesting historical speculation. In fact by the end of August the central bankers observed such a falling-off in the demand for credit that they started to relax, and interest rates began to fall. By the time Parliament met in October, Mr Fleming could proudly declare that the Conservatives had reversed the Liberal wickedness of tight money. A meeker or more philosophical Governor than Mr Coyne might have been happy to let it go at that. But Mr Coyne felt that he had a duty to try to explain to the Canadian people what was really happening. He took the opportunity in his annual report to repeat that it was excessive demand for money, not contraction of the money supply, that had raised interest rates. The money supply, he said, had kept on increasing, and the Bank of Canada had never tried to reduce it. If "tight money" means contracting the money supply, he said, then "there has never been a tight money policy in Canada."

This report appeared in the middle of the second election campaign, in which the Minister of Finance was still talking about the evil of tight money. Mr Fleming promptly issued a statement. He said that the Governor put "his own interpretation on 'tight money policy' but the public attached a different meaning to the phrase," and the government would "continue its efforts" to "ease the tight money condition." In this semantic argument the Governor got the worst of it. What he meant to say would have been clearer if he had used an analogy. He might have written: "Suppose my wife puts on a lot of weight, until her girdle becomes uncomfortable. Would you call that a 'tight girdle policy'?"

The girdle is not pinching now. Bank deposits (including those of the government) plus currency circulating outside the banks are up by almost $1,000 million, more than 10 per cent, over their level a year ago, and demands of private borrowers are much reduced. The banks' general loans to business in Canada are slightly below their level last year; but holdings of Treasury bills have increased by $122 million and of other government securities by $515 million. Moreover a new stimulus has been provided by the federal government's anti-recession programme. In April the government successfully raised $950 million in a four-barrelled issue, with coupons of 2½ per cent for 1959 maturities, of 3 per cent for 1961s, 3½ per cent for 1970s, and 3¾ per cent for 1978s. Of the proceeds, $600 million was needed to refund a war loan. Another $400 million of wartime loan falls due on October 1st and a further $950 million at the beginning of January next. In addition to all this refunding, the budget deficit, which some people expect to be as large as $1,000 million, will require a substantial addition to the government's debt. Additional hundreds of millions must also be raised for advances to crown companies which have been urged to bring forward their capital works. Some $350 million has already been voted by Parliament for housing loans.

If the government, with its need for new borrowing, has accepted a realistic view of interest rates, the Bank of Canada has accepted the demands of the recession for monetary ease. But there remains in the background the potential conflict between the short-run need to stimulate the economy and the long-run need to combat inflation. A difference, at least of emphasis, must be expected between the central bankers' primary responsibility to defend the currency and the political leaders' primary concern with the current level of employment.

Canada has been through a number of phases in its view of central banking. The Bank of Canada was established in 1934 by the Conservative government of the late R. B. Bennett, who made it a privately owned institution and always insisted that it should be free from political control. The Liberals, under Mackenzie King, from the first wanted the Bank of Canada to be publicly owned and controlled, and after a few indecisive moves they finally nationalised it in 1938. The boom period of 1955-1957 was in fact the first occasion for the central bank to try out its full authority to restrain excessive expansion. With more limited capabilities and aims the Bank of Canada pursued anti-inflationary policies during other postwar periods, notably after Korea. But it was not then considered as anything more than an auxiliary support for other action by the government. In the post-Korean inflation Canada still had no functioning market in short-term money. The government of the day welcomed monetary restraint as a contributory aid to its own anti-inflationary policies. But it was itself running big budget surpluses; it was allocating scarce materials to priority users; it was using the tax laws to defer depreciation allowances on "unessential" projects; it was regulating consumer credit.

In these last two years, by contrast, the task of restraining inflation has been left entirely to the central bank. Apart from some fiscal support in the 1956 budget, the government took no direct action to fight inflation. Mr Coyne and his colleagues must sometimes have felt that they were the only people in Canada who wanted to check the progressive depreciation of money. They also found that bank advances were singularly unresponsive to the central bank's touch on the brake. At the crucial point late in 1955, the chartered banks made a "gentleman's agreement" with the Bank of Canada and with each other to give no more "term loans" to business. But it was then discovered that, in the competition for big accounts, the banks had made advance commitments for business loans amounting to several hundreds of millions. At the central bank's first attempt to tighten the screw on credit, therefore, the banks sold holdings of government bonds to a much greater extent than most observers had expected.

The banks have a statutory obligation to maintain their cash at not less than 8 per cent of their deposits. When the pinch came at the end of 1955, this cash ratio seemed less important than the secondary reserve of other liquid assets. The Bank of Canada's power to influence monetary affairs seemed to be in danger of frustration unless the banks accepted some minimum standard for liquid assets. So a gentleman's agreement was also made to build up liquid assets (meaning day-to-day loans and Treasury Bills) to an

additional 7 per cent of deposits. But this agreement was not reached without some hard feelings ; and though it may have been necessary at the time, it was a move of such fundamental importance that many people think it should have been taken only by legislation.

A third way in which the central bank found the initial impact of its control being dulled was in the practice of the Canadian banks of taking "personal savings deposits" (which pay interest on a minimum balance) and treating these like current account deposits as backing for loans. Experience showed that even throughout the depression of the thirties, personal savings were almost immune from changes in the financial climate. Suggestions for segregating personal savings from other deposits were made to the banks early in 1957, and not accepted. Mr Coyne wrote about them in his annual report, which appeared just before the 1957 election; and he was then repudiated by the Liberal Minister of Finance, Mr Walter Harris.

THE combined effect of all these limitations was that the Bank of Canada's attempt to prevent undue expansion, introduced in the autumn of 1955, did not begin to take effect for nearly nine months. Canada's international transactions added further complications. Monetary restraint has a far more powerful effect on small enterprise than on large and wealthy corporations. In Canada's case the large and wealthy are the foreign-owned corporations, which were drawing in a huge inflow of foreign capital. The Bank of Canada had no easy means of discouraging investment from these sources ; indeed, at this point its weapons of raising interest rates acted as an added inducement to foreign investors.

Hence in curbing the total volume of investment money competing for goods and services and labour, it could be argued that the central bank imposed a disproportionately heavy burden on the smaller Canadian corporations and on the smaller municipalities which could not borrow in the New York market. For some of them this did mean an unfair degree of hardship. For Canada it may have meant postponing projects on which the rate of return appeared to be higher than on some of the projects carried through. This inherent difficulty in Canada's economy causes particular trouble when monetary policy is left to carry the whole burden of restraining inflation. It justifies some of Mr Fleming's criticisms of the effect of "tight money." It led some of the Liberal ministers at one time to consider other methods of curbing the boom, either by changing depreciation allowances or by adopting Britain's system of screening new borrowing through a Capital Issues Committee. None of these proposals was adopted.

The weapons of the central bank are of general application. What then is the central banker to do? However much he may dislike imposing sanctions that bear especially heavily on the smaller Canadian enterprises, he must still look first to his solemn mission of defending the currency. The one thing he cannot do is to acquiesce when a politician is tempted to say "Inflation doesn't matter." And if the government of the day insists on opposing him, the only course open to the Governor of the Bank of Canada, as the situation is now understood here, is to resign. That necessity, happily, has not yet arisen.

The State in India's Finances

BY A CORRESPONDENT

The banks in India have hitherto trodden a difficult path. Will the Mundhra affair dampen the enthusiasm of Mr Nehru's government for control and regimentation as part of its drive towards socialism?

THE commission of inquiry into the purchase last autumn by the State Life Insurance Corporation of investments in the Mundhra industrial group, which led to the resignation of Mr T. T. Krishnamachari as Indian Finance Minister and to a departmental investigation, still in progress, into the conduct of certain officers of the Finance Ministry in these ill-fated transactions, could have a profound and lasting impact on the pattern of India's finances and of India's economic society. The Mundhra affair has served to concentrate public attention on the role of the state as investor and final arbiter of Indian investment policy. While always prepared to believe the worst about private enterprise, Indian public opinion has never accustomed itself hitherto to the possibility that the government itself could be unbusinesslike or incompetent or make costly errors in a field in which precise and accurate judgments are of the utmost importance.

The result is that the Mundhra affair and associated events have left Indian opinion a little stunned and breathless ; for once, government has shown itself just as fallible and liable to error as any operator on the highly speculative Calcutta or Bombay markets and, having got into difficulties, just as evasive as any hard faced punter. The result has been a sharp bout of disillusionment ; Delhi's pronouncements in the sphere of investment will no longer carry the authority of holy writ. But it remains to be seen whether this one major mistake, and the ensuing scandal, will dampen the Nehru government's partiality for control and regimentation in the sphere of finance as part of its plan for the establishment of a Socialist pattern of society.

The reaction has shown a strong tendency to go to extremes. On the one hand there are those who say that the whole affair has demonstrated the state's inability to manage large investment operations, that an intelligent clerk would have perceived the warning lights that eluded the minister and the three or four senior officials concerned with the purchase by the Life Insurance Corporation of a million pounds worth of shares in the Mundhra Group of companies. After all, was not the ostensible motive for nationalisation of life insurance to protect the policy holder against the risk of fraud and incompetence on the part of the private insurer?

On the other hand there are those who say that the remedy for this sort of malpractice is not less but more state

control of the investment operations, and that those who made the Mundhra investment were merely outsmarted by a financial adventurer whose record was such as to require that each detail of an investment in his companies should have been subjected to the closest scrutiny. The trouble, it is argued, arose because the officials were much too trusting of a man who seems to personify everything which, in the eyes of the Indian politician, is wrong with private enterprise. Thus, far from resolving the issue the Mundhra affair has intensified and confused the controversy over the relative merits of governmental and private activity in trade and finance.

IN practice it would be exceedingly difficult, if not impossible, for an administration as heavily committed to the philosophy of state enterprise as is the government of India to make anything like a precipitate retreat from the apparently fixed positions it has taken up in the field of investment and finance. It would be no more practicable for the Indian government to unscramble the omelette in which such nationalised institutions as the State Bank and the Life Insurance Corporation are principal elements than it would be for the British Government to hand back the railways and the coal mines to their former owners. Moreover, certain of the basic assumptions of the second five-year plan rest upon the effective control of savings and investment by the authorities. It will be wise to assume, therefore, that the government of India's intrusion into the higher spheres of investment and finance is of a permanent character.

The real point at issue is whether the government will seek to regiment and supervise the banking system and the capital market still further, or whether it will decide that collectivist policies have gone far enough for the foreseeable future, and that it should rely upon the co-operation rather than the coercion of private institutions. Referring to the relations between the commercial banks and the central banking authorities Mr C. H. Bhabha, chairman of the Indian Banks' Association, recently put the matter thus : "Instead of thinking in terms of more controlling legislation and wider powers, cultivation of more cordial and intimate relations and establishment of mutual trust and confidence would go a great way in quickening the progress of banking in this country."

An example of the kind of wet-nurse activities to which the commercial banks object is provided in the recent decision to relax selectively the restrictions on bank advances against food grains, which were imposed in consequence of the heavy speculative activity that developed in these commodities during 1957. The Reserve Bank directed that advances on food grains should be cut down by a significant amount. The scheduled banks soon found that this edict was acting as a serious deterrent to the operations of new branches, most of which (with the government's positive encouragement) are being established in the agricultural districts where crop finance is the chief item of banking business. One of the stock allegations against the commercial banks is that they have failed to extend their activities into the rural areas of the interior where, it must be admitted, banking facilities are mainly conspicuous by their absence.

None the less, the joint stock banks have in recent years made a very real effort to bring their services into districts where it inevitably takes a very long time to put a new branch on to a paying basis. The limitation on credits and overdrafts granted against stocks of food grains made it certain that the opening of such new branches would be an even more speculative venture, and representations were accordingly made to the Reserve Bank, which took the point promptly enough. A recent notification accordingly provides that the advances against food grains made by new branch offices will not be included in the aggregate of such advances of individual banks for the purposes of the original Reserve Bank directive, "provided that the new offices are at centres where, within a radius of 20 miles, there are no offices of other scheduled banks and provided the advances made by each office or branch against food grains in its possession or control do not exceed Rs 1 lakh ; this exemption will, however, cease to be effective after the opening of a branch or office by another scheduled bank in any of these centres, but in any case will operate for a minimum period of one year." The petty and bureaucratic character of this concession to reality is, alas, only too typical of the State's other excursions into the realms of finance and investment.

THE banker, the investor and the entrepreneur are inevitably left with the strong impression that they are to be watched and corrected like children: in the particular matter quoted above, the harassed manager of a branch in an agricultural district is liable to have to reverse his lending policy if perchance a competitor appears on the distant horizon twenty miles away. Despite all the pushing and prodding and exhortation that Indian banking receives from the government and the legislature, its development has not kept pace with the country's economic growth. Practically no new banking venture has been launched in the past decade while, according to Mr Bhabha, the existing banks tend to think chiefly in terms of consolidation or even of contracting their activities.

Indeed, mainly as a result of amalgamations and mergers among the smaller fry, the total number of banks operating in India actually declined from 517 to 405 between 1952 and 1956. The total number of branches of Indian (as distinct from foreign) banks rose by less than one hundred (from 3,900 to 3,999) over the same period, which would hardly seem to be proportionate to the mounting tempo of the economy during those years. Furthermore, the main increase in branches seems to have been in those of state-owned or state-controlled institutions, whose rate of expansion is prescribed by government. The commercial banks cannot afford to move too far ahead of genuine demand for fresh banking services ; but Indian bankers claim that official policies, and in particular the hurdles that have to be surmounted to obtain permission to open a new branch, have acted as a serious deterrent to expansion of facilities.

Periodically proposals for the nationalisation of India's banks emanate from private members on the back benches of Parliament, but the experience of the recent past suggests that the government will be reluctant to embark upon further large measures of nationalisation in the financial sphere. It is not forgotten that the nationalisation of life insurance was somewhat hurriedly undertaken and it will be a long time before the dust of the affair of the Life Insurance Corporation settles. But the authorities in New Delhi will doubtless continue to prescribe policies in banking and investment in a good deal of detail
