DESIGNED FOR TODAY
"SUPER-7" CLIPPERS (DC-7Cs)
BEST WAY TO THE U.S.A.

"Super-7" Clippers—the envy of aircraft designers—the last major development in piston-driven aircraft.

Four turbo-compound engines develop 17,400 horsepower.

Only Pan America has made over 65,00 transatlantic crossing.

Radar picks out the smoothest path through the skies for a radius of 150 miles.

Both first-class *President* and tourist-fa *Rainbow* service—each the most popular in its class—are available on Pan American's "Super-7" Clippers.

Pan American has pioneered the commercial aviation uses of Ground Control Approach Systems, Long-Range Radio Aids to Navigation, Scientific weather forecasting, Engine analyzing instruments and radar.

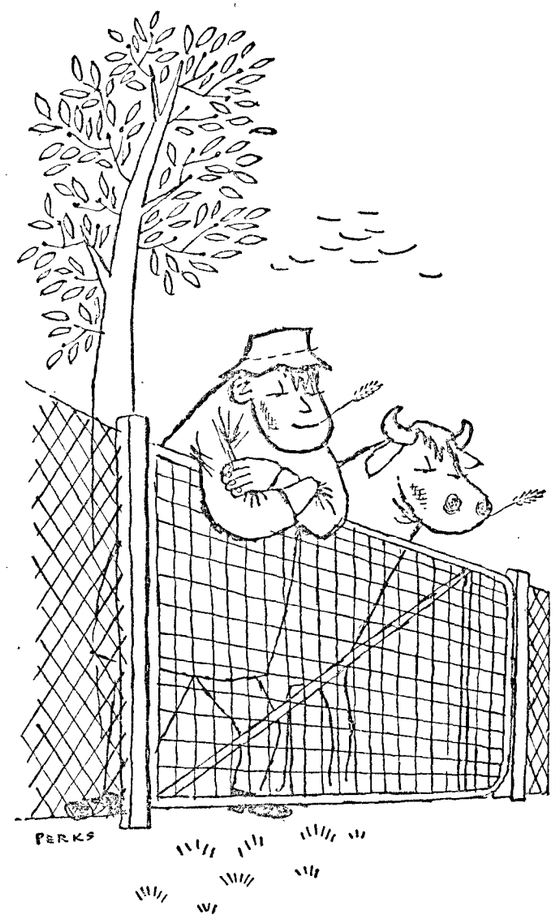
"Super-7s" are the world standard in fast overocean airliners. Pan American holds 18 transatlantic speed records.

When you're in a hurry to get to the U.S.A.—or anywhere else in the world—make your first choice one of Pan American's record-breaking "Super-7" Clippers*.

Pan American flies more of these Douglas-built DC-7Cs than almost all other airlines combined. Both first-class *President* and tourist-fare *Rainbow* services are available aboard the "Super-7" Clippers.

While the smooth-working crew up on the flight deck sends your "Super-7" racing through the sky, back in the cabin you'll enjoy the world standard of superior service in the air. Meals served aboard the Clippers have recently been awarded three prizes by a jury of world-famous gourmets and chefs at the International Culinary Exhibition in Frankfurt.

And whatever your origin, Pan American—*host to the world*—makes you feel perfectly at home. For instance, 36 languages are spoken by flight service personnel on Pan American's transatlantic services alone; many speak three and four languages.



Remember, too, when you go by Clipper you are in the hands of million-milers. Over 1400 Pan American pilots have flown over one million miles each . . . almost 150, more than three million.

For reservations, call your Travel Agent or Pan American—600 offices throughout the world.

Wrong Place to Cut Costs of a New Process Plant

When building a new process plant, engineering is the easiest place to cut investment costs. But it's the wrong place! The saving of a few hundred hours of engineering, or trying to buy engineering at a price, can cost thousands of extra hours of field labour and additional thousands of pounds for materials. Although the added cost of inadequate engineering seldom can be pin-pointed beforehand, it is inevitably reflected in the operating record of the plant. Better engineering is the basis of the Kellogg organisation's world-wide reputation both as engineers and builders of complete process plants and as consultants on various special engineering projects. This better engineering is the result of good engineers working in an atmosphere where sound engineering is the measure of success for both the individual and the organisation. To Kellogg's clients, better engineering means plants built at the lowest capital investment consistent with reasonable operating and maintenance costs. Kellogg International Corporation welcomes the opportunity to demonstrate how better engineering can benefit companies contemplating new process plants.

. . JUST LIKE THE VALUE YOU GET WITH ATV

How would you like to see your sales quadruple after spending just £1,375?

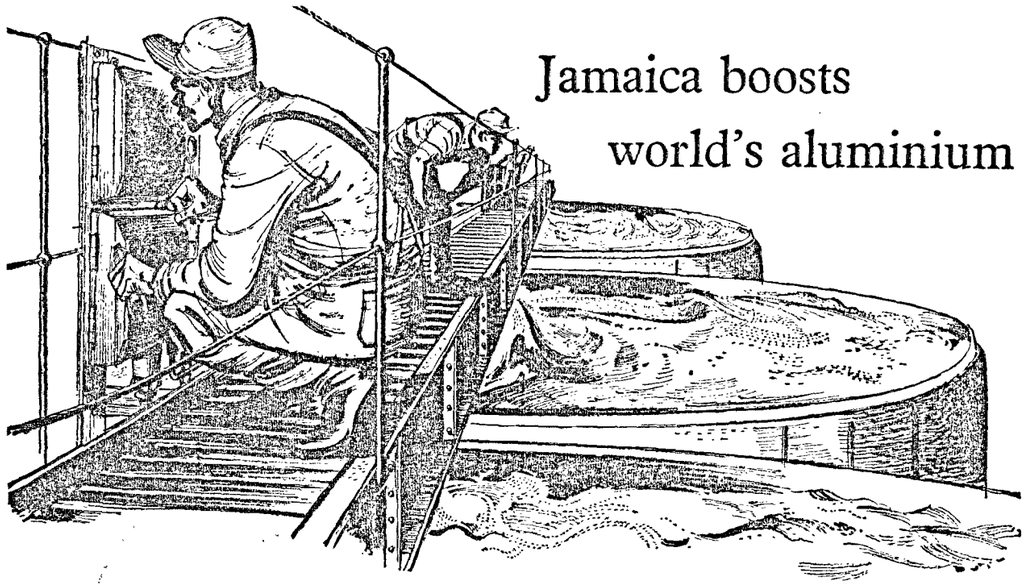
ATV

ASSOCIATED TELEVISION LIMITED
PROGRAMME COMPANY FOR THE WEEKEND IN LONDON AND WEEKDAYS IN THE MIDLANDS

Maybe you thought TV advertising was just for the big-time boys—manufacturers with £100,000 or more to invest.

Well, let's clear that one up.

On ATV, for £5,000, you can have a campaign which will drive home your message to 3 million people in the Midlands or 5¼ million in the London area!



There has never been a medium to touch television for impact. Your product is alone on the screens, with no distractions, with all the resources of film and sound technique to support it. No wonder sales of Pliobond adhesive soared by 400% after an ATV campaign costing only £1,375.

As the enormous ATV audiences increase so the cost per thousand declines. "Sunday Night at The London Palladium" cost about 12/6 per 1,000 homes per 30 seconds in November, 1957, and will decrease to only 8/9 in September, 1958.

With ATV you get two special advantages—a closely segmented rate structure that saves money, and rates stabilized for long periods so that you can budget well ahead.

Ring us up, and we'll give you full details.

Jamaica boosts world's aluminium

The world's aluminium supplies depend on the ore bauxite, from which alumina, the oxide of aluminium, is extracted. One of the largest newly discovered sources of high quality bauxite is in Jamaica, where Alumina Jamaica Limited, fully owned subsidiary of Aluminium Limited, started production in 1953. It is estimated that by 1958 Jamaica's yearly output of alumina will have been raised from 230,000 to as much as 800,000 tons. In the alumina plant in Jamaica the first stages of processing bauxite involve mixing with caustic soda in large vats, 40 ft. diameter at the top and 70 ft. deep. There are 120 of these vats, forming a solid block. An important part of this process is the agitation of the liquid by passing compressed air through it from the giant Atlas Copco compressors, of which six have now been supplied.

A section of the plant, showing the great 70 ft. high vats.

Light—out of thin air

Compressed air is versatile. Atlas Copco provide the means for all its many applications. One of their most remarkable units is an air-operated floodlight, powered by a built-in turbine generator. This lamp is flame-proof and is proving its worth in mines, tunnels, oil refineries and tankers—and even under water.

The Atlas Copco Group of Companies is responsible for the manufacture of compressed air equipment and its distribution and servicing in 90 countries throughout the world. Group Headquarters: Atlas Copco AB, Stockholm 1, Sweden.

Prospects for 1958

WHAT'S to become of the British economy this year depends less upon what happens inside it, and more upon external circumstances which Britain can do nearly nothing to influence, than at any time since the war. This is only formally because the Government last autumn committed itself to adjust the internal economy strictly and wholly in accordance with the external value of the currency. It is more because in doing so the Treasury has fully extended itself in a posture of rigid but precarious respectability: in the short run it can do little more that would strengthen sterling, and dare do nothing that would weaken it. But the main reason is that most trends in the world economy at the opening of 1958 are at least mildly threatening.

No assessment of prospects for the British economy in 1958, therefore, can proceed from the nice calculation of less or more resources available at home with which analysts have usually begun such guesswork in recent years. Towards the close of the greatest capital investment boom in its history, British industry is still producing hardly any more than it was three years ago; nobody can doubt that the economy has capacity and to spare for all the home demand that the Government could conceivably afford to unleash, and for more exports than British industry is likely to be able to sell this year. The dependence of this country upon world demand, upon world capital movements, and upon foreign confidence in sterling has never been more plain; and this New Year series of articles upon the economic outlook for 1958 must begin in this week's first instalment with these dominant external influences upon the level of British demand and activity.

In the closing stages of 1957 signs have been abundant that expansion in the world economy is tending to level off. World trade has appeared still to be growing, but much more slowly than a few months ago. In many industrial countries production is now slipping, or running level, or rising with much less steam behind it. The housing boom is past; industrial investment, though still very high, is hardly rising; defence spending has been tending downwards in most western countries, at least on pre-sputnik appropriations. World demand for commodities has already fallen enough to cut the incomes of primary producing countries significantly.

Yet in most of these western countries costs—primarily labour costs—have still been rising in 1957, and wage increases in particular have still been sapping the value of money. Thus it is that most treasuries, with reason, have consciously entered a period of incipient deflation with their steering gear set over against inflation—or against rises in prices that have outlasted anything that might be called inflation in strict demand and supply terms. All, again with reason, will be reluctant to bring the tiller hard over too soon—aware that this very reluctance could strengthen or prolong a short-term deflationary turn, but aware too that the long-run problem of the world economy since the war has been

inflation. For Britain, little choice offers itself; any relaxation of the current policy, unless and until the rest of the world starts reflating, could bring sterling under fire again.

Whether deflation in the world economy sets in will depend primarily upon the American recession: how deep, and how long. Nobody expects the rest of the world to ride this out as well as it did the last one. Outside the United States, at any rate, 1958 is not 1953: Germany and other western countries are not so voraciously expanding their demand for imports. The key evidence must first be sought across the Atlantic.

Report from America

There is no lack of evidence from America —much of it conflicting. Here is our Washington correspondent's preliminary sifting:

FOR ONE reason or another, neither of the two post-war recessions in the United States developed the cumulative downward pressures required for a full-scale depression. As recession number three gets under way in familiar style, there appears still to be a pervasive confidence—both among the volatile investors on Wall Street and the academic sages making their annual forecasts—that it too will be halted before the downward spiral can take hold. Despite the disappointments of the past four months, it is to 1953-54, not to 1929 or even 1938, that most commentators are looking back and saying that the United States has been here before.

The best single measure of the extent of the 1957 recession to date is the decline in the seasonally adjusted index of industrial production: from 145 in August (1947-49 average is 100) to 139 in November. This is a drop of 4 per cent, and it has occurred at about the same pace as the decline in the last third of 1953; at that time the decline "bottomed out" in the following summer after reaching 10 per cent. Unemployment rose this November to 3,200,000 which, when seasonally adjusted, amounted to 5.1 per cent of the labour force; the total seems certain to reach or exceed 4 million in February or thereabouts on seasonal grounds alone. The depressed signs are everywhere one looks, and usually on something like the 1953-54 scale: steel operating at around 60 per cent of capacity, lay-offs in the automobile industry as sales of 1958 models get off to a sluggish start, freight car loadings consistently about 15 per cent lower than in the same week a year earlier, new orders of manufacturers drifting downward month after month in a gentle slide.

Of perhaps the greatest immediate significance is the fact that a general liquidation of inventories has at last begun; in October, for the first month since December of 1954, the total book value of manufacturing and trade stocks declined. This new element accounts for some of the drop in industrial production in the last few months; it is the element that could be of greatest immediate danger to overseas countries' export earnings, but some commentators in America read it rather as a factor that could help to prepare the way for subsequent upturn. Both previous recessions have been in large measure inventory recessions, which by definition cannot last forever. Professor Slichter of Harvard lays so much emphasis on this point that he is already on record with a forecast that the final quarter of 1957 has been the low point of the recession. He bases his argument on the probability that no quarter of 1958 will see a rate of disinvestment in inventories as great as these last three months.

But Mr Slichter's is an exceptional view. Most other forecasters are less cheerful. Both government and non-government surveys agree that there may be a decline, ranging from 5 to 10 per cent, in business expenditures on new plant and equipment in 1958 as compared with their 1957 record. Some people believe that housing activity, spurred by somewhat easier credit conditions, may advance slightly from the sluggish 1957 level, but the homebuilders themselves are more sceptical. The government has officially forecast another small increase in total construction, but this can be misleading. Included in the totals are large increases in school and highway construction—the very increases that lead to forecasts of higher state and local spending, which are also cited as an optimistic element. The optimists, in short, cannot have this factor both ways. Little "help" is expected from foreign trade, —in other words (perhaps fortunately for the outside world) no great upsurge is expected in American selling abroad, but drastic declines in American exports are not foreseen either. The consumer thus remains, as always, the key to the outlook outside the government sector. Perhaps the most general forecast about the American consumer is that he will continue to spend, at best, about the same portion of his disposable income as he has been spending for the last two years; and this income has begun to drift lower.

ALL eyes, then, turn to Washington, where the authorities are moving very gently on to a less restrictive tack. Even before the budget, the Administration has made two token anti-recession moves. It has reactivated the "lease-purchase" programme for constructing new government buildings worth about $100 million, and it has unfrozen $177 million in housing funds voted by Congress but until now not released to the housing agencies. The latter action will permit an early start on perhaps $150 million of military and co-operative housing that otherwise would not have been undertaken. But it is the post-sputnik defence budget that is properly the centre of attention. Three different elements in it need to be disentwined.

(1) Quite apart from the new budget, there will be a marked increase in new military orders in the first half of 1958. This is because the economy drive of last summer produced a near-halt in placing orders with the funds voted this year by Congress; as a result in the first four months (i.e., July-October) of the current fiscal year only about $2.7 billion out of a planned total of $14 billion in orders had been placed. These orders will now go out in a rush.

(2) There is the "new obligational authority" side of the next budget, which is quite distinct from the expenditure side. It corresponds to the new appropriations to be requested of Congress, and is the best determinant of the rate of placing new orders (not the full payment for them) in the next fiscal year beginning in July. It is likely to rise to $41 or $42 billion, compared with a total of $36 billion approved by Congress this year and $38.5 billion requested. If anything, Congress next year will probably increase the amount of the request.

(3) The expenditure figure itself in the fiscal year beginning next July will rise less steeply. The estimate is likely to be around $40 billion, an increase of only a little over $1 billion from the expected total of $38.5 billion in the current fiscal year.

Taken together, these three factors add up to some boost for the economy—although perhaps more to a confidence-inspiring placement of new orders than to an early efflux of dollars from the Treasury. Outside of defence, the budget is likely to be unexciting in economic terms. The total of non-security spending will probably be a shade under the estimate for the current fiscal year. On the revenue side, there has been no talk whatever, as yet, of a tax cut as an anti-recession device. The budget as a whole seems likely to be essentially in balance.

Down in Mr Martin's domain—despite the much-heralded reduction in the discount rate from 3½ to 3 per cent, and some helpful open market operations—the Federal Reserve has by no means yet swung to an easy-money policy. The banks are still under some restrictive pressure. This is in sharp contrast to 1953, when a formal policy of "active ease" was adopted almost before the recession had begun. Mr Martin and his colleagues are convinced that they pursued easy money too eagerly and too long in 1953-54, and that this was a leading cause of the subsequent 1956-57 price inflation. The market for Government bonds has already anticipated a much greater degree of ease than now exists, and it may be right. But if in January the Federal Reserve fails to let natural seasonal forces produce a marked easing in the market, bonds are due for a severe tumble. Each week there have been rumours of another dramatic move by the Federal Reserve, such as a reduction in the banks' reserve requirements or another cut in the discount rate, but each week the "Fed" preserves its calm silence. It may be that it is merely saving its dramatic weapons for use in steps as the recession develops, but the increasingly nervous money market wishes it were sure of this.

* * *

SO MUCH for our American correspondent's report. Three judgments can perhaps legitimately be hazarded after it. First, the apparently blithe lack of fear in America that this might be another 1929 is an important element which, if maintained, should still prevent it from becoming a 1929; there has been no glimmer yet of the crisis of confidence that could turn the mild recessional into a rout. Secondly, the extreme optimists, who believe that the worst is already over, have some arguments on their side: the extent to which a run-down in American inventories has already occurred, and the bunching of 1957-58 military orders into this second half of the fiscal year, had not been generally recognised on this side of the Atlantic. Thirdly, however, if the balance of argument is taken to be against a check to the downturn early in the new year—and most commentators seem to assume that it is—then it is very difficult to see why the recession should not outlast the summer. The prospect for mid-year does not look particularly reflationary. And the question that must echo like a raven's croak through the City of London and the British Treasury's chambers in 1958 is whether an American recession of even a relatively gentle sort might not be of very serious consequence to sterling.

Sterling in a Straitjacket

Against this international background, what prospects does 1958 offer for Britain's trade, and for sterling?

IN official and unofficial prognostications about sterling's prospect, there has perhaps been too much emphasis on the effect that an American recession may or may not exert on the *current* account of the sterling area. This current account is compounded of two elements—Britain's own surplus or deficit, and that of the overseas sterling area. In six of the last eight years—the exceptions were 1951 and 1955—Britain itself has run a surplus of between £188 million and £300 million each year. On present indications, it should remain within that range in 1958; indeed, there seems no obvious reason at the moment why the 1958 surplus should be below the £250 million or more that has probably been earned in 1957. The import price index in October was already 4½ per cent below the 1957 average; that alone, if continued through 1958, would cut Britain's import bill by some £175 million a year. In addition, the fall in commodity prices had not by October worked its way fully into

the import price index, and British industry's stocks of imported materials do not seem likely to be significantly increased so long as commodity prices look as if they might fall still further.

It would not be surprising, therefore, if the total cut in the import bill in 1958 came to £300 million or so. It would require about an 8 per cent fall in export receipts to wash the effects of that away. Some fall in export volume and also in Britain's invisible receipts—because of the slump in shipping freights and lower dividends from overseas raw material producers—is very likely. But, as of now, it requires very gloomy juggling with the estimates to assume that these losses will necessarily more than—or even entirely—offset Britain's prospective savings on import account.

While Britain has generally run a current surplus since the end of 1951, the overseas sterling area has done the reverse. In five of the six years between 1951 and 1956 it ran deficits—ranging between £87 million and £197 million a year.* In the first half of 1957, the overseas sterling area managed to secure a surplus of £34 million on this basis of calculation, but in the second half of the year it is presumably likely to have returned to a deficit at an annual rate of over £100 million again. In 1958, on present trends, everybody will expect its deficit to be still bigger; but by how much? It would not be surprising if it went above the overseas sterling area's second worst postwar deficit of £197 million, in the commodity slump year of 1952; it might even approach its worst postwar record of £273 million in the American recession year of 1949.

Without over-much reliance on the clouded crystal, a rough guess may now be attempted. On the assumptions that the American recession does not go very much further than our Washington correspondent seems to expect, and that there is "friendly co-operation" about dollar import restraint at the coming Commonwealth economic conference in Canada, the overseas sterling area's current deficit in 1958 should not be much above £250 million, and Britain's current surplus should be of around the same order. The total current account of the whole sterling area would then be in approximate balance.

UNFORTUNATELY, however, as the experience of the last few years has shown, a balance on current account is not necessarily the thing that most matters. Between the end of 1954 and the middle of 1957, the total current surplus of the sterling area was just under £100 million; but the gold and dollar reserves (including the drawing on the International Monetary Fund) *fell* by £336 million—indicating a net loss on capital account of some £436 million. In the second half of 1957, the sterling area as a whole was probably still in current surplus; but the gold and dollar reserves (including the drawing on the American Export-Import Bank) had fallen by £159 million by end-November, and there was then only £780 million left. Since the end of 1954, in other words, an intermittent flight from sterling has been on. The question on which Britain's immediate prosperity may hang is whether in 1958—when the accounts of the whole sterling area may be in balance rather than surplus—anything is likely to set the flight in progress again.

At any one time, three factors determine the likelihood of a flight from sterling. One, of course, is the opportunity given to foreign speculators for fleeing. Some commentators are assuming that there should be less opportunity for such speculation in 1958, because foreigners' working balances in sterling are said to be already at a level that is too low for commercial comfort. But the figure for net sterling balances can be misleading; it is the borrowers of sterling, not merely the holders of it, who can cause a lot of the trouble. The experience of 1957 strongly suggests that whenever there seems to be a prospect that some international currency—such as the D-mark—might be up-valued, speculators will flock to borrow some other currency which can be converted into it; and the pattern of exchange controls both in the speculators' own countries and in Britain now often makes borrowing in London the easiest option. It can then be with the sterling area's exiguous gold and dollar reserves that foreign speculators *font leurs jeux*.

The second factor that could determine whether there will be a capital strain on sterling in 1958 is, therefore, whether there is likely to be what might be called a casino attitude towards exchange rates, and a scrambling for scarce currencies, at any time during the year. To an uncomfortable extent, control over this factor may not be in Britain's hands. The two currencies about which Britain must be most afraid of "appreciation talk" and scarcity value in 1958 are probably again the dollar and the D-mark.

THE possibility of a world shortage of dollars in 1958 is obvious; even a continuation of the American recession on its present mild scale seems likely to widen the world dollar gap that has already appeared. The possibility of a continuation of Germany's exorbitant export surplus has tended to be forgotten in the past two months because of the recent check to the accumulation of German exchange reserves; but that check may be largely a short-term backflow from Germany's excessive speculative accumulation up to mid-September. On commercial account, Germany, like the United Kingdom, should gain in 1958 from the fall in prices of the raw materials it imports; the evident slowing down of its own domestic investment boom may make its producers of capital goods even more eager to search for markets abroad; and, even if Germany suffers from bigger wage increases than Britain this winter (which seems, on the whole, likely), there is some reason to fear that German exports might fare better than Britain's quality goods within a dipping volume of world trade.

If a growing American export surplus and a continuing German export surplus should cause an intensified shortage of dollars and marks in 1958—and if a world in desperate search for these scarce currencies found the easiest door to them through still greater use of its transferable sterling—then Mr Thorneycroft would face an awkward new year. It is a year in which more seems likely to be heard of unofficial suggestions for reinforcing the world's liquid reserves and, in particular, for lifting some of the burden of providing second-line liquidity for the world from the shoulders of sterling on to, say, some wider clearing union system. But at the moment Mr Thorneycroft's policy seems to be to sit tight, to hope that nothing so dislocating as an acute scarcity of dollars and marks will in fact occur—and to rely, meanwhile, on the one factor in the foreign exchange situation which he regards as under his control.

This third factor is the degree of foreign confidence in sterling itself. It is the emotive effect on foreign confidence of price inflation here that makes the resistance to general wage increases this winter all-important; every foreign speculator's eye is now focused on that struggle. Clearly, too, the need to maintain confidence in sterling provides a very strong case against any early reduction in Bank rate; since high interest rates have a direct effect on foreigners' use and abuse of sterling, by making it more profitable to hold money in London and less profitable to borrow here, dear money is now the best weapon of internal discipline for Britain to use. What about the budget next April, if signs of internal deflation have by then appeared within the British economy? It is to the prospect for this, and for demand within the British economy, that this series of articles will turn next week.

*These rough figures are derived by combining the overseas sterling area's deficit with Britain (as shown in British balance of payments white papers) with the "balance of inter-area transfers" to the overseas sterling area as shown in those papers.

A Sort of Twilight

The craggy realities that must underlie any eventual deal on disarmament can be discerned even through the current fog of talk.

"MOST men of business," wrote Bagehot, "love a sort of twilight." He was writing, in "The English Constitution," of the members of the House of Commons in the 1860s—of men distrustful of dogma, always seeking a little room for manœuvre. The cap fits the western nations of today as they consider the next phase in international policy. There is a general recoil from rigidity, an instinctive groping for elbow room. The lively public debate about when and how to negotiate with the Soviet rulers, about the scope and terms of such negotiations, and about the chances of their bearing fruit, has been fanned rather than damped by the meeting of the Atlantic allies' heads of government—whose unanimous declaration itself left much scope for manœuvre.

But twilight is not the same thing as fog. Twilight in the sense of room for discussion, of flexibility (not indecision), of readiness to look at new ideas (not, however, to clutch at them just because they are new), is a natural and needful phenomenon in free societies. Mental fog is not; and a lot of it has crept into the debate on negotiation, disarmament, disengagement and the like, irritating the defenders of familiar arguments (whose ideas, if static, are at least clear), and also the proponents of new ones (who find themselves lumped together with the fog-merchants and condemned with them).

Fog now enshrouds not only the whole "summit" concept, but also the cautious suggestions of Mr Kennan, who is being appreciatively quoted by Moscow and branded by some western critics as a "soft line" man, although his professed goal is to roll back the Russians out of Eastern Europe, his main military thesis is massive retaliation. Fog obscures the fact that military disengagement in Europe raises not just a simple issue of pros and cons, but the much trickier question how. Fog distorts and exaggerates the importance of the bickering about how many governments should join in disarmament talks. In the end, all these things are determined by underlying realities. And however small or localised the first steps that may be thought practicable, they too have to be related to those realities.

It is time to attempt a brief catalogue of the underlying realities, for even those that seem to have been lost to sight retain all their power to determine what is possible and what is not. Take first the position of the communist powers. Russia now has or will soon have nuclear rockets that could reach America. Its exultant rulers (or ruler) are in no mood to sacrifice any important interest for the sake of disarmament—though this mood may change before long, less because of American piling up of new weapons than because of the piling up of stiff bills on Mr Khrushchev's desk. Russia has also two great allies: China and secrecy. China, which reinforces the Soviet advantage in manpower while still depending on Soviet munitions, cannot be excluded either from a disarmament plan or from any calculation of relative military strengths, and its international status must in time be accepted for that reason alone. An equally important military factor, too

often omitted from discussion of the arms problem, is the top-secret state that Stalin built on Tsarist foundations. Whoever rules Russia, free from the attentions of a watchful press, a legal opposition and an articulate, informed public opinion, enjoys so many advantages denied to democratic governments that they cannot stake their peoples' fate on a gentleman's agreement or solemn exchange of pledges with him.

Against this must be set the fact that Russia's nominal allies in Europe are in reality restive prisoners. In contrast, the public bickering between the allied nations of the West, and of non-communist Asia, is a recurrent reminder that they are allies by their own choice. A withdrawal of American protection would demoralise them ; but no western Budapest is sullenly waiting for the departure of the last alien tank to give the signal for a rising. Russia's long-range rockets have altered the western allies' relationships by bringing North America into the exposed front-line area alongside Western Europe ; offsetting the military reversal, there is the prospect of a new sense of solidarity based on a clear community of interest. In the wake of the sputniks there has also come a more widespread realisation of the impossibility of attaining a decisive military superiority over the communist powers ; a realisation that—failing general disarmament—the allies' choice is limited to maintaining either an adequate deterrent (which, it cannot be too often or too loudly emphasised, is indispensable) or an inadequate one (which would be ruinous). If new contentions have broken out among the allies, some at least of the old ones are evaporating.

THE two big power groups are not, however, alone in the world. Among the basic realities must also be counted the existence of the " uncommitted " group of states, and of elements within the allied nations inclined toward this group's views. Ironically, although the uncommitted neutrals could not hope to survive a global communist victory, their barbs are mostly directed against the democratic allies. In part this reflects Asian and African anti-colonial sentiment ; in part, a half-conscious recognition that peoples under communist rule are too well sealed off to be open to persuasion ; but it also reflects the fact that geography and politics have compelled the West to rely on methods of defence which the neutrals automatically dislike. The communist powers could dispense with formal alliances, for they have far more compulsive bonds ; the free allies cannot. Again, the geographical remoteness of the United States makes the alliances of which it is the core embarrassingly dependent on a system of far-flung bases, and on the development of nuclear weapons as a counter-balance to the human masses which the communist powers could quickly deploy in conventional warfare in Europe or Asia. And it is alliances, foreign bases, and nuclear explosions that particularly scandalise the uncommitted states.

All these considerations have to be borne in mind by the western governments as they complete and co-ordinate their replies to Marshal Bulganin's latest message—which will also be in some sort replies to Mr Khrushchev's speech in the Supreme Soviet, to that body's declarations, and to the Polish proposal for a central European zone free of nuclear weapons. In Paris last month, the Atlantic allies declared themselves ready to examine any disarmament proposals from any source, and to engage in any form of negotiation that held out hope of progress. Mr Selwyn Lloyd has specifically cited the Polish proposals, Dr Adenauer the Bulganin letter, as worthy of careful examination ; Mr Dulles speaks of a " determination to continue probing." The allies were already committed, in the far-off summer days before the sputniks, to an offer to stop both making and testing nuclear weapons—an offer which the Russians have not yet even discussed seriously. The United Nations' disarmament commission has been enlarged as a result of Soviet complaints ; the Russians want it still larger, but whether they now boycott it is of scant importance (except for the possible effects on Russia's reputation for zeal about disarmament), for doors to alternative forums for negotiation are being carefully propped ajar. Elements of compromise exist. The problem is to devise incentives that may induce the powers to start fitting these elements together.

CLEAR incentives exist for the West, strained by economic burdens and forebodings, nervous about its own missiles as well as about Russia's, inherently eager (indeed, over-eager) for relaxation, anxious to cut a peaceful figure in the eyes of the uncommitted and to find funds for development in Asia and Africa as well as at home. In Russia's case, however, the equation of incentives is harder to work out. The economic burden of maintaining both new weapons and conventional forces, of meeting demands both from China and from satellite states which can no longer be treated simply as milch-cows, is increasingly hard for even a dictator to reconcile with the growing demands of the Soviet population itself. As to fear of war itself, Mr Khrushchev sometimes acts as if he were almost sure that he can indulge in his own brand of brinkmanship without inviting catastrophic reactions ; but he can hardly be quite sure. And he faces the fact that his monopoly of inter-continental rockets will be short-lived.

But for Russia there are also obvious disincentives. The inspection that must form part of any worthwhile disarmament plan would cause particularly sharp pangs in the top-secret state (and even the amount of free circulation by foreign inspectors needed to secure a European zone free of nuclear arms might have unsettling effects in Czechoslovakia or East Germany). Any settlement involving the Red Army's withdrawal from Eastern Europe would mean the sacrifice not merely of military positions but of satellite regimes. A settlement that led to genuine relaxation and security would rob Moscow of its best loved propaganda themes ; it could no longer incite Asians and Africans against a militarist, imperialist, aggressive West, nor exploit particular fears and suspicions to divide the allies themselves. And the fact must be faced that Soviet divisive tactics are still paying rich enough dividends to make Mr Khrushchev very loth indeed to jettison them.

It is in this last respect that most can be done to bring nearer the day when substantial progress toward disarmament will become possible. As long as the Russians can hope to achieve through the free world's divisions much the same gains as its unilateral disarmament would bring them, there will not be much prospect of their coming to any conference table, on any level, in any mood to compromise. The road to an eventual accommodation with the communist powers leads through a whole series of necessary accommodations between the Atlantic allies, resolved as they must be to be strong and vigilant together, and between them and other free nations ; and even the first modest steps, now being canvassed, in the direction of limited discussion of limited possibilities with the Russians, need to be scrutinised not only for their relevance to an east-west *détente,* but also with a keen eye to their impact on the unity of the free world.

Leftovers of Empire

What is to become of the small colonies dotted over the world when the big and viable ones become independent ? A rump British empire, like Spain's ? Or can these islands and provinces be married off in ways that make sense to them, and friends for us, as well as tidying up the map ?

ONE of the inconveniences of dissolving an empire on which the sun did not set is the disposal of the penumbra of minor territories after the big slabs of red on the map have been given, or have taken, independence. The strings of islands, the mid-ocean bomb-sites, the bits of mainland which appear to interrupt the continuity of other peoples' coastlines may fit very well into a world-wide structure of imperial power. But without it, they make the second part of the term " Commonwealth and Empire " look rather like the second wheel of a penny farthing bicycle.

The briefest survey of their size and resources makes clear that they cannot hope to become sovereign states and members of the United Nations. Many solutions have been proposed to give them an appropriate place in a brave new non-colonial world, but, surprising as it may seem, this is not necessarily as easy as making nation-states of Ghana, Nigeria or even Uganda. In particular it is complicated by the misapprehension of certain other countries that what has been happening is not, in fact, the evolution of a new entity in world affairs, the Commonwealth, but rather a gigantic sale of ex-British property, and that the remnants are shortly to be had at knockdown prices in the bargain basement.

Cyprus has for some time looked like a bit of curtain material over which two angry ladies (Greece and Turkey) are fighting ; there is an ominous sound of rending. Other ladies have also had their eye on choice bits: Chile and Argentina planning to partition the Falklands and dependencies ; Guatemala desperate to get British Honduras before a bigger lady, Mexico, makes off with it. Yemen feels nearly as sure of getting Aden as China is of Hongkong. If the sale really is on, and any of these new imperialists get their bargains, other contestants may confidently be expected to appear.

Already this attitude has spread to the neighbours of other run-down empires. India got Pondicherry, and feels sure of Goa if it tugs hard enough. Indonesia does not care what damage she suffers in the melée if she can get West Irian. Just as Spain is reaching out for Gibraltar, Morocco has made a grab at its bankrupt imperial stock in West Africa. Spain is much incensed ; perhaps, like other colony-owners, it will now realise that imperialists ought to stand together. Most colonial powers indeed blame Britain for starting the trouble ; but what is sauce for Gibraltar or Hongkong is sauce for Ifni or Macao.

THERE are, of course, Britons who would hang on to the remnants of the Empire as tenaciously as Spain to Ifni or Portugal to Macao. Most people, however, instinctively feel that to keep a full-dress colonial office going to run the minor territories, after all the big and viable regions have become Commonwealth countries, would be not only undignified but incredibly impolitic. It would be to court the continued accusation of being " colonialist " both in Russian and in American circles without actually having any worthwhile colonies ; the distinguishing feature of the minor territories, of course, is that most of them need substantial subsidies to meet their budgetary needs, and will need more as time goes on.

THE SMALL COLONIES

Territory	Population	Area (sq. m.)	Territory	Population	Area (sq. m.)
Hongkong ...	2,440,000	391	Bahamas	95,500	4,400
Singapore	1,264,000	224	Br. Honduras.	79,000	8,866
Aden	788,000	225,000	Brunei	65,300	2,226
Somaliland ...	640,000	68,000	Tonga	53,800	269
Sarawak	614,000	47,071	Bermuda.....	40,800	21
Mauritius	543,000	809	Gilbert Islands	40,800	369
Cyprus	520,000	3,572	Seychelles....	38,700	156
Br. Guiana ...	485,000	83,000	Gibraltar.....	24,900	2
North Borneo	364,000	29,387	St. Helena....	4,880	47
Fiji	339,000	7,040	Rodrigues....	14,000	42
Malta	314,000	122	Virgin Islands.	7,680	67
Gambia	281,000	4,003	Falklands.....	4,618	3,590
Zanzibar	274,000	1,020	Tristan	280	38
Solomon Is....	99,500	11,000	Pitcairn	120	2

No question of selling them, as the Danes sold their West Indian islands, arises. But the question of what is to be done about them is important. As the table shows, no single simple solution will suffice for territories of such variety—but none of which can hope to stand alone, being either small, poor and overpopulated, or large, underdeveloped and poor.

The Colonial Office set up a committee to work out solutions long ago, but the fact that its recommendations (if it made any) have not been published, suggests that it found none that were very satisfactory. The Labour party has published its proposals, of which the most notable was the suggestion that the pre-Statute of Westminster concept of "Dominion status" should be revived and conferred on all colonies which desired to manage their own affairs, but which were too tiny to afford defence forces, *corps diplomatiques* and other trappings of sovereignty.

Undoubtedly some provision for a series of island San Marinos or Monacos will have to be made; indeed, the Maldive Republic is a prototype. But before this point is reached every effort ought to be made to link small islands and minor provinces with larger entities in a way that will give them a share in a real, rather than a fictitious sovereign status, access to adequate economic resources and a fair field for the exercise of the talent of their outstanding citizens.

Federation is, of course, the tried and tested constitutional device. Thus by great efforts the West Indies have been combined into a fair-sized if farflung maritime confederation. But it is most unfortunate that so many British minor territories in the western hemisphere have either refused to join, or were not brought in. Thus British Guiana and Honduras and the Virgin Islands have stayed out (though invited) and Bermuda and Bahamas were not invited. A possible federation which would solve the difficult problem of Singapore, would be one between the independent Federation of Malaya and the British territories of North Borneo, and Singapore, whose big Chinese population would not then outweigh the Malays. If this is not done, Indonesia will probably ultimately stretch out her hand for these states; as Senegal will towards the Gambia if it is not combined, in a miniature Pakistan, with Sierra Leone. The device of integration with Britain, proposed for Malta, does not seem likely to be used for other territories—if, indeed, now for it; the bogy of British MPs that a wedge of "colonial members" will be inserted in Westminster fades with every fresh row with Mr Mintoff.

But when all the possibilities of federating ex-British areas have been exhausted, we should surely not shrink from making effective political units by political combination with non-British areas, where this can be done. This idea will be anathema to many. It will set precedents which will bring in the bargain-hunters in force. But there are regions where it is the obvious answer to problems that face the west as a whole. In Somaliland, the objective should clearly be a union of the British, French and trustee territories, in a single viable Somaliland (otherwise not only will Ethiopia try to pick them up piecemeal but there will also be trouble from Arabia). Again, if British Guiana will not go in with the Federation of the West Indies, a union of the three Guianas—British, French and Dutch—may be the ultimate solution (Venezuela, for racial reasons, does not covet them). Such solutions demand a readiness of other ex-imperial powers to wind up their affairs in good order which at present is not very perceptible.

Even with good progress along these lines, there will still be territories left over. The will of the local inhabitants must always be reckoned first, and some of them are extremely attached to the British connection, colonial as it may be. Many are likely to demand independence, and a seat at the Commonwealth premiers' conference, without the remotest idea of the cost. Even Sierra Leone, which is clearly set on the road to sovereign status, must face this; and some Sierra Leoneans are beginning to talk of a merger with Liberia, with which they have ties of history, tribe and language (though none of political institutions). But Mauritius is obviously too small, and so, too, is Zanzibar. A Federation of the Pacific seems unfeasible. What is to be done, ultimately, about these? What, too, is to be done about the "fortress colonies"?

For the remoter islands and areas there are various possibilities—of which condominium arrangements with other Commonwealth countries may be most worth exploring. Australia in the past has shown as much reluctance to shoulder responsibilities for the Pacific archipelagos as South Africa has shown eagerness to take over Bechuanaland, Basutoland and Swaziland. But Australia may change its mind; this would be far better than bringing the United Nations into their administration. For the fortress colonies two things should be borne in mind. The first is that strategic needs change—Bermuda was a naval base once; the second is that some remote area may acquire military importance in conditions now unforeseen (cf Antarctica). Britain should not hang on to what it no longer needs; but it should not idly give to others what it or the west may come to need.

Beyond this, one other point is clear. In any reorganising of the minor colonial territories we should seek to give their peoples lasting regard for the West. Prestige should not stand in the way. This is a doctrine that should be argued patiently in Paris, The Hague, Lisbon and Madrid—and also in Washington. One obvious goal in the evolution of the Commonwealth is to kill anti-colonialist myths in the United States—myths that hamper co-operation in many fields. And we should take time by the forelock; for radical thinking cannot be rushed, and the larger colonial territories are moving fast to independence—and towards the Bandung block.

NOTES OF THE WEEK

MALTA

Brainstorm

Rarely can a politician have pulled down his own house on his head with quite such abandon as has Mr Dom Mintoff this week. A fortnight ago he appeared to have put himself in an ideal position to continue his manœuvres to squeeze something very near "equivalence" for Malta out of the weary and browbeaten Colonial Office. He had squashed the Malta General Workers' Union, which had dared criticise him for accepting any possibility of temporary unemployment among dockyard workers; he had swung the opposition behind himself in demanding maintenance of the dockyard—which implied that it was now less well placed to oppose integration; he not only had substantial concessions from the Colonial Office in his pocket, but he knew there were more to come. Quite how well he had done out of the long-drawn negotiations on the terms of integration was only revealed in the letter which Mr Lennox-Boyd sent him this week, in a last-minute effort to prevent the Maltese parliament from accepting Mr Mintoff's motion to "sever all ties," unless Britain undertook to maintain any displaced dockyard workers until they were found alternative employment.

In pressing this motion to acceptance *nem con* in his parliament, Mr Mintoff has cast away every card in his hand, in what can only be regarded as a fatal—to him—brainstorm. It is not even against integration as such, or against any proposition to close the dockyard, that he has carried his absurd and constitutionally meaningless motion; he has carried it solely against British refusals to guarantee to keep 140 dock workers on full pay until they are re-employed. He has made this demand precisely when unemployment in dockyards, aircraft factories and elsewhere is appearing in Britain itself, where there are no such guarantees; and he has chosen for this display of truculence the moment when plans were being made to put down a Nato oil storage facility, and when British industrialists were being invited to set up factories, in Malta. For good measure, in the debate he again abused the Americans, who spend $1 million a year in Malta, and who, after the last Mintoffian insults, were with difficulty persuaded by the Colonial Office to stay on.

The proper British retort to Mr Mintoff is, quite simply, to threaten to let him have his own way about severing ties with this country. The Navy is doubtful about its need for the Malta dockyard in a year or two. The door to a dockyardless, Natoless, sterlingless, dollarless and neutralised independence for the island should therefore be politely held open. In the nature of things, it would take some time for the British establishment there to be wound up; but let there be no talk about Malta being turned into another Cyprus in the meantime, because that would only hurry the British on their way, which Mr Mintoff does not really desire. Because he does not really desire it, things are unlikely to come to the dramatic pass of disintegration; the storm over this week's extraordinary display of bad temper is much more likely eventually to blow over. But the right immediate tactics for the Colonial Office to discuss with the governor, Sir Robert Laycock, who is hot foot for London, seem clear. Let Mr Mintoff be left in no doubt that he is demanding from Britain too high a price for something that Britain does not much want.

ISLE OF WIGHT

Redundancy's Other Island

Those who think that there is justice in Mr Mintoff's demands for full and unchanging employment in Malta should presumably consider that the Isle of Wight County Council now has even more reason to sever all ties with Britain. Redundancy in the Saunders Roe aircraft works, as a result of the scrapping of the SR 177 project (further discussed in Business Notes on page 61), faces the island, whose total population is 100,000, with serious unemployment. Some 450 men were laid off last August, of whom perhaps 80 have found work on the mainland. Another 1,000 will be unemployed at the end of January, with the prospect of more. In all, the new sackings may eventually amount to some 5 per cent of the island's insured working force of about 30,000; that would double the proportion of unemployed in the island—which is already far above the national average (partly, of course, because employment in a seaside area is always seasonal). And these bare figures do not tell the full story. Although three-quarters of the island's workers are engaged in holiday resort pursuits, trade and commerce—plus some 2,500-odd in agriculture—Saunders Roe, hitherto employing over 3,000, has accounted for half its *industrial* employment; the island also has one medium-sized shipyard and a number of small boat-building slipways. The loss of over 1,000 Saunders Roe wage packets weekly could have a disproportionate multiplier effect on local trade, particularly in the winter months.

Foreseeing trouble, the county council some time ago set up an industrial information service, in the hope of attracting new factories; but this has not so far had many inquiries. In some ways, this is surprising. One would have thought that the Isle of Wight was that rare thing: an area with some pool of unemployed labour, which—unlike the grimmer and older development areas—would have certain personal locational attractions to the business man (and his wife). The skilled men now thrown out of work will have no difficulty in getting new jobs if they emigrate to the Midlands; but in a seaside area where more workers than usual own their houses—and have often based their family economics on the prospect of letting part of them in the summer—emigration is not easy. This is not a case for Government succour by disbursement of cash; but it is a case for use by the island's—and by national—authorities of every possible means of advertisement for attracting industry. They should show Mr Mintoff how.

CYPRUS

Sir Hugh Reports

After four weeks spent energetically and valiantly probing the situation in Cyprus, Sir Hugh Foot has returned to London to report his findings to the Government. Whatever the outcome of these discussions in London, the new Governor has gone far, by his gestures of good will and by going out and about among the people, towards creating the sort of atmosphere on the island in which progress towards a settlement might be possible. Indeed, he has himself more than once sought to damp down dangerous optimism ; he has appealed to the Cypriots not to be misled by wild speculations and not to expect any sudden ready-made miracle.

Sir Hugh is right to be cautious. On his arrival in London on Tuesday, he said that it would not help to be "official and half-hearted" and that in searching for the right road out of the present deadlock he himself was in favour of taking risks. But will this invigorating attitude stimulate the ministers and officials in Downing Street and Whitehall to seek a fresh way out of the present blind alley? And even if the need for a new approach is accepted, it will be very difficult to decide exactly what it should be. At a time when change is in the air the interested parties are naturally staking their claims high. No doubt Sir Hugh Foot found ordinary Cypriots desperately anxious that the crisis should be ended, but all the various protagonists—Mr Menderes in Ankara, Archbishop Makarios in Athens and Colonel Grivas in his Cypriot hide-out—are still striking defiantly uncompromising attitudes.

It is becoming clearer than ever that no progress with the Cypriots is possible unless the Archbishop is brought back into the picture, and eventually allowed to return to the island. The rub is how to do this without causing a disastrous explosion in Ankara. Yet it would be tragic if continued, and even heightened, deadlock between Greece and Turkey were to rule out the attempt to take advantage of the better atmosphere in the island. Unlikely as it may seem at the moment, progress on the Cypriot front may turn out to be the only way of facilitating progress on the international one.

COMMONWEALTH

Visit to Five Sisters

Mr Macmillan will be the first British Prime Minister ever to visit the Antipodean and Asian members of the Commonwealth while in office. It may come as something of a shock to many people to realise that this is so. The Prime Minister himself has let it be known that he wants his tour to symbolise the abandoning of the outdated assumption that personal contact between Commonwealth premiers ought always to be centred on London. His thinking and his gesture are heartening. They should pave the way to a further step toward full recognition that the Commonwealth countries are in fact what they have long been constitutionally, an equal sisterhood of nations. How soon will it be found possible to hold a full meeting of Commonwealth premiers in a capital other than London?

When Mr Macmillan's tour was first suggested, it was naturally welcomed as a further contribution to the reknitting of ties between Britain and the Asian sister states. Now, however, it may turn out to be even more timely in another respect. New Zealand has not only acquired a new Labour government, but has also been driven to reimpose full-scale licensing of imports (its problems are further discussed in a Business Note on page 56). The closeness of this remotest realm's relations with Britain is apt to be too easily taken for granted here ; and New Zealanders who are already resentful of Britain's failure to help them out of their economic troubles are, justifiably, all the more indignant when they get the impression that their affairs are not even getting any serious attention in London. Mr Macmillan's visit ought at least to dispel that unfortunate impression. And it is picturesquely apt that he should be journeying towards Wellington at a moment when British and New Zealand explorers are struggling to link hands across the South Pole.

INDONESIA

Sukarno's Strenuous Rest-Cure

The conflicting announcements about President Sukarno's travelling plans suggest a tug-o'-war in which the advantage is sometimes with the president, sometimes with those who would like to put some restraint on his self-injuring nationalism. Three weeks ago the story was that he had to have a rest in a friendly neighbouring country, "in order to be completely detached from his daily activities." Now the restful stay abroad has become a strenuous jaunt to India, Pakistan, Egypt, Ceylon and Japan. This suggests either that he was not very tired in the first place or else that he has made a remarkably swift recovery.

In turn, two equally valid guesses suggest themselves. One is that he is being edged out by those who feel that a return to official sanity would be easier in his absence ; the other, that he has regained full control and is sufficiently confident to spend the next few weeks abroad. It is clear, however, that the extreme anti-Dutch measures he has initiated in the past few weeks are not universally accepted in Jakarta. Thus Dr Hatta, the moderate former vice-president, has criticised the anti-Dutch measures—on economic grounds—in a magazine article.

Dissenting voices are, however, few. The general mood in Jakarta is of bravado and those who are not with the extremists tend to be regarded as un-Indonesian. This mood, in which hysteria plays a part, explains the series of bellicose measures announced in the past fortnight. The claim of sovereignty over all waters between the Indonesian islands has been followed by the proclamation of a "state of war"; a request—which has been turned down—that Dutch warships be denied the use of Singapore harbour ; and now, a measure empowering the army to conscript civilian experts —a law that could apparently apply to British or other foreign nationals as well as to Dutchmen.

In addition, it has been revealed that Indonesia plans to buy arms from the communist block unless American ones are made available. This belligerent sequence comes at a time of fresh rebellion in the Celebes and when Java and other islands face an acute shortage of rice owing to the seizure of Dutch ships on the inter-island run. The new arrangement under which Japanese shipowners will lend 75,000 tons of shipping to Indonesia for six months may at least have the virtue of alleviating the hunger and distress caused by the government's actions.

WAGES

Bus Politics

When representatives of the Transport and General Workers' Union came back to see representatives of London Transport on the last day before the Christmas holiday, both sides decided to postpone action about the London bus pay dispute for two weeks. London Transport formally agreed to "reconsider" its previous refusal to grant any wage increase, and said that it would issue a final reply on Tuesday of next week. When that reply is issued, it should—and presumably will—be a reiteration of the previous flat rejection. What happens then?

There is no reason why outside observers—or London Transport—should be frightened of the threat of a London bus strike or overtime ban ; indeed, there is a strong case for saying that London Transport would have been wise to issue on Christmas Eve a prompt refusal of any "reconsideration" of its previous announcement. It is very doubtful whether a London bus strike would succeed under present conditions ; the fate of the hospital workers' unsuccessful overtime ban confirms that the unions are not well placed to secure gains through direct action at this time. The possibility that the unions might turn the flank of wage restraint in 1958 by successful pleading in some arbitration court has always seemed greater than the possibility that they might break through the front by strikes. The leaders of the transport union are well aware of this, which is why they would still like to refer the London bus dispute to arbitration, if they dare.

The question is whether they will dare. The militants in the London bus garages still look upon reference to arbitration as a strategy of weakness rather than of cunning ; they have said that they will have none of it. Personal reputations in the union have therefore become involved, and Mr Cousins is reported to be about to take charge of the negotiations himself. One guess at his strategy is that he might threaten or start direct action, but with the object of ending it as soon as possible by reference to some arbitration court. If this is the course he chooses, the test case in the battle against wage inflation may at last be about to arrive. It may be much better for the national economy that it should arrive in this way—with the dispute about this very thinly supported claim of the London busmen brought to a head in about mid-January—than that the test should be delayed until the Railway Staffs National Tribunal hands down its recommendations for railwaymen at end-February or thereabouts.

NON-WORKING HOURS

The Lost Day of Christmas

Nineteen fifty-seven was a bad year for industrial disputes in Britain. They caused the loss of 8.4 million working days, a total four times greater than for 1956 and the highest for any year since the general strike. Put in this way, the figures sound frightening. But there are 23 million people at work in Britain, so even in 1957 only a little over a third of a day per worker was lost through strikes ; and an end-of-the-year calculation may help those who regard strikes as such disasters to put their fears into perspective. It is possible that, in purely economic terms, the loss of production caused by strikes in 1957 was no greater than the loss caused by the fact that Christmas and Boxing Day fell on Wednesday and Thursday—with the result that many people made a very long weekend of it, and stayed away from work on the Friday as well.

It is impossible to compile any precise statistics about how many did so. Many people were absentees with permission. When London Transport contacted about a thousand firms to find if they would need buses to take their men to work on Friday, 70 per cent replied that they would not. The main line stations reported a much bigger reflux from holiday on the Sunday night than on Boxing Day. Some workers in some firms, such as Fords, worked on a Saturday before Christmas to make up time ; but extra overtime to make up earnings is also common after a strike. Probably, the Friday was even more commonly a holiday for the white-collared man than for the factory operative. Among the unluckier workers, Friday was a full working day for most of those in basic industries, such as electricity generating, steel and agriculture ; railway services were normal except on the eastern region ; and the coal-miners were expected to work their ordinary shifts, although attendance figures show that many of them did not. Retailers were open throughout the country, largely to supply those who had been eaten out of house and home at Christmas, and one big store in central London got smartly away to its winter sale. But the general figure for official—and French—leave in almost every activity is known to have been high.

ACTS OF PARLIAMENT

Into Force

As usual each New Year's Day, a number of new orders and Acts of Parliament came into force on Wednesday. The most publicised and welcome order was, of course, that reducing the charge for some telephone calls. The most important of the Acts which have now reached their appointed day were the Occupiers Liability Act, the Advertisement (Hire Purchase) Act, and the Baking Industry (Hours of Work) Act. The Occupiers Liability Act makes a tidier and less anomalous definition of the degree of care which an owner of premises must take under his liability in tort in respect of visitors, and also his liability arising out of his obligations under repair. Most householders are, or ought to be, covered by insurance policies against the damages they may have to pay if the charlady slips up on a carelessly left piece of his soap ; the "trespassers" now covered by the act will also be covered by most householders' policies. The Advertisement (HP) Act was a private member's bill which won government support ; it makes an attempt to ensure that the terms of a hire purchase contract are clearly set forth, so that firms cannot use a prominently displayed single clause in such a contract to create misleading ideas—of, for example, cheapness of the goods offered. (The "Yours for two shillings!" type of notice.) It stipulates that the cash price must also be stated.

The one regrettable newcomer is undoubtedly the Baking Act. It was put on the statute book in 1954, but its operation was specifically deferred for three or four years (the Minister wisely chose four years, at his discretion), in order to give the industry time to reorganise. In effect, among other restrictions, it provides that a "night bakery"

may not employ its bakers at night more than 26 weeks in the year; and it gets round the incidental difficulty that this means that all workers must be able to make cakes, which are baked by day in cooling ovens, by permitting the bread and cake-making activities of a firm to be treated as two separate establishments. It is presumed that during the period between the passing of the bill and its coming into operation, bakers have been trained as cake-makers (a skilled job). The Act, even with the reorganisation done during the period of grace, will bear heavily on the small bakery. It exemplifies the growing British principle that work is to be regarded as something done in fixed hours, between about 8 am and 6 pm. This would not be a bad principle if the conclusion drawn was that work done at other times would have to be paid for, under the normal processes of labour bargaining, at special overtime rates. But the principle of this Act is that some work most appropriately done "out of standard hours" should not now, by legislative decree, be done at all. As for the consumer, if he does not like staler or more tardily delivered morning bread, he must apparently lump it; or else—in a phrase not previously recognised as symptomatic of social egalitarianism—let him eat cake.

EUROPE

Capital Candidates

On New Year's Day, the much-celebrated European common market treaty came officially into force. When the foreign ministers of the six signatories meet next week, they will therefore face two urgent decisions—who is going to head the executive bodies of their new communities, and where they are to be set up. The site has lately become a lively diplomatic issue. Brussels, Strasbourg, Paris, Milan, and Luxemburg would all like to be the future "European capital." All command a measure of national support, for, whatever their other virtues, the European administrators will certainly provide off-season sustenance for hotelliers, foreign exchange, and a stable source of revenue for shops.

The argument is one which Britain can hardly ignore, for the city where the headquarters of the common market settles will have to be the centre of the wider free trade area too. The political and economic centres of the two overlapping groups must be in one place. Nor can the Coal and Steel Community, whose energy policy must merge with Euratom's, and whose market for steel and coal must fit into the broader common market, remain apart. The site the Six choose for their new institutions will become in time the political and economic heart of all the European organisations.

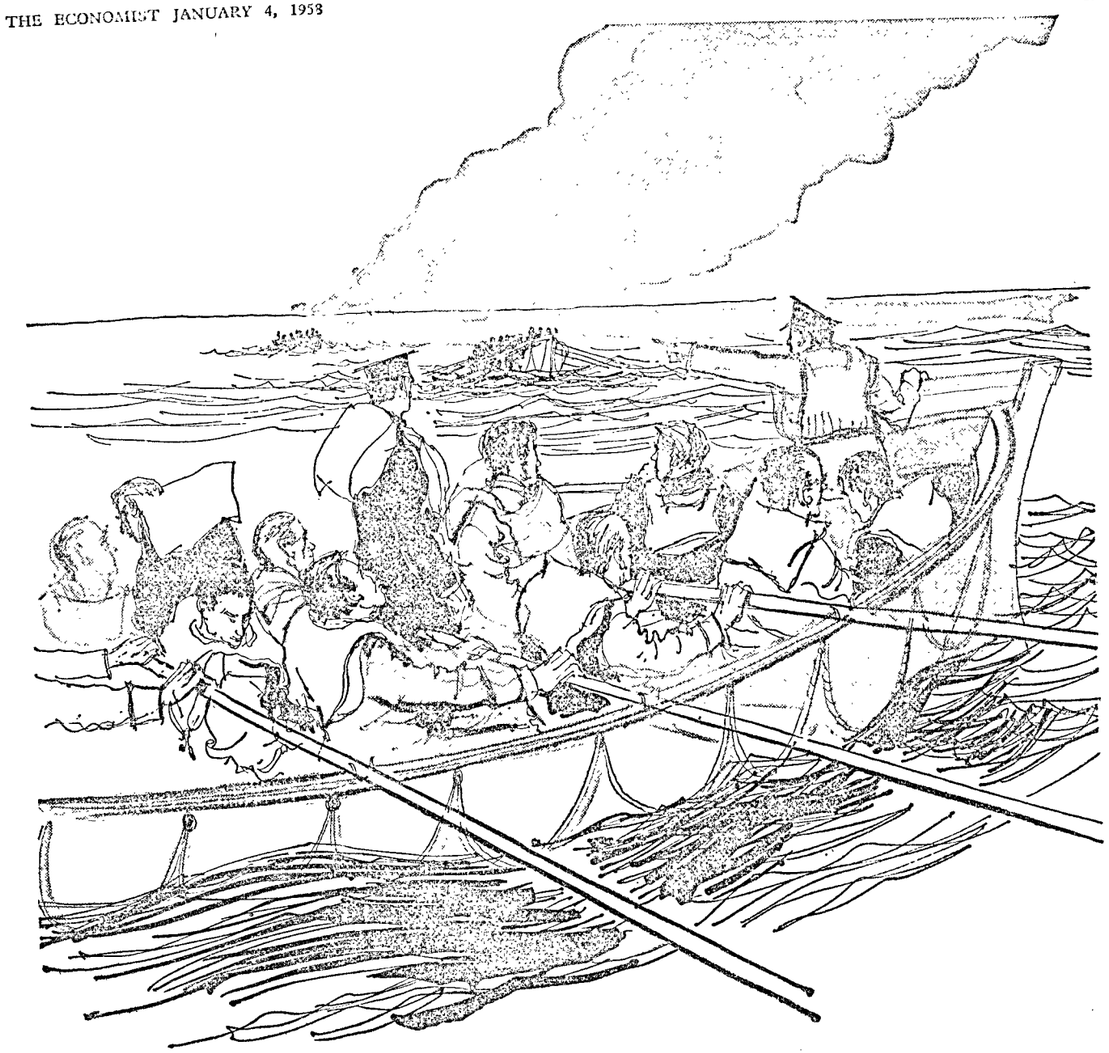
With Nato and OEEC already there, Paris has always seemed a natural centre for the new bodies too. But the eyes of the Six are turning towards Brussels, Luxemburg and Strasbourg. Of these Brussels seems the obvious choice. The new European organisations will be blighted if they are set up in a provincial backwater; they need to be based in a cosmopolitan capital city, where the live currents of Europe's political and economic life can be felt.

For some time it has seemed likely that the permanent head of the commission of Euratom would be a Frenchman, that a German would head the High Authority of the Coal and Steel Community, and that the president of the vital commission of the common market would come from one of the Low Countries. If Brussels is to be the "capital," a Dutchman will probably get the job, and Mr Mansholt, who has just resigned from the ministry of agriculture, is evidently a favourite. At first this seems a strange choice. A liberal approach appears essential if the common market is to work; and Mr Mansholt has a background of "dirigisme." However, he is not inflexible in his approach, and he has always been a keen advocate of the free trade area.

EGYPT

Resumption of Talks

This weekend the British Government will propose to Egypt a date for resuming the Rome talks which were suspended on December 12th. The discussions will probably reopen before the middle of this month, for both governments wish to avoid any further delay and a Cairo report of the official Middle East news agency suggests that President Nasser is willing to offer a helpful compromise on the outstanding issue.



The Rome negotiations, which are concerned with financial claims and counter-claims arising from the Suez crisis, reached an impasse in December over the valuation of British property held in Egypt. The Egyptian side chose to consider the British proposal for a neutral referee as an infringement of sovereignty. According to the Cairo agency report, it is now willing to accept the services of experts from neutral countries in cases of dispute, as long as both countries approve the individuals called in. Although this proposed compromise seems only to apply to property that has been "Egyptianised," that is, seized, and leaves aside the large volume of property which has been sequestered and may be subject to claims regarding loss or damage, it does go some way towards meeting the difficulty over valuation. The prospects for a settlement are therefore that much brighter.

Every argument is now in favour of a quick settlement leading to a prompt resumption of diplomatic relations. The Suez intervention would no doubt have compelled Britain to becoming modesty in the Middle East in any case, but to continue into the second year without diplomatic posts in three countries of this sensitive region, where Britain still has vital interests, is excessively retiring. Syria, which has no real cause to maintain the diplomatic break, is no doubt awaiting Egypt's lead; and Saudi Arabia might well choose to forget for a moment the Buraimi dispute rather than stand alone against the British connection. President Nasser, for his part, must realise that it is not to his advantage to be so dependent on the Soviet block; and there is some evidence, despite the roll of left-wing drums at the Afro-Asian conference in Cairo, that he would like to climb back into the saddle of his neutral hobby-horse.

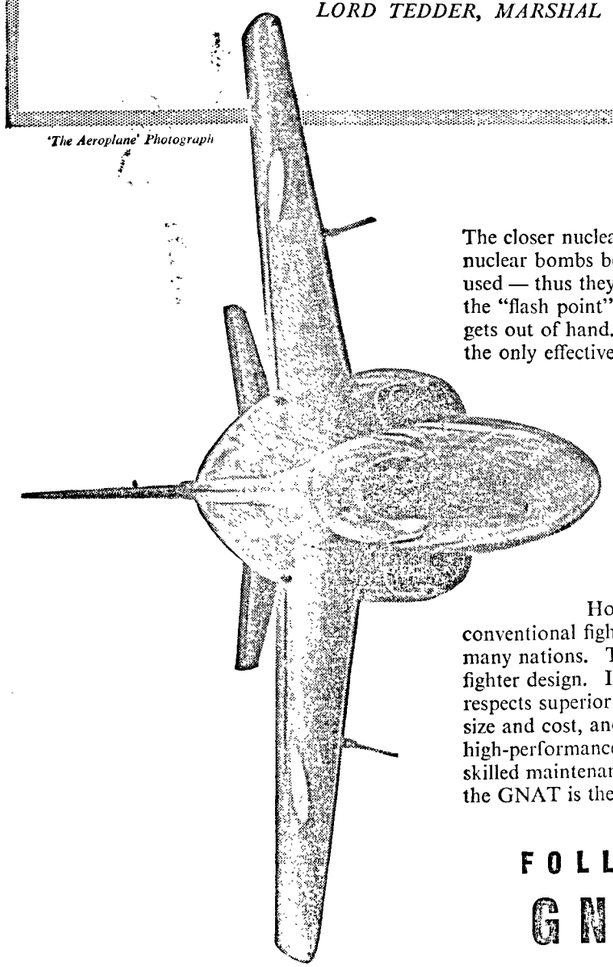
BAGHDAD PACT

Who Goes Where?

Mr Dulles will for the first time head the delegation of American observers at the ministerial council of the Baghdad pact in Ankara on January 27th; but, according to reports from Washington, the State Department attaches

A sullen sky . . . a heaving swell . . . a pall of smoke

Desolate scene, and mercifully so rare. When fate or the elements take toll, skill and precaution are the sole recourse of man.



* *Science makes a notable contribution in the form of the modern lifeboat, made from polyester/glass-fibre material. This boat, as strong as steel yet lighter than wood, has built-in buoyancy; it will not corrode and is impervious to marine borers. Special grades of Beetle Polyester Resin have been evolved and supplied for these new lifeboats.*

"TAKE MY WORD FOR IT—

there are going to be aeroplanes and military aeroplanes, too, as far ahead as we can see. The idea that we are all going to sit in dug-outs and press buttons is just fantasy."

LORD TEDDER, MARSHAL OF THE ROYAL AIR FORCE
2 June 1957

'The Aeroplane' Photograph

The closer nuclear parity approaches, and the more devastating nuclear bombs become, the less likely it is that these bombs will be used — thus they lose all value as deterrents to local conflict. Yet the "flash point" of nuclear war may well be the local one which gets out of hand. Strong and flexible conventional force remains the only effective deterrent to local conflict, and the air component must be the first consideration.

However, the size, complexity and cost of the conventional fighter imposes a crushing burden on the economy of many nations. The Folland GNAT has reversed this trend in fighter design. It has proved equal in performance, and in many respects superior to the conventional fighter, yet it is only half the size and cost, and a third of the weight. It can operate wherever a high-performance machine can go and it makes little demand on skilled maintenance. As a modern air superiority or tactical fighter the GNAT is the right aircraft, for the right job, at the right time.

FOLLAND
GNAT
LIGHT JET FIGHTER

FOLLAND AIRCRAFT LIMITED, HAMBLE, SOUTHAMPTON, ENGLAND

no special importance to the matter. In fact, said its spokesman, Mr Dulles had always wished to attend meetings of the council but had just been too busy. Now that he has only to consider sputniks, missiles, the reconditioning of Nato, the prospects of talks with Russia, and the generally uncertain state of the free world, it appears that he has leisure for the jaunt.

What is this all about? The American objection to the pact at the outset was simply that it did not seem to be a stabilising factor in the Middle East, or in short, that Egypt and Syria did not like it. Since then, it has joined the committees of the pact and subscribed to its funds. It has, furthermore, drummed up an anti-communist alignment in the region more forcibly than ever the pact did. The western commitment implicit in the pact, which was the principal reason for Arab opposition to it, is now identified with United States policy more than with that of any other country. What cause has Mr Dulles now to boggle at membership and to disclaim mock-modestly the importance of his distinguished presence at its council?

One might argue logically against American membership of the Baghdad pact, but no longer in favour of this shaky hand stretched from the Potomac to the Tigris. The United States so obviously supports the pact that it should enter into full membership. Indeed, it would naturally be assumed, from the fact that Mr Dulles is going to Ankara, that the United States intended to do so—were it not that his spokesman has said that there is no such plan. The truth is that at the root of this indecision about the Baghdad pact, this manner of being of it but not in it, lies the general hesitancy of United States policy in the Middle East.

TRADE UNIONS AND EDUCATION

To School until Sixteen?

THE Trades Union Congress, like a number of other bodies, has been offering its advice to the Central Advisory Council for Education in England and Wales, which is studying the large question of how children should be educated between the ages of 15 and 18. One might have expected trade unionists to be particularly interested in the subject of apprenticeship, the present system of which has recently been questioned because it has the effect of obliging boys to leave school before they are sixteen. But the TUC's statement, published last week, says nothing on this point, and is mainly confined to unexceptionable generalisations.

On one controversial point, however, it takes a line of its own. It puts only second in its list the establishment of "county colleges," which, when the 1944 Education Act comes fully into force, are intended to give compulsory part-time education, on one day a week, to young people between the school leaving age and eighteen. It feels that to raise the school leaving age to sixteen is the more urgent reform. The association of local authorities' education committees has taken the opposite view.

This is a problem for thoughtful debate. It is possible that the TUC is right, and not only because—as might be expected—its proposed order of priorities would bring the greater theoretical equality. What middle class parent, after all, would allow his child to leave school at fifteen? Moreover, there is not much evidence as yet of how effective an education county colleges could give in their one day a week, or where the right kind of teacher could be found. Against this, those who are kept whole-time at school against their will, especially if they are none too bright, may make poor use of the time and public money expended. The last year until fifteen is not always well used as it is—perhaps because the parents are impatient to have a juvenile earner in the family, perhaps because the pupil leaves almost the very minute he or she is fifteen even if this happens in the middle of the school year. The proper course may be to recognise that the enactment of compulsory education until sixteen is a most desirable ideal; but to precede it, and then to combine it, with other measures designed to ensure that the last year of schooling is of higher quality.

AGRICULTURE

Farm Improvement

OF the various ways in which public funds can be used for the benefit of agriculture, much the least vulnerable to economic objection is the grant of funds for long-term improvements to land and fixed equipment—the partial assumption by the state of a necessary role which taxation has made disproportionately onerous to the individual landowner. Since Part II of the Agriculture Act of 1957 came into operation last September, the minister has had power to make grants of one-third of the capital cost of such improvements; plans are submitted in the first instance to the regional officers and judged for approval, after inspection of the land or buildings concerned, by the County Agricultural Advisory Committees. By the end of November, it is now announced, more than 17,000 proposals had been received for England and Wales; 2,691 had been formally approved and a further 3,280 were ready for approval subject to the submission of detailed plans and tenders; 2,164 had been rejected, withdrawn, revoked or lapsed; the rest—approximately half the total—remained "under consideration" to try the patience of the would-be improvers.

This is not too bad a record; the initiation of any scheme of this kind is bound to produce a rush of applicants and a consequent queue. The standards by which an improvement plan is accepted or rejected are necessarily rather vague and a matter of local judgment. Is the work such as a reasonable landowner would undertake either on his own behalf or that of a tenant? Will the farm, as improved, be capable of yielding a "livelihood" (i.e., an agricultural labourer's wage) to a competent husbandman? This last question is a prickly one; the struggling small man who cannot get a grant precisely because he is small and struggling understandably feels aggrieved. Natural as this feeling may be, however, it could justify a relaxation of standards only if the aim of the scheme were (like so much of the tangle of privileges now bedevilling European agricultural policy) to preserve at practically any cost the way of life of a traditional peasantry.

Whatever may be said of France, Germany or Austria, there could be no possible justification for actively encouraging high-cost splinter holdings in Britain. The answer for the very small man is not a very small farm yielding a national-assistance-standard income, but a job and an allotment. Indeed, one of the most economically promising provisions of the Act is that allowing grants to be made, on application, towards the legal costs of amalgamating

small farms. Any measure which, without compulsion and without reducing the total of land under cultivation, might shorten agriculture's long tail of high-cost producers, is a step in the right direction. This measure seems to be working reasonably well.

THE UNIVERSITIES

Who Wins Open Scholarships?

THE Oxford and Cambridge open scholarship results announced last week have called forth press comment that the public schools, as usual, have carried off most of these much coveted awards. This is true, but many of the victorious schools are not what are commonly thought of as public schools at all. They are members of the Headmasters' Conference, as all the public schools are, but that conference includes many different types of school. The list published last week showed that about 70 per cent of the open scholarships and exhibitions went to candidates from Headmasters' Conference schools; but within this 70 per cent, about 18 per cent were direct grant day schools (which made a very good showing), and 12 per cent were schools which, although members of the HMC, were aided or maintained by local authorities. The four schools at the head of the list were Manchester Grammar School (21 awards), Winchester (17), Dulwich College and Nottingham High School (14 each).

Local authority schools that are not members of the conference won only 30 per cent of the awards. Even if one makes up this total to 42 per cent (by adding in the 12 per cent of awards won by their aided schools, mentioned above), the local authority schools made a poor showing in relation to their numbers: they contain some 250,000 children between 15 and 18, compared with the 90,000 or so who are being educated in public, direct grant and independent schools officially recognised as efficient. But again the reasons are not as simple as they might seem. For those who go to the university from the council schools there is no financial advantage in winning a college open scholarship once one has won a county award or state scholarship, because the amount of the latter is then cut. Moreover college scholarship examinations are taken in March or December, and are therefore likely to mean spending an extra two or three terms at school after taking the General Certificate at A level, on which the county or state-scholarships are given. Many a boy will naturally opt for going up to university, or being out in the world, a year earlier. But the public schools and the good direct grant schools set such store by their record in these open scholarships that they put pressure on boys to stay the extra time to take the examinations—even though the result may be a small exhibition whose total value over three years (even if it is not means-tested away) will not equal half the cost of an extra year at a public school.

MIGRATION

Travel Made Easier

A LION'S share of credit for having shifted nearly all the Hungarian refugees from Austria and Jugoslavia must go to the Intergovernmental Committee for European Migration. This organisation was started in 1951 to help the movement of Europeans to countries with more room. Its basic function is to organise cheap, regular transport and to be the cashier for the money that member governments contribute towards assisted migration. But it has consistently done more than was laid down in its original brief, and when the flight from Hungary burst upon Europe, it collected all the money it could lay hands on, whether earmarked for other purposes or not, and set about clearing the refugee camps. Now all the refugees who fled to Austria and wanted to move on have done so. A few months ago it looked as if it would be much more difficult to find permanent homes for the 20,000 that escaped to Jugoslavia, and it is a tribute to ICEM's efficiency that only 1,500 now remain in camps.

Apart from the Hungarians, the committee has helped to transplant some 650,000 people. These are principally Italians and Germans, with a large sprinkling of Austrians, Greeks and Dutch. They go, in order of preference, to Australia, the United States, Canada, Argentina, Brazil and Venezuela. Since the movement benefits both sides, contributions are paid willingly and the ICEM only has to pass the hat round its members in emergencies. Twenty-seven countries belong; about half of these are sympathetic onlookers, not much affected by migration themselves. Britain stands out as the only important western nation that has always refused to join; successive British governments have said that they could not afford the obligatory contribution to administrative expenses.

The committee's overwhelming difficulty is that the receiving countries, being short of technicians, are offered unskilled labourers. In an effort to put things right, the ICEM has been experimenting with vocational training courses for prospective emigrants, and has also sent job-finding missions out to the receiving countries. Soon these extra-mural activities will be put on an official footing and expanded. Delegates from six member governments will be meeting in Washington in February to reconsider the work and purpose of the committee in the light of economic changes and the development needs of immigration countries. They are bound to approve and encourage ICEM's alchemy in turning the unemployed and the unskilled into the skilled and the wanted.

AFRO-ASIANS

Cairo Roundelay

FIVE hundred delegates from 42 countries, gathered in Cairo for the Afro-Asian conference, found safe common ground in condemning the hoary sins of the West. Colonialism, imperialism (defined by an Egyptian spokesman as the modern form of colonialism through capital investment) and racial discrimination are fusty enough topics, but the conference's moral indignation was stimulated by the presence of delegates from British and French colonies—and by the absence of others who had been stopped from coming.

Otherwise, the forty or so logs were by no means all being rolled in the same direction. Delegates from the dependent territories, and from countries like North Vietnam and North Korea, had come to air their own specific grievances. The Soviet delegates were resolved to show that they were all Asian brothers under their carefully selected darkish skins, but that Russia, having pulled itself up by its bootstraps, could now help its less fortunate brethren. It seems that they even contrived to leave the impression that they had promised all sorts and varieties of Russian aid, guaranteed stringless—despite the fact that their own published record gives no sign that they promised any. But they did not have it all their own way, and at one point they were on the brink of some awkward questioning about their own empire when the Cypriots suggested a general resolution on people's right to self-determination.

The Egyptians also have found the conference an embarrassment as well as an opportunity. They welcomed the acceptance of Cairo as a central meeting place. The new Afro-Asian Peoples' Solidarity Council will now be based there, and Egypt will nominate its secretary-general. But participation in a communist front group has no place in President Nasser's balancing tricks between east and west, and the conference paid less than lip-service to the "positive neutralism" that Colonel Anwer el-Sadat underlined in his speech of welcome.

Worth Nailing Down

One of the more practical things to come out of the meeting was the decision to hold a Cairo meeting of Afro-Asian chambers of commerce towards the end of 1958. At first the economic committee tossed about the fashionable idea of a common market, but presumably got discouraged by the prospect of adjusting tariffs between countries as differently placed as Oman, Chad and the Soviet Union. The final resolution was a loosely worded boost for economic co-operation and increased trade wrapped round the recognition that every state has a right to nationalise its assets. Co-operation between countries with the same interests, rather than an ambitious portmanteau scheme, would obviously be a step forward. But the overwhelming economic problem in underdeveloped countries is the lack of outside money; the Afro-Asian states would do well to nail down Russia's airy promises.

TRADE UNIONS

Not Tennis Clubs

A FABIAN research pamphlet*, published just before Christmas, looks into the law of trade unions. Legally, a British trade union is a voluntary, unincorporated association on a par with a lawn-tennis club. Its rules, in so far as they concern the mutual rights and duties of its members, are accordingly its own affair. A member who suffers damage because a rule has been broken to his detriment may invoke the law of the land for redress (provided his union is, like most, registered; if it is not, he may find even this limited redress harder). But if his grievance, however extreme, arises not from the breach but from the due application of the rule, the law can do nothing for him. If he did not wish to be subject to the rule whose workings have injured him, it is held that he should not have joined the "voluntary" organisation concerned.

This distinction and others are explained for the layman in the pamphlet. A useful job of clarification is well done. The real lesson of the pamphlet, however, is that a fearful confusion subsists, at least among the left-minded, about what unions are and ought to be. Were they genuinely voluntary, on the tennis club model, then the present state of the law as it affects their relationship with individual members would be reasonably satisfactory. (Their powers of coercion against the public in general might still be open to question.) But union membership is not, over a large part of industry, voluntary in any sense, let alone the tennis club sense; and according to the Labour view it should become less, not more, a matter of individual choice. Entry into any wage-earning employment ought ideally, they say, to imply membership of the appropriate union as surely as birth implies nationality; the non-union worker should be as rare a bird as the stateless person, and his lot should be no less uncomfortable.

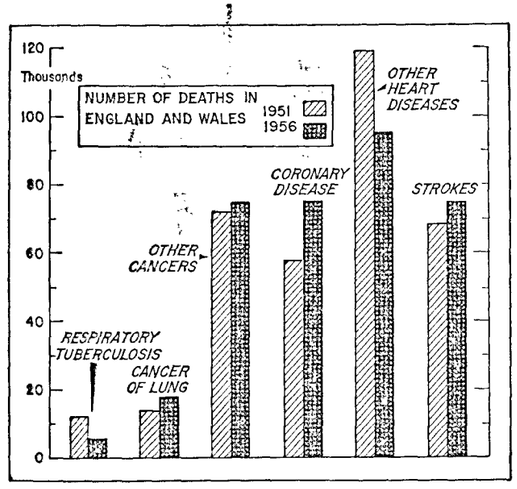
This is at least a coherent idea, detestable as it may be to the liberal mind. But only an extraordinary mental incoherence could simultaneously approve that ideal—or the approximation to it already reached wherever the closed shop is established—and the degree of legal unconcern appropriate to the internal arrangements of a tennis club. The nearer trade unionism approaches to its ideal of comprehensiveness, the more inescapably important becomes, in the life of every worker, his relationship with his union; and the more necessary it is, as a result, that the rules governing that relationship should be both just, as justice is understood in other contexts, and compatible with his civic duties outside the union. That is not a matter to be determined by each union for itself; one way or another, the law must judge not only the application of the rules but the rules themselves. The unions and their champions may not like the idea; but they cannot for ever have it both ways. A free society should not encourage them to think that they can.

* "Trade Unions and the Individual." By Cyril Grunfeld. Fabian Society. 33 pages. 3s.

The Economist Diary

For the better ordering of the working day, and for the comfort and delectation of secretaries, there is nothing to equal it.

A week's appointments at an opening; a book that lies open flat on the desk	A diary lay-out specially designed to meet the needs of the busy man
Bound throughout in red leather; title blocked in gold. Size: 10" x 8"	All information easily found by means of handy thumb-indexes
A memorandum book, an appointments register, and a complete reference book	Facts and figures covering the world always available when required
43/- Price for U.K. only, including postage and purchase tax	Prices to overseas addresses vary widely; a schedule will be sent on request



ILLUSTRATED PAMPHLET FROM DIARY DEPT.

VITAL STATISTICS

Of What We Die

A GENERATION ago there were in England and Wales between three and four thousand deaths a year from diphtheria. In 1956, according to the Ministry of Health's belated annual report, there were 56 cases and 8 deaths, the lowest totals ever recorded. The disease has, in fact, been for all practical purposes eliminated, but the Ministry's report emphasises the continuing importance of maintaining a high level of immunisation among school-children.

Tuberculosis, another disease that used to take a heavy toll of the young, also shows a spectacular decline in mortality. As the diagram shows, deaths from respiratory tuberculosis in 1956 were only 40 per cent of the number registered as recently as five years previously. Conversely,

deaths from cancer have gone up in the same period, but it is worth noting that much the greater part of the total increase is accounted for by deaths from cancer of the lung; these numbered 18,186 in 1956, compared with 13,247 in 1951. Another notable and steady rise has occurred in deaths from coronary disease. Deaths from all causes in 1956, at 521,331, were 28,000 fewer than five years earlier, but about half of this decline can be explained by deaths in the influenza epidemic of 1951.

JAPAN AND KOREA

Face Well Lost

JAPAN, whose reviving authority in world affairs was symbolised by its entry into the Security Council on New Year's Day, also ended the old year in good style. An agreement, signed on December 31st, has brought its long quarrel with South Korea a step nearer to a conclusion. The negotiations that have been dragging on interminably about the citizens of each country whom the other is holding in detention camps, have now been concluded. Discussions broke down several times in the past because neither side was willing to forgo claims unacceptable to the other; it appears to be the Japanese who have at last climbed down. They have granted the Koreans their point that, whereas Korean nationals who entered Japan illegally after the war and are now held in detention camps are to be deported to Korea, the 400-odd Koreans in the camps who were brought to Japan before 1945 (when Korea was under Japanese occupation) are to be released and, reasonably enough, allowed to stay in Japan. In return the Koreans will release the Japanese fishermen they hold at Pusan, who have completed the prison sentences imposed on them for fishing within the vast stretch of water off Korea which President Rhee has marked off as his country's private property; the Japanese, however, have not insisted on the return of the fishermen who have not yet completed their sentences, though they regard these sentences as illegal.

This should provide the evidence of Japanese "sincerity" for which the Koreans have plaintively been asking, and talks can now be resumed on the other points at issue between the two countries. There is scope for give and take by both sides here. The "Rhee line" has caused much hardship to fishing villages on the Japanese coast opposite Korea. Plans were announced in Tokyo last month for sending extra patrol boats into the area to protect fishing vessels working across the line. The Koreans promise to "resist force with force." Before firing breaks out, they might consider whether they would agree to let the Japanse do at least a little rationed fishing within the waters that, by common international standards, ought to be free to all. The Japanese, for their part, have in the past made huge claims for compensation for the ex-Japanese property in South Korea which was seized by the allies in 1945 (and most of which was, anyhow, destroyed in the Korean war). Mr Kishi's government has shown signs of understanding that, if Japan is to keep its economy viable by doing more trade with its Asian neighbours, it must clear away the ill-will left by the last war. By giving way on comparatively minor points, as it is doing with Korea, it will in the end gain more than it loses.

ISRAEL

German Herrings?

ISRAEL'S reported plan to shop for arms in Germany has a baffling sound. The cabinet leak has blown the scheme sky high, but it has not so far revealed what arms the Israelis hoped to get or why they expected the Germans to provide them. About three weeks ago, Dr Josephtal, the secretary-general of Mapai, went to call on Dr Adenauer. On his heels, Mr Ben-Gurion apparently arranged to dispatch a "leading personality"—Israeli newspapers have printed without comment the photograph of Major-General Dayan, the chief of staff—to find out whether the Germans could supply arms. Some of this information was leaked to *Lamerhav,* the left-wing Achduth Avoda party's daily newspaper, and the mission was cancelled. Instead, a less eminent personality, Mr Shimon Peres, the director-general of the defence ministry, spent a couple of days in Bonn immediately after Christmas.

Bonn spokesmen say they are mystified by the whole affair. Germany has to import most of the weapons for its own army, and even if there were any arms to spare—which there are not—Israel would be one of the last countries to receive them. The German government made it known that it will use its constitutional powers to stop private firms from selling weapons to areas that are "the centre of acute conflict." Equipment that could be used either in peace or war might get into Israel under the reparations agreement, but Mr Ben-Gurion, when explaining his action to the Knesset on Christmas Eve, specifically mentioned the need for defensive weapons for use against Egypt's Soviet submarines.

The most plausible explanation offered seems to be that all this talk of anti-submarine devices and other secret weapons was no more than a rather clumsy red herring trailed before the Knesset. The left-wing parties acknowledge that arms must be got from whoever will sell them; their real fear, described by our correspondent in Tel Aviv on page 45, is closer alignment with the West. The prime minister may have wanted to take their minds off Dr Josephtal's visit to Bonn just before the Nato meeting. At that time it looked as if Mr Menderes of Turkey was going to enjoin his Nato colleagues to return to the ten-year-old UN resolution on Palestine, and Dr Josephtal was probably briefed for some discreet lobbying. Several cabinet members apparently found out about this meeting only after it had taken place, and were strongly critical of the prime minister's high-handedness.

*

Even without this new flap, full diplomatic relations between Israel and Germany are not an immediate possibility. At present, Germany has no official representative in Israel, although there are Israeli reparations and consular offices in Cologne. The Israelis have painfully got around to admitting that businesslike relations with Germany would be more useful than distasteful; it is now the Germans, afraid of doing anything that might provoke the Arabs into recognising the East German government, who are going slow. Their known nervousness makes the arms deal story sound doubly fantastic—and brings out the detective in every commentator.

RELEASED PRISONERS

The Public's Part

THE Central After-Care Association is statutorily concerned with the care and supervision of certain classes of prisoners—mainly those released on licence from corrective training or preventive detention; it exercises similar functions for certain long-term prisoners who accept after-care voluntarily. It is also responsible for the after-care of young men and women released from borstal institutions. The depressing feature of its report for 1956 is the proportion of cases in the association's care who are reconvicted within a year or so after they have been discharged from prison.

Of the long-term prisoners, the "star" and other selected prisoners naturally make the best showing; the association is also right to be pleased that only a third of its men discharged from Dartmoor in 1954, all of them former old lags before they were sentenced to Dartmoor, had been reconvicted by the end of 1956. On the other hand, for those discharged from local prisons the proportion was 43 per cent, and of those released from corrective training in 1954, half had been reconvicted two years later. It is even more disappointing that roughly half also both of borstal cases and of young prisoners discharged to the association's care had been reconvicted by the end of 1956.

The Central After-Care Association has to take what it is given, and if the prisons and borstals are not discharging their inmates fit to lead a life free from crime, the association is not primarily to blame when things begin to go wrong. But its report also points to another reason for failure. Even were the prison system as good as could be devised, its efforts at reforming prisoners will always be unavailing if society is unwilling to accept them back. The association's report mentions, particularly, the difficulty it has in finding somewhere for prisoners and borstal boys to live on their discharge. There are also other ways in which the public can help: employers can offer jobs; trade unions can accept into membership those who have completed trade training courses during their detention; social organisations can welcome ex-prisoners as members; everyone can treat them as human beings. Society sends criminals to prison; if it does not want them to return there again and again and at vast public expense, it has to play its part in their rehabilitation.

The Economist

JANUARY 2, 1858

THE HIGH PRICE OF EDUCATION

Mr Thackeray, in his speech to the commercial travellers last Saturday, and *The Times* in commenting on his remarks, have complained not a little of the increasing cost of education, and *The Times* has attributed it in great degree to causes affecting rather the apparent than the real value of the education given. . . . Where £40 per annum was, a generation ago, the average cost of a lad's boarding-school education, even up to the age of 11 and 15, the "two little heroes" of 6 and 7, whose not very peculiar case Mr Thackeray cites, each costs his father £75 per annum; so that the expense of education would *appear,* in some cases, to be more than doubled. This unpleasant result is attributed by *The Times* to accidental causes—the weakness of parental anxiety, and the dexterity of professional teachers in appealing to that anxiety on its weakest side. Parents have more confidence, it is fancied, in the "earnestness" of men who take a high remuneration for their toil. . . . Now, first we extremely doubt whether the cost of mere teaching *has* risen much of late years. The school usher, the private teacher, the country curate, and the dissenting minister, with an education that would have fitted them to go to the bar had they the means—still receive pittances less than those of the better class of artizans. . . . It is otherwise, however, with the cost of the particular sort of education gained at *boarding schools,* which bears no due proportion to the expense of day schools. This has no doubt increased very rapidly of late years. . . . The price of teaching has not risen, but teaching is now much more generally separated, and more easily separable, from domestic superintendence than it was. . . . The teacher can "utilise" his talent, if he will, without opening a boarding school—and the privacy of domestic life is far more highly valued than in former days. If, therefore, he not only teaches but receives pupils into his house, he does so only for the same reason for which cadets go out to India, or merchants' clerks to Batavia—in the hope of realising a competence which will enable him to give up the occupation altogether after some twenty years' work. . . . Boarding-school superintendence is something much more responsible and much less easy and agreeable than mere teaching, and any one who enters upon it naturally looks for a rate of payment proportioned to the magnitude of the private sacrifices he makes.

LETTERS

The Sterling System

SIR—The gravest threat to our economic destiny, implicit in the policy of liberalisation and convertibility which destroyed the economic and commercial coherence of the sterling area, was that the burden of capital requirements would prove intolerable because it would become one-sided. The reaction to this in Britain would endanger the financial ties that bind the Sterling Commonwealth together (it is significant that Mr Bandaranaike and other overseas statesmen should come out in favour of the sterling system at the precise moment when it seems to lose its adherents in this country).

This is precisely what has happened. In the recent controversy—including your two articles—the economic aspects of the sterling system were completely ignored. The conclusion was, then, inevitable that the maintenance of that system in its present form was far too costly, and that the same sort of exchange control should be enforced on payments to sterling countries as is in effect in respect to other areas.

The argument that the present status is profitable to Britain does not hold water. The answer to those who say in favour of it that the invisible income of the City is over £100 million per annum is that an overwhelming part of that income—80 to 90 per cent being insurance, specialised banking services, etc.—would be maintained under any system of exchange control. The loss of the remainder is incomparably smaller than the costs in terms of increased rates of interest, and worsened terms of trade inflicted on us by liberalisation. In any case, if the maintenance of the present system requires, as you say, a "tough" policy of dear money, we shall lose most of the banking business—short and long term—to other more favourably placed centres.

Moreover, it was this policy which has caused untold losses to our dependent territories through the depreciation of their reserves invested in gilt edged. Their present determination to repatriate their reserves was partly caused by these losses. The endeavour of the Bank of England to enforce a continuation of this policy through limiting the scope of the newly established central banks will, in the end, merely have the opposite result. The revulsion will carry the newly independent territories farther away from Britain than is either desirable or—even now—inevitable.

The question of sterling must not in fact be posed in financial or banking terms because those must distort the discussion. Whether this country can "afford" to give assistance through capital exports to a large extent depends on what sort of commercial arrangements exist between this country and the co-members of the sterling system (just as it is erroneous to discuss the uses of our current export surplus without taking into account that a large part of it is due to our exports of capital). What we cannot afford is the capital export to the US or Canada which does not improve our export (or import) capacity. It is the Kuwait and, more recently, the "soft dollar" gap which we cannot afford: it was this sort of capital export after 1925 which really choked British recovery and not the revaluation of the pound of that year. The starvation of British industry of capital resulted in a relative decline of productivity and made readjustment to the prewar parity impossible. The danger is even greater now.

What must be envisaged is a slow rebuilding of a co-operative economic unity in the sterling area which permits us to discharge our debts without causing undue strain on our terms of trade or, through dear money, ending our economic expansion.

Exclusive attention to the purely banking aspects of the sterling system have blinded people to the great economic possibilities. The fact that people begin to realise how powerful an advantage is offered by a preferential system such as the European common market might perhaps persuade them to revise their views of the sterling area which provided this country with unique advantages in respect to over half of its exports—which were surrendered without any counter concession in the dogmatic drive towards convertibility.—Yours faithfully, T. BALOGH

Lowes water Hall,
Cumberland

★

SIR—Your question whether it is in Britain's economic interest to maintain the unlimited freedom of sterling balances and their convertibility at virtually official rates cannot be answered by an unqualified "No." One of the fundamental causes of the long-term distrust of sterling abroad is based on the belief that we are trying to do too much. But there are other factors.

First, it is believed that a further devaluation of the French franc is inevitable and that this will be followed by devaluation of the principal European currencies, except possibly the Deutschemark and the Swiss franc.

Secondly, credit restrictions in their own countries impose upon non-residents the alternative of selling either their sterling or their dollar holdings. Conversion of a great number of European and other currencies into dollars, particularly for capital account, is not as simple as it looks. It is much easier, particularly if tax problems are involved, to move into dollars via sterling. In these circumstances, the dollar rate for transferable sterling has become the support price of the "marché parallèle" of a great part of the world.

Thirdly, the Malayan and Ghanaian sterling balances are of relatively recent origin. Ghana in particular is embarking upon an ambitious programme of industrialisation. The possession of American and German equipment has today become almost a matter of national honour in under-developed countries. Australia has now put imports from the US and the UK on the same basis. Ratification of the Australian trade agreement with Japan would open its markets to Japanese imports.

These are not all the benefits accruing to non-residents. They are entitled to buy transferable sterling at a discount and use it for the purchase of sterling commodities. For non-residents the sterling discount is therefore tantamount to an export subsidy. Residents cannot use their foreign exchange revenue to purchase sterling at a discount. The utilisation of our hard currency income for the purchase of transferable sterling would reduce the foreign exchange offerings to the Bank of England, but it would not reduce the net amount of hard currency remaining available to this country.

Any reduction of the inflationary pressure at home will make sterling that much less vulnerable abroad. But the world is faced with liquidity and transfer problems that are caused by political developments over which economic policies have little control. I do not advocate a retreat from sterling's present responsibilities, whether on capital or current account. I submit, however, two points for consideration. First, our present sterling policy *vis-à-vis* non-residents should not be maintained without a clear-cut understanding with the principal central and international institutions on the movement of funds out of this country and, in particular, on the maintenance of their working balances. Secondly, there is no reason to deprive residents of their rights to purchase transferable sterling.—Yours faithfully,

London, S.W.1 GEORG TUGENDHAT

Labour Party

SIR—Periodically the "XYZ Club" attracts attention in the press and I note you refer to it in your issue of December 28th as a "dining-group formed exclusively of the better educated—and better breeched—members of the party." The political correspondent of a Sunday newspaper described it a fortnight ago in almost similar terms, as an "exclusive dining-club," formed in the inter-war years "by followers of the late Mr Harold Laski's brand of socialism." The implication of most comments is that this is a wealthy clique of socialist dilettanti too much favoured by the leadership of the party.

May I, as the founder of this "club," be permitted to give a few facts about it? I started it over 25 years ago, in 1931, with the object of creating some link between the Labour party and the City. Apart from such relations as existed between Snowden and the Governor of the Bank, the Labour leaders of those days had absolutely no contact with City leaders and little

knowledge of the machinery of the City, a state of affairs that seemed to me ridiculous and also to hold dangers for the future. The original members were all men in responsible positions in the financial world, none were politicians, all gave a great deal of time and effort to the objects of the "club." At an early stage regular discussions began with those Labour leaders concerned with financial problems and we were joined by two or three young but distinguished academic economists. Apart from wartime interruptions, regular meetings have continued right up to the present time, but the chief value of the "club" still lies in the opportunity it affords of a frank exchange of views on current problems between Labour and the City.

Membership has naturally varied over the years. It is only exclusive in the sense that for purposes of practical discussion numbers must be limited. It is in no sense wealthy and only half the members belong to either House. I would only add for the record that the leader of the party is unfortunately a very rare attendant.—Yours faithfully,
Aylesbury H. VAUGHAN BERRY

Export Insurance

SIR—In your article last week, you state that the Section I side of the business of the Export Credits Guarantee Department is run on strictly commercial lines, the premium charged being calculated to cover the risk assumed. This is only partly true for the good reason that, while the commercial aspect of an export credit risk, that is to say the risk of insolvency of the importer, is to some extent susceptible to premium rating, the political aspect is certainly not.

Insurance against loss due to the insolvency of commercial debtors relies on careful selection and control of a good spread of individual risks and premiums based on experience; so called insurance against non-payment for exports due to political causes, exchange transfer restrictions, war and so on is not true insurance, because the risks are much too concentrated, even on a world-wide basis, to permit the law of averages to operate. If this were not the case, private enterprise could and would provide the facilities which are now only available with the backing of the state.

The premiums charged by the ECGD are intended to cover administration expenses and to enable normal commercial losses to be paid while leaving a surplus for building up funds to meet a political crisis. Nevertheless, it can only be a matter of pure chance whether the premiums are adequate, excessive or inadequate for the last of these purposes.

So far as the political aspects of export credit risks are concerned, there is much to be said for a system of control by selection of the countries to be guaranteed with a universal flat rate of commission to cover administration expenses. The argument that this would be the equivalent of an export subsidy seems to me to be fallacious. There is no question of providing money to cheapen exports; what is provided is protection by the state against contingencies of a political nature which are beyond the scope of private enterprise.

You also state in your article that it is not considered feasible to hand over the ECGD's Section I business to private enterprise. I would agree with that so long as the department combines the guaranteeing of political risks with the insurance of commercial risks, and it should be appreciated that not all exporters require the dual cover. If, on the contrary, the department were to confine its activities to guaranteeing political risks on a flat commission basis, either directly for exporters or by way of reinsurance of private enterprise, I believe the latter would be able to look after short term commercial risks in a flexible and efficient manner.—Yours faithfully, A. N. PATRICK
Trade Indemnity Company

American Railroads

SIR—The article in your American Survey of December 7 leads me to suggest that condensation may be the thief of enlightenment, although it is the law of journalism as well as of judicial opinion-writing. District Judge Clary, in his opinion in the antitrust suit between the truckers (American for "road hauliers") and the railroads, condensed 6,000 pages of evidence and 968 exhibits into his 200 pages, and thereby managed to create the impression that there was only one side to this important case. Your article, however, undertook to condense his 200 pages into one of your pages and thereby left hardly a shred even of those indications that Judge Clary gave that there was much to be said on both sides of the case.

He found from the evidence that the plaintiff truckers had engaged in practically all the techniques and offensive acts of a very hot propaganda shooting war with which they charged their competitors, the railroads. The principal difference the judge relied on was that the truckers had done the same things more brazenly, without much bothering to hide themselves, whereas the railroads, through Carl Byoir, had been more sophisticated and hidden themselves more behind "false fronts." But he found that the truckers had spent large sums of money subsidising the campaigns of political candidates and influencing legislatures and had been so successful that they had won "hands down" before the Pennsylvania legislature. The railroads were only able to prevail in the last ditch, before the Governor.

Why then did Judge Clary hold that the truckers had not violated the antitrust laws and dismiss the railroads' counterclaims? He based this holding on a finding alien to the principles of the antitrust laws—that the truckers, in committing those same acts, had subjectively intended only to help themselves and not to injure the railroads, whereas, in his view, the railroads had committed the same acts with a primary intent to injure the truckers and not merely to defend themselves. But the controlling principle in this field always has been that a party is legally held to have intended the reasonably foreseeable consequences of his acts and cannot be held to contend that he had no subjective intent to inflict those consequences on an injured party. Judge Clary completely overlooked that principle.

Moreover, this was a suit in equity. But equity, English and American, has always had another controlling doctrine, that no relief will be granted to a plaintiff who does not "come into equity with clean hands." Judge Clary also completely overlooked that doctrine. He did not even undertake to hold that the hands of the plaintiff truckers were clean; indeed, his own findings conclusively show that they were dirty with the same dirt he held to have grimed the hands of the defendant railroads. All he held was that subjectively the truckers had no injurious intent. This is perhaps the only equity suit of record in which plaintiffs have had their dirty hands excused merely upon their profession that their hearts were pure. I conclude that perhaps condensation, as well as democracy, can be manipulated.—Yours faithfully, SIDNEY S. ALDERMAN
Washington

Bolivian Development

SIR—In the first paragraph of a letter in your issue of December 21st, Dr Keenleyside misquotes my words and then hints that I am prejudiced; but neither he nor Mr W. W. Morton (in your issue of December 7th), who also served in the UN team in Bolivia, deny that the republic is worse off today than when the technical assistance programme began seven years ago. This failure to come to grips with economic decline they qualify or think excusable. It may well be so—though they say it "as shouldn't"—but it does not disprove the point which was the only object of my letter of November 30th, namely, that the Bolivian case cannot reasonably be cited to justify a repetition of the experiment in the "new democracies." These, as you say in the article "How to Guide a Democrat," need top-level consultant engineers and advisers. I wrote also to point out that this country specialises in that type of service, and it will be a double injustice if they are to be ousted by international civil servants. That is what the Bolivian case demonstrated.

By "fettered and distracted" in the choice of personnel, I meant that the UN must give ear to all member countries with equal attention—a criterion inimical not only to the optimum in forming technical teams, but (alas) also to the evaluation of their performance.

To take care of its vital duty of international conciliation the United Nations needs all the prestige it can get: whilst that issue is so much in doubt it should risk no credit in sideshows.—Yours faithfully, J. GARNETT LOMAX
London, S.W.1

BOOKS

Banking Colossus

Lloyds Bank in the History of English Banking

By R. S. Sayers.
Oxford University Press. 381 pages. 35s.

THIS book is not to be taken lightly. Its bulk and weight alone determine that; the style of its content adds emphasis. For it is not always easy going. Indeed the earnest reader, plunged into the opening chapter, must wonder what is in store as Professor Sayers skips hither and darts thither, picking up pieces of the jigsaw puzzle and letting them fall again with bewildering rapidity. Here, as also in the final chapter, the crying need is for a chart, or series of charts, to show amalgamations of the vast number of small banks that welded themselves into the present giant institution.

This is not a banking history on the lines of the classic accounts written twenty years ago. Mr Sayers has tended to use the records of Lloyds Bank to supplement existing knowledge. This has to some extent been forced on him by the absence of records lost through "the salvage campaigns of two wars and the bombs of one." The effect, however, has been to upset the balance. Great detail, testifying to the intensive research that has preceded the writing of the book, is mingled with sparsity; and one must wonder whether a whole chapter devoted to two West End banks is not a disproportionate use of space, despite the considerable interest attaching to Cox and Co., as army agents, and to Herries, Farquhar and Co. as pioneers of travellers' cheques.

There is, as one would expect, much of value to the student and much to absorb the general reader. The story really develops from the foundation of Taylors and Lloyd in Birmingham in 1765, although at least two banks later absorbed reach back to Restoration London. At that time banking was often the ancillary business of traders, manufacturers and mining concerns; the inspirer of this bank, Sampson Lloyd II, made his money from the iron trade. Ten years after its formation, the bank had as its customers a wide variety of tradesmen; and an interesting sidelight on social conditions then current is that women customers numbered twenty-five per cent of the total.

The history of an institution such as Lloyds Bank must develop from the personalities of its leaders and the efficiency of their staffs. The Lloyd family itself has been rich in men of acumen, drive and discretion. Sampson Lloyd II, a Quaker, married twice, and both marriages contributed to the second generation of bankers; it is probably because of the particular genius of one of his sons, Charles, that the bank survived to its present eminence. He was the dominant figure at the end of the eighteenth century and the beginning of the nineteenth. An outstanding personality of a later generation was Howard Lloyd, general manager from 1871 until 1902. Under his guidance the bank blossomed forth into a system of many units, although surely Mr Sayers errs when he says that during these thirty-one years it was "transformed from a private bank with a single office into a joint stock bank with 267 branches"; the bank had already begun to digest other banks before 1871.

Lloyds became a joint stock company in its centenary year, and thereafter amalgamations and absorptions took place rapidly; gradually the hub of the bank moved from Birmingham to London. It was indicative of the bank's growing national importance that Spencer Phillips, chairman from 1898 to 1909, became the first to use the annual meeting as an occasion for substantial commentary on the economic affairs of the nation. His predecessor, however, had in 1891 struck a note that every banker today will echo, for he told the annual general meeting that he did "not believe that a Chancellor of the Exchequer or any other government officer can manage our business half as well as we can manage it ourselves." *Plus ça change. . . .*

The book has two serious shortcomings. First, the story virtually finishes about 1923. There are only fleeting references to later happenings; the consolidation after amalgamations ended and the developments in techniques and practice in changing decades, of supreme interest to all categories of readers, are shunned. Secondly, it does less than justice to the proud institution whose story it sets out to tell. It lacks comprehensiveness. The jigsaw is not made in its entirety, and the complete picture is not seen; only certain parts of it. In all fairness to the author, he could not be expected to assemble and evaluate material that was lost; but one wonders whether, in being enabled to write about "what I liked and in the way I liked," he has made the best use of available data. He has indeed brought a scholarly approach to his subject. At the same time he has shown a clinical detachment, and there remains a final feeling of regret that the writing of this history was not entrusted to someone, possibly in the bank itself, who would have been less dispassionately disposed to the institution and who would have infused warmth, colour and virility into a story that is well worth telling.

Economic Breakthrough

Studies in Economic Development

By Alfred Bonné.
Routledge and Kegan Paul. 294 pages. 32s.

An International Trade in Managerial Skills

By J. S. Fforde.
Blackwell. 153 pages. 18s. 6d.

The Political Economy of Growth

By Paul A. Baran.
Calder. 308 pages. 30s.

HISTORY never quite repeats itself; the problems faced by the underdeveloped countries of the mid-twentieth century are not identical with those which confronted Britain when first launched on the rapids of the Industrial Revolution. Yet there are enough common elements (demographic explosion; dire physical poverty made less tolerable by insecurity, social uprooting, and the spectacle of widening inequality; political tension; conflicting ethics and analyses) to give meaning to the question "What did eighteenth and nineteenth century Europe have that Asia, Africa and Latin America have not?"

Professor Alfred Bonné's "Studies in Economic Development" asks it almost in so many words; he concludes that the crucial lack is the tradition of innovating entrepreneurship. Given a sufficient entrepreneurial leaven (and the necessary conditions of peace and security under the law) development is self-sustaining and, despite fluctuations, cumulative; failing that leaven, stagnation continues in the economy at large, whatever may happen in the enclaves of foreign enterprise geared to the foreigner's requirements. To get development going, enterprise must be "implanted"; the state must play the entrepreneur's part. The immediate results may be, indeed probably will be, uneconomic; hope lies in the educational effect as managers learn to manage, technicians practise their skills, and workers acquire the necessary habits of regularity and co-operation.

"Implantation" alone is not enough. There must be due attention to the "infrastructure" of education, health, communications, transport; natural leanings towards the spectacular (which is apt to lead to the neglect of agriculture) must be firmly resisted; social obstacles must be firmly tackled—traditions of graft and nepotism, immobilism or nomadism, obsolete systems of land tenure and the power relationships accompanying them; there must be a proper concern for particular local circumstances. But if these conditions are fulfilled, "implanted" development will put down roots and achieve independence of state support. Because of the initial sacrifices involved, the extreme difficulty of forming capital out of an inadequate margin of resources, and the growth of population, aid from the wealthier nations is imperative; but there is no need to envisage a permanent parasitism. Given a concentrated effort, the newly developing areas should do

better, not worse, than the Europe of the Industrial Revolution.

For all its "ifs," this is a stimulating and fruitful thesis. Unfortunately, it is embedded in a forbidding mass of ill-digested, ill-presented, and frequently incompatible material. Statistical tables contradict one another and the text; far too much evidence, presented as contemporary, is out of date. The book appears to have been written around 1951, far from adequately revised about 1955, and becalmed in the press ever since. (The Indian First Five-Year Plan is enthusiastically described, so is the Turkish development programme; of the consequential difficulties besetting both countries for the last two years, not a word.) Along with much repetition there are yawning gaps; nothing on the Colombo Plan, nothing on FAO's Technical Assistance. The style is tortuous, verbose, often ungrammatical, sometimes downright incomprehensible. All this is the more a pity since Professor Bonné has long, if geographically limited, firsthand experience of his subject.

How would nineteenth-century Britain have fared had it been able to draw on the expertise of twentieth-century technicians and managers from, say, America? Chasing such a hare is a luxury; and in any case the parallel for many of the underdeveloped areas is rather with the England of Edward III than with that of 1750-1820. Mr J. S. Fforde has produced an interesting and practical study of the various ways, ranging from individual recruitment for a once-for-all advisory job, through "joint enterprise," to permanent establishment of agencies and firms, by which British expertise can be put at the disposal of newly developing countries and used to foster their own citizens' advancement. He has much that is both sensible and humanly perceptive to say; but his anxiety not to offend anyone anywhere is so extreme that the reader unable to translate, from experience, his anonymous generalities and abstractions into concrete terms may well be thoroughly baffled.

Professor Baran's book is a predictable piece of Marxist orthodoxy, giving the characteristic impression of having been written under dictation from a public address system.

Sound and Fury

Warwick the Kingmaker

By Paul Kendall.
Allen and Unwin. 365 pages. 30s.

THIS is a companion volume to the author's "Richard III," and it is described by the publishers as "every bit as colourful and dynamic as its predecessor." In this they do the book some injustice. The earlier work was swollen with an unendurable rhetoric which has here somewhat abated. There is, it is true, an ominous admission by the author that he has "fleshed out scenes, here and there, with touches of detail which, if not documented for the particular moment, are vouched for by the general customs of the age," and this process of "fleshing out" seems to require a remarkable repertoire of such sentences as:

> The changing times in their working had cast up brilliant personalities to flash in the sunlight of power, but these for all their flamboyant wills, were struggling in the grip of vast nether tides that would sustain some and pull others to destruction.

But in general we must note with pleasure a greater sobriety of language than before, and a more straightforward treatment of the sources. There are no enigmas, real or supposed, in Warwick's career at all comparable with those in the career of Richard III, and our credulity is never strained by fanciful theories to explain his actions. This of course means that Warwick is a less interesting subject, and he remains a man of tinsel to the end.

There is insufficient attention to the governmental problems of the day, to Warwick's real difficulties and material interests; everything moves too much on the plane of pageantry to be convincing. Indeed, so far as the facts of Warwick's life are concerned, it is hard to find anything here which was not duly and drily set out by James Tait in a dozen pages of the "Dictionary of National Biography" sixty years ago. The rest is largely sound and fury. These qualities certainly played a considerable part in the life of the Kingmaker and cannot be ignored, but they quickly become tiresome. The reader longs for some "penny plain"; but having bought his "twopence coloured" he must go through with it to the end. And those who like it that way will no doubt enjoy this book as much as they did the previous one. Nor can anyone be so churlish as not to enjoy the portrait gallery provided by the illustrations. They are the heralds of a great age in the exact observation of the human features, and our regrets are therefore all the greater that Warwick's face, like his character, should be lost to us.

Brought up under Stalin

Child of the Revolution

By Wolfgang Leonhard.
Collins. 447 pages. 25s.

THIS is not yet another book in the series about the God That Failed: Mr Leonhard did not play with communism. He was brought up in Stalin's Russia. Taken to Moscow—from Germany via Sweden—at the age of thirteen, he lived there first in a school for German refugees and then in Russian institutions. Though he was deported to Karaganda at the outbreak of the war, he was shortly after selected for the comintern school (described as a sort of college for red monks) and went back to Moscow to write and broadcast for the German troops. At the age of twenty-three he travelled back to Germany on Herr Ulbricht's staff. He seemed destined for a brilliant career. Yet five years later, in 1950, he escaped from Eastern Germany.

It is not easy to pin down Mr Leonhard's break with Stalinism to a single cause. What makes his book most interesting is that he does not repudiate his former beliefs wholesale, but describes events as they looked to him at the time. He lived in the Soviet Union through the bloody purge of the thirties (his mother was actually sent to a camp); he saw the nauseating zigzags and injustices of stalinist policy. Yet, at that time, he was able to justify them to himself. The blind copying of the Soviet model in Eastern Germany had a more profound effect on the young communist official, and the expulsion of Jugoslavia from the Cominform dashed his hopes that east European countries would be allowed to follow their own road. It was then that he decided to leave.

Impressions of the Soviet world run the risk of being quickly out of date. Some of the things that had shocked the author were subsequently repudiated by Stalin's successors. Even the idea of "separate roads to socialism" was once again revived. But Mr Leonhard's vivid personal reminiscences help one to understand the background to these changes. He shows that western propaganda—using a different language and concerned with different problems—makes no impact on doubting communists. He confirms the view that the communist countries will have to work out their own salvation.

Viceroy and Mahatma

The Viceroyalty of Lord Irwin 1926-1931

By S. Gopal
Oxford University Press. 152 pages. 21s.

Talking of Gandhi

By Francis Watson.
Orient Longmans, Calcutta. 141 pages. Rs.6.

LORD IRWIN took office at one of the most turbulent periods of the nationalist struggle. The end of his predecessor's term had seen a widespread revolt against Dyarchy. The arrival of the Simon Commission to report on further constitutional development let passions loose that evoked answering warmth in the rank and file of the administration. Mahatma Gandhi initiated the boycott of British goods and awoke the masses to political consciousness by his dramatic pilgrimage to the sea to distil salt illicitly, followed by the civil disobedience campaign. Conditions for constitutional advance could hardly have been worse, and if Lord Irwin had contented himself with maintaining order and marking time politically, his reputation would not have been diminished. Instead, he brought off the apparently impossible. For while he enforced law and order and gave the police and the civil service all the support necessary to maintain their morale in trying circumstances, simultaneously he sought with unflagging patience and determination to secure a political settlement. In this, his statesmanship was matched by that of Mahatma Gandhi. What the "half naked faquir" and the British aristocrat had in common was integrity of character, honesty of purpose, and a deep conviction of the importance of spiritual values.

Mr Gopal's readable and scholarly pages suggest that the measure of the greatness of the British viceroy and of the Indian leader lay in two facts: first, each was ready to face courageously the hostility of his own people, and to risk being disowned by them, in order to secure acceptance of the settlement to which he had set his signature; secondly, the settlement contained the embryo of the Government of India Act of 1935 on the foundations of which the structure of independent India was raised in 1947.

That there should have been published within a few days of each other this scholarly appraisal of a great Englishman by an Indian historian, and an outstanding contribution* to the understanding of Mahatma Gandhi's personality and work by a British biographer, is surely concrete evidence of the continuing fruitfulness of the Indo-British partnership.

* To be published in Britain by Longmans in a few months.

Crown and Parliament

King and Commons 1660-1832.

By Betty Kemp.
Macmillan. 168 pages. 16s.

THIS account of some involved passages in the history of the British constitution is presented by Miss Kemp so simply that the complexities of her task remain out of sight. She has restricted herself to a skilful study of one aspect of the development of the machinery of government: the relations between the monarch and the House of Commons from the restoration of Charles II to the Reform Bill. There is comparatively little on the seventeenth century; Charles II and James II preferred ruling without a parliament at all, and William III, leader of his own administration, was preoccupied with the struggle with France. In Miss Kemp's opinion, the accession of George III brought the power of the king and the power of the Commons into balance. She finds the Septennial Act of 1716 of cardinal importance, for it made a seven-year duration for each House of Commons not only the House's legal term, but something that its members soon came to expect as their right: not till 1784 was a House next dissolved before five years, at least, had gone by without a general election. Indeed, as she points out, a Hanoverian king would not as a rule dissolve parliament in order to suit his ministers; he preferred to dissolve his ministries in order to suit his parliament.

This leads Miss Kemp to a discussion of the number and role of "placemen" in the eighteenth-century Commons. These "King's friends," though a necessary prop to any government, were not always a sufficient one, for

> The grant of an office was regarded, on both sides, as a reward for services rendered, not as a guarantee of firm support in the future . . . they were not a political party and they were not united in support of a particular policy.

However, most of the places which these placemen held were abolished, or made incompatible with membership of parliament, in the last fifty years of Miss Kemp's period; as she reminds her readers, these were in fact fifty years of substantial administrative reform, designed to promote efficiency.

Short though this book is, it is somewhat repetitive; and it would have benefited from fuller treatment of the financial questions that came in the end to subordinate the king to the commons. The style is usually clear, but there are some constructions, such as "the development towards . . . the abandonment of the idea that . . .", which must make Fowler turn in his grave.

Russia Left Dark

The Soviet System of Government

By John N. Hazard.
The University of Chicago Press. London: *Cambridge University Press.* 267 pages. 30s.

IN his introduction to this, the first volume of a new series, the Chicago Library of Comparative Politics, its general editor Professor Roy Macridis makes an astonishing statement. He says that those writing in this "field have tended to shy away from generalisations and hypotheses and to avoid interpretative studies of the dynamics of a system." This suggests either that Mr Macridis has a rather limited acquaintance with the literature, or that he has an arbitrary concept about what the field of comparative politics may be. It is true that Professor Hazard provides one generalisation that is intended both to assist an understanding of the Soviet system and to enable the phenomena it exhibits to be used for comparative purposes. He considers that the best way to look at the system is to see it as a democracy into which a number of undemocratic "counterweights" have been introduced in order to prevent it from getting out of the control of the leadership.

But this does not get us very far forward compared with more conventional explanations, and one suspects that the real reason is that the dynamism of the system, which consists in a three-way play between the forces of ideology, personality and social development, can best be explained historically, and that history is anathema to the political scientists of the stricter American school. The omission of Mr E. H. Carr's four volumes from a bibliography specifically limited to works in English is perhaps significant. More significant still is the fact that when Mr Hazard is forced by his material to handle it historically, he does so with such obvious lack of ease as to distort the whole purport of what he is trying to convey. This is equally true whether he is dealing with the establishment of the original central institutions, the development of management and control in industry and agriculture, and disputes over the role of the trade unions or the nationalities question.

Mr Hazard enjoys a deserved reputation on the basis of his studies of the social material provided by Soviet court proceedings, and he is most successful in the present volume when dealing with aspects of Soviet affairs that can be dealt with through such material or through that provided by the interrogation of Soviet defectors. But little of this material is relevant to the study of the "system of government" as this phrase is usually understood. Here the material which would permit an intimate study is admittedly difficult to come by and interpret; but there is at least the foundation provided by the basic legislation of the Soviet state and by its major policy statements, and this has been inadequately assimilated. The book would not, for example, give much help to a student trying to disentangle what is serious in Khrushchev's programme of industrial reorganisation, nor assist him in using the budget as a method of interpreting economic or political trends. Indeed, except in relation to Soviet "federalism," finance goes unmentioned; the novice might believe that the Soviet citizen was not a taxpayer at all. Similarly, the nature and conditions of employment in the state bureaucracy appear only as a parenthesis in the discussion of education.

Generalisations and hypotheses may be as fruitful in politics as in other studies, but the prerequisite of comparative work is to establish the facts. It may be that the space allotted was insufficient; it may be that the elimination of footnotes allowed the author to rely on his memory when establishing a reference would have put him right; it may simply be that Mr Macridis chose the wrong author. Before this ambitious series gets much further he would be well advised to think again.

Individual in Society

The Tension of Citizenship: *Private Man and Public Duty.*

By H. Mark Roelofs.
New York: *Rinehart and Co.* 278 pages. $4.00.

FROM the history of western political theory, from Aristotle to St. Augustine, Professor Roelofs unravels three notions of citizenship which, he contends, flow continuously into modern democratic theory. These are the Greek idea, which presupposes full and active participation in communal life; the Hebraic, assuming loyal service of the community; and the Christian-Roman idea, involving the two divergent notions of individual privacy, or "inner life," and membership of a universal brotherhood of man. Whereas the first two bind the individual to the community, the third insists upon some measure of independence for each citizen from his community. From the interplay of all three concepts can be evolved, he asserts,

a sound theoretical basis for reconciling the tension between public and private duties of men in modern democratic society.

There is little original in this analysis. It is a more portentous way of describing what has often enough been described as a dual necessity to consider "man in society" and to respect individual freedom. Thus far the argument is little more than a peg on which to hang an account of the not unfamiliar evolution of political ideas before 1500. It has point only if, by applying the results of this analysis to modern society, a more comprehensive theory of democracy can be devised. This is what Professor Roelofs attempts in the second part of the book. But because he skips much too lightly over the really formative period of modern democratic ideas in the seventeenth and eighteenth centuries, and even in the more interesting discussion of American individualism fails to apply his argument with enough rigour or in enough concrete detail, his whole thesis largely misses fire. The book contains some insight, a good deal of learning, and an obvious sincerity of purpose. The questions it raises are usually the right questions, but the answers to them are too often tenuous, unconvincing or trite. It is less by historical description of origins and evolution, and more by practical ingenuity and development of social organisations, that modern democratic principles are likely to evolve in the twentieth century.

Faith Undiminished

A New Birth of Freedom? *World Communism Since Stalin.*

By K. Zilliacus.
Secker and Warburg. 286 pages. 21s.

On finishing this book it is tempting, although unkind, to reflect that it cannot have been very hard work to write it. For Mr Zilliacus quotes profusely and at length from the communist press and from the speeches of communist leaders. He also fills up a great deal of space with lengthy summaries of what Mr Khrushchev, Marshal Tito and other leading communists told him when he paid a round of visits to Moscow, Belgrade, Prague and Warsaw (but not Budapest) in the autumn of 1956. Some of these talks are quite interesting as far as they go. But there is little in this book about developments in the communist world that a reasonably diligent reader of the daily press would not already have learnt for himself.

What the book provides is a view of these developments as seen from Mr Zilliacus's own particular slant. He himself says, rather disarmingly, that the sensible reader of any controversial book tries to discover the bias of the writer. His own bias is well known. In this book, under the impact of the 20th Soviet congress, it emerges in a rather curious and elliptical way. Mr Zilliacus has seen the light about Stalinism and roundly condemns all its manifestations. He acknowledges the lack of freedom and political democracy in the communist countries and states fairly the communists' dilemma—how to give more political freedom without jeopardising the monopoly of power of the communist party.

But he remains extraordinarily optimistic about the future of communism. And he makes the astonishing assertion that what the West really objects to about communist countries is not that they have produced "some pretty horrifying police regimes" and failed to develop democracy, but "the fact that they are building a new society"; he maintains, moreover, that these societies have "enormous vitality" and that those who are building them "are sustained by a power of faith that cannot be matched in the West." Mr Zilliacus, who has drawn such comfort from destalinisation and the 20th Soviet congress, really should not turn such a blind eye to the lessons of the Hungarian revolt.

SHORTER NOTICES

Histoire des Relations Internationales: *Vol. VII. Les Crises du XXème Siècle. I. 1914-1929.*

By P. Renouvin.
Hachette, Paris. 384 pages. 1,200 francs.

The latest volume in Professor Renouvin's series, and the third to be contributed by the general editor himself, is written with the same clarity and economy as its predecessors, and makes use of the same wide range of monographic material in many languages. It is confessedly a textbook rather than an essay at personal interpretation; but there are very few good textbooks on the period—the common tendency to begin with 1919 instead of 1914 is very noxious from the teaching point of view—and Professor Renouvin's book should be welcome to undergraduates and their teachers. It devotes less space to institutional arrangements, and more to economics and diplomacy, than most Anglo-Saxon works on the League period, but this is not necessarily a fault. It also makes plain the impact of world developments upon European politics; but the author's treatment of Soviet-German relations, written without the benefit of Dr Gerald Freund's recent book, is insufficient on the military side.

Bank of Canada Operations 1935-54: *No. 5 Canadian Studies in Economics*

By Dr E. P. Neufeld.
University of Toronto Press. London: *Cumberlege.* 230 pages. 30s.

This succinct and enlightening survey of how, since its inception in 1935, the Bank of Canada has attained its present importance fills a long felt gap. Beginning with a penetrating analysis of the bank's position "in a system of responsible government," Dr Neufeld goes on to an equally revealing discussion of its objectives, and the techniques it has used in attempting to realise them. He traces the evolution of the bank's policies and operations through three periods. Before the war there was no conflict between the three major responsibilities of the bank as fiscal agent for the federal government, as public debt manager, and as monetary manager. During the war years all aspects of policy were subordinated to the necessity for "channelling real resources to the war effort." In the postwar period "harmony between debt management and monetary management ceased to exist" and the bank had to adapt its policies to an unprecedented situation of full employment and inflationary problems.

The bank's operations have been remarkably effective subject to limitations imposed by Canada's close relationships with the United States, involving as these do formidable capital movements, balance of payments problems and exchange rate complications. This careful analysis of the way in which the Bank of Canada forged "appropriate tools" and established "essential prestige" for its work will be of great interest to anyone concerned with current Canadian financial and economic problems, and it adds a useful and illuminating chapter to the literature of central banking.

Annual Abstract of Statistics No. 94 1957

Central Statistical Office.
Her Majesty's Stationery Office. 322 pages. £1 1s.

Unchanged in price since 1952, this new volume of British statistics contains as usual a wealth of information on subjects such as population, social services, employment, production, trades and the various financial fields. Most tables give figures for postwar years up to 1956 and, where possible, a prewar year is also included. Few changes in content have been made since last year's issue, but a new table showing annual average wholesale prices of a number of commodities since 1950 is to be welcomed.

OEEC PUBLICATIONS

The Network of Intra-European Trade

Trade by Product in 1956

A basic document for any study of the Free Trade Area and the Common Market proposals. It shows, product by product, the trade in 1956 of each of the countries concerned, with each of the others. Figures are also given for the six Common Market countries combined and for the Free Trade Area as a whole. Both values and quantities are given. Additional tables show the extent of the European trade of each country in relation to its total trade.

216 pages Price 18s. (*post* 1s. 3d.)

Use REMINGTON 'Know-how' to solve your accounting problems

FOREMOST is adaptable to every accounting operation; fully electrified, it performs its computations automatically.

REMTIMATIC brings mechanised principles to any manual accounting operation—simply and inexpensively.

Is your Accounts Department fully up-to-date? Why not take advantage of the Remington 'know-how'? This 'know-how' is unique, in that it enables British businessmen to profit from world thinking and experience. For Remington Rand, London, is the clearing house of the latest ideas in business systems and techniques, collated from plants and laboratories and field experience in 41 countries, developed and adapted to British needs. This is why Remington Rand alone can offer so wide a choice of the most advanced Accounting Machines, each the result of world research and testing. One of them is certain to be made-to-measure for *your* business. To find out which it is, send for the Man from Remington Rand. He will survey your accounting problems and suggest the practical solution—without obligation.

Also available are FRONT FEED TYPEWRITERS, where the accounting needs do not warrant an accounting machine, and STERLING ADDERS to suit every adding/listing application.

THE 99 PRINTING CALCULATOR gives printed proof of accuracy of any operation involving addition, subtraction, multiplication or division.

AMERICAN SURVEY

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Exploding Cities

FROM A SPECIAL CORRESPONDENT

Of the many explosions during the past ten years it is the least earsplitting which has had the most profound effect on the life of the average American. This "metropolitan explosion," almost unnoticed until recently, has left cities blighted, set off a mass flight to the suburbs, made the motor car an essential of existence and raised the "urbanite" proportion of the population to 65 per cent of the whole 170 million. But the last year has yielded a crescendo of warnings about the dire effects of unplanned growth and brought metropolitan disintegration into the national spotlight.

The rapid and haphazard urbanisation of today is threatening two cherished American institutions: the small town and the wide open spaces. While the American welcomes the amenities of the city, his way of life has always been somewhat wistfully oriented to the small town which originally gave it birth and which since then has given shape and impetus to the suburban dream. But nowadays the urban refugee will quite possibly find himself in the next city before he has achieved the green periphery he is seeking. Towns have become cities overnight and, along the east and west coasts and in heavily populated areas in the middle west, cities have spilled over their boundaries and are growing together to form "urban regions." In the past the recognised urban unit has been the standard metropolitan area, consisting of a "core" with 50,000 or more people and the surrounding counties which are integrated with it for administrative purposes. Actually this may add up to several large cities and include parts of several states as it does most obviously in the New York metropolitan area. The urban region is an amorphous agglomeration of two or more adjacent metropolitan areas which, however, are unintegrated and form no political or administrative unit. Of the nineteen urban regions, the largest stretches continuously along the northeast coast to form a single 600-mile linear city, over-riding boundaries and scrambling existing resources, facilities and jurisdictions. Covering 5 per cent of the area of the country, it houses 20 per cent of the population.

The prodigal using up of land, when the vertical city topples into the horizontal suburb, is robbing Americans of the reassuring certainty that, if progress gets out of hand, there is always the possibility of making a fresh start in the wide open spaces, a luxury now disappearing at an estimated rate of 1.1 million acres a year. Before long their dinner tables may also be robbed, for the growing population will have eaten up the surpluses of farm products—or so some prophets predict. Speculative real estate practices often mean that it is the best farm land which is used for housing developments, and highways are covering crops with concrete. A factory or government office when laid out flat in the suburbs, with adequate parking space, may require 30 times as much land as before, and the former occupants of a block of apartment houses can fill a development covering miles. Three million more people and a million more houses in the United States every year are dynamite when at the same time cities are crowded and the cost of living in them is becoming astronomical. From 1950 to 1956, the population of the suburbs grew six times faster than that of the almost static central cities, and since 1954 almost 70 per cent of all permits for housing and industrial building have been for the suburbs.

It is the automobile, however, that really set off the metropolitan explosion and that is now compounding its problems. The volume of traffic on city streets, up 70 per cent since the war, is choking urban centres. Outside, where two cars to each family is almost a necessity, every mile of super-highway swallows 50 or 60 acres, and every foot of length added by the car manufacturers adds miles to the bumper-to-bumper traffic jams which frustrate commuters and police daily. It has been found that in some areas, notably Los Angeles, more highways generate more traffic instead of alleviating congestion. At a recent symposium an impressive array of experts laid stress on the importance of relating the new federal highway system to metropolitan planning, now lagging far behind. Finally, the automobile has crippled the city by carrying off the cream of the taxpayers to live in the suburbs.

Many of the difficulties which plague cities today stem from the exodus of the middle class with its resources of money and leadership and the influx of low-income families and minority groups with their expensive problems of social welfare. Speculators and landlords have kept the values of city properties artificially high, thus forcing up the density of population in slum areas, making it difficult to do business profitably in decaying commercial districts and increasing the cost of slum clearance programmes. Industrial and commercial enterprises have followed the well-to-do private residents, seeking lower costs and more space on the outskirts of the city. With higher taxes now yielding less revenue, the city has yet to assume increased responsibility for the whole metropolitan area and provide for the daily influx of commuters whose financial and civic allegiance is given to the suburbs.

The factors which have brought blight to the city are already sprouting outside where, like crabgrass on suburban lawns, they spread farther and faster. Where city land can absorb 400 to 500 people an acre, a density of 100 in the suburbs may produce slums, and the uniformity of a housing development tends to hasten its deterioration. Suburban communities have been unable to revamp their often rudimentary governmental machinery and increase their borrowing authority fast enough to assimilate and provide facilities for the deluge. In one suburban area, the population grew

by 38 per cent in seven years, while the indebtedness of the local government jumped by 232 per cent. Satellite communities fight with each other and with their parent cities to attract lucrative but well-mannered industries, so that soaring taxes on residential property can be stabilised, while at the same time pressure mounts for the land to be kept clear for parks and playgrounds.

Meanwhile high government officials are meeting informally under presidential auspices to seek methods of solving the knottier metropolitan problems; among authoritative suggestions made during 1957 for dealing with the threat of an asphalt jungle was one for a "nation-wide urban planning project" to consider the tangled developments which are making American cities "obsolete" and another for a Federal Department of Urban Affairs headed by a member of the Cabinet. The existing Federal Housing Administrator has warned cities that, if they have not made an urban renewal plan by 1960, they will be facing municipal bankruptcy by 1965. Delay in tackling slum, traffic, revenue and other crucial matters accelerates not only the process of disintegration, but also the loss of the resources without which it cannot be fought.

Much of the apathy about the metropolitan explosion is often attributed to the supposed American aversion to planning anything not dedicated to a specific purpose; no one has apparently decided what the purpose of a city is. Now, however, the idea seems to be taking hold, both in print and in concrete, that it should be a cultural centre attracting the intellectual and artistic flower of the nation to a Utopian existence. Some cities have made impressive starts on urban renewal along these lines and on the construction of inspiring city centres. Given enough enthusiasm, the American city could presumably become as efficient and decorative a machine as the automobile.

This is the first of a series of articles; others will describe in more detail some of the administrative and social questions arising from the way in which the United States is outgrowing its cities.

Fire under the President

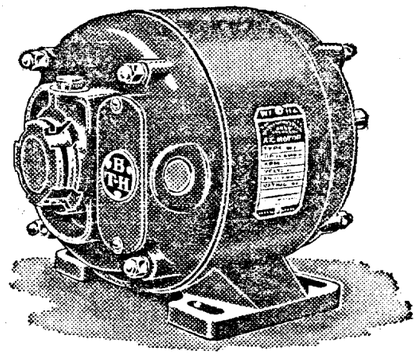
HOWEVER useful the President's trip to Paris may have been, his appearance on television with Mr Dulles on his return was a sad anti-climax. If the purpose was to show the President in full control of American foreign policy, it failed lamentably. Mr Eisenhower was cast in a minor part, as a self-conscious listener to one of the Secretary of State's less inspired scripts. The let-down was all the greater because of the expectation that the President might use this occasion to tell Americans what they must do, and even do without, to catch up with the Russians. This expectation owed a good deal to the Gaither report, a sizzling document on the future defence of America which was submitted to the National Security Council on November 7th, and which has been smouldering ever since. As a top secret NSC paper, not even the Senate sub-committee can, technically, be allowed to see a copy. But Washington being what it is, and the men who wrote the report being determined that it should not be buried in the files, most of its sensational conclusions have now leaked to the press.

The influential businessmen and eminent scientists who unanimously agreed on the report cannot be altogether brushed aside; they have the ear of the Vice President and much support from enlightened members of the financial community who have been among the President's strongest supporters. But the White House may fairly complain that the Gaither group exceeded its brief, which was to make recommendations about atomic bomb shelters. Broadening its task almost beyond recognition, it concluded that the Soviet Union stands a good chance of gaining such a military lead by 1961 that it could then destroy or neutralise the United States. To prevent this, the report demands sharp increases in military spending, rising from the present $38 billion a year to $46 billion by 1960, and many other costly programmes besides. Next week the first of a series of private Rockefeller studies will also conclude that the United States is in "mortal danger" and will recommend big increases in defence spending.

The President is said personally to favour a big bold programme, but to be convinced that the country would never foot the bill unless it were gripped by war fever or the kind of panic that the publication of the Gaither report might produce. But now that its main conclusions are known, the President will be expected to discuss them candidly next week in his Message on the State of the Union. He will have to be convincing if Congress and the country are to accept an increase of $2 billion or less in defence spending as adequate, particularly after this week's statement from Mr Wilson, the former Secretary of Defence, that Mr Eisenhower himself insisted on past economies because he feared political trouble.

Dollars for India

WASHINGTON, DC



ALTHOUGH there is strong support within the Administration for providing substantial help to save India's second five-year plan, it has been decided that it would be unwise to put a special "aid-to-India" Bill up to Congress. Not only might it be defeated but, even if it passed in some form, this might be only after a rancid debate that might destroy the good will the Bill was expected to create. Furthermore, the Administration would find it very embarrassing to explain to a stout military ally such as Turkey, which has recently been told that it was impossible to put a special $300 million aid Bill through Congress for its benefit, why neutralist India had been able to talk its way to the front of the queue.

India's needs are too great for more than a relatively small part of them to be met out of the Development Loan Fund, which Congress created last spring, but to which it gave a first instalment of only $300 million. The present policy, therefore, is to scrape together a bundle of small subventions: $100 million, perhaps, from the loan fund; a second substantial slice of surplus American food, with the rupees generated from its sale lent back to India for development; and a loan from the Export-Import Bank. The proposal to replenish the bank's resources by $2 billion, which the President announced at Paris, may enable the United States to do much more for India than has hitherto been thought likely. On the other hand, this expansion of the bank's activities may complicate the already uneasy relationship between the bank and the loan fund and endanger the latter's usefulness.

Seasonal Sailings save you £120 or more

A journey to 'Down Under' is a major operation to be planned wisely, economically and well beforehand. So choose your time, travel Boomerang and you can save at least £120 on the normal first class fare and even more if you return 'One Class'.
The P & O Boomerang Ticket means that by travelling out during the quieter times February to May and returning during September to December of the same year or next, specially reduced fares operate to your advantage. First class or 'One Class' you will find the voyage equally enjoyable.
The P & O Boomerang Ticket is a true case of time being money. So sail 'Boomerang'.

FOR SINGLE JOURNEY PASSENGERS Here's a suggestion. Travel during the months of February to May and you get more for your money. How? The first class accommodation is up-graded during the quiet season and you may have a wider choice of cabins at a lower rate.

P&O *Still the finest way to travel*

Your Travel Agent can help you with details or write direct to:

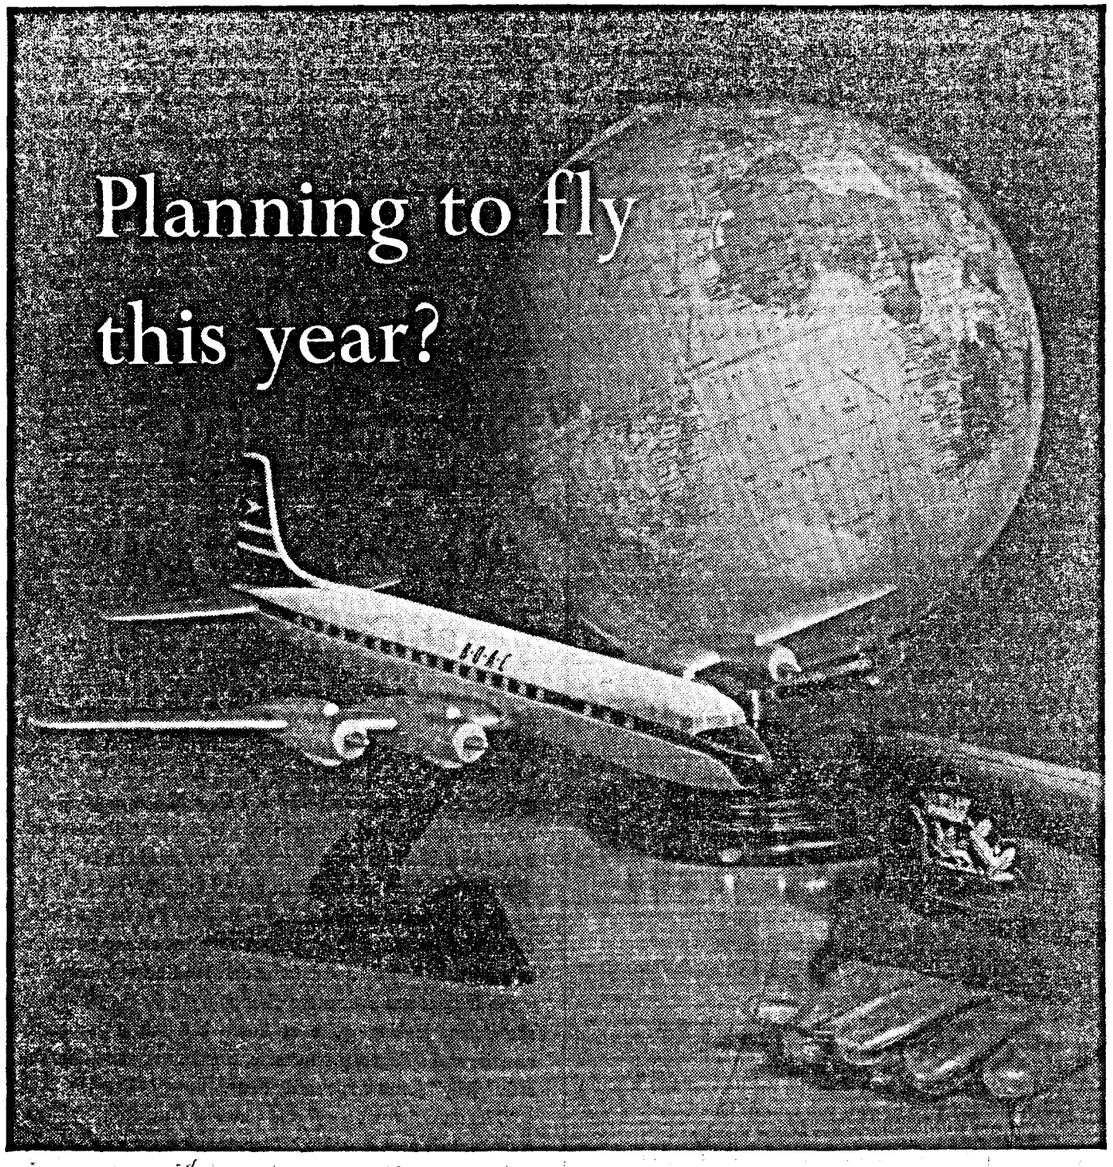
The Curious Affair at Curio Corner

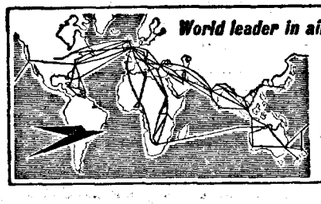
AUBREY CABRIOLE-QUINT loves everything that is old. Old houses—for he has restored Curio Corner (still known in the village as 'the old Rectory') to a more-than-Georgian splendour. Old furniture—for it brings him a more-than-modest income. And old-fashioned business methods—for he drives a ferocious bargain, and always deals in cash.



These amiable characteristics brought him to the notice of "Jelly" Jones, the celebrated safe-breaker. For he too loves old things—untraceable banknotes and all small and portable valuables. So he paid a visit (after dark) to Curio Corner.

No burglar was ever more disappointed. In the cluttered showroom, looking quite at home between a Jacobean armoire and a Regency rent table, stood a very new Chubb safe. "Jelly" Jones crept softly away.

"Not much harm done," said Cabriole-Quint to the police complacently next morning. "I long ago learned that there is nothing so worthless as an antique safe. Now excuse me—I must get some of the latest Chubb window catches."



Incidentally, you too can get Chubb locks and catches from most well-stocked ironmongers. For safes, fire protection equipment and the more specialised products of our art, seek out a Chubb branch office, or write to Chubb & Son's Lock and Safe Co. Ltd., 175-176, Tottenham Court Road, London, W.1. (MUSeum 5822).

DON'T LEAVE IT TO CHANCE

BRITISH OVERSEAS AIRWAYS CORPORATION WITH S.A.A., C.A.A., QANTAS AND TEAL

Unlike the bank, which raises its money from the Treasury at 3½ to 3⅝ per cent and lends it to foreign governments and private individuals at 5¾ to 6 per cent, repayable in dollars, the fund is meant to be a "bank of last resort." It is to make "soft loans" when money for promising projects in under-developed countries can be raised from no other source. Local currencies can be used to repay the principal—over as much as forty years—and the interest, which will normally be about half that charged by the bank. The money, unlike that advanced by the bank, which must be spent on American goods, can be used in the cheapest market.

The loan fund has only just begun to creak into operation with the appointment of Mr Dempster McIntosh as its manager. This is not a moment too soon, since Congress expects to hear what it is doing with its first $300 million before deciding whether to appropriate the rest of the $925 million authorised. For the first year, at any rate, this is likely to undo much of value of the main concession which a jealous Congress made to enable longer-term planning: that the fund need not spend all its appropriation in one year. Moreover, in the interests of political discretion, it will probably have to distribute its favours widely; India cannot be given the lion's share.

FORTUNATELY, since the visit to Washington of Mr Krishnamachari, the Indian Finance Minister, there has been a pronounced thaw in the mutual frostiness of India and the bank. Previously the bank had tended to think of India as a poor credit risk because of its unsympathetic attitude towards private enterprise, while India has looked askance at the bank because its loans involved the obligation to buy expensive American materials. But Mr Krishnamachari cannot now afford to be too choosy about the conditions under which he gets his foreign currency. During his visit, to avoid embarrassing his hosts, he did not make any formal request for a loan. Instead, he spoke quietly but impressively to groups of influential officials, businessmen and journalists. His was the "oriental soft sell," the opposite side of a coin more normally showing to Americans the Mephistophelian features of Mr Krishna Menon. While India's friends in the American press were still attacking the Administration for placing unrealistic emphasis on giving help to private enterprise, India's Finance Minister was telling his hosts that the help he was asking would mainly be directed into the private sector.

Evidently this has had some effect. A full-scale mission from the Export-Import Bank was due to leave for India on New Year's Day in order to survey the prospects. The interest of the bank carries two substantial advantages: it is the agency in the foreign field most likely to be given the full amount it needs by Congress, and its specific operations are not normally debated in detail. On the other hand, if the bank's field, which hitherto has been confined mainly to Latin America and Europe, is to overlap that of the loan fund, this may strengthen the natural tendency of Mr Waugh, the president of the bank, to urge cautious policies on the fund. He is in a strong position to do so since, to placate Congress, he was made a member of the fund's three-man loan committee. The early decisions of this body will necessarily be somewhat distorted by the need to make a good political record. But they will be critically scrutinised by all who are worried about the need for an effective answer to the Russian economic offensive.

Education for Survival

THE Russian moons have set a tide flowing which may at last float federal aid to education over the reefs of racial prejudice, indifference and political conservatism on which formerly it has come to grief. So, at least, the Administration seemed to feel when it gave priority this week, among its legislative proposals, to a completely new scheme which would emphasise students, teachers, and teaching, particularly in the sciences, rather than the school buildings for which aid has been asked, and denied, in the past. The whole four-year emergency programme would cost about $1 billion—a little less than was proposed for school construction—and $225 million or so would be spent in the next fiscal year.

Of the total, about a fifth is for direct federal scholarships. Ten thousand, worth about $750 each, will be divided among the states, according to population, in each of the four years and awarded to gifted high school students who otherwise could not afford to go to college. There will also be about 5,000 graduate scholarships to encourage scientists to train for college teaching, and matching grants for graduate schools. In awarding the undergraduate scholarships some preference will be given to students with a grounding in mathematics and the sciences, but the emphasis will be on further training for the gifted, whatever their speciality. Every year about 200,000 of the ablest high school students fail to continue their education. Federal help will also be forthcoming for centres to train teachers of foreign languages and for the expansion of the work of the National Science Foundation in improving the quality of scientific training, teaching, and research. The rest of the money—apparently about half the total—will go to states which are willing to spend an equal amount on tests to identify gifted high school students and persuade them to go to college, and on improving science teaching and laboratories and the salaries of science teachers.

This emphasis on participation by the states and on the purely temporary nature of the programme is to reassure those who genuinely fear that federal aid means federal control of education, and to disarm the conservatives who suspect that a new permanent load is being placed upon the Budget and the federal taxpayer. Such concessions may help the Bill through Congress, but they are a great disappointment to educators who had set their sights on a federal programme ten times as big, which would permit the doubling of most teachers' salaries. The present modest, piecemeal scheme seems likely to increase the demands on the colleges without helping them to find the teachers or equipment they need for the 3 million students who are already enrolled.

Wealthy—and Wise?

FORTY-EIGHT more voices have been added to the chorus of advice telling the United States how it should set about the tasks of the future. They belong to a distinguished panel of experts, from both America and abroad, who were asked by the Committee for Economic Development to say what they thought to be the most important economic problem confronting the country in the next twenty years. The CED, which is composed of 150 men and women prominent in business and education, aims to

encourage economic research and education and to guide American economic policy into what it considers to be paths of healthy progress. Its political centre of gravity lies probably in the Eisenhower wing of the Republican party; it was established partly in order to balance the conservative influence of the National Association of Manufacturers. The present symposium, which was conducted with the aid of a grant from the Ford Foundation, represents a collection of individual views, not a policy statement by the committee itself. The views it has sponsored, however, have a notably liberal ring.

More than a third of those who submitted papers said they thought that aid to poorer countries was the most urgent problem facing America. None, despite the clouds now hanging over the American economy, placed the possibility of a depression at the top of their list, and only eight were primarily concerned about the perils of inflation. A remarkably high proportion of the contributors put the emphasis, not on the preservation or expansion of the wealth of Americans, but on the need to persuade them to spend it wisely. Some of those who advocated foreign aid as the best outlet for American plenty showed awareness of the political problems that a prolonged distribution of *largesse* is liable to create. The fact that American dollars too often carry with them Americans, and at least the appearance of American influence, is a difficulty that has also been exercising the Administration. It is discussing whether it should replace a good many of the American technicians working on aid projects overseas with locally recruited substitutes; Mr Nixon is said to have decided on his recent world tour that the presence of some Americans caused more resentment than they were worth. American diplomats in Asia and the Middle East are said to be fighting his view.

Even among the CED's contributors who dwelt on American domestic needs there was a powerful body of opinion which thought that redistribution of riches, rather than their further accumulation, was the principal task to be tackled. Several papers urged that attention be given to the removal of the social and geographical "pockets of poverty" that survive in the United States and to the betterment of sprawling and congested urban areas. Declarations of this kind will give point to the growing sentiment that America ought to divert more of its resources from personal consumption to improving its public services.

Delay in Dallas

THE next crisis in the struggle over racial integration in southern schools had been expected this month, in Dallas, Texas. But now the Circuit Court of Appeals has delayed indefinitely the order, made last September by Judge Atwell, which required that Negro pupils be admitted to white schools when the next term began on January 27th. The Appeals Court decided that the 88-year-old Judge Atwell had acted hastily and unreasonably and that he had not fulfilled his legal duty of paying due regard to local conditions when he set a date for integration; he had held no hearings and had allowed the Dallas school authorities no time in which to prepare a plan for orderly integration—something which they say they will do by next summer. A disorderly failure to integrate might not have been unwelcome to Judge Atwell, who believes that the Supreme Court exceeded its powers and stepped from the legal into the sociological field when it made its historic ruling on the schools in 1954. His September order requiring immediate integration was issued in what looked like a fit of pique after the Appeals Court had reversed his two earlier refusals to force the Dallas authorities to integrate their schools.

About one-sixth of the 100,000 schoolchildren in Dallas are Negro; it is a place with a strong southern outlook but it is also a prosperous growing city, a financial and industrial centre of a wealthy state, which has had a heavy influx of new residents from the North recently. For this reason it had been regarded as a test case and also because, if the school authorities had been obliged to carry out Judge Atwell's order, they would have risked losing their share—about $1.5 million a year—of funds from the state. The legislature has decided that any school integration which has not been approved by local voters will be penalised in this way and the judge had allowed no time for the necessary referendum.

The Texas Legislature recently went even farther in its defiance of the Supreme Court and authorised the closing of any school where troops were needed to keep order, as they have been since last autumn in Little Rock, Arkansas. There the last of the regular soldiers were withdrawn over a month ago, but National Guardsmen—territorial troops—remain outside the Central High School and will have to stay, according to Governor Faubus, as long as the nine controversial Negro children continue to attend classes. But he has hailed the Dallas decision as showing a way out of the stalemate he has brought on Little Rock, for there the school board, itself quite ready for integration, never appealed for a postponement of the local court order which required that Negro children be allowed to attend white schools last September. Now, Mr Faubus thinks, the board should follow Dallas's example and appeal in its turn.

Oil for the Trade Act

PRESIDENT EISENHOWER'S Christmas present to Canada was hardly that of a good neighbour. By extending "voluntary" restrictions on imports of oil to the five western states on Christmas Eve he deprived the hopeful young petroleum industry on Canada's west coast of part of its nearest and most promising market—and one that had been expected to expand rapidly—in Washington and Oregon, states which produce no oil of their own. Not surprisingly Ottawa has protested bitterly against the new restrictions. Where Canada is concerned these cannot even shelter behind the excuse of being necessary to the national security for, in the event of war, Canadian oil would be as available to the United States as its own domestic supplies. Therefore, if imports are being curtailed, as is officially claimed, in order to encourage the development of plentiful reserves at home for use in case of an emergency, then the restrictions should not affect Canada. The same argument can be applied to Venezuela, although to a lesser degree since oil from there comes to the United States by sea. This other important supplier of petroleum to the west coast has also protested, but rather more politely than Canada.

The real consideration in the minds of the President and his advisers was not of course the national security, but the renewal of the Reciprocal Trade Agreements Act. Three years ago an attempt by friends of American oil

producers to write mandatory quotas on imports into the Act was only frustrated by the Administration's undertaking to deal with the situation under its discretionary powers to ease the impact of tariff reductions which fall too heavily on American industries. This year the protectionists are expected to concentrate on an effort to take these discretionary powers away from the President and to put more rigid provisions directly into the Act. He will find it difficult to win this battle unless he can show that he has in fact used the discretionary powers to help American industries.

Certainly last summer's attempt to help domestic oil producers could easily have been made to look ineffective if the restrictions on imports had not been extended to the west coast, originally excluded because it does not produce enough oil for its own use. At that time the Administration suggested that imports of 275,000 barrels a day would be a suitable quantity for the region; in fact, importers have been planning to bring in 348,000 barrels a day during the first half of this year. The importing companies which have been trying to make up on the west coast for some of the markets lost elsewhere in the United States as a result of the restrictions there have themselves to blame that imports to that region, too, have now been cut—to 220,000 barrels a day.

Angel on Broadway

FROM A CORRESPONDENT IN NEW YORK

ON Thanksgiving evening, November 28th, when the curtain fell on the first performance of *Look Homeward, Angel,* a new play based on the novel by Thomas Wolfe, it was obvious that the producer, Mr Bloomgarden, had a smash hit on his hands. Its success has brightened a rather dull season in the theatre. Of the more than thirty plays which have arrived in New York since September, only a handful have been well received, and even these have aroused no great enthusiasm.

This is not unusual; the great hit is always rare. During the average Broadway season, which runs from September to June, about eighty dramas, musicals, revues and comedies come to town, but only about fifteen win sufficient critical, popular and financial success to justify their occupying one of the 28 theatres which are all that are left of the eighty that New York had twenty years ago. In that period, the average cost of production has more than tripled. The cost of putting on a straight play today runs to more than $80,000, while some musicals take more than $350,000. Thirty years ago, 264 plays were produced in a single season. Now there are too many plays clamouring for too few theatres for Broadway to have room for anything but the most overwhelming kind of success.

The birth of a play is a risky business, from every point of view. But the possible rewards are high enough to make the gamble tempting to many. Last year, for example, 10 million theatre-goers spent a record $37 million on tickets for the 86 productions on Broadway, the traditional theatrical district; how many people spent how much to attend the 72 plays produced off-Broadway is anybody's guess. While most of the shows soon close and cost their backers most or all of their investment, some make fortunes. *Abie's Irish Rose,* for instance, returned $2 million for each $1,000 invested; *Tobacco Road* earned $215,000 for each $1,000 put up by its backers; and there are others which have been almost as lucrative. Such fabulous profits were earned, for the most part, during the nineteen-thirties and earlier, when costs of production were much lower than they are today. But even now some shows, such as *My Fair Lady,* are gold-mines.

This is likely to be the case with *Look Homeward, Angel.* While most Broadway dramas use only one set, and cost about $80,000, *Look Homeward, Angel,* has two sets and a very large cast for a straight play. As a result, it was calculated that $125,000 would be needed for the show, with a 25 per cent overcall (the right to ask backers to find an additional 25 per cent above the original investment). Seventy investors put up an average of $2,150 apiece, and just before rehearsals began a group known as Theatre 200 Inc. contributed $50,000 and was taken in as co-producer. But several weeks before the opening, the *Angel's* backers were relieved to hear a clamour for tickets, as rumours of the play's quality began to circulate. The advance sale soon stood at more than $300,000. Theatre parties were busily buying up the entire house for specific evenings, and the ticket agents hurried to stock up.

Within a few days, *Look Homeward, Angel,* was sold out until well into the spring. Its weekly takings will be more than $40,000, while the actors' salaries, royalties and other operating expenses amount to about $26,000 a week. Thus within ten weeks the play will have earned enough to repay its "angels" and begin returning profits. Every ten weeks thereafter, as long as it plays to capacity audiences in New York, these backers will double their money. Moreover, they will share in the profits of performances staged outside New York, and in the returns if the play is sold to Hollywood.

WHILE *Look Homeward, Angel,* is attracting a great deal of attention, another aspect of the New York theatre is exciting almost as much interest as the Broadway stage. This is off-Broadway—that collection of small theatrical companies which produce plays in basements, attics, churches and any other available space in Greenwich Village, along the east side, on the west side and all around the town. There is a growing interest in the theatre—from both sides of the footlights—despite the decline in the number of plays produced on Broadway and the continually mounting cost of tickets. Actors Equity, the performers' trade union, notes that its membership in the past five years has risen from 6,000 to nearly 10,000. And all these actors are looking for places to show what they can do.

Several years ago groups of performers, directors and other theatre people began to produce former hits, near-hits and the classics on small stages before small audiences in Greenwich Village, New York's Bohemia. The success of one of these groups—Circle in the Square—put the off-Broadway stage on the theatrical map. The critics and the public were enthusiastic over its productions of such plays as Tennessee Williams's *Summer and Smoke,* Calder Willingham's *End as a Man,* and Eugene O'Neill's *The Iceman Cometh,* now the longest running show in New York. As with all the off-Broadway companies, the actors were young, well-trained professionals seeking to make their names; out of this group alone have come some of today's biggest stars.

In 1955-56 about 46 plays were produced off-Broadway, compared with over 80 in the established theatrical district. Last year the numbers were nearly even and this year

Broadway may have to take second place. Some groups, such as Circle in the Square, have tended to concentrate on old plays by established modern authors ; others, such as the Phoenix, have assembled casts studded with stars from Hollywood and Broadway and produced a variety of plays ranging from Shakespeare to new shows ; still others have experimented with dramas and musicals which have not been able to gain a hearing on Broadway ; and the Shakespearwrights have had resounding successes.

The costs of these off-Broadway shows can be kept very low. Many are "theatres in the round"—with the stage in the centre of the audience—which demand little scenery. They use small and inexpensive theatres, thus saving on rent. And they pay their actors very little—between $30 and $40 a week, instead of the salaries which on Broadway may reach thousands of dollars a week. Companies with such low costs are able to perform before small houses of 200 people or less and still earn tidy profits. And they are also able to take chances on new and unusual shows, old plays which failed on Broadway, and the classics—all things which are too great a financial risk for the major producers in the established theatres.

In the last year it has become fashionable to beat a path to these out-of-the-way theatres. The ticket agents have for some time been handling seats for such small theatres as the Phœnix and Circle in the Square, but until recently they have boycotted the groups performing the classics. Just a few weeks ago the agents began to sell, at their centrally placed mid-town offices, tickets to the Shakespearwrights' production of *Julius Caesar*, which has won much favour from the critics. And they are selling all the tickets they can get, despite the facts that the play is by Shakespeare, who has never gone well in New York, and that the names of the actors are unknown on Broadway.

Hoosier Hatchets

WASHINGTON, DC

SENATOR JENNER'S decision to give up the life in Washington that he was finding so distasteful and to go back to practising law in his home town has, in the artless words of his colleague, Senator Capehart, "split the Republican party down the middle" in Indiana and offered the local Democrats an unexpected prospect of success. Hoosier politics—the Hoosiers being the traditional name for the inhabitants of Indiana—are predominantly Republican, almost invariably conservative, highly professional, particularist and personal, and often very savage for impenetrable local reasons. Among the state's Republicans there are two main factions, the right wing associated with Mr Charles Halleck, the deputy leader of the Republican minority in the House of Representatives, and the extreme right wing, to which Senator Jenner and the present Governor, Mr Handley, belong. There was once a "middle of the road" group headed by the previous Governor, Mr Craig, but like nearly all the younger Republican leaders picked out by President Eisenhower during his first term as showing particular promise, Mr Craig is now an extinct political force.

Indiana's Republican party has one very special characteristic: its leading members regularly predict each other's defeat at the hands of the Democrats. Senator Capehart expressed confidence that Senator Jenner would be defeated in 1952 ; but Mr Jenner, who is probably Mr Eisenhower's most implacable foe, shared in the President's electoral triumph. In 1956 he returned the compliment by stating openly that Mr Capehart, who was then up for re-election, would lose by a margin of 200,000 votes. Mr Capehart won by 212,000. Before Mr Jenner announced his retirement, both his fellow Senator and Mr Craig had been saying that his defeat was certain next year. However, practically everybody else, including most of the Democrats, felt sure that he would win.

Governor Handley, who shares most of Senator Jenner's extreme views but does not normally express them in the same hysterical language, would like to succeed him in the Senate. But last week a microphone inadvertently left on in a closed meeting of the Republican party's leaders in the state relayed to delighted reporters the outspoken opposition of Senator Capehart and Mr Halleck. These now pass, in the absence of the genuine article, as the leaders of the Eisenhower Republicans.

SENATOR CAPEHART, a round, bumbling business man who made his fortune from juke boxes and high fidelity, has never maintained allegiance to any one faction, but at different times has hitch-hiked with them all. Although he once described Mr Eisenhower as "the Democrats' choice as Republican candidate," he has lately taken to speaking up in the Senate in defence of the President's policies. Mr Halleck, a political mechanic of some skill and great seniority, has represented himself ever since the President took office as being the archetypal "Ike man" and has been accepted in the White House on his own valuation, although he sabotages any liberal measure on the President's programme whenever he feels he can get away with it. His prestige in Indiana is high, and most factions would probably rally round him if he were willing to accept the Senate nomination. But for many long years he has been eating his heart out in bitterness waiting for Mr Martin to retire from the party leadership in the House of Representatives. This would make Mr Halleck the Speaker if the Republicans won control of Congress. He would be unlikely to abandon these rewards of his long service in the House for the sake of becoming a very junior Senator.

Indiana is one of the few states which still nominate candidates for important offices at party conventions instead of by primary elections. From the eavesdropped exchanges it is apparent that there will be a major battle at the convention next summer between supporters of the national Republican Administration and those of the state Republican Administration.

The most immediate beneficiary of these differences is likely to be Mr Paul Butler, the national chairman of the Democratic party, who is a Hoosier and has been toying with the idea of running for the Senate next year. Although Democrats are seldom elected in Indiana, Mr Butler is a hard-hitting campaigner and Senator Jenner's retirement makes his prospects much more tempting. His candidature would not be universally welcome to Hoosier Democrats ; two old-style politicians, Mr McKinney and Mr McHale, cronies of Mr Truman's whom Mr Butler tossed out of the leadership of the state party, have been intriguing against him ever since. But it is possible that they may grudgingly accept his senatorial ambitions as the price to be paid for his departure from high party office.

THE WORLD OVERSEAS

The Two Faces of France

FROM OUR PARIS CORRESPONDENT

THIS New Year is a good time for stock-taking in France, partly because the country's crisis is so spectacular and should reach a climax in the coming months and partly also because 1957 and 1956 together form the main watershed of French affairs since the war. In these two years the French Union has been tossing in what looked like death throes in Algeria, throwing out disastrous metastases at Suez and in political life in Paris, yet renewing itself in black Africa with reforms that point to a new kind of commonwealth. France itself has seen the culmination and end of its greatest boom since the early years of the century, and this has made possible the common market and a probably decisive step towards European unity. Finally, oil discoveries in the Sahara have symbolised both oversea troubles and technical rejuvenation. Seen from a distance, France's progress looks like that of a bicyclist careering madly downhill. Nearer at hand, the motion resembles a seesaw with the weight of a political past turned to lead at one end and the strength of a new economic and social vitality at the other. The year 1958 will probably decide which tips the balance.

The rate of growth of French output since 1953 has equalled Germany's and has outstripped that of all other European countries. Although big industry has raised production 45 per cent in four years, the figures matter less than the changes of attitudes that expansion has brought. France has not experienced such progress for a generation —a generation that had suffered continuously from inflation, or unemployment, or humiliation in war. Peeling stucco on grey city walls had become the apt symbol of a great country fallen on evil times. As the American, Mr John E. Sawyer, pointed out in an acute essay written in the forties: "industrialism has not realised its potential in France. . . . French society has accordingly experienced far more of the social problems of industrialisation than of its economic product."

The stormy thirties and forties assumed that only violent change from left or right could save France. The nineteen-fifties have at last provided some of the counterbalancing "economic product." In 1956, for the first time in years, the best French manufactures reached the top international class. French methods of electrification of railways have been adopted in Britain and India. French mining engineers are modernising the Japanese mines. The Renault Dauphine in a single year has become the nearest rival to the Volkswagen in America. French aircraft, dams, and electronic telecommunications have become respected on the world markets. French industry still has innumerable dark recesses of defeatist traditionalism, but the climate has changed. Executives of a younger generation have reached the top in business, and some, like M. Felix Gaillard, in politics. For many bankers and industrialists whose peasant-like self-defeating caution was formerly notorious, expansion has now become a fetish—to the exclusion, even, of common sense—in dealing with the trade crisis. As for the wage-earner, his position advanced more in France between 1953 and 1956 than in almost any other country. Recent inflation has probably cut two years out of this progress, but meanwhile the attitude of the trade unions has changed. Their vitality, sapped by political strife and strikes in the nineteen-forties, has been revived by chances of bread and butter bargaining, instead of ideological stone-throwing. Even the student today is said to be far less ideological and more concerned with facts than his recent predecessor. Rising population, a bountiful agriculture easily improved, and the new sources of energy which will gradually wipe out the old handicap of poor coal seams, give France every prospect of acquiring a fertile modern economy. Inside every Frenchman there is a Jules Verne crying for release. Beneath the disgust with government and the humiliation over repeated retreats, there is a strong hidden tide of optimism in the country. For all the mental reservations one can make, the acceptance of the common market has involved for France a bigger revaluation, not only of Germany, but of itself, than is usually realised.

Curiously, all this progress has been achieved against the grain of the anachronistic obsessions of French political life. Algeria today is the walking ghost of the past which the French have not laid. The government's condoning of tortures and the harrying of domestic critics—and the lack of any loud protesting echo in the country—are only the most flagrant signs of a dangerous political rot. The last two years have brought out all the nationalism fermented by the defeat of 1940 ; all the Frenchman's heroic notions of honour, which make him see even colonial wars as a kind of single combat in which calculations of expediency are despicable ; and all the far from heroic permutations of the party political round. The emotional confusions have been clearer on the sidelines of Algeria than on the Algerian field itself. The antagonism of race in Algeria is, after all, only equalled in South Africa, and that kind of tension is the hardest in the world to relax ; but the preference for attitudes over realities is patent when it comes to views on foreign intervention or on the trade crisis. The French have constantly suspected the foreigner, especially the American, lusting, as it is supposed, for Sahara oil, of trying to oust France from North Africa. In fact the French have had an unbelievably favourable international climate. The Russians, the Americans, the Tunisians and Moroccans, the French African negroes, and even India and the United Nations, all for varying reasons have been reluctant to aggravate France's difficulties. If ever a country had a free hand it has been France.

Reluctance to face issues is equally clear over the trade gap. Because of the boom French governments were able for a time to run the war without reaching into the French-

man's sensitive pocket, but the price was a steady erosion of foreign exchange reserves which governments, with their usual taste for brinkmanship, never resisted till they were hanging over the precipice. Yet you still hear innumerable speakers insisting on expansion at all cost. It is the irresponsible refusal of the parties to give up their slogans for a programme, and their incapacity to see Algeria or the financial crisis whole, that make plausible the fears that 1958 may see the end of the regime.

On the threshold of 1958 there are two Frances. One is the utilitarian aggregate of private citizens, who are moving fast into the twentieth century, and who are impatient of the rising prices associated increasingly with Algeria which hamper further prosperity. The other is those same citizens and the army as heirs to a nineteenth-century empire and a nineteenth-century view of the world, who are ashamed to give way to guerrillas in Algeria—and, it must be added, to "abandon" their kin. The pessimist says that in 1958 the economic crisis will intensify the passions of the Algerian struggle and pave the way for a coup d'état. This seems less likely than the optimist's hope that the pressure of rebellion in Algeria, and of austerity or rising prices or both, will bring opinion down to earth, loosen M. Mollet's grip on the Socialists, and incline Parliament towards negotiations. But there is still a third possibility. The government claims to be winning a military victory over the rebels, and hopes to staunch inflation as well, at least in part by cutting investment. The danger of such a "victory" would be that, without allowing one soldier to be released from the Algerian vigil, it would encourage the Right in its refusal of reforms, and postpone all economic expansion in preparation for the common market. The year 1958 would then break a French renascence simply by perpetuating the political spinelessness of the last two years.

Canada: the Candid Ally

FROM OUR CORRESPONDENT IN OTTAWA

THE curious ambivalence which characterises in one form or another the relations of all the Nato countries with the United States takes a particularly sharp form in Canada. In defence matters no other country lies in such a close American embrace: defence against air attack is planned as though the two countries were one. When the Canadian ministers returned from the Nato meeting in Paris, they found waiting for them a proposal, already worked out by officials of the two governments, for building new bases in northern Canada from which tanker-planes of the US Air Force could take off to refuel the strategic bombers. A refusal is hardly possible. The Conservative government placed the last formal coping stone on the integration of air defence commands last summer, when it sent Air Marshal Slemon, former chief of the air staff, to Colorado Springs as "deputy" to the commanding American general. But if there is any truth in all the standard policy utterances, an even more vital part of Canada's air defence lies in maintaining the nuclear deterrent of the Strategic Air Command.

Yet for all the submissiveness to United States requirements for the defence of the North American continent, Canada's constant, underlying uneasiness about American diplomatic and political views reached a new intensity before, during and after the Nato meetings. It is becoming more outspoken. In reaction from negative policies towards Russia, Canadians are increasingly convinced that results could be obtained from patient and painstaking diplomatic dealings with Russia. In oversimplified form, the feeling growing here—and taking on a new sharp edge of irritation with Washington—is now coming close to denying the fundamental premise of American policy. The Americans, it is said here, behave as though Mr Khrushchev and his colleagues were merely waiting for a favourable opportunity to launch war upon the United States. The military men in the Pentagon are therefore striving constantly to increase their forces. But Canadians are less and less inclined to believe that the present regime in Moscow has any intention of making war, even if it has a passing superiority in weapons. From defence planners on the western side (led by the Pentagon generals but with a fair following from other countries) comes the fear that Russia's rockets might enable it to knock out the United States retaliatory force before it could get into action, and thus remove the stalemate of mutual capacity for destruction. But from the Russian side, it is noted here, there is not the slightest sign that anybody believes that the American power of retaliation has been removed. Neither in public nor in private do the Russian leaders talk as though their missiles had ended the stalemate, or given them potential immunity from nuclear attack.

★

All this had made the Canadian government somewhat sceptical about the urgent need to rush missiles or nuclear stockpiles into Europe. And even if the Pentagon's case was stronger than they believe it is, Canadians still would say that the political case against scattering nuclear armament around the world is far stronger than the Americans seem to have realised. At the Nato meeting in Paris, Canada was just about the first to object to Washington's first proposal of what should be done—a proposal that seemed to be based on the belief that the one thing the world wanted was a great demonstration of increasing Nato power to counterbalance the "sputnik craze." Nothing could have appeared here to be more out of touch with the facts. The one thing most of the world feared, it appeared to Canadians, was another panic American rush to get more nuclear weapons more widely distributed and more closely threatening Russia.

Soundings that were immediately made in the other Nato capitals suggested that, while some fresh military measures might have to be taken, Nato's object must be to set them in a framework of closer co-operation and peaceful intentions. Agreement was general, and nowhere warmer than in Bonn. Dr Adenauer's role, both in regard to Mr Bulganin's letter and at the Nato meeting itself, is very highly praised in Ottawa. His insistence that the Bulganin letter must be explored corresponds entirely to Canadian views. Even if there were nothing else in it worth attention, the proposal for a nuclear no-man's-land of Poland, Czechoslovakia and both parts of Germany simply had to be taken seriously. It is believed here that the idea did originate with the Warsaw government, and it is known that the Poles are pressing it as hard as they can. For them, and for the West, it is believed that this may be the only way of avoiding the permanent establishment of Russian military forces throughout eastern Europe. To put missiles into West Germany, in other words, might mean the permanent subjugation of eastern Europe.

This is the really serious, vital question left by the Nato meeting, as it is seen here; and thankful prayers are offered that Dr Adenauer and Herr von Brentano are parties to the decision as well as Mr Dulles and General Norstad. To spread more nuclear devices through other countries such as Turkey or Italy or France would, it is agreed, matter less. But grave doubts are still felt about the wisdom of doing so. The worst case, after Germany, is thought to be Turkey. Any sober political calculation must relate the stationing of nuclear weapons in Germany to the prospects of achieving a Middle Eastern settlement: it cannot merely accept the soldier's eagerness to get launching sites as near to Russia as possible. And how the chance of a Middle East settlement could be improved by putting nuclear armament into the hands of the Turks, sober observers here cannot see.

Nato's move towards closer military integration, specially the talk about co-ordinated production, is welcomed: so, even more warmly, is the work of the scientific committee. But the value of the proposed steps can hardly be judged until they are worked out in practical form. Meanwhile there remains the depressing fear that, for all the wordy talk of the final declaration, the United States has not really come close to the belief in political and diplomatic efforts which Mr Pearson and his successor, Mr Smith, have both expressed. When they contemplate the Washington policy-makers Canadians are getting unhappily near to adapting the saying of the Duke of Wellington: "I don't know what the Russians will think of them; but, by God, they frighten me."

Israeli Tangle

FROM OUR CORRESPONDENT IN TEL AVIV

AFTER a fortnight of dreary negotiations between the coalition partners Mr Ben-Gurion resigned on Tuesday; this involved the resignation of the whole cabinet. The crisis started when Achduth Avoda made public the government's intention of sending a "high-ranking personality" to Bonn, thus knocking the mission on the head for the time being. Mr Ben-Gurion told the Knesset later that the purpose of the mission was to sound the west Germans on the possibility of obtaining certain defensive weapons. He indicated that these weapons were necessary because of the Russian submarines that Egypt had bought last summer.

In his letter of resignation the prime minister accused Achduth Avoda of publishing cabinet secrets. That party, and Mapam too, have indignantly denied these Mapai accusations; they stress that arms may and should be bought wherever possible, provided no political strings are attached. This provision is all-important for neutralist Mapam, which stubbornly maintains that Mr Ben-Gurion is not just interested in collective cabinet responsibility, but brought on the crisis in order to clear the way for far-reaching new political plans. Both left-wing parties and some other circles stress that Russia's increased hostility would outweigh the advantages of additional arms and that Israel's security depends on a four-power agreement in the Middle East. They argue that the road to such an agreement, although very difficult at present, might be completely blocked by whatever sort of arms deal with Bonn is contemplated. Thus the cabinet crisis was precipitated not only by Achduth Avoda's unauthorised publication of the Bonn mission, but also by deep differences of opinion over foreign policy within the coalition.

Mr Ben-Gurion is now trying to form a new government. There is a possibility of a small coalition composed of Mapai, with forty seats in the Knesset, Hapoel Hamizrachi, with eleven seats, and the Progressives with five seats. Assuming that the five Arabs who go along with Mapai would vote with the government, this would furnish a total of sixty-one in a parliament of 120 members. This small majority would be strengthened by the tacit backing of the orthodox Agudath Israel. The inclusion of the General Zionists in the cabinet is considered unlikely at present, but experience has shown that surprises are always possible in party negotiations.

If the formation of a coalition should prove too difficult, the possibility of holding new elections would come up. Some newspapers are already advocating this course. They point out that the last coalition, made up of three Labour parties, Progressives and Hapoel Hamizrachi, represented the will of the people according to the results of the elections in the summer of 1955, but that conditions have changed completely in the meantime and the common platform of the coalition partners has been eroded by recent international events. Mapai, however, appears not to relish the prospect of going to the country in the near future. It wants to concentrate on the celebrations for the tenth anniversary of the state, beginning in April and scheduled to last for the whole year. Moreover, new elections might be delayed beyond the statutory 170 days because the voters' registers are not up to date. The minister of the interior revealed that at least eight months would be needed to prepare the registers.

According to Israeli parliamentary custom, the outgoing government remains in power as long as no new cabinet has been formed. Thus the ministers whom Mr Ben-Gurion wishes to get rid of remain at their posts as long as no new government is formed. This may spur the prime minister in his negotiations.

Soviet Economy in Transition

"FIVE-YEAR-PLAN" is a term that Russia has given to the world. But the word itself will soon be dropped from the Soviet vocabulary. From 1959 Soviet economic planning is to be geared to seven-year periods. The current year, for which the plan and budget were approved last week by the Supreme Soviet, will, therefore, be a year of transition. It will be so in more senses than one. Mr Khrushchev's managerial reform is still being put into practice and the process of decentralisation still goes on. Mr Zverev, in his budget speech, announced that the individual republics will have much bigger funds at their disposal than before. Mr Kuzmin, the new chief planner, proclaimed that the plan now covers only the main targets so that more scope is left for the regional economic councils. A draft plan for 1959 is also being prepared so as to provide time for counter-proposals from below. The planning machine is clearly being overhauled.

All this foreshadows important changes in method. The contents of the plan and the budget, on the other hand, do not indicate any great changes in economic policy. On the revenue side of the budget the share of the turnover tax, levied mostly on consumer goods, will be somewhat increased; the planners seem to expect a rise in consump-

tion of nearly 10 per cent. The increase in revenue from the profits tax should reflect higher production by the state enterprises. The decline in direct taxation, never very important in the Soviet Union, is due to a lifting of the "tax on bachelors" and other small concessions on income tax. Finally, the almost total disappearance of revenue from state loans confirms the fact that this form of forced saving is coming to an end in Russia.

SOVIET BASIC PRODUCTION
(mn. tons)

	1955	1957	1958 plan	1960 original plan
Coal	391	452	478	593
Electricity*	170	210	231	329
Crude oil	71	98	112	135
Crude steel	45·3	51·1	53·6	68·3

* Billion kWh.

More than two-fifths of the budgetary expenditure now goes into economic development. In the growing industrial investment more has been earmarked for such modern branches as chemicals and plastics; for gas and oil; for more mining of scarce iron ore; and, as usual, for machine-building. Social expenditure now accounts for just over one-third of the total. Most of the increase is due to higher pensions. But scientific research and education are also getting a bigger slice. The Russians have not been made dizzy by their high-flying sputniks. Indeed, one of their leading scientists, the academician Nesmeyanov, addressing the Supreme Soviet, mixed praise for the Russian achievement with blame for various shortcomings, particularly for the antiquated equipment in some branches of industry. He freely admitted that in certain scientific fields the Soviet Union still lags behind the United States. The educational drive, however, is in full swing. One figure will be enough to illustrate it: 1.34 million pupils—or about one half of the young people in the relevant age group—are expected

SOVIET BUDGET

Other§	63·7	10·5	‡	‡	49·4	7·9
Total	604·6	100·0	598·2	100·0	627·7	100·0

* Revenue: total raised to 643·0 billion roubles. Expenditure: revised figures. † Including insurance funds, collective farm taxes and profits of MTS. ‡ Figure not available. § Including interest and premiums on bonds; advances to banks.

to matriculate in the current year. Finally, defence expenditure remains almost unchanged, though its share in the total is slightly reduced.

According to the figures given by Mr Kuzmin, Soviet gross industrial production rose last year by 10 per cent—that is, faster than planned. National income, on the other hand, increased less than scheduled, by only 6 per cent. A small harvest largely accounts for this. Mr Khrushchev's programme for developing the virgin lands miscarried last year and the poor grain crop will affect his schemes for livestock breeding.

In the current year industrial output is to increase by 7.6 per cent, with heavy industry continuing to advance faster than light. The slow rate of growth in the steel industry confirms the diagnosis that progress here is hindered by a shortage of ore; indeed, the mining of more iron ore has now been fixed as one of the most urgent tasks. In fuel and power—particularly in oil, gas and electricity—progress is more rapid. Mr Kuzmin was less generous with information about the consumer goods industries. The wages of Russia's lower paid workers have been increased, pensions have gone up, sales are expected to climb substantially, but output of consumer goods is to be only six per cent higher than last year.

For Russia's town population the best piece of news is concerned with housing; 1958 should be the second year running in which house-building has been stepped up by more than a quarter. In 1957 48 million square metres of new floor space were provided in the towns; this year the target is 61 million metres. This is still very little to meet the huge demand, but nearly one square yard per person is a welcome Christmas gift token for Russia's horribly overcrowded town dwellers.

There may be a faintly encouraging international aspect to all this. Mr Khrushchev may be relying on his agricultural schemes to give the Russians a better diet. What they want above all, however, is better accommodation and those industrial consumer goods that are no longer a luxury in advanced western countries. But to provide these in substantially greater quantity it is necessary to reorganise the pattern of production. Mr Khrushchev told the Supreme Soviet that, as long as there is no agreement on disarmament, the Soviet Union will continue to produce the latest weapons; it will, however, try not to overburden the country's economy. In any case, this year's very slight cut in defence spending will certainly not be enough to release resources for a still bigger housing drive or for other consumer investment, both of which would help Mr Khrushchev to consolidate his position. He knows perfectly well that the Russian people do not live by sputniks alone.

South Africa's Races Confer

FROM OUR CORRESPONDENT IN SOUTH AFRICA

For over 300 years white and non-white have lived together in South Africa; and so ingrained is race separation and so unquestioned the white man's political domination, that when 300 men and women of all races—European, African, Coloured and Asian—recently took part in a conference in Johannesburg to seek a common solution to the country's complex and burning problems, it made history as the first gathering of its kind.

The conference had its origin in the challenging invitation of a body seldom heard of, the Interdenominational African Ministers' Federation, which decided, at its annual meeting a year ago, that the future of South Africa lay not in isolationism or a policy of Africa for the Africans, and still less in Nationalist apartheid, but in co-operation between all races. The gathering was organised by the federation and by individuals from a wide variety of organisations. It was attended, in all cases in their individual capacities, by leading churchmen of various denominations, with the notable exception of the powerful Dutch Reformed Church, university teachers and a representative selection of politically minded individuals whose affiliations do not preclude them from multi-racial contact or action. This eliminated some anti-white organisations as well as the Nationalists and the United party. The African and Indian Congress movements were strongly represented, and so was the left-wing Congress of Democrats. It is significant, however, that the conference was not in any way dominated by left-wing opinion. And the fact that such a diverse collection of individuals was able to meet within a few months of the passing of the Native Laws Amendment Act, which seeks to reduce inter-racial contact to a minimum, was in itself a hopeful and significant achievement.

★

The most difficult decision concerned political rights, and after lengthy discussion and some hesitation, the conference recorded its belief that only universal adult suffrage on a common roll can meet the needs and aspirations of the people of South Africa. But while accepting as their fundamental aim the creation of a common society, the delegates appreciated "that there is disagreement as to the ways and means of achieving the transition from white supremacy to a non-racial democracy in which these franchise rights may be exercised." Without being able to agree on the speed and the methods of achieving their aim, the participants felt that they should start working immediately "towards the achievement of the goal of a universal adult suffrage." Basic human rights, it was felt, should be safeguarded in a Bill of Rights, which should be an integral part of the constitution. The conference drew attention to the danger of a "headlong collision between the forces of white domination and those of counter-domination," and felt that South Africa must now choose between a common society or the "bitter conflict between these two wills to dominate." The days of white supremacy, it believed, are past, while apartheid simply condemns all people to an "unnatural life of vigilance, anxiety and fear."

The present educational policy that seeks to perpetuate white domination, accentuate ethnic differences and resuscitate tribal nationalism was condemned, and the day when compulsory segregation in schools is ended was envisaged as a prelude to the establishment of a peaceful multi-racial society. All colour bars in industry, as well as discriminatory labour restrictions based on colour, should be abolished, and workers should be entitled to a living wage according to civilised standards. When the conference turned to religion it took its stand on the conviction that "all men are made in the image of God for a divine purpose, possessed, therefore, of an inviolable personal dignity, irrespective of race, colour or culture." From there it followed naturally that the conference agreed that "any good society must guarantee civil rights to its citizens, and that these civil rights are fundamental to human freedom." To withhold civil rights for reasons of race or colour or creed "is a violation of moral principles and civilised standards," and the conference was urged to elect a standing committee to "publicise the pernicious effects of the denial of civil rights involved in the pass and other discriminatory laws, and to encourage united opposition to laws withholding civil rights."

What did the conference achieve? It demonstrated, by its adoption of the Universal Declaration of Human Rights, that not all South Africans are out of step with world opinion. It showed, too, that despite years of frustration, conflict and naked discrimination, despite race prejudices instilled from the cradle to the grave, it is still possible for some South Africans to meet in an atmosphere of reason and goodwill to discuss their conflicting ideas and aspirations. Finally, it showed the measure of real ability possessed by the educated Asian and African communities.

The conference is unlikely to produce any short-term political results. The overwhelming majority of whites would be horrified at the thought of giving the vote to non-whites on anything approaching universal franchise; and many of the other conference decisions would be rejected out of hand by the white electorate. That, however, will not deter the organising committee from carrying on with its work, although it is not clear precisely what action is to be taken or what tasks tackled. Attempts are to be made to broaden the base of the sponsoring organisation and to establish a fully representative continuation committee; in particular, approaches will be made to the Afrikaans churches and the Nationalist-inspired South African Bureau of Racial Affairs. It is doubtful whether these will succeed.

Even if Bishop Reeves of Johannesburg was being over-optimistic in saying that the conference might well go down in history as "the beginning of the turning of the tide in South Africa," the fact that it took place at all is important. It was certainly held at a time when the Nationalists are less optimistic and certain about apartheid than ever before, and when an American missionary, Dr Ray Phillips, had just said, after forty years' work in Johannesburg, that he hoped he was witnessing the death-throes of apartheid. But it is not only Nationalist opinion that is the stumbling block: it is white opinion. That is where the conference might have its most important effect; in opening the eyes of South Africans to the grim realities of the race situation and the urgency of doing something positive about it.

Prelude to Singapore's Independence

FROM OUR CORRESPONDENT IN SINGAPORE

On December 11th, Sir William Goode, KCMG, was installed as the last Governor and Commander-in-Chief of the Colony of Singapore. Seventeen colonial predecessors had been installed before him but none will succeed him. In former years a governor would have been flanked on such an occasion by a group of officers in white colonial uniform. On this last occasion there was only one other officer behind him in the full dress of the Malayan civil service. The rest of his council were elected ministers of the coalition in power and behind them were ranged the elected representatives of the parties in opposition. The atmosphere was friendly, and the Chief Minister, Mr Lim Yew-hock, made a welcoming speech in which his English education was apparent—even to the extent of a quotation from Lewis Carroll. Present but silent was Mr Lee Kuan-yew, leader of the People's Action Party. Absent was Mr David Marshall, Singapore's first Chief Minister and leader now of the Workers' Party.

From the classical portico of the Victoria Hall those who left after the ceremony could glimpse the sea and, beyond it, the dark outline of islands to the south. These are in

Indonesia, and some may have wondered for a moment at the contrast between the peace and order of Singapore and the growing chaos in Java, Sumatra and Celebes. The events of the succeeding weeks have not abated the chaos but they have lessened the contrast. For the stream of Dutch and Eurasian refugees now reaching Singapore, and being humanely received there, has inspired Mr Lee Kuan-yew to observe, in the Legislative Assembly, that the Indonesian example in nationalising colonial-owned firms is one that might well be followed in Singapore.

The voice of an opposition leader may not seem important in itself, but the recent municipal election results lend a new significance to the PAP attitude. They seem to foreshadow what may be the results of this year's general election. There have been rumours, it is true, of a coming coalition between the Labour Front, now the majority party, and the PAP. But even were this coalition to become effective, it is likely that the PAP will be the dominant partner. It must be remembered, furthermore, that Mr Lee Kuan-yew, with his talk of expropriation, represents the right wing of a party of which the left wing leaders are detained for sedition.

The details of this recent election to the City Council do not reveal a burning interest in local politics, for the 165,526 people who voted comprised only 32.9 per cent of the municipal electorate. This was partly due to rain and partly to the fact that perhaps 100,000 names on the register were those of voters who had moved since registration to some other address. There is little reason, however, to suppose that a higher percentage of voters would have produced a different result. As things were, the PAP had a clear victory with 13 seats out of the 32, and the Labour Front only got four seats. Of the candidates elected, 22 were Chinese, 4 Indian, 3 Eurasian and 3 Malay. Of the PAP members elected all but two are Chinese.

★

These results are to be interpreted in the light of the previous agreement between the Labour Front and PAP to avoid any direct trial of strength. Thus the Labour Front contested 16 seats and PAP contested 14 of the other seats. They did not compete with each other, but the results announced provide a contrast not only in the number of seats gained—13 as compared with four—but also between the total votes cast and between the majorities achieved. The PAP polled 49,100 votes, while the Labour Front could claim only 26,395. Contesting all thirty-two constituencies, the Liberal-Socialists (a right-wing coalition) polled 53,593 as against the 88,506 votes recorded for the three left wing parties combined. The effect of Mr David Marshall's splitting of the Labour Front was to deprive that party of 13,000 votes and four seats ; his fifth candidate failing, significantly, to beat a PAP opponent. As regards the majorities, ten of the successful PAP candidates had majorities of over 1,000 and only one a majority as low as 401. Of the successful Liberal-Socialist candidates, none had a majority of 700 and three had majorities of under 200. The PAP leaders can point out to the leaders of the Labour Front that PAP could have gained the four constituencies which the Labour Front lost to the Liberal-Socialists, and at least one other seat lost to an Independent. The victory of the PAP would seem to be complete.

As a preview of what may be expected to happen in the general election this municipal election is probably not inaccurate. There are rural constituencies outside the city limits of Singapore, and in most countries the rural vote tends to be conservative. It is doubtful, however, whether this is true of Singapore, where the rural voters include, for example, the employees of the naval base and where the actual rustics are few. If the effect of the general election is to cut Singapore off from Britain, and as effectually from Malaya, its future would seem to be dark indeed.

More Aid for Spain?

FROM OUR CORRESPONDENT IN MADRID

GENERAL FRANCO wants to raise the rent. This seems the likeliest explanation of the invitation that Mr Dulles received to visit Madrid for a talk on his way home from the Nato meeting in Paris. The Russian sputniks, the trouble in Ifni, and a relentlessly worsening economic crisis have tilted out of balance the bases-for-aid agreements signed with the United States in 1953—or so Madrid believes. Therefore reappraisal is necessary and the Americans should not be too much surprised if what the Generalissimo wanted to discuss with the American Secretary of State turns out to have been a substantial increase in economic aid.

Before the Russians launched their first sputnik, the Franco regime was already glumly dissatisfied with the amount of economic assistance received from the United States ; in its various forms, this has amounted to some $700 million. And now that the Russians have demonstrated that they possess long-range guided missiles which the Americans have so far failed to develop successfully, the uncomfortable feeling of having made a bad bargain has become almost unbearable. The Soviet rockets have drastically increased the risks which Spain accepted when it entered into the bases agreements with the United States. At the same time, as the Americans themselves have pointed out, the Strategic Air Command's overseas bases are more vital than ever, since its nuclear bombers will have to be the free world's main deterrent against Soviet aggression until such time as western ICBMs are produced. In Spain the American air force has moved on to the four air bases which are now in their final construction phase and are sufficiently advanced to be available for operational use in case of emergency. Like the other overseas installations, the Spanish bases compensate somewhat for the American lag in long-range supersonic rockets by placing jet bombers within closer striking distance of Soviet targets.

In the Spanish view the increased importance of the bases, and the greater risk that they involve for Spain, justify a "readjustment" of the American agreements. Madrid underscored this sentiment by publishing, on the day of Mr Dulles's arrival from Paris, the text of Mr Bulganin's note to the Spanish government. This note warned Spain of the dangers of having American bases on its soil.

The implications (not publicised) of the Ifni trouble are also of grave concern to the Franco government. What if the fighting breaks out again, spreads to other Spanish territories bordering on Morocco, and drags on for months ? Spain's economy is in no state to take on an African war of prolonged duration. Possible disasters, such as the massacre of Spanish nationals living in Morocco's northern zone, could affect political stability at home, and it was Spain's political stability, as well as its strategic position, that attracted the Pentagon when it was looking for bases.

THE BUSINESS WORLD

Steel below Capacity

CAPACITY is a word that means different things to different steel industries. In the United States it has a quite specific meaning : for any year, it represents the tonnage of crude steel that could be produced in a normal working year, allowing for holidays and furnace "down time" but assuming maximum demand for every last ton of it, from all the plant that American steelmakers have in operation on January 1st of that year. In reality, new plant will be coming in all through the year—recently, the American capacity has been rising by about 5-6 million tons each year. So towards the end of any year, if business is good, the industry can operate at well over 100 per cent of capacity : and even if it is not the operating rate will be rather flattering. But on January 1st of the next year comes the industry's moment of truth. This January, since December rates of operation were only around 65 per cent of the January 1, 1957 "capacity" of 133.5 million short tons, the truth has looked particularly ugly : the 1958 capacity will be about 140 million short tons, which would alone pull the weekly operating rate down to about 60 per cent. Such a rate must nowadays bring many companies below the break-even point.

STEEL SUPPLIES, 1956 & 1957

Supply	1956	Est. 1957
Home production	20·6	21·7
Re-usable material and supply from producers' stocks	+0·1	+0·1
Imports	1·8	0·9
Total supply	22·5	22·7
Disposals		
Home consumption	18·6	18·5
Consumers' and merchants' stock change	+0·6	+0·2
Exports	3·3	4·0
Total disposals	22·5	22·7

For the British steel industry, capacity has no such precise and practical meaning. Many steelmakers here, indeed, think that is as it should be ; and certainly the conceptual difficulties of measuring furnace capacity, taking into account different mixes of materials, are considerable, even if one stops short of the endless intricacies of trying to rate rolling mills or whole integrated plants. In practice, the British industry has hardly talked about capacity* for several years ; it has not needed to. Its first postwar development plan, in 1946, did propose an increase of capacity to 16 million ingot tons, which at an operating rate of 94 per cent then considered by the industry a satisfactorily "high rate of utilisation" would give 15 million tons of crude steel. In the event, the targets for both capacity and output were altered and surpassed (by the introduction of continuous working as well as the installation of actual new plant). The industry has been able to record actual figures of steadily rising production rather than offer calculations about potential output. Formally, ratings of plant capacity do survive in the pricing formulae of the Iron and Steel Board, and the board did to some extent talk in terms of capacity in its special report on development last summer. But when the industry said it would have the capacity to produce 22.4 million ingot tons last year, and 23½ million tons this year, it was not offering some theoretical measure of maximum potential output from its mills : these, corresponding to the "high rate of utilisation," were the tonnages that British steelmakers would have been glad to produce.

They did not succeed in 1957 ; and in 1958 they do not expect to. Final figures for 1957 are not yet ready, but production was probably just under 21.7 million ingot tons. In November the industry's furnaces could probably have turned out more than 445,000 ingot tons a week : in fact, the weekly rate was about 429,200 ingot tons. Against the possibility of 23½ million ingot tons this year, the industry does not now expect to be able to sell much more than 22 million tons.

* Except in technical discussions at Geneva, where the Economic Commission for Europe is trying to reach some working definitions for the word

For last year Britain used slightly less steel than in 1956; and, though the rate of steel consumption in the last few months may have been a little higher than 12 months before, the British Iron and Steel Federation expects that the tightened credit squeeze will mean "some check to the use of steel at home" in the first half of 1958 and no "marked upturn . . . before the closing months of the year." It does not expect buoyancy in consumer durables, particularly the motor industry, fully to offset the effects of tighter credit on investment, which is a heavy steel user. Moreover, the effect of lower steel consumption on actual steel buying in 1957 was reduced by further increases in consumers' steel stocks (now representing some four months' consumption). The industry as yet sees no sign that consumers are running down these stocks, which must inevitably overhang the market; but they certainly cannot count upon much further stockbuilding. "At the worst," the federation concludes in its quarterly review, "deliveries to the home market should not fall by more than, say, 5 per cent." That "worst," it should be noted, would imply the running down of steel stocks. If it were to occur, the industry's hope of a small increase in output would go by the board: production might be down to not much over 21 million ingot tons.

SOME of the margin opening between flagging home demand and continually accruing steel capacity can be taken up by cutting steel imports. In 1957 these represented nearly a million ingot tons of steel: the industry is cancelling or stretching out its own orders from abroad, and though the motor manufacturers are still having to import some of their sheet, it may be possible to halve steel imports this year. Another expedient, obviously, will be to increase steel exports: this may be harder. The industry pushed up its export tonnage by no less than 20 per cent in 1957, in a steadily softening market. International prices have fallen: continental exporters such as Belgium are fighting hard for the business, and though American steelmakers do not ordinarily cut prices abroad when home demand is slack, they may come under greater pressure yet to run their capacity at a profitable rate of operations. Export premiums have been sharply reduced, though on plate and sheet, for example, they are still significant.

Britain has already closed down a fringe of obsolete plant that can no longer compete, mainly in Welsh tinplate (see page 63). An output "somewhat exceeding 22 million ingot tons" this year would still represent 90 per cent or more of full capacity working and this would be a comfortably profitable rate. Even "at the worst" the industry should still be operating at about the rate that is assumed in working out the controlled prices so as to offer a standard margin of profit to all but the highest-cost producers. But 1958 offers little hope of a rate as high as the steelmakers have enjoyed for several years past. Profit margins on home sales must come under pressure from overheads: and the fat is being squeezed out of export prices. After many mean years, steel companies this year have disgorged higher dividends: in this lean new year, fewer of them seem likely to have the chance.

Power from Fusion

The Government will make a statement on the control of thermonuclear reactions by the end of the month. This article describes the background of the scientific work to turn the principle of the H-bomb into power.

TWELVE months from now it should be possible to classify the outstanding scientific event in each of the three preceding years:—

1956 ... opening of Calder Hall
1957 ... launching of Sputnik
1958 ... control of fusion

Each is an exotic flower grown on a poisonous military plant—two nursed to maturity in this country and one in the Soviet Union. To decide which of the three will have the greatest impact on society and on the world's economies will need more than twelve months; but controlled thermonuclear fusion, with its promise of immense power and unlimited fuel from the sea, has the fairy-tale appeal of a cornucopia that lesser mortals miss in the chilly prospect of a journey to the stars. But is it more than a fairy-tale? The technical difficulties in the way of thermonuclear power look far more forbidding than those which faced the designers of Calder Hall.

There is no reason to believe that the fusion process will prove any easier, cheaper, or simpler to harness than atomic fission has been—rather the contrary. The stakes, however, are higher. If the Government's statement later this month shows that the experiments in Britain towards the control of fusion have been successful, the bid for hydrogen power will be on. How long it will take to bridge the gap between a successful laboratory experiment and a working commercial power station is another story. What can sensibly be said at this stage is something about the way the scientists might go about it and about the fitting of a fusion power system into an existing electricity network.

Fusion might be said to be an unnatural process compared with fission. Atomic fission involves the break-up of large, heavy and already rather unstable atoms. There is a natural predisposition for atoms to disintegrate, and a natural repugnance for them to

combine. The technical difficulty about bringing the fusion process into useful service is to overcome the strong natural revulsion of the nucleus of one atom for the nucleus of another. The key to the whole fusion process, whether in a hydrogen bomb or in hydrogen power, rests on bringing atoms, or rather their nuclei, sufficiently close for them to fuse together into one slightly larger atom. The positive electric charge carried by the nucleus of every atom is doing everything in its power to keep it apart from its neighbour. Extraordinary effort is needed to overcome the strength of this electrical repulsion, and the only workable approach that the scientists have found is to imitate the sun where fusion is going on all the time, and create temperatures of 100 million degrees, and for preference nearer 1,000 million degrees. (There is no such problem in an H-bomb where fusion is started by the intense heat of a fission explosion; an A-bomb acts as a percussion cap.) Fusion will start at temperatures from a million degrees upwards, but it will not happen at a fast enough rate to present a useful source of power until the temperature is brought much nearer the 100 million degree mark.

ALL the mechanical, engineering and metallurgical problems connected with harnessing H-power stem from this point; scientists are forcing atoms to do something that is basically unnatural to them and fantastic temperatures are required to bring the reaction about. Having decided that great heat is the only environment in which fusion can occur, scientists then have to find methods of raising—and even more difficult of holding—these fabulous temperatures. The creation of high temperatures has presented the greatest difficulty. It is easy enough to provide sufficient electric voltage for the purpose; the difficulty is to stop heat from being lost and thus preventing the build up of the temperature inside the container to a level that will sustain fusion.

Between 1948, when research into fusion first began, and the summer of 1957, scientists at Harwell managed to reach temperatures of 200,000 degrees centigrade; scientists in Russia reached temperatures of nearly one million degrees. The system on which they were working was a relatively simple one. The hydrogen atoms used for fusion are in the form of a gas. If an electric current is put through the gas scientists can create what they call a "pinch" effect. In practical terms, it means that the gas collects in a dense column down the centre of the container without touching the walls, and so subjects it to the full effect of the high temperature. If the container is in the form of a tube, joined at its two ends—like a ring-shaped doughnut—the current exerts its maximum effect on the gas. But the "pinch" effect is not a neat and tidy phenomenon. One of the vital tricks in controlling fusion lies in knowing just how to apply a magnetic field to the gas column in a way that irons out its instabilities and makes it flow smoothly. The second, even more vital, one is to know how to hold the high temperatures long enough to heat the gas to the point where fusion occurs. It may be necessary to keep those temperatures building up for anything up to a second, but the higher they get (from 100 million degrees upwards) the sooner fusion begins.

Several small doughnuts have been built at Los Alamos in the United States; one is working in France; but the biggest has been constructed at Harwell and this came into operation only last summer. This is the apparatus known as Zeta, and it is now believed to be the fact that since the autumn controlled fusion of hydrogen atoms has been brought about in this plant. The temperatures reached are most unlikely to be high enough to give useful power, they probably lie somewhere between 1 and 5 million degrees centigrade which is cool by fusion standards although sufficient to bring it about. But these experiments have demonstrated that Harwell's scientists have mastered the difficult tricks of controlling the gas column and raising and keeping high temperatures. This is the knowledge that other countries are seeking, and though it sounds unromantic it is the basis for the current belief that Britain leads the world in the control of fusion. Controlled fusion is not possible without this knowledge.

A power station based on this type of controlled fusion might consist of a battery of such doughnuts, although some scientists think a single one would suffice, since it is potentially capable of releasing a million megawatts of heat in a single pulse. H-power is essentially a pulsed system; whereas the fuel charge in a conventional atomic power station lasts from three to five years, the gas within a doughnut is burnt up in a second or less, after which it has to be recharged with new gas and the voltage reapplied to bring it up to fusion temperatures. It follows that fusion power stations would be heavy consumers of their own electricity.

IN theory, and using the ideal fuels for fusion (which are not necessarily the cheapest or the easiest to use) it should be possible to get a power gain 100 times as great as that required to start the reaction. But the engineers who are seriously studying the possibility of fusion systems do not think that they will be able to get anything like this gain in practice. They are beginning to doubt whether a fusion power station producing electricity alone would be any more efficient than they hope ordinary atomic power stations will become.

A fusion power station could, however, do much more than produce electricity. It could also manufacture nuclear fuels in the same way that they will be manufactured in the "breeder" reactor being built at Dounreay—only at a much faster rate. The breeding process is triggered off by the small atomic particles that are released by both fission and fusion alike. At Dounreay and plants of that type a high proportion of these particles are needed to keep the reactor working, and only the balance is used for "breeding." In a

fusion plant, the whole lot would be available for breeding in almost unlimited abundance. A fusion power station could be looked on as a large-scale nuclear fuel factory, exporting quite a useful net surplus of electricity into the grid, but manufacturing meanwhile large quantities of uranium and plutonium out of normally useless materials and feeding these into a network of conventional atomic power stations. In the first stage, therefore, the economics of fusion may well depend on integrating fusion power stations into a network of conventional nuclear stations, which will depend on it for their cheap fuel supply. If there is a rapid development of fusion, breeders of the Dounreay type may never be built for commercial use.

The most exciting prospect that H-power holds out is the direct production of electricity. There is a distinct possibility that fusion can be harnessed to the direct generation of electricity, without all the cumbersome intervention of heat exchangers, boilers, steam raising and turbines. Scienfists argue in this way: after the gas inside the doughnut has been "pinched" by the electric current into a dense thin column, fusion takes place and under the heat of fusion, the pinched gas expands. Could this expansion of the gas be used as a means of feeding back power into the transformer that supplied the original voltage for heating the gas? If so, it should be able to feed back a good deal more power than the transformer originally put into the doughnut. Fusion is the first source of power to suggest that this kind of direct electricity generation may be even theoretically possible. It is the philosophers' stone for which electrical engineers have searched for generations. It would represent so radical an advance in power production that all existing standards would become meaningless. And it could be achieved using a fuel as cheap and abundant as sea water. No one can say at the beginning of 1958 how long it will take to reach this power millennium nor how great are the engineering difficulties that lie in its way. But this year, in this country, at what was 12 years years ago a disused airfield called Harwell, the first steps are being taken on that road.

BUSINESS NOTES

BEA's JET

Mr Jones in Muddy Waters

THE Minister of Supply, in his role as technical adviser to British European Airways, finds himself in some of the muddiest reaches of the aircraft industry, where three manufacturers are fighting with no holds barred for one of the few big plums in a shrinking aircraft market. Until the water clears, it will be difficult to judge how far the Minister himself has become involved in the skirmish at a time when he would be much better advised to stay high and dry on the bank.

The order under dispute is for a medium-range jet airliner for British European Airways, and Mr Jones's present predicament rises from an understandable difficulty in satisfying himself that either of the three contestants really have the type of resources needed to develop and build this aircraft as a private venture. These fall under three headings: design ability, liquid capital, and a good production record.

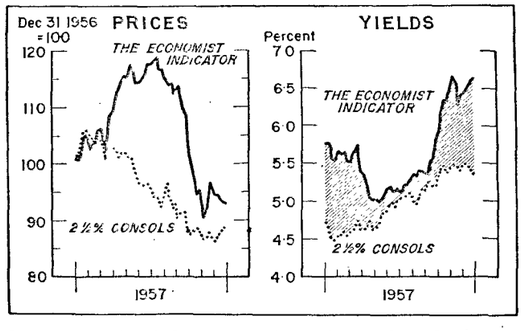
The three contestants, A. V. Roe, of the Hawker Siddeley Group, the Bristol Aeroplane Company and de Havilland, soon narrowed to two, and in the spring the Bristol design with the company's Olympus engine seemed to be in the lead. But by late summer BEA's engineers had settled in favour of the de Havilland aircraft with a Rolls-Royce engine, and they advised the corporation accordingly. The board of BEA accepted their advice.

This would normally have been the end of the matter, but the Ministry of Supply had decided that the aircraft must be financed as a private venture without any government assistance. There had to be some evidence, therefore, that whichever company had the order also had the capital resources needed to carry it out. The lowest figure for which this could be done is about £10 million; taking tooling and production into account, the total might be nearer £20 million.

Moves and Counter Moves

IN preparing its bid for BEA, the de Havilland Company also made tentative arrangements with other manufacturers, notably Bristol, but also Fairey, Handley Page, Hunting and others, to sub-contract extensively to them; and when the government's refusal to finance the aircraft's development was made known, de Havilland worked out a scheme by which these associated companies would provide some of the finance for development. Much of its own contribution was expected to come from sales of aircraft that are now on its order book. There are indications that the Ministry rejected this scheme out of hand just before Christmas on the grounds that it was not convinced the resources shown were adequate.

Within the past few days, shortly after this hitch in the contract arrangements began to be known in the industry, the two unsuccessful competitors made a strong countermove. Bristol and Hawker Siddeley announced the formation of a new joint company to build the jet airliner to Bristol's design, this time with whatever engines the customer was to choose. Bristol therefore has a double hedge. It has yet to be shown that either of these companies, the one heavily involved in Britannia production and the other with a collection of new interests to digest, is in any better position to take on a fresh commitment requiring large sums of capital than is de Havilland and its partners.



The Bristol-Hawker Siddeley counter-proposal is made, moreover, with the knowledge that the Bristol design has been rejected by BEA engineers and for reasons that go deeper than the choice of engines. In the present confusion there is some danger of BEA's interests being pushed to one side. It would not be the first example of pressure being applied by a government department to influence the buying policy of the two air corporations. The decision to use a jet fleet on medium-range operations such as BEA's has not been an easy one to take, which makes the suitability of the aircraft for the work in mind of the highest importance. The Ministry of Supply will find itself in an extremely unpleasant situation if it deliberately blocks the placing of an order with de Havilland and its associates and then attempts to channel it towards a competing group on the sole ground that the latter has a better chance of finding the capital—a matter on which the Ministry of Supply is hardly the best judge. What happens if such pressure makes BEA's board drop the idea of a new jet order altogether and make do with the Comets that it has already bought?

IN THE MARKET

The Crystal Ball

"THIS," the investor will grumble as he glances down his battle-scarred gilt-edged list, "is where I came in." The similarities between the opening days of 1958 and those of 1957 are too close to be overlooked: the crack in prices in the previous autumn; the brisk recovery in an oversold market as the new year opened; the fact that the Government broker was obviously selling his wares like hot cakes and would soon need a new issue to replenish his shelf; the equally obvious fact that the authorities believed that they had the market under control; and the confidence in the City that the next move in Bank rate must be downward. The investor, alas, also remembers last year's sequel. Before February was out Bank rate had indeed been reduced and the market rally was spent. By May it was plain that the authorities had lost their grip and by the end of September the pound had been saved from disaster by the narrowest of margins.

But history never repeats itself exactly. There is a world of difference between the infant 1957 born with Wall Street rising, Montreal booming, and inflation on the home

front, and the infant 1958 born in straitened circumstances. The difference concerns the holder of ordinary shares as much as the investor in gilt-edged. So now the equity holder surveying *The Economist* indicator is wondering even more nervously: "Is this where I ought to get out?"

Certainly *The Economist* indicator standing about 20 per cent below last year's peak and still probably edging downwards offers little encouragement. And a flood of planned new issues promises to restrain both the industrial and the gilt-edged markets. For once in a decade the chances on the gilt-edged side seem brighter than on the industrial, especially at a moment when the Government broker has run out of his popular Conversion 4½ per cent 1962—and the first gilt-edged issue is not for the British Government, but for the Federation of Rhodesia. More of investors' funds may move into the gilt-edged market. Offers of ordinary shares may be more critically scrutinised. It may also be right to look again at existing portfolios of industrials and to say goodbye to some old favourites in the capital goods industries. But this is a time for watchful hope, not an occasion for indiscriminate selling of well-chosen equities.

Floodtide of Issues

LAST year, according to the Midland Bank's figures, £383 million was raised in new capital issues; one broker was concerned with others in about £225 million of them. These are remarkable figures—bigger and certainly better than in the 1928 new issue boom. And there is every sign that the flood will continue, spurred on by a natural anxiety to launch some of the smaller issues before the giant issue from Shell soaks up much of the investible funds.

With the Newcastle 6 per cent loan standing at a premium of 1⅝ on the issue price of 99½, the terms on which the Federation of Rhodesia and Nyasaland (which has an unlucky new issue record) is coming to the market indicate an anxiety to make sure of success this time. The Federation is to issue £10 million 6 per cent stock 1976-79 at 96, offering a running yield of £6 5s. per cent and a gross redemption yield to the latest date of £6 7s. 1d. per cent.

Industrial borrowers are numerous and bidding high. Babcock and Wilcox, the engineering group heavily engaged in atomic power, is to make a two-tier issue. It will raise about £2 million on a debenture to be offered on terms to be announced to existing shareholders. Another £1,800,000 will be raised by a "rights" issue of 1,881,099 ordinary shares of £1 each at par in the ratio of one for every four held. The directors predict a dividend of 13 per cent on the new capital (as opposed to 15 per cent paid on the existing capital). The market's response to such an issue was inevitable: the existing units tumbled by 5s. 9d. to 52s. 3d.

British Timken has followed the same course; with the prediction of a maintained dividend of 10 per cent, it has offered 1 million ordinary shares of £1 each at par in the ratio of one for three. Ex-rights and ex-dividend, the old shares were quoted at 41s. 9d. An issue combining in effect scrip with cash is not the only device: Colvilles' issue to be underwritten next week will consist of about £6 million of convertible stock with a 6 per cent coupon. For a steel company a high coupon stock with rights to convert into the equity gives the best available financial and political hedge.

FOREIGN EXCHANGE

Sterling at $2.81

STERLING celebrated the turn of the year by rising to $2.81—its highest rate since May, 1956. This rate held for a short time both in London and in New York on the last

day of the old year. It slipped back fractionally and then moved up to $2.81⅛, the highest rate since as long ago as August 1954. The sharp rise followed the withdrawal of the authorities from the market where they had previously been taking in dollars in substantial amounts and so preventing the rate from rising. Their withdrawal seems to indicate satisfaction with the inflow of dollars and other foreign currencies in the earlier part of the month, and suggests some assurance that the reserve figure published after this issue went to press has been approximately up to the standard of the previous month. November, it will be recalled, showed a true dollar surplus of over $70 million. Transferable sterling has also been firm with the rate touching $2.7920. Sterling has also strengthened against Canadian dollars, the cross rate for which in terms of US dollars has moved below 101.50. But sterling this week has been weak against most EPU currencies.

PRODUCTION

Level as Ever

INDUSTRIAL output in November seems to have been a little higher than during the worst of the influenza epidemic in October, rather lower than in September, and about 2½ per cent down from last year's highest rate of production, which—allowing for seasonal factors seems to have come in June. During the first eleven months, the official index of production averaged 138 in 1957 as against 137 in 1956: for the year as a whole, output will probably have been about 1½ per cent higher than the year before, and roughly back to the level of 1955. The minor upturn of output last summer, due largely to the resilience of recovery in the motor industry, seems to have subsided, and most indications suggest a very slight decline in the level of total activity this winter.

The motor industry is as active as ever: in November output of cars was 32 per cent higher than in the very bad November of 1956 and commercial vehicle output 29 per cent up. It is in certain capital goods industries, and in particular in industries supplying building, that the weaknesses in are now being recorded: production of bricks was 8 per cent down and of cement 9 per cent down on a year before. Coalmining and sulphuric acid—a key indicator for many sectors of industry—showed declines in output: steel production was no more than 1 per cent over the level of November 1956. In engineering, it took some time for the motor recovery to bring about a corresponding revival among suppliers of semi-finished material and components. The decline in new ordering of industrial capital equipment is now beginning to affect production of certain types of machinery. Manufacturing output as a whole is slightly below the levels of late 1955.

INDUSTRIAL OUTPUT
(seasonally adjusted)

	1956	1957

NEW ZEALAND

Drastic Import Curb

EVEN though New Zealand takes only about 4 per cent of Britain's total exports, Britain supplies over half New Zealand's imports. The drastic curb on imports announced by the Prime Minister, Mr Walter Nash, on Wednesday, must therefore impinge sharply on British trade with the Dominion. In the almost complete absence of detail as to how the new controls will work it seems likely that textile exports to the New Zealand market will be seriously affected. All imports according to the announcement are made subject to licensing, trading banks granting exchange only against an import licence obtained from the Customs department. Exchange would, the Prime Minister said, be found for the basic foodstuffs—wheat, tea, coffee and dried fruits and there are to be allocations for other items. But on some less essential imports, soap, footwear, leather goods, woollen piece goods, and carpets, he proposed not to "waste funds."

	1955	1956	1957*
UK exports to New Zealand (£ mn.)	139·1	127·9	139·0
Per cent of total British exports	4·6	3·9	4·1
Main commodities (£'000) :—			
Woollen yarns and fabrics	4,810	3,997	4,533
Cotton yarns and fabrics	6,983	6,008	6,702
Synthetic fibre yarns and fabrics	3,315	3,083	3,201
Miscellaneous textile manufactures	9,523	8,335	9,185
Of which : Carpets	2,209	1,434	1,922
Clothing, footwear, etc.	2,135	2,601	2,795
Cars and commercial vehicles	17,342	13,775	15,310
Electric machinery	12,319	10,491	11,718
Beverages	2,241	2,405	2,189
Proportion of New Zealand imports from UK sources	55·0	53·6	—

* Eleven months at annual rate.

The immediate cause of these distressing cuts has been a rapid deterioration in New Zealand's balance of payments. Mr Nash gave the figures of the Dominion's total overseas balances—£83 million at the beginning of October and £45·5 million on Christmas day, and the figures seem to bear out his statement that his country had been living beyond its means, and must drastically cut spending in 1958. All experts will also agree with his deduction that to meet the present situation by overseas borrowing (of which he would have needed £50 million) is not possible in the present state of the London capital market. He did not add what is equally important—that it would not be possible in any state of the London or any other money market without New Zealand itself taking steps to redress the unbalance in its payments. It is indeed of minor consequence whether the present Labour Government is right in blaming its predecessor for the present trouble, or whether the decline in commodity prices, which affects New Zealand's produce is not a root cause. It is important that New Zealand has decided at heavy cost to redress the balance and that it has put aside the facile but disastrous alternative of devaluation.

OIL SHARES

News from Royal Dutch

A FEW copies are now available in London of the preliminary American prospectus for the Royal Dutch Company's issue of 7,602,285 ordinary shares as rights in

the ratio of one for eight at a price still to be fixed. For students of oil this massive document contains data that have not hitherto been revealed. For dabblers in the market enough is now disclosed about the dollar/guilder side of the operation to make it possible to hazard a guess about the shape of the sterling—"Shell" Transport—side of the operation. The 60:40 division between Royal Dutch and Shell is to hold good for the provision of capital as well as for the allocation of profit. So if, for example, the Royal Dutch issue were fixed at $30 to raise £80 million—which is the usual and apparently reasonable market guess—"Shell" Transport would have to raise about £54 million. For that purpose one for eight at £5 10s. would raise a little too much and one for ten at £6 not quite enough. Lists for the Royal Dutch issue are to remain open from January 18th until February 10th. So there is every chance of the two issues overlapping in point of time. Shareholders in Royal Dutch have the option of subscribing either in dollars or in guilders. Six London merchant banks, Rothschilds, Barings, Hambros, Lazards, Morgan Grenfells, and Schroeders are in the underwriting syndicate.

Much that is interesting about the structure of the Royal Dutch-Shell group is now revealed. For example Shell Venezuela's interest in the Mene Grande production is 25 per cent and of this one third is under contract to Canadian Eagle in which Shell has a 20.92 per cent interest. The figures also show how the group's income and its oil reserves are divided between the Western hemisphere and the Middle East. No less than 63 per cent of the group's net income in the first nine months of 1957 was earned in the Western hemisphere, compared with only 44 per cent three years earlier. Excluding royalty oil, over two-thirds of the group's production and purchases of crude oil in the first nine months of 1957 were made in the Western hemisphere, and little more than 20 per cent in the Middle East. On the other hand, nearly 60 per cent of the group's net proved reserves of crude oil are in the Middle East. Indeed if supplies arising during the next 69 years from the group's contract with Gulf Kuwait are included, the Middle Eastern proportion rises to nearly 80 per cent.

Capital expenditure of the Royal Dutch-Shell group runs high. For the first three quarters of 1957 it was £273 million and the prospectus names the seemingly disproportionate figure of £400 million for the full year and about the same figure for 1958. It shows also the rough geographical division of the total of £1,781 million expended in the 5¾ years ended September 30th. It was 35 per cent United States, 27 per cent other Western hemisphere, and 38 per cent Europe and the East.

Ultramar and the Speculators

FOR the success of these big issues the steadier tone that has now developed among oil shares and the clearing up of some of the speculative accounts is a good augury. Speculative weakness in the oil share market has shown itself not nearly so much among the oil giants, Shell, BP and Burmah as in a smaller gambling counter—Ultramar, whose shares in the ten days before Christmas fell 9s. 3d. to 58s. This company exploits an oilfield of eastern Venezuela jointly with the Texas company, and has always attracted the speculators. Even in 1948 when it was still in the development stage and when many difficulties and disappointments lay before it the 10s. ordinary shares reached 86s. Now with the bulk of its once very big debts repaid and shareholders in receipt not of a dividend, but of two 10 per cent distributions from capital reserve, the speculators have again burned their fingers.

The company has gone out of its way to deny that there were any aspects of its business that would account for the share movements. Therefore apart from any cutbacks that Ultramar, like other oil producers, may expect to suffer if oil is in surplus, the set-back seems to be founded wholly on the troubles of the speculators. There has been selling, some of it from America possibly designed to establish tax losses. There has also been a proper tendency in the market to discourage operators who keep their positions open from account to account by selling for cash and buying for new time. Quite a volume of these "cash and new" transactions took place at the beginning of the last account on December 11th. Some operators may since have been warned that it would be less easy in future. Finally the uncovering of this speculation in Ultramar owes much to the closing of a big protected bear account for 25,000 shares a few weeks ago. The market seems to have felt that the operator was being paid too much for consenting not to deliver his stock. The recovery to 60s. 3d., well held despite the trouble in Venezuela, does not necessarily mean that all the speculators are out, but it does suggest that the market is now healthier.

SHIPBUILDING

Excuses for Stagnation

IN spite of considerable increases in supplies of shipbuilding plate last year, British shipyards managed to build and complete fewer vessels, with a slightly smaller combined gross registered tonnage than in 1956. Final figures are not yet available, but the latest estimate of total completions in 1957 is a shade under 1.45 million tons, which compares with 1.46 million tons in 1956, and a total building capacity estimated by the industry itself of about 1¾ million tons.

The industry is still putting the blame for its disappointing performances partly upon steel suppliers for not meeting its every requirement, particularly as to the sequence of plate deliveries by grade and size; and partly on its labour force for the production losses and dislocation of schedules caused by the general stoppage of work last spring, by local interruptions throughout most of the year, and by restrictive practices such as footling disputes over demarcation. It bemoans, also, the shortage of certain grades of skilled labour, which it ascribes to the general "condition of full employment" in the country. There is some substance in all these excuses. But they do certainly not add up to a wholly convincing explanation of why, with bigger orders than ever, the industry's output has not increased at all during the last two years.

With orders stretching well beyond 1960, a shortage of certain specialised labour would seem to suggest better pay to attract, and retain, the extra men shipbuilders want. Steel supplies improved further in the second half of last year—well after the general stoppage of work—yet shipbuilding output was lower than in the last six months of 1956, and shipbuilders' stocks of steel have continued to rise. And, after all these years, surely the industry's management ought to have made further headway sorting out its problems with the labour it has got.

The slow rate of production, and the depressed shipping freight market, has not yet led to any more cancellations

of orders than the industry normally experiences. But the rate of new ordering has dropped, from nearly 2½ million tons in 1956 to not quite 1.7 million tons last year. This brought the industry's total order book down a little from the peak of last summer to just over 6¼ million tons of new ships at the end of December.

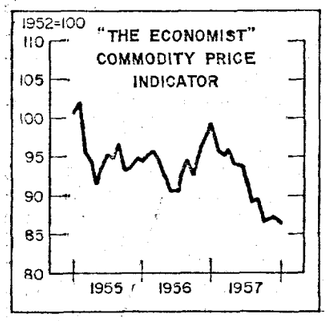
CINEMAS

Attendances and the Levy

AN "unprecedented decline in attendances" at cinemas and the "penal entertainments tax" are the reasons Mr John Davis of the Rank Organisation quotes for the pruning of Rank's film production plans during the next six months. One is not so sure of the "penal entertainments tax," which after being cut last budget, certainly now takes no more out of the cinema industry than taxation removes from its principal new competitor—the television industry. But the decline in cinema going in the last few months has certainly been startling. Board of Trade returns show a drop of 7½ per cent on 1956 attendances in the first quarter of last year and a decline of 19 per cent in the second quarter; the industry's tax committee has now stated that the figures for the third quarter, which are due out next week, will show a drop of 20½ per cent and that in the first seven weeks of the fourth quarter of 1957 attendances were down by 25 per cent. It looks as though cinema attendances last year came to only 900 million, compared with 1,100 million in 1956 and 1,276 million in 1954, and that box office receipts may have fallen below £100 million for the first time since the war.

This sudden increase in the rate of decline in cinema going, which is prevalent throughout the country and only slightly more serious in the newer commercial television areas—television and the relative content of current television and cinema programmes incidentally are not mentioned in the Rank statement—has upset the Board of Trade's calculations for the new statutory levy upon exhibitors for the aid of British film makers. The government took the unusual step last year of writing into the Cinematograph Films Act the precise sum that this levy should produce during its first year, which began last October. The Board of Trade took account of the declining cinema market in fixing the rate of levy that would produce the figure in the statute book—£3¾ million, against £2.7 million in the last few years—but evidently it did not expect the rate of decline that has taken place. On the present flow of receipts the levy may produce not quite £2½ million by next October. As the Board is obliged by this Act to ensure that film makers get £3¾ million from the levy, presumably it may have to step up the percentage impost on box office takings; to be made palatable to exhibitors, that might require the Chancellor to make a further concession in entertainments tax next April sufficient at least to offset this higher rate.

COMMODITIES



Not at the Bottom?

THE general level of commodity prices as measured by *The Economist* indicator fell almost continuously through last year and finished about 13 per cent down. Prices of leading commodities given in the table show that the whole run, with the outstanding exception of cocoa, joined in the fall. What has happened, however, is never a certain guide to what is going to happen. Commodities are now at their lowest levels for four years, and they have just suffered a steep fall; but a further steep fall may be less likely since some prices have reached levels at which production will be curtailed.

COMMODITY PRICES

Commodity	Unit	End-1955	End-1956	End-1957	Per cent. fall or rise end-1957 compared with end-1956
Tin	£ per ton	833½	782½	730½	6·6
Copper	£ per ton	400½	263½	180½	32·8
Zinc	£ per ton	100⅜	102⅝	61⅛	40·4
Lead	£ per ton	120½	116½	72½	37·8
Rubber	d. per lb	37⅜	31 15/16	24⅛	23·3
Cotton (US futures)	d. per lb	27·40	26·85	26·55	1·1
Wool (futures)	d. per lb	105½	136	108⅜	20·3
Sisal (East African)	£ per ton	85	75½	73	3·3
Whale oil	£ per ton	87½	95	82½	13·2
Sugar (fas Cuba)	cents per lb	3·23	4·90	3·85	21·4
Cocoa	sh. per cwt	244½	192	305½	+ 59·1
Wheat (cif UK)	£ per ton	30/ 6/6	32/ 9/9	27/15/6	14·5
Maize (cif UK)	£ per ton	24/11/9	27/13/9	21/ 3/9	23·5
Barley (cif UK)	£ per ton	25/ 7/–	28/ 7/9	20/ 5/–	29·7
Shellac (futures)	sh. per cwt	358½	292½	176	39·8

Some of the causes of falling commodities are plainly transient; the aftermath of the uprush at the time of Suez and some sales from the British strategic stock come into that class. Two other causes are likely to be more enduring—the return of output from heavy capital investment made in mining when metal prices were high and the fact that the American strategic stockpile has ceased to absorb commodities. The last and most vital cause—industrial recession in America — must also be transient, but when will it pass? Merchants, industrial consumers and investors will find it impossible to build firm conclusions on such quicksands. All that they can firmly conclude is that the full effects of the fall that has already taken place have not yet worked through the economy. Neither the prosperity of the primary producing countries, nor the profit and dividends of the mining and plantation companies, nor the balance sheets of consuming companies in this country and elsewhere yet fully reflect what has happened. It is a fair supposition that stock losses will affect the accounting results of many companies this year, and that there will be no great haste on the part of industrial consumers to rebuild their stocks of primary raw materials.

Copper Sale Postponed

AT the end of the year the Board of Trade announced its decision to postpone again the sale of the 27,000 tons of surplus copper from the British stockpile. A further announcement will be made when it is decided to resume

sales. The decision to postpone selling is obviously right. Hardly anyone would suggest that it would be good either for the market or for the public purse to force on the market a valuable block of copper at a moment of obvious surplus. But the fact that postponement is necessary underlines the continuing threat to the commodity markets of the British stockpile and still more the American stockpile. In total the amounts of metals which the British stockpile is releasing are quite big enough to depress a weak market. The transactions in non-ferrous metals are listed below:

Copper: 65,000 tons sold between 1955 and 1956; 36,000 tons sold between November, 1956, and March, 1957; sale of 27,000 tons now postponed.
Tin: 2,500 tons announced as available; none yet sold.
Lead: 30,000 tons sold between March and November, 1957; 20,000 tons available, of which 7,200 tons are being sold between now and mid-1958 at 1,200 tons a month.
Zinc: 27,000 tons available, of which 9,000 tons are being sold in the three months December, 1957, to February, 1958.

In addition there have been important releases of other commodities, particularly of wool (of which between 80,000 and 100,000 bales are being sold in the year ending in March) and of timber.

Both the British and the American governments are fully aware of their obligation to conduct stockpile operations with a minimum disturbance to markets. But Commonwealth primary producers and British markets have so much more to fear from the American stockpile than the Americans have to fear from the British that it is essential that the British Government's example should be impeccable. What would be the effect on the economy of Malaya if the American stockpile, relying on American industrial advice, were to use its great power to depress rubber and tin, as it has sometimes been accused of doing? These huge stocks of commodities are inevitably a great obstacle to normal trading however carefully they are turned over. Just because governments have it in their power to distort markets, neither traders nor industrialists will hold more stock than they must.

DEFENCE ORDERS

The Last Fighter

With the belated cancellation of the small Saunders Roe SR 177, it is now certain that the English Electric P.1 and the frequently forgotten Folland Gnat are the last fighter aircraft to be built in this country—always excepting the perennial de Havilland Vampire trainer which small air forces use as fighter, bomber or strike aircraft as circumstances dictate. It seems to have been overlooked that the cancellation of the SR 177 is not a retrograde step so much as a sign of progress, and material proof of the Air Ministry's current belief that it has become easier and cheaper to build a primitive guided missile than a manned aircraft for the same role. The SR 177 was designed much on the lines of the small Continental fighters whose function is to climb after their targets with the speed of a missile (the SR 177 would have flown at least twice the speed of sound, the French Trident can climb at that speed). Such an aircraft might have been invaluable had it been a year or so earlier, but the SR 177 was lagging somewhat behind schedule, and the guided missiles which replace it are already on the production lines.

The Air Ministry had at no time placed or showed any signs of placing an order for the aircraft and the Defence White Paper last April deliberately omitted any reference to it. The Ministry of Supply clung, however, to the project and financed it for a further nine months partly because it seemed to be shaping well, partly in the hope that orders from the Navy and from foreign customers might still justify tooling for production. The Germans did not buy the aircraft; the Navy did, but its order alone is not big enough to justify the cost of developing a fighter as intricate and complicated as this. Nevertheless, the fact that the fighter was cancelled at a time when the Navy has no early prospect of anti-aircraft guided missiles, raises doubts about how long the Ministry of Defence in fact intends to keep its carrier fleet.

The Ministry of Supply now faces heavy cancellation charges, which will eat up a good deal of the savings expected from stopping further work on the aircraft. It is odd, however, to find that the Ministry which is most in touch with technical developments should have clung for so long to an obsolete project. It is too early yet to reckon the saving of the country's finest young men that will follow on the decision to ground the pilot and use an unmanned missile in his place. The toll of life, even in peacetime in the RAF, and among test pilots, is considerable, and this kind of cost should be balanced against the effect of local, and probably transitory, unemployment on the Isle of Wight.

THE REVENUE

All Square above the Line

The last quarter of the financial year—the months of January, February and March—are the tax gatherer's harvest season. Notoriously deductions based on the first three quarters of the fiscal year (which yield less than half the taxes on income) can be wide of the final result and this year, after Bank rate, the cost of servicing the debt in the last quarter must be high. Nevertheless the nine months figures to December 31st seem to show the above-line accounts to be running roughly as estimated in the budget, and the below-line accounts to be running much worse than those estimates.

BUDGET ESTIMATES AND THE NINE-MONTHS OUT-TURN

	April 1 to Dec. 31, 1957	Change on April to end Dec., 1956	Budget estimate for full year 1957–58	Expected change in full year on 1956–57 out-turn
Revenue:				
Income tax	867·1	+ 66·1	2,176·3	+ 62·1
Surtax	53·1	− 0·2	149·0	− 9·0
Death duties	126·2	+ 5·5	170·0	+ 1·0
Stamps	50·1	+ 4·2	60·0	− 3·0
Profits tax†	195·2	+ 42·2	255·0	+ 55·0
Other inland revenue	0·2	...	0·5	− 0·1
Customs	918·7	+ 9·4	1,204·3	+ 5·4
Excise	704·1	+ 28·8	912·9	+ 11·2
Post office (net)	0·6	− 2·7	20·0	+ 15·5
Other revenue	201·9	− 5·0	341·0	− 6·9
Total ordinary revenue	3,117·1	+148·4	5,288·9	+131·1
Expenditure:				
Debt service	497·3	− 72·8	640·0	− 70·6
Sinking funds	25·5	+ 0·2	38·0	+ 1·0
Other consolidated funds	53·3	+ 3·0	79·0	+ 3·0
Supply services	2,984·9	+ 77·3	4,070·0	+ 25·6
Total ordinary expenditure	3,561·0	+ 7·6	4,827·0	− 41·2
Above-line balance	−443·9	+140·8*	+461·9	+172·3
Net below-line outlays	453·6	+110·8	587·0	− 34·0
Total deficit	897·5	− 30·0	125·1	−206·3

† Comprises profits tax, excess profits tax and levy. *Reduced deficit.

Above the line the budget looked for a surplus of £426

million, £172 million greater than a year ago: it is in fact running £142 million greater. Income tax has been yielding what was expected from it, and profits tax (including the EPT and the EPL back logs) is a little below estimate; expected to yield £55 million more—the actual yield was only £42 million more. Money incomes clearly have risen and offset the cost to the Exchequer of enlarged earned income and certain other reliefs. Customs and excise duty, estimated to yield £16.6 million more, are actually up by £38.2 million, while the Post Office, contributing about £3 million less than the year before, had by December 31st only just begun to reflect the increased postal charges.

In total, ordinary revenue has been *£148 million higher* than a year earlier, against an estimated increase of £131 million. That the surplus above the line does not fully reflect this improvement is largely due to unexpectedly high expenditure on the supply services. They were expected to cost £26 million more in a full year. To date the increase is £77 million.

Weakness down below

CAPITAL outlays below the line were estimated in the budget at £587 million, £34 million below those of the previous year. So far they are running £121 million up on the corresponding period of last year. The significance of the shortfall may not be great. Much of it reflects the cost of financing the capital expenditures of the nationalised industries. And it was not until August, 1956, following a budget decision of that year that the Treasury cut those boards off from the market and undertook to finance their necessary capital expenditure itself, so that there are probably some initial distortions in the comparison. In the first threequarters of 1956 the Treasury provided £26 million for the National Coal Board (which has never been under the obligation of raising its own finance by issuing stock) and a net £154 million for the others. Comparable figures this year have been £88 million for the Coal Board and £231 million for the others. The difference—£139 million—accounts for most of the £155 million shortfall below the estimates.

NICKEL

Supply Meets Demand

LAST year saw the end of the shortage of nickel. Supplies in the free world, running at about 490 million lbs, as compared with 450 million lbs in 1956, came into "close balance" with demand. The phrase is that of Dr John F. Thompson, the chairman of International Nickel, whose production of about 290 million lbs of nickel dominates the market. Supplies increased at the moment when demand for defence purposes was sharply reduced and when the United States Government began trying to dispose of the nickel it was receiving under contract for its stockpile. That nickel was offered to industry at premium prices (ranging between 88 cents to 116 cents a lb, as compared with International Nickel's price of 74 cents) and in the last quarter of the year a "large portion" of the premium priced metal was not taken up.

By the end of the year there was more than sufficient nickel at the market price for civilian requirements in the United States. Supplies this year should be raised by a further increase in production, and are expected to exceed market demand in that country. For the free world as a whole, Dr Thompson expects another "close balance," but some nickel, he says, will still be offered at premium prices.

Is this merely a temporary equilibrium? By 1961, Dr Thompson estimates nickel production capacity at between 650 million and 675 million lbs a year. During the period of shortage many substitutes for nickel in alloys were found. There is thus a market for nickel to win back and International Nickel has always considered that there are many new uses to which the metal can be put.

ATOMIC ENERGY

Atomic Aid to Italy

THE terms of the agreement on atomic aid signed last week between this country and Italy are of more than purely local interest. They are widely being regarded as a prototype of those on which Britain is prepared to do business with countries buying nuclear power stations from British manufacturers. Italy is the first to have taken positive steps towards placing such an order, a letter of intent was given to the Nuclear Power Plant Company a few weeks ago. Other potential customers, as well as competitors, will note that the terms are generous. They cover a wide range of technical help, not only in building reactors and training staff, but in building ancillary plants for manufacturing fuel elements and for treating them when they come from the reactor. Since these plants cost from £5 to £10 million apiece, a country is unlikely to wish to build them until it has embarked on atomic energy on a really large scale, but it would be quite on the cards for Italy, for example, to set up a fuel treatment plant to meet the joint needs of all Euratom countries.

Perhaps the biggest difference between the British and American pattern of atomic trade is that Britain is prepared to sell fuel outright, whereas the Americans will only lease it. Several countries find the concept of leasing tolerable for research reactors, but unacceptable when the fuel is for so important an installation as a base load power station. Some consternation has also been aroused in the United States by the discovery that Britain, or rather the Atomic Energy Authority, is not only prepared to sell fuel outright, but also to guarantee the life and performance of the fuel elements. Since these are the most vulnerable components of any big reactor, such a guarantee gives the customer a comforting degree of protection against either failure of the rod or failure of the fuel itself to give as much heat as expected. When a charge of fuel costs £5 million, even a small error could be expensive. So far the US atomic authorities have steadily refused to give any such guarantee, and in the coming months US manufacturers may find this a considerable handicap in the export markets.

WOOD PULP

Scandinavian Prices Cut

PAPERMAKERS are paying £2 a ton less for their main raw material, Scandinavian wood pulp, from January 1st. Prices are normally negotiated over six months and the present reductions apply for the first half of 1958. Mechanical pulp, from which newsprint is made, costs after this reduction £30 a ton, cif. Bleached chemical pulp, used for high quality paper, is priced at around £58; unbleached kraft, the chief material for bag and wrapping paper, at £45. The immediate cause of the fall in prices—the sharpest since the Korea bubble was pricked in 1952—has been the weakening of the British market for paper. Britain is much the most important buyer of Scandinavian pulp, absorbing about two-fifths of Scandinavian exports. Manufacturers of newsprint and magazine paper overestimated demand for advertising space in 1957 and therefore bought too much mechanical pulp in 1956. Manufacturers of other paper found that demand did not expand sufficiently to match the enlarged capacity. Dear money added its share in cutting British imports from 1,817,000 tons in the first eleven months of 1956 to 1,747,000 tons in the same period of 1957.

In consequence pulp mills in Scandinavia have been forced to reduce output of mechanical pulp—which even a year ago was still scarce. Beyond the British-Scandinavian scene there is also the prospect of a mounting surplus of wood pulp in North America. Years of scarcity and highly profitable prices have fostered rapid expansion of capacity in both Canada and the United States, and the completion of much new capacity coincides with the onset of recession in America. Whether the reduction in prices paid by papermakers in this country will be passed on to the customers is open to doubt; they are faced with higher costs in other directions.

TINPLATE

Only Three Mills Matter

AT the end of this week, when the three hand tinplate mills of the Upper Forest and Worcester Steel and Tinplate Works, near Swansea, suspend production for the second time this winter, there will be only five hand tinplate works, with 15 mills between them, still in production. All the rest of the 200 hand mills that were operating five years ago have since closed down, 30 of them in the first half of 1957 and 60 since last June. It is likely, too, that the remaining 15 will have gone out of production within the next few months, though a few that produce certain special types of hot dipped plate may be able to get by for a while longer.

Last year, with below average crops, was not a good year for canners, but the softness of home demand for tinplate only partly accounts for this dramatic sweeping away of the remaining South Wales hand mills. The last year or so has seen, in effect, the addition of 1½ large strip mills, producing better average quality material, to the tinplate industry's capacity, with the extensions at Ebbw Vale, the first of the three modern tinplate strip mills, and the running-in of the latest one—Velindre. Trostre also has been able to turn out more; it is now producing at the rate of more than 400,000 tons a year. The three strip mills together produced 820,000 tons of tinplate in the first eleven months of 1957, against 642,500 tons in the whole of 1956. In the same periods hand mill output fell from 265,500 tons to 160,000 tons.

Thus 1957, which saw tinplate output exceeding a million tons for the first time, also witnessed the virtual disappearance of the old type of hand mill and the concentration of the industry into three large plants in South Wales. These three plants could reach their full combined capacity of some 1.2 million tons a year by the latter half of 1958, though new tinning capacity may not come in as rapidly, and in any case demand is unlikely to grow to match this potential expansion of output. Exports of tinplate rose by a third to 400,000 tons last year; a further but smaller increase is expected this year, though French and now American tinplate producers have been penetrating more deeply into Britain's overseas markets. The prospects for home consumption seem somewhat better now that the industry's customers have got their stocks down to more manageable levels. But total deliveries in 1958 are not likely to rise as far as the industry's enlarged capacity could manage—and the chances that the hand mills can make yet another comeback this year woud seem to be nil.

BUILDING SOCIETIES

Halifax Mortgage Rates

BORROWERS from the Halifax Building Society who took their mortgages before July 1, 1956, have received notice that from April 1st their interest will be raised to 6 per cent. By this step the Halifax abolishes a concession to old borrowers that most other societies have already discarded and brings all its mortgages into line with the rate of interest charged to old and new borrowers by most building societies. It will affect about 200,000 (nearly two-thirds) of the society's borrowers. For nearly all of them it involves an increase of only ¼ per cent though there are a few outstanding mortgages, mostly for tiny amounts, at present paying 5 per cent or 5½ per cent, and they too will be brought up to 6 per cent.

It must be assumed that the Halifax will not move its rates charged to new borrowers and paid to shareholders unless the rest of the movement does so. What it does now is to bring in a fairly substantial block of extra income from existing mortgages on which the gap between the interest charged and the cost of the money can have left hardly any room for strengthening reserves. Since the society has enjoyed a good inflow of investment money in recent months, has been lending freely (though not to satisfy completely the demand for mortgages) and wishes to continue doing so, it is a fair guess that some shrinkage in the ratio of reserves to total assets must have occurred, even though the balance sheet on January 31st may show an increase in their size. The society now lays its hands on an additional income that should gradually rebuild the reserve ratio.

The Halifax increase comes at a moment when the building societies generally are trying to avoid any increase in

on hand for yarn than for four years past. They have acted by acquiring a number of new subsidiaries, scattered across the various sectors of the textile trade, by developing the production of synthetic fibre yarns, by going into the expanding market for tufted carpets and by planning further schemes of modernisation. And it is the new subsidiaries and new ventures that are primarily responsible for the improvement in earnings.

While Lancashire Cotton seems intent on broadening the base of its activities, **Cyril Lord Ltd.** (which has also gone into the tufted carpet industry, selling directly to consumers) appears to be narrowing its activities. Its immediate financial concern is to reduce its bank overdraft; on June 1st this stood at over £1,100,000 but since then it has been reduced by about £200,000. The company is selling off its retail shops, which specialised in the company's own fabrics, and it has partially severed another close contact with the retail trade by closing down its merchanting division—though merchant converting seemed to many to be the foundation of its business. This has led to a terminal and non-recurring loss of £211,919 which represents about two thirds of the fall from £656,697 to £354,721 in trading profits for the year to June 1st. Cyril Lord Ltd will in future concentrate upon spinning (which has been profitable) and limited weaving (which Mr Cyril Lord admits has been unprofitable) but it will retain an indirect interest in merchanting through its ownership of 42 per cent of the equity of Silmyra Fabrics; Cyril Lord Ltd purchased that interest for £129,136 but on June 1st it had a market value of only £34,485.

The directors of **Fine Spinners**, having reported a period of "good trading" in the six months to September 30th, a maintained interim ordinary dividend of 5 per cent and "a satisfactory order book," draw attention to the Government's financial restrictions which they suggest, by forcing traders to cut their commitments, have added to the cotton industry's worries. *Plus ça change, plus c'est la même chose* seems to be a just comment on Lancashire's grievances.

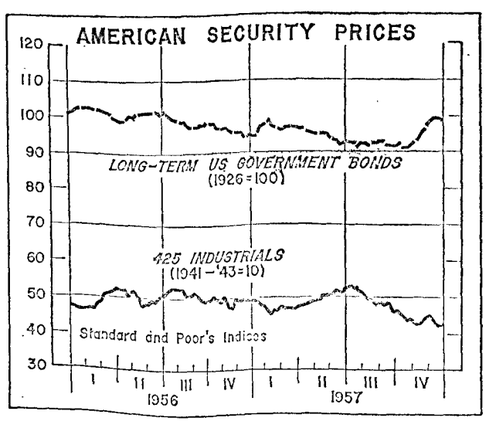
CANADIAN PACIFIC

FOR 1956, Canadian Pacific paid a dividend of $1.75 per $25 ordinary share. In the six previous years the dividend remained unchanged at $1.50 and for 1957 the dividend has been brought back to this rate. As the Canadian boom tailed off investors anticipated that the extra dividend of 25 cents paid in 1956 would not be repeated. The president of Canadian Pacific, Mr N. R. Crump, sums up 1957 in these words: "the adverse effect of the decline in Canada's economic growth in 1957 was reflected in a sharp decline in railway traffic." But Canadian Pacific is still planning its development and modernisation programmes on long-term growth prospects.

In the period January-October, the company's railway revenues fell by $13,800,000; within this total, rail passenger receipts were up by $800,000 but freight traffic receipts were down by $11,400,000 and other rail receipts by $3,200,000. As a result over the year the company's return on net railway investment will be below the "unsatisfactory rate" of 3.2 per cent recorded in 1956. In commenting on these results Mr Crump refers to the slow down in residential construction and to "a wide adjustment in inventories" which resulted in a smaller volume of freight traffic in a broad range of commodities; to a sharp fall in grain traffic, reflecting the decline in exports; and to a strike of locomotive firemen in January.

The $25 ordinary units of Canadian Pacific are much more than simple railway equities for the company has big interests in shipping, air transport, hotels and minerals. But this is a stock bound to the fortunes of the Canadian economy and since July, the peak of the boom in dollar securities, the price in London has come down from $75½ to $43½ and it now yields 6.2 per cent.

London Stock Exchange



FIRST DEALINGS:	Dec. 11	Jan. 1	Jan. 15
LAST DEALINGS:	Dec 31	Jan 14	Jan. 28
ACCOUNT DAY:	Jan. 7	Jan. 21	Feb. 4

SINCE the Christmas break business has remained at a low level, but prices have remained firm. The improvement in gilt-edged gathered pace on the rise in sterling and the fall in US interest rates; 4½ per cent Conversion 1962 gained 1/32 to 95 1/32 on the cessation of official selling and 3½ per cent War Loan improved by ½ to 63⅛.

Bank shares made small gains in anticipation of the results; insurance shares made much larger gains, Prudential "A" rising 1⅜ to 38½ and Commercial Union 3s. 9d. to 73s. 9d. Industrial stocks were mainly firm, with stores making fresh gains, but electrical stocks remained weak. Redundancies in the cinema industry caused a general fall in cinema shares on Wednesday, Rank Organisation ordinary shares losing 3d. to 6s. Among aircraft producers de Havilland dropped 10½d. to 16s. 3d. and Fairey Aviation 9d. to 16s. 6d.; Bristol Aeroplane made a small gain to 14s. 3d.

Leading oil stocks rallied after earlier dullness and Shell made an overall gain of 3s. 1½d. to 145s. 7½d. Kaffirs were consistently firm and made good gains on Wednesday; Western Holdings rose to a peak of 91s. 3d. and Winkelbank advanced 10½d. to 17s. 10½d.

***The Economist* Ordinary Share Indicator has been re-based on December 31, 1957, and linked back to the original base (average 1953=100). The merger of Courtaulds and British Celanese reduced the stocks in the Indicator to 49; the number has been restored to 50 by the inclusion of Furness Withy £1 units.**

(1) 1939 figures calculated on the basis of a smaller sample. From January, 1957, as a result of a change in definition some 200,000 to 300,000 persons temporarily laid off or waiting to start new jobs formerly classed as employed are subsequently classed as unemployed. (2) 1939 figures not strictly comparable with rest of series; stocks are at end of period. (3) All commercial banks. (4) Annual figures are total for the fiscal year ended June 30th. (5) Figure for second quarter. (6) Estimate for November: $16·6 billion. (7) Bonds due or callable from 10 to 20 years.

Financial Statistics

EXCHEQUER RETURNS

For the 10 days ended December 31 1957, there was an "above-line" deficit (after allowing for Sinking Funds) of £13,527,000 compared with a deficit of £39,540,000 in the previous week and a deficit of £65,139,000 in the corresponding period of last year. There was a net expenditure "below-line" of £42,356,000, leaving a total deficit from April 1st of £897,534,000 (£927,470,000 in 1956–57).

THE MONEY MARKET

THE year end money squeeze was not felt until Monday, December 30th, when institutions other than the banks heavily recalled their loans to the market, forcing two or three houses to borrow from the Bank at the penal rate. On Tuesday the rate on over-night loans ranged up to 6½ per cent, but the following day the rate fell below 5 per cent.

At the Treasury bill tender on Friday last week the discount market raised its common bid for 91-day bills by 4d., to £98 8s. 2d. No 63-day bills were offered —£50 million of them were allotted at the previous tender—and this more than accounted for the increase by £40 million, to £260 million, in the allotment of longer bills.

Total applications at £409.2 million compare with applications in the previous week for £52.8 million of 63-day bills and for £351.1 million of 91-day bills, the market securing 54 per cent of its common-price applications, excluding the bills taken up on Friday. Three months from then will be Good Friday, and applications for that day were allotted in full. The average rate fell 1s. 4.03d. to £6 7s. 5.91d. per cent. The rate for 91-day bills has now been declining for over two months.

The United States Treasury bill rate rose again, this time from 3.140 to 3.174 per cent. Throughout the week sterling has been above parity against the US dollar.

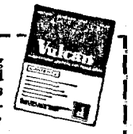
BEFORE | **AFTER** — ***and the difference?***

Maybe £5,000



How?
Faulty water gauges were spotted, and an accident costing £5,000 or more has been prevented.

Spotted by whom?
By a Vulcan Engineer-Surveyor during his regular inspection of the boiler. Experience gives him almost second sight into the accidents that are waiting to happen.

Are his services expensive?
Not at all. Your broker will tell you that, though the Vulcan man is a specialist, his services cost no more than insurance and inspection by general practitioners.

What Vulcan insures, Vulcan inspects—thoroughly and *regularly*. As a result our clients have made us one of the largest engineering insurance companies in Europe.

COMPANY MEETINGS

OK BAZAARS (1929)

(Incorporated in the Union of South Africa)

INCREASED NET PROFIT

SUBSTANTIAL EXTENSIONS TO BRANCHES

The twenty-eighth annual general meeting of shareholders of OK Bazaars (1929), Limited, was held on December 31st at OK Buildings, corner Eloff, Pritchard and President Streets, Johannesburg, Mr S. Cohen (chairman and joint managing director) presiding.

The following is the directors' report circulated with the accounts for the year ended June 30, 1957:

CAPITAL

The Share Capital of the Company appears in the Balance Sheet at the same total as last year.

PROFIT

The net profit of the parent Company for the year under review after providing for all expenses and taxation was £1,071,202 as compared with £943,800 for the previous year. The amount available for allocation and appropriation in the accounts of the parent Company has been dealt with as set out below:

1956			1957
£		£	£
2,114,257	Balance brought forward from previous year		2,144,046
943,800	*Add :* Profit for the Year		1,071,202
3,058,057			3,215,248
	Deduct : Preference dividends	75,400	
	Interim dividend of 20 per cent, declared 13th June, 1957, since paid	168,870	
	Second Interim dividend of 2½ per cent, declared 15th November, 1957, payable 24th December, 1957	21,109	
268,488			265,379
2,789,569			2,949,869
350,000	*Deduct :* Transfer to Capital Reserve		500,000
2,439,569	Balance		2,449,869
	Which your Directors recommend be dealt with as follows :		
	For the payment of a final dividend of 40 per cent on 31st January, 1958 (making a distribution for the year of 62½ per cent, as compared with 60 per cent for 1956) to holders of Ordinary, "A" Ordinary and "B" Ordinary Shares		
295,523			337,741
£2,144,046	Balance to be carried forward		£2,112,128

The second interim dividend of 2½ per cent payable on December 24, 1957, was declared to avoid the incidence of Undistributed Profits Tax.

CONSOLIDATED ACCOUNTS

Shareholders are referred to the Consolidated Accounts of the Company and its Subsidiaries which show the position of the Group as a whole. The Consolidated Net Profit, after deducting all expenses, taxation, interests of outside shareholders and preliminary expenses of certain subsidiary companies, is £1,249,373 which compares with £1,153,283 for 1956. Provision for the replacement, renewals and modernisation of shop fittings and equipment has in this year's Balance Sheet been increased by an amount of £69,131. This provision has been made in conformity with our policy of modernising our shop lay-out and sales presentation. The trading stocks on hand were increased by £1,406,339 in order to provide for the new branches and for the increased turnover of existing stores.

The following statistics are given for the information of shareholders:

	1953	1954	1955	1956	1957
	£	£	£	£	£
Preference Capital	1,040,000	1,040,000	1,040,000	1,340,000	1,340,000
Ordinary Capital	651,000	651,000	651,000	844,000	844,000
Reserves and Unappropriated Profits	5,976,000	6,271,000	6,953,000	8,703,000	9,347,000
Totals	7,667,000	7,962,000	8,644,000	10,887,000	11,531,000
Profits after tax	834,000	853,000	966,000	1,153,000	1,254,000
Percentage of profits of above totals	10·88	10·71	11·17	10·59	10·88
Preference Dividends paid	57,000	57,000	57,000	57,000	75,000
Profits attributable to Ordinary Shareholders	777,000	796,000	909,000	1,096,000	1,179,000
Dividends to Ordinary Shareholders :					
Amount	326,000	390,000	390,000	507,000	528,000
Per share	2s. 6d.	3s. 0d.	3s. 0d.	3s. 0d.	3s. 1½d.
Profits retained	451,000	406,000	519,000	589,000	651,000

The £2,616,000 profits retained in the business over the above five years have assisted the Company in extending its activities.

DEVELOPMENT

The new Durban shop was completed in July, 1957, and the shopping facilities now provided in this important city are unsurpassed. Substantial extensions and alterations have been made to our Pretoria, Welkom and Bloemfontein branches. New branches at Kitwe (Northern Rhodesia) and Orange Grove (Johannesburg) will be completed in this financial year and a new branch to be completed in July, 1958, is in the course of construction at Randfontein to replace our present store which is inadequate. Considerable extensions are now in hand to the present store in Klerksdorp (Transvaal), which town is rapidly expanding as a gold and uranium producing centre; preparations are well advanced for the erection of a new branch at Florida (Transvaal). It is hoped that before the close of the current financial year, building operations will have commenced on our new store at Rosebank (Johannesburg). We have discontinued the business formerly known as Paramount Stores (Johannesburg) and we now trade as "CTC Bazaars" in the same premises which have been modernised. Last year we reported the arrangements made with Federated Stores Limited in regard to the adjacent sites at Port Elizabeth, Salisbury and East London. Work is in progress at Port Elizabeth and it is expected to be completed in 1959 and the Salisbury project will commence early in 1958. Extensions to the East London branch have been deferred. Similar arrangements have been made with Federated Stores Limited in regard to Johannesburg and Wynberg (Cape) where sites adjoining our branches have been acquired for extension purposes. Capital outlays will be required for these extensions, as well as for alterations to certain other stores on long term leases, the major portion of which will be recovered from Federated Stores Limited over a period of years. At June 30, 1957, the amount of such recoverable outlays was £271,581, as reflected in the Accounts.

DIRECTORS

The retiring Directors are Messrs. James Cranko and Stanley Cohen, who being eligible, offer themselves for re-election.

GENERAL

We again take this opportunity of complimenting South African manufacturers on the continued improvement of their products which constitute the major portion of our requirements.

We extend to all members of the staff our thanks and appreciation for their continued loyal co-operation and efficient services. This year, as in previous years, bonuses were paid to the staff.

The report and accounts were adopted and the dividend as recommended was approved.

The retiring directors were re-elected and the remuneration of the auditors, Messrs Peat, Marwick, Mitchell & Co. was fixed.

TURNER & NEWALL LIMITED

SATISFACTORY TRADING RESULTS

INCREASINGLY COMPETITIVE CONDITIONS

The Annual General Meeting of Turner & Newall Limited will be held on January 21, 1958, at the Chartered Accountants' Hall, Manchester, when it is expected that Sir Walker Shepherd, the Chairman of the Company, will preside.

Sir Walker Shepherd's Statement to the Stockholders has been circulated to them with the Report and Accounts, and, after dealing with the accounts of the Company, it contains a detailed review of the Company's operations during the year to September 30, 1957, both at home and abroad.

The following are extracts from the Statement:

ASBESTOS TEXTILES

Despite increasingly competitive conditions in both home and export markets, coupled with reduced demand for textile-based brake lining materials, the trade of Turner Brothers Asbestos Company Limited in asbestos textile products was maintained during the year at a satisfactory level. A further expansion of export turnover was achieved, establishing a new record, and overseas demand in this field continues generally buoyant. Mainly as a result of substantial contracts from the National Coal Board for fire-resisting conveyor belting, output from the Company's belting factory at Hindley Green showed a considerable increase over any previous year. Trading conditions, however, in the belting field also became strongly competitive as the year progressed, so that the financial results were less favourable than might have been anticipated.

Further steady progress has been made with the modernisation and enlargement of the Rochdale factory, and also with the transfer of various important manufacturing processes to the new asbestos textile and plastics factory at Hindley Green. The benefits are being felt progressively as the work proceeds, but the full effect will only become apparent when these transitional factors cease. One advantage which has already accrued from the transfer programme has been the partial relaxation of pressure on the Leeds factory of J. W. Roberts Limited, which continued to make a useful though diminishing contribution to asbestos textile production, while maintaining its output of fibres processed for other purposes. The Company's postion in the field of Sprayed "Limpet" Asbestos and "Ferobestos" technical plastics has been further consolidated, and steady development is confidently anticipated.

BRAKE AND CLUTCH LININGS

Whilst the export sales of Ferodo Limited attained a new high level, home market turnover was slightly below the record figure of last year, mainly due to the effects of the Suez crisis. This had significant repercussions in the automotive field, and the Company was able to avoid redundancies amongst its workpeople only because of the cushioning effect of its expansion into markets outside the motor trade. It is the Company's policy to continue energetically with the development of activities in such markets. Rising costs have been a problem during the year, but it has been possible to increase factory efficiency by major reorganisations of plant and improved techniques. Against the general trend, selling prices have not been increased. The immediate outlook in the home market is naturally uncertain as the Company has reason to know that, in times of dear money and restriction of credit, the motor trade is invariably amongst the first to suffer. Backed by extensive patent protection both at home and abroad, the Company has expanded its range of heavy duty friction materials by the introduction of sintered metallic products. Research facilities are being expanded by the construction of a new building wherein under one roof will be housed all research activities —laboratories, testing facilities, experimental production workshops and administration. Also during the year the Company has arranged for the construction of its own test track for vehicles at a location close to its factory.

ASBESTOS CEMENT

Falling demand, and the resultant intensified competition, have been experienced by Turners Asbestos Cement Company, Limited, in both home and overseas markets; under these circumstances it is satisfactory that this Company has reported results which are very similar to those for the previous year. Political and economic difficulties have had an adverse effect in a number of important export markets; at home the restriction of finance for capital development is progressively affecting the building and civil engineering industries which are important customers for the products of the Company. New products have been developed and marketed to meet the changing demands of the building industry, in particular in relation to fire resistance and insulation against wasteful loss of heat. Current trading continues at a satisfactory level, but maintenance of this situation is clearly dependent upon some easing of national financial difficulties.

CHEMICAL AND INSULATION

The factories of The Washington Chemical Company, Limited, operated at high capacity throughout the year, with a sales turnover considerably in excess of that of the previous year. Increasing costs of production resulted, however, in reduced profit margins, whilst export business, although demand was strong, remained very competitive. Good progress was made with the factory modernisation and enlargement schemes, whilst research work on the Company's products and processes proceeded favourably. Newalls Insulation Company, Limited, also experienced a satisfactory year, with turnover approximating to the record figures reported last year.

EXPORT TRADE IN GENERAL

The development of export turnover by our manufacturing companies located in the United Kingdom has varied in degree; this is only natural since the type and nature of the products which they are able to offer overseas buyers cover a very wide range of industries. Whilst the total volume of export business has not fully equalled the record figures of the previous year, which, as I stated at the time, were beginning to be influenced by the political situation, the difference is not very great and is completely understandable in the circumstances.

DIRECTORS

Since the date of our last Annual General Meeting, Mr George Wilson resigned from the Board with effect from January 31, 1957. He had been troubled by ill health, and his retirement from the Board, whilst not unexpected, has meant the severing of the last link after a lifetime of service to our Organisation. We wish him well for the future, and record the Board's appreciation of his long and valuable service. During the year four new Directors were appointed in the persons of Messrs R. M. Bateman, N. A. Morling, G. S. Sutcliffe and J. A. E. Clogg. All of these gentlemen have been in the service of our Organisation for many years, in most cases almost entirely in the section of our Organisation which is operated through the medium of the subsidiary company or companies of which they are now respectively Chairmen. In my view their appointment represents a considerable strengthening of our Board.

DIVIDEND ON ORDINARY STOCK

This year your Board recommend a final dividend on the Ordinary Stock of 12½ per cent, making, with the interim dividend already paid, a total distribution equivalent to 15 per cent for the year on the Issued Capital as it now exists. This compares with last year's total distribution of 27½ per cent on the old Capital, or 13¾ per cent on the present Issued Capital. Although, since the close of the financial year under review, the downward tendency in business still continues, the Aggregate Net Profit for the year to September 30, 1957, before Taxation, was slightly higher than that for the previous year, due mainly to the substantially improved results of the overseas companies, and this fact has enabled your Board to recommend this small increase in distribution.

FUTURE PROSPECTS

In my statement of last year I indicated your Board's anticipation that the Group would remain prosperous, but at a level which, so far as we could then see, was likely to be rather lower than that which we had experienced during the two preceding years. This forecast is in process of being fulfilled, although its full effect cannot be observed or deduced from the figures of the financial year which ended on September 30, 1957. The second half of that financial year was less satisfactory in its results than the first half, and so far as can be foreseen at present the conditions which obtained during the second half of the financial year 1956-57 are likely to be maintained, and possibly somewhat intensified, during the whole of the now current financial year. In so far, therefore, as forecasting is possible under conditions of acute uncertainty in many directions, I would repeat that we expect the year now in progress to yield reasonably satisfactory results, but on a lower level than has been our experience in recent years. We are, however, completely confident that our Company, and our industry, has satisfactory future prospects, and significant scope for development; we do not propose to be deterred in any way, in our constant forward planning for expansion, by conditions which, for the time being, are likely to give us less material reward than has been the case during the years of postwar boom.

THE PLESSEY COMPANY

(Manufacturers of Components for the Electrical and Mechanical Engineering Trades)

PROFITS HELD DESPITE RISING COSTS

MANUFACTURING AGREEMENTS WITH AMERICA PLAY AN INCREASINGLY IMPORTANT ROLE

INCREASE IN NOMINAL SHARE CAPITAL

The thirty-third annual general meeting of The Plessey Company Limited was held on December 30th in London, Mr A. G. Clark (chairman and managing director) presiding.

The Secretary (Mr W. F. Cross, BA) read the report of the auditors.

The following is the statement by the Chairman which had been circulated with the report and accounts:

We now submit accounts for the year to June 30, 1957. At £1,548,305 the profit for the year compares with £1,544,712 for the year to June 30, 1956. For a somewhat difficult year, during which adequate profit margins became steadily more difficult to obtain I consider the result may be regarded as satisfactory. Profit margins have been lower because we have endeavoured, where practicable, to hold prices steady in spite of rising costs. Notwithstanding these difficulties we are convinced that business is to be had, provided the necessary effort is made to get it, and we organise ourselves flexibly enough to cope with the changing conditions.

As you know, a considerable part of our work is for Government Departments, particularly for the Admiralty and the Ministry of Supply, and although there are inevitably fluctuations in their requirements from us which must cause some dislocation in our production facilities, nevertheless we would place on record our appreciation of the high degree of understanding which we always encounter in these departments and which we feel sure is unsurpassed in the departments of any other Government in the world.

We have always been firm believers in co-operation across the Atlantic and it is now over a quarter of a century since our first Licence with an American Corporation was signed. Today we have twenty such Agreements whereby we enjoy the benefits of American techniques or they enjoy ours; these Agreements cover a wide range of equipment, components, or raw materials.

Additionally, we have specialised since the latter part of the war, in the translation of American manufacturing data, specifications and drawings into our own language for manufacture of American products in this country. This process, known as "Anglicisation," will be playing an increasingly important role in our business lives.

Today our turnover covers many products in many fields, of which radio and television are only two. This diversification necessitated some time ago the decentralisation of our Organisation into a number of Groups and Divisions operating in factories in various parts of the country.

AIRCRAFT AND AUTOMOTIVE GROUP

In the Aircraft field we have continued to make progress as suppliers of high grade Mechanical and Electrical Equipments to the Government and the Aircraft Industry. No aircraft of British origin flies today which does not include equipment of our design and manufacture, and spares and servicing arrangements have been made throughout the world in support of the outstanding export achievements of our aircraft and engine manufacturers.

The use of hydraulic power in the Agricultural, Earth Moving and Lifting Gear Industries has greatly increased in recent years and in this connection we have been active in developing hydraulic systems in conjunction with the vehicle manufacturers. This work has now been consolidated in our Industrial Hydraulics Division which is self-contained and well equipped from the point of view of technical development and manufacturing facilities.

ELECTRONICS GROUP

The Electronics Group is concerned not only with Radio and Television, but also with Telecommunications, where we are making a substantial contribution to the equipments of all three Fighting Services under the auspices of the Admiralty and the Ministry of Supply.

This Group is now extending its endeavours into the field of Industrial Electronics where one of the main characteristics is the necessity for the most up-to-dare techniques.

COMPONENTS GROUP

The past year has shown a steady improvement in all the Divisions of the Components Group. Research and Development is being continuously carried out in product design, as well as in mechanisation and improved methods of manufacture in order to widen our range of products and reduce costs.

This year has seen the establishment of a new factory in this field at Havant.

PLESSEY NUCLEONICS LIMITED

By virtue of our experience in mechanical, electrical and electronic engineering problems, we were able, early on, to provide a basic team of engineers to enter the Atomic Energy field and this resulted in 1956 in the formation of Plessey Nucleonics Limited, a self-contained subsidiary company engaged entirely in the nuclear field. It is in business on a broad basis designing and manufacturing control equipments for use in the new atomic power stations and their first major installation, the Calder Hall Fuel Element Monitoring System, has been in successful service for more than a year.

PLESSEY DEVELOPMENT COMPANY

It has been our policy to introduce to this country new products under agreement with manufacturers overseas.

To assist in the development of these manufacturing interests we have brought certain of them together under one general control in their early stages of development until they are able to operate as separate Divisions.

Shareholders will have seen in the Press during the year that we have concluded an agreement with The Philco Corporation of Philadelphia for the manufacture in this country of transistors and semiconductors, and to this end we have formed a new Company known as Semiconductors Limited.

INTERNATIONAL COMPANY

Plessey International Limited is steadily increasing its direct exports and during the Financial Year in question has reached an all time record.

NEW PREMISES

In addition to the factory for transistors which we are erecting at Swindon, the Swindon Corporation are erecting for us on their new Trading Estate a factory of over 350,000 sq ft and we place on record our appreciation of the close co-operation and understanding that exists with the Corporation.

We are ever mindful of the Government's call for assistance in fighting inflation and we propose in the future to pursue even more energetically our long established policy of creating yardsticks for our people at every level, from shop floor to Board room—gearing rewards to results—and thus ensuring the continuance of the real effort which we find so richly forthcoming from all spheres and levels of our own organisation.

I would like to take this opportunity to remind our shareholders that if they know of any keen young men who wish to progress in various spheres in our line of business, we will be only too happy to see them to find out whether there is any opening which is suitable for their talents. Our Company Secretary is ready to deal with any such applications as may be forthcoming.

We are calling an Extraordinary General Meeting to follow the Annual General Meeting at which we will ask you to authorise an increase in our nominal share capital by £1 million represented by 2 million additional Ordinary shares of 10s. each. At the present time the only unissued capital is £215,000 in Second Preference shares. We consider it desirable to ask for your approval to their creation so that they may be available for issue as and when the interests of the Company require.

The report and accounts were adopted, the retiring Directors, Mr B. G. W. Attwood and Mr M. W. Clark were re-elected, and the remuneration of the auditors, Messrs Deloitte, Plender, Griffiths & Company, was fixed.

At the subsequent Extraordinary General Meeting, the increase in the nominal share capital of the Company, as mentioned, was approved.

ARTHUR GUINNESS SON AND COMPANY LIMITED

STATEMENT BY THE EARL OF IVEAGH, KG, CB, CMG

The Annual General Meeting of Arthur Guinness Son and Company Limited will be held on January 15, 1958, at Park Royal Brewery, London, N.W.10.

The following is an extract from the statement by the Chairman, the Earl of Iveagh, KG, CB, CMG, which has been circulated with the Report and Accounts :

The year again ended with increased profits and sales, exports being particularly good, and in the brewing group new records were established. Total group profits before taxation were £7,461,000 against £7,007,000 for the previous year. After holding our prices unchanged against rising costs for six years, our diminishing profit margin compelled us to raise our wholesale prices in the United Kingdom and Northern Ireland.

Since the end of the year under review the Government's financial measures in the United Kingdom have begun to show their influence. We shall give the utmost assistance, as stability in prices and costs is the basis of prosperity and the standard of living. An easy trading year was not anticipated and the battle against inflation must have unpleasant effects.

The increase in net profit at £3,493,978 against £3,029,754 was largely due to the transfer of control of our Dublin Company to Ireland, the tax provision in 1956/57 being about £250,000 lighter than normally.

In these circumstances the Board decided that an increase in total dividend could not be recommended. This policy permits increases in contingency reserves and reinforces the position against future possibilities. The five-year summary at the end of the Accounts this year showed a progressively strengthening position ; the retained profits had been largely used to develop the business.

TRANSFER OF CONTROL OF DUBLIN COMPANY TO IRELAND

The transfer of control became effective on October 1, 1957, and involved the division of the Pension Fund into two separate funds. This completed the reorganisation which had been in hand for some years.

RECORD OVERSEAS SALES

The Export Company had a record year and the results had since continued to be most satisfactory. Ale brewing had been discontinued in USA and interests were confined to the export trade. Though on a small scale, ale brewing in Ireland had been promising. The new "Phoenix" ale had been successfully established in most of the country.

CANNED GUINNESS

Through adding a seventh mash tun at Park Royal Brewery, there had been increased efficiency and closer quality control. The introduction of Canned Guinness had been popular, particularly in the holiday season, but higher costs militated against its being taken up in a large way.

RESEARCH

There had been considerable research into the methods of brewing, quality and cost being the two great objectives. In Ireland work on improving the quality of malting barley had continued.

CONFECTIONERY GROUP

The William Nuttall group showed a small decreased profit though sales increased. In this more competitive market, success depended on good selling and quality. The 20 per cent minority stockholding of this group had been acquired.

It is proposed to recommend the payment of final dividends on January 16, 1958, of 3 per cent on the Preference Stock and 15 per cent on the Ordinary Stock, both less Income Tax.

Staff and Employees are receiving a bonus of one month's pay.

THE LANCASHIRE COTTON CORPORATION LIMITED

SUBSTANTIALLY IMPROVED RESULTS

MR R. M. LEE ON POLICY OF EXPANSION

The Twenty-ninth Annual General Meeting of The Lancashire Cotton Corporation Limited will be held in Manchester on January 23, 1958.

The following is an extract from a Statement circulated by Mr R. M. Lee, the Chairman, with the Accounts for the year ended October 31, 1957:

ACCOUNTS

It is always a pleasant duty for a Chairman to be able to report to stockholders an increase in profits, and I am very gratified that I am able to do so this year. As you will observe from the Consolidated Profit and Loss Account, the Group Trading Profit amounts to £4,021,239, compared with £2,929,715 last year.

We have allocated to General Reserve £500,000, which brings the total of this Reserve to £7 million. We have also allocated £750,000 to Replacement of Fixed Assets Reserve, and this Reserve now totals £4,650,000.

The Board has decided to recommend a final dividend of 12½ per cent less tax, on the Ordinary Stock, which is the same as last year, and which, with the interim dividend of 5 per cent less tax, paid in August, gives a total of 17½ per cent less tax, for the year. The interim dividend absorbed £232,675 and the dividend now recommended absorbs £581,686. After deducting the net Preference dividend of £345, the amount carried forward is £1,032,173 of which £76,444 is retained in the accounts of our subsidiaries.

We have continued our policy of expanding our activities, and to this end during the year we have acquired all the capital of Tulliallan Fabrics Limited, R. P. Lawson & Sons Limited (and its subsidiary, A. Brooks & Company Limited), and Willow Bank Mills (Holdings) Limited.

Since the end of our financial year we have made two other purchases, namely the Dowry Spinning Company (Holdings) Limited and Richard Barnes' Sons Limited.

YARN AND CLOTH IMPORTS

Last year I referred to the importation of yarn and cloth, free of duty, from India, Hongkong and Pakistan, and to the mission which was visiting these countries, at the suggestion of Sir Anthony Eden. I regret to state that the mission was unable to secure a satisfactory agreement and subsequent efforts have not yet produced a solution. Meanwhile these imports have continued and increased. The increase is, of course, solely based upon cheaper prices resulting from artificially low raw cotton prices, low wages rates, and an abundant supply of labour. Latterly imports of grey cloth from China have commenced and have attained alarming proportions.

These imports from behind the iron curtain are obviously made at "political" prices, unrelated to actual costs of production. Too often these facts are ignored and the industry is exhorted by those not in it to increase efficiency of production. In an industry such as ours, composed of hundreds of factories, it must of course include some where machinery and equipment are not of the most modern, but it also includes many mills which are at least as modern as any in the world. The United Kingdom cotton textile industry was the first industry in the world to apply mass production techniques, and it has continued in the forefront of progress through the efforts of the many private research departments which are maintained, and of the British Cotton Industry Research Association, to which the industry makes large contributions.

The solution regarding these cheap imports is therefore mainly a political one.

EUROPEAN FREE TRADE AREA

We have always had a substantial market for yarn exports to the Continent of Europe, and we can reasonably expect that the Free Trade Area will enhance our opportunities for yarn exports.

The situation regarding our customers, cloth manufacturers and knitters, is, however, more complex. In some cases no doubt the Free Trade Area will offer additional opportunities for exports, but undoubtedly it will expose many of our customers to severe competition in the home trade.

It should be a matter of the first importance for our Government to ensure that such Continental competition is based on fair practices and does not contain any element of subsidy ; for example, we must insist that our competitors do not have access to raw cotton from their Colonial sources at prices lower than we can obtain. It will also be of the utmost importance that the "definitions of origin" are such as to prevent the European market being flooded with textiles produced from Asiatic yarn or grey cloth.

YARN SPINNERS' ASSOCIATION

In previous years I have referred to the Yarn Spinners' Association and to the solid advantages which this Association has conferred upon the whole industry.

In May, 1957, the Yarn Spinners' Agreement was referred to the Restrictive Practices Court by the Registrar, and for some time intensive work has been going on in preparing the Association's case for submission to the Court.

BRITISH OVERSEAS MINING ASSOCIATION

NEED FOR EXTENDING THE SCOPE OF OTC LEGISLATION

The twelfth ordinary general meeting of British Overseas Mining Association was held on December 30, 1957, at 49 Moorgate, London, E.C.

Mr A. M. Baer, the President, who was in the chair, in the course of his speech said :

The provisions of the Overseas Trade Corporation legislation go some way towards satisfying the claims which the Association has consistently advanced on behalf of the overseas mining industry, particularly where United Kingdom operating companies are concerned, and to that extent they may be regarded as the culmination of the unremitting efforts of our Taxation Committee, to which the industry is undoubtedly indebted.

The present organisation of the overseas mining industry is, however, a very complex structure comprising many types of company. Some of these, such as the mining finance houses and holding and co-ordinating companies of various descriptions, which are responsible for the organisation and financing of the greater part of modern mineral exploration and development, do not at present qualify for OTC benefits.

The Association understands the desire of the tax authorities to move cautiously with this new departure in United Kingdom tax legislation, but hopes that, with experience of its application, the Government will find it possible to extend its scope to include these sections of the overseas mining industry.

The claims of two such sections have been put forward in a letter which the Association has recently addressed to the Chancellor of the Exchequer. This letter suggests, firstly, that, when a company not itself carrying on a trade has non-resident subsidiaries which are not carrying on a trade in the United Kingdom, dividends from those subsidiaries should be treated as OTC trading income, and, secondly, that when an Overseas Trade Corporation holds, as a trading interest and not merely as a portfolio investment, not less than 25 per cent of the ordinary shares in another company which carries on a trade outside the United Kingdom not excluded under Section 24(3) of the Finance Act, 1957, dividends from that other company should qualify as OTC trading income.

As regards the present legislation, the Association recognises the need for careful scrutiny of claims for OTC status and the application of certain tests for determining the validity of such claims. If, however, these tests are applied too rigidly, the position of some mining companies of the very type for which, in the Association's view, the OTC provisions were designed may be prejudiced and the Association has drawn the attention of the Inland Revenue to this possibility.

PLAN FOR EXTENDING SCHOLARSHIP FACILITIES

At our General Meeting in December last, my predecessor as President referred to the need for taking steps to ensure that the influx into the Schools of Mines and Universities of young men offering themselves for training in such subjects as mining engineering, geology and extractive metallurgy, is maintained at a level sufficient for the anticipated needs of the overseas mining industry.

A Working Party, which was set up to make a comprehensive study of this problem, recommended, amongst other measures, that the scholarship facilities at present offered by the industry should be expanded. This recommendation has been accepted and the Association has decided to establish a Central Scholarship Fund.

A number of the larger companies and groups of companies have already promised generous financial support and a general appeal will shortly be issued to members of the Association inviting them to contribute.

It is important that new entrants into the industry shall be of the best available quality and I believe that, in order to attract young men of the right type and to encourage them to qualify for a university degree, provision should be made in the new scholarship scheme for giving adequate assistance to students who would be debarred under "means tests" from accepting scholarships offered by the State and other sources.

A Committee has been appointed to consider details of the new scheme and it is hoped that an announcement will be made on the subject early in the New Year.

METAL STATISTICS

The British Bureau of Non-Ferrous Metal Statistics continues to render a valuable service to the mining and metal industries. The statistical information given in its monthly Bulletin was substantially expanded in 1956 and this expansion has been consolidated during the past year. The Bureau's expenditure is closely controlled and there has been a small but welcome increase during 1957 in its revenue both from advertising and from new subscriptions.

The report for the year ended September 30, 1957, was unanimously adopted.

Mr Clifford Waite was elected president and Mr A. V. Conrad vice-president for the ensuing year, and the proceedings terminated with a vote of thanks to the retiring president.

ALBION DROP FORGINGS

The fifty-sixth annual general meeting of Albion Drop Forgings Company Limited was held on December 19th at the registered offices, Coventry, Mr J. L. Brockhouse, MA (the chairman), presiding.

The following is an extract from his circulated statement: Although the trading profit this year is rather lower than that of last year, the overall result is not unsatisfactory. During the first half of the year profits were seriously affected by the special surcharge on oil and the curtailment of requirements by the principal Motor Companies. I am pleased to state, however, that at the present time production is running at a peak figure and the order book is satisfactory.

During the year your Company has entered into an association with Kobenhavns Saenksedie of Denmark. The agreement governing the association provides for an exchange of technical advice and the development of the drop forging market in Scandinavia. Your Company has already received some worthwhile orders from this area, and looks forward to a profitable and interesting development as a result of this association.

It is a significant fact for those considering the potentialities of the European Free Market, that we find we are competitive with our European neighbours in the production and supply of semi-finished products such as drop forgings. Your Subsidiary Company, Bretts Patent Lifter Company Limited, has enjoyed a good year.

Subject to the general conditions of trade in the Country I am satisfied that we can expect good trading returns during this current year.

The report was adopted.

J. BROCKHOUSE & CO.

IMPROVED TRADING RESULTS

The sixtieth annual general meeting of J. Brockhouse & Company Limited was held on December 18th at West Bromwich, Mr J. L. Brockhouse, MA (chairman and managing director), presiding.

In his circulated statement the chairman again reported an increase in net profits.

The Overseas Subsidiary Companies had made a substantial contribution but the trading profit of the Home Companies showed a small reduction.

Having outlined the exceptional items of expense incurred during the year, without which the Company would have shown an improved trading result at home as well as abroad, Mr Brockhouse stated:

"Looking at the Group as a whole, our current order position must be regarded as satisfactory, and I can see no reason why our general level of activity should not continue at the present rate and I am optimistic enough to think that it will increase."

Commenting upon labour problems within industry, he continued:

"Undoubtedly there would be a great deal more confidence if the threats of labour troubles were removed, but I believe that this presents a great opportunity to the Employers' Organisations, and particularly those covering the engineering field, to meet the Trade Unions concerned and thrash out an agreement to cover at least another twelve months."

The report was adopted and a total dividend of 8½ per cent on the Ordinary Stock for the year was approved.

LANKA PLANTATIONS

RECORD CROP

The seventy-seventh annual general meeting of The Lanka Plantations Company Limited was held on December 30th, in London, Mr W. R. T. Picton-Warlow, MBE, chairman, presiding.

The following are extracts from his circulated statement for the year ended June 30, 1957:

The past season has been a satisfactory one. The crop from the Company's estates amounted to 2,295,238 lb. That of the subsidiary company, Deaculla Tea Estate Company Limited, amounted to 350,720 lb. The crop from The Lanka Plantations Company's estates, was again a record one. The cost of production for the Group amounted to 28.70d. per lb.

Export duty has remained constant throughout the year at 65 cents, or approximately 11¼d. per lb. This is a very high figure as compared with that of other tea producing countries. Fortunately this company's high grown teas have secured reasonably good prices, and the company has been able to show a satisfactory profit in spite of this very heavy duty.

The accounts show a net profit of £76,047, against £139,268 for the previous season. After providing £47,214 for taxation and £25 retained by the subsidiary company, there remains £28,807 to which should be added £3,800 in respect of tax provisions no longer required and the balance from 1955-56 of £10,675, making £43,282 to be appropriated. Your Directors recommend a final dividend of 25 per cent, making 30 per cent for the year.

The report and accounts were adopted.

R. A. LISTER & COMPANY LIMITED

In the course of his Statement to the Shareholders, the Chairman, Sir Percy Lister, said:

Once again from the Consolidated Accounts you will, I am sure, have noted with satisfaction that the financial year ending September 30th last has been another record year for your Group of Companies.

The year in question had not progressed far before the Suez crisis and its repercussions had to be faced. Your undertakings were, at that time, some forty per cent through the completion of a very substantial Egyptian Government contract, and in justifiable anticipation of increased business in the Middle East we had incurred forward commitments in that area. I am pleased to advise you that we have since completed the Egyptian contract and liquidated the commitments aforementioned.

The repercussions of this crisis are, of course, still with us, and spread from Casablanca to Pakistan to the detriment of the whole world and the world in general. It is to be hoped that wise and co-operative statesmanship will bring sanity and with it prosperity to the peoples of these rich and potentially very prosperous lands.

Your directors have donated the diesel engines for the power station of the American University of Beyrouth. In this most modern and up-to-date University young Arab engineers, who will have an influence in the shaping of the Arab world at the years ahead, will be able to get valuable experience therefrom.

The financial policy of the past has found your undertakings, at a time when liquid money is required and yet for reasons well understood difficult and expensive to obtain, in a satisfactory liquid position. However, in this regard it must be anticipated that the credit requirements both in the home and overseas markets, will make the demand for money still greater. Any broadening of the scope of the Export Credits Guarantee Department could alleviate these problems materially.

Your Directors, in addition to maintaining the Dividend on the same basis as has pertained since the increase of capital in 1954, have thought it wise to increase the Dividend Equalisation Account by £50,000, bringing this Reserve to £200,000. We have also transferred £150,000 to General Reserve, bringing this Reserve up to £850,000, and there is left £556,519 to be carried forward on the Profit and Loss Account.

Consistent with the progressive development of your Group's undertakings, two new companies have been created during the year under review namely, the Lister Blackstone Rail Traction Company which will concentrate on this growing section of your activities and should still further develop the outlet for your Diesel Engines for an application for which they are eminently suitable.

The second is the opening of your German Company, Lister Blackstone GmbH. We hope that this new Company will prove of value to our old and potential clients in Germany, a market in which the purchasing power is steadily growing.

Your Company has given noteworthy leads in recent years in its efforts to minimise the inflationary tendency in regard to prices, and we believe that today as never before was it so necessary to stabilise existing prices so that shareholders and employees at all levels may enjoy the full benefits of their capital investment and their greater productivity. These they will never enjoy if the vicious spiral and inflation is allowed to continue.

The wisdom of the policy which promotes the purchasing power of what is in the pay packet or the *dividend envelope* is worth far more than the fictitious and fallacious policy of advocating more and more in the pay packet or dividend envelope, knowing that its purchasing power gets less and less to a point where our currency and competitive ability are imperilled.

During the year under review your Directors have decided upon a revision to the pension schemes put into operation in times when the purchasing value of our money was substantially greater than it is today. The revised basis approved by your Board will permit of pension provision to present and future pensioners more in keeping with current conditions and with what you would wish.

KENDALL AND GENT LIMITED

(Machine Tool Makers)

ELECTRONICS IN FUTURE DEVELOPMENTS

The ordinary general meeting of Kendall and Gent Limited was held on December 20th at Victoria Works, Gorton, Manchester, Mr F. C. Mosley (Chairman and Managing Director) presided, and in his speech, said: The net profit is £82,601, and we are again making full provision for taxation by reserving £39,000. Your Directors recommend placing £5,000 to General Reserve Fund, and to increase the carry forward to £58,909. Capital Reserves remain at £20,000.

The interim dividend paid was at the same rate as last year, and it is now recommended that the final dividend of 10 per cent be maintained with a bonus of 5 per cent making a total of 20 per cent less tax for the year.

The past year was most difficult, but in spite of the engineering strike, a slightly increased output was achieved by improved methods. Wage awards made the difficulty of obtaining overseas orders more acute, but the order book was maintained at a satisfactory level.

The strike also affected the Subsidiary Company, but production is now back to a normal level.

Our investment in our Sales Organisation, the Associated British Machine Tool Makers Limited, shown in the Balance Sheet at £10,372, is a very low figure indeed. The powerful world-wide sales organisation of ABMTM allows us to devote a greater proportion of our energies to perfecting our products, keeping ahead in design, and striving to give our customers the best possible service.

During the past year we have embarked upon an intensive programme of re-designing to further improve the technical advantages of our products. For example, we have built a number of new machines incorporating some of the latest electronic devices available to the Machine Tool Industry, and the field of electronics will undoubtedly be of increasing importance in our future developments.

Since the war, there has been a marked increase in the size and complication of our products. This year we have to produce a machine weighing approximately 400 tons. These large machines strain our plant resources, and if the trend continues, we shall be forced to consider the installation of heavier and larger equipment.

The report was adopted, and the total distribution of 20 per cent for the year was approved.

KEPITIGALLA RUBBER ESTATES

The fifty-first annual general meeting of the Kepitigalla Rubber Estates Limited was held on December 31st in London, Mr Chas. H. Wright, chairman, presiding.

The following is an excerpt from his circulated statement for the year ended March 31, 1957: I voice the hope that your company will slowly and perceptibly grow in stature from the springboard of the estate from which it derives its name.

In August last the penal rates of rubber export duty and cesses which had persisted in an amount of 48.53 cts (8.7d.) per lb from January 1st of this year were reduced to more realistic levels in an amount of 29.53 (5.3 pence). But I would venture to suggest that the present rates of duty and cesses absorbing just over 5½d. per lb are still far too onerous for the industry to bear at the present price level.

It is the responsibility of all Governments not only to maintain but to improve the standard of living of their peoples, a responsibility which for its fulfilment in the case of territories dependent in the main on revenues stemming from the soil assuredly calls for a progressive increase in the acreage under cultivation, matched at the same time by an increased productivity of the acreage in hand. But neither objectives are attainable if indirect and direct taxation are to remain so onerous as to discourage the investment of new capital for such purpose or make possible the ploughing back of capital generated from the old. The appropriation of so penal a sum as that levied last year by way of export duty and cesses in an amount of £37,414 on this company's produce income of £142,692 is surely sufficient proof of the urgent need for revising the whole structure of export duties and cesses in Ceylon. But should you destroy the substance you destroy the shadow at the same time, and I submit unreservedly for the deliberations of all those concerned with the future of Ceylon that the maximum impost which Ceylon rubber producers can afford to pay by way of export duty and cesses without inviting nemesis is contained in an amount of 10 cts per lb with a rubber price up to 2s. 6d. per lb; it is a matter of simple accountancy to verify such a statement.

The report and accounts were adopted.

APPOINTMENTS

THE VACUUM PHYSICS DIVISION of STANDARD TELECOMMUNICATION LABORATORIES invite applications from suitably qualified and experienced MATHEMATICIANS, PHYSICISTS, ENGINEERS and ASSISTANTS for work involved in long term research in the following fields:—

Generation of millimetre radiation.
Electron optics.
Design of high power centimetric oscillators.

Applicants are expected to be capable of original work in one or more of these fields and publication of results is encouraged.

The Company bears the entire cost of its schemes for pensions, sickness and accident, which include provisions for the benefit of employees' dependants.

Write to Mr. P. J. Rogers, Personnel Manager, STANDARD TELECOMMUNICATION LABORATORIES Limited, Progress Way, Great Cambridge Road, Enfield, Middlesex, who will arrange an informal interview.
Expenses of travel will be met.

LONDON ELECTRICITY BOARD
DEPUTY SECRETARY

The London Electricity Board invite applications for the appointment of Deputy Secretary.

Candidates should have wide experience of secretarial and administrative work with public authorities, preferably have a technical supply industry.

The appointment will be made on Grade 9, S.O.—C.O. of the National Joint Managerial Agreement, the salary being within the range £2,760-£2,960 p.a. plus £150 p.a. London Area Allowance.

Applications, stating age, qualifications, experience and present position and salary, should be forwarded to the Secretary, London Electricity Board, 46 New Broad Street, London, E.C.2, by January 16, 1958. Ref. No. 3419 BXD.

CHARTERED ACCOUNTANT aged thirty to forty with approach with economics degree required for subsidiary office, country, New South Wales; accommodation in Sydney. Apply, with full details, to Messrs. J. Farrell, Solicitor, Bligh Street, Sydney, New South Wales, Australia.

A SENIOR PHYSICIST is required to act as DEPARTMENT HEAD in the VACUUM PHYSICS DIVISION of STANDARD TELECOMMUNICATION LABORATORIES. [illegible] physics applied to communication [illegible] of work [illegible] of classical electron physics, [illegible] and secondary emission [illegible] Research ability is more [illegible] The Company bears the entire cost of its schemes for pensions, sickness and accident, which include provisions for the benefit of employees' dependants.

Write to Mr. P. J. Rogers, Personnel Manager, STANDARD TELECOMMUNICATION LABORATORIES Limited, Progress Way, Great Cambridge Road, Enfield, Middlesex, who will arrange an informal interview.
Expenses of travel will be met.

UNIVERSITY OF ADELAIDE
SOUTH AUSTRALIA

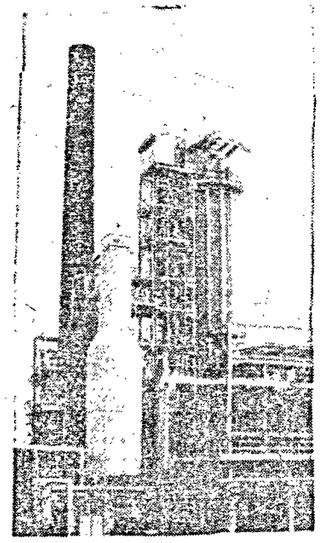
The increased financial support for the University to be provided by the State and Commonwealth Governments following their general approval of the report of the Murray Committee on Australian Universities makes it possible for the University at once to invite applications for the following appointment at the new salary scale quoted below:—

LECTURER IN ECONOMICS

The new salary scale for a lecturer is £A1,420—£90 (7) —£2,050 p.a. Superannuation is provided on the F.S.S.U. basis. The actual salary within the scale will be fixed in relation to the qualifications and experience of the successful candidate.

General terms of appointment may be had from the Registrar of the University or from the Secretary of the Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1. Those will include particulars of general duties, tenure, study leave, promotion, and travelling expenses. A potential candidate in Great Britain may borrow from the Secretary of the A.U.B.C. a coloured film illustrating the University including the Waite Institute and the city and surroundings of Adelaide. The University Calendar may be consulted in the Library of any University which is a member of the A.U.B.C. Further information about the University or about any particular post will gladly be supplied on request to the Registrar.

Applications must include particulars of age, nationality, married status, academic record, teaching qualifications, war service (if any), and present position; a list of publications; copies of testimonials; the names and addresses of two referees of whom completed enquiries may be made; a recent photograph; and a medical certificate of good health. They should be lodged in duplicate with the Registrar of the University, Adelaide, South Australia, not later than February 15, 1958.



TREASURY INSPECTOR required by HONG KONG GOVERNMENT on probation for 3 years with prospects of permanency. Salary scale including Inducement Pay for single men: £1,200-£1,440 (1) (2)-£1,680 (3) (4)-£1,824 (5) (6)-£1,968 (7) (8)-£2,112 (9) (10)-£2,256 (11) (12)-£2,400 (13) (14)-£2,544 (15) (16)-£2,688 (17) AIR EDITION

The Economist

JANUARY 11, 1958 ONE SHILLING AND SIXPENCE FOUNDED 1843

A Principle Worth a Chancellor?

(page 89).

PROSPECTS FOR 1958

This week's article in the series on the economic outlook concentrates on the British economy and on specific industries (page 129).

Passage to Asia
Mr Macmillan's tour can be a timely contribution to Anglo-Asian relations (page 91).

Ice and Fire
An angry dispute has marred Antarctica's long peace—and it may not be the last (page 93).

Challenge to Congress
Congress returns to Washington with brave hopes, but little likelihood, of stimulating new policies (page 113).

lded Youth
lagers under the statistical micrope (page 94).

The Three Princes of Laos
A gamble with Communism that affects all South East Asia (page 122).

Men and Machines
A review of the latest volume of *A History of Technology* (page 108).

Annual Postal Subscription by ordinary mail £4.10s.; Overseas £5; by air see page 175

The recruits you need may well be reading this newspaper

The problem of attracting the right kind of recruit besets many organizations including, probably, your own. To help solve this problem the Manchester Guardian initiated its now well-established 'Careers' series—and there is every evidence of its success.

For the fifth year, leading firms are making their personnel requirements known through full-page announcements appearing from Monday to Friday.

The new series begins on January 20th. If your company is not represented this year, the names of the organizations taking part in this Manchester Guardian service to industry and commerce will convince you that you are doing less than you might to win your fair share of up-and-coming talent.

MANCHESTER GUARDIAN

FLY WEST COAST TO South Africa BY DC-7B

EVERY SUNDAY
LONDON-JOHANNESBURG
IN LESS THAN A DAY
One stop only en route.

EVERY THURSDAY
LONDON-JOHANNESBURG via AMSTERDAM-ZURICH-KANO-LEOPOLDVILLE

Facilities for stop over at intermediate points.
In addition three services per week via Rome and Nairobi.

SOUTH AFRICAN AIRWAYS
(in association with B.O.A.C. and C.A.A.)

Full particulars from your Travel Agent, B.O.A.C., C.A.A. or South African Airways, South Africa House, Trafalgar Square, London, W.C.2. Telephone: WHitehall 4488. For reservations 'phone VICtoria 2323.

HEAVY TRANSPORT

Think of the clutch

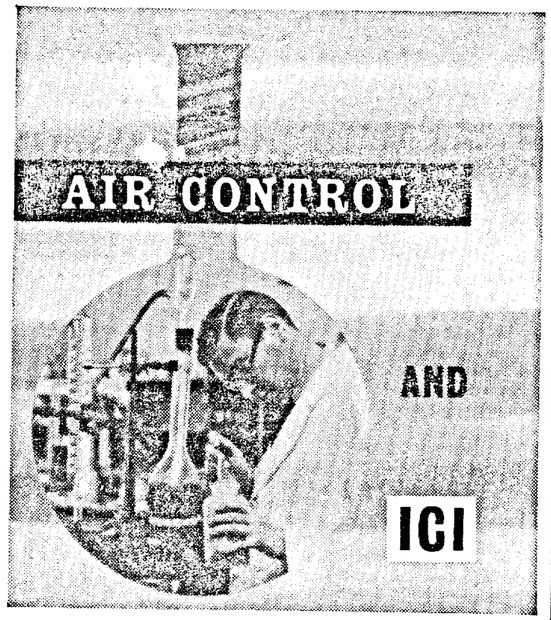
"In ..... out! In ..... out!"

You can almost hear the Boat Race commentator's voice intoning the repetitive action that wears out the crews in some twenty minutes.

And so with clutch plates. The punishing friction inseparable from repeated engagements of the clutch inexorably wears out the normal type of clutch plate, with regrettable speed. Result—costly idle time for refacing or replacement.

But this is not so with SINTERLINK clutch plates. Faced with sintered metal of cellular structure, they stand up to a tremendous amount of friction for very much longer than conventional clutch plates. The exceptional resistance to wear of SINTERLINK and its remarkable ability to withstand and dissipate heat are the explanation.

Any Answers?
We will gladly answer any questions either by correspondence or by personal call.



Think of MORGAN SINTERLINK

Low Rate of Wear—Smooth Operation
Stability—Absence of Fade—
High Thermal Conductivity

... the final factor in power transmission

THE MORGAN CRUCIBLE CO. LTD. BATTERSEA CHURCH ROAD, LONDON, S.W.11. BAT 8...

prophecy in metal

magnesium will make more of lightness

MEL will make fact of this prophecy.
With their vast experience in the whole field of magnesium technology they can show you how to profit from it—and much more besides.

make more of magnesium

Magnesium Elektron Ltd

Clifton Junction Manchester
London Office: 5 Charles II Street St. James's SWI
Magnesium Elektron, Inc., New York 20, USA

Prophecy — a sculpture in magnesium for MEL by Winston Clarke

The day the airman's world becomes yours

No part of the world is strange to him. He has seen the majesty of sunsets no artist could capture. He has watched dawn come up softly over oceans and continents. He has the sureness of a man who has found himself. He's the master of a mighty Flying Clipper*.

When you're high over the Atlantic, it is your Clipper Captain's privilege and pleasure to share his world with you. His role as host is as much a part of him as his experienced handling of the controls. Up on the flight deck other qualified Clipper pilots (at least four are on every overocean flight) relieve him while he relaxes with you and your fellow passengers.

Over 1200 Pan American pilots have logged over a million miles each . . . 100 pilots, well over the three million mark. Experience is their gift to you.

SIR ROBERT McALPINE & SONS LTD.

Bradwell, Essex, has leapt into fame as the site of the first commercial nuclear power station in the world to be built by N.P.P.C. Eight names make The Nuclear Power Plant Company Limited. N.P.P.C. thus combines the resources of eight specialist companies whose individual skills are co-ordinated to form a unified team capable of undertaking the construction of complete nuclear power stations throughout the world.

Bradwell nuclear power station will have a guaranteed output of 300 Megawatts. It is being built by The Nuclear Power Plant Co. Ltd. for the Central Electricity Authority.

All is not Game in East Africa

There was a time when elephant ivory was the only major export from East Africa. Today the £177,000 earned annually by ivory pales into insignificance compared with the £38,600,000 which in 1956 came from coffee or the £27,600,000 from cotton. The grand total earned by all exports during 1956 from the three mainland territories of East Africa—Kenya, Uganda and Tanganyika—was £114,200,000.

The day is long past, too, when the imports to the territories amounted to no more than could be carried as head loads by the porters accompanying traders on their up-country safaris from the coast. In 1956 East Africa spent £133,800,000 in the markets of the world, and more and more manufacturers of consumer goods are setting up factories in East Africa to meet the growing demand, coming largely from the 20 million African population, which is taking an increasing part in the new developments.

And just as the East African Railways and Harbours serves the export and import trade at the ports and along 12,000 miles of rail, road and inland water services, so it is serving these new industries by taking an active part in the establishment of industrial areas and in providing them with the necessary sidings and transport facilities.

For details of these industrial areas, and of other business opportunities in East Africa, write to the Commissioner, East African Office, Grand Buildings, Trafalgar Square, London, W.C.2.

A Principle Worth a Chancellor?

THE resignation of Mr Thorneycroft and his two political juniors at the Treasury promises Mr Macmillan no happy returns on his first anniversary as Prime Minister. The need is to ensure that it does not promise even more unhappy consequences for the currency. The first thing to make clear—indeed it had better be made very clear, in view of present dangers to sterling—is that this has been primarily a politicians' and administrators', not an economists', quarrel. The disagreements that have lately appeared among some economists—about whether Britain should relax its defences against inflation in order to fight possible recession, and whether the maintenance of sterling as a world banking currency is worth the strains this is said to impose upon economic policy—have played no direct part in the fall-out.

They might have been suspected of playing more part if Mr Thorneycroft's successor had been anybody other than the conservative and orthodox Mr Heathcoat Amory. But the new Chancellor is known to be as firm an advocate as the old of the need for strengthening sterling and achieving a stable internal price level. When he said in his inaugural statement that these "are the dominating aims of the Government's economic policies, and nothing whatever will take precedence over them," there is every reason to suppose that he spoke from his own opinions, from a large majority Cabinet decision and not merely from the most convenient book.

It follows that Mr Thorneycroft has resigned on a matter which did not concern fundamental ends, but only £50 million of means—although perhaps much more than that measure of exasperation. Conservatives were divided this week whether he had thereby shown himself a man of rare resolution or merely of peculiar punctilio. The fairest judgment may be two-thirds of the one and one-third of the other. Mr Thorneycroft deserves support in two respects, and specifically against the Prime Minister. First, it is a minister's duty to resign if he differs from his colleagues on a fundamental matter of judgment affecting even means, not just ends, in his own department; the British political system works best that way, and it would work worst if there were any further obeisance to the notion—implicit in Mr Macmillan's sharp letter this week—that a minister ought to stay on to implement a policy with which he disagrees, out of loyalty to the old team. Even if Mr Thorneycroft's ideas were quite wrong, his action, in a Government and Parliament where politicians have too usually been professional sheep, would deserve to be hailed as democratically refreshing.

Secondly, however, the Prime Minister's letter did raise one issue which many beside Mr Thorneycroft would regard as a resignation-worthy point of principle, not just a matter for understandable differences of judgment. There should be no sympathy—no sympathy whatever—with Mr Macmillan's argument that parts of government expenditure cannot be cut because this would make more difficult "the task of

those who have the responsibility of working for wage restraint." Wage rises do not depend on the excuses that trade unions may put up for them, such as the intolerability of their members having to pay an extra 2d. a day for school meals; they depend on the amount of money available for meeting them, and that would be reduced, not expanded, by a cut in net government expenditure. If Mr Thorneycroft had resigned to rub this argument home, or in an effort very significantly to reduce the proportion of national income absorbed by government expenditure, then he would deserve unmitigated congratulation.

THE suspicion that gives some pause to the congratulation, however, is that Mr Thorneycroft did not resign solely for these sweeping and sensible reasons. It seems very possible that he resigned also in consequence of one of those administrative imbroglios in which it is very difficult to distinguish between a principle and departmental *amour propre*. The present system of preparing government estimates—initially, the various departments present them, and then some official in the Treasury trims—contains familiar seeds of administrative conflict. It leads to the cynical but widely heard assertion in Whitehall that second secretaries in the Treasury are currently the most powerful men in the country. The strains are particularly great when those second secretaries are working to a rigid formula; this year the Treasury formula was that government current expenditure in 1958-59 should be no higher than in 1957-58. Such a formula, of course, when regarded impartially, has precious little in logic to recommend it. Whether government expenditure in 1958-59 should be higher or lower than the newly-agreed estimates will propose—probably it should be lower—ought to depend on the standard of social services decided upon as a long-term policy and the number of people likely to call on those social services next year. This has no direct and easy connection with the amount actually spent in 1957-58, when the number of school-children, old age pensioners, university pupils and others has been lower than those whose needs will have to be met in 1958-59.

Nevertheless, this "1957 ceiling" was the formula Mr Thorneycroft had applied in the case of fixed investment by the nationalised industries and of private bank advances. He had his eyes on a similar target for government current expenditure, and it is easy to see how he could have convinced himself that foreign holders of sterling had their eyes on that target, too. In this, he was probably wrong. Foreign bankers did not even know that this was what he was trying to do. To have kept government current expenditure down to within £50 million of the 1957-58 total, despite the rise in prices since the beginning of that year, implies—as an article on page 129 points out—a significant saving in real terms. This could fairly have been presented to the foreign speculator as a confidence-inspiring factor, while Mr Thorneycroft's resignation is clearly a confidence-sapping one.

By Sunday last, however, the position which had apparently been reached was that, after trimming by the Treasury and then by the Cabinet itself, all but these last £50 million of economies had been agreed. To have taken this last bite would have required deliberate changes of policy, of the sort that would need to be announced (as were last year's health service increases) at the time the estimates were presented. There are pragmatic grounds for arguing that special announcements of very small economies of what might be called this "school meals" sort, which take on the appearance of an extra budget, do not really give confidence to the foreign speculator; they rather serve notice on him that continuing economic anxiety persists. On balance, many sensible people would cast a vote against Mr Thorneycroft on this point. But it was apparently when a majority of the Cabinet did thus vote against him, on what he believed to be his own departmental affair, and at the end of a bitter struggle with other ministries in which Treasury officials had regarded their formula (and even prestige) to be at stake, that he marched out of the Government.

SO much for the personalities and prejudices involved. They matter not mainly for themselves, but because of their implications for future policies and politics. For the future of economic policy, the reaction of foreigners to Mr Thorneycroft's resignation will be all-important; in the first two days that reaction has been bad, but not calamitous, for sterling. Once Mr Heathcoat Amory has surmounted this disturbance, there is no reason to suppose that he will be quicker to relax the squeeze than Mr Thorneycroft would have been. Indeed, there are three reasons for suggesting that he may be even more cautious and stern. After this week's assurances that there is to be no change in policy, he will be under some public and political necessity even with his audience at home to match (or at least not contradict) his words with deeds, and to counter the inevitable suspicion that this may be the start of a retreat from resolution. He has a reputation to make (where Mr Thorneycroft merely had one not to lose) with the foreign speculators; and the early tendency for a modest and inexperienced politician must be to walk warily with his own civil servants when stepping into a martyr's shoes within a bereaved and bruised department. For some time to come when faced with alternative decisions, one tough and the other less tough, Mr Heathcoat Amory seems very likely to feel that he will have to take the tough one. About the implications of his accession for longer term policy, it is too early to speak; he will not have had time to think about that himself.

THE RESIGNATION

Other aspects of Mr Thorneycroft's resignation are discussed in Notes of the Week on pages 96 and 97, and in the second instalment of our feature, "Prospects for 1958," on page 129.

In the political field, an obvious analogy is between 1958 and 1951. Mr Thorneycroft has resigned because there are not to be certain fractional economies in the social services; Mr Bevan resigned because there had been. The emotional impact on the extreme wings of the two parties could be rather similar. The effect on the Labour Government in 1951 was that, having got rid of Mr Bevan, it quickly embraced more Bevanism; its decision to impose a freeze on dividends followed within three and a half months. A general election followed within six, and Labour split into warring factions when it went into Opposition.

One's guess, however, is that the Conservatives will avoid all three developments. Some ministers may now be eager not to give fresh offence to the party right wing, for example on colonial affairs; but this Government absorbed Lord Salisbury's resignation without any visible change of its general course, and it should be able to absorb Mr Thorneycroft's also. Moreover, in one field of policy which will please the right wing, in saying "No" to the trade unions, government policy is in any case almost bound to be more firm. It therefore seems very unlikely that Mr Macmillan will be driven by exasperation with his own party into holding a general election this year. Even those Tories who have supported Mr Thorneycroft in wanting a little quicker unemployment, do not favour quicker unemployment for themselves. There must be more doubt about the long-term shape of the Conservative party when it does get into Opposition; but that, if it happens, is probably still nearly two years off.

By then, too, the political consequences of this week's explosion may have been overshadowed by one by-product of it that has attracted surprisingly little comment. Mr Thorneycroft, for all his qualities (which are many, if not great), has never looked really like a potential Prime Minister and party leader; most people will agree that the Foreign Secretary does not either. The accession of Mr Heathcoat Amory into one of the two principal operative departments of state introduces an element of promise and speculation which Mr Macmillan's government has hitherto lacked. This stable and level-headed West Country manufacturer is in the tradition from which builders of Conservative unity are made; he may suffer no disadvantage from entering into the highest places at a moment of party crisis, at the beginning of a period of not inconsiderable personal opportunity for famous service to the nation, and with no ringing of bells.

A Passage to Asia

The Prime Minister's tour should help clear the way to better understanding between Britain and Asia—but the way is still a long one.

AFTER the much publicised Cairo conference of Asian and African "delegates" loud with plaints against Europe, the same instigators might just as profitably work up a complementary meeting at Strasbourg—a meeting at which Dutchmen ejected from their homes in Indonesia, Britons with still vivid memories of both Japanese and North Korean prison camps, Belgian and Italian nuns scarred by years of imprisonment in Chinese jails, would be induced to rehearse their sufferings and grievances. As at Cairo, ancient as well as modern wrongs could be aired; Arab colonialism in Spain and Portugal, the devastation of Europe by Mongol and Tartar aggressors, the ravaging of Italy by the African, Hannibal. Even the silliest clutching at emotional straws would contribute towards the aim, so desirable for the communist powers and—as Cairo showed—so acceptable to many non-communists, of envenoming relations between the West and the Asian-African world.

It is, of course, heartening to see how much organisation and effort have to be put into the envenoming job. Perfectly genuine grievances are, after all, abundant. Europeans, Asians and Africans have inflicted, and in some places are still inflicting, almost as much suffering upon each other as, say, Europeans have inflicted upon other Europeans, Asians upon other Asians, Africans upon other Africans. Plenty of dry tinder lies ready to the hand of the political incendiary; it is sometimes surprising that he has so much trouble getting it to make a satisfactory blaze.

What of the fire brigade? In Britain, it is apt to be an axiom of faith that the Commonwealth is the world's strongest defence against the threat of a decisive schism between the West and Afro-Asia. The first Commonwealth tour ever undertaken by a British Prime Minister makes this a timely moment to examine such assumptions. Just how strong are the ties between Britain and the Asian countries that Mr Macmillan is now visiting?

A DECADE has passed since the Commonwealth's great transformation; India and Pakistan celebrated the tenth anniversary of their independence in August, Ceylon will do the same next month. It has been anything but a tranquil decade. Dozens of issues have divided the sister nations: South African racialist policies, relations with communist China, Kashmir,

European free trade projects, the Indian minority in Ceylon, south-east Asian defence, Palestine, colonial conflicts ranging from North Africa to New Guinea by way of Kenya and Goa. London is no longer a cornucopia of capital; the gravitational pulls of the "Bandung" club, of Peking, of Washington, and of Europe strain the old ties in various ways; the Suez Canal conflict nearly broke them. Yet through all this the Commonwealth ties have held.

They may yet snap. True, the erosion of Britain's colonial empire is progressively removing certain obvious sources of friction. But the corresponding increase in the number of sovereign Commonwealth countries simultaneously promotes a multiplicity of different interests. The new Malaya's interests, for example, do not correspond precisely to those of any of its sister nations. The feuds between India and Pakistan are only the most obvious instance of the kind of rift which, although more localised than a schism between occident and orient, can gravely damage the Commonwealth's fabric. True, it has shown a mystified world how the most bitter resentments can be regularly set aside so that practical collaboration can proceed. Even after an acrid United Nations debate in which they have voted on opposite sides, Commonwealth

representatives will still meet in weekly conclave. Their relationship does not depend on reconciliation; they have learnt the secret of quarrelling without shutting the door. But such secrets can be lost. Even the best regulated family quarrel can lead to somebody stamping out in a huff.

HAPPY families, in fact, are not just born that way; they have to be kept happy. The quickest way to imperil harmony is to take it for granted. The Suez crisis illustrated this dramatically; many people in this country showed a quite inexplicable surprise when the Asian sister states reacted violently against the shock that the British Government sprang on them. But mere neglect, while less dramatic, can also be deadly; so, too, can be even the appearance of neglect. In the case of Mr Macmillan's current visits in Asia, it may be argued that Mr Macmillan has had many previous opportunities of meeting Indian, Pakistani, and Ceylonese political leaders; that he will have little time either to learn or to explain anything; that there are countless other forms of contact available, such as last month's Commonwealth parliamentary conference in Delhi. So there are, but they are not enough.

In Asia and Africa the personal gesture carries even more political weight than in the West. Messrs Khrushchev, Bulganin and Chou En-lai have flatteringly and effectively wooed south Asian opinion by making successive tours; even now, Mr Macmillan's visit to Delhi has to be dovetailed with those of the Indonesian President, the Czechoslovak premier, and Ho Chi Minh. The endless flux of statesmen round the world may seem comic, or irritating, or exhaustingly wasteful of precious energies; but the game is on, and no one can afford to play dummy.

Yet top-level travel is no substitute either for policy or for the fostering of understanding on lower levels. However warm Mr Macmillian's welcome in Asia, however harmonious the echoes of his visits, there should be no illusion that thereafter mutual comprehension between free Asia and Britain will cease to require sustained efforts—on both sides. The Prime Minister's imaginative venture, like the basic Commonwealth bond itself, cannot do more than clear the way for these efforts. More is involved than just arguing the tosses of the moment. In Britain, there still needs to be fostered a general recognition that ultimate harmony with the Afro-Asian world will call for the rooting out of racial discrimination in every form; and we are a long way from that yet. In Asia, the crying need would seem to be a wider realisation that no retreating imperial power that has its tail endlessly tweaked can be expected to show unbroken patience—and to submit with grace to the simultaneous milking of its udders. But most important of all is the need for recognition of the jeopardy into which disaster for either half of the free world would plunge the other. That is a lesson which has yet to be fully taken to heart either in the West or in Asia.

The Economist

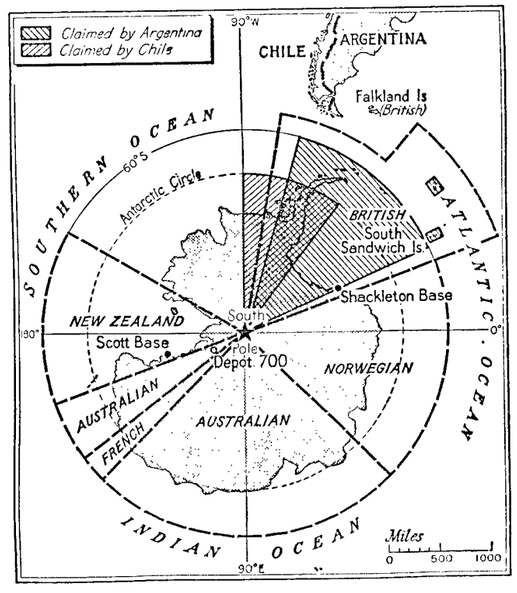
JANUARY 9, 1858

INDEPENDENT MEMBERS

We must keep a large class of constituencies open for what we may call *general* interests—constituencies where neither land nor capital nor labour demand an exclusive tone and bias in the politics of the candidate who presents himself. Otherwise we shall tend more and more to a representative system which admits only locally *concentrated* interests to an audience, and excludes those, quite as important, which are weakened by being spread widely over the country. It is because the secondary boroughs return men of no fixed type, but of all types,—because they return the men whose politics are free from the stamp of strongly-marked constituencies—the men who may mediate between the various interests and so become emphatically *statesmen*, that we should deplore as the most obvious degeneracy in our representative system, any change which should apportion members in proportion to the numbers of the electing constituencies. You cannot, as a rule, persuade the great electoral constituencies to elect likely men for the service of the State. They elect them for their *own* service,—which means the service of one very important but also exclusive element in the State. This is not so with the secondary boroughs. There is no sufficiently preponderating influence there. Personal qualities, —minor interests,—*general* interests tell greatly on the election. A great engineer, or an economist, or a philanthropist, or a scientific man, or an educational reformer, has a good chance of election without being devoted to any one of the three great political interests. Such, then, is our reason in favour of preserving to the secondary boroughs their present predominance in the political system of England. . . . We do not wish to see any diminution in the political influence of those constituencies which are comparatively impartial as regards land, labour, and capital,—which are identified with none of them,—which from time to time elect men who are bound up with various interests less able to make themselves heard.

Ice and Fire

One squabble has already broken out in Antarctica. International rivalries, and the advance of science, may bring more serious ones in the future.



ANTARCTICA is no longer for the penguins. Man has arrived in numbers, and an unaccustomed heat is already stealing across the frozen expanses. The dispute that has broken out between Dr Fuchs and Sir Edmund Hillary, conducted at long range with the ultimate weapon of intercontinental telegrams, is unlikely to be the last international argument over the region. About Sir Edmund's actions there seem to be two things that can fairly be said on the evidence available to those outside Antarctica.

The substance of his argument, as distinct from the manner in which he has tried to get it accepted, carries a good deal of weight. Dr Fuchs's party, in its laborious progress towards the pole, is at present basking in what passes for high summer at the bottom of the world. These fair conditions are likely to come to an end by late February or early March, when the blizzards that killed Scott will close in again. Even if Dr Fuchs can keep up his comparatively fast pace of the last few days, he will probably not reach the pole before about January 18th. He then has another 1,200-odd miles to accomplish if he wants to complete the passage to Scott Base on the other side of the continent. If this takes him as long as it took Sir Edmund, when the latter was heading for the pole, he will not reach safety until the beginning of April; and even if, at the most improbably optimistic estimate, he maintains his recent 30-mile-a-day pace all the way (across terrain some of which made Sir Edmund go much more slowly, and probably in worse weather than he had) it would still take Dr Fuchs until the end of February.

There is thus going to be a period, of anything from a few days to several weeks, in which Dr Fuchs's party may be exposed to considerable danger, and in which it might be very difficult even for modern methods of rescue to find him and extract him from the snowstorms. If Sir Edmund had confined himself to saying this, and then waiting in his appointed post at Depot 700 until the matter had been thrashed out, he could not be criticised. He is apparently not to blame for the fact that the quarrel became public, for the leakage occurred in New Zealand. Nor is his independent sprint to the south pole relevant to the main issue; although it was not part of the expedition's plan, and although it left a taste of melodramatic opportunism, it would not have prevented him from returning to Depot 700 and performing his main task, to guide the commander of the expedition from there to Scott Base. Where he seems to have offended is in what looks very like an attempt to force his views on Dr Fuchs and the committee that controls the expedition—by rejecting Dr Fuchs's request to wait at the pole for him, by going back to Scott Base and by invoking the "concern" of the American expedition at the pole, which it is up to the Americans, if they feel it, to express for themselves.

After all, there is no need for a final decision until Dr Fuchs reaches the pole and can see how much time he has left. Sir Edmund's party would meanwhile have been in no danger. If Dr Fuchs and the London committee then agree that the risk is a manageable one, Sir Edmund's responsibility is to go as far back along the line of march to the pole as is necessary to help the main party safely home. He now seems to have accepted this; and it is to be hoped that Dr Fuchs will not be stung into carrying out his threat to go it alone.

IN the end it may turn out that this dispute reflected little more than the difference between British and New Zealand ideas about the lengths to which a subordinate can go in pressing his views on his leader. The world will be lucky if Antarctica is vexed by no more earnest matters than this. At a time when everyone is wondering what the Russians will do next, and sure that, whatever it is, they will do it sooner than expected, it is natural that the West should look uneasily

at the enigmatic red star lately erected by a Soviet sailor on an uninhabited British island in the South Sandwich group. There is a gentleman's agreement that neither the Russians nor anyone else taking part

in the International Geophysical Year will make any claims to territory on the basis of the survey work they are doing; but a determined sense of national interest can find as many holes in this sort of injunction as in a colander. In particular, wary eyes in a good many foreign ministries must be watching the wide slice of Antarctica which no one has yet claimed.

Australia, New Zealand and South Africa, hitherto comfortable in the knowledge that geography has confined the Soviet Union to the northern half of the world, would be concerned if Russia were to lay a claim that might, conceivably, one day lead to intercontinental missiles poking their snouts out of southern icefields. Western naval planners, wondering what to do if bombs blocked the Panama canal, might well feel alarm at a Russian base within striking distance of the route round Cape Horn. American scientists, fearing that the Russians are ahead of them in long-range weather control, may be forgiven for shivering at the thought of antarctic winds across the Great Plains.

The Americans might be tempted to forestall these unpleasant possibilities by claiming the remaining wedge of no-man's-ice for themselves. The trouble is that this would almost certainly sting the Russians into a counter-claim, which they could make all the more virtuously because the United States has an IGY base there (and could thus be accused of violating the gentlemen's agreement) whereas the Russians have not. As an alternative, it has been suggested that the Americans might extend a kind of Monroe doctrine to Antarctica. But, although President Monroe in his day could rest confident in the effectiveness of his warning to European powers not to interfere with the American continent, his successor today is perfectly aware that there would be very great risks in attempting to stop the Russians setting down on an unpeopled coast.

A third school of thought is in favour of removing the whole region as far as possible from national rivalries by putting it under United Nations control. However, this, too, has its snags. If it were done by turning the present claimants into UN trustees, the Russians might still be tempted to demand a slice of the cake, even though the icing of total ownership had been removed, in order to extract what plums they could from qualified control. And if the whole continent were simply turned over to the United Nations, that body would then have to get its members to agree on a way of administering—and protecting from marauders—a territory in which some of them discerned desirable private benefits.

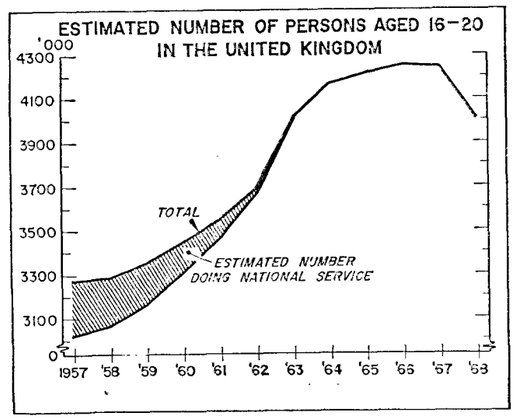
These problems are not yet urgent. The International Geophysical Year is proceeding fairly amicably on its course, the only major squabble having occurred where it was least expected. It is likely that science will have to advance a little further before man can make full use—for better or worse—of Antarctica. But the one generalisation it is safe to make at the moment is that science, at least in the Soviet Union, is advancing faster than anyone thought. There are many reasons why Moscow might one day think it desirable to extend an arm into the half of the world from which it has hitherto been excluded. Nationalism can strike sparks even in that frosty climate, and it will be surprising if all the nations fold their tents and go quietly home when the present surveys are concluded. Antarctica's native inhabitants, on seeing the tractor marks in the snow, may well raise their flippers and ask themselves what will happen next.

Gilded Youth

The money, manners and morals of modern British teenagers are subjected to some statistical scrutiny—and also the very different prospect for teenagers in five to ten years' time.

THE teenage generation of today is a source of sociological mystification, personal indignation and a good deal of plain, blunt envy to their elders. The picture usually conjured up is one of boys in string ties and crepe soles, girls in tight jeans and dazzle socks; most of them shiftless, uninterested in self-improvement, and with much more money than is good for them; an increasing number sexually promiscuous at altogether precocious ages, and with a bigger minority of criminal bad hats than any generation in Britain before. These impressions are usually based on personal inexperience, and are then either specifically supported or hotly refuted by those with personal experience of particular groups of teenagers under or out of their control. Yet the statistical material for more accurate generalities exists; it is worth burrowing through it in order to find out whether the young men and girls of today have cause to be angry—or whether they are a generation whom the rest of us should get angry about.

In 1957, there were just over three million girls and boys aged between 16 and 21 in the United Kingdom, of whom roughly 2½ million were at work. 300,000 were at school or university, and 250,000 were doing national service. Of those at work, three-quarters had left school at the earliest possible moment, that is between 15 and 16. But just because they did so, it is by no means true to say that their education stopped short then; the argument that this generation is less



interested in self-improvement than its fathers and elder brothers does not hold water. Thirty-seven per cent of all boys leaving school at 15 now go on to take an apprenticeship to a skilled trade, which means attending evening classes once or twice a week, and probably spending a day a week at a technical institute as well; the apprenticeship courses concerned last in most cases for five years.

The chances to learn a skill vary widely from industry to industry and from firm to firm, depending on the facilities available and the willingness of employers to allow time off for study. In engineering and shipbuilding, 90 per cent of boys are released for this purpose; in mining, 55 per cent. At the other end of the scale, agriculture and distribution release less than 5 per cent of their young employees. These predominantly unskilled trades tend to have a higher job turnover than those in which skill is demanded; but the record as a whole is not one of irresponsible job leaving. Nearly half the boys who start a job at 15 are still there at 18; and slightly less than another third change their job only once during this time.

Girls look on their working life as less important than boys, and, if secretarial courses are excluded, only 8 per cent. do any further training after they leave school. Most go instead into unskilled work, primarily into the distributivetrades, which absorb a third of all girls entering employment; other popular industries are clothing, textiles and food, drink and tobacco. But in spite of the rather suspicious attitude that many employers and trade unionists have towards women at work, they form a larger and more stable part of the total labour force than is often supposed. In 1956 around a third of all workers in Britain were women and girls, half of whom were married.

So much for accusions of a dead-end mentality and of greater shiftlessness than twenty years ago. The common impression of greater affluence among teenagers is much more usually true. Since before the war earnings for boys and girls have soared. Taking 1938 as a base year (100), the index of weekly earnings in industry in April, 1957, was 454 for girls and 402 for boys; this compares with 387 for women and 350 for men. In other words, boys have done better than men, and girls better than women, by around 15 per cent in each case. Putting these indices into money terms, the average wage for a boy under 21 in industry today is £5 5s., and for a girl under 18 £4 4s.; while outside industry they often seem to have done as well, if not better, than this. A secretary from a college taking her first job can expect £6 10s. a week, against 25s. to 30s. before the war, and shop assistants' pay has risen almost as much. In real terms (i.e., after making allonce for the rise in the cost of living), the average teenage boy factory workers seems to be 55 per cent better off than before the war, and the girl secretary can be asuch as 75 per cent better off; this compares with a rise in living standards of 35 per cent for the male industrial worker and 7 per cent for the community as a whole.

In all probability, the rise in teenagers' casual spending money has been greater still. A main reason for this—and a major feature of the present British social scene—is the sudden, temporary and quite unwonted prosperity that can now strike the British working family as most of its children pass into their teens. To take a fairly extreme case. A family with four boys and one girl between the ages of 9 and 14, where the father earned the 1951 average industrial wage of £8 3s. a week, would have had to live on £475 a year (including family allowances) then. Today, if all the children are at work and the father earns today's average industrial wage, the family will have an income of £1,840 a year net of income tax. That, incidentally, is the equivalent of a before-tax income of £2,050 a year for the family of similar size with only one breadwinner. The change in living standards is so abrupt and, because the children will soon float off into matrimony, so temporary, that comparatively little adjustment is made in

expenditure on essentials (including the rent, which is probably still subsidised); a lot of the extra money is therefore left with the teenagers for their luxuries. Hence the full dance halls, the huge sales of "pop" records, the expensive teddy boy or teddy girl clothes, the juvenile drunkenness figures and the rest.

Another result, of course, is that the young can afford to marry earlier; in 1955, one in ten girls, and one in forty boys, got married before they were 21, proportions in both cases double those for 1938. But although increased earnings may be one reason for earlier marriages, it is certainly not the only one. Another can be inferred from the fact that 54 per cent. of all girls who married before 21 and had children in the first two years of marriage did so within less than nine months of their wedding day. Unfortunately, too, in spite of all this wealth, the recent trend of crime among the teenagers has been markedly upwards—especially in robbery and housebreaking, which lead to three-quarters of juvenile convictions. In 1956, one

out of 91 boys between 16 and 21 was found guilty of an indictable offence, and since many cases never reach the courts, the proportion of boys breaking the law during the year was probably nearer one in 50. This is at least three times the crime rate for men, and one of the more gloomy aspects of the coming teenage bulge looks like being the need, between now and 1964, to expand borstal facilities very considerably.

THE prosperity of teenagers—and of families with teenage children—provides a strong case for looking at the incidence of tax rates at different stages of the ordinary family's life; perhaps taxes should not be graduated according to individual incomes earned, but only according to incomes available per member of the family. One reason why nothing has been done about this, however, may be that part of the problem of excessively gilded youth looks like being very temporary. As the diagram shows, the number of people between 16 and 21 will increase by a million in the next decade, and the number reaching the labour market will expand still faster if national service is ended. Even in the next five years, the number starting work is expected to rise by 40 per cent, while trends in office automation and self-service shops may hit at the demand for labour in jobs in which a high percentage of juveniles are employed. It seems unlikely, therefore, that the wages of young people will rise in the next ten years by anything like as much as they have done since the war. In real terms, they are quite likely to fall.

This may be no bad thing. But it only emphasises the pressing problem of how best to make use of this influx of young people; if properly trained, they could go a long way towards providing the technicians and skilled workers which Britain so much needs. Unfortunately this is nothing like so easy as it sounds. Apart from the difficulty of finding sufficient instructors, the craft unions use apprenticeship schemes largely as a method of restricting entry into their trade, and they have no wish to see them expanded. Even if the unions would agree, many small businesses (and some large ones) are unwilling to release employees for training.

Another, less tangible, challenge will be how to give these young people a chance to deveop any qualities of leadership they may possess. This will be all the more important now that national service which could give a boy a chance to show his mettle outside his job, is to be abolished. There is going to be scope here for much more work along the lines of the youth club organisation, the Outward Bound schools, and so on. Teenagers in the fifties have been lucky; teenagers in the sixties will be more numerous, probably less blatantly prosperous, and many may have a chip on their shoulders in consequence. To save them from being a much more real problem than their elders is a challenge that the country does not look at all ready to meet.

NOTES OF THE WEEK

MR THORNEYCROFT'S RESIGNATION

The New Team

PROBABLY the choice of Mr Heathcoat Amory as Chancellor was determined simply by the fact that he was the senior minister whom Mr Macmillan had marked out as next in line for appointment to one of the really top posts. It is also true, however, that the resolute supporters of disinflation among the civil servants at the Treasury may well have welcomed him as the Conservative minister most nearly in Mr Thorneycroft's image; after all, he served his apprenticeship in economic management under Mr Thorneycroft at the Board of Trade. Among the other possible condidates, Mr Macleod might have been regarded as too keen on encouraging expansion, as distinct from containing inflation; Mr Maudling might seem too expert an economist in his own right; Sir David Eccles might have been regarded as a difficult choice for other reasons. So Mr Heathcoat Amory comes to Great George Street with the maximum of goodwill possible in the circumstances. He will have the benefit of intermittent economic advice from Mr Maudling, who already has three other jobs; indeed Mr Maudling's present role of revolving round Whitehall like a sputnik is one that ould seem to the outsider to be oddly uncomfortable and eroic. The new Chancellor's only other political aide, as financial Secretary, is to be Mr Simon, Mr Butler's form bright young man at the Home Office, and the Consentives' first rising discovery among their lawyers for sometime (the last man who was usually given that appellation as the present Foreign Secretary). Mr Simon's inquiring mind will presumably be turned mainly, not to matters of high policy, but to details of expenditure and tax reform; there is room for such a mind, particularly if it is oi prepared to be beastly to the Inland Revenue.

To fill the gaps caused by Mr Hthcoat Amory's promotion, two personable middle-rank conservative politicians, Mr Hare and Mr Soames, go to t Ministries of Agriculture and War respectively. Mr H takes up office uncomfortably near the time for the anal farm price review; he may be helped, though he ou not to be, by the fact that Mr Heathcoat Amory is no the gamekeeper turned from poacher. Unfortunately, th is an objection of principle to be entered against Mr H's appointment. Surely it is a mistake to appoint a Conserive Minister of Agriculture who is not only a dairy farr himself but sits for a conceivably marginal (majority 90) agricultural constituency?

Without New Revolt?

WHILE Mr Macmillan was blandly describing the resignation of the entire political team at the Treasury as "local difficulties" which had recently caused him a "little anxiety," the rest of the Government was laying on the biggest public relations drive one can remember to explain why the explosion had occurred. The dominant point made—in public speeches, in personal talks, and in Lord Hailsham's anxious message to Conservative constituency organisations—was that the quarrel implies no retreat by the Government from a stern policy to defend sterling. The argument was about means not ends.

Mr Thorneycroft's most obvious targets, for the £40 to £50 million of additional economies he wanted to secure would have been the £70 million odd a year that is still spent on subsidising school meals, welfare milk, national milk, cod-liver oil and the like; perhaps because stringent cuts here would have affected agriculture as well as social policy, however, a rearrangement (which would have meant a cut) in the system of family allowances, and an increase in national insurance contributions, were also put up for consideration. The Cabinet's main objection to this list was the very bad one that it might affect the "climate" for wage claims. This was reinforced, however, by an exasperated feeling that the whole quarrel was in some way a quarrel *de minimis*. It seemed odd to the Cabinet that a Chancellor should resign because of a dispute about less than £50 million of planned government expenditure—especially when it is remembered that in the five full fiscal years of Conservative power planned government expenditure has differed from actual eventual government expenditure by an average of £150 million a year (sometimes up, sometimes down) anyway. Moreover, the ceiling for the coming year's investment by the nationalised industries was a figure of £1,500 million guessed by the Treasury for such expenditure in 1957; there are signs that it may have been an over-estimate of actual past expenditure and that there was some "give" written into the figures. The ceiling which Mr Thorneycroft demanded for government current expenditure, and for which he has now resigned, was a ceiling to be set by a figure in which there was no give at all.

Thus, perhaps unfairly, is the case for saying that Mr Thorneycroft protested too much. And, however unfair, it is a case which, on present evidence, seems likely to be accepted without great revolt by Conservatives in the constituencies and on the back benches in Parliament. Mr Butler is reported to have told a correspondent on Tuesday that, by and large, the "rocks of the party—the chairmen of committees and so on—seem to be behind the Government." The Government had not been at all sure that they would be on Monday night.

EAST-WEST RELATIONS

Why Did He Say It?

MR MACMILLAN'S broadcast last Saturday was of a kind to evoke the question "Why did he say it?" rather than the question "What did he say?" What he said was that in pursuit of some agreement with the Russians for disarmament and the relief of tension,

> We could start by a solemn pact of non-aggression. It would do no harm. It might do good.

Could we? No one can tell for certain, but it seems more probable that anything like a general pact would have to come after, not before, the armaments race had been slowed down and the asperities of the cold war tempered. This, or something more like it, was evidently what the Foreign Office wished the Prime Minister had said, for it explained on Monday that "what he was really saying" was that "such a pact, to complete the agreements, might do some good."

However, the Prime Minister chose his words, and it is not hard to conjecture that he had his reasons for choosing them. The climate of feeling in Europe has lately been such that other men, certainly not less closely identified with the military solidarity of Nato than he, have been finding it expedient to express a readiness to explore ground for possible western agreement with the Russians. Dr Adenauer, with his unequalled feeling for the German climate, is one. This country is no exception; why should it be? But Mr Macmillan had a more specific reason for making his affirmation of willingness to talk and "perhaps," as he said, "to get the path ready for a meeting of heads of government." Just about to set off for India, he may well have thought it useful to indicate before he went that his mind is not as tightly shut against ideas of compromise, or as dominated by preoccupations of military preponderance, as people in Asia assume the minds of western statesmen to be.

There is always a risk that such an indication may rock the boat of western solidarity, but it need not; it "may even do good." On the other hand, to treat Mr Macmillan's *obiter dictum* as a substantial stroke of statesmanship would be altogether out of proportion. Western leaders, and (let it be hoped) Russian leaders, too, will probably go on groping aloud for ways out of the wood; but this particular way of the non-aggression pact has been advertised by the Russians before; it is not going to catch on now.

How Many are Left?

BECAUSE the total strength of the Russian armed forces has never been divulged, the reductions which the Russians announce from time to time do not make the impression in the West that might be expected. The latest cut, of 300,000 men, to be carried out by the end of the year, was announced on Monday; there have been previous announcements of reductions, in August 1955 of 640,000, and in May 1956, of 1,200,000 men. The Soviet deputy foreign minister, who made the announcement on Monday, refused to say whether the number of Russians under arms would now be brought below the three million mark. This reticence is rather curious, since according to western intelligence estimates, the number of men in the Soviet armed forces should now stand (before the cuts) at some 3,200,000—provided, that is, that the previously announced cuts have really been carried out, a point which the West has no means of checking, and on which the figures from communist sources cast some doubt.

Lacking adequate or reliable information about Soviet armed manpower, the West suspects, probably rightly, that the Russians do not intend to lose their preponderance. Yet the shortage of civilian manpower, which the low birth-rate during the war years is beginning to make more acute, must make the Russian leaders anxious to get men back into the factories and on to the land. Their present lead in

long-range weapons presumably allows them to feel they can do so more safely; while the West's post-sputnik reappraisal of defence planning and of policy towards Russia makes this a good moment to squeeze the maximum propaganda effect out of the cuts.

With so much talk of disengagement in central Europe in the air, it is not surprising that the Russians specifically announced the withdrawal and disbandment of 41,000 men from Germany and of 17,000 from Hungary. They are presenting this to the world as proof that they want the idea of disengagement to be taken seriously. Yet the cuts still leave strong forces behind. In Eastern Germany there will still be around 17 Soviet divisions; while there will still be more than twice as many Soviet soldiers in Hungary as there were before October, 1956. Mr Kadar is nowhere near redeeming his promise to get rid of all Russian troops.

BUSES

Lower Sights

WEDNESDAY'S talks on the London busmen's pay claim were an interesting anti-climax. This was the third time London Transport had met the union representatives to say that it would not give a pay increase this year. The two sides spent six hours discussing whether London Transport really meant it. The final decision was to refer the dispute to Sir Wilfred Neden, the Chief Industrial Commissioner at the Ministry of Labour; he is being asked by the union if he can suggest any machinery of investigation through which negotiations might be resumed.

The union's decision to call in Sir Wilfred Neden, instead of to call a strike, has two implications. The first, of course, is that any machinery of investigation is bound to be a machinery for some delay; the union is still eager not to be the first on to the battlements in the wages struggle this winter. The second point, however, is that all the union seems to be thinking of now is an increase for some of its members, not necessarily all of them. It wants some examination of the fact that certain groups of London busmen—for example, the crews of buses in Central London—have done worse than other groups in recent annual pay awards. This is a notable lowering of Mr Cousins's sights. Even with these lower sights, however, he should not be allowed to hit his target. This is not only because of the consequences that a rise for even some London busmen could have on all other pay awards; the need for a standstill is reinforced by London Transport's present commercial quandary, especially in central London.

Empty Seats

LONDON TRANSPORT'S commercial reasons for refusing any pay increase to its busmen were revealed by a statement from its chairman last weekend. Sir John Elliot announced that London's buses and underground trains are now carrying half a million people a day less than they were at this time last year, and that total travel by public transport is now 16 per cent below the level for 1950. Buses, which carry half of their passengers on the 3d. minimum fare, are particularly affected. As late as 1952 the minimum charge was still 1½d.; it went up to 2d. in that year, to 2½d. in 1955, and to 3d. in 1957. There is now quite strong evidence that the demand for bus journeys, at any rate over short distances, is elastic. Midland Red, the largest provincial bus company, has just recognised this by reducing its minimum fares by ½d.

That step would probably help in London too. But London Transport's principal emphasis is being laid on competition from private cars, which not only reduce the number of passengers carried, and thus raise costs, but also force buses to work over routes so packed with traffic that people find it quicker to walk short distances than to take a 3d. ride. It is to the problem of relieving traffic congestion that London Transport's main efforts are now turned. A good deal is being achieved along these lines. Bus routes are being localised so that more buses travel to and from central London, but less travel through it; vigorous steps are being taken by inspectors to stop bunching; and last month, the world's first electronic system for bus control, BESI, was put into operation on Route 74. But buses in central London, where much of the short distance travelling is done, still average only 7½ mph; and indiscriminate parking, which causes so much of the trouble, continues as before, while the test case for meters in Mayfair drags on for month after month.

The problem of private parking in London will obviously have to be tackled some day soon, preferably by vigorous use of the meter system; but meanwhile London Transport has its own part to play in removing the congestion from which it suffers, but which it also very largely creates. In few large foreign cities that one can think of is the casual traveller so profusely served by buses, travelling in almost every direction, as he is in central London. If the number of buses running in daytime through, say, Piccadilly and the Strand were cut by a half, would that make London Transport better off or worse off? If it would make it better off, then by all means axe the schedule.

AFRO-ASIANS

Cairo's Permanent Guests

THE first meeting of the new Afro-Asian People's Solidarity Council was held in Cairo over the weekend. This body theoretically represents the "delegates" who attended the recent conference in that city, the majority of whom, in turn, represent nobody but themselves. The council is not, however, as significant a legacy of the conference as the permanent secretariat that is being set up in Cairo. The Russian and Chinese secretaries will not, numerically, swamp their eight colleagues, but, as they enjoy the full support of powerful states, they will automatically carry greater weight than the genuinely non-official secretaries. In short, Russia has gained what must have been its main objectives in sponsoring the conference from behind the scenes: acceptance as an "Afro-Asian" nation, and a recognised office for the further dissemination of propaganda in Africa and Asia (through the journal to be published by the secretariat.)

A Soviet success of a more dramatic order was the "unconditional" offer of aid that made headlines throughout the non-communist world. In *The Economist* last week it was pointed out that Russia's own record made no mention of a promise of aid. Chapter and verse are worth giving. There is no doubt that a verbal offer was made by Mr Arzumanian, one of the Soviet delegates, for it was reported by the international news agencies from Cairo, with circumstantial references to the applause that greeted it. On the other hand, the Tass agency report of Mr Arzumanian's speech as it appeared in *Pravda* of December 29th, and as it was distributed in English, made no mention of a Russian offer. But elsewhere in the same issue of *Pravda* the offer was put into the mouth of Mr Arzumanian—in a quotation from the Egyptian newspaper *Al Gomhouria*. One inference could be that Mr Arzumanian spoke out of turn; another, that the Russians, while out for world headlines, had no intention of leaving the offer on the formal record.

President Nasser, who drew dividends from the conference in the shape of resolutions condemning "imperialism" in Algeria, Cyprus and other areas in which he has displayed interest, cannot, however, have been entirely pleased by the dominant role played by the communists. Indeed, he is credibly reported to have complained to the Egyptian delegates that things were getting out of hand. In the long run, he may find the activity of the new secretariat in Cairo an onerous price to pay for Afro-Asian "leadership."

MIDDLE EAST

Well-Advertised Money

A LEISURELY seven weeks after General Amer, the Egyptian war minister, returned from the Soviet Union brandishing the promise of economic aid, Dr Aziz Sidky, the minister of industry, has gone off to Moscow to fix the details. The Russians have promised Egypt credit up to £62 million—and the Czechs have put their name down for another £20 million—towards a five-year plan of industrial development. However, when it comes to signing the agreement, the Russians may follow the precedent they set with Syria and decline to commit themselves to a sum. Repayment, at 2½ per cent interest, will not apparently start until 1963, when the plan should theoretically be completed, and will then be spread over twelve years.

The Egyptian plan in its most ambitious form has been estimated to cost about £230 million, of which £160 million would have to be in foreign currency. If the plan were the Egyptian government's only major commitment, it would be easier to see how it could foot its share of the bill. But there is also the question of compensation for the Suez Canal company shareholders—and President Nasser has not dropped the idea of building the Aswan High Dam. When he opened the National Assembly in July, he said that plans were complete for the first five-year stage of the dam project. This would cost £60 million, of which £28 million would be in foreign currency, taken from the proceeds from the Suez Canal.

The burden on the Syrian economy if its development programme is carried through is even more unrealistic. The seven-year programme for developing electric power, irrigation, communications and mineral deposits is estimated to cost £200 million. The Russians have never said publicly how much of this they will provide, but reports from Damascus say that the ratio of foreign to Syrian currency will be 6 to 14. This would mean that the Russians contribute £60 million and the Syrians, in the form of labour and local materials, £140 million. (The Czechoslovak loan of £60 million for factory equipment is for the second stage of economic development, and would not apparently be used to help finance the nineteen projects in the Soviet agreement.) In 1956 the Syrians spent £1½ million on economic development (and a good deal of this was in the end diverted to defence) out of a budget of £36 million. It is clear that overwhelmingly more money is needed if the seven-year plan is to be carried out.

The Russians have contrived to leave the impression that not only are they paying the lion's share of the Syrian scheme, but that all the credit will be automatically available. But the truth is that each individual project has to be approved by Russian technicians, and only then is the credit for that project advanced. This could mean that the completion of the Syrian loan—and presumably of the Egyptian too—depends on the continuing good will of the Soviet Union.

MALTA

Mr Mintoff Unrepentant

MR MINTOFF has made an adroit reply to the message which the Colonial Secretary sent to him with the request that it be read during the debate on the resolution to "break the ties" with Britain because of dockyard redundancies. The men dismissed a few weeks ago have providentially been re-absorbed (as Mr Mintoff knew they would be) in civil work, and an adventitious ship repairing contract ensures that other dockyard redundancies will be taken up for the time being. As there is to be no immediate unemployment, Mr Mintoff is able to extricate himself neatly with the cool announcement that though the resolution is to remain on the record, it will not be implemented "so long as Britain keeps faith with her pledge of keeping intact the level of employment." This pledge, like the constitutional power of the Malta government to cut ties, has been invented by Mr Mintoff, and Mr Lennox-Boyd should jump on it with both feet hard and at once. No such pledge has been given, or could be given; the most that has been done—and that is probably far too much—is to undertake that employment in the dockyard will not fall below 12,000 for three years. But if this trick is not nailed, Mr Mintoff may go on from here to declare that Britain has promised to keep every Maltese in a job to the end of time.

Equally insidious is Mr Mintoff's demand for "new negotiations." Negotiations have been going on for two years, and upon every conceivable issue. What Mr Mintoff is asking for in fact is still more money and more concessions on top of those already granted; though his suggestion that these negotiations be undertaken "in a spirit of give and take without predetermined formulas" will induce wry smiles in the Colonial Office. Does that mean that Mr Mintoff will give up the all-embracing formula of "equivalence"? Nor should he be allowed to get away with his lengthy smear of the British Government, which is plainly as much directed at maintaining his grip on the Maltese people as at impressing British opinion. As our correspondent points out on page 124, Mr Lennox-Boyd's message showed many Maltese that Britain could be tried too far. Nothing should be done to efface that impression. Mr Lennox-Boyd should not go "urgently" to Malta to make "amends" for the "upheaval" which defence changes entail for Malta's economy by "adopting remedies that ensure the survival of the people

of Malta." Britain's cheque-book should stay in Mr Heathcoat Amory's pocket, and Mr Mintoff should be challenged to accept the generous terms already conceded for integration, or kindly to reveal to the Maltese some scheme of his own manufacture which guarantees perpetual full employment without British aid.

HOTELS

An Economic Paradox

THE January number of *Design*—which is devoted to the special needs of the hotel industry in architecture, furniture and equipment—slips from æsthetics to economics and raises questions of considerable public and commercial interest. More travel, whether for business or pleasure, means a bigger demand for hotel accommodation. The British Travel and Holidays Association, with its eye on the tourist trade, notes an imminent doubling of trans-Atlantic air capacity; it is estimated that there will be 50 per cent more cars in Europe three years hence; whatever may be Britain's share of the implied growth of tourist travel, and however vulnerable tourism may be to short-term recession (holiday spending, an eminently elastic item in most personal budgets, takes a disproportionate knock from any general fall in incomes), the long-term market looks exceedingly buoyant.

On the face of it, therefore, the hotel industry should offer an outstandingly profitable field for investment. In fact, a mere handful of new hotels have been built in Britain since the war, and the experts whose discussion is summarised in *Design* take an almost unanimously gloomy view of their prospects. Modernisation is a better bet, and has provided 500 new rooms in London alone; but this compares with a shortage, estimated by the BTHA, of ten times as many. Even modernisation is expensive, and the higher the proportion of tourist to "commercial" trade the more forbidding becomes the problem of the dead season.

There are ways of alleviating these difficulties. One is to aim at the right target—*de luxe* or tourist-class trade as the case may be—with standards of accommodation, food and service all in keeping. Another, perhaps the most hopeful for new construction, is the lucrative letting by hotels of one or more lower floors for shops and offices. Another, of course, is sheer ingenuity in the maximum use of space. Another, rather wistfully recommended by *Design's* experts, is the lowering of equipment costs by specialisation and by longer runs in the relevant industries.

The truth is, however, that the by no means cheap prices of British hotels have only been kept from rising even higher, in face of the running costs imposed by the Catering Wages Act, by what amounts to continuous raiding of the industry's amortisation and obsolescence funds. The new and ultimately inescapable level of costs is as much a fact as the new level of demand. Whether the industry should be subsidised, directly or indirectly, in the interests of its status as No. 1 dollar earner, is a question of national policy; such subsidies would be on an exact economic par with those devices which, when applied to goods, have been internationally condemned and (on paper anyway) renounced. Failing subsidy, hotel owners and travellers alike might as well face the fact that charges must rise—indeed ought to rise—very substantially. To talk in the same breath of "shortage" and the impossibility of meeting it without loss is economic nonsense.

INTERNATIONAL MONETARY FUND

Bailing Out France

FRANCE expects a lot from M. Monnet's visit to Washington—the release of the remaining $262.5 million of its quota in the International Monetary Fund and a loan of some $200 million from the Export-Import Bank. The French hope that these loans, together with their own efforts to put their house in order, will tide them over their exchange difficulties in 1958; especially if they can obtain as well a large further extension of credit facilities in the European Payments Union.

France's hopes may well be satisfied and its day of reckoning put off once more. But there is no doubt that the French loans are causing a good deal of heart-searching both in the United States Administration and in the International Monetary Fund. The liquid resources of the IMF are low. There is a danger that if France goes away satisfied, other importunate customers like India and Japan will be difficult to refuse. The IMF was of course designed in part to tide countries over temporary exchange difficulties. But it was not intended to promote inflation or sustained imprudent policies of expansion. As the exchange problems of a number of countries have become urgent in the past year, discussion about the role of such international sources of finance has grown.

One of the main weaknesses of the IMF in the past seems to have been the automatic nature of the credit facilities it provides. Each country has a quota; each has tended to regard this as a reserve on which it can automatically draw. The IMF might well be able to play a more active part in keeping the flow of international payments going if it had greater discretionary powers to raise money from countries that have plenty of foreign exchange and lend it to those that have not. But such loans have only a limited value unless they can be used as a means of pressing for more prudent policies in the borrowing country and to strengthen the hand of the international institution acting for the world trading community.

At one time it seemed that the present "liquidity" crisis in several countries might provide an opportunity to move in this direction. There has been talk of a new severity in the grant of the second half of IMF quotas, linked with a more vigorous effort to compel countries to put their domestic affairs in shape. But when France asks for cash it can use its political weakness as an overriding argument: the danger of communism, or of an anti-communist *coup*. The IMF and the EPU may find themselves forced to depart from strict economic precepts on political grounds.

ECONOMIC PROSPECT

Europe Marks Time

ECONOMIC growth in Europe, as in Britain, is slowing down. Throughout the first nine months of last year the rate of industrial growth slackened; since the summer the trend has continued. Outside the United Kingdom, the most notable slackening has been in western Germany. There, partly through a check to exports, industrial production has been running only some 5 per cent higher than a year before, considerably less than the record figures of earlier years. But the pace in other European countries, too, has eased.

The timing of the slowdown has varied from one country to another. The easing of the investment boom has made itself felt most notably in steel and some branches of engineering. Countries like Belgium, and in some measure Germany, being highly dependent on the international market for those products, have felt the pinch. Belgian output may actually have fallen. Those countries that had been forced to adopt restrictive policies for balance-of-payments reasons—the Netherlands and Sweden, for example—seem to have been affected first by the slower rate of growth. France, pursuing growth at any foreign exchange cost, and Italy, were the two main exceptions to the summer check. But in both those countries the weakening of demand abroad, and in France import restrictions, have brought a marked hesitation in the last few months.

The economy of western Europe is not in recession; the

Strategic and Tactical

THE words "strategic" and "tactical" are beginning to be used very loosely and confusingly in relation to thermonuclear weapons. In the past, strategy and tactics related not to weapons, but to objectives in warfare—the first referring broadly to the grand design, or possibly to particular campaigns, the second to methods of winning particular battles or manœuvres. The same *weapons*, infantry, cavalry, artillery or ships, were employed both in strategy or tactics. By derivation, a "strategic weapon" has now become a weapon that can be used to further strategy in war—which means in effect a weapon which is used against an enemy's war-making potential—whether its industries, or its economic organisation, or its will to fight on. Until the coming of atomic bombs, there were no "strategic weapons," only the use of weapons strategically (for example, the use of warships to enforce economic blockade).

The question arises now only because of the very wide-ranging explosive effects of modern weapons, which often cannot be confined precisely to any battlefield or tactical target. Even so, the old classification by use and not by nature still holds. A large proportion of these modern devices, whether explosive or infective, could still be used *either* in a strategic *or* in a tactical role—according to how they are delivered. The following classification may serve to show that labels cannot be pinned on any weapon *easily*.

I. WEAPONS

1. **Bacteriological weapons.** These are almost wholly strategic, in the sense that they could hardly be used in a battle at all.

2. **Gases.** In the past these have only been used tactically—to win battles. The improved modern versions are still mainly suitable in such uses, whether alone or in conjunction with atomic weapons, but they could in quantity be used strategically—i.e. against industrial concentrations, etc.

3. **Atomic Warheads.** These can, irrespective of size, all be used in tactical as well as strategic roles: e.g. a megaton bomb could be dropped on a fleet at sea as the most economic weapon to destroy it; a nominal (Hiroshima-size) bomb can be used equally to destroy cities or military formations on land; a "low yield" bomb could be used strategically in the sense of being used to destroy a particular strategic target—such as the War Office or the Pentagon; but its main role would be as an economical substitute for a normal artillery barrage by sea or land, or for a pattern of anti-aircraft shells.

II. MEANS OF DELIVERY

1. **Long range** ballistic rockets (US *Atlas, Titan,* 5,000-6,000 miles). These are almost certainly suited to strategic roles only—for wrecking industrial cities and the fabric of organised society.* Normally they are expected to have atomic warheads but could conceivably deliver (1) and (2) above as well, but hardly in quantities large enough to justify the cost.

2. **Intermediate range** ballistic rockets (US Army *Thor, Jupiter,* US Navy *Polaris, Triton,* British Missile X). All these seem also to have a strategic role; the shorter range is merely an interim stage of (1), or adapted to delivery from nearer bases. *But* they could have a battle role—e.g. against the known position of fleets, armies, air bases and even launching sites when more accurate.*

3. **Short range** ground-to-ground missiles of both the ballistic and aerodynamic types. The very short range varieties (US *Honest John, Corporal, Sergeant,* 50 miles, and *Redstone,* 200 miles)* are tactical weapons in the modern setting (though in the smaller military arenas of even 50 years ago they would have been deemed strategic). Weapons that carry 700-1,000 miles (US *Matador, Regulus*)* have both roles, according to the nature of the conflict and their own location. In a limited conflict, if such is possible, they could presumably knock out the vital zones of both contestants; even in a big war, they could make a strategic contribution.

4. **Atomic Cannon.** US*. Having a range of only 20 miles, these are confined to tactical roles by land or sea.

5. **Ground-to-air** (US *Nike-Hercules*)* (US *Talos,* and air-to-air *Genie*): tactical.

6. **Air-to-ground** missiles, or "stand-off bombs" although inherently short range, are designed primarily for use with bombers on strategic missions, lengthening their range and enabling them to avoid defences.

7. **"Air breathing"** long-range robot aircraft (US *Snark,* 5,000 miles) are suited to strategic roles only.

8. **Long range** air strike forces—might seem to have only strategic significance, but again if these were sent from a distance merely to redress a battle situation in a place where other means of delivery could not be employed so well, they could have a tactical role. V-bombers attacked, if inaccurately, the Egyptian forces on the Suez Canal in November, 1956.

9. **Intermediate range** air strike forces; they have obvious tactical roles, however armed; but they can have strategic roles, if armed with hydrogen or even "normal" bombs in quantity if (*a*) they are located near enough to the enemy's homeland; (*b*) their range can be lengthened because the crews are sacrificed; (*c*) they are refuelled in air; (*d*) they carry a flying missile which lengthens their range enough.

10. **Short range** strike forces: tactical.

It follows from all this that what counts is the way in which weapons and delivery vehicles are used, their location, and their number. (Enough A-bombs, dropped together, add up to one H-bomb.) No hard and fast line can be drawn. Once a state has the atomic bomb its ability to influence the strategic balance of power, as distinct from the tactical course of a battle, depends on what means of delivery it possesses. And the whole argument is still theoretical, not to say academic, even though the words "strategical" and "tactical" are so much bandied about; to the recipient of the latest explosives, it is a distinction without a difference. And to the expert, though the strategic results of dropping two "nominal" atomic bombs on Japan are known, it is still surmise what would happen if an attempt were made to use these weapons tactically.

* Denotes that Russians are known to have weapons in this class, with atomic warheads.

162853

labour market is still tight in many countries, and there is not much productive capacity unemployed outside the United Kingdom. Some sectors of industry, notably cars and a number of other consumer industries, are still working at full speed. Still, Europe is tending to mark time; a new impulse may be needed before the boom can resume.

EDUCATION

Heads Together

WELL-TO-DO parents burdened with intelligent families must have pricked up their ears last week when Mr A. H. Jennings told the conference of the Incorporated Association of Headmasters (the state schools equivalent of the Headmasters Conference) of what looked like a new way of getting round the means test if their children win a local authority scholarship to the university. Mr Jennings is reported to have told of a father who went to a solicitor and legally disowned his son, in order that the local authority, finding him without means of any kind, would be compelled to give him a full grant on the strength of the scholarship which he had won. Unfortunately, if Mr Jennings's story is really true, it seems that the father must have pulled a fast one. The law of disinheritance does not really seem to enter into this matter. In common law, parents' responsibility for children terminates at sixteen, and the means test is apparently not tied to any legal definition of parent. If a school leaver gets a scholarship, the local authority requires from the parent, guardian or other relative *in loco parentis* the buff form duly filled in with a statement of means. In rare cases orphans do fill in their own buff forms, but it seems open to a local authority, if it finds that an orphan has a rich relative, to require this next-of-kin, or even remote-of-kin, to fill in the form. It is up to the scholarship-winner to possess form-filling parents or guardians.

If an actual case of a local authority increasing its grant to a "disinherited" winner of a university scholarship has occurred, this was certainly not one of *force majeure*; local authorities give or withhold at their own discretion—and there is little uniformity about the way they do so. Hard bullying by a determined parent sometimes yields a bigger grant; presumably this is all that must have happened in the case Mr Jennings quoted.

The headmasters attacked the rigidities of the educational system at many points, and with many telling quotes. Thus "children today have three parents—Mummy, Daddy and Telly." And the story was told of one headmaster who had recently informed a certain examining board that he would not submit any more candidates to it, because he got more passes from another board. This last point—about the unevenness of the standard of examining for GCE—is one of which the Ministry of Education is ruefully aware.

PUBLISHING

No End of Books

A RECORD total of 20,719 new titles were published in Britain last year, including a marked revival in new fiction. Publishers are a little too quick to bewail this, associating a flood of new books with the ebb in sales that characterised the thirties. As the table below suggests, 1956 was a remarkably prosperous year for publishers. It may be that the increase in titles—and in reprints—which occured in 1957 was a natural reaction to bumper sales then.

	Personal expenditure on books (£ mn.)		Publishers' turnover † (£ mn.)	New titles published †		
	Current prices	1948 prices	Current prices	Total	Reprints and new editions	Fiction
1937	...	...	10·5	17,137	5,810	5,097
1938	10	15	10·7	16,219	5,307	...
1952	39	34	42·8	18,741	5,428	4,181
1953	40	35	44·9	18,257	5,523	4,301
1954	40	35	46·3	19,188	5,846	4,204
1955	44	37	49·4	19,962	5,770	3,702
1956	50	43	56·7	19,107	5,302	3,443
1957	...	...	*	20,719	5,921	3,737

* In the first quarter of 1957, publishers' turnover was £13·8 million, compared with £11·95 million in corresponding quarter of 1956.

† Turnover statistics compiled by the Publishers' Association; titles by *The Bookseller*.

The figures in the first three columns of the table are interesting. The increase in book-buying since before the war has been much greater than most people would have suspected. So has the pace of the increase since the relative doldrums of 1952-54. The truth is that books have stood up to the steady development of other media of entertainment and instruction extraordinarily well; and there is further ground for satisfaction in the fact that—taking a very rough and perhaps misleading average—the price of books fell in 1956. Even compared with 1938, books have risen by less than 80 per cent in price.

VENEZUELA

Shifting Sands

FAULTY organisation and bad security made the New Year rising in Venezuela misfire. The government got advance warning of the plot, and when the air force led off at Maracay, the air base fifty miles from Caracas, it got only limited and unconcerted support from the army; the navy made no move at all. With several service chiefs in prison and other leaders of the revolt in refuge in Colombia, President Pérez Jiménez can claim that all is calm. But the revolt has shown that in spite of his pampering of the officers, some of them at least are restive. The myth that the armed services are firmly on the side of the president is exploded.

The president over-reached himself last month by holding a plebiscite instead of presidential elections. The government claimed that 2.3 million people said "yes" to another five-year term of office for the president; 500,000 said "no." Both the substance of the plebiscite and its form were an insult to the Venezuelan electors' intelligence, of a kind for which the accumulating national wealth does not compensate. The regime has already been under fire from the Roman Catholic hierarchy; the Archbishop of Caracas has formally denounced in a pastoral letter the maldistribution of oil revenues. Although the causes are as different as the two presidents themselves, this addition of ecclesiastical censure to military discontent recalls the omens that preceded the fall of General Perón. An abortive air force rising signalled the revolution that ousted the Argentine dictator—who may now be fearing that his Caracas retreat is less secure than it looked.

All this is an unfortunate prelude to what is believed to be the first visit to Latin America by a British President of the Board of Trade. Sir David Eccles is due to arrive in Caracas on Sunday. British governments have long appeared to regard Latin America as half off the map, but the oil pinch a year ago gave a reminder of the riches of Venezuela. Sir David Eccles is right to cultivate friends in Latin America; on sands as shifting as those in Caracas just now he may find it unusually hard to know where to put his feet.

ISRAEL

Mysterious Ways

TO dissolve a coalition and then to re-form it with no change at all is a curious manœuvre. Mr Ben-Gurion and his cabinet, including the two Achduth Avoda ministers who were in disgrace last week, are all back in their places. The coalition has reiterated its belief in collective responsibility and has bound itself to vote for all government measures. Although the prime minister has dropped his insistence that indiscreet ministers should be dismissed if two-thirds of the cabinet agree that they should be, the official secrets act is to be given some new tentacles that will stretch over the press as well as over the cabinet. In exchange, the prime minister has apparently promised to tell his ministers what he is doing before, rather than after, he does it.

The coalition is predominantly left-wing, but with some parties considerably further to the left than others. The prime minister's moderate labour party Mapai accepts Israel's western connections as the basis of any realistic foreign policy; Achduth Avoda and, more particularly, Mapam, toy with the neutralism that seems to give the Arabs a better lever than Israel in world affairs. The prime minister, perhaps anticipating a cabinet flare-up over foreign alignments, may have decided to have the crisis in his own way, in his own time. Contriving to blanket the division about foreign policy, he chose instead that the crisis should occur on the narrow and uncontroversial issue of spilt cabinet secrets. The left-wing parties were outmanœuvred. They may have been preparing to jump off Mr Ben-Gurion's wagon some time before next year's elections, but they obviously concluded that a reputation for unreliability was no ticket on which to go into opposition.

Election manœuvres may explain the upheaval. But it is difficult not to speculate on other reasons for Mr Ben-Gurion deciding, at this time, to consolidate his position. He may just have wanted to chasten the supporters of neutralism. But arms that Israel cannot get itself are piling up in the surrounding states. The more the western powers shrink from contact with the Jewish state, the more Israel is thrown back on its own resources.

UNITED NATIONS

A Conflict of Loyalties

FRESH representations by refugee Hungarians have again drawn attention to the curious case of Mr Bang-Jensen, who was suspended from his post in the United Nations Secretariat a month ago. Last year this Danish official served as deputy secretary to the committee appointed by the Assembly to report on Russia's action in Hungary. Some of the refugees who testified before it, understandably afraid that Mr Kadar's thugs would take reprisals against their relatives and friends, agreed to speak only on condition that their identities were kept secret. Mr Bang-Jensen apparently promised some of them that he would not divulge their names to any other persion whatsoever; he believes that they would have refused to testify without this specific personal assurance. He has taken the relevant documents into his own custody and refused to entrust them to that of the secretariat; hence his suspension.

Mr Hammarskjöld's consequent dilemma is painful. No organisation can let its employees remove and retain its official records, however high their motives for doing so. Although Mr Bang-Jensen has been copiously reassured that no communist, or indeed any other, member of the Secretariat, would have access to the names of the anonymous witnesses—it has been suggested that the papers should be sealed and locked away under the supervision of Mr Andersen, the Danish chairman of the committee, and of the secretary-general himself—he has so far maintained his stand, and has engaged lawyers to argue his case. An official inquiry has been set on foot, but it would tax the powers of a moral philosopher to say who is really right and who wrong in this matter. Mr Bang-Jensen originally erred in giving a promise inconsistent with his sworn loyalty to the international organisation. But one must respect a man who jeopardises his career for honest humanitarian reasons; and it has to be conceded that, however watertight Mr Hammarskjöld's precautions might be, the United Nations may some day change its procedures (and will some day change its secretary-general), while, on the other hand, police-state regimes tend to have elephantine memories, infinite patience, and inexorable vindictiveness.

UGANDA

Calmer Counsels

IT does not now look as if the resignation of two members of the Uganda Legislative Council will spark a crisis in the territory. It is true that the Buganda electoral college and the Busoga district council have refused immediately to elect successors. But Busoga has agreed to hold direct elections later this year, which means that one will automatically be elected then; while the obduracy of Buganda is not being carried as far as had at one time been supposed. Its other four members have not resigned.

The more demagogic of the two Uganda parties, the Uganda National Congress, has condemned this small show of non-co-operation on the sensible grounds that constitutional progress can only be achieved in the Uganda Legislature, not outside it; admittedly, its main motive in this statement is a desire to discredit the United Congress, which it regards as a breakaway and traditionalist body. Both organisations, nevertheless, have as their objective an increase in the number of African representative members, now 18 in a house of 60, all of which they want to be elected. Meanwhile the government has made some show of giving greater weight to African opinion in the Legislature by appointing a speaker to preside over the house in place of the Governor, by withdrawing the Resident for Buganda from it, and by adding three new backbench members, all Africans, two to vote in place of the governor (who had an ordinary and casting vote) and one in place of the Resident. These members will vote for the government on a confidence motion—but not necessarily at other times. When the Kabaka of Buganda makes his forthcoming brief private visit to Britain, polite efforts may be made to persuade him to look at Buganda's cantankerous attitude in a new perspective.

CO-OPERATIVES

Lost Impetus

". . . and the best shop to shop is the Co-op shop!" So sang Gracie Fields, long ago. Non-members of the co-operative movement, and probably the majority of members, generally get no further in the forming of an opinion than agreement or disagreement—variously qualified according to the goods they have in mind—with Gracie Fields. The wider co-operative ideal lost its momentum long ago; merged in Labour politics, nibbled by apathy, discouraged by the failure of many producers' co-operative ventures, it preserves what seems to the outsider to be an anæmic and inconspicuous existence.

The uphill job of keeping the co-operative dream—as distinct from the solidly prosperous co-operative trading organisation—alive and recognisable belongs to the Co-operative Union, which has just published a handbook on Co-operative Education.* The topics treated include technical training for employees; conferences, lectures, classes, informal study groups, and cultural activities, for members; the education of consumers as such; the Co-operative Youth Movement; and committee and secretarial procedure. There is much good practical sense in almost every chapter—though that on the youth movement affords glimpses into a decidedly weird underworld of cranks. There is nothing, however, which could not equally be found in the ordinary run of commercial "How To . . ." sub-literature, the circulars of a summer school of any denomination, or the house organ of a reasonably enlightened large firm. Significantly, the binding (though solid) is nasty, the printing dull, the layout ugly, the style undistinguished, and the illustrations abysmal.

And these last points surely underline the whole problem. Why the co-operative movement, while honourably avoiding both outright shoddiness and the production of anything in anyway deleterious, should provide so many examples of dowdy hideousness in display, packaging, print, and some of its other activities is a question not to be answered offhand by a reference to its notoriously sub-standard top salaries. It seems likelier that these are the outward and visible signs of an inward and spiritual fustiness. Among the British working class today the live-minded and the idealistic, the rebellious, the devoted, the unconventionally creative, the gifted in organisation and democratic leadership, have other and more attractive openings for their aspirations; to say nothing of the creaming-off process, ominous to the whole working class movement, which now recruits the brightest of each rising generation to the professional classes. Somewhere along the line, the co-operative channel has got silted up; its educational impetus, on the evidence of this book, is unlikely to be great enough to set the tide running again.

ARGENTINA

Shopping in Moscow

An Argentine economic mission is expected to leave this weekend for a round of visits in the Soviet Union and East Europe. The mission is armed with a credit balance of $30 million, the hope of additional loans and a long shopping list. The credit is a hangover from various trade agreements with the Soviet empire that fizzled out when General Perón was removed. But Buenos Aires is believed to have set its sights high. The republic's economic recovery hangs on increased energy supply, and one of the provisional government's most intractable problems has been to borrow the money to develop oil resources without compromising the state fuel and power monopoly.

A couple of months ago the Export-Import bank again refused to lend Argentina any more money, on the ground that its dollar balance was already too deeply in the red. But Argentina can only get straight by cutting its oil imports. The truth is that nationalised power concerns are as great an anathema to Washington as the suggestion of some kind of oil partnership is to Buenos Aires.

So President Aramburu has turned to Moscow. If he is successful several other Latin American republics may follow his lead, for although Brazil has been much luckier than Argentina in borrowing western money, it too maintains a state oil monopoly. Moscow is bound to welcome any such chance of establishing influence in the western hemisphere. But it may not be entirely fanciful to speculate whether the Soviet Union is not particularly interested in Argentina because of Argentina's proximity to Antarctica and its claims there.

SHORTER NOTE

Britain's appeal to Nato on the issue of support payments for the Rhine army has had a first limited success. The Nato council, considering a report from three independent experts which it appointed to examine the question, has decided that payments difficulties justify Britain "in appealing to her allies for help." The Council has not suggested how such help should be granted; bilateral negotiations with Germany, which will presumably be the main source of it, may still be arduous. But Nato has now given its support to the one really telling British argument in this dispute—the economic one. Perhaps its specific endorsement of the British case will make it possible to break away from the earlier arrangement whereby any help to Britain was automatically accompanied by a proportional help to France and America too—a link which inevitably made it more difficult for the Germans to make concessions.

FREER TRADE IN EUROPE

For those wishing to keep continuously informed of free trade and other developments in Europe we provide two subscription services:

*A four-page bulletin devoting each week a full page to European free trade developments:

WORLD BUSINESS SPOTLIGHT

*Our three-monthly reports on business conditions and prospects in the countries concerned grouped in *two new* REGIONAL SUBSCRIPTIONS at specially reduced rates:

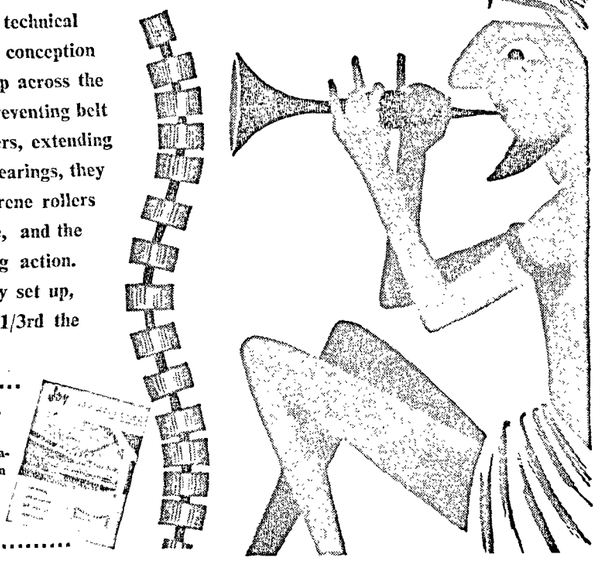
FLEXIBILITY *hath charms too...*



ESPECIALLY WHEN APPLIED TO CONVEYOR IDLERS

F-L-E-X-I-B-I-L-I-T-Y is but one of the unique technical advantages of JOY LIMBEROLLERS—the new conception in conveyor belt support. Exerting a cushioned grip across the full belt width—centralising the load on the belt—preventing belt slip, they give up to 10 times the life of steel idlers, extending belt life 20%. Suspended on two self-lubricating bearings, they need positively no maintenance. Multi-disc Neoprene rollers resist most corrosive chemicals, grease, oil and fire, and the disc flexion under load promotes a self cleaning action. JOY LIMBEROLLERS can be easily and speedily set up, knocked down and re-situated. They weigh but 1/3rd the weight of steel idler sets.

THE FULL STORY

Dimensions, technical specifications and drawings, installation recommendations . . . they're all in this JOY Booklet. Ask for Publication No. L 125.

A computer in my business?

Forward-looking concerns are now considering, 'What can a computer do—and at what cost?'

The computer is a tool of management. It provides the data necessary for more effective control. It produces selective information earlier, more accurately and less expensively than any other method. Structure and direction visibly improve—management can be increasingly more dynamic.

With proper planning, your objectives can be met efficiently and economically by a comparatively small computer. Hec General-Purpose Computers are small compared with some, but they will do the things you expect from a computer. And they do not involve heavy capital and operating costs.

Investigation into their use for you will provide invaluable experience in computer techniques—experience equally valuable if, later on, the growth of your needs calls for other types of Hec computers. Hollerith freely assists in every phase of such investigation and in training and installation.

Hollerith REGD

Education. In the past three years, hundreds of executives and their staffs have attended Hollerith electronics courses. These courses help to solve the problems involved in applying a computer to a business and are (subject to accepted bookings) open to anyone.

Hec Computers — Pathfinders of Industry
Hec computers are already serving many industries, ranging from railways to fine chemicals. Their applications are equally varied—from accounting to production control.

LETTERS

Food Prices

SIR—It is unfortunate that your inherent bias against the farmer has crept into your two recent articles on how to cut prices. In the second of these you compare the 1 per cent increase in food prices in the United States since 1951 with the 36 per cent increase in Britain. While generously not blaming agricultural producers "for all, or even most" of this difference you leave a strong impression on your readers that the prices that the British farmers receive are the main cause for high food prices. You apparently forget that food does not pass direct from the farmer to the table without intervening middlemen, all of whom perform services and take profits. You also seem to ignore the fact that little more than half of our food requirements are produced by British farmers, the rest coming from overseas. These two factors together mean that a reduction of 10 per cent in the price to the British farmer would mean a reduction of only 2½ per cent in the cost of food to the consumer—assuming that processors', wholesalers' and retailers' margins remained the same and the price of imported food did likewise.

In fact in the last four years the British farmer has received increases for his barley, sugar beet and fat cattle; but for commodities which to him are far more important, wheat, potatoes, milk, pigs and eggs, he is now receiving significantly less than he did four years ago. And for the most important single item, milk, in spite of rising production costs, the guaranteed price is virtually the same as four years ago, but because of higher production, the price actually received by the farmer is somewhat lower. It is also well to realise that in spite of an increased production of 10 per cent since 1951 farming profits have fallen from £349 million to £342 million. In terms of purchasing power this means a considerably larger decline.

I therefore suggest that anybody who is interested in reducing the cost of food to the consumer should not concentrate his attention solely on the home producer but should turn it especially to those who come between the producer and the consumer. A perusal of the accounts of many of the most important firms engaged in such businesses will show, in contrast to farm accounts, a very substantial rise in profits over the same period.—Yours faithfully,

Cambridge H. D. WALSTON

Luxury Cars

SIR—Your motoring correspondent states a startling theory when he tells us that "now that Rolls-Royce has fitted automatic transmission and power steering . . . its leadership is re-established."

Automatic transmission was introduced by General Motors in 1939 and had been in widespread use for about 14 years before Rolls started building it under licence. Following foreign rivals after a safe interval seems a quaint formula for re-establishing leadership.

What will be said when Rolls adopts air suspension, press-button window operation, six-way press-button seat adjustment, automatic headlamp dipping, wrap-around windscreens, air-conditioning, and self-tuning radio? Will your contributor find these refinements a further cause for unending satisfaction at the Rolls details? Most American models have some of these devices already, and the "regardless of expense" ones have them all.

Nearly all the advances in every department of motor-car design are at present being made in America, and while this is so, it is silly to talk of the finest car being built in Britain.—Yours faithfully, H. A. FIELDHOUSE

*London, W.*14

Arbitration

SIR—I am truly sorry that I unintentionally misrepresented Mr Einzig's case by omitting the words "tend to" from my summary. He did, of course, say that "in the absence of such compensation"—viz., an arbitrator's award of a money wage increase—"wages would tend to recover their former purchasing power through a decline in prices."

To the extent that the phrase is significant, however, it would seem to me that Mr Einzig's advice is invalidated. It was that arbitrators wishing to compensate a given fall in real wages are "in a position to restore real wages by deciding against the increase of money wages. Should they adopt this attitude the decline in real wages would prove to be purely temporary." To the extent that reduced demand only tends to reduce prices, however, real income will only tend to be restored, and arbitrators should take account of the difference by making a money award. This is not stated.

Mr Einzig criticises those instances of price rises which I suggested would not be cancelled out by price reductions even if wages were held. They were price increases due to the removal of subsidies; to higher import prices; to lower output in preference to lower prices; and to higher defence expenditure. Although I am diffident in tackling an acknowledged authority on his own ground, it seems that even on his own analysis there is a strong chance of a shift in real income from one section of the community to the others as substitution and supply/demand elasticities work out. In the fourth case he concedes that there would be no price reduction, but wage restraint would prevent an accentuation of the rise. Maybe so—but why should the burden of resisting that part of the inflationary pressure due to higher defence costs be centred on those whose income is subject to arbitration? This would be unjust and only discredit the system. In the other cases it seems equally improper and, in the long run, impracticable to use arbitrators to assist in adverse transfers of real income, no matter how disinflationary these may be.

Of course, I do not favour non-stop wage increases, yet I am suspicious of any proposal which looks like introducing a tighter or less sympathetic determination of wages in what remains in other respects a free economy. This is, I think, the position of most other active trade unionists. We do not like a free market economy much, but so many economists insist upon its virtues that we do not see why they should be denied to us alone. Many would consider some form of control of wages as part of a general plan, but not, as now, in order to cope with the consequences of unrestrained freedom in other spheres and Government financing.—Yours faithfully, JAMES TINN

Co. Durham

Veto Versified

Your own Correspondent has failed to take note
Of certain arrangements regarding the vote
To be taken whenever decisions are needed
Providing how crime can be safely impeded.
The Council's appointed to deal with the tangle,
But one of the members accomplished a wangle,
And gave its dependent a permanent seat.
Its rival protested, and, not to be beat,
Demanded that one of the members could foil
The plan for preventing to come to the boil
The trouble the criminal state should be making.
They called it the veto, and so it is taking
The power from the Council for most of the time.
Another great body may deal with a crime.
It's called the Assembly, and may recommend
Any state to behave, but that is the end.
Decisions are made, one vote to each state.
No effort is made with a view to equate
The number of people supporting the matter,
So twelve per cent carries the day with a clatter,
If measured by states, no matter how small.
So hampered these bodies have had a great fall,
And all the Queen's horses and all the Queen's men
Will be needed to set up our Uno again.

Birkenhead F. A. ROBINSON

BOOKS

Men and Machines

A History of Technology, Volume III: *From the Rennaissance to the Industrial Revolution, c. 1500-1750.*

Edited by Charles Singer, E. J. Holmyard, A. R. Hall and Trevor I. Williams. *Oxford University Press.* 766 pages. £8 8s.

THE volumes of the "History of Technology" continue to appear at a speed that is rare for works of collaborative scholarship, and their interest heightens as they approach modern times. The second volume covered two millennia in which technical gains were small; this one covers two and a half centuries in which technical progress became a distinguishing feature of European society. The editors do full justice to those branches of technology where no important advances were made—agricultural implements, for example, and town planning; and they do not neglect those achievements which were spectacular but fruitless—the fantastically figured fabrics or the massive exuberantly decorated wooden ships, the climax of a line of evolution without a future. But the technology of these centuries was made to be studied *sub specie futuri* and interest is naturally focused on those developments which led to the threshold of the Industrial Revolution.

Technology in this period owed curiously little to contemporary developments in scientific theory. Navigation and cartography, here ably discussed by Professor E. G. R. Taylor, were of course indebted to mathematics, and clocks were improved by analysis of the properties of the pendulum. But, in most fields, progress depended on the ingenuity of the craftsman, not the research of the scientist. Even the construction of bridges, ships and houses drew little upon contemporary mathematics, even when the architect was, like Wren, himself a scientist. Nor was war as powerful a stimulus to technology as one might expect from the enormous incentive to achieve the slight margin of superiority that wins battles. As Mr A. R. Hall shows in a brilliant chapter, gunners could make no effective use of the advances in the mathematics of ballistics because their weapons were so clumsily made. Engineering and chemistry were not revolutionised by the demands of war in the seventeenth century; it was warfare that was revolutionised in the nineteenth century by independent developments in technology.

But if the inspiration of science and war was so fitful, what was the impetus behind technical progress in this period? Why did invention push ahead in some fields and lie dormant in others? Why did the millwright lag so far behind the makers of watches and scientific instruments, and why was mechanical science more successful in exploring the heavens than in improving the earth? Among the many fine illustrations there is a diagram of Huygen's first pendulum clock, a mechanism of great complexity and precision, and a plate of an intricate and beautiful sixteenth-century gunner's level; placed alongside the clumsy, ponderous machines for crushing ore and raising water, one would suppose they belonged to an entirely different epoch of civilisation.

The editors, of design, have eschewed such questions. The forte of the volume is the description of processes and instruments. It is a more rewarding task for this period than for earlier or later times, for methods of operation no longer have to be inferred from archæological evidence—there are ample printed descriptions—but they are still simple and slow to change, so that the whole range of productive techniques can be made intelligible to the non-scientific layman. This work of description is magnificently done; almost without exception the writers expound the technical detail with authority and lucidity, whether they have had practical experience of the crafts they write about—for example, Mr Clapham on printing, and Mr Angus-Butterworth and Mr Charleston on glass-making—or are economic historians like Mr A. P. Usher, or historians of science like Mr Derek Price who contributes two admirable chapters on precision instruments.

What one misses in this feast of technological exposition is a systematic examination of the influences that determined the form and speed of development. Although most of these influences may themselves have been technical, in the sense that certain problems were riper for solution than others, some were economic. As Mr Hall says, "inventors have always been attracted by large markets," and it was the potential mass demand for cotton textiles that sustained the rapidity of invention in this industry. The nature of costs influenced the direction of technical improvement, as Mr Naish implies when, in an excellent chapter on ships and shipbuilding, he suggests that the rising cost of large crews was among the factors that enforced the abandonment of the galley in favour of the broadbeamed sailing ship. Yet other influences were social, and on the sociology of invention there is now a large literature, some of it in a form that can be used to illuminate technological change, for example, Mr Gilfillan's study of the ship.

The history of technology, if it is to be a history and not an encyclopædia, should surely take account of all these influences. Nowadays technology makes the pace; it speeds ahead under its own impulsions, and social and economic institutions adapt themselves as best they may. But in the centuries covered by this volume technology did not make its own history, and it needs a combined operation by technologists, economists and sociologists to trace to their source the springs of technical progress. Will not the editors in their next volume, which is to cover the Industrial Revolution, abandon their self-denying ordinance and give us analysis as well as description?

More About Bureaucracy

Central Administration in Britain

By W. J. M. Mackenzie and J. W. Grove. *Longmans.* 487 pages. 30s.

THIS is an exceptionally good addition to the flow of books about the civil service. The authors describe it, fairly but modestly, as "primarily a text-book, a systematic exposition of what is already known"; and they say that their object is descriptive rather than critical. The atmosphere, as may be gathered from this prospectus, is that of the Natural History Museum rather than of the Nature Reserve; but it is the present-day museum, not all skulls and skeletons, but with each fowl stuffed in a lifelike posture and posed against a fair representation of its natural habitat. It is extraordinarily comprehensive and exact; the few criticisms which the authors allow themselves are very sensible; and the style is admirable. It is not just a reference book; it can be read right through. The only detectable fault, in the ground that they cover, is that their treatment of finance is rather formal and could be improved.

There are only two criticisms that can be made of the book, and both stem from the title. First, a minor matter: it refers to "Britain," but is in fact almost entirely about England and Wales. That hardly matters, provided patriotic Scottish purchasers are warned. The other is much more serious. The authors claim to describe central administration, but in fact they describe the civil service. Apart from a short historical excursus and occasional side-references, departmental ministers appear briefly at page 191 as an appendage to a section on their private secretaries, and are then lost to view till page 334 where they reappear, collectivised, in a chapter on the Cabinet. It is the contemporary fashion to play civil servants up and ministers down, and this may be due to the number of academicians who served in the civil service during the war, when the machine was on top; but seldom have ministers been put so comprehensively in the sack.

This impression is enhanced by the arrangement of the book. The first part deals with the internal affairs of the civil service, with nothing omitted, right down to sick leave and provincial differentiation; the next with the organisation of departments (ministers practically ignored); then on to central control, including the Cabinet but also the Stationery Office; and only at the end does one come on the relations between the administration and Parliament, the courts and the public. It is rather like reading Hamlet the wrong way round without the Prince of Denmark.

In fact—let it be stated for the hundredth time—the most important man in any department is the minister, and his influence, if he is a strong one, reaches right through. The department exists to carry out his responsibilities in the way that he wants this done. In wartime things change, and the departmental minister loses importance as much as the war leader gains it; but in time of peace there is no such unity of purpose or leadership, and administration reverts to its proper place as a branch of politics.

The book is so good in all respects but this that one hopes that it will reach many editions; and in the process, perhaps, it will be turned inside out and the little button restored to the top. Meantime, it should certainly be read, but with this reservation. The jacket says that "the purpose of this book is to organise and present the available material in a way likely to be useful to second or third year students of political science and to working administrators at home and abroad." So far as the latter class of readers is concerned, who can supply their own political background, the authors succeed triumphantly; but the former may be a bit bemused by the trees and misled about the shape of the wood.

Perplexing Island

The Land of Look Behind. *A Study of Jamaica*

By Mona Macmillan. *Faber.* 224 pages. 21s.

MORE books have been written about the West Indies than is really good for them; a prospective visitor who searches the library shelves for information will arrive with hopelessly muddled advance impressions. Mrs Macmillan spent a year in Jamaica as the wife of a visiting professor, and she is not entirely to blame if her own impressions of that perplexing island are also muddled and contradictory. For, though the language is English and there are many English habits and traditions, these superficial similarities are probably more of a barrier than a help when it comes to trying to understand the people and what they are really doing. Mrs Macmillan obviously found the effort depressing, and the picture she gives is on the whole gloomy. Certainly Jamaica has its gloomy side, and the cricket and the calypsoes are in part a form of escapism from the realities of slums, poverty and depression. But it is not really quite so gloomy as Mrs Macmillan paints it.

One feels that the only real contacts she made were with the critical (but often very liberal-minded) whites of Kingston and the sugar estates. For the rest, she conscientiously visited the slums and the villages and genuinely tried to understand their problems, but her approach was that of a social worker coming to the people from outside; the result was that she was more alarmed by what she found than she need have been. Consequently she tends to underrate the considerable elements of vigour to be found among Jamaicans of most ages and groups. Kingston and the University College of the West Indies are the leading intellectual centre of the islands, but she gives this side of life little attention. Nor did she seem to notice the remarkable development of the periodical press, which plays a major part in the building up of a Jamaican (and Caribbean) cultural consciousness.

Kingston clearly did not accept her, but that was because she seems not to have accepted Kingston; she was too anxious to delve into the shady side without **really** comprehending it. Jamaica, like most of the Caribbean, is a place where one is forgiven for being white provided one loses one's white self-consciousness. This is what Mrs Macmillan failed to do, and this is why her book, though full of useful information, does not truly present an island which at one and the same time attracts the foreigner and drives the best of its own people away. For the really sad thing is that the vigorous elements are the most anxious to seek new lives elsewhere.

Towards a European Currency

Europe and the Money Muddle: *From Bilateralism to Near Convertibility 1947-56*

By Robert Triffin. *Yale University Press.* London: *Oxford University Press.* 351 pages. 40s.

AT a time when hopes of further European integration are high yet overshadowed by growing currency difficulties, Professor Triffin's study of Europe's monetary experience in the past twelve years is apposite. His book rambles over too much ground for comfort, but his theme is valid. It is that regional monetary co-operation, above all in Europe, has proved remarkably rewarding, prompting economic growth, freeing payments and trade in the area and in the end doing more to bring the western trading world to the threshold of a broader convertibility than the more ambitious attempts to rush the fence on a world wide basis. The star of the book is, quite properly, the European Payments Union, which provides so many revealing object lessons on how the real common interest of a group of countries in a free effective system of multilateral trade and payments can be canalised through wise institutional arrangements. The moral of the book is that, in a world where domestic policy brings pressures to bear on international payments which the nineteenth century never knew, virtual convertibility cannot be achieved merely by restoring international market mechanisms; it can come only through the further evolution of institutions like EPU and OEEC which, side-by-side with the working of the market, draw together separate national economic policies.

Not everyone will agree with Professor Triffin's historical analysis—his cheerful view of the dollar gap for instance. Its reopening since Suez has given the pessimists plenty of ammunition. But his picture of the enormous underlying improvement in Europe's dollar position since 1949 gets in proper perspective the relatively modest loss of reserves which the rest of the world has lately suffered. His long treatment of the evolution of European countries after the war towards greater monetary stability is also apt today; he brings out clearly the straightforward relation between domestic liquidity in each country and the balance of payments.

The main interest of Professor Triffin's book, however, lies in his suggestions for the future. It has long been clear that if the common market or the free trade area are realised, they will imply the evolution of something like a European currency. Professor Triffin expounds some of the stages by which this might occur. The first and vital stage would be to transform EPU into a European Clearing House, in which all central banks would be required to keep their European currency holdings, and perhaps a proportion of their other gold and exchange reserves too. Settlements in Europe would be made by the debiting and crediting of the central

Household Expenditure in 1953-54

Necessitated by the ever-changing pattern of family spending, the findings of this report will be of value to economists and others interested in patterns of expenditure of various types of household in different income groups.

The Measurement of Levels of Living

By C. A. MOSER

A sociological study of an international problem based on the author's findings during a nine-week visit to Jamaica in 1955. Detailed consideration is given to certain aspects of levels of living such as education, nutrition, health, housing, and, to a lesser degree, income and expenditure. Indexed.
13s. 6d. (*post* 5d.)

HMSO

from the Government Bookshops or through any bookseller

banks' accounts. The holding of common reserves would enormously strengthen European currencies against speculative movements, and increase effective international reserves in relation to the volume of trade. Later, Professor Triffin suggests, European currencies might be given reciprocal intercirculation privileges; exchange guarantees in terms of the EPU unit might be legalised. In time common rules governing currency issue and banking credit would be adopted, with central banks under the supervision of a European Monetary Authority.

When Professor Triffin was writing his book, one of his main worries about all this was the aloofness of the United Kingdom and the problem of linking sterling with such European schemes. Today Britain is seeking closer links with the rest of Europe with a new sincerity, while the pros and cons of maintaining the sterling area system are being much debated in this country. The encouraging feature of Professor Triffin's suggestions is that they confront Britain not with a choice between sterling and Europe but with a road which may allow the sterling area to evolve in a constructive new direction.

Border Book

Ulster and the Irish Republic

By William A. Carson.
Cleland. 57 pages. 3s.

THIS book is described on its dust-jacket as "a brief survey of Irish Republican propaganda and an exposure of its fallacies." The reader will know what to expect; and he will not be disappointed. It was possibly a mistake to let him know the purpose of the book before he could even open its pages; but Mr Carson is content to preach to the faithful and let the heretics go. He should not worry about that; most publications on the other side make the same mistake. An Irish reviewer may be pardoned some regret that those living north and south of the border should devote so much energy to slanging each other. The regret is tempered by the reflection that few people will read either side: the Irish border is not one of the great issues of humanity. The Republic, in spite of Mr Carson, is not really a badly run country: Lord Brookeborough, in spite of all that is said in College Green on Sunday evenings, is not a western version of Mr Kadar.

The shortcomings of the Republic are described in great detail and with a wealth of quotation, often from pietistic journals circulating in Dublin which one would not have expected to have been eagerly read in Belfast. These quotations from periodicals and speeches of public men might suggest that there is considerable liberty of thought and speech south of the border; but it is doubtful if that is the impression which the quotations are intended to convey. It is pretty certain that a Dublin propagandist would not find similar gems in the speeches of Ulster Unionists. This may prove that everything is perfect in the Six Counties; or it may be that no one can ever say anything there for fear of, not rocking, but sinking the boat. The Republic after all can and does change its government: the Six Counties have no such felicity.

This book will be so unsuccessful in Dublin that southern writers may at last realise that their publications are equally useless in Belfast. Their appeals to national unity ignore the number of truculent people living around Belfast who refuse to be run from Dublin—or, in certain circumstances, from London though Mr Carson naturally does not dwell on that. On his side, he argues from the premise of greater prosperity, which has always been irrelevant to Anglo-Irish issues, and ignores the fact that some parts of the Six Counties have voted so steadily to be let out that their case would have been considered long ago had they belonged to any European country other than the United Kingdom. This should be the border book to end all border books.

Rambles Round Australia

People for Australia

By A. Lodewyckx.
Melbourne: *Cheshire.* London: *Angus and Robertson.* 230 pages. 30s.

Reflections on Australian Foreign Policy

By F. W. Eggleston.
Melbourne: *Cheshire.* London: *Angus and Robertson.* 216 pages. 30s.

The Australian Commonwealth

By Brian Fitzpatrick.
Melbourne: *Cheshire.* London: *Angus and Robertson.* 337 pages. 30s.

THESE three books suggest the perhaps unfair generalisation that Australians are not yet good at writing broadbrow books about public affairs. They can write treatises, such as S. J. Butlin's "Foundations of the Australian Monetary System," but they do not seem to have mastered the art of the popular book about economics or politics, which argues forcefully and is written plainly. The common fault of these three is that they will not stick to the point: they ramble, they digresss, they quote unnecessary figures and authorities.

"People for Australia" is a passionate appeal for changes in the Australian attitude towards immigration from Europe and coloured countries, and also for a new approach towards intensive cultivation in the well-watered areas. There is a good argument to be put here, but to be effective it would need to attack Australian prejudices in terms of the structure of beliefs and attitudes which is characteristic of the country. Instead, Mr Ledewyckx maintains a ragged running fire against economists, demographers, geographers and others who have been pessimistic about Australia's carrying capacity: he quotes interminably, but he does not clinch his argument.

"Reflections on Australian Foreign Policy" is the posthumous work of a diplomat who served his country well, and wished to set down his thoughts when he was too old and ill for active work. It should not be judged too harshly. But it is a most disappointing book, ill-named, discursive, out of date and inconclusive.

The least worthy of the three, however, is "The Australian Commonwealth." Written in a style so involved as sometimes to be unintelligible, it is a parade of hobby-horses with no other connection than that they have all been ridden by the author. For those already acquainted with Australian life and history, it has moments of amusement, even of discovery; but these are forgotten in long periods of annoyance at the author's smug assurance that only he and his associates have shown any patriotism, altruism or understanding. On almost every page Mr Fitzpatrick deserts the opportunity to tell a straightforward story in order to ride one of his hobby-horses down a blind alley.

SHORTER NOTICE

Climate and Economic Development in the Tropics

By Douglas H. K. Lee.
Published for the Council on Foreign Relations by *Harper*, New York. 200 pages. *London: Oxford University Press, 28s.*

Professor Lee's book has been published under the auspices of the Council on Foreign Relations, an American "non-profit institution devoted to the study of international aspects of American political, economic, and strategic problems." Recognising that the United States "now occupies a critical position in relation to these less developed countries of the free world"—the underdeveloped tropics—the council has encouraged this study in human ecology, as an inquiry into why the tropics are underdeveloped and what factors are at work impeding progress. Uncle Sam needs the intellectual and learned equipment for shouldering his burden.

In different sections there is an analysis of the effects of climate on agriculture, animal production, human health and efficiency, and industry. Professor Lee breaks little new ground, and his book suffers from being alternately too specialised and too elementary, but it is valuable for its assembly of relevant statistics and other factual information, its formulation of practical problems that need investigation, and its cautiously hopeful outlook that the difficulties are not invincible, and that few climatic factors in the tropics are absolutely incapable of manipulation.

AMERICAN SURVEY

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Challenge to Congress

WASHINGTON, DC

As Congress formally re-assembled this week, there was much brave talk from Democratic Senators about taking over the lead from a waning Administration. But the truth of the matter is that the whole machinery of American government has got stuck and the chances of the Legislature re-starting it are not good. Congress is too divided in purpose to take the place of the President, the one unifying element in the American system. And no one expects very much any more from the direction of Mr Eisenhower. Unless his health gives way, however, he will be—to borrow a phrase—the best President the United States will have for another three long years. The challenge facing the Democrats who control Congress is how to offer constructive criticism, with all proper regard for party advantage, without at the same time adding to the present partial paralysis of the Administration.

The pattern of this session will obviously not be quite the same as last year's. Thanks to the Russian satellites, there will be no general drive for economy forcing the President to retreat, as he did in 1957, before an apparently spontaneous revolt against a big Budget. There is unlikely to be a domestic issue which generates so many intense feelings as did the Civil Rights Act of 1957. Since 1958 is a year in which all members of the House of Representatives and a third of the Senators have to face elections, at which they will want to boast of what they have done for the voters, it is unfortunate that many of the controversial issues clamouring for early attention are of more immediate interest to foreign governments. These include the extension of the Trade Agreements Act, which would otherwise expire on June 30th; American participation in the Organisation for Trade Co-operation; the completion of the endowment of the new foreign aid agency; the International Development Fund; and the amendment of the Atomic Energy Act to permit pooling of scientific information with America's allies. Of these, the last probably has the best chance of passing in reasonably satisfactory form.

America's humiliation over the satellites is apparently going to produce two main types of proposal: projects for the reorganisation of the Defence Department, to get quicker decisions and lessen inter-service rivalry; and plans for extending federal assistance to scientific education. Something on the lines of the Administration's scheme for federal scholarships and funds to match state expenditure on science teaching and aptitude tests in the schools, with more money for the National Science Foundation to spend on basic research, should have a fair chance of being enacted. On the other hand, if Senator Lyndon Johnson's preparedness subcommittee, which is continuing its searching investigation of the inadequacies of America's military posture, should endorse some of the more drastic proposals for structural reforms at the Defence Department, inter-service rivalry is certain to get worse before it gets any better. The Navy is already manœuvring itself into position to fight any moves, such as those just proposed in an unofficial report from the Rockefeller Fund, that would bring the services nearer to unification.

Next year's defence Budget is obviously going to be larger than the current year's, which itself will be raised by a supplementary appropriation. Partly on account of this, partly because revenue is falling short owing to the recession in business, it is now clear that there will be a small deficit this year. The new Budget for the fiscal year ending on June 30, 1959, will provide formally for a small surplus, but few expect it to materialise. Congress will be willing to go as far as the President considers necessary, and perhaps farther, in voting extra money for armaments. Because congressional committees have the power to reopen arguments between service advisers, on which the President and Secretary of Defence have already pronounced, it is in this sphere that Congress may come nearest to carrying out the Democrats' threat to usurp the role of the Administration.

MR DULLES'S foreign policy will certainly come in for a great deal of criticism, but it is not equally sure that this will be much to the point. The fact that Mr Dulles is now universally distrusted by friends, neutrals and foes abroad has become very widely understood. This even led that cold-blooded political manipulator, Mr Thomas Dewey, the former Governor of New York, to tell the President shortly before his last illness that Mr Dulles ought to be retired immediately. There are those who think this is likely to happen. But the weight of the evidence seems to be against them. As his health, energy and popularity decline, Mr Eisenhower is becoming increasingly dependent on the formidable technical resources of his Secretary of State.

After years of appeasing the neo-isolationist Republicans who were until recently his chief critics in Congress, Mr Dulles is finding it difficult to adjust himself to the appeasement of the internationalist Democrats who are now his principal worry. But the sorry fact is that even these Democrats are not really supplying the country with a debate on the great issues of foreign policy. Not one Senator of standing has the imagination or daring to raise such issues as those propounded by Mr George Kennan in his famous BBC lectures, not even Senator Humphrey of Minnesota, who is perhaps better equipped by talents and instincts to give a lead than any of his colleagues.

Only Mr Harold Stassen, of those in high places, seems disposed to challenge Mr Dulles's policy of not dealing with the Russians until the United States has regained a "position of strength" and the Russians have proved their good faith by "deeds not words." Mr Stassen, one of the

most original and creative members of the Administration, but a man unfortunately as mistrusted at home as Mr Dulles is abroad, has been shunted on one side in the development of the American position on disarmament, although he is still nominally responsible for it. He is now planning to bring his differences with Mr Dulles to a head, so that he may resign on an issue of principle. This might give him a good send-off in his effort to make a political comeback by being elected Governor of Pennsylvania. So politically discredited a figure is not, however, likely to make much of an impact on the public at this late date.

What is much more likely to happen is that, while Senator Fulbright and other Democrats on the Senate Foreign Relations Committee are abusing Mr Dulles for forfeiting the confidence of America's allies, other members of Congress will be stripping American policy of such imaginative and non-military features as it possesses. Nothing is more discouraging at the start of this new year than to note the number of prominent Senators and Representatives who are returning to the capital determined to find more money for missiles by cutting foreign economic aid. Perhaps the Vice President, Mr Nixon—his arm strengthened by the freshly released report from the State Department on the Russian economic offensives—can rouse the country to the need to counter the threat on this front as well. Perhaps Senator Lyndon Johnson, when he has completed his work with the preparedness subcommittee, will broaden his conception of the part which Congress should play in spurring on the Administration to do great deeds. But if nothing new is to be expected from the Administration this year, it must be confessed that on the eve of the session it does not seem very likely to emerge from Congress either.

Chief Trouble

For weeks all the American democratic processes have been working overtime to find out what ails the country's military system and to set up standards for judging the adequacy of the remedies which the President will be proposing in his State of the Union message while this issue of *The Economist* is in the press. But the only diagnosis which has actually been published, just in time to crystallise the arguments as Congress returns to Washington, is the Rockefeller Report, unofficial but prepared by a group of respected and well-informed experts. The group is particularly concerned lest the United States, by concentrating on new weapons, is losing the ability to fight a limited war, but it believes that shortcomings in preparations for both this type of war and for an all-out conflict can be overcome by strengthening allied co-operation; by a substantial increase in defence expenditure, of $3 billion a year for several years, an amount which the national economy can afford, according to the report; and by basic changes in defence organisation to correct the inefficiencies arising out of inter-service rivalry.

The report does not go so far as to advocate the complete amalgamation of the three services—Army, Navy and Air Force—which some believe to be essential in the age of missiles, but it does recommend a system which would in effect leave these services with no separate existence at the operational level and which would establish a chain of command running directly from the President to the commander in the field through the chairman of the Joint Chiefs of Staff. He would become the principal military adviser to the Secretary of Defence, an elevation over the Chiefs of Staff from the other branches which is now forbidden by law. Much of the evidence heard by Congress in recent weeks has pointed in a similar direction, including that of the Army's energetic egg-head, General Gavin, who has now resigned from the service in order that he may express his views freely.

Indeed, ever since the present defence organisation was set up in 1947, greater centralisation, some form of general staff, has been urged by many—among them General Eisenhower himself—as an essential development if the so-called unification of the armed forces is to become effective. But first reactions to the Rockefeller Report, cutting right across party lines, show that not even the sputnik has drowned the fears and prejudices which led originally to the present time-wasting and inefficient compromise which puts all three services on an equal and competitive basis. The most far-reaching objection to the Rockefeller proposals is that the concentration of so much power in one Chief of Staff would take the ultimate control out of civilian hands and make a dictatorship possible. So opens one of 1958's great debates.

What's Good for Ford

The Chevrolet division of General Motors will once more be able to claim, as it has for 21 years, that it is "first in production and sales." But the 1957 results show that the rival Ford was behind by only 132 cars in the big production race and, when the final figures for domestic retail sales and registrations come out next month, it may well prove to be ahead, by a bumper-length, in these more vital statistics. Factory sales—to which Chevrolet will refer—include exports. Inside America, Ford cars were out-selling Chevrolets, GM's low-priced entry, during the first eleven months of the year and, although the attractive new Chevrolet introduced this autumn stepped on the accelerator as 1957 closed, it was doubtful whether it could overtake Ford's lead. Even in production, Ford cars accounted for 31 per cent of the 1957 total, compared with 28.7 per cent in 1956, while GM fell from 52.7 to 46 per cent. The smallest of the big three, the Chrysler Corporation, showed the greatest burst of speed—an improvement over its own performance in 1956 of 40 per cent. It provided 20 per cent of the automobiles assembled, against 15 per cent in 1956. Of the two small independents, the American Motors Corporation owed an improvement to the popularity of its small Rambler, while the Studebaker-Packard Corporation, with only about 1 per cent of the market, seemed to be facing a year of do-or-die in 1958.

How Detroit divides the pie, however, is of less importance to economists than its size. Last year, for the fourth time, the industry turned out more than 6 million cars: 6,115,000, or 5 per cent more than in 1956. Now everyone who is trying to plumb the depths of the present recession will be watching anxiously for the return of the traditional spring upturn in sales. So far, Detroit is picking its way rather cautiously into 1958, tailoring its production to demand, which failed to respond vigorously to the introduction of the new models, and looking ahead rather ner-

Keeping water out in the rain

MASONRY WALLS made of brick, stone, or concrete have long stood the test of time. But today, they can be made even better with a coating of silicone water repellents. These amazing materials prevent damaging rainwater from entering the countless tiny pores or openings in masonry structures.

WHEN THE WATER FREEZES after penetrating, it can cause spalling—cracks off small pieces. And, if it seeps all the way through to the inside of a building, paint peels ... woodwork warps ... plaster stains and cracks.

NOW, SILICONE WATER REPELLENTS provide the answer. Brushed or sprayed on the surface, they line—not seal—the pores in masonry. Even heavy rain driven by hurricane winds cannot break through this invisible raincoat ... yet moisture from within can evaporate freely.

THE PEOPLE OF UNION CARBIDE produce silicones for other uses, too ... automobile and furniture polishes, lubricants, electrical insulation, and new rubber-like products ... all of which help bring more and better things for all of us.

vously to the negotiations with the Automobile Workers' Union for a new contract to take the place of the expiring five-year one. Mr Curtice, the president of General Motors, fears that the hesitation of purchasers to pay today's higher prices may mean that only 5.5 million of Detroit's cars will be sold to Americans this year compared with 5.8 million in 1957. Mr Henry Ford looks through rosier spectacles and sees a strong underlying demand, particularly from people who bought on hire purchase in 1955 and who have just finished paying off this debt. But he had a happier 1957 than Mr Curtice.

Khrushchev Pluvius

AFTER the intercontinental missile, the prospect of intercontinental siege by weather: Americans, with their quickened respect for Soviet science, have discovered another weapon which Mr Khrushchev may one day hold over their heads. An advisory committee set up by Congress four years ago to investigate the possibility of increasing rainfall by "seeding" clouds gave its final report to the President last week, and took the opportunity to repeat some of the recent warnings from other American scientists that in the future the United States might find itself flooded or parched at the whim of weather-makers in the Kremlin. But it is not yet clear how the Russians might influence the rainfall in America even if they wanted to.

Most of the known research into weather control has been concerned with fairly localised improvements designed to benefit the country concerned. The American advisory committee has confirmed that it is possible to increase rainfall in specific areas by a tenth or a fifth by seeding clouds (injecting them from above or below with silver iodide or particles of dry ice); this proportion is big enough to make the process an economic proposition. Another American project is looking into the mechanics of hurricanes, and there are hopes that they can be tempered or diverted from their course by bombarding them with silver iodide or by burning fuel oil in their path at sea. The Russians, for their part, are experimenting with a way of opening up frozen wastes to agriculture by coating them with a dark dust that would increase their intake of solar radiation.

However, the science is still in its infancy, and it is suspected that the present pattern of the world's weather

Code for Teen-agers

FROM A CORRESPONDENT IN OREGON

THE majority of American youngsters, who never see the inside of a police court, are fed up with the universal coupling of the words "juvenile" and "delinquency." They admit to being juvenile, but they resent the implication that all are subject to the aberrations of the few. Recently more than 400 boys and girls of high school age convened in the legislative chamber of the Oregon State Capitol at Salem to express this resentment constructively. Selected by their schoolmates as delegates to the first Oregon Youth Conference, they represented student bodies from all sections of the state and had come to Salem to debate a Teen-agers' Code, a detailed guide to upright living, drafted not by adults, but by the youngsters themselves. A Youth Planning Council Committee, composed of representatives of state-wide youth organisations, such as Hi-Y (the high school affiliate of the Young Men's Christian Association), had spent the past year drawing up the code.

The chairman of this committee, from a high school in Portland, also presided at the Salem meeting. But neither he nor the few adults in attendance restricted the discussion or influenced the decisions of the young delegates. Indeed, not many adults would have dared to suggest some of the stringent regulations with which the Oregon teen-agers unanimously bound themselves at the meeting.

Chaperones should always be in evidence at youngsters' parties, they resolved high-mindedly. To crash a party — to come uninvited — was branded as inexcusable. There is "no place in the well-ordered party," the code reads, for "lights out!" The delegates were equally austere in establishing standards for drinking, smoking, driving and dating. They went even further than the committee which had drafted the code, favouring more forceful state laws restricting the sale of tobacco and spirits to persons under eighteen years old.

The Salem conference added a citizenship section to the code.

> Young people should realise that they have a responsibility to the group of which they are a part.

The delegates also enlarged on the basic rule which serves as a preamble to the code. As drafted, the rule read as follows:

> Students and parents should inform each other of their whereabouts while away from home. Parents should know what their sons and daughters are doing and with whom they are spending their time, and also should know what time their young people return home.

The delegates at Salem, after discussion, added the following sentence:

> A proper attitude consisting of co-operation, respect and love should exist between parents and youth.

Then they went on to approve the code, which contains, among other things, the following guides to conduct for youngsters—and, in some cases, for their parents:

> Finances should be planned together (between parents and children).
>
> The home should be the centre of young people's social activity.
>
> The home should be offered and encouraged as a possible place for dating. Parents should co-operate by providing an agreeable measure of privacy. Public entertainment puts a strain on young people's finances.
>
> Parental consent for the driving privilege should be based on:
>
> (1) possession of a driver's licence,
> (2) young people's proof of ability to control themselves and the car,
> (3) a healthy attitude regarding the lives, rights and welfare of others.
>
> No one has the moral or legal right to serve any alcoholic beverages to other people's children.
>
> Young people should understand that it is not a disgrace to decline an alcoholic drink.

An adult reporter who covered the Salem gathering saw no potential delinquents in the young people who attended the conference, none of the slighted and friendless who turn to crime to attract attention. Those present conducted themselves gravely and decorously in the deliberative sessions and in the evening social hour that closed the conference. At the latter affair, the lights remained bright throughout the evening and there was no work at all for the chaperones. Some sceptical adults may consider on this evidence that the delegates to the conference are no more representative of American youth than are the delinquents. The proof of the pudding, for Oregon parents at least, will be in the practical application of the code, now prominently displayed on many kitchen bulletin boards in the state.

depends on a very delicate balance of natural forces—so delicate, indeed, that an erupting pimple of fire on the sun's surface may influence the course of hurricanes and that, according to one American physicist, the heat given out by automobile exhausts and factory chimneys may melt enough polar ice to raise the oceans by forty feet in the next half-century. But more rain in one part of the world may mean less in another, and changes in the Arctic or Antarctic might send floods round the world. In particular, any country that could alter significantly the amount of solar radiation absorbed by the earth—by the Soviet "dark dust" technique, or by modifying the sun's evaporative effect on the sea—might start a chain of events that would permanently affect atmospheric currents and ocean streams. Whether such processes could ever be controlled accurately enough to be used as a weapon is another matter; but American meteorologists who have visited the Soviet Union have been deeply impressed by the work and money their Russian colleagues are putting into the problems of the weather.

Missiles on the Line

FROM A SPECIAL CORRESPONDENT

PERHAPS the most significant sign of the acceleration of military effort which followed the simultaneous arrival in Washington of the sputniks and a new Secretary of Defence was the decision at the end of November that two intermediate range ballistic missiles, both capable of carrying a thermonuclear warhead 1,500 miles, should go into production immediately. Until then it had been intended that, after an orderly and leisurely testing of the Army's Jupiter and the Air Force's Thor, one would be chosen as the only IRBM to be produced in quantity. Evidently the latest trials of both of them had been unexpectedly—and conveniently—successful and had led the experts to believe that any remaining deficiencies would be corrected on the production line and would not involve redesigning the missile itself. But this does not explain why two weapons are being developed for one purpose. The answer lies more in the belief of responsible officials that competition spurs researchers to achieve the best results than in the rivalry between the Army and the Air Force for the right to have the IRBM; incidentally a third 1,500-mile missile, the Polaris, is under development by the Navy for use from submarines.

The propelling systems of both the Thor and Jupiter are the same—a Rocketdyne engine of about 165,000 pounds thrust, originally designed for the now abandoned Navaho missile; it also constitutes half the engine to be employed in the Atlas, the 5,000-mile intercontinental missile. Outwardly the Thor and the Jupiter are almost identical, the pictures showing only larger tail-flanges in the case of the former. The differences between them are largely in the nose-cone and in the method of guidance, the two other main elements in such missiles.

The nose-cone diffuses pressure waves to overcome superheating from air friction, and thus permits re-entry into the earth's atmosphere. There are variations in the bluntness, the material and the internal construction of nose-cones; two schools of design are represented in the Thor and the Jupiter and both work. The actual differences between these nose-cones are naturally secret; even more so are the differences between the systems of guidance of the two missiles, which are the very heart of these weapons. Both employ inertial (that is, pre-set) guidance. In addition to gyroscopic stabilizers to maintain the exact angle of fire, small gimbal-mounted rockets at the tail to assist the stabilizers, automatic cut-offs of fuel supply at the predetermined moment and the normal correctives of any major ballistic missile, there is presumably in both cases a control to correct direction. The difference between the two may lie in the frequency and thoroughness of these essential controls; perhaps it concerns the degree of complexity in the instrument, which determines the all-important degree of reliability. Insufficient precision might lead to a very bad miss of the target, while excessively delicate adjustment might make the whole thing less rugged and bring disaster of another kind.

A further difference is that the Thor, following the Air Force's usual theory, was designed within the private aircraft industry as the first of its type, so that the testing of all its components singly and in combination constitutes a large task. Jupiter, a child of Army artillery practice, has grown up in a military arsenal; the well-tested principles of the 50-mile Corporal missile of years ago were adapted to the larger, 300-mile, Redstone missile, these to the test-vehicle Jupiter C and these in turn to the 1,500-mile Jupiter. The Jupiter's Army friends insist that this means that its reliability is more fully assured than is that of the Thor.

The telling consideration behind the order for putting both missiles into production without further delay was, of course, the time-factor, the need to get some IRBMs to Europe by the end of this year, almost regardless of cost. Obviously two production lines can produce results faster than one. The Douglas Aircraft Company has now been working on the Thor for some time and is said to be able to produce two to four a month now and perhaps thirty a month by mid-year. The Chrysler Corporation, which has now, after some criticised delay, been given the contract for the Jupiter, already has a similar Redstone assembly line in operation, and is tooling up quickly for large-scale output of the new missile.

In the making of IRBMs there will not be the profusion which has been traditional in war production. The cost of a single such missile has been put at $2 million, although it might be reduced to as little as $500,000 by mass production. But a missile is designed for just one journey, not, like an aircraft, for many flights. Obviously, somewhat more quantitative restraint must be shown in producing them than there is in the making of 155 mm. shells.

Consumers' Balance Sheet

EVEN with the fall in earnings during the last months of 1957, the year's total for personal incomes after taxes is expected to be about 5 per cent above 1956 and to amount to roughly $300 billion. Consumers spent rather more of these incomes than in 1956 so that the proportion saved will be less than last year's 7 per cent. But, according to an estimate in the December issue of the *Survey of Current Business*, the net total added to savings was only just below last year's postwar record of $20 billion. About $11 billion went into savings accounts in banks, over $1 billion more than last year, but this was offset by a decrease in holdings of government savings bonds. People invested in corporate

Power to end poverty

Goodwill is not enough to abolish squalor. The power must also be there—the physical energy, plentiful and cheap, to knock down and rebuild, cleanse and re-create.

Nuclear energy gives the promise of such power. To Britain goes the credit for translating that promise into reality.

At Berkeley in Gloucestershire, the AEI-John Thompson Company is creating one of Britain's first nuclear power stations. Into that task has gone the skill of such mighty firms as BTH, Metropolitan-Vickers and John Thompson. Now the experience of this great consortium is at the service of the world.

TOTAL LIABILITIES	**$451,218,990.46**

stocks at the record annual rate of $11½ billion during the first half of 1957; although the volume of such investment is thought to have fallen off later, the final increase for the year is likely to be above 1956's $9 billion. The various forms of insurance also continued to increase during 1957, but not quite so fast as in 1956. This also applies to holdings of fixed assets, largely because of the difficulty of

borrowing money to buy houses as a result of the general shortage of credit.

On the other side of the balance sheet this shortage also meant that mortgage debt grew more slowly in 1957; the amount outstanding increased during the year by about $8½ billion, compared with $11 billion in 1956. The peak of expansion so far was in 1955 and this is true also of instalment borrowing; the amount of the latter outstanding expanded in that year by $6½ billion, while last year the total went up by only about $2½ billion. Hire purchasing of durable goods other than motor cars slowed down in 1957, reflecting a shift of consumers' interest to non-durable goods and services, not usually bought on the instalment plan. But more and more shops are setting up some form of revolving credit scheme, although these still account for less than 10 per cent of total instalment credit. Fewer people bought cars on credit in 1957 than in 1956, but the total of loans for this purpose went up because the cars bought were more expensive. Personal loans continued to expand steadily as they have done for some years. The December issue of the *Federal Reserve Bulletin* reports that roughly half the families in the United States are repaying instalments debts of some sort, with as much as 20 per cent of their incomes frequently being taken for this purpose. So far it is seldom suggested that this type of borrowing may have got out of hand, although in recent months it has been becoming more difficult to collect on these debts.

Season Ticket for Taxes

WITH more and more members of the middle classes moving out to the suburbs, the problem of the vanishing taxpayer, who enjoys the amenities and services provided by the big city but makes no contribution to them, has become increasingly serious for states and towns struggling with the high cost of government. Denver in Colorado, for example, needs money to balance its budget and to provide new schools and better city services; it has been hoping to find it by becoming the 41st city to adopt an income tax. But this would have fallen both on the 514,000 residents of Denver proper and on the 270,000 who live in the suburbs which are included in Metropolitan Denver. The suburban third had no vote, but protested so vigorously that Denverites turned the tax down, though by such a small margin that it may be adopted when the city finds a less inept Mayor.

Other complications arise when cities like New York and Boston draw workers from neighbouring states which are lucky enough to have escaped the income tax; there are seventeen in this condition of backward blessedness. Since 1919 New York State has firmly taxed the income earned inside its boundaries by residents of New Jersey and Connecticut; two years ago Massachusetts passed a similar law. The right to levy such "taxation without representation" has been upheld by the Supreme Court, but only if it is not discriminatory. The Governors of New Jersey and Connecticut are now reviving the complaint that the New York law does discriminate against 170,000 commuters, by not allowing them all the deductions which can be claimed by native New Yorkers. One study suggests that they pay 45 per cent more than similar taxpayers who live in New York.

The Governor of New York, Mr Harriman, has agreed to discuss the grievance, but he is not likely to be accommodating about a tax which brings in $26 million in a year when he may have to allow other taxes to rise. New Jersey and Rhode Island are seeking a constitutional amendment which would forbid states from casting their tax nets outside their own boundaries. But a constitutional amendment is at best a time-consuming remedy. The aggrieved states would be in a stronger position to reach a reciprocal arrangement if they had an income tax of their own. Stay-at-homes in those states, however, may well feel that this is too big a price to pay.

SHORTER NOTES

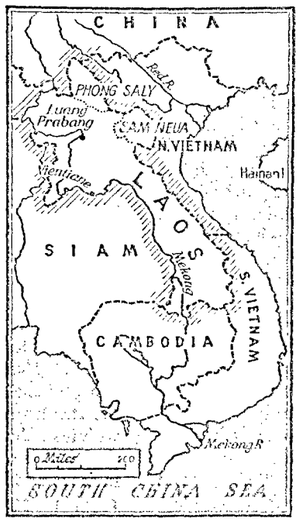
The new Civil Rights Commission, which Congress authorised last summer, was finally sworn in late last week after Mr Hannah, the president of Michigan State College, and a strong foe of racial discrimination, agreed to accept the chairmanship resigned by Justice Reed as incompatible with his judicial duties. The commission's job is to investigate denials of Negro rights and to recommend any changes in the law which it feels are needed. It has until September, 1959, to report, assuming that the careful balance of northern and southern members gets the commission over the preliminary hurdle of Senate confirmation.

* * *

New York last week became the first city in the country to extend its ban on racial discrimination in public housing to the much larger private sector. Both political parties thus recognised—in principle—that the growing Negro and Puerto Rican elements in the great melting pot have equal rights to shelter. But it will be a long time before this victory of principle brings the walls of the coloured ghettoes tumbling down in fact, even if the Courts reject the appeals of private property owners when the measure becomes law in April.

THE WORLD OVERSEAS

The Three Princes of Laos



FROM OUR CORRESPONDENT RECENTLY IN LAOS

IT is too soon yet to lay firm odds on the dangerous gamble of compromise which the three princely brothers of Laos, who once bitterly distrusted one another, have now decided to play in this "Land of a Million Elephants." Prince Petsarath, the eldest brother (67) and chief adviser to the ancient king, and Prince Souvanna Phouma (51), the perennial prime minister, are privately anti-communist but anxiously neutralist. Prince Souphanouvong (44), the renegade to communism and leader of the Pathet Lao (guerrilla "Free Lao" movement), has been allowed, since July, 1956, to act as spokesman for the Viet Minh Communists, who have armed and master-minded the Pathet Lao rebellion in the jungles of northern Laos. (All the indications suggest that Mao Tse-tung has been content to grant the Viet Minh full operational authority.)

There are those in Vientiane and Luang Prabang who deny that the urbane Prince Souphanouvong—a brilliant engineer trained and, it is said, snubbed at the Sorbonne—is a real communist; they say that he is under the influence of his wife, a communist party member, and that he is anti-French rather than pro-communist. However, he certainly would not have enjoyed the full support and enthusiastic endorsement of Hanoi throughout the negotiations unless he was at least serving communist ends efficiently.

No one knows why, after six years, the communists agreed to accept temporary and superficial peace in the two northern Laotian provinces of Sam Neua (or Houaphanh) and Phong Saly, which had become virtually part of communist North Vietnam. The Royalist government had no prospect of stamping out the jungle terrorism. Yet under the revised and stiffened terms of compromise submitted by the prime minister, Prince Souvanna, in October, Prince Souphanouvong agreed, almost eagerly, that his seven or eight thousand guerrillas would lay down their arms, swear allegiance to the king and return to their loyal communities. (Only an estimated 10 per cent live in Sam Neua and Phong Saly.) Two Pathet Lao battalions (1,500 men), selected by the communists, will actually be integrated into the Royal Laotian army. On their side, the former rebels will be allowed to form a "democratic" party (Neo Lao Haksat, or "National Patriotic Front"), and Prince Souphanouvong and his right-hand political adviser in the deadlocked jungle war, Phoumi Vongvichit, have joined the government.

Prince Petsarath and the prime minister insist that they can safely quarantine and sterilise the red poison which they are accepting into the Laotian bloodstream. Their tough and gallant army Chief of Staff, Colonel Ouan Rathikoun, who himself fought with the Pathet Lao as a sergeant against the French, reckons that it will take him two years to reindoctrinate all the guerrillas. He proposes to isolate his 1,500 communist recruits in a "training camp" for at least six months; his manner certainly conveys the impression that he will be no naïve or mild corrector of subversive tactics. Whether Petsarath and Souvanna will unflinchingly support his vigorous reindoctrination and brainwashing in reverse is perhaps not so certain.

The undefeated guerillas, who are now marching with their small arms, grenades and rice ration into the check-points in Sam Neua and Phong Saly, bear themselves like victors. Their morale is high—not to say cocky. Colonel Ouan claims that only three or four hundred are dangerous hard-core communists. The rebels with whom I was able to talk in the dust and heat of Sam Neua all parroted the party line. For example, they said that they had no objection to His Majesty King Sisavang Vong as a person or an institution "at present," but added that they would deal with him as seemed necessary, desirable or useful when they had taken over the government. They obviously believed that the gamble in integration had been a straightcut victory for their side. My western interpreter, who has lived in Laos for twenty years, said wryly: "These are not the easy-going Laotians I know; something horrible has happened to them; they are hard strangers." The hand-picked elements who will be accepted into the Royal Laotian army train regularly under arms, chanting communist songs; the observer suspects that even Colonel Ouan will not have an easy time with them.

Integration should officially be completed by the end of next week. There are still doubts whether all the guerrillas will come in. Certainly most of their heavy equipment is not being handed over, as pledged; it has either been returned to North Vietnam or buried in the jungle. Mountain tracks and approaches to waterholes are still littered with American mines, seized in Hanoi or at Dien Bien Phu. The guerrillas scattered them indiscriminately and women and children are still being maimed or killed. "They had better not try to send any of the guerrillas home through this village," one Royal Laotian paratrooper said to me; "the women would tear them leg from leg."

The vexed question of wasted and misused American aid to Laos is at present under searching examination. Inside Laos, American policy is now in wise, prudent and experienced hands—both diplomatic and economic. There are reports, which the American authorities on the spot cannot, of course, discuss, that Washington hopes to induce the Royal Laotian government to accept a bold scheme of monetary reform, which will end the multi-exchange-rate scandals. Under this proposal, the rotten and manipulated local *kip* would be converted into virtually hard currency, backed by the Laos government's own ample dollar holdings in New York ($24 million), stabilised at an exchange rate of perhaps 100 to the dollar (instead of the absurd official rate of 35 and the ruling black rate of around 85) and, on this sound basis, would become redeemable and freely convertible currency on world markets.

Prince Petsarath, an intelligent and subtle personality, who remained in voluntary exile in Siam long after his brother Souvanna returned to Laos and his other brother Souphanouvong went over to the Communists, declared frankly to me that his anti-communist influence would be weakened if American aid were reduced. It is reasonable to assume that he personally would support the proposed monetary reform.

The success of the risky but perhaps inevitable Laotian gamble must depend on dogged patience, as well as immediate firmness, by the two elder brothers. Laos is geographically and literally a wedge driven sharply through the heart of South-East Asia. If the Communists succeed in controlling this wedge by expanding infiltration instead of deadlocked and limited terrorism, the common frontiers of Burma, South Vietnam, Siam and Cambodia are all menaced. A reversal here for non-communist forces would threaten all South-East Asia. It is, one must report, too early yet to call the odds on the gamble; but, watching the confident and defiant guerrillas march in to "submit" to integration, while Radio Peking and Hanoi both applaud, it is easy to be pessimistic.

A German Miracle Man

FROM OUR BONN CORRESPONDENT

ALTHOUGH they will often gently chide loose reference to the "German miracle," west German economists and business men seem none the less to be just as often at a loss themselves for apter definition. Swallowing their initial pedantry, they will presently be heard compromising for convenience' sake with the "*so-called* miracle." The truth is, they do in fact still find something rather wondrous about it; all the more when they are members of firms long rich and powerful, contemplating the rise to rivalship of individuals whose resources ten years ago lay chiefly in themselves.

Granted that Rudolf Oetker, now owner of Germany's largest merchant fleet, inherited a lucrative blancmange and baking-powder business whose profits fattened during the lean years when housewives were desperately preoccupied with the conundrum of turning out meals. But Hermann Krages was an obscure timber merchant in 1948 when he began to engage in the speculations that have since made him a much-watched giant of the financial world; and the entrepreneur Willy Schlieker, now ruling shipping and industrial kingdoms on the Rhine and the Elbe, set out even less materially equipped to make his fortune.

Another of these individuals who, exploiting the unique opportunity for new beginnings afforded by defeat, have made wealth and a name at home and abroad within the space of a decade, has lately been expanding his empire still farther, to the astonishment of older hands engaged in the same game. The name is Grundig, and it has become as familiar in its particular commercial arena as the names of Telefunken, Siemens, and AEG. Before the war Max Grundig ran a modest, double-windowed radio shop at Fürth, near Nuremburg. Today, Herr Grundig at fifty is sole owner of Europe's largest radio factory and makes some 70 per cent of all the tape-recording machines in use throughout the world. He employs 20,000 workers. In 1958 he anticipates a turnover in the neighbourhood of DM500 million.

★

During the war Herr Grundig was detailed to turn out component parts for Wehrmacht signalling equipment for assembly by AEG. He was allotted some prisoners of war, who, grateful for decent treatment, protected his stores from looting in 1945. Those precious stores made a start of some sort possible. But at that time German industry was forbidden to manufacture such luxuries as radio sets. Grundig, well aware of the demand, hit upon the profitable idea of getting past the law by producing a make-it-yourself radio kit. Nominally a toy intended only for boys—he gave it the nursery name of "Heinzelmann"—Herr Grundig's box of parts provided the buyer with all the components of a working radio except the valves. It was left to daddy to get hold of the valves—which he invariably was able to do without much difficulty on the all-embracing black market. So hot was the demand that Grundig manufactured over 100,000 Heinzelmann kits during the few months left before the German radio industry was permitted to return to normal production. He ploughed all profits back into his expanding factory at Fürth. In 1948 he was in a position to bring out his first complete set, the *Weltklang*. By 1950 his 150 workers had become a thousand. By May, 1952, they had made between them a million apparatuses of one sort or another.

Today Herr Grundig's seven factories, which are all in Bavaria, are disgorging 120,000 apparatuses monthly, and total production has reached nearly five and a half million. Factory I at Fürth, which is the firm's general headquarters, manufactures radio and television sets and measuring instruments. Factories II and III at Nuremberg turn out tape-recording machines and dictaphones. Factories IV and V, at Georgensgmünd and Augsburg, make most of the wooden cabinets required by the other factories. Factory VI at Dachau specialises in portable radio sets and small cabinets. Factory VII, which was opened at Bayreuth last autumn, produces tape-recorders. (The Bayreuth site was chosen because there is labour still be found in that part of western Germany, particularly among women, from whom Grundig has always drawn as much as 70 per cent of his total labour force. Average wage for a five-day week is DM75.)

Apart from the singular chances of postwar upheaval, and his own assets of strong nerves and robust constitution, Herr Grundig attributes his success chiefly to his canny sense of what people want. He studies their requirements with elaborate care. This self-made millionaire still insists on opening all the firm's mail himself every morning. Many of the letters he reads from beginning to end; the remainder

he quickly tastes. While he is so engaged, from 8.30 to 10, no one may interrupt him. Later he makes up generously for this inviolate seclusion. He has laid it down that every one of his employees has the right to come and see him so long as the visit is relevant to the firm's business. And every evening of the week except Saturday and Sunday he holds council with his departmental chiefs. To help ease the atmosphere the conference is held at a round table laid with sandwiches, Bavarian beer, and Franconian wine. (Grundig is a Frank and proud of it.)

What of the future? Can Grundig keep it up in less miraculous times? He is sure he can and is making all the dispositions he deems necessary. He has lately bought controlling interests in the Triumph and Adler Works with the intention of switching them over from the production of bicycles to that of office machinery, including electric typewriters and adding machines. And, although he does not expect to increase output much farther, he is confident that the seven Grundig factories are going to be fully busy for several years to come. To keep abreast of competition Herr Grundig employs a staff of 250 on automation alone—for application both on the production lines and in the administrative offices. Five hundred scientists and technicians are engaged wholly on research—into colour television for instance, which is expected to be a commercial proposition in five years' time. A portable television set has just been perfected which is going into production this spring. Grundig's most highly paid research workers are giving their minds to problems of industrial television, involving the application of television to such ends as oil drilling and the measurement of metals during processing. As he has been from the start, Herr Grundig is very confident indeed.

Truce or Force in Malta?

FROM A CORRESPONDENT

Malta, Tuesday

YET another unsightly patch has been temporarily applied to hold together the fabric of Anglo-Maltese relationships. Since Mr Mintoff's Socialist administration was elected to office early in 1955, on a ticket of either "integration" or "self-determination," crisis has followed crisis. The island has never been so consistently in the headlines since the heroic days of World War Two. Mr Mintoff's "either-or" has been characteristic of his shotgun tactics ever since the 1949 ultimatum. In his handling of the latest showdown, involving the discharge of 130 dock workers, he has shown no sign that he is prepared to abandon these tactics in favour of a policy of give and take.

This unpalatable fact is perhaps the blackest cloud looming on the horizon of Anglo-Maltese relations. The Maltese parliament has unanimously resolved, at Mr Mintoff's bidding, to absolve Malta from its obligations to Britain and from those hitherto assumed towards its allies until "the British Government gives a guarantee that the number of their employees in Malta will not diminish before there is alternative employment for those discharged." Her Majesty's Government has given no such guarantee and the authority granted by the Malta parliament to Mr Mintoff still holds good. Mr Mintoff is thus armed with unanimous parliamentary authorisation, as well as with his electoral manifesto, to impose his own conditions or else.

This situation creates a constitutional curiosity in the Commonwealth, since Her Majesty's Maltese ministers are sworn to perform their constitutional duties, while at the same time making reservations that exonerate them from the responsibilities of office. The Colonial Office may prefer to test this bridge when it has to cross it. If so, Mr Mintoff is able to assure himself of one important tactical advantage. The bridge will have to be crossed if and when he decides—and if the Maltese premier is clumsy in his diplomacy, he is by no means a beginner as a tactician.

Mr Mintoff excels in producing unforeseeable situations. Unfortunately, foreseeable friction between Britain and Malta seems likely too. In his latest message to the Maltese prime minister Mr Lennox-Boyd divulged for the first time that Mr Mintoff was informed that he could not be provided with any more money this year. Mr Mintoff has done nothing to adjust his financial arrangements accordingly. During the last three years he has received a generous flow of financial and technical aid. Yet Anglo-Maltese relations have never been under the same persistent stresses and strains as in recent years. Mr Lennox-Boyd has not minced his words in indicating that the Maltese premier has not behaved in the spirit of the declaration of July, 1955.

The Colonial Secretary's two straightforward messages—one for the consumption of the Malta parliament, the second for the Maltese public at large—have succeeded in dispelling much of the artificial fog that was obscuring the Maltese industrial scene. The British Government's decision to stand firm, and to honour its "obligation of keeping the Maltese people informed," caused Maltese public opinion to stop and think and to harbour second thoughts on the recent trend of events. Mr Mintoff has been held responsible for the fact that the 130 discharges, over which so much has been said, were basically due to the Malta government's delay in agreeing to the installation of a Nato underground oil storage system. Dockyard workers have been assured that their own jobs are reasonably secure for the next three years. They have come to realise that much of the goodwill shown by Britain during the protracted integration talks over the last three years, is still unpublicised. They see the nationalist opposition apathetic and speechless in face of recent developments, and this is an added factor making for a possible split in the nationalist ranks.

These are all factors contributing towards a new political realignment; the shift of political forces is likely to be pronounced because it is realised that Maltese democracy will not be able to survive unless a stronger, more vocal and more aggressive opposition comes into being. Opinion on this matter has been growing harder for many months. On the other hand, Mr Mintoff's position is still formidable enough to make the Malta Labour party confident that it can dominate immediate developments. The foremost advantage enjoyed by Mr Mintoff is the fact that the British-owned local broadcast system (Rediffusion) does not allow any opposition views to be heard in Malta, and this under the agreement between the Maltese and British Governments. The second important fact is that the 18,000-strong general workers' union is a captive of the Labour party and in the past has repeatedly allowed trade union funds to be used for political purposes. Finally, there is a nagging fear that Mr Mintoff will, as in the past, resort to force to press his own views. The incident last year when he ordered government employees to damage Rediffusion property and to suspend the island's broadcasting system is by no means forgotten.

French Hopes of Solvency

FROM OUR PARIS CORRESPONDENT

THE first practical proof of the common market's existence, the first cut in tariffs, is due only next New Year. The capacity of France to balance its payments by that time is of critical importance for the European community. For this reason, M. Jean Monnet's prospects of success in his trip to Washington this weekend to negotiate a dollar loan to carry France over the next year are a European concern. At the moment the feeling is growing in Paris that, despite Algeria, the tide in the balance-of-payments crisis is probably turning. True, inflation continues. Industrial production, including housing, reached a new peak in November of 153 points (1953=100). The cost-of-living index went up by more than 2 per cent in the same month. The new year has begun with an increase in the national minimum wage and the announcements of higher fares on the railways and Métro and of higher prices for various foodstuffs. There is little doubt that prices must continue to rise till February or March on their present impetus.

Yet other symptoms are probably more telling. France's deficit in the EPU in December was the lowest since 1955 (17.6 million dollars). This has been obtained, of course, only by restricting all imports. But other signs confirm the trend. The franc, which at the end of the last government crisis had fallen as low as 507 to the dollar on the unofficial market, as against the official rate of 420, has risen again to 467. The labour market, perhaps the biggest single reflector of inflation, has relaxed considerably of recent weeks, partly as a result of heavy immigration (150,000 foreign workers, mostly Italian, came into France in 1957), partly as a result of the employers' belief that the boom is really ending. This in turn is linked with the investment cuts in the budget, which will particularly affect public works such as hydro-electric schemes. The budget, trimmed to the potential dollar and mark lenders' specifications, and passed by the Assembly on time—this is becoming a habit—reduces the deficit from 1,000 billion francs in 1957 to 600 billion francs, of smaller value, in 1958. To this must be added the credit restrictions applied by the Bank of France, especially on housing; though real building outputs should not fall, because contractors formerly wasted time and money taking on more sites than they could finish in order to get the initial credits for opening them. Further, inflationary spending has recently been fed largely by the faster turn-around of money, not by an increase in circulation. If, with returning confidence in the franc, the velocity of circulation falls, higher prices will produce a lack of liquid money which should itself be deflationary. The government forecast that production will rise 1 per cent or 2 per cent in 1958 really means that it will mildly decline from recent levels, as these, extended over a year, would produce an increase of 3 per cent or more.

It is also striking that the unions have not reacted as violently to higher prices as the traditions of French inflation, or the preliminary warning strikes of October, led your sedentary correspondent to believe. This marks an important change in French social psychology, and may well be linked not only to the end of certainty of over-full employment, but also to the desire to hold on to gains rather than risk trouble. Food prices in February, March and April (the critical months for vegetables) may well be decisive in settling whether France frees itself or not from the grip of inflation; they are the prices to which the French housewife is most sensitive. It is not, in any case, unreasonable of M. Gaillard to hope to curb inflation by the summer. That alone cannot solve the export problem; present plans provide for no more than a 5 per cent increase in exports, which may be hard enough to obtain with high French prices in a world recession, even a slight one.

France will therefore need the $400 or $500 million which are hoped for from the IMF and EPU. But it might be possible to relax some of the quotas before the beginning of next year, and then to take part, at least formally, in the first round of "customs disarmament" in the common market. "Formally," because the treaty itself permits the French to impose special import duties, up to 15 per cent, to "compensate" for the freeing of quotas; and those duties would cancel out the tariff cuts if not the quota relaxations. The French prospect for the first stage in the common market thus remains far from rosy; but the worst fears, that France would not only benefit from concessions but live apart in a kind of self-exclusion from the European context, may be proved wrong. The conditions attached to foreign aid will almost certainly be a spur to France to put its house in order. But the present efforts are also a sign of the first effects of the common market itself in making Frenchmen realise that political motives (which they appreciate) as well as economic ones (which they always tend to discount) make a healthy franc indispensable.

No Capital for Europe Yet

FROM OUR PARIS CORRESPONDENT

NO one will accuse Europe's industries of cartel-mindedness if they show half the competitive spirit in the common market that some of the foreign ministers of the Six have displayed in the scramble for the lucrative honour of housing Europe's "capital." The motives for concentrating all the communities, the old ECSC as well as the new common market and Euratom—a principle to which all six governments at least pay lip-service—are practical: ease of communication, and of consultation between communities. But above all they are political: the sponsors of European unity believe that together the communities will have magnetic force as presumptive ministries of tomorrow's federation, whereas separately they might fade into merely technocratic secretariats. But the motives of the Belgians and Luxemburgers seem to have been commercial. Rumour has it that the Belgian foreign minister, spurred to the pursuit of successes by the coming elections,

promised the Germans, and the Italians, and the Dutch, that he would support whatever candidate each might put up for president of the common market's executive commission, if each in turn backed the claim of Brussels to be the capital. The Belgians also seemed to have a gentleman's agreement with the Luxemburgers, to leave the Coal and Steel Community in the Grand Duchy. M. Bech, premier, foreign minister and minister for viticulture of Luxemburg, has vetoed any move to take the ECSC away, ignoring the commitment he undertook when the High Authority first went to Luxemburg. On the other hand, he was not willing to welcome all the communities, unless all his five partners insisted, for fear Luxemburg should be overrun "as a nation." The Italians generously offered four capitals, Milan, Turin, Monza and Stresa ; but they did not press the point. Since the ministers had to be unanimous, it is not surprising that they took refuge in a dilatory compromise, deciding to decide on the first of June after consulting the new, enlarged European Assembly, the presidents of the new Commissions, and even "town planners."

But one should not generalise too much from all this bazaar haggling. The ministers have balanced it by a good choice of men for the commissions both of the common market and of Euratom (over which the brilliant M. Louis Armand will preside). It is an event in itself that the French should readily accept a German as president of the common market commission—even if he is a man so closely associated with Community Europe as Professor Hallstein. Also, he will have at least three outstandingly able colleagues in the nine-man commission: the recently resigned Dutch agricultural minister, Mr Mansholt, the Belgian economic minister, M. Jean Rey, and the French ex-secretary-general of the OEEC, M. Robert Marjolin. This is important.

The Dutch, French, Germans and Italians did succeed, too, in getting a compromise that favours a single capital in principle. They have passed the buck for deciding the temporary location of the commission (until June 1st) to Professor Hallstein and M. Armand, who will almost certainly choose Luxemburg to keep the communities together. If M. Bech, as some people believe, is really anxious not to have all the communities in Luxemburg, he may by then be ready to compound for the departure of the ECSC ; if not, possession is nine points of the law.

New Zealand Tightens its Belt

FROM OUR CORRESPONDENT IN WELLINGTON

WHEN the Labour party, after eight years in opposition, returned to office in New Zealand on November 30th, it was already clear that something would have to be done to check the run on the country's overseas reserves. Already before the election these had been reduced to not much over £50 million ; and by December 18th when the last Reserve Bank summary was issued, they had been run down to £49 million, of which just under £34 million was either held in gold or invested in London sterling securities. Actually the run-down had been gathering momentum for nearly a year. At the end of 1956, reserves were down to just over £60 million : the year before they stood at nearly £76 million.

With a margin of barely £15 million with which to meet the continuing run and to provide for the country's requirements until payments for its exports begin to accumulate again in March, the new administration had no choice but to take drastic action; and it was unlikely to look for any alternative policy because the type of action indicated was one to which it was already predisposed. It reimposed import licensing from January 1st and reduced the intake of a number of major imports by percentages ranging from 25 for unassembled motor cars, to 50 for carpets and linoleum. Other imports considered to be in the luxury or non-essential classes were either deprived of an exchange allocation altogether, or placed in a category in which individual claims must be established on their merits. The new schedule makes few or no cuts at the moment in imports of necessary raw materials, essential clothing, foodstuffs and plant ; but it relies heavily on New Zealand industries to fill some of the gaps.

★

Mr Nash would not have been human, or a politician, if he had not pointed to the previous National government's responsibility for the situation. In an effort, no doubt, to regain some of its popularity before the elections, the National party cabinet allowed its already limp credit squeeze to be so far relaxed that apprehensive importers, intent on covering themselves against the effects of a change of government, were allowed to pile up orders to an unprecedented extent. The run on reserves was further aggravated by rumours of devaluation. But nothing effective had been done before the elections, either by the government or by the Reserve Bank, to check the trend. At the same time, Mr Nash does not explain how he proposes to try to reconcile the inflationary influences inherent in Labour's policy with strict import restrictions. One supplementary measure —price control—obviously cannot be avoided. But the new Labour administration may have learned some lessons from the unpopularity which its predilection for controls earned for it towards the end of its earlier tenure of office ; and in consequence it may tread circumspectly. It will be encouraged to do this by the knowledge that its present majority is only three and is likely to be reduced to two after the Clutha by-election on January 15th.

It is extremely unlikely that the decision to restore import controls, which, it is acknowledged, must affect British exporters heavily, is in any way dictated by feelings of resentment over Britain's inability or refusal to provide greater protection for New Zealand's exports. The plain fact is that the Labour decision was inescapable and that if the National party had been returned, it, too, would probably have had to do something similar.

No indication has been given whether the new controls are likely to be temporary, though a good case could be made for maintaining them only until the reserves are restored to the margin suggested by the 1955 Royal Commission on Monetary Affairs—six months' normal import requirements. The margin just now is considerably less than six weeks. Mr Nash will undoubtedly have this answer ready for Mr Macmillan when he comes. It will be a difficult answer for Mr Macmillan to counter, particularly as Mr Nash and his administration can with justice disclaim a good deal of the responsibility for a decision that makes it necessary to put the country, almost at the peak of prosperity, on short commons. Mr Nash is unlikely to forget that the inescapable facts have greatly strengthened his bargaining position in any future trade negotiations with Britain.

FAIR WEATHER FRIEND THAT NEVER FAILS

S. M. BAILEY, *1st Refrigeration Engineer Officer on board the* P & O *ship*, CHUSAN.

ABOVE there are people sleeping warmly under light covers. No great distance away a few couples are dancing in the cool to familiar music. Nearby the tinkle of ice in tall glasses is punctuating the melody of comfortable talk. Meanwhile, the subtle hum of ventilation goes unnoticed by all except a rapt man in a white duffle coat far below. To his ear it is a hymn of creation. For beneath his watchful gaze a beautiful climate is being born.

Who is this man? None other than S. M. Bailey, 1st Refrigeration Engineer Officer on board the P & O ship, CHUSAN . . . cold storage and air-conditioning expert . . . fair weather friend that never fails. Every second of every day his mighty refrigerated compressors supply refrigeration for 15 provision rooms, six cold storage chambers and the domestic plant . . . make ice for 6 bars and the galley cold services . . . provide air-conditioning for the 1st Class Dining Saloon and a large number of passenger cabins. In port or at sea his department never stops. And it's just as well—for refrigeration is indispensable to P & O ships *and* P & O *is a Commonwealth lifeline.*

Operating from 122 Leadenhall St., London, E.C.3, the Peninsular and Oriental Steam Navigation Company links Britain and Britons with the Mediterranean, Aden, Pakistan, India, Ceylon, Australia, Malaya and the Far East.

RONALD MORRISON & CO. LTD. EDINBURGH

Save money— make TAPER-LOCK your standard method of fixing to shafts

Use a TAPER-LOCK Bush and fix your pulley to its shaft in less than a minute. TAPER-LOCK Bushes are interchangeable too ; you can fit them to any diameter shaft. They cut out keywaying, save space and have no dangerous projections.

TAPER-LOCK Bushes are off-the-shelf stock at 19 Fenner Branches. Many Distributors at Home and overseas also stock them.

J. H. FENNER & CO. LTD. HULL

Branches at: Belfast, Birmingham, Bradford, Bristol, Burnley, Cardiff, Glasgow, Hull, Leeds, Leicester, Liverpool, London, Luton, Manchester, Middlesbrough, Newcastle-on-Tyne, Nottingham, Sheffield, Stoke-on-Trent.

LARGEST MAKERS OF V-BELT DRIVES IN THE COMMONWEALTH

The growth of an Idea

For many years Barclays Bank has been building up a structure unique in world banking, a structure based upon two distinct principles. The private banks which combined to form Barclays have provided the foundation for a system of Local Head Offices which lodges in the hands of local people a broad measure of the day-to-day control of affairs; while, ranged around the English bank, there has been developed a group of associated companies which provide in Scotland, in France, in the Mediterranean, in Africa, in Canada, and in the West Indies, a banking service comparable to that of the parent company. The Englishman doing business overseas may well find invaluable this direct representation in many countries; it is of course supplemented by a network of correspondent banks throughout the world.

The system of decentralisation through Local Head Offices is not confined to this country. Branch managers can deal with practically any banking question you put to them; but if they have to refer to higher authority most of them need go only to their Local Directors in Norwich or Nairobi, in Cardiff or Capetown, rather than to a remote Head office in London.

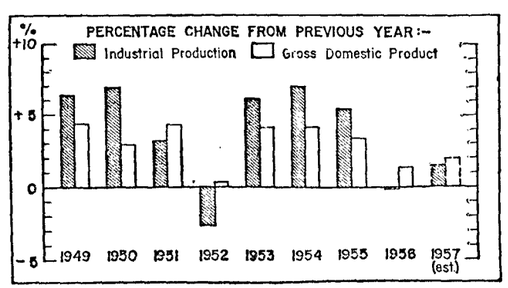
THE BUSINESS WORLD



PROSPECTS FOR 1958

While the Policy Lasts

Last September Mr Thorneycroft put sterling first: his successor is formally committed to do the same. It was argued in these columns last week that this commitment precludes any shift of policy that could be interpreted abroad as a weakening of that determination, unless and until signs of deflation in the world outside become plainer and much more generally recognised. Mr Thorneycroft, that is to say, could not have afforded to reflate home demand until foreign example might have made reflation thoroughly respectable. His departure lays upon Mr Heathcoat Amory the need for even greater regard for foreign confidence in sterling.

It is politically realistic as well as economically convenient, even now, to begin any appraisal of the economy's internal prospects for 1958 from the assumption that in principle, if not in precise mathematics, Mr Thorneycroft's policy must remain unchanged for the time being. Internally, its objective remains a stable price level: until signs of that stability become apparent—primarily in the price of labour—the policy will have passed no real test at all before searching foreign eyes. The mere time-table of wage negotiation means that success in this first trial could not be demonstrated—if success it turns out to be—much before Budget time: and even then the engineering wage claim cannot begin to be negotiated before May.

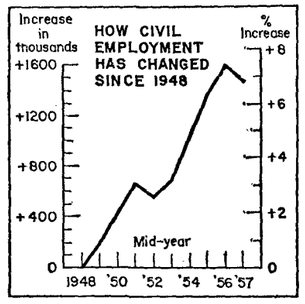
What economic prospects does the policy offer Britain during this short or long period of enforced restraint? Statistics, with their usual timelag, happen at the outset of this year to offer the forecaster practically no help at all: very few of them as yet cover periods recent enough for the tighter measures of mid-September to have worked through at all. The tightening of credit did not check hire-purchase business or demand for new cars: industrial production, which had already levelled off after its short rise in the early summer, showed no significant decline; unemployment turned upward, but fractionally. The trends in the economy from which one must extrapolate for 1958 were for the most part manifest before September 19, 1957: what happened then seems to have ensured their continuance, only more so.

These trends of autumn 1957 were: a levelling off in the high rate of fixed investment, and an expectation of some slight decline; a continued moderate rise in consumption, particularly of motoring and of durable goods, possibly slackening a little towards the end of the year; a slight reduction in current expenditure by public authorities, particularly as compared in the second half year with the high cost of Suez; higher exports of goods and services, but no longer rising as fast; and a high but again declining rate of addition to stocks and work in progress. In aggregate demand, over the year, these may have represented an increase of perhaps £450 million (at 1956 prices): with little change from the 1956 rate of surplus in the current balance of payments, the rise in internal

demand seems to have been met entirely from an increase of about 2 per cent in the country's gross domestic production. Industrial output did not increase so much—it was up about 1½ per cent—but non-industrial output (principally services) may have grown rather more. In recent years, the courses of industrial and total production have often diverged slightly: "non-goods production" is less volatile than industry but recently it has been equally in need of labour, and two years of disinflation have given its service trades more chance to expand their employment and output.

The tightening of the squeeze in September must be expected further to have decelerated the remaining growth in these major sectors of demand. Over the full year of 1958, one would expect consumption to rise very little if restraint continues. By the end of 1957, prices seem to have risen roughly enough to take up the margin of extra disposable income from pay increases conceded last spring and summer, and overtime earnings are already being thinned out somewhat. Rents have risen for a very large proportion of tenants; along with less secure expectations of steady increases in income, and following a year of rapid growth in hire purchase debt, there may come some slackening of the growth in spending on cars and other capital equipment for the family. Prices, however, should become more stable; any increase in wages and salaries this year will offer a less evanescent increase in purchasing power. As a rough figure, one might postulate an increase of only about £100-150 million—roughly one per cent—in consumption this year as a result of this policy.

THE private investment boom has clearly passed its peak in Britain, and house-building, private as well as public, seems certain to decline this year. One should not interpret the last Chancellor's "money ceiling" on total public investment (which was never fully explained) too cautiously: some adjustment was made for rises in prices up to September, and total state-controlled investment was probably somewhat below the nominal "ceiling" of £1,500 million at the time. Public investment in 1958, therefore, is likely to be roughly as large in real terms as it was in 1957 with a slight margin to take care of further rises in prices. But one must now accept private industry's own (pre-September) expectations of a decline in 1958. So investment must be expected to slip downwards: and over the year one might count upon some very slight decline—say rather more than one per cent, or about £50 million in demand—in total fixed investment during the next twelve months.



The "less than one per cent increase" in money terms in Government estimates for the next financial year, over which Mr Thorneycroft and his Treasury colleagues found it necessary to resign, suggests in real terms a somewhat greater cut in public authorities' current demands upon the economy than outside analysts might have guessed. During the past year the prices of the goods and services which public authorities buy has been rising: so that to secure the same volume of current demand upon the economy might have required an increase of, say, 2-3 per cent in money estimates based upon current price levels. Estimates less than one per cent higher, in money terms, imply a reduction of current public demand upon the economy in 1958 of, say, 1-2 per cent—say £50 million or rather more.

If reductions in home demand in 1958 could readily be offset by the diversion of the corresponding output into overseas markets, production might be maintained and the current surplus greatly increased, with substantial benefit to the reserves. But this year, as was argued last week, there are more indications of some fall in exports than of any significant rise. Import demand from the sterling area is already being cut down by reductions in several countries' current income from primary commodities. India's rate of import for its development programme will remain high, but "inessential imports" are being strictly limited, in view of the near exhaustion of its balances; other Commonwealth countries have far larger sterling balances, but for the immediate future less ambitious development plans. Expansion in Europe has slowed down enough already to reduce its demand for British imports. Exports to the United States, one of the brighter features of our trade in 1957, are high and may remain so even in a mild American recession, simply because the amounts concerned, for example of British cars, are hardly large enough for American producers to bother with. Canada, also, should take more of its exports from Britain in 1958; but its own economic prospects, while raw material prices and American demand remain depressed, are not favourable. The heavy fall in import prices, in any case, seems likely to improve Britain's current balance of payments in 1958: but some fall in exports of goods and services—perhaps £150-200 million in real terms—seems probable.

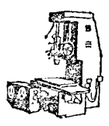
A SLACKENING in general demand throughout the economy probably implies some "involuntary stockbuilding" in 1957—the piling up of unsaleable finished goods and work in progress. Nevertheless, the cost of holding stocks has been sharply increased by higher interest rates; few people think that commodity prices have yet reached bottom; and there is every reason for caution in forward ordering. Moreover, the fragmentary indications available imply that there may have been a substantial net increase in stocks last year. There seems no logical reason to expect much further net accumulation of stocks in 1958 while restraint is maintained; and there are possibilities of quite substantial reductions. At the least the rate of stockbulding must be greatly reduced this year, by £150 million or so. But even a levelling off, or a minor reduction, in the heavy volume of stocks that overhangs the economy, as compared with the apparently substantial accumulation in 1957, could represent a really significant reduction in demand upon the economy—say £300-£400 million.

A full year of continued restraint, on this analysis, might mean a net reduction in demand of, say, £150 million in real terms from consumption, fixed investment, government current expenditure and exports combined; added to which, a halt in the net accumulation of stocks and work in progress could reduce aggregate demand in the British economy in 1958 by twice as much again. The result could be a fall of £250-£550 million in demand upon the country's productive resources: allowing for the assumed fall in imports, this might mean a reduction of about one or two per cent in the total national output and of about 2-3 per cent in industrial production, where the cuts would mainly be felt.

Such a decline in output could eventually mean a reduction of about a quarter of a million in civil employment, which was already steadily running throughout 1957 about 100,000 people lower than in 1956. How many of the no longer employed would show up on the unemployment registers is hard to guess, since these have not recently reflected the full reduction in the working force: but the proportion of the labour force unemployed might go up from its present 1½ per cent to more than 2 per cent. Demand for labour in general would have softened considerably—though it would take far more deflation than this to soften demand for skilled men and technologists. What would be more important to most wage-earners might be very substantial reductions in overtime earnings in many industries.

THESE prospects are hardly those of general inflation, with demand outrunning the nation's capacity to supply it. But the disinflationary influences of the past two years, reducing output below what could be achieved from expanding capacity and employment below the 1955-56 levels, but not significantly increasing unemployment, have not been sufficient to check the ordinary recognition signals of inflation—rising prices. Wages have continued to rise; manufacturers have found it possible to increase prices for their branded goods although their demand, and of late the prices of their raw materials, have been falling. Restrictive practices have been strongly in evidence on both sides of industry: the unions have been able to impose featherbedding and under-employment, while industrialists have ironically used what is as yet the only tangible result of a new act aimed against restrictive practices to strengthen their individual legal sanctions against anyone willing to cut the prices of their products. To check these rises in price is the internal aim of the Government's tighter policy: until it appears to be working, foreign distrust of Britain's chronically inflationary economy can hardly be allayed.

It is still possible to hope that this year's wage awards need give away practically nothing at all: there is little chance that the increases will be more than 2-3 per cent. If so, it should be possible to present this abroad as the moderate success which it undoubtedly would represent for the policy Mr Thorneycroft laid down. There seems little danger, at any rate, of the 5 per cent standard of wage increases that would spell defeat for the policy; and in two to three months' time this first obstacle in checking rises in internal prices may demonstrably have been surmounted.



Circumstances in the world economy, as well as the effectiveness of restraints within Britain, will then determine whether a British Chancellor will be able to afford next April to inject some moderate stimulant into internal demand without forfeiting foreign confidence in sterling. It ought not to be considered a disreputable objective, for example, to hold production level in Britain, rather than to squeeze it down. It seems very doubtful whether the early reduction in Bank rate that is being counselled in various quarters would be expedient or wise: if the new Chancellor finds in three months' time that he is justified in a little reflation, it would be best done through the budget. Some stimulus to private investment decisions in late 1958 and in 1959—perhaps through investment allowances, which have a fiscal time-lag built in that might be ideal for the uncertain circumstances of 1958—would be the first claimant. Any stimulus to consumption might best be given in the lower half of the direct tax range.

But no very large relaxation in the ruling policy is likely or can be afforded while sterling retains so little underlying foreign confidence and is supported by so slender a reserve—unless world deflation should patently be spreading outward from a deeper and longer American recession than most economists have yet any firm reasons to fear. Nor is that, indeed, likely to become apparent before midsummer. Whatever could be afforded in the budget might begin to edge consumption up in the second half of this year. It could not significantly affect private investment, or for that matter public, before 1959. There is comparatively little that the Government could do to influence exports; nor to moderate any run on stocks (though it might stop embarrassing disposals from its own stocks of strategic materials). Certainly it cannot this year afford to increase its own demands upon the economy. Another year of fairly level production seems about the best hope one can make out for the British economy—provided the foreigner is prepared to allow us that modest aim.

The Industrial Prospect

Crystal-gazing about the course of demand in the economy is inevitably done in general terms: but it affects particular industries. How can Britain's key industries be expected to fare in 1958?

OVERLOADING of the metal-using industries has been a recurrent feature of Britain's postwar inflation; anxiety about the load upon these **engineering** industries, particularly those producing plant and machinery, is now a recurrent concern in the Treasury. In practice, during the recent investment boom these machinery producers have managed an impressive increase in output—roughly 20 per cent since 1954—thus providing for a substantial increase in exports as well as for the wave of industrial investment at home. This was achieved after years of comparatively low investment in their own industries: but capacity for manufacturing capital equipment can to a considerable extent be "shared" by extensive subcontracting, and not all the producers of industrial machinery have been busy at quite the same time. This year, their order books are well below the level that frightened Whitehall in early 1956; their output which may have risen 2-3 per cent in 1957 is still high; demand upon them seems certain to decline further during next year, and their deliveries may run down somewhat.

Home investment has been taking about 30 per cent of the output of all the metal-using industries, and exports roughly the same proportion. Cars and durable equipment for consumers account for no more than 10 per cent of these industries' final output (though perhaps for a substantial proportion of the intermediate engineering products used inside the industry); defence, after the latest round of cuts, may account for even less. The prospect of a year in which total investment slips a little and industrial investment rather more; in which exports probably fall too; and in which defence demand continues to decline somewhat, suggests that the metal-using industries as a whole might be down by 2-3 per cent, in line with industry as a whole, even if some expansion in consumer demand for metal goods goes on.

The main element of increase in this engineering field last year was the remarkable resilience of the motor industry: no sector seems likely to manage such a dramatic individual increase during 1958, though motors are hopeful of some further increase.

APART from engineering, the main supplier of investment goods in the economy is **building and constructional engineering**: towards the close of an investment boom, one would expect construction to be declining rather in advance of the supply of equipment, and this industry's activity had already turned downward before the end of 1957. Public money pays for just over half of all new building work: so the Government's stated intention to keep public investment expenditures to the same level for the next two years may indeed offer the building industry extra work on other public investment, such as the roads programme, railways, hospitals, schools, and water and sewerage to offset part of the £30 million reduction in public housebuilding. But private spending on new construction, on the other hand, seems certain to turn downward. Fewer private houses will be built; together with the smaller local authority programme this will probably mean about 275,000 houses against 300,000 in 1957. Industrial building will also decline. But private expenditure on other forms of new buildings, which accounts for about a quarter of all new private construction, has been growing rapidly: thus spending rose by a sixth in 1957, and may still rise a little this year.

Altogether, then, total spending on new construction seems likely to show a small downward trend in 1958, in real terms. Repairs and maintenance expenditures may also drop further, though whether the Rent Act is going to lead to any significant increase in house repairs is uncertain and maintenance of industrial buildings is a postponeable item in times of tight money.

The recession that builders have been confidently predicting for their industry for the last couple of years may actually occur in 1958. Last year, though the full year's figures are not yet out, building output probably increased further by about 4 per cent in value and up to one per cent in volume. This year the prospect is of some slight decline in volume and possibly of levelling out of the total value of output as well.

THE **motor** industry has rebounded strongly out of the pit of its recession twelve months ago. 1957 opened gloomily with petrol rationing cutting further a home market already severely damped down by the Government's fiscal measures, and overseas shipments hampered by the closure of the Suez Canal and by the general shortage of shipping. By the end of the year, however, all parts of the industry, even including commercial vehicles, were running with throttle wide open (though still short of full capacity). Car output probably reached 850,000 (against 707,600 in 1956), commercial vehicle production totalled 275,000-280,000 (against 287,300), and wheeled tractor output was up to a record 145,000-150,000 (against 108,500).

This year vehicle production should rise a little further. Car output should top 900,000, just beating the 1955 total, even though manufacturers now have the capacity to produce more than a million cars. They will have a full spring selling season at home this year, unclouded by anxieties about petrol supplies, but while they can probably count on no change up or down in purchase tax and hire purchase controls, there is unlikely to be any more money to spend on new cars, particularly by business which is still a large customer. Exports should top last year's record 400,000; the growth of American sales (now easily the largest overseas market) should continue under the impetus of the wider distribution systems of Ford and Vauxhall. Elsewhere exports may not show much change, except in Australia and New Zealand and other Commonwealth primary producers where sales will be lower.

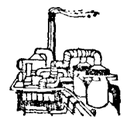
For vans and lorries, 1958 may also bring slightly larger sales, perhaps up to 300,000. Exports are not likely to be any easier to achieve nor are hauliers and industry likely to spend much more at home, though they may have to make up long-postponed replacement programmes. With three new models in production, tractor sales should be higher, though this year's gains will be smaller than last year's. The fall in farm commodity prices is bound to have an effect on overseas sales outside Europe: British and European farmers also may become choosier about tractor replacement. If all three sections of the vehicle industry are able to produce between them in 1958 as many vehicles as they did in 1955—1,360,000—they will have done well.

NO British industry has yet been prepared to discuss economic prospects for 1958 more coldbloodedly than the producers of **steel**—who are uncomfortably conscious that a steel sword weighing over 4 million tons hangs above their production estimates. British steel customers and merchants have that much steel in stock; as yet they have shown no signs of running it down. But if consumers should begin to cut stocks, they could cut the industry's planned production by three-quarters of a million ingot tons quite rapidly, bringing about a 5 per cent fall in home deliveries from the record level of 1957.

Even if they do not, the industry does not hope to sell much more steel than the 21.6 million ingot tons it sold in 1957—perhaps a little over 22 million tons. Demand from the motor industry may go on increasing, necessitating imports of steel sheet; extra plate for shipbuilders to make no more ships out of will continue to be in demand. But other steel for investment goods will become less easy to sell; and the already softer export market will offer the industry less fat to live on from the export premiums it has been earning in recent years.

Capacity in this industry continued to grow during the period of reduced consumption in early 1957, and is still growing this year; it will not all be fully used. The practical output next year could be 23½ million ingot tons; but the demand might be for little more than 21 million ingot tons. These are not the easiest commercial circumstances in which to go on investing about £100-120 million a year or to raise the money, as steelmakers are discovering.

IF the **coalmining** industry were free to tell the country, "We will supply all the coal you can use this year and next winter, and sell what we can abroad, but we can't afford to produce coal for stock. Don't complain about our output unless you're prepared to buy more," it would be in its healthiest commercial situation since nationalisation. In 1958, it is about 3 million tons of large coal—plus a large pile of politics—short of this freedom. The extra 6 million tons of coal it put in stock during 1957, when home consumption fell by 5 million tons, does not include enough of its scarcest resource—large coal.



The Coal Board enters 1958 with absenteeism markedly higher than before it abandoned the attendance condition upon payment of the weekly bonus; production after June last year, when that concession was given, was in disappointing contrast to its "best-ever" performance in the first five months of 1957. Final output was, this year, 223,640,000 tons, with 210,060,000 tons of it from the mines: this deepmined production was virtually unchanged from 1956. Sir James Bowman hopes mined output in 1958 may reach 212-214 million tons.

But for the first time in twenty years, coal output is beginning to depend somewhat upon the course of demand, at any rate for qualities of output; the board is certainly no longer interested in getting the last possible ton of unsaleable coal out of the highest-cost mine. Last year's fall in demand, it thinks, was due more to warm weather than to continued stagnation in industrial output; so a decline in industrial output and demand for industrial coal this year could still leave total demand unaltered even if the weather turns round.

CERTAIN general **chemicals** such as sulphuric acid generally follow the general level of industrial activity: chemical production as a whole does not, and since the war has expanded much more than the rest of industry. Exports can exert an influence quite separate from the course of home demand; and some parts of the industry, buoyed up by their own inherent growth, have continued to expand regardless of what may be happening in other chemicals. Both of these other influences were at work last year. Overseas sales were up by about 8 per cent over the year as a whole and petroleum chemicals production was stepped up further to meet the still growing demand for plastics materials, some of the man-made fibres, and other products. As a result production of chemicals rose further while total industrial output only just topped the 1956 level.

The second half of 1957, however, saw a marked slackening in both exports and total chemical production, and the guess of the industry is that the growth in its overseas sales will continue to slow down in 1958. The bulk of its shipments go to the Commonwealth and other countries in Africa and Asia that are not likely to import much more than in 1957. The petroleum chemicals side is also likely to expand less rapidly this year; plastics output, which appeared likely to top 400,000 tons for the first time in 1957, will feel the pinch of slackening industrial and personal spending during the present year. So 1958 may bring chemical output rather more into line with the rest of industrial activity. The small rise expected in the output of metal users and motors and the drop in building will affect sales of solvents and paints. The further decline in textiles will likewise mean a softening of demand for dyestuffs and, possibly, for most man-made fibres. Pharmaceuticals will be cut if the Health Service estimates are down, and if the farmers suffer any drop in their incomes fertiliser demand may also be down. The heavier inorganic chemicals have already weakened with the slip in industrial activity towards the end of 1957.

ALL the major industries that serve the consumer directly had a share of extra spending early in 1957; roughly the same seems likely to happen to any increase in 1958. Moreover, there seems less prospect this year that extra income will quickly be eroded by increases in prices. Any further slight fall in food prices may mean more to spend on food and other items, but higher housing expenditures (rents, primarily) and no doubt increased fuel and light charges will pre-empt some of this extra spending.

The boom in consumer durables, which has more than made good ground lost in 1956, is bound to slacken off soon, as the total of hire purchase debt mounts up. Sales should still go on rising, but probably much less rampantly, and as exports, which are still lower than in 1955, are unlikely to be any easier than last year, production is not likely to climb markedly. Over a sizeable number of items of durable equipment—cookers, washing machines, and vacuum cleaners—output is still below 1955 levels. Should the new Chancellor decide to relax restraint somewhat on consumer demand later in the year, these industries might be among those that gain.

The food trades can at least be assured that their total market is unlikely to decline—in volume. But any significant drop in overtime earnings or increase in unemployment may lead to the cutting out of some of the frills and the housewife being rather more discriminating about the more expensive foods. Both drink and tobacco, even at present prices, always seem to get a share of any extra money that is going. Beer sales are still rising steadily and tobacco sales have now got over their budget palpitations of two years ago. About clothing, in another year of standstill, it is harder to guess; spending at home may show some slight increase, but textile production, with a difficult year for exports, is hardly likely to grow.

BUSINESS NOTES

IN THE MARKETS

Assessing the Changes

JUDGED by market prices the City's first reactions to the clean sweep at the Treasury appear to be small. But that is not because the financial community has failed to realise that something that may be most important has occurred. It is rather that City opinion is sharply divided into two schools of roughly equal weight. In the acid test of prices sterling took a sharp dip and recovered; gilt edged stocks took a small fall and rallied, and so did industrial shares. On balance over the week ended on Wednesday *The Economist* indicator is slightly up at 176.5 against 175.9, though the *Financial Times* industrial index shows a small move in the opposite direction, from 165.6 to 165.2. The *Financial Times* index of Government stocks has on balance risen from 79.40 to 79.65, though more than the whole of that rise occurred before the event. On the dip in gilt-edged that occurred on Tuesday morning jobbers were able to pick up some cheap stock and were glad to adjust their books after a prolonged rise.

One City view, held widely by those who are chiefly concerned with gilt edged, is that the departure of the firm hand at the Treasury is a most unhappy event, that it must react badly abroad, and that it reveals a difference of emphasis in policy that must have been running for some time between Mr Thorneycroft and his colleagues. On that view, if a widespread loss of confidence is to be avoided it will be necessary for the City end of the control system to lean over backwards to show no sign of weakness, so that 7 per cent Bank rate is likely to last longer. The other view, more prevalent on the industrial side of the market and among those specialising in new issues, seems to be that the differences between Mr Thorneycroft and his colleagues were marginal, and that with quite minor modifications it should be possible to settle for the policy without the Chancellor. Events will show which school is right.

£500 Million Exchequer Issue

CALCULATIONS that the Government's next funding operation could not be delayed for long after the Government broker had run out of his supply of Conversion 4½ per cent stock (1962) have proved correct. The issue was announced on Thursday of £500 million 5½ per cent Exchequer Stock 1966 at 99½. Lists open and close next Tuesday; payment in full is required on application and the first interest coupon of 13s. 1d. per cent will be paid on March 15th. The news was well received in the gilt-edged market which judged the terms well adjusted to the present level of prices. Exact comparison is difficult as there is not another "short" with a coupon as high as 5½ per cent. The running yield of £5 10s. 9d. per cent and the redemption yield to the single date of £5 11s. 6d. per cent ought to prove attractive.

The purpose of the operation, which was clearly planned sometime before the changes at the Exchequer, is threefold. The Government broker's shelves will be replenished, for nothing like the whole of the £500 million will be taken outside the departments. The banks, it is hoped, may also find the new stock attractive. And at the best it might be that some holders of the maturing 4 per cent Conversion stock due for redemption on June 15th next will be tempted to sell and buy the new one. Obviously one of the main short-term objectives of financial policy now is to gain control of the £592 million of that maturing stock, and to persuade the holders into longer dated securities.

There is no lack of other new issues. The Federation of Rhodesia, so often unlucky with its new issues, opened its lists on the morning of Mr Thorneycroft's departure. The £10 million issue of 6 per cent stock (1976-79) at £96 instead of being over three times subscribed, as had seemed certain, was just comfortably covered, applicants up to £25,000 receiving full allotment and the larger ones 54 per cent of their applications—the stags had withdrawn but the new stock opened at ¼ discount. The rights offer by Richardsons, Westgarth of £3½ million 6 per cent convertible unsecured loan stock (1976-81) at £99 was an outstanding success; dealings started on Thursday at 3¾ premium and rose further as the day progressed. "Shell" Transport has now decided that the basis of its rights offer is to be one for ten; the issue price will be decided later, but the market is guessing that a one in ten ratio would not provide enough money unless it is in the region of £5 10s. per share.

STERLING

Under New Management

STERLING took the changes at the Treasury with commendable and surprising calm. The pound came under pressure on Tuesday when the rate against the US dollar dropped from $2.81¼ to $2.80⅞ and the transferable rate from $2.7920 to $2.7895. But since then the rates have recovered to $2.81⅛ and $2.7915, respectively. Though there may have been official support on Tuesday's thin market it must have been quite small. Most Continental currencies moved against sterling on Tuesday, but the pendulum was swinging the other way again later in the week. In EPU currencies there is a fairly persistent offering of D-marks as forward purchases made many months ago mature: the speculators are covering and taking their losses.

Technically sterling is strong at the moment. At this time of the year there is always a commercial demand and as working balances by countries outside the sterling area have not been restored to their normal levels, these commercial requirements are being satisfied by hand to mouth buying. This has helped sterling to withstand the impact of this week's political shocks. Dealers in the market are now asking whether the reconstitution of working balances and the return to more normal "leads and lags" in sterling, both of which were under way until the political changes were announced, will continue at the same rate now that sterling is under new bosses at the Treasury.

ATOMIC ENERGY

The Unseen Hazard

MUCH of the latent public anxiety about the dangers of atomic energy, says Sir Alexander Fleck in his report on the health and safety organisation of the Atomic Energy Authority, "arises from the knowledge that exposure to radiation is not immediately recognisable by any of the senses." But he goes on to say that "the public may be assured that the precautions which are applied are extremely elaborate." The practical safety measures taken by the AEA have been outstandingly successful: there has been no case yet of death or serious injury from radiation to any member of the staff.

The committee was therefore less concerned with immediate safety measures, which are sound enough, than with the means of making them as near fool-proof as possible. One of the secrets of the AEA's outstandingly successful record of research and development is its loose-knit, almost casual, method of organisation. But the same decentralisation of responsibility is not a sound way of safeguarding public health. Starting at the top, the Fleck committee recommends that the Atomic Energy Office, that exclusive subdepartment of 18 which comes under the Prime Minister, should assume responsibility for co-ordinating all the government departments and research bodies that are concerned with radiation hazards. This would relieve the Atomic Energy Authority of much of the responsibility for public health which should not properly fall to it, but which it assumed in default of anyone else. The handling of the Windscale accident showed its serious limitations for such a task.

The trouble is to find the men. The committee recommends that the health experts dealing with medical risks of contamination, and the safety experts dealing with the engineering safeguards to prevent it, should be merged at each point into a single organisation, preferably under a man with medical qualifications. This will have to be done, but at present such men simply do not exist in the numbers required. They are scarce inside the authority, and scarcer still outside it. It would take, on the committee's estimate, 18 months' full-time study to train a health physicist in radiation hazards. How many medical officers of health could be spared for so long? Yet the committee emphasises that they, their senior medical staff, the factory inspectors, the sanitary and water engineers, industrial nurses, health visitors and the police must all acquire some working knowledge of this new industrial hazard, because atomic power and radioactive materials are going to become part of the warp and woof of our daily life. This training should be carried out by the AEA, as part of its general responsibilities and service to the country. It is impossible to quarrel with the logic of this conclusion; but the ordinary man will draw a deep breath at the scale of the training operation that would be needed. Sir Alexander has established a principle of public safeguard; but further, much more detailed, inquiry will be needed before it can be implemented.

BANKING RESULTS

Bank Profits Falling

THE dividend season for the big banks has yielded no surprises. Every one of the "Big Seven" has either maintained its distribution for 1957 at the 1956 rate or has fulfilled the forecast of somewhat higher payments made at the time of its capital simplification carried through during the year. There were no fewer than five such capital schemes—those of the Midland, National Provincial, Westminster, Martins and District banks—and the biggest effect upon dividends occurred in the Westminster and National Provincial. In terms of the former capital the Westminster's *distribution* was increased from 16 to 18 per cent and that of the National Provincial from 18 per cent to 19.8 per cent (on the former partly-paid shares) and to 21 per cent (on the remainder of the equity).* In both these banks the disclosed additional cost (not counting the extra tax cost) was slightly over £100,000.

BANK PROFITS AND DIVIDENDS, 1954–57

	1954	1955	1956	1957	Change in 1957
	£	£	£	£	%
Barclays	2,549,399 12	2,645,381 12	2,917,112 12	2,861,407 12	−1·9
Lloyds	2,186,072 12	2,322,439 12	2,541,793 13	2,502,391 13	−1·6
Midland	2,397,597 18	2,654,110 18	2,888,443 18	2,846,687 18·4*	−1·4
Nat. Provincial	1,827,044 18	1,882,139 18	2,030,483 18	2,061,966 19·8*	+1·6
Westminster	1,623,197 16	1,708,316 16	1,865,050 16	1,852,481 18	−0·7
"Big Five" Total	10,583,309	11,212,385	12,242,881	12,124,932	−0·9
Martins	918,477 17½	930,616 17½	944,780 17½	901,402 18*	−4·6
District	588,863 20	636,784 20	663,060 20	672,960 21*	+1·5
"Big Seven" Total	12,090,649	12,779,785	13,850,721	13,699,294	−1·1

* Effective rates on largest category of former capital. Effective rates on all categories as follows:- Midland: £12 partly paid, 18.4%; £2 10s., 18.6%; £1, 18.9%. National Provincial: £5 partly paid, 19.8%; £1, 21%. Martins: £20 partly paid, 18%; £1, 18¾%. District: £5 partly paid, 21%; £1 "B", 21%; £1 "C", 22%.

While money rates have reached their highest points for many years, most of the banks suffered a slight reduction in their disclosed profits from the bumper amounts reported for 1956. As the accompanying table shows, the declines range from 0.7 per cent for the Westminster Bank to just under 2 per cent for Barclays and 4½ per cent for Martins; exceptionally, the National Provincial and the District both show increases of roughly 1½ per cent. These two banks (and also Martins, among the Big Seven) have consistently adhered to the tradition of writing down their investments to (or below) market value. It seems hardly conceivable that further provisions have not had to be made on this account during 1957, in spite of the relative firmness of the very shortest stocks.

The downward tendency of published profits seems to have taken some people by surprise; but the average level of money rates through 1957 was only a little above that for 1956 (because of the reduction of Bank rate from 5½ to 5 per cent in early February). Such advantage as this increase brought to the banks by way of higher gross returns from their interest-earning assets was more or less offset by the sharp rise in the cost of interest on deposit accounts and by the further increase in the cost of staff and administration. The cost of deposit interest is now extremely burdensome; since the rise in Bank rate to 7 per cent last September, there has been a further marked switch of funds from the non-interest-bearing current accounts to deposit accounts, now carrying 5 per cent interest. The banks during 1957 have had the benefit of some increase in the average

volume of deposits (by about 2 per cent, almost restoring the 1955 average), of a moderate expansion in banking turnover, and of some recovery in the average volume of advances, which reversed their 1956 trend. Now the renewed tightening of the squeeze is curtailing advances again ; in the interests of disinflation, it is to be hoped that it will curtail deposits and banking turnover also. The banks cannot count in 1958 upon profits as good as in 1957.

DISCOUNT HOUSES

Casualties of 7 per cent

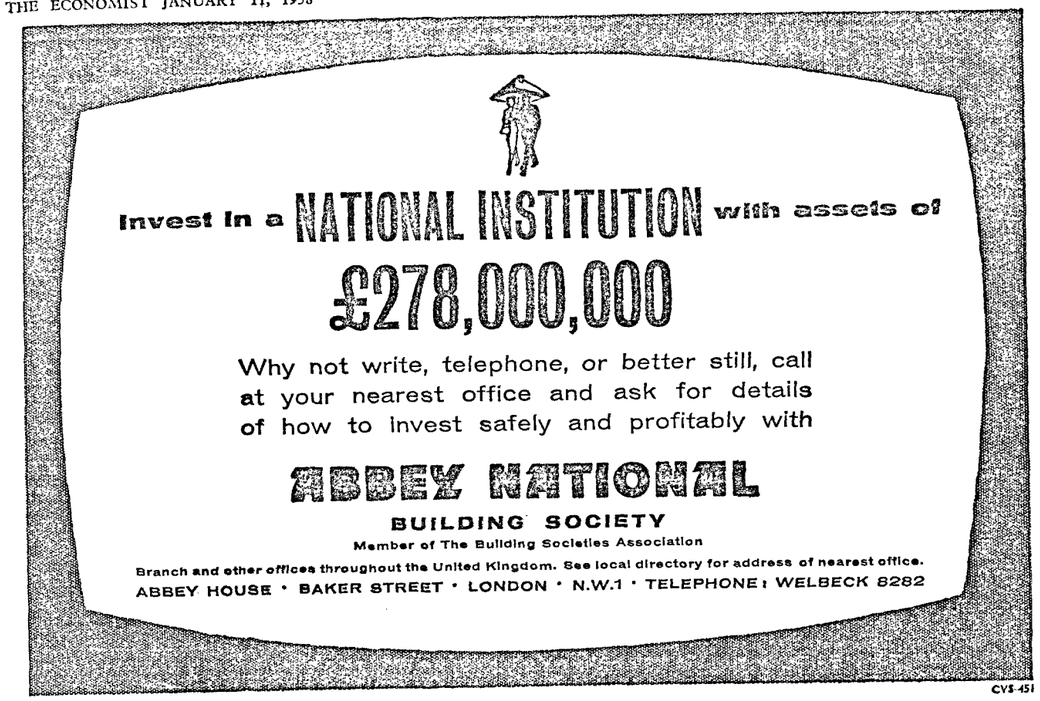
CONTRARY to popular belief, professional money dealers are always badly hit by dearer money—at least by its first impact. September's bludgeon of 7 per cent hit no-one harder than the discount houses. Bills bought at 4¼ per cent discount had to be sold at 6½ per cent discount, while the market values of bond portfolios took a further sharp knock. For 1955, not one of the big three of the London discount market, which also happen to be the houses that make up their books to the end of December, could show a true profit, but merely a "balance" after transfers from contingency reserves. For 1957 that has not been necessary ; though two aspects of valuation by the National Discount appear disturbing. Both the Union Discount, the giant of the market, and Alexanders show reductions in net profits, the Union from £420,769 to about £415,000 and Alexanders from £65,400 to £50,900. The Union maintains its dividend at its old rate of 12 per cent and the National Discount maintains its rate at 10 per cent (cut from 12 per cent in 1955) ; but Alexanders makes a further cut—to 5 per cent, after 7½ per cent in the two previous years and 12½ per cent before 1955.

Alexanders has again made a provision from profits towards the depreciation of its bonds ; its disclosed depreciation is reduced from £2.6 million to £2.3 million. The Union Discount can continue to show its bonds below market value, covering the whole depreciation from inner reserves. But the National Discount, the one house to show an increase in profits—from £202,103 to £208,117—shows a significant widening in its uncovered depreciation, from £2.5 million to £3.1 million. The intended implication is presumably that current profits rose but that depreciation on the portfolio also increased. That does not seem to have been the experience of other big houses in 1957—though experience of different houses does of course vary. Market value of their bonds, although well below the levels of mid-summer, are not on the whole below the levels of end-1956 : the discount houses today hold for the most part only very short dated bonds, to which a year's progress to maturity makes a big difference. The chief exception is the popular high-coupon 4½ per cent Conversion, down nearly 3 per cent on the year.

In their trading operations, the discount houses have done badly in bonds ; in the first half of the year as money rates were falling, running margins looked better, but since September, with average money costs around 5½-5⅝ per cent, every bond in the list has been carried at a running loss. Experience with bills has been almost the opposite. Margins between the cost of the money borrowed and the yield on the bill were pushed low while the market was expecting reductions in Bank rate ; but since 7 per cent running margins have been excellent—at first around ⅞ per cent, and lately, as the bill rate has fallen from near 6⅝ per cent to 6 7/16 per cent, margins have still reached ⅝-¾ per cent. Losses on bills in portfolio in September have been offset, at least in part. The net effect of these conflicting influences of 1957 appears to have differed in individual houses ; the profit figures of both the Union and Alexanders may be taken to imply that profit from current trading was less favourable than in 1956 ; on the other hand, the capital depreciation may be smaller now than a year ago.

The National's Valuation

BOTH the computation of profit and the valuation of the bond portfolio adopted by the National Discount mark a departure from previous years, and from normal practice. The "balance of profit" for the year was arrived at "after including the excess of amounts added to the book values of securities for customary amortisation of discounts on short-dated securities purchased below redemption values over a provision made towards securities depreciation" and after profits tax. Presumably, this "amortisation" implies a notional appreciation of book values of securities purchased under par; and it appears to be unrelated to market value. Part of this future redemption profit is included in the balance of current profit—although the year's realised losses from sales of securities are charged on contingencies and not on current profits.



The effect of this practice is to raise the book value of the bond portfolio not only above market value but also above cost. The valuation is changed from "at or under cost and below redemption values" (the form adopted by the banks and discount houses in recent years that have disclosed depreciation in market value) to "at cost plus a proportion of discounts on short-dated securities purchased below redemption values." The change in practice could be one influence in the increase in the disclosed depreciation, noted above. No further information on these practices has been forthcoming. It is earnestly to be hoped that the changes, which are described in words of less than pellucid clarity, will be fully expained in the full balance sheet and justified in the chairman's report.

BEA'S JETS

Mr Watkinson and Mr Jones

THE Minister of Transport has now become the key figure in the unhappy BEA jet airliner dispute. It is Mr Watkinson who will say, probably in the next day or so, whether or not British European Airways is to carry out its original intention of last August, to order a jet airliner from de Havilland. But the issue has already gone beyond the conflicting technical merits of the two aircraft designed by de Havilland and by the Bristol Aeroplane Company. (Part of the Hawker Siddeley Group is to co-operate in manufacture with Bristol ; their own Avro design was turned down some time ago.) It now presents one of those recurring test cases of the Government's attitude towards civil aviation. The central issue is whether the Government is prepared to accept the judgment of the two nationalised air corporations on how they should run their businesses as commercial undertakings. An airline is as good as the aircraft it operates ; its freedom to order the equipment that it judges to be best suited to its services should not be inhibited save for reasons of decisive and demonstrable national interest.

Sir Thomas Sopwith did not pull his punches at the

Deft flicks of small levers control tons of glowing metal in the first stage of rolling at Lackenby. When it is finished the Universal Beam Mill will produce steel beams in all shapes and sizes.

Stanley Curphey (right), steelworks superintendent, talks with Jack Smith, chairman of the Lackenby Trade Union branch. Friendly contact at man-to-man level may explain the absence of industrial strife.

Tomorrow clamours for steel —and the steel is coming

By GRAHAM HUTTON

Demand for steel is advancing. Atomic power stations; fly-over road junctions; new, more complicated equipment for the world's industries; our own industries—all clamour for steel. To meet this challenge, the Steel Industry has planned to raise steel output by another third by 1962. What does this mean in terms of men and money?

THE legendary site of the Garden of Eden is in Iraq. There the supposed Tree of Knowledge is shored-up on a girder of steel like bridges and buildings throughout the world bearing the names "Dorman Long." I thought I would go to the steel mills whence it came.

From old works in Middlesbrough this famous concern has spread down-Tees, modernising, expanding. High-capacity automatic ore-unloaders were the first step in post-war progress. Then came the open-hearth steel plant at Lackenby, two large blast-furnaces, and a blooming mill and medium section mill. The post-war developments of Dorman Long alone required investment of about £60 millions.

One building three-fifths of a mile long

The biggest project, due for completion this year, is the first of its kind in this country. It is a combined Universal Beam and Heavy Section mill. It will roll out solid beams of steel in one piece in their proper shapes, to hold anything from bridges to skyscrapers. It is three-fifths of a mile long – one building.

You quickly see that millions of pounds go into incredibly complex apparatus. Electronic computers; gigantic shafts and universal-joints to drive rollers; massive rollers and cooling-beds.

But money has to *come* from somewhere. Steel prices (which are fixed by the State-established Iron and Steel Board) are calculated to furnish some of the new capital required out of profits. But taxes take about 50% of profits. So one-third of the capital required will probably have to be raised from people's savings in the open market.

If you sink a lot of profits and other savings in costly equipment you must see that it earns its keep and a fair return on those savings. That thought keeps steel companies on their toes. And that is where Management comes in.

What does good Management do?

At Dorman Long, production rose over 50% from 1946 to 1952. More continuous use of plant meant that Management could take on 12% more workpeople, raise pay, improve deliveries, yet keep costs below the average rate of rise – even *before* the Lackenby plant began production in 1953. Meanwhile the new ore-preparation plant cut costs and helped to increase output. It knocked 15% off the coke needed to make a ton of iron. Better use of all capital led to better pay, more employment, better service.

Management means men. Industrial relations in steel are *probably the best in* all industry. Apart from the General Strike in 1926 there has been no official strike by the Iron and Steel Trades Confederation for 50 years. Modern apparatus demands *more* skilled labour, not less. Dorman Long were the first company in the steel industry to introduce the "sandwich" course to train supervisors and managers. They offer outstanding employees all the Company's support, and turn them into managers. After 20 years of such industrial democracy, Dorman Long are reaping a fine crop of talents, trained "all round the shop." Management in steel knows its men. It has to.

Like all "human interest stories," this story has no elaborate plot. Like them, it is never-ending. Human brains invent new uses for steel every day. Britain's Iron and Steel Industry is abreast, if not ahead, of those of America or Germany. Its relations with workpeople, customers and suppliers, are excellent. It has made ambitious plans, and is swiftly fulfilling them. Steel is serving us well.

This personal report was invited by the British Iron and Steel Federation, which believes that everyone in Britain should know the facts about steel, and about the men and organisations that make it.

Hawker Siddeley Group's annual general meeting on Wednesday. He said that "talk of the technical superiority of one aircraft on paper over another is nonsense." But swinging blows of this kind do little to advance the argument. Two competing aircraft are likely to be superficially identical if they are both designed to meet the same specification; and with the exception of the engines, these two may be near enough alike. What an airline weighs when it buys an aircraft off the drawing board is not so much the design as the design team offering it and the company behind it; in this case BEA's engineers have expressed a clear preference for de Havilland. The Ministry of Supply considers that the financial and production resources of the Bristol-Hawker Siddeley group, the formation of which was announced a few days ago, are superior to those of de Havilland (which would also work with Bristol and other companies if its aircraft was chosen) and has thrown its full weight against giving the order to de Havilland. But airlines themselves have to take a company's production record into account before they give it an order and British European Airways should be as capable of weighing the ability of a company to produce a new aircraft as it is of deciding whether this is the new aircraft that meets their needs. Conceivably the corporation could make a mistake, but that is the responsibility of BEA's board. If as airline operators they feel justified in rejecting the urgent advice of the Ministry of Supply (whose arguments are controversial enough) it is their public duty to do so. Mr Jones's wish to have fewer and stronger units in the aircraft industry is one that all reasonable people will share. But that aim will not be advanced by exerting leverage on BEA. The customer should have his own say.

GOLD RESERVE

Another Modest Gain

RELIEF, but not rejoicing, followed the rise of $88 million in the gold and dollar reserves at the end of December. At $2,273 million, the reserves show a rise of $423 million from the low point of $1,850 million touched at the end of September; of this increase more than half ($250 million) comes from the October drawing from the Export-Import Bank. The reserves even show a modest rise of $140 million over 1957 as a whole, but that rise is wholly illusory; it was much more than covered by the British drawing on the Export-Import Bank plus the Indian drawings on the International Monetary Fund; the true dollar deficit for the year exceeded $400 million. In December the waiver was exercised, so that the figures for that month contain only insignificant exceptional items—about $15 million in all, including the $7½ million regular quarterly repayment on the Canadian interest free loan. There is always room for some difference of view about the treatment of small recurrent capital items such as this and the $3 million monthly funding payment on the EPU debt. The complexity of the calculation probably explains the rejection of a recent request from a leading firm of jobbers in the gilt-edged market for weekly figures of gold movements.

On balance, the fairest computation of the true dollar balance in December, counting the European Payments Union settlements against the months in which they accrued, instead of against the months in which they were paid, was $83 million—compared with $71 million in November and $141 million in October. The true dollar surplus was $295 million over the last three months of 1957. This compares with a dollar loss in the previous three months of $628 million or, if allowance be made for the exceptional German deposits in that period, a loss of well over $750 million.

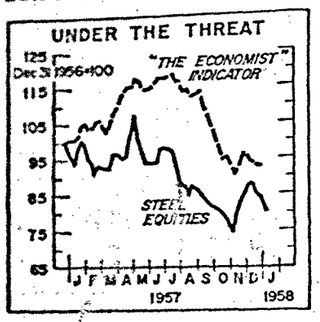
As it happens, the gold figures at the end of last year show neatly how far the economy had recovered at the moment of the Chancellor's departure. Gold has flowed in regularly for three months—ever since the decisive action of September 19th. But less than half of the damage suffered last summer had been made good when the pilot left the helm, and a long stretch of difficult navigation still lies ahead. Among the aspects of the monthly gold movements that are still far from satisfactory is the persisting deficit with EPU—£6.1 million last month, against £1 million in November. About a third of the December deficit represented interest on Britain's accumulated deficit; another influence may have been end-of-the-year window-dressing by foreign banks and other institutions that hold balances in London. But it seems that much less than the whole of last summer's bear drive against sterling can yet have been reversed.

	True dollar balance in period* $mn	Actual change in reserves $mn	Reserves at end of period $mn
January–June	− 77	*+ 248*	*2,381*
July	− 32	− 14	2,367
August	−300	−225	2,142
September	−296	−292	1,850
October	+141	+243	2,093
November	+ 71	+ 92	2,185
December	+ 83	+ 88	2,273
1957 year	−410	+140	2,273

* Adjusting for one month lag in settlement of EPU balance, for known special payments (but not regular quarterly or monthly ones) and credits from IMF, Export-Import Bank, etc.; no adjustment is made for Germany's deposit of £75 millions in the summer months.

STEEL SHARES

Investing in Political Fireworks



TWO years and five months still lie ahead before a general election must be held; steel shares have already been a political market for a year. The chart shows how they diverged last year from the general line of *The Economist* indicator as they came under two related political pressures —the fear of investors that their shares will be taken from them at unsatisfactory prices and the fear that the companies will find it hard to raise the money they need from investors exposed to that risk. Indeed, the fall has gone so far that the investor might now find a worse hole. Other stocks, too, will fall if a government pledged to nationalisation comes in.

	Issue date	Issue price	Current price	Current yield
United Steel	November, 1953	25/– 17/8§	19/9*	11·7
Lancashire Steel	January, 1954	22/–	24/3	9·9
Stewarts and Lloyds	June, 1954	35/– 17/6‡	21/1½*	10·4
John Summers	October, 1954	24/6 23/–†	24/1½*	11·6
Dorman Long	November, 1954	22/6	22/–*	9·1

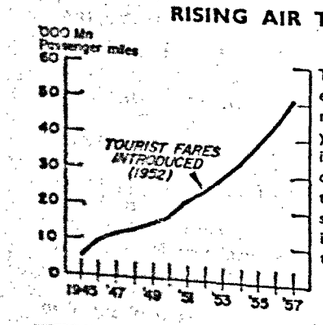
Steel Co. of Wales	March, 1957	20/–	15/9*	10·2

Adjusted for :—* Ex dividend. † Rights issue. ‡ Scrip issue. § Rights and scrip issue.

Steel company chairmen are unanimous in their hatred and fear of nationalisation, but far from unanimous as to how the political hand should be played. At the one extreme, Mr A. G. Stewart makes a most vocal appeal to



the public. He has tried public advertisement, and he now invites a resolution from the shareholders of Stewarts and Lloyds backing any action the directors take to oppose nationalisation. At the other extreme the chairman of South Durham leaves the subject severely alone. Between those extremes comes a reasoned statement by Sir Ellis Hunter, of Dorman Long, showing that the industry under private ownership is harmonious and progressive, and an appeal by Mr Harald Peake, of Steel Company of Wales, for a truce of at least five years during which the industry would be kept out of politics. The public controversy school now led by Stewarts and Lloyds and by Sir Walter Benton Jones, of United Steel must presumably feel that a public anti-nationalisation campaign will do no harm and might do good. But these two spokesmen are exceptions to the general line taken by other steel chairmen on nationalisation—to emphasise the positive achievements of the industry under private enterprise, rather than enter into premature political controversy.

It is recognised that the task before the steel industry is not only to sell steel but also to borrow money. Already money for steel has to be tempted out. The terms on which South Durham is borrowing from Finance Corporation for Industry involve a costless and automatically profitable option extending until 1967 and therefore at least into the life of the third parliament from now. The option is at par, which is both below the current price of 23s. 9d. and much below the theoretical re-nationalisation price of 27s. 6d. The terms on which Colvilles will raise £6 million from the public (with preferential allotment to stockholders) are a 6 per cent convertible debenture stock 1978-81 at £99, which is not over-generous but obviously intended to be worth about par, irrespective of the option to convert into ordinary stock.

The option starts in March next year at 27s. 6d. (only 1s. 6d. above the present price) and the conversion price rises gradually to 30s. 11d. in 1963. It therefore covers at least a parliament and a half.

RISING AIR TRAFFIC

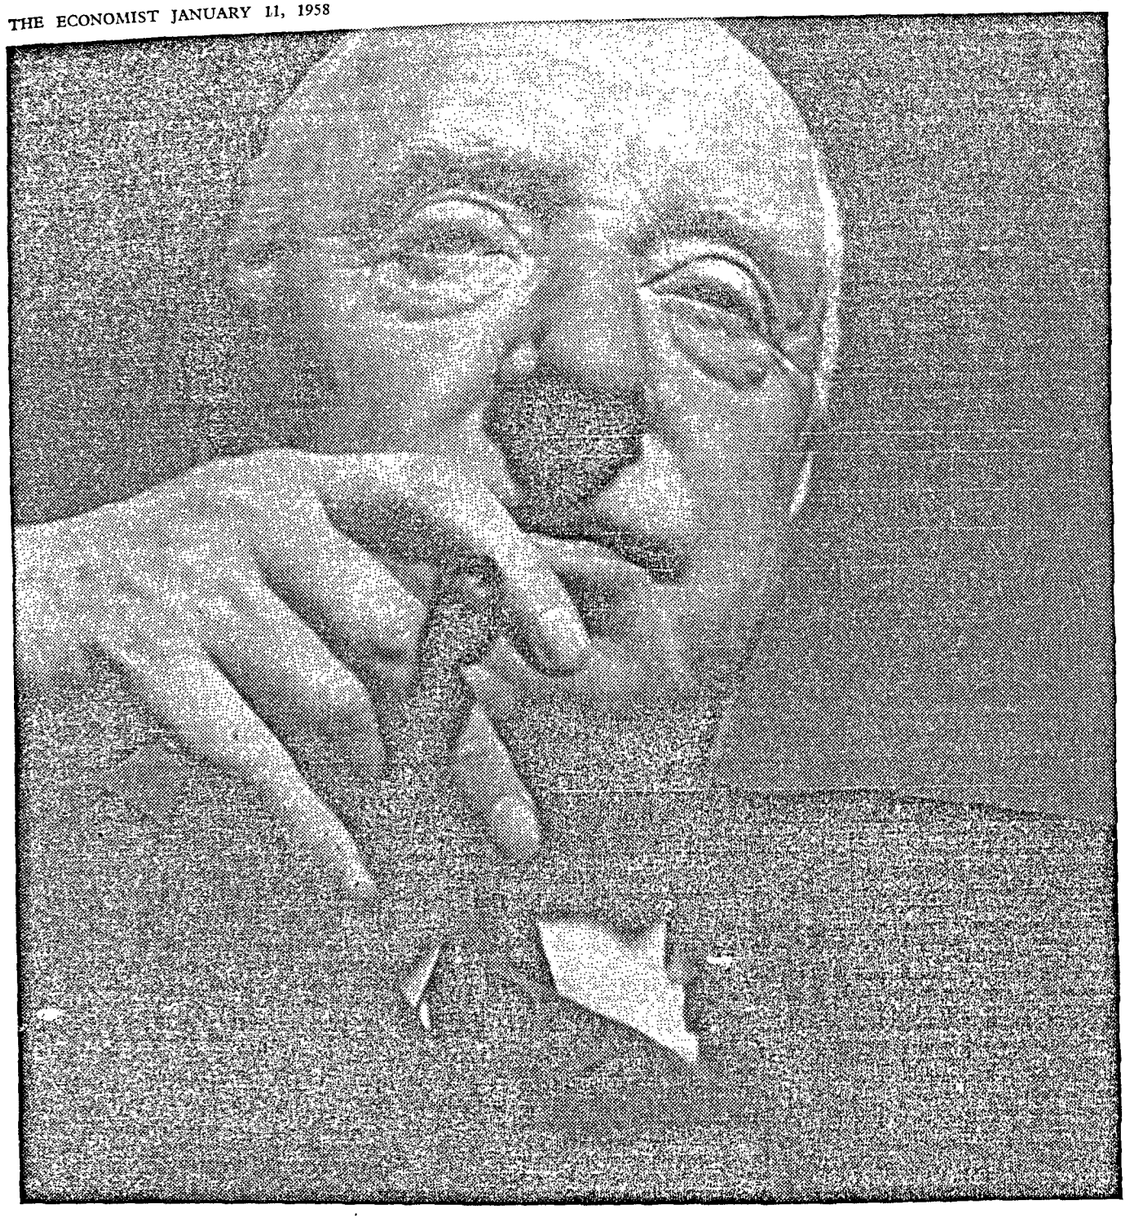
The airlines' passenger traffic, excluding Russia and China, rose by some 16 per cent last year. Next April, the airlines introduce third class services on the North Atlantic. Will this give them another boost such as they enjoyed from the introduction of second class tourist fares six years ago?

(Source: ICAO)

ANTI-DUMPING

Silicones in the Dumps

It is unfortunate that the first anti-dumping order made by the Board of Trade should have been published within days of the inauguration of the European Common Market, and should have been made against a French company. European industry is not likely to take this as a gesture of British goodwill. British industry, on the other hand, seems cheered by this evidence that the Board of Trade does intend to use last year's Customs Duties Act to take special steps against dumping by foreign manufacturers.



The steps taken in this case amount to a special anti-dumping duty of 4s. a pound imposed on silicone fluids manufactured by the important *Société des Usines Chimiques Rhone-Poulenc*. This is no case of a small British industry complaining against a foreign bully. The two companies who protested to the Board of Trade—and they alone make silicones in this country—are Imperial Chemical Industries and Albright and Wilson. Each complained separately that their home sales were suffering from the import of French silicones into this country at prices substantially below those ruling in France.

Silicones are an intriguing class of chemicals, based in theory on silica, but made in fact from synthesised gases. They come in a variety of forms, fluids being the most common, but they also include solids and emulsions. The defence industries use special products like silicone rubbers and greases because they stand up to extreme temperature changes; other industries use them as "special property" additives, for example to plastics and polishes, to textiles for waterproofing, to paper and baking tins to prevent sticking. Silicones were developed in the United States, and were first manufactured about eight years ago in this country by Albright and Wilson, and in 1955 by ICI, both using American techniques. In the late forties, the Board of Trade was anxious to see silicone manufacture established in this country, and that may in part explain its willingness now to protect two powerful concerns against a foreign competitor. Albright and Wilson's sales first began to suffer noticeably in the second half of 1956; and both companies had lodged a formal complaint by the spring of 1957. Meanwhile, imports from France almost wholly replaced imports from the United States, which started to run down as soon as the British factories got into production. Between 1953, when imports were almost wholly American, and last year, when they were largely French, the average value of silicone imports of all types fell from about £1.4 per pound to a little over £1 per pound; imports in recent years have averaged about 500,000 pounds. The effect of the new duty should be at least partly offset by the devaluation of the franc but a watch will need to be kept that British industry does not badger the Board of Trade to use its anti-dumping powers as a handy substitute for tariff protection.

tember 30th. The trading profits of these companies rose by about 4¾ per cent, by £14.6 million to £323 million—a lower rate than the 5½ per cent increase reported in the previous quarter. Earnings, after tax, on the ordinary capital of the 482 companies rose by about £5½ million to nearly £110 million and net ordinary dividends increased by about £3 million to £40½ million. Expressed as a gross rate per cent on issued ordinary capital, these dividend payments represent a very slight drop in the rate of return, from 15.5 to 15.4 per cent. The usual detailed statistics will be published in next week's issue.

It is apparent that the increase in total profits is due largely to bigger earnings in such consumption trades as brewing and food and confectionery; profits of the capital goods industries show little change. Even before the latest squeeze earnings showed no real buoyancy: the extra £5½ million in net earnings came from an additional investment of £110 million in net assets.

DIAMONDS

Gems and Industrials

THE Russians have announced a second big diamond find, though they have still to show diamonds from their first find in Siberia; and the Central Selling Organisation, which markets between 80 and 85 per cent of the free world's diamonds, has announced another record in sales. Over the last five years the figures are as follows:

	Gems £ mill.	Industrials £ mill.	Total £ mill.
1953	43·3	17·8	61·1
1954	45·6	16·5	62·1
1955	50·3	24·0	74·3
1956	50·5	24·0	74·5
1957	52·8	24·0	76·8

The latest record owes something to the increase in gem prices and in a few grades of industrials (including crushing boart). Sales were beginning to fall off in the last quarter of the year as business activity in the United States began to slow down, and the strike of diamond-cutters in Antwerp did not help. Even so, sales of industrial stones have kept up despite the cessation of buying by the United States stockpile. There are signs that the market is softening for this the hardest of all materials. Personalities count for much in this industry, and the world's diamond market has suffered the double shock of the deaths recently of Sir Ernest Oppenheimer and this week of Dr John Williamson.

MOTOR EXPORTS

Prospects after the Cuts

NEW ZEALAND is the first of the motor industry's overseas markets to cut imports since the fall in commodity prices received major attention. The new import quotas cover a wide range of goods besides motors but vehicle exporters appear likely to be the hardest hit here, though just how far this year's vehicle shipments are to be reduced is still a little uncertain. The announcement spoke of a 25 per cent cut in the original, unspecified quota for 1958 for unassembled vehicles and a 50 per cent reduction in the number of assembled vehicles. Presumably the original 1958 quotas would have allowed larger imports than last year's 50,000. It also appears that imports of vans and lorries are now to be licensed as well and will come out of the new overall 1958 quota. One Wellington source has suggested that these measures will mean an import of vehicles this year of about 35,000, a reduction of some 30 per cent.

Fortunately the motor industry is now somewhat less "at risk" in these markets in the southern hemisphere that are liable to fluctuate so from year to year. Shipments to Australia (which has not yet officially cut back imports) and New Zealand accounted last year for only a seventh of total car exports, while two years ago they took more than a quarter. They are still important buyers, but both the United States and South Africa are now bigger, and sales in Canada last year were ahead of those in Australia, formerly the largest single market. With nearly 100,000 cars shipped to the United States—and 85,000 sold there—last year, British exporters had a remarkably good year, the first of the new Ford and Vauxhall American distribution networks. Most foreign cars did well there and registrations of all imported cars doubled to about 3 per cent of the total. This marginal sale, which is nonetheless important to European manufacturers, and consists largely of "second" cars bought by motorists on the two coasts, should enable foreign makes to prosper further this year even if domestic models sell less well. British manufacturers are hoping to do so, and also to keep up their recent progress in some of the key "third" markets in Europe, such as Sweden (where 20,000 British cars were exported last year) and Belgium. But this country's car exports are still heavily directed towards countries with fluctuating primary product incomes, and 1958 shipments to all markets are not likely greatly to exceed last year's record 400,000.

WHALE OIL

New Antarctic Season

AGAIN the Antarctic whaling season, which started this week, consists of 20 expeditions—nine Norwegian, six Japanese, three British, one Dutch and one Russian. The only changes compared with last year are that one Norwegian land station will not function in 1958, and that the South African expedition now flies the Japanese flag. Again, as last year, the maximum catch allowed by international agreement is 14,500 "blue whale units"; a blue whale unit is one blue whale, or two fin whales or two and a half humpback whales. All the expeditions are parties to the agreement, though proposals for international observers on board to enforce it are still under consideration.

The outlook for the campaign that will end in March depends on two imponderables—the yield of the whales to be caught and the troubles in Indonesia, which threaten to reduce world supplies of vegetable oils. Last year the expeditions were fortunate: the yield of the whales killed was high and the rise in commodity prices resulting from the Suez episode made it possible to sell about 150,000 tons of whale oil at between £90 and £93 a ton. Since then the price of whale oil has fallen. It touched £75 a ton at the end of September. But the most recent sale under the influence of the Indonesian crisis was just under £80 a ton. No expedition has yet sold any part of its 1958 catch in advance.

LIFE ASSURANCE

Record New Business

ONCE again the life offices have done more new business than ever before. The life offices' associations put the new ordinary life sums assured in 1957 by 72 offices at £1,330 million, representing an increase of 12 per cent on the 1956 total of £1,190 million. In 1956 the total of new sums assured rose by 11 per cent and in 1955 by 14 per cent. Industrial life assurance also had a record year, new sums assured so far reported having risen by £27 million to £330 million.

These are global figures, but last year's buoyancy in ordinary life sums assured seems to owe more to individual contracts than to new group life cover. The overseas contribution (which represents about 15 per cent of new sums assured) has been fully maintained. Yearly premiums paid in 1957 for annuities will have topped the £100 million mark (compared with £275 million in assurances). But new assured pensions by deferred annuities may be no larger than in 1956 and this pause in business may owe something to the publicity given to the Labour party's pension plan. "Millard Tucker" pension policies for the self-employed got off to a slow start in 1956 and the silence of many of the offices about their more recent experience suggests there has been little, if any, quickening of the pace—though there may be a last-minute rush this spring under the dispensation that allows the first premium (for 1956-57) to qualify for tax relief provided it is paid before April 5, 1958.

Personal savings through the life offices are not measured by the new business secured but by the growth of their funds. Last year these funds will have grown by upwards of £250 million. These funds were subjected to the blast of the fall in Stock Exchange prices and an average portfolio of life and annuity assets probably suffered a fall of about 4 per cent in market values last year. But as the life funds have continued to grow and as assets are matched against liabilities as they emerge, the life offices were under no compulsion to sell their holdings. Their funds have not been permanently scarred, even though their investment reserves may have been temporarily depleted.

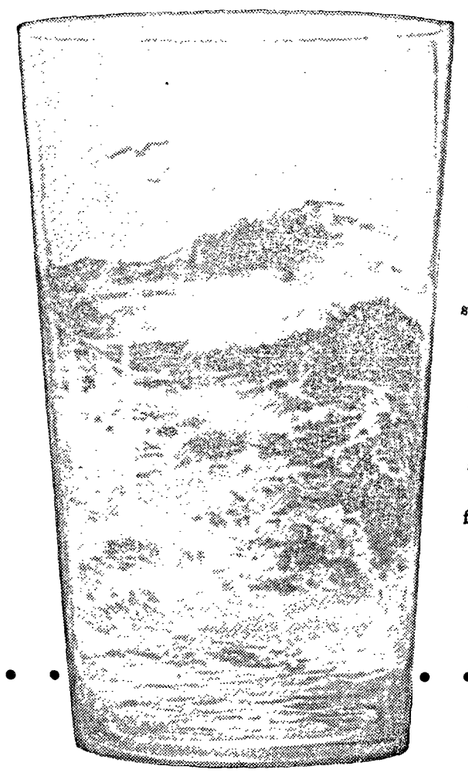
WORLD OIL PRODUCTION



Expansion below Average

IN spite of the Suez affair, production of crude oil in the free world in 1957, at 768 million tons, was 29 million tons or 4 per cent higher than in 1956. But this increase, held down by the sluggish demand both in the United States and elsewhere towards the end of the year, was smaller than the average increase since 1950, which exceeded 6 per cent. Production in the United States, although roughly the same as in 1956, was a million barrels a day (equivalent to an annual rate of 50 million tons) lower towards the end of the year than it was in March, the peak month of the "oil lift" to Europe. A combination of slackening industrial output and mild weather held back domestic demand in the United States, which still consumes over half the world's oil, to an increase of only one per cent over 1956. Affected by this, by a weak market in Canada as well, and by increased competition from Venezuelan and Middle Eastern producers who were helped, towards the end of the year, by the slump in tanker freight rates, output in Canada rose by little more than a million tons to 24.5 million tons. Venezuela, on the other hand, produced 17 million tons more in 1957 than in 1956, and output fell less sharply there than in the United States after the Suez emergency ended. In December Venezuela's output was running at only 400,000 barrels a day below the peak output achieved in June 1957, and was still well above the pre-Suez rate.

In the Middle East, despite the Suez interruptions, output rose slightly in 1957 as a whole, by a little over 4 million tons. Persia was the principal gainer, with a rise of 5 million tons, and Iraq the principal loser, with a fall of 10 million tons caused by the damage to IPC's pipelines. Kuwait, the leading producer in the Middle East, produced more than 57 million tons in 1957, compared with Saudi Arabia's 49 million tons—and Venezuela's 146 million tons.

Stocks at the beginning of 1958 were high throughout the world. This year, US domestic demand may rise by two to three per cent, but this is expected to be more

To any town thinking of drinking sea water—

Mad idea? Not a bit of it. Go mad *if you drink it?* Nonsense. Not today; not with modern evaporators; certainly not with the newly developed Richardsons Westgarth evaporator. This tidy and compact piece of plant will distill for you—from sea water—anything up to 250 tons of fresh water every hour. And by fresh we mean crystal clear, far purer and softer than good drinking water supplies.

Of course, large sea water evaporators are not, in themselves, anything new; Richardsons Westgarth and many other people have been building them for years. But this latest R.W. evaporator is the result of a radically different approach in design. It is indeed *something* quite new in its simplicity of operation, relatively low first cost, and ability to go on delivering full output—without having to be shut down for cleaning—for months or years on end and with almost negligible attention and maintenance. Fresh water from sea water now becomes *feasible* economically where cost had hitherto put it out of court.

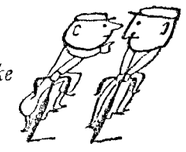
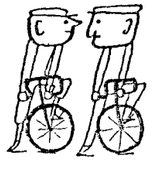
the things they say!



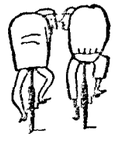
This is the Age of the Common Man, all right!

Maybe, but even today I doubt if the worker gets a proper stake in industry.

Things are changing, though.



Not that I've noticed.



Well, quite a number of concerns now have profit-sharing schemes, and some—like I.C.I.'s—also enable their employees to become stockholders.

Yes, but these schemes are only smokescreens. The bosses simply depress wages to find the money to pay for them.

That's where you're wrong. I.C.I. workers get the wages that have been negotiated on their behalf by seventeen Trade Unions. Any benefits they receive under the Company's profit-sharing scheme are over and above what they get in their pay envelopes.

Yes, but I.C.I. isn't Santa Claus. If the wages don't suffer, something else must—amenities or something.

Wrong again, friend. I.C.I.'s policy has led to a steady improvement in the service conditions of its employees, and the profit-sharing scheme is just another example. From now on, the employees are going forward with the stockholders as joint partners in their own efficient and expanding business.

ICI

J

than offset by a decline in exports, and the Department of the Interior predicts that the output of crude oil in the United States will fall by nearly two per cent. Demand in the Eastern Hemisphere should continue to rise faster, but the rate of increase, like that in the United States itself, is largely dependent on the course of the American economy. The prospect is again one of a less than average increase in world oil output in 1958—while the net addition to productive capacity, especially in Venezuela and the Middle East, is likely to be exceptionally large.

NATIONAL SAVINGS

Savings Tide Runs Out

DISAPPOINTMENT must surely be felt about the "national" savings figures for the calendar year 1957. Lord Mackintosh of Halifax, chairman of the National Savings Committee, put the net savings figure at £76 million (against £128 million in 1956). His figure must therefore have been struck excluding the repayment of defence bonds on maturity. If these are included the year's final figure for net national savings (savings, plus accrued interest, less withdrawals) was, as the table shows, £55 million, against £80 million in 1956.

NET NATIONAL SAVINGS
(Calendar years)
(£'000s)

	1954	1955	1956	1957
National Savings Certs.	+34,100	+32,350	+56,300	+ 9,900
Defence Bonds	+36,244	+32,514	+ 7,325	− 8,142
Post Office Savings	−60,009	−71,656	−52,616	−49,236
T.S.B.	+24,148	+ 2,676	+15,293	+17,860
Premium Bonds	...	...	+51,500	+68,560
	+34,483	− 4,114	+77,802	+38,942
Nett interest accrued	+86,836	+81,403	+49,746	+37,352
Defence Bonds—repaid on maturity	31,629	43,309	47,354	20,814
Totals*	+89,690	+33,980	+80,194	+55,480

* Excluding quoted Government securities bought through the G.P.O.

Lord Mackintosh summed up the savings result of last year by saying: "In the first half-year we seemed set for record figures, but afterwards the tightening of the credit squeeze, rising interest rates and increased spending made further progress increasingly difficult." This seems to underline the basic fact that the shift in interest rates in September left the rates on the small savings media—those of the National Savings Committee and those of the building societies—almost alone unaltered. The time for a new appraisal with new incentives to saving must surely have arrived.

BULLION

Bigger Gold Turnover

TURNOVER in the London gold market is believed to have risen by about 20 per cent in 1957. This is the estimate of Mocatta and Goldsmid; given the reduction both of private hoarding and of direct speculation in gold, their annual report attributes increased activity in the London market particularly to the European central banks. Whenever the sterling price of gold is appreciably below the equivalent of $35 per ounce central banks with deficits in EPU meet them by buying gold rather than dollars, for in these settlements gold as well as currencies is reckoned at par of exchange.

Mocatta and Goldsmid report that after the repayment of lend-lease silver by the British Government had been completed, the authorities in London became sellers of silver extracted from the old coinage. They estimate that the amount of silver obtained in 1957 from that source was in the neighbourhood of 12 million ounces. This happens to coincide with the estimated turnover in the "essential market," that is the silver required for authorised industrial uses. The coinage demand for silver has shrunk to a shadow of its former self; during the past year only two mints—those of Vienna and Stockholm—bought silver in London.

CYCLES

Mounting Scooter Sales

SINCE the beginning of last year the Board of Trade has been recording scooters separately in its production figures for cycles—an act of official recognition for this new sector of an established industry that is both useful and timely. It is only two years since the first British models appeared (though five since the Italian *Vespa* was first manufactured here under licence). But already for every four conventional motor cycles that are made in Britain for the home market and for export, rather more than one scooter is now produced—almost entirely for the home market.

	Bicycles Output	Motor cycles Output*	Scooters Output	Scooters Imports	Scooters Total
	('000)	('000)	('000)	('000)	('000)
1953	3,000	154	5·0	1·0	6·0
1954	3,300	180	7·5	3·5	11·0
1955	3,564	178	9·5	18·5	28·0
1956	2,868	125	8·5	24·7	33·2
1957 (9 mths.)	1,838	140	26·7	41·0	67·7

* Including only part of scooter output before 1957.

The new official figures for scooters can be compared only with private estimates for earlier years, but while

MOTOR BUSINESS

The December issue of this quarterly research bulletin for the motor and allied industries is now available. It includes:

THE OUTLOOK FOR 1958
THE ITALIAN MOTOR INDUSTRY
THE MARKET IN THE UNITED STATES FOR EUROPEAN CARS

The Bulletin is fully illustrated by charts, amongst which are:

PRICE INDICES OF USED CARS AND VANS
NEW REGISTRATIONS IN GREAT BRITAIN

For full particulars of this Bulletin apply to:

THE ECONOMIST INTELLIGENCE UNIT LIMITED
22 Ryder Street, St. James's, London, S.W.1.
Whitehall 1511, Ext. 48

bicycle manufacture fell further during 1957 and output of "mopeds" (powered bicycles) and the more conventional kinds of motor cycle rose by about a fifth to a quarter on 1956, scooter production is likely to have jumped fourfold. With bigger imports as well, total sales in Britain were around the 80,000 mark for 1957 as a whole, roughly doubling the numbers on the road a year ago.

Scooters create a new market in mechanised mobility rather than encroach heavily into established ones: probably few of the large number of women scooter owners, for instance, would previously have thought of getting a motor cycle. But the increased popularity of lighter weight machines, including two-strokes, among the younger buyers of motor cycles has not been ignored by manufacturers of either type of two-wheeler. The increased performance and extra power of the new models that scooter makers plan to bring out in 1958 are intended to hit the conventional motor cycle market at its weakest point. Buyers of scooters have a wide selection already: there are some 40 makes, comprising more than 50 models, obtainable in Britain. Nearly 20 of these are made here, but the Italian machines are still well in the lead, with *Lambretta* ahead of *Vespa*. Then probably come the Cyclemaster *Piatti* (designed by an Italian) and the BSA *Dandy* (which at 70 cc, half the size of most scooters, is more in the nature of a light motor cycle). In comparison with some continental countries, the British scooter market is still puny. But it is growing rapidly.

SHORTER NOTES

The Board of Trade is about to dispose of the whole of the remainder of the British stockpile of softwood. This final release of about 55,000 standards will be opened to tender on or about January 24th.

Lord Rank attributes the drop in profits of Ranks Ltd. from £8.1 million to £6.6 million in the year to August 31st to stock losses resulting from the continuous fall in wheat prices after the big rise during the Suez crisis. Profits from animal feeding stuffs also suffered a setback, but profits from the group's bakery interests increased. Results for the first quarter of the current year show a substantial improvement, which Lord Rank expects to continue.

* * *

Last year the total assets of the Abbey National Building Society grew by £20 million to £278 million. Receipts from investors remained practically unchanged at £48.8 million, and £38.6 million (4.2 per cent less than in 1956) was advanced on mortgage. The liquidity ratio remained unchanged at 14.4 per cent and the reserves and carry forward were built up from £9.9 million to £10.6 million.

* * *

The Orange Free State gold mines in the Anglo-American stable have now announced their estimated losses for tax purposes. The figures, which still have to be agreed with the tax authorities, are: Free State Geduld, £16,903,000; Loraine, £14,917,000; President Brand, 3,411,000; President Steyn £11,780,000; Welkom, £15,901,000; Western Holdings, £6,778,000. No tax is payable until these losses, in effect representing capital expenditures, are absorbed by profits.

COMPANY AFFAIRS

Steel's Good Year—and After

THREE factors govern the outlook for steel shares: the threat of nationalisation; the prospect that profits this year will not be so buoyant; and the fact that many companies now have to raise money. Nationalisation and new capital needs are discussed in an earlier note. Together they overshadow the bigger dividends and the immediate economic outlook for the industry. Bigger dividends have been the order of the day this year and in general bigger profits amply justify this. But trading results have been patchy and are likely to be patchier this year. That is inevitable when development programmes are at varying stages of completion. Results will also vary according to the industries that individual steel companies serve. Spokesmen of companies supplying such industries as motor manufacture seem more confident than those chiefly serving the capital goods industries.

Profit margins are likely to be lower and the steel industry as a whole is in for a thinner time than it has recently enjoyed. With profits less buoyant can the companies afford further dividend increases? The cover for present dividends is substantial, even when net profits are calculated, as they are in the accompanying table, after deducting appropriations to replacement reserves. But many steel companies, with their liquid resources already strained by heavier working capital commitments, have massive development programmes to complete and the only present means of financing them would need the heavy support of prior charge capital. Another bout of dividend increases on the recent scale seems unlikely late this year.

Stewarts and Lloyds has spent since the war about £55 million on capital development and intends to spend another £41 million. The chairman, Mr A. G. Stewart, describes that sum as the "minimum expenditure" required if the company is to hold its own in the international tube trade. Some of it will have to be met by borrowing—in the first instance from the banks.

This year, the company's profits will be less buoyant. The chairman says that the home trade in steel tubes shows no sign of improvement and that while the home trade in cast iron pipes should be maintained, export trade may decline. Last year deliveries of steel tubes to industries other than oil were appreciably down. The increase in exports of tubes (especially to the oil industry) was insufficient to take up the slack in the home market and in the latter months of the year some of the plant was on short time. Though the value of sales made by the group rose by about £15.3 million to £129.4 million, trading profits rose by only £2 million to £21 million.

The Steel Company of Wales, the newest, the most heavily capitalised and the last (as yet) to be denationalised, will spend about £52½ million on the third stage of its development programme, designed to bring its annual steel output up to 3 million tons; of that sum it has already spent £10½ million. The company's loan of £28.8 million from the Finance Corporation for Industry has been repaid and it has borrowed £40 million on a 5½ per cent debenture (issued at 98) and £25 million on a 5¾ per cent debenture (also issued at 98) from the Iron & Steel Holding and Realisation Agency. To finance the remainder of their programme, it has already drawn £8½ million from the £40 million facilities with ISHRA. Its fixed interest charges are thus growing rapidly but the chairman, Mr Harald Peake, is confident that this important producer of strip, sheet steel and tinplate will earn not less than £20 million in profits this year and will pay the forecast ordinary dividend of 8 per cent. Last year trading profits rose by £4.8 million to over £19 million.

South Durham Steel and Iron has now announced details of its scheme to build a new integrated steel works. The first phase of this scheme, due to be completed late in 1962, will cost £43 million and the second another £12 million. FCI has agreed to advance the company (at an unspecified rate but presumably running above Bank rate as is usual for FCI loans) up to £22½ million in instalments up to 1967; as part of the agreement FCI has been granted an option to take up 2,000,000 South Durham's £1 ordinary shares at par between October, 1959, and September, 1967. This option could be valuable, if renationalisation does not materialise—and equally if it does, for the shares rank equally with those that were sold to the public at 27s. 6d. Barclays Bank has agreed to make £10 million available for South Durham and, to complete this pyramid of financing, the company has plans (which will ultimately include an issue on the stock market) to borrow another £8 million towards the cost of the second phase of development. More immediately the chairman, Mr B. Chetwynd Talbot, believes there will be no "appreciable diminution" in the company's steel deliveries to the shipbuilding and heavy engineering industries.

Dorman Long has nearly completed its development programme. Outstanding capital commitments are put at £7 million and the company is likely to call up the balance of £5¼ million of its loan from the FCI, making in all £15 million. After charging depreciation, repairs and replacement reserve appropriations, the gross profits earned by the Dorman Long iron and steel divisions fell slightly from £4,550,000 to £4,355,000 but profits earned by its bridge building, engineering and chemical divisions rose briskly from £2,734,000 to £3,863,000. The chairman, Sir Ellis Hunter, says that order books for rolled steel have been "well maintained" but that "it would be optimistic to assume that the effects of the credit squeeze and the high Bank rate will not be felt."

United Steel spent over £16 million, and almost completed a number of its development schemes last year; that development was financed by retained earnings and by the rights issue of ordinary shares early last year. Having got into the queue for new money early, United Steel is one of the few steel companies whose liquid resources match its outstanding capital commitments. The group has spent £81½ million on development since the war and has no longer a massive programme before it.

That may make its shares more attractive to investors than those of companies which still have great programmes to complete and big finance to find. Another attraction is the diversity of the group. Last year, with the introduction of new capital, the group's sales went up from £100.7 million to £117.8 million and its profits before all charges from £14.8 million to £20.4 million. And the chairman, Sir Walter Benton Jones, says that the company's output is "being maintained at full capacity" and its output, with the exception of one or two products of the lighter departments, is finding a ready sale. He is confident that the company will "retain its present proportion of home orders, despite any possible temporary levelling off, or even setback to the market as a whole." He agrees that prices in export markets have softened but still hopes to expand exports.

Thomas Firth and John Brown acquired William Beardmore last year and made a rights issue of ordinary shares to pay for it. The dividend, held at 10 per cent on the increased capital, was one of the few steel dividends not to be increased, but profits before tax rose from £3,227,720 to £3,537,016. The chairman, Sir John Green, does not specify how much of that increase was due to the inclusion of the earnings of William Beardmore. But he does describe the past year as "difficult," materially affected by the engineering strike and by the rise in wages and other costs. This company is closer to the heavy engineering industry than some of the other steel companies and though its order books are "satisfactory" Sir John reports a slowing down in new business and a softening in most of the markets that the company supplies. It might not be able to ride out the period of slackening trade so easily as some of the bigger groups, but it is fortunate in that its liquid resources match its capital commitments.

Lancashire Steel in its preliminary statement reports a fall in its gross trading profits from £3,985,652 to £3,001,826 and in net profits from £1,456,652 to £901,826. The ordinary dividend, however, has been raised from 11 to 12 per cent. The directors attribute the fall in profits to a strike by skilled maintenance men and, more significantly, to "the fact that for seven months of the financial year the company suffered a serious reduction in profit margins on billets, wire rods, bars and light sections which comprise 90 per cent of its products, under price awards determined by the Iron and Steel Board in December 1956." There was a further price award in July, 1957, and that, together with an increase in output, has recently put earnings back to their 1956 level.

CARRERAS

TOBACCO shares remained steady despite the reduction in the ordinary dividend of Carreras from 8¾ to 6 per cent. But the company's 2s. 6d. "B" shares were marked down by 4½d. to 2s. 1½d. to yield 7.1 per cent. Group profits before tax for the year to October 31st fell from £1,197,430 to £1,007,485 and after tax from £780,732 to £605,599; the dividend absorbs £256,701 net. Tobacco is now a most competitive trade and the directors attribute the fall in earnings to lower margins and to "a much greater expenditure" on advertising and sales promotion (the whole of which has been charged in the accounts). The increase in cigarette prices in September came too late to make any material contribution to the year's results.

HAWKER SIDDELEY

THE statement made by the chairman of Hawker Siddeley, Sir Thomas Sopwith, is handsomely illustrated, but it does not contain the hard figures which shareholders need in order to judge the soundness of the group's remarkable expansion. Sir Thomas makes general comments on the value of diversification and reveals that expansion in industries other than aircraft, resulting from the acquisition of the Brush Group and Dosco, has reduced the proportion of the group's net assets committed to aircraft from 85 per cent to 30 per cent in two years. This coincides with the run-down of the group's military order books for aircraft. He also reports that the group's borrowings from banks in Canada have increased, but he does not say what the bank debt now is, nor does he reveal the division of the group's earnings and bank debt. High interest rates have, he admits, checked the plans to raise permanent capital and he hopes for "an improvement in the country's economic conditions" which will give the group the opportunity to do so. Shareholders will hope so too, but many of them would like more facts to go on.

BREWING RESULTS

IN the year to September 30th, the gross trading profits of **Watney, Combe Reid** rose by nearly 23 per cent, by £507,882 to £2,729,310. The ordinary dividend was raised from 20 per cent to 21 per cent. This is some recompense on the money the company has spent on building new public houses and improving old ones, but the credit squeeze has now drastically cut down this programme.

Some of the improvement in earnings has also come from the sale of "Coca-Cola" (which for the first time showed a profit), from the sale of canned beers (especially in export markets) and from the three "motels" the company has opened.

Through its amalgamation with J. W. Green, **Flowers Breweries** can be numbered among those brewers to have grown the fastest in recent years. The advance is still being consolidated. The company has opened new public houses but has also closed down unremunerative ones. It has pushed the sale of its draught "Keg Bitter" on a national scale, spending heavily on advertising. It is concentrating its bottling plant, so as to reduce overheads. Gross trading profits rose by nearly 15 per cent, from £935,972 to £1,076,429, and the ordinary dividend has been raised from 15 to 17 per cent.

DECCA RECORD

AS promised last February when the company made a rights issue of ordinary shares, Decca Record has held its ordinary dividend for the year to March 31, 1957, at 1s. 9d. per 4s. share on the increased capital. The group's sales for the year rose by £4,190,000 to £17,050,000 and its gross profits by £562,000 to £2,360,000. The boom in gramophone records is still on and the group's sales in the first nine months of the current financial year were "considerably greater" than for the same period in 1956.

London Stock Exchange

FIRST DEALINGS:	Jan. 1	Jan. 15	Jan. 29
LAST DEALINGS:	Jan. 14	Jan. 28	Feb. 11
ACCOUNT DAY:	Jan. 21	Feb. 4	Feb. 18

MR THORNEYCROFT'S resignation temporarily checked the advance in gilt-edged stocks. Part of the small losses were made good on Wednesday and prices showed an overall improvement over the week. On Thursday, when the Government announced a £500 million issue of 5½ per cent Exchequer Stock (1966) at 99½ gilt-edged remained firm. The new Rhodesia and Nyasaland loan was oversubscribed, but the stock slipped to ⅝ discount before recovering to ¼ discount when dealings began on Wednesday.

Bank shares eased after the announcement of lower profits, and the reduction in dividend caused a fall of 2s. 6d. to 19s. in Alexanders Discount. The advance in insurance shares suffered a check, but Sun Insurance rose 7s. 6d. to 142s. 6d. and Refuge Assurance "B" 5s. to 105s. while Legal and General lost 2s. 6d. to 115s. Gramophone record producers rose; EMI gained 9d. to 29s. 3d. and Decca 6d. to 27s., before the announcement of its results. Lyons "A" made a gain of 3s. 9d. to 89s. 9d. and Unilever rose 4s. to 78s., the NV shares jumped 5s. to 80s. 3d. Tobacco shares rose in anticipation of dividend declarations and remained reasonably firm after the Carreras results. Steel shares weakened on the political changes. Talk of a rights issue lowered South Durham 1s. 3d. to 23s. 6d.

Shell Transport lost 3s. 9d. to 141s. 10½d. as more details of the forthcoming issue became available. Burmah made good earlier losses and showed an overall rise of 2s. 1½d. to 74s. Diamond producers recovered after the fall that followed reports of Russian discoveries. St. Helena rose 2s. 3d. to 38s. 6d. among Kaffirs. Tanganyika Concessions was outstanding among copper mines, rising 7s. 6d. to 113s. 9d., while Rhodesian Selection Trust gained 9d. to 14s. 10½d.

[1] Great Britain. [2] Provisional estimate. [3] Excluding all screening losses normally amounting to around 5,000 tons a week. [4] Excluding government stocks. [5] Average for third quarter. [6] Average for fourth quarter. [7] Rayon and nylon production only. [8] Including filter cake from May, 1956. [9] Revised series; stocks at producers' works of ingots, semi-finished steel and alloy, in terms of ingot equivalent. [10] From January, 1957, excluding newsprint for periodicals and certain other purposes for which stocks at end December, 1956, totalled 19,600 tons.

[1] Electricity production in New Zealand represents deliveries only and in Canada, prior to 1957, excludes industrial generation for own use. [2] Copper and tin refer to metal production. [3] General trade (including re-exports) except for Canada, which is special trade only. Imports are cif except for Australia, Canada and S. Africa which are fob; exports are fob. Trade for India includes that going by land; annual figures for India are for 12 months beginning April 1st of year stated and for Australia 12 months ended June 30th. [4] Gold and foreign exchange holdings are those of the government and central bank; only figures for Australia include holdings of commercial banks. Cost of living for S. Africa and S. Rhodesia relates to Europeans only and for S. Africa includes direct taxes. [5] Including foreign investments. [6] Including semi-processed gold. Beginning January, 1955, including South-West Africa. [7] In July, 1948, part of holdings was transferred to the State Bank of Pakistan. [8] April, 1948—March, 1949. [9] Including some long-term securities.

Financial Statistics

EXCHEQUER RETURNS

For the 4 days ended January 4, 1958, there was an "above-line" surplus (after allowing for Sinking Funds) of £40,166,000 compared with a deficit of £13,527,000 in the previous week and a surplus of £35,752,000 in the corresponding period of last year. There was a net expenditure "below-line" of £37,102,000, leaving a total deficit from April 1st of £894,470,000 (£940,926,000 in 1956-57).

THE MONEY MARKET

THE Treasury bill rate fell again at the tender on Friday last week; the average rate on the whole allotment was down by 11.21d. to £6 6s. 6.70d. per cent, over ¼ per cent below its level in the month after the rise in Bank rate; the rate has been declining for ten successive weeks. Last week's decline was notably steeper in the rate to outside applicants than to the discount houses: the market raised its common bid for 91-day bills by only 2d., to £98 8s. 4d. per cent, after the rise of 4d. at the previous tender. As a result, bids at the common price were allotted only 44 per cent of applications after 54 per cent the week before. However, the market received a full allotment of its bid (of £98 8s. per cent) for 92-day bills which span Easter Monday.

Credit conditions in Lombard Street in the week to Wednesday were easier; the Bank has given no help through purchases of bills; and no houses have had to take penal loans. Rates on overnight loans have mostly been below 6 per cent, and on Wednesday money from outside banks ranged down to 4½ per cent.

Sterling closed at $2.81¼ on Monday before Mr Thorneycroft resigned. On Tuesday it slipped below $2.81, but recovered later in the day and closed on Wednesday at $2.81⅛, a gain of ⅜c on the week. This movement, together with a fall of 0.01c to $34.99 an ounce, in the dollar price of gold, has led to a decline in the price of gold in London from 249s. 2½d. to 249s.

COMPANY MEETINGS

DORMAN LONG AND COMPANY LIMITED

SIR ELLIS HUNTER'S REVIEW

NEW PLANT BROUGHT INTO COMMISSION

BRIDGE AND STRUCTURAL ENGINEERING ACTIVE

STEEL RE-NATIONALISATION THREAT

The sixty-eighth annual general meeting of Dorman Long and Company Limited will be held in London on Wednesday, January 29, 1958. The following are extracts from the statement by the Chairman and Managing Director, Sir Ellis Hunter, circulated with the report and accounts.

TRADING RESULTS

After charging depreciation based on historical cost, transferring £1,500,000 to the Fixed Assets Replacement Reserve of Dorman Long (Steel) Limited (last year £1,250,000), and charging £675,183 for Provision for Relinings, Repairs and other purposes (last year £440,970), the group profits before taxation amounted to £8,631,977. From this there falls to be deducted the profits of subsidiary companies attributable to outside shareholders, approximately £441,000 before taxation. This leaves approximately £8,191,000 which arose broadly as follows :

	1957		1956	
	Amount £	%	Amount £	%
Bridge building, Engineering and Chemicals	3,836,000	47	2,734,000	38
Iron and Steel.	4,355,000	53	4,550,000	62
	8,191,000	100	7,284,000	100

Profits on bridge building and engineering are taken on the contracts completed in each year and the 1957 results include profits on work commenced in previous years. The fall in 1956 in the profits of the engineering subsidiaries operating in Africa and the Argentine has been more than recovered in 1957.

Increasing costs and the larger size of plant units have necessitated the strengthening of the provision for relinings, repairs and other purposes by setting aside £234,213 more than last year. The effect on capital allowances for Profits Tax purposes of new plants coming into operation has so far been relatively light. During the current financial year and in the following year there will be substantial increases. The charge for depreciation follows the Inland Revenue allowances for Profits Tax purposes and will rise accordingly.

The profits again include substantial credits from increases in prices of trading stocks and the benefit of higher prices for export sales. These have been more than offset by the increase in working capital.

Interest on loan capital has increased substantially owing to the 4½ per cent Unsecured Loan Stock being fully paid for the whole year and further calls during the year on the loan from Finance Corporation for Industry Limited. During the current financial year the balance of this loan will be called up and the interest charge will further increase.

DORMAN LONG (STEEL) LIMITED

The year has been noteworthy for the exceptional amount of new plant brought into commission. This has been carried through with the minimum adverse effect on production from existing units, and congratulations are due to all concerned on the effective way in which it has been accomplished. Developments of this magnitude require a period of some months to run-in equipment, overcome teething troubles, train new personnel and settle down to normal operation.

Good results are already being obtained at the new coke ovens and blast furnaces and our blast furnace practice generally will benefit from the expansion of sinter plant capacity now in hand.

Experience at the new Medium Section Mill at Cleveland has been encouraging and gives promise of good performance when full scale production has been achieved. Installation of plant at the Universal Beam Mill at Lackenby is approaching completion; the Blooming Mill rolled its first ingot in the latter part of September and it is expected that early in 1958 trial rollings of universal beams and columns will begin. Production of blooms is still on a restricted scale but early experience indicates that this, the first rolling mill unit to be brought into operation at Lackenby, will prove to be highly efficient. The billet mill should be completed before the end of the current financial year and the rod, bar and strip mill a few months later.

1958 should see Stage III of our development programme almost completed. It has been fortunate that throughout a long period of heavy expenditure on development and modernisation demand for our products has been well maintained so that our existing plants have been fully employed. The modern and highly efficient units now coming into operation should in time strengthen our competitive position and improve our profit-earning capacity.

Blastfurnace coke output for the year increased by 308,215 tons to 1,210,432 tons and basic iron output was 151,361 tons higher at 1,322,126 tons. Production of ingots increased by 62,267 tons to 2,118,715 tons. Rolled steel would also have shown an increase but owing to a break-down at Britannia works in the latter part of the year it fell by 1,436 tons to 1,498,764 tons. During the year 237,120 tons of ingots were sold to other makers. These sales will fall as our new mill installations are commissioned and our own need for ingots rises.

Generally order books for rolled steel have been well maintained and current consumption is satisfactory. It would be optimistic to assume that the effects of the credit squeeze and the high bank rate will not be felt. If the Government's policy is to succeed there is bound to be a shortening of commitments by consumers in the immediate future. However, if these measures restore the country's economic health, the steel industry will share in the benefits.

RE-NATIONALISATION THREAT

The Socialist Party's declared intention to re-nationalise the steel industry ignores the outstanding contribution the industry has already made to the well-being of the nation and is continuing to make under the supervision of the Iron and Steel Board appointed by the Government.

The industry has modernised and expanded its capacity and, with active co-operation from its employees, has raised production to an exceptional degree. By providing increasing supplies of steel at highly competitive prices, it has, both directly and through exports of manufactured goods by home consumers of steel, done much to fill the gap left by the coal and textile industries in our export trade, thus enabling full employment and a high standard of living to be maintained in this country.

The strength of our competitive position has been established by free enterprise and there are adequate safeguards under the Iron and Steel Act, 1953, to protect the public interest.

The immediate effect of this threat of re-nationalisation is to make it more difficult to secure additional capital for further modernisation and expansion.

Thinking people may well ask why the Socialist Party should seek to disrupt the present arrangements which work so successfully.

The negotiations for the European Free Trade Area should further improve the prospects of full employment in the iron and steel industry and in the steel consuming industries of this country by enlarging their scope in the export markets, but success will depend on maintaining and indeed enhancing the efficiency which the industry's progressive policies have achieved.

ENGINEERING INTERESTS

While our structural engineering interests cannot expect to escape the effects of the Government's restrictions, each of the Companies —Dorman Long (Bridge and Engineering) Ltd., Redpath Brown and Co. Ltd., Tees Side Bridge and Engineering Works Ltd. —has a substantial volume of work on hand and will be able, it is hoped, to maintain a normal rate of activity in 1958.

Dorman Long (Bridge and Engineering) is busy with the fabrication and erection of 30,000 tons of steelwork for Durgapur Steelworks in India. The Bridge Department has work on hand in New Zealand, Iraq, Lagos and Malaya as well as a number of bridge schemes in the United Kingdom.

Redpath Brown is carrying out work in most of the chief industrial centres of Great Britain and has increased by 38 per cent its shipments of fabricated steelwork overseas. Tees Side Bridge and Engineering has secured important contracts in the developing atomic energy field.

Dorman Long (Chemicals) Limited has a highly efficient modern works where major developments completed early in 1957 resulted in notably increased production in all sections.

THE UNITED STEEL COMPANIES LIMITED

Extracts from the Statement by the Chairman on the Accounts for the year ended September 30th 1957.

The directors in their report record the death of Mr. Gerald Steel. In the steel industry and in many walks of life Mr. Steel was widely known and greatly admired, not only for his ability and energy but for his great interest in the lives of men. His work for our Company and the success which it brought is well known and cannot be too highly appreciated, but more than anything else in all ranks of the Company's organisation he will be remembered for himself.

My statement this year after commenting on the most interesting figures in the accounts is divided into three parts. First a kind of stocktaking of the Company's growth and spending from 1945 to 1957; secondly, future prospects; thirdly, what we call Nationalisation.

The report of the directors and the accounts covering the twelve months ended on 30th September 1957 are enclosed with this statement. There is little to say about them for the reason that together with the notes and the schedules they are self-explanatory. They follow the form introduced two years ago, which it is interesting to record received The Accountant Annual Award.

Again it will be the wish of us all to express our thanks and recognition to the staff and employees at all levels for the interest they take in the Company's operations and for their contribution to its success.

Stocktaking 1945-1957

Towards the end of the war we prepared programmes of development on which we started as soon as the war was over. These programmes for the most part have been carried out. As activity increased it became necessary to enlarge them and in these days they are revised each year to cover five forward years.

What has been done and what has been spent has been reported from time to time, but my colleagues join with me in thinking that it will be informative and interesting to our fellow shareholders to substitute a stocktaking review of the post-war period (1945-1957) in place of the customary references to performance in the last completed year.

Generally, the gross book value of the Company's fixed assets is now £95 million. The fact that £81.5 million has been spent since 1945 indicates that a very large part of our plant and machinery is either new or has been modernised in twelve years. The large increase in profits shown this year is a direct result of this very large expenditure.

Outputs of primary products have greatly increased.

	Outputs		
	1945/6 Tons	1956/7 Tons	% Increase
Ironstone	1,931,000	4,868,000	145
Coke	1,021,000	1,592,000	56
Iron	959,000	1,748,000	82
Steel	1,604,000	2,855,000	78

By comparison the total number of men employed exclusively in producing these outputs has increased to a modest extent as shown in the following table:

	1945/6	1956/7	% Increase
Steel, Peech & Tozer	6,845	8,319	21
Samuel Fox & Co. Ltd.	5,183	6,699	27
Appleby-Frodingham	7,901	10,305	30
Workington	3,549	3,546	—
Ore Mines	742	1,581	112
	24,229	30,360	25

Clearly, much greater use has been made of fixed capital investment and in consequence the output per man has risen significantly. This greater use is due partly to the introduction of more efficient plant, and partly to more continuous operation. But in the main the growth in production has followed from extension and modernisation of plant and machinery.

In particular, our stocktaking at the several branches is set out shortly as an appendix to this statement. This appendix records the work done on extension and modernisation and the capital cost of it.

Perhaps the most imposing installations are:
The blast furnace works, including the extensive ore preparation plant at Appleby-Frodingham.
The electric furnaces for extending the making of alloy and stainless steel at Samuel Fox.
The continuous medium width strip mill at Steel, Peech & Tozer.

Future Prospects

The Company's output is being maintained at full capacity and its products find a ready sale, with the exception of one or two of the manufactures of the lighter departments.

Many companies, however, and indeed industries, are looking to the New Year with caution. Although there is nothing disturbing to report so far, the steel industry is consequently in some doubt what the position may look like next spring if monetary restrictions are enforced to a point where industrial production suffers or is only maintained by reductions in stocks.

Nevertheless, the Company is confident that it can retain its present proportion of home orders, despite any possible temporary levelling-off, or even setback to the market as a whole. The products made by the Company cover a wide range and its plant has been virtually renewed since the war. These factors, together with the care that has been taken in the past to spread sales in the various markets for steel both at home and abroad, should now stand us in good stead.

Turning to the field of exports, it has been calculated that about 40 % of the steel produced in this country is exported either in plain form or indirectly in goods made from steel such as motor vehicles, ships and engineering products.

We shall continue to support our customers at home, but with any slackening of the home market we shall endeavour to expand our steel exports, although this market is clearly much more competitive than it has been for many years as a result of which world prices have been falling steadily.

It seems probable, therefore, that the hitherto overwhelming world-wide demand for steel, which has been manifest since the end of the last war, may as a result of widespread disinflationary measures, slacken for the time being. In the long run, however, I am confident that demand must continue to increase, based as it is on new-found uses for steel and on a steady expansion of industrial production which derives from the now conscious and almost general endeavour on the part of Governments to raise their national standards of living.

Nationalisation

The Socialist Party at its conference this autumn issued a statement setting out its policy on future public ownership entitled "Industry and Society".

The statement repeated the intention of the party, if and when it was returned to power, to renationalise steel or as it was put, to restore public ownership in the steel industry.

All who are interested in the steel industry, whether as proprietors or employees must realise that the nationalisation of iron and steel has once more become an urgent question. Accordingly, following the Socialist statement my colleagues and I, as the elected representatives of the proprietors of our Company, believe we should declare their opposition to any further interference with ownership or management of the steel industry.

I shall not waste time in repeating arguments which are well known anyway, because I want to call attention to what is said to be Labour's policy (which truthfully should be called Socialist policy). In it steel is only one thing, but we must rouse ourselves and we must realise that there is no end to the things that are to be nationalised as soon as the socialist element in Parliament has a majority large enough to make new laws.

It would be wrong to dismiss these ideas and aims as crazy or belonging only to the distant future. The programme is serious and it has been formulated by men whose lives are spent in striving to realise these aims.

But first let us see where steel is now. It has been nationalised and it has been denationalised and now the Socialist Party say it should be renationalised.

Why?

On its merits no one wants to nationalise steel. Neither the proprietors nor men employed in making it nor the people who buy it nor the men and women who elect members of parliament although some of these might favour it for reasons which have nothing to do with merits.

But although nobody wants it, the attitude of the Socialist Party and the threat of renationalisation which it broadcasts, psychologically might well undermine the confidence so essential for regular development in all the long chain from the primary products to the infinite variety of intermediate and final products.

If a finger is pointed to the nationalised industries, whether to have nationalised them has been a good thing or a bad thing may be still a matter of opinion. But in the conduct of them since, it has been demonstrated that when nationalised they soon wear political clothes. The Acts by which they were nationalised provide management machinery which it was claimed would make them free of political interference, but in practice it has been found that what is their business becomes the business of Parliament. But steel is very different from the nationalised industries. Steel is a manufacturing and trading activity.

What is steel? It is not just the conversion of iron ore into something which the man in the street calls steel and which in its primary state he has never seen. The companies and persons who make steel work it up into innumerable things used for all kinds of purposes, the building of ships, railways, motor-cars and even small things like pins and needles. Steel cannot be nationalised in isolation. In the nature of things undertakings which make steel must fashion it into many finished or semi-finished things. Not all steel undertakings turn their steel into the same kind of finished things and the finished things in many cases are also made by people who do not make steel.

These undertakings are competing against each other and against the steel industries of the world and their success depends upon flexibility of policy and speed of decision which can only be achieved if the men on the spot have both the responsibility and the authority. Nationalisation of them must inevitably involve centralisation of ultimate responsibility and loss of time. This must mean interference with the executive authority of the management of the industry and the growing reference of decisions to a central body—a central body which cannot be aware of local circumstances and which will, moreover, often operate with its head over its shoulder to observe parliamentary reactions to its operations.

Steel then is not a service but a manufacturing and trading industry. More than this it is an industry which directly and indirectly produces a large proportion of the things which our country exports, in other words it provides a large proportion of the exchange with which we pay for our imports on which we depend for our living to a greater extent than any other major country in the world.

This industry is highly organised in every branch and co-ordinated by means of a central organisation presided over by an independent chairman. In addition, as the result of years of experience in trading, its connections with customers and the goodwill and confidence which it has built up are spread all over the world. Are all these to be set back or lost by transferring the ownership and management of the industry to the State?

On merits there is no reason or even excuse for nationalising the steel industry. The only ground left to the Socialists is their determination to follow the doctrine preached by Karl Marx, 100 years ago, namely, to nationalise "the means of production, distribution and exchange". This can cover so much that it would cause a revolution in the country's economy and would put an end to private ownership of nearly every kind of property.

If we look at the road which the steel industry has travelled since the end of the first world war in 1918 and its ups and downs, it is not very different from the roads which other industries have travelled. It has been a long journey and some ups and downs have been large but all have been influenced by the same trade cycles and by the violent disruptions in the world at large. It cannot be said that it has not held its end up at least as well as others. And it cannot be said that on economic grounds it needs to be succoured by the State.

Sir Hartley Shawcross has recently said in public that industries should not be nationalised for the sake of nationalisation, but only if they were not being conducted efficiently. He went on to say that although the steel industry might have been in such a state it was doubtful whether it was actually so at the time it was nationalised.

How does the industry stand in relation to the State in this year of 1957?

The Act of Parliament by which the steel industry was denationalised in 1953 was not a sale back to the actual parties from whom it had been compulsorily acquired in 1951. It is true that it provided for the sale back to private ownership. Much consideration had been given by Parliament to the form of management and control of the industry after denationalisation and the Act set up machinery for supervision which today may not be remembered by the man in the street. This machinery was a body called the Iron and Steel Board. It is composed largely of members independent of the industry (including the chairman and several steel consumers) and has other members drawn from the employers and the trade unions. The function of the Board is to take care that sufficient iron and steel is provided for the country's needs, that the industry's future plans are adequate, that sufficient raw materials and fuel should be made available, that prices should not be excessive, as well as encouraging research and safety, health and welfare and arranging for joint consultations.

This Board has been in daily operation ever since the Act was passed and the industry works in co-operation with it. In this way the State seems to have all the authority needed in the interest of the State and for the protection of the consumer.

The renationalisation of steel will no doubt be vigorously opposed by shareholders and others who may hold anti-Socialist views. But it should be realised that in the Socialist programme the nationalising of steel is only a beginning. Shareholders in other industries and owners of every kind of property will follow in their turn.

Ownership by the State and management by the State is not just something which is not good or restricts our freedom: it is a bad thing. It is the beginning of communism and logically in time it would convert our country into a state as completely communist as Russia and other eastern states which are either already communist or going that way.

Industry and everybody who depends upon it in their daily lives should do a lot of hard thinking and should really try to understand where the policy of the Socialist Party may lead.

It is dangerous for members of the community who are not particularly interested in the steel industry to think that the nationalisation of steel concerns only the proprietors, that is, the shareholders in steel undertakings. It concerns all because it is a large step forward in a programme which sooner or later will make the State the proprietor of every kind of property and the employer of the whole population. In other words it is a programme which leads to slavery, and we can become slaves without having chains round our necks and wrists and ankles.

If this should seem an exaggeration, it is nevertheless a warning to all of us to think very hard about the Socialist aim to enlarge State ownership and State control and a warning to those who are strangers to steel to be as much concerned about what may happen to them as steel people are concerned to retain their property.

Apathy is an easy path but it leads to descent. State ownership and State control by Act of Parliament mean the loss of personal liberty, which Parliament was established to protect and for which civil wars have been fought even in this country. We are so engrossed in our daily affairs that evolution and even quiet revolution can overtake us while we sleep. If we could all give the aims of the Socialists serious thought we might well find that they are leading to a crisis as far reaching as any in our history.

Final Conclusion

As I said at the beginning of this reference to politics and the steel industry, I have not repeated the many arguments on the merits of the steel industry. I have confined what I had to say to warnings of the danger of the threat by the Socialist Party to renationalise steel. I have gone further than this and said that nationalisation of steel is only a beginning, the nationalisation programme of the Socialist Party is a threat to every industry and is already undermining confidence abroad. And I have added that the programme is a threat to personal freedom.

These threats create a national crisis as important and as serious as any in our history. To say this may seem an ignorant and prejudiced exaggeration. But is it?

STEWARTS AND LLOYDS, LIMITED

A RECORD YEAR FINANCIALLY

TRADING PROSPECTS—A CAUTIOUS NOTE

FINANCING DEVELOPMENT PROJECTS

RE-NATIONALISATION OF IRON AND STEEL INDUSTRY THREAT

"A DISASTER FOR COUNTRY AS A WHOLE"

MR A. G. STEWART'S APPEAL TO SHAREHOLDERS FOR SUPPORT

The sixty-eighth Annual General Meeting of Stewarts and Lloyds Limited will be held in the Merchants' Hall, 30 George Square, Glasgow, on Tuesday, January 28, 1958, at 12.15 p.m. The Accounts for the fifty-two weeks ended September 28, 1957, have been circulated with a statement by Mr A. G. Stewart, the Chairman, which reads as follows:

As Shareholders will have seen from the dividend declaration, this has been a record year financially. The profit of the whole Group amounted to £18,251,000 before tax and before charging £2 million for Fixed Assets Replacement Reserve. The table set out below shows that the increase in the profits of £1,728,000 as compared with the previous year is largely due to the improvement in the earnings of Stewarts and Lloyds Limited as a manufacturing company.

	Profit	Per cent of total profit	Increase	
	£		£	
S. and L. Ltd.	10,987,000	60	1,455,000	15%
Home Subsidiaries	4,619,000	25	86,000	2%
Trade Investments and Overseas Companies	2,645,000	15	187,000	8%
	£18,251,000	100	£1,728,000	

I shall be referring to these figures in later sections of this statement.

TRADING POSITION

The total tonnages dispatched were:

	52 weeks ended September 28, 1957			52 weeks ended September 29, 1956	
	Tons	Per cent of total	Per cent variation on 1955–56	Tons	Per cent of total
Steel Tubes:					
Home, excluding Oil	480,000	50	−15	567,000	58
Oil Industry—*Home*	58,000	6	+23	47,000	5
Export, excluding Oil	198,000	20	+15	172,000	17
Oil Industry—*Export*	233,000	24	+20	195,000	20
	969,000	100	− 1	981,000	100
Spun Iron Pipes and Castings:					
Home	256,000	70	−25	340,000	72
Export	110,000	30	−17	133,000	28
	366,000	100	−23	473,000	100

(a) Stewarts and Lloyds Limited

It will be noticed that 969,000 tons of steel tubes were dispatched in the financial year 1957 compared with 981,000 tons in the previous year. There has thus, at least temporarily, been a halt in the steep increase in steel tube dispatches that occurred in the years 1955 and 1956.

In my address at the Annual General Meeting last year I referred to a falling off in home trade demand for general purpose tubes in sizes up to 4 in. diameter, which comprises the largest single section of our trade. This fall in demand continued throughout the first six months of the year under review, and although demand has steadied since then, it has continued at a relatively low level. There has been a consequent reduction in dispatches of this class of tube in the home trade.

The demand for quality tubes in this size range has been satisfactory, though not so strong as in the previous year. A good share of the business available was secured and orders reached a reasonable level. In the larger size ranges demand continued to be high, but the financial restrictions have recently reduced the amount of merchant buying of this class of tube which was a feature of previous years.

In export markets, demand from the Oil Industry at the beginning of the period was much in excess of our capacity to supply, and although towards the end of the year it became evident that the Oil Industry's requirements throughout the world were being satisfied, our order book remained full. In consequence of our policy of supplying our regular oil company customers to the greatest extent possible, we were unable during the year to offer for other major pipeline projects. You will have seen that our export dispatches to the Oil Industry during the year increased in volume by 20 per cent over those for 1956.

Overseas demand from customers other than the Oil Industry remained fairly steady and we succeeded in increasing our share of the trade.

Notwithstanding the increase in exports, this was not sufficient to take up the slack in home trade demand for general purpose tubes, with the result that some of our tube plants have been on short time during the latter part of the year.

Dispatches of manipulated pressure pipework maintained the record level achieved during the previous year, but owing largely to general financial stringency, demand for low pressure pipework declined substantially and competition has been severe.

Among the most important users of tubes today are Nuclear Power Stations which currently use considerably greater quantities of tubes than conventional power stations of the same capacity. We have orders on our books for a wide variety of tubes and pipework for Nuclear Power Stations amounting to well over £2 million in value.

During the year costs of materials, wages and freights continued to rise, the average increases for the year in comparison with 1956 being 7 per cent on coal and wages, and 4½ per cent on freights. Home trade tube prices increased over the year by an average of 7½ per cent and therefore rather more than kept pace with increasing costs though they fell short of making up the ground lost in recent years. Tube price increases in 1957 were less than increases in steel prices generally.

Our tube works operated in 1957 at 93 per cent of capacity in producing 969,000 tons as compared with 101 per cent of capacity in 1956 when 973,000 tons were produced.

The rise in the earnings attributable to Stewarts and Lloyds as a manufacturing company, despite the slight fall in the total tonnage dispatched in comparison with the previous year, resulted partly from the increased tonnage delivered for export and partly from the improved production from new plants which reflects the benefits derived from our heavy capital expenditure in recent years.

(b) The Stanton Ironworks Co. Limited

The demand for spun and vertically cast iron pipes fell during the year and dispatches were down overall by approximately 25 per cent. The reduction in the export trade was due in particular to interference with contracts on hand for Egypt and to a diminution of trade with India, one of Stanton's best export markets, owing to India's foreign exchange difficulties.

Increased interest was shown in prestressed concrete pipes, dispatches of which were considerably greater than in the previous year. On the other hand, dispatches of concrete products other than prestressed concrete pipes fell by almost 20 per cent below those of 1956, due mainly to the measures introduced to restrict credit.

Total production of pig iron approximated to the level of the previous year, as also did dispatches of foundry iron, but owing to the fall in demand for pipes, furnace capacity became available which was turned over to the production of basic iron for outside sale to steelmakers.

Increases in the cost of materials, wages and freight were much the same as in the case of Stewarts and Lloyds. In spite of absorbing as much as possible of these extra costs by means of production economies, it was necessary during the year to increase the prices of all Stanton's main products. These continuing increases in costs are of considerable concern owing to competition from alternative materials.

(c) Tubewrights, Limited

An outstanding engineering accomplishment in tubular structures by Tubewrights was the building of the roof over the new Admiralty Test Tank at Gosport. This tank is some 2¼ acres in area and was covered in a single span of 220 feet. Their year ended with a record order book.

FUTURE TRADING PROSPECTS

In January, 1957, I said that it was perhaps easier to take a long-term view than to forecast trading conditions for the immediate future, and that although I was confident that in the long term the requirements of our customers at home and overseas would justify the capacity that we have installed and were planning, the short-term position was not so clear cut.

The experience of 1957 has, I think, justified what I said about the short-term position, and those remarks are even more valid today having regard not only to the Government's financial measures for the restriction of expenditure, but also to the general international economic situation.

So far as the prospects for steel tubes in the current year are concerned, the home trade demand shows no sign of improvement.

In the case of cast iron pipes, whilst present indications are that the home trade demand is unlikely to fall in the current year below the level of last year, conditions in the export market are becoming more competitive and it may be difficult to maintain the level of last year's trade. The foundry iron market is weak and shows no sign of reviving, at any rate in the near future.

Taking the UK Group as a whole, what will primarily determine the level of our business will be the condition of international trade, which, quite apart from its direct effect upon our exports, affects the whole industry of this country on which our own home trade depends.

It is a long time since we have faced prospects as uncertain as they are today, but there have been many occasions when the Company has faced similar conditions and far worse ones. I hope, therefore, that these remarks will be accepted as striking simply a cautious note.

We are as well equipped as any of our competitors to respond to market conditions, whether at home or overseas.

In the longer term, given a stable international situation, the Government's measures to check inflation and maintain the value of sterling should lead to a general increase in confidence and an expansion in demand. We look forward in the export trade to a continuing growth of the Oil Industry and of its demand for our products, and we are going ahead with our plans to meet these increased requirements.

DEVELOPMENTS

(a) Ironstone

Production of the Group increased by 9 per cent to 5,700,000 tons.

We are planning to increase our annual ironstone production within the next five years by 1,500,000 tons to meet the anticipated requirements of our blast furnaces. During the past year we have drilled approximately 1,000 exploratory boreholes in order further to prove the extent and quality of the ore.

We have now had some seven years' experience in operating large walking draglines, and one of the new machines of this type which we have on order is designed to remove up to 110 feet of overburden from the ironstone without the use of auxiliary plant. From our experience to date, however, it is clear that a large proportion of our reserves will have to be worked by underground mining.

I have referred previously to the new underground mine which we are developing at Thistleton in Rutland. This is the first major underground ironstone mine to be developed in this part of the Northampton Sand Ironstone Bed, and the problems being encountered show that there is still much to be learned about this type of operation. It would be unwise to count on any substantial increase in production of home ore by underground mining within a short space of time.

It has already been announced that jointly with the United Steel Companies, Limited, we have agreed to a request by the Iron and Steel Board to carry out, as soon as possible, a survey to ascertain the extent, nature and workability of the unproved reserves of the Northampton Sand Ironstone Bed lying in Rutland and South Lincolnshire. We and United Steels have also undertaken that if the results of the survey are satisfactory and if other conditions at the time are favourable, we would proceed to develop this field further with the object of supporting additional iron and steel making capacity to be built and operated by ourselves or others. We consider that it will not be possible to carry matters to this stage by 1962 and that it may be some considerable time thereafter—assuming our conditions to be satisfied—before further capacity based on such ores could be operating.

(b) Blast Furnaces and Coke Ovens

The additional ore preparation equipment at Corby, designed to bring the proportion of sintered home ores used on our blast furnace burdens to 70 per cent and with corresponding technical advantage in utilising the type of home ore now available, is almost ready for service. In due course it is intended to follow up this development, when certain technical features of the new plant have been proved in practice, by the installation of a further sintering unit capable of raising our sinter production to 100 per cent of the ore burden used at the Corby furnaces.

Progress is also being made with the new ore preparation plant at Stanton which we expect to come into operation in 1959.

The construction of the 50 new coke ovens at Corby is proceeding according to schedule.

(c) Steel Works and Rolling Mills

Steel ingot production rose by 41,000 tons over last year's record output. It would have been higher but for the recession in tube demand.

Unfortunately, the tonnage oxygen plant at Corby, which we expected to be in service already, is not yet in operation. Serious delay in the delivery of the plant has forced us to confine our present activity to development trials in the application of oxygen to steel making, and it would appear that the bulk oxygen supply will not now be available until March, 1958.

Further progress has been made with the replacement and reconstruction of the Corby heavy rolling mills.

At Bilston steps are now being taken to instal two additional open hearth furnaces with ancillary equipment. On completion, the ingot capacity at Bilston will increase to 550,000 tons per annum in comparison with the 1957 capacity of some 325,000 tons. It has now been decided to replace the blooming and bar mills by mills of modern design.

On completion of these measures, the Company will have at Bilston, with the new blast furnace already installed, an efficient, integrated iron and steel works for the production of steel suitable for seamless tube manufacture.

At Clydesdale a sixth open hearth furnace and additional casting facilities are under construction, to raise the steel capacity to 300,000 tons per annum for the rotary forge tube plants.

(d) Tube Works

Progress has been made with the second stand for the new rotary forge tube mill and other plant extensions at Clydesdale, most of which will be brought into commission during 1958. The manufacture of electric fusion welded tubes in the larger range of sizes has now commenced at our British Works, Coatbridge. We are proceeding with the installation of an extrusion plant at our Prothero works in the Midlands and production should begin in 1959.

In order to increase our capacity for the production of pipe to meet the expanding needs of the Oil Industry, we have decided, as already announced in the Press, to instal on a site adjacent to the Shotton Works of John Summers & Sons, Limited, an electric resistance weld tube plant. This plant will use strip supplied by Summers and will produce tubes in the size range from 6⅝ in to 16 in o.d.

We have been watching developments in the plastic pipe industry, particularly in so far as its impact on our trade is concerned. We recognise that, in certain limited and specialised fields, the plastic pipe has its application. We have therefore decided to manufacture plastic pipes on a modest scale, and to this end a small plant has been built and is in production.

(e) General

The new laboratories at Corby, for our Department of Research and Technical Development, are progressing satisfactorily.

It is our intention to instal during 1958 at Corby a "Leo" Electronic Computer. This

machine, as its initial duty, will prepare the pay roll for some 7,500 men and provide an analysis for costs purposes. Programmes have been, and are being prepared, for a variety of other work which it is hoped the Computer will undertake for Corby and other branches of the Company.

(f) Obsolete and Redundant Plant

Constant attention requires to be given to the adoption of new processes and to keeping plant and equipment up to date. This involves not only the modernisation of existing plants and the putting down of new ones, but also the scrapping of old plants which have served their time and have become obsolete.

We have recently closed the tube mills at Landore and at Imperial Works, Airdrie. The blast furnaces at New Cransley, near Kettering, have also been closed down. Most of the men who became redundant and were not immediately pensionable are receiving *ex gratia* allowances according to length of service. Those who were pensionable and who had the necessary service qualifications benefit under the Works Pension Fund introduced in July, 1956.

FINANCE

Up to September, 1956, the capital expenditure of the UK Group since the war amounted to £46,500,000. During the year under review expenditure amounted to £8,500,000, giving a total of £55 million. It is stated in the accounts that the balance of schemes approved, including commitments and £917,000 for further investment in The Indian Tube Company (1953) Limited, amounts to the substantial sum of £41 million, but this expenditure will be spread over a number of years. The schemes to which I have already referred indicate the directions in which this money is to be spent. Perhaps I should emphasise that nothing is included in this figure for the possible developments based on the unexplored ironstone areas in Rutland and South Lincolnshire. It will be appreciated from what has been said already that the Company is not committed beyond the exploratory boring programme.

Since the recent restriction of Capital Investment all our schemes and the phasing of the expenditure have been re-examined. The £41 million represents the minimum expenditure we feel we must incur if we are to maintain our position in the international tube trade.

You may well inquire how, under present conditions, the money for this development is to be found.

It has always been the policy of the Company to plough back a considerable proportion of annual profits and thereby finance capital expenditure largely from that source. During the year under review the cash position of the UK Companies worsened to the extent of £1,870,000. This is not perhaps surprising when it is pointed out that some £12,750,000 had to be found for assets of one form or another.

The significance of this is that despite the larger profits, increased borrowing was necessary. As shareholders will know, it is our intention to finance our developments partly by borrowing, but it will be appreciated that the degree of borrowing must increase if the profit level is not maintained. The present state of trade and the current restrictions on borrowing are, therefore, the cause of some concern to your Board. It is not possible at this stage to anticipate exactly how the situation will develop. Our Bankers are willing, as in the past, to provide the necessary facilities, and application has been made to the Capital Issues Committee to enable them to do so.

Dividend

As has already been pointed out, last year's financial results were a record. In recommending a final dividend on the Ordinary Shares of 8 per cent, making 11 per cent for the year, we have in mind the results of last year rather than the prospects for the current year as seen at present. Without wishing to forecast in any way the Company's future dividend, I would however remind you that the cover is substantial.

The profit available for appropriation after allocating £2 million to Fixed Assets Replacement Reserve for the year amounted to ... £6,072,000

Preference Dividend amounted to ...	£316,000	
The allocation to General Reserve is	£3,500,000	
The Ordinary Dividend proposed including the interim, amounts to	£1,265,000	
and		
The unappropriated profits have increased by ...	£991,000	
		£6,072,000

I should add that £2 million has again been transferred from General Reserve to Fixed Assets Replacement Reserve, to bring the total amount allocated over the years to that Reserve more into line with current replacement values.

Shareholders

It may be of interest to give you some indication as to who the shareholders are. In October, 1954, shortly after we were denationalised, we had 12,217 Ordinary shareholders. Some 7,000 of these were shareholders in the Company before nationalisation. Of the 12,217 shareholders, 81 per cent held 500 shares or less. In October, 1957, the number of Ordinary shareholders had risen to 18,395, and 78 per cent held 500 shares or less.

In 1954, 42.5 per cent of the Ordinary shares were held by individuals and in 1957, 47.2 per cent.

These figures indicate that the confidence in the Company shown by the small investor at the time of denationalisation has grown—surely a healthy sign of public approval of free enterprise, when account is taken of the enormous weight of investment in public companies by insurance companies, banks and pension funds, and by public bodies generally.

The Accounts

The accounts are presented in the same form as last year. An additional schedule has been included giving some particulars of the Company's finances over the past ten years. It is hoped that this, and the pictures also provided for the first time, will be appreciated by shareholders.

Apart from the cash position to which I have already referred, an item which might cause interest is the increase amounting to no less than £5 million in the UK Group's stocks. Of this, £2 million is due to cost increases and the balance of £3 million is due to increased quantities. The latter is partly explained by the establishment of steel stocks to ensure that there is no shortage during the period in 1958 when the heavy blooming mill is being replaced.

The charge for Employees' Benefit Fund and Pension Funds at £1,272,000 is £500,000 greater than last year. This is almost entirely due to the Works Pension Fund being in operation for the whole period as compared with three months last year.

OVERSEAS COMPANIES

South Africa

The turnover for the year of Stewarts and Lloyds of South Africa, Limited, and its subsidiary companies showed a further increase to £14,500,000 compared with £13 million last year. There are, however, signs that the results of the current year may fall short of the 1957 record

In February, 1957, an offer of 400,000 5s. Ordinary Shares formerly held by Stewarts and Lloyds, Limited, was made and met with a very good response from the South African public.

Southern Rhodesia

The Que Que tube works of the South African Company's subsidiary in Rhodesia had a moderate year. Production had to be curtailed through lack of demand.

The negotiations whereby The Rhodesian Iron and Steel Company, Limited, in which Stewarts and Lloyds, Limited have an interest, took over the steel works at Que Que from the Southern Rhodesian Government, were satisfactorily concluded during the year. Under the guidance of the Lancashire Steel Corporation Limited, and Stewarts and Lloyds, Limited, progress is being made with the reconstruction of the works.

Australia

The down-turn in home trade demand experienced by our associated companies in Australia persisted throughout the year in some sections of the market. There was a welcome improvement, however, in some other sections and this, combined with increased exports, resulted in the turnover of the group being rather more than maintained at approximately £A31 million. The new financial year has made a good start but export orders are more difficult to obtain.

New Zealand

The tonnage of steel products handled by the New Zealand Companies was well maintained, the turnover being slightly up at £3,200,000. Deliveries both from the United Kingdom and Australia improved, thus assisting to preserve our Companies' share of the New Zealand market.

Canada

Stewarts and Lloyds of Canada, Limited, had a satisfactory year, turnover being considerably above last year's level. Towards the end of the year, however, demand eased off.

India

The Indian Tube Company (1953) Limited had a good year. The output of the continuous weld plant was 36,500 tons.

The electric resistance weld plant and cold strip mill were completed according to programme early in 1957. Production has been limited owing to initial difficulties with strip supplies for this plant. A satisfactory order book has been built up.

Good progress has been made in the erection of the seamless plant.

Stewarts and Lloyds of India, Private Limited had a satisfactory year; the production of fabricated and manipulated pipework again increased.

Eire

Stewarts and Lloyds of Ireland, Limited's first full year of trading was satisfactory, although demand in Eire was not so high as in previous years.

THANKS TO EMPLOYEES—HOME AND OVERSEAS

I would like, on behalf of all Shareholders, to thank all our employees for their work in the past year, and here I refer not only to those in this Country, but all others overseas who keep the flag flying so splendidly.

Over 42,000 men and women are now employed by the Company at home. In addition a considerable number is employed in our overseas subsidiary and associated companies. We are indeed fortunate in the quality, energy, and loyalty of this large body of people.

PROPOSED RE-NATIONALISATION OF THE IRON AND STEEL INDUSTRY

I referred, last year, to the threat of nationalisation. Recently, of course, the Labour Party has reaffirmed this threat to the industry.

Under normal circumstances, I believe it most inadvisable for industry to enter into political controversy; but in this exceptional case, where your Company is threatened, your Directors feel it necessary to fight the issue of nationalisation; and if thereby and to that limited extent, we become involved in politics, it just cannot be helped.

The Labour Party must be well aware that there is little confidence in nationalisation in this country. Many of the general public are thoroughly disillusioned with it: they have seen it in action, they have suffered its cost and witnessed its failures.

Maybe it is for this reason that those politicians who now propose to throw Britain's steel industry back into the battlefield of political strife are not saying very much about it. Perhaps they prefer to do the deed by stealth. Perhaps they feel that once the people fully understand what their intentions are they may lose votes. It is our object to see that the alarm is sounded before it is too late.

The industry is tired of being treated like a shuttlecock. The threats to which it is subjected by the left wing, are doing incalculable harm to the steel industry, both here at home and overseas. One immediate result of the threat of nationalisation is that capital for further expansion becomes more difficult to raise.

We have everything to be proud of in the massive development and expansion of steel. What has been achieved in the last few years in steel is a national triumph.

By every reasonable test that even the most ardent nationaliser could apply, steel is serving the nation well. Prices are among the world's lowest; production has exceeded the most sanguine estimates; labour relations are a model for the rest of industry.

Since the war, the industry has invested about £740 million at current prices in one development after another. One result is that crude steel output has been increased from 12,700,000 tons in 1946 to approximately 21,600,000 in 1957.

This has been achieved largely out of the industry's own resources with the help of the private investor. What more could nationalisation do—save to throw the burden of future investment on to the ordinary taxpayer?

What about the workers? Will they be better off under nationalisation? Wages in the steel industry, I am pleased to say, are above the national average, while strikes are almost unknown. There is harmony and contentment that just does not exist in State undertakings, where the workers find themselves checked and encumbered by red tape. In the coal industry last year (1956) there were 3,771 separate disputes. That is how contented the miners are!

What about the country? Is a State-owned steel industry in the national interest? I cannot believe that the responsible Leaders of our great political parties can, with the experience of nationalisation of other industries, conscientiously believe that nationalisation of the steel industry is the proper course to take in the interests of the prosperity of this country, and I hope that as time goes on, and before it is too late, common sense and wisdom will override party prejudice.

Nationalisation of the steel industry would, in my opinion, be a disaster for the country as a whole.

Of Britain's total exports of £3,172 million per annum more than 50 per cent depends on steel. If progress in steel is blocked, if efficiency is impaired, there will be no hope for this country.

In the case of Stewarts and Lloyds, who rely so much on export trade, there can be no doubt that the difficulties of selling abroad would be greatly increased if our customers had to negotiate with what would be virtually a "Government Department."

I know that many of our friends abroad, with whom we have such valuable technical contacts, would be less willing to come forward and exchange information with Government-owned industry.

In my view, no responsible body has the right to play such a game of political spite and tit-for-tat with the prosperity of the nation.

It is our intention to fight this threat. Following the Labour Party Conference we inserted an advertisement in the Press circulating in the neighbourhood of our works, under the heading: "Should Steel be Re-Nationalised?" This advertisement concluded with the words:

> "We therefore urge all voters, particularly those who support the Labour Party, to call upon their candidates and local organisations to examine again whether the re-nationalisation of the steel tube industry is necessary or desirable in the interests of the country as a whole. Would not such a step hamper the economic progress of this country?"

The existence of a strong Iron and Steel Board provides a general supervision over the industry, sufficient to safeguard the interests of the community, and within this supervision the steel companies should be free to exercise their initiative and enterprise without bureaucratic interference.

When we were nationalised, and it was for just over three years, the effect was not serious as the Iron and Steel Corporation had neither the knowledge nor a sufficiently long term of office to assume active control of the industry. I am, however, certain that, had we continued to be under their control, and Government ownership, the whole machinery of production, research, expansion and marketing would have been slowed down disastrously.

Those who are involved in the management of industries of all sorts in this country are only too well aware of the international difficulties involved in trading, and of the difficulties in running modern industry, and I cannot see how it can be argued that the Government machine is better equipped to carry out this extremely important but difficult task.

Your Board is inviting encouragement from the shareholders in the stand we are taking in seeking to convince public and political opinion, by asking you to pass an ordinary resolution at the Annual General Meeting, in the following terms:

> **"The Ordinary Shareholders of Stewarts and Lloyds, Limited, being of the firm belief that nationalisation of the Iron and Steel Industry in Great Britain would do harm to the Company, its employees and its customers, confirm the power of the Board of Directors to take, and approve the Board of Directors taking, such steps as they consider necessary or desirable to counter such nationalisation."**

I would urge all those who are in agreement with the views I have expressed, but who cannot be present at the meeting, to complete the enclosed proxy form.

COTTON PLANTATIONS LTD.

NEW INVESTMENTS IN RESIDENTIAL PROPERTY

The thirtieth annual general meeting of Cotton Plantations, Ltd., will be held on January 28th at 26 Portland Place, London, W.

The following is the statement by the Chairman, The Marquess of Donegall, which had been circulated with the report and accounts for the year ended December 31, 1956:

As you can see from the Directors' Report herewith my co-Directors and I took office early this year.

The new Board continued with the Company's objects of Financial and Investment Trusts and in February, 1957, the Company acquired the whole share capital in a number of Investment Companies owning, in the main, residential freehold and leasehold properties. The total cost of these Investments was £249,229, part of which was provided by mortgages.

The gross Rental income from these properties exceeds £30,000 per annum, to which must be added the impending benefits of the Rent Act.

PROPERTY SALES

The new Rent Act encouraged the Board to embark on sales to sitting tenants and outside purchasers. These sales in the course of the first six months of trading have provided a net profit (subject to taxation only) of £27,954. In connection with these sales I should mention that the properties sold have realised on an average approximately three times the original cost price to the Company. Since the date of these interim figures the sales have continued and attained as good a result.

It is this encouraging trading profit that has caused your Board to recommend a 7½ per cent interim dividend.

Your Board felt that as we are approaching the result of a further six months of trading that I should mention that we will consider the payment of a final dividend.

In conclusion my Board wish to join with me in expressing our gratitude to all the Executives and Personnel of our Companies for their efforts.

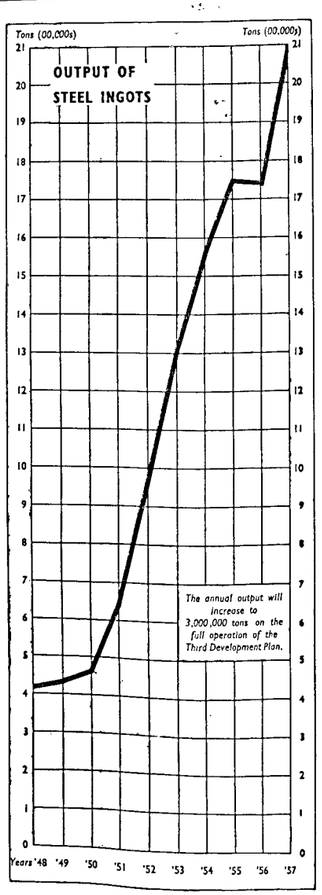
THE STEEL COMPANY OF WALES LIMITED

PROFIT A RECORD IN COMPANY'S HISTORY

COMPLETION OF SECOND DEVELOPMENT PLAN

EXCELLENT PROGRESS AND PROSPECTS OF INCREASED PRODUCTIVITY

MR HARALD PEAKE'S REVIEW OF OPERATIONS



On March 14, 1957, The Iron and Steel Holding and Realisation Agency offered for sale to the public at par 40 million Ordinary Shares of £1 each in the Company. Firm applications for 45,695,000 shares were received and a scaling down of the larger applications took place before allotment. This offer produced the largest amount which had up to that date been raised in the City of London by an issue of one class of shares on one day. 1,778 out of 22,750 eligible members of the staff and of the employees applied for and took up shares under a scheme providing for payment to be spread over a period of two years by means of an interest free loan from the Company. Capital subscribed under this scheme amounted to £248,500.

There are now approximately 29,000 shareholders including one in every twelve persons employed by the Company.

In the prospectus relating to the issue, I stated that the Directors were then "of the opinion that in the absence of unforeseen circumstances, trading profits for the year to September 28, 1957, will be not less than £16 million before depreciation, interest and taxation." It is encouraging to be able to report an actual profit of £18,980,450. This is in excess of the profit for 1955 and is the highest in the history of the Company. The profit for 1956 was affected adversely by reduced production resulting from the embargo on overtime by maintenance craftsmen. The record profit for 1957 is largely due to increased production resulting from the completion of the second development plan and also to improvements in operating.

The value of sales in 1957 was 25 per cent higher than in the previous year. Approximately a quarter of the proceeds of sales were from exports.

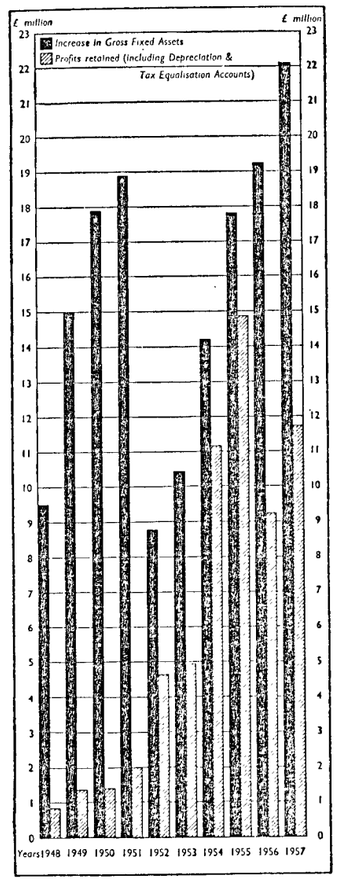
The past year has been one of excellent progress in all three divisions.

CAPITAL REORGANISATION

In March, 1957, the authorised capital was increased from £40 million to £60 million. Subsequently 23,063,959 new ordinary shares of £1 each were subscribed in cash at par by the Agency, bringing the issued capital up to £40 million. Shares to this amount were the subject of the offer and sale to the public to which reference has already been made.

Two million and 1 million ordinary shares were taken up, respectively, by Guest, Keen and Nettlefolds Limited and The Metal Box Company Limited. Both companies are substantial customers for our products and the directors welcome them to the share register.

To replace the £15 million 3 per cent First Mortgage Debenture Stock 1952/57, which was repaid at £101 per cent on July 16, 1957, and to repay loans from the Agency and from Finance Corporation for Industry Limited, £40 million 5¼ per cent First Debenture Stock 1980/85 has been created and, subsequently, issued to the Agency at £98 per cent and £25 million 5¼ per cent Second Debenture Stock 1964/87 has also been created and, subsequently, issued to the Agency at £98 per cent.



In order to provide funds for the completion of the third development plan and also for additional working capital the Agency have agreed to make or arrange for advances up to £40 million repayable not later than 1964. The amounts drawn against these advances are expected to reach their peak in 1959 and thereafter, depending upon conditions at the time and the actual cost of the work, should be finally repaid in the course of the subsequent three or four years.

By these means all the foreseeable financial requirements of the Company have been secured.

THE ACCOUNTS

In the Consolidated Profit and Loss Account it will be seen that the trading profit is £18,980,450 compared with £14,228,057 in the previous year. As a result of continued heavy spending on capital account the provision for depreciation is higher at £5,659,569 compared with £4,694,488 last year. Interest on Debentures and Loans is higher at £4,164,217 against £3,583,172 owing to higher interest rates. Taxation on profit for the year has increased from £1,950,000 to £4,500,000 as a result of the higher profit and a reduction in the amount of investment allowances.

The balance of profit after taxation is, therefore, £4,656,664 compared with £4,000,397. The directors have allocated

£2,400,000 against £1,700,000 to Fixed Assets Replacement Reserve.

Dividends, less Income Tax, paid and proposed on the ordinary shares will absorb £1,380,000 compared with £389,529 due to the higher amount of capital issued and to the higher rate of dividend. After deducting from the balance of profit brought forward from past years £1,648,459, being the cost of the capital reorganisation and £3,063,959, being the amount of the special dividend which was paid to the Agency on March 5, 1957, there is a balance of profit to be carried forward to next year amounting to £6,066,487 compared with £9,902,241 a year ago.

To summarise the result of the year's trading, the profit of £18,980,450 has been used to the extent of £5,544,217 on interest and dividends, £4,500,000 on taxation and the remainder amounting to £8,936,233 has been retained in the business for provisions for depreciation of assets in use and to meet part of the cost of the second and third development plans.

The main changes in the Consolidated Balance Sheet are related to the capital reorganisation already referred to.

Debtors, creditors and stocks have increased compared with the previous year due to the higher volume of trade and the general increase in prices.

The decrease of £90,000 in trade investments is due to the repayment out of profits of the balance of the loan to Heckett (Wales) Limited.

THIRD DEVELOPMENT PLAN

By the end of the year expenditure amounting to £48 million had been sanctioned by your Board and £10,500,000 had actually been expended in respect of the plan which is now estimated to cost £52,500,000.

In the early months, the greater part of the work and of the expenditure was in connection with the foundations of the larger units.

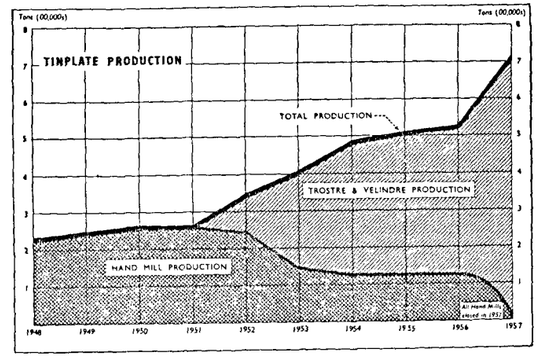
Now that the foundations are nearly complete, constructional work is going ahead rapidly and there are good prospects of the plan being completed by the end of 1959.

When this development plan is in full operation the Company's steel output will be increased to 3 million tons annually which will be rolled into plates, sheets or tinplates as the market conditions require.

STEEL DIVISION

Production of ingots at 2,095,000 is the highest so far attained. At the end of the year production was running at an annual rate of 2,300,000 tons.

It has been a year of excellent progress in all departments in spite of the consequences of the nationalisation of the Suez Canal. At the year end the only part of the second development plan awaiting completion was a battery of twenty-five coke ovens which has now been brought into production.



The number employed in the division is approximately 13,500 with a further 3,200 working on the third development plan.

Special attention is being given to training not only of new entrants, but also of foremen and of persons in managerial positions. The results are most encouraging. In this connection numerous visits have been made to North America and to the Continent.

During the year arrangements for research have been reorganised with notable achievements in many directions. The oxygen gun developed at our works for use in open hearth furnaces is now used under licence by other companies at home and abroad.

TINPLATE DIVISION

Production of tinplate was 703,000 tons compared with 536,000 tons in the previous year. The Trostre Works, near Llanelly, which was completed in 1952, has broken all previous records in production. The sister Works at Velindre, near Swansea, which started production in July, 1956, has developed in advance of expectation and is now approaching completion. These two works which are as up to date as any in the world, with their supplementary tinning facilities at Burry, near Llanelly, and Elba, near Swansea, are now able to supply all of our customers at home and abroad with tinplate of the highest quality. Consequently, it has been necessary to close down the remaining old type hand-mills at Gorseinon and Pontardawe in March, Old Castle and King's Dock in June, and Melingriffith, Lydney, Teilo and Mardy in October.

The closing of these mills was inevitable, and, whilst foreseen, it came about rather sooner than had been expected. It is sad to see what may be described as the end of an era and the redundancy of many men and women who have spent the whole of their working lives at these works. Everything that can be done is being done locally to find alternative employment for them, and a measure of success is being achieved in this respect.

The past year is a memorable one, as it marks the end of the importation of tinplate to meet home requirements. The value of tinplate which we have exported to over forty countries amounts to £20 million, and is expected to increase in the current year.

The members of the staff and our workpeople have every reason to be proud of achievements which are so helpful to the national economy.

NEWPORT DIVISION

During the first half of the year the demand for electrical sheets was reduced, but sales of mild steel sheets were well maintained. Subsequently, the consumption of electrical sheets improved, and by the year end it was necessary to work overtime to satisfy regular customers.

The year almost saw the completion of the expenditure of £2 million for the increased production of "Unisil" grain-oriented electrical steel in strip form.

It is likely that some additional expenditure will be necessary in the near future to meet the requirements of a rapidly expanding electrical industry which depends upon Orb Works for more than half of its supplies of electrical sheets.

The vital importance of continuous research is fully realised and our research staff work in close consultation with our customers.

MARKETS

The overall position has been good with higher tonnages sold and increased proceeds of sales of our three main products which are steel sheets, steel plates and tinplates.

The year opened with a reduced demand from the motor trade for steel sheets and the fall continued during the period of petrol rationing which lasted from December 17, 1956 to May 14, 1957. Consequently, it became necessary to find new customers, both at home and abroad, and it is not surprising that such customers expected continued service from us when trade improved. The demand for steel plates and for tinplates at the beginning of the year was strong.

In December, 1956, the Iron and Steel Board authorised increases averaging 6 per cent in the maximum prices of iron and steel products. These increases were related to increases in wages, transport costs, of coal, of maintenance materials and of fuel oil. These increases did not take into consideration the increases resulting from the closing of the Suez Canal and in July, 1957, further increases averaging 7½ per cent were authorised in respect of increases of wages and materials, including fuel oil. It is interesting to note that following the second increase the home prices of sheets, plates and tinplate produced in the United Kingdom were still below those of our competitors on the Continent and in the United States.

While the demand for plates remained firm throughout the year the demand for tinplates eased slightly, just when the production at Velindre was coming along ahead of schedule. The result was that customers who were able to obtain tinplate from the continuous strip mills declined to take delivery of tinplate from the old type hand-mills and the closing of our remaining hand-mills was accelerated. At the present time both Trostre and Velindre are in a position to increase deliveries of tinplate as soon as markets can be found. Great efforts are being made to develop the export trade for tinplate.

In the early summer, the motor industry returned to full-time working and has, subsequently, achieved the highest production in its history. At the present time some importation of sheets from abroad is necessary. It seems likely, however, that when the effects of the blocking of the Suez Canal have passed, and with the rising production at the

existing strip mills, the full requirements of an expanding motor industry can be met from United Kingdom sources.

The time has now come when it is vital in the interests of the shareholders, the workpeople and the customers that there are no further causes for increases in the costs of our products.

LABOUR RELATIONS

Personally, I attach the greatest possible importance to the maintenance of good relations between shareholders, management and workpeople. It is by no means easy to achieve ideal conditions in this respect in a vast company with a labour force which has expanded very rapidly.

The local authorities, with encouragement and assistance from the Company, have worked wonders in the provision of additional houses. Employees have been attracted to our works from a wide area and it takes time for them to get to know their supervisors and neighbours as well as to absorb local traditions.

It is not easy for workers to appreciate what goes on in departments other than their own, and only a very few come into close contact with our finished products. Members of the top management can only be known personally to a small proportion of the total number of persons employed.

The Company negotiates, and has friendly relations, with no less than thirteen trade unions. It is not surprising that the interests of the different unions sometimes come into conflict, and that in meeting the views of one union the Company may displease another.

The Company has done much to meet these difficulties. Our processes, machinery and tools are second-to-none. Conditions in the new works are very good indeed, and the arrangements for transport, feeding, baths and washing, accident prevention and medical attendance are excellent.

Our monthly magazine *The Dragon* is a useful channel of information for keeping our staff and workpeople in touch with each other and with current events affecting the Company.

Since the close of the financial year the directors have announced the institution of a pensions scheme with group life insurance for employees other than members of the staff, for whom provision has already been made. The Company will make a substantial payment into the pension fund to provide pensions for those who have entered the scheme at an advanced age. Arrangements are being made for those who wish to do so to purchase additional pension rights.

It is interesting to note that 17,072, or 76 per cent of our employees, have opened savings accounts under schemes agreed with the trade unions.

My objective is to achieve relations with labour as good as or better than any in the country, and I feel certain that I can count on the co-operation of leaders of all trade unions to this end.

DIRECTORATE

Early in 1957, Mr K. S. Peacock and Mr David J. Young were elected to the Board, and the appointments were duly confirmed at the last Annual General Meeting held on February 14, 1957. Mr Peacock is Chairman of Guest, Keen and Nettlefolds Limited and has a very wide experience in the iron and steel industry. We are very fortunate to secure his services as a director.

Mr Young has been secretary of the Company since its inception and more recently has served as comptroller. He is exceptionally well qualified to fill the post of executive director for finance.

Sir Charles Bruce-Gardner, who joined the Board and was appointed deputy-chairman when the Company was formed, has attained the age of seventy and retires under the provisions of the Companies Act. Sir Charles has a profound knowledge of the iron and steel industry and has been of very great assistance to me. I hope very much that the shareholders will re-elect him for a further period.

Sir Robert Barlow retires by rotation. As Chairman of The Metal Box Company Limited, Sir Robert has a unique knowledge of tinplate and its use. I hope that the shareholders will ensure that his services continue to be available as a director.

The Earl of Dudley, who also retires by rotation, has intimated that for reasons of health he does not seek re-election. He joined the Board in 1952 and has occupied many important posts in industry, including the Presidency of the British Iron and Steel Federation and of The Iron and Steel Institute. We are very sorry to lose the services of a most useful director.

PROSPECTS

The Company is in a good position to take advantage of continued industrial activity at home and abroad. Production at all of our works is likely to increase during this year. Competition in the markets of the world, particularly for tinplate, is becoming keener, and quality and price are more important now than at any time in the history of the Company.

It is encouraging to know that the foreseeable financial requirements of the Company have been provided for, and the directors are grateful to the Iron and Steel Holding and Realisation Agency for making it possible to achieve this objective.

When the offer for sale of the ordinary shares was made in March, 1957, I stated that by January, 1958, "in the absence of unforeseen circumstances and if trading and general economic conditions remain broadly comparable with those of today, the trading profit should then be running at the rate of £20 million per annum. In that event the Directors would expect to be able to recommend dividends totalling 8 per cent, less income tax, for the financial year 1957-58 on the Ordinary capital." At the present time the directors see no reason to modify that expectation.

Among our customers, workpeople and shareholders are persons holding widely divergent political views, and for that reason I think that politics should be kept out of industry. Unfortunately, politics have again been brought into the Iron and Steel Industry, and in the interests of all concerned I should refer briefly to this issue. The points which should be borne in mind are as follows:

(1) In recent years the Industry has an exceptionally good record for increased production at prices which compare favourably with world prices.

(2) Labour relations in the industry are good. Wages in the steel industry are amongst the highest in the country. Conditions for working have improved greatly and will improve further as the industry expands.

(3) The products of the industry, both directly and through other industries, are making a most important contribution to the national exports, and it is essential to the national economy that this should continue and increase.

(4) The profits of the industry make a very large contribution in the form of taxation to the national expenditure.

(5) Developments and expansion schemes costing large amounts are now being planned. These can only be financed out of savings if there is confidence in the future of the industry.

No industry can flourish in a state of uncertainty regarding its future, and when dealing with iron and steel a vigorous and enlightened long-term policy is essential.

I appeal most earnestly to all those who believe in the theory of nationalisation to take now a practical view in the national interest and to agree to a standstill policy in regard to renationalisation for five or, better still, seven years in order to allow the industry time to complete the developments which it has planned and to increase the exports on which the livelihood of our whole population depends.

At the end of the period those in authority can judge the success or failure of ownership and control by the hundreds of thousands of individuals whose names appear on the share registers in the industry.

I do not think that they will have failed.

CORONATION SYNDICATE

The fifty-second annual general meeting of the Company was held in Johannesburg on December 23rd.

Mr J. H. Mitchell, OBE, Chairman of the Company, presided and, in the course of his speech, said: The Group mine working profits have again increased, amounting to £228,853 in comparison with £219,790 for the previous year. The premium on purchase of shares in subsidiary companies amounting to £42,551 has now been written off. At the same time the opportunity has been taken of increasing the Group General Reserve to £145,000. As a result of these adjustments the carry forward to unappropriated profit of the Group has been reduced from £58,100 to £9,483.

I trust you will agree with me that the parent Company's Balance Sheet reflects a very satisfactory financial state of affairs. Subject to your approval, a final distribution of 3¾d. per share will be made.

Arcturus Mine: The working profit was £64,611 before charging depreciation, compared with £61,166 for last year.

Muriel Mine: The Muriel Mine continues to make a substantial contribution to the success of the Group. This year working profits were £134,455 before charging depreciation, compared with £111,307 for last year.

Tebekwe Mine: The Mine has now ceased operations entirely and the property has been placed on a caretaker basis.

The report was adopted and the declaration of Final Dividend No. 11 of 12½ per cent for the year ended June 30, 1957, was confirmed.

SAMUEL OSBORN & COMPANY LIMITED

By a regrettable printer's error on page 1159 of *The Economist* of December 28th, the name of this company appeared incorrectly at the head of the report of the Chairman's speech to shareholders.

ANNUAL REPORT AND STATEMENT OF THE CHAIRMAN

Hawker Siddeley Switches Emphasis to General Industry

SIR THOMAS SOPWITH REVIEWS SUCCESSFUL EXPANSION AND DIVERSIFICATION

ACQUISITION OF BRUSH AND DOSCO

HIGHLIGHTS CHANGES IN GROUP STRUCTURE

WORLD WIDE BUSINESS IS NOW MAINLY INDUSTRIAL

The twenty-second Annual General Meeting of the Hawker Siddeley Group was held on January 8, 1958, at the Dorchester Hotel, London. During the course of his speech the Chairman, Sir Thomas Sopwith, CBE, said:

FINANCE

The profits of the Group for the year ended July 31, 1957, before taxation, amounted to £12,108,483, compared with £12,847,867 last year.

I have on many previous occasions drawn your attention to the necessity to retain substantial funds in the Group. More than £8 million has been spent this year in equipping our companies with up-to-date plant for research and production.

Your Board is recommending a final dividend on the Ordinary Shares of 7 per cent, less tax, making, with the interim dividend already paid, a total dividend for the year of 10 per cent, less tax.

Highlights of the year include:

The acquisition of the Brush Group in the United Kingdom and a 76 per cent interest in the Dominion Steel and Coal Corporation in Canada, has changed the character and structure of the Group. Two years ago the net assets of the Group were divided in the proportion of 85 per cent aviation and 15 per cent industrial. Today, they are roughly 30 per cent aviation and 70 per cent industrial.

The Group's new interests include, among many other things, steel production, shipbuilding and ship repairs, complete power plants for the generation, distribution and utilisation of electricity, marine generating sets, steam turbines, most sizes of diesel engines, coal mining and many kinds of steel structures including bridges and power transmission pylons.

During the year the Group has achieved considerable success in the export field with Hawker "Hunter" fighters, "Sea Hawks," Avro Aircraft CF-100s and "Orenda" engines. Brush has obtained orders for large diesel electric generating sets.

Sir W. G. Armstrong Whitworth Aircraft Limited's "Seaslug," which is the first Naval guided missile to be developed in the United Kingdom, has been fired with success and, we believe, is the first surface-to-air missile in this country to be operated under Service conditions.

The veil of secrecy has been raised in connection with Avro's activities in the weapons field, by the disclosure of its new stand-off bomb. This new weapon, capable of carrying a nuclear head, is the natural and logical armament of all the "V" bombers.

Hawker Siddeley Nuclear Power Co., Limited is now well established and the company has been examining a number of reactor system projects for land and marine use.

The Hawker Siddeley John Brown Nuclear Construction Limited has been formed to act as the focal point for the resources of both groups of companies in this field.

Work is well under way on the Armstrong Whitworth A.W.650 "Freightercoach" and its prospects for sales look promising. Armstrong Siddeley is now actively developing engines for the civil market.

In Canada Avro Aircraft unveiled the "Arrow," a very advanced long-range supersonic interceptor.

Orenda Engines has developed a supersonic turbo-jet, the "Iroquois," which will be used in production versions of the "Arrow" and, it is hoped, in other aircraft. An agreement has been signed for this engine to be manufactured in the United States by the Curtiss-Wright Corporation.

British Railways have ordered a number of diesel-electric locomotives. Twenty have been ordered from The Brush Group Limited and the first of these is now in service.

The Group's current operational types—the Avro "Vulcan" and "Shackleton," Hawker "Hunter" and Gloster "Javelin"—have proved very successful in service with the Royal Air Force.

And now to give you a picture of the new companies that have been acquired.

The Brush Group is engaged in the design and manufacture of diesel engines, diesel-electric generating plant and other power installations for industrial and marine purposes including transformers, turbo-alternators, steam and gas turbines, switchgear, diesel-electric locomotives, fusegear, gas and dual-fuel engines and free piston gasifyers.

This company has nine manufacturing subsidiaries which have been integrated during the last twenty years into a rationalised organisation of power engineers.

In recent years the exports of The Brush Group have exceeded 65 per cent of its annual turnover.

Lack of capital has restricted expenditure on research and development for some years and this in turn has impeded prosperity and progress. Your Board has already commenced to improve that situation so that The Brush Group can begin to take full advantage of its opportunities.

Dominion Steel and Coal Corporation Limited, known as Dosco, is our most recent acquisition.

It has a fully integrated iron and steel plant with about 20 per cent of Canada's prime steel-making capacity, one of North America's important coal deposits, one of the largest iron ore properties, buildings, machinery and equipment, railways, shipyards and steamships.

It employs 25,000 people.

In terms of sales, it means a volume in excess of $200 million. Put this with A. V. Roe Canada's sales and you have a figure in excess of $400 million annually.

Dosco is the biggest single economic unit in Canada's four Atlantic provinces and, in addition, has operations in Montreal, Toronto, and Windsor, Ontario.

In addition, it produces fabricated steel: rails; bars, pipes; railway freight cars; bridges, pylons and other steel structures; and the Dosco Miner for mechanically digging and loading coal. Its output includes steel products ranging from bridges to coat hangers.

About ten years ago the company undertook a major modernisation programme and therefore its plant and equipment is of a very up-to-date nature.

A. V. Roe Canada Limited has now become one of the largest industrial organisations in Canada. It comprises more than 40 subsidiary companies and employs some 47,000 people.

Research and development facilities are being continually improved and it is worth remembering that research on military aircraft often leads to valuable results which may spread throughout many branches of engineering and bring benefits and advantages that were never foreseen when the research was originally started.

He concluded: What is the future outlook for the Group? We have expanded and diversified considerably. We have become one of the leading industrial organisations both in the United Kingdom and in Canada. Although we have diversified we are still in the aircraft industry; and our aircraft factories have work which should keep them busy for some time.

We look forward with confidence in our ability to make good profits in the future, and I think you will agree that with such an industrial spread we should be able to weather any storm.

May I ask you to join me in expressing our sincere thanks to the executives and employees who have made this such a successful year for the Hawker Siddeley Group.

The Report and Accounts were adopted.

ENI

ENTE NAZIONALE IDROCARBURI, ROME, ITALY

(Italian State Corporation for Oil and Natural Gas)

PROFITS EXCEED LIT4,500 million

FOUR TANKERS UNDER CONSTRUCTION

The ENI balance sheet for the year ending April 30, 1957, was published recently. Details of the report of the Board of Directors which accompanies it are set out below:

PROSPECTING AND PRODUCTION ACTIVITIES

The area covered by prospecting permits which the Group had secured in Italian territory, outside those areas where it had exclusive rights, amounted to altogether 3,396,659 acres on April 30, 1957.

In Sicily an agreement in principle was concluded with the Regional Government providing for the issue of prospecting permits to companies set up by ENI in which, in the event of hydrocarbon deposits being found, the Regional Government would acquire a participation of 25 per cent. Important agreements were also concluded in foreign countries. Compagnie Orientale des Pétroles d'Egypte (COPE) was set up in Egypt with 51 per cent of its shares being held by IEOC, a company controlled by ENI, and the balance of 49 per cent being shared by two Egyptian organisations. In Persia AGIP Mineraria concluded an agreement with the National Iranian Oil Company (NIOC) for the establishment, on a basis of full equality, of Società Iraniano-Italiana dei Petroli (SIRIP) which is being given prospecting and exploitation rights in three zones with a total area of app. 8,880 sq. miles.

The Persian State will receive 50 per cent of net profits by way of royalties, taxes and duties. The remaining profit will be shared equally by the two partners. The cost of bringing wells into production, and working them, and of transporting the oil will be borne by SIRIP, whilst prospecting costs will be advanced by AGIP Mineraria and charged to SIRIP in the event of success.

Research and prospecting activities were carried on vigorously during 1956. Geological research in Italy has been almost completed by now both in those areas exclusive to the Company and in the zones covered by prospecting permits obtained before September, 1956. Geophysical surveys carried out in Italy during the year totalled 197 crew-months. Another five crew-months were reached in Somaliland, and twelve crew-months in Spain on account of other companies.

Exploration activity during the year produced important results. In the area exclusive to the Company, eight gas deposits were discovered, including two at Selva and Minerbio (Bologna) which were especially large. Besides, oil was discovered near Busseto (Parma). The wells at Madonna della Croce and La Plaja were the result of the discovery of an extension of the oil deposit at Vallecupa (Pescara) and had reached a daily production of 150 tons by the beginning of 1957. Gas discoveries in Sicily during 1956 and the first few months of 1957 were made at Rizzo, south-east of Castelvetrano, and in the Enna area which AGIP Mineraria is exploring jointly with Snia Viscosa. During the same period, oil was found at Gela, where daily production reached 180 tons during the first few months of 1957, and at Noto. In Egypt, exploration work started on two geological structures on the eastern coast of the Gulf of Suez.

Drilling activity in Italy during 1956 can be summarised as follows: 138 wells were sunk with a total depth of 714,148 ft., which included 57 exploration wells and 81 production wells. Wells sunk in Egypt by IEOC reached a total depth of 83,747 ft., and other boreholes were sunk by constituent companies in Somaliland, France and Libya.

Production of natural gas by *ENI* companies rose to 146,874m. cu. ft. in 1956—an increase of 28,816m. cu. ft. (24 per cent) compared with 1955. This represented 93 per cent of Italian production as a whole. Output during the first four months of 1957 reached 59,505m. cu. ft.

Total output of liquid and liquefiable hydrocarbons in Italy amounted to 134,828 tons during 1956—an increase of 17 per cent over 1955.

In Egypt, IEOC reached a total production of 257,016 tons of crude oil during 1956, compared with 75,000 tons in the preceding year. The rate of production reached 2,700 tons a day halfway through 1957, and will amount to more than 4,000 tons by the end of the year. It is expected that more than one million tons will be shipped to Italy in the course of 1958.

TRANSPORT AND UTILISATION OF NATURAL GAS

The ENI Group had 36 drilling rigs in operation at the end of 1956 without counting those owned by foreign companies in which AGIP Mineraria holds an interest. ENI's gas pipeline network continued to develop during 1956 in step with the growth in the production and consumption of natural gas and reached a total length of 2,706 miles. Another 74.6 miles were either under construction, or already completed but not yet in service, on December 31, 1956.

At the end of last year, consumers directly connected to the networks of SNAM and AMP (industrial users and local authorities) numbered 1,854, as against 1,720 at the end of 1955. Metano Città put three new urban networks into operation during 1956, and another four were being built or about to be taken into service at the end of the year.

In 1956 the ENI Group distributed a total of 153,125m. cu. ft. of natural gas—a figure equivalent to 97.2 per cent of Italian consumption as a whole. In every sector of consumption there were increases in sales, which amounted altogether to an advance of 23.7 per cent over 1955. The relatively biggest increase (41.2 per cent) was achieved as in the previous year by domestic and civilian users, who accounted for 9.8 per cent of the gas distributed. The total calorific value of the natural gas distributed for such purposes was roughly equivalent to that of the whole of the gas produced by gasworks in Italy. At the end of the year, 1.63m. domestic consumers out of a total of 2.45m. for the whole of the country were supplied either partly or wholly with natural gas.

PETROLEUM TRANSPORT

The Group's tanker fleet achieved a total of 4,900 million ton-miles during the year. At the end of 1956 it comprised 11 units with a total deadweight capacity of 118,000 tons, as well as two small units equipped for the transport of liquefied petroleum gas which had been taken into service during the year. Two tankers of 36,000 dwt. each are at present under construction, as well as another two, of 45,000 dwt. each, besides a small unit for the transport of liquefied petroleum gas. The programme of new construction, which will be completed in the course of 1960, will increase the capacity of the fleet at present in service by 176 per cent.

PROCESSING

Large-scale work to extend and improve present equipment was carried out during the year and is still in progress at the Group's refinery at Cortemaggiore, as well as at the Bari and Leghorn refineries run by STANIC and at IROM's refinery at Porto Marghera.

During 1956, the refineries connected with the Group processed 5,410,700 tons of crude oil and residual products, an increase of 8.2 per cent over 1955. The 1956 output was taken up by the Italian home market to the extent of 71 per cent, compared with 62 per cent in 1955 and 55 per cent in 1954.

In 1956 the gasoline extraction plant at Cortemaggiore processed 34,926m. cu. ft. of natural gas and produced 59,120 tons of liquid and liquefiable hydrocarbons.

DISTRIBUTION OF PETROLEUM PRODUCTS

The new 98-100 octane Super-cortemaggiore (RM) petrol was given a most favourable reception by the public.

Sales of fuel oil registered a considerable increase.

The distribution of liquefied petroleum gas showed a further remarkable development. Five bottling plants were taken into service during last year, and work on a further four is about to be completed.

Centralised distribution systems continue to extend, and two urban networks for the distribution of propanised air are functioning at present. Others are being built. Sales of bottled liquid gas (AGIPGAS) rose by 35 per cent and the number of users increased to 2,400,000. Foreign sales are also growing, and a large number of concessionaires is already operating abroad.

PETROCHEMICALS

Work continued during the year on the petrochemical plant at Ravenna, which in its first stage will produce 35,000 tons of synthetic rubber annually, a figure which will rise to 55,000 tons in the second stage. Other products will include 650,000 tons of nitrogenous fertilisers. The plant will utilise as its raw material the natural gas discovered by ENI in the area, and is expected to begin production in a few months' time.

NUCLEAR ENERGY

AGIP Nucleare, a company set up in January, 1957, has already displayed a good deal of activity. Its programme comprises the construction and operation of power stations; secondary activities connected with these stations; the procurement of the necessary raw materials; and the installation of switching gear.

Negotiations were started with important British and American concerns and organisations, and definite agreements reached on co-operation in designing plants to be erected in Italy. This co-operation will provide ENI technicians with particularly valuable experience for future activity in this field in Italy. A start has also been made on organising SIMEA—a company set up jointly with IRI—for the establishment in Southern Italy of a nuclear power station, the second in the line of projects planned by AGIP Nucleare.

MISCELLANEOUS ACTIVITY

In the engineering sector, Nuovo Pignone completed its switch-over to products needed by the oil and chemical industries. The output of compressors and engine-compressor units showed an increase of 45 per cent in 1956. In April, 1957, Nuovo Pignone delivered to AGIP Mineraria the first drilling rig built under licence from Ideco. Another 23 rigs are now under construction.

Favourable prospects are opening for the Group in the field of engineering and the design and erection of industrial plants, and two companies were, therefore, set up in 1955 and 1956—SNAM Montaggi and SNAM Progetti. The former has already carried out or secured important orders in Italy, Egypt, the Netherlands and Pakistan.

GROWING POWER NEEDS

In Italy, energy consumption continued to expand in 1956 at an even faster rate than that which had obtained in the previous year.

Hence the need to intensify its efforts to ensure a growing supply of energy without either endangering its trade balance or raising the cost of production. This can be achieved in three ways—increasing internal output of the traditional sources of energy; participating directly in production from traditional sources of energy abroad; developing a national atomic industry.

PROGRAMMES AND PROSPECTS

ENI's activities to increase the power available in the country are developing in every one of the three directions indicated above: (1) ENI continued to prospect for hydrocarbons throughout Italy in 1956. Apart from the considerable output of natural gas in the Po Valley, they resulted in the extraction of oil at Gela. (2) ENI took the initiative to ensure Italy's participation in the exploitation of oil resources in foreign countries which are much richer in oil, and adapted the traditional relations between the oil undertaking and local governments to the political and economic realities of the present day. (3) ENI has drawn up a nuclear programme, which it proposes to carry out in the next few years.

SUMMARY OF BALANCE SHEET

The Profit and Loss Account at April 30, 1957, showed a net profit of Lit.4,585,974, which the ENI Board proposes to distribute as follows: Lit.917,194,989, or 20 per cent, to the ordinary reserve fund; Lit. 2,980,883,713, or 65 per cent, being the share due to State funds; Lit.687,896,242, or 15 per cent, to finance scientific studies and research into hydrocarbons and other sources of power.

SOUTH DURHAM STEEL AND IRON COMPANY LIMITED

GREATER PRODUCTION AND RECORD PROFITS

LARGE-SCALE DEVELOPMENT SCHEMES

A MILLION TONS OF STEEL PLATE PER ANNUM BY 1962

MR B. CHETWYND TALBOT'S REVIEW OF ACTIVITIES

The Fifty-ninth Annual General Meeting of South Durham Steel and Iron Company Limited will be held on January 29th at Caxton Hall, Westminster, S.W.

The following is the statement by Mr B. Chetwynd Talbot, TD (Chairman and Managing Director), which has been circulated with the report and accounts:

In forwarding to you the Report and Accounts for the financial year which ended on September 28, 1957, I include my address to shareholders which will be made at the Company's Annual Meeting in London on January 29, 1958, and which will appear in the Press in advance of that date.

SUBSTANTIAL INCREASE IN PROFITS

I will now explain in detail the causes which have led to a substantial increase in the level of your Company's profits during the last financial year. The gross profit, including £13,392 income from investments and after charging an amount for Directors' Fees, Staff Pensions, etc., of £89,722, amounted to a total for the year of £5,076,680, equivalent to an increase of 59 per cent over the profits earned in the previous financial year. This figure represents a record in the long history of South Durham and has been achieved primarily by the increase in the level of steel production at both West Hartlepool and Cargo Fleet and secondly by the benefits which have been secured during the year of new units of plant coming into production.

In some instances the benefits secured have only been for a short part of the financial year, as difficulties have been encountered by our contractors due to the attitude of labour in completing erection of plant by the dates previously indicated. In addition the past financial year contains profits for the first time from a full year's working of the new 40 ft steel pipe plant at Stockton, to which I refer later in my Remarks in greater detail.

BALANCE SHEET FIGURES

In commenting on the Balance Sheet figures for the past financial year I would draw your attention to the capital expenditure, including routine capital expenditure, amounting to £5,508,717. Of this total approximately 56 per cent was secured from your Company's resources by way of sums set aside for Depreciation and transfers to Reserve. The capital commitments at September 28, 1957, still to be expended on Stage Two Development amount to £5,703,805. The principal items of plant on which this money will be expended comprise at West Hartlepool (i) boiler plant and turbo alternators and (ii) a large diameter blast furnace and ancillary equipment; at Cargo Fleet the principal items include (i) ore discharging facilities on the River Tees, (ii) a large capacity ore stocking ground, (iii) boiler plant and turbo alternators, and (iv) sinter plant. Benefits will be secured from these items of plant as and when they come into active production during the present and subsequent financial years.

Due to increases in the levels of production during the year, to the incidence of the higher levels in costs of raw materials and to the values and amounts of work in progress as compared with September, 1956, stocks and work in progress increased by £1,013,440 to an amount of £6,314,783. For similar reasons Trade Debtors have increased by an amount exceeding £700,000 to a figure of £3,564,347. The amount owing to our Bankers at September 28, 1957, amounted to £2,701,149.

During the last financial year Investment Allowance Reserve has been increased by £450,000 to an amount of £1,380,000 and Replacement of Fixed Assets Reserve by £350,000 to an amount of £950,000. These appropriations are incorporated together with the sum of £1,300,000 transferred to General Reserve as detailed in the Profit and Loss Account.

PLANS TO INCREASE PRODUCTION

In my statement which was circulated with the Report and Accounts for the year ended September 29, 1956, I indicated it was the intention of your Directors to submit proposals to ensure a substantial addition to the level of steel plate production by your Company. I likewise indicated the shortage of steel plates of the larger range of sizes was acute and to avoid the deficiency between supply and demand reaching a serious figure in the next few years action to correct this position was essential.

The Iron and Steel Board gave formal approval on March 26, 1957, to the proposals put forward by your Directors and a public statement was made on March 28, 1957, outlining the major portions of your Directors' policy to secure this object.

NEW INTEGRATED WORKS

A site of approximately 530 acres has been acquired within easy access of the existing West Hartlepool Works of the Company. On this site we shall erect a new integrated steel works designed to operate in conjunction with the existing works so far as concerns the transfer of blast furnace gas and coke oven gas and of raw materials, molten metal and ingots for rolling into plates in the new plate mill.

An important part of the plan is the installation of new rolling equipment comprising (a) a new slabbing mill of the latest design capable of dealing with the whole ingot output of the two plants including the increased tonnage to be secured under the development plan and having reserve capacity for further increases of tonnage at later dates and (b) a new plate mill consisting of two 4-high stands capable of rolling steel plates up to 136 in. wide which are now required by the Shipbuilding and Engineering industries.

FIRST PHASE

Having regard to the magnitude of the project the scheme has been divided into two phases; the first and larger phase will comprise the slabbing and plate mills referred to above together with the installation of (i) a new battery of coke ovens (together with by-product plant) to produce 130,000 tons per annum of blast furnace coke and (ii) a steel melting shop comprising one active mixer and four steel furnaces with an estimated ingot production of 11,000 tons per week. This phase will also include the common services necessary on opening up the new site including roads, sidings and the provision of engineering and maintenance shops and all ancillary services.

The cost of the first phase including a provision for rising prices and the necessary increased working capital is today estimated at £43 million which will be spread over the five years to September 30, 1962. I am glad to be able to tell you that the necessary finance for this phase has been secured and that all required consents and approvals have been given so that this important and necessary scheme can proceed immediately. We have received great co-operation from the Finance Corporation for Industry Limited and from Barclays Bank Limited, our bankers; FCI has entered into an Agreement with us whereby advances up to £22½ million will be made available until September 30, 1967, and the Bank have agreed for a shorter term to increase our borrowing facilities up to £10 million which sums, together with the money to be found from internal sources, principally from retained profits and depreciation provisions, will, we believe, be adequate to finance the peak requirements until the new plant becomes revenue-earning. These borrowings from FCI and Barclays Bank will be secured by Debentures ranking after the Company's publicly held Debenture Stock.

I think it right to place on record that as part of our Agreement with FCI we have granted them an option over 2 million Ordinary Shares of £1 each at par, exercisable on three months' notice between October 1, 1959, and September 30, 1967.

SECOND PHASE

On completion of the first phase of the scheme the new slabbing and plate mills will have a capacity in excess of the output from the primary stages of iron and steel production of the Company from the existing and new plants. A second phase of the development will therefore be devoted to increased iron and steel production to be secured by the installation of two further batteries of coke ovens, additions to the ore handling

plant, a new 27 ft 6 in blast furnace and a further active steel mixer and two additional steel furnaces. This second phase is estimated to cost an additional £12 million including, as before, a provision for rising costs and the necessary additional working capital.

It is our intention to proceed with this second phase as soon as we have arranged for it to be financed. The necessary approvals have been given and consent has been received from HM Treasury to the raising of the sum of £8 million which is the proportion that is estimated to be required. This matter is receiving the attention of your Directors and I hope to be able to announce our plans at an early date.

The Iron and Steel Board are most anxious that the full scheme should be implemented at the earliest date since the provision of an increased tonnage of steel plates is being given high priority. Your Directors are satisfied that these plans are not only in the National interest but also in the best interests of the shareholders.

PROPOSED CAPITAL INCREASE

The completion of these large scale development schemes will depend on delivery and installation of the vast amount of structural steel and intricate plant required but present estimates are that the level of steel plate production should advance by a substantial tonnage during the financial year ending September 1962, with a consequent increase in earning capacity. In the immediate subsequent years under normal conditions the level of earning capacity should increase in accordance with the enhanced levels of production which will be secured.

These large plans for development will necessitate an increase in the borrowing powers of the Directors and also proposing that the Authorised Share Capital of the Company should be increased by £6 million. You will be asked to approve Resolutions to this effect at an Extraordinary General Meeting to be held immediately after the Annual General Meeting on Wednesday, January 29, 1958. So far as the share capital is concerned there is at present in reserve a total of 4 million unclassified shares of £1 each and we are proposing that the reserve should be increased to £10 million by the creation of a further 6 million similar shares. The borrowing powers of the Directors are limited by the present Articles of Association to an amount equal to the aggregate of the paid-up capital of the Company and the Group Reserves. We are proposing that in future the limit for borrowing by the Company and its subsidiaries should be increased to an amount of £50 million.

IMPORTANCE OF LOCATION

In developing an integrated plant of the magnitude I have described a vital factor is the exact location in connection with an existing Works in order to secure every benefit from the many valuable facilities already in operation. The approach in the early stages by your Directors to this problem comprised the use of 110 acres of land, which have been in the possession of your Company for many years, and the removal of 3 million tons of slag to secure a larger area. An early examination of the first of these two considerations provided definite proof that the increase in plate production would for all time be limited to a level of output not commensurate with the capital outlay involved. A further scheme to extend the original area was examined and was finally abandoned on the advice of foundation and soil experts due to irregularities of strata conditions which would have necessitated a costly outlay on piling construction. Your Directors were relieved this latter scheme was abandoned as it comprised the destruction of a substantial amount of modern housing property.

Negotiations were then proceeded with for the purchase of 532 acres of land in the vicinity of the existing West Hartlepool Works and have been completed during the last few months. Examination and testing have given satisfactory proof that the strata conditions are of the requisite standard to support the heavy loads demanded in a modern plant of this nature. The area available for the developments previously referred to constitutes in the opinion of the experts who have examined the plans and drawings a site possessing the greatest potentialities. In this respect it is intended for purposes of identification to refer to these two plants as The North, the existing plant, and The South Iron and Steel Plants of the South Durham Steel & Iron Company, Limited.

TRANSPORT FACILITIES

The South Plant will have immediate access to the main Stockton-West Hartlepool railway of the British Transport Commission and likewise excellent road facilities on trunk roads. The distance from the Hartlepool Docks of the British Transport Commission where facilities already exist for the rapid discharge of 15,000 ton ore carriers is only 3½ miles and the British Transport Commission is already proceeding with work to duplicate the existing berthage facilities to accommodate simultaneously two large capacity ore carriers.

These two plants of your Company are situated in one of the greatest and most important of the Industrial areas in the United Kingdom. The carriage rates to the Shipbuilding and Engineering Works on the North-East Coast, to your Company's Steel Pipe and Constructional Departments at Stockton, and to the Engineering Works further inland, are considerably below the National level, and the reduction in mileage will ensure a quicker turn round by the British Transport Commission of steel carrying wagons.

I have mentioned previously that due to their location it will be possible to link up the services, the supplies of coke oven and blast furnaces gases of the North and the South Plants to form an integrated unit of the highest efficiency of any similar plant in the World. When the benefits of the Full Scheme are obtained during 1962 steel plate production will approximate 1 million tons per annum of heavy, medium and light plates all rolled in two 4-high mills possessing the highest level of efficiency and accuracy. When expenditure of this magnitude is involved, it is always prudent to retain some measure in hand to increase production to an even higher level. This has been the policy which your Directors have applied as far as the potential level of steel plate production is concerned from the new slabbing mill and the 4-high plate mills. On completion of the Full Scheme a further modest expenditure to increase pig iron and ingot production would enable a further reasonable increase in plate production to be achieved.

OPPORTUNITY FOR PLANT CONCENTRATION

Taking into consideration this additional steel plate capacity which can ultimately be secured, in my view a great opportunity now presents itself as advocated in the White Paper issued in the immediate postwar years for the concentration at one plant on the North-East Coast of heavy and medium plate production. To reinforce these remarks it would be in effect a continuation of the policy which has been accepted in other sections of the Iron and Steel Industry for the fullest usage to be made of modern plant possessing the highest level of efficiency.

In the Special Report issued in July, 1957, The Iron and Steel Board indicated the level of ingot production which individual firms should achieve by 1962 and subsequent years. The level of ingot production from the West Hartlepool and Cargo Fleet plants of your Company amounted during the last financial year to 863,000 tons. On the completion of the Full Development Scheme at West Hartlepool the combined ingot production is estimated to rise to an annual level of approximately 2 million tons.

Your Directors are satisfied under normal trading conditions on the completion of the two phases for increasing plate production the amount of capital invested per ton of ingot production will bear favourable comparison with any modern plant producing similar ranges of steel products. Moreover, the expenditure which I have outlined above is for the increase in the level of output of a steel product which, firstly, secures a higher price level than other heavy steel products and, secondly, will enable the potentialities of steel pipe production to be further extended.

In the conclusion of my Remarks on your Company's policy to play an active part in lifting the level of plate production I feel you would like me to place on record the high level of assistance and advice which myself, Mr Williams and your Company's technicians have received both from producers of plant and machinery in this Country and in the USA and from the executives responsible for the operations of such enterprises during recent visits to the USA.

CANADIAN CONTRACTS

I referred earlier in my Remarks to the activities of your Company's Steel Pipe Department at Stockton. Commencing during the latter months of 1955 and concluding in April, 1957, 313 miles equivalent to 87,500 tons of 30 in. diameter steel pipe in 40 feet lengths were produced at Stockton and shipped to Vancouver, British Columbia. This mileage represents 47 per cent of the 662 mileage of the pipe line to convey the natural gas resources from the Dawson Creek area in Alberta and from the Peace River area in British Columbia across the Rocky Mountains to Vancouver and thence into the United States. I attended the inaugural ceremony at Fort St. John on the Peace River on October 7th last when the vast natural gas resources of Alberta and British Columbia were merged for flowing down the 662 miles of this great enterprise. It may interest you to know the completion of this pipe line is considered in British Columbia as a project of equal importance as the linking up with Eastern Canada by the opening of the Canadian Parific Railway in 1885.

Your Company has been engaged since March, 1957, in the execution of the contract with Trans-Canada Pipe Lines, Limited, of its proportion of the 2,200 miles of the even greater project for the conveyance of natural gas from Alberta to Eastern Canada. The tonnage to be manufactured and shipped by your Company between March, 1957 and June, 1959, amounts to 178,000 tons and is equivalent in distance to 636 miles.

The combined value of these two contracts amounts to 52.5 million dollars. It will continue to be the policy of your Directors to keep available from the level of steel pipe production a substantial tonnage for projects in Canada of a similar and important nature.

Concurrently with these two Canadian contracts the Steel Pipe Department has continued to provide substantial tonnages of steel pipes for the principal International Oil Companies. The rate of deliveries in the immediate years ahead will continue to show an increase as compared with the last two years to this World-wide Industry on which the economy of the Free World depends.

OTHER ACTIVITIES

The progress of the activities of your Company in other fields of the supply of structural steelwork in World Markets has proceeded satisfactorily. In Jamaica the supply and erection of the bauxite treating plant at Mandeville for the Aluminium Union Limited has been completed and work has commenced on a new plant at Ewarton. The contract has been entrusted to your Company for the supply of the steelwork for a similar plant in British Guiana.

Important contracts have been secured for specialised steel construction work for oil jetties both in the United Kingdom and in the major oil producing countries in the World.

FUTURE DEMAND

I now turn to the future level of demand for the range of steel products manufactured by your Company and my remarks embrace both Home and Export Markets. In view of the volume of the order books secured in recent years by the Shipbuilding Industry I consider it is unlikely any appreciable diminution in the rate of deliveries of steel products will occur. I feel similar remarks apply to the section of the Heavy Engineering Industry engaged in the manufacture of products containing a large element of steel.

As from January 1, 1958, I am pleased to be able to inform you export licensing has been withdrawn on all heavy steel products manufactured by your Company with the exception of steel plates. It will not be the intention of the Steel Industry to abuse this freedom to export at the expense of home consumers. In certain respects during the imposition of export licensing difficulties were manifest not only to retain our position in traditional markets but also to secure confidence from our friends in World Markets that ultimately reliance could be expected for a reasonable proportion of their steel requirements to be obtained in this Country.

DIVIDEND POLICY

I would refer you to the statement I issued at the end of March last in connection with the policy which your Directors intended to pursue with regard to the annual rates of Dividends during the years the heavy expenditure on capital account will be incurred. Compared with the rate of Dividend postulated in the Offer for Sale dated January 20, 1956, the final payment for the last financial year at 6 per cent together with the Interim Dividend of 4 per cent paid at the end of June 1957, represents an increase of 25 per cent in a period of less than two years. The market prices of all Steel shares, despite the higher Dividends paid by the major Steel Companies, still remain unduly depressed, principally due to reasons outside the control of the Industry.

The Dividend for the year at the rate of 10 per cent is in the opinion of your Directors an equitable distribution and it must be borne in mind persuasion is still being exercised by the Government on all Companies to restrict steep rises in the rate of distribution. It will continue to be the policy of your Directors to maintain the rate of Dividend on the Equity Capital of your Company at an amount in relation to annual profits.

PENSIONS AND LIFE ASSURANCE

During the year negotiations have been concluded and the necessary administration arranged to introduce Pension and Life Assurance Schemes for Male Works Employees in the full time service of the Company and the Schemes will apply as from January 1, 1958. The basic pension is non-contributory but provision is made for the voluntary purchase of additional pension by individuals, which provision has been utilised by a substantial number of the Company's employees. Life Assurance cover is provided under the Scheme and if a member dies on or before normal retiring date his representatives will receive a Life Assurance Benefit of £400.

You will have noted from the Directors' Report The Honourable E. F. Ward was elected a Director of your Company during the year. Mr Ward has great experience with the intricacies of the Steel Industry in Europe and in the USA. I am confident Mr Ward's appointment as an Executive Director will be of great benefit to your Company and I am certain you would wish me to express to Mr Ward every success on his appointment.

During the last year certain valued members of the Staff of your Company have retired. I would like to draw to your notice the fact in many instances the whole of their working life has been spent in the employment of your Company. Over and above the level of pensions secured under the original scheme introduced in 1937 and subsequent amendments thereto, it has been the policy of your Directors to supplement the agreed amount of pension from the sum set aside each year and which is included in the Profit and Loss Account under the heading of the Provision for Supplementary Non-Contributory Pensions. During the last financial year the amount set aside for this purpose has been increased by £20,000 to a figure at the rate of £35,000 per annum.

In concluding my Remarks I would like to place on record the great assistance which has been so willingly given both from the financial and technical aspects in the preparations of our Development Schemes by all members of your Company's Staff. Likewise I desire to pay tribute to the services of our Staff and workpeople during the year and I feel sure we can rely on their continued co-operation in the future.

BARCLAYS BANK DCO

ANNUAL GENERAL MEETING

MR J. S. CROSSLEY'S STATEMENT

The thirty-second Ordinary General Meeting of Barclays Bank DCO was held on January 3rd at 29 Gracechurch Street, London, E.C.

Mr Julian Stanley Crossley (the Chairman) presided.

The Secretary, Mr C. F. S. Pringle, read the notice convening the meeting and the auditors' report to the stockholders.

With the concurrence of the stockholders present, the Report and Accounts and Statement by the Chairman, which had been previously circulated, were taken as read.

Before proceeding with the formal business of the meeting the Chairman referred to the recent death of Sir Ernest Oppenheimer and paid tribute to his memory and to the work he did for Africa. He mentioned that for more than 20 years Sir Ernest had been a Member of the Central Board of the Bank, having previously been a Director of the National Bank of South Africa since 1918. Sir Ernest had only relinquished his directorship in the DCO in 1950 when his place was taken by his son, Mr Harry Oppenheimer.

The Chairman also referred with deep regret to the death of Sir Harold Cartmel-Robinson, CMG, OBE, who had been a member of the Bank's Rhodesian Board since 1949 up to the time of his death. He spoke of Sir Harold's distinguished career in the Northern Rhodesian Administration and mentioned that Sir Harold had been appointed Chief Secretary there in 1945 and acted as Governor during his last year of service. He will be greatly missed by his many friends in Rhodesia as well as in this country.

The Chairman then referred to the appointment of Mr Norman Hyde-Jones as a member of the Bank's Rhodesian Board and to two senior staff appointments since his statement to the Stockholders was printed—that of Mr J. A. Scott as a Local Director of the Ghana and Sierra Leone Board and Mr J. B. Bailey as a Local Director of the Nigeria and Cameroons Board.

GROUNDS FOR CONFIDENCE

The Chairman added that the year covered by the accounts had not been by any means an easy one and the fact that the Bank had emerged as well as it had done from the year now past gave grounds for confidence in the future.

He then moved the adoption of the Report of the Directors and the Statement of Accounts and the payment of a final dividend of 4 per cent actual on £12,932,250 Ordinary stock, making 8 per cent for the year, less income tax at the standard rate of 8s. 6d. in the £.

The motion was seconded by The Honourable Sir Geoffrey Gibbs, Deputy Chairman, and carried.

The retiring directors, Mr Julian Stanley Crossley, Mr Alexander Ludovic Grant and Mr Frederic Seebohm, were re-elected.

On the motion of Sir Frank Newson-Smith, Bart., seconded by Mr T. Bland, the auditors, Messrs Deloitte, Plender, Griffiths & Company, Price, Waterhouse & Company, Peat, Marwick, Mitchell & Company and Cooper Brothers & Company, were re-appointed.

A vote of thanks to the Staff, proposed by Mr A. L. Grant (a Director) and seconded by Mr A. D. Marris, CMG (a Stockholder), was carried unanimously and was responded to by Mr R. D. Smith (a General Manager).

A vote of thanks to the Chairman for presiding at the meeting was proposed by The Right Honourable The Viscount Knollys, GCMG, MBE, DFC, and was unanimously accorded.

BANK OF CEYLON

INTERNATIONAL TRADE: STEPS FOR BROADENING BASE

MEETING EVER-INCREASING DEMAND FOR HIGHER STANDARD OF LIVING

MR H. V. PERERA ON NEED FOR EMPHASIS ON DEVELOPMENT

The annual general meeting of the Bank of Ceylon was held on December 21st at Colombo.

The following is an extract from the statement by the Chairman, Mr H. V. Perera, QC, on the report and accounts for the year ended September 30, 1957: During 1957, Ceylon's economy suffered a set-back and its business climate was hardly conducive to steady economic growth. Our major export products were adversely affected by falling commodity prices, though export earnings maintained the previous year's level owing to increased production resulting from the chance circumstance of good growing conditions relating to agricultural products. The dislocation of trade caused by the Suez Canal closure and the general political unrest in other parts of the world had their inevitable impact on our economy.

External factors apart, our country had its share of internal troubles. Serious civil disorder that might have occurred over the language issue was averted by the basic good sense of the two major communities.

A situation of greater consequence to the country's economic future arising from labour disputes has recently developed. A spate of strikes has seriously affected our main port and disturbed the economic life of the country. The consequent loss to the economy in terms of national income and damage to our development effort will be considerable. Demands for a higher standard of living are justifiable and should be met not so much by increased wages as by increased national output.

The picture, however, is not one of unrelieved gloom. It is brightened by the laying of foundations more broad-based for international trade. Ceylon has widened her circle of friends by establishing diplomatic relations with more countries, and at the same time has strengthened the political and economic ties of the past. The wider circle of friendly nations means an expanding market for our products. It also implies a larger area from which we could select our requirements of capital and consumer goods as well as financial aid and the technical know-how necessary for economic development.

EUROPEAN COMMON MARKET

At the Commonwealth Finance Ministers' Conference held in October, European economic integration and Commonwealth trade relations loomed large in the discussions. I am sure that our Government is giving adequate thought to the possible repercussions of the European Common Market on the country's economy, particularly with regard to the pattern of our foreign trade. We welcome the decision taken at the Conference to assess the opportunities for economic expansion in the less developed countries of the Commonwealth and the requirements of capital and technical assistance needed for the purpose.

FALL IN COMMODITY PRICES

The general fall in commodity prices this year gave rise to much anxiety both at home and abroad. The strain on commodity prices was aggravated by fears of a recession in business in the United States of America and by a steep increase of the Bank Rate in the United Kingdom and by other forms of restriction on credit throughout the world. Tea and rubber producers in Ceylon were embarrassed by the low level of prices for their produce and made unsuccessful bids for reductions in export duties. The decline in our external assets reflected inter alia an adverse trade balance and to some extent the repatriation of the sale proceeds of foreign-owned assets. Following a directive by the Central Bank, commercial banks restricted credit for imports of non-essential goods and for the purchase of properties owned by non-residents.

After reviewing the conditions in the tea, rubber and coconut markets and various aspects of the monetary position, the chairman continued:

ECONOMIC DEVELOPMENT

I have referred earlier to the recent spate of strikes which has made the Government grant considerable increases in living allowances. These increases, unless matched by increased production, must necessarily result in inflation of a serious magnitude causing a further rise in the cost of living and consequently leading to demands for further increases in allowances.

Development requires investment, and investment in turn depends on adequate savings as the availability of foreign capital for investment in the country is limited. Since the increases in living allowances recently granted will swell the purchasing power of those whose propensity to consume is high, it must follow that the developmental efforts of the Government must suffer owing to reduced savings. I am confident that the Government will be bold enough to face realities and find a solution to meet the ever increasing demand for a higher standard of living by placing more emphasis on development than on the distribution of a stagnant national income now showing signs of serious deterioration. The world in general is faced with the problem of population expansion, and Ceylon in particular is much concerned with this problem in view of the fact that the rate of population growth in this country is among the highest in the world. What is required, and what must be aimed at, is not a mere stepping up of production to give a better standard of living to the present population but the raising of production to a level that will provide for the needs of a growing population. It is disquieting to find that the present trend in this country is in the opposite direction. We believe that it is not beyond the capacity of our Government to reverse this trend within the framework of democracy to which it is committed.

BANK OF CEYLON

The assets of your Bank as on September 30, 1957, stood at Rs 742 million, representing an increase of Rs 119 million over the assets figure at the end of the previous financial year.

Advances.—Your Bank continued to provide credit to customers in the form of Commercial Advances, Medium Term Loans matched by Medium Term Deposits, and finance for exports and imports. These advances reached a total of approximately Rs 160 million, an increase of Rs 18 million over the figure of the previous year.

Investments.—The Bank has found itself in a position to assist in the Development schemes of Government and has during the year increased its investment portfolio from Rs 127 million to Rs 154 million, though investments of the banking system as a whole registered a fall. Our holding of Treasury Bills, however, fell from Rs 29 million to Rs 18.8 million. Our investment in the Development Finance Corporation of the face value of Rs 2.8 million is written down in the Balance Sheet to Rs 2.52 million. The valuation of Government and Government guaranteed securities continues to be on the basis of the lower of book or par value.

Deposits.—While the total deposits of all commercial banks dropped by approximately 5 per cent, the total deposits of your Bank increased by just over 7 per cent. After making allowances for hot deposits in our books at the end of the last financial year the deposits held by your Bank constitute over 37 per cent of the total deposits of all commercial banks of this country. Our continued progress in this field is, I venture to think, an indication of the appreciation of our services by depositors, both large and small, and the confidence reposed in your Bank.

Liquidity.—Cash, Loans at Call, Money at Short Notice and Treasury Bills amounted to Rs 159.5 million, constituting 33.9 per cent of total deposits. Our total liquid assets, which include Bills discounted, amounted to Rs 192.6 million. The percentage of liquid assets to total deposits is thus 40.9; the percentage to demand deposits is 62.

PROFITS

In spite of increased turnover the net profits fell in the face of increased operating costs and taxation, from Rs 732,600 to Rs 726,000. An interim dividend of 7½ per cent was paid on June 1, 1957, and your Directors are recommending payment of a final dividend of 7½ per cent making a total of 15 per cent for the year.

Your Directors are recommending the transfer of Rs 350,000 out of current profits to "Other Free General Reserves," which will then stand at Rs 4,850,000. In addition, the Directors have authorised the transfer from Inner Reserves of a sum of Rs 1,150,000 to this account during the current financial year. "Other Free General Reserves" will therefore stand at Rs 6 million. The Capital and published free reserves of your Bank will then aggregate Rs 16.5 million, in addition of course to substantial free inner reserves.

LONDON OFFICE

Our London Office has moved to new and more spacious quarters in Moorgate, which is in the heart of London's financial area. The premises were formally opened by an old and valued friend of the Bank, Sir Claude Corea, who was, as you know, Ceylon's High Commissioner in London at the time.

The report and accounts were adopted.

MERCANTILE CREDIT COMPANY

LARGER PROFITS

The twenty-fourth annual general meeting of Mercantile Credit Company, Limited, was held on January 8th, in London, Sir Mark Turner, chairman, presiding.

The following is an extract from his speech circulated with the report and accounts for the year ended September 30, 1957 :

I should first like to pay tribute to Sir Edward de Stein, who retired in May. Sir Edward has been the principal architect in the creation of Mercantile Credit Company as we know it today, and shareholders and his colleagues on the board owe him a great debt of gratitude.

There will be few who have not realised from newspaper reports based upon Board of Trade returns and other sources that the year covered by the accounts before you must have produced very spasmodic conditions in hire purchase in the United Kingdom.

Despite these changing circumstances, we have, I am glad to say, been able to show for the parent company an increase in its outstandings and profits as compared with 1956.

Owing to the increase in the Bank Rate it was necessary to transfer £55,000 from the total of what would otherwise have been earned during the year under review. This is perhaps a smaller sum than one might have anticipated, but our analysis showed a reduction in average term compared with previous years, and our new level of unearned charges which includes this sum is therefore in proper relationship. For several years past it has been the policy of the company to accept deposits and they now represent an important part of the funds available for our business.

You will see in our consolidated balance sheet under "Current Assets" a new item for Treasury Bills, amounting to approximately £600,000. This could be said to owe its origin to the increasing volume of deposits to which I have referred.

NEW ACQUISITION

I now wish to refer specifically to the recent acquisition this summer of the whole of the Ordinary share capital of United Motor Finance Corporation.

At the time of the amalgamation the outstandings of UMF, as the company is generally known, approximated two and three-quarter millions and these, of course are now incorporated in the group figure in the consolidated balance sheet.

We have recently given notice of our proposal to acquire the whole of the outstanding Preference shares in UMF by an offer to those shareholders to exchange their shares into Preference shares of MCC. We have obtained the consent of the Capital Issues Committee to capitalise £805,500, part of the £913,498 standing to the credit of the share premium account, by the issue to present holders of 5s. stock units of one Ordinary share of 5s. for each 5s. stock unit now held.

OVERSEAS INTERESTS

In Ireland, South Africa and in the Federation of Rhodesia and Nyasaland, we have made progress.

Interprovincial Building Credits, Toronto, in which we obtained a substantial share interest during 1956, continues to make satisfactory progress.

So far as the current year is concerned, our experience to date suggests that we may expect a satisfactory level of business.

APPOINTMENTS

FERRANTI LIMITED

MANAGEMENT ACCOUNTING

Forecasting and Overhead Analysis are two of the aspects of management accounting dealt with by a section of the Ferranti Company covering a most interesting range of products, including ELECTRONIC COMPUTERS, AIRCRAFT EQUIPMENT, PRECISION INSTRUMENTS, AND DOMESTIC APPLIANCES.

A vacancy exists in this section and applications are invited from candidates of about 25 years of age, with an interest in these aspects of industry and able to discuss at all levels data relevant to forecasts of future policy. Some industrial experience would be an advantage.

A graduate might well find in this work a suitable introduction to management accounting.

The Company has a Staff Pension Scheme and an Assurance Scheme for Dependants.

Forms of application can be obtained from T. J. Lunt, Staff Manager, Ferranti Limited, Hollinwood, Lancs. Please quote Ref. J.W.

A PROGRAMMING AND PROGRESSING ENGINEER is required on the Civil Engineering Construction of a Major Steelworks at Durgapur in India. The Contract is for three years, at a salary of £2,000 per annum tax free, with bonus, free medical attention, paid leave, free passages for families and furnished accommodation at a reasonable rent.

Applicants should have had at least 3 years' experience on major projects either with Consulting Engineers or Contractors.

Apply, giving full personal details and details of qualifications and experience, to :

THE CEMENTATION COMPANY LTD.,
Durgapur Project,
20 Albert Embankment,
London, S.E.11.

J. & J. COLMAN LTD., a member of the Reckitt & Colman Holdings Group of Companies, requires a Manager for its Market Research Department. The duties are concerned primarily with foodstuffs, and the appointment involves residence in Norwich. The post demands wide experience in practical field work, and a broad knowledge of statistical methods.—Applications, stating age, qualifications, experience, salary required, should be sent to the Secretary, J. & J. Colman Ltd., Carrow Works, Norwich, Norfolk.

QUALIFIED ACCOUNTANT. A large manufacturing business, with Head Office in London, requires a qualified Accountant, under 30 years of age, with commercial experience and ability to control staff. This position offers a man of exceptional calibre the opportunity to progress to a senior executive position. The commencing salary will be not less than £1,250 per annum and the appointment carries eligibility for free life cover and pension and profit sharing.—Applicants should state full details of qualifications and experience, age and present salary when replying to Box No. 8533.

METROPOLITAN BOROUGHS' ORGANISATION AND METHODS) COMMITTEE require PROGRAMMER to take part in studies of the application of an ELECTRONIC COMPUTER to accounting and clerical work of local authorities and the establishment of a large scale automatic office. 1st or 2nd Class Honours degree (preferably in mathematics) desirable. Full training in programming will be given. Initial salary between £700 and £1,000 according to qualification. Pensionable.—Application form and further particulars from Honorary Clerk, Westminster City Hall, W.C.2. Closing date January 30, 1958.

WORKERS' EDUCATIONAL ASSOCIATION
WEST MIDLAND DISTRICT.
Applications are invited from graduates for the post of ORGANIZING TUTOR in North Warwickshire. Teaching subjects: Industrial Studies or History or P.P.E., though other subjects may be considered. Salary £650 to £1,200.—Details (please enclose stamped addressed envelope) from R. P. B. Davies, M.A., 79, Calthorpe Road, Birmingham, 15.

UNIVERSITY OF THE WITWATERSRAND, JOHANNESBURG
SOUTH AFRICA

Applications are invited for appointment to a post of SENIOR LECTURER on the staff of the DEPARTMENT OF LOCAL GOVERNMENT AND PUBLIC ADMINISTRATION. Duties are to be assumed as soon as possible.

The salary will be according to the scale £1,200 x £50—£1,500 per annum. In addition, a married man will receive a temporary cost of living allowance, the present rate being £234 per annum. A commencing salary above the minimum notch may be paid on the grounds of special qualifications or experience.

Membership of the University Institutions Provident Fund is compulsory, and membership of the University's Staff Medical Aid Fund is compulsory in the case of an officer who is found eligible in terms of the rules.

Intending applicants are advised to obtain a copy of the Information Sheet relating to this vacancy from the Secretary, Association of Universities of the British Commonwealth, 36, Gordon Square, London, W.C.1.

Applications close, in South Africa and London, on February 20, 1958.

UNIVERSITY OF GLASGOW
STEVENSON LECTURESHIP
IN CITIZENSHIP

The University Court will be considering shortly an appointment to the Stevenson Lectureship in Citizenship, tenable in the first instance for a maximum period of five years from October 1, 1958, or from such later date as may be arranged. The appointment will be full-time. The stipend will be £1,350 x £75—£1,800 per annum, with superannuation. All who may be interested are asked to communicate with the undersigned, who will supply further particulars.

ROBT. T. HUTCHESON,
Secretary of University Court.

HER MAJESTY'S OVERSEAS CIVIL SERVICE
ECONOMISTS/STATISTICIANS, TREASURY, KENYA

Candidates, who must be under 45, should possess an Honours Degree or equivalent in Economics or Economics and Statistics. Experience desirable of economic research or economic administration and previous service in a government organisation an advantage. Some knowledge of handling statistical data and experience in its collection and interpretation is essential. One of these two vacancies requires a knowledge of agricultural economics and experience in an advisory capacity in this or in agricultural research. Duties will include collecting economic and statistical information from various organisations, analysing this information and preparing reports and precis for submission to the Economist to the Treasury.

Appointment will be on probation for the permanent and pensionable establishment, inclusive salary scale £939-£1,863, point of entry determined by experience. Government quarters, if available, at moderate rental. Free passages for officer, wife and family. Income tax at local rates. Generous home leave.

Application forms and further particulars from Director of Recruitment, Colonial Office, Sanctuary Buildings, Great Smith Street, London, S.W.1 (Reference BCD 161/7/01).

TECHNICAL COLLEGE

Principal : R. HEWITT, M.Sc., A.F.R.Ae.S., F.R.G.S.

Applications are invited for the following new appointment :

DEPARTMENT OF COMMERCE
Head of Department, Grade I (man or woman).

The post is for a new department of the College which will become operative in September, 1958. Applicants must be well qualified and should have had considerable experience of similar work in a technical college. The successful candidate will be required to take up duty in April, 1958.

Further particulars and forms of application (stamped addressed envelope) may be obtained from the Principal, Technical College, Hunnyhill, Newport, Isle of Wight, to whom they should be returned as early as possible.

A. L. HUTCHINSON,
County Education Officer.

MARKET RESEARCH. A London Advertising agency requires an Assistant in its Research Department. Candidates should preferably be between 25 and 30 and should have either a university degree in Economics and Statistics or practical experience in market research and/or marketing. Some knowledge of advertising practice and particularly media selection would also be an advantage.—Please write to the Secretary, C. R. Casson, Ltd., 6 Aldford Street, W.1.

ACCOUNTANT. Growing group of city import and export merchants seeks services gentleman (28/35), preferably qualified, to undertake reorganisation and running of their mechanised accounts department. Applicants must be hardworking, with initiative, nimble mind. Salary to draw best from staff. Salary about £1,200. Liberal pension scheme. Own staff aware of this advertisement.—Please submit fullest particulars in confidence to Box Z581, c/o Streets, 110, Old Broad Street, E.C.2.

B.E.A. require a CARGO RESEARCH OFFICER. Duties include collection and analysis of statistical data relating to carriage of freight by air and surface and preparation of estimates of future traffic and yield rates. Previous experience in research work essential. Economics degree or equivalent qualification and experience in analysis of statistical information desirable. Commencing salary £1,025, rising to £1,250 p.a.—Written applications to Personnel Officer, Head Office, British European Airways, Keyline House, Ruislip, Middlesex.

HIGH-CLASS SECRETARY of good general education and preferably with knowledge of German required for Director of London Merchant Bank. Attractive emoluments including non-contributory pension scheme.—Please reply, giving details of qualifications and experience, to Box 2591, c/o Streets, 110, Old Broad Street, E.C.2.

WOMAN GRADUATE required by Merchant Bankers for Research Department. Work would primarily involve extracting and arranging of economic and investment material.—Please write, stating age, experience and qualifications, to Box DE/92 c/o 95 Bishopsgate, E.C.2.

AUSTRALIA
UNIVERSITY OF SYDNEY

Applications are invited for the position of LECTURER IN ECONOMICS.

The salary for a lecturer is within the range £A1,200—80—£1,750 per annum, plus cost of living adjustment (£70 men, £53 women) and will be subject to deductions under the Superannuation Act. (The current scale of salaries is under revision.) The commencing salary will be fixed according to the qualifications and experience of the successful applicant.

Under the Staff Members' Housing Scheme in cases approved by the University and its Bankers, married men may be assisted by loans to purchase a house.

Further particulars and information as to the method of application may be obtained from the Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1.

The closing date for the receipt of applications, in Australia and London, is February 15, 1958.

UNIVERSITY OF MELBOURNE

Applications are invited for positions of
SENIOR LECTURER and LECTURER IN ECONOMICS.
LECTURER IN COMMERCE.
LECTURERS (2) in ACCOUNTANCY.
LECTURER in ECONOMIC HISTORY (Knowledge of American and/or Asian economic history an advantage).
RESEARCH ASSISTANT in ECONOMIC HISTORY.

The new salary scales to operate from January 1, 1958, are as follows :
Senior Lecturers—£A2,100 to £A2,500 per annum;
Lecturers—£A1,450-£A2,100 per annum.
Research Assistants—£A1,050 per annum.
Initial salary will be fixed according to qualifications.
Superannuation similar to F.S.S.U. in Great Britain is provided for Senior Lecturers and Lecturers.

Further particulars and information as to the method of application for all posts, except the Research Assistant in Economic History, may be obtained from the Secretary, Association of Universities of the British Commonwealth, 36, Gordon Square, London, W.C.1. Inquiries about the latter post should be sent direct to the Registrar, University of Melbourne, Carlton, N.3, Victoria, Australia.

The closing date for the receipt of applications, in Australia and London, is February 28, 1958.

APPOINTMENTS

QUALIFIED ACCOUNTANT

RICHARD COSTAIN LTD.

invite applications from top grade chartered accountants (or an equivalent qualification) to be responsible for the accounting and financial administration of large overseas contracts. This is a senior and permanent appointment and on the satisfactory completion of the initial tour another appointment of equivalent responsibility will be offered.

The post calls for good organising and administrative ability as well as accounting knowledge, and it is essential that candidates have worked in the contracting industry or have had several years' industrial experience of a first-class company and are capable of earning £1,500-£1,750 in the United Kingdom.

The immediate appointment will be to a contract in the tropics and will provide bachelor accommodation only. However, a salary of over £2,000 per annum will be paid together with free accommodation and messing, kit allowance, first-class return air passage, and generous leave on full pay at the end of the tour.

This salary is not liable for local income tax.

Write, giving full particulars, to

Group Accountant
RICHARD COSTAIN LTD.
111, Westminster Bridge Road,
London, S.E.1.

BEECHAM FOODS LTD. require a Brand Manager to be responsible to a Marketing Manager for the advertising and promotion of a group of nationally advertised brands. Candidates should be between 27 and 35 years of age; good practical experience of marketing and advertising consumer goods essential; past selling experience would be an advantage. The post offers excellent opportunities to a young man of ability to prove himself and prospects of promotion are good. Non-contributory Pension and Profit Participation Schemes.—Please write in confidence, giving details of qualifications and experience, to Personnel Controller, Beecham Group Ltd., Great West Road, Brentford.

CHARTERED ACCOUNTANT, age 35-40, wanted to assist senior financial controller of substantial public company. This is a unique opportunity for a man with experience and enthusiasm to join a large industrial group. Good salary and excellent prospects leading possibly to a top management appointment at the highest level.

Applications invited from Accountants who have had experience in the administration and financial control of large groups of companies with interests at home and overseas.

Reply by letter in first instance, giving full particulars of background and positions held. Applications will be treated in fullest confidence; and all applicants whose qualifications and experience appear to meet requirements will be interviewed.—Box 825.

TRADES UNION CONGRESS invites applications for Assistant in Social Insurance and Industrial Welfare Department, which besides Social Insurance, Department covers occupational health, welfare and safety. Background knowledge of economic aspects of social legislation desirable.—Further particulars from Sir Vincent Tewson, C.B., 23-28 Great Russell Street, London, W.C.1. Closing date for completed applications January 20th.

CHARTERED ACCOUNTANT aged thirty to forty years preferably with Economics degree required for visitor's office, country, New South Wales, accommodation arranged, fares financed.—Write J. Farrell, Solicitor, Temora, New South Wales, Australia.

OPERATIONAL RESEARCH (WOMAN)

A staff vacancy exists for a suitably qualified and/or gifted young lady to enter this field in a young and expanding concern of electronic control engineers. A degree in engineering, science, maths, psychology, or economics, with interest in statistics, will help. The work involves analysis of operating figures and assessment of management problems in quantitative terms. Adequate guidance, equipment and scope will be given, but not much clerical help. A positive and sympathetic outlook on the terms of industry is essential.—Please write in confidence to the Managing Director, Mr. Richard Steel, Servomex Controls Ltd., Crowborough, Sussex.

THE UNIVERSITY OF MANCHESTER

RESEARCH STUDENTSHIPS AND RESEARCH GRANTS IN ECONOMIC AND SOCIAL STUDIES

Applications are invited for the above studentships and grants, tenable for one year in the first instance, and renewable for a further period not exceeding two years. The studentships are normally of the value of £350 or £400 per annum. They are offered to candidates who have obtained the degree of Bachelor or Master in this or some other approved University.—Applications should be sent not later than February 15, 1958, to the Registrar, The University, Manchester 13, from whom further particulars and forms of application may be obtained.

CENTRAL ELECTRICITY GENERATING BOARD

CENTRAL PURCHASING AND CONTRACTS DEPARTMENT

Applications are invited for the post of CHIEF PURCHASING AND CONTRACTS OFFICER. This officer will be responsible for buying the Generating Board's plant and buildings, equipment, materials, stores and services.

Applicants must have had extensive experience in the purchasing and contracting departments of a large industrial concern and must be used to negotiating major contracts and trade agreements.

The salary for the post is dependent upon qualifications and experience, but will be of the order of £5,000 p.a.

If you are interested in this important and interesting post please write personally to Mr. Ernest Long, Member for Finance and Administration, Central Electricity Generating Board, Bankside House, London, S.E.1, within 14 days of the appearance of this advertisement.

A SALES MANAGER aged between 30-40 is required by the Brazilian subsidiary of Ferodo Limited for marketing brake linings manufactured locally in the Sao Paulo area. Applicants should preferably be able to speak Portuguese or at least have an aptitude for Latin languages, while previous experience of South American markets and/or motor vehicles will be advantageous. Subject to results the successful candidate may be invited to join the local board in a few years' time. There will be an initial training period of some months in England prior to taking up residence in Sao Paulo.—Write, stating age, experience, &c., to Export Director, FERODO LIMITED, Chapel-en-le-Frith, via Stockport, England.

OVERSEAS TECHNICAL SALES REPRESENTATIVE

ARMSTRONG SIDDELEY (BROCKWORTH) Ltd., Diesel Engine Division, invite applications for the position of Overseas Technical Sales Representative. It is essential that the successful applicant has extensive experience of overseas markets with particular emphasis on South East Asia. He must be prepared to travel as required in the course of his duties. He must also have a sound knowledge of all aspects of small Diesel engines and their installation. Applications, stating age, qualifications, experience and salary required, will be treated in the strictest confidence and should be addressed to the Personnel Manager, Armstrong Siddeley (Brockworth) Ltd., Diesel Engine Division, Hucclecote, Glos.

EXPORT. The extension of activities in the Export Department of an important manufacturing organisation necessitates the appointment of a Senior Executive to take responsibility for one group of markets. The position will carry a high starting salary and offers an attractive career for an energetic man who can draw upon sound experience of competitive selling in the export field. Ideally candidates should be 30-40 and a fluent knowledge of German and French or Spanish is essential. Preference may be given to those with a University degree. Applications should contain full career details and will be treated in strict confidence.—Box 830, c/o "The Economist" Newspaper.

APPOINTMENTS REQUIRED

FREE AS AIR" 2 to 3 months—Oxonian, single, in athletic young middle age Barrister, experienced Administrator, knowledgeable in Public Affairs, Public Relations, Lecturer—would welcome ANY job of human interest (full- or part-time). "Bowler hatiumbrella" variety not essential. Area preferably within 6 miles Charing Cross.—Box 828.

SOCIAL ANTHROPOLOGIST (D.Phil.Oxon) specialising in human relations in industry seeks permanent or research post.—Box No. 831.

CONSULTANT or advisory work in industry (part-time) sought by graduate physiologist, also medically qualified. Food chemistry and general scientific interests, practical imagination, three languages.—Box No. 832.

SALES MANAGER, M.S.M.A., at present with International Food Company, wishes to change for personal reasons. Fully experienced all aspects of National Sales Management, and also Marketing, Sales Promotion and Advertising. Extensive experience in Food and Allied Trades. Fully mobile and keen to join organisation with fresh vision and scope where vigorous and mature leadership is required. Excellent references.—Box 829.

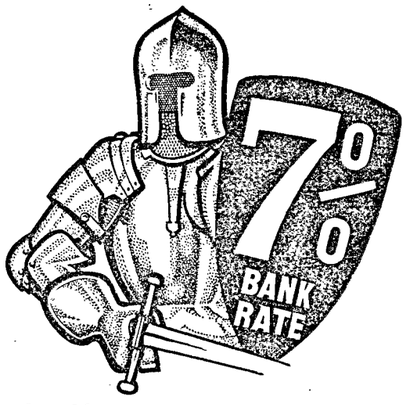
NEWALLS ADVISORY SERVICE
is available to anyone interested in increasing productivity and working efficiency by better thermal insulation.

"'This one shouldn't be allowed to get away,' I said"



"And when we came to the next item on the agenda I suggested there was one thing which shouldn't be allowed to get away. Fuel wastage, I thought, would be avoided and costs pegged by better heat insulation. I was wrong because when we called in Newalls they showed how fuel costs could actually be REDUCED *if we followed their proposals. And, sure enough, before the trout season was over, I was able to report savings on fuel bills—not small fry either."*

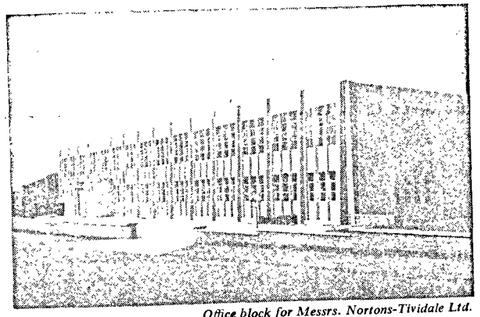
Money is dear but . . . today BEECHAM BUILDINGS cost less

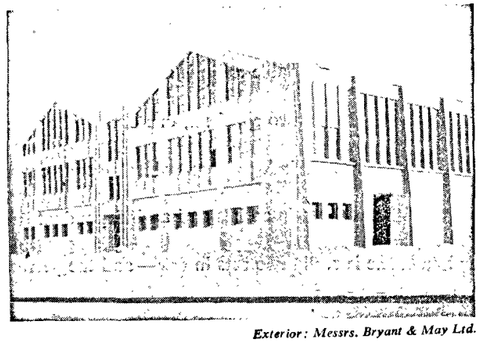


Beecham Buildings construct high-quality commercial and industrial buildings—from office blocks and small factories to large industrial layouts covering many acres at prices which, over the past twelve months, have actually fallen. We accomplish it in these days of 7% by working quickly and eliminating waste.

WE STREAMLINE PRELIMINARIES

We in Beechams have the *complete* building organisation, including departments for every phase of building from first design to final finishing. Consequently we can quote firm prices as soon as sketch designs are agreed, saving much valuable time over the usual procedure when outside contractors must be consulted for quotations, and enabling us to move on to a site months earlier.

WE BUILD BY MODERN METHODS

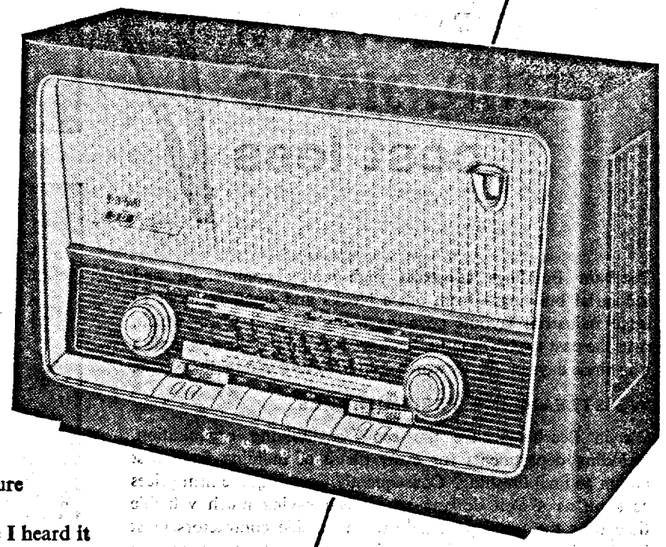


Because we employ advanced techniques, we are able, without sacrificing quality,* to put up your factory faster, perhaps in only half the time you could have it built by older methods. You will get into production months earlier with a quick return on invested capital. With capital tied up at 7% this saving in time is a heavy saving in money. Every contract is kept under one control. Every operation is timed and its completion dovetailed into the schedule, ensuring maximum efficiency and minimum site delay. The use of planned factory production of precision cast concrete units, served by our own fleet of specialised transport—ensures control of quality, free from the hazards of the weather. Beecham methods mean rationalisation; and rationalisation means economy.

Office block for Messrs. Nortons-Tividale Ltd. Tipton, Staffs.

Interior: Central Engineering Workshop. Messrs. Bryant & May Ltd. Fairfield Works, London, E.3.

Exterior: Messrs. Bryant & May Ltd.



✳ *Beecham quality signifies*

1. A PERMANENT STRUCTURE, EASILY MAINTAINED
2. THE USE OF FINEST MATERIALS
3. AN INDIVIDUAL DIGNITY OF DESIGN
4. A FUNCTIONALLY APPROPRIATE BUILDING
5. A HIGH DEGREE OF NATURAL LIGHT AND THERMAL INSULATION

"As soon as I heard it I *KNEW*...."

They were broadcasting the "Messiah"—something I must have heard dozens of times and know as well as the back of my hand. But this was a V.H.F. broadcast *and* the first time I'd heard the Grundig Pembroke. It was superb. I stood there lost in it; hearing subtleties of voice and orchestral texture I'd never noticed before—and as soon as I heard it I knew that I'd found the radio I was looking for.

The Pembroke table radio is a V.H.F. set which provides standard reception as well.

It has two speakers, one bass and one treble, acoustically arranged to give full frequency reproduction.

There are four independently variable tone controls covering the bass, middle and upper audio frequencies.

With two built-in aerials and an independent tuning system for V.H.F. as well as standard reception the Pembroke is really two sets in one—and the performance of either is an experience.

Ask your local dealer for a demonstration

The recruits you need may well be reading this newspaper
The problem of attracting the right kind of recruit besets many organizations including, probably, your own. To help solve this problem the Manchester Guardian initiated its now well-established 'Careers' series—and there is every evidence of its success.
For the fifth year, leading firms are making their personnel requirements known through full-page announcements appearing from Monday to Friday.
The new series begins on January 20th. If your company is not represented this year, the names of the organizations taking part in this Manchester Guardian service to industry and commerce will convince you that you are doing less than you might to win your fair share of up-and-coming talent.
MANCHESTER GUARDIAN

Flats at Croydon. *Architects: Riches & Blythin, F.R.I.B.A.*

Tall buildings at high speed and low cost. Wates have the plant, the organisation and the know-how. Add to this early collaboration with the owner, his architect and his engineer, and the building goes up on time and within the budget. Quick completion means earlier revenue.

Ideas become concrete when

Have you thought about AIR FREIGHTING to and from Europe?

TO SWITZERLAND FOR EXAMPLE

ZURICH from **LONDON** *14 flights per week*
GENEVA from **LONDON** *9 flights per week*
BASLE from **LONDON** *2 flights per week*

In addition there are direct flights to Zurich from Birmingham and Manchester

BEA operates frequent direct flights to all main commercial centres in Europe

HERE ARE EIGHT REASONS WHY YOU SHOULD

Transit time cut from days to hours
Packing costs cut by up to 95%
Lower insurance rates
Special cheap rates for many products
No warehousing or stock piling
Negligible losses through breakage, theft or exposure
More markets within easy reach
A quicker return on your capital

Some or all of these reasons apply to your overseas trading. For detailed information on how to make the best use of BEA Air Freight Services, consult your Forwarding Agent, or nearest BEA office. Or write to this address: BEA Air Cargo Depot, 14 Dilke St., Chelsea Embankment, London, S.W.3.

FLY FREIGHT BEA ALL OVER EUROPE

BRITISH EUROPEAN AIRWAYS

'...we began to see there was a stronger link between a 17th century itch and 20th century advertising than we had realised'

The above is an extract from

"The Itch"

Have you had your copy of 'The Itch'— a little booklet which we have produced and seems to have been well received? If not, give us a ring at Sloane 0474 or write to E. Walter George Ltd., Incorporated Practitioners in Advertising, 25 Lower Belgrave Street, London S.W.1.

Mr Thorneycroft's Challenge

"MY colleagues would not agree upon the object of containing next year's expenditure at a level no higher than this." That is the nucleus of Mr Thorneycroft's case for resigning from the Government. The speech in which he made the case to his constituents in Newport was the best he has ever made. It ranks, in its dignity, restraint and simple conviction, among the best of the many past statements of departed ministers. Although it was fitting for his local supporters to hear it, it is a loss that it will not be recorded in Hansard's roster of ex-ministerial statements from the familiar back bench. (Mr Thorneycroft has not decided whether to speak in next week's debate.) To the charge that he deserted the team, the ex-Chancellor's retort is, in effect, that the team deserted him—and the policy which last September they had all approved.

Since September Mr Thorneycroft has construed his duty, and the Government's, quite simply. It was correctly (without thinking too precisely on what species of inflation was in train) to hold down prices and to hold up the pound. The method of doing this, too, was quite simply defined four months ago. It was to hold down the flow of money spending in the coming year, whether private or public, to the flow of spending in the year before. This was the curb put on both public investment programmes and bank advances when Bank rate was put up to seven per cent on September 19th. Precisely the same monetary restraint, Mr Thorneycroft contends, was due, in both equity and expediency, upon Government spending in the year which begins next April; and it was his colleagues' reluctance to clinch this bond, when pruning next year's estimates, that caused him to resign.

In this reckoning, the final fifty million pounds, to be saved perhaps on certain welfare services, was not the real reason for the resignation, but the last straw. That is, Mr Thorneycroft was not bent upon particular economies, but simply upon a final estimate of spending for 1958-59 no larger than, not last year's estimate, but what the actual swollen spending in 1957-58 will turn out to be. (The figures are discussed in a Business Note on page 234.) Where the sacrifice came was not his point; his concern was that it should be made. Earlier, it seems, he sought it, with less than success, in service pay (where he queried the abolition, for political reasons, of conscription) and other defence expenditure. It was, by this account, only accidental that the split came on the social items that were considered later. Mr Thorneycroft's contention is that, if this yardstick of economy is accepted, no sector of spending can be sacrosanct. The false claim by Mr Macmillan and other ministers that social cuts could not be made because they would breed more wage claims is only an added offence against what Mr Thorneycroft believes to have been the agreed doctrine. To the reasonable rebuke that another fifty millions could not possibly determine

whether the country was solvent or "in the red," he replies, equally reasonably, that

> if fifty millions is the figure and is a triviality, could it not be found somewhere out of the five thousand million pounds to keep us straight?

The case is not only cogent but powerful, because he is meeting his colleagues on their own ground. This is not a conflict between two schools of thought. Mr. Thorneycroft's policy was the policy of the Government to which he belonged. He made his statement of September 19th with their full approval: "There can be no remedy for inflation and the steadily rising prices which go with it which does not include, and indeed is not founded upon, a control of the money supply." The question he is asking now is whether the Government still agrees with what it then upheld.

CLEARLY, the members of the Government who remain, after Mr Thorneycroft, Mr Birch and Mr Powell have gone, are not fools or knaves. Mr Thorneycroft is quick to recognise both that the policies which he expounded again on Tuesday were Cabinet policies, not simply his, and that "it is possible to be wrong on issues of this kind." That is why it is so regrettable, not only for the Government but for the nation and the pound, that the parting of the ways came. There are, of course, other arguments. Any arithmetical measure of economic restraint is bound to be imperfect: it is fraught with statistical complications and administrative anomalies and, in terms of actual resources, can be economically unreal, as was seen by many commentators four months ago. It can fairly be argued, too, that the effort by these means to cut back "a range of projects beyond the resources at our command," in order to "remain with profit and honour the centre and heart of a prosperous sterling area," must include a recognition that there is some limit to the liabilities that the sterling area itself can bear; the threat to the pound in September was abroad not at home, and Britain's payments were, and are, in surplus, not in deficit. But it hardly lies in the mouth of ministers to make these protestations. What was accepted by all the Cabinet as sauce for the rest then is sauce, as Mr Thorneycroft says, for the Government now. Lord Hailsham can fairly speak of the need for a reappraisal of the basis of social service financing; but it is not possible for the Government to plead against Mr Thorneycroft's case other kinds of policy.

"One must decide whether one is trying to beat an inflation or a slump." The decision has always to be made afresh as the world scene changes; it will have to be made again. But the Government plumped, with Mr Thorneycroft—and plumped rightly, and indispensably—for inflation as the present danger while the pound is in peril; and a price has to be paid in cut expenditure as well as, for a time, in lost production. That is the familiar and perennial dilemma between short-term necessity and long-term and no less necessary aspiration. Mr Thorneycroft's personal challenge to the Government, while he seeks to lead "no body of revolt," is whether it is still prepared to pay the price; Mr Heathcoat Amory insists, with obvious sincerity, that there has been no change. The immediate challenge (which is the subject of the following article) is whether there is still the determination in the Government and the nation at the imminent testing-point—that is, on the wages front—to stand fast for the first fruits of a policy that seemed to be bringing strength to the pound.

The Wages Test

THE greatest new danger to sterling in the past week has been the reaction of responsible opinion to the latest stage of the London bus dispute. The usual signs have begun to appear of an encouragement to retreat. They are being conditioned upon public opinion in the usual way: through the industrial correspondents of the newspapers, almost certainly after soundings with a public corporation employer. If this movement is to be stopped in its tracks, then the public as a whole will need to recognise exactly what the threat is—and whence.

The important question in the bus dispute is *not* whether this Friday's delegate meeting of London busmen will agree to refer their pay claim to third party "conciliation" or whether they will insist on calling a strike first; the union leaders are recommending the former course because they do not think that a strike would do them any good, but the militants at the somewhat showy mass meeting (there will be one delegate from each of London's 114 bus garages) may conceivably demand the latter. In the broad sweep of Britain's economic history, however, this difference of tactics is unlikely very much to matter. A strike now would cause inconvenience to London commuters, but no significant interference with production; it would do something to deplete union funds; it is arguable whether it would precipitate the dispute into conciliation-cum-arbitration under conditions rather more favourable to some wage increase than now, or whether (as the union leaders themselves apprehend) it would cause sufficient annoyance to queer some of the busmen's pitch. Probably, however, any influence either way would be minimal. Eventually, after or without a strike, somebody sitting round some table is going to make "independent recommendations" which will decide. The crucial question for the future of price stability is what will be the climate of opinion under which that somebody will work?

The first influence upon that climate will be the attitude of London Transport itself; if it is implicitly ready to grant some wage increase to some of its men, then some is very likely to be given. Until now London Transport, encouraged but not ordered by the Government, has resolutely said "No" in public. But a nationalised industry which is in deficit usually does say "No" at the first stage of its annual wage negotiations; past experience has been that it has always said "Yes, partially" later. For the last few weeks those who want to stop inflation have been watching anxiously lest there should be any signs of this usual second stage change of heart. Last Friday they—or what will be widely interpreted as they—appeared. A rush of articles in the daily press suggested that, while all London's bus crews do not deserve a rise, perhaps about 85 per cent of them do.

The 35,000 crewmen of London Transport's "central" red buses, it is being pointed out, have received increases in standard wages since 1939 of only 115 per cent for drivers and 126 per cent for conductors; the 6,000 crews of London's country or green buses—those that serve Guildford, Luton, and so on—have received increases of 155 per cent for drivers and 180 per cent for conductors. (All groups have received larger increases in standard earnings.) But in the disparity between red and green, says the voice of Jacob, there are surely seeds for a compromise. The crewmen of central London may deserve a special increase in view of their special skill; perhaps, it is argued, those who drive London Transport's less important green buses, or its maintenance men around the garages, could this time be left out, or given a lower increase. The official and immediate reaction of the union leaders will no doubt be that an increase given to this majority of their members must be given to all; but they can afford to tap gently at the wedge, because once it is in they know quite well that the rest will follow through after. As Mr Cousins read his newspapers last Friday, he must, like Little Audrey, have laughed and laughed and laughed.

FOR he and we, of course, have been here so many times before. This "special case for these specially deserving skilled workers" of a nationalised industry is an argument which has been pitched at, and then by, the industrial correspondents of the newspapers at about this stage of the annual struggle every year since wage inflation began. Every year it has been accepted in anxious appeasement—whether it has been applied to engine drivers or bus drivers or (after some nationalised industry has first given way) to skilled engineers or whatever other groups of workers are serving as wage inflation's front-runners. Every year, with considerably more regularity than the first cuckoo of spring, newspaper leaders have been published which say, that, while general wage restraint is imperative and lengthy delay desirable, yet for example:

> To the outside observer, it would seem that the skill required and the strain imposed by stopping, starting and threading through the traffic in central London is so great as to justify a fairly substantial differential. . . . By the time . . . investigations were completed it might well be possible to envisage some selective wage increase which would restore to central London busmen a little—it could only be a little—of their previous advantage.

A major question this year had been whether, brave words forgotten and resolutions against flinching thrown away, editors would allow this sort of emollience to appear in their columns in 1958.

They have done so. The passage quoted above appeared in the second leader in *The Times* last Friday, January 10th. A leader in very similar terms also appeared in the *Manchester Guardian* on the same day. Other newspapers have followed, and to pick out these two for special mention is not in any way to accuse them of being particularly blameworthy; indeed, it is to recognise their importance as acknowledged leaders of the sort of public opinion which is often decisive. But there are general and specific reasons, of quite desperate importance for the whole country, why it should not be decisive this time.

THE general reason is obvious. If the door is opened to wage inflation in this first test case, in a nationalised industry that is in deficit, hopes of containing other forms of inflation will thenceforth be vain; the advantages sought by a stern policy, which has held down production for three full years in preparation for this moment, will have been inconsequently thrown away. That general consideration should be the decisive one for policy, even if it were in some airy way "unfair" to London busmen. But is it? Let us get soberly down to the microscope to study this particular case.

The particular reasons which are being prayed in aid of a selective increase in wages for central London busmen are that they have done badly since the war compared with London Transport's minority of country bus crews, compared with other industrial workers, and compared with the competitive pull of the labour market (so that London Transport is said to suffer from a shortage of recruits). The comparison with the green bus crews is true; it is the result of the men's union having demanded each year flat rate increases, with a bias towards lower paid workers, instead of percentage increases, with a bias towards the skilled drivers. But as the central bus crews are in a majority in their section

ESTATE OF THE REALM OR VESTED INTEREST?

Early in February *The Economist* will start a series of articles on the status and problems of British trade unions.

of the union, this is their own fault; it is hardly up to London Transport to compensate them for this fault of theirs, in a year when general wage restraint is essential.

The comparison with other industrial groups is also true, but for a simple economic reason. All over the advanced industrial world, bus driving in cities is a contracting occupation, but in London it has not sufficiently contracted. That is why London Transport is in deficit, while there is still insufficient money to give an average factory worker's wage to each of its too many busmen. And this, too, is why the argument that London Transport is short of more than 2,000 recruits for its red buses is frankly misleading. So long as London Transport is in deficit, and so long as it cannot easily get into surplus by raising its fares (because the demand for bus travel is elastic), there can be no sensible argument that there is a shortage of busmen : there is a superfluity of buses.

The figure of over 2,000 required recruits has in fact been reached by estimating the ideal manning schedules that would be required for London Transport's new spring timetables; the buses on these timetables are to be cut by only 4 per cent below last year's levels—although demand has fallen by much more than that in reaction to last year's rise in fares. The cutting of timetables has not been determined by a decision to take off the streets every bus that is unprofitable; London Transport's aim is rather to provide what its organisers regard as an adequate service, so that too many people will not have to wait too long at the rush hours—and from the number of buses provided at rush hours all else follows.

ONE can understand the attraction of this system for any administrator properly keen on his job. It would be nice for any organiser anywhere to be allowed to run his industry in this way. If the standard of service provided by *The Economist* did not have to be determined by the standard which readers will pay for, but only by the standard which we think would be morally good for them and professionally satisfying to us (with no worries about any deficit), life in this office would become much more expansive; you would not have to wait a week for these words of wisdom just as you do not have to wait a quarter of an hour for a bus, and we would sign up as many correspondents as are marginally desirable in far Cathay. The British economy will never return to balance until it is realised that it is nonsense to run any industry, including any nationalised industry, in comfortable disassociation from market demand in this way. It would be even bigger nonsense to set the pace for wage inflation in 1958 by an attempt so to run London's buses. But unless public opinion can be pulled sharply back from the first familiar stage of incipient annual appeasement —a stage which is now again upon us—this is precisely what seems to be about to be done.

To the Summit?

If the Russians want talks the West cannot refuse. But what is the real Russian intention? And what ought to be the real intention of the West?

FOR all its bland presumption, Mr Bulganin's announcement in letters to nineteen states of his intention to "call" a gargantuan conference of heads of government, which would seek an end to the cold war, is a formidable diplomatic move, not to be brushed off as "nothing new." The western governments can afford neither to dance to the Russian tune to the extent of turning up meekly at Mr Bulganin's conference to discuss his chosen agenda before his chosen audience, nor can they afford to sit tight; for they must know that Mr Bulganin's artless reference to the "ardent wishes of the peoples" is not altogether without basis. As is evident—and as President Eisenhower has already tacitly conceded in his reply last weekend to an earlier Bulganin letter—if the Russians want talks, it is not really possible to refuse. But it is possible, and indeed essential, to insist that any talks be prepared in a serious way and that, if and when they happen, there is a serious agenda to be discussed. This, not stonewalling, is the western diplomatic task for 1958.

In approaching the task the western statesmen are crossing a room in the dark; they are very naturally nervous of knocking over the furniture. As it seems, the Russians want talks; but for what purpose? Is it merely for a propaganda effect—to conciliate their own people, to present themselves as men of peace in uncommitted regions of the world, or to divide public opinion in the West? Is it to set a strategic trap? Or is there a real alarm in Moscow at the apparent drift towards war, and a real desire to insulate the danger-points? The western governments cannot disregard any of these possibilities. They have to guard against the first two; but they have also to adopt a negotiating programme of substance (as distinct from a forensic attitude designed for the press conferences) for the event that the third possibility may prove, after all, to have something at any rate in it. The possession of such a programme will be no guarantee at all that a summit conference would succeed. But, without it, not only would it be a waste of time; it would also be likely to end in the western statesmen being outwitted, or put in the wrong, or induced to accept a bad solution rather than go home with their hands quite empty.

SPECULATION about the kind of practical compromises with Moscow that the West might be prepared to make if and when they proved possible is, therefore, useful and necessary. To foreign ministers, rightly concerned to let no chink appear in western solidarity, such speculation may be uncomfortable. Secretaries of State, past and present, naturally deplore the hetorodox trains of thought set in motion by Mr George Kennan. But the political leaders may console themselves with the fact, becoming constantly more evident, that western solidarity could suffer far more from the general dissatisfaction with a too dogged perseverance in the entrenched cold war positions than it will from novel trains of thought.

If, then, there is to be a summit conference some time, let it, when it comes, be serious. This implies that it should be prepared for, among the western governments as well as between them and the Russians —not necessarily by conferences of foreign ministers, but certainly (and most usefully) by unobtrusive diplomatic work. It implies that no meeting should be held until an agenda is ready for it. It implies that it should have not as many, but as few, participating governments as possible; probably the ideal number would be two, the United States and Russia, each having prepared the ground with its allies beforehand.

In the possibly long interval before the leading men of the western and Communist worlds get to the point of meeting, problems now dormant can become acute; no one can say with complete confidence what topics may thrust themselves forward by then. But, leaving the unforeseen aside, the obvious matters for discussion fall either under the heading of disengagement in Europe, or under the heading of disarmament. The western alliance cannot accept either a degree of disengagement, or a degree of disarmament, that will deprive it of the strength to ensure that a Russian aggression would be suicidal. The task is to make a start on disengagement, and a start on disarmament, on terms that might offer each side a reasonable *quid pro quo* and promise some alleviation of the world crisis in one aspect or another. Possibly the two could be combined; but neither, at this stage, could go very far. What is at present completely obscure is whether the Russians would be interested in measures of either kind sufficiently limited, or sufficiently well balanced, for the West to be able to contemplate them.

The West itself has some reasons for considering again the strategic view of Germany that caused earlier suggestions of disengagement (for instance, Sir Anthony Eden's in 1955) to be dropped as too risky. For one thing, it seems by now unlikely that the German defence contribution will ever play the precise part in the Nato system that was envisaged for it when the military planners recommended it in 1949. The likelihood has diminished that the German forces now being formed for Nato, with or without the allied troops that are stationed in Germany, can provide the kind of defence that would safeguard Europe (except against small-scale encroachment) without recourse to a nuclear war. At the same time, the character of the western defence effort itself is tending to change; it may very well, before long, rest mainly on missiles, and only secondarily on a modest force to hold the ground. Can such a system be adequately stationed in an area that excludes Germany? The answers rest on a complex of technical factors; but western Europe is not, at a glance, so small that it could not.

Then there has been—or should have been—a revision of the western appreciation of the politics of central Europe. Events in 1956 showed beyond serious doubt that the withdrawal of Soviet troops would gravely endanger the Communist regimes in eastern Europe, and in time would bring them down. In west Germany, the political development of ten years has proved the converse: it is no longer plausible to suppose that west Germany would fall a victim to communist subversion (as distinct from Russian attack) if the western allies withdrew their armies. All in all, Europe is now the main, perhaps the only important, region of the world where the West can feel confident that the political forces are working strongly in its favour. Its purpose can reasonably be, therefore, to thin out and detach the military systems to a point at which the peoples of central Europe—beginning with the east Germans; but other east European peoples would quickly follow if they had the chance—can begin to assert their own political will.

A WITHDRAWAL of Nato forces from the Elbe, if it were accompanied by a Soviet withdrawal of equivalent military value, might therefore, in the near future, work in favour of the West. Certainly, there is much less reason for the West to be afraid of it than there was in 1952 when the first treaties of Bonn and Paris were signed. This is assuming that the western allies, including Germany, can reasonably be treated as a single community in their dealings with the Russians, a community held together by stronger common interests than the internal differences within it. It is true that the western allies apart from Germany have another, no longer generally admitted, motive for hesitating to contemplate a future withdrawal: they feared in the past, if they do not fear now, that a united Germany might get out of hand and pursue a divergent national policy of its own. But it is nursing an illusion to suppose that Germany even now is tied to the western allies by anything but its own view of its interest. Neither the occupation nor the four-power system can be restored. The only hopeful course is to

seek to restore Central Europe to political existence, with Germany as its largest component. It goes without saying that this would require Germany's eastern frontiers to be settled.

Most probably the Russians are aware that a change in central Europe would tend to operate to their disadvantage. The political regime of central and eastern Europe depends on the presence of their troops ; this is their weakness. Many Soviet utterances in the last year or two have indicated a marked attachment to the political *status quo*, if only the *status quo* could be made safe. Thus, the Russians may prove not to be interested in disengagement in Germany by itself. What they really want may prove to be Germany divided as it is now, with Russian troops in position to keep the communist regimes clamped on the neck of east central Europe, but with a set of military rules designed to file down the horns of the western defence system. They might easily demand arrangements of that kind—including a prohibited zone for nuclear weapons—in the name of disarmament. The demand would be difficult to resist, but the West ought to resist it except as part of a plan for withdrawal of troops. The natural alternative course for the Russians would be to put their price for a withdrawal of Soviet troops so high—say, an Anglo-American withdrawal from the whole Continent—that agreement would be out of the question.

Plainly the bargaining will be hard, as well as long. There is a basic clash of interests, which can be resolved only if the two sides can eventually persuade each other that the risks of an agreement are on the whole less than the risks involved in going on without any agreement at all. If this happened, it would be because the Russians had grown tired of the danger and strain implicit in maintaining by force a division of Europe that the European peoples—particularly in the eastern half—find unnatural and intolerable, and because the West took heart and remembered its basic source of strength, that it maintains its armies for military purposes alone ; they are not needed to impose a political system.

Do 600 Submarines Matter ?

The western allies have to ask what uses are intended for the very large Russian fleet of submarines, and to concert precautions against them.

THIS may be the right time to ask Mr Sandys to include in the defence white paper due at the end of next month some assessment of the significance of the shoals of Russian submarines, in terms of the realities of atomic warfare. Not long ago the Prime Minister suddenly declared that they were a most serious threat. Yet, in the context of last year's white paper, which left the role of the navy in doubt, they seem to make little sense. The general argument then was that a world war fought with thermonuclear weapons would be so destructive to both sides that the war would end with the atomic assaults. The idea that the second phase would be a broken-backed war fought on with the remaining stockpiles of conventional weapons, which had been put forward in earlier defence statements, was discounted. So the need to spend money preparing to wage it, including submarines and anti-submarine warfare, was discounted, too.

In the light of the argument of last year's defence white paper, that is, the Russians have backed a non-starter in their very large and growing underwater fleet. Can we, therefore, rest content in the belief that the Russian submarines represent one of the other side's white elephants—a fleet planned and built by backward-looking admirals and their German advisers for a type of war already outdated by technology ? Can we continue to run down western anti-submarine defences as irrelevant, on the argument that if war comes you cannot be deader than dead ?

One possibility, certainly, is that the Russians may now regret spending so much on their fleet—or part of it. Mr Khrushchev was recently heard to say that cruisers—Sverdlovs—were obsolete. The rate of submarine-building, too, has slowed. But that may have something to do with the advent of atomic propulsion ; and there is little sign that the Soviet naval men are feeling as pessimistic as the British. The obvious possibility has to be faced that the Soviet strategists are no more convinced by the argument of Mr Sandys's white paper than are Britain's own Nato allies ; they may feel that whatever form atomic war might take, they must be able, in order to administer the *coup de grace* to the West, to sink its supply ships. Another possibility is that, whatever the precise role originally planned for the Soviet navy, it is being adapted to changing conditions —with a role to play in the first phase of any nuclear war. Yet another possibility is that the Russians have uses for their fleet quite apart from any contribution it might make in the nuclear disaster which they hope, as we do, to avoid.

TO consider these various possibilities briefly is the task of this article. The first question is the potentialities of the Soviet fleet. Its exact size is not known ; but it is thought now to consist of 25 cruisers, mostly Sverdlovs designed for commerce-raiding, and nearly five hundred submarines, still being built at such a rate that the final target may be not far short of 600. This would compare with the six surface raiders and 46 submarines with which Hitler began operations in 1939. Eighty per cent of the Russian submarines are long-range ships, of a type superior to the Walther class U-boats which the Germans brought into action, and with which the allied navies were finding it hard to deal, in the last months of the war. They probably have a submerged speed of up to 20 knots and are capable of diving below the 600 feet of the German boats. They are well dispersed and could stay at sea six to nine months without returning to harbour, provisioned by their own supply vessels.

It is generally assumed that, in deciding the shape of their navy in 1947, the Russians realised what an economical weapon the submarine was for the capital invested : a weapon which had twice nearly defeated British sea power and which tied up vast anti-submarine forces. Their only divergence from German theory was in the numbers needed—they multiplied by five or six. The equivalent cost to Britain of maintaining a navy of this size and type would be well over £1,000 million a year. The Russians may argue that their fleet has already diverted huge British and American resources to purely anti-submarine requirements, yet without giving either country any real security from the threat to its communications.

Would communications matter in a nuclear war ? The idea that the Russians were caught on the wrong foot by atomic developments hardly squares with the fact that they in part put on their spurt in submarine construction after 1951—after they had the atomic bomb and were already working on the hydrogen bomb. Possibly the speed of their progress thereafter surprised them. Even so, the Russian navy today seems to enjoy fully competitive conditions with the other services in getting resources. No more Sverdlovs are being built, it is true, but against this it is thought that the Russians will have an atomic submarine by 1961 and then be able to build two or more a year. The atomic submarine is worth many hydrogen peroxide fuelled boats, with its speed of 35 knots, its ability to remain submerged without using a snort, and its ability to cruise for years without refuelling.

SUBMARINES have, in fact, many uses in Russia's strategic position other than that of preparing for a broken-backed war on the sea routes. The first of these is to neutralise the deterrent effect of western aircraft carriers which have atomic strike power. A combined air-undersea operation in the Atlantic and Mediterranean would be particularly dangerous if, for political or military reasons, the West had lost its land atom bases and had to rely on the sea. The development of the missile, however, also gives the Russian navy a directly offensive role never before possessed. Though some experts are doubtful of its value to the Russians, others are clear that the missile-throwing submarine would reinforce the effect of their long-range missiles against America (besides being cheaper) ; it would tie up American warships in coastal defence ; it would also enable the Russians to strike at places still out of even the inter-continental missile's range—the Panama Canal, the South African and Australian coastal cities.

The use of Russian submarines against the western powers would entail all-out atomic war ; but would their use by other states in limited wars do so ? The Russians are supplying submarines to their allies : certainly to the Chinese and Egyptians. They would seem to be a suitable way to employ "volunteer" forces. Since in any limited war the west's supplies and men would have to go by sea this is no light threat ; a dozen "North Korean" submarines handled well would have greatly increased American losses in the Korean conflict.

Finally, there are dividends to be secured by the Russian fleet in the cold war itself. A squadron of Sverdlovs accompanied by submarines on a goodwill tour would make a powerful impression on neutral countries ; it would be hard to match except with carriers. More insidiously, the use of submarines in aiding subversion is seldom discussed ; but when revolt from within is the chosen method for countries separated by sea from the communist land mass, submarines seem to have some very real advantages.

IT is in the light of all these possibilities that collective western naval policy and expenditure must be framed. It is true, of course, that, though the Russians are spending on their navy three times as much as the British on theirs, the Americans are trebling the Russian total again, at £3,800 million a year. But in terms of the equation between submarines and escorts, the Russian fleet certainly is far from outmatched by western naval strength. In a conventional war, it could drain off a very high proportion of western naval strength in convoying, and even so would inflict large losses. If atomic weapons were somehow banned, it is likely that the Russians would at one stroke secure not only superiority on land, but also at sea ; the Russian (and allied communist) fleet adds a complication all of its own to disarmament negotiations.

But against how many of these Russian naval initiatives is it practicable to prepare ? Certainly this country cannot even think of "going it alone" at sea. But, in their concerted naval planning, it is still the protection of sea routes that the western countries have to consider first. What is the minimum risk that can be taken, and the maximum insurance that can be afforded ? And the question has also to be asked what counter-effect on the West's deterrent power at sea the Russian fleet exerts, and if it can be met. These are the matters which Mr Sandys has to settle not only with Lord Mountbatten and his cabinet colleagues but also with his allies ; and the first conclusions should be reported in next month's statement.

NOTES OF THE WEEK

MR THORNEYCROFT'S RESIGNATION

The Backbencher of Monmouth

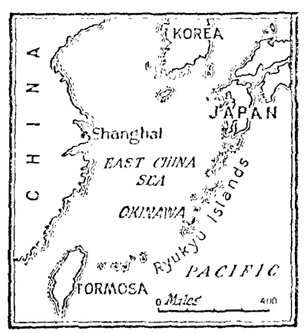
MR THORNEYCROFT'S speech to the massed ladies of his constituency party was a supremely dignified performance. His had been a hard decision, but he would have felt dissatisfied with himself if he had not taken it, and he stood before them "as a man content." Politically, his expression of loyalty to Mr Macmillan as a backbencher has been taken by the Tory leadership as removing the danger of any splintering off from their party in next Thursday's parliamentary debate; in fact, that danger probably never really existed. But the fervent applause Mr Thorneycroft drew at Newport—and would have drawn for this speech from any Conservative gathering in the country—does serve to intensify the political implications of his resignation. Perhaps those implications can best be assessed as lying about half-way between Labour's cherished belief (which may be much in evidence next week) that the "Tories are breaking up," and Mr Macmillan's expressed hope that he has now left behind him his little "local difficulties."

Mr Macmillan's Government has not suddenly become something which many Conservative backbenchers are likely to revolt against. But it may have become something which many of them may now find it less easy to be inspired by, more tempting to gird at, more respectable to harry on particular issues, a focus for grumbling rather than a rallying symbol of their instinctive convictions. This mood could pass with the appearance of any new issue on which the Government clearly succeeded in doing Labour down in the public estimation; a single great parliamentary occasion to set the Tory order papers fluttering in acclamation behind Mr Macmillan, and Mr Thorneycroft could quickly be politically almost forgotten. But if no such occasion offers itself, if there is merely a continuation of the Prime Minister's recent slide in party popularity, then it is not wholly inconceivable that the life of this Government could gradually come to be barely worth living. Then, and only then, it may be permissible to begin to speculate on the possibility of some foreshortening of this Parliament's allotted two-year span.

CYPRUS

Delayed Decision

SPECULATION has been flooding into the vacuum created by the British Government's delay in making any statement about the future of Cyprus. It has had precious little to go on, but some sober conjecture is possible. From all that Sir Hugh Foot has said and done since he became Governor, it is reasonable to deduce that he came back to London two and a half weeks ago convinced that a positive and determined effort must be made to end the stalemate in the island. He has stayed on in London longer than he originally intended, and it is impossible to avoid the impression that his proposals, whatever they were, have been hotly debated in Whitehall.



Two factors that might influence some ministers and some officials to cry caution can be picked out. One is the unremitting pressure by the Turkish government to prevent any change in British policy that might, in the Turkish view, endanger the position of the Turkish Cypriots and eventually bring the island under Greek control. The second is the Thorneycroft storm that broke over the Tory party in the middle of Sir Hugh Foot's consultations. The Government must know that any step that risked upsetting the Turks in Ankara would create another storm among the Tory backbenchers at Westminster; and it would naturally be reluctant to add to its domestic difficulties, especially with the Prime Minister out of the country.

At the time of writing it is not known what kind of attempt will be made to reconcile the conflicting interests involved in the Cyprus problem. One can only hope that in the end the Government will not prove too timid to make any attempt at all. To send Sir Hugh back to Cyprus empty-handed after the expectations that have been aroused might well have disastrous consequences. It is not just that it would almost certainly bring the terrorists out again. Even more important and tragic, in the long run, would be the disillusionment of the ordinary Cypriots with Britain's good faith and good intentions.

OKINAWA

The Hot Seat

THE name of Okinawa is beginning to toll the same message for American ears as Cyprus tolls for British: that you cannot damp down the fire of aggrieved nationalism by sitting on it. Last Sunday's election in Naha, the capital of the island, leaves the American administration hot and pained. It was held to choose a new mayor in succession to Mr Senaga, the near-communist whom the Americans went to considerable lengths to displace last year. In the summer, after an election forced on him by his opponents in the city council, Mr Senaga and his supporters came triumphantly back to the council in greater numbers than before. He stayed in office until November, when the American deputy military governor changed the constitution to unseat him. In the latest election he gave his support to a candidate of the far left wing, Mr Kaneji, who also received the blessing of the Japanese Communist party and of Sohyo, the left-wing trade union federation. Mr Kaneji won in a high poll.

His majority was slender, but, since his sole opponent was a Socialist whose criticisms of American policy were only slightly less caustic than his own, the Americans must be perturbed about the temper of the island.

Naha is not the whole of Okinawa, but its city elections are the forum where the islanders' grievances can be expressed most vocally; there is an Okinawan legislature, but the chief executive is American-appointed. The most specific of these grievances concerns the land which the Americans requisition for their base on the island, which is the hub of the defence system in the western Pacific. The islanders want them to take less land and to pay more for what they have. But both candidates in the Naha election also demanded that the Americans name a date by when they intend to hand Okinawa back to Japan. Under the terms of the peace treaty Japan retains only a ghostly "residual sovereignty." All parties in Japan, and Okinawa's most effective politicians, want something more substantial than this. The Americans have undoubtedly brought many good things to the island, from a university to a taste for soft drinks; but material benefits, as other colonists have discovered, are no rival for the glitter of *enosis*. Would the base be any harder to operate, in the long run, if the island were restored to Japan?

UNITED NATIONS

Acorn for a Blasted Oak

SUPPOSING that Mr Khrushchev were to accept the suggestion, made in Mr Eisenhower's letter to Moscow, that Russia and America should limit their use of the right of veto in the United Nations, what would be the effects? The President is proposing a voluntary self-denying agreement, not a revision of the UN Charter; if accepted, his idea could thus be put into effect without any delay. The three other veto-wielding governments, those of Britain, France and Formosa, would be affected only by the force of example; Mr Eisenhower makes no reference to them at all. And he tacitly recognises the unwillingness of any one of the privileged powers to let a really crucial vote in the Security Council go against it. The most he asks from Moscow (or from Congress) is that when seven out of the council's eleven members can agree to suggest how a dispute might be peacefully settled, they should not be prevented from formally recording the fact.

It is not much to ask. The privileged powers would remain free to prevent the council calling for joint resistance to aggression, doing anything else about a breach of the peace or a threatened breach, or even determining that a breach had occurred. They could still block the admission of a new member state, the suspension or expulsion of an offending one, or the election of a secretary-general. They are already unable to prevent the council from discussing a dispute—it can decide to do that by a simple procedural vote—and in the case of disputes, its powers are in any case limited to investigating and making recommendations. Moreover, very few of the bones of contention laid on the council table are labelled "disputes"; appeals more usually take the form of a warning or complaint that the peace is being broken or endangered, which brings a different chapter of the Charter into play.

Russia could therefore accept the proposal without risking more than an occasional mild embarrassment. If it did so, various people who are eager to see some sign, however small, of a new harmony between the powers would be pleased. But it is doubtful whether anything can bring about a shift of authority back from the UN Assembly to the Security Council at this late stage; the habit of taking to the assembly issues that were originally supposed to go to the council has become ingrained, and the 77 member states that wield no veto have little wish to reinforce the position of the privileged five. The almost lifeless skeleton of the council stands like a blasted oak in the background of the UN scene. It would take more than one little experiment with an acorn to restore the sacred grove.

AGRICULTURE

The Farmers' Share

IN all the discussion about cuts in Government expenditure, very little has been said about the item that is bound to show one of the most notable increases above the original estimate this year: because the Government's guarantees of prices to farmers are rigid, and because world prices and some British market prices have fallen, the cost of Exchequer support to agriculture is soaring. The supplementary estimates shortly to be presented under this head are likely to be very large indeed. Despite this, and although the farm price review for the new year will take place next month, Mr Thorneycroft did not list the farmers as an appropriate target for his axe during his otherwise courageous Newport speech. It has been left to Mr Butler, who, among other manifestations of his new lease of life, has made two recent speeches in his own partly agricultural constituency, to foreshadow use of the one very soft weapon of economy immediately available. He has told farmers that "this is surely a year in which you have to balance on your side the undoubted increased costs you have sustained"; and he added that, as the taxpayer now realises that agriculture involves one of the biggest grant-spending items on the estimates side, "farmers' leaders would be wise to approach any negotiations in a spirit of give and take." Preferably, one might add, of give.

But the Government is working within statutorily narrow limits. Under the Agriculture Act of 1957 it can make farmers absorb their own increases in costs up to a total equal to only 2½ per cent of the income guaranteed to them; in effect, this means that they can be made to absorb £30 million or so—after that, they must get in 1958-59, very much against the market trend, an actual increase in their guaranteed prices. The presumption must be that Mr Heathcoat Amory in his new role as gamekeeper will demand—and Mr Hare in his new role as minister enforce—full absorption. It will be a major sign of Government flinching if they do not. Certainly farmers' leaders, in view of the adverse publicity they are going to get when the supplementary estimates are presented, would be unwise to kick too loudly against this.

The second test before Mr Hare, however, will be how he spreads his presumed £30 million of cost absorption among particular products. The maximum cut (or enforced absorption of costs) he can make in the price of any individual commodity is 4 per cent each year. Here, again, Mr Butler propounded what can pass for broadly the right—although almost absurdly gently defined—formula. Farmers "have to reflect whether indefinite price increases are wise or economic in a product which has reached vir-

tually its ceiling in the way of home consumption." Translated out of politicians' language into plain English, this means that the Government should go as far as it statutorily can in cutting the subsidy which it now pays to encourage excess milk to be produced—and to go to waste. If Mr Hare can make these two resolutions—maximum permissible absorption of costs and maximum possible cut in returns for milk—he will have made as promising a debut as the Agricultural Act now allows to him.

UNEMPLOYMENT

The First Redundancy Strike

It is quite clear that unemployment and short-time working are likely to spread in Britain this winter. The year's first redundancy strike, which has just blown up and then blown over in the bicycle industry, is therefore particularly interesting. Bicycle producers, among whom Raleigh Industries and Tube Investments are dominant, have fared badly in recent years. Both home and export demand (thanks partly to American restrictions) have contracted sharply; the industry's output, which was 4 million units in 1951, was only 2.8 million in 1956 and 2.1 million in the first ten months of 1957. It now seems likely to drop still further. As a result, after a period of short-time working, Tube Investments, who make Phillips, Hercules and Norman cycles, decided after Christmas to dismiss eighty of the semi-skilled employees at its Smethwick factory. The area is one which still has plenty of alternative vacancies. The firm, however, announced the sackings without first consulting the unions, who complained that it had thus broken an agreement to negotiate on redundancy. Whether this complaint was justifiable is disputable: the agreement concerned referred to short-period redundancies caused by factory reorganisation, not to overstaffing caused by a fall in trade over a long period.

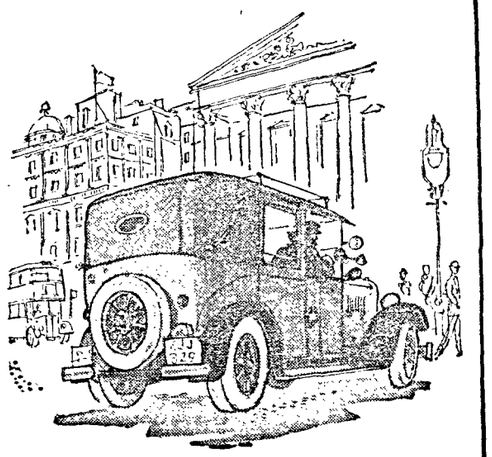
The men demanded that the notices of dismissal be withdrawn. The firm refused. On January 3rd, therefore, 1,000 men at Smethwick started a strike, which was subsequently recognised as official by the three unions concerned, the Transport and General Workers Union, the Amalgamated Engineering Union and the Society of Metal Mechanics. By this week another 1,000 men had come out in support of the strikers, and a standstill was threatened in the whole of Tube Investments' cycle division. At the eleventh hour on Tuesday, after conciliation by the local office of the Ministry of Labour, a formula was agreed between the firm and the unions. The 80 men stay sacked; they will get compensation equal to an additional week's wages; and there will be a set scale of compensation, at least a fortnight's notice and more "consultation" with the unions when redundancies occur in future. On Thursday, full working was resumed.

Three familiar lessons emerge. First, strikes by people who are still employed, designed to secure the reinstatement of men already sacked, seldom last long; prolonged action of this sort does not accord well with unkind human nature. Secondly, however, in so far as the result of this dispute has been more generous compensation for the dismissed men, it is to be welcomed; the proper economic and social formula for the period of trade recession that probably lies ahead is quicker sackings, swifter labour mobility but large severance pay. Thirdly, therefore, the one doubt to be expressed about the Smethwick peace formula concerns the employers' obligation to carry out more detailed consultation with the unions about redundancy. It is to be hoped that this does not imply a string of future concessions to the unions' instinctive attitude: that workers should not move as the consumer dictates, but that recession should be met by indefinite periods of short-time working.

GERMAN-SOVIET RELATIONS

No Time to Answer

Dr Adenauer and his advisers have been wrestling with a puzzling question this week. Should they answer the first Bulganin letter without taking any notice of the second? Or should they get down to read them both and answer the two together? At this rate, one can only hope that they will not be landed with a third epistle before they have answered either. Mr Bulganin's output has made the diplomatic methods of Bonn as well as other western capitals look a little slow. If Dr Adenauer's new manner at the Nato meeting meant anything, it was that use should at last be made of the diplomatic channel between Moscow and Bonn to sound out the Kremlin for any trace of receptivity. This Fabian approach hardly seems to belong to the world in which grand new proposals—for summit talks of one sort or another, pacts, agreements about outer space—rocket from capital to capital each week.



The notion of a slow and patient probing for opportunities to reach limited agreements which might in the end bring a German settlement in sight has its value, but it requires at least a curiosity about Russian intentions which has never been much in evidence in Bonn. Mr Macmillan's casual reference to a non-aggression pact and Mr Selwyn Lloyd's conciliatory mention of the Rapacki plan evidently caused alarm in the Bonn foreign office. Still, the Chancellor himself is aware of the pressure of opinion in Germany as well as elsewhere in Europe towards a more flexible approach to Russia. And his foreign ministry itself is very much divided over such crucial matters as diplomatic relations with the Poles.

In the delicate balance of such decisions, the coming departure of Professor Hallstein from his position as State Secretary at the federal foreign office to the presidency of the commission of the European common market has obvious significance. Professor Hallstein's intellectual gifts will be valuable to the European economic community. But in Bonn's relations with eastern Europe Professor Hallstein's clear and narrow vision and the remarkable fidelity with which he mirrors the instincts of Dr Adenauer have not always been an unqualified asset. Between the Chancellor and the state secretary, the position of Herr von Brentano, the foreign minister, has been uncomfortable.

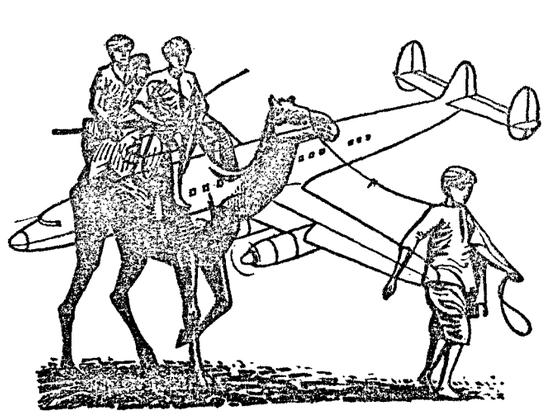
THE DETERRENT

Virtues of the Missile

Those European countries which are about to play host to a brood of American missiles may have been puzzled by one passage in President Eisenhower's state-of-the-union message to Congress last week. Speaking of the deterrent power wielded by Strategic Air Command through the threat of nuclear retaliation, the President said:

Taxi to Tokyo-2/6

A man on his first posting to the Far East is a man who needs advice. While you are in Town to collect your tropical suit, look in on us.



For the price of a taxi fare, you can save yourself a lot of financial worry. We can give you a preview of social and living conditions wherever you are bound – to Tokyo or Teluk Anson, to Borneo or Bombay. We can advise you on local currencies and monetary regulations. We are, in fact, the largest British bank in the Far East; and the unrivalled service we offer extends to the major trading centres of thirteen Asian countries.

THE HONGKONG AND SHANGHAI BANKING CORPORATION

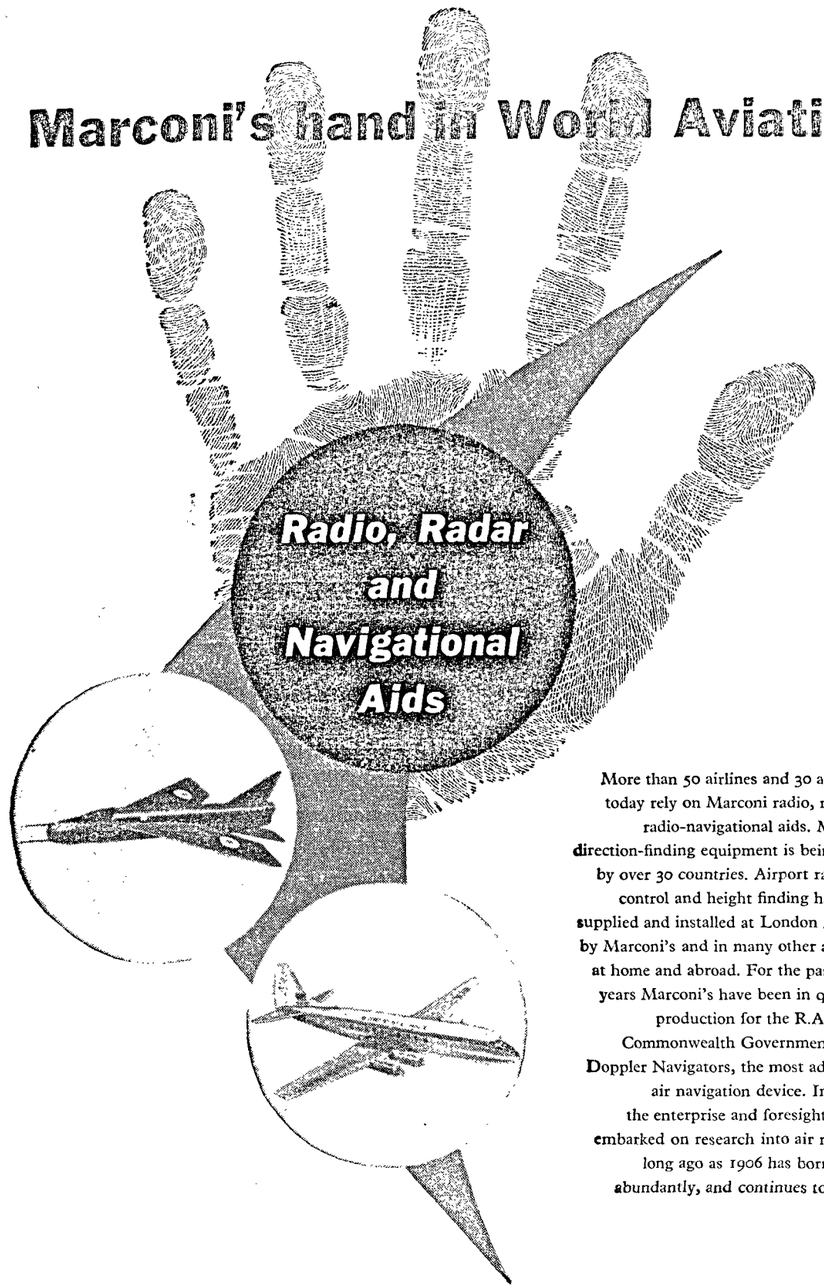
HEAD OFFICE: HONG KONG

LONDON OFFICE: 9 GRACECHURCH STREET · EC3

Offices in Europe and the United States and throughout the Far East

London today, Pakistan tomorrow

But here the adventurous businessman will be meeting people whose customs and traditions are very different from his own. That is why he will do well to consult the **National Overseas and Grindlays Bank Limited** — a recent amalgamation between the National Bank of India and Grindlays Bank. This bank not only provides an efficient modern banking service but also a fund of knowledge of all kinds concerning Pakistan.



NATIONAL OVERSEAS AND GRINDLAYS BANK LIMITED

Head Office: 26, BISHOPSGATE, LONDON E.C.2

London Branches:

15, ST. JAMES'S SQUARE, S.W.1

Shipping, Passage and Insurance Departments: 9, Tufton Street, S.W.1.

Branches in: INDIA · PAKISTAN · CEYLON · BURMA · KENYA · UGANDA · TANGANYIKA · ZANZIBAR · ADEN · SOMALILAND PROTECTORATE AND NORTHERN AND SOUTHERN RHODESIA. *Bankers to the Government in:* ADEN · KENYA · UGANDA · ZANZIBAR AND SOMALILAND PROTECTORATE

More than 50 airlines and 30 airforces today rely on Marconi radio, radar or radio-navigational aids. Marconi direction-finding equipment is being used by over 30 countries. Airport radar for control and height finding has been supplied and installed at London Airport by Marconi's and in many other airports at home and abroad. For the past three years Marconi's have been in quantity production for the R.A.F. and Commonwealth Governments with Doppler Navigators, the most advanced air navigation device. In short, the enterprise and foresight which embarked on research into air radio as long ago as 1906 has borne fruit abundantly, and continues to do so.

LG 22

> Even if we assume a surprise attack on our bases . . . our bombers would immediately be on their way in sufficient strength to accomplish this mission of retaliation.

In that case, European critics of the missile bases may be tempted to ask, why bother about missiles? It used to be thought that the danger from the Russian intercontinental missile was that it could, in one fell swoop, obliterate so many of the Americans' sprawling bomber airfields that the survivors would no longer be able to mount an effective deterrent. If this is not the case, why not leave the job to bombers?

One advantage of the missile is that it is cheaper than the bomber. The intermediate-range missiles that will soon operate from Europe are believed to cost (once research has been paid for) roughly £200,000 apiece, compared with £600,000 for the medium-range British V-bombers; an American B.52 intercontinental bomber comes much dearer still. In theory, of course, aircraft can be used more than once, but a nuclear war might not go on long enough for bombers to come home for another load. Again, launching-sites are less liable to be put out of action than airfields as Russian methods of attack improve. Their storage buildings and control centres are scattered over a wide area, but the launching platform itself is small and less vulnerable than a network of runways.

However, the bombers' chief weakness lies in the Soviet Union's improving system of defensive missiles. The Russians are thought to be already better equipped with these than the Americans; and if they are not yet good enough to knock down so many bombers that the deterrent becomes ineffective, they may soon be. Hence the necessity to mix a certain proportion of missiles into the deterrent before Russia's rapid advance in missile technology makes its main constituent obsolete. The need to bring the missiles to Europe springs less from the loudly proclaimed acquisition of the intercontinental weapon by the Russians than from their quiet progress in defensive equipment.

SOUTHERN RHODESIA

Mr Todd Battles On

MR TODD has briskly called the bluff of his mutinous cabinet, which resigned in its entirety last Saturday as a gesture of no confidence in his leadership. So far from being forced to confess that he could not sail the ship without them, he has promptly signed on a new crew—and, from a liberal and probably also an administrative point of view, a better one. The new Southern Rhodesian ministers, though not experienced in office, present impressive testimony that substantial farming and industrial interests believe that Mr Todd must be backed. It is true that, after the resignation of Sir Patrick Fletcher and his colleagues, Mr Todd was worsted by 12 votes to eight in a caucus meeting of the United Federal party; but five members were absent. Mr Todd, coldly playing for time, has therefore refused to accept the caucus verdict; he has summoned an extraordinary party meeting to thrash matters out on February 8th, before the impending elections. By then he hopes that tempers will have cooled.

When they have cooled, everyone in Southern Rhodesia will have to think out very carefully where he stands. The fate not only of the Southern Rhodesian government, but also of Sir Roy Welensky's federal government, is at stake, for Southern Rhodesian electoral feeling is decisive in the Federation. Mr Todd has always forcefully, sometimes tactlessly, and occasionally overbearingly, led liberal opinion in Southern Rhodesia. To throw him over in favour of Sir Patrick Fletcher now would not only be to vote for dull mediocrity, but would give the world the impression that Southern Rhodesians were irrevocably turning against partnership between the races and towards South Africa. Sir Roy Welensky, for all his personal differences with Mr Todd, is bound to lend him support in this crisis, or the fissure in the territorial section of the party will extend fatally to his own. It seems possible that a substantial part of the Southern Rhodesian electorate will realise how dangerous this would be.

Some split, however, seems certain. The opposition, led territorially by Mr Stockil and federally by Mr Field (whom we have called apartheid-minded, but see his letter on page 205), expects to gain substantially. Fortunately, the racial attitudes of Mr Field are distasteful even to right-wing members of Mr Todd's party. Sir Patrick may yet find that it is he, not Mr Todd, who is for the wilderness. For the sake of Rhodesia's standing in the world such a consummation is to be wished. But it will be a close-run thing; and this week's events are a warning to all liberal critics abroad of men in Sir Roy's and Mr Todd's position. To try to push these best available liberals of southern Africa too fast and too far ahead of the white settlers' racial fears and suspicions is to increase the possibility of pushing them out of office altogether.

ARTIFICIAL INSEMINATION

The Practice and the Law

A JUDGMENT given in a Scottish divorce case last week is bound to provoke questions to the Government, when Parliament reassembles, on its attitude towards artificial insemination. The outspoken condemnation of the practice by the Archbishop of Canterbury on Tuesday will be repeated in demands that it should be forbidden by law.

The Church of England distinguishes, as do other bodies that have pronounced on this subject, between artificial insemination by means of the husband and artificial insemination by means of a donor, and it is the latter, and more frequent, practice that the Archbishop deems morally wrong. It was also the basis of last week's case, the first in Britain in which the court has had to decide whether artificial insemination by a donor without the husband's consent is grounds for a divorce. Although for technical reasons the final judgment in the case has not been given, the judge has declared that, of itself, artificial insemination in these circumstances does not constitute adultery. Thus, even though the wife has committed what many people will think a worse offence against her husband than adultery, he may still have no remedy. Here, surely, is a case for making some change in the law—or, rather, a reinforcement of the powerful arguments for basing divorce law as a whole on judicial assessment of when a marriage has broken down, rather than on legalistic definitions of what is a "matrimonial offence."

A case like this has not been decided before because the few doctors in Britain who undertake the artificial insemination of women normally insist on first having the written consent of both husband and wife. They also recommend complete secrecy, so that the child is registered as the husband's when in fact it is illegitimate. This deception

was roundly attacked by the Archbishop as a particular evil of artificial insemination—yet a church commission has encouraged clergymen to allow deception in the baptismal records of adopted children. The law can properly concern itself with the civil status of the artificially conceived child, just as it has done for the adopted and the illegitimate. If the law is clear, it should be stated, so that married couples and doctors know exactly where they stand; if the law is not clear, it should be made so. But any legal offence should be restricted to such matters as false entries in the register of births; the practice itself should be left as a matter for the individual consciences of married couples and the ethics of the medical profession which might well be given some guidance on when artificial insemination is deemed unethical. Prohibitions on abortion and homosexuality have amply illustrated how easily the law is brought into contempt, and how dangerous its effects can be, when it tries to concern itself with private morality. And those who feel that artificial insemination is too unnatural to be permitted should remember that many people still think this about birth control—and that little more than a hundred years ago anaesthesia in childbirth was widely and fiercely condemned as against nature.

THE SERVICES

Resettlement and Recruitment

THIS week the Ministry of Labour has put out the full details of its impressive scheme to provide every area of the country with a high-powered committee to help resettle redundant service personnel—men and officers, but especially officers—in civil life. One's first question must be whether all the busy business men who are to chair these regional committees will be able to give enough time to the job. Certainly, it seems unlikely that they will be able to interview many ex-servicemen individually; but probably they are not meant to. The actual placing of the men will still be done by the local employment exchanges and through the professional and executive register. The main task of the committees may be to be conversant in general terms with the talent offering, and to use their contacts vigorously to press for its use among the business firms in their areas. Only men of their quality, making a positive nuisance of themselves in places where company directors and senior managers meet, can impart the impulse from the top which may induce more business firms to develop a policy of using ex-officers.

It will also be the task of the committees to select men for business courses; and here a word of warning is necessary. They should not just select men; they should also vet the courses. Though these bridge courses have been put together with the utmost goodwill by the ministry, the services and the local authorities, they are often makeshift; most of them are too short and too superficial to effect that conversion to the psychological feeling of business life which ex-officers need to imbibe from them. It is here that the new committees can do valuable educational work. They should also at once put out general advice on how to apply for business jobs.

As the officers are axed, the new streamlined professional services take shape. A further month's recruiting figures are now out—prudently prefaced by stern warnings to journalists not to base elaborate conclusions on a single month's results. The main figure is, however, on the encouraging side. The number of six-year army enlistments has risen again, this time in an off-peak month, to 831. Disregarding all warnings: these figures would, if sustained month by month, and other things being as assumed in *The Economist's* calculation in the issue of December 7th, produce a regular army in 1961-2 of almost exactly 100,000 other ranks. That compares with the 88,000 deduced from the October figures, and with the 145,000 odd the army thinks it will then want.

EGYPT

Call of "Duty"

AS soon as the British Government proposed that the Anglo-Egyptian talks should resume in Rome, the Egyptian press came out with the statement that Egypt intended to ask for neutral assessment of the damage done by the Anglo-French attack in 1956. The Egyptian Government has confirmed neither this intention, nor its willingness to compromise about the British proposal for a neutral arbiter on British property which Egypt has sequestered or seized; but it is the kind of point on which the Cairo press usually gets close to the mark.

The talks so far have concerned the British property, with the exception of the Canal Zone base; they have excluded the question of damage done to Egypt, perhaps because President Nasser is in a dilemma regarding the damage done by Israel, with which he always refuses to negotiate. It was suggested in Egypt early last year that Britain and France would be asked to foot the Israeli bill, on the ground that all three countries were in collusion. The idea has not since been revived, but even without this high-flying demand the Egyptian claim is so fraught with difficulties that any attempt to press it at this stage would delay a settlement indefinitely. One would imagine, in any case, that Egypt would have to negotiate with Britain and France simultaneously.

In a television interview on July 1st last year, President Nasser remarked that it was the "duty" of Britain and Egypt to resume diplomatic relations. A British Foreign Office spokesman replied at the time that there was "no present intention" to do so, and no doubt President Nasser felt he had been rebuffed in a conciliatory gesture. Although since then the Egyptian attitude, as Colonel Hatem, one of President Nasser's advisers, expressed it in London in the autumn, has been that diplomatic relations cannot be restored until the financial problems are settled, the president's earlier opinion probably still holds good. If he believed that the British Government would be willing to restore relations in advance of a settlement he might very well renew the offer; the matter could easily be put to the test. If the British and French had diplomatic staffs in Cairo it would be very much easier to deal with all the details of a settlement, which may otherwise take an unconscionable time in coming.

UNITED NATIONS

Hell-Bent for Chequers

MR HAMMARSKJÖLD'S flying visit to Chequers has about it an aura of the dramatic, almost the melodramatic. It seems more in Sir Edmund Hillary's line than in that of the hitherto discreet Secretary-General. There is a touch

of Mr Trygve Lie in it, too; it evokes faded memories of the luckless round of visits to major capitals which Mr Hammarskjöld's predecessor paid in 1950—shortly before the Korean war broke out—when he thought that this kind of personal intervention might prove the best solvent for the great power deadlocks over China and other issues. But the present Secretary-General is not stepping so far out of character as to brandish a ten-point programme at his welcoming but slightly puzzled hosts.

Officially, the aim of this week's dash to Britain is no more than a general exchange of views; it is merely a belated substitute for a passing visit to London which Mr Hammarskjöld had hoped to pay on his way back from Gaza after Christmas, and which he is now managing to squeeze in between other, unspecified, engagements. This official version may have gratified people who are so sensitive about Britain's status that they cannot bear the thought of the Secretary-General omitting to come here after he had had corresponding chats with American, French, Israeli, Egyptian and other Arab leaders. It can scarcely have satisfied anybody else. Apart from the Soviet boycott of the UN disarmament talks, there are several Middle Eastern matters about which Mr Hammarskjöld doubtless has urgent suggestions to make and urgent questions to ask.

Whether such an eye-catching descent upon one Foreign Secretary is a wise, or a necessary, procedure is another question. Welcome as he is, Mr Hammarskjöld would have stirred up less speculation if he had fitted his visit into a more deliberate round of consultations on this side of the Atlantic. In the past he has shown little interest in making headlines, and a strong preference for doing business in the kind of privacy which the presence of permanent delegations in New York makes possible. Has some flaw in British diplomatic machinery forced him to switch to more flamboyant methods? Or has the fashionable fever for personal high-level contact infected the Secretary-General?

KASHMIR

Lion at Large

SHEIKH ABDULLAH, the "Lion of Kashmir," was released last week after four years' detention without trial. At least two of the former prime minister's followers were freed at the same time; his other lieutenants who are still in jail will presumably be liberated too if things remain quiet. So far, the lion's first roars have awakened few answering echoes. Mr Bakshi, who was made prime minister after his chief had been arrested in 1953, seems confident that it is now safe to let the angry animal out of the cage. Abdullah's teeth may still be sharp, and bands of his loyal followers have hastened to hail his reappearance; but Bakshi controls the Kashmir Assembly and the National Conference, he has Delhi's blessing, and the generous subsidies provided by India have enabled him to foster a widespread interest in the continued stability of his regime. Wisely, he forbade his police and storm troopers to interfere with the first demonstrations by the released prisoner's followers, which were not impressive. His real difficulties will arise only if Abdullah's partisans, growing in numbers and boldness, clash violently with Bakshi's men and acquire martyrs.

Abdullah's difficulties are more immediate. He is hardly in a position to join hands (except, perhaps, for temporary tactical purposes) with the only other effective opposition group in Indian-held Kashmir, the faction led by Mr Sadiq and Mr Dhar, for its links with communism have become too obvious. Indian bounty has eroded the Kashmiri enthusiasm for independence which Abdullah was imprisoned for inciting. He himself has now declared that independence is impracticable, and instead has echoed the Pakistani demand for a plebiscite. This is grist to Pakistan's mill at a moment when Dr Graham, the United Nations special envoy, is once more discussing the Kashmir question in Delhi and Karachi—in which two capitals Mr Macmillan has meanwhile declined, very properly, to be drawn into taking up a partisan position. But Abdullah originally drew his strength from his being identified neither with India nor with Pakistan, but with the interests of the four million Kashmiris themselves. How many of his supporters will follow him into a straightforward alignment with Pakistan? (And, one is tempted to wonder, how quickly, if Srinagar passed into Pakistani hands, would the restive Abdullah find himself in jail again?) The calculated risk taken in releasing him may pay off.

EDUCATION IN ART

Education, being an artificial want, cannot be, and never has been, left to grow up spontaneously. Man is the better for it, but he must possess it in a certain degree before he can feel the want of it. It is the duty of the ruling powers to procure for it a recognised position among the wants of a community. If this be true of elementary teaching, how much more certainly true must it be of so high a branch of education as art. The mass of the people have to be taught what is beautiful and true before they can look on it admiringly, and derive any real benefit from it. It is, therefore, the duty of a government to exhibit such examples of artistic excellence as shall insensibly train the eye to the appreciation of beauty and the mind to that degree of refinement which such means can produce. . . . Mr Ruskin has lamented the necessity which causes some of our best artists to offer yearly sacrifices of talent at the shrines of wealthy mammas. Who has not sighed over the amount of good painting expended over those interiors where the furniture is so well drawn, and the tea-table looks so cheerful, and the fire so bright? The little girl in flounces, the baby in embroidered robe and sky-blue hood, and the lap-dog, are all well known to us. . . . Thus an ignorant public exercises a baneful influence over modern artists, and Mr Ruskin is perfectly right in insisting upon the general education of the public as one great step towards producing good art. He is also right in advocating a more liberal patronage of art by the Government, who, having the best advice at hand, need never make unwise purchases. Like all men who throw their whole soul into a cause, Mr Ruskin is apt at times to ride his hobby rather hard, and to speak as if the world were made for the artist, and not the artist for the world. But this amount of exclusive earnestness is necessary for the achievement of any great object. Mr Ruskin himself finds that in this world of competition a man must speak loud if he wants to be heard.

minister did not attend recent cabinet meetings, and speculation is rife as to the identity of his successor. Like Dr Malan before him, Mr Strydom came in as a lion and goes out (if indeed he is going out) like a lamb, at least in the view of his right-wing followers. It would be appropriate if the process, which tacks inexorably if in zig-zag fashion towards a republic dominated by *het volk*, continued with Mr Verwoerd. There are, however, other possibles, though they are not necessarily to be classed as moderates. Mr Eric Louw, the external affairs minister, is certainly one, and Dr Dönges is another. There are several sections in the Nationalist party, each with a candidate.

In fact it cannot matter very much in terms of policy who wins the leadership. The Nationalists are deeply committed to repression—primarily of the Africans and Coloureds, but secondarily of the opposition and the English (or cosmopolitan) influences which it exhales—in the long trek towards the promised land, where, in a heavily industrialised, rich, powerful and comfortable South Africa, the simple life and verities of the Afrikaner republics will be retrieved, and the native become once again bucolically content in his own menial place. One measure must therefore be expected to follow another in grim logic—and the next choice would seem to be legislation to strike at the very existence of the African Congress, and certainly additional police powers to prevent semi-passive resistance movements. The measure, however, which seems long overdue—in terms of the programme—seems a tightening of control, which has long been predicted, over the English-language press. But until Afrikaners think that such policies lead only one way—to civil war—their despotism is not likely to hurt the Nationalists electorally. Nor are there great signs of optimism in the United party with the elections now perhaps only two months away.

GROCERIES

Tea without Sympathy

SOME gentleman's agreements are so gentlemanly that they do not even have to be agreed ; this makes their breach a particularly heinous offence. Such is the view of the Midland Council of Grocers' Associations, now up in arms against the " sheer piracy " of the Midland Counties Dairy. This firm's milk roundsmen have taken to offering their customers packets of tea ; the grocers of Wolverhampton have already imposed a boycott on the dairy's goods, and if they have their way it will be made general throughout the area.

No one outside the grocery trade is likely to concede its claim to moral monopoly. Economically, the most that can be said for the grocers is that the multiplying of outlets, the spreading of custom yet thinner between retailers, has a faintly wasteful air. But it is, of course, yet another fruit of the retail price maintenance system which, by preventing low-cost retailers from undercutting their high-cost competitors, keeps turnover low and unit costs high throughout most of retail business. In present social conditions the conclusion to be drawn from the Wolverhampton story is precisely the opposite of what the Midland association would like. Partly thanks to the same restrictive-mindedness, as it affects local authorities and their use of planning powers, the typical housing development of today consists of acres and acres of residential estate virginally untainted by commerce, whose inhabitants must pram-push past anything up to a mile or a mile and a half of other people's front gates before reaching a shopping centre. No doubt the perfect Economic Woman would so order her affairs that, even without an American-style deep freeze, two or three shopping excursions a week would keep her reliably stocked with necessaries ; she would also be openly and irresistibly rebellious against price maintenance, a hawk-eyed seeker-out of cut-price shops and special offers, and, unless physically incapacitated, be entirely disdainful of such expensive sops to incompetence as a daily door-to-door delivery of non-perishable groceries. But Economic Woman is an even more remote abstraction than Economic Man.

Given the " uneconomic " behaviour of the ordinary housewife—her habit of running out of things, her acquiescence in, and indeed preference for, standard prices —the development of door-to-door retailing is a perfectly reasonable and desirable piece of consumer service. And the existing framework of milk distribution is an excellent foundation on which to build. (It would be even better were someone, at long last, to devise a really satisfactory alternative to the heavy and fragile milk-bottle, so that the roundsman could carry a wider line of goods.) If the grocery trade really wants to scotch and limit such developments, its line of attack should be diametrically opposite to that of the Midland association ; it should appeal from the haphazard to the methodical shopper, from the fixed-price addict to the bargain-hunter, from restriction to competition, and make a clean sweep of price maintenance. Few changes of heart are less probable ; and the prospects for " piracy " are correspondingly bright. More jolly rogers, please.

EDUCATION

Means Test in Reverse

IT is a time-honoured principle that private and corporate wealth should be used to alleviate hard cases produced by the rigidities of public policy. In that light may be viewed the scheme—in any other age it would be regarded as a very odd scheme—just announced by three engineering institutions: they are to provide twenty scholarships for deserving but needy boys to do engineering at universities —the qualification being that the parents of these boys must jointly be earning a *minimum* of £2,000 a year. Below this income level, it is argued, there is no major problem from having numerous and intelligent progeny ; the children concerned may hope to be adequately financed if they win state scholarships. But above about £2,000 a year a new form of secondary poverty has appeared for surtax-paying parents when, after providing public school educations for a number of children, these duly get state scholarships and local authority awards to the university—all but £30 a year of which are then means-tested away from them. There is then often no capital left to sink into their further training, no savings having been possible during their schooling.

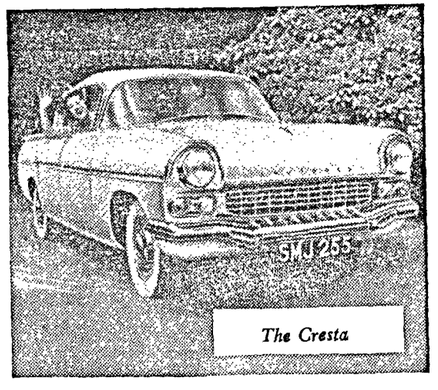
Clearly, however, twenty scholarships will not go far. How big the need is nobody knows. It is estimated that the cost of abolishing the means test now imposed for all state and local authority awards that are taken up would be £3,000,000 a year (for state scholarships alone, £800,000). What these figures do not show is how many poor little rich children really do refuse to take up scholarships because their parents say that they cannot afford to pay the difference between the value of the award offered and the cost of a university education. Nor does it show

Nothing rivals the 1958 Vauxhalls for value !

The Victor

Now's your chance to see and try them

Never before have such exciting value-for-money cars been available. In style, ride, performance and safety these 1958 Vauxhalls are years ahead. Here are the advanced features others may have later . . . they are yours *today* on a Vauxhall.

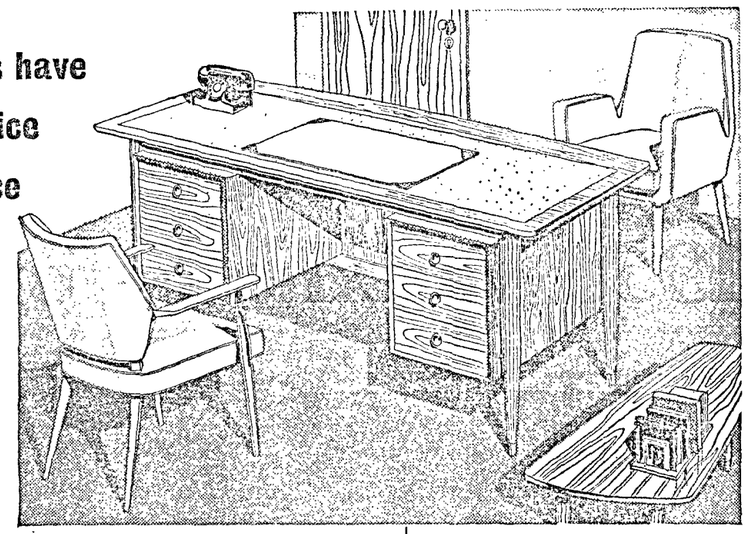


Advanced styling
Longer and lower, this is the sleek, functional line of the future. Full 6-seater roominess in the new Velox and Cresta, 4/5-seater comfort in the Victor.

Smoother ride
Special Vauxhall 'flat-ride' suspension. Lower centre of gravity gives phenomenal roadholding.

Superb performance
6-cylinder flexibility on the Velox and Cresta. Effortless high cruising speeds. Sports car acceleration. Remarkably low fuel consumption. With the 4-cylinder Victor, the smooth top-gear glide you expect only on expensive cars.

Greater safety
Precise steering, powerful brakes, panoramic vision.



Try them now
See and try them now at your Vauxhall Dealer's New Year Show. The Victor costs only £498 (+ PT £250.7s.). The Victor Super £520 (+ PT £261.7s.). The Velox £655 (+ PT £328.17s.), and the luxurious Cresta £715 (+ PT £358.17s.). Try them on the road. Prove for yourself the 1958 Vauxhalls are the most exciting value-for-money cars on the market.

how much hardship really is concealed in the £3 million odd which the parents and grandparents now presumably pay, and which some would like the state to take over.

If the state ever did take it over, the best scheme would undoubtedly be to treat scholarships as earned income secured by the family: to give every award-winner his full grant—but to add it to his parents' earnings for income tax and surtax purposes. This would be an automatic and gentler means test, on which the state would presumably lose considerably less than £3 million a year on balance. It would be a better change to make than tax reliefs for children at public schools. But there is a conflict of economic aims here. A principal reason why a man earning, say, just over £2,500 a year net after tax—and with other commitments—may not be able to keep three children at the university is that he is likely to be paying enough in income tax and surtax to be keeping two other people's children there. Should the object be to help him carry his educational burden, or alleviate his tax burden? A logical principle for reducing taxes would be to introduce more means tests, for other social services, lower down. In that case, however, the only way one could sustain the argument against this university means test would be by saying—perhaps plausibly but still controversially—that a scholarship is a student's earning, not a grant.

ISRAEL

Resettling Arabs

WHILE western governments save their money and watch the Arab refugee problem grow daily more explosive, in Israel first steps are being taken towards compensating the 20,000 Arabs who lost their homes but remained in Israel. These families were, for security reasons, transplanted by the Jewish authorities from their villages on the Jordan border to refugee settlements in Galilee. This week a government committee recommended spending £2 million on their housing and rehabilitation; if the Knesset approves the sum, building should start in the new financial year. However much the refugees may dream of their old homes, their position in Israel is too weak for them to refuse resettlement.

Some 200,000 Arabs remain in Israel. About half of them live in Galilee with Nazareth as their centre; others live along the Jordan border and in the Negev. Except for the displaced tenth, the Arabs have prospered under Jewish rule. Some of the farmers hold less land than before, but most of them are better off for all that; prices of farm products have consistently been high, and modern instruction and better tools have helped the farmers to increase their output. Labourers are earning good money, even though their wages are lower than those paid to Jews doing the same work. Piped water supplies are being laid on to the Arab villages, though slowly; Jewish settlements come first. The government has built new schools, and all the Arab boys, and some of the girls as well, now go to school. But if the Arab farmers are doing better than most Arab farmers do in Arab states, they are quick to notice discrimination between them and their Jewish neighbours.

Arab settlements still come under military rule, with all the paraphernalia of curfews and travel permits that this involves. Normally these regulations are irksome, but not much more; there have, however, been some horrifying examples of abuse of powers. It only takes a few incidents to keep bitterness alive. Communist propaganda makes the most of this, and in the last elections 20 per cent of the Arab voters in Israel voted communist. The scheme to spend £2 million on Arab settlements is a welcome move, and will be the more welcome if its material benefits go hand in hand with an increased willingness to treat the Arabs as equal citizens.

LETTERS

Export Insurance

SIR—Mr Patrick writes with great authority on credit risks and his comments on the working of Export Credits Guarantee Department should be welcomed, as provoking much-needed discussion.

In the matter of transfer or remittance, the chief risk, in the mind of the exporter, is that an overseas country may at very short notice impose new restrictions on payments in sterling by its nationals, and thus delay, for an unforeseeable period, the payment of the exporter's accounts. Most exporters (and Mr Patrick) call this a political risk, but its origins are chiefly in economic conditions which can be studied by anyone who will take the trouble. The Export Credits Guarantee Department (at great expense) watches these conditions all over the world, and is thus able to make an estimate of the way this risk is changing in each overseas country. It can thus modify its premium for that country and the conditions of its guarantee, until it may decline to offer any further cover. Over 20 years its losses on such guarantees have been broadly covered by the relevant premiums.

A ceaselessly fluctuating service such as this cannot be classed as administration or covered by a fixed fee. It calls for as much skill and knowledge as any insurance problem. Mr Patrick will not recognise it as insurance because the risks are too concentrated to permit the law of averages to operate. But insurers carry many risks to which this law does not strictly apply—e.g. hailstorm; and many, in a similar way to E.C.G.D., as an extension of another policy—e.g. the windstorm extension to a fire policy in the USA. And underwriters have, in recent years, written something equivalent to the transfer risk, e.g. on Turkey, without any appreciable spread of such risks.

The subject is technical but, as Mr Patrick implies, it is unfortunate that the insurance world has kept so aloof from export credit risks, and E.C.G.D. so aloof from the insurance world. To bring them together should not be difficult and would be of great benefit to the country.—Yours faithfully,

The Athenæum FRANK NIXON

Rhodesian Politics

SIR—In the November 30th issue of *The Economist*, under the heading "*Central Africa*," there is reference to "the apartheid party of Mr Field."

I assume this means the Dominion Party, of which I am the leader, and would point out that this adjective is quite incorrect as apartheid is not our policy and there is nothing in our constitution, principles or policies to indicate that such is the case.—Yours faithfully,

Southern Rhodesia W. J. FIELD

Solid Fuel by Pipeline

SIR—I have noted the appearance in your issue of November 2nd of a story on American Gilsonite's new slurry pipeline and gilsonite processing plant, along with two letters which question some of the statements made in the news story.

The Gilsonite development has been

fairly well chronicled in the pages of *Chemical Engineering* over the past 16 months, occupying a prominent position in our review this January of the ten top technical trends of the year. Briefly, we credit this project with these "firsts":

(a) First successful operation of a long-distance slurry pipeline. The coal slurry pipeline in Ohio began trial operation a few weeks before the gilsonite line, but has not yet (almost a year later) operated successfully on a sustained basis. A major source of trouble has been improper particle-size distribution. Other solids, including Florida phosphates, have been moved through pipelines as slurries, but these have been over very much shorter distances and without the unusual engineering problems posed by the mountainous terrain of Utah and Colorado.

(b) First large-scale, privately financed project to produce conventional petroleum products from a solid raw material. The SASOL plant in South Africa, as well as the German Bergius and Fischer-Tropsch plants operated during World War II, have been government-financed. In a privately financed project the technical aspects must be executed with sufficient skill to meet the free competition of the marketplace. An example of a project which has met with failure in this respect is the plant at Brownsville, Texas, which used natural gas as basis for Fischer-Tropsch synthesis.—Yours faithfully,

CECIL H. CHILTON
Senior Associate Editor,
Chemical Engineering

Small Colonies

SIR—"*Leftovers of Empire*," in your issue of January 4th, provides a welcome review of some salient features of the present structure and future possibilities. As it involves the lives and destiny of nearly ten million people of vastly varying colour, religion, history and standards of living, it merits the closest examination and some comments and perhaps suggestions.

With the British, freedom is traditional. We do not shun agreeing to independent status. Witness Canada, Australia, New Zealand, and South Africa. One wonders sometimes, however, whether the mid-twentieth century achievement of this millenium by coloured peoples is really compatible with the theory behind the Statute of Westminster.

Much has been said in recent years about the "upsurge of nationalism," but if a fraction of the people to whom it applies have even an inkling of its implications, it must be very small. In other words, it is the timing of independence rather than the principle which can be questioned, and we can only pray that it has not been forced upon a great majority of people too soon through some mistaken political ideology.

With regard to the "remnants" of the British Empire. As you so rightly point out, they can never hope to become sovereign states and members of the United Nations, but, on the other hand, there is little common ground for the settlement of strictly local and domestic problems. They certainly cannot stand alone—dominion status or otherwise. In all the circumstances, therefore, it is difficult to agree with your claim that it would be incredibly impolitic to maintain a colonial administration from London. That Russia or the United States should object to this is hardly relevant. True these colonies need subsidies to meet budgetary requirements for the moment, but there is no reason to dispense with them. Your suggestion that they might be linked with larger entities, while by no means a new idea, is nevertheless worth fuller consideration provided that they are Commonwealth entities. Association with an alien people on the condominium principle is too fraught with political danger and is scarcely likely to make us new friends.

There remains the economic tie. Each of the remnants you cite has an economic potential. The needs common to them all, however, are an assured market and capital for expansion, but to encourage capital from the Commonwealth it is necessary that the Commonwealth at large should be the prime market.

What we need most today is complete freedom of adjustable preferences throughout the entire Commonwealth in order to increase production and stabilise currency balances. Although no two member countries are precisely similar, at least they should have a common economy and the colonial empire could well become the bell on the handle-bar rather than the second wheel of a penny-farthing.—Yours faithfully, E. C. F. R. MACKENZIE
Empire Industries Association

Arbitration

SIR—I am glad that Mr Tinn has now gone some way towards accepting the substance of my theory that in the absence of wage increases the rising trend of prices would tend to become automatically reversed. In your last week's issue he suggests that, since in such circumstances prices do not return precisely to their former level, wage awards should allow for the discrepancy which would otherwise reduce real wages.

This is easier said than done. The ultimate effect of a contraction of demand resulting from a rise in prices unaccompanied by a rise in incomes depends on a variety of incalculable circumstances. Arbitrators are not even in a position to predict the extent of that contraction itself, because it depends on future wage decisions by many other arbitrators or employers.

But, in any case, arbitration can only aim at rough justice. That end could be better served if all wage demands based on price increases and not on previous increases of productivity were rejected. Real wages would then recover at least a large part of their decline, and in the long run they would rise above their previous level. On the other hand, if wage demands are conceded to the full extent of the price increases, real wages would inevitably suffer, because the very act of granting higher wages would cause further price increases. Then, of course, the trade unions put forward fresh wage claims, to compensate their members for the increases in prices caused by their previous wage award. This is exactly what has been happening since the war, and this is what Mr Tinn would like to continue to happen indefinitely.

Would it not be wiser to break the vicious spiral by refusing wage increases based on previous price increases, thereby reversing the trend of prices? This would obviate the need for continuing the credit squeeze, and the resulting increase in the output would justify non-inflationary wage increases. Progress could resume its course if only the unions were prepared to relinquish, purely temporarily, a fraction of what their members have gained since the war.

But Mr Tinn seems to think that it would be improper for arbitrators to try to arrest inflation at such a cost. He is even opposed to the participation of industrial labour in the burden of a rearmament. Let the rest of the community shoulder the entire burden. Amidst full employment an increase in arms expenditure necessarily means a decline in the output of civilian goods. The resulting rise in prices tends to spread the effect over the entire community. But Mr Tinn would like the trade unions to escape their fair share of that effect. Their wages must be raised so that they can continue to maintain their purchases. The rest of the community is thereby condemned to bear also their share of the burden.

In the light of the above considerations Mr Tinn's rhetorical question as to "why should the burden of resisting inflationary pressure through higher defence costs be centred on those whose income is subject to arbitration?" does not ring very convincing.—Yours faithfully, PAUL EINZIG
London, E.C.4

[This correspondence is now closed.]

Crown and Parliament

SIR—Many of your readers must be aware that the significance of the accession of George III is one of the great controversies of modern history—I need cite only Professor Butterfield's recent book, "George III and the Historians." May I, for this reason, refer briefly to one point of substance in your review of my book, "King and Commons, 1660-1832," which appeared in your issue of January 4th? The reviewer states: "In Miss Kemp's opinion, the accession of George III brought the power of the king and the power of the Commons into balance." I do not put forward this opinion in my book, and have not done so elsewhere: it is not, in fact, my opinion.—Yours faithfully,

BETTY KEMP
St Hugh's College, Oxford

[We apologise for this slip. George I was intended where George III appeared in print.]

BOOKS

Destiny Deflated

The Poverty of Historicism

By K. R. Popper.
Routledge and Kegan Paul. 166 pages. 16s.

HUME once said that errors in religion were dangerous but errors in philosophy merely ridiculous. This remark is characteristic of those British philosophers who would dismiss Hegel as a pompous ass after reading only a few chapters and Existentialism as a merely literary movement after seeing a play of Sartre. But Professor Popper is very un-British. He dedicates a book on philosophy to

> the countless men and women of all creeds or nations or races who fell victims to the fascist and communist belief in Inexorable Laws of Historical Destiny.

It is a pity that this book was not published soon after 1945 when its contents appeared in the form of articles in *Economica*. For at that time there was considerable interest in the views of sociologists, like Mannheim, who presented a diagnosis of our time or historians, like Toynbee, who picked out patterns in historical change. Serious intellectuals flirted with Marxism; and planning of a utopian sort was part of public policy. But now all that is changed. Perhaps it was the bomb that did it; perhaps it was inflation and the fate of the Labour governments. Perhaps, even, Professor Popper's "Open Society and Its Enemies" contributed a bit. But, whatever the cause, people in this country do not now need reminding that there is no "meaning" in history or that holistic social experiments are dangerous. They are only too ready to believe that life is one damn thing after another; and they sheer away from utopian proposals for reform. "The Poverty of Historicism" cannot but seem in 1957 rather like the framing of the marriage lines to remind a jaded bride of the end of an affair.

England in 1957 is, thus, not a fitting historical setting for "The Poverty of Historicism." But this detracts little from the sheer philosophical merit of the book. Sociology, to the external observer, often looks very much like a hotch-potch of banal statistics, bad philosophy and grandiose speculation. It never looks much like a science. Indeed, as Professor Popper points out, much of it is the production of naïve misunderstandings of the natural sciences, which have led sociologists either to indulge in imitations of natural science or to set up a different type of science—a historical science studying social wholes and developing laws of their historical evolution that would permit historical predictions, like Marx's prophecies about the fate of capitalism. Professor Popper is at his best in exposing the misunderstanding of the natural sciences from which both these conceptions of social science derive. As a philosopher he has the rare merit of having exciting things to say and saying them in a rigorous manner. Indeed his book abounds in stimulating distinctions: between prophecy and prediction, historical laws and historical trends, theoretical and historical sciences, piecemeal and utopian methods of social reform. His analysis of concepts like "evolution," "social whole" and "intuitive understanding" is most illuminating; so also is his treatment of the role of experiment, observation and quantification in science.

The trouble is, however, that Professor Popper, with an admirable sense of relevance, only deals with these topics in sufficient detail to refute historicism. The reader feels vaguely irritated when the guided missiles impinge upon the gaseous balloons of historicist metaphysics — balloons which Professor Popper admits that he himself has rigged a bit to render them even determinate targets. It is rather like reading Locke's First Treatise, where he elaborately demolished Filmer's Patriarcha. But Locke did proceed to his Second Treatise. Professor Popper should do the same.

Wittgenstein said of psychology that there are experimental methods and conceptual confusion. The same surely is even more true of social science today. It is to be hoped that Professor Popper's astonishing erudition and acumen will soon be employed in helping to advance the struggles of contemporary social science. He has demolished the intellectual case of the enemies of the "Open Society"; but he has shed too little light on the difficulties of its friends.

War Guilt in 1870

Bismarck and the Hohenzollern Candidature for the Spanish Throne. *The Documents in the German Diplomatic Archives*

Edited with an introduction by Georges Bonnin.
Chatto and Windus. 312 pages. 42s.

THESE documents emphasise the conclusions reached over thirty years ago by Professor R. H. Lord in his study of the "Origins of the War of 1870". They are a vitally important introduction to the documents which the Germans allowed Professor Lord to publish and overlap them for only about ten days of July 1870. (Anyone, by the way, hoping at last to find here the original Ems telegram will be disappointed.)

It is already known that King William of Prussia had behaved with dignity and moderation over the matter of the offer of the Spanish throne to his Catholic Sigmaringen cousins, but these newly published documents show him to have been a man of shrewd judgment, a Prussian king who yet genuinely wished to avoid the war with France that he knew to be at stake—in spite of the fact that he must have had a very fair notion of the glittering prizes that such a war could bring. His marginal notes on Bismarck's recommendation, on March 9, 1870, of the Hohenzollern candidature have never been published before; they provide ample evidence of his intelligent scepticism towards Bismarck's assertions.

The king's attitude is the more remarkable by contrast with that of his army chiefs. Both Moltke and Roon were enthusiastic supporters of the plan to make a Hohenzollern king of Spain for military, and, indeed, frankly imperialistic, reasons. The Sigmaringen Archives, which Professor Bonnin has also been able to use, provide fresh proof of this in Prince Karl Anton's account of the so-called Crown Council held in Berlin on March 15, 1870. On that occasion Moltke, like Bismarck, hinted at the desirability of a return to the empire of Charles V, although it was clear that anything of the kind would be an unbearable affront to Napoleon III. It should not be forgotten that Karl of Hohenzollern-Sigmaringen was already king of Rumania.

In some ways the most interesting revelation in this book is the diary kept from May 18 to July 22, 1870, by a Prussian staff major called Max von Versen, who was one of Bismarck's secret agents. Towards the end of April the Hohenzollern candidature had in fact been dropped, thanks mainly to the king's forebodings. But Bismarck needed it; through Bucher and through Versen, who had been in Spain officially to report upon the Spanish Army, he succeeded in working upon the Sigmaringens so that they accepted the Spanish offer after all. "Now I have got things going again," noted Versen on May 25th. (Versen, who should have been on duty in Posen, had been readily made available to Bismarck by Moltke.)

Other documents here released for the first time show to what lengths Bismarck went in order to deceive the king, claiming that it was necessary to keep from him the knowledge of activities that were not a part of official Prussian policy: William, by contrast, showed touching—or was it ironical?—consideration for Bismarck's state of nerves.

Professor Bonnin's introduction to this publication examines the official German attitude towards the secret papers concerning the Hohenzollern candidature in Spain. As late as March 1924 two historians, Rheindorf and Platzhoff, who had been allowed to see the secret files and were then consulted about them, recommended that they should remain unavailable because they were too compromising for Bismarck's

reputation; they felt that the German authorities must not make it possible for anyone to attribute the guilt for 1870 as well as for 1914 to Germany. In 1931 Thimme himself was deliberately deceived by the Foreign Ministry over some German dispatches from Madrid in 1870.

Then and Now in Africa

An African Survey: *Revised edition*

By Lord Hailey.
Oxford University Press. 1676 pages. 105s.

NEARLY twenty years since its original publication, the "African Survey" has been revised by Lord Hailey and re-issued. In spite of the great increase in the volume of information about all aspects of African life in recent years, he has managed to keep well within the limits of the previous volume by using a slightly larger page. The new edition has just under 1,700 pages, compared with over 1,800 in the earlier one, and is easier to read and handle. Though the diligent student may from time to time disinter an odd sentence or two that can be found in the earlier edition, most of the book has been so completely rewritten as to constitute an entirely new work.

One of the most striking differences between the new and the old Hailey is that the old represented, as we can now see, the epitome of an era, written just as that era was about to close. It was dominated by the assumptions of a period within which the colonial rule of Africa was taken for granted and assumed to be likely to exist for an indefinite future, and in which colonial powers were supposed to be, within wide limits, free to implement such policies as they might deem appropriate. Moreover, it was an era in which, by and large, Africa was a "closed shop"—a subject and a sphere of action for specialists. Twenty years later none of these assumptions is even remotely plausible. In 1938, it was possible to organise the greater part of the material in terms, on the one hand, of "indirect rule," the preservation of African society and culture, peasant cultivation of cash crops; and, on the other, of imposed western administrative systems, the destruction of African ways of life and values, the development of the economy by plantation and mining enterprise. It was indeed one of Lord Hailey's great merits in assessing an Africa generally seen in such terms that he came to Africa from an India in which, although the westernisers had defeated the orientalists, they had now lost any aggressive confidence they might once have had. He was thus exceptionally well placed to see the weaknesses as well as the strength of the philosophies of "indirect rule." Of course this dichotomy was not everywhere shared, and we can now see that it was a great over-simplification: but in its place no alternative has yet appeared. The new Hailey is thus confronted, not merely with the great difficulty of being even reasonably up to date in a period of intensely rapid changes, but also with the absence of any accepted framework within which the material it deals with can be organised.

On the whole, Lord Hailey has been successful in removing from the Survey the concentration on "native administration" that characterised the outlook of British Africanists twenty years ago. The section devoted to what is now called, not altogether happily, "The Administration of African Affairs," may seem excessive in the contemporary climate of opinion. But much of the basic instability of Africa today stems from this fact: that the major changes in the personal outlook of Africans that are needed if they are successfully to operate the modern economies and administrations which the colonial powers have set up have been brought about mostly among a relatively small number of people concerned with central operations. They have hardly yet begun so far as concerns the conduct of the day-to-day local affairs of the vast masses. That is the sphere of the administration of African affairs and its long-term importance can hardly be over-emphasised.

Although the Survey is admittedly based on contributions by many hands, Lord Hailey has once again successfully imposed on the whole mass the masterful imprint of his own particular outlook and it is definitely his book and no one else's. Its temper is detached and its tone equable. This personal note, evident throughout, is possibly most clearly exemplified in the pages about "The Rising Spirit of Africanism": "one of the most distinctive features in the picture of postwar Africa" and one whose progress makes it unlikely that one feature which the Survey has in common with its predecessor will be shared by any successor, the fact that the whole of Africa south of the Sahara is seen from Europe and essentially from London.

How to Manage

Managers: *Making or Marring Them*

By Joseph Dean Edwards.
Macdonald and Evans. 232 pages. 17s. 6d.

SOME readers, picking up this book and seeing on the contents page a chapter headed "Your Executive Floor, is it Ticking?", may hastily put it down as "just another one of those." They would be wrong, for Mr Edwards, despite his chapter headings, has written a human, lucid, concise and eminently sensible book about management development. He is, in no sense, original, but managers who have not read any of the other books should find this one worth while and, indeed, they will be lucky because this is rather better written and more helpful than the others.

A major theme is that executive development programmes have become a farce. This statement, so untrue in this country where few companies could be said to have an executive development programme, is the first of many indications that this is an American book—a fact which the British publishers are careful not to mention. (In America the title was "Executives—Making them Click.") This reticence, although understandable, can result in misleading conclusions; for instance, in the chapter called "Future Managers," a number of references are made to surveys of management practice in recruitment, but no indication is given of the country where these surveys were made.

This book, like its counterparts, which are also cashing in on management uncertainty in human relations, prompts the question: "can advice on how to handle people be given effectively through the written word?" The open-minded, conscientious manager, who believes that the development of his subordinates is one of his most important duties, could probably benefit from reading this book, but he is the person who least needs to do so. Will the manager who is a poor coach—and is probably both totally unaware of this weakness and uninterested in it—become any better by reading that he must develop his people individually? We do not know the answer to the question posed at the beginning of this paragraph, but at least, faced by this flood of literature, we should ask it.

Beneath Our Feet

The World of the Soil

By John Russell.
Collins. 226 pages. 25s.

WITH popular attention straying towards cold and sterile space, and the prospect of increasingly large sums of money leaching away in the exploration of its lifelessness, it is a good time to be reminded of that equally little known but infinitely more important world of the soil. We then realise with a deflationary shock that our own life and activity is nothing but the unintended by-product of the life and activity of the inhabitants of "that thin layer of miscellaneous rubbish" which covers the fertile parts of the earth. Mankind's dependence upon them is absolute; it would be ironic if, with gaze fixed on the heavens, it failed to feed its multiplying numbers by omitting to take account of what is happening under its feet.

What really happens under our feet is incessant, fierce and relentless warfare. There are up to five thousand million bacteria in a heaped saltspoonful of good garden soil, voraciously attacking dead organic matter. They are preyed upon by protozoa and other larger entities, which in turn are preyed upon by the just visible insects. Into this mêlée the seedling plant pushes out its roots, and from the litter of the battlefield draws its sustenance. The adventure is not without risk, for there are many organisms that prey upon plants.

A detailed description of the soil inhabitants forms the fascinating centre section of Sir John Russell's book. It is preceded by a brief description of how the soil was formed and is followed by chapters dealing with the control of the soil for agricultural and gardening purposes. Here the chemist in Sir John takes over. The soil inhabitants are relegated to the background and the emphasis is upon the artificial provision of chemicals known to be required for plant growth. Indeed the inexperienced might be left with the impression, which cannot have been intended, that only thirteen elements are needed for plant nutrition. The increasing use of chemical fertilisers in recent years is noted with approval, but as there are, in fact, sufficient of these elements already in the soil (areas of specialised deficiencies apart) to last for hundreds if not thousands of years this approach is questionable on grounds of economics at least; there is a growing body of opinion that considers it questionable on other and more vital grounds as well. A description of how the soil organisms are able, under suitable conditions, to release not only nitrogen but all the other necessary elements, known and unknown, from this vast constantly renewable store would have completed an invaluable work.

Cash for Work

Incentive Payment Systems:
A review of Research and Opinion

By R. Marriott.
Staples Press. 232 pages. 21s.

IT has been taken for granted for many years that the most effective method of obtaining higher production is the use of an incentive payment system. In view of the resistance from workpeople that has often had to be overcome, the continuous friction that is usually produced by payment by results schemes and the high cost of administration, it is surprising that such unquestioning faith has been placed in the efficacy of these methods. Although this survey of incentive payment systems, made at the suggestion of the Department of Scientific and Industrial Research and the Medical Research Council, is far from conclusive, it may well shake the assumptions that have been made by industrial managers for far too long.

There is remarkably little objective evidence to show to what extent financial incentives affect productivity. One of the main reasons for this is the extreme difficulty of isolating the effect of cash incentives from the many other factors that influence human behaviour at work. The author, however, appears to conclude that expert opinion is tending to the view that cash incentives cannot of themselves provide the necessary motivation for workers to reach the optimum level of productivity.

He cites evidence from a number of concerns employing about 50,000 people in the chemical, electrical, mechanical engineering, food and tobacco industries, which have in recent years decided to replace incentive systems with controlled day work. They have done this for the following reasons: the need for a more human method of payment, which would encourage greater worker responsibility and interest in company progress; the need to improve worker relations and morale; the need to get rid of a system of payment that modern methods of production had rendered obsolete; the need to reduce administrative costs; the need to increase operator mobility; pressure from unions; the need to create a new works atmosphere.

The development of automation will compel the management of many firms to re-examine their traditional methods of payment; it is to be hoped that more care and attention will be given to the devising of new methods of wage payment and their introduction than was often given in the past to the adoption of an incentive payment system.

Indian Anecdotes

The Jewel in the Lotus

By B. J. Gould.
Chatto and Windus. 266 pages. 25s.

THE aim of the late Sir Basil Gould was evidently to write a cheerful, anecdotal book that would recall a vanished service and way of life, and would pay warm and graceful tribute to a number of selfless men and women. In this he was admirably successful. His book will give keen pleasure and revive memories, happy, nostalgic, gay and stark, among the dwindling band of retired officers, and their wives, of the Indian Civil and Political Services, and of the Indian and British armies, who served on and beyond the north-western and north-eastern frontiers of India, in remote places whose names fall like the echoes of a romantic trumpet blast on the ear—Malakand, Swat, Chitral, Gilgit, the Khyber Pass, the Tochi valley Waziristan, Afghanistan, Sikkim, Bhutan and Tibet. Sir Basil himself emerges delightfully from his own unpretentious pages as a very Bayard—devoted to the welfare of the peoples among whom he worked, generous, kindhearted, a keen lover of nature, appreciative of flowers, forests, beasts and birds; as zestfully at ease with horse, hounds, rifle and fishing rod as a pre-1939 Englishman should be. His chapters on Sikkim, Bhutan, Tibet and Lhasa—including a unique eye-witness account of the installation of the fourteenth Dalai Lama—are first-rate, colourful and sympathetic.

Admitting that it is a critic's most tiresome failing to reprove an author for not writing the book that the critic would have chosen, one may perhaps be permitted a passing sigh that a man so close to such historic events and personalities as Kitchener and Curzon in feud, Montague and Chelmsford in the birth pangs of reform, the attempted assassination of Lord Hardinge, the third Afghan war, the Faqi of Ipi, the Quetta earthquake, and many more should rarely have any but superficial reflections to make, and should add little to our knowledge or understanding of them.

SHORTER NOTICES

The Birmingham Post 1857-1957

By H. R. G. Whates.
Birmingham Post and Mail. 254 pages. 21s.

In 1857, two years after the abolition of the stamp duty on newspapers, the *Birmingham Post* started as a daily penny paper five days a week—on Saturday the older *Birmingham Journal* was published at twopence. Twelve years later the penny *Post* appeared on Saturdays as well.

In the hundred years since then Birmingham has had an exciting history, as a pioneer in municipal reform and on the national scene when Chamberlain became a national leader. The story of the *Birmingham Post* as the leading local paper throughout this century should also be exciting; yet, as told in this book, it fails to hold the reader. The reason lies in the divided interest. There are two threads running through the book—the story of Birmingham and the domestic story of the *Post*. They are told in alternating chapers, which never quite get to grips with either story. The personalities never come fully to life, not even in the story of the paper's change of politics in following Chamberlain, which led to the dismissal of its liberal editor. The author was handicapped because Sir Charles Hyde gave most of the already meagre records for salvage in the war, and there is consequently little in the way of original sources. There are, however, some good anecdotes.

The Economics of Man-Made Fibres

By Douglas C. Hague.
Duckworth. 315 pages. 30s.

This book is at its best as long as the author, a lecturer in political economy, is drawing on existing written material about the history of the industry, which has been done very painstakingly, with minute attention to the sources of reference. The results of his personal contacts with the industry—based on many visits to firms—are less successful as he not only sometimes gets his facts wrong, but is too prone to draw conclusions, which a less cursory knowledge of the industry could have prevented.

Mr Hague makes a brave attempt in his conclusions to fit the industry into a recognised economic pattern: "The man-made fibres industry has a record of rapid innovation. Is it going too far to ask whether this is because monopolistic and competitive forces are present in the industry in more or less the right proportions?"; "Yet it was the comparatively fierce competition in the textile-yarn field which helped to encourage these two viscose producers to look to the industrial market as a way of escape." Here the author is referring to the entry of Courtaulds and British Enka into the tyre yarn field, and his statement is typical of his speculative conclusions. In fact, it was the war that brought Courtaulds and Enka together in this field in order to ensure a supply of yarn for tyre cord, with the close co-operation of the Ministry of Supply. Mr Hague says that the women's stocking trade has twice changed its raw material, "first abandoning silk for rayon and later for nylon." But the silk stocking trade, which reached record proportions in the 1930s, was a result of the widespread fashion of the 1920s, which came in with rayon, not silk and short skirts.

Copyfix

BECAUSE IT IS FOOL-PROOF AND FUSS-PROOF

'Anson' Copyfix produces a true 'second original' of letters, reports, statements, balance sheets, specifications, sheets of music, pages from books, etc., in a few seconds. **It gives** perfect **white photocopies** even from **red** or other coloured originals. Annotations, alterations and signatures are faithfully and strongly reproduced, a perfect facsimile.

Copy-typing, checking and correction are entirely eliminated and anyone can use the 'Anson' Copyfix. Occupying no more space than a typewriter, it is part of ordinary office equipment used in everyday office conditions.

No dark room, no rinsing, washing, fixing or stains.

One 'Anson' Copyfix does twice as much work in one day as six typists in one week CORRECTLY.

'Anson' Copyfix is worthy of further investigation. Kindly complete the form below for full details.

AMERICAN SURVEY

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Eisenhower Begins Well

WASHINGTON, DC

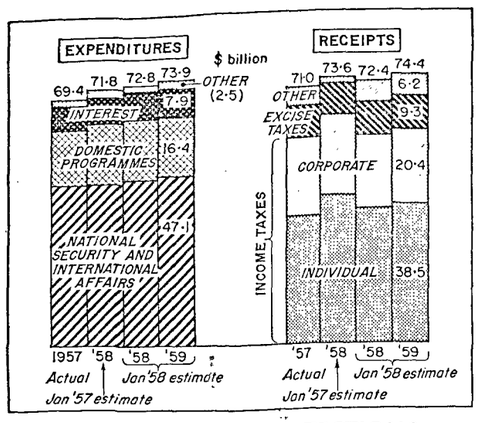
THE President made a good speech last week. This was such a relief to most members of Congress that they applauded to an abnormal extent and such a surprise to many journalists that they reached for ecstatic phrases to describe it. In this year's message on the State of the Union, delivered in person to a joint session of Congress, the strength of the man was on test as much as the validity of his programme. The temporary dispersal of some of the more shattering doubts about whether the nation's leader had it in him to come to grips with the great crisis of American power induced the *New York Herald Tribune* to declare in a special editorial on the front page that in this speech "the President attained his finest hour."

It was not a great speech. There were no phrases that future generations, or even this one for that matter, will remember. However, it did achieve three most important effects. By leaving out the usual hodge-podge of unrelated proposals, most of them sure to be ignored by Congress in any case, Mr Eisenhower was able to concentrate on the central issues of national security. Thus, though the style of the speech was undistinguished, in the essential passages it achieved a crispness, a unity of theme and a healthy instinct for the cheer-line which enabled a vigorous confident-looking, smiling President to put himself on effective display. Secondly, in the passages dealing with defence, where his listeners were on the alert to detect and repudiate any remaining complacency, the President showed himself abreast of, and on the matter of reorganisation of the Department of Defence possibly slightly in advance of the general demand for a "knocking together of heads." Finally, in the field of foreign economic policy where the President still needs to educate Congress rather than the other way round, Mr Eisenhower went about the task with a will which he has seldom displayed hitherto.

Departing altogether from his usual respectful attitude to other people's opinions, Mr Eisenhower held up to scorn those who "shot down" foreign aid with the slogan of "give-away" rather than with rational arguments. He cleverly linked an admission that he had been caught napping, as his congressional critics had alleged, about the psychological effect of the Russians having the first satellite with an exhortation to Congress not to make an even worse mistake by failing to anticipate the more serious impact of the Soviet economic offensive. And in his peroration he returned to the theme by telling Congress bluntly that

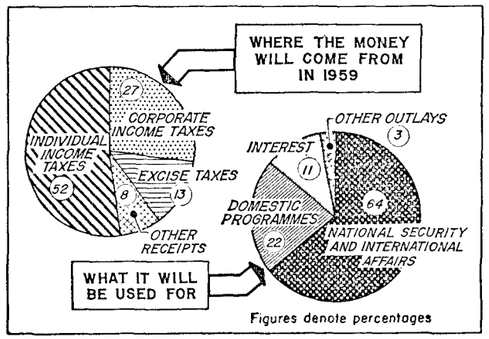
> it makes no sense whatever to spend additional billions on military strength to deter a potential danger and then, by cutting aid and trade programmes, to let the world succumb to a present danger in economic guise.

All these signs of new verve are most welcome, although those who have been observing Mr Eisenhower for the last five years remain sceptical about whether he will follow through on his tough beginning. But there are some favourable omens. The Administration has made a serious effort to get its proposals for trade and foreign aid ready to be tackled early in the congressional session. The President has asked Mr Eric Johnston to drum up a high-level citizens' movement of the kind which has effectively mobilised public opinion on these issues in the past. Two of the leading Democrats, Mr Truman and Mr Stevenson, have been asked to join and Mr Stevenson, doubtless bothered by the tendency of opposition Senators to harp on military needs, is already in Washington quietly attempting to persuade his political friends.



BUT the immediate debate will surge around the adequacy of the President's defence proposals and, since the Budget appeared on Monday, this rather than the speech to Congress is now the central document. This weighty publication contains most of the Administration's legislative programme and enough figures to support almost any viewpoint. The Administration is naturally laying stress on the fact that spending on missiles, military research and the strengthening of the existing nuclear deterrent—all matters of immediate concern in Congress—is to go up by a possible $4.3 billion over that originally planned for the 1958 year, which ends on June 30th. This figure is reached by totalling up a request to Congress for an additional appropriation of $1.3 billion for the current fiscal year, a further increase of $2.5 billion in the 1959 year, which begins next July, and a special $500 million which the President can spend at his discretion on exciting new technological discoveries that cannot be accurately forecast.

Besides this the President has asked for extraordinary power over the sprawling, committee-locked Defence Department, by seeking authority to switch sums up to a total of $2 billion from their appropriated purposes to others which he may consider more pressing. It is hardly surprising that the chairman of the House subcommittee which deals with the defence appropriations protested that this would destroy Congress's power of the purse. A more fundamental complaint comes from the critics who argue that, starting from the actual current rate of military spending and deducting the $1.5 billion which the President hopes to save from the conventional military budget, the genuine increase for the next fiscal year is only $900 million. This they contrast with the cumulative increases of $3 billion a year which the recent Rockefeller report held to be imperative.



Apart from differences in the use of figures the argument is being conducted according to two different frames of reference. There is, first, the question of whether enough extra money is going to be spent to cut down the time it takes to develop and equip American forces with the large

Budget to Keep the Peace

WHAT THE PRESIDENT WANTS

In addition to the actual appropriation of funds requested in the Budget for the 1959 fiscal year, the President also asked Congress in its current session to provide for :—

1. Another year of corporate income taxes and excise taxes at present rates.
2. Raising the limit on the public debt from $275 billion to $280 billion.
3. Reorganisation of the defence establishment.
4. Extension of the Reciprocal Trade Agreements Act for five years.
5. American membership in the International Trade Organisation.
6. Exchange of scientific information with allied countries.
7. Improvements in scientific education.
8. Legislation on labour-management relations and trade union funds.
9. Adjustments in ex-servicemen's benefits.
10. Changes in farm programmes, particularly as regards price supports.

Among other less important recommendations, many of which have been made before, are a number of proposals for transferring certain responsibilities from the federal government to state and local governments or to private enterprise and for providing economic returns on federal services and loan programmes.

missiles which will ultimately take over the role of deterring aggression from the superbombers. Related to this are the further questions of whether enough is being done to preserve the present deterrent—by greater dispersal of bases, sharper early warning systems and so forth—and whether the Administration is not being premature in closing the production line of B52 bombers this year before either their manned or unmanned successors are very firmly in being. Since the tongues of so many generals, industrialists and scientists have been unloosed by Senator Johnson's investigating committee there will doubtless be loud appeals against the President's judgment on all these matters.

But then there is the further question whether or not the United States should have highly mobile land forces to fight a limited war as well as long-range thermo-nuclear missiles for a world war. Although the Budget does not explicitly reject the proposition its calculations certainly seem to assume that even greater reliance will be put on the great deterrent. The President has clearly made an effort to carry out his pledge that the new defence effort should be financed by the cutting back of less essential civilian programmes. But even if his suggestions in that direction get through Congress, which seems unlikely, they will not begin to show really significant economies for several years. The one big cut which makes possible the rather frail prediction of a balanced Budget is that of $1½ billion in spending on conventional defence. One concrete effect of this is that the army will be reduced next year by yet one more division to fourteen.

A second article next week will discuss the effect on the national economy of this Budget for the coming 1959 fiscal year which begins on July 1st ; it will also deal with the President's annual economic report.

Mile Nearer the Summit?

NOTHING in the President's State of the Union address won such hearty congressional applause as his promise that he " would go an extra mile with any one " to bring nearer a genuine peace and that any reasonable proposal on disarmament would be considered. Such phrases suggested that if Mr Dulles, the Secretary of State, had one of the President's ears, the other was not entirely closed to the arguments of Mr Stassen, his Adviser on Disarmament, who has been advocating a more positive and flexible response to the Russian initiatives. Mr Stassen, it was thought, would make a final effort to make his ideas prevail when the National Security Council discussed the reply the President was to send to Mr Bulganin's suggestion of another summit conference in two or three months.

In fact, the reply—drafted for the most part by Mr Dulles—reflects hardly any of Mr Stassen's optimism about the Russians' eagerness to reach an agreement or his willingness to meet them half-way by, for example, accepting a ban on nuclear tests without demanding an accompanying agreement to cease producing nuclear weapons. But the letter's reasonable tone, and the readiness of the President to join in a meeting of heads of state, if there is adequate preparation and some hope of substantial agreement, has had a warm reception, even from newspapers and Democrats normally frosty to the " negative " attitude of the Secretary of State. The new proposals, for a joint renunciation of the veto in the Security Council and the insulation of outer space from military exploitation, are regarded as a belated but dramatic grasping of the initiative, even if only in the sphere of propaganda which the Russians usually monopolise. If Mr Stassen sticks to his determination to resign on principle, he may take little political capital with him. Mr Dulles, indeed, is basking in an unusual glow of approval: he made a favourable impression upon influential Democrats when, in his briefing of the Senate Foreign Relations Committee, he put his main emphasis on a quarter new to him : the importance of foreign economic aid to counter the Soviet offensive in the under-developed countries. It will be fortunate if this congressional thaw lasts, since the President's impassioned defence of Mr Dulles at his press conference this week—the first since October—shows that he has no thought of finding a new Secretary of State.

Mr Dulles must also relish the repudiation of Mr George Kennan by Mr Acheson, who was Mr Truman's Secretary of State and remains a respected adviser to the Democrats on foreign policy even though he cannot hope to resume his old post. Last week Mr Acheson insisted that Mr Kennan, once head of the State Department's Policy Planning Staff under the Democrats and the author of the policy of containment, spoke only for himself in advocating a withdrawal of American, Russian, and British troops from central Europe ; Mr Kennan, in the view of his former boss, " never grasped the realities of power relationships." New ideas, it seems, make heavy weather in both parties.

Credit Out a Notch

TO raise the revenues necessary to balance the biggest peace-time Budget, the President counts on an economic rebound, beginning in the second half of this calendar year, which would increase personal incomes by $9 billion. Businessmen who looked to the Budget to help them out of recession may feel, however, that, apart from the increase in military spending, this is a case of faith without public works—faith in dynamic technologies and in the electric effect of a population increase of 3 million every year. For example, instead of offering new schemes to stimulate the building industry, a popular method of turning slump into prosperity, the section of the Budget on housing and slum clearance places its main emphasis on transferring part of the burden, in the years to come, to the states and local communities and to private financing.

Credit, it is true, is being let out a notch. With the fall in the Treasury bill rate, there are lively expectations of a further cut in the discount rate by the Federal Reserve Banks ; already this week the Federal Reserve Board has reduced the margin required for share purchases and short sales from 70 to 50 per cent. And in housing itself, the modest recovery of the last few months is being stimulated by a number of small measures to make it easier for people to find the money for a home. The Federal Housing Administration has relaxed its rule that incomes of people seeking a mortgage must be five times the yearly cost of their house to them ; in some circumstances, the fees connected with completing a purchase may be included in the amount borrowed, so that it is easier to get together the very small down-payment required. The President now proposes that the amount on mortgage which the FHA may insure

should be increased to $30,000. Such concessions will help in a year when prospective home-owners are nervous about their incomes and the weight of debt they are already carrying but, even with the upturn in family formations, due to the war-time rise in the birth-rate which began in 1940, it may take time to lift the rate of housebuilding very far above the million or so of houses and flats which were started in 1957.

For helping cities to clear out their slums and rebuild their blighted centres, the President proposes capital grants of $250 million a year for five years—on condition that, beginning in 1960, the two-thirds of the cost which the federal government now contributes to such projects be reduced gradually to 50 per cent. But last year Congress raised the "urban renewal" grant from the $175 million which the President requested to $350 million, and the mayors now testifying before a congressional sub-committee want the sum raised to $500 million a year for five years—with Washington paying not two-thirds, but four-fifths of the cost. The Budget does not necessarily have the last word.

Better Farming

IMPROVEMENT, according to Mr Benson, the Secretary of Agriculture, was the keynote of conditions on American farms in 1957; for the second year running agricultural income rose, as it had not done since 1947, and the value of farmers' assets was at an all-time high. But there is no evidence of improvement in the generally poor view which farmers and their congressional representatives take of Mr Benson's proposals, being outlined in detail this week, for changing the price support system in order to free farmers to make greater use of their ever-growing productive capacity and to relieve the drain of the present system on the pockets of taxpayers and food-buying housewives. At present price supports account for about three-quarters of the government's annual outlay on agriculture, which for next year is estimated at a total of $4.6 billion, only $300 million less than this year.

However, Congress is expected to look more favourably on two other, less basic farm improvements for which the Administration is asking. There is an element of "we-told-you-so" in the apparent congressional willingness to end the acreage reserve section of the soil bank at the close of this crop year, for it is not long since the legislators nearly forced the Administration to abandon this plan, by which until recently it set great store as a means of reducing the output of surplus crops. Last year, as a result of it, over 20 million acres were kept from producing 2 million bushels of cotton, 6 million hundredweights of rice, 93 million pounds of tobacco, 225 million bushels of maize and 175 million bushels of wheat. But the remaining acres produced record yields and this year, with the drought really broken and with acreage reserve payments now limited to $3,000 a farm, the scheme has lost much of its attraction. The President himself was one of the farmers benefiting from it last year—although by only $2,000, not by the $280,000 which went to one Kansas farmer or the $50,000 each which went to 67 others—but he now believes that more material and lasting profit for each government dollar spent can be obtained from the longer-term conservation reserve section of the soil bank; $450 million is asked for this in 1959, $125 million more than this year.

Since mid-1956, however, the government investment in surplus farm commodities, now valued at about $7 billion, has been reduced by one-sixth and supplies valued at nearly $6 billion have been disposed of. This is largely the result of sales abroad under the Agricultural Trade Development Act, which has much to do with 1957's all-time record, both by value and by quantity, for agricultural exports which came to $4.7 billion worth in that fiscal year. This foreign demand is now falling off but the President has asked for the Act to be extended to mid-1959 and for an increase of $1.5 billion, to $5.5 billion, in the authority to incur losses under it.

Burial of a Worker

AFTER considerable agony and obvious foul play, New York's *Daily Worker* expired on Monday. In a secret meeting held last month the national executive of the American Communist party ordered the paper to close down, whereupon its editor, Mr John Gates, not only refused to obey orders but also announced his defiance to the world. However, the *Worker's* anæmic circulation of 5,000 made it dependent on the party's willingness to continue as blood donor; its infusion ran to a quarter of a million dollars last year. Mr Gates was censured for disobedience and the paper, after prolonging its existence for a week, was finally forced to give up the ghost. Mr Gates has now resigned from the party, calling it a "futile and impotent sect" with an effective membership that he puts at no more than 7,000—less than a tenth of the total it claimed just after the war.

Mr Gates argues that the party could well afford to keep the *Daily Worker* going if it wanted to, and it is plain that the paper has been suppressed chiefly for political reasons. Ever since the Hungarian rising Mr Gates has been the spokesman for the liberal, anti-Stalinist faction among the American Communists. He told the press last week that he dates his change of heart from the years he spent in gaol, convicted under the Smith Act of conspiring to advocate the overthrow of the government, when he "read widely and thought a great deal." Last February, at the party's turbulent convention in New York, he supported a motion criticising the Soviet intervention in Hungary, and he has also been in trouble for printing articles in the *Daily Worker* by apostates like Mr Howard Fast.

A good many sympathisers are likely to follow Mr Gates out of the party, including several members of the *Daily Worker's* staff. The closure of the paper represents a defeat for the liberals who, by hurrying too fast down one of Mr Khrushchev's separate roads to Socialism, found themselves in the dangerous cul-de-sac of "revisionism," the heresy condemned by the recent congress of Communist parties in Moscow. However, it does not represent a full victory for Mr William Foster, the American party's tough old Stalinist leader. At the New York convention last year Mr Foster, though publicly supported by the Russian press, was beaten by an alliance between the Gates faction and a group of middle-of-the-roaders led by Mr Eugene Dennis, the party's former general secretary, who produced a resolution declaring that the Americans would not be bound by Moscow's interpretation of Communist doctrine. The middle-of-the-roaders now seem to have dropped the liberals, but the meeting which decided to close the *Worker* also refused to endorse last November's declaration by the Moscow congress which reasserted the Soviet Union's leadership over Communist parties elsewhere. The United States is evidently not without its Titoists, and there may be fresh quarrels among the few survivors of American Communism.

Kink in the Pipe Lines

THE expanding natural gas industry, which added nearly 2 million customers in 1957 and hopes for nearly three million more by 1960, may burn to serve in vain if the Supreme Court does not soon come to its rescue. The pipe lines through which the gas goes to the consuming centres in the north and west have been tied up in knots by a court decision that they must secure the consent of all the gas companies they supply—an impossible condition—before they can raise the prices they charge. In the past, the Federal Power Commission, which regulates the gas pipe lines, has permitted them to raise their rates while waiting for their applications to be dealt with; the additional income has been held in bond until the approval of the commission was forthcoming.

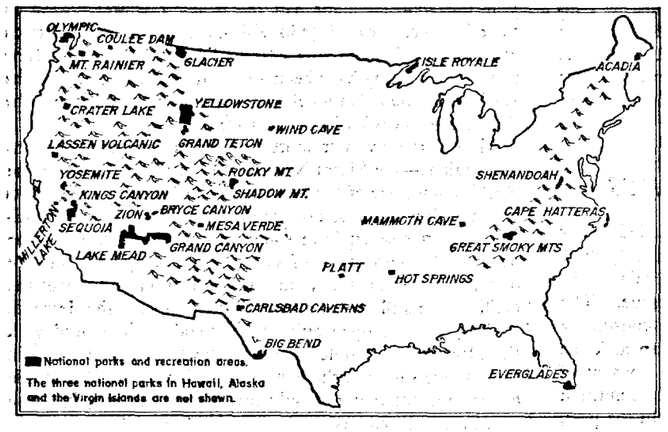
In November, however, when the city of Memphis appealed against higher rates charged by the United Gas Pipe Line Company, the federal court held that the standard contract signed by all the pipe lines' customers did not give effective advance assent to increases in rates. It decided that the company should have invoked the alternative procedure of asking for a full-scale investigation of its rates by the FPC. This is not only time-consuming and likely to swamp the FPC if applied wholesale; it also does not provide for higher rates while the investigation is going on. The decision may mean that the companies must pay back $200 million or more in recent higher charges.

The FPC, which agrees with the pipe line companies that the ruling would be financially disastrous to them, has asked the Supreme Court to review it as soon as possible; until this is done, it is allowing the companies to raise their rates. Even the pipe lines' customers, after some preliminary rejoicing, are beginning to have cold feet; half-frozen prices may slow down the supplies of natural gas on which consumers and industries now depend. The pipe line companies themselves, frightened of being squeezed between the prices they must pay for gas and those which they can charge, are postponing their plans for expansion; it will not be easy to borrow money for such projects, in any case, until the uncertainty has been dispelled. Chicago is the first victim: a $182 million scheme to expand the supply of natural gas to the middle west has been set aside for the time being.

Wheels in the Wilderness

FROM A SPECIAL CORRESPONDENT

UNTIL recently the national parks have rated low on the list of places where Americans go for the winter holidays which are becoming more popular every year. Nowadays eight out of the twenty-nine parks are open for snow sports, while at the ones in milder climates (such as the Everglades Park in Florida and Hawaii in the Pacific) there are more visitors in the winter than in the summer. Last year the sporting eight had the heaviest winter season in their history, with 361,760 visitors, and the Park Service expects that demand this year will be even greater. New facilities for skiing have been added at Hidden Valley (in the Rocky Mountain National Park) and even Paradise (in the Pacific Northwest) will be improved.



Most of these winter sport areas lie in the western mountain regions—the Sierra Nevadas on the Pacific Coast or the Rockies—but one of them, Shenandoah National Park, offers skiing within easy reach of the District of Columbia. Facilities vary, but seven have some form of ski tow, and some have a full complement of ski teachers, equipment for hire or for sale, cross country ski trails and so on. In places the facilities are still on the amateur side, but so is the demand. At least two are open only at week-ends. Compared with the fifty million people who visit the twenty-nine parks in the average summer, the winter count is very small, but it is a development that not only fills a new demand, but also creates new problems.

If the Park Service is to carry out its glowing promises (made in the project called Mission 66) to gear the park system to the demands of this motor age by its fiftieth anniversary in 1966 and, if that gearing must now include provision for the year-long use of parks which used to be closed for half that time, its budget will need to be reappraised. Last year's appropriation ran to over $60 million and about $2 billion has been the total estimate for the ten-year project.

Of the twenty-five million acres which the National Park Service has under its care, the twenty-nine parks and five recreation areas themselves hold rather more than half. The rest is scattered among 147 other units, nearly all much smaller—national monuments, battlefield sites, national cemeteries, parkways, the parks in the city of Washington. The twenty-nine parks differ widely in age, size and character. The oldest and most famous of them is Yellowstone, carved out of the empty west in 1872. The newest, added only last year, is on St Thomas, in the Virgin Islands of the Caribbean. Most of the parks lie west of the Mississippi River, perhaps because eastern lands were fairly well pre-empted by private owners when the movement started; but the total includes a skyline drive along the tops of Virginian mountains, an island off the coast of Maine, and a million and a quarter acres of swamp, mangrove trees and alligators in Florida, described officially as the "largest remaining subtropical wilderness in the United States."

IT is the duty of the Park Service to guard all of these for the enjoyment of future generations, but it is not an easy duty to fulfil. In the first place, the service is a political agency and is therefore conscious of the need for making friends among the voters; this it does mainly by welcoming visits to its geographical wards. But in the second place, the service is bound by the terms of its guardianship to keep those wards intact and free from human damage. Hence it must be constantly inventing diplomatic ways of saying, "Please come and look, but don't touch."

In the early days of Yellowstone, visitors came in by stage-coach or wagon train, were housed in great caravanseries, and driven in groups to see the geysers, watch the feeding of the grizzly bears and marvel at the mild majesty of erosion in Yellowstone Canyon. Then people were handled in companies; they did little straying and could be ushered in and out of the parks without much danger of damage to

themselves or to the wilderness. But the proliferation of the family motor car has made the problem of control far more complex. With everybody free to wander behind his own internal combustion engine, the authorities have a much harder time protecting both the citizen and the landscape. However, few of the visitors walk much, and most of them stay close to their cars, so that, except for litter (for which litter bags are provided at park entrances) and the peril of fire from a careless cigarette, the basic problem is to control the car. Fortunately most motorists prefer to stay on paved roads and close to shops where Junior can be fed and watered.

In some of the western parks the indomitable picnicker is kept in hand by the roaming black bears; lumbering, loose-jointed beasts, seeming as tame as the ducks in St James Park, they have been taught over the years that humans give food. But even the man who aspires to photograph a bear behind his steering wheel, or the woman eager to give little Susie a ride on a cub's back, will yield to sudden fright. Warned by an untoward gesture or an obscure memory that these big pets are still wild animals, they scramble back into their steel shelters, step on the starter, and leave the wilderness to itself. The 1956 record in one park was seventy-three bear injuries to a million and a quarter visitors, but that small percentage teaches only the injured. On the other hand, the national heritage has a hard time while the name-carvers and the experimentalists who yearn to see whether the blow holes of the geysers will boil an egg amuse themselves and forget the claims of the future.

The responsibility for safeguarding the visitors and making them feel welcome, while at the same time curbing their vandal instincts, falls on the rangers, the naturalists and the various field officers who are trained to be teachers and police officers as well as experts in geology, nature conservation, mountain climbing, first aid and how to build a camp fire in a high wind. They shepherd groups of city boys on their hikes into Yosemite, they quiet the fears of young typists whose first contact with empty space is the breath-taking mule trip down into the Grand Canyon; they manage packhorse trips into the primitive regions of Yellowstone, watch over ski trails, or guide bird lovers through the winding water reaches of the Everglades. The educational demands made on them are not usually profound, but they cover a very wide range and their training is a major preoccupation of the Park Service.

The ten-year project of development called Mission 66 means in many of the parks that the wilderness must be adapted to the motor age, an aim loaded with contradictions. The newest attempt to reconcile these can be seen at Colter Bay, a lakeside reservation in the Grand Teton National Park, which was shown as a model to park superintendents holding their biennial conference about a month ago. Hidden from the road and in sight of peaks that rival the best of the Alps, an organised camping ground offers a variety of accommodation for 3,000 people. Those who come in their own caravans are assigned a parking space with electric current, drinking water and plumbing connections laid on. Those who choose to sleep under canvas get a tent site, a parking space, a campfire with grill for cooking, and toilet facilities just down the path. Group campers are allotted community fire sites with seats and picnic tables. Those who do not trust tents may rent furnished log cabins, while docks are provided for those who bring motor boats on trailers. The centre of this informal village holds an assembly hall, a cafeteria and a set of food shops as well as a governing headquarters.

Obviously Colter Bay is better tuned to the motor age than are the great caravanseries built in the nineteenth century, but the day of the big hotel in the national parks is by no means gone. The Park Service has recently announced a new million-dollar lodge in prospect at Yosemite, extensive hotel improvements for the Grand Canyon and additions at Glacier and Shenandoah; but in Florida it was decided that space in the Everglades National Park was too limited and that additional overnight facilities could better be provided oustide its boundaries. Yet even with such attempts to preserve the wilderness, those who love it for its own sake have a feeling in their bones that its days are limited.

SHORTER NOTES

Last June, there was $6.2 billion worth of materials in the strategic reserve, and 63 of the 76 purchasing programmes had been completed. These are designed to carry the United States through a three-year war, rather than the five-year one originally contemplated when the stockpile was set up. In future, purchases will be smaller, with an emphasis on finished goods rather than raw materials which there might not be time to process, and the most serious question, which a committee is about to answer, may be how to dispose of materials which are not now needed without upsetting already depressed markets.

* * *

In 1956 all the property in the United States subject to local property taxes was assessed at a value of $280 billion. Such taxes provide all but about 10 per cent of local revenues. Of the assessed values, which are often much less than actual market values, more than a half was for non-farm residential property, and a quarter for commercial and industrial property. New York had the largest share, $36 billion, of any state, Vermont the smallest with only $429 million.

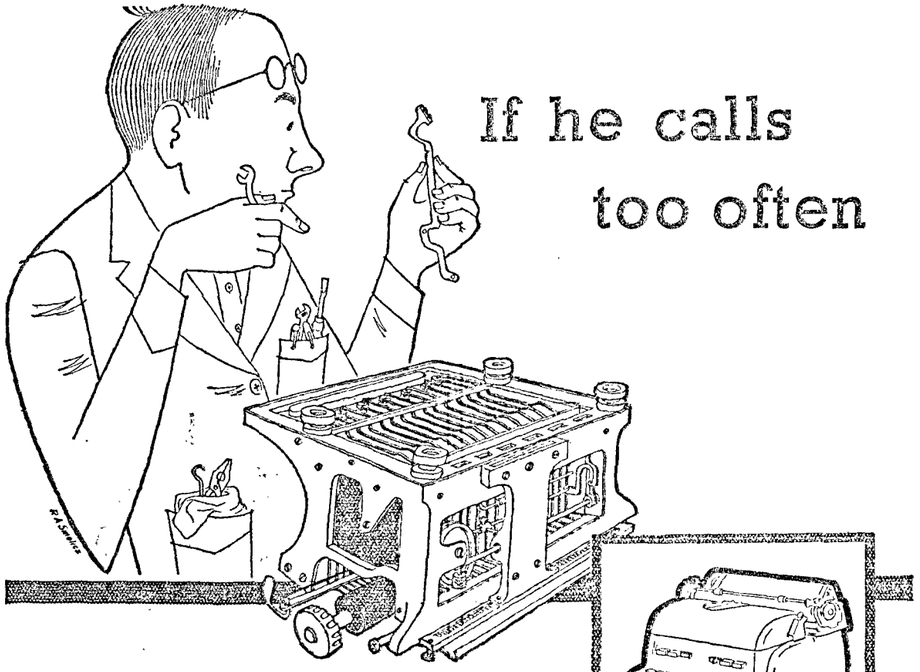
SHERATON
A FAMILY OF 45 FAMOUS **HOTELS**

THE KING EDWARD SHERATON WELCOMES YOU TO TORONTO, ONT.



When you visit Canada or America you will find that the name standing for gracious hospitality and first-class travel accommodations is *Sheraton.* In Toronto, in Montreal, in Hamilton, Ont., in Niagara Falls — and clear across the United States from Boston to San Francisco — there are Sheraton Hotels to serve you. These hotels have become first choice of International visitors, as well as Americans, for many reasons. Here are a few:

- *Reservations held if ships or planes are delayed*
- Facilities for banquets, business meetings and conventions
- Bilingual departments • Sheraton's Family Plan
- No room charge for children under 14 in room with adults (except in New York, Syracuse, Los Angeles and French Lick)

For reservations see your travel agent, or write Mr. Alberto de Leon, Director, International Department, Sheraton Hotels, Sheraton-McAlpin, Broadway and 34th St., New York 1, N. Y., U. S. A.

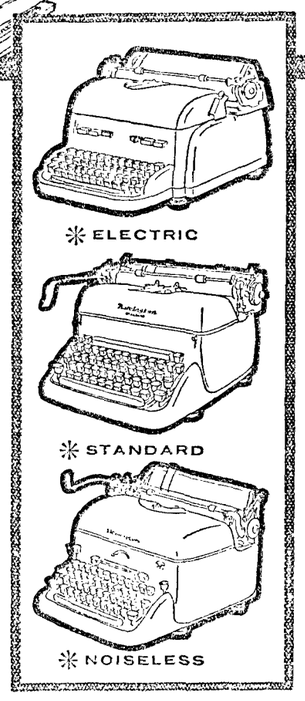
If he calls too often



call in Remington

No typewriter improves with age. Eventually you begin to pay more for its keep. Pay for endless maintenance: for the expensive typing skill it wastes: because, as well as wasting time and materials, it produces letters that harm your company's prestige.

Bring in a new Remington and things look up at once. For a fraction of your secretary's salary you get a machine that gives you letters you are proud to sign. You save money on retypes and time on maintenance. You soon find that the best typing in the world costs a lot less than the stuff you have been putting up with.

Remington make a complete range of superbly designed office typewriters: brilliantly engineered by Scottish craftsmen to incorporate all the latest time and labour-saving ideas. One of them is exactly right for *your* office. During the whole of its long working life, it will save you money in a really *noticeable* way.

See, too, the Remington Ultravox dictating machine and its exclusive sound sheet. With Remington Ultravox, those costly, time consuming 'dictation bottlenecks' become a thing of the past.

✻ Only Remington makes all 3

THE WORLD OVERSEAS

M. Gaillard Tackles Constitutional Reform

FROM OUR PARIS CORRESPONDENT

M. GAILLARD has opened the 1958 political season with a bill of constitutional reforms designed to strengthen the executive against an irresponsible legislature. French politicians are aware of the discredit into which they have fallen in the country, and themselves are weary of crises that lead to so little change. Forty-eight governments between the wars, twenty-five since the Liberation: the total is too much for all but the most fervent "ministrable."

One of M. Gaillard's main proposals is that the premier or, in a crisis, the President should be able to dissolve parliament—instead of the government as a whole having to agree on this. His second main proposal is that an opposition can replace the government only if it first wins a majority for a programme and a premier of its own. In theory, this should prevent conservatives, Poujadists and Communists from unclenching the fists they usually shake at one another to join hands in overthrowing premiers as they overthrew MM. Mollet and Bourgès-Maunoury. If applied strictly, it could make irresponsible votes much harder.

M. Gaillard, however, has already been driven by the conservatives to dilute the mixture : the premier designated by the opposition would not be nominated, but only recommended, to the President. Sceptics already see the opposition putting up fancy premiers and whisking them away immediately their destructive work is done. As for dissolution, the new weapon is probably blunter than it looks : the obstacles have always been practical rather than constitutional. Dissolution has been unpopular since Marshal MacMahon tried to put it to royalist ends in 1877—a point that is not as academic as it sounds in a Republic frequently harried from the far right. Equally cogently, for a working politician, dissolution risks bringing little profit. In going to the country, how can he make a clear-cut issue when a dozen other parties go with him ? M. Edgar Faure discovered this to his cost in the 1956 elections.

So it would be wrong to expect very much from the proposed reforms. The interesting thing is rather that they should be seriously debated at all. They undoubtedly echo a political mood. A few weeks ago, the weekly *L'Express* reported a private meeting of youngish higher civil servants, lawyers and business men. They had gathered to discuss what they could do to stop "the rot." A stranger might assume they talked about Algeria, or disarmament or European unity. But not at all ; their main concern was constitutional reform. The need for more stable government has become an obsession with most Frenchmen close to authority. Fearing that the Fourth Republic is breaking down, yet seeing a new, more dynamic country beginning to flex its muscles, they see the problem as above all one of making the political regime work smoothly.

Again, the stranger might cruelly suggest that they are turning to constitutional reform to evade the Algerian problem, in the same way as the parties negotiated about the outline law for Algeria among themselves rather than with Moslems who might have spoiled their blueprint. At least it would be wiser to revise at once the article in the Constitution which proclaims the "Republic one and indivisible," and is holding up fuller self-government in negro Africa. The stranger might also object, like many Frenchmen, that political opinion in the country is too deeply divided for procedural devices to change the habits of generations, even the disastrous ones. There is no doubt that the Third Republic endorsed Jules Ferry's dictum, "What France needs is weak government." Dominated by peasants, artisans and grocers whose horizon was their parish, this essentially 19th century France, haunted by memories of absolute government before and since the Revolution, stubbornly opposed a strong executive.

Yet there is more than escapism to the preoccupation with constitutional reform. The price of weak government, like prices generally, is rising. M. Gaillard admitted last weekend that ministerial instability not only generates distrust between the government and the governed, but encourages the growth of pressure groups and saps the authority of ministers over their civil servants. A distinguished civil servant, M. Marjolin, last year suggested that it also undermined the quality of the civil service itself. The perpetual crisis of recent years, the pressure and complexity of foreign and economic affairs, have taken the charm out of institutionalised anarchy. France has lost heavily, for example, from its indecision over the European Defence Community, from "empty chairs" at international meetings and from the fact that the Algerian rebels almost publicly hope one premier's word will be retracted by another. Economically, too, the modern world cannot allow France to be divided into 44 million parts, each blithely cultivating his own rural garden. Strong government would probably not have improved France's Algerian policy ; but it might have prevented such a foolhardy economic policy in 1956. Over a long period, it would also probably have done much to prevent the present demoralisation of public opinion.

For these reasons the Fourth Republic has shown more concern than the Third with constitutional reform, though with no better results. The Constitution of 1946 has not succeeded. General de Gaulle's preaching for a presidential system—though it is probably the best for France—has jarred on Republican ears because of its Bonapartist overtones. The "reformette" of 1954 was quite unimportant. But M. Mollet revived interest in reform in 1956 by clearing away some of the Socialist roadblocks to it. As premier he found that the left-wing preference for weak government could hinder a Socialist who saw himself as his country's saviour in a crisis, just as much as a Conservative. The

Fourth Republic still has a *shifting mass* of radical and conservative individualists, the Goodwin Sands of French politics. M. Mendès-France's difficulties with the radicals and the conservatives' behaviour over the outline law for Algeria show that they rarely follow their alleged leaders. A conservative "boss" like M. Duchet and the Socialist boss, M. Mollet, are alike eager for an organised right-wing party—in fact they have agreed that France needs a straight labour-conservative fight. But, even without utopianism, better-disciplined parties would greatly stabilise French politics; bargains between leaders could be firm and not the starting-point for further bargains.

It already seems obvious that once again the traditional party divisions will be too strong for *real changes*. Parliament is returning from its holidays disgruntled and ill at ease. The Socialists dislike easy dissolution. The conservatives have brought up electoral reform, the most controversial of all questions; this will greatly complicate the debate. M. Gaillard has threatened a national referendum, as the constitution permits, if Parliament fails to provide the necessary majority, but has prudently set the summer holidays as the time-limit for the debates.

Is it wise, then, to have announced the need for reforms in the apocalyptic terms M. Gaillard used in his speech last week-end? One of the sources of the Frenchman's mistrust of his rulers is the gap between promise and performance. Another "reformette" will simply feed the conviction that Parliament is the biggest lobby of them all, concerned *with its privileges, not with good government*. The fashion for constitutional reform while Algeria continues to poison politics, and the insufficiency of the reforms themselves, will be taken, as the Gaullists take them, for the despairing efforts of a doomed regime. In fact, they may also be a sign that the new structures of French society must find political expression in more workmanlike methods of government. But that is not necessarily reassuring for the Fourth Republic.

A Change in Bonn

FROM OUR BONN CORRESPONDENT

ALTHOUGH Professor Hallstein's going raises some immediate difficulties in the practical conduct of foreign affairs (he has been State Secretary in the Bonn foreign ministry since it was formed) his appointment as president of the commission for the European economic community has for a variety of reasons kindled a glow of satisfaction on the Rhine. The glow is not least in the bachelor-professor's own, rather lonely bosom. All who have met him during the last *few days have discerned* an unusual aura of contentment emanating from the fifty-six-year-old State Secretary. For over seven years he has devoted his powers with unswerving singleness of mind to the labyrinthine toil of restoring German prestige, influence, and security.

He has neither sought nor achieved personal popularity. On the contrary. He seems entirely to have disregarded frequent public gibes charging him with parsimony and obsequiousness. He has continued to live in his three-room utility flat in Bonn, patiently on call at all times to a chancellor exactingly preoccupied with foreign policy. It is not surprising that Professor Hallstein, accustomed to chilly airs outside the Palais Schaumburg, has been warmed, even a *little excited, by this recognition of his capabilities.*

Unlike some of the much-advertised professors in this land of debased titles, Herr Hallstein has undisputable academic qualifications and has held chairs at Berlin, Rostock, Frankfurt, and Georgetown universities. A specialist in international law and international economic relations, he himself is quite confident of his qualifications for the job of driving Europe to market. *His own favourite* testimonials are the part he played in reviving Frankfurt university after the war, in the bargaining that led to Western European Union and German participation in the Atlantic alliance, and in the highly delicate deal with France, political and economic, over the Saar.

Professor Hallstein is planning to call the constituent meeting of the nine-man commission some time next week. The six months thereafter he expects to spend alternatively in Paris and Luxemburg, trying among other things to induce unanimity on a site for a European headquarters. Now convinced of the necessity of a complementary European free trade area, Herr Hallstein intends to encourage its development as vigorously as he can. He appears genuinely to admire Mr Maudling, and has described the Paymaster-General's approach *to his special* European assignment as "energetic and elegant." Yet he himself thinks that the creation of the free trade area will take longer than some optimists suppose.

Bonn's natural pleasure at this latest trophy of national rehabilitation is all the greater for certain administrative and political opportunities which it is considered to have brought in its train. A successor to Professor Hallstein should be named by the end of next week. Dr Adenauer and Herr von Brentano are giving much careful thought to choosing him; also to finding an additional State Secretary to help despatch the foreign ministry's ever-growing business. The need to broaden the office at the top is being acutely felt. Herr von Brentano and Professor Hallstein have been perforce assiduous travellers and conference-goers. During their frequent absences from Bonn work has piled up obstructively, the Bundestag has felt neglected, and foreign diplomatists have been sometimes at a loss with whom to deal. Until the other day it was generally supposed that Herbert Blankenhorn, the competent and ambitious German representative at Nato headquarters in Paris, would be a likely successor to Professor Hallstein. A markedly brusque official denial, stating that he is still required where he is, has put Herr Blankenhorn out of *the running for the* time being. But he certainly has Dr Adenauer's confidence to an unusual degree. The second state secretary is to pay special attention to expounding foreign policy in the Bundestag. Herr Kiesinger, head of the Bundestag foreign affairs committee, who was cheated of cabinet office in October largely for denominational reasons, is frequently named as a likely candidate.

It is being widely mooted in Bonn that Professor Hallstein's departure comes at what may turn out to be a propitious moment in the tide of foreign affairs. The peculiar national conditions prevailing during his term of office have enabled the unobtrusive State Secretary to exercise an extraordinary influence upon the Chancellor. Fairly or unfairly, Professor Hallstein is credited with having industriously and *expertly set up all the comfortable* legal buttresses supporting Dr Adenauer's hitherto rigidly westward-looking policy. Professor Hallstein is suspected of having been too ready to encourage Dr Adenauer to simplify the issues between east and west and to bring German policy too precisely in line with that of the State Department. It

is being ungratefully recalled that already as a model prisoner-of-war Herr Hallstein distinguished himself in the eyes of his American captors, and that in 1948 he returned to the United States as a guest professor of law at Georgetown. *Undoubtedly the State* Department has come to look upon him as the soundest of the Chancellor's intimate advisers. But there are signs that even Dr Adenauer is beginning to be aware that the time has come for greater manœuvrability and for a fresh bid to establish less menacing relations with the principalities and powers whose western-most line runs through the heart of Germany.

From Parkinson's Case Book

Singapore

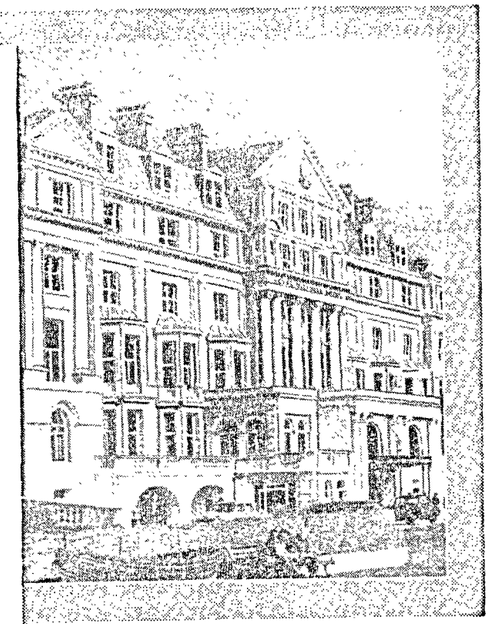
SINGAPOREANS who follow events in London, and who have learnt of Mr Thorneycroft's resignation on a point of policy arising from difficulty experienced in balancing the budget, are looking at each other with amazement. For the *limitless wealth of the British Government* has been visibly demonstrated for so long here that the idea of there being a shortage of funds never crosses their minds. When Singapore fell in 1942 its garrison surrendered to a Japanese army of vastly inferior numbers: the generally acceptable explanation was not lack of valour or skill but that the fighting men were so pitifully few compared with cooks, orderlies, batmen, schoolmasters, printers, psychologists and clerks in uniform. This has remained true of the forces since they returned, except that the proportion of fighting men is now lower than ever. On the people who live in Singapore this daily spectacle of extravagance has made an impression which it is now difficult to efface. What, they ask can be the *meaning of this talk of stringency from people who so* obviously have money to burn?

General Headquarters, Far East Land Forces, is rumoured to include an establishment of fifty-six brigadiers. Whatever the truth of this, there are a dozen or more to be seen about. Full colonels are numerous; majors are there literally in hundreds. What they are all doing is a mystery. They are not directing the war in Malaya, for that task has been entrusted to another headquarters on the mainland. They are not concerned with administering the services by which the troops in Malaya are maintained, for that rests with Singapore Base District, another headquarters on the island itself with nearly another thousand officers of its own. They cannot be planning for British armies, for no such army is expected, and apparently none exists.

As if the cost of GHQ, FARELF was not staggering enough in itself, there must be added the cost of the naval base, with its pay-roll for thousands who are not even in uniform. No base could be laid out with more perfection of planning. Few bases could rival its 2,000 acres in mere extent. Nowhere else can exist such amenities and accommodation—barracks, hospitals, houses, schools, playing-fields, swimming pools, clubs. All that is lacking is a fleet. The few vessels that refit there are almost lost in the immensity of the facilities at their disposal. In the King George VI graving dock a destroyer under repair would look like a pebble in a well. But no fleet ever steams into the harbour; indeed, no fleet—save that of Japan—has ever been there at all. And it may now be asked what fleet in the atomic age could venture into the confined waters around Singapore, which afford no room to manœuvre or escape?

Apart from the annual cost, the saving of which would build the Royal Navy several ships, there is the value of the buildings, equipment and land. Were the docks to be handed over to the Harbour Board and the rest to the army, the whole of the Alexandria Base area, now occupied by the army technical services, could be sold for millions; and there would still be barracks and to spare at Selarang, Nee Soon and Blakang Mati, where the site values are less staggering. That this is not done would seem proof enough that money is no object in Whitehall. But if money is no object, why—ask the Singaporeans—should the Chancellor of the Exchequer have resigned?

The Case of the Bishop of Prato



FROM A CORRESPONDENT IN ROME

NEXT week the case against the Bishop of Prato, Monsignor Pietro Fiordelli, is due to be heard in Florence. The bishop has to answer a charge of defamation brought against him by Signor Mauro Bellandi. Last August Monsignor Fiordelli ordered a parish priest in his diocese to read a letter from the pulpit denouncing Signor Bellandi and his wife, who were married in a registry office, as "public concubines and sinners."

When Signor Bellandi cited the bishop, the Italian public was mildly stirred to know what the judges in the court of enquiry would do. Legal opinion in the country, as in the court, was divided, but somewhat to the general surprise, the magistrates decided that the case should be heard. Then, after the cabinet meeting on December 27th, the procurator of the Republic at Florence, who moved that the case should be heard and who should have acted as public prosecutor at the trial, was removed to a superior post at Trent. At the same time the procurator of the court of appeal at Florence, who ordered the case to be transferred from a lower court to the enquiry section of the court of appeal and there moved that it should be dismissed, has been promoted to be president of the court of appeal at Florence. Thus, if the first sentence goes against the bishop, the case will be heard again in a court of appeal whose president has already expressed his opinion in the bishop's favour. To placate an outcry in the press, Signor Gonella, the minister of justice, has been obliged to write letters to a number of papers denying that these promotions have anything to do with this case. The fact remains, as *La Voce Repubblicana* points out, that, after the cabinet meeting on December 27th, the bishop is in a much more favourable position than he was before.

Italian culture is predominantly juridical and everyone, in this nation of lawyers, enjoys a legal argument. But this does not mean that the public is acutely sensitive to constitutional issues. In Cavour's day—and long after—a case like this, could it have arisen, would have raised a strong liberal reaction. Contemporary Italians, on the other hand, are more inclined to discuss the points of legal finesse, for and against the bishop, than to drag forward the great arguments about Church and State. Among other things, the bishop described marriage performed by the officers of the State as "so-called marriage" and said that, for the baptised, this was not marriage at all but "the preparation for a sinful state of concubinage." It may even be doubted whether Monsignor Fiordelli recognises civil marriage as a legal institution for, in his letter, published in the parish bulletin, he refers to Signor Bellandi's wife not as Mrs. Bellandi but as Miss Nunziati. The Italian State has brought no action against the bishop for contempt of its institutions or for inciting to contempt of the law. In the law courts,

The right hotel makes a holiday

You can confidently entrust your holiday to a Trust House Hotel. Always a spotlessly clean room; always a standard of service distinguished by its thoughtfulness; always a satisfying meal; and always a reasonable bill.

OVER 230 TO CHOOSE FROM

There are more than 230 Trust House Hotels and Inns in England, Scotland and Wales. They include fine holiday hotels at seaside resorts, in the Lake District, the Spas, Cathedral cities and touring centres; and country inns in those rare bits of old England that are reached by car, cycle, or on foot.

Stay for a night, stay for a week, stay for a week-end or a year, but always stay at a Trust House.

as in Italian drawing rooms and cafés, the only point to be debated is whether or nor he has committed an offence under Italian law by publicly denouncing two people as concubines. Is the word concubine defamatory? Can the opinion of a religious authority defame? And so forth.

In its political aspect the case has aroused some misgiving, mainly because it has occurred under an all Christian Democrat government shortly before the elections. It is not the magistracy, still less the bishop, who is under suspicion but the government. The bishop may be within his rights. The Italian State voluntarily gave up a part of its sovereignty when the Concordat was signed in 1929. The point is that, in the first real conflict concerning the boundary between Church and State the Christian Democrat government has not stood forward to defend the State as it would have done—or so many Italians, both Catholics and non-Catholics, believe—in Signor de Gasperi's time. The case of the Bishop of Prato looks, to the Italian public, suspiciously like the thin edge of the wedge; a foretaste of the sort of thing that is likely to happen if the Christian Democrats obtain an absolute majority at the elections. Why stop at black-listing concubines, it is asked. Black lists of fornicators and blasphemers pinned on the church doors may be the next step towards "moralising" Italian life.

It may be argued that, on the eve of a general election, the Christian Democrat ministers, mindful of the help they will need from the parish priests to procure votes for the party, are not as eager as they would normally be to uphold the authority of the State. But how would they act should the electorate give them a free hand? Liberals, Radicals, Republicans, Social Democrats, Socialists and Communists all attack the Minister of Justice for attempting to manipulate this case, but since all these parties either hope to join in coalition with the Christian Democrats after the elections or else are courting a part of the Catholic electorate, none of them, with the possible exception of the tiny group of Radicals and Republicans, is really prepared to do battle for the State.

The Monarchists have always claimed that the Crown was a counter-authority to the Church and they now say that the others have only themselves to blame for the present dilemma. In reality the Constitution of the Republic intended to devise a safeguard. Articles 104 and 105 prescribe the erection of a Supreme Council of the Magistracy presided over by the President of the Republic and partly elected by Parliament with powers to appoint, promote and remove the higher magistrates. These powers are now exercised by the Council of Ministers as they were under the Fascist government. The case of the Bishop of Prato has drawn attention to this anomaly, and it is safe to predict that the erection of the Supreme Council of the Magistracy will be President Gronchi's main object in the next legislature, just as the creation and consolidation of the Constitutional Court has been his principal object in this.

Back to Normal in Siam

FROM OUR CORRESPONDENT RECENTLY IN BANGKOK

"MARSHAL SARIT slew a dragon, but he is no St George," wrote a western diplomat in Bangkok to his foreign ministry this week, summing up post-election sentiment in Siam. The new strong man, after overthrowing the durable Marshal Pibul Songgram and ruthlessly consolidating his power, now feels confident enough to undertake medical treatment for a lengthy period in the United States. But his choice for prime minister, General Thanom, makes no secret of his conviction that he himself will not remain long in nominal office. Indeed, the only point on which all Siamese parties and commentators are in complete agreement is their hearty endorsement of General Thanom's own modest contention that he has no qualifications for the post.

There has always been an easy-going cynicism about Siamese politics, but even the hardheads were shaken by the celerity and brusqueness with which Marshal Sarit discarded the Unionist party and its leader, Dr Sukit Nimanhemin, who won a majority of votes in the elections last December. True, the Unionists were graciously permitted to join the new party which Marshal Sarit created: the Nationalist Socialists (Chartsangkhom). But even Dr Sukit's opponents believed that he should at least have been given the opportunity to form a government—in alliance, naturally and unavoidably, with the majority block of army-appointed members in the Assembly. Dr Sukit, a scholar and economist of some renown, commented ruefully but realistically: "I neither approve nor disapprove; I merely listen."

The new party includes members of Marshal Pibul's old Seri Manangasila party, who campaigned as "independents" and won re-election because of personal followings. They represent, after all, powerful elements of the old ruling group, which split when Marshal Pibul fled. Marshal Sarit doubtless feels the stronger for their support; as a fair-minded man, he probably concedes also that they should not all be heartlessly deprived of their share of the rackets, rakeoffs and perquisites which they helped so diligently and successfully to develop as one of the foundations of Siamese parliamentarianism.

The Chartsangkhom now musters about 200 of the Assembly's 283 members—elected and appointed. There is not the slightest evidence of any pretence at reform of public venality, and the empiric redistribution of spoils, after Marshal Pibul's downfall, becomes even more nebulous as old familiar faces reappear gratefully at the trough under the ægis of the new party.

One leader who emerged with credit and dignity from the "democratic" burlesque of the elections was Pote Sarasin, the caretaker prime minister, who took office after the September coup. He refused pointblank, under the strongest and angriest pressure from the army, to lead the new government. He insisted that Dr Sukit had won the right at the elections to form a government: "The elections would have no meaning if I, not elected, took office." He has indicated, however, that he may take part in the elections in four years' time, when the constitutional appointment of "second category" members has been abolished. Pote Sarasin's prestige at present stands high among the limited minority of informed Siamese who take an intelligent interest in politics.

Nai Khuang's conservative Democrats, who won 39 seats (against the Unionists' 45), remain doggedly in opposition. Khuang may even find himself in expedient alliance at times with the remnants (12 seats) of Nai Thep's Socialist front. Khuang's conservatives scored well in Bangkok, despite the concentrated campaign for over two years against Seato, American aid and Siam's anti-communist policy. There is still comfort for the West in this popular steadfastness on international matters, although the unchanged political facts of life inside Siam must also be accepted: army domination, corruption and graft.

One final point. There is now no doubt in diplomatic

circles in Bangkok that Marsahl Pibul Songgram is finished. Marshal Sarit's assurance has ended speculation over a possible comeback. The King, it is reported, has been increasingly outspoken in his personal denunciation of the exiled leader, and has even asserted that Marshal Pibul intended to set up an open dictatorship—as distinct from the kind disguised as democracy.

Pressures on Israel's Coalition

FROM OUR CORRESPONDENT IN TEL AVIV

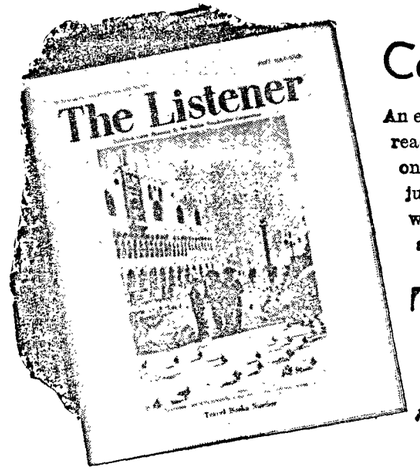
THE Hebrew press is full of cartoons ridiculing the new coalition government, which is exactly the same as the previous one. The same question is asked again and again: why was this crisis necessary, if after three weeks of excitement, negotiations, mutual accusation and speculation everything is as it was before Mr Ben-Gurion's resignation? And how can it be explained that men who were accused of nothing less than sabotaging Israel's defence effort should still remain members of the cabinet?

There is no satisfactory answer to either question. And at this stage it is more profitable to ask a further one: will this cabinet manage to work together harmoniously until the next elections, which are due in 1959? The coalition partners have expressed their willingness to do so. But the Knesset debate that followed the presentation of the new cabinet proved that differences of opinion are as sharp as ever. Mapam sticks to its neutralist conception. Achduth Avoda is opposed to co-operation with "Nazi generals." The rift between the parties on foreign policy runs deep between Mapai and the two left-wing parties.

Difficulties over domestic policy are to be expected too. Income from the bond drives in the United States is less than in former years owing to the American business recession. The $75 million loan by the Export-Import Bank has not yet been granted, although negotiations have been going on for many months, and it is expected that it will be much lower than the original figure. Foreign currency income, it is true, is still considerable; German reparations are at their height and personal restitution payments increase yearly and may reach $50 million in 1958. But time is running short. Everybody agrees that the standard of living is much too high in relation to actual earnings and that thoroughgoing reforms are needed if the shock expected in 1962 when German reparations end is to be cushioned.

This can be done only by increasing productivity, cutting down consumption and pushing exports. This slogan has been repeated *ad nauseam*; but although physical development is impressive and production has risen, the profitability of many enterprises is doubtful as they are kept going by an intricate system of open and disguised subsidies. Every attempt to keep down wages is stubbornly opposed by Mapam and Achduth Avoda, while Mapai, keeping an anxious eye on the prospective voter, is afraid of drastic measures. But the celebrations for the tenth anniversary of the foundation of the State, which are to start in April, will overshadow everything else, and make Mapai more likely to postpone reforms unpalatable to the left-wing parties. The celebrations should, therefore, help to keep the coalition together.

So should the pressure from the opposition parties. One of the orthodox representatives in the Knesset made an illuminating speech in the debate on the new coalition. It showed that the religious group is pressing its demands with the utmost vigour, and that Mr Ben-Gurion would have a very difficult time if he ever had to heed their demands in order to buy their backing in a coalition.



The professed goal of the orthodox parties has always been the recognition of religious law as the law of the land. Even today the authority of the rabbinical courts is far-flung, as far as Jews are concerned. They are married by the Rabbi, divorced by him and buried by a burial society under rabbinical supervision. This set-up still stems from the time of the British Mandate when every community, Jews, Christian and Moslem alike, was left to look after everything concerning personal status. No reform has so far been introduced, although freethinkers complain that under rabbinical law no marriage between a Jew and a Gentile is possible and that some other laws, deriving from a purely patriarchal society, lead to hardship for women. Suggestions that the religious authorities themselves should introduce reforms have met with no response. On the contrary, the religious parties have pressed consistently for concessions, and have successfully forced the municipalities—except "red Haifa"—to suspend public traffic on Saturday; they have also persuaded the Ministry of Transport not to run the railway on the day of rest. In addition, the sale of pork has recently been forbidden in a number of towns and the religious parties press for further concessions, because they know well that many of the new immigrants cling to strict observance of religious customs.

Lately freethinkers in Israel have been shocked into increased watchfulness against orthodox pressure. A fairly large number of Christian women have immigrated from eastern Europe with their Jewish husbands. They have encountered a certain amount of animosity, especially in small villages where bickerings between immigrants from different countries are not unusual. These conflicts were already being discussed in the press when an unfortunate incident focused attention on the problem. The child of a Christian mother and a Jewish father who had died and was refused burial in a Christian cemetery was interred just outside the Jewish cemetery of the village where the parents were living. This brought indignant protests from many quarters and there were proposals to set up municipal burial societies so that the citizen would be freed from the supervision of the rabbinate. Orthodox circles, however, defended the decision of the rabbi who had ordered the separate burial, by citations from religious law. And in the speech in the Knesset already mentioned one of the foremost orthodox representatives denounced in violent terms every attempt to change time-honoured customs, even in the slightest degree, and asked Gentile women who are married to Jews to embrace the Jewish religion because they could not otherwise be integrated into the Jewish community.

The separation of church from state in Israel is, in fact, far from complete. This is not surprising; religious and national traditions are intimately intertwined. The strong pressure of orthodox circles has until now prevented the writing of a formal constitution, for Mapai was convinced that a fight over this very controversial issue would split the community as perhaps no other issue could. But Mr Ben-Gurion knows, too, that the free-thinking section of the public would resist further concessions to orthodoxy.

Correction.—The word "dictaphone," which was used on page 123 of *The Economist* last week in an article on the Grundig enterprises, is a trade name of the Dictaphone Company; the term "dictating machine" should have been used instead.

Five years before railways came to Uruguay

The building of the first railway system in Uruguay was started in 1868—five years after the Bank of London and South America opened its doors in Montevideo. Since then, commerce with Latin America has increased enormously, and with it have grown the influence and interests of the Bank. Today, the Bank holds a unique position as the *only* British bank in Latin America. It has Branches in most of the important trading centres of that vast continent. Up-to-date reports on local markets, trading regulations and general economic conditions are received regularly from Branches overseas and are summarized in the Bank's *Fortnightly Review*, which is distributed to customers and made available to those who have business in Latin America, Portugal or Spain.

THE BUSINESS WORLD

PROSPECTS FOR 1958

Thin Ice for Investors

It is safe to predict that this year's Derby winner will be a three year old and not a rhinoceros. The investor at the outset of 1958 lacks any fixed point of certainty. He may hope that sterling this year will be strong enough to ride the autumn squalls. He will pray that America will stop industrial recession developing into serious slump. He must presume that the Government's monetary policy is unchanged. The one certain assumption that he can make is that there will not this year be a boom on the London Stock Exchange. He must try to pick his way through a market more confused and threatening than any since the war.

THE bear market in industrial stocks rests on widespread pressure on profits (not in this country alone); a tailing off in the rate of industrial investment; a world-wide fall in commodity prices; and a flattening out in the volume of world trade that could well turn into a fall. Mr Thorneycroft did not create these facts, though his emphatic decision to defend sterling at all costs determined the shape of the market's reaction to them. Mr Heathcoat Amory cannot abolish them and he, too, proclaims his determination to defend sterling.

Not for more than a generation has the investor been so well paid for avoiding long term investment. That is one of the consequences of 7 per cent Bank rate that cannot be ignored. The investor who decides today to put his money on deposit in a bank at five per cent draws without risk of depreciation a better net return than was earned a mere couple of years ago on many investments since slashed by market depreciation. This explains the growth of bank deposit accounts at the expense of current accounts—at considerable cost to the profits of the banks. If he has £500 or £1,000 in hand, he can place it for six months with a leading hire purchase finance house at 8½ per cent per annum. If he fancies gilt-edged, the shorts will yield him more than the longs. That he is more than usually uninvested must explain part of the phenomenal success of such recent new issues as BP and Newcastle-on-Tyne, for stagging is an ideal short-term adventure for those with spare money. It is strange that this rise in the returns on short-term investment—which ought to be a powerful incentive to saving—has not so far been extended to the investments intended specifically for the small saver. Neither the yield on the "national savings" media nor that on the shares of most building societies has been revised.

A second big change also springs from the decisions of September 19th. The relative attractiveness of fixed interest stocks and of equities has been inverted. Seven per cent Bank rate plus the ceilings on bank advances and on public investment may even have marked the end of a downward drift in gilt-edged that was ten years old. That depends partly on whether Mr Thorneycroft's old policies are

THE PRICE OF MONEY

Gross yields	End 1955 per cent.	End 1956 per cent.	End 1957 per cent.
Consols 2½%	4·42	4·76	5·37
British Transport 3% 1978/88	4·56	5·01	5·73
Bank deposits	2½	3½	5
H.P. deposits	5–5½	6–6½	8–8½
Building Society shares	5·22	6·09	6·09
The Economist Share Indicator	5·01	5·91	6·63

THE PRICE OF COMMODITIES

	£	£	£
Copper (per ton)	396½	268½	180½
Tin (per ton)	834½	782½	730½
Lead (per ton)	121	116½	72½
Rubber (per lb.)	36 7/16d.	32d.	24½d.
Wool tops (64s. per lb.)	110d.	138d.	113d.
The Economist Commodity Indicator (1952=100)	95·3	98·3	86·5

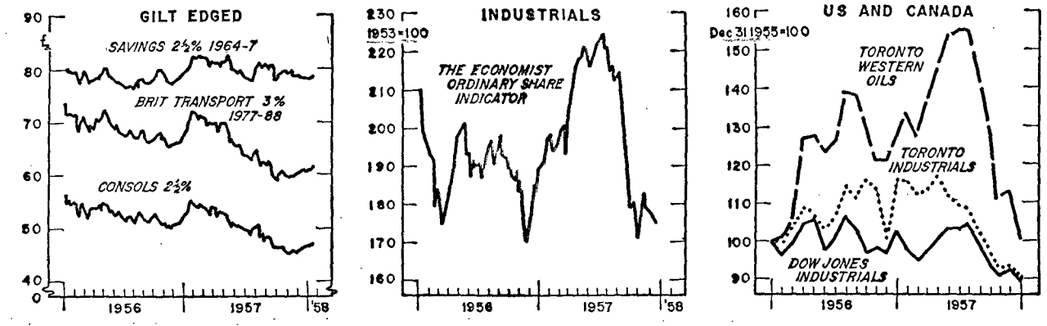
pursued in full force by the new Chancellor. At least it can be agreed that the longer-run outlook for fixed interest stocks is sufficiently brightened, and the outlook for equities sufficiently dimmed, to make the big investment funds that have been steadily switching out of gilt-edged into equities for several years past pause and think.

As soon as economic policy justifies the holder of £100 of 3½ per cent War Loan in the belief that his £2 os. 3d. after tax will buy about as much next year as this, confidence in British Government stocks can be expected to return. It would spread right along the line from Treasury bills to undated stocks. The limitations on Government spending and on finance for the nationalised industries, together with the Government's sales of stock from the official portfolio, would cut the supply of Treasury bills and set the discount market competing more vigorously for short bonds. The banks, limited in their lending, would begin to feel safe in increasing their investments. These processes will at best be slow, but the response to this week's £500 million 5½ per cent Exchequer issue suggests a fair beginning. Cynics are entitled to their doubts after so much gilt has been rubbed off gilt-edged. The prospects looked rosy just a year ago, but disillusion soon followed. Yet the parallels are not very close ; wage inflation at home had not then been tackled ; recession in Canada and the United States had not appeared : and commodity prices stood at a peak.

But even those who believe in the possibility of a firm and gently rising market in gilt-edged and in other fixed interest stocks would agree that a boom in gilt-edged is out of the question. An active policy of funding (to which, presumably Mr Heathcoat Amory is no less committed than his predecessor) presupposes steady sales of gilt-edged from official holdings and the coaxing of investors into longer stocks. That policy certainly sets a limit to any rise. Moreover, there is a long queue of would-be borrowers ; Commonwealth countries and local authorities at home must be allowed to come forward at a rate that will neither destroy the market nor let it run out of hand.

QUITE markedly the outlook for industrial shares has worsened. Looking backwards, it can be seen that profit margins, as shown in *The Economist's* quarterly analysis of profits, have been under the squeeze for more than two years, though less so in some of the consumer goods industries, such as food and brewing, than among the producers of capital goods. Inflation and the clamour for industrial stocks as a hedge against it masked the effects of steadier profits ; but the decisions of last September made it less attractive to hedge against inflation and exposed industry to the triple hazard of dear money, difficult borrowing and a check to industrial expansion. The investor must now concentrate entirely on future earnings.

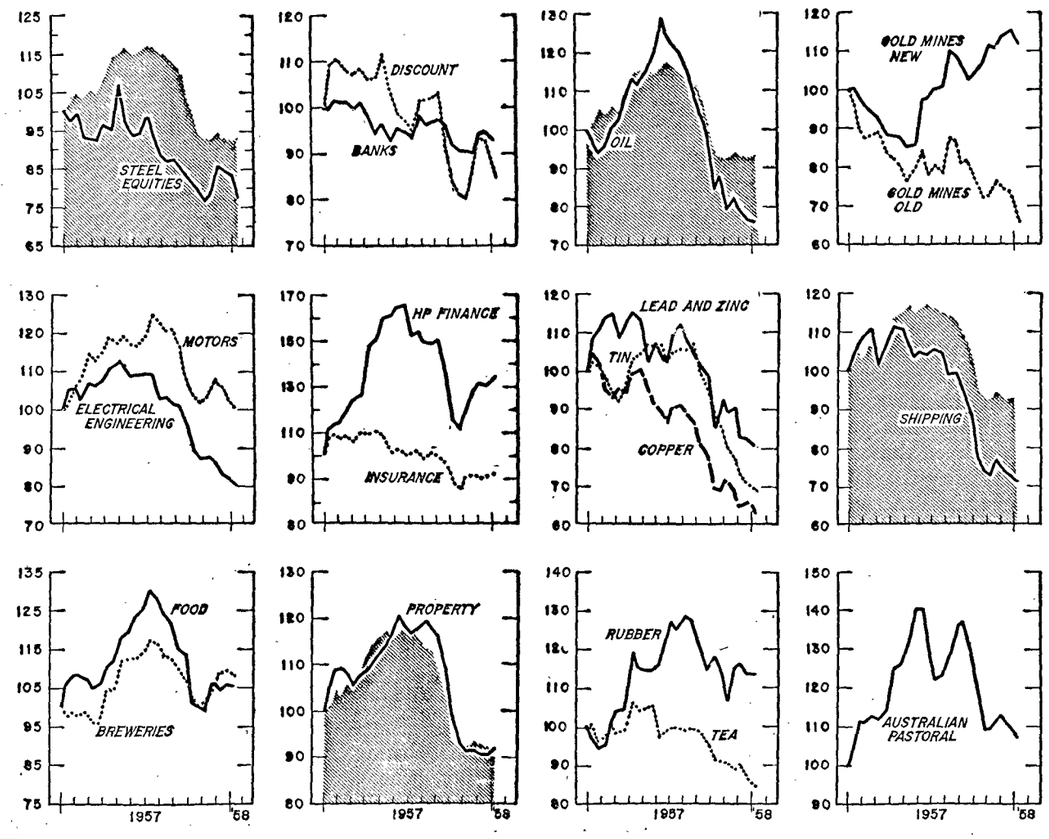
Falling commodity prices, a real though small increase in unemployment, and a predicted curtailment both of industrial expansion and of international trade, point to harder going industrially this year. Credit restriction may be biting harder before spring is over. The fall of share prices that has already occurred—an average of about 20 per cent from the high point of last summer—discounts some of that harder going. There are many who now argue that the worst of the fall is over, and that Guy Fawkes day of 1957, when the *Financial Times* industrial index stood at 159.0, will prove the true bottom of the market. They can be left to their argument in the certainty that revival is not yet due. It is equally wise to avoid fatuous guesswork about the duration of 7 per cent Bank rate and to rely upon the probability that, whatever the exact rate may be, a fairly long period of dear money cannot be avoided. Lower prices of commodities have bitten hard into the incomes of the overseas sterling countries. They may have to draw further on their reserves and sterling will not be immune from pressure. A strict credit policy will be the natural defence.



The third main fact that investors must now weigh is the weakening overseas—the fall in the Wall Street and Toronto markets, in world commodity prices and in shipping freights, all springing in part at least from a single source, industrial recession in America. There is no certainty that these movements are yet played out. While that is so—and so long as the public neither here nor abroad distrusts sterling—there will be no rush into Wall Street nor into Canadian shares. One of last year's favourite pastures is no longer luscious.

THIS seems to be a time, then, for careful re-appraisal of existing portfolios of industrial stocks rather than for either adding to holdings or jettisoning wholesale. Some shares may be worth holding just because they have fallen too steeply and one or two because they show a significant rise against the downward trend, but there are also some old favourites that ought to go. In the present state of the industrial market, investors will show increased fondness for that attractive double option, the convertible prior charge. Since the lender now calls the tune, a convertible stock that stands on its own feet as a fixed interest stock yielding something over 6 per cent has to be offered and with it an almost costless right to convert into ordinary shares. These terms may be thought onerous by many companies, but if they want money urgently, they must pay the full rate for it.

It is not the general run of the industrial market, so much as the side lines of equity investment—those markets on the fringe that seem to stand out from the general trend—that are likely to attract attention. They are worth a careful look, even though most investors will not find them suitable for more than limited venturing. Some of the attractive possibilities of yesteryear are not now attractive. The investor will think twice about shipping shares despite their high yields, in the face of lower freight rates and tougher international trade. Oil shares attracted much of last year's speculative activity. Is the outlook for oil as a commodity



The Bear Market Charted

The fall in industrials has been sharply accentuated by the events of last September, and a falling market in gilt-edged halted by them. Bear markets in industrial stocks in the United States and Canada appear still unchecked.

Side Lines of the Stock Market

Against the background of *The Economist* indicator, which is shown shaded across some of the charts, some of the share groups that stand out of the general run of the market are depicted. The six left hand charts cover home industry, consumption and finance and the six on the right hand cover investment overseas.

good enough to sustain speculative buying in 1958? Or will oil shares not lose some of their following when the big new issues are out of the way? Property shares have reached a low yield basis, and though the main benefits of the Rent Act have still to come the last fraction of the adjustment may be slower going. On the other hand, the trend still seems to favour the hire purchase houses. The value of HP business may shrink this year, but the companies should be able to develop other outlets for their depositors' money.

Nearly all the commodity groups are under the shadow of falling markets. Copper dividends, for example, must be slashed this year, though it will be surprising if, given the cuts in production now arranged, a time for reconsideration does not arrive before the year is out. Active bargain hunting will continue in the rubber share market too, based not on the outlook for rubber but on talk of take-over, of liquidation and of cash distribution. The chosen companies will not be the cream of the market, but those whose net assets and absence of voting control invite a bid. And if British estates operating in Indonesia decide to throw in their hand, break-up possibilities will be there.

Chief among the side shows likely to attract investors this year, however, is the gold share market. It stands as a whole a little lower than a year ago with the *Financial Times* index around 70 against 76½. But that index covers two divergent movements; the established mines of the Rand have been out of favour, while the new companies of the Orange Free State and Far West Rand have been rising briskly. To see a fair risk in the latter it is not necessary to dream of a higher dollar price for gold. No American recession at present foreseen would be sharp enough to make the Americans raise it. The investor who chooses gold shares now is not even seeking currency hedge; he is simply choosing an industry that has not yet reached its peak, but has covered the bulk of its capital commitments. Unless he has deliberately chosen a dying issue in the hope of a satisfactory final break-up, he is looking for rising dividends.

The choices before the investor are therefore three: to maintain a high degree of liquidity; to venture gradually into the gilt-edged market; and to stand on the side lines waiting for the opportunities that must surely develop before the year is out. And as he sweetens his gilt-edged portfolio with a few gold shares he may remember that though gold is the only commodity that never goes up, it is also the only one that never comes down.

Fifty-Fifty in Oil

Terms conceded by Italian and Japanese oil companies in the Middle East appear generous, but do they really threaten the profit-sharing principle observed by the major oil groups?

RECENT agreements between the Persian government and an Italian oil company, and between the Saudi Arabian government and a Japanese concern, have been widely proclaimed as the thin end of the wedge that will smash the equal profit-sharing arrangements now applying to oil production in the Middle East. The principle of an equal division of profits between the country owning the oil resources and the foreign company exploiting them was first established in Venezuela after the second world war; today it prevails in every large producing area. There are some exceptions: countries where little or no oil has been found have tried to entice oil companies into risky exploration by offering them more favourable terms; others, like Italy, have scared foreign oil companies away by legislation that appears to be more onerous than fifty-fifty. In the Middle East, the agreements made by the oil companies provide explicitly or in effect for most-favoured-nation treatment: if a host government is offered better terms or receives a higher revenue per ton from one company, consultations between other companies and their host governments may have to follow. So the question may become critical: Have the Italians and the Japanese conceded better terms than the established producers in Persia and Saudi Arabia?

Much has been made in the Middle East of the Japanese offer of 56 per cent of the "profits." It is easy to represent this as being more generous than 50 per cent. But 56 per cent of what profits? The major international oil groups provide not only a half share of the profits on crude oil production for the governments of Kuwait, Saudi Arabia, Iran, Iraq, Qatar and Bahrain; they also provide the assurance that large profits will be made. It is the world-wide refining, transport, storage, and distribution facilities of the major international oil groups that have made the oil revenues of the Middle Eastern governments as big as they are. Newcomers such as the Italians and the Japanese have less to offer in the way of experience and capital resources; nor, except for some preferential treatment in their own relatively small home markets, do they control important outlets for the crude oil they may produce. That forces them to offer extra lures—more than half of the profits, a participation by the host government in the producing company, or, as is said to be stipulated in the recent Saudi-Japanese agreement, a share of any profits earned outside as well as inside the producing company.

Profit-sharing agreements usually provide for a royalty, generally an eighth of the value of the oil produced, to be paid to the government whether the company makes a profit or not. This assures the government a minimum revenue related to the volume of oil produced. The profit-sharing agreement usually comes into play when the income remaining with the oil company (before it pays income tax to its own government) begins to exceed the total of royalties, local taxes, import duties and other payments to the government of the producing country; income tax is then levied to adjust the total payments by the oil company to one half of its net income. Having handed over half of its net income, the oil company is usually—though not always completely—exempt from all other forms of taxation. Income tax is levied by the British, American or other foreign governments only on the share of the profits retained by the oil company, and the company can offset against this tax liability the income taxes that it pays to the government of the producing country.

THIS sort of arrangement, simple enough in outline, is highly complicated in practice. What is the net income, the "tax base," on which the government's 50 per cent share is to be computed? Is all unproductive exploration expenditure allowed as a charge against income? Is there a depletion allowance, which is deductible from gross income before striking profit? If so, is it the same as in the United States—27½ per cent—or is it lower, entailing a correspondingly higher payment to the government? Over how many years can capital expenditure be amortised? Above all, on what values for the oil are the profits established?

There is plenty of room for argument, and this last question, particularly, has caused many squabbles. In Venezuela, profits are based to a large extent on prices realised on export; in the Middle East, the great bulk of the oil is sold to affiliates of the producing companies on family terms, but governments have insisted on calculating profits at full posted prices, subject, in some cases, to quantity discounts and marketing allowances. If a producing company has to sell below posted prices in order to secure a market, it still has to calculate the government's share of the profits as if the oil had been sold at the full posted price less only the permitted discounts.

The share of the profits is, in any case, only part of the story. To get concessions oil companies have also to accept many other commitments. Companies usually have to pay an annual rental for their prospecting area; if oil is found, the rental is increased, sometimes retroactively. Often, large bonus payments or premiums have to be paid to obtain the concession, followed, in some countries outside the Middle East, by additional lump sum payments on entering the exploitation phase. Many agreements now require the company to refine locally a sizeable share of the crude oil it produces; if it already has refining capacity at its markets, this requirement imposes a heavy extra cost and risk. The commitments that oil companies assume in fifty-fifty deals have been steadily increasing; only by taking them all into account can the total outgoings on the concession be realistically set against the prospective yield.

Seen in this light, the terms conceded to Persia by the Italians and to Saudi Arabia by the Japanese are not as onerous to those oil companies as might at first appear. It is true that the Italians are assuming the entire burden of exploration, while accepting the National Iranian Oil Company as an equal partner in producing and selling any oil they may find. But in return for this they are absolved from all rental or bonus payments, which might well have been more expensive. And the joint company will not have to pay more than half of its profits to the Persian government. On the other hand, the Japanese concession and two of the Italian company's three concessions are offshore, where the cost of drilling a "wildcat" well is exceptionally high; and if the Italians find oil in their third concession, in the interior of Persia, they will then be faced with the heavy cost of constructing a long pipeline to deliver their oil to seaboard. In this sense both newcomers have paid dearly for their concessions. And the sceptic might say that this reduces still further the chance that they will ever make lush profits to divide with their host governments.

More significant may be the clause in the Saudi-Japanese agreement that is said to concede to Saudi Arabia a right to a half of all profits earned on its oil outside the Middle East, "right down to the motorist's petrol tank." Traditionally, most of the profits in an integrated oil operation are made in production; but, as crude oil prices sag under a world surplus of oil, there may be a tendency during the next few years for a larger share of a smaller total profit to be made at the refining and marketing end of the business. If this happened, the desire of the producing countries for a share in the profits earned at later stages would be heightened. Saudi Arabia, for example, in its protracted negotiations with Aramco, wants to profit from a fully integrated producing, refining, transporting and marketing company, whose entire operations would be controlled from Saudi Arabia. The oil companies' compelling objection to such proposals would extend beyond the immediate effect on costs and tax liabilities to the interference of the Middle Eastern governments in the oil companies' day-to-day operations in Europe and in the United States.

A share of the profits, however large the percentage, and however wide the net is cast over activities outside the Middle East, means nothing unless it is related to the volume of sales and to the prices at which those sales are made. Under the existing fifty-fifty arrangements, it is in the oil companies' interests to supply Middle East oil to an increasing share of the markets they control. Yet, while Middle Eastern governments have never been slow to exploit the knowledge that the world cannot do without their oil, they appear to be ignoring the growing surplus of crude oil producing capacity outside the Middle East. New concessions granted recently in Venezuela, for example, have sharply raised that country's export potential; and in the Sahara, in the more distant future, the Middle East

may have a more than marginal competitor. But at the same time the rate of growth in the demand for oil, both in the United States and elsewhere, has slackened off. Even if it recovers, so many new oilfields are being found and developed that for several years, at least, the oil available in the world is likely to be well in excess of the demand for it. Producers in Venezuela, now restricted in their access to the American market, are seeking urgently for new outlets in the Eastern Hemisphere, in competition with Middle East oil. And if the governments in the Middle East insist on raising the oil companies' costs, or on interfering with their commercial operations outside the Middle East, they must not be surprised if the oil companies find the extra supplies from Venezuela—if their dollar cost can be reduced—a more attractive buy.

Nor can the Middle Eastern governments guarantee the growth of their oil revenues, in a period of world oil surplus, by encouraging Italian, Japanese or other independent operators to find and exploit new fields in competition with companies long established in the Middle East. These newcomers will be tempted—if their concession agreements will permit them—to sell below posted prices in an attempt to gatecrash the markets of their established rivals. The upshot of this price competition, once it assumed serious proportions, could be a lower general price level in the Persian Gulf—and now that the American market is effectively insulated against low cost imports, lower prices would bring few extra sales. So the net result would be that all producing interests, governments and companies alike, would be financially worse off. Seen in this economic context, the long-term interests of the Middle Eastern governments lie in keeping operations in their territories commercially attractive to the major oil groups that have the markets. But seen in the more familiar and more emotional context of national prestige, future financial rewards lose some of their lustre. The big question for the oil companies is whether they can go still further than they have gone already in assuaging nationalist pressures, without accepting impossible limits on their power of commercial decision.

BUSINESS NOTES

5½ PER CENT EXCHEQUERS

A Good Response

THE Old Lady of Threadneedle Street is old fashioned with her figures. The argument against announcing the response to an issue of Government stock is simply that those issues are not sold to the public on a single day: one of their main purposes is to replenish the supplies of scrip which the Government broker will use for his selling and switching operations over a period. If therefore the Bank disclosed after a loan such as the issue of £500 million 5½ per cent Exchequer Stock 1966 made this week, that the public had subscribed for X and the Government departments had taken the balance, everyone would know what the Government broker held when dealings started. But the public must be content with the formal statement that applicants for over £5 million received 74 per cent of their applications.

That figure has some meaning. Traditionally the Bank announces allotments of 90 per cent and over when it is disappointed with the response and of below 80 per cent when it is pleased. Outright sales of the new stock (largely to the banks) are believed to have exceeded expectations, and further considerable amounts were sold in exchange for the maturing 4 per cent Conversion issue. That £676 million issue is due for repayment in June, and the authorities are now busy getting control of it. In a dull but by no means weak gilt-edged market the issue received a deserved success. It was considered orthodox, neither forcing the market upwards nor depressing it. Despite the pleasing amount of support it is obvious that the official portfolio holds a large block of the stock, which opened at the issue price of £99½. That price does not attract the Government broker, who would, probably, be willing to sell at a small premium. The prospect that he will remain a potential seller for some time raises an unusual technical point. There is not another Government stock with a coupon as high as 5½ per cent, and buyers may forget that gross interest accumulates at the rate equal to about 1/64th in the price every day. The purists must not therefore accuse the authorities of forcing the market by selling at rising prices.

STEEL DEVELOPMENT

Steadying the Pace?

CONSETT IRON COMPANY this week confirmed what it had hinted some months ago—that for the present it feels able to go ahead only with part of the development programme that the Iron and Steel Board approved in January last year. The project that it then put forward as a major element in the steel industry's 1957-62 development plan comprised new coke ovens, sinter plant, a new blast furnace, melting shop, and a modern 4-high plate mill: it now intends to proceed first with the plate mill and a smaller steel melting shop (using an oxygen-blown Bessemer process). No other steel company has yet specifically announced any postponement or "stretching out" of its fixed investment plans: but so far not many contracts have been announced for the new steelworks plant included in the industry's programme—though some of the orders for basic metallurgical plant, such as blast furnaces, appeared to have been placed even before the board published its report last July.

Last week it was confirmed that the main South Durham plate mill contract had been placed with Davy-United of Sheffield, the country's largest builders of rolling mills: this is a £4 million contract, and Davy-United will engineer

and co-ordinate the supply of plate shearing and finishing equipment. Some smaller orders have been placed in Britain and abroad. But Consett has understandably not yet ordered its new plate mill; Colvilles does not appear to have done so either. And continued uncertainty about whether and where the Government may decide a fourth wide strip mill should be put down is holding in abeyance orders for the developments proposed by Richard Thomas & Baldwins at Newport and Redbourn.

In practice, therefore, some "stretching out," which was always probable, does seem to have begun: Colvilles' prospectus this week, for example, talks of projects shown in the board's special report as due for completion in 1962 as to be carried out "over the next six years." The five-year programme did indeed involve a sharp increase in the pace of steel development—to roughly double the rate of the last decade. Some slight moderation could, indeed, obviate strain on the capacity of those plant manufacturers likely to be most fully engaged—so long as it does not mean in practice first a hiatus in orders and then a rush to get early places in the manufacturers' "queue" of building. In one sense, moreover, delay is narrowing the gap of time between the dates when a fourth strip mill could be completed and when the industry thinks it could be economically employed. But seven per cent and the prospects of slower expansion are not ideal conditions for contemplating very heavy long-period investment: when this and other development projects come to be reviewed in the spring, even further grounds for disagreement could emerge.

SHELL ISSUE

The Terms Fixed

THE price of £5 10s. a share announced on Thursday for "Shell" Transport's one for ten rights issue accords exactly with market expectations. With "Shell" Transport (registered) stock standing in London at Thursday's better price of 142s. the Royal Dutch-Shell giant will get its £120 million of new money it is seeking. The value of the rights for Shell shareholders is about 3s. 9d. per share—sufficiently attractive but not excessively so. It is the prestige of Shell and the fact that it can tap all the main capital markets of the world that will ensure success. The shares will rank for the final dividend for 1957 to be maintained at 2s. 9d. per share tax free (13¾ per cent) again making 18¾ per cent tax free for the year.

What will Burmah Oil do with the rights on its large shareholding in Shell? Burmah as a company will presumably not find it convenient to increase its total investment in Shell and BP. There seem to be three choices: to pass the rights to shareholders as was done with the BP stock issue; to sell other holdings in order to exercise the rights; or to sell the Shell rights.

SUEZ CANAL COMPANY

Something from Suez?

AN active market developed in London in the shares of the Suez Canal Company just after the Christmas decision by the French Government that though the company was now French, transferable francs (on which the exchange rate is about 1,200 to the £) might be used for arbitrage in the shares. This change from the market's previous information brought London some useful arbitrage busines which came to an end when the Paris price fell and the London price rose so as to squeeze out the opportunities for arbitrage. The London price of the capital shares is now at about £49 and the Paris price in approximate parity at 60,000 francs; arbitrage business is at a standstill, but a fair investment demand, encouraged, it is believed, by one of the merchant banks, has sprung up in this country.

That investment demand may increase rather than diminish following the expression of views released in this country by M. Jacques Georges-Picot, the former general manager who has just been appointed chairman and managing director. M. Georges-Picot, who welcomed the negotiations with Egypt, which he expected would start next month or early in March, also expressed the intention of distributing in specie to shareholders a large part of the shares of SIM (Société d'Investissements Mobilières). This is an orthodox investment trust holding nothing but quoted securities with an issued capital of 7,000 million francs in ordinary shares of 10,000 francs each, almost all owned by the parent. Its assets, worth between 20,000 million and 25,000 million francs, represent roughly half the net assets of the Suez Company.

Since M. Georges-Picot also considered it "very probable" that if the compensation negotiations with Egypt were satisfactory "a large part" of the compensation money would be distributed to shareholders, it is obvious that those who have thought that much of the surplus assets of this now over-big investment undertaking ought to be distributed, are on the way to gaining a good deal of their point. The good intentions thus broadly outlined need much closer definition. Are they, for example, contingent on the carrying through of one other objective that M. Georges-Pigot mentioned—the reduction of the present complex capital structure to a single class of shares? The prospect of the Suez Canal as a viable and interesting investment holding, 35 per cent in the Commonwealth and 20 to 25 per cent in North America, has, however, been improved.

BANKERS' SPEECHES

No Comment

THE main interest in this year's round of reviews by the bank chairmen must be in their comments on last September's minor revolution in economic policy—comprising not only 7 per cent Bank rate, but the adoption of a purist approach to inflation, seen as too much money to be checked by no more money. Neither Mr A. W. Tuke of Barclays, nor Sir Harold Bibby of Martins, the two chairmen whose speeches have appeared so far, devote themselves at length to this question; they are silent too on the major questions of theory and mechanics that have come under discussion in the past year, on velocity of circulation and "cost-push" inflation.

Indeed, the bankers do not even suggest that the measures marked a turning point away from customary postwar ills. Sir Harold states that Mr Thorneycroft was to be congratulated on the strength of his measures. He considers that the Government must set the example by achieving a balance in the budget to cover below-line capital expenditures and also permit a "substantial" reduction

in taxation, the disincentive effect of which Sir Harold sees as a major bar to long-term progress. Mr Tuke is a little grudging about the September measures. He sees them as nothing much more drastic than the Macmillan plateau and apparently places little importance on the standstill in advances—they will fall anyway if prices and activity fall, but can hardly do so if prices rise. The standstill in the nationalised industries' capital outlays is, he says, "a mere holding operation." Mr Tuke, too, lays much emphasis on Government expenditure. Commenting, somewhat surprisingly, on Mr Thorneycroft's resignation, he suggests that the increase of £50 million in the estimates should have been offset by a reduction to that extent in capital outlays. Since he wrote within twenty-four hours of the announcement he presumably could not know that the argument was turning not on the original estimates but on those estimates plus known supplementaries.

Both bankers emphasise the danger of continued wage inflation, and Mr Tuke has no time for appeals against the pull of market forces to the unions. But he makes no mention of the impact of 7 per cent and the new Treasury policy in this connection. On the prospect for sterling, Mr Tuke emphasises that the recovery of foreign confidence has still not been spectacular; and he sees as a first priority an increase in the reserves, even at the expense of curtailing "for a time" new overseas investments.

The banks themselves, as last week's profits statements had suggested, were unfavourably hit by the 2 per cent increase in Bank rate, in particular by the big switch from current accounts into interest-bearing deposit accounts, and by the fall in bond prices. Barclays, which again shows investments at under cost and below redemption price, shows a depreciation below market price of 3.4 per cent, virtually the same as at end-1956 but up from 2.7 per cent at mid-1957. Martins again shows investments below market value. Mr Tuke points out that on two occasions in the past year Barclays could take "favourable opportunities" to add a total of £17 million to the investment portfolio; but the present proportion of investments to deposits of 32½ per cent "is higher than we really like it to be," though there is a good supply of early maturities. The balance sheet of the Midland Bank shows a difference between book value of investments and market value of £22 million or 5.1 per cent, compared with 2.5 per cent in mid 1957 and 4.9 per cent a year ago.

BUDGET ESTIMATES

£50 Million Over What?

MR THORNEYCROFT'S quarrel with the Cabinet, it is now clear, turned on a significantly different precept to that implied by the Prime Minister. The Treasury team was fighting not to maintain the estimates for 1958-59 at the level of the Budget estimates for 1956-57, but at the level of those estimates as increased by the supplementary estimates that will have to be presented. This total will be substantially larger than the original estimates.

The quick picture is as follows. Mr Thorneycroft budgeted in April for a reduction in total ordinary expenditure of £41 million—an expected increase of £26 million in supply expenditure being offset by an expected cut of £67 million in consolidated fund payments. The 2 per cent rise in Bank rate in September, adding to the cost of servicing the floating debt, must have upset this latter estimate; on the other hand, there is a saving of £37 million of interest from the deferment of the payment on the North American loans (the deferment for end-1956 was not effected until the current fiscal year, fortifying miscellaneous revenue). Thanks to the 1957 deferment, the saving on debt interest so far is actually already as large as the estimate for the full fiscal year, but the final saving is likely to be smaller.

Supply expenditure is now running £51 million higher than at the corresponding stage of 1956-57, an excess twice that estimated for the full year. The heavy supplementaries now expected—guesses range above £200 million—are bound to comprise substantial further provisions for agricultural subsidies, an automatic consequence of the fall in world prices. They may also be needed for pensions. Spread through all departments will be the impact of last summer's 5 per cent increase in civil service salaries, which is estimated at around £26½ million in the current fiscal year.

The amount of supplementary votes does not, of course, denote the actual excess of total expenditure over the original estimate, since there are normally savings in other votes. However, Mr Thorneycroft's emphasis on the estimates plus supplementaries suggests that the offsetting savings may not be substantial. In 1956-57, when total supplementaries reached £182 million (of which £41 million was for defence, £26 million for the health service, £19 million for education and £16 million for agriculture), offsetting savings reached £56½ million; but these were swollen by Mr Macmillan's long and disappointing search for economies promised in the budget.

FOREIGN EXCHANGE

Japan Sells Sterling

STERLING, now receiving the peak load of a seasonal commercial demand, rose early this week to $2.81 7/16, its best since August, 1954. The improvement was not fully held and the rate is now around $2.81⅛. The dominant influence in the latter part of the week has been the sale of transferable sterling on Japanese account. Until the end of last week Japanese banks could only negotiate their transferable sterling in an insulated domestic market where the rate had dropped below international parity. As from the beginning of this week the Japanese exchange control gave Japanese banks permission to sell transferable sterling in international markets. They did so in sizeable amounts and have pushed the transferable rate down from $2.7915 at the end of last week to $2.7850.

The British Exchange Control which until a week or so ago was being called upon to intervene fairly consistently as a seller in the transferable market so as to prevent the rate for transferable sterling rising to the rate in the official market, has been prepared to let the margin widen again. It would no doubt intervene as a buyer if the margin showed signs of widening to the point at which commodity shunting become profitable. The relapse in transferable sterling has communicated itself to other sterling rates and during the latter part of this week most of the European currencies were moving fractionally against sterling.

The Italian lira rate has shown no response to the latest relaxations in exchange control announced from Rome. The travel allowance for Italians is being raised to 350,000 lira (about £200). In addition Italy is following the lead of

Fair going!

by Swissair means business and pleasure become one. Visit the world's great Fairs and Exhibitions of 1958 ... Milan, Vienna, Brussels, Basle etc., or any other of the major international events.

Double the pleasure by flying Swissair in precision-maintained modern airliners, weather-radar equipped for smooth flying, and enjoy the courtesy and efficiency so traditional to the Swiss.

Some important dates:

Vienna	9-16th March
Osaka (Japan)	12-27th April
Milan	12-27th April
Basle	12-22nd April
Brussels	17th April-19th October

I'll tell you something else about Shell...

Forget petrol for a moment and think of plastics . . . there's an industry that's really gone places in the past few years. Many plastics products start life as something-from-petroleum in one of Shell's chemical plants — Shell Chemicals supply base ingredients in bulk. They're already making plastic materials in useful quantities. Now they are starting production of this new high-density polyethylene we've been hearing about — and that'll stir up some new ideas in domestic and industrial equipment! The plastics industry is forging ahead and it's people like Shell, with their vast knowledge of organic chemistry, who will be producing the "goods to make the goods".

Shell Chemicals are important in plastics

Germany, Belgium and the Netherlands in unifying its treatment of non-resident capital accounts. There will be one category of these accounts for both convertible and EPU currency countries. The change is designed to favour the investment of new foreign capital in Italy. The capital accounts will no longer be tied to the type of currency which may have led to their formation. It will be possible to make transfers between capital accounts and both capital and the dividend earned on it will be freely reconvertible into whatever currency the non-resident holder desires.

BUILDING SOCIETIES

New Deposit Scheme

BY an ironical coincidence, on the day after the Building Societies' Association announced there would be no change in borrowing rates the Leicester Permanent Building Society, ranking ninth in the movement, announced a scheme that broke with tradition and the policy of no change. It is paying 3 per cent on deposit accounts, 3½ per cent on shares and 3¾ per cent on subscription shares—all tax free. These rates it leaves unchanged, but to them it now adds a fixed deposit paying 4 per cent tax free (equivalent to £6 19s. 2d. per cent gross at the standard rate). The deposits must stay in for a fixed term of three years, and they can be for any sum ranging between £100 to £2,500; if the depositor dies, however, the executors of his estate will be able to claim an early repayment.

Vickers' New Jet

THE £60 million order that the British Overseas Airways Corporation signed on Tuesday morning for 35 of the biggest airliners ever built in Britain suggests, if it is at all representative of airline thinking, that operators are looking with relief towards a decade of technical consolidation rather than further dramatic change. The Vickers Armstrongs VC10 is not significantly bigger, faster or lighter than either of the two American jet airliners already in production, but its design incorporates refinements that directly measure the lag between the time when it and they went on the drawing board. When BOAC gets its first VC10s, the Douglas and Boeing jets will have been in service for about four years.

Measuring nearly 53 yards from nose to tail, weighing 133 tons, the VC10 should have an edge in performance over its earlier rivals partly through extra engine power and partly from the position of those engines. Designers have known for years that a clean wing, uncluttered by the bulges and excrescences that come from burying engines in its root or hanging them from it in pods like Christmas trimmings, sets up much less drag in flight and gives far better lift at take-off than the type of wing traditionally used on multi-engined aircraft.

More recently, they have seen the possibilities of further improving the efficiency of the wing by putting movable surfaces along both edges, which again cannot be done unless the engines are mounted other than in or on the wing. The only other position for them on a civil airliner, which plainly has no room in the fuselage, is outside on the tail. The French accepted the logic of this several years ago with their *Caravelle* jet airliner (tail view on the left). By last year, most other designers had come round to the same way of thinking. Vickers have put the VC10s four Rolls-Royce Conways in pairs on either side of the tail; Lockheed in America used the same lay-out on the 10-seat Jetstar; and the three companies that submitted designs to British European Airways each used three tail-mounted engines. The drawing on the right shows how A. V. Roe proposed to fit these between a "butterfly" tail; Bristol and de Havilland favour a conventional tail with the middle engine incorporated into the upright fin.

The model of the VC10 shows a wing that is clean and sharply swept, and which incorporates an unexpected number of movable surfaces in the form of flaps on the trailing edge and slotted leading edges. These devices so improve take-off and landing performance that although the VC10 will weigh as much as an American jet, its runway requirements should be 25 per cent less. This is essential on an aircraft used mainly on the relatively small airfields of BOAC's eastern routes. These are the services for which the VC10 was primarily ordered, but its performance has developed since the first paper studies and it is likely to be used much more extensively than is now planned on BOAC's North Atlantic services, where it could carry 152 passengers.

Subsidiary gains from rear-mounted engines are quieter cabins and no jet-stream buffeting of the fuselage; the biggest drawbacks are a great increase in tail weight. The Vickers tail is itself basically a heavy structure; more weight still is added by the stiffening needed to hold the engines in place. The hazard from stones that might be thrown into the engines from the squat undercarriage has still to be measured. The aircraft's engines, being military, will need little extra development, but the airframe cannot cost Vickers much less than £20 million. It marks an attempt to reduce costs by design improvements rather than, as in the past ten years, by spreading rising overheads over a steadily rising number of seats.

figures, which, as the accompanying table shows, reveal a slight growth in assets though nothing like the full mortgage demand has been satisfied. The new Leicester scheme leaves its mortgage rates to existing borrowers unchanged at 5¼ and 5¾ per cent, but new borrowers will have to pay 6½ per cent. The fixed deposit is a move in the right direction for those who believe the capital structure of the building society movement should be altered so as to lengthen the life of their capital liabilities. The move immediately raises the question of transferability. Such fixed deposits can be assigned at a mutually agreed price from one person to another, and there are a few in the movement who would not be adverse to a regular market in such fixed term deposits if they became generally acceptable to the investing public.

RAILWAY FREIGHTS

Using Present Facilities Better

THE railways' hopes of wresting back from the road the freight traffic it has been losing steadily year by year cannot wait ten or more years for the full benefits of modernisation, and the improved methods that would come from re-equipment, to be realised, nor can they rest solely upon the more immediate advantages of commercial freedom that permits freight charges to be more closely allied to actual costs of operation. The more pressing need, examined with some vision and imagination by Mr C. P. Hopkins, general manager of Southern Region, in a paper read to the Institute of Transport this week, is to make more effective use of existing equipment and freight facilities while modernisation gets under way.

Continuous braking, bigger wagons, modern marshalling yards and depots, and improved signalling and communications will mean higher train speeds and quicker service, but "speeds do not of themselves imply regularity or reliability." It is service that counts, and, in Mr Hopkins' view, the railways have no need to wait for improved equipment to increase the reliability and regularity of freight services. In particular, he dislikes the traditional attitude that freight is the great adjustor, priority number two after the passenger has been got through. Industry is now much more sensitive to the "stock" cost of goods delayed in transit—one reason why road fleets have grown so since the war. He would like to see, therefore, a more systematic freight train service, with the gradual development of scheduled services similar to those already built up on a much smaller scale for the movement of exports to the docks and more recently in the Scottish region for general freight.

In short, Mr Hopkins wants the railways to run a general schedule of regular freight runs between marshalling yards, with close-knit feeder services to outlying depots, stations and private sidings (by road as well as rail), and "when required" timings to cope with irregularities in traffic flow. This would involve fuller traffic analyses, more detailed supervision of freight train operations, and more time-table staff. But these changes, he argues, would have to come with modernisation anyway and the benefits of freight scheduling, before the results of new equipment were felt by freight services throughout the country, would outweigh these extra costs. Non-railwaymen are not in a position to test the detailed practicality of these suggestions, but any improvements in the reliability of freight services would certainly strike at the root cause of the loss of goods traffic, the main revenue earner of the Transport Commission, and it is encouraging to find railwaymen thinking actively on these lines.

ALUMINIUM DUMPING

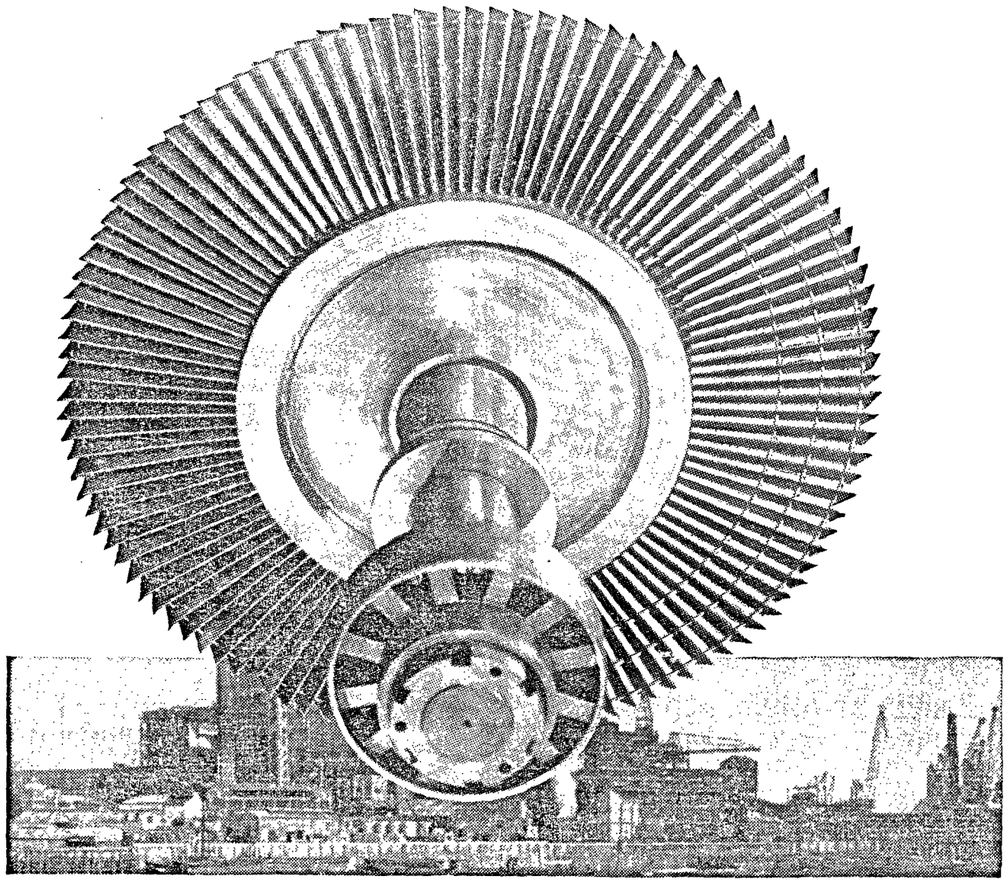
Casting the Net Too Wide?

THE Board of Trade has announced that it is considering a request by the Aluminium Company of Canada, the principal supplier of aluminium to British users, for an anti-dumping duty on imports of Russian aluminium. Imports of Russian aluminium, which have been rising rapidly this year at the expense of those normally supplied by Canadian producers, are said to be offered at prices £10 a ton below the import price of Canadian aluminium.

Can this be proved to amount to dumping, as defined in the Act—and if so, where do the interests of British consumers lie? Goods can be shown to be dumped if the "fair market price" in the country of origin is greater than the export price, and it is this that the Aluminium Company of Canada has apparently undertaken to prove to the satisfaction of the Board of Trade. Considering the state of Western knowledge of Soviet internal pricing, Alcan seems likely to have taken on a difficult task. What allowance for profit is included in the Russian home market price, for example? And at what exchange rate should the home market rouble price be converted into sterling or dollars? There is not much labour cost in aluminium, certainly, but the vast difference between one of the highest standards of living in the world and that of the Russian worker might suggest that some price differential, at least, might be expected between the Russian and the Canadian metal.

Even if dumping, in this sense, could be proved, is it in the national interest that an anti-dumping duty should be imposed, thus raising the price paid by British users of Russian aluminium nearer to the higher prices they have to pay for the Canadian metal? There is no question, in this case, of British producers protesting; indeed, British users of aluminium are gaining from the lower prices. But, under the terms of the act, the Canadian producers have a right to present their case, and the Board of Trade's responsibilities are defined, if rather obliquely. Where no British producers are hurt, the Board must not impose an anti-dumping duty if to do so would conflict with Britain's obligation under the provisions of GATT. By inference, the Board may have an obligation to impose an anti-dumping duty if to do so would enforce the principles agreed on in GATT—one of which is that members should enforce anti-dumping duties in the interests of freely competitive industries in third countries.

AUTOMATIC CONTROL



Making Machines Reliable

THE more that automatic controls replace the human operator, the more reliability matters in industrial equipment: yet the electrical and electronic controls themselves become increasingly complex, and complexity is the enemy of reliability. Sir George Barnett, the Chief Inspector of Factories, whose responsibilities impose upon him a more synoptic purview of the state of mechanisation in British

SCANDINAVIAN AIRLINES SYSTEM

industry than probably anyone else can possess, singles out this point in his annual report (for 1956, published in January, 1958). Reliability of industrial equipment has a direct bearing on safety: many factory accidents are associated with machine failure, and the factory inspectorate is always concerned to stress that equipment should "fail safe"—which is not always certain with photo-electric control equipment, for example.

Reliability in complex equipment requires far greater reliability in the parts from which it is made up. A piece of equipment made up of 20 components each of which is 99 per cent reliable (i.e. only one in 100 fails during the planned life of the equipment) will have a reliability of $(0{\cdot}99)^{20}$, which means that nearly one in five must be expected to fail: as the number of parts increases, the total reliability drops off. For only one piece of equipment containing 500 parts to fail in 200, each individual part needs a failure rate of not more than one in 10,000. With electronic components, these rates are attainable: one company making connectors for military equipment claims that on average only one part fails in 35,000. But achieving them is onerous: it imposes on the designer the need for the utmost simplicity in achieving any purpose, and on the manufacturer the strictest of quality control. Designs without moving parts, such as printed circuits, obviously help: but even these will remain liable to electrical leakage across the insulated surface between conductors, until some moisture-repellant coating is devised.

BRITISH TRADE

The Year's Reckoning

LAST year's trade accounts closed on a respectable, if none too cheerful, note. The December deficit was smaller even than the November gap, but this was due entirely to a decline in imports and not to any spurt in exports, which were also reduced in value. Over the whole year, British exports at £3,326 million and imports at £4,079 million were both 5 per cent higher in value than in 1956. If, however, silver bullion repayments to the United States are excluded from one side of the account and adjustment is made for imports delayed by the Suez Canal blockage on the other, then the rise in money terms was 5½ per cent for exports but only 3½ per cent for imports. On this adjusted basis, the Board of Trade estimates that both imports and exports were about 2 per cent higher in volume in 1957 than in 1956, export prices having risen more than import prices, although the latter, in spite of the sharp fall in recent months, were on the average 1½ per cent higher last year.

Taking into account the fall of 9 per cent in the value of re-exports caused mainly by lower trade in rubber, the visible trade gap (the excess of imports, valued cif, over exports and re-exports, valued fob) rose last year by £52 million to £620 million. All and more than all of this

* Provisional. † Excluding repayments of silver bullion to the United States amounting to £22 million in 1956 and £7 million in 1957.

widening of the gap is covered by the special factors of silver bullion repayments and carry over of imports. On a true payments basis, moreover, the deficit can have been only a fraction of this magnitude. For the first half of 1957, the trade returns show a deficit of £342 million; with both imports and exports valued fob, the payments deficit was a mere £25 million, a postwar low. Exceptionally high freight charges had to be met in the early part of the year when longer hauls were necessary to avoid the Suez Canal. On a strictly comparative basis it appears that the true trade gap was reduced last year.

It is, of course, the favourable turn in the terms of trade that improved the trading account last year. If exports expand no more in volume than imports then, without any help from prices, the trade gap must grow. On an annual basis, last year's trade accounts are not unsatisfactory and one bright aspect of them is that exports to North America rose more than the average. But the disturbing feature is

FREER TRADE IN EUROPE

that the margin of expansion in British export trade seems now to have disappeared: in the last quarter of 1957 exports were no greater in volume than in the same months of 1956.

COPPER

More Ten Per Cent Cuts

IT is beginning to look as though the copper producers were acting dangerously late in their efforts to arrest the fall in prices. The proposal for a 10 per cent cut by Chile, followed by a similar cut in the Congo which a month or two ago might have restored confidence in the market, fell on deaf ears. The Chilean announcement was made on the very day that American copper producers had again to reduce their selling prices. Kennecot came down by 2 cents to 25 cents per lb, the custom smelters by ½ a cent to 24½ cents. As a result the effect in the London market of the Chilean reduction has been negligible; there was a little bear covering but cash copper at £173 a ton has scarcely rallied. It is £6 a ton lower than it was at the beginning of the month and nearly £95 a ton lower than a year ago.

In total the amount of reduction already announced is now big. Including the Chilean cut, which at present is only an expression of willingness, and the announcement from Union Minière it will amount in total to over 230,000 tons a year. There is no statement so far from Rhodesian Anglo American, which made an involuntary cut last year. But it is doubtful how far a reduction of the order of 230,000 tons a year, which was the calculated gap between supplies and consumption early in the decline, would now suffice to restore the balance. Some market estimates put the surplus now in the region of 300,000 tons a year. That may be an over-estimate, but there is much stock in the pipe line making the effect on the market of any cuts act slowly. When Sir Ronald Prain told the informal meeting of shareholders of Rhodesian Selection Trust and Roan Antelope in London last week: "We and others in the copper industry must expect leaner times than anything we have experienced for some years" he was saying no more than shareholders ought to have expected.

RADIO INDUSTRY

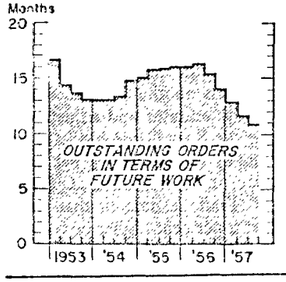
Enough TV Sets?

THE sudden setback to television sales just before Christmas is the first indication that the television market might be approaching saturation point. Now that roughly one out of every two households has the telly, the replacement market has become an important part of the industry's revenue. It has not been too difficult in the past to persuade customers with a postwar 9 or 12-inch set to replace it with something that was substantially bigger, more sophisticated and offered both channels (it was not worth converting old sets to take the two services, BBC and ITV, even where it was technically possible to do so). But owners of modern sets with medium-sized screens seem in no hurry to change them just for three to five extra inches of cathode tube. Television sales, which had kept up reasonably well during the year and averaged two per cent higher than in 1956, fell back sharply in November to less than three-quarters of their level at the same time a year ago.

One company, at least, seems to believe that the sluggishness of the replacement market is behind this decline. Pye Ltd. has started a short experiment under which dealers will offer in some cases more than twice the normal trade-in value for the company's old 14-inch sets to customers replacing them with a new 21-inch Pye receiver. With sales for the eleven months to the end of November at 1,199,000 sets instead of 1,236,000 at the same period of 1956, other dealers, too, may find that they will have to offer something more generous than the standard £5 to £8 trade-in allowance for old sets to revive their flagging sales.

CONSUMPTION

Personal Spending after Suez



PERSONAL spending last year, in terms of the actual quantities of goods bought, seems to have risen rather more than in 1956, though the rate of increase was certainly still well short of the annual gains of 3-4 per cent achieved since the 1952 recession. The full year's figures will probably not be known until the *Economic Survey* is published, but those for the third quarter, which were published this week, show that the volume of spending up to September was running at about 1½ per cent above the year before, against increases of less than half of 1 per cent in the first nine months of 1956 and of about half of 1 per cent during the whole of that year. In total value, personal consumption last year grew at a slower pace than in 1956, but the rise in the cost of living slackened even more.

PERSONAL SPENDING

	9 months spending (£mn.)	
	1956	1957
Food	3,210	3,298
Drink	630	662
Tobacco	689	724
Housing	833	837
Fuel and light	433	440
Household equipment	649	707
Clothing	933	976
Travel	371	392
Other goods	1,034	1,080
Other services	1,022	1,034
	9,800	10,200

This slight—and possibly temporary—quickening in the growth of real consumption covers the period of the Suez upheaval and the strong revival in spending on household equipment. October retail trade returns suggested a slight faltering in the recovery of expenditure on household durables, but in November both spending on these items and total retail shopping look to have gone ahead again. These quarterly figures show also a return to the previous pattern of spending on public travel, now falling again after the bonus offered by petrol rationing, and on private motoring. This last item is now concealed in the official figures under the heading "Other Goods," which rose in volume

FALLING MACHINE TOOL ORDERS

New orders for machine tools, from British industry as well as from overseas, have been declining for the last 18 months. Deliveries have recently been growing, and total order books have reached their lowest point, in terms of output, since these figures were first collected—and probably since before the Korean rearmament drive.

by more than 6 per cent in the September quarter—when both car sales and motoring expenditure were going well. Food expenditure, which has proved relatively inelastic to increased purchasing power over the years, rising by very small quantities each year since rationing ended, dipped slightly in the third quarter of 1957, but this part of the household budget often shows some erratic changes from one quarter to another. The volume of spending on clothing and tobacco rose rather less than before in the third quarter—not a long enough period to suggest any levelling off—but expenditure on drink was still rising steadily.

OIL

A European Stockpile?

IN its report on the "implications and lessons of the Suez crisis" the oil committee of the OEEC recommends that European countries should consider increasing their oil storage capacity beyond normal working requirements to provide an insurance against any future interruption in oil supplies from the Middle East. Europe began the period of emergency supply last winter with a total of 17.5 million tons of oil in stock, with consumption running at 115-120 million tons a year. Not all of this stock was available for distribution. A large part of it, perhaps two-thirds, was tied up in the industry's working stocks, in transit and elsewhere. At the most acute phase of the crisis Europe's stocks never fell below 13 million tons, though stocks of fuel oil, which was in acutely short supply, dropped more rapidly.

Any addition to these stocks, apart from the increase in working stocks that would have to accompany growth in demand, would be fully available for distribution in an emergency. The drawback to this insurance scheme is its very high capital cost. The OEEC committee estimates that to increase Europe's total storage capacity by the equivalent of only one extra day's consumption and to provide the oil to fill it would cost more than £7 million, apart from maintenance costs. The "three months' strategic reserve" often suggested—though not by OEEC—as a worthwhile insurance against another Suez affair would, on this reckoning, cost well over £600 million—and there is not much scope

No Buoyancy in Profits

THE increase of 4¾ per cent (by £14.6 million to £323 million) in the trading profits of the 482 public companies whose results were published in the last quarter of 1957 shows no real buoyancy of earnings. The increase, slightly smaller than that reported in the third quarter of last year and exactly the same as that reported in the second quarter, springs from an increased investment of fixed and working capital.

There were marked variations in earnings between different industries, as the detailed statistics on pages 252 and 253 show. The biggest increases were reported by cotton (up by 49½ per cent), by electrical manufacturing (up by 30½ per cent) and by breweries and distilleries (up by 14 per cent). The profits of another important group, food and confectionery, were up by 1½ per cent, though the consumer trades as a whole did well. Profits of the capital goods industries, such as engineering and building, show little change. Earnings of the motors, cycles and aircraft group, statistically the biggest in the quarter, were as good as could have been expected for a difficult year.

The increase in the invested capital from which these earnings sprung was substantial. The gross value of fixed assets rose by £150 million, the value of stocks and debtors by £86 million and of other non-liquid assets by £8¾ million. That additional investment was financed by additions of £148 million to depreciation provisions and retained earnings, of £33½ million in new capital issues for cash, of £32 million in creditors and of £9¾ million in other liabilities. The gross liquid assets of the 482 companies rose by £8½ million, but their bank overdrafts rose by no less than £29½ million. There was in fact some call on net liquid resources to pay for this increase in capital investment. It is here that credit restrictions are likely increasingly to bite.

for reducing the bill by using "natural" underground storage.

The case for increasing oil storage capacity varies, however, from country to country. Britain, for example, is better off for storage capacity in relation to its annual needs than most other European countries, and has the Admiralty's fuel oil stocks to fall back on as a last resort. Several countries already hold, by law, stocks in excess of the normal commercial level. There are, of course, large seasonal variations in oil demand to be provided for, and in the Scandinavian countries stocks have to be built up against the danger that ice may close ports in the winter. Faced with these special considerations, some countries may feel the cost of extra storage capacity worth paying; others, including Britain, may feel that other forms of insurance—supertankers for the Cape run, and the development of new concessions in Venezuela, for example—should provide sufficient breathing space in any future emergency. The cost of extra storage would have to be borne by the consumer in the end, either through higher taxation if governments were to foot the bill, or through higher prices for oil products if they did not.

WOOL

New Zealand Wools Cheaper

The series of London wool sales that began this week with an offering of over 60,000 bales possibly marked one of the crisis points for the course of wool prices. The auctions coincided with the start of the second half of the wool-selling season in Australia, New Zealand and South Africa. And they started with wool people labouring under two grave doubts. Japan's import programme for the season has been sharply cut to about 900,000 bales, against an original programme of 1,300,000 bales; and the rate of consumption in the world as a whole is now roughly estimated by the Committee of London Wool Brokers at 2,800 million lb a year, compared with 3,000 million lb a year in the first half of last year.

The outcome so far is indecisive, but wool prices did not show the steep fall that some had feared. In London this week Australian wools held up moderately well, all being less than 5 per cent below the levels of the previous London sales. New Zealand prices at the outset dropped noticeably, most crossbreds falling by about 7½ per cent. That pattern follows what has been happening in the primary markets, for sharpish falls having been registered at Wanganui and at Auckland, while in Australia prices have been held up by Japanese buying at Sydney and by East European buying at Melbourne.

The development of the markets thus follows approximately the present patchy state of the Yorkshire wool textile industry. By no means the whole of that trade is depressed, and to the general surprise the latest Bradford statistics showed a modest rally of about 2 per cent in the daily rate of raw wool consumption in November after the sharp fall of October. The impression is however current, though it cannot be statistically supported, that Bradford is still reducing stocks. That might go some distance towards offsetting the fact that, largely because of the previous overestimate of the size of the current Australian clip, the quantities coming on the market in Australia in the second half of the season will be less than in the first half.

ADVICE TO CONSUMERS

Two Bodies—or One?

The number of people in this country willing to subscribe to a publication that analyses the merits and drawbacks of particular consumer goods and services is probably quite limited. Even Consumers Union and Consumers' Research in the United States, which have now been active for more than twenty years, still have a total readership of under a million, a mere fraction of the total buying public there. British consumers have recently been provided with two such advisory bodies, each publishing a quarterly bulletin for an annual subscription of 10s., and they have supported both of them with a relatively good start. The Consumer Advisory Council, an adjunct of the British Standards Institution, reports a membership of well over 15,000 for its "Shoppers' Guide," the third number of which appeared last week (plus an estimated 10,000 more through local groups that have become associate members); and the Association for Consumer Research, whose bulletin "Which?" appears for the second time this week end, claims 23,000 subscribers in three months.

But the cost of buying and testing goods—particularly the more expensive kinds of household equipment where advice would be most useful—can be heavy, and so are publishing costs and the expenses of administering organisations with a fairly sizeable individual membership. With a limited potential readership for consumer bulletins—apart from government grants and charitable donations, the sole independent source of revenue for such advisory activities—it is perhaps not surprising that there should already be talk of the desirability of a merger between CAC and CR.

So far the only contact between the two bodies has been of a purely unofficial character between individuals, but as a result of these private approaches CR has decided to make a formal statement to CAC of the terms on which it would be prepared to consider a merger—namely preserving both complete independence, financial and otherwise, of any person or body commercially interested in consumer goods and the standard of testing and reporting it has already developed in "Which?". CAC, which will discuss this at its next council meeting in February, will no doubt reply that it is equally independent, even though some of its finance comes from the industrial membership of BSI (and from the government). Whether the two bodies could agree on a merger on CR's terms seems doubtful. It would seem preferable for the two to continue in competition for a while longer; later, when they are more established and the scale of their activities grows, a merger might be more acceptable.

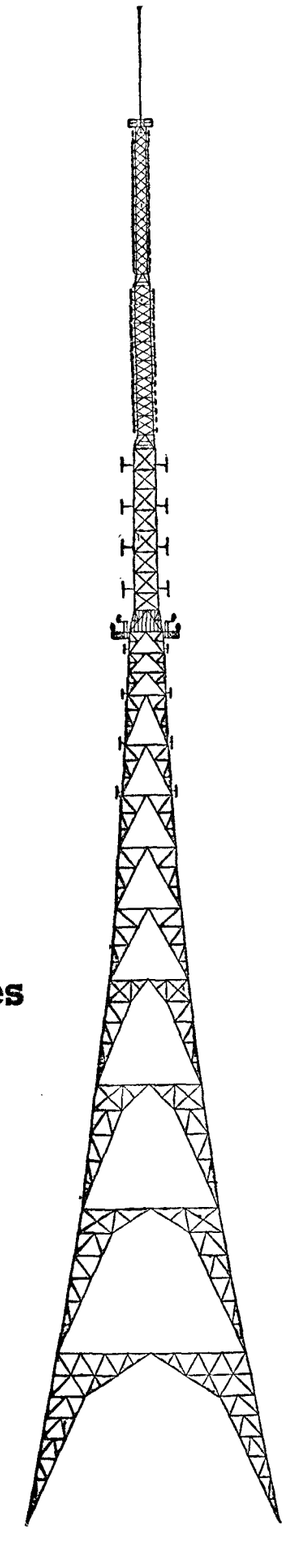
SHORTER NOTES

The International Bank for Reconstruction and Development has lent the equivalent of $11 million to the privately owned Mexican Light and Power Company. The loan, guaranteed by the Mexican Government, is at 5⅝ per cent and extends over 20 years. Amortisation begins in September, 1959; seven private financial institutions have put up, without the World Bank's guarantee, $1 million of the loan and their *tranche* ranks for the first amortisation maturities.

We are the cablemakers

but not that alone.

We are helping viewers to see
with greater definition
the shows, the talks, the news and names that appear on television.



At Crystal Palace, we have just completed a tower
which will help to give the BBC transmissions more power.

If you were at the top of it
you would be 1,000 feet above sea level (and probably dizzy).
In high winds you and the tower top
could move 40 inches from centre,
thanks to the tower's natural frequency of vibration—
one complete cycle in 2¼ seconds.
Where there's a wind, there's a sway
which, fortunately, can be calculated in advance.

Below, from among the statues and the terraces
it rises like the Eiffel Tower (Paris's):
a lattice-steel, four-legged giant,
standing upon piled foundations,
each leg set in a reinforced concrete pad,
fourteen feet square and four feet thick.

Why so tall? Aerials are not that big.
The answer is: the TV tower is like a lighthouse,
casting a beam to the radio horizon:
therefore the higher the aerials
the greater the range.

Hence 708 feet of tower,
a new London landmark
and a brighter inlook.

we think for the World on many lines

BICC

BRITISH INSULATED CALLENDER'S CABLES LIMITED

Parent company of the BICC Group the—World's largest organization (comprising 40 companies) with complete facilities for research, manufacture and contracting in the transmission and distribution of electrical energy for power and communication.

Head Office: Norfolk House, Norfolk Street, London W.C.2
International Sales Office: 21 Bloomsbury Street, London W.C.1. Museum 1600

How economical is YOUR transport?

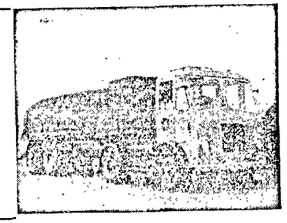
With co-operation, wise planning and reliable, efficient transport, BRITISH ROAD SERVICES help you to keep down costs.

TRANSPORT TODAY — with all its ramifications— can form a very important item in a company's costs. B.R.S. realise this and strive to see that you receive real value for the money you spend with them. Real value is service and reliability, which they set out to provide through their unrivalled nationwide facilities. They co-operate fully to obtain for you your full money's worth, *for they believe in service.*

Economical advantages

Planning: Economical transport begins at the planning stage and B.R.S. have enthusiastic, experienced men eager to co-operate with you in devising the most efficient means of moving your particular goods. They will advise on palletisation, mechanical handling and other modern techniques, and with their up-to-date knowledge they can often suggest very real economies for you.

Vehicles: B.R.S., with their vast resources and their huge fleet of many different types of vehicle, are able to provide the most suitable and economical vehicles for your load, or, if need be, they will adapt existing ones, or build new ones to suit your particular purposes.



Precautions: No practical security measure is overlooked, and careful precautions are taken to safeguard perishable or valuable goods. The 24-hour engineering service — on call all over Britain — ensures that all equipment is kept in tip-top condition by planned preventive maintenance. B.R.S. aim at reliable services for you and safety for the public.

Behind the scenes: A teleprinter network links all B.R.S. depots throughout Britain and speeds communications. Special instructions are passed over it to ensure that your needs — and those of your customers — are properly cared for. B.R.S. realise how valuable customers are — to you and to them.

All these advantages, and many more, enable B.R.S. to provide you with reliable, fast, economical transport, transport that *really* justifies its cost.

Just telephone your local man — action will follow immediately.

Most suitable vehicle. This articulated vehicle carries a load of 15/16 tons. Whilst the trailer is loading or unloading, the tractor can be busy elsewhere, helping B.R.S. to give good service at reasonable cost.

British Road Services

Look up your nearest depot in your local telephone directory

Tate and Lyle had to make extensive use last year of loans from the banks and the bill market to finance its big stocks of sugar. The chairman, Mr Ian D. Lyle, now says that with falling sugar prices the burden of stocks will be lessened and that "there seems no immediate necessity to increase the permanent capital of the company."

* * *

Consolidated African Selection Trust, and its subsidiary Sierre Leone Selection Trust, which are the Western African members of the diamond syndicate, qualify as Overseas Trade Corporations with effect from the beginning of this year. This will result in a non-recurring tax saving of £290,000 relating to previous profits and provide savings of British tax on all future trading profits.

* * *

Sir Donald Perrott, financial and administrative director of the Atomic Energy Authority, is expected to go to Windscale next month to look into complaints of the Institution of Professional Civil Servants that some of the staff are aggrieved by the comments made in the official report on the part which reactor operators played in the Windscale fire. Sir Donald's visit follows an offer, which was not taken up, to make representations to a three-man board sitting in London.

COMPANY AFFAIRS

STEEL RESULTS

THE accounts of a further batch of steel companies continue the themes, as in those discussed in these columns last week, of capital development, the immediate market prospect and the threat of nationalisation. All three are major influences on the course of steel shares in Throgmorton Street, and explain why they lagged behind in the rising stock market in the early months of 1957 and led the fall when the market entered its bear phase.

Colvilles, the big Scottish steel company, is broadly based though its production leans, as is inevitable with its proximity to Clydeside, towards plate. It has almost completed the first stage of its development programme; at the end of September it had spent all but £5½ million on this £25 million scheme. The second stage of the scheme, spread over six years, will cost about £40 million and Colvilles has come to the market with a 6 per cent convertible debenture to raise just under £6 million. The rest of the finance it needs will come either from retained earnings or from the banks.

The new plant at Ravenscraig first produced steel ingots in September, and so made no significant contribution to the year's record production. Profits advanced strongly from just under £9 million to over £12 million. In the prospectus for the debenture issue the directors say that trading conditions continued "favourable" in the last quarter of 1957 and that trading results in the current financial year "will not differ materially" from those achieved in 1956-57.

John Summers, which concentrates upon sheet steel and is one of the chief suppliers of the motor industry, is still in the midst of a development programme designed ultimately to bring capacity up to two million tons of ingots a year. Its outstanding capital commitments are of the order of £18 million. The programme has been delayed but in the middle of last year the company raised £4½ million by offering ordinary shares at par. But even after this issue, John Summers like most of the other steel giants is short of liquid funds.

Last year it was able to avoid short time working when the motor industry was slack by exporting steel sheet. The hand mills controlled through its subsidiary, Burnell and Company, were adversely affected, but Summers' consolidated trading profit went up from £9.3 million to over £11 million. Mr Richard Summers is reasonably confident about immediate prospects. The demand for flat steel is "still very brisk" and he sees no cause for concern unless further credit restrictions are imposed. The unintended delay in the Shotton development programme, in fact, helps to keep national production in line with expected demand and Mr Richard Summers suggests that for the time being a "marginal tonnage of sheets" will still have to be imported.

Consett Iron, supplying steel plate for the shipbuilding industry, is being pressed by the Iron and Steel Board to get on with its development programme. Its particular expansion scheme was likely to cost more money than the company feels able to raise; and now the chairman, Mr Clive Cookson, says that it has been decided to go ahead one stage at a time. He does not reveal the cost of the scheme except to say it will require a "considerable amount of new finance." Consett's trading profits advanced from £4.7 million to £5.4 million, and the chairman speaks of a "steady demand for plates for many years to come" from the shipbuilding industry.

Richard Thomas and Baldwins has not yet been denationalised, nor has the argument about a new strip mill been finally resolved. The company owns the oldest continuous strip mill in the country—though that does not mean it is technically much behind the newer plants. Indeed, because this strip mill was installed before the war, its operations (if capital costs are taken into account) must be more profitable than those of the newer mills. But Richard Thomas and Baldwins had also, until recently, a flock of hand mills under its wings. The closing of some of these mills and a reduction in output from the rest must be largely responsible for the fall in the group's trading profit from £10,075,840 to £9,694,407. After appropriations to replacement reserves, the net earnings of the group are down from £2,963,068 to £2,603,440; but the company is paying an unchanged ordinary dividend of 13½ per cent on the ordinary shares, held by the Iron and Steel Holding and Realisation Agency.

BORAX (HOLDINGS)

IN 1955 the growth stock *par excellence* was Borax. American as well as British investors were eager buyers, correctly anticipating far-reaching changes in the company's structure. Those changes did indeed take place and later buying heavily discounted the earnings likely to accrue from the major development programme and the tax savings which arose from the reorganisation of the group.

Now Borax (Holdings) has published its preliminary report for the year to September 30, 1957, and investors can get busy on the arithmetic. The calculations are interesting. First, the coming into production in July of the major development scheme in California does not yet seem to have had any appreciable effect on trading profits. The company calculated that if the reorganisation scheme had been operative throughout the whole of the year to September 30, 1956, the profit would have been £3,974,462. The actual profit in the year to September 30, 1957, was very close—£3,999,495 before depreciation.

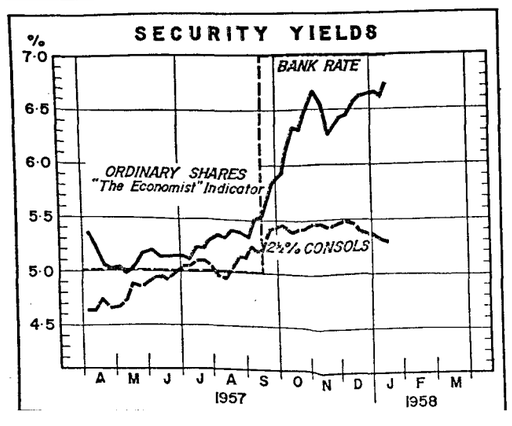
Secondly, investors can compare various charges against profits between 1955-56 (when the company was partly in its old and partly in its new form) and 1956-57 (when it was wholly in its new form). They will note that there is some slight saving in tax: the charge is £788,989 (excluding distributed profits tax), compared with £821,947. But they should note too that the depreciation charge is up from £546,651 to £1,000,360; that interest on debentures and unsecured notes is up from £76,923 to £242,619; and that profits attributable to minority interests are up from £155,467 to £677,999.

Most of the latest net profit of £1,437,462 is retained by subsidiaries; the latest dividend of 5¼d. per 5s. share (compared with 5d. per 5s. share) absorbs £452,813 and is paid for out of the accumulated carry forward of the parent company. Earnings, which are subject to seasonal fluctuations, have dragged downwards quarter by quarter and, though shareholders had been warned that the disparity between the final and interim payments would be reduced, they will hardly welcome the unexpected reduction in the final dividend—from 3.8d. to 3.5d. per 5s. unit. Investors knew that it would take time for profits to mature from the development programme. The latest accounts will strengthen that conviction, just as they demonstrate that while growth and reorganisation may produce bigger profits and smaller taxes they can also produce bigger charges of other kinds to be set against these profits. In the meantime the skeleton thin yield of 2.3 per cent on the 5s. deferred units, now standing at 19s., continues to put a big discount on future earnings.

RADIO RENTALS

THE control of hiring order, under which the initial rent on radio and television sets has normally to cover the first nine months of hiring, did not prevent Radio Rentals from achieving a record profit in the year to August 31st. In that year the group's trading profit jumped from £2,695,593 to £3,350,688 and the ordinary dividend was effectively raised from 22½ to 30 per cent. No less conclusive evidence of expanding business is shown in the growth (at cost) of radio and television sets "on or for rental" from £10,390,000 to £13,072,794. Such a rate of expansion leaves the group short of liquid resources but it is its policy to write down its sets quickly and that benefits profits if the sets (as they seem to do) stay out on rent after they have been written down in the company's books.

The chairman, Mr P. Perring-Thoms, says that the increase in profit is due primarily to "expansion and improved efficiency" and that rents and selling prices (for the company is in the hire purchase business too) remain "keenly competitive." Much of the expansion, as might be expected, has come from television rentings and not from radio rentings. Thus far in the current year trading has continued to be "satisfactory" and at 28s. the 5s. units (on which the disparity between the interim and final dividends is to be reduced) yield £5 7s. per cent.



London Stock Exchange

FIRST DEALINGS:	Jan. 1	Jan. 15	Jan. 29
LAST DEALINGS:	Jan. 14	Jan. 28	Feb. 11
ACCOUNT DAY:	Jan. 21	Feb. 4	Feb. 18

THE new Exchequer Stock issue had little effect on other gilt-edged prices, which were firmer on consideration of the reduced trade gap in December and the strength of sterling. The new loan was dealt in around its issue price of 99½ on Wednesday. The rise in short-dated stocks was checked by increasing offers since Tuesday.

Prices of industrial stocks were persistently weak up to the start of the new account on Wednesday, when however widespread but small gains occurred. Over the week *The Economist* indicator dropped by 2.2, but the relaxation of US margin requirements caused further gains on Thursday. Insurance shares relapsed; Sun Insurance fell 10s. to 132s. 6d. and Employers' Liability the same amount to 110s. Birmingham Sound Reproducers was outstanding among electrical stocks, rising 2s. to 33s.; and among the caterers Lyons "A" gained 2s. 6d. to 92s. 3d. There were some weak features among motors and aircraft; Hawker Siddeley lost 1s. 4½d. to 28s. and Rolls-Royce slipped to 87s. 3d. before recovering to 89s. Bowmaker gained 6d. to 23s. 4½d. on the increased payment and United Dominions Trust rose 1s. Shipping shares eased, London and Overseas Freighters falling 9d. further to 17s. 6d. xd. Hudson's Bay recovered on Thursday, but Borax were dull on the results.

Oil shares rebounded on Thursday in anticipation of the Shell group's issue terms, Shell recovering an earlier loss of 3s. 1½d. to 141s. 10½d. Kaffirs had a poor week, losing ground daily, Western Holdings falling 3s. 1½d. in all to 86s. 3d. By contrast diamond producers gained ground, De Beers deferred rising 5s. to 87s. 6d. Copper mines suffered heavy losses, Rhokana declining 1¾ to 23 and Bancroft 1s. 9d. to 14s.

Figures cover general trade as far as possible. Area totals include estimates for countries for which data are not available. Data refer to calendar years. (1) Excludes China (mainland), USSR, and non-reporting countries of Eastern Europe. (2) Including the trade of Newfoundland in 1948, with no adjustment for trade between the two areas. (3) Partly estimated.

Financial Statistics

EXCHEQUER RETURNS

For the week ended January 11, 1958, there was an "above-line" surplus (after allowing for Sinking Funds) of £135,490,000 compared with a surplus of £40,166,000 in the previous four days and a surplus of £134,584,000 in the corresponding period of last year. There was a net expenditure "below-line" of £11,698,000, leaving a total deficit from April 1st of £770,678,000 (£820,037,000 in 1956–57).

THE MONEY MARKET

THE ten weeks' decline in the Treasury bill rate was checked at the tender on Friday last week, when the average rate rose fractionally 0.55d. to £6 6s. 7.25d. per cent. The market maintained its common bid at £98 8s. 4d.—but applications for an unchanged allotment of £260 million fell by £7.0 million, to £398.7 million, and the proportion allotted to tenderers at the common price rose a little from 44 to 45 per cent.

The easier credit conditions of last week continued through Thursday, when balances were unlent, but disappeared over the week-end. The Bank helped the market by large purchases of bills on Saturday, and again on Monday and Tuesday; on each day rates on overnight loans ranged up to 6½ per cent. In addition, four or five houses had to take moderate loans at Bank rate on Monday. However no help or loans were needed on Wednesday, the clearing banks' monthly make up day, and overnight rates of outside banks at the close fell to 5 per cent.

The fiduciary limit to the note issue has again been reduced by £50 million, to £2,050 million. In the three weeks from Christmas Day, the note circulation has declined by £133.2 million; in the corresponding period a year ago it fell by £107.9 million.

The Treasury bill rate in New York fell sharply this week, to 2.591 per cent, more than 1 per cent below its peak three months ago.

MR A. W. TUKE ON RECENT HOME ECONOMIC DEVELOPMENTS

The annual general meeting for the year 1958 of the Stockholders of Barclays Bank Limited will be held at the Head Office, 54 Lombard Street, London, E.C.3, on February 5th.

The following is the address by the Chairman, Mr Anthony William Tuke, which has been circulated to Stockholders with the Report and Accounts for the year ended December 31, 1957:

As will be seen from the Report we have during the past year elected three new Directors, Mr Guy Bryan, Mr Francis Fairfax-Cholmeley and Sir Edward Thompson, whom we welcome to our Board and who will submit themselves for the approval of the stockholders during the course of the Annual Meeting. Mr Bryan is our senior executive Local Director in Birmingham and Chairman of our Birmingham Local Board; Mr Fairfax-Cholmeley is the executive Director of Barclays Bank (France) Limited, resident in Paris, and Sir Edward Thompson, who has already been a member of our Birmingham Local Board for seven years, is Chairman of John Thompson Limited and comes to us as a representative of industry in the Midlands. At the close of the Meeting Lord Dudley Gordon will, to our great regret, surrender his seat on the Board on account of his age. He was elected a Director in 1944 and during the intervening years we have learned the value of his advice and of his friendship. We shall miss him very much.

We congratulate our colleague and Vice-Chairman, Mr John Thomson, on two eminent distinctions. The University of Oxford has conferred on him an honorary degree as Doctor of Civil Law in recognition of his services as Deputy High Steward; and he has been appointed Her Majesty's Vice-Lieutenant of the County of Oxford. We also congratulate Sir George Hayter-Hames on the honour of Knighthood which was conferred on him in the Birthday Honours in recognition of his services to Agriculture.

We have appointed as a General Manager Mr F. S. Bedford, who has had experience successively as a Branch Manager in the North of England, as Joint Foreign Manager and as an Assistant General Manager. He takes the place of Mr E. Brimelow, to whose impending retirement from this office and appointment as a Local Director at Pall Mall I referred last year.

THE YEAR'S RESULTS

The results for the past year, which we submit to you, do not differ greatly from those of 1956. After equalising at 6 per cent the interim dividend which was declared in July we are recommending a final dividend of 6 per cent which makes a total of 12 per cent, the same as for 1956. Apart from the last three months, when they have been highly abnormal, money rates were rather lower in 1957 than in 1956, and the upward change which took place in September did not have, on balance, a favourable effect on the year's results. We therefore had to expect a slight fall in our profits, especially having regard to the rapid increase in our expenses in recent years; not only in the principal item of staff remuneration but also in the miscellaneous overheads, from the maintenance of the fabric of our branch offices to the stationery which we use for our daily work. Although we have almost covered these increased charges we are fully alive to the need for economies in our overheads. We may expect that these will come not only from the increased mechanisation of various book-keeping processes, but also from the constant study of labour-saving expedients of every kind. We have a growing department which applies itself to just these matters, not only in theory but also by experiment.

BARCLAYS BANK DCO

Stockholders are well aware that we are deeply interested, not merely financially, in the overseas business of Barclays Bank DCO, which has shown such remarkable progress and has brought us so much satisfaction since it became a member of the Barclay family just over thirty years ago. A substantial, though proportionately small, part of this bank's business was in Egypt, and I had the pleasure of visiting it in the spring of 1956, when the Suez crisis was in the making. When that crisis came to a head, the British staff in Egypt were banished by the Egyptian Government and the Egyptian branches of the bank were sequestrated. On these unhappy incidents I cannot do better than quote from the recent speech of Mr J. S. Crossley, the Chairman of Barclays Bank DCO, to the stockholders of that bank.

. . . We have lost an old and much prized business; many close friends and happy associations have been shut off from us. The history of our Bank in Egypt, the oldest bank in that country and for many years the leading commercial bank, covers nearly a century. There are many today who will remember exceptional services rendered there during the war, but the story in the main has been one of service to the people of Egypt, not to the foreign interests or wealthy merchants and landowners alone, but to many small cultivators and traders throughout the entire country. It would be surprising if all this could be terminated so harshly without causing deep wounds and creating much suffering. Stockholders will, I think, hardly wish me to pass over in silence such an incident involving, amongst other things, the total loss of a remunerative business. Although nothing can restore the damage done, we hope that recognition of our claim for compensation for the events in Egypt will not long be delayed. . . .

In spite of this setback the business generally has continued to prosper, and the loss of the Egyptian deposits has been fully made up within the year through expansion in other areas.

THE CHEQUES ACT 1957

I expressed my views last year on the desirability of introducing legislation for rendering unnecessary the endorsement of the great majority of cheques and similar instruments, and I am glad that this has now been brought about. The Cheques Act, 1957, came into force on October 17th last. This Act will have important and far reaching effects upon the practice of banking. The banks, quite rightly in my opinion, have extended the benefits of this Act as widely as possible, having due regard for their reasonable and proper protection. There is no doubt that it has brought about a very considerable saving to the community at large, even though the financial benefit to the banks may be no more than marginal.

THE IDEAL BANK

Stockholders will have seen references in the Press to the affairs of the Ideal Bank in Birmingham, and to our having come to the rescue of the depositors so that they should not lose any of their money when that bank was obliged to stop payment. The affairs of the Ideal Bank had been conducted with complete propriety, and the depositors had not been tempted by extravagant rates of interest. The directors, deluded perhaps by the propaganda, so prevalent at one time, that cheap money had become a permanent feature of our economy, had invested a large proportion of their funds in long-dated Government stocks and had in some degree neglected the need for adequate liquidity, even in a savings bank. The Ideal Bank thus became a victim of the fall in values which is the counterpart of the high interest rates imposed on the economy in the effort to counteract inflation.

We, for our part, have been taking good care of our liquidity recently, but nevertheless on two occasions during the past year we have found ourselves able to take favourable opportunities of adding to our portfolio of Government investments, which consequently show an increase of £17 million on the year. Our present percentage of investments at 32½ is higher than we really like it to be, and that makes it the more necessary that we should be amply provided with maturities during the next few years. We believe that we are so provided, and that with the effluxion of time, which in this regard is a faithful ally, they will enable us to restore

our liquidity at any moment in case of need without embarrassment.

BANKER'S OBJECTIVES

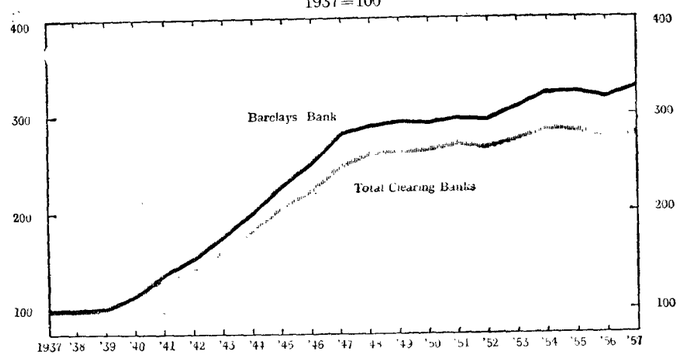
In the daily conduct of his business a banker always has to hold the balance between two conflicting objectives: to use his resources to the best advantage, and to maintain ample provision for any drawings likely in his judgment to be made by his customers against their deposits. Learned economists will discuss at great length the causes of a rise or fall in these deposits. The practical banker, puzzled perhaps by these erudite lucubrations, pins his faith to what he knows from his experience and can understand, which is that his deposits, and with them his cash, rise and fall day by day with the balance, credit or debit, of his daily clearing account with other banks and the Government.

If on a certain day a banker finds that he has a favourable balance in the clearing of £5 million, the effect, taken in isolation, will be that his cash at the Bank of England will be increased by that amount, and that there will be a corresponding increase in the deposits of his customers or alternatively a decrease in their borrowings; or more probably some unforeseeable combination of the two. He will assume that the money has all gone into deposits and as he needs to keep only 8 per cent of his deposits in cash he will have 92 per cent or £4,600,000 to invest, which he will doubtless employ in the first instance on the money market. If the situation is reversed, as it well may be, on the following day, he will have to find £4,600,000 from his money market assets to make good the fall in his cash, the balance of 8 per cent not being required because he will know that his deposits have returned to their former level. It is true that, when he next takes out his balance sheet, he may find that, apart from the changes which he has foreseen as a result of the daily movements of his clearing account, there has been an increase or decrease in the borrowings of his customers, of which he could not previously have been aware, and a corresponding change in the total of his deposits. Here practice begins to move into the region where theory flourishes, but even so there is nothing that the individual banker can do to increase or decrease the credit balances of one group of his own customers by increasing or decreasing the amounts placed at the disposal of, but not necessarily used by, another group.

A RATHER BETTER THAN AVERAGE RESULT

When inflation is in progress, every bank is likely to find itself taking in money over a period in the clearing and its deposits increasing accordingly; and this growth may not be exactly proportionate as between one bank and another. Any bank which in the long run continues to receive rather more than its proportionate share will find itself by that much less embarrassed when operations undertaken by the Government in furtherance of a credit squeeze reduce the total of deposits in the banking system. In this respect we have been somewhat favoured during the postwar years, as will be seen from the chart which demonstrates the percentage increase in the deposits of the eleven clearing banks, together with our own for comparison, taking 1937 as a base and the monthly averages at yearly intervals.

There is, I suppose, no merit in mere magnitude, but an increased girth is very useful when one is being squeezed. Our figures have not been affected during this period by any adventitious aid nor artificial stimulant, and there is no special reason, that I know of, which has produced for us a result rather better than the average. Such a persistent trend can hardly be fortuitous. A contributory cause is, I am sure, our decentralised method of administration through Local Head Offices, and another may well be our extensive and widening interest in Barclays Bank DCO and in various other banks operating in the overseas territories of the Commonwealth. In the main, however, it must, I believe, reflect the satisfaction of our customers, old and new, with the service given to them by our staff at home, an explanation which I certainly believe to be true.



RECORD LEVEL OF DEPOSITS

On the year our deposits have increased by no less than £100 million to a record figure of £1,513 million and £70 million of this has been added in the last six weeks; indeed on the last day we took in unexpectedly £15 million which we were not able to employ fully on the market, with the result that we finished with a wholly abnormal cash ratio of 8.82. Apart from these late movements there were no unusual fluctuations in our total credit balances, but there have been considerable underlying variations in the relationship between current and deposit accounts. In November for example the overall total was unchanged as compared with October, but current balances had fallen by £22 million and deposit accounts had risen correspondingly.

CURRENT, DEPOSIT AND OTHER ACCOUNTS

(ANNUAL AVERAGES OF MONTHLY FIGURES)

1937 = 100

A movement of this kind affects adversely our profit and loss account, since there is no increase in funds available for investment to offset the additional interest payable by us. The individual credit balances, both on current and deposit account, naturally vary enormously, but it is of some interest to note that in Barclays Bank the average balance in each case is just over £500. It must be borne in mind that interest-bearing deposits are of two diametrically different kinds: the savings of private persons, which may be individually small but are in the aggregate very stable, and the deposits of trading companies, which are often individually large but may be very mobile in quality. Within the deposit accounts themselves there is thus an unknown factor. There has been a tendency since rates became high for holders of large individual deposits to transfer their money into Treasury Bills, so that the rise of £22 million in our deposit accounts in November probably understates the amount by which the smaller accounts have increased during this period.

It is not likely, however, that much of this increase represents new savings. The propensity to save is largely a matter of tradition. Traditionally the middle class have been the savers in the past; as a matter of moral principle and because the metaphorical rainy day was always present in their minds. In the past the weekly wage-earner usually had nothing to spare and it was all that he and his wife could do to get from one weekly pay day to the next. The well-to-do nearly always had many obligations and sometimes also quite expensive tastes, so that he found means of spending his money even before the tax-gatherer solved that problem for him and created a new one. Now it is the salaried man who is living from hand to mouth and the money is in the hands of people whose horizon is bounded by their next pay day and who through no fault of their own usually have no tradition behind them to induce them to save. Increased rates of interest appeal to them less than might be expected, because they are not naturally interest-conscious, and although the premium bond has attracted considerable support it does not seem to have taken away any business from the football pools. Making provision for the future rainy day holds little appeal to anyone who knows that there is a welfare man waiting to hold a nice big umbrella over him whenever he needs it; and, thanks to hire purchase, PAYE has come to mean not only pay as you earn but also pay as you enjoy.

SAVINGS

We should like the potential savers of today to make more use of the services of the banks but they have never been much accustomed to doing so, and it would seem that the Government would prefer that they did not acquire the habit. That at least must be presumed to be their motive in refusing to extend to depositors in the banks the exemption from income tax of the first £15 of annual interest on deposits in the Post Office and Trustee Savings Banks. It is true that, from the point of view of curbing inflation, it is better that the Government, if they must borrow, should borrow directly from the citizen rather than indirectly through the banks, but I believe that there will always remain a residue of depositors who prefer dealing with a bank, and if it is right to make special concessions of this kind (which I doubt) it seems a pity to discourage any possible source of savings when the accumulation of capital is so badly needed in the national interest.

Much is done today to dissipate the nation's savings as well as to discourage their accumulation. Innumerable people are forced by inflation to live on their capital but the most notorious and long-standing instance of this dissipation is the dissaving involved in the exaction of an annual capital levy on a part of the population in the form of death duties. Leaving aside any political prejudice about inherited wealth and unearned income, taxes which have to be paid out of capital are inherently unsound because they are a drain on the nation's savings and the capital realised has to be replaced by new savings from some other source.

COMPETITION FOR MONEY

There is today an increasing tendency for organisations other than the Government to take deposits or loans directly from private individuals and companies instead of from the banks. Local authorities frequently finance themselves by this means and even borrow from one another, and other financial institutions such as hire purchase companies advertise freely for deposits, sometimes offering rates of interest which seem unnecessarily high for short term investments if they are of good quality. This raises an important question: whether the banks should attempt to resist this tendency by offering higher rates for money, or even, in the case of hire purchase, by taking a direct interest in the business themselves. To offer higher rates would in any case be futile, in my opinion. There is no sense in the banks' competing for money at rates which make it impossible in present conditions to employ it profitably, and whatever rates we offer, our rivals outside will always bid, like Chu Chin Chow, one dinar more for what they need; in some cases apparently several dinars.

The alternative may be that the banks must face a gradual diminution of their deposits and a change-over to more exclusive dependence on their current account balances for the raw material of their business, a trend which was already apparent during the long period of 2 per cent Bank Rate between 1932 and 1951. Although there may be attractions to the official mind in having as much as possible of the loose money in the private sector of the economy channelled through the banks, through a bottleneck where it can be controlled with the minimum of effort, I feel that we should not accept that view without the closest scrutiny of all its implications.

HIRE PURCHASE FINANCE

The banks have done satisfactory business as lenders to hire purchase companies in the past, but if these companies are going straight to the market it may be better that they should finance themselves entirely independently, and be subjected directly to whatever restrictions may be necessary. They would then rely on the banks only for very temporary accommodation in an emergency, thus conforming to the traditional method of the building societies, with whose business theirs has much in common. A banker must always put the quality of his business first, and must never be tempted to reduce his standards in order to increase his profits or maintain his turnover. *Corruptio optimi pessima.*

AN EVENTFUL YEAR

From a trading and financial point of view 1957 has been a year of fluctuating fortunes. After the debacle of Suez almost anything might have happened. The country mobilised its reserves and metaphorically held its breath. In fact our overseas trade recovered from the shock and dislocation with remarkable rapidity and financially, if not politically, confidence in the Government quickly began to be restored; so much so that in the early months of the year they were able to carry out extensive funding by means of sales of their own securities through the market. They also made a new issue of £300 million very long-dated funding stock, but it is unlikely that much of this was taken by the public at the time and its main purpose was probably to restock the shelves which had been so satisfactorily lightened. Bank Rate had been reduced from 5½ per cent to 5 per cent early in February and in June the repayment of £400 million of stocks then maturing involved a new issue of only £100 million. There was an even more satisfactory manifestation of successful management in the autumn, when a maturity of £500 million was met without the issue of any further stock.

MONETARY AND CREDIT SYSTEM

Mr Thorneycroft announced in the course of his Budget speech in April, that he proposed to appoint a Committee to enquire into the working of the monetary and credit system and to make recommendations. The banks welcome the opportunity of making their contribution towards the evidence on which this advice will be based. It will be noted that the terms of reference are not limited to a report on inflation, but, just as in 1931 the Macmillan Committee reported in the context of deflation and heavy unemployment, so the present enquiry is operating, at any rate at this stage, in the context of overfull employment and inflation. When a Greek dramatist had got himself and his plot into a hopeless tangle it was his habit to have recourse to a device later known as the *deus ex machina*, whose function it was to sweep away the difficulties with a few miraculous strokes. The Chairman of this Committee, Lord Radcliffe, has been asked, not for the first time in his distinguished career, to play the part of the god from the machine. Perhaps the Government had hoped to use the Committee as a stalking horse, from the cover of which they might take action against inflation, and if necessary to treat it as a scapegoat when their actions made them unpopular. If so, they have been disappointed, because the rapid development of the exchange crisis during the past summer has forced them to take action on their own responsibility and it may be that, before the Committee is able to report, the background will have changed.

WAGES AND PRICES

When people discuss the causes of the present inflation they are apt to put much of the blame on the Trade Unions for constantly forcing up wages beyond the point which can be justified by increased production or increased prices. Published statistics show that between 1951 and 1957 (the twelve months ending October in each year) retail prices went up by 32 per cent, wages by no less than 44 per cent and production by only 18 per cent. On these facts wages have well outstripped prices, and production still has a long way to go before any further claims can be justified on that ground. Trade Union leaders are nothing if not realistic, and if they see profits falling it may well be that they will come to the conclusion that the time has arrived to consolidate these very impressive gains and to allow future increases in production to be reflected in reduced prices instead of in increased costs. This would enable those living on fixed incomes to participate in the benefit and would seem to be more in keeping with the Socialist doctrine of fair shares for all. It is interesting to notice that in the last few weeks the Government have adopted this idea and seem to have quietly abandoned their earlier doctrine of wage increases being related to an increased productivity which did not always get beyond promises.

To my mind it is not very sensible to blame the Unions for making these repeated claims. Owing to inflation, the demand for labour has for years past almost continuously exceeded the supply. The Union leaders, being realistic men and remembering how their members suffered when contrary conditions prevailed in the period between the wars, are only following an old capitalist principle, now discredited, of taking full advantage of a market shortage. Naturally they have presented a continuous series of demands, the end of one round merging into the beginning of the next. To be sure each separate claim seems right and proper to those who make it; even if an all-round advance is not justified, everyone honestly (I think that may be the right word) believes that his own case is in some way exceptional. The country bus drivers recently made a complaint that they ought not to be paid thirty shillings a week less than the London drivers. That certainly seemed reasonable enough, and they were granted an increase of eleven shillings. Immediately the London drivers murmured because their differential had been reduced. How very logical, and yet how utterly ridiculous. Special pleadings and misunderstandings are not confined to wage claims. It is just possible that unprejudiced observers do not see as clearly as our staffs and we ourselves do that it has been right to make very substantial increases in bank salaries in recent years.

Up to now employers have been in a difficult position in resisting demands which they have felt to be unreasonable. Apart from the fact that they are almost bound to follow when the Government and the nationalised industries lead the way, they cannot afford to lose key men, or indeed any kind of labour, when their order books are full, which is the usual state of affairs in an inflated economy. And when goods can be sold without any trouble, even at increased prices, at least on the home market, there is not sufficient incentive to apply the maximum efficiency in production. In a sellers' market increased wages or restrictive practices do not necessarily hamper the employer, because he can increase his selling price; they may even serve to increase his profits, just as under a cost-plus system inefficiency adds to the cost and therefore to the "plus."

STERLING SPECULATORS

Although there has been continued inflation at home, our exports have continued to increase and the balance of trade, including the invisibles, has remained favourable. In spite of Suez, there was a realised trading surplus of £125 million in the first six months of 1957 and it appears likely that a further surplus was earned in the second six months. Why, in the face of these favourable influences, did international traders and speculators decide in August that the pound was doomed to devaluation? It is true that the persistent weakness of the Government in facing inflation had made a very bad impression abroad, but there was nothing new in that and I believe that the actions of international operators at this particular time may be attributed to a curious aftermath of Suez. That unhappy incident, which we would all like to forget, and which has been strangely forgotten in the stress of subsequent events, had one outstanding result in the political field, which was to unite Great Britain and France in not very splendid isolation. Politically for a time we had to stand or fall together. It would seem that many people abroad assumed that we were equally involved in a common fate economically, which did not follow at all. It is not just a fanciful idea that this assumption was made. It was asserted categorically to me (not by bankers) both in Germany and Italy during the month of August.

In some respects France is stronger economically than Great Britain; she can, for example, very nearly feed herself, whereas we have to import 50 per cent of our food. France, moreover, does not conduct the most important international money market in the world, which involves such great responsibilities as well as advantages. But against this France has been for years past spending blood and treasure in trying to defend her overseas

possessions, and weakened by this draining of her wealth the franc was unable to withstand the sudden recrudescence of Germany as a powerful creditor nation. The belief that the mark would be upgraded in value, and the franc downgraded, gave ample scope for speculative exchange operations, and it was perhaps not unnatural that the operators overlooked or ignored our relatively favourable trading position which amply justified our authorities in using our reserves freely to meet the crisis. The insufficiency of these reserves is often emphasised. Apart from having to protect sterling against periodical attacks from operators who are mere speculators, they are used to iron out fluctuations in the vast mass of international trade financed in sterling, which is estimated to be in the region of £60 million a day.

When international traders are apprehensive about the value of our currency those who are receiving sterling sell it as soon as they can; on the other hand those who have payments to make in sterling find any pretext they can for postponing them. These "leads and lags," as they are called in financial circles, can exercise great pressure on our reserves. Against the vast mass of trade financed in sterling must be set the total of our first line reserves, $2,273 million; the equivalent of thirteen days' trading only. Even this is twice as much relatively as we held in reserve in gold before the first war and then there was never any question about the value of our own or any other leading currency. However, with our present liabilities, it is essential to increase these reserves, even at the expense of curtailing for a time our new investment overseas.

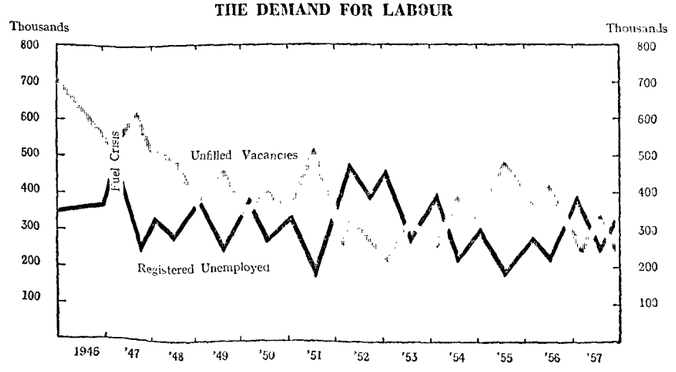
MR THORNEYCROFT'S PRONOUNCEMENT

After the *de facto*, though not *de jure*, devaluation of the franc in August, the speculative pressure on the pound became intensified and in September the then Chancellor found it necessary to make a pronouncement of his determination to bring inflation at last to a halt and not to entertain any adjustment of the parities of sterling. This pronouncement was accompanied by a statement of policy regarding proposed Government expenditure during 1958 and 1959 and by yet another request to the banks regarding the level of their advances; and his words on these subjects were accompanied by a resounding explosion in Threadneedle Street, Bank Rate being increased from 5 per cent to the almost unprecedented level of 7 per cent. What a change in three short months! For at least two years past the Government have been bombarded by business men with the advice that they should at any cost cut their own expenditure. Unsolicited advice is seldom welcomed, least of all when it is unpalatable, and this case was no exception. Now they have suddenly discovered that the advice was sound, as if by divine revelation; possibly the *deus ex machina* getting to work behind the scenes.

The Chancellor was accused of declaring war on the Trade Unions by deliberately inducing unemployment, but there does not seem to be much prospect of deflation and therefore of reduced employment in what he proposed to do in regard to the expenditure for which he was responsible; nor indeed in what he asked the banks to do about their advances. As for the capital expenditure of central and local government and of the nationalised industries, all that the Chancellor promised was not to allow more expenditure in either 1958 or in 1959 than was spent in 1957; in other words, not to add any more fuel to the fires of inflation as (although it is almost incredible) he had apparently intended to do. A mere holding operation can hardly be regarded as a positive contribution towards solving the problem. On current account the Government's civil and defence expenditure would, he said, be limited, which might have meant anything, and did in fact apparently carry a stricter interpretation in the mouth of Mr Thorneycroft than in the minds of his colleagues in the Cabinet. He did not, in his statement, mention the cost of servicing the national debt, which is bound to be increased with dearer money, and the worst feature of this is that a larger amount of interest has to be paid to overseas holders of certain sterling investments, which increases the strain on our balance of payments.

BANK ADVANCES

The banks, for their part, were told that they must keep their advances in the succeeding twelve months within their level for the twelve months to September last, which they can hardly do if prices rise, but which will happen in the natural course of events if prices continue to fall and industrial activity is reduced; indeed in that event they are likely to fall. All this reads to me like nothing much more drastic than a revival of the doctrine of the Macmillan plateau, which was successfully maintained from April, 1956, until it collapsed in the Suez crisis in the following autumn; and this produced no unemployment problem. There is a sensitive barometer of the labour market in the relationship between unfilled vacancies and registered unemployed, although it undoubtedly understates the real demand.* I have brought up to date the chart of the fluctuations in this relationship which I published two years ago.



BANK RATE

There remains the question of the effects of the 7 per cent Bank Rate, both external and internal, in so far as they can be distinguished from the effects of the measures as a whole. The external and internal effects are separate, though they interact upon one another. Traditionally a high rate encourages lending and discourages borrowing by foreigners on the London market, and thus serves to correct a disequilibrium on the exchanges. While the latter consideration holds good today, the former cannot make much headway if confidence is lacking. There was a distinct risk that the rise might have been regarded as a sign of desperation, which would have increased the apprehensions of our well-wishers abroad and have whetted the appetites of those who have hoped to make money out of our discomfiture. For better or worse the reaction on the exchanges was likely to be seen immediately, and happily there was in fact a gradual recovery in the value of the pound throughout the first month to above the middle point of $2.80. During the month of October the authorities were able to recover some gold and dollars over the exchanges, but only enough to settle the September deficit in the European Payments Union. On the figures of "leads and lags" which I have given above, this gain represented the equivalent of less than one day's sterling trade, which suggests that those who were "taking a view" decided at that stage to take in some sail but not yet to change course. It may well be that they were waiting to see whether at last the Government would match its brave words with brave deeds. Like the pieman in his dealings with Simple Simon, they were not doing any business on trust. "Show me first your penny." The outcome of November was again satisfactory but by no means spectacular, as it might have been if the outright speculators had decided to cut their losses, and the December result was of the same order. However, confidence has gradually increased, and on the last day of the year the rate touched $2.81 for the first time since May, 1956.

REACTIONS ON BUSINESS ACTIVITY

At home the reactions are always bound to be much slower. There is likely to be an immediate fall in the market prices of fixed interest-bearing securities, and the psychological effect of this may be considerable, especially if the fall is extended to equities as it was on this occasion. Just as when prices are booming people feel rich and are inclined to spend money, so when prices are falling they feel poorer and draw in their horns. There is a large psychological element both in booms and slumps. The reactions on business activity are much more gradual. When orders are given to manufacturers they take weeks or months to fulfil, and it is seldom desirable or even possible to bring capital expenditure to a premature halt even though it would not have been started in the changed conditions. If dear money becomes effective on the home front the result will be that a manufacturer will receive fewer orders and will then himself order less raw material and this will cause him voluntarily to borrow less money from his bank; he will certainly postpone any plan for enlarging his factory which he had been considering in order to meet an expanding market. There have already, during the past year, been signs of lessening activity in the building industry, which is always quick to react to a change in the economic climate. External circumstances also have lately become conducive to a change of outlook in business. There has been a considerable fall in the price of a number of raw materials, especially metals, and this in itself should be reflected in the value of manufacturers' stocks and in the amount of money required to finance a given volume of output. Lower prices should eventually penetrate to the retail trade which would help to release the pressure of inflation in this country and the whole community would then reap the benefit. A fall in prices, if carried too far, would have awkward repercussions on the producers of raw materials and on the economies of the countries from which they come, and at home it would mean that the confidence of business men in continued prosperity would be shaken and industrial activity would be lowered.

THE DEMAND FOR LABOUR

* Barclays Bank, for instance, engages over 1,000 new staff every year, but does not register those vacancies at the Employment Exchanges.

MR THORNEYCROFT'S RESIGNATION

I must finally refer to the resignation of Mr Thorneycroft on a point of principle regarding the estimates of current expenditure for 1958-59, and I do so perforce within twenty-four hours of the astonishing announcement. I find the cause of the quarrel most disturbing. To try to pass off an increase of £50 million in the estimates as being "only a little one" really will not do. Little babies have a way of growing into ugly old men. An increase in the current estimates could surely have been offset by a decrease, instead of a mere holding operation, in the estimates for capital expenditure. The immediate effect on the economy of the expenditure by the Government of £50 million is no different, whether the money is used to make welfare payments on current account or to build schools or power stations on capital account. But in any one year the latter can be reduced by mere postponement, whereas the former cannot. Surely a compromise could have been reached on these lines. But if certain of his colleagues, supported by the Prime Minister, forced the issue by refusing their co-operation, then I would say that Mr Thorneycroft was right to resign and I commend his courage in doing so. Nevertheless, it is a sorry commentary on the manner in which our affairs are conducted.

CHELTENHAM AND GLOUCESTER BUILDING SOCIETY

The Cheltenham and Gloucester Building Society report a satisfactory year.

Assets now amount to £30,274,000, being an increase of £1,603,000. After deducting withdrawals, and allowing for interest added, the total increase in savings in the Society amounted to £1,262,000. A total of £4,410,000 was advanced on mortgage, being an increase of £681,000 over the previous year. It is a source of great satisfaction to the Board that they have been able to increase their loans for house purchase by such a substantial amount during a year when other sources of finance available to would-be home owners have been severely curtailed.

The increase in the Bank rate to 7 per cent resulted in a fall in the market value of the Society's holdings in gilt-edged securities, and the Board have therefore allocated a further £50,000 out of the year's surplus to investment depreciation reserve, bringing this up to £275,000, which more than covers the present market depreciation. All the Society's holdings are in dated stocks which, if held until redemption, will show an ultimate surplus over book value of £172,000.

A further £50,000 has been transferred to General Reserve, and £21,000 carried forward. The total reserves and unappropriated profit now amount to £1,793,000, representing 5.92 per cent of the assets. The Society's liquid assets exceed £4 million, representing 13.4 per cent of the assets.

J. H. FENNER & COMPANY (HOLDINGS) LIMITED

The twenty first ordinary general meeting of this company and subsidiary companies was held on January 13, 1958, at the Queen's Hotel, Leeds. The following extracts are taken from a Joint Statement by Mr C. Bradshaw, FCA, the Chairman, and Mr S. B. Hainsworth, FTI, the Deputy Chairman and Managing Director.

FINANCIAL POSITION

The consolidated net profit of the Group is £449,593 compared with £428,096 for the year ended August 31, 1956. After adding the balance brought forward from the last account of £180,654 and the sum of £66,647 being a reserve for taxation no longer required, the sum of £696,894 has been appropriated as follows: Transfer to Mortgage Debenture Stock Sinking Fund £9,607, Provision for Taxation £225,621, Transfer to Taxation Contingencies £30,000, Dividend on Preference Shares £3,953, Dividend on Ordinary Shares £43,125 leaving a balance to carry forward to next year of £384,588.

The Inland Revenue has granted non-distribution relief for Profits Tax. In certain circumstances, however, tax liability may arise and since your company has always followed a conservative financial policy, a reserve of £30,000 has been made to help to meet any such contingency.

The trading results shown are, in the opinion of your Directors, satisfactory, and for your further information we now comment on the activities of your Companies.

J. H. FENNER & COMPANY LIMITED

Taper-Lock.—As forecast in last year's report, we have now transferred most of our Pulley and Taper-Lock manufacturing equipment to Hull. There have been many difficulties and extra expenses involved in connection with this transfer, but we are convinced that the move we have effected to new and adequate premises with room for expansion will be justified in the end. We report that your Board, which has spent more than £1 million in Hull on buildings, plant, and machinery since the end of the war, is giving careful thought to what extent further development in that city should take place.

Taper-Lock sales continue to expand, both in V-Pulleys and chain sprockets, and the bushes are now available in a complete range of millimetre sizes, thus making them suitable for the Western European markets which are expanding.

Torque-Arm Speed Reducers.—In addition to the six double reduction units, we now have six single reduction boxes Nos. 11 to 16, and have two new larger reduction sizes Nos. 7 and 8 on the way. By our sales efforts, and more particularly because of the excellence of design of this shaft-mounted speed reducer itself, we have found a reasonable market for the device. One of its great advantages is that by using a standard unit with the appropriate Taper-Lock V-Belt drive, any speed within quite a wide range can be obtained exactly. Change to another speed can also be made easily, quickly and at minimum expense.

"Hainsworth" Variable Speed Unit.—The demand for this device, the best of all methods of getting variable speed, expands satisfactorily. During the year the design of the belts and the pulleys has been developed still further and, taken together, these have given us an apparatus with a practically nil complaint rate. There are other new products on the way in our Engineering Division and news of them will be released as they become available for the market.

Premium V-Belts.—Our leadership in the V-Belt field (we are the largest producers of V-Belt drives in the Commonwealth) has been maintained by our being the first to introduce to this country Premium V-Belts with certain man-made fibre pulling cords. These new V-Belts, which deal effectively with heat, oil and static electricity conditions are, in our overseas customers' view, as good as anything being produced in the United States, and that, in our business, is praise indeed.

Fenaplast Colliery Conveyor Belting.—Much has been heard of the use of man-made fibres such as nylon in flame-proof colliery conveyor beltings. Whilst these fibres have certain valuable features, they also have some disadvantages, not the least of which is their high price. Your Company is in a particularly favourable position to utilise whatever yarn or fibre proves most effective, due to the basic advantage of the solid woven type of belt construction allowing a free choice in design. In the long run, however, our view is that the key question will be whether or not the unconventional belt constructions give the National Coal Board value for money in terms of cost of coal carried. Our design staff are keenly aware of this fundamental aspect of the work and every yarn and type of belt construction used has accordingly to merit its acceptance. A vigorous large-scale development programme is behind the continued success of our colliery belting.

J. H. FENNER & COMPANY (OVERSEAS) LIMITED

This Company does the overseas selling of the products of the other Companies. Your Managing Director has been in Australia during the year and was glad to have the opportunity of working with long established friends there.

In South Africa the Fenner Department of our Agents, Messrs Reunert & Lenz Limited, continues to make progress and we have received great encouragement from some of the successes they have achieved. For instance, one of the leading mining groups, covering six very large gold fields, has taken the decision to order its entire V-belt requirements from a single supplier. They have contracted with us, they tell us, because of three reasons, (1) the quality of the Fenner product and the superior life it has given, (2) the advantage of large local Fenner stocks, and (3) competent technical assistance we have been able to give their engineers. In India, J. H. Fenner & Company (India) Limited is responsible for sales from our factory there operated in conjunction with A. & F. Harvey Limited. The production from our Indian factory, Fenner Cockill Limited, is coming round satisfactorily, although there have been delays in getting licences for the basic manufacturing materials required. As these overseas manufacturing enterprises grow, so does the Government of India tend to reduce the import licences they are willing to grant for the same products imported from this country.

Fenner Dodge Limited, formed in conjunction with our friends in the United States, the Dodge Manufacturing Corporation of Mishawaka, Indiana, is proceeding with its development of sales in certain markets outside the United Kingdom.

MARTINS BANK LIMITED

STATEMENT BY THE CHAIRMAN SIR A. HAROLD BIBBY, DSO, DL

RESPONSIBILITIES IN WORLD POLITICS

STEPS FOR A STRONG STERLING

The one hundred and twenty-seventh Annual General Meeting of members of Martins Bank Limited will be held at Head Office, Liverpool, on February 12th. In his statement circulated to members, the Chairman, Sir A. Harold Bibby, DSO, DL, writes:

The net profit for the year ended December 31, 1957, is £901,402 which compares with £944,780 in 1956. Higher rates of interest have attracted large sums from current accounts to deposit accounts on which interest is paid, while income from our investments has not increased. General expenses have increased substantially and the result reflects a narrower margin of profit. In the light of all these conditions the Board consider the result as not unsatisfactory.

A final dividend of 7½ per cent, less income tax, is recommended which with the interim dividend of 7½ per cent makes 15 per cent, less income tax, for the year. This is equivalent to, approximately, 18 per cent on the old capital which last year received 17½ per cent, and is in accordance with the forecast.

In March a scheme was passed by the shareholders for the elimination of the callable and reserve liability on the partly paid shares as the result of which the paid-up capital was increased from £4,315,096 to £5,276,425 10s. by the capitalisation of £961,329 10s. from the published reserves of £6,150,000; the published reserve was then brought back to £5,500,000 by transfer of £311,329 10s. from the Bank's contingency fund.

At the same time, opportunity was taken to make the share capital more widely marketable by sub-dividing the shares into a single class of 5s. and this has been generally appreciated.

After providing for the dividend, appropriations of £200,000 have been made to Staff Superannuation Fund and £250,000 to Premises Redemption from published profits.

Total assets as shown in the comparative balance sheet stand at £366,289,158 (1956—£359,044,484) and customers' funds and other accounts at £334,301,681 (1956—£324,455,334).

We have again deemed it wise to continue to maintain a high degree of liquidity throughout the year, our total liquid resources at December 31st being £137,319,136 (1956—£136,866,747) and the ratio of these resources to our deposits is 41.01 per cent compared with 42.11 per cent. It will be observed that the Bank's investments stand at £88,714,641 as compared with £88,507,564 a year ago and continue to be valued at or under market prices. All British Government securities have fixed maturity dates and the majority mature within six years.

CREDIT RESTRICTION

Our advances of £91,487,280 are increased by £5,505,848 compared with a year ago. There has been no relaxation of the credit squeeze during the year but customers have made greater use of the agreed facilities at their disposal and our experience shows that seasonal and other swings have been more pronounced causing quite substantial fluctuations in borrowing. This is, of course, the type of finance which banks should provide as it is directly related to day-to-day and short term requirements rather than to long term borrowing. The banks in adhering to the various official directives have had to decline many proposals which on strictly banking principles they would have liked to implement. This has caused the determined borrower to go outside his normal banking sources, often paying a high rate of interest, but still obtaining the funds he required. The banks must continue to be given flexibility in handling the multitude of applications received for financial assistance whilst endeavouring to carry out the Government's latest instruction that the general level of overdrafts should be held to the average for the year ended September, 1957. They have exercised with considerable skill a cautious and careful assessment of the needs of customers in direct relationship to the national interest in carrying out the requests to curtail credit of successive Chancellors who have on various occasions thanked the banks for their help and co-operation in the fight against inflation.

THE DIRECTORATE

I have to record with deep regret the death of Mr F. A. Bates, MC, AFC, DL, who had served the Bank well for twenty-three years as a Director, of which nine were as Chairman. As Chairman he guided the destinies of the Bank through all the difficult war years with his wise counsel and firm conviction that principles must never be sacrified for expediency. We miss his wealth of experience and charming personality.

Sir John M. Brocklebank, Bart, has been elected a Deputy Chairman. He has already served the Bank as a Director for nine years and his wide knowledge will be more than ever at our disposal.

During the year Mr Morton D. Oliphant, MBE, TD, has joined the General board. He has already proved a most useful member. This appointment will require confirmation at the Annual General Meeting.

We also welcomed to the London board in December Mr P. G. Walker, whose breadth of experience in business affairs will be most valuable.

We wish to congratulate Viscount Mackintosh, our colleague on our London board, on the further honour conferred upon him by Her Majesty the Queen in her birthday honours.

Following Mr E. H. Denman's retirement after forty-five years of distinguished service to the Bank, Mr E. Norman-Butler has been appointed a Joint General Manager and our chief executive in London. Mr R. Davidson has been promoted Assistant General Manager and Mr H. C. Horton has become Overseas Manager.

Mr L. G. Tunnah has taken over the duties of London District General Manager.

Our staff have continued to give their devoted service which we gratefully acknowledge and for which we tender to them our sincere thanks.

During the year steady progress has been made in affording increased facilities to our customers by opening new branches in areas where we were not previously represented.

Many of our other branches have been improved and modernised thus adding to the convenience and comfort of our customers and staff alike.

The research into electronics continues and further progress has been made in mechanisation and reduction of overhead expenses in routine procedure but the increase in general expenses goes on. During the year in common with other banks there have been substantial basic increases in salaries and wages of our staff, and amongst other things, higher maintenance costs and fuel and light bills have had to be met and the full impact of the increased cost of postages is still to be felt.

In the light of the substantial increases in salaries and wages it has become necessary once again to review the position of our Superannuation Fund. The Actuary calculates that there will be a capital deficiency of £400,000 in the Fund and has advised the restoration of this sum at the earliest possible date. The Board are, therefore, recommending an appropriation of £200,000 out of published profits this year and that a similar sum should be provided next year.

NATO AND WORLD PEACE

The year 1957, while not being so fraught with dramatic episodes as 1956, has reflected the consequences of the events of that previous year.

There has been a change of thought, and now happily of direction, across the Atlantic where our American friends are realising the responsibilities attaching to their role in world politics and are finding that the path is not strewn with roses.

The blind faith reposed in the United Nations Organisation is giving way to a more realistic appreciation of its powers and shortcomings and the feeling is gaining ground that more hope should be placed in NATO rather than UNO to maintain world peace.

UNO, with its wholly disproportionate voting rights on the one hand and the veto on the other, seems incapable of performing the international function for which it was designed as the supreme authority whose recommendations would be universally accepted.

In the absence of an adequate international police force, under present and past conditions, the law abiding submit and the criminals, although convicted, are not even effectively bound over with the result that some powerful nations become impotent and some weak ones impertinent as the Suez incident demonstrated.

Out of the tangle of diplomatic exchanges over the past year and a half the clear thought emerges that earlier there had not been the full understanding and confidence in one another that should exist between ourselves and our friends across the Atlantic and that no real effort had been made on either side to present the facts which alone could bring mutual accord. The visit of Her Majesty and Prince Philip followed by the Prime Minister and Foreign Secretary to the United States has, however, been of immense value in leading to a better understanding between the two great English-speaking nations.

New-born nations are realising that complete independence, which has become almost a religious faith, has disadvantages as well as nationalistic blessings and are appreciating the advantages and security of the Commonwealth fold.

CONFIDENCE IN STERLING

The battle for the stability of the pound is slowly being won but some time must elapse before full consolidation of the recaptured ground can be assured.

The paramount importance of restoring world confidence in the pound is recognised by everyone irrespective of their political creed.

The Government is to be congratulated upon the strength of its measures to control inflation. The use of such a high Bank Rate as 7 per cent is exceptionally severe but has been justified. Nevertheless, it should continue until such time as the green light is clearly seen and this we hope will not be long delayed as such a high rate is not good for business.

It is only through strong action here that the world at large can be convinced beyond doubt that we in this country are determined to live within our income. Only then will full confidence in sterling return and the free international foreign exchange markets, a necessity for international trade, eliminate the heavy speculative movements that have characterised dealings in sterling in recent years.

How are we to demonstrate to the world that we are determined, no matter how painful and inconvenient the process may be, that we will put our own house in order by living within our income?

The Government, the Nationalised Industries and the Local Authorities must set a good example by practising what Ministers so freely preach by drastically cutting their own expenditure. The budget must be balanced both above and below the line by a reduction in expenditure which will also permit a substantial reduction in the heavy burden of taxation. This is a prerequisite to any real recovery and stability.

It is now generally agreed that only increased production can support an increased standard of living in which not only the wage earners but also the whole population of the country must share.

Till now. so many have approved, if not applauded, each individual rise in wages, salaries and remuneration generally and then thrown up their hands in dismay at the logical and inevitable consequence of rising prices.

Each advance without pre-demonstrated proof of increased production, we all know, adds up to further inflation and an automatic rise in the cost of living, both of which all wholeheartedly condemn.

Gestures, paid in advance, are useless. Any advance to higher pay must first be earned and not exchanged for a promise of higher output which more often than not is never fulfilled. It is therefore sincerely to be hoped that the country will not be faced with serious industrial disruption by reason of the pursuit of ill-advised wages claims.

REAL SAVINGS A NECESSITY

The fundamental and inescapable facts remain that increased expenditure on capital investment can only be financed out of real savings and that increased expenditure on consumer goods can only be justified by greatly increased national production, facts which are accepted in communist and capitalist countries alike.

When applying these truths to smaller units such as our own personal and domestic expenditure or to our own businesses it is at once recognised that if we are to remain solvent we must not spend more than we earn. When precisely this same problem is translated into the larger spheres of national and municipal finance, these elementary truths get lost sight of in a haze of argument in which every advocate tries to make a case for his own pet point.

There is a crying need for increased capital expenditure in almost every field of industry and in public works, but this must be limited to the nation's actual and real savings.

There is only one sort of saving. It is the sum of private and industrial earnings in excess of the sum of private and industrial spending and government expenditure on current account.

There is the simple choice whether such savings, from which alone capital investment can be made, shall be made by individuals and industry ploughing back its profits or by forced savings through taxation by the government in power.

To get the former there must not only be an incentive to save but a new attitude towards the saver.

Till our penal rates of taxation are reduced a strong inflationary influence will remain; there will be less inducement to save and less than adequate savings.

To many the saver who accumulates the new capital so essential for expansion is looked upon as a greedy, almost reprehensible, person who should be taxed out of existence during his life and his property confiscated by duties on his death. In fact, he or the industry that saves and ploughs back those savings is the provider of the wherewithal which enables thousands upon thousands of others to earn a good living.

In default of the private and industrial saver, if there are to be savings and further expansion at all, there is only the State with compulsory savings through heavy taxation with all its disincentives and frustration.

If the State takes on the role of compulsory saver to acquire and finance the means of production, it inevitably means rigid control, licences for everything, for imports and exports and, sooner or later, the control and direction of labour as well as of capital, in fact a communist or near communist state.

Those who amiably smile on the elimination of private enterprise would be horrified when they realise that it leads ultimately to the loss of freedom of choice in their employment and to compulsory transfer from one industry and area to another.

The signposts are clearly marked, and it is well that all realise where each road leads and that we choose aright.

THE FREE TRADE AREA

The prospect of the Free Trade Area will entail a sharpening of our competitive ability with the industries within that area if we are to maintain our share of the trade with the member countries and increase our export trade through a larger and wider market.

Here is the chance of a free market of two hundred and fifty million people with all the prospects of increased trade, continued full employment and rising standards of living provided that all the out-dated restrictions of employers and employees alike are swept away and the taxation structure overhauled

MARTINS BANK LIMITED

STATEMENT OF ACCOUNTS, December 31, 1957

LIABILITIES

Capital paid up	£5,276,425
Reserve Fund	5,500,000
Current, deposit and other accounts (including Profit and Loss Account)	334,822,165
Acceptances and engagements on account of customers	20,690,568
	£366,289,158

ASSETS

Cash in hand and at Bank of England	£32,009,163
Balances with, and cheques in course of collection on, other banks in the British Isles	22,631,573
Money at call and at short notice	29,538,000
Balances with banks abroad	428,967

HEAD OFFICE: WATER STREET, LIVERPOOL, 2

to give the adventurous and enterprising the requisite incentives to make the taking of inherent risks at least a worth-while proposition.

Many doubts have been expressed as to the advisability of joining this Free Trade Area, but whatever the disadvantages may be of joining, the disadvantages of not joining are overwhelming as we would shut ourselves out of this enormous market and have to rely on a highly protected and shrunken home market as the springboard for our export trade.

The smaller turnover would mean higher manufacturing costs which might well disqualify us from our export trade however preferential some of that might be.

With our industrial know-how, with our brilliant scientific and engineering achievements and the inherent good sense of the people of this island, there is a great and promising future ahead, but it calls for determination, unselfish co-operation and a realisation that we can only have what in fact we earn in the world markets.

May it be that we face up to the position now rather than wait till our backs are forced against the wall when our fight to regain prosperity would be more difficult and more prolonged.

JOHN SUMMERS & SONS LIMITED

BETTER RESULTS DESPITE DECREASED DEMAND

HOME MARKET AFFECTED BY RESTRICTIONS

WORKS FULLY EMPLOYED

MR RICHARD F. SUMMERS ON STEEL NATIONALISATION

The annual general meeting of John Summers & Sons Limited will be held on February 5th at The Iron & Steel Institute, 4 Grosvenor Gardens, London, S.W.

The following is the statement of the chairman, Mr Richard F. Summers, circulated with the report and accounts for the 52 weeks ended September 28, 1957:

Following my practice of previous years I do not propose to devote much time to the Balance Sheet as I feel that it is in itself largely self-explanatory, and the main points of interest are dealt with in the Directors' Report. I would, however, like to refer to the somewhat better results which we have been able to achieve in spite of the fact that in the early part of the Company's financial year there was a very decided falling off in the demand for our steel in the home market. This was due in large measure to the tightening up by the Government of credit arrangements, and the restriction on the importation of motor cars into some of the Dominions. Thanks to the energy of our Sales organisation, and to the fact that we were able to obtain from the Board of Trade greater freedom in the export licensing arrangements we were able to avoid any short time working. Our long established practice of selling our products in as wide a field as possible also contributed to our ability to keep our works fully employed.

PRODUCTION

The changed conditions did, however, have some adverse effect, and it is gratifying that we were able to improve on our last year's production figures, as is shown in the table set out below, and in spite of these difficulties, increased wages and the rise in the cost of certain raw materials and services, achieve somewhat better trading results.

PRODUCTION FROM SHOTTON AND SHELTON WORKS COMBINED

	This Year	Last Year
	Tons	Tons
Coke	1,142.247	1,078,081
Pig Iron ...	987,239	854,717
Steel Ingots ...	1,292,521	1,208,714

There was a corresponding increase in the total delivery of sheets.

DIVIDEND

I feel sure that shareholders will be pleased at the recommended increase in dividend. In arriving at our decision we had a number of factors to consider, not the least of which was the large amount of capital expenditure to which we are committed, but, as I have said in the past, we are not unmindful of the very natural desire of our shareholders to participate in the increased efficiency and prosperity of the undertaking, and we felt that notwithstanding what has still to be done sufficient progress has been made to justify us in recommending this increase; at the same time we deemed it prudent to retain in the business for future developments a very considerable sum comparable to that put aside in the previous year.

CAPITAL

The other item in the Balance Sheet upon which I should like to comment briefly is the increase in the Ordinary Capital. You will recollect that in May 4,500,000 Ordinary Shares were offered to shareholders at par. We were glad to be able to give our shareholders the opportunity of securing additional shares on these favourable terms. That it was appreciated was borne out by the fact that all but 49,148 shares were taken up under original Allotment Letters.

DEVELOPMENT

We are pressing on with the scheme announced two years ago which is designed to increase steel output at the Shotton works to between 1,600,000 and 1,700,000 ingot tons per annum. The main features of the plan are modifications to our existing steel furnaces, additions to our sinter plant, and a complete modernisation of the hot strip mill, which will more than double its capacity. A very considerable addition is being made to the finishing and despatch departments in order to enable us to cope with the increased output Unfortunately a number of our Contractors are very much behind with their deliveries, and I am afraid that the date on which this new plant will come into operation cannot be before the latter part of 1959. We are, however, satisfied that so far we have no need to revise our estimate of the cost of this plant. In the meantime we shall make every endeavour to keep our existing plant running efficiently, and wherever possible at a higher rate of production.

AGREEMENT WITH STEWARTS AND LLOYDS LIMITED

Some of you may have seen the announcement in the Press that we have entered into an agreement with Messrs Stewarts and Lloyds to supply them with hot rolled strip, which they in turn will make into tubes, very largely for consumption in the oil industry. They are going to erect this tube plant on a site adjacent to our works at Shotton, and it is expected that work on the project will start almost immediately.

This agreement will necessitate increasing the steel production figure which I have mentioned by about 4,000 tons a week, which would bring the annual output at Shotton to nearly 2 million tons. We are satisfied that the modifications which are being carried out to the open hearth furnaces will enable us to produce this extra tonnage. The increase in steel output will of course call for more pig iron from our blast furnaces, and in order to provide this it will be necessary to improve the burden on the furnaces, which will have to be achieved by better ore preparation and by the introduction of yet more sinter plant capacity. The cost of this new equipment is likely to be in the neighbourhood of £3,250,000.

STELVETITE

Last year I referred to the success we had had with our electrolytically coated sheets sold under the name of Zintec, and our tightly coated galvanised sheets sold under the name of Galvatite. I also mentioned the fact that we were working on further types of coating, and you may have seen the announcement in the Press of our new product which is known as Stelvetite. This is a steel sheet coated with a plastic material, which we have developed in conjunction with BX Plastics Limited. It can be supplied in a variety of finishes and colours, and can be welded, pressed, and formed in a great variety of ways. The material has passed its experimental stage, and we are satisfied that we now have sufficient experience to put it into commercial production in the near future. It has aroused very great interest, many thousands of inquiries having been received since our initial announcement. We believe that in due time its application may cover a very wide field

MARKET PROSPECTS

There has been a considerable amount of talk as to what effect the restrictions on credit are likely to have on the steel industry, and the belief is generally held that in some quarters at any rate the very high pressure

to which we have been subjected for the last few years may be somewhat reduced. As far as the flat product side of the industry is concerned the demand is still very brisk, and it is once more a question of having to turn away orders. Naturally we are constantly trying to assess the future trend of demand, and at present we see no reason to expect any marked change. I would, however, add that if there were further restrictions on credit, hire purchase, etc., these might well have an adverse effect on the demand for consumer goods, which would in due course be reflected in a slackening in demand for steel sheets. In 1957 there was a substantial increase in the tonnage of cold reduced sheets produced by the three strip mills in the country. Until the expansion schemes on which these Companies are now engaged are completed it seems likely that a marginal tonnage of sheets will have to be imported so long as demand is maintained at the present level. If there were any falling off in demand presumably these imports would be reduced.

One of the results of the easing of pressure on the strip mills in the early part of the year was that some customers who had previously used sheets rolled on the hand mills were enabled to change over to strip mill sheets. This had an adverse effect on our subsidiary, Burnell & Company, Limited, who operate hand mills, and the management there deserve considerable credit for the fact that in spite of this they were able to keep the plant operating fully.

SHELTON IRON AND STEEL LIMITED

This Company has had a very successful year, and has once more made a useful contribution to the Group results. Whilst the site is somewhat cramped, and much of the plant is old, great ingenuity has been displayed in adapting it to modern requirements, and the whole works has been most efficiently run and maintained. The new sinter plant which is being installed will increase the efficiency and output of the blast furnaces. A very interesting development at these works is the installation of a new electric generator driven by a gas turbine. Whilst the outlook for the future demand for sections and joists is not as bright as that for sheets and plates, the management at the Shelton works are confident that they will be able to maintain their fair share of whatever business is going.

PENSION SCHEMES

For some time past we have been considering the question of providing pensions for our works employees; I am glad to be able to tell you that the Board have now introduced a scheme which will come into operation on April 1st next. Basically it is a non-contributory Pension and Life Assurance scheme, but it contains provisions to enable those who wish, by making personal contributions, to acquire either a higher pension or lump sum on retirement or prior death, or a combination of the two. Whilst the cost of this scheme will be substantial, the Board feel that it will further enhance the very cordial relations which exist between the Management and the men employed in the Group, and I know you will be glad to hear that it has been very well received by all concerned.

At the same time as we introduced this scheme we modified the one which has been in existence for several years for staff employees, to bring it more into line with modern conditions, and to give improved pensions to those who have had long service with the Company. These increased benefits are being provided without requiring any further contributions from the members, and here again the alterations have been received with much satisfaction.

NATIONALISATION

One had hoped that the steel industry might have been freed from political interference, but you will have seen from the statements made by the Socialists that if returned to power it would be their intention once more to subject this great and progressive industry to further political controversy. It is difficult to think of any potent argument as to why it would be more efficient if renationalised, or what benefits would accrue to the nation, or to those who are employed in the industry. It is misleading to compare the steel trade with those other industries which are at present nationalised. They are quite different in character. In most instances the present nationalised undertakings are providing services almost entirely within the the British Isles, whereas the steel trade is a commercial and trading organisation, making a very large variety of products ranging from large castings weighing hundreds of tons to things like hypodermic needles. Steel is used in a very large number of industries, and apart from its direct export a high percentage of the total exports of the country contain at least some portion of steel. These exports go all over the world, and have to be sold in competition with other countries.

The success of the British steel industry both at home and in the overseas markets has been largely due to the initiative and foresight of those who have built it up under private enterprise. They have been free from bureaucratic control, and in a position to take advantage of every situation and make quick decisions when necessary. For many years there has been a large measure of agreement and mutual respect between those who have controlled the destinies of the steel trade and the leaders of the main Unions in the industry. Both have displayed qualities of leadership and sound judgment, with the result that it has prospered, progressed and expanded as fast as, if not faster than, many others. Very great expansion in capacity has taken place in the last ten years; techniques have improved, so has the quality of the products. At the same time the conditions for the men working in the industry have been immeasurably improved. In many cases their tasks have been lightened, and much of the very heavy manual effort required in the past has disappeared altogether. Their remuneration and other benefits have increased, and their security has never been more assured than at the present time.

PROGRESSIVE AND EFFICIENT INDUSTRY

There are many other arguments that could be put forward against the re-nationalisation of the steel industry, but they have been quoted so often that it might be wearisome if I were to repeat them here. I must, however, say that in my opinion considerable harm could be done to the country and the industry by further political disruption. What has already been said has created a great deal of uncertainty; it has made the raising of money by Steel Companies more difficult and unnecessarily costly, and has also had a very depressing effect on the value of steel shares on the Stock Market. Since they were returned to private ownership all the large Companies have spent many millions on expanding and improving their plant, in considerable measure out of moneys set aside by means of Depreciation and transfers to Reserve. The shareholders are entitled one day to reap the benefit from the greatly increased value of their property.

If a Socialist Government should be returned at the next election I would most sincerely hope that they would think very carefully before subjecting this great industry, which has contributed so much to the progress of the nation, to further upheaval and interference. No one can accuse the steel trade of being unpatriotic or narrow minded; it is a happy, progressive and efficient industry, anxious to play its full part in the economy of the nation. Those who say that it is so important that it must be controlled, have their answer in the fact that this is already being done through the medium of the Iron and Steel Board, who have sufficient powers under their constitution to see that everything is done in the best interests of the nation.

TRIBUTE TO EMPLOYEES

In conclusion I should like once more to pay tribute to all the employees of the Company who by their efforts have assisted in its continued progress and development. Much lies ahead to be done, but I know that we have a loyal and efficient team, and that we can, by hard work and co-operation, surmount our difficulties and achieve our objectives.

ALFRED CASE & COMPANY LIMITED

(Non-ferrous Rolled Metal Manufacturers)

The twentieth annual general meeting of Alfred Case & Company Limited was held on January 9th in Birmingham, Mr K. E. West (chairman and managing director) presiding.

The following is his circulated statement:

In my remarks to you on the Accounts to September 30, 1956, I referred to the considerable fluctuations in the prices of our raw materials. During the past year the price of Copper has continued to fall and, in fact, during the trading year under review Copper moved from £292 10s. per ton to £191 per ton. Our profits have been adversely affected by this fall. We are also aware that we are in a far more competitive trading phase. The previous high prices of Copper created substitution of other materials by the consumer. It will be helpful to us if the future price of Copper can be stabilised in the lower range. Firstly, it will encourage consumers to revert to the use of Brass instead of the substitute materials, since some of these alternatives are now much more expensive than the Copper Alloys. Secondly, it will enable us to release some of our funds, which can then be used for capital investment.

Having regard to these difficulties the Directors are of the opinion that the results of the past year's trading are reasonable. After providing for Taxation and for the proposed Dividend of 25 per cent the sum of £13,380 has been added to the carry forward balance in the Profit and Loss Account.

We are continuing our policy of capital outlay for the modernisation of our existing plant in order to keep the Company up to date with competitive productive methods.

It gives me great pleasure again to report that the relations between the Company and its employees continue to be excellent and I thank them all, Management, Staff and Operatives, for their loyalty to the Company throughout the past year

The report was adopted.

WILLIAMS DEACON'S BANK LIMITED

DIFFICULTIES AND PROBLEMS OF 1957

PROGRESS TOWARDS REALISATION OF FREE TRADE AREA

SIR ERIC A. CARPENTER ON INTERNATIONAL AFFAIRS

The Annual General Meeting of Williams Deacon's Bank Limited will be held in Manchester on Thursday, February 13, 1958. The following is the statement by the chairman, Sir Eric A. Carpenter, OBE, on the report and accounts for the year ended December 31, 1957 :

You will see from the Report in your hands that, in November, the Board suffered a great loss by the death of Sir Kenneth Crossley. Sir Kenneth served the Bank continuously as a Director for the long period of 40 years. He will always be remembered by his colleagues for his sound practical approach as well as for his great personal charm. In June, Mr Kenneth Murray, who for almost 16 years had rendered distinguished service to the Bank, decided to retire from the Board. We warmly congratulate him on the well merited honour of Knighthood conferred on him by Her Majesty the Queen in the New Year Honours. I would like to record our deep appreciation of the services of both these Directors, whose long experience and sound judgment have been a great source of strength.

In June, Mr J. H. King retired from the post of General Manager of the Bank and was at the same time elected to a seat on the Board, which appointment you will presently be asked to confirm. Mr King held the position of General Manager with great distinction for the past 13 years, and I should like to place on record our great appreciation of the ability and wisdom with which he conducted the affairs of the Bank. I am very pleased indeed that we shall continue to have the benefit of his experience and advice in his capacity as a Director.

To fill the position of General Manager we have appointed Mr A. H. Allman, and I take this opportunity of wishing him every success in his new office in which I assure him of our wholehearted confidence and support.

THE ACCOUNTS

I will first take the Accounts, from which you will see that Deposits stand at £135,941,026, an increase of £656,138.

On the Assets side, the liquid items, namely Cash, Money at Call and Bills Discounted, amount in total to £48,329,130, or 35 per cent of our Deposits.

British Government Securities stand at £34,954,348. The fall in gilt-edged securities continued during the year, and prices touched new low levels, following the increase in Bank Rate in September, though they have improved a little since. We have, however, continued to value our British Government Securities at market price or less.

Advances at £45,910,255 show a reduction of £3,229,889 as compared with December, 1956.

NET PROFIT

Our Net Profit, after making the usual provisions (which include contributions to Staff Pensions and Widows' and Orphans' Funds and appropriations to Contingencies Account) is £389,976, a decrease of £4,272 on the year. With the balance brought forward of £240,815 this gives a total of £630,791 to be dealt with. After transferring £150,000 to Pension Funds we propose to pay dividends at the rate of 8 per cent on the "A" Shares (making 16 per cent for the year) and 6½ per cent on the "B" Shares (making 12½ per cent for the year, the maximum) and to carry forward £285,830. I feel sure you will agree that these results are satisfactory.

With a view to simplifying the capital structure of the Bank, resolutions have been passed to cancel the uncalled liability on the "A" Shares and to convert the "A" Shares and the "B" Shares into a single class of shares of £1 each. A Petition for the confirmation of this re-arrangement of the capital by the High Court will be presented in due course.

NEW BRANCHES

During the year a Branch has been opened at Leicester and the business of the sub-branch at Bretherton has been transferred to Croston Branch. The number of Offices open therefore remains at 220.

Premises have also been acquired at Bristol, Cardiff, Chester, Leeds, Southampton and Warrington, and branches will be opened there as soon as the necessary alterations can be made.

The opening of these new branches is in accordance with our recent policy of widening the area covered by our system, thus enabling us to provide a better service for our customers which I know is greatly appreciated.

A DIFFICULT YEAR

In the wider sphere of international affairs to which I now turn, it has to be said that 1957 has brought a full complement of problems and difficulties. At the outset we were contending with the problems created by the Egyptian seizure of the Suez Canal, an action in respect of which no just settlement has yet been achieved. The year has seen no progress in the reduction of armaments ; on the contrary, progress has only been in the development of more costly and devastating weapons with their attendant drain on the economic resources of all engaged in the race. In such circumstances, our minds are inevitably pre-occupied as to the motives which prompted the launching of the Russian sputniks now circling the earth and all that they seem to portend. It is sad to reflect also that in Cyprus, though violence has subsided, we appear to be no nearer a permanent settlement. The French have increased troubles to contend with in North Africa, Indonesia is more disturbed than ever, and the Middle East enjoys little of the stability it needs to make the progress which the possession of vast oil resources should bring.

Against this rather gloomy background of international stresses and strains it is good to see that the older democracies in Europe are continuing to make progress towards the realisation of the ideals of a common market and a free trade area. It will be a great achievement on the part of the statesmen of Europe if they can bring the necessarily complicated negotiations to a successful conclusion.

It was never clearer that tolerance is the first requirement in human affairs and that passions, whether inflamed by racial or nationalistic emotions or played upon by outside influences for purely disruptive purposes, are the enemies of orderly progress. It is so much easier to destroy than to build.

The year has been a disturbing one in the economic sphere and the outlook as it ended was not a comfortable one in spite of some favourable factors. It has been dominated, so far as this country is concerned, by the external difficulties of sterling, culminating in the severe loss of gold and dollar reserves necessitating the raising of the Bank Rate to the very high level of 7 per cent in September and the imposition of further restrictions on credit. So high a rate has not been seen since 1920.

The early part of the year was favourable to the gold and dollar reserves and it was felt possible to reduce the Bank Rate from 5½ per cent to 5 per cent in February, though not to lessen the restrictions on credit which have been the banker's portion since 1952. The actual increase in the reserves continued monthly until June, though there were special reasons for some of this and in any case the first half of the year is the more favourable one for sterling.

It was, however, after the turn of the half-year that sterling came under heavy pressure. All that had been gained was lost in July and August and the early part of September.

Since the Chancellor's announcement in September of the Government's determination to maintain the value of sterling, the imposition of a 7 per cent Bank Rate and the further call on the Banks to restrict advances even more firmly, the adverse tide has been stemmed.

Our difficulties arise primarily from a lack of confidence abroad and the fact that sterling is the currency in which over half the world's trade is conducted. It may be that currency weaknesses in France and the very reverse in Germany set in motion the run on sterling, but this would not have happened had there been confidence in our ability to check inflation and so no question of sterling having to be devalued.

HEALTHY ECONOMY

The general state of the economy of this country is healthy, as the trade figures show, but we have a particular responsibility arising from our position as bankers to the sterling area. It is a prime responsibility of a banker to hold adequate liquid resources and reserves. It may be that no country would now willingly shoulder the heavy responsibilities entailed in being bankers to the sterling area, but we have carried them for many years and are in honour bound to bear them still. Though they are more difficult to bear as a result of two world wars, they are not without advantage to us and, having accepted the responsibilities, we must behave as a good banker should.

This means that in running our own affairs we need to exercise restraint so that not only do we not try to get more out of the common pool than we put in, but also that it is clearly seen that we are building up reserves. It may be that in recent years we have been using too much of the resources which have come into our possession to invest abroad, including investment in the underdeveloped areas of the Commonwealth, on a long-term credit basis. This is, of course, quite a laudable thing to do, not without profit to ourselves in the long run, and a thing which, I am sure, all people in these Islands want to do, particularly to the extent of helping those less fortunate than themselves. If, however, at the present time we had these resources in liquid form, moderate though the amount is in proportion to our national product, we should be the better able to fulfil our duties as a banker and the present crisis, which is essentially one of confidence, might not have arisen.

In the long run, nations as well as individuals must live within their incomes, or confidence will disappear, and for that reason the Government are to be congratulated on being willing to take a firm line, unpopular though it may be, involving amongst other things harsh measures in the monetary sphere. The British people can rise to great heights in times of crisis, especially when the crisis is a matter of life itself. This crisis is not a matter of life so much as of mode of living. It can be overcome by co-operation between all sections of the community, with employers and employed acting together to use the available resources of both men and materials to the best advantage. This co-operation has never been more necessary than it will be in the next few months, when the world will be watching closely to see whether wage increases are linked to greater production or are merely another round in the spiral of inflation.

Such things may seem to be remote from the average worker, particularly when he is not engaged in an export industry, but he, too, has a vital part to play in the twin problems of restoring confidence abroad and defeating inflation at home. It is hoped that responsible Trade Union officials will explain to their members the nature of the problems now confronting the nation and persuade them to play their part in making secure what has already been won in the way of improved living standards of which the greatest share since the war has gone to the workers themselves.

THE CREDIT SQUEEZE

I would now like to say a few words about the credit squeeze which has gone on for so long. Immediately after the war the Banks were asked to restrict advances and to give precedence to exports and other desirable projects. The restrictions have been modified from time to time but in the summer of 1955 an actual reduction was called for from certain sections of the community. The latest request is that advances shall not exceed the average amount of the previous 12 months. This again means an actual reduction since the figure of advances at September 1957 was some 5 per cent more than in September 1956.

The Banks have, of course, always carried out to the best of their ability the requests of the authorities though it has not always been easy to do so and will be even less so in the months ahead because of commitments entered into some time ago. On the other hand, a 7 per cent Bank Rate is certainly a strong deterrent to borrowers. It is always distasteful, however, to have to refuse business which, on purely banking grounds, is perfectly satisfactory and to decline to help old friends in perfectly laudable projects which appear to be commercially sound. I would like to place on record our appreciation of the understanding attitude of customers when we have been unable to meet their requests.

The question does arise, however, as to whether too great an emphasis is being laid on monetary measures in the private sector Granted, the Chancellor has recognised that restraint and restriction are essential in the public sector. I think the Banks can justly claim from their records that, throughout the long period that inflation has been with us, they have exercised wise discretion and discipline in the national interest in the employment of their resources. It never has been, and is not now, the province of the Banks to provide capital for long term investment. But the well-being of the economy of the country is dependent upon the skill and enterprise of a vast number of firms, large and small, with varying degrees of access to the capital market. It will be a tragedy if, by the too rigid application of restrictive monetary measures, we stifle the productive enterprise of the smaller firms who have throughout made such a notable contribution to our economy. The Banks can, and should be permitted to, continue to play their constructive and discretionary role in this vital field of enterprise.

It is perhaps not sufficiently realised the extent to which, in the monetary field, there has been an increase in the velocity of circulation. In other words, the existing stock of money has been made to work harder. Can it be that in the application of that process in a broader sense we have the key to the solution of our problems. It cannot be denied that a little more conscientious effort on the part of each one of us in the discharge of our duties in whatever sphere they lie, would make a major contribution to the well-being of our economy at the least cost to ourselves.

The Government are to be commended for their determination to maintain the internal and external value of the pound and their declaration that to achieve it wage increases must be earned by greater production and profits made harder to get. I am sure, however, that our people will respond to a lead which promises an end to constantly rising prices and that the economy will be the healthier for it in the end. It will enable us to face the problems which the European Free Trade Area will make for us, as well as the better to reap its benefits. It will find favour with housewives and especially with pensioners who are the worst sufferers from inflation.

The alternative does not bear a moment's thought. If we cannot discipline ourselves by general agreement the totalitarian states can, and they have shown a frightening efficiency only this last year in the application of their efforts to courses quite unconnected with the material well-being of their own people. Moreover, we cannot repeat the present operation—we must see that it succeeds or it is not too much to say that we shall lose our place in world affairs.

The question is being asked as to how long the present restrictive measures and high Bank Rate should be kept on. There is always a possible danger that the restrictions could be maintained too long and produce something of a recession but it would be foolish for us to relax too soon. It is a little embarrassing in a money sense that the effect of changes in Bank Rate is as much psychological as practical and too much can be read into any individual change by the community at large. The present high rate should be reduced as soon as it safely can be, if only because of the high cost in interest on funds already held here by foreigners and also because crisis rates do not attract new money as they once did—only confidence can do that.

The signs, however, are not wanting that the time for a reverse move is not very far ahead. The hesitancy in the US economy, the fall in commodity prices, the signs here—of which we have received reports from most of the areas in which our Branches are situated—that the monetary medicine is beginning to work, and the distinctly less favourable outlook for shipowners and shipbuilders coupled with the radical changes which seem to be imminent in the aircraft industry, all point to a state of affairs which will need careful watching during the year ahead if we are to avoid quite a major upheaval in the economic sphere.

One change which would be most welcome is the prospect of selling more of our goods to Canada as has been envisaged during the recent visit of the Canadian Trade Mission. This is a particularly happy prospect to me as a member of the Dollar Exports Council.

THE FUTURE

To summarise, I would say I am not fearful of our future, our economy is fundamentally sound and if we will accept and work to the fact that our standard of living cannot be higher than the standard we earn in a highly competitive world, the vista before us can be exciting and full of promise.

CONCLUSION

I would like, in conclusion, to express on behalf of myself and my colleagues on the Board to Mr Allman, the General Manager, to the Assistant General Managers and to all the members of the Staff our best thanks for their devoted services throughout the year and our appreciation of their efficiency and enthusiasm.

JOSHUA HOYLE & SONS

PROGRESSIVE POLICY ON MODERNISATION

The Annual General Meeting of Joshua Hoyle & Sons, Limited, was held on January 9th in Bacup, Mr A. Duckett, JP, the Chairman, presided and in the course of his speech said:

Group trading profit amounted to £542,056 compared with £381,589 in 1956. In a year of intense and severe competition, there has been an upward trend in the Group's turnover, but this has been coupled with a still further narrowing of our margins.

It has long been our view that one of the most practical approaches to the adverse problems confronting us, is that of equipping and maintaining our mills to ensure they have every modern production technique. To this end, we expended a further £320,000 last year, which has brought our expenditure during the past 10 years to over £2 million. Thus, we have the advantage of a complement of machinery of the most recent design.

Our policy has been to introduce the automatic loom in place of the Lancashire loom which has proved increasingly uneconomical as a principal producer of cloth of the type imported. During the period under review, it has been possible to operate most of this automatic machinery to full capacity once again and, to some extent, to employ it in double shift working. This policy we intend to extend further during the coming year and in doing so to produce more economically and, at the same time, overcome the ever-present problem of labour shortage, by offering more remunerative and attractive working conditions.

The report was adopted.

SCOTTISH AGRICULTURAL INDUSTRIES LIMITED

LEITH FERTILISER WORKS IN PRODUCTION

MR W. D. SCOTT'S REVIEW

The Thirtieth Annual General Meeting of Scottish Agricultural Industries Limited was held in the North British Hotel, Edinburgh on January 16th. The Chairman, Mr W. D. Scott, presided. In submitting the Report of the Directors the Chairman said:

You will see from the Report and Accounts sent to you before Christmas that sales for the year 1956-57 were six per cent less at £22.7 million, and that profits, before providing for taxation, were £623,000, compared with £1,041,000 for the previous year.

Several factors contributed to these reductions in turnover and profits. Our new fertiliser Works at Leith started production in the last quarter of the year, giving rise to the substantial expenses inseparable from the commissioning of a new large factory. Working stocks had to be built up and the quality of the bulk production fully tested and confirmed before the flow of goods to the consumers could start. Consequently deliveries, which normally would have been completed in the last three months of the financial year, were postponed and will fall into the current year.

It has already been reported to you that your Board, in further pursuit of its policy of fixing effort on main objectives, decided during the year to go out of the agricultural implements business. This decision was influenced by the fact that we were able to sell the businesses as going concerns to specialists already in the implements field, thus avoiding any unemployment or the cessation of an agricultural service. The process of disposal has, however, involved us in losses on the realisation of stocks, and, moreover, during 1957 prices of both animal feeding stuffs and home-grown cereals fell substantially. The consequential losses on these stocks have been borne in full out of the year's trading profits and we have not drawn upon our stock provision.

Taxation in 1957 does not absorb so high a proportion of the profits as was the case in 1956, because, in consequence of the expenditure on the new plant at Leith, substantial reductions for wear and tear are allowable when computing the total taxation payable.

You will have noticed that debtors have been reduced by some £900,000 as compared with a year ago. This large reduction in working capital, together with profits retained in the business and the depreciation written off fixed assets, has sufficed to cover the heavy expenditure during the year on new plant and equipment. Indeed, the book value of the fixed assets has been increased by almost £1.2 million. Owing to the reduced summer deliveries of fertilisers, to which I have already referred, stocks of fertilisers at September 30, 1957, were higher than at the same date last year.

Your Directors recommend a final Ordinary dividend of five per cent, which, with the Interim dividend of three per cent, makes the same eight per cent total dividend as was paid last year. If you confirm these recommendations, there will be an increase of £271,000 in the reserves appearing in the consolidated balance sheet, which will then total £2,154,000.

CAPITAL EXPENDITURES

The Accounts show that we still have large contractual commitments for capital expenditure, some £575,000 compared with one and a half million pounds last year. The major item is for a storage building which we are erecting on the site of the old Leith factory. This will serve the new Leith Works and will contain not only high speed packing plant but modern mechanical facilities for bulk handling. We expect to complete this building by the summer of 1958. You will be interested to learn that we finished the chief manufacturing units of the new factory in August, several months ahead of the estimated date. At the same time the handling plant, giving direct connection with the deep water berths in Leith Docks, was put into commission, and we now enjoy the advantage of being able to take sea-borne raw materials directly into our factory.

As regards the future, we find no cause in our business for pessimism. If we continue to improve in every way possible the internal efficiency of our business in the face of rising operational costs, we can look forward, with real confidence, to reaping a reward for our expenditure in the recent past.

May I end by reminding you that your business of Scottish Agricultural Industries Limited is the expression of the work done by those employed in it. It is their efforts, both staff and work people, which make it possible for me today to review progress and to express optimism. I want to express our thanks for their loyal and effective service, and I am sure you will wish to support me very cordially in this.

The report and accounts were adopted.

TATE & LYLE, LIMITED

AN ANALYSIS OF INCOME AND EXPENDITURE IN 1957

	£	£	*Proportion of each £1 of Income* s.	d.

THE ROYAL BANK OF CANADA

CREEPING INFLATION NOT CAUSED SOLELY BY PRICE-COST SPIRAL

JOINT EFFORT NEEDED TO CHECKMATE TREND, SAYS MR JAMES MUIR

The Eighty-ninth Annual General Meeting of Shareholders of The Royal Bank of Canada was held on Thursday, January 9th, at the Head Office in Montreal. Mr James Muir, Chairman and President, after reviewing the economic trends of the past twelve months, said, "I shall not attempt to determine whether in the gobbledy-gook of economic forecasting we are having a 'recession' or a 'rolling readjustment.' Whatever we call the phenomenon, it is abundantly clear that, though all inflationary forces have not disappeared, we have reached what seems to be the end of the latest inflationary surge. A mild slump at this time should cause little surprise or apprehension; it would be unrealistic to expect our economy to go on expanding indefinitely without some kind of breathing spell."

PRICE ADJUSTMENTS NEEDED

"Lower interest rates do not mean that money has become really 'easy,'" said Mr Muir, "and it is unlikely that the time is yet ripe to adopt either deficit financing by government or easy money policies by the monetary authority and the chartered banks.

"It would seem that now, as in 1953 and 1954, price adjustments are necessary to maintain stability and prosperity at home and to ensure our competitive position in world markets. The fact that lower raw material costs have not been reflected in retail prices means today, as in that earlier period, that we have suffered not only from open inflation but from a concealed inflation of production and distribution costs.

"The process of healthy adjustment would seem now to require the elimination through price reductions of inflated production and distribution costs. A tight money policy has inhibited inflation and has indeed been instrumental in breaking the circle and ending, for a time at least, the round-robin of cost and price increases that can continue indefinitely only if the money supply or the velocity of the monetary circulation is allowed to increase.

CHRONIC INFLATION

"This brings us to a problem that transcends the events of the immediate past: Must we look forward to a gradually rising tide of inflation such as we have witnessed in the years since the Second World War? I am thinking particularly of the chronic type of inflation that monetary and fiscal policy seem unable to reach. The typical kind of inflation usually arises from the fact that business and consumer spending temporarily exceed the supply of goods at current prices or, in the common and useful phrase, we have 'too many dollars chasing too few goods'; but the key word is 'temporarily.' In the past, spending sprees of this kind have been followed by a dull morning-after, a business depression or recession, that brought prices back to a reasonably stable norm. In contrast, the alternately 'creeping and surging' inflation we have been through since the Second World War seems to belong to a different genus. How do we account for the difference? I would suggest a number of possible explanations:

(1) The large governmental budgets of wartime and postwar years, combined with the nature and composition of taxes and expenditures, have made increasingly important certain built-in stabilisers that tend to damp down fluctuations in the national income and expenditure. Thus our *progressive* income tax structure causes government revenues to rise faster than the overall rise in the national money income. Similarly, tax revenues fall faster than the national money income on the down swing. This means that an automatic surplus appears in inflation, an automatic deficit in deflation.

(2) Large liquid holdings by the public after the war have undoubtedly made the task of inflation control more difficult. There are still large sources of liquidity outside the banking system and beyond the direct control of our monetary authorities. These sources of liquidity are especially important in financing consumer credit.

(3) It is sometimes argued that chronic inflation is due to repeated and excessive wage increases in response to successful trade union pressure or perhaps that there are two culprits: successively increasing labour costs and profit margins both in excess of what the traffic can reasonably be expected to bear.

RESTRAINT NEEDED

"This round-robin of cost and price rises is undoubtedly a factor in *any* inflationary situation. But even the best intentions on the part of both labour and management cannot long resist an inflationary environment created by excess spending through the errors or inefficiency of monetary and fiscal management. In such a situation wages would rise even without trade unions to press for them. The employer finds that to increase production in response to rising demands he must bid for labour at a higher price, and even to maintain present production he must resist the efforts of others to raid his labour force. He may often find it necessary to raise prices, but these higher prices can be paid only because the original inflationary environment makes it possible for his customers to pay them. Under these conditions wages and profits rise together, but they are the symptoms rather than the cause of inflation. However, once the circle is broken, by effective monetary and fiscal policy, mutual restraint is clearly in order. Profits fall first and unions might well at this point temper the wind to the shorn lamb. In fact, if we are to obtain not merely full employment and growth, but stability as well, the exercise of restraint in making demands must become the responsibility not only of labour and business, but of electorate and government as well.

PESSIMISM UNWARRANTED

"Today, in contrast to the high spirits and great expectations of a few years ago," concluded Mr Muir, "we find a growing uncertainty and lack of enthusiasm. This is an extreme that we should avoid. After all, we have the same country with the same people, the same enormous natural resources, and the same potential for prosperity and economic growth. There is no reason, therefore, for a pessimism born of a temporary check to the almost unbelievable prosperity and expansion of the past few years. In fact, properly handled, the readjustment that I have previously mentioned may lead to an even greater and healthier prosperity and expansion in the future"

ASSETS EXCEED $3,760,000,000

Mr K. M. Sedgewick, General Manager, commenting on the bank's financial statement, noted that assets had reached the impressive figure of $3,760,544,617, an increase of $189,246,000 during the year and a new high point in Canadian banking history. Capital Funds now stand at more than $202,000,000. The cash position of the bank is strong, assets in this form, coupled with Canadian Government Treasury Bills and Day-to-Day Loans representing 22.57 per cent of the aggregate liabilities to the public. Referring to the bank's extensive organisation abroad, Mr Sedgewick mentioned that in the British West Indies, where important constitutional developments are taking place, the Royal Bank is playing a part in assisting in the economic growth of this newly developing member of the Commonwealth family. "We are in a preferred position to give assistance and counsel to businessmen seeking a share of this attractive and expanding interchange of goods and services," said Mr Sedgewick.

HOULDER LINE LIMITED

The annual general meeting of Houlder Line Limited, will be held on January 31st in London.

In his circulated statement, the chairman, Mr Walter C. Warwick, said that the past year had been one of exceptional difficulty in many directions. Statistics recently published as Freight Indices by the Chamber of Shipping illustrated only too emphatically the very severe reduction that had taken place during recent months.

The trading results of the Company for 1957 were not greatly below the results achieved for the previous year but this was to a considerable extent due to the fact that many of the voyage results included in the Accounts were carried out in the early part of the year when freight and charter rates were much higher than those applicable to the later and current voyages.

Operating costs further increased during recent months with the advance in seafarers' wages which came into operation in July last, and it was unfortunate that those increases coincided with the serious and general collapse of freight markets. He felt that restraint on all sides was essential, with a determination to secure closer collaboration with all sections of Industry, if our present favourable standards of living were to be maintained.

Mr Warwick concluded: Subject to the all-important proviso that we are spared the trouble and tribulation inevitable from strikes, lockouts, etc., we can, I think, face the future with confidence in the knowledge that your Company is well equipped with well-found ships, first-class personnel, substantial Reserves and a sound degree of liquidity.

APPOINTMENTS

The
Common European Market

MAKES US LOOK OUT FOR A RELIABLE

AGENT OR

REPRESENTATIVE

We are producers of seamless drawn Brass, Copper and Aluminium Tubing. Our specialities are ballpen and antenna tubing, tubes for the lamp industry air-conditioning, refrigerators, T.V. aerials, aircraft building, etc.,

Representatives of domestic Brass Mills not handling tubing are also invited to send in their applications with record of experience, banking information, curriculum vitæ and recent photograph to:

STANDARD-WERKE G.m.b.H.

WERL/WESTFALEN,

WESTERN GERMANY

A PROGRAMMING AND PROGRESSING ENGINEER is required on the Civil Engineering Construction of a Major Steelworks at Durgapur in India. The Contract is for three years, at a salary of £2,000 per annum tax free, with bonus, free medical attention, paid leave, free passages for families and furnished accommodation at a reasonable rent.

Applicants should have had at least 3 years' experience on major projects either with Consulting Engineers or Contractors.

Apply, giving full personal details and details of qualifications and experience, to:

THE CEMENTATION COMPANY LTD.,
Durgapur Project,
20 Albert Embankment,
London, S.E.11.

BEECHAM GROUP LIMITED, Consumer Research Division, requires a SENIOR RESEARCH OFFICER who should have experience in planning and interpreting consumer research surveys. The department is expanding and offers excellent opportunities. The company has a non-contributory pension fund and a profit sharing scheme. Candidates should be aged 25/35 and should apply in writing giving details of age, education and experience, to The Personnel Controller, Beecham Group Ltd., Beecham House, Great West Road, Brentford, Middlesex.

A TOP London Advertising Agency specialising in television requires a RESEARCH OFFICER. His responsibilities will include contact with audience measurement companies and interpretation of their results; initiation and execution of research into television advertising communication; the supervision of statistical information service relating to television; a certain amount of marketing research; the presentation of his findings to an occasionally sceptical audience. This is a new position with real opportunity to do original work. Experience in this field an advantage, but not absolutely essential. Age 25-35 years. Salary according to experience, but competitive.

This matter will be handled only by the Managing Director: Please write to him, with full details of experience, qualifications, and salary range, at Box 834.

ASSISTANT MANAGER (male or female) required to take up position on or before February 1, 1958, for administration of the Space Booking, Records, Dispatch, etc. Department of expanding Advertising Contractors. The successful applicant will probably (a) have previous administrative experience and some experience in non-financial records, e.g., stock control, etc.; and (b) be between the ages of 30 and 45. Essential quality is the ability personally and through subordinates to ensure strict method in the maintenance of meticulously accurate records. Some organising ability is also required. This is an executive position with prospects of promotion, and the commencing salary will be within the range of £1,000 to £1,400, according to experience and qualifications.—Write Box 835.

THE UNIVERSITY OF MANCHESTER

Applications are invited from graduates for the post of TUTOR IN SOCIAL ADMINISTRATION in the Department of Social Administration of the Faculty of Economic and Social Studies, in connection with the Selective Recruitment and Training Scheme for Hospital Administrators in Wales and Scotland. The appointment is for three years, in the first instance, with a possibility of a renewal for a further period. The salary per annum will be on one of the following ranges: £700 to £850; £900 to £1,050; initial salary according to qualifications and experience. Membership of F.S.S.U. and Children's Allowance Scheme.—Applications should be sent not later than February 15, 1958, to the Registrar, the University, Manchester, 13, from whom further particulars and forms of application may be obtained.

UNIVERSITY OF MALAYA

Applications are invited from Honours graduates for (i) Lectureship or (ii) Assistant Lectureship in Economics.
Salary scales: (i) £1,148 x 49—1,442/1,540 x 56—£1,828 per annum; (ii) £1,001 x 49—£1,099 per annum. Entry point according to qualifications and experience. Allowances: expatriation in range £280-£308 per annum, cost of living in range £210—£560 per annum. All paid in Malayan currency. Passages for appointee, wife and children under 12 years. Part-furnished quarters at reasonable rent. Provident Fund Scheme. Applications (airmailing) naming three referees and detailing qualifications and experience by February 15, 1958, to Secretary, Inter-University Council for Higher Education Overseas, 29, Woburn Square, London, W.C.1, from whom further particulars may be obtained.

GHANA INDUSTRIAL DEVELOPMENT CORPORATION

PROJECT OFFICER (ECONOMICS). Applications are invited for this vacant post with the above Corporation.

Candidates should have a recognised degree or equivalent qualification in Economics with at least five years' subsequent practice in trade, commerce or industry in positions of responsibility. Ability to undertake general surveys, market research, and compile statistical data in connection with new industrial projects is essential. Candidates should also be able to appreciate product design and write clear, concise reports with graphical or othe. visual illustrations.

Initial salary will be fixed between £1,000 and £1,500 per annum according to qualifications and experience.

Furnished accommodation at rates £60-£75 per annum. Contract period eighteen months with option for extension. Successful applicant will be required to join Corporation's Provident Fund, employee's contribution being calculated at 7½ per cent and employer's at 17½ per cent of salary.

An officer recruited overseas would receive passages for himself, wife and up to three children below the age of 18, paid leave at the rate of seven days per month and outfit allowance of £30. An interest-free transport loan and other generous allowances are available.

Apply, stating age, qualifications and experience, to the Director of Recruitment, Ghana High Commissioner's Office, 13 Belgrave Square, London, S.W.1.

FERRANTI LIMITED

MANAGEMENT ACCOUNTING

Forecasting and Overhead Analysis are two of the aspects of management accounting dealt with by a section of the Ferranti Company covering a most interesting range of products, including ELECTRONIC COMPUTERS, AIRCRAFT EQUIPMENT, PRECISION INSTRUMENTS, AND DOMESTIC APPLIANCES.

A vacancy exists in this section and applications are invited from candidates of about 25 years of age, with an interest in these aspects of industry and able to discuss at all levels data relevant to forecasts of future policy. Some industrial experience would be an advantage.

A graduate might well find in this work a suitable introduction to management accounting.

The Company has a Staff Pension Scheme and an Assurance Scheme for Dependants.

Forms of application can be obtained from T. J. Lunt, Staff Manager, Ferranti Limited, Hollinwood, Lancs. Please quote Ref. J. W.

NATIONAL HEALTH SERVICE

TRAINING POSTS IN
HOSPITAL ADMINISTRATION

The Minister of Health and the Secretary of State for Scotland invite applications for up to sixteen training posts in hospital administration.

Successful applicants will hold these posts for a maximum of three years, beginning in the autumn of 1958, and will be given practical experience of all branches of hospital administration, together with courses of instruction at the University of Manchester or at the Hospital Administrative Staff College of King Edward's Hospital Fund for London.

A short list of applicants will be called for interview by a Selection Committee.

Applicants should be not more than 30 years of age at September 1 1958, but the Selection Committee has discretion to accept applicants up to 35 years. If *already employed in the hospital service* they should either

(i) be a graduate of a British university; or

(ii) be the holder of a professional qualification acceptable to the Selection Committee; or

(iii) have had at least three years' experience in the hospital service on September 1, 1958, and to have passed at least the intermediate examination for a professional qualification.

If *not employed in the hospital service* they should either

(i) be, in September, 1958, a graduate of a British University; or

(ii) be, in September, 1958, the holder of a professional qualification acceptable to the Selection Committee.

Applicants should have discharged their obligation for national service.

Applications will be considered from students who are due to take their final examinations in 1958.

The salary during the training period begins at £556 (plus a small addition in the London area) with an increment of £20 in the second and third years. Applicants already in the hospital service will retain their present salary scale if higher than this. Training fees will be met.

Further information and application forms can be obtained from University Appointments Boards or by writing to the Secretary, Department of Health for Scotland, St. Andrew's House, Edinburgh, 1, or to the Secretary, Ministry of Health, Savile Row, London, W.1. Applications should be completed and returned to the Secretary, Ministry of Health, *not later than FRIDAY*, February 28, 1958.

RUSKIN COLLEGE, OXFORD, offers a RESEARCH SCHOLARSHIP of £500 per annum, with possibility of accommodation in College, for one or two years beginning October 1958 EITHER for a study of INDUSTRIAL RELATIONS within a particular industry OR for the study of a TRADE UNION or FEDERATION OF UNIONS. Closing date March 10th. Apply Secretary, Ruskin College, Oxford.

UNIVERSITY OF CAMBRIDGE
DEPARTMENT OF ESTATE MANAGEMENT

HAROLD SAMUEL BENEFACTION

The Department of Estate Management proposes to award, from October 1, 1958, grants for research in economic, legal or social matters related to the use, tenure, or development of land.

Essential qualifications: good honours degree in History, Economic History, Economics, Agricultural Economics, or Law, or a degree with a high class in Estate Management, or evidence of likelihood to obtain such a degree not later than July, 1958.

Value of a grant £400 a year, plus University and College fees. Normally tenable for two years.

Particulars from Secretary, Board of Estate Management, 74 Trumpington Street, Cambridge. Completed applications should reach him by February 26th.

A MARKET RESEARCH EXECUTIVE is required by a nationally known company (located in the Southern half of England), which includes among its major activities the production and marketing of commercial and domestic refrigeration equipment. Applications are invited from men who are graduates of Universities in the United Kingdom whose degrees have been obtained in Economics, or in social or business studies, and who have had at least three to four years' post degree experience in Market Research. Age group preferably 28-38. Salary in the range of £1,100-£1,500 per annum, according to age and experience. This is a permanent appointment with sound prospects. There is a Pension Scheme.—Apply in writing, giving full details of career to date, to Urwick, Orr and Partners Limited, Management Consultants, 29 Hertford Street, Park Lane, London, W.1, quoting on the envelope Reference TOD/1228.

ORGANISATION & METHODS

Vacancies exist in the Organisation and Methods Department at Guest, Keen and Nettlefolds (Midlands), Ltd. The Department serves both Divisions of the Company; the Screw Division at Heath Street, Birmingham, and the Bolt and Nut Division at Darlaston, 11 miles away.

The intention is to strengthen the team, whose chief work is the review, establishment and maintenance of the administrative procedures which operate throughout the company. The whole object is to ensure that the clerical service continues to be both effective and economic.

Applicants must be able to show a successful experience in organisation and methods work coupled with a sound educational background. The age bracket is from 28 to 35.

Alternatively, if a younger man with an honours degree can demonstrate a real interest in this work, which calls for an analytical mind and an ability to work with people, he would be given consideration, and, if successful, training in Organisation and Methods Techniques would be arranged.

I.C.W.A. or similar qualifications could be very useful in either category.

There is more than usual scope for advancement and the salary is attractive.

Applicants should write fully to the Personnel Officer, Guest, Keen and Nettlefolds (Midlands), Ltd., Box 24, Heath Street, Birmingham, 18.

STATISTICAL ECONOMIST

required by J. Walter Thompson Company, preferably with some years' experience in the Marketing and Distribution of Consumer Goods and in the employment and interpretation of Market Research statistics.

Completely objective outlook essential. The main function is to study the practical implication and application of statistical and economic data in relation to business problems. The job has scope for growth in influencing the development of the company.

This is an important appointment and will be rewarded accordingly. Age preferably from 28 to 35.

Write Personnel Secretary, J. Walter Thompson Company Limited, 40 Berkeley Square, London, W.1, and mark *Strictly Confidential*.

MINISTRY OF SUPPLY: LABOUR OFFICERS. Applications invited for 7 pensionable posts in the provinces, mainly in Royal Ordnance Factories.

Age at least 25 on August 1, 1957.

Candidates must have a University degree, preferably in social studies, or have taken a recognised course in Personnel Management, and have had some industrial experience in personnel management. Alternatively, applications will be considered from candidates with a Higher School Certificate (or an equivalent qualification) and at least 3 years' experience (10 years' if without academic qualifications) as a practising Personnel or Labour Officer in an industrial undertaking.

All candidates should have a working knowledge of the social services, industrial legislation and methods of joint consultation, and be familiar with day-to-day working problems.

Starting salary £680 (women £623) at age 25 up to £800 (women £735) at age 28. Higher starting salary at 28 or over exceptionally well-qualified men's maximum £1,055. Somewhat higher rates in certain large provincial towns. Women's rates being improved to reach equality with men's rates by 1961. Promotion prospects. Five-day week. Particulars and application forms from Civil Service Commission, 6 Burlington Gardens, London, W.1, quoting No. 4801/58. Application forms to be returned by February 25, 1958.

APPLICATIONS are invited by an organisation with widespread overseas interests for senior post in its London office. Applicants must have had commercial experience, particularly in conducting negotiations and investigations. Age 35/40; contributing pension scheme. Applications, which will be treated as strictly confidential, should give full personal particulars, details of qualifications, experience and previous appointments, and salary required.—Appl. to Box No. 1Q L 9522, A.K. Advg., 212a Shaftesbury Avenue, London, W.C.2.

THE Controller of Research of a Company of international reputation manufacturing a wide range of Scientific Instruments requires a PERSONAL ASSISTANT. This is a post which will offer valuable administrative experience, and offers the prospect of a progressive career with an expanding company. The essential requirements are an Honours Degree in Physics; a lively and enquiring mind and the ability to work harmoniously with colleagues. Suitably qualified young men, who need not have had previous experience, are invited to write, giving full details of their careers to date, to the Chief Personnel Manager, Hilger and Watts Ltd., 98 St. Pancras Way, Camden Road, London, N.W.1.

UNIVERSITY OF GLASGOW
STEVENSON LECTURESHIP
IN CITIZENSHIP

The University Court will be considering shortly an appointment to the Stevenson Lectureship in Citizenship, tenable in the first instance for a maximum period of five years from October 1, 1958, or from such later date as may be arranged. The appointment will be full-time. The stipend will be £1,350 x £75—£1,800 per annum, with superannuation. All who may be interested are asked to communicate with the undersigned, who will supply further particulars.

ROBT. T. HUTCHESON,
Secretary of University Court.

APPOINTMENTS

PERSONNEL ADMINISTRATOR

A large Group of Companies in civil engineering and related fields with headquarters in London, requires an active, ambitious, progressive, qualified PERSONNEL ADMINISTRATOR, between ages 30-35, who is interested in the development of a full-scale personnel programme.

Present personnel functions require further organisation and development and position has excellent prospects with expanding responsibilities. Appointment offers unusual possibilities for successful candidate with good experience.

University degree helpful and I.P.M. membership desirable, but not necessary. Four-figure salary with good prospective increases. Pension plan.

Apply in GUARANTEED STRICTEST CONFIDENCE, stating contact telephone number, details of date and place of birth, education, background, names of firms, positions held with dates and salaries, quoting reference K.P. 2811.

Dr. P. S. de Q. Cabot,
P. S. CABOT & COMPANY,
37-41, BEDFORD ROW,
LONDON, W.C.2.

BRITISH PETROLEUM COMPANY LIMITED has a vacancy for a STATISTICIAN to work at their Research Station at Sunbury-on-Thames, Middlesex. Candidates should have an honours degree in Statistics, or in Mathematics with a diploma in Statistics. They should also have a good basic knowledge of Physics and Chemistry (G.C.E. Advanced Level). Work will include the design and analysis of experiments connected with research at the small scale and pilot plant levels and also with operations on refinery plants. An electronic computer will be available. Non-contributory Pension Fund. Assisted House-Purchase Scheme. Removal expenses and settling-in allowance payable in certain cases. Luncheon Club.—Write, quoting reference H.S.1, to Box 5662, c/o 191, Gresham House, E.C.2.

MARKET RESEARCH ASSISTANT

A Senior Assistant to the Research Manager is required by RCN. Applicants should have at least three years' experience—some of it preferably with an advertising agency. Sound statistical background is essential, plus the ability to initiate surveys and carry them through to completion of final report. This position carries plenty of scope and excellent prospects for the future. Applications, stating age, experience and salary required, should be addressed to:

Research Manager,
RCN Ltd.,
184 Strand,
London, W.C.2.

UNIVERSITY COLLEGE OF GHANA

Applications are invited for Lectureship in Agricultural Organisation and Economy. Post-graduate research experience in Agricultural Economics essential. Salary scale £950 x £50—£1,600 per annum. Entry point determined by qualifications and experience. Family allowance £100 per annum per child (maximum £500 per annum). Outfit allowance. F.S.S.U. Passages for appointee, wife and maximum of five children, on appointment, normal termination and leave. Part-furnished accommodation at rent not exceeding 7.5 per cent. of salary.

Detailed applications (six copies), naming three referees, by February 24, 1958, to Secretary, Inter-University Council for Higher Education Overseas, 29, Woburn Square, London, W.C.1, from whom further particulars may be obtained.

THE UNIVERSITY OF LIVERPOOL

Applications are invited for a Leverhulme Postgraduate Fellowship in any Department of the Faculty of Arts. The Fellowship will be tenable for one year at a value of £550. Applications, three copies, stating age, qualifications and experience, proposed field of research and the names of two referees, should be received not later than March 1, 1958, by the Registrar, from whom further particulars may be obtained.

UNIVERSITY OF EXETER

Applications are invited for the post of:—
ASSISTANT LECTURER or LECTURER in STATISTICS (Faculty of Social Studies).
Salary Scales: Assistant Lecturer, £700-£850. Lecturer £960-£1,650 (with efficiency bar at £1,300).
Further particulars may be obtained from the Secretary of the University.
Closing date for applications, February 8, 1958.

UNITED KINGDOM ATOMIC ENERGY AUTHORITY

INDUSTRIAL GROUP HEADQUARTERS
TECHNICAL POLICY BRANCH

The Industrial Group of the Atomic Energy Authority invites applications from young men in their early thirties with a background of technical attainment and with the ability to achieve rapid appreciation of detail, for posts in the Overseas Department of the Technical Policy Branch at Risley, Warrington, Lancashire.

Responsibilities of the posts will extend over negotiation with foreign governments and industrial undertakings implementing international agreements on the uses of atomic energy and attendances at international conferences.

The technical scope of the duties will cover all facets of the industrial applications of nuclear power, including development and construction of commercial reactors and chemical plants as well as the design and fabrication of fuel elements.

A good industrial background together with membership of a senior professional institution or equivalent qualifications are essential. Experience of overseas liaison and a knowledge of economics and foreign languages may be an advantage.

Selected candidates would be given facilities to acquire an understanding of the technical processes and plants of the Industrial Group.

Salary will be assessed according to qualifications and experience in the scale £1,790 to £2,080.

Contributory Pension Scheme.

Housing or assistance towards legal expenses on house purchase may be available.

Send postcard for application form, quoting reference 2204, to Recruitment Officer, U.K.A.E.A., I.G.H.Q., Risley, Warrington, Lancashire.

Closing Date: January 27, 1958.

FINANCIAL ACCOUNTANT

MARKHAM AND COMPANY LIMITED requires an executive capable of engaging in all financial and related activities. Candidates for this important post must be members of one of the leading professional accounting bodies and have adequate industrial experience of financial control, including cost and works accounting. They must be capable of advising on occasion on the financial implications of large-scale contracts and tenders for home and overseas work. The successful candidate will be a man of personality and mature outlook, who could in due course be considered for appointment as Financial Director. His age will be between 35 and 45 years. The post combines full executive responsibility with interesting and rewarding work in a well-established Company, enjoying considerable reputation for its products.

Candidates are requested to apply, in confidence, with full information, to the Managing Director, Broad Oaks Works, Chesterfield.

THE INDUSTRIAL WELFARE SOCIETY wishes to appoint a SECRETARY, age 35-55, of good education and personality, with a knowledge of British industry and commerce and some experience of financial administration.

His main duties, for which he will be responsible to the Director, are the promotion of the Society's many services in Britain and the Commonwealth.

The work is varied, interesting and involves reasonable travel in the United Kingdom.

The position is pensionable and will be remunerated according to the qualifications and experience of the successful candidate.

Applications are invited in confidence to:
The Director,
Industrial Welfare Society,
48, Bryanston Square,
London, W.1,
stating salary required and availability.

UNIVERSITY OF CAMBRIDGE
SCHOOL OF AGRICULTURE

MATHEMATICIAN required to work in Agricultural Research Council statistical group dealing with a wide range of agricultural subjects: previous statistical experience not essential. Appointment will be in Assistant Experimental Officer grade; starting salary from £370 per annum at age 18 to £645 per annum at age 26 or over. Application in writing stating age and qualifications should be made to the Secretary, School of Agriculture, Downing Street, Cambridge, not later than February 7, 1958.

APPOINTMENTS REQUIRED

EXECUTIVE with pioneer experience of new methods of financial control and management accounting applied in a wide range of industries seeks top level post with truly progressive company.—Box 841.

ECONOMICS GRADUATE (31), several years as successful export executive, seeks change to progressive company expanding, or entering, exports.—Box 837.

SOUTH AFRICA.—Young Englishman, A.C.A., C.A. (S.A.), passed I.C.W.A. Exams., seeks permanent commercial position in or near Johannesburg.—Reply, Box 838.

FEMALE GRADUATE, 34 years' experience welfare/personnel/educational work is looking for stimulating, progressive post in these or allied fields.—Box 839.

UNIVERSITY OF LONDON

A lecture entitled "Can Cost Inflation be Distinguished from Demand Inflation?" will be delivered by Professor W. J. Fellner (Yale) at 5 p.m. on January 23rd at the London School of Economics and Political Science, Houghton Street, Aldwych, W.C.2. ADMISSION FREE, WITHOUT TICKET.

JAMES HENDERSON,
Academic Registrar.

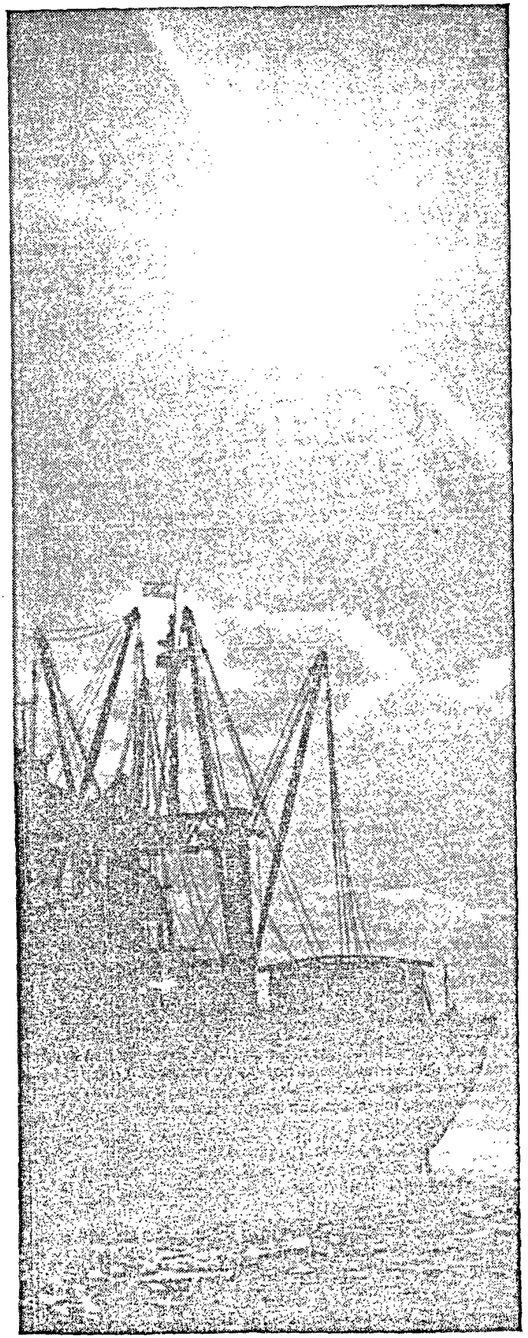
Food and Agriculture
Tenox® antioxidants protect fats, oils and foods containing these products against development of off-flavour, unpleasant odour, or discolouration.

By inhibiting oxidation of fats and oils, Tenox antioxidants extend shelf life and markedly reduce complaints due to rancidity in lard, nuts, potato chips, cereals, baked goods and many other foods.

Tenox antioxidants are used to stabilise inedible fats in animal and poultry feed. They are also added directly to poultry feed mixes to protect vitamin content and safeguard against deficiency diseases.

For easy use, Tenox antioxidants are available in a large number of formulations, liquid and solid, containing one or more of the following ingredients: butylated hydroxyanisole, butylated hydroxytoluene, propyl gallate and citric acid.

Protective Coating
Cellulose Acetate makes tough, water-resistant wire and cable coatings. *Cellulose Acetate Butyrate* produces lacquers, adhesives, airplane dopes and melt and peelable coatings possessing high strength, flexibility and excellent weathering properties. *Solvents* and *Plasticisers* in a broad range, including economical isobutyl acetate, are available.



Textiles
Dyes of outstanding fastness for synthetic fibres. *Cellulose Acetate* flake for producing acetate fibre spinning solutions.

Petroleum
Tenamene® 1, 2, 3, 60 and *MD 50* are gum inhibitors and metal deactivators used in motor and aviation fuels to maintain quality during storage and use.

Rubber
Eastozone® 30 and *31* antiozonants protect rubber products against the effects of atmospheric ozone.

Waxes and Polishes
Epolene,® a low-molecular-weight polyethylene wax, is produced in regular and emulsifiable grades, and in a new low-melt form. Epolene is recommended for use in paper coatings and polishes and as an upgrading agent for paraffin and other waxes.

Stocks of many of these products are maintained in Europe, assuring quick delivery. If you would like to investigate any of these quality products, call or write Eastman's European Sales Office in The Hague. They will put you in touch with our local representative. NUCLEAR ENGINEERING

announces record size

'Buyers' Guide' issue for February

Like the giant industry it serves and describes *Nuclear Engineering* is constantly outstripping the hopes of even its most ardent readers and friends. Witness the 250-page February issue—a record one for size, including a 48-page BUYERS' GUIDE, containing what must indeed be essential information for all concerned in nuclear development, production control, and industrial research. A greatly increased print order will bring *more* pages to *more* readers in *more* countries (to be precise 93)—*Nuclear Engineering* demands consideration equally as a vital reference journal and an impelling advertising medium.

CONTENTS INCLUDE:

- ***Purchasers' analysis listing manufacturers of reactors and components under classified headings.***
- ***World survey, giving main authorities overseas and recent progress***
- ***Reactor technique survey of present progress and possible future development***
- ***A survey of methods and economics of energy storage***
- ***An analysis of the properties of magnesium with pull-out data sheet***
- ***World nuclear literature analysis for 1957***

Sixty six years of specialised publishing

AN EXPORT OPPORTUNITY

CANADA

average earnings £24 a week

BIG POTENTIAL FOR BRITISH GOODS

In 1956, capital investment in Canada reached $6,617 million. An average industrial worker's earnings are $64.69 a week; it is reckoned that Canadians' discretionary spending power is now *seven times* pre-war. And consumption may nearly double in the next ten years.

What of British goods? Between 1949 and 1956, imports from Britain rose 30% from about $307 to $400 million. But total imports rose faster—they increased by 45%. This means a *big potential sale for British goods of all kinds.*

Speaking their language

It's easy for the British manufacturer to advertise in this great market, by using the magazine that Canadians like best.

In Canada, The Reader's Digest has almost twice as many readers as any other magazine. It is the *only* publication that covers both great language groups, with separate English and French editions. And its readers are the people who matter most to you *as customers.* Your advertising in the Digest reaches more of Canada's higher-income families than in the next two magazines combined.

All over the free world, through its overseas editions, *the Digest speaks to your customers in their own languages.* It has international stature—yet keeps the local touch. In most countries it reaches the most people *and* the best prospects, at far lower cost than other magazines.

We can help you plan—here in London

If you consider advertising in Canada—or elsewhere overseas—we shall be glad to help with facts, figures and information.

Here in London you can book space in one or any combination of our 29 editions, to cover your best markets without waste circulation. You can avoid the uncertainties of remote control, and be sure of full advertising value for what you spend. A further convenience: in most cases you can pay in sterling.

If you'd like an analysis of how The Reader's Digest covers *your* areas of interest, just write or telephone: The Advertisement Director, Reader's Digest, 25 Berkeley Square, W.1 (MAYfair 8144).

29 Editions . . . 13 Languages . . .

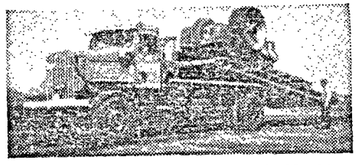
20 million copies sold every month

The Reader's Digest has separate editions covering the following markets in their own languages. (Monthly circulation in brackets.) **U.S.A.** (*11,500,000*). **Commonwealth:** U.K. (*1,100,000*); Canada (*English and French editions—925,000*); Australia (*450,000*); New Zealand (*75,000*); South Africa (*140,000*); India (*in English—60,000*). **Latin America:** Brazil (*460,000*); Spanish-speaking countries (*4 separate editions—1,175,000*). **Western Europe:** France (*1,050,000*); Belgium (*100,000*); Switzerland (*German and French editions—105,000*); Holland (*100,000*); Germany (*700,000*); Austria (*100,000*); Italy (*500,000*); Spain (*150,000*); Sweden (*300,000*); Denmark (*235,000*); Norway (*185,000*); Finland (*135,000*). **Middle East** (*in Arabic—50,000*). **Japan** (*450,000*).

All over the world people have faith in

The Reader's Digest

Albion Leyland Scammell

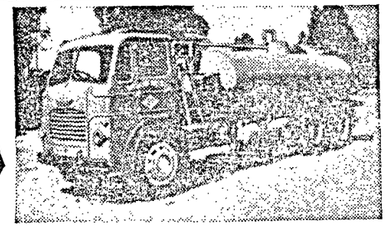


for the world's

finest vehicles ... widest range

AND BIGGEST VALUE

Leyland 'Titans', shown here operating in Madrid, are the biggest-selling double-deckers in the world.



Working in a Middle East oilfield, this Scammell 4 x 4 'Mountaineer' is self-loading a skid-mounted piece of heavy equipment.

The new 'Aberdonian' economy coach made by Albions. The unladen weight, with this 39-seater body, is only 5 tons 5 cwt. 1 qr.

The Leyland 6-wheeled 'Hippo' (19 tons gross) enjoys a world-wide popularity. Here is one with 2,000 gallon vacuum tank operating in Orange Free State.

No transport manufacturing organisation in the world can offer anything approaching the extensive range and high quality of the road vehicles produced by the famous manufacturing association of Leyland, Albion and Scammell.

Well over 100 different models come from their factories, rising from the popular Mechanical Horse and other short-haul trucks at the bottom of the scale to the outsize 150-ton multi-wheel giants employed in big engineering and constructional projects. They also make buses and coaches with seating capacities for 26 to 78 passengers.

Leyland and its associated companies combine unrivalled knowledge, experience and resources for the betterment of the transport industry. Each and every one of their vehicles is built to operate on a top-profit economy basis . . . with an after-sales service that is a nearby helping hand to customers in more than 60 countries, AND EVERY VEHICLE IS PRICED AT A FIERCELY COMPETITIVE FIGURE THAT PROVIDES THE BIGGEST TRANSPORT VALUE IN THE WORLD.

The famous Leyland 'Comet' (7-8 ton payload) sells in thousands at home and abroad. No other same-capacity trucks can show such favourable m.p.g. figures.

Power to light a city . . .

. . . when "Acheson" slows the neutron

Out of the atom comes power—power for peace—power for industry—power to light our great cities.
The tremendous speed of fission particles must be greatly reduced so that man can harness their energy. To achieve this in the Calder Hall Reactors specially pure "Acheson" graphite is used as a moderator.
In close collaboration with the United Kingdom Atomic Energy Authority, 5,000 tons of "Acheson" Graphite conforming to an exceptionally strict specification for purity were supplied from current output for the Calder Hall 'A' Reactor. This project demanded considerable production capacity backed by the highest technical skills and experience gained from many years producing "Acheson" graphite for the British Chemical, Electronic and Metallurgical Industries.
Now at the threshold of a New Age of Atomic Power, British Acheson are already ahead with immense expansion programmes to provide "Acheson" graphite for the new demands of Atomic Energy. In 1958 present capacity at Sheffield works will be increased by 200 per cent.
British Acheson Electrodes Limited is continuing to anticipate the changing trends and new demands of British Industry.

The birth of New Techniques

Continually the frontiers of science advance, and our knowledge becomes more exact. At the same time the result is that new techniques are developed, used and discarded in favour of those yet newer. In steel structures it is now possible to take advantage of the economies possible when rigid designs are made. Welding has made many of these designs possible. Cleveland's important contribution has been in helping to make fabrication for such structures practicable and economic. Manipulators and handling equipment have been specially designed to reap full benefit of the automatic welding in which the Company specialises.

AN INVITATION Our services are always available in design, in detailing, and in the costing and construction of all types of structures.

The first £10,000

SUCCESSFUL men admit that the great problem in becoming rich is to amass the first £10,000. The rest is relatively easy. We are not going to suggest that if you take the Manchester Guardian it will prove a first step towards getting-rich-quick. But it will certainly keep you well-informed on the Money Market and on affairs financial.

Excellent as are the City Page and Industrial Notes in the Manchester Guardian, they are only a part of the reason for reading it. Men of affairs will get from the other columns of the Manchester Guardian a remarkably accurate and clear picture of the whole world-situation.

Do not be deceived by a certain homespun appearance of the Manchester Guardian. In its quiet and unassuming way it is becoming increasingly the newspaper which commands the attention of thoughtful people in all countries. It is quoted with respect by many overseas papers. Dwelling somewhat apart from the ruthless race for huge circulation, the Manchester Guardian realises that strength does not lie in numbers alone.

JUST LIKE THE CONFIDENCE YOU INSPIRE THROUGH ATV

The retailer... have you got him on your side?

He's pretty shrewd, generally speaking, your average retailer. He knows quite a bit about advertising—and he can usually tell a campaign that's going to sell from one that only *sounds* good.

No wonder he perks up when he sees your product is on ATV. He spends his working day serving customers and it hasn't escaped his notice how they ask for ATV-advertised goods —*and* he knows which they are.

Yes, the retailer watches the commercials pretty closely. When he sees yours, he makes an appreciative mental note. When your salesman describes your hard-selling ATV campaign, he doesn't get shown the door. Your display material by-passes the wastepaper-basket and goes in the window. You open scores of new accounts.

An ATV advertising campaign is the surest, quickest way to get the retailer on your side. And it needn't be an expensive business either. ATV's rate structure (stabilized for a year, despite rising audiences, and closely segmented, so that you can pin-point your audience) takes care of that.

For further information and the answer to any questions, please telephone CHAncery 4488 or Birmingham Central 5191.

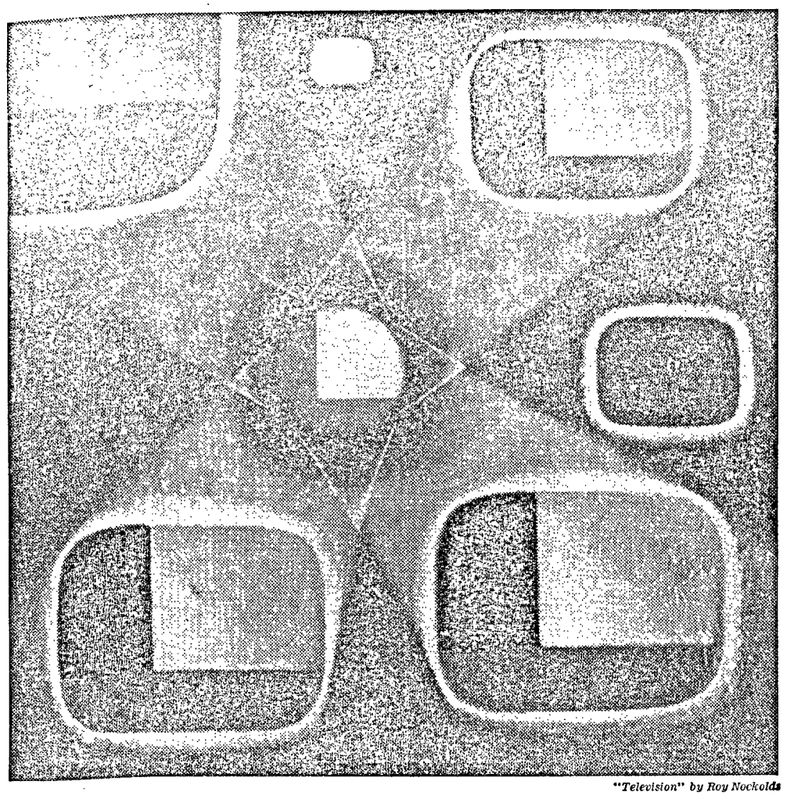
Chemicals basic to industry...

DOW

helps keep auto radiators from freezing with

DOW



You might consider chemicals such as Dow Glycols foreign to your everyday life. But actually they are almost as close as the air you breathe. If you drive a car, for instance, quite possibly a glycol-base antifreeze keeps the cooling system running properly in winter. Dow Glycols also go into ink, soap, textile lubricants, glue, cosmetics and tobacco. And for numerous other products, manufacturers choose these glycols because supply is dependable, quality is high and they are available anywhere. Your local Dow representative can give you more information, or contact the Dow branch office in your area.

R. W. Greeff & Co. Ltd., Garrard House, 31/45, Gresham St., London, E.C. 2, England.

DOW CHEMICAL INTER-AMERICAN LIMITED • Montevideo, Uruguay • Mexico, D. F. • Midland, Michigan, U. S. A. • Cable: Dowpanam.

YOU CAN DEPEND ON DOW

"Television" by Roy Nockolds

Looking back to tomorrow

One of the greatest tragedies that can befall man is the destruction of recorded knowledge. Throughout the ages men have looked back to seek in the traces of earlier civilisation, the foundations on which new knowledge could be built.

In modern times, all knowledge is recorded, to be studied and adapted for the purpose of progress in new, uncharted regions. Television today owes much to pioneers whose names are almost household words, and much to unknown scientists without whose recorded work in other fields there could be little development.

The designers of modern television receivers use electronic tubes, valves and components which have gained in performance and efficiency from knowledge and experience gleaned in other branches of electronics. That is why Britain's leading manufacturers of television receivers use Mullard products so extensively. Mullard products are used in almost every electronic application—from radar to radio, from telemetry to television—providing a great wealth of know-how on which you, as a designer or a user of electronic equipment, are free to draw.

Technical Information Services

Mullard Technical Information Services cover almost every field of electronics. If you have an applications problem, write to the address below.

Politicians' Ramp

THE City can now throw the accusations about a second bankers' ramp back in the politicians' teeth. The sober, careful and detailed report of Lord Justice Parker and his two colleagues goes as far as any document could to fulfil Mr Cameron Cobbold's hope that full inquiry into the allegations of Bank rate leak would "not only maintain, but actually enhance, the reputation of London for financial integrity." All those who participated in, or had any advance knowledge of, any of the policy decisions put into effect on September 19th are given a clean bill of honour. The result should be regarded by the whole country—which depends upon the City's reputation for more of its standard of living than it realises—as the least unsatisfactory result that was possible once the false rumours and the inquiry had been set afoot. But as the wild goose chase for non-existent evidence from Hong Kong to Watford fades into fairy tale history, three serious questions remain. They are questions which the tribunal has specifically and properly left for judgment by other people; they are now the proper subjects for newspaper discussion.

The first question, which Labour in particular should ask itself, is what on earth has happened to British public life that so many wildly damaging innuendoes against the reputations of so many distinguished public figures should have been given currency, with such complete lack of basis and (while the hunt lasted) with such obvious glee. The press and certain gossip-mongers in the stock exchange must bear part of the blame, but there was always a barrier against their hurting personalities by their excesses: they could be sued for libel or slander. The only people who could not be so sued were politicians in Parliament assembled, and from their position of privilege they had a special duty to damp down any plainly unsubstantiatable rumours. Instead, it will be the general opinion that Mr Wilson and his colleagues did all they could to dredge them up.

By the end of the hunt, Labour was actively hoping that some accusations—any accusations—of improbity against Conservatives or City financiers would be proven true. That is the only conclusion which squares with the tone of some of its parliamentary questions and with the desperately clutching interest which Mr Wilson took in stories from the flimsiest sources: sources ranging from Mr Pumphrey on the Woking train, through Sir Leslie Plummer's avid reading of a gossip column, to the report that somebody had "overheard two representatives of Japanese banks in London talking excitedly in Japanese about an impending rise in the Bank rate," and the idea that the trustees of the investment committee of the Ancient Order of Foresters' Friendly Society must have had prior knowledge of the rise in Bank rate because of certain action they took five days after it.

Most of these incidents now raise a smile. But the part of the tribunal's story that clearly still deserves something angrier than

derision is Labour's concerted campaign of smear, from the security of Parliament, against Mr Oliver Poole; in one respect, even after all the evidence was assembled, Mr Wilson made a final effort to carry on this campaign in a minor key before the tribunal itself. In one of its sharpest phrases, the Parker report stigmatises this last throw as being of "no validity."

To pick up these points will be regarded by some as merely to seize any opportunity to be rude to Labour. It is not. They would be of minor moment if they did not mirror a disturbing present trend in British political life, and one of which the Labour offenders themselves would disapprove if they would only pause for a moment from their habitually excessive political excitement to consider it. It has always been almost a duty of party politicians to portray opposing politicians as fools; but it is a new feature for them to go to such lengths to try hopefully to persuade themselves and other people that their opponents are active rogues as well. This is not a trend entirely confined to Labour; some leading Conservatives have privately been guilty of very much the same thing, particularly in their encouragement of innuendoes against colleagues who resigned because of Suez or the estimates. But the new habits represent just the sort of deterioration in public life which a man like Mr Gaitskell should regard it as his function to stop. His attitude in the debate on the report will be carefully watched; he will lose a lot of respect if he allows his colleagues to go on claiming virtue for insisting on the scotching of rumours which everybody knows they themselves fed with their malice.

THE second question which the tribunal has left open to judgment by other people is whether there should be a change in the system of appointments to the court of the Bank of England, because a director "who has other business interests may find himself in a difficult and embarrassing position." Wisely, the tribunal adds:

> Had it been our duty to express an opinion on this matter, we should, before doing so, have required exhaustive evidence as to the advantages and disadvantages of continuing a state of affairs which has so long existed. The criterion, of course, must be the national interest.

The point of view to be immediately stated here is that the national interest would not be well served if the Bank of England were turned into an enclave of whole time public servants, cut off from personal contact with the unnationalised activities of the City which it is largely its job to control and foster. This argument, and the proper degree of independence for the court of the Bank, is discussed more fully on page 325. Here it is necessary only to make one general comment. A potential clash between public and private interests occurs at almost every point of political or economic decision in a democracy; it affects all MPs who also belong to a trade association or trade union, all ministers and civil servants who hold any stocks or shares, indeed anybody who may influence any policy decision who also belongs (as he must) to any particular income group. There is no reason to suppose that directors of the Bank of England cannot reconcile their variant of this clash as well as anybody else. Moreover, the clash at the Bank (unlike some other clashes) is not of the sort liable to influence adversely actions taken by the authorities themselves. It was never really suggested before Lord Justice Parker that the private interests of Bank directors might affect public policy; that is why the wildest allegations before this tribunal were always of less serious import to the national interest than those before the Lynskey tribunal. The allegations —now disproved—were that foreknowledge of public policy might have been used to further private interests, to instigate sales which would have brought no loss to the nation but only to certain stock-jobbers. But it has now been shown, after exhaustive inquiry into a particular instance, that such sales were not instigated. If there was a case for changing the system of appointment of the court before September 19th, when this evidence was not available, the case must logically be regarded as weaker now.

THE third and final point, which the tribunal says is a matter for decision by Parliament alone, is whether ministers were wise to reveal the proposed restrictive financial measures (other than the Bank rate) to certain representatives of the press, including their own party's disguised publishing house, called the Conservative Research Department. The tribunal states merely that it "understands and appreciates" ministers' reasons for doing so.

There is a general question at issue here, to be considered before this particular case. The general question is whether it is more in the national interest that the newspaper articles which, for better or worse, are likely to do most to influence opinion at home and abroad should be written in a hurry on the basis of bare public announcements, or at a more leisurely pace after briefing by the Chancellor behind the scenes. Wisely or unwisely, there has been a trend towards the second system in every major democratic country. The selected press cannot sensibly claim any "rights" in the matter. The question is, surely, simply one of usefulness, for the minister concerned to decide; it is for him to determine whom he can usefully talk to in any particular case either to give or get views or news. As with the court of the Bank, "the criterion, of course, must be the national interest."

The particular national interest which Mr Thorneycroft thought that he was serving on September 18th was to try to enlist support for his policies and through them, as he believed, for sterling. One sort of policy decision of which the press must not be given foreknowledge, however, is any decision which might affect stock prices. For that reason Mr Thorneycroft found that he had to deceive in order to keep

his secret; those who were given this briefing certainly left the Treasury less disposed to expect an increase in Bank rate the next day than they would have been if they had not gone to see him.

It is arguable that this might have had the reverse effect to that which the Chancellor hoped for; journalists might have been humanly annoyed when they discovered that they had been given (necessarily) such a misleading half of the truth. As a cold fact of reporting, however, the support Mr Thorneycroft got for his policies from the so-called responsible press was probably greater than that he got among not dissimilar sorts of people who had not had the advantage of his briefing—witness, the adverse reaction to the Bank rate by a majority of economists at the universities. Looking back, Mr Thorneycroft's public relations tactics seemed to have been fairly successful for the object he had in view. That conclusion is disputable; but the dispute should be recognised to be one about tactics, not about any great principle.

The main lessons, then, that emerge from this whole Bank rate story are that it strengthens the case for an end to the exploitation of parliamentary privilege and for a reassessment by politicians of how far party excitements provide any excuse for abandoning normal decencies in conduct; that it weakens the case for any change in the method of appointment of the court of the Bank; and that Government public relations tactics had better remain a matter for pragmatic decision in each particular case. Let nobody encourage any further wreckage from this politically inspired storm in a teacup.

Glimpse of Eurafrica

Algeria's indigent millions depend for bare subsistence on work unlikely to be obtainable outside France. Is this relationship to be discarded, or to serve as a basis for a logical settlement?

THE biggest anomaly in the relationship between France and Algeria is seldom discerned from Paris. There, the talk is all of day-to-day issues: at present, whether the army can justifiably claim to have mastered the rebellion; how much or how little torture takes place in the prisons of Algiers; whether new arms have given the rebels new unity; whether the Moroccans, as well as the Tunisians, are conniving at the traffic in arms.

Not until the traveller reaches Marseilles does he get the full impact of the paradox. Through that bottleneck, visible before they splay out on their avocations, flow two streams of humanity, travelling one in each direction. The south-bound stream consists of young Frenchmen in uniform, off to fight in order that Algeria may remain an integral part of France. The other consists of young Algerian Moslems, all looking to African leaders who are hot for independence, yet coming north to earn (often in the jobs the young Frenchmen have vacated) so that their families may have enough to eat till next harvest.

The streams converge and pass in silence: have they nothing to say to one another? Is not this macabre cross-traffic evidence of a basis for compromise, if only both sets of participants were to accept it as a symbol that each is following leaders who ask too much?

Throughout the Algerian war, the two have crossed, purposeful as ants, with scarcely a glance at one another, because each has had planted in his head an image that is patriotic, but out of keeping with the hard facts of the second half of this century. The Frenchman has been told that he is preserving the rightful patrimony of fellow-countrymen who have made a success of an African shore that was once derelict; the Algerian, that his lot will be happier if he throws off the status of a dependant on Europe and cleaves to a nation of his own kind and continent. Yet each, if stopped and challenged to think, ought to acknowledge that his nation's first goal is a square deal for all its members—otherwise put, that both favour levelling out the inequalities that at present bedevil the Franco-Algerian scene. Carry this thought a stage further, and each would have to admit that these inequalities cannot be levelled out to his satisfaction either by France's all-out policy of the absorption of Algeria into the French body-politic, or by Algeria's independence policy that exposes it to the risk of losing privileges in France. Both ambitions are excessive.

THE main fact that makes them excessive is soon grasped if, instead of surveying Algeria's population in its two classic groups—its million European *colons* and its eight million African Moslems—it is looked at in a less conventional but more practical light. The true picture is of two social groups. The smaller of these, consisting of the million Europeans and perhaps two million of the Moslems, leads a European-type life based on the chance of a job, some training, regular meals and a prospect of betterment. The other and larger group, six million strong and wholly Moslem, enjoys none of these assets. Indeed, the number of calories it eats per head is falling because of the rate at which it is multiplying. Civilisation has impinged

on it just enough to root out the historic causes of early death (feud, pestilence and famine) but not enough to stop it from breeding against these old eventualities ; its numbers are therefore increasing at the rate of just over 2 per cent per annum—that is, it adds another quarter of a million mouths to its strength every two years but, as at present organised, adds nothing to its productivity. One of its methods of keeping total penury at bay is to utilise the right of citizenship to send breadwinners to France. There were, on the last count in June, about 200,000 Algerians working there ; sometimes there are 400,000 ; these workers (by going short themselves, which makes them less lusty employees than, say, Poles or Italians) use their earnings to keep alive upwards of 2 million otherwise indigent relations. How else are these Algerians to stay alive ?

Viewed in the context of this problem of mounting indigence, France's desire for total integration of Algeria is an overbid ; either the policy must lead to a perpetuation of inequality, and a need to hold down by force an unhappy social and biological situation for which Paris will have accepted responsibility, or else it must entail an effort to right the unbalance—an effort which, to be successful, would demand an outlay so very much larger than anything hitherto attempted that it would be bound by its very size to drag down the standard of life in metropolitan France.

But equally, Algeria's ambitions are excessive to a degree that has so far commanded little attention. The nature of the excess has lately been most sympathetically reviewed in a short and cheap book by a French ethnologist—a book that merits more notice than it has had because of the thought it provokes on the likely course of social development in Africa.* For Algeria's problems are not unique ; they are common to a number of underdeveloped, underprivileged areas (not all of them dependencies or ex-colonies) ; they are one of the results of a civilisation that makes its inroads on the traditional patterns of Africa and Asia spasmodically instead of uniformly and smoothly. What is unique about Algeria's lot is the chance hitherto open to it to earn overseas, as of right, in the way that the Irish or the Italians were able to earn in New York half a century ago. This process at the least keeps men alive and, at best, improves their lot by affording them free access to a "developed" and privileged working community—in Algeria's case, the world of French industry.

Tell an Algerian nationalist that he is at an advantage over the Tunisian or the Egyptian and he will laugh in your face. To him, they are free, whereas he is in chains. He will cut some caper learnt in Cairo that distracts his attention, and is meant to distract yours, from empty bellies and other current facts of life. But he will be wrong. He is wrong because most of the two million Algerian Moslems who have worked their way into the privileged group maintain themselves there only thanks to French enterprises ; and because, of the six million indigents in the underprivileged group, perhaps two million eat fairly regularly thanks to emigrant remittances from France, while the other four million can rely on a French dole of free food or free seed corn when an emergency is critical.

Were their leaders' quarrel with France to grow so acute as to rob the Algerians of these assets, the narrow margin between the majority and ruin would dwindle and might disappear. No one else, stepping in to arrest catastrophe, would be likely to offer openings of the same dimensions as does France, or to provide them so continuously. American net grants of non-military aid to the whole of the Middle East, South Asia and Africa in the fiscal year 1956-57 amounted to almost exactly the same sum (approximately £89 million) as French central government allocations in 1957 for development and budgetary purposes to Algeria alone.

One of the targets dear to most Algerian nationalists is a closer link with Tunisia and Morocco, but if that link were to entail a wider distribution of the privileges at present exclusively available to Algerians in France, Algeria would lose by the bargain. Already, these rivals are appearing on the French labour market under reciprocal arrangements now being reached with the Tunisian and Moroccan governments. If the Moroccan worker proves stouter, or the Tunisian more astute, than his Algerian counterpart, the chances of a livelihood for the latter's family will drop faster than ever.

Is there a way out of the wood ? By the standards of the French ethnologist already quoted, there is none if sentiment for the *colons* causes further French governments to pursue an outdated dream of preserving European privilege ; and there is also none if the Algerian nationalist temper is driven to such a pitch that the leaders forget the considerable outlay required to keep the bulk of their population alive at all. But there are middle courses between the extremes—courses that might yet be manageable if France would accept the Algerian wish for an African nationality, and if Algeria would admit the need for a link with France that preserves for it access to the French labour market until such time as it has converted its present six million paupers into productive persons—a feat it can achieve only by establishing a climate tempting to the French and foreign investor, without whom it cannot found a nation.

Dilemmas mutually confront not only the French cabinet but the nine-man Algerian National Committee. Need both go on striking their present conventional attitudes until it is too late to negotiate a Eurafrican bargain ? The cost to Africans would be psychological concessions ; to France, financial outlay that, while great, would be no greater than the present £2 million a day that is the cost of the war. Is the price too high for the only course that stands a chance of seeing them both through the morass in which each is floundering for lack of a hand outstretched by the other ?

* L'Algérie en 1957. Germaine Tillion. Les Editions de Minuit. Paris, November, 1957. 375 francs.

Germany Shortens Pace

Since 1948 the West German recovery has been one of the main elements in Europe's economic growth. The first question to be asked is whether it is slowing down.

In the past decade the German economy has provided the main thrust in the expansion of industrial Europe. West Germany's industrial production and national income, fed by the influx of eleven million refugees, have more than doubled ; its export industries have returned to a leading place in world markets. The boom has sucked in a remarkable increase in imports. The Federal Republic has become the best customer of France, Italy and Holland ; for some years it has been easily the fastest-growing market for Britain. Will this great expansive drive continue or is the "economic miracle" a thing of the past ?

The past year saw certain warning signs, signs, at least, that the German economy may not go on growing at the great pace of recent years. The real national product grew by some 5-5½ per cent, it is thought, compared with 6 per cent in 1956 and 8 per cent the year before. In the autumn the signs of slackening were particularly marked ; industrial output during the year was only 5.1 per cent greater than a year before and there was a new patchiness in industrial growth not seen since 1952. In the period January-October, output of many engineering products—machine tools, office equipment, electric generators—was actually lower than the year before. Profit margins seem to be narrowing ; several well-known firms, like the big Henschel locomotive and vehicle concern at Kassel, have been in financial difficulties. Business men, who have tended to work on slender liquid resources ever since the currency reform of 1948 wiped out all their assets, are looking more anxiously at their balance sheets. The signs of a slackening pace are real. They inspired the Bundesbank to drop its discount rate by ½ per cent on January 16th.

Some elements in the more gradual German growth are of a long term nature. Slowly, ever so slowly, full employment is creeping in, despite the continuing influx of refugees. Though unemployment in December was actually larger than a year before, shorter working hours tightened the labour market during most of the year. Industrialists now have to think twice about where skilled labour is to come from. Since the spring, too, less building has been done than in 1956 ; industries supplying constructional materials and building machinery are feeling the pinch. Though west Germany still needs two million new homes, the backbone of the re-housing problem has been broken. Housing subsidies may fall, so that the fabulous figure of half a million homes built each year since 1951 may not be repeated after this year. In industry—even in steel and ship-building, where recovery started late—"reconstruction" is long since over. And the great geographic shifts of industry that resulted from the division of Germany—the creation of a new spinning industry to replace the mills of Saxony, and the new western plants making electrical equipment—are largely complete.

Temporary factors also brought a new note of caution to industrial investment last year. Though investment continued to grow, it may have taken a slightly smaller slice of national income than the 23 per cent achieved in 1956. Some industrial investors held up their new spending until the elections were over ; and since the elections new worries have appeared. There is no disposition to cut major investment schemes ; in steel and in chemicals big new plans are going ahead ; but some business men are holding back the timetable of larger projects, waiting and watching the economic portents in the United States.

German industry, like British, is feeling the slackening of export demand both in Europe and overseas. Its highly competitive costs mean that where sales can be won on price, German exporters are not the first to lose ground. But import restrictions have already shut the door of the French market—Germany's best customer—with a clang, and restrictions in India and other countries are making themselves felt. If world trade should slump, a country that earns a fifth of its national income through exports would be hard hit. Then many smaller firms would suffer badly from their lack of liquid capital.

Yet, though mild signs of hesitation can be detected, new expansive forces promise further growth. The chief of these is growing public spending. The small size of Germany's defence bill has long drawn fire from its allies ; even if occupation and support costs are added to the new spending on the Bundeswehr, the slice that defence has taken from the national income has actually fallen since 1950. In the years 1958 to 1961, spending on the Bundeswehr should soar. Costly new weapons mean that "rearmament" may cost some 55 billion marks by 1961, instead of the 45 billion originally estimated. If the target of 340,000 well-armed men for 1961 is to be achieved, well over 30 billion marks (more than £2.5 billion) may have to be spent in the two budget years 1959-1960 and 1960-1961. Indemnities to Jews and other victims of Nazi persecution are also expected to jump up, as well as social spending—for example, the generous pensions, tied to the cost of living, which were granted in the election year. Cuts in housing subsidies and elsewhere may ease the budgetary problem.

But there is no doubt that under Herr Etzel, the new finance minister, the economy will get a greater stimulus from the budget than it did under Herr Schäffer, who garnered large surpluses in relative disregard of industry's pleas for relief.

As more men are called to arms, the industrial labour market will feel the pinch. But the influx of refugees from the Soviet zone may continue to counter this; and the great reserve of labour that still exists on tiny inefficient farms will still stream towards the towns, lured by higher wages. Labour shortage ought not to brake expansion too sharply. The investment industries seem likely to take defence production in their stride; what they cannot fit into their plans with ease will be bought abroad. And shortage of exchange reserves is not likely to check German expansion in the next few years. The two chief limits to growth will be demand abroad and, at home, the extent to which the government will seek expansion even at the risk of some price increases. Both are important limitations.

TODAY, as export orders falter, business men are wondering how much growing domestic demand may compensate for loss of sales abroad. In the last few years consumption of industrial goods has steadily risen. Wages, it is true, are still rising only roughly in step with productivity, despite the gradual tightening of the labour market, and consumption still takes barely 60 per cent of the national cake. It could well take more. Still, in the order books of the investment industries, the plans of German consumer industries—including cars—now form one of the stable elements. German workers are beginning to buy refrigerators, television sets, even cars. They are moving into the revolution in living which their British and American counterparts are already experiencing.

The German economy is unlikely to repeat in the next decade the spectacular growth achieved in the last. But it should still remain a great expansive force at the heart of Europe, achieving increases in national product of the order of 3 to 5 per cent a year. In a country whose capital assets—houses and furniture, fields and roads, as well as factories—suffered crippling losses in the war, a great deal of rewarding investment remains to be done, especially in fuel and transport. In industry, after the uninhibited expansion of recent years, there is still plenty of scope for higher productivity through rationalisation and through more selective investment. Indeed, something of a pause, a narrowing of profit margins, a canalising of investment into the most profitable channels, may be valuable. Germany's main immediate economic problem remains not the danger of recession, but the payments surplus, and the inadequacy of the capital market. These will be discussed in a later article.

Old Bailey  in the Dock

A correspondent propounds the startling theory that since 1834 most trials at the Old Bailey may have been illegal.

IN February, 1953, a man was being tried at the Old Bailey on a charge of robbery with violence, when suddenly the judge came out with an unusual and curious declaration. "I am sitting illegally," he said. And immediately he adjourned the trial till the next day. What had gone wrong? Nothing untoward had apparently happened in the court itself; nothing improper had been said; nothing that it was necessary to say had been left unsaid. The cause of the illegality was simply this. Apart from the judge himself, no alderman of the City of London could be found anywhere in the building of the Old Bailey; and the absence of the alderman was enough in itself to turn the proceedings into a mockery of the law.

For some reason that particular hearing on that particular afternoon had gone on longer than hearings at the Old Bailey usually go on. Instead of rising at four o'clock the judge had sat on till 4.40; and the alderman in attendance, thinking the day's business was over, had gone off to perform his aldermanic duties elsewhere. And apparently his departure from the building had invalidated everything that happened in court from the moment when his feet touched the pavement in the street outside. While he was in the building he had taken no part in the trial; he would in no event have had anything to say; he would not have contributed to the summing-up or been consulted by the judge in the determination of the sentence. He would just have stayed in own room, immersed in whatever business might be engaging his attention at the time. But directly he left the building the river of justice ceased to flow. Thenceforth the trial was *extra legem*.

This strange and supernatural power of sitting in one room and simultaneously administering justice in another is presumed to be given to aldermen of the City of London by the Central Criminal Court Act of 1834—the act which fixes proceedings at the Old Bailey. When a High Court judge visits the City, he takes his place on the bench not as a puisne judge but as a commissioner of *oyer* and *terminer* and as a temporary alderman of the City of London. He discharges his judicial duties exactly as he discharges them in the Strand. He is addressed by the same counsel. He is bound by the same laws of evidence. He offers the same summing-up to the jury. But he is there as a commissioner and an alderman, and his High Court judgeship is temporarily inactive.

Theoretically the judge is not sitting alone for, by the Act of 1834, he must be accompanied in the trial by at least one brother alderman. And this is where the regular alderman, who caused such confusion by going home too soon, came into the picture. There is always in attendance at the Old Bailey a real flesh and blood, whole-time alderman, who walks into the court with the professional judge and for a short time sits near him on the bench. Beautifully dressed and decorative in silk breeches and frills, this City father stops in court for a bit, looking (usually) detached and a little bored; and after a decent period he glides unostentatiously away to his private room outside the court. There he stays till he is wanted in court again. So long as he is in the building, everything is taken to be correct; but let him step out of the building for five minutes and immediately the engine of the law seizes up.

THAT was what happened by mistake in the trial of February, 1953; and four years afterwards (in October, 1957), after the prisoner had almost or completely served his sentence, the case was referred to the Court of Criminal Appeal by the Home Secretary under a section of the Criminal Appeal Act of 1907. The appeal judges dismissed the appeal on the ground (*inter alia*) that no substantial miscarriage of justice had occurred; but they did not decide that the alderman's absence from the building was immaterial. They seemed carefully to avoid that point, and it is pretty clear that they thought the judge at the Old Bailey was right, four years before, when he exclaimed: "I am sitting illegally."

It would not be suggested that in the 1953 trial justice was not done. But doing justice and acting within the law are two different things; and an earnest-minded citizen, as he compares the daily routine of the Central Court with the wording of the act under which it functions, may well feel concerned at the apparent conflict between the two. He may indeed suspect that every trial at the Old Bailey sessions is illegally conducted. This is what the act says:

> It shall be lawful for the justices of the Central Criminal Court *or any two or more of them to inquire of, hear, determine and adjudge all such treasons, murders, felonies*. . . .

That sentence surely is clear enough and its meaning unmistakable. The act does not say that a case may be heard and adjudged by one man sitting in court, so long as another man, unseen and unheard, lurks in the background. The inquiring of, the hearing, the determining, must all be done by at least two justices. And can anyone, stretch the English language as he may, argue that an alderman in the seclusion of a private room is simultaneously inquiring of, hearing and determining actions in three separate courts in other parts of the building? Or is it true that for a century and a quarter men and women have been sent to prison and to the gallows after an illegal trial?

NOTES OF THE WEEK

PARLIAMENT

Smooth Beginnings

CIRCUMSTANCES conspired on Tuesday to give the Government a happier return to Westminster than it had much right to expect. To some extent, of course, Ministers themselves contrived the circumstances; it was they who arranged the debate on the resignations for Thursday, thus ensuring a peaceful debate on Tuesday about the Cayman Islands and Turks and Caicos Islands Bill, and it was they who timed the publication of the Bank rate report for Tuesday afternoon. This report is regarded by delighted Tories as very much one in the eye for Mr Wilson. The Government was helped on Tuesday by a great display of tact by Mr Thorneycroft himself. The ex-Chancellor bustled into the House in the middle of a crowd of members the moment business began. It is quite clear that he did this to avoid any demonstration which might have greeted a later and solitary arrival; even the iron Chancellor would not otherwise thus have condemned himself to sitting through a score of extremely parochial Scottish questions.

These are, of course, early days to say that the Government has weathered the Thorneycroft crisis. Although the ex-Chancellor behaved very handsomely to his colleagues on Tuesday, he looked in ominously good fettle as he settled into the traditional seat of resigned ministers, on the corner of the third bench below the gangway. Nothing that happened on Tuesday could be more than a preliminary skirmish for the main debate on the resignations, which is taking place as this issue of *The Economist* goes to press. But the most important of Tuesday's skirmishes also went well for the Government. This was Mr Amory's first private meeting as Chancellor with the Tory backbenchers. By all accounts, he created a good impression, and for an intriguing reason. He was taken to confirm that the Government's long term thinking about the social services is on the lines of shifting more of the cost away from general taxation and on to the insurance stamp, and on to the consumer in the form of more health service charges. This is now finding favour even in "progressive" Tory circles.

Cuts to Come?

WHAT was not very clear, however, was which of two different operational plans Mr Amory was talking about. It now seems to be generally accepted that the Government has decided, after all, that it wants to introduce its long-term superannuation reforms for the elderly during this Parliament. The belief is that this will include graduated national insurance contributions expressed as a proportion of earnings; and that the scheme will then aim to secure—as Labour's projected superannuation plan pretended to aim to secure—a substantial increase in the insurance fund's surplus during the early years. Conceivably, reform of health service finance might be attempted at the same time—including perhaps a separate weekly stamp for health insurance, marked with some appropriate medical symbol.

The long-term changes in superannuation, however, could not be expected until the parliamentary session starting next October. Meanwhile Mr Amory has his estimates to present next month, and it has been widely advertised that these will be less than £50 million above this year's expected spending. But, making allowance for the rise in prices since the beginning of this financial year, for items of expenditure that rose in the course of this financial year and will have to be borne for a full twelve months in 1958-59, for increases in the number of school-children, for reportedly impending increases in service pay, agricultural support, etc., it is quite clear that the economies which Mr Thorneycroft had secured before he resigned must involve quite a considerable trimming of services. Not all of this trimming can be in defence or administration; some is bound to be in social fields that will cause a political row. Is it possible, in view of Mr Amory's remarks, that an increase in health service charges was among the Thorneycroft proposals which the Cabinet accepted, not among those it rejected? And that it is struggling with the non-Cabinet members concerned about the details of them now?

DISENGAGEMENT

One Zone Too Many

UNLIKE lightning, Mr Bulganin strikes twice in the same place: the tender spot in western public opinion that is responsive to appeals for disengagement. The proposal put forward by the Russians on Tuesday for a Middle Eastern "zone of peace," from which nuclear weapons and missile sites would be banned, follows closely upon their approval of the Polish suggestion of a "denuclearised" area in central Europe. The difference between the two is that a Middle Eastern zone would involve more serious military risks for the West, without the prospect of counterbalancing political advantages that would make these risks worth bearing.

One of the chief aims of the Soviet proposal is clearly to exclude Turkey from the list of countries in which Nato can deploy the six or ten intermediate-range missile squadrons which, in General Norstad's opinion, are necessary to keep the western deterrent effective. In itself, Turkey is not an essential link in the chain of missile bases; but it becomes increasingly desirable to have access to it as other sites within range of Russia are struck off the list. There are good arguments for keeping these weapons out of Germany to keep the possibility of a settlement of the German question open for the future. But the necessary number of sites must be put somewhere. It might even be worth while for the West to leave out Turkey and try to squeeze the sites into the remaining available countries—Holland, Italy, perhaps Cyprus—if the Russian plan offered some corresponding benefit. Does it?

Unlike the Polish proposal for Europe, it applies only to the western side of the fence, since it says nothing about any bases along the Russian side of the Middle Eastern border. However, this is not the main objection. The main thing the West would want in return for its own nuclear self-denial in the area would be a Russian undertaking not to put any more guns into Arab hands. To fix a limit to the size of Middle Eastern armouries would be a gain that might well justify the sacrifice of some potential western missile sites. But it is very unlikely that the Russians would agree to an arms embargo that did not include Turkey, and that did not also secure the removal of the existing American bases in the area. If their price for withholding their armaments from the Arab countries is not merely the West's abstention from new (nuclear) bases but also the demolition of its existing defence, then the price is too high. If European tensions were one day eased, the military importance of the Middle Eastern flank would diminish and a different situation might arise. But it is difficult to see how a genuine "zone of peace" can be established in the Middle East without first coming to a settlement about Europe.

POLAND

Mr Khrushchev Goes a-Hunting

MR KHRUSHCHEV is not normally shy of publicity. His foreign tours are usually arranged in a way likely to hit the headlines. But his trip to Poland last week and his meeting with Mr Gomulka in a hunting lodge were surrounded with utmost secrecy. The bare fact was only revealed after the event by a brief and cryptic communiqué. One reason for the caution and lack of pomp may be connected with the awkward precedent of Mr Khrushchev's visit to Poland in October, 1956, in the company of other Soviet leaders, when he made an abortive attempt to prevent Mr Gomulka's return to power. That piece of unsuccessful blackmail has left a bitter taste. Relations between the two countries have improved since then. Mr Khrushchev has reconciled himself to the existence of the Gomulka regime, while the Poles have made it plain that they will not seek to break away from the Soviet block. Yet it may have been thought that the mood in Warsaw was not yet ready to welcome Mr Khrushchev with any warmth.

The communiqué naturally proclaims that the conversations were friendly. It says nothing about their subject. The Poles have probably raised the question of their economic difficulties. The awkward position of the Polish balance of payments has been made worse by the fall in the international prices of Poland's exports, particularly its exports of coal. A Polish trade mission is now in Moscow discussing the terms for this year's exchanges and it would have been natural for Mr Gomulka to ask for special treatment to meet the emergency. Alternatively, the Poles may have tried to make it clear that their attempts to get American aid are prompted by economic and not political considerations.

But this would not have been enough to send Mr Khrushchev beyond the Soviet frontiers for hunting that he could find in Russia. His Polish trip was determined by more urgent business. It is reported that Mr Gomulka was accompanied by General Spychalski, the Polish minister of defence. The questions raised by any proposal for a great-power agreement involving Soviet troop withdrawals in eastern Europe may well have been discussed. The Russians, whatever their aims, cannot want to get to the summit in blissful ignorance of the risks as well as the gains of a potential bargain. Finally, the two sides must have pondered over the strategic and political implications of what is called the Rapacki plan, the Polish proposal for a nuclear-free zone in central Europe. It may be worth watching whether Mr Khrushchev's mysterious trip will be followed by any variations on this theme.

WAGES

The Economy's Arbitrator

WITH great practical wisdom, the London busmen duly decided last weekend to submit their pay claim to the most flexible possible form of voluntary arbitration. They have asked the Ministry of Labour to appoint a chairman to a three man committee of investigation; the other two members would be recommended respectively by the union and London Transport. In view of the common belief that London Transport may be more willing to be jostled into making some wage increase than other nationalised employers, the chairman appointed by the minister to this investigational committee will have a great responsibility; it is on him that the battle for or against wage inflation this winter may very largely depend. By Thursday afternoon an appointment had still not been announced.

Meanwhile, amid resolute assurances by the other nationalised industries that they will stand firm, and to the sound of lip-smacking among the unions, other wage claims are hastily queuing up behind the busmen's. The most interesting new claim in the past week has been the miners'. In the same week as the Coal Board rejected their claim for a national sick pay scheme and a 40 hour week, they have asked for a 10 shillings a week wage increase; this would exactly offset the rise in the cost of living and national insurance contributions since their last award ten months ago. The main reason why the miners have not asked, as in former years, for more than this is that they want this "cost of living only" claim to go to arbitration as a test case. This would provide the unions in general with a third possible line of attack on the wage restraint policy if anything did happen to delay a settlement of the bus and railway claims, or a final clash over them.

GOVERNMENT CHANGES

Junior Come Lately

OF the three new Government appointments which complete the post-Thorneycroft reshuffle, the most unqualified welcome will be given to the promotion of Mr Robert Allan. As a very able Parliamentary Private Secretary to two successive Prime Ministers (under Sir Anthony Eden he restored this unofficial post to something of its former position of importance), Mr Allan might have expected something more senior than Parliamentary Secretary of the Admiralty. But with his chief (the Earl of Selkirk) sitting in the Lords, he will at least share with a not very commanding Civil Lord all the Admiralty work in the Commons. Mr David Renton's knight's move to Under Secretary at the Home Office presumably reflects Mr Butler's need for a lawyer in that post, and the Whips' need to maintain the National Liberal quota in the Government. Mr Simon, now in Mr Enoch Powell's shoes at the Treasury, had been making a considerable name for himself as Mr Butler's junior. Mr Renton will fill the legal gap left by Mr Simon's departure; it remains to be seen whether he will also fill the gap in imaginative enthusiasm.

The third new appointment is one of the most intriguing there have been for some time. Sir Ian Horobin becomes Parliamentary Secretary to the Ministry of Power at an unusually advanced age for a first tilt at junior office—57—and after a backbench career of often caustic and always right-wing criticism of the Government's presumed weakness both at home and abroad. But the unworthy gibe from the left (based on a physical resemblance) that Sir Ian is really the late Heinrich Himmler, turned Tory MP and in thin disguise, is belied by his record of remarkable courage as a war prisoner of the Japanese and long service in social welfare. When backbench critics are promoted there is always a suspicion that the Government is buying off trouble: that, in this case, the fuel rebels, usually headed by Mr Nabarro, are now to be outfaced by a tartar of an ex-Nabarroite, but speaking from a Government brief. Sir Ian, however, has never seemed likely to stay a member of a Government which fails to live up to his high uncompromising standards. His further progress will be watched by his old comrades on the back benches with some fascination.

VENEZUELA

Filling a Dictator's Shoes

ON Thursday the clouds of censorship that had obscured events in Caracas lifted to permit the release of reports that the dictatorship of President Pérez Jiménez had been overthrown. Some of the clouds of confusion, however, remained. It is clear that the president's struggle to recapture the loyalty of the armed forces—that of the majority of Venezuelan civilians was hopelessly lost—failed sooner than most observers had expected.

Since the abortive rising, spearheaded by air force officers, at the New Year, he had dropped such unpopular members of his cabinet as Senor Vallenilla Lanz, the minister of the interior, and had sought to placate the restive soldiers by strengthening their political position; he had then surmounted, with momentary success, a challenge from his new defence minister, General Fernández; and as recently as last weekend he seemed, on the face of things, to be recovering his grip on the military machine which has been the only real source of power in Venezuela for the past ten years. Now, if the reports that a five-man military junta has established itself are correct, his fellow officers have evidently decided that the president must be thrown overboard to appease a people that has become progressively more restive since he established his one-man rule in 1952.

But have they decided anything else? In other words, is Venezuela reverting to 1952—when a provisional junta, with a puppet civilian at its head but an essentially military character, held power but lacked any long term political objective—or to 1948, when a freely elected government of

the moderate left was in office ? It will be surprising if the military men now manage to join hands with the Acción Democrática leaders of 1945-1948, such as the exiled Romulo Betancourt ; but they might manage to reach an understanding with more conservative politicians, like Sr Caldera, the leader of the Copei party, who is also now in exile. The prospects of a transition to civilian, or partially civilian, government, and the character that such a regime would take on, may very soon be indicated ; the key indicator being which, if any, of the exiles now return to Caracas —as, in similar circumstances, political exiles have lately returned to Buenos Aires and Bogotá.

NEUTRALISTS

Summits are so Bracing

No invalid ever skipped through a convalescent trip so zestfully as Dr Sukarno, the supposedly ailing Indonesian President. The tour of rest and recuperation on which his advisers despatched him earlier this month has sent him hopping nimbly from one congenial haunt of neutralism to another ; so far India, Egypt, Jugoslavia and Syria have been ticked off his list. One of his chief aims has been to enlist support for the Indonesian claim to West New Guinea. The Jugoslavs and the Arabs appear to have been happy to give him moral encouragement in what they look on as a straightforward issue of anti-colonialism ; but Mr Nehru, while declaring in general that colonialism was outmoded, added pointedly that he hoped the West New Guinea problem " would be resolved in a peaceful way."

Like that other distinguished traveller, Mr Macmillan, Dr Sukarno must now be wondering what new troubles await him on his homecoming. The latest development in Indonesia is the defection to the Sumatra rebels of the governor of the central bank, Dr Sjafruddin, who is also a leading member of the Moslem Masjumi party. Indonesia's two most expert economists have now gone over to the rebels (the other is Dr Sumitro, the former minister of finance) and the dissident colonels may now be in a position to set up an independent financial system of their own in the territory they hold.

No doubt Dr Sukarno found a refreshing change of subject in Marshal Tito's suggestion of a " neutral summit " conference to be attended only by the uncommitted countries. This particular summit, more than most, seems to hang in the clouds without visible means of support. It is not clear who would be invited to it. It would not be a purely Afro-Asian affair, since Marshal Tito would be the convener ; nor, apparently, would it include the other European neutrals like Sweden and Austria because, although " unaligned " in terms of military pacts, they are supposed to be too warmly sympathetic to the West to be properly " uncommitted." But every country on Marshal Tito's list has links of some kind, economic or political, with one side or the other, and a search for quintessential uncommittedness is liable to end up with the formula that all are neutrals but some are more neutral than others. Nor is there any obvious purpose for the conference, save that of urging on the two blocks to a summit of their own ; and that can be done just as well by the individual nations concerned. It must be suspected that the chief motive for the suggestion is the feeling of Olympian exhilaration that comes to those who sit on high and reprove the mere mortals tussling in the dust below.

EDUCATION

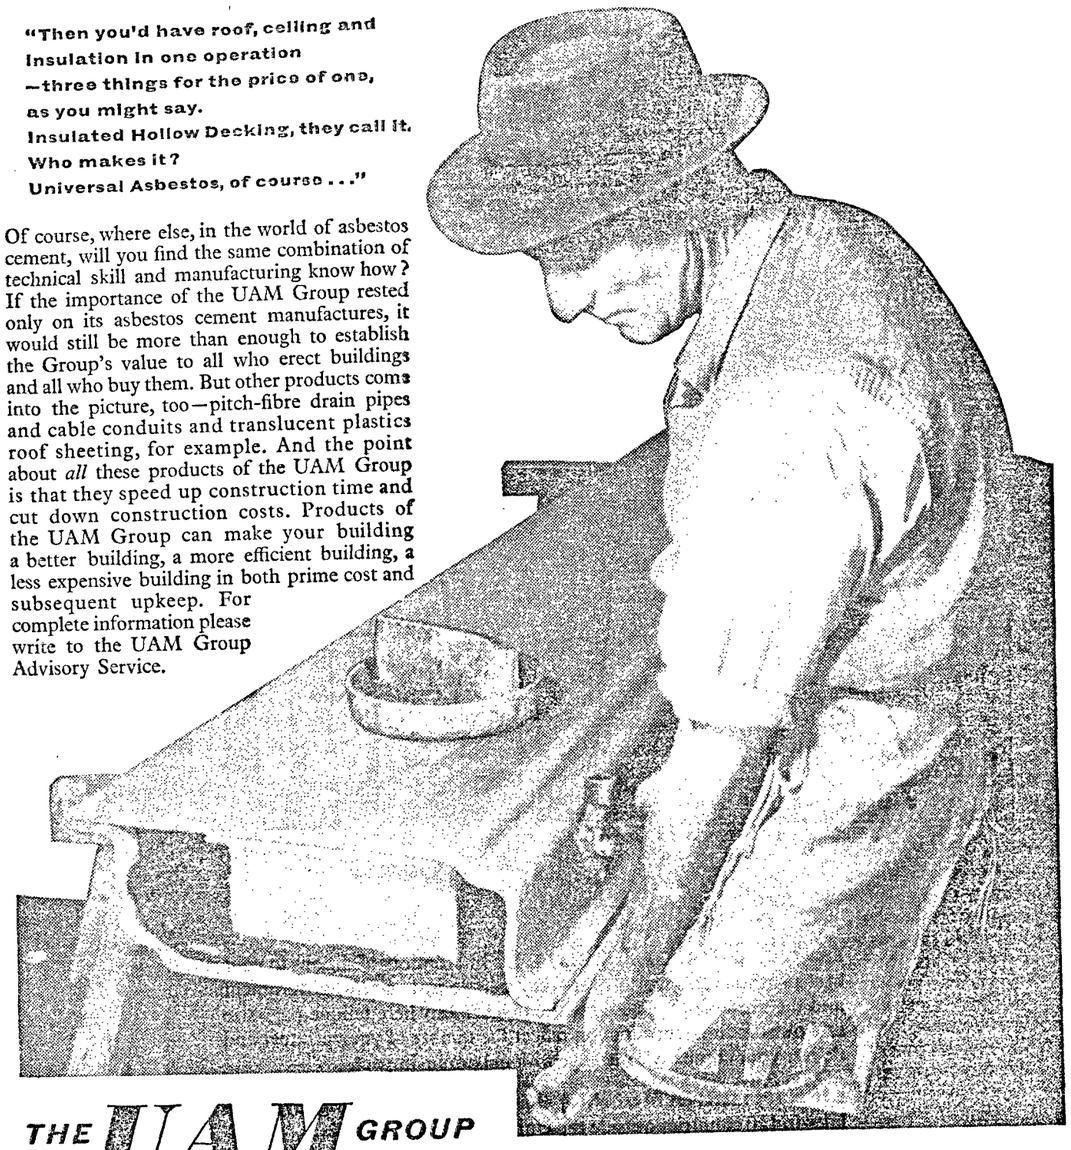
To Get a More Flexible Block

One of Parliament's main tasks between now and the presentation of the budget is going to be the detailed consideration at committee stage of the Local Government Bill, including the controversial block grant for education. As was argued in these columns on November 23rd, the case against the block grant would be much less strong if some incentive factors could be introduced into it. At the moment the only weighting factors mentioned in the relevant first schedule of the bill (factors to which the ministry will give different weightings for each block grant period) are factors wholly outside each local authority's control, such as the number of children under 15 in its area. If this schedule were amended, it should not be beyond the bounds of administrative ingenuity to weight a block grant formula—so that, for example, grants might increase as authorities get their classes down to a certain national average size, or as they make other educationally desirable improvements. The aim should not be, as under the present percentage grant, to give more Exchequer money to those authorities which already have above-average facilities ; instead, more money should go to those below-average authorities who are making positive efforts to get better.

Some Conservative backbenchers have grasped this point, and are likely to press amendments upon the Government at the committee stage. How best can they do so ? It would probably be a mistake to try to write into the schedule a demand that every conceivable educational reform should be considered as a potential weighting factor. Nobody can be quite sure as this stage which educational reforms will be most desirable all through the 1960s, and the schedule concerned is already too fussy-precise anyway. Some quite general enabling power might permit the Government, for example, to " give weight to factors which might serve to further particular objectives of its educational policy."

This might seem, at first sight, to leave too great powers of discretion in the hands of the minister. But any such amendment could be backed by a demand that the Government will produce a white paper on its proposed system of weighting at the beginning of each block grant period. Parliament could then debate this white paper ; it might indeed become the main educational debate of the year, like the defence debate on the defence white paper. Changes of this sort would be resisted as administratively almost impossible. But that is an argument that can more easily be debated when the first weighting period arrives and all the figures are available. Meanwhile the aim in amending the first schedule to this bill should merely be to keep the formula flexible ; educational reformers can bide their time to win improvements under it.

FARMING



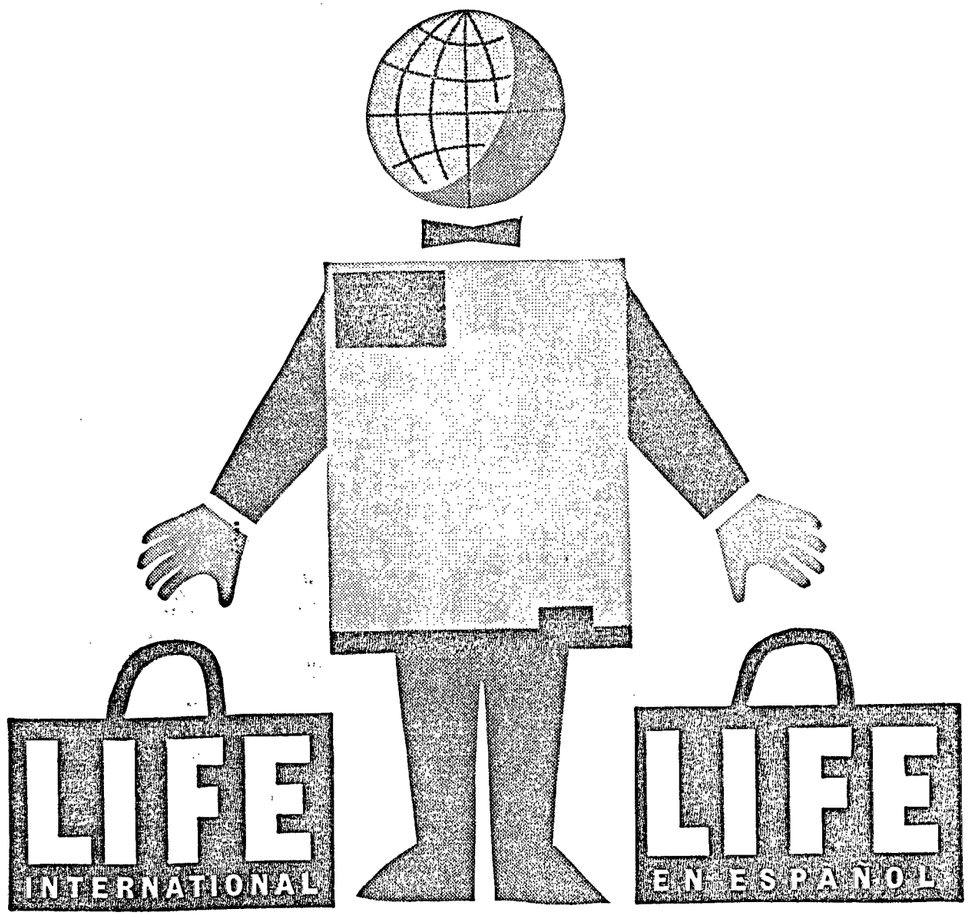
Unjubilant Jubilee

A special correspondent who attended this week's annual general meeting of the National Farmers' Union writes :

The tone of this jubilee meeting ranged from the doleful to the militant. Farming, it was repeatedly agreed *nem. con.*, is on the rocks ; farm incomes are dropping intolerably ; rising costs have been absorbed up to and

This could be over your head

"Then you'd have roof, ceiling and insulation in one operation —three things for the price of one, as you might say. Insulated Hollow Decking, they call it. Who makes it? Universal Asbestos, of course . . ."



Of course, where else, in the world of asbestos cement, will you find the same combination of technical skill and manufacturing know how? If the importance of the UAM Group rested only on its asbestos cement manufactures, it would still be more than enough to establish the Group's value to all who erect buildings and all who buy them. But other products come into the picture, too—pitch-fibre drain pipes and cable conduits and translucent plastics roof sheeting, for example. And the point about *all* these products of the UAM Group is that they speed up construction time and cut down construction costs. Products of the UAM Group can make your building a better building, a more efficient building, a less expensive building in both prime cost and subsequent upkeep. For complete information please write to the UAM Group Advisory Service.

THE UAM GROUP serves the building industry

beyond all reasonable limits; the small farmer is about to disappear, so is the horticulturist; there must be a full recoupment—preferably more than full recoupment—at next month's price review, and in one way or another imports must be cut down. The skill of Sir James Turner—sympathetic, bluff, terse, confidence-inspiring, achieving the almost impossible feat of sounding human over a public-address system—persuaded a stormy meeting not to pass a motion of censure on the Government there and then; instead the motion is to "be on the table," as a sort of ultimate deterrent, until after the price review. But Sir James will be able to present to the Government negotiators an unanswerably truthful picture of angry discontent.

At bottom, it is against the threat of redundancy that the farmers—especially the small farmers—are protesting. Again and again, from Wales, from Norfolk, from Derbyshire and from Devon, indignant speakers more or less consciously revealed their major premise: anyone who is now a farmer has the inalienable right to remain a farmer, any land now farmed is inalienably sacred to farming. How, and at what cost, these rights and sanctities are to be enforced is immaterial; by higher guaranteed prices, cheaper credit, more generous improvement grants, more effective exclusion of imports, or, as hinted in one horticultural resolution, a closed shop; they themselves are unquestionable.

A good deal of grief and much imputation of bad faith could be avoided if it were made unequivocally clear to the farming interest that for any society not willing to fossilise itself for keeps this is a completely unacceptable view. It is at present public policy—agreed by both the main political parties—that Britain's farm output shall be larger than that which pure market forces would determine. No particular component of that output, no particular area, and no particular farmer is, however, sacrosanct. Instead of demanding that each product, each area and each farmer be underwritten without limit, and backing the demand (as did successive speakers at Central Hall) with a farrago of economic nonsense, it would be better for the NFU to concentrate on a common task: that of finding the means which should keep output at the desired higher-than-market level at the least public cost. In that way it would become a force encouraging long-term maintenance of the subsidy policy; it will risk being the reverse if it deteriorates too completely into being merely a short-term pressure group.

THE MEDITERRANEAN

In Troubled Waters

LAST Sunday the *Slovenija*, a Jugoslav ship heading for Casablanca, was intercepted by the French Navy and forcibly brought to the Algerian port of Oran. There she was relieved of 150 tons of arms and ammunition before being allowed to proceed. This incident is more than an episode in an exciting smuggling game. It has already provoked angry exchanges between Paris and Belgrade and has led to a state of tension between the two countries. It also raises awkward questions, both political and legal.

The French naturally insist on the political aspect of the matter. They claim to know that the arms came from Prague and were destined for the FLN (the Algerian rebels). If the claim is true, the case of the *Slovenija* reveals the first instance of communist arms shipments directly intended for the insurgents. On this issue M. Pineau, the foreign minister, commented that France "will use all means to ensure the defence of its troops." The Jugoslavs, on the other hand, stress the legal side of the problem. They are not concerned with the origin of the cargo. The *Slovenija*, they argue, was merely an agent for a Swiss firm and a Moroccan recipient. The ship having been seized on the high seas, the French have committed an act of piracy; they should return the goods and pay compensation.

France's concern over arms that may have been destined for use against its own soldiers is understandable. But the incident emphasises two anomalies in the present French position. One is the fiction that no state of belligerency exists, which prevents the French from invoking the right of search on the high seas. To claim this right, as the French now do, up to 50 miles off their shores in peacetime is to extend the dangerous proposition of a "contiguous zone" perilously far; it is a bad precedent. The relations between France and Algeria's neighbours are the other anomaly (last week's new diplomatic wrangle with Tunisia, following a border incident, was a reminder of the state of tension). Belgrade might well suggest that it is up to the French to prevent arms from crossing Algeria's frontiers with Morocco or Tunisia. And what would have happened if the ship had belonged to a greater power than Jugoslavia? France's North African tangle presents dangerous pitfalls not only for the international lawyers, but for others besides.

DEFENCE

A Community of Three?

CO-OPERATION between the European members of Nato on arms production and development is a necessity. Yet the agreement in principle at Bonn this week by the defence ministers of France, Italy and west Germany, that their three governments will develop and produce arms jointly with a view to standardisation among them, arouses mixed feelings. This looks like the embryo of a three-power arms community. What about the rest? Britain with its developed arms industry clearly has a part to play; Western European Union, the European body which was entrusted in 1954 with the co-ordination of arms production in Europe and with the inspection and control of any arms manufacture in Germany, has not even been informed of what is going on. There has been no mention of nuclear weapons in connection with this week's meeting. But there have earlier been suggestions in France and Germany that the French, or some of them, might wish to enlist German collaboration in the French nuclear programme. Conceivably WEU might be able to control a German nuclear programme, but it is hard to imagine it controlling, in any effective way, a programme in which France and Germany were engaged jointly.

The significance of the new triple alliance can be exaggerated. Meetings between Mr Sandys and the German, Dutch and French ministers of defence had earlier produced joint working parties to co-ordinate arms development. The official British line is that the latest arrangement is but a further step in the same direction. If it is, it seems high time that a management consultant was called in to co-ordinate the co-ordinators. In fact, the inspiration of the new grouping is not wholly amiable. It results in part from French resentment against the Anglo-Saxon powers. The Germans have been reluctant to commit themselves to

backing a French-led counter-block of continental powers. Now, it seems, Dr Adenauer has given his blessing to a grouping which could become a community of three.

One reason for the German plunge may be the growing friction with Britain over the support costs issue. At the same time, it is clear that Anglo-German arms co-operation has not got very far. Some useful work is being done on rockets. But no joint production is yet planned and there are important German arms manufacturers who have never heard of the Anglo-German working group. Excellent technical grounds have been produced for the lack of German arms orders in Britain. The fact remains that a close working relationship between the ministers of defence, and between the manufacturers, of the two countries might have brought different results. Mr Sandys has been too busy fighting battles at home to develop the partnership with the continental allies. It can only be hoped that both the new trinity and Britain will work constructively to broaden the new arrangements into a wider grouping within WEU.

TRADE UNIONS

Starting at the Top

THE outcome of wage demands on the buses and in other occupations which are traditional strongholds of trade unionism will make the stuff of economic history in 1958. But this week there has been another claim that may well be a landmark in the development of trade unionism itself. The Institution of Professional Civil Servants has asked for pay increases varying from £2,350 to £275 a year for the 8,000 scientists employed by the Atomic Energy Authority. The claim for an additional £2,350 a year at the top is the largest ever made by a union ; the claim as a whole would cost £3 million a year if conceded in full and, since the authority has virtually no commercial income, the money would have to be paid directly by the Government. The institute bases its case for the increases on the grounds of the authority's inability to recruit enough men, especially those with the right qualifications for research and for the maintenance of safety ; and it cites the report of the Fleck Committee to support its point. But, as the committee pointed out, the solution to understaffing in atomic work lies as much in providing more training as more pay ; and, in any case, many will feel that what the union calls "the price of the new industrial revolution" has been put unnecessarily high.

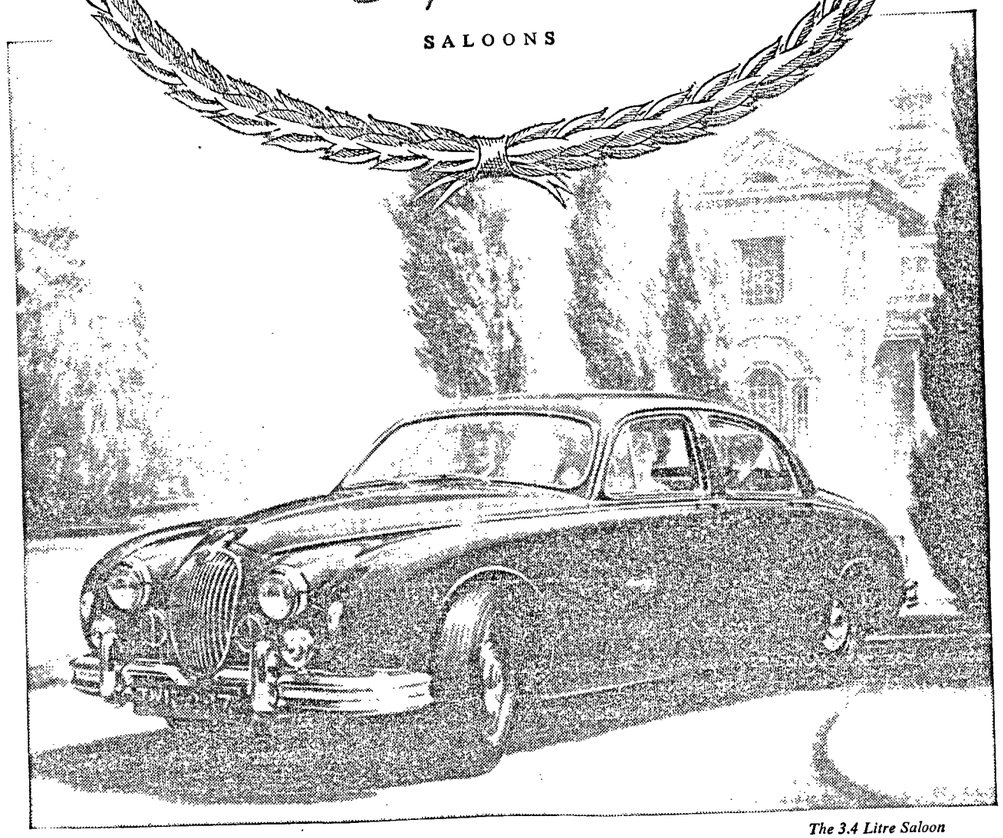
However, justified or not, it is the fact that a pay claim for top-level atomic scientists should have been made by a union at all that is the revealing thing. For those who have not looked at recent figures of increases in union membership, it may come as something of a shock to learn that the greatest strides in unionism are now being made among white-collar workers, at a time when total union membership among manual workers is only just holding its own. One potent reason for this has been nationalisation. When white-collar workers are widely scattered in comparatively small groups among different firms unionism is weak ; it is when they come together under one boss that collective bargaining grows. Another factor is that professional organisations of trained white-collar workers—teachers, professional engineers, journalists and the like—have often been formally registered as trade unions for reasons of administrative convenience. But, especially where they now bargain with the Government or a nationalised industry, these trade unions in form have often been turned into very effective bargaining trade unions in reality.

Before the national health service came into being, there was no comparison between the British Medical Association and most normal members of the TUC in the matter of bargaining ; now the association has become as tough as any in its dealings with the Government. The same applies to the farmers, the teachers and many others. Recent union successes in the civil service also suggest that the most fruitful way to recruit white-collar workers is to start by helping those who are already highly paid; it is among clerks in private employment rather than among consultants, scientists and permanent under-secretaries that collective strength is now at its weakest. The £2,350 a year claim at the top by the atom scientists—a claim which would not have been formulated in this way if atomic energy were not nationalised—is a social phenomenon whose significance should not be missed.

STOWAWAYS

The Quality of Mercy

MR BUTLER deserves credit for the curt order which he issued to his over-zealous department to right about turn in the matter of the three families of Hungarian refugees who had stowed away to London on a British vessel from Brazil. Mr Butler also did the approved thing in upholding the motives of his department in trying to evict the families from the country in the first place, and in insisting that any criticism of the force used by the police in arresting them should be directed at himself as the policemen's political chief. This performance of Mr Butler's was so much more liberal than any to which we have got used from former Home Secretaries that it may seem ungracious to follow praise with criticism. But there should be criticism of the parts of Mr Butler's statement which were clearly designed to placate the reactionaries on the Home Office staff. Mr Butler insisted carefully that "the general policy on which we conduct our immigration regulations is right," that the original decision to try to send these people back to Brazil was "in principle correct," and that he will abide by the department's past principles in future.



The Aliens Department is a prime example of a department which should never be concerned with rigid principles ; it should always be concerned with men and women. This case of the Hungarian refugees should have been considered from the first solely on its merits. Quite apart from sympathy with them as Hungarians, the fact that one of the women in the party was about to have a baby which was bound to be born a British subject even if she were deported (for the ship is British) should have made the Home Office officials a great deal more circumspect. Instead, the "principles" they followed were clearly, first, their rule book ; secondly, their department's lurking animus against aliens seeking to take the bread out of British mouths ; and, thirdly, the usual anxiety to bundle any stowaways back on the ship they arrived in (thus avoiding undue expense in deporting them later on). The hard-hearted will say these particular Hungarians pulled a fast one. Others will say that sometimes fast ones have to be let through to uphold this country's claim to be civilised and to be an asylum for some at least of the world's more enterprising unfortunates. Mr Butler, who takes the responsibility, should tell this to the aliens department.

THE

JAGUAR

3·4 & 2·4

SALOONS

The 3.4 Litre Saloon

Whether personal preference be for the 2.4-litre or the more powerful 3.4-litre model the same Jaguar characteristics exist in both. Either model offers impeccable road performance allied to comfort and refinement of the highest order. Both are available with disc brakes, overdrive or automatic transmission as optional extras. Indeed every car in the Jaguar range, including the Mark VIII Saloon and XK150 models can be obtained with Automatic Transmission.

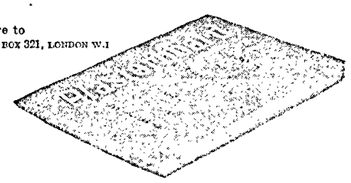
Plasterboard and Premiums

Ask your Insurance Company to quote the premium they will charge if your building is lined with plasterboard, and for comparison—the premium if you decided to use a combustible lining material.



Your premium should be less if you use plasterboard. Plain plasterboard only costs about 4d. per sq. ft. It is inexpensive as well as attracting a low fire insurance premium. Readily available throughout the country, it is strong, easy to handle and erect, and very easily decorated.

SAFE, LOW COST THERMAL INSULATION
Insulating Gypsum Plasterboard provides a high degree of thermal insulation without constituting a fire hazard. At approximately 5d. per sq. ft. for fire protection AND thermal insulation it saves money. Insulating Gypsum Plasterboard conforms to B.S.476, Class I, *and does not require any additional treatment involving further cost.*

It's the core that counts . . .

THE INCOMBUSTIBLE GYPSUM CORE OF PLASTERBOARD

SYRIA

Rift in the Left Lute

SOME Lebanese newspapers are saying that behind the scenes in Syria there is now acute rivalry between the Baath Party and the communists, whose alliance provides the hard core of the present government. The Baath is said to be aware—rather late in the day—that the communists are out to seize power. It is difficult to estimate how much substance there is in these opinions as long as the parties, the army and the *deuxième bureau* are all mixed up in the politics of the country, but there are some non-Arabs well acquainted with Syria who give credence to them.

The rivalry would not be surprising. The Baath (which means "resurrection" of the greater Arab nation) claims to be socialist but is certainly more nationalist than anything else. Men like Akram Hourani and Salah Bitar, whatever people outside Syria may think of their left-wing opinions, would not willingly be wagged to political extinction by a Moscow-led communist tail. And that fate is possible for them in Syria. Khaled Bikdash, the Levant communist leader, is an able and well-trained political operator of a quality not found elsewhere. He is, for example, not the sort of man President Nasser would knowingly tolerate alongside him.

Unfortunately, Britain and the United States are in no position to take advantage of rivalry inside Syria because they have spent a considerable amount of past effort in assuring themselves of the hatred of the Baathists. In King Abdullah's day it used to be regarded as a good thing when the Baath leaders in Jordan were thrown into desert gaols, and last spring it was essentially the Baath Party leadership that was smashed by King Hussein to the accompaniment of American applause.

The western attitude is not difficult to understand, for the Baathists were awkward people at the best of times. But to start with they were not even socialists, and it was largely because they were ostracised by the western powers that they drifted into alliance with the communists in Syria. The British Government, in fact, either had no contact, or broke, with all the nationalist groups; and that is one reason for the success that Soviet policy has had in the Middle East during the last three years. Nationalists of the Baath type are the only force capable of resisting communism, and Syria will not be saved from undue Soviet influence except by some of the people who are now in alliance with Mr Bikdash. For them to do so, however, two conditions are necessary: they must not feel that the west is implacably opposed to their ideas, and a relationship must be established with them that will permit western advice to season their policies with some experience. Arab neutralism will continue to be pro-Russian until western policies induce it to be otherwise.

PIPELINES

No Promise to Iraq

THE failure of Iraq to get an agreement in Damascus guaranteeing the security of its oil pipelines across Syria indicates the sort of influences now at work inside the Syrian government. Pipelines are still regarded as "imperialist"; there is no strong current of feeling in favour of assuring their security. As Syria's present leaders see it, they might very well have to blow up pipelines, or anything else, yet again for the Arab national cause; they hold that the Iraqi government should be quite willing to lose another £56 million in royalties (as it did when the pipelines were sabotaged by the Syrian army in 1956) for a patriotic reason.

Iraq has in fact not only made more sacrifices for the Arab cause—as when it stopped the flow of its own oil to Haifa during the Palestine war—than any other Arab country; it is perhaps the only one to have made substantial material sacrifices at all. It would make them again if the reason were good enough. But it does not want the Syrian Army to decide unilaterally what is good reason. It has therefore sought since last September an agreement with the Syrian government which would guarantee the flow of oil unless and until both governments agreed it should be stopped. The talks broke down when Syria refused to accept arbitration by the International Court regarding any disputes about the interpretation of the agreement.

The Syrian government, full of Arab patriotism, suggested that the council of the Arab League should be the

EMINENT NOVELIST

"The Warden" and "Barchester Towers" raised Mr Trollope to a very promising position among modern novelists. He had attained that degree of eminence at which a new publication becomes a matter of curiosity and interest to the whole novel-reading public. His reputation, however, stood at a critical point. One step in advance would have fixed it as a recognised and established thing, and the slightest falling-off would have materially damaged its half-fledged glory. "The Three Clerks" has not settled the question as might have been expected. It is inferior in many respects to "Barchester Towers," but at the same time it contains indications of higher powers than any that were displayed in that amusing tale. Mr Trollope owed his previous success not only to his smart, but to his really good writing. There was a buoyancy and life about his style, as well as an aptness and precision in all his expressions, that was irresistible. In "The Three Clerks" there is, perhaps, nearly as much "go," but the subtler and more delicate charms of style have sadly decreased. It bears evidences of having been written in haste, and reads as if the author had not given himself time to find the most exact and appropriate expressions for his meaning. This is unpardonable in one who has the power of writing so pointedly and so well. Mr Trollope cannot afford to be careless; such a fault in his case would be suicidal. A good style is in a certain sense synonymous with good matter. . . . As our literary wealth increases, precision of expression becomes more and more important. The broad truths of the world, the truisms, in fact, which admit of loose and manifold expression, we all know by heart. If an author would tell us anything new, he must penetrate into that labyrinth of subtler and less obvious thoughts which elude the touch of the unskilful or hasty pen,—which require to be clothed in well-fitting words in order that we may recognise the pith of their meaning. Now Mr Trollope possesses this power of exact expression to a high degree; any haste or carelessness which leads him to forgo its advantages, detracts materially both from his style and his matter. No one who has read "Barchester Towers" and "The Three Clerks" will fail to observe an unsatisfactory looseness, and consequent superficiality, of thought in the latter, as compared with the former.

arbiter. The Iraq government refused this, well knowing that states without oil are only too willing to vote for sacrifies by those that have it. Thus, if the matter had gone to the Arab League council at the time of the Anglo-French landings at Port Said, the vote might well have been in favour of bigger and better sabotage. On purely practical grounds the Iraqi proposals were in the Syrian interest, since, if accepted, they would have afforded new encouragement to the international oil companies to invest more in their pipeline systems through Syria ; the prospect of arbitration by the Arab League would not give the companies any such confidence. Still, the Iraqis are in a difficult position. They want their oilfields to be exploited more rapidly, and this involves an expansion of pipeline capacity ; yet they cannot let down "sister Syria" by agreeing to new pipelines through Turkey. So long as that is so, Syria holds the whip hand.

ESTATE OF THE REALM OR VESTED INTEREST ?

On February 8th *The Economist* will start a series of articles on the status and problems of British trade unions.

FRANCE

How Much Help?

SILENCE suggests that M. Monnet is not meeting with all the success he hoped for in his efforts to raise money in Washington. The International Monetary Fund, it appears, remains reluctant to release for France the whole of the second half of its quota—$262.5 million. France may not get more than half this remaining sum—or $131.25 million. And the help it gets from the Export-Import Bank will not all be available at once.

French officials' hopes of help from the European Payments Union, however, remain sanguine. They are seeking both a direct loan of $150 million from EPU and a $400 million extension of their "quota." Since three-quarters of EPU deficits are generally paid in gold, and a quarter covered by credit, this extension would mean, in effect, the grant of a further $100 million of credit. About $100 million of the direct loan is expected to come from west Germany, which has already made it clear that it is willing to help France.

The board of EPU, however, is carefully watching proceedings in the IMF. Both bodies are rightly anxious to ensure that their assistance is used by France, not merely to postpone the day of reckoning, but as a bridge on its way back to solvency. If the IMF finds that M. Gaillard's measures do not promise a real solution to France's problems, it will not be easy for the EPU to give way too. No one abroad, after all, can feel any certainty that France is approaching the end of its economic "tunnel" so long as the Algerian war shows no sign of coming to an end.

The choice for EPU is difficult. In the European communities which, it is hoped, will start to operate next year it will have a key role to play as a clearing house, as a source of emergency credit and, through its power over credit, as the main common agent of pressure on members to align their economic policies. Excessive generosity now could weaken the position later on. Yet it remains a political necessity to keep France going.

MENTAL DEFECTIVES

Informal Treatment

ONE major recommendation of one royal commission has actually been put into force within a few months of its being made. This is the proposal of the Percy commission on the lunacy and mental deficiency laws that, wherever possible, defectives should be admitted to mental deficiency hospitals informally, without being subject to compulsory detention and, therefore, certified.

At present, hospitals for the mentally ill can accept "voluntary" (that is, uncertified) patients, but only if the patients in question are capable of expressing a wish to enter hospital for treatment and can sign a form to that effect. They also undertake to give three days' notice of their intention to discharge themselves. Thus, the admission of uncertified patients to these hospitals is bound by the legal formalities laid down in the Mental Treatment Act of 1930. For the hospitals and institutions for mental defectives, on the other hand, there is no legal provision to enable them to accept "voluntary" patients. But this gap in the law relating to mental deficiency is now seen to put mental defectives at an advantage over the mentally ill. For although almost all defectives are at present certified when they enter an institution, there is nothing in the Mental Deficiency Act which says that they have to be. Informal admission and discharge can therefore start forthwith. For the mentally ill, who can enter the mental hospitals only under one or other of the procedures laid down by law, informal treatment will have to await legislation.

★

Defectives already in hospital will have their cases reviewed, and, wherever possible, the powers of detention over them will lapse so that their treatment will henceforward be on an informal basis. But this does not mean that large numbers of them will immediately discharge themselves ; as the Percy commission pointed out, most of them are so simple and childlike that they will accept whatever arrangements are made for them. For the minority of defectives for whom detention in hospital is considered essential for their own protection or the public's, the existing powers of certification will be used. The new arrangement will, however, considerably curtail the system of licence by which some certified mental defectives have been allowed to live in the community, with the order subjecting them to compulsory detention remaining in force so that it can be reapplied at any time. Only a small proportion of defectives are out on licence, but the system, with all the official restrictions it imposes on the private lives of defectives, has often been criticised, particularly by those who are passionately concerned with the liberty of the subject. Few will be sorry if it eventually passes into disuse.

BAHAMAS

The Bay Street Mob Again

ONCE again the peculiar constitutional arrangements in the Bahamas are in the news. Troops have been flown in, and a frigate has arrived, to maintain calm during a strike by coloured hotel workers, dustmen, taximen and shop assistants. The cause was simple enough. The owner-drivers of Nassau's taxis have for long considered that transport to and from the airport was their own, highly profitable, trade ; they resented the introduction of large-scale enterprise in the ferrying of tourists from airport to hotels. Finally they withdrew their cabs, and other workers came out in support. Something like a general strike has developed, and union leaders have not hesitated to fortify the strikers at mass meetings with strong draughts of rhetoric, such as that they are worse treated than negroes in the American south.

This has, quite naturally, led them to remember that they are free British citizens and once again to back demands for a new adult franchise. At present the Bahamas franchise is an extremely low property qualification ; but it is confined to males, and it permits plural voting. A voter with property in several islands or districts has a vote for each ; but to even this up, the vote attaches only to separate freeholds, and this means that however many people live in a building only one tenant may exercise the vote attached to it. The result is that a property-owning oligarchy, known as the Bay Street merchants, in fact controls the Legislature, which has firmly rejected all proposals to liberalise the franchise.

But grievances go deeper ; there is considerable colour discrimination in the Bahamas, and the Bahamanians in heated moments are easily persuaded that adult franchise would cure that. To some degree it might ; but what would the end of discrimination do to the island's tourist trade, which earns $38 million a year ? The tourists are as firmly in favour of segregation as the coloured workers are against it. An abrupt removal of the colour bar might also remove the tourists, leaving the Bahamas to sustain life on the sponge trade. In this matter, the Bahamas are not part of the Commonwealth, but part of North America ; it is their customers, more than the Bay Street mob, who make the rules. But theirs is an archaic constitution, and its anomalies are self-perpetuating ; the strikers' demand for a commission from Britain to report on the island is not unreasonable and should be accepted. Its terms of reference, however, should cover constitutional, social and economic issues, which are inseparable—the islanders would need to understand the implications of any changes that might be made in the name of racial equality.

POLICE

Rationalising Robert

THE first report and evidence of the Select Committee on Estimates, published last week, provides a useful critique of police organisation. The committee did not find any obvious examples of waste of public money. It did make some sensible suggestions—such as that hauliers who involve the police in extra work because they send difficult loads through the streets should pay for the help they get. But the real value of the report is the light it throws on the possibility of so organising police forces that their constabulary (and specials) could be more effectively deployed, thus reducing the "gap" between establishment and actual strengths, and reducing the considerable cost of overtime and recruitment drives.

It is perfectly obvious, as the committee says, that there are too many small police forces. Insufficient use has been made of the provisions of the Police Act, 1946, to combine forces. Since it was passed the total number in England and Wales has fallen only from 131 to 126 ; of these, three are still under 100 in strength, and 58 more under 250. It took publicity consequent on irregularities to induce the small Carmarthenshire and Cardiganshire forces to amalgamate. The tie between a police force and its local area is important, and the committee recognise the ingenuity of administrative arrangements—they are certainly elaborate—for combining a measure of central control and inspection with local autonomy. No practical policeman wants to break this territorial tie, which the locals say is potent in securing recruits and in aiding the prevention and detection of small scale crime. But crime knows no frontiers in the motor age and decentralisation can go too far ; there are for example 16 police forces in the special review area of the Birmingham-Midlands conurbation. The committee was surprised to find how rarely one area called in police from another to meet emergencies—a situation which means, for example, that Blackpool is chronically under-policed in the holiday season. Such elementary co-operation is, in fact, regarded locally almost like "calling in the army" except for purely ceremonial occasions.

There can be little doubt that peak periods of overstrain, and the wide disparity in the ratio of police to indictable offences as between areas, can only be avoided by more amalgamations. The path to that can be paved by such devices as regional crime squads and joint use of services. The problem is where the initiative is to come from at a time when the councillors of even the smallest counties try to hang on to everything they have got. If necessary the Home Office should certainly wield the big stick.

JERUSALEM

Limited Objective

MR HAMMARSKJÖLD'S Colombian mediator, Dr Francisco Urrutia, has scored a quiet success on the Mount Scopus dispute. He has damped a smouldering situation by admitting that some of the provisions of the 1949 armistice agreement between Israel and Jordan were too ambitious. The agreement called on both sides to arrange for the normal use of the "cultural and humanitarian institutions on Mount Scopus." But it was obviously impossible for the Israelis to run a university and a hospital on an enclave inside Jordanian territory. Instead Dr Urrutia has persuaded both governments to revert to the 1948 agreement, which only provided for the demilitarisation of the area and the maintenance of police garrisons. The Secretary-General's own emissaries are to be allowed to inspect the garrisons, and the United Nations is now responsible for controlling the Jewish convoy and for seeing that it gets through. This agreement compares favourably with the method adopted in another dispute on the outskirts of Jerusalem—about the Israeli tree-planting scheme—upon which the Security Council gave a ruling this week.

LETTERS

600 Submarines

SIR—*The Economist* seems to be the first British paper to make a serious attempt, in "Do 600 Submarines Matter?" in your issue of January 18th, at assessing the meaning of the huge Soviet effort made in building a submarine fleet. However, it appears to me that—as in your "Defence Brief for Nato" of December 7th last—you overlook one very serious strategic contingency, viz., that the Soviet power, as every other continental military power previously, will use its unquestioned and massive superiority in conventional land forces as its main striking bolt—and everything else it has only as powerful auxiliary weapons. The Soviets might be able to arrive on the coasts of the English Channel and the Atlantic before your rocket and nuclear deterrents can come into play. Once they are established there you will be unable to hit them from the air, lest you kill also millions of your allies in the process.

And the huge Soviet superiority in U-boats will then enable them to prevent any allied outflanking attempt by landing in the Scandinavian north or in the Middle Eastern south, as well as unexpected descents by commando or expeditionary forces on unguarded beaches of the Atlantic or the Mediterranean.

There is one further development which, I perfectly into this overall strategic picture, viz. that the Soviets are putting their main effort at developing atomic marine propulsion into giant icebreakers. These have the purpose to keep the north-east passage open to their supply fleets and navy, so that they can switch their naval forces to the east in case an attempt at forcing their eastern backdoors should be made by the United States.

Seen like this, their U-boat fleet makes strategic and tactical sense, and does not appear to be a "non-starter," conceived by "backward-looking admirals."—Yours faithfully, ERNST SCHLOSSER

London, N.8

Export Insurance

SIR—No one has greater authority to express views about export insurance than Sir Frank Nixon, who was the architect of the ECGD before the war; but may I reply to some of the points he makes in his letter?

I agree that the ECGD watches economic conditions all over the world and attempts to control its commitments by varying its rates. This method of control is not always effective, *vide* Brazil a few years ago.

I also agree that insurers carry many risks to which the law of averages does not strictly apply—insurance against loss due to the insolvency of a debtor is one of these and hail and windstorm insurance are others. Nevertheless, I maintain that when it comes to the transfer risk, the odds are incalculable, a fixed fee to cover administration with a margin for contingencies is as good as any fluctuating charge and control can best be effected by turning down risks at the appropriate time.

Finally, I do not want to appear too dogmatic as I believe that everything is to be gained by exchange of ideas between those who hold Sir Frank Nixon's views and those who hold mine.—Yours faithfully, A. N. PATRICK

Trade Indemnity Co. Ltd.

Youth Clubs

SIR—I was interested in your article "Gilded Youth," but whether young people would consider this an appropriate title is a matter of opinion. Though most of your comment is sound, I would question the validity of the statistics relating to the further education of that great majority who leave school at fifteen. While local authority registers may show your 37½ per cent at the beginning of the term, later checks reveal a very different picture. This is perhaps a reflection on the quality of the teaching, or perhaps on the choice of subjects offered.

The increase in crime rate is only to be expected. But your conclusion really poses the basic problem of young people today: the more one converses with them, the more one becomes aware of the tremendous gap between two generations—greater, I suspect, than ever before in history. By and large, they feel that we owe "it" to them and they have been abandoned, or they adopt a cynical attitude to an H-bomb world which we can hardly pretend is irrational.

Nobody with knowledge of the facts will challenge your statement that there is scope for youth club organisations. The problem, however, lies in the paucity of financial support from quarters where it should be forthcoming. Since the beginning of the last war, youth work has been regarded as an integral part of the education service. Education itself has received a raw deal from successive governments, but the unfortunate Youth Service, treated as a Cinderella, receives only £2½ million out of £500 million. In view of the vast job to be done this is not even chicken-feed.

Either we take seriously the implications of the mass of our young people virtually ending their education at the tender age of fifteen, or we ignore the whole problem and scrap an economic nonsense. Indeed, unless we are prepared to accept the fact that the Youth Service is in desperate need of much larger resources, the Government would be well advised to stop frittering away £2½ million.

The existing situation is intolerable. Our Youth Service, always undernourished, is now dying of starvation. It cannot exist without a steady influx of new people with new ideas; yet it is ironical that many outstanding men and women who would gladly join the service are deterred by the primitive training facilities, the complete lack of status, security or prospects, which accompany indigence.

Regarding your suggestion that there may be need, between now and 1964, to expand borstal facilities, no doubt you are aware of the cost of maintaining one boy in a borstal institution? The answer is precisely the same amount as would provide an adequate salary for one trained youth worker. If we gave our young people the Youth Service they need and deserve, delinquency would shrink to negligible proportions, as would other problems which now seem insoluble.—Yours faithfully,

Reigate RICHARD DAVIES

Luxury Cars

SIR—Mr Fieldhouse misunderstands the nature of the Rolls-Royce claim to excellence. It does not consist in rapidly changing models to get in first with some new development. It consists in using developments in engineering only when they have been thoroughly proved by experience, and then making them with such care that they operate more smoothly and reliably on a Rolls-Royce than when made by other firms.

As regards the particular American developments which Mr Fieldhouse mentions, only one relates in the main to the chassis, namely, air suspension. I have not tried a car fitted with air suspension, but it would have to be very remarkable to be more comfortable than the current Rolls-Royce, which can be instantly adjusted for soft or hard suspension by a switch below the wheel, soft for normal use and hard if one finds oneself approaching an awkward corner so fast as to need to check roll.

As regards the standard Silver Cloud, I know of no more perfect combination of grace and dignity of appearance, and to suggest that the vulgar horrors perpetrated by many American firms are superior seems to me to be astonishing. The only possible criticism of the Silver Cloud body is that if one opens the windows at speed there is disturbing wind buffeting in one's ears, but I find the ventilation of the car perfectly controllable with the windows shut, by means of the system of blowing in hot or cold air through ducts under the windscreen and near the floor at front and back.

If one visits the Crewe factory to place an order for a car one does not find an automatic conveyor with men working against time to complete the job before it moves on. One finds a calm quiet atmosphere with no hurry, the object being to do the job right even though it takes longer to make cars that way.

It should be considered, too, that there is first-class after-sale service behind a Rolls-Royce. At all their special retailers there is a department set aside exclusively for Rolls-Royce-Bentley work, staffed by men trained at the works at Crewe. If one sends the car there every five thousand miles everything will be attended to correctly and there is very little to do in between, there being a pedal which lubricates the chassis if given a couple of shots every two hundred miles. Finally, there is a three-year guarantee. All that a car can do for a man, a Rolls-Royce will do, quietly and without fuss.

Lastly there is one curious psychological point about the firm's cars, namely, that many, indeed I think it is most, of the cars are modestly disguised behind a Bentley radiator shell. There is no difference of any kind between a Rolls-Royce Silver Cloud and a Bentley S Series, except the radiator shell and the name, which is altered according to whether the customer dares to admit that he has a Rolls-Royce or whether he prefers to hide humbly behind the Bentley radiator disguise.

How much longer will this bit of inverted snobbery and humbug be thought necessary?—Yours faithfully,

Wolverhampton ROGER H. GASKELL

Scholarships for Surtax Payers

SIR—Your comment on the proposed foundation of scholarships for the higher income groups omits some important factors which might have been mentioned. First, the figure of £2,000 has been bandied about as the limit for supplementation. This is true only for those with no other children. Further, the scale used by the Ministry of Education is one of the few that allows the cost of private school fees (for additional children) to be taken into account. I know of no other case in the social services.

Next, these pupils have already been given an education which gives them preferential entry to the more expensive universities. This has been established beyond doubt by "Early Leaving," published by the Ministry of Education, and by Mr Kelsall's study for the vice-chancellors.

Lastly, the universities are so heavily subsidised by the taxpayer that the fees they charge represent only a small proportion of their costs. In a London medical school about four-fifths of the costs are not borne by fees and the figures are probably not dissimilar for engineering. When to these facts are added your comments that there is no evidence that such funds are needed, that they are a considerable tax-free gift, and that the whole issue of university awards is one of great complexity, one wonders whether the money might not be spent in more fruitful ways than in meeting a non-existent demand and subsidising the comfortably-off.—Yours faithfully,

Oxford JOHN VAIZEY

BOOKS

Unfinished Story in France

The Strange History of Pierre Mendès-France and the Great Conflict over French North Africa.

By Alexander Werth.
Barrie. 428 pages. 30s.

M. MENDÈS-FRANCE cuts a strange figure on the French political scene. He was prime minister for only eight months and yet he is, next to General de Gaulle, France's most famous politician. He commands merely a dozen votes in the assembly, but at each successive political crisis outsiders inquire about his chances. A dangerous "neutralist," say some of his opponents; "the father of German rearmament," reply others. "Gravedigger of the French empire" for some and the potential saviour of French greatness for others, he has been described as the most loved and most hated man in his country.

Mr Werth has used his great knowledge of the French background for the study of this controversial figure. With the help of M. Mendès-France's own reminiscences, he at first provides a brief sketch of his prewar career: a barrister at 21, a Radical deputy for the Eure constituency in Normandy four years later, Mendès was made under-secretary for finance in the second Blum cabinet of 1938. Then Mr Werth describes the war period: imprisonment by Vichy, a daring escape to England and service as an airman with the Free French. General de Gaulle prevailed on him to accept the post of commissioner of finance in the Algiers committee, and he then became minister for economic affairs in the first post-liberation government. But M. Mendès-France advocated a policy of austerity and, when his plans were rejected, he resigned. There followed nine years in the political wilderness.

Mr Werth shows how this principled behaviour, while most of his colleagues were joining in the government's game of musical chairs, earned M. Mendès-France respect and envy. Progressively he emerged, first, as the principal critic of economic cowardice, political *immobilisme* and the handling of Indo-China, and then as an unofficial leader of the opposition. He did not command a majority in the chamber, but in June 1954, after the Dien Bien Phu disaster, he was brought to power on a flood of popular indignation. His eight months' race against the clock is still remembered. First came the successful gamble to bring peace in Indo-China from the Geneva conference within a month. On the morrow, M. Mendès-France brought off another bold stroke: he offered a new deal to Tunisia, taking Marshal Juin along on this trip to silence colonialist critics. But German rearmament could not be tackled in the same way. Since the European Defence Community treaty was rejected and the Paris agreements ratified while he was prime minister, M. Mendès-France gained no friends but made new enemies by his handling of this awkward problem.

Mr Werth has written elsewhere on the EDC controversy, and so skips rapidly over the subject and turns his attention to the other tasks before the Mendès government. With his agenda so full, M. Mendès-France had no time to put his economic policy to the test. Most deputies who had taken part in previous coalitions considered this dynamic newcomer a dangerous intruder. The lobbies—both economic and North African—sounded the alarm. An ugly smear campaign was set in motion and the deputies brought the government down as soon as they thought this could be done with impunity.

Defeated, M. Mendès-France could, like General de Gaulle, have tried to use his undoubted prestige and popularity to organise a Rally. He chose instead to reform and modernise the Radical party—a Sisyphean task as Mr Werth points out. In any case, M. Mendès-France was given very little time as the general election was precipitated by an early dissolution. To counter this stroke, M. Mendès-France formed an alliance—the Republican Front—with the Socialists. No group emerged from the election with a majority and M. Mollet formed the first government of the new chamber. His first move was a disastrous trip to Algiers, where he gave in to the colonialist diehards and abandoned the electoral pledge of the Front. M. Mendès-France remained for a time in the government as a prisoner of his electoral alliance. Then, however, he resigned and resumed his role of Cassandra, warning the rulers about the disastrous effects of their policies. But his voice fell on deaf ears in a period aptly described by Mr Werth as "National Molletism," an era of jingoism that is not yet at an end.

All these events are vividly described by Mr Werth with a wealth of interesting detail drawn from French sources. But since Algeria has become the heart of the matter, he then shifts the scene to North Africa, where he himself spent a couple of months touring the three neighbouring countries. Thus, as Mr Werth's title indicates, we get two books in one. His impressions are always interesting and this Algerian travelogue is worth reading. Yet it distorts the pattern of the book. The reader is left with too many questions unanswered—for instance, about the Algerian war, its

impact on the French economy, the value of M. Mendès-France's solution or his parliamentary prospects. Mr Werth may reply that his hero has not yet said his last word, while the North African conflict will, unfortunately, continue to dominate French politics for a long time to come. It is to be hoped that he will write a sequel—or rather two sequels—to his unfinished stories.

At the Poles

Arctic and Antarctic: *a prospect of the polar regions.*
By G. C. L. Bertram.
Heffer. 123 pages. 21s.

FOR many weeks now the Antarctic has continuously been front-page news. This is unprecedented. It might be thought to be due to the improved communications of modern expeditions. But though that plays a part (and sometimes an unfortunate one), it is nevertheless true that at no previous time in the history of the world has there been so much activity in the polar regions. And equally, as the handling in the daily press of recent polar events testifies, never has there been greater need for some proportion in interpreting this activity.

This is really what Dr Bertram is setting out to do, and he does it very well in the short space he has allotted himself. No one is better qualified. As Director of the Scott Polar Research Institute from 1949 to 1956 he was in touch with a wider variety of polar endeavour than probably anyone else in the world. He has plenty of personal experience of both polar regions, where he has followed his calling as a biologist. These qualifications matter greatly, because his book is no geographical textbook, but both a very personal summary of many of the problems the high latitudes present and judgment upon them. He discusses ably such practical matters as clothing, rations, and the management of dogs, and touches upon the many different transport media that are now available. He writes interestingly on leadership and the psychological difficulties of keeping very close company with a small number of others for a long time. All this is enlivened by evident personal experience, which is not however permitted to unbalance the judgment. Throughout he distinguishes three phases—the "pioneer" before 1914, the "transitional" between the wars, and the "modern" since 1945. The commonest failing today is to think of present developments in terms of the earlier phases. (Sir Edmund Hillary's attainment of the South Pole is an obvious case in point.) The chapter entitled "Polar prospect today" moves on from the practical consideration of living and working in the cold to raise questions of motive and of politics that should be pondered by many outside the fraternity of travellers.

The book is technically a second edition of one first published in 1939, but it has been very considerably rewritten, with many new and excellent illustrations. It is to be thoroughly recommended to all who take more than a passing interest in the events now filling the newspapers.

Last Instalment

Georgian Afternoon
By L. E. Jones.
Hart-Davis. 269 pages. 21s.

IN his last chapter, with his usual mixture of gusto and detachment, Sir Lawrence Jones describes how he came late in life and almost by chance to the joys and excitements of authorship. In describing his books and plays, he modestly stops short of his trilogy of recollections, which has brought him to the knowledge of a far wider public than his previous works can have given him. It is good to know, from what he says, that their success must have given him as much pleasure as it has done to his readers.

The end of "An Edwardian Youth" left him just married and just going into business, with the first war ahead of him. His third book deals with the long years since then, and inevitably makes less of a consistent whole. The making of a man, well told, is always a story with a shape and an end; but, if that man, once made, has many interests and no one thread of activity through life, the picture defocuses when he comes to maturity. This lack of continuity is enhanced by Sir Lawrence's very respectable desire not to write about his family or his surviving friends, so that, as the years advance, the book deals less incisively with other people's personalities. But the author's strong and delightful character shines through from the first page to the last, as it did in his other two volumes. One of his main strengths as an autobiographer is that one likes him so much.

Sir Lawrence has dealt with the problem of form by giving not a continuous story but a series of studies based more on subject than the lapse of time: the war, which he saw as soldier and as prisoner, the City, deerstalking, birds, country life and shooting, such of his friends as are dead, and authorship. To those who read his earlier books, no commendation is needed; to new readers, one need only say that they have three pleasures ahead of them. At the end one feels that one has added to one's acquaintance something completely new: a highly stimulating and individual man who enjoys all the traditional pleasures, but questions them all the time.

Warts and All

A Portrait of Lord Nelson
By Oliver Warner.
Chatto and Windus. 372 pages. 30s.

NELSON was born on September 29, 1758, and the year of the two hundredth anniversary of his birth was not likely to pass unnoticed by naval historians and biographers. Mr Warner is in the van, and has written a book, which, although it adds little of importance to our information about Nelson, does present a portrait of the man, and the admiral, that will be read with profit by both the specialist and the general reader. As the author himself says, the biographer of Nelson must work on material that has been long and widely known; even if, like Mr Warner, he has had access to unused material, he must beware of giving undue stress to the trivial merely because it is new. This, and all the other perils that beset the course of the biographer of a genius who has been the subject both of unrestrained idolatry and sweeping moral condemnation, are skilfully avoided.

As an admiral, Nelson has two main claims to fame. He believed that annihilation of the enemy was the only real victory, and he established a new standard of leadership based on his own high courage and unique ability to inspire the devotion of his subordinates. Along with these virtues went faults which Mr Warner does not conceal: vanity; a tendency to unnecessary heroics; and, on a lesser scale, that professional fault of which one suspects most admirals are guilty—of interfering too much with the working of his flagship. Nelson's early career and the three great victories of the Nile, Copenhagen and Trafalgar are well described, and the general naval and political background deftly filled in. Nelson's achievements would have been impossible without the support of his seniors and the skill and gallantry of his subordinates. Among these, Mr Warner singles out St Vincent and Captain Foley. Until Copenhagen, St Vincent regarded Nelson as an eccentric genius, not necessarily fitted to take the long drawn-out strain of commander-in-chief in the Mediterranean; but the maintenance of the health and morale of his men, and of the efficiency of his ships, during the years of unbroken watching off Toulon proved that Nelson possessed qualities of administrative energy and skill equal in value to his capacity for tactical leadership.

Mr Warner's treatment of Nelson's private life is equally well-balanced. He shows that Nelson had at least one other mistress before Lady Hamilton and, by a skilful use of Nelson's letters to Emma, how she satisfied his passionate and romantic nature in ways beyond the ken of his timid and placid wife. New light is thrown on the attitude of Sir William Hamilton to Nelson's relations with Emma. Hamilton was a man of the eighteenth century world, who had virtually bought Emma from his nephew, Charles Greville, and was under no illusions about what was involved in marrying a highly successful courtesan much younger than himself. He seems to have found a curious consolation in being supplanted by Nelson, for whom he had the strongest admiration and affection. Nothing, however, can hide the suffering which Nelson's infatuation inflicted on his wife; nor can one overlook the hypocritical blindness it produced.

The book is well provided with illustrations and battle-plans, but its inade-

quate system of references is frustrating to anyone wishing to follow up the sources of Mr Warner's information.

A Poet's Symbolism

W. B. Yeats and Tradition
By F. A. C. Wilson.
Gollancz. 286 pages. 25s.

THE publishers assert this to be "as finely imaginative a piece of zetetics" as they can recall. For the reassurance of those whose Greek is rusty or non-existent, this merely means that Mr Wilson is an investigator rather than an evaluating critic, and a very thorough and enthusiastic investigator, too. His contention is that the right interpretation of Yeats's poetry and drama depends upon a knowledge of the tradition within which the poet was working—that ancient system of myths and symbols which has a wider provenance than the Christian scheme of imagery. Yeats never came to terms (as Blake eventually did) with Christianity, so one source of traditional symbols was virtually closed to him; but he could not be content with a private, arbitrary symbolism, and therefore had recourse (like Blake in his experimental years) to the esoteric tradition of Platonism, Neo-platonism, cabbalistic and alchemical learning. Yeats added to this amalgam Celtic folklore and various theosophical doctrines.

There has been some inclination on the part of critics and ordinary readers to dismiss this "system" of his as a farrago of fantasies, apt enough for the poet's purposes, perhaps, but highly eccentric and not worthy of prolonged consideration. Mr Wilson scores over these critics in being a devotee not only of Yeats but of "the perennial philosophy." His book is therefore serious in the best sense. He does really believe that symbolism of an archetypal kind conveys truth; for him, the poet's vision of the human spirit, its progress and destiny, has a vital importance for everyman, and therefore it is worth finding out the exact significance of his terms. Certainly Mr Wilson's researches—concentrated on five late plays and a handful of poems—do reveal an extremely intricate pattern of meaning. Those people who read poetry in the same temper as the orthodox devout search the scriptures will be rewarded; they will find philosophy and doctrine latent in the dramatic and lyrical utterances.

Yeats was a poet who took most earnestly his function as *vates* and seer. If he and Jung are right in their belief that archetypal symbols exist in the collective unconscious, then the response of the reader to traditional symbolist poetry should be deep, immediate and intuitive. How far is it necessary or desirable to expound the symbolism, as Mr Wilson so painstakingly does? A valid answer would be that since Yeats wrote for initiates as well as for the general public, the correct interpretation of his writings was not a matter of indifference to him; it can also be urged that his intimations of immortality were far too valuable to be misunderstood by reason of negligence and ignorance.

Farflung Fur Empire

The North West Company
By Marjorie Wilkins Campbell.
Macmillan. 295 pages. 35s.

THE Trans-Canada Highway is not yet complete, but nearly a hundred and fifty years ago a trans-continental canoe route reached from the St Lawrence 3,000 miles overland to the Pacific coast. It was the lifeline of Montreal's commercial empire, organised and operated with extraordinary efficiency and enterprise by the loose-knit and kaleidoscopic partnership of fur-trader explorers, whose story is told in this book. It is a story of fantastic adventure and high achievement. The Nor' Westers, as remarkable a group of men as any in either history or fiction, rolled back to the Arctic and the Pacific the map that the French explorers had left in 1763 when New France became a British colony. They laid the foundations of modern Canada by establishing the east-west axis of the St Lawrence across the northern half of the continent. They played an important part in the "struggle for the border" as the United States expanded westward.

They were entrepreneurs on a magnificent scale, who used the Indian canoe, dog sled, snow shoe and pemmican to build a trading system that distributed tons of trade goods from London right across the continent to Arctic and Pacific posts and returned argosies of rich furs. Their gay and hardy Canadian *voyageurs* paddled the great brigades of canoes from the St Lawrence across the continent, transporting tremendous loads past falls and rapids and over the heights of land separating the great river systems that served them as highways. It was a formidable task to organise supplies of food and trade goods along the route and to meet requirements at posts thousands of miles, and as much as two years, away. The costs were enormous, involving problems of overheads that drove competition to cut-throat and ruinous extremes, and forced, in the end, a merger in 1821 with the Hudson's Bay Company, which had the advantage of the much shorter routes to the interior from "The Bay." The successes and limitations of the North West Company provide fascinating illustrations of many contemporary problems of enterprise, competition and monopoly.

Mrs Campbell has gathered into a unified whole scattered material about the company, supplementing documents and studies already available with new material. Based on firsthand sources and personal explorations of the Nor' Wester's posts and routes, her record is a lively one; she brings to vivid life the dramatis personae of the economic and political processes with which she is concerned. She is clearly fascinated by the Nor' Westers and their exploits, and her account of the clash with the Hudson's Bay Company is frankly partisan. The book's readability is increased by the fact that its documentation is relegated to a brief "Note on Authorities"; this shows how substantial is the research it is based on.

JOHN LODWICK

the novelist, in collaboration with D. H. Young (for twenty years Gulbenkian's secretary), presents the *inside* story—much of which even the family cannot know — of the fabulous Calouste Sarkis

Gulbenkian

universally known as "Mr Five per Cent." In a brilliant series of flashlight pictures John Lodwick gives an exceptional interpretation of this fantastic man, his family and his vast commercial empire.

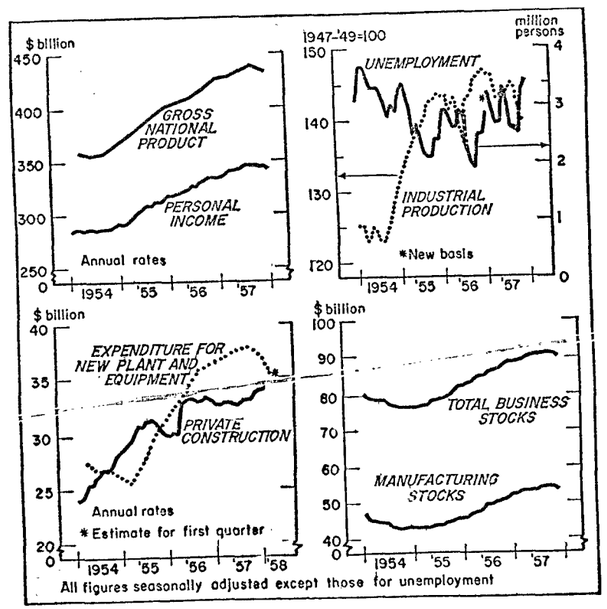
AMERICAN SURVEY



AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Beyond the Recession

WASHINGTON, DC

It is now widely accepted that the President's economic advisers are genuinely confident about the outlook for business, and that the optimism expressed in the Budget and in the Economic Report is not just window-dressing to bolster public confidence. The optimism comes opportunely. It is now a foregone conclusion that unemployment this month will reach a postwar record of about 4 million; industrial production has fallen 6 per cent since August; personal incomes, although they have dropped far less steeply than mine and factory output, are already off nearly $4 billion at annual rates, or slightly over 1 per cent. With further downward pressures to be expected from the declining rate of business investment in plant and equipment, from exports, and probably from additional liquidation of stocks, the situation would, on the face of it, invite concern.

But the President's advisers are confident, not only that the recession will be halted, but also that it will be halted by the third quarter of 1958 at the latest, and their reasoning is rather widely accepted in private economic circles. They start with what appears to be a fairly recent factual discovery: that the combined effect of defence spending and of business spending on plant and equipment determines business policy on stocks (leaving out the special case of automobiles). They conclude that, thanks to defence orders, this effect will become positive early in 1958. Thus the liquidation of stocks, which has accounted for the bulk of the decline to date, will by this reckoning soon cease, and the very arithmetic of national income accounting will produce an upturn in the economy. That is, a shift from the liquidation of stocks at an annual rate of $3 billion in the last quarter of 1957 to, say, a neutral position by the second quarter of 1958, with stocks neither rising nor falling, would be the equivalent of a $3 billion stimulus for the economy. In practical terms, it would mean, for example, an operating rate for steel of perhaps 75 per cent of capacity instead of the recent 60 per cent; it would mean that workers were being rehired and incomes rising again.

That is the reasoning in its most general terms. The analysis escapes what appears to be one important flaw by concentrating on defence orders rather than on actual spending for defence. This is not expected to be large enough this year to offset entirely the estimated decline in plant-and-equipment spending in dollar terms. But new defence orders, financed with both old and new appropriations, will be nearly 100 per cent larger in the first half of the calendar year 1958 than they were in the last half of 1957, and for the whole of 1958 will be about $23 billion compared with $17 billion for the whole of 1957. This rise should have important secondary effects on stocks.

To support their analysis, the Economic Report and the Budget mention other upward forces: a certain increase in state and local government spending on such things as highways which, together with defence, will mean that total government outlays, even in dollar terms, will rise more than business investment will fall; the impact of the new technology as a factor in slowing up the decline in business investment; the rise in the population which requires, in effect, that consumers continue to spend a high portion of their incomes (people cannot defer expenditures with a new baby in the house); the present and prospective strength of residential construction, bolstered by a recent government decision to relax credit standards for federally insured mortgages; and finally, easier money. The Administration's advisers, discussing the report, let it be known that they were dissatisfied with the help provided by the central bank and that they felt money should be made much easier. These views were expressed before the latest ¼ per cent reduction in the discount rate announced on Tuesday. But, adequate or not,

the shift in monetary policy up to now has already produced what is probably the steepest rise in bond prices in history. The new reduction in the discount rate still leaves some questions about how aggressively the central bank will pursue easier credit, but it can be expected to step in with even more dramatic action if the economic statistics continue to be gloomy.

AGAINST this background of confidence in the immediate outlook, the Budget and the Economic Report have each provided an interesting, and somewhat ironically timed, assessment of the nature of the problems the country is likely to face after the recession ends. In the Budget the President has proposed perhaps his first genuinely Republican programme: he has asked for a significant degree of disengagement from the welfare state. While details have not been supplied in all cases, the proposal as a whole is striking. Under it the President would actually reduce present programmes, or shift their financing to state and local governments or to private sources of credit, in the fields of farm subsidies, benefits for ex-servicemen, aid to the needy aged, rural electrification, slum clearance, hospital construction, improvement of rivers and harbours, military housing and vocational education.

The savings to the federal Budget from these changes would not begin to materialise until 1960, but that is also the year when the growing defence programme will demand significant increases in actual spending. The President appeared to be saying, though not in so many words, that future spending on national security is going to eat up all the revenues produced by an expanding economy at present tax rates and that, therefore, only a genuine retrenchment in domestic programmes offers any hope of future tax reduction.

It goes without saying that the chances of Congress accepting these proposals are practically non-existent. It is, to begin with, an election year and no members, outside of a handful of orthodox Republicans, would be happy about cutting "civil benefits" which affect large numbers of voters. Moreover, the Democratic party, which controls Congress, prides itself on having invented most of these programmes and will scarcely care to preside over their liquidation or limitation. As in almost every case a positive act of Congress is required to effect the change, the power of delay enjoyed by the chairmen of committees is alone enough to block the way. Nevertheless, the President's suggestions, coming at a time of economic decline, when theoretically he should want to increase rather than decrease federal spending, are a significant measure both of his confidence in the immediate economic outlook and of his belief that only reductions in domestic programmes can halt a perpetual rise in government spending.

Although the Economic Report was written at a time of recession, the problem it stresses is inflation, and specifically wage inflation. The report itself rejects the argument of organised labour that large wage increases are the best way out of the recession. In discussing the report, the President's advisers were even more emphatic. They let it be known that they feel that excessive wage demands, if successful, could be the greatest impediment to recovery. They fear that further increases in prices would stimulate consumer resistance on the one hand, and a resumption of monetary restraint by the central bank on the other.

The President's advisers explicitly accept the possibility, even the likelihood, that this year will see a recession accompanied by rising prices. More gloomily, they foresee the possibility that governmental action to check creeping inflation—which they believe should and must be checked—will, more or less permanently, keep the economy less than fully employed and growing less rapidly than it could and should. They do not pretend to know the solution. But there is little doubt that their concern about this problem of competing claims for income pressed by powerful private interests—business corporations as well as trade unions—is as great as their worry about the current contraction in the economy. It is an anxiety not confined to Washington.

Republicans Down to Earth

TO the 40,000 Republicans who met on Monday at 44 banquets in 27 states to gather strength for next autumn's congressional election campaign and to celebrate the fifth anniversary of President Eisenhower's inauguration, the speech by him which was televised to them all from Chicago must have typified the disappointment and frustration which those five years have brought to the party faithful. The occasion was supposed to inspire the Republicans for what they all know will be the uphill—and many believe the Sisyphean—task of winning control of Congress on November 4th. But Mr Eisenhower's prescription for victory was not even realistic: to define in simple terms what the party stands for—as if the disunited Republicans could agree on any terms—and to sell the party to the voters on its record of bringing the country peace, prosperity and strength—a record which did not help its congressional candidates much in 1954 or 1956 and most of which is now of doubtful validity.

Even worse, from the politicians' point of view, the President asked that the great issue which moves Americans today—the question of the national security—be kept out of the election campaign. But while he took this statesmanlike attitude above the party struggle, his closest adviser, Mr Sherman Adams, giving another of his famous demonstrations of the split Republican personality, came right down to earth, and deep into the political mud, by bitterly blaming the Democrats for every American setback in the international field since Pearl Harbour, particularly—and with some justification, since they were in charge of the Congress which cut appropriations last year—for the recent reductions in military spending.

The President, struggling to balance his Budget, had already shown himself out of touch with the facts of political life by his proposals for reducing farm price supports and outlays on electricity and water development and other public works, which will be particularly damaging to his party if the present economic recession lasts long enough to become another of next November's great issues. Already Republicans in Congress are protesting against these policies, particularly those from western states where feeling runs high on such matters and where the Democrats are counting on many election victories. But they are counting on victories everywhere and, to judge from the unusual number of Republicans who have decided not to defend their seats this year, there is real need for Vice President Nixon's exhortation to his party not to be defeatist.

Mr Reuther's New Model

IN originality and breadth of mind Mr Walter Reuther, the head of the automobile workers' union, has no trade union rival; as an expert in public relations he is also unique. This year's proposals to the motor industry are well up to the standard of daring he has set in the past, but they have an unsubstantial air compared with the solid innovations already to Mr Reuther's credit as a result of previous negotiations: the five year contract agreed in 1950 to preserve labour peace, regular increases to cover rises in productivity and the cost of living, and a much modified form of the guaranteed annual wage. 1958 was to be the year of the four-day week for five days' pay but, with the recession and a poor outlook for car sales, that model was clearly a non-starter, even though it appeals to some trade unionists as a device to "share the work." The four-day week is all too likely to come this year, but accompanied by only four days' pay.

Instead, the agile Mr Reuther has wrapped up his wage demands in a startling suggestion to the "big three" producers: that they should share their "excess profits"—defined as profits before taxes, but after retaining 10 per cent on net capital—with their workers and customers. The two small firms have no profits worth sharing. Without going into the problem of how the companies would pay their taxes—a sign perhaps that the proposal is not to be taken too seriously—Mr Reuther proposes that 25 per cent of the "excess profits" go to the firms' workers and 25 per cent to buyers of cars, leaving 50 per cent for stockholders and executives' bonuses. The managements may protest that this would be inflationary, alien to free enterprise and an invasion of their rights of property but Mr Reuther has taken the opportunity to publicise once more his sense of social responsibility.

The striking wrapping around the wage package may divert attention from the fact that its contents are unsensational. A demand for an increase of 10 cents an hour is justified as non-inflationary on the grounds of increased productivity in general and on the score that purchasing power must be raised to float the country out of its recession. Timely additions to the unemployment benefits paid by employers to supplement state benefits are also sought. But the fact that the motor workers are only thinking in terms of a year's contract—the one which expires in June was for three—is a sign that Mr Reuther does not expect much of it and hopes to return to the bargaining table with stronger cards in 1959.

Case for the Army

FROM A SPECIAL CORRESPONDENT

LIEUTENANT-GENERAL GAVIN'S publicised retirement from the Army, as well as from his post as chief of research and development, was the result of his profound discouragement at the defeat of his cherished plans for a sturdier defence system for the United States. The Army is still committed to the programme for increasing its mobility and flexibility, with light weapons of great firepower and much more efficient transport and communications, but this is certainly not being implemented as rapidly as was recommended. General Gavin expressed views which other forward-looking officers have not yet brought themselves to state publicly, but which seem likely to be elicited from them in the coming congressional hearings on the defence budget.

Last year civilian support for the thesis of these officers came from Dr Kissinger of Harvard, whose book "Nuclear Weapons and Foreign Policy" aroused interest in unexpected quarters. Like the Army's spokesmen, he believes that, because of the deterrent powers of the great missiles, a limited war is now likelier than an all-out war, and that preparations must be made accordingly. Others have pointed out that the impressive anniversary parade in Moscow last November revealed fourteen new weapons intended for the use of the Russian ground forces, some superior to corresponding western types. This proved that the Soviet Union, undeniably bounding forward with the massive weapons, is also providing radical improvements for the traditional forces.

Critical analysts of the budget for the coming fiscal year point out that the additional sums in it for defence are almost all going to massive weapons and related equipment. New contracts worth about $41.1 billion will be negotiated and actual military expenditures are estimated at $39.7 billion, against $38.8 billion now estimated for the current year which ends next June. Of the grand total, $3.3 billion will be spent on missiles, almost half on the big ballistic ones; missiles will get almost half as much as all aircraft combined and about a quarter of all the money for procurement will be devoted to missiles, compared with only 2 per cent in 1953.

The need for this additional expenditure is not questioned, for these are both the great deterrents and the means of massive retaliation. But in spite of the arguments in favour of maintaining readiness for limited war as well, the traditional forces are now losing much of what they had—one Army division (leaving only fourteen), a score of Air Force wings (mainly tactical wings supposedly replaceable by missile squadrons), a number of naval units. Moreover, there has been a slowing-down in procurement of many of the weapons and instruments which are essential to the "modernisation" which has been announced for the Army. It is getting its new M-48 tank at half-speed—only two hundred in the year, with five hundred going to allied countries; only half as many of the new armoured personnel carriers, which are essential to the Army's much publicised mobility, are arriving as had been expected; there is no sign of the needed addition to air transport; and the new all-purpose machine-guns and light rifles are being delivered too slowly by Army standards. All this adds up to a far lesser degree of combat readiness than the Army had contemplated in its planning; allotted $8.9 billion in the new budget, it is the only service which is getting less than last year. Even the reserve elements are to lose 70,000 men—and this may in fact bring more complaints from Congress than the more serious criticisms, for the reserve organisations have much influence on the legislators.

EVEN though spending on research by the services is up by over 10 per cent next year, to $2.1 billion, there is a feeling that the emphasis on having intermediate range missiles by 1959 and inter-continental ones by 1960 has led to some forgetfulness of both 1958 and of, say, 1968. The Army is now getting Hawks and Corporals; but it ought to be developing a new and improved version of the Hawk, and moving faster towards the coming

Sergeant. Moreover, the critics hold, it should also be doing active research and early development work on weapons not even clearly predictable now—precisely as it ought a few years ago to have been much more vigorously at work than it then was on the marvels now coming into existence. This applies particularly to wholly new atomic weapons and, interestingly enough, not to bigger ones, but to smaller ones.

With all the talk of thermonuclear megatons, the public has got into the habit of thinking that a mere kiloton of explosive power—Hiroshima's bomb had seventeen kilotons—is hardly worth developing, although one thousand tons of high explosive in a single package would have been regarded respectfully in pre-Hiroshima days. The fact is that an enlightened Army, thinking of mobility and flexibility and swift punches at just the right spot, could make very good use of a nuclear weapon of one-tenth or, better yet, of one-hundredth of a kiloton—and the atomic technologists are now making these possible. Such weapons could have great, although as yet unassessable, advantages of price, of transportability, of flexibility in the field and of enabling opportunities to be exploited swiftly.

Fair Play for Communism

For seven years the Subversive Activities Control Board has been holding superficially superfluous, but legally necessary, hearings to determine whether the Communist party is a "communist-action organisation" under the Internal Security Act, and whether it should be required to register as such; if the party loses, it will have to make public its list of members, who will then forfeit their rights to passports and other privileges. Twice the board has found against the party; twice its decision has been upset in the courts. The first time the Supreme Court, without ruling on the constitutionality of the Internal Security Act, decided that three of the government witnesses were "tainted" and untrustworthy. Last week the Court of Appeals in Washington decided that the Supreme Court's ruling in the Jencks case applied to hearings before administrative boards as well as to court trials and that it had not been observed by the board.

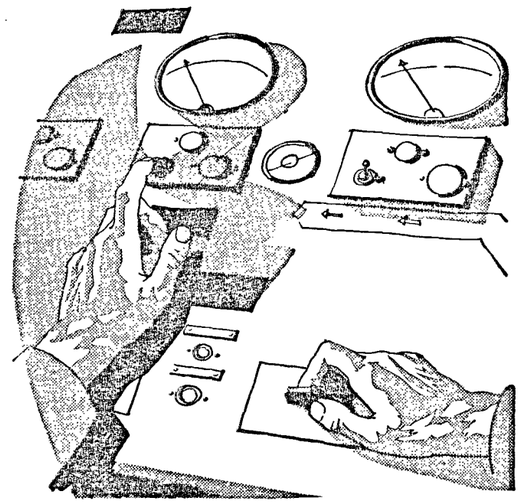
Mr Jencks was a trade union organiser who was convicted of filing a false anti-Communist affidavit under the Taft-Hartley Act. When the case came to the Supreme Court, it decided that he must have a new trial; his lawyers had not been able to test the veracity of the witnesses against him by comparing their testimony in court with their reports to the Federal Bureau of Investigation. The Department of Justice has now dropped the case against Mr Jencks, not, it maintains, because it was unwilling to comply, but because meanwhile the chief witness against Mr Jencks, the informer Mr Harvey Matusow, had recanted.

The judges last week decided unanimously that "simple justice, the requirements of fair play," demanded that lawyers for the Communist party should have access to the reports of Mrs Mary Markward, one of the government witnesses, who was an agent for the FBI from 1943 to 1949, and whose memory and reputation for truthfulness were questioned. If this decision is not over-ruled by the Supreme Court the government will have the choice of producing these reports or dispensing with Mrs Markward's testimony, and the SACB the prospect of starting a third round of hearings which, if they prove nothing else, show that today the courts guard the rights of Communists as zealously as those of any citizen.

EXPLODING CITIES—II

Race Against Decay

FROM A SPECIAL CORRESPONDENT



How to make urban pastures greener than suburban ones has become a major concern of city fathers throughout America. In order to stem the flight to the suburbs, and to lure taxpayers back to the blighted cities, new glass and steel office buildings are rising airily in many downtown districts for the first time in twenty years. Jungles of slums have been replaced by cultural centres surrounded by trees and grass and by garden flats to attract parents as good places to bring up children. Proposed through-roads, loops, and cloverleaves promise to sweep away decaying commercial districts while bringing life-giving business to the languishing tradespeople in the centres of the cities.

These are shining prospects, but unfortunately cities still appear to be deteriorating faster than they can be rebuilt. The process of bringing order out of metropolitan chaos seems to be a bootstrap operation, involving enormous amounts of the things most lacking in today's cities—money, housing, unencumbered land and strong administration. Considerable skill with the crystal ball is also needed, since mistakes in urban planning, once they are cast in steel and concrete, are extraordinarily durable as well as costly to correct. They inevitably freeze the shape of the city for years to come.

The belief is growing that, to succeed, rebuilding plans must consider the whole community. But money on this scale is hard to find. Redevelopment schemes are plagued by disputes over responsibility: should they be public or private, state or federal? There is no politically powerful urban block to champion "urbiculture," and farms and highways receive considerably more public support than cities do. The federal government has left few sources of revenue for the local communities to draw upon, to replenish treasuries suffering from the effect of blight upon the tax yield. Aid from the states would be highly desirable, but most State Legislatures are dominated by rural interests which are unmoved by the plight of the cities. Nor are the prospects promising for large-scale private investment until cities can be put on a paying basis. Federal subsidies for the construction of highways and, to a lesser extent, for public housing provide much needed money, but these are piecemeal schemes; for lack of a comprehensive plan, they may increase rather than diminish the pressure of traffic and population in areas where it is least wanted.

The federal urban renewal programme, authorised in the Housing Act of 1949, has been the chief hope of a nation-wide effort to rescue stricken cities. It offers various kinds of financial aid to enlist both government and private enterprise in a simultaneous attack on urban blight and housing shortages. In order to qualify for assistance, cities must produce for federal approval a master plan for developing the community as a whole, including proposals for re-

Mechanised Muscles

Cheap and speedy materials handling in many industries owes not a little to Simon developments in mechanical, pneumatic and fluidised conveying and in automatic process control. A Simon plant on Tyneside, for example, bunkers a million tons a year of iron ore from ocean vessels, and at the touch of a button on a control panel loads 500 tons into rail wagons in five seconds. Simon equipment loads flour from the mill into Simon bulk flour wagons and discharges it into Simon bulk bins at the bakery. Simon plants load, unload, handle and store a multitude of materials in countries all over the world. Simon engineers welcome Industrial handling problems on anything from a factory to a national scale.

constructing existing slum areas and preventing future ones, by adopting adequate building codes. A total of $1.3 billion has been appropriated by Congress for this programme, but the White House has been suspected of considerably less enthusiasm for it than Congress, which itself has just been besieged by hard-pressed city Mayors seeking a ten-year " rock bottom " programme of $350 million a year and an increase in federal participation from two-thirds to four-fifths of the cost of renewal projects.

While the Mayors were expressing their conviction that healthy cities were quite as important to the country's welfare as outer space, the release of this year's " missile " budget dropped an additional bomb on the exploding cities by proposing a reduction in federal aid during the next six years to $200 million a year, at the same time cutting the federal subsidy for individual projects to one-half. Congressional supporters of urban renewal predicted that this would effectively kill " an already crippled programme " and that Congress would produce its own plan.

The urban renewal scheme provides capital grants to cover two-thirds of the net cost of acquiring and clearing slum properties, which are then resold to private interests at a loss for redevelopment assisted by government-insured mortgages. Up to November 30th, a total of $975 million in capital grants had been reserved for 476 renewal projects in almost 300 cities, the projects ranging up to $40 million in cost and several hundred acres in scope. So far, Philadelphia leads in the completion of urban renewal projects using federal funds. The main drag on progress is the years needed to buy the land, since the money cannot be released by the government until then. In the meantime, costs mount, sponsors lose heart and those opposed think up legal difficulties.

WHILE Washington provides incentives and tools, the initiative must come from the cities themselves and depends on an intrepid mayor, actively supported by businessmen, civic organisations, brave investors and ungrudging taxpayers. This combination is rare in today's hard-pressed cities. However, the rewards of successfully reversing the process of decay are varied and dramatic. In New Haven the $200,000 now spent for police, fire protection and welfare in a 42-acre slum area will be halved when the project is completed, while revenues will be almost tripled. In Chicago, the clearance of a district of residential slums for industrial development will pay for itself in two years. At Columbus Circle in New York, the giant Coliseum exhibition hall has turned a former slum into a world attraction. In a different kind of project in New York tall buildings now house twice as many families spaciously as the previous squalid tenements did with a family to a room.

The shortage of adequate housing for people with low incomes is a major obstacle to urban renewal. Inhabitants of areas slated for clearance must be rehoused, but this is not easy when an estimated 400,000 persons a year are flooding into the big cities looking for jobs. Mr Wagner, the Mayor of New York, pointed out to a congressional committee that a single housing development used up almost two-thirds of a normal year's quota of federally subsidised public housing, but eliminated only about 1 per cent of the city's poorest dwellings and improved only 26 out of its 2,000 acres of slums. No additional public housing is provided in the Budget for the year which begins in July, though more liberal mortgage facilities are recommended to help displaced families find private housing. But if they can find no better place, they go to other slums and thus spread the blight.

There is reported to be a trickle of people back to urban life and a growing disillusionment on the part of some with suburban life. Decisions now as to what kind of buildings are built and what kind of transport is provided will determine to a large degree who comes and how. " High rise " luxury apartments attract older, wealthy couples, and " low rise " garden apartments appeal more to younger ones with small children. Already the personality of the American city is changing as its inhabitants change. There has been a decrease in manufacturing jobs and an increase in service jobs in advertising, law and finance. The suburbs can never compete with the city as a breeding place for dollars or as a meeting place for all kinds of people, for the cross fertilisation of ideas.

Railways Without Passengers?

THIRTY railway presidents marched up Capitol Hill last week to warn Congress that bankruptcy was the industry's destination unless the government came to its rescue. They marched down again without anything much more substantial than sympathy. But they left in the lap of Congress a whole casebook of chronic ailments which have become acute with the falling revenues from freight which are characteristic of a recession. The eastern railways which have to carry heavy deficits, even in prosperity, on passenger and particularly on suburban traffic, are especially hard hit. In the country as a whole, the railways lost nearly $400 million on passengers last year. The Pennsylvania Railroad, the largest in the country, expects a total deficit of $5 million in 1958 and smaller lines are proportionately worse off. Maintenance and re-equipment are having to go by the board, a vicious circle which loses more traffic.

The railways want Congress to relieve them of the rigid regulation benting the monopoly they once were, which simply cripples the lines now that they carry less than half the country's freight and only about a third of its passengers. Today the Interstate Commerce Commission will not let them lower freight charges if this would take business from the lorries ; state regulatory agencies delay the abandonment of unprofitable services and empty stations (the New York Central has lost enough on one service, while its case was pending, to buy a new Chevrolet for each indignant commuter) ; the railways are not allowed to diversify by taking to the air or to the roads, and often are refused permission to merge ; they are heavily taxed, but enjoy none of the free government benefits showered on the airlines and road hauliers, their bitter competitors.

Greater economic freedom might satisfy the prosperous freight-carrying railways of the South and the West, but by itself it would not arrest the decline of most of the eastern railways, unless they are allowed to throw their passengers overboard, something which is inconceivable today, although it may come nearly to that in the end. Subsidies, either direct ones for suburban lines, or in the form of government aid to secure new equipment, are favoured

by most of the eastern lines. But government aid looks like the thin end of the wedge of government ownership to luckier railways. This may bedevil a solution when Congress comes to grips—as it soon must—with the problem of whether the railways are worth saving.

Cotton Helps Itself

FROM A CORRESPONDENT IN ARIZONA

A RECORD number of 1,700 cotton men—farmers, ginners, seed crushers, merchants and textile manufacturers—gathered at Phoenix last week for the National Cotton Council's annual conference, held west of the old cotton-growing belt for only the second time. While the womenfolk were being shown the young, fast-growing city of Phoenix and other attractions of dry, sunny Arizona, the men crowded into the conference rooms, lobbies and bars of the Westward Ho Hotel to consider how cotton could expand its markets. But not all the time; the men, too, shared in the lighter side of events, notably a mammoth barbecue complete with Indian dancers and cowboy band.

Since the war American consumption of cotton has been squeezed between two groups of competitors: on one side, the glittering and ever-changing array of durable goods—TV sets, refrigerators and electric mixers—all offered on easy payment terms; on the other, rayon and synthetic fibres and non-woven fabrics like paper, all backed by vigorous sales promotion and research. The result of this—and of the fact that spending on textiles, like spending on food, is relatively inflexible and does not go up proportionately with rising incomes—is that the American public has been devoting a smaller share of its total spending to textiles generally than before the war and a smaller share of its spending on textiles to cotton fabrics.

In the last year or two all sections of the cotton business have begun to realise that more money must be found for sales promotion and research. It is hoped that the council's expenditure on these can be doubled this year; thanks to higher contributions from members, its receipts in 1958 will be nearly $2.5 million, compared with $1.6 million last year. The annual cotton fashion awards, national cotton week, and the Maid of Cotton are now to be reinforced by the launching of a national Little Miss Cotton, who will tour the country with a complete wardrobe of back-to-school clothes made out of cotton.

The makers of rayon and synthetic fibres spend nearly five times as much on research as does the cotton industry, though the volume of their output is only half as large. Moreover, these expenditures are concentrated among a few big companies, while cotton's research efforts are widely diffused among hundreds of mills and other agencies. The council intends to initiate a special programme of research on behalf of the entire industry and, in company with other textiles interests, including producers of synthetic fibres, it is also seeking to expand the market for all woven fabrics. One suggestion is that the textile industry should take a tip from the makers of durable goods and, by more frequent changes of design, style and colour, quicken the obsolescence of its products. According to the head of one retail chain,

> it should be as important to change the draperies, upholstery and floor coverings as to discard a refrigerator that still runs perfectly.

But the council is aware that none of these programmes can be fully effective as long as cotton prices remain relatively high. Though rayon staple, the main competitor, sells at only a few cents a pound less than cotton, a study by the council suggests that, over about two-thirds of the market for cloth, rayon's real price advantage to the spinner, after making allowances for differences in quality, cost of transport and wastage, is from six to ten cents a pound. The need for lower prices and the possibility, if this year's crop is hit by bad weather as was 1957's, of an acute shortage of good quality cotton prompted the directors of the council to take the unprecedented step of proposing a resolution on policy for growing and pricing of raw cotton; thanks to elaborate preparations behind the scenes, this obtained the support of all those present except for a minority of farmers.

The leaders of the council have in mind a system that would allow low-cost farmers to increase the land they may plant to cotton, if they are prepared to accept a substantial cut in the level at which the government supports cotton prices; the high-cost farmers fear that this is the thin end of a wedge which would force them to stop growing cotton altogether. The Administration seems to be thinking along the same lines as the Cotton Council, to judge from the President's agricultural message last week; but reactions to it show that most Congressmen are in sympathy with the views of the high-cost farmers.

SHORTER NOTES

Senator Neely, the Democrat from West Virginia who died last week, will probably be succeeded by a Republican since the Governor of the state, who will appoint a successor to fill the seat for the rest of this session, is a Republican. But this is not so serious for the Democrats as it would have been a few months ago, before Wisconsin's unexpected choice of a Democrat to take Senator McCarthy's place gave them a majority of four votes; they will still have 49 seats to the Republicans 47.

* * *

The steel industry has long felt that there were drawbacks to its policy of assessing activity in the industry primarily by the percentage of capacity being used in a given week, since this figure varies not only with current output but with changes in total capacity; for instance, on this basis an operating rate of 80 per cent this year would yield over 112 million tons of steel, 37 million tons more than would have been produced by operations at that rate in 1948. Therefore in future the American Iron and Steel Institute in its weekly figures will emphasise the actual tonnage produced and the index of 1947-49 production; it feels that this method will give a clearer picture of the real state of the industry.

* * *

This month has seen the peak of a campaign to induce all Americans under forty to have injections of the Salk vaccine against poliomyelitis. There are said to be 37 million people in this age group who have had no injection at all and 44 million who have had only one or two instead of the necessary three doses. Meanwhile, stocks of the vaccine, remaining unused for six months or more, are being destroyed in large quantities.

THE WORLD OVERSEAS

Mr Pearson's Cruel Choice

FROM OUR CORRESPONDENT IN OTTAWA

THE debut of Mr Lester Pearson as leader of the Canadian Liberal party has intensified doubts whether international statesmen can turn into domestic politicians. Mr Pearson's eventual choice as Liberal leader has been a lively possibility ever since he first went into politics in September 1948; it has been a probability since 1952 when he refused to become Secretary-General of Nato and a virtual certainty since the Liberal defeat last June. One section of Liberal MPs and political organisers always preferred Mr Walter Harris, the former finance minister in Mr St. Laurent's cabinet, because he could not be suspected of being aloof from the necessities of local politics; he was, however, eliminated last June when he lost his seat.

The only rival contender for the leadership, therefore, (apart from Mr Maverick, the Presbyterian minister who is mayor and member for Portage La Prairie, Manitoba, and who received one vote) was Mr Paul Martin, the bilingual member from Windsor, Ontario, who was minister of health and welfare under both Mr Mackenzie King and Mr St. Laurent. Before last week's Liberal convention he was expected to withdraw. Instead, he organised a reasonably impressive claque on the lines of American conventions, with large buttons and placards and bands, and he himself embarked on a formidable campaign of handshaking which proved he was no egghead. This put Mr Pearson in a difficult position right from the start. Canadian party conventions are held only when a new leader has to be chosen. This was the Liberals' fourth since 1867. So the constituency delegates, especially those from the more extroverted western areas, arrived eager to promote the influence of "grass" against "brass," as they liked to put it. Discontent with the central direction of the party from its Ottawa headquarters was natural after the election débâcle. It led to the convention insisting on quadrennial policy conventions of the party organisation to meet outside Ottawa.

With delegates in this mood and with Mr Paul Martin setting a tough pace in backslapping, Mr Pearson obviously felt obliged to put up a show for the grassroots too. Nevertheless, his nomination speech still showed some of the egghead. Things he really wanted to say were stated as though in a diplomatic note, mainly by suggestion or implication. Mr Martin immediately followed with a characteristic fighting political speech. Mr Pearson was told he had been a flop, although it made no difference to the voting, which gave him a ten to three majority over Mr Martin. But he must have felt obliged to make an acceptance speech that proved him to be a fighting politician. He made that kind of speech. It appeared to please convention delegates, but a significant number of admirers regretted his determination to show he was not Adlai Stevenson. They picked on various twists which other politicians might have got away with and told him he should not try to be a stump orator.

In this uncertain atmosphere, Mr Pearson had to face a cruel choice when he first appeared as Leader of the Opposition in the House of Commons last Monday. The Liberals had their last chance to move an amendment of no confidence on a supply motion. The trouble was that if they framed a motion which the smaller parties, the CCF and the Social Credit, were likely to support, they could defeat the government and plunge themselves into a general election which the government wants much more than they do. The course Mr Pearson took was to move an amendment in terms which other parties could not accept and which the CCF leader, Mr Coldwell, ridiculed. Mr Pearson invited the government to resign and to recommend giving his own party a chance to form a government without an election. Mr Coldwell pointed out that the Liberals had told the Governor-General in June that they could not carry on the government, and since then they had lost two seats to the Conservatives. It was not surprising that no one voted for Mr Pearson's amendment except 95 Liberals; 150 members from all other parties voted against.

But the vote was mere anticlimax. The real lesson, which seemed all of a piece with the story of last week's convention, lay in the merciless slaughter of Mr Pearson's first speech as Opposition leader. Mr John Diefenbaker gave a display of forensic oratory such as the House of Commons here has not heard in many years. He had correctly anticipated the main lines of Mr Pearson's attack, which were the current unemployment and the alleged deterioration of foreign trade relations. There was admittedly plenty to mock at in the Conservatives' uncertain course in pursuit of a fifteen per cent diversion of trade to Britain. But Mr Pearson had no fresh barbs to add to the goad, and he spent more time deploring the Conservatives' attitude to the United States; he even suggested that the new restriction on oil imports from Canada was a result of it.

Here Mr Pearson was on much weaker ground and Mr Diefenbaker merely read extracts from the speech made by the Liberal leader at San Francisco last July, which appeared to say the same things he was now attacking the Tories for saying. Similarly, it was manifestly unfair to blame the Tories for the present unemployment, which is a result of the end of the boom and had been foreseen well before the Liberals left office. Mr Diefenbaker answered this case with a manœuvre which was devastating in debate but the propriety of which is being questioned. He read a confidential memorandum, written last March by some of the government's expert advisers, which predicted the course events have now followed. Whether it was proper to produce a privileged document in this way may be uncertain. It was certainly unfair to present it as the government's only official

advice, when at the time it was a highly contentious view bitterly opposed by the Bank of Canada and other economists who still considered inflation the greater danger. But as a weapon to destroy Mr Pearson's first major attempt as a fighting political leader, it could not have been better.

Mr Diefenbaker has scored his first overwhelming parliamentary success. His one disappointment is that he evidently will have to choose his own moment for dissolution. It might well come as soon as the business of the present session can be completed. There is only one major bill left and few departmental estimates. Once they are out of the way there is no reason to keep this parliament in being unless it is to meet for the new 1958 session. A minority government has become very tiresome both to itself and to most Canadians. The Conservatives have such a good chance of securing an overall majority that they want to get the election over as soon as possible. On his opening form the Nobel prize winner and expert international negotiator will not present a very formidable challenge on the home front.

Problems of a Dying Parliament

FROM A CORRESPONDENT IN ROME

It is in the last days of a dying parliament that the inadequacies of a written constitution become apparent. As the second legislature of the Italian Republic draws to its end, the gaps in the constitution, which it behoved the government to fill, yawn dangerously at the feet of incautious politicians. The most serious lacunae, for the safety of this still fragile democracy, are the absence of a law establishing the procedure for a referendum and the non-existence of a Superior Council of the Magistracy to guarantee the independence of the judicature. Both institutions are prescribed in the constitution but, since the first is a check on the parliamentary majority and the second restrains the executive, the government parties have never found it in their interest to give them effect. Today, public opinion is alarmed on behalf of the independence of the magistrates. At the same time two issues have arisen which could call for a referendum, but instead of turning its attention to the matter, the government appears to derive a false sense of security from the fact that, without a law to implement it, the referendum does not legally exist.

The two questions which could, in theory, be referred to a referendum are the reform of the Senate and the question whether or not intermediate range missile bases should be installed on Italian territory. The reform of the Senate is a constitutional law which may, if the request is properly formulated, be referred to a referendum within three months of its publication unless it has been approved in both houses by a two-thirds majority. Far from obtaining such approval the Senate Reform Bill has been sent back to the Senate from the Chamber so burdened with amendments that one illustrious jurist has questioned whether it may legally be considered the same Bill. The incipient conflict between the two houses is being turned to account by the Christian Democrats in an effort to induce the President to dissolve the Senate when the Chamber expires this year. The constitution provided that the Chamber should sit for five years and the Senate for six. When the first Chamber expired in March, 1953, a turmoil arose in the Senate over the Electoral Reform Bill; the Speaker resigned, and President Einaudi dissolved the Senate and Chamber together. The attempt to make this a precedent is not likely to have much weight with President Gronchi. The reasons adduced by the Christian Democrats in favour of dissolution make political sense but have little constitutional value and are not acceptable to the Senators themselves. The expense of a second election twelve months after the first, the inconvenience of keeping the country in a state of political excitement, the difficulty for any government of working serenely with such a prospect before it, are arguments which have quite failed to persuade the Senators to reduce their term of office from six years to five. The only reform they are willing to accept is a reduction of the number of electors per Senator from 200,000 to 150,000. All the proposals for a non-elective "integration" of the Senate have been turned down and a rigid conception of caste interests, which overrides normal political divisions, has determined the Senators to reject all but the minimum reform.

Never before has a situation arisen in which the President of the Republic was so completely arbiter. Should the Senate reject the Chamber's amendments to its Bill, as there is every reason to expect, it will be too late to pass the reform in this legislature. The Christian Democrats will clamour for the Senate to be dissolved on the plea of a conflict between the Chambers. This party's effort to recover an absolute majority depends in great measure on the possibility of holding the elections to the Chamber and Senate simultaneously. In a staggered election the Christian Democrats are unlikely to follow up a victory in the Chamber with a similar triumph in the Senate, and if their success in the first election is moderate they will not easily improve their position in the second. The difference to the political future of Italy between a simultaneous and a staggered election may reasonably be considered enormous. It is equally reasonable to suppose that President Gronchi will listen to none but the purely constitutional arguments in favour of either solution.

★

The Communist party threatens to ask for a referendum on the subject of missile bases and says it is collecting the half-million signatures prescribed by the constitution. The government claims to be sitting pretty since, in the absence of an appropriate law, no referendum can be held. Meanwhile the left-wing parties have forced the government to accept a debate on defence and foreign policy next week. They will ask the defence minister and the foreign minister to tell the country squarely what commitments concerning missile bases were accepted by the Italians at the last meeting of the Nato Council. Since no final decision appears to have been taken in Paris, it will not be difficult for the government to answer evasively.

Opinion on defence is divided in the country very much on the lines of the left-wing parties versus all the rest. Such a cleavage, on the eve of a general election, is dangerous since it tends to over-simplify the issues. The Socialists, like the Communists, favour neutralisation, but while the Socialists hold this view on principle, the Communists do so because they believe that a neutral belt suits Moscow. The isolation of these two parties will make it difficult for the Socialists, after the elections, to pull away from the Communists. All the other parties insist on a strong defence policy, missile bases and all. Many Italians believe that Albania has such bases (as well as bases for atomic submarines) already.

In the Christian Democrat party there is a nuance of opinion in favour of greater European independence of America. This is the view of the minister without portfolio, Signor Dino del Bo, who, at the last cabinet meeting, pressed the government to send a more conciliatory and constructive answer to Mr Bulganin. Although Signor del Bo is credited with having obtained a slight attenuation of the Italian message, Signor Zoli's letter is considered here as virtually a *fin de non recevoir*. The leader of an opposite tendency in the party is Signor Taviani, the defence minister, who at the Nato Council urged the European powers to accept the American request for IRBM bases in Europe. No member of the Italian cabinet has expressed enthusiasm for Mr Macmillan's suggestion of a non-aggression pact but this indifference may be attributed to the Italians' suspicion of top level talks from which they are afraid of being excluded. It is difficult to estimate the importance of the cleavage in the Christian Democrat party on the subject of defence. Whichever way individual views incline, the party takes its cue, on the question of East-West relations, and consequently on disarmament, from the recent speech in which the Pope asserted that a dialogue is impossible between people who have no common language.

Long Haul for the Free Trade Area

FROM OUR PARIS CORRESPONDENT

"We heard all this months ago," was the comment of one observer of last week's free trade area talks. Something like that seems to have been the reaction of most of the negotiators at the end of the OEEC meeting. The British memorandum on agriculture had gone down badly with all but the Swiss. This in itself was not a surprise. In fact, the continental reaction was less robust than some had expected. What was depressing was that the debate charged once more down the old beaten paths. There were objections from small countries that the common market system would leave them at the end of the queue for food contracts, and retorts by the Six that the privileges of the common market could only go to those who had subscribed to its obligations, which were not just commercial but primarily political. Many of the negotiators are beginning to feel weary. Will the free trade area talks ever get under way? Is the ministerial procedure wrong? It seemed a good idea in October to bring the ministers together to give them a new stronger impulse. But it already seems apparent that, with a few exceptions like Mr Maudling, the ministers are distrait gentlemen between two trains, with too many other worries at home. The common market took two years to negotiate. The free trade area will need an effort comparable in intensity if not in time. Yet even the argument that such negotiations must be difficult is wearing thin. The need for a poker-face at the bargaining table may be understandable; but at the moment the ministers seem incapable of throwing the dice. In particular, do the French want to?

This question mark explains the relief with which everyone, from Mr Maudling down, has hailed the prospect of the French memorandum to be produced in a month. At last, runs the hope, the French—and their five partners—will begin to commit themselves. Indeed the French negotiators realise that if there were to be no free trade area, the common market itself might not move off to a brilliant start under the handicap of British resentment. But they have to take account of French opinion, especially employer and right-wing opinion, which does not share this anxiety. Their view is that the common market is strong medicine made healthy because there will be European institutions to draw up the prescription, and political unity at the end of convalescence. But the free trade area without the "community" aspects of the common market, is an overdose of the nostrum. Privately, most people holding this view are anxious, despite the renewed Germanophilia of the Right, not to lose touch with Britain. But they would prefer to explore the chances of an association of the common market and Britain, leaving out the smaller countries, whom they regard as at best a complication. This seems the attitude underlying the employers' manifestoes against the free trade area. The conservatives have taken up the cry against the British-style free trade area. As it greatly recommends itself neither to the federalist Europeans in the Assembly nor to the farmers and trade unions, there is no one to gainsay them. On present fears the free trade area would sail straight into a rejection by the Assembly like another European Defence Community.

★

To prevent that, the French negotiators have decided they must systematise their own ideas into a counter-proposal. It is too early to know what they will produce, but it looks as if they may resuscitate two old notions. One is that "customs disarmament" in the free trade area should lag a few years behind that in the common market. The other is that the first four-year stage of the area should be clearly mapped out in the pact but that negotiations on the subsequent stages should accompany or follow it. There are hints also that a third idea might surface in the memorandum. French industrialists are more and more insisting on the tremendous advantages Britain would enjoy as a trader and as a magnet for American investments, from its location at the crossroads of two preferential systems, the Commonwealth and the free trade area. They argue Imperial Preference cannot remain taboo. The motor-car makers, for instance, want to sell cars in Australia. If the government decided to take up the demand, the memorandum would have something on Imperial Preference.

If it did, the next weeks would obviously be critical in the negotiations. But it has been apparent for some time that a crisis would be necessary to get real negotiations going. The gap that divides the British conception of the free trade area from that of the Six, is too great to be bridged by minor tinkering with the original proposals. The attempt to produce piecemeal compromises is leading to a welter of escape clauses, the only way of reconciling the British distaste for giving powers to international authorities with the refusal of the Six to go back on their common market approach. Take harmonisation of social charges, which the ministers discussed last week: the British idea is that every time trouble arises from differences in national legislation, the plaintiff may lodge an appeal. But the appeal board cannot impose a solution, nor do governments seem likely to change their procedures.

Instead, there would probably be an escape clause. This is one example among many. At the rate at which they are piling up, the free trade area would become impossible to administer simply because of the number of exceptional situations—and not just French ones. It is necessary, therefore, to go back to a general approach with the French view in one extreme corner and the British in the other to make honest sport of it.

But will it be a match or a brawl? The situation is so fluid at the moment that no one dare say. Certainly no country, least of all the French, wants to be responsible for a breakdown of the talks. Among the Six, both Benelux and Germany are anxious for a free trade area, to keep the common market as open to the world as possible. The Six have also woken up to the fact that they will have to think afresh about the free trade area. For instance, they have now created a committee to produce new ideas on agriculture. And some people argue that the common market commission could, if it would, do much to weld the views of the Six together, and clarify the situation in negotiating on their behalf. But what seems certain is that, though there is admiration for Mr Maudling's ability and flair, few would agree with him that the talks will end by July. One remembers Mr Thorneycroft making just the same rash forecast last year. It would be surprising if the free trade area were ready to leave the starting-line when the common market makes its first tariff cuts next new year.

Athenian Straws in the Wind

FROM A SPECIAL CORRESPONDENT

THERE is an air of unreality about most conversations in Athens on the Cyprus question. Whereas six months ago the British visitor might have been subjected to a histrionic harangue—on the follies of Whitehall or the maladministration of the Harding regime—today he may be received with a slightly synthetic wistfulness, bordering almost on sympathy, as for one who shares the yoke of an intolerable political burden. Almost inevitably there is expressed (in reverent undertone) the pious hope that a "way will be found" to solve the problem—which, one might assume, had been imposed on two hapless but innocent parties by the cruelty of the Fates, rather than incurred by the singular folly of their own policies. Without indulging in over-optimism, it is hard to escape the conclusion that, willy-nilly, a spirit of rapprochement is in the air; which is perhaps another way of saying that the Greeks, are now beginning to get just a little bit tired of the dispute—though of course they would never admit as much.

Within the past ten days there has been a sequence of events which can perhaps be regarded as straws in the wind. Perhaps the most publicised has been the bringing to book of the five Cypriots charged with causing the bomb outrages at the American air base and information library. On the face of it, this may simply appear to be justice taking its course, but it is idle to pretend that on an issue involving Cyprus, which has always been political dynamite for the Karamanlis government, such an action by the public prosecutor does not have political significance. Its importance is heightened by the fact that Archbishop Makarios himself has requested leniency for the culprits "on account of their youth."

Another development which, without causing wide public interest, has caused some slight eye-brow raising among the *cognoscenti*, has been the leading article last Sunday in the influential *Kathimerini*, which is known to reflect closely the thinking in government circles. (In this connection, indeed, its Sunday editorials often have special significance.) On this occasion, the writer criticised both the British and the Turks, in what may be termed the accepted fashion, but at the same time injected, albeit indirectly, a curious reference to the need for Greece itself to take some initiative ... to prevent "complete stagnation" in Cyprus. A phase had perhaps been reached when "something must be done." While too much should not be read into one section of one leading article, there was in this perhaps the obliquest of hints that the Greek government might be prepared to deviate from its hitherto rigid line that the Cyprus problem is essentially one between the British government and the Cypriot people, in which no direct initiative from the Greek government is called for.

The most significant development in recent days, however, has been the strange affair of Mr Pournaras, the head of the Cyprus section of Athens radio. Formerly a leading figure in extreme left-wing circles, and by temperament a political extremist, Pournaras (though then in the Opposition camp) was given charge of Cyprus radio broadcasts on April 1, 1955—curiously, the day that terrorism broke out in the island—and despite rumours of clash and conflict, he held this post until he resigned on January 10th. A few days later he issued to the press the text of his letter of resignation which exposed mercilessly the conflict and embarrassments within the Karamanlis government over the Cyprus issue.

On three previous occasions, Mr Pournaras declares, he offered to resign because the government wanted him to "pull his punches" in his propaganda broadcasts to Cyprus. Each time some factor—or some individual—intervened to make him change his mind (on the third occasion in March of last year it was Archbishop Makarios who averted the rupture). But now, finally, the situation was impossible; he could not concur in any attempt to impose a settlement contrary to the aspirations of the Cyprus people. (What "*settlement*" he is envisaging is, unfortunately, not made clear.) The foreign minister, Mr Averoff, and the minister to the prime minister, Mr Tsatos, were misleading the people by systematically clouding their real intentions on Cyprus. After cataloguing a number of occasions when he was (allegedly) urged to tone down his broadcasts, he winds up with an appeal to the prime minister to "put an end to

FREER TRADE IN EUROPE

1 **"BRITAIN AND EUROPE"** the E.I.U.'s handbook on British industry with special reference to the likely impact of the Common Market and a Free Trade Area.
15/- from bookshops, 16/- from E.I.U. packing and post included.

2 **"E.I.U. SPOTLIGHT."** This four page bulletin each week devotes a full page to European trade developments.

3 **THREE-MONTHLY REPORTS** on business conditions and prospects in the Common Market and Free Trade Area countries at reduced rates when taken as part of one or two special regional subscriptions.

Serving Europe, all Canada, the U.S.A., Bermuda, Nassau and the Caribbean

Something wonderful's happened to this office—
TIME-MASTER

You wouldn't believe how difficult life was *before we got our Time-Master.*

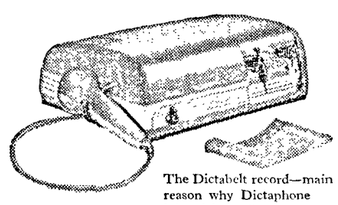
He'd start to dictate—the phone would ring. That'd be that. Or he'd hand me a sheaf of scrawled notes and—"Memo please, Miss Fox." Awful!

Time-Master's changed all that. Now he dictates on to those wonderful little Dictabelts. Letters—memos—notes—everything. I type them out at my own speed, in my own time, and I'm *never* rushed.

He says he thinks Time-Master is the best investment he's ever made.

I should know!

THE DICTAPHONE TIME-MASTER
the world's greatest dictating machine



★ Made to an unequalled standard of precision engineering.
★ Fingertip control.
★ Perfect recording, playback, and correction.
★ Fast, efficient service—everywhere.

DICTABELT—the world's most modern dictation record—exclusive to the Dictaphone Time-Master

★ Light, handy, but virtually indestructible.
★ A permanent, visible recording. Can be posted or filed.
★ Crystal-clear recording at extremely low cost.

You cannot know *all* the advantages of owning a Dictaphone Time-Master until you've lived with it for a week. Try it—free!

The words DICTAPHONE, TIME-MASTER, and DICTABELT are registered trade marks

The Dictabelt record—main reason why Dictaphone Time-Master far outsells all other dictating machines

NOTHING CAN COMPARE WITH
DICTAPHONE

what is happening in secret in the ministry of foreign affairs and the office of the prime minister." When he explained his motives for resigning, in a letter to the press, he roundly summed up the situation thus: "To avert capitulation on the Cyprus question there must be open, courageous war against the truce-mongers."

It would be unwise to treat this affair as evidence of a major policy shift in Athens. It is true that Mr Karamanlis and Mr Averoff are probably now in a more flexible mood, and there are grounds for believing that this may also be said of Archbishop Makarios (whose move to visit Turkey, it should be noted, took the government by surprise). Likewise it is true that the people as a whole are now perceptibly tired of the Cyprus problem. But, politicians being what they are, the opposition has not yet got tired of baiting the government; this week it launched in parliament a personal attack on Mr Averoff for his alleged mishandling of the Cyprus problem. For some time it looks as if every inch taken by the Karamanlis government towards "meeting the British half-way" will have to be taken with one wary eye over its own shoulder. In the coming weeks a further easing of tension, rather than any speedy alignment of viewpoint, between Athens and London seems the most realistic thing to hope for.

Division over Nile Waters

SAYED MIRGHANY HAMZA is returning to Khartoum to report the failure of his negotiations with the Egyptian government over the division of the Nile waters. For six weeks he has been trying in Cairo to get a new agreement which would give the Sudan rights to more water and would free Egypt to proceed with its High Dam scheme (assuming the money can be found). The precise reasons for the breakdown are not yet known but the politics behind it are clear. The Sudanese government insists that any new Nile waters agreement should come from a conference including the other two riparian territories, Uganda and Ethiopia. Egypt wants a bilateral agreement because it knows that if any disputed points were left to such a conference the countries on the upper reaches would vote with the Sudan.

It is a fair assumption that President Nasser is waiting for the February elections in the Sudan, in the hope that there will be a new government more amenable to Egyptian claims. This is an interesting sidelight on the election situation. The PDP (People's Democratic Party) section of the coalition cabinet is commonly reckoned to be closer to Egypt now than any other party, including the opposition NUP (National Unionist Party), and many people believed that Egypt would back it, even financially, in the elections. But Mirghany Hamza, the most important member of the PDP, is quite clearly not willing to barter any part of Sudan's vital water rights for an electoral advantage.

From whom in the Sudan can Egypt now expect succour? It was the present opposition NUP, led by Sayed Ismail el-Azhary which, after winning the 1954 elections on a policy of unity with Egypt, put the decree of independence through parliament. NUP leaders express extreme distrust of Egypt in private and the Egyptians feel they were double-crossed by the NUP. However, elections are expensive affairs, and the NUP finds itself short of money at the same time as the Egyptians are baulked on their Nile water agreement. Is it totally surprising, then, that last week at an election rally at Wadi Halfa, on the frontier with Egypt, Ismail el-Azhary announced his five-point foreign policy as follows: a bilateral defence pact with Egypt, co-ordination of foreign policy with Egypt, co-ordination of economic and cultural policies with "liberated" Arab countries, boycott of military pacts and in particular the Baghdad Pact, and fidelity to the Bandung resolutions? This programme amounts to less than unity with Egypt, of course, but it shows President Nasser that the NUP's heart is in the right place—at least, until after the elections.

The Revolt against Mr Todd

FROM A CORRESPONDENT IN SOUTHERN RHODESIA

THE cabinet revolt against the Southern Rhodesian prime minister, Mr R. S. Garfield Todd, came as no surprise in Salisbury. Anti-Todd sentiment among Europeans in the Federation has been mounting steadily in the past year. It has arisen not as a result of any unusually "liberal" course of action adopted by Mr Todd, nor even as a consequence of the new Southern Rhodesian Franchise Law, with which his name is invariably linked although it received the overwhelming support of his party caucus—the same caucus that has now turned against him.

The real reason for Mr Todd's unpopularity among right-wing and "right-centre" Europeans lies in the picture of him as being anti-white, pro-black and an ultra-liberal, a picture that has been built up in the public mind partly by a skilfully conducted campaign by opposition elements, including the Dominion party and the Segregation Society, and partly by Mr Todd's own naïve public relations. For Mr Todd has never learnt the basic lesson, mastered years ago by Lord Malvern and Sir Roy Welensky, that a Rhodesian politician can put a significant amount of liberal and progressive legislation on the statute book and still be re-elected, provided that he does not shout about it, and that when he does make a public statement, he emphasises his conservatism and his determination to maintain the high standards of western civilisation. Mr Todd, far from accepting these conditions for political survival in a country that still has an overwhelming European electorate, has allowed his public statements to sound a great deal more liberal than his legislative record has, in fact, been. His position has been further bedevilled by the fact that he began life as a missionary, and missionaries, particularly political missionaries, have been distrusted by Europeans in Southern Africa since the days of the Great Trek from the Cape, when Piet Retief accused them of using "the cloak of religion" while casting "unjustifiable odium" on white settlers.

It is against this background of anti-Todd feeling that the events of recent weeks must be viewed. Mr Todd's four former cabinet ministers and his parliamentary secretary resigned not because they dissented from his legislative policy, which they themselves have helped to shape throughout the past four years, but because they were afraid to face the electorate later this year under the leadership of a man who, they believe, is regarded by a sizeable section of that electorate as an ultra-liberal concerned only with the political and social advancement of Africans. Discussions on these lines first took place within the cabinet in November last year, but were apparently inconclusive. The first hint of renewed trouble came on January 9th when Mr Todd flew back to Salisbury from a coastal holiday in South Africa four days earlier than expected. He was met at the airport by the

acting prime minister, Sir Patrick Fletcher, who said that the cabinet had lost confidence in Mr Todd and were prepared to offer their resignations.

The following day Mr Todd presided over a cabinet meeting which failed to settle the differences. The four "rebels" then offered Mr Todd time to make up his mind before they resigned. All were clearly convinced that the prime minister would have no choice but to resign himself. It came as something of a shock to them when, the next morning—Saturday—Mr Todd telephoned his Treasury minister and asked for the cabinet's resignations in writing as soon as possible, as he intended to meet the press at noon. Their bluff called, the ministers resigned. Mr Todd then gave the news to the press; he added that he himself intended to remain in office and he promised to announce his new cabinet within a week. He said that the issue of his leadership could be settled one way or the other at the end of March at the inaugural congress of the United Federal party. This is the party that was formed last November by the fusion of Sir Roy Welensky's Federal party (the government party in the Federal Parliament) and Mr Todd's United Rhodesia party (the government party in Southern Rhodesia.)

The prime minister met the press again the following night to tell them that he had formed a new cabinet. The question of his continued leadership, he said, would now be referred to a congress of the Southern Rhodesian division of the United Federal party, to be called specially for that purpose early in February. On January 14th the five new cabinet ministers were sworn in. The same day Mr Todd held a five-hour meeting of his caucus, during which he, as caucus chairman, maintained the position that discussion of his leadership was not a matter for the caucus but for the party congress. After five hours of accusation and counter-accusation, thirteen of the twenty members present walked out and issued a declaration of no confidence in the prime minister.

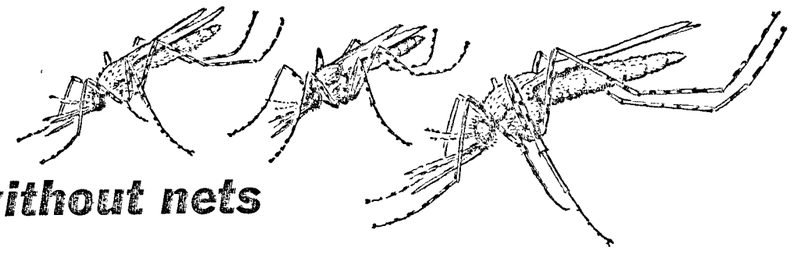
★

Mr Todd's position today could scarcely be more precarious. In Parliament he will face at least thirteen "rebel" members of his own party as well as five bitterly anti-Todd Opposition MPs—a minimum of eighteen hostile votes in a House with an effective voting strength of twenty-nine. Mr Todd has arranged to postpone the opening of Parliament from February 4th to February 18th since the party congress will open on February 4th. His chances of surviving this congress are slender. For the first time he will then face, not only representatives of his own United Rhodesia party, which is far from being united behind him, but also the Southern Rhodesian section of the Federal party, which contains some of his sharpest critics.

One of the questions no one has yet attempted to answer is whether Mr Todd will resign the premiership if the congress turns him out as Southern Rhodesian party leader. Some of his recent statements seem to indicate that he will abide by the congress decision, but many political observers in Salisbury believe that he will advise the Governor to dissolve Parliament and call a general election. In some quarters he is being urged to do this now before the resumption of Parliament and before the party congress, on the ground that such a course of action would force Sir Roy Welensky to "come out on his side and save him." Sir Roy has so far remained silent.

If Mr Todd does retire gracefully after a defeat by congress, he is unlikely to be replaced by one of his former colleagues, all of whom have emerged from the crisis with their political reputations slightly tarnished. A compromise candidate is virtually a certainty. The dispute has split the Southern Rhodesian section of the United Federal party from top to bottom, leaving reactionaries and especially the opposition Dominion party rubbing their hands in pleasurable anticipation.

Finns in the Red



FROM OUR SCANDINAVIAN CORRESPONDENT

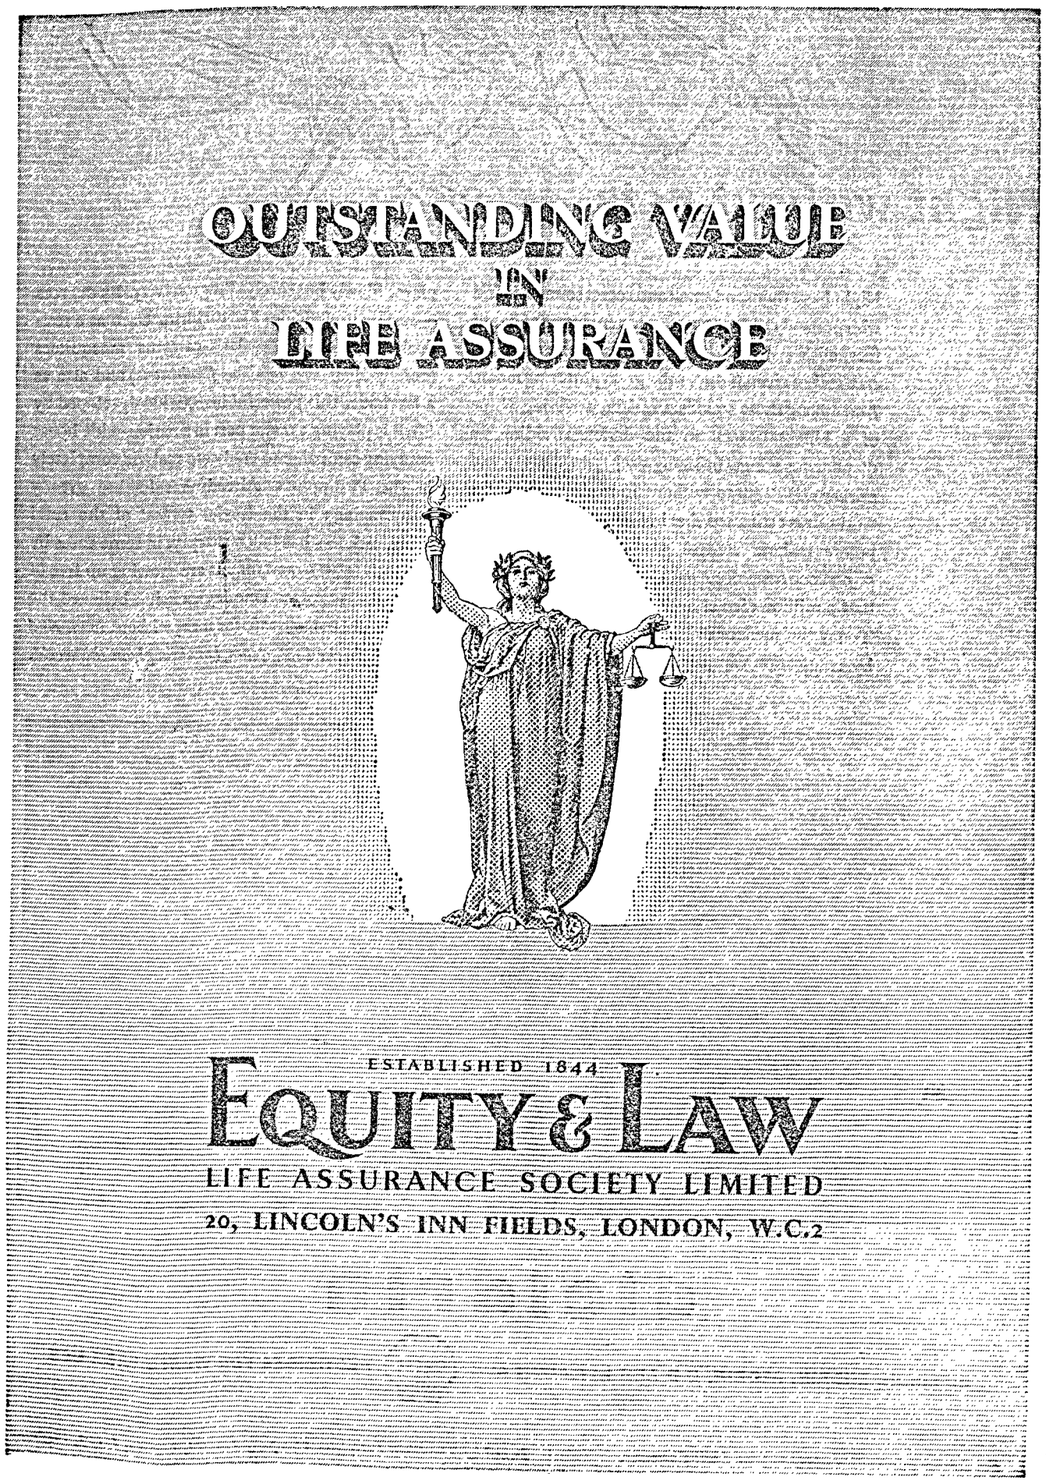
FINLAND'S economic crisis has grown graver. The prime minister, Hr. Rainer von Fieandt, has bluntly told the Diet that the exchequer is empty, and that bills are mounting rapidly. Hr von Fieandt, the former Governor of the Bank of Finland who was called in to head the present non-party "government of civil servants" last year, revealed that the drastic step of freezing all state payments, including the salaries of civil servants, had been only narrowly averted.

The finance minister, Hr Hietanen, told the silent Diet that revenue at the end of December showed a deficit of 3,000 million marks (£3½ million) on the estimates, and that increased taxation and cuts in state spending were unavoidable. He submitted proposals to save 10,000 million marks, by reducing pensions, freezing governmental payments for three months and cutting overall state spending by ten per cent. The minister emphasised that even this strong medicine would be no more than a temporary palliative for the ailing Finnish economy. Indeed, it has been calculated that economies of thrice the magnitude envisaged by Hr Hietanen would be necessary to ensure stabilisation. Although the state still has a credit of 1,800 million marks with the central bank, this is only three-quarters of the legal minimum, so that the present situation is already a breach of the constitution.

This desperate situation is the context for the general election which is due to be held in the summer. Once again, the two main non-communist parties, the Socialists and Agrarians, who represent respectively urban workers and rural interests, will be competing for the voters' favour. Although they may be strongly tempted to strike attitudes designed to appeal to sectional interests, there is a feeling that the electorate is wearying of crises. It may well be dangerous to attack the present government and the hopes of economic stability that surround it.

Moreover, both the Socialists and the Agrarians are divided internally by ideological conflicts and personal rivalries, and would undoubtedly dislike being landed with the intractable baby at present squalling in Hr von Fieandt's lap. A continuing crisis would benefit only the already strong Finnish Communist party. With seasonal unemployment at its height, and the effect on prices of the trade liberalisation that followed devaluation in September still not clear, the indications are that Finland's present caretaker government will be able to stay in office and steer a reasonably steady course at least until the elections. Meanwhile, it has negotiated a temporary loan of 4,000 million Finnmarks from the private banks at the penal interest rate of 13 per cent—which only goes to show what a costly matter it is to be poor.

Night without nets



Night has a thousand small and secret sounds. Wind whisper and creak of board, sudden skitter of lizard feet, click and tap, slither and rustle, the ceaseless *crik-crik* of cicadas under the great glittering moon. And among those sounds, the thin, wavering whine of a killer: unseen in the darkness, riding on diaphanous wings, bringing each year disease and misery and death to millions in many parts of the world. It is estimated that in South East Asia alone, before malaria control was introduced, at least 50,000,000 cases occurred annually and that of these half a million died as a direct result of the disease. Today the menace is being driven from the scene by eradication campaigns like that in the Philippines. Slowly but surely. Progressively. By degrees—and by insecticides like dieldrin. Used as a residual spray to kill malaria-carrying mosquitoes (chiefly *Anopheles minimus flavirostris*) and also as a larvicide, this powerful insecticide developed by Shell is playing a major part in a nation-wide house spraying campaign to eradicate malaria completely in the Philippines. Already results are greatly encouraging; in the *barrios* typical of the rural areas, sickness has fallen sharply, in some cases by as much as 75%, and infants are growing up free of the malaria menace. One day soon, it is believed, the night will be made safe for man, without nets. *And not only in the Philippines, but throughout the world.*

THE BUSINESS WORLD

The Bank of England

THE unequivocal conclusion from the Parker Tribunal that there is no justification for allegations that information about the raising of Bank rate last September was improperly disclosed by any person will do much to restore the City's self-confidence and the regard of overseas financial centres in its probity. Both are needed. Some of the mud slung at the City from Westminster will, unfortunately, stick; it is altogether improbable that the man-in-the-street's view of the City as a place where people in the know do well for themselves will be conclusively changed by the report. The handling of money is not well-regarded these days; and the City as a whole has neglected its opportunities to explain itself to the ordinary man. The small investor and the small bank customer feel remote from it—and that is, to a large extent, the City's own fault and perhaps a fault too late fully to remedy. In evidence before the tribunal transactions by no means extraordinary took on the quality of esoterica and that, to most uninformed opinion, is a patent reason for suspecting them.

No matter has aroused more public concern than the apparently invidious position of the independent directors of the Bank of England. It is most satisfactory that Lord Kindersley and Mr W. J. Keswick have been so clearly absolved from any allegation that they disclosed, either intentionally or unintentionally, any information about the increase in Bank rate on September 19th. Both knew of the possibility, and both knew later of the provisional decision to increase it. Both were involved in decisions affecting the interests of their companies where a slip—much less than a deliberate false step—would have put them on the wrong side of the line of propriety. Both emerge, after the most strenuous test before the tribunal, free of the least suggestion even of inadvertent misbehaviour and therefore entirely clear of any charge that they might have used information gained as directors of the Bank of England for their own ends.

Relief at this conclusion is the greater because, at several points during the hearings, there seemed to be some wonderment at the idea that honourable men can keep in watertight compartments information that they acquire in their different activities. Lord Kindersley put the point frankly, and it has been accepted in the tribunal's report:

> After many years now I have found that I can to my satisfaction divorce the knowledge which I know I have acquired from the Bank of England or one of the other companies, from my normal business judgment . . . I know that it is a difficult thing . . . and I have been in a very awkward situation many a time. If I can avoid discussion . . . I avoid it like the plague, but if I have got to discuss it I have found myself quite capable of doing that.

Yet the point remains. The position of a director of the Bank of England with other business interests—the very interests which qualify him to be a director—may occasionally be difficult and embarrassing. To surmount this, Lord Justice Parker even suggested, might call for "almost superhuman" qualities. Lord Kindersley, ten years a director of the Bank, admitted to ten or twelve occasions on which secret knowledge (not on Bank rate alone) might have been a source of embarrassment. And the report of the tribunal draws attention to the particular case of Mr W. J. Keswick, to whom his colleagues in Hongkong looked for advice on Jardine Matheson's investments which he had a duty to give.

Is this burden unfair? Is it justified, so far as the Bank is concerned, by the benefit of advice and experience that could not be secured in any other way? The report does not express any view, for reasons that must be accepted as wise:

> This raises a general and very important question of policy with which we are clearly not concerned. Had it been our duty to express an opinion on this matter, we should, before doing so, have required exhaustive evidence as to the advantages and disadvantages of continuing a state of affairs which has so long existed. The criterion, of course, must be the national interest.

Many people, less wise, have jumped to the conclusion that there is no longer a proper role for the independent director of the Bank of England. This is, one may hope, a matter that will come within the purview of the Radcliffe Committee; certainly it is rooted in the fundamentals of monetary policy. Put quite shortly, it is one of the principal matters that will in future determine whether the Bank of England itself can continue to assert some effective degree of independent counsel and decision or whether it is to become merely a subordinate agent of Treasury policy.

It is possible to exaggerate both the embarrassment that may sometimes be caused to the outside directors of the Bank and also the direct use that is made of their counsel. The Governor of the Bank admitted that strain is occasionally put on directors from their possession of special knowledge, but in his twenty years' experience on the Court he had not found that it caused frequent difficulty to his colleagues; in any case of uncertainty, a director would consult him or the Deputy Governor about his proper course of action—as, indeed, Mr W. J. Keswick did. Nor is this a problem exclusive to the Bank; it is an everyday occurrence throughout the range of banking and professional practice.

Nor, again, is it something new in the Bank's experience. Bagehot was deeply conscious of the point in the early seventies:

> But in fact the particular interest of single directors is not to be regarded; almost all directors who bring special information labour under a suspicion of interest; they can only have acquired that information in present business, and such business may very possibly be affected for good or evil by the policy of the Bank. But you must not on this account seal up the Bank hermetically against living information; you must make a fair body of directors upon the whole. . . .
>
> (Lombard Street: Chap. VIII.)

Could the point be better put today? If the Bank is to be something more than "a mere operating department of the Treasury"—to quote a phrase used and rejected by the Governor—the quality of decision in the wide range of financial matters on which the Bank acts for or advises the Government (above all, perhaps, in the field of foreign exchange) must flow from precise judgment supported by the widest experience of financial, commercial and industrial life. In the last resort the Bank must conform, as any central bank must, to the sovereign power of government; but apart from the matters in which it exercises a direct responsibility, including the management of the money market and the fixing of Bank rate, there is a wide area in which the Bank, in consultation with and tendering advice to the Government, can, and should, make its influence felt in the formulation of economic policy.

The proximate responsibility in this does indeed fall on the Governor and Deputy Governor. They have the assistance of the four executive directors and the staff. Thus the permanent establishment of the Bank is the predominant force in its decision-making. The other directors are not originators of policy, but they are informed and consulted about major policy proposals. In the Governor's words:

> The directors of the Bank cover between them a very wide range of interests in banking, industry, commerce, trade unions, shipping and insurance. . . . It is quite invaluable to the Governors to be able to draw on this fund of knowledge and experience in formulating policy and to be able to share with the Court responsibility for decisions which must affect sterling throughout the world. . . . If the nature of the Court were to be altered so that it were not to be composed of active practical men of business, or if directors were to become mere figureheads divorced from the real affairs of the Bank, then it is my belief that the utility of the Bank to the public interest, in this country and in the Commonwealth, would disappear.

Good arguments would be needed to overthrow this conclusion—far better ones, indeed, than those that are now being used in favour of making the Bank subordinate without question to the Treasury.

Indeed, the weakness of the present system is not that the Bank still preserves some aspects of independence, but that in practice these are so vestigial. The independent director is the last remaining symbol of an independent Bank. Theoretically, the Court on a Thursday could refuse to endorse a change of Bank rate. Any such change would first have been set in motion by the Governors, agreed to in principle by the Chancellor of the Exchequer and accepted by the Committee of Treasury (acting, as it were, as a subcommittee of the Court) on the preceding day. But in theory the Court could upset it; hence the preparations by the Governor and the Deputy Governor to carry all the directors with them last September in a change critical in both size and timing. Yet, in retrospect, the weakness of a notional power of veto unsupported by any positive opportunity for the directors to play an originating part in the formulation of policy emerges from the proceedings before the tribunal. It took six weeks from August 7th, when the Chancellor of the Exchequer left instructions for a study to be made in the Treasury of the possibility of "bringing about a measure of deflation in the economy" before action on public investment, bank advances and Bank rate was decided. Holidays got in the way; the monetary position continued to be "watched very closely"; consultations proceeded between the Bank and the Treasury in the pattern of a formal dance. It was not so important that a lot of people during these weeks came to know that action was afoot, as that, when the storm that had long been rumbling over sterling finally broke, umbrellas were still furled and had to be opened so desperately to shelter from it.

For the Bank, supported by its outside directors, to propose action that it had reason to apprehend might not be supported by the Government could be held to jeopardise the relations between the two. But such differences have not been unknown; they are natural and it is a good thing that they should be aired from time to time. Perhaps there were differences during those six weeks—with the Bank unwilling to move unless the Government moved too. They do not emerge from the evidence, but when they occur they should be matters on which the Bank ought to feel that it has a duty to the public, and is accountable to it.

As the proceedings before the Parker Tribunal have shown, the public has a close interest in the way the Bank is constituted and served by its directors. But its respect for the Bank is less than it was, simply because the Bank's part in affairs is allowed to appear so negative and subservient. That is not nearly so true of central banks in other countries. It is within the power of the Bank of England to invest itself with greater authority. The Governor should feel more free to explain what the Bank's views are, and its annual report should be a document of substance. So the Bank could develop, not indeed as in any sense a rival power in economic policy-making, but as a more respected coadjutor and source of independent economic opinion. And it is here that the part of the independent director could be of decisive importance.

The City under the Glass

Some of the highlights on the City and its institutions in the 300 pages of proceedings and evidence before the Parker Tribunal are picked out below.

Bank Rate Timing

Never, presumably, will the mechanics of reaching a Bank rate decision be revealed so soon after the event or in such detail. The bare chronology gives its own impression of mounting crisis.

1957

Aug. 7:	Chancellor orders study in the Treasury "to bring about a measure of deflation in the economy."
Aug. 8:	Sir Roger Makins (Joint Permanent Secretary of the Treasury) talks with Governor of the Bank of England at the Treasury.
Aug. 12:	Further talks at Bank of England.
Aug. 22:	Governor and Deputy Governor call at Treasury. Governor gives his views on desirability of rise in the Bank rate.
Aug. 26:	Meeting of Chancellor with Treasury officials to discuss proposed measures.
Aug. 28/29:	Deputy Governor tells Committee of Treasury and Court of Bank of England that Bank rate has not come under discussion with Treasury, but is being kept under review.
Sept. 3:	Deputy Governor writes to Mr W. J. Keswick and two other directors of the Bank out of London "and not expected back for the best part of a fortnight," informing them of discussions on measures to deal with the exchange situation, which might eventually include action on Bank rate, though that was "quite open and undecided." The letters were not to be taken as a warning that they might be recalled to London.
Sept. 4:	Deputy Governor tells Committee of Treasury that discussions are still proceeding. Sees Chancellor in the afternoon to discuss bank advances. Bank rate "just mentioned," but agreed that "the subject did not arise at that stage."
Sept. 6:	Sir Roger Makins talks with Deputy Governor regarding proposed measures "including a possible move in the Bank rate."
Sept. 9:	Meeting of Chancellor, Deputy Governor, Chairman and Deputy Chairman of Committee of London Clearing Banks to discuss restriction of bank advances.
Sept. 11:	Committee of Treasury informed by Deputy Governor of discussions with Chancellor; the programme was "still undecided, but depending on how it went we might have to consider whether there was a part to be played by Bank rate." Deputy Governor discusses with Sir Roger Makins draft statement to be made following week by Chancellor, including no reference to Bank rate. Any recommendation by the Court would have to await return of the Governor (on holiday from Aug. 24 to Sept. 14).
Sept. 12:	Court of the Bank of England informed on discussions. Continuation of talks on bank advances (see Sept. 9).
Sept. 13:	Deputy Governor has "short discussion" with Chancellor on Bank rate; no figure mentioned. Sir Edmund Compton (3rd Secretary, Treasury) prepares paper on consequences of increased Bank rate at different levels.
Sept. 14:	Governor returns from leave and spends 24 hours at Deputy Governor's house.
Sept. 15:	Joined by Mr Parsons, executive director of

Bank for discussion on exchange questions. Meeting with Sir Roger Makins at 5.30 p.m. Join Chancellor and Economic Secretary at 6 p.m. Governor indicates "provisional view" in favour of increase in Bank rate to 7 per cent, and is asked by Chancellor to give the Bank's firm view by the evening of September 16th.

Sept. 16: Governor consults with available directors of the Bank on 2 per cent rise in Bank rate on September 19. Informs Chancellor at 6 p.m. (with Sir Roger Makins and Sir Leslie Rowan in attendance) that Bank considers such an increase desirable. Asked to give arguments for that view. At lunch Deputy Governor mentions to Mr W. J. Keswick possibility of "swingeing" rise in interest rates.

Sept. 17: Arguments presented by Governor. Wording of statement on restriction of bank advances considered. At 9 p.m. Governor discusses with Chancellor his recommendation for 7 per cent Bank rate. Recommendation repeated to Prime Minister, who said "he would not make up his mind whether the Government should agree to the Bank rate being raised and, if so, to what figure, until following morning."

Sept. 18: 11.45 a.m. Sir Roger Makins informs Governor that Government would approve increase. 12.30 p.m. Governor and Deputy Governor recommend to Committee of Treasury (five regular members and two invited directors) for submission to Court on September 19 that Bank rate be raised from 5 per cent to 7 per cent. 4 p.m. Government Broker informed of increase by Chief Cashier.

Sept. 19: Proposal of Committee of Treasury approved by Court at 11.45 a.m.

Did the Jobbers Squeal?

Bagehot says in "Lombard Street" that "all 'City' people make their money by investments for which there are often good argumentative reasons; but they would hardly ever be able, if required before a Parliamentary Committee, to state those reasons." How did the stock market survive this test?

Evidence submitted by the Government broker, Mr Mullins, throws some revealing light on the turnover in gilt-edged securities on September 18th. Almost £16½ million was bought by jobbers and £14 million sold—a balance of £2½ million bought by the market. In addition there seem to have been outright transactions between institutions selling and buying of a further £2 million. That, said the Government broker, was "by no means an abnormal day's turnover." Indeed, a week later turnover amounted to £62 million.

He put the total sales to the market between 2.30 p.m. and the closing of jobbers' offices on September 18th at £4 million. After the Bank rate increase, there was a "considerable amount of talk about selling (on the afternoon of September 18th) by people who knew something." He agreed that jobbers are apt to take knocks, though "probably not of this magnitude"; at the same time the total of £2½ million taken on to jobbers' books did not strike him as a surprising amount at all. The Government broker, incidentally, makes it a rule never to deal on Thursday before Bank rate is announced.

The leading gilt-edged jobbers varied in their view of business that afternoon. Mr Richard Holden, of Francis and Praed, felt that "people who dealt with us . . . knew something more than we did." His partner, Mr Wilfred Barron, having mentioned that at lunchtime "we were all optimistic about the outlook for the market" (it had been firm since the beginning of the week) remarked later in the afternoon in the presence of financial journalists that "someone seems to know more than I do." His firm was then seeing a number of sellers and had no buyers and they had taken a loss.

Chairman: It is right to say that jobbers and the partners in your firm, which is a big firm, would not squeal lightly would they?—No.

You were all very annoyed?—We were annoyed, yes.

Allegations that the jobbers had squealed were clearly encouraged by a letter sent out on September 24th by Mr Percy Spooner, senior partner in the jobbing firm of Wedd and Owen. They bought £165,000 of stock from one firm of brokers and £20,000 from another after 3.30 p.m. on September 18th and decided not to deal any more that day. Mr Spooner was already contemplating the dismantling of his firm, and he admitted that in the letter he "used whatever occurred" as an excuse for doing something which he knew might become necessary in future in any case. The letter stated that the firm had for many years been prepared to deal after hours. "This facility," it said, "has occasionally been abused but never to the extent that it was on the night of Wednesday September 18th last." But Mr. Spooner admitted that he was really taking advantage of these after-hours dealings to secure a necessary reduction in the firm's operations without affecting its credit.

On this part of the evidence, the outsider will conclude that not all jobbers in the gilt-edged market were prepared to grit their teeth and take a loss. They are not to be blamed for ceasing to trade if they think the scales are weighted against them; but the revelations in this section of the evidence demonstrate once again how far the erosion of jobbers' capital has gone, and the personal risks that they run, in these days of heavy taxation, in jobbing in the old commercial way. Even in gilt-edged stocks, the market is often thin to the point of disappearance, and the sudden reversal of the firmer trend of the previous two-and-a-half days as a result of a flow of after-hours selling was a legitimate point of concern to them. Yet the volume of after-hours offerings on September 18th might not have been impossible to accommodate if the stock had been offered during official hours. Nor would it have been likely to attract any attention if the daily turnover of the Stock Exchange was regularly published.

Through Lazards' Swing Doors

Rarely does the outsider have a sight of the working affairs of the merchant banks. Important aspects of the business of Lazard Bros. are revealed in the evidence.

Lazard Brothers conducts its day-to-day affairs through seven managing directors; there are also six other directors who attend monthly board meetings. The seven meet each morning, with Lord Kindersley *primus inter pares*, in informal discussion, and the activities of the house are threefold: acceptances, credits and money; new issue business; and stock business, including investment companies and clients' estates. Lord Kindersley and Mr J. V. O. Macartney-Filgate are responsible for the banking business; Mr P. Horsfall and Mr A. D. Marris are concerned with the industrial and new issue business; Mr T. H. Brand takes "an overall look" at the issue business and with Mr D. Meinertzhagen is responsible for the security business. "When we come to a decision in principle," Lord Kindersley stated, "it is up to *that* partner, *that* partner, or *that* partner to carry it out."

Lazards aim at keeping 50 per cent of call money and other available resources against the deposits placed with them by customers and "they take notice" if the ratio goes down to 40 per cent. Between mid-August and September 12th the ratio was slightly above 40 per cent; on September 19th it had been raised to 61.22 per cent.

On August 22nd deposits totalled £10,658,000 against almost £12 million on July 11th. From that date, there was a sharp drop of £2½ million to September 12th involving the sale of £1 million short-dated gilt-edged and the calling in of £500,000 loans to local authorities. On September 13th, the liquidity ratio against £8 million deposits was 40.72 per cent. If deposits had fallen to £7 million, Mr Brand pointed out, a 50 per cent ratio would have become the minimum for safety. On that day, there was "a common purpose," based on a suggestion by Lord Kindersley, to sell gilt-edged to meet the fall in deposits, though no decision to sell on that day (a Friday) or about the amount. The figure in his own mind to sell was £1,650,000; he was impressed for the need to "do it once and be sure of doing it adequately."

The matter was further discussed by Mr Macartney-Filgate, Mr Meinertzhagen and Mr Marris on September 16th (Mr Brand being away from the office); on September 17th Mr Brand approved the proposal of Mr Meinertzhagen to sell up to £2 million; Lazards sold £1,450,000 on September 17th and 18th and retained holdings amounting to £3,700,000. After the increase in Bank rate, call money was deemed high, and £750,000 of gilt-edged was bought on September 23rd and 24th, reducing the liquidity ratio close to 50 per cent.

Acceptances of bills by Lazards totalled over £12 million. This figure, Mr Macartney-Filgate stated, had a close bearing on the amount of call money that the house kept with the discount market. Lazards would have to pay the bills, whether their clients put them in funds or not; that fact necessitated the keeping of a certain amount of money on call for that purpose. The discount market, which had taken these bills, "have a pretty shrewd idea" of the total volume of the acceptances by any one name. They expect a certain amount of call money to be kept with them, and if it gets too low and remains too low "there might be some comment. Your prestige, your name might suffer. . . ." Against £12 million of acceptances, he would certainly not want to drop below £3 million in call money and would rather have more—particularly in periods of crisis—as a declaration of strength. The discount market would, of course, have no knowledge of the further strength of Lazards represented by its holdings of Treasury and bank bills and gilt-edged.

Royal Exchange Assurance

The Court of directors of the Royal Exchange Assurance meets at 12.30 each Wednesday; it concludes its business at 12.45 and the Treasury Committee meets thereafter. The proceedings in the Treasury Committee on September 18th were closely examined by the Tribunal.

The Investment Secretary of the Royal Exchange Assurance was the only witness to declare that Bank rate ought to have been raised at least a month earlier, to 6 per cent. He, like many others, had written off an increase as a possibility, though not devaluation. In this mind he was concerned with "a serious deterioration in the liquid position" of the Royal Exchange Assurance that had occurred in the three weeks to September 16th and he sought approval from the Treasury Committee on September 18th for sales of investments "to provide fully £500,000 after allowing for large pending departmental settlements and the interim dividend." In the event, stock was sold to realise £1,160,000 out of the REA's total holdings worth more than £20 million. These sales had been carried out by 3.30 p.m.

The commitments included the dividend (£270,000 payable November 6th), departmental settlements (£300,000) the corporation's potential liability under the Vickers issue (£400,000) instalments due on tanker loans (£150,000) a fire loss (involving £250,000 gross) and a bank overdraft (£230,000)—a total of £1,600,000. Many of these items, as the evidence showed, turned out to be considerable over-estimates, and provision appears to have been made already by the accountant for funds to meet the interim dividend. Nor, incidentally, does any allowance appears to have been made in the calculations for the effect of accruing premiums in alleviating a temporary state of illiquidity. It is commonly thought that insurance offices do not make large outright sales of investments (as distinct from switches). It was revealed that the Royal Exchange had in fact previously sold gilt-edged to the extent of £750,000 in January, 1956.

The Vickers Underwriting

Attempts were made to postpone the Vickers' issues of loan stock and ordinary shares in the few days before September 19th.

Morgan, Grenfell and Co. underwrote the Vickers issues formally at 2.30 p.m. on September 16th. Offers of sub-underwriting were then posted and in the hands of the recipients on September 17th. Sub-underwriting was largely completed by 4.30 p.m. on September 18th when Lord

Kindersley called on Lord Bicester, the senior director of Morgan, Grenfell, to discuss the effect of the issue on the market and the effect on City opinion of the issue being allowed to go forward when a severe increase in Bank rate must inevitably overtake it. The issue, it appears, had received Bank approval in August, and underwriting had been discussed informally and sub-underwriting commitments undertaken verbally a week before. The Royal Exchange Assurance underwrote £618,900 of the issues, including £400,000 of the shares, and Lazards underwrote £42,500 loan stock and £50,000 shares.

Lord Kindersley sought authority of the Governor of the Bank—having been told by him at 12.45 p.m. on September 16th of the intention to increase Bank rate—to discuss the Vickers issues with Lord Bicester. He satisfied himself on September 17th that by that time nothing could be done to arrest the issues. If the operation could have been postponed, the underwriters would have been released ; but that could have been done only if the directors of Vickers had sought the approval of their shareholders. Meanwhile they were assured of their money. The underwriters stuck to their commitments, incurred considerable losses, and enhanced the reputation of the City by honouring their bargain. And fortunately the Vickers ordinary shares, though heavily "stuck," have not been too heavy a millstone on the rest of the market.

BUSINESS NOTES

BANKERS' SPEECHES

The Bankers Pronounce

THE statements of the chairmen of the big clearing banks have followed hard on each other this week, completing the annual round begun last week by Mr Tuke of Barclays and Sir Harold Bibby of Martins. Their comments run as usual over over a wide range, with one notable exception. Sir Oliver Franks of Lloyds Bank feels debarred by his membership of the Radcliffe Committee from commenting on domestic monetary developments ; the loss is made good by a thoughtful survey of problems of sterling and international payments.

The bankers generally appear to approve the measures of September last, which have brought no profit to them ; but they are emphatic that the need for these painful bludgeons has arisen from the Government's previous failings, particularly to cut its own expenditure. Lord Monckton, in his maiden speech as chairman of the Midland, points out that the failure of confidence overseas "sprang largely from a perhaps unduly sceptical assessment of the authorities' will and power" to apply corrective action. Sir Thomas Barlow, of the District, approves of the accent on the money supply—"costs and prices cannot spiral upwards without an increasing supply of money"—but Mr Roberts, of the National Provincial, fears that the restriction of the money supply in the private sector both here and in the United States may lead to world recession, which by fostering Government expenditure would in the end lead to further inflation. All the chairmen indeed place great emphasis on government spending ; and Lord Aldenham, of the Westminster, has the same objections as Mr Tuke to financing the nationalised industries by borrowing rather than from their own or Exchequer revenue. The bankers' plans are in line with the demand by Mr Cobbold last autumn that the budget should achieve a balance over all expenditures, below-line included.

The bankers feel, understandably, that the government's shortcomings in its own sphere have consistently placed an unfair burden on themselves, and on the private sector generally. Lord Monckton shows that whereas gross national income, in money terms, had risen by two thirds between 1950 and 1957, credit balances on current accounts had actually fallen slightly.

And he gives a useful new measure of the increasing amount of work to which the stable volume of money has been put—"business turnover," comprising the annual totals of the turnover on current accounts at the Midland Bank, excluding the figures for a few City branches which are heavily affected by purely financial operations. The result shows a rise of 51 per cent between 1950 and 1957 ; Lord Monckton presumes that a similarly constructed index of all the clearing banks would not differ greatly. If the other banks should see their way to presenting such figures, an accurate measure of the velocity of deposits could at last be available.

Weak Spot of Bretton Woods

NOTHING, Sir Oliver Franks points out in the searching analysis he presents to Lloyds Bank's shareholders, can change Britain's dependence on overseas trade ; and in the past 5 years the sterling system has by no means worked to Britain's disadvantage. But it would be wise now to provide "appropriate financial arrangements and incentives" to the Commonwealth holders of the sterling balances to limit the stresses they place on the common system. Sir Oliver suggests that this might be done by maintaining here a combination of high long-term rates and (once the crisis is past) low short-term rates, to discourage the holding of balances in liquid form. This proposal would, of course, have major implications for domestic monetary policy.

Sir Oliver's main fear for the future is that the present system of world payments is ill-equipped to withstand the impact of general world deflationary influences, which may (and Sir Oliver puts it no stronger than that) be replacing the inflationary trends of the postwar years. If they do, the policies followed by creditor countries will be of decisive importance ; and whereas there is always a sanction against excessive deficit, namely bankruptcy, the same is not true of excessive surpluses : "if over-expansionist policies can be suicidal, over-restrictive policies are undoubtedly fratricidal." The most serious weak spot of the Bretton Woods rules is that they provide no means of correcting (though they do provide a sanction against) the obstinate creditor.

Obviously there is at present a danger from both America, if its recession gets worse, and from Germany, if its current surplus and its restrictive domestic policies continue. Germany has a number of choices that would ease its pressure on its neighbours: further trade liberalisation, foreign investment, revaluation, or an increase in domestic consumption. Any country is entitled to choose the remedy it prefers : "but it is not entitled, if it wishes to act as a loyal member of an international system, to reject all of them."

Finally, there is evident need to increase the world's international reserves. Sir Oliver makes two suggestions for special action. The first is a stabilisation loan for sterling, in recognition of sterling's own great contribution to world reserves, and perhaps to permit larger British foreign investment than would otherwise be possible. The second is to give greater resources to the International Monetary Fund, through the deposit of countries' exchange reserves for use by a more independently managed Fund rather than through a general increase in quotas. Sir Oliver has given the world's bankers and finance ministers ample food for thought.

BANKING TREND

Year of Credit Expansion

THE movements shown by the end-year balance sheets of the big banks are in striking contrast to those that most people might expect from a year that saw the imposition of abnormally dear money and tighter directives over credit. Aggregate "net" deposits of the clearing banks (that is, excluding deposits represented by cheques in course of clearing) rose over the year by £211 million to £6,516 million, or by 3.4 per cent. This is the biggest rise since 1953 ; it contrasts with one of £44 million in 1956 and a decline of £298 million in 1955.

This speeding up of credit expansion, moreover, was by no means confined to the period before the emergency measures of last September. In the last quarter of the year bank advances, partly in consequence of the new directive

but also because of the fall in commodity prices, declined by £70 million, whereas in the similar period of 1956 they rose by £63 million. In spite of this contraction of advances, bank deposits rose during these three months much more than seasonally—by £342 million, compared with £263 million in the final quarter of 1956 and £152 million in 1955. No less than £280 million of the expansion occurred in the last six weeks of 1957 ; the December rise in the seasonally adjusted index of Lloyds Bank, by 2.4 to 109.9, was the largest recorded for a decade. The only part of the year in which credit was less expansionary than in 1956 was that affected by the run on sterling, when the Treasury was receiving large sums in sterling in exchange for its sales of dollars and gold.

The main counterpart of the additional deposits, both over the year and especially over the final quarter, is indeed to be found in those of the banks' assets that mainly reflect borrowings by the Treasury. These liquid assets—comprising cash, loans to the money market, and Treasury and other bills—rose during the quarter by £386 million and over the year by £173 million, compared with only £20 million in 1956. The ratio of these assets to deposits was raised by the year-end to 38.5 per cent, and for most banks was comfortable throughout the year. Thanks to this easy liquidity, the substantial additional advances made during the first half of the year could be financed by the banks without any considerable sales of investments. The £32 million net decline in advances over the year (mainly represented by repayments by the nationalised industries) was, indeed, much more than offset by a net addition to investment portfolios—by £68 million, raising them to some £130 million above the low point reached in August, 1956.

The Treasury's Influence

TWO main influences seem to account for the Treasury's increased borrowings through the banking system, and therefore also for the faster growth of deposits. First, the virtual seizing-up of the gilt-edged market, and the suspicion

of fixed-interest securities generally, during a substantial part of the year made it impossible for the Treasury to finance as large a part of its domestic needs as formerly by sales of securities to the public. Its market sales (including the public take-up of new issues) probably did not quite keep pace with maturities and purchases, in spite of the very large sales achieved in the opening weeks of the year when Bank rate was being talked down. The Treasury's domestic deficit, allowing for National savings, tax certificates and changes in the note circulation, was, however, only a little larger than in 1956.

Secondly, the Treasury's need to borrow sterling was increased by external influences, probably more substantially than in the previous year. Britain's external surplus on current account cannot have been smaller in 1957 than in 1956, and any such surplus tends to increase the Treasury's need for domestic finance—that is, to repay Treasury bills

representing overseas sterling balances that are being run down. Such internal strains from the current surplus may be in some degree offset by the effects of capital pressures against sterling; it is possible that, over 1957 as a whole, the net offset of this kind was smaller than in 1956. That was certainly true of the final quarter, when the speculative movement was in the opposite direction, and thus must have then tended to reinforce the domestic financial strains resulting from the external current account.

MOTOR INDUSTRY

Patterns of Recovery

THE end of the recession in the motor industry has left slightly more of its total output in the hands of the three largest manufacturers. BMC, Ford, and Vauxhall, between them produced not quite 900,000 cars, vans, and lorries during 1957, which was rather more than three-quarters of the total, while two years before, at the height of the boom, the combined share of these three firms was a little under three-quarters. Since 1955, however, two of the three have completed hefty expansion programmes—but as the number of vehicles coming off their assembly lines

VEHICLE PRODUCTION
('000)

	1955	1956	1957
BMC	468	331	450
Ford	307	284	300
Vauxhall	144	123	150
Standard	96	66	(60)
Rootes	120	105	...
Others	92	81	...
Cars	897	708	861
Commercial vehicles	330	287	279
Total	1,227	995	1,140
Home registrations	661	554	570
Exports	527	458	543

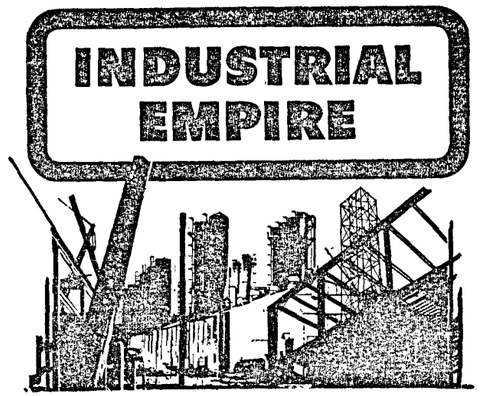
has grown only slightly over the two years, this increased net capacity has remained so far largely unused. BMC, which planned for a capacity of 12,500 vehicles a week, or well over 600,000 a year, is currently producing at the weekly rate of about 11,000, and Vauxhall is turning out about a third less than its new annual capacity of 250,000 cars and commercial vehicles. Ford, which weathered the recession rather better than the other two companies, will not benefit from its expansion programme for about another year : it has been producing to capacity since the summer, though a change of commercial models last autumn meant that its total output for the year fell slightly below 1955.

IN THE MARKETS

Australia's Turn Soon

RELIEF and sober satisfaction were the feelings with which the report of the "leak" Tribunal were received in the City. Both the gilt edged and the industrial sides of the market advanced ; the rally in industrials was barely perceptible ; but good business developed in medium and long dated gilt edged stocks, including the 1999-2004 stock. Substantial investors showed by their buying that the report had disposed of a doubt—of an obstacle to business—and that investment policy could now return to its pre-determined course. On Wednesday the *Financial Times* index of Government stocks jumped 0.24 to 80.26.

Discussion therefore reverts to how far the present tendency of the institutions to use a high proportion of their available funds in the gilt-edged market is likely to carry the rise. Is there much risk of the market running out of hand as it did with an unhappy sequel a year ago ? Certainly the official portfolio in the course of its open market funding has sold a large amount of stock recently though it cannot have been selling such great quantities as in the first weeks of last year. The recent issue of 5½ per cent Exchequer stock has also been designed partly to maintain control at the short-medium end of the list. The danger of a weakening of control, which seems slight, exists at the long-dated end of the list. It is certainly not expedient to make a Government issue in that range of dates so soon after the shorter dated issue.



The supply of long dated stocks must therefore be maintained by a succession of smaller issues of trustee status. A few local authorities may be allowed to borrow and will probably be encouraged to stick to the 6 per cent coupon and to long dates. The largest of the forthcoming trustee issues, will, however, be for Australia and will presumably have to be made next month since it will replace £20 million of 3 per cent stock (1955-58) which matures at the beginning of April. Such an issue would fit neatly into the pattern of the gilt edged market provided that it is long dated and at an acceptable price. That should also enable Australia to take advantage of the reviving demand for long dated stocks. Suggestions that Australia might not seek to make a London issue but replace this sterling loan by dollar borrowing are not taken seriously in the market.

The Shell Prospect

ON the industrial side of the market the problem is still to accommodate the run of big capital issues. The £45 million that "Shell" Transport is to raise in the London market by its rights issue of one for ten at 110s. happens to be the largest industrial issue that the London market has ever tackled. It is flanked, also, by the Royal Dutch issue in New York and Amsterdam of one for eight at 30 US dollars (or 114 Dutch florins) raising about £81 million, so that the total sum that the oil giant will take from the capital markets of the world is £126 million. Owing to the difference between London and New York rules it has proved impossible to quote "Shell" Transport "ex rights" until after holders receive the provisional allotment letters to be posted on February 10th. While the Royal Dutch rights are now separately quoted (at around 8s. 3d.) Shell is still quoted "cum rights"; the price of 141s. 10½d. includes rights to the value of just under 3s. per share.

It now seems certain that Burmah Oil will exercise the rights attaching to its large holding of over £3 million in Shell ; the company will thus have to put up about £1,700,000. The market understands that it will do so without either selling from its existing portfolio or having to raise additional capital within a year. That decision must have been taken with due regard to the timing of Burmah's capital requirements in India.

Over the coming months and indeed until the new Shell stock becomes fully paid on May 16th this great issue, on terms good enough to ensure success but without any margin of generosity, must overhang the market. Other big issues will also restrain prices. Babcock and Wilcox has announced

BP MAPS THE FUTURE

This underwater drilling barge will shortly be at work for BP in the Persian Gulf, 80 miles from the Arabian mainland. The legs retract to enable it to be towed, and it has a helicopter landing platform.

Can oil supplies be doubled in the next ten years?

TODAY THE WORLD is using twice as much oil as in 1946. So far, production has kept pace with demand. At its expected rate of increase, by 1966 demand may well have doubled again. What is being done to meet this situation?

The answer is that exploration in known and suspected oil-bearing areas is proceeding on a colossal scale. In this world-wide operation the BP Group of Companies and its Associates are engaged, in some twenty countries, at an investment cost running into millions of pounds.

BP is also increasing the capacity of its fourteen refineries; adding new vessels to its 2,000,000-ton tanker fleet; expanding its marketing system, which already covers a great sweep of the globe, from Canada through Europe to Asia, to New Zealand.

In 1946 the world used some twenty million tons of BP products; in 1956 fifty-three million.

The ever-increasing demand for oil must be met: no organisation in the world is working harder to meet it than The British Petroleum Company.

THE British Petroleum COMPANY LIMITED

the terms of its debenture issue. It is to be £2 million of 6 per cent stock 1980-83 at £97 and is offered to the company's ordinary and preference shareholders and debenture holders. With a good cover and a gross redemption yield of £4 4s. 8d. per cent the stock should prove attractive. Canadian Pacific Railway Company's issue in Canada of $40 million 15-25 year 5 per cent collateral Trust bonds at 98 does not impinge directly on the London market. But the formation of a new subsidiary—Canadian Pacific Oil and Gas—has attracted the interest of stockholders in this country. It seems to foreshadow that the company will adopt a more forward oil prospecting and developing policy which might one day add a new spice of interest to the ordinary shares.

FUEL CONSUMPTION

A Whiff of Economy?

THIS week's cold snap has set salesmen in the fuel industries rubbing their hands together. Warm weather last year—particularly at the wrong times—overlay all their individual difficulties, such as shortage of large coal within a surplus of small, or in oil the painful recovery after "Suez rationing." Over the year, average temperatures were just over 2 degrees Fahrenheit higher than in 1956 (itself a rather warmer year than the standard set by the 30-year average, 1921-50). Total fuel consumption in 1957 was probably down by 3 per cent.

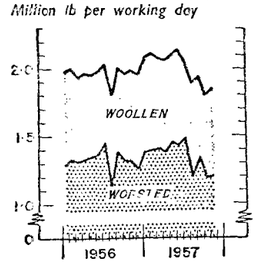
End-year figures from the National Coal Board show "gross inland consumption" of coal as 212,968,000 tons: after allowance is made for exports and changes in stock of the coke made from some of this coal, the "adjusted consumption" figure will probably come down to 208-209 million tons last year, against 214.5 million tons in 1956. In the first nine months of last year total oil sales inside Britain were a million tons, or 5½ per cent, down on the same months of 1956. Since then sales have recovered enough to suggest that for the year fuel oil sales, at least, may show a small increase; but total sales of petroleum products are fairly certain to be lower than last year. Reckoned in terms of "coal equivalent," total fuel consumption may have been about 246-247 million tons in 1957, against 253.7 million tons in 1956 and 249.8 million tons in 1955.

BURNING LESS COAL

	1956	1957
	(mn. tons)	
Gas	27·8	26·4
Electricity	45·6	46·5
Railways	12·8	12·2
Coke ovens	29·3	30·7
Industry :—		
Iron and steel	6·1	5·6
Engineering and metals	3·5	3·2
Others	29·9	28·7
Domestic	37·9	35·9
Collieries	7·9	7·2
Miscellaneous	17·3	16·5
Gross inland consumption	218·1	213·0

For the fuel industries in general, weather, the lack of expansion in industrial output, and Suez probably offer sufficient explanation of this; but the coal industry in particular must be looking rather more carefully at the levelling out of home coal consumption since 1953-54. Its guess that weather accounted for three million tons of the reduction in coal consumption last year is possibly liberal: in any case, that is probably only about half the total reduction, and industrial output has not been falling. Last year two of the coal conversion industries, electricity and the coke ovens, used about 2¼ million tons more coal than in 1956. Even if one ignores the collieries' own cut in consumption, and excludes the railways and iron and steel making as sectors of the market known to be declining, there was a reduction of more than 6½ million tons, or about 5½ per cent, in demand from the remainder—gas, engineering, "other industries," and domestic coal consumption.

OIL PRICES



Cheaper Petrol?

RUMOURS of a further reduction in the price of petrol seem premature. There has been no change in the basic fob price of petrol in the US Gulf and Caribbean since petrol prices were last reduced in this country in November. The spot tanker market has collapsed, but the average freight rate paid on oil moving to this country, which is the rate taken into account in deciding on price changes, fell by only 11d. a ton between October 1st and January 1st, and is unlikely to have fallen at any faster rate since then. The gasoline market in the United States is admittedly weak, and refiners there, despite the narrow profit margins to which they are already working, may have to cut petrol prices by a further ¼ cent a gallon. If that should happen, the British motorist could expect a corresponding reduction. But a reduction in the price of petrol in Britain before it falls in the Caribbean would mean that the oil companies had abandoned their cherished "Caribbean-plus" yardstick. The British market for petrol has been weak this year, even since the Suez restrictions were removed; but because of the high tax on petrol, demand can only be stimulated by a price cut where large quantities are bought by a single buyer—in the highly competitive commercial consumer business, where special rebates off the scheduled price are already a common practice.

Fuel oil sales, on the other hand, should benefit from a further price cut. Although the rate of conversions to fuel oil has recovered a little, so that over 1957 as a whole possibly a little more fuel oil has been sold than in 1956, the pre-Suez rate of increase in fuel oil sales has not been regained. Prices to large consumers are already quite heavily "shaded" below the scheduled prices, and, for most uses, fuel oil is now again competitive with coal in price. The price of heavy fuel oil in the US Gulf fell last week by 5 cents a barrel and light fuel oils fell more sharply, at a time of year when the price usually rises, and this fall has not yet been reflected in a further reduction in fuel oil prices in Britain (except for marine diesel). But

BRITISH WOOL CONSUMPTION

Million lb per working day

Source : Wool Industry Bureau of Statistics

The British wool industry seems to have passed its peak; the upper line shows the daily total consumption of raw wool and the lower the consumption in top making. The lower shaded portion therefore depicts activity on the worsted side of the industry and the upper, the woollen side. Other fibres consumed in conjunction with wool are excluded.

British prices were reduced in November rather more than fob prices in the Caribbean; a cut in Caribbean prices now without a corresponding fall here would therefore merely bring British prices back into line with the Caribbean plus formula, which, in the case of fuel oil, a product that still crosses the Atlantic in quite large quantities, is still a reasonable basis for pricing. Colder weather in Europe this week may stimulate fuel oil sales here without a price cut, and indeed the weather, both here and on the eastern seaboard of the United States, still holds the key to fuel oil prices everywhere.

FOREIGN EXCHANGE

Sterling "Ex Leak"

STERLING has been in good commercial demand during the past week, particularly on American account. In the official market the rate has been held at $2.81½. It would have gone bounding towards its ceiling of $2.82 but for sizeable purchases of dollars by the Exchange Equalisation Account. The Bank Rate Tribunal Report has been well received, but to have had little positive effect on business. After Mr Thorneycroft's resignation foreign centres lost interest in the Tribunal's investigations. The reassuring verdict, however, has prevented renewed pressure on sterling that would otherwise have occurred.

The transferable sterling rate has also recovered slightly, reaching $2.79. The Japanese selling of transferable sterling seems to be finished, and there has been a good demand for it from the Continent. Forward sterling against dollars has held steady at around 27/32 premium for one month. This indicates an interest rate of about 3½ per cent per annum, which approximately spans the difference between bill rates in New York and London. The further decline in American interest rates which has been started by the reduction in the Philadelphia Reserve Bank rediscount rate may involve a slight widening of the dollar premium.

Against Continental currencies, however, sterling has barely held its level this week. The position in this group of currencies is still dominated by the exceptional strength of the guilder, which has been getting the advantage of covering of bear accounts. The reduction in The Netherlands Bank rate from 5 per cent to 4½ per cent was another sign of this new found strength. The British Exchange Control appears to have gained very few Continental currencies during the past month. On the evidence of foreign exchange market dealings—as visible to the naked eye—the end of January gold and dollar reserve figures should show an appreciable improvement, though the EPU settlement may be somewhat disappointing.

INTEREST RATES

Cheaper Money Abroad

ONE of the disadvantages of having had to defend sterling tooth and nail last autumn and of having still to nurse it carefully, is that London has become one of the dearest money centres in the world. Another disadvantage is that other countries can now afford to meet incipient recession by easier money while London cannot yet take that risk. As foreign interest rates come down and London rates remain steady the interest differential in favour of London widens. That has begun to happen. This differential does not automatically produce its own anti-body. To the extent that funds brought to London are matched by forward sales of sterling the gold reserve does not in the short run benefit. Three moves in the direction of relaxation must be recorded.

In West Germany the Bundesbank cut its rediscount rate last week from 4 per cent to 3½ per cent. This cut follows the similar reduction made in September when the London Bank rate was raised to 7 per cent. The previous reduction was doubtless a German contribution to the problem of the hot money going into marks and the pressure on sterling. The present move, inspired by a slackening of employment, order books and production, looks more significant. It may mark a move away from the tightly restrictive measures with which Germany has in recent years held its economy in check. The Netherlands, now enjoying the bear covering that follows the pressure on the guilder last summer, reduced its Bank rate on Thursday from 5 per cent to 4½ per cent.

American moves toward offsetting recession have been more complex. Doubtless a reduction in Federal Reserve

BANK RATES

	January 1, 1957	July 1, 1957	Now
	Per cent.		
United States	3	3	2¾–3
Canada	3·92	4·06	3.90
United Kingdom	5½	5	7
Germany	5	4½	3½
Netherlands	3½	3½	4½

rediscount rates has a part to play. The Philadelphia rate has already been cut from 3 per cent to 2¼ per cent and reserve banks in other centres may follow. In doing so they will be loosening the credit screw in the orthodox way, as they did in November when the rate came down from 3½ per cent to 3 per cent. But the American monetary authorities have a variety of weapons in their armoury and they have already used one other: the margin requirement on the New York Stock Exchange was reduced from 70 per cent to 50 per cent, thereby allowing the investor (and speculator) to operate with more borrowed money and less of his own resources. If the move were successful it would show first through Stock Exchange prices, only gradually breeding increased confidence in industry and trade. It must be recorded that the reaction on Stock Exchange prices has so far been modest. Since January 14th, the day before the announcement, the Dow Jones industrial average now at 445.70 has shown a net gain of 3.90, almost all of it secured on the day of the announcement.

OPENCAST COAL

Power to Ravish

NO politician could enjoy introducing permanent legislation to replace the Defence Regulations under which the National Coal Board works coal opencast by stripping the surface from some of Britain's fields, but this week Mr Maudling was reasonably businesslike about the distasteful necessity. Other speakers in the Commons on the second reading of the Opencast Coal Bill dilated more eloquently upon the unpleasantness of what is a brutal though efficient and cheap way of getting coal. Since the last Labour Government had committed itself to the forecast that opencast working would not be needed after 1953,

and the then Conservative Opposition had attacked them for not ending it before, most members were somewhat shamefaced in accepting the new measure. This bill will confer powers upon the Board to obtain, for ten years, "compulsory rights orders" for the use of land over periods of up to ten years; so, in effect, it may authorise opencast mining during 20 years from the time that it becomes law.

Opencast production amounted to 13,582,600 tons last year, and was entirely responsible for the small increase in total coal output, because production from the deep mines fell. About 110 sites are being worked today by civil engineering contractors on behalf of the board. This strip mining is a matter of large-scale earth moving and excavation, performed with heavy mobile equipment and generally operating 24 hours a day: the yearly productivity is about 1,200 tons per man employed, against 295 tons a year for deepmining, and costs are far lower, so that both the contractors and the board make a comfortable profit on it. This coal near the surface is often not of particularly good quality, but as far as size goes it is no worse than deep mining; something over 30 per cent of its output goes into the "large coal" grades.

Rights of protest before land is taken over for compulsory use, of compensation or, at the owner's option, of purchase, are probably more favourable to the landowner under the new bill than under the arrangements the board has recently been making, quite apart from the conditions imposed in the early years of opencast working. The restoration of the land, moreover, is now perhaps about as careful as it could be—the board accepts considerably greater obligations in this respect than most other industries working minerals from the surface. However reasonable these provisions may be, they will not persuade landowners to like the infliction: this rape of the earth, even when inevitable, is not one that anybody can relax and enjoy.

OVERSEAS STERLING AREA

Ghana's Sterling

A LURID gloss has been put on some remarks that K. A. Gbedemah, Minister of Finance in Ghana, made about the new Dominion's sterling balances. What he said when he returned from discussions in London was that plans had been completed "for the better management of the assets, most of which are now invested in British Government stocks." The interpretation which some have chosen to put on these words, namely, that Ghana is about to effect massive conversions of sterling into dollars and other cur-

British Trade in 1957

THE rate of expansion of British exports as a whole slowed down last year. But once again exports to non-sterling countries rose more than exports to the sterling area. If repayments of silver bullion to the United States are excluded, total exports to the dollar area rose 9 per cent in value. Exports to Western Germany, Italy and Belgium were higher than in 1956 but several other OEEC countries bought little, if any more.

Exports of cars and non-electric machinery revived last year after their poor or sluggish showing in 1956. On the other hand, aircraft, ships and boats and railway vehicles, which had been major growth exports in 1956, all declined in 1957. There was a marked slowing down in the rate of growth in the engineering group but the first increase in textile exports since 1951.

Import trade was considerably disturbed by the Suez crisis which delayed from 1956 goods to the value of about £30 million. Two-thirds of the rise of 13 per cent in imports from the dollar area was accounted for by supplementary purchases of dollar petroleum. Imports of finished manufactures showed a strong rise once more. The average price of industrial materials in 1957 was little different from 1956, but rubber was cheaper and the decline in the value of imports of non-ferrous metals can be entirely accounted for by the fall in copper prices.

The Floating Mountain

THE WRITINGS of Ibn-Battutah, a 14th-century traveller, make lively reading. Once, in the Java Sea, his boat was caught in the monsoon and tossed about for forty days. Suddenly the clouds lifted and the seamen saw a mountain rising from the sea. The whirlwind rushed them towards it. When they were but ten miles away the mountain seemed to hover between sky and sea. The sailors wept, and bade one another farewell. "What we thought was a mountain is a roc. This monster bird will surely destroy us." But all at once a favourable wind arose and carried them to safety. So Ibn-Battutah never knew what he had seen—an airborne mountain or the legendary roc.

Unearthly dangers no longer menace travellers. But there are mundane risks enough that travelling merchandise must face. That is why modern manufacturers protect their goods with cartons of 'Thames Board', and 'Fiberite' cases in solid or in corrugated fibreboard.

rencies and in effect pull out of the sterling area, is without foundation. All that is intended is to transfer the responsibility for the investment of these funds from the Crown Agents to a permanent committee of financial experts, in the main British, who will be appointed by and solely responsible to the Ghana Government. This move is at least not inconsistent with the emergence of Ghana as a self-governing dominion.

Mr Gbedemah referred to sterling balances amounting to nearly £160 million. These are mainly funds accumulated since the end of the war and held by the Cocoa Marketing Board, Pension Funds, and various funds other than the currency reserve. The latest available global figures for Ghana's sterling balances relates unfortunately only to the end of 1955 when they amounted to £215 million, of which £40 million was held by the Currency Board as backing for the currency issue. The present figure of £160 million would compare with the £175 million which was invested for funds other than the currency reserve in 1955. The sterling securities held by the Currency Board will be transferred to the new Central Bank this year, and it may well be that arrangements will later be made for departing from the present practice of 100 per cent sterling cover for the currency. That together with some reshuffling of sterling securities seem to be the only moves under contemplation. One of the reasons for the demand for "better management" of these assets—a phrase that seems wounding to the Crown Agents—may well be their serious depreciation along with other gilt-edged stocks last year, and the consequent desire of the Ghana Government to keep them much shorter-dated in future.

COMMODITY EXPORTS

A New Trade Index

A NEW index measuring the volume of the trade of the overseas sterling area is introduced alongside other statistical material in the current issue of *Economic Trends*. This shows exports from the area doing about as well as those from similar primary producing areas, sharing with them a growth that has failed to keep pace with that of the parts of the world trading in manufactured goods. Between 1950 and 1956 world exports rose about two-thirds in value

TRADE OF THE OVERSEAS STERLING AREA

(Index numbers 1950=100)

	Value of imports	Value of exports including oil	Value of exports excluding oil	Volume of imports	Volume of exports excluding oil
1936 to 1938	21	...	20	...	82
1948	80	...	65	...	88
1950	100	100	100	100	100
1953	118	117	110	104	106
1954	126	119	109	113	107
1955	142	129	118	127	117
1956	150	134	123	132	124
1957, first half...	161	141	134	135	133

and about 45 per cent in volume; the exports of the overseas sterling area in the same period rose 23 per cent in value (or 34 per cent if Middle East oil is included) and about the same, or slightly more, in volume.

The demand for raw materials has, the figures suggest, shrunk in relation to final output of manufactured goods. They might reflect, for example, the spreading of tin more thinly on the tinplate or the growth of synthetic rubber usage. Moreover, industrial countries have increased their domestic production of raw materials and have also been buying more from each other. Thanks to the support of United Kingdom sterling purchases, the overseas sterling area has been feeling this pressure only in the last few years, but in that time it has suffered a marked decline in its share of imports into the main manufacturing countries. There is naturally an obverse of the same medal—the long-term results of industrialisation in the overseas sterling area. Manufactures and semi-manufactures accounted for 19 per cent of the value of domestic exports (excluding oil) in 1950, 21 per cent in 1956. The trend seems to have started towards the export of more highly finished goods rather than raw materials.

OIL TANKERS

More Ships; Less Oil

TANKER freight rates plumbed new depths last week when spot cargoes from the Persian Gulf to the UK/Continent were fixed at about 13s. 6d. a ton (excluding Suez Canal dues of 6s. 3d. a ton). This is a mere quarter of the "normal" rate for the voyage, well below the rate at which even the most modern and efficient vessel can operate at a profit. At the peak of the Suez shortage last year up to £19 a ton was being paid: the freight then represented nearly four times the fob value of the oil, whereas today it amounts to less than a fifth. An owner would accept such unprofitable rates only as an alternative to the even less profitable journey home from the Persian Gulf in ballast, and it would presumably be his intention to lay the ship up at the end of the voyage. Though the spot market has collapsed, the great bulk of independently owned oil tankers are still being operated on quite profitable time charters that still have months or even years to run. The Average Freight Rate Assessment, which includes all tankers in use, still stood at the beginning of January at nearly five times last week's single voyage rate, and is unlikely to have fallen appreciably since then. Paradoxically, while many of the tankers now operating profitably under time charter are old vessels that might well be laid up, several brand new tankers in Norwegian and German yards for which no time charters had previously been arranged have taken one look at the spot market and gone straight from the builder's yard to the laying-up berth. About 2½ million deadweight tons of tankers are now laid up, to say nothing of those temporarily unemployed, and the oil companies, whose re-entry into the market as charterers provides the only hope of an early revival in rates, are still re-letting their own or chartered tonnage.

Short of another closure of the supply routes through the Middle East, there is little in recent forecasts of oil demand in 1958 to encourage tanker owners. Between 1950 and 1956 the world demand for oil was rising at an average rate of 7½ per cent a year; as average tanker hauls lengthened with the increased reliance on the Middle East, the demand for tanker tonnage increased at a faster rate, by 10¼ per cent annually during the same period. Today, few oil companies would put the probable average increase in the world demand for oil between now and 1960 at above 6 per cent a year, and it also seems unlikely that the average length of tanker haul will continue to increase, unless much more reliance is placed on the Cape route to Europe from the Persian Gulf. With over 5 million tons of new tankers due to be delivered in each of the next three years, more cancellations of orders and accelerated scrapping of old tankers can hardly be avoided.

SHIPBUILDING

Writing on the Wall?

PLUNGING tanker freights and berths crowded with laid up tankers must inevitably cast shadows across the shipyards, but, so far as British shipbuilders are concerned, the impact as yet has been small. According to the Shipbuilding Conference, orders for only 15 ships totalling 100,000 gross tons had been cancelled in British yards by the end of the year, and most of these were dry cargo vessels; options not taken up on berths may have accounted for another 100,000 tons. Thus British yards entered 1958 with an order book worth some £1,000 million, comprising 812 ships of 6,828,000 gross tons, nearly 400,000 tons more than they had on the books twelve months earlier. Nearly 1,500,000 tons, however, had been added in the first nine months of the year, and only 180,000 tons were ordered after September, when the slump in the spot tanker market began to look more permanent. Contrary to some reports, the P. & O. has not changed its programme to build some 500,000 dwt of tankers, with the first delivery promised for late 1958—though whether it will be able to find profitable employment for them immediately is another matter.

Foreign yards, especially in the United States and Japan, have felt the wind earlier. New orders by oil companies have more or less balanced deliveries of new ships and cancellations of existing orders, so there has been little change in the total of some 34 million deadweight tons supposed to be under construction or on order throughout the world. No oil companies are known to have cancelled firm orders (though they may have decided against the additional building programmes many of them had under consideration); oil companies can always dispense with chartered tonnage to make way for additions to their own fleets, and may even welcome the opportunity to raise the proportion—which had been falling—of the owned to chartered vessels in their fleets, as a matter of long term policy. But the independent operators, except where they have already secured time charters for vessels not yet delivered, must now forfeit their pound of flesh to the oil companies who provided them with fat pickings last winter. Last week, for example, the Onassis interests were reported to have cancelled a contract to build three 47,750 ton tankers in an American yard; and to judge from the favourable payment terms and short delivery dates now being dangled before unwilling shipowners by Japanese shipbuilders, American yards are not alone in feeling the pinch. Cancellations now could not have much effect on the rate of deliveries from yards before the middle of 1959, at the earliest. So the tanker surplus is bound to become worse for at least the next eighteen months.

MONORAILS

By Air to the Airport

THE main attraction of the project for a monorail link to London airport that a consortium of six British firms have put up to the Minister of Transport is the claim that it has a very strong chance of paying its way. A helicopter service has never seemed likely to do that, nor do the present airport coach services; and the scheme for a rail link, also starting from Victoria station, would cost about £16 million, which would be double the capital expenditure that the consortium Air-Rail, Ltd. expects its project to involve. If the Ministry is satisfied that the monorail would be completely safe and if all the other legal preliminaries are cleared, it could be ready for operation in 1961. By then passenger traffic to and from the airport is expected to have increased from more than 3 million now to over 5 million. If the monorail could secure half of that traffic, Air-Rail reckon that it would more than cover its operating costs and capital charges with a single trip fare of 5s. In addition the monorail would be able to carry freight from the new Victoria air terminal (the cost of which is not included in the £8 million) and any commuter traffic to the airport area.

The two other advantages of a practical and viable monorail service would be its speed and its ability to operate in all kinds of weather. Two parallel concrete rails would run for sixteen miles from Victoria to the airport, following the Southern Region railway as far as Feltham, then cutting across country to the airport. To this spur the rails would be carried on pillars and nearer the airport they could run along the ground. This would give an unimpeded run in each direction at speeds of up to 100 mph, which the first diesel-powered bus-type coaches would be able to do. Signalling and traffic control by an induction relay system would be designed to give the monorail something equivalent to automatic train control, so that fog and darkness would not limit journey speeds.

The monorail system Air-Rail offers to develop is the saddle-type in which the coaches run astride the rail, instead of being under-slung. Originally a British invention, it has recently been taken further by a Swede and tried out for a short distance in Cologne. It runs on tyres with supporting wheels running along the top of the rail and guiding and stabilising wheels on the vertical surfaces; tyres reduce the noise of movement but set, at present, a limit to maximum coach speeds. This Air-Rail coach has a normal set of wheels as well so that it can leave the rail at either end and travel as an ordinary bus. Thirty coaches, to make up ten or more train sets tailored to aircraft loads, would be built to begin with.

EXPORT CREDITS

ECGD's Record Business

A RECORD value of £485.4 million of goods was shipped under insurance granted by the Export Credits Guarantee Department last year. That is 18½ per cent more than in 1956, and a notable achievement with which to face the Speed Committee at present re-examining the Department. But as might be expected the growth eased in the last quarter, falling to a rate only 7 per cent above the 1956 level. There was also a marked difference between the trend of medium-term and of short-term policies.

The insurance of new medium-term transactions—transactions involving credit up to a maximum of about five years—reached a record of £156.6 million during the calendar year. New business in this field—mainly of the capital goods type—was thus double what it was in 1956. On the other hand, the face value of short-term policies outstanding at the end of the year declined by £28.0 million, to £518.6 million, while the average face value of each policy fell by 8 per cent. Since policies are normally taken out a year in advance, this may give some indication of how British exporters of non-capital goods estimate their prospects. Indeed, the high current level of insured exports represents the fulfilment of expectations held in 1956, when the total value of outstanding short-term policies rose by £56.8 million, or nearly 12 per cent, and the average value rose by 6 per cent.

MOTORWAYS

The First 53 Miles

THE speed at which the London-Birmingham motorway, which will run for 53 miles from the St. Albans by-pass to the Dunchurch by-pass near Birmingham, is to be completed is certainly fast. The Ministry of Transport invited tenders for four sections of the motorway with two alternative completion dates, October next year and October, 1960, and has decided to award the contract for all four sections to John Laing, stipulating that each section is to be ready by the earlier of the two dates. As the major excavation work will take Laing most of the rest of this year, the laying of the concrete and the construction of the 62 major bridges will have to be done in little more than ten months. This rate of motorway building will compare very well with the pace of any previous work on the Continent or in North America.

Though the work has to be done in so short a time, the award of the contract to a single firm (which quoted the lowest price for all four sections) will allow that firm to use its equipment and organisation more effectively. Laing, which is one of the largest road builders in Africa—where conditions are admittedly somewhat different—intends to split the work up into the four original sections, with a separate team for each. It has the necessary concreting plant already, and envisages no difficulty in adding to its stock of excavation equipment, recruiting additional labour, or in securing supplies of materials.

But this sudden burst of speed by the Ministry of Transport in its motorway programme causes more surprise. Plans for the London-Birmingham motorway, which will form the southern part of the Y-shaped north-south motorway linking London with Lancashire and Yorkshire, were first announced three years ago and the intervening time has been taken up in various preliminary negotiations and surveying. Both the Preston and Lancaster by-passes, which are small parts of the Lancashire branch of the motorway, are now being built at the rate of two years or more for stretches only nine and eleven miles long. The 21-mile Ross Spur, too, is expected to take 2½ years to build. Would it be merely churlish to think that part of the explanation for this sudden quickening up is that, if this week's contract is completed on time, Mr Watkinson has a good chance of being present as Minister of Transport at the opening of the first long motorway, before the next General Election?

COMPANY AFFAIRS

F. W. WOOLWORTH

THERE was a little buying of the 5s. ordinary shares of F. W. Woolworth before the company's dividend announcement. The small gain in the price was, however, lost when the dividend of 40 per cent for 1957 was announced. It was exactly equivalent, after allowing for the 50 per cent free scrip issue, to the 60 per cent paid for 1956. The 5s. units, now standing at 39s. 7½d., yield just over 5 per cent, a figure which implies that shareholders still expect rising dividends.

Following the revaluation of its properties, the company's provision for depreciation has more than doubled at £312,239 against £680,692. Gross trading profits before deducting that charge have risen from £23,631,594 to £24,752,445, a cheering increase of about 4¾ per cent which must mean an expansion in turnover more than sufficient to offset rising costs. Woolworth's tax bill has risen from £12,313,238 to £12,838,552, and its net profits have edged up from £11,006,117 to £11,233,201. The net ordinary dividend absorbs £7,762,500, but the ordinary earnings cover—about 57 per cent—is high enough to justify those who look for some increase in the dividend one day. But will F. W. Woolworth and other retailers of consumer goods be able to repeat in 1958 their 1957 achievements—achievements which, in part at least, have already been discounted in share prices?

MONTAGUE BURTON

NEW blood was injected into the management of the multiple tailors, Montague Burton, when in 1953, not many months after a bad spell of net trading losses, it absorbed Jackson the Tailor (and in effect Mr Jacobson). Since then the record has been progressive. In the year to August 31st last, the company's gross profits rose by £213,967 to £2,431,113. After tax, net profits rose from £993,535 to £1,063,867. Allowing for the 100 per cent free scrip issue in non-voting "A" ordinary shares the ordinary dividend has been effectively raised from 8¾ to 10 per cent. The new dividend absorbs £256,353 net and is covered over three and a half times; Throgmorton Street was disappointed with the dividend, marking the ordinary units down.

This is a handsome cover but it is not the only reason why both the ordinary and "A" ordinary shares are highly priced. The 10s. ordinary units (that carry votes) stand at 24s. 4½d. and yield only £4 2s. per cent and the 10s. "A" non-voting ordinary units stand at 21s. 10½d. and yield £4 12s. per cent. Yields as low as these are not justified by trading results alone—nor by prospects, on which the fall in wool prices must have some bearing. The yields are low for the same reason that a differential exists between the prices of the voting and non-voting stocks: Montague Burton is the prey of recurrent rumours of possible take-overs. Such rumours, however baseless in fact, have this justification: in recent years, multiple tailoring has been heavily concentrated under the control of two big groups, Great Universal Stores and United Drapery Stores. How long, the rumourmongers ask, can Montague Burton stay independent? Or, indeed, how long is it willing to do so?

STEEL RESULTS

BY coincidence and by contrast, the reports that round off this year's trading results from the iron and steel industry are from companies reporting lower profits. These are the exceptional reports; the other steel giants reported better earnings and dividends. They come from companies which have not been, as many of the others were, massively engaged in development programmes.

Richard Thomas and Baldwins, still nationalised, issues its report to its single shareholder, ISHRA. Tersely, all its directors say about the fall in trading profits from £10,075,840 to £9,694,407 is that it "resulted from various factors, some domestic and some external." But they do mention the closing of hand mills and add that "the position of certain other old-type works owned by the company, including steel works, is under review and some further closures may be necessary."

A continuous galvanising plant at Ebbw Vale and a sheet steel plant in the Midlands accounted for much of

the money spent on capital account last year. Outstanding capital commitments are estimated at about £5,400,000. Because of an increase in stocks and debtors, the group's liquid resources were reduced from £7.1 million to £4.2 million (largely made up of a loan of £3,250,000 to ISHRA) during the year. The group should have no difficulty in meeting its immediate capital commitments, which are small beer for the steel industry and for Richard Thomas and Baldwins. The main question is still whether or not another strip mill is to be built and whether or not RTB is to be concerned in it. Until that issue is resolved, the costly alternative development projects that the company has in mind—and probably its denationalisation—are likely to wait.

Lancashire Steel raised its ordinary dividend from 11 to 14 per cent despite a fall in its gross trading profit from £3,864,930 to £2,861,880. In the full report the directors merely repeat the view they expressed in the preliminary announcement—that the principal cause of the fall in earnings was that the Iron and Steel Board did not allow high enough prices for billets, wire rods, bars and light sections. Since the end of the financial year earnings have improved. During the year the group spent nearly £2,300,000 on capital commitments are estimated at nearly £1,600,000. Lancashire Steel has not, as many other steel companies have, a big development programme to complete and at the end of last September it held about £2,400,000 in liquid assets.

Arthur Lee and Sons is a much smaller concern, making strip steel, wire rods and bright drawn steel bars. It, too, has reported a fall in trading profits—from £1,351,212 to £1,219,247. It has left its ordinary dividend unchanged—at 10 per cent, less tax, plus a tax free bonus of 2½ per cent. In his statement the chairman, Mr G. Wilton Lee, attributes the fall in profits to the recession in the motor industry (the company's biggest customer), to the increase in costs without a "commensurate increase" in controlled selling prices, and to some reduction in orders. But orders, he adds, are now "much healthier than they were a year ago." He looks forward to a "successful year."

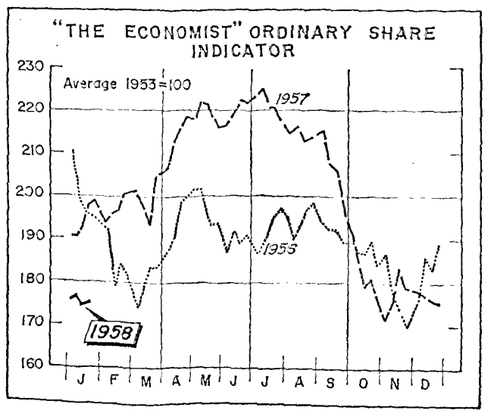
WESTINGHOUSE BRAKE AND SIGNAL

SOUND and progressive is not an unfair description of the merits of the £1 ordinary stock units of Westinghouse Brake and Signal. For the year to end-September the ordinary dividend was effectively raised from 9 to 10 per cent, following an advance in gross profits from £1,733,122 to £2,143,466 and in net profits from £741,620 to £888,847. On this dividend the £1 units at 33s. 7½d. xd yield just under 6 per cent.

Last year also witnessed a rights issue of ordinary stock, raising about £3 million. This new money eliminated the bank overdraft of £1¼ million, which had been spent on the group's capital programme; at the end of September the group had net liquid assets of about £725,000, to set against immediate capital commitments of £856,000.

Thus the group is well placed to meet the further demands that will be made on its productive resources this year. Last year, costs were rising but the pressure on profit margins was offset by a bigger volume of production, as new equipment and plant began to make its contribution. Record deliveries were achieved both at home and overseas. Other major factors in bringing about the increase in profits were better results from subsidiaries in the Commonwealth and the elimination of losses made earlier by Douglas (Kingswood), which as well as making brakes and pneumatic control equipment is the manufacturer of "Vespa" scooters in this country. Orders received last year were again a record and the chairman, Mr A. R. S. Nutting, says that the modernisation programme of the British Transport Commission, while it had no material effect on the 1956-57 results, will swell the demand for vacuum brakes and signalling equipment "during 1958 and thereafter." The Westinghouse ordinary stock units should ride through 1958 quite comfortably.

London Stock Exchange



FIRST DEALINGS:	Jan. 15	Jan. 29	Jan. 12
LAST DEALINGS:	Jan. 28	Feb. 11	Jan. 25
ACCOUNT DAY:	Feb. 4	Feb. 18	Mar. 4

PUBLICATION of the "leak" report, lower interest rates abroad, a fall in the Treasury bill rate and another rise in sterling encouraged buyers of gilt-edged stocks after a pause on Tuesday, but prices responded more briskly on Wednesday, lifting the *Financial Times* index of Government securities a further quarter of a point to 80.26, compared with 79.75 a week before. The new Exchequer stock crept up steadily to 99¼ from its issue price of 99½.

Industrial stocks moved uncertainly, last Thursday's improvement giving way to weaker conditions until a rally on Wednesday more than made good the losses. Bank shares gained ground, Barclays rising 1s. 6d. to 41s. 6d.xd. and Lloyds 1s. 9d. to 44s. 6d. But discount houses suffered losses, National Discount "B" falling 2s. 6d. to 30s. xd., and Union Discount 1s. 3d. to 41s. 9d. Following the results, Borax declined to 18s. 1½d. at one time, before recovering to 18s. 4½d. De La Rue gained 1s. 6d to 23s. on the proposed free scrip issue. Record export earnings failed to halt a fall in motor shares. There was a more pronounced slide in aircraft stocks among which Hawker Siddeley slipped a further 1s. 6d. to 26s. 6d. Steel shares stage a sharp recovery on Wednesday; Colvilles convertible debenture, which started at a discount on Monday, rose to its issue price. Shipping shares receded, P & O falling 1s. 3d. to 22s. 9d.

Despite a reaction last Friday, leading oil stocks, with the exception of Burmah, made gains of several shillings, but became uncertain on Thursday. Royal Dutch rights were quoted at 8s. 3d. Platinum shares fell heavily before the passing of the interim dividends, and weakened further on Thursday. Tin producers turned easier, and copper mines drifted lower.

(1) Annual figures are for June of each year. (2) Engineering, shipbuilding, electrical goods, vehicles, metal goods, precision instruments and jewellery. (3) Textiles, leather goods, clothing, food, drink and tobacco, manufactures of wood and cork, paper and printing. (4) Number registered as unemployed expressed as a percentage of the estimated number of employees. (5) From June, 1956, onwards comparison with earlier figures is affected by the revocation of the Notification of Vacancies Order, 1952. (6) United Kingdom. (7) Reduction due to discontinued registration of persons losing title to unemployment benefit.

(1) Relates to wholesale prices in Athens and Piraeus only for Greece. Figures for Ireland from 1955 onwards are for home-produced goods only. Figures for Germany, F.R. are producers' prices of industrial products. (2) July-December. (3) Relates to prices in capital cities only for Austria, France, Greece and Turkey. Austria and Belgium exclude rent. Denmark includes direct taxes. Figures for Ireland are based on August, 1953=100. (4) Including direct taxes. (5) Including trade with Faroe Islands. (6) Index numbers of unit value which compare the current average value of trade with its value in 1953; they are influenced by changes in the composition of trade as well as price movements. Export prices in Ireland are adjusted for seasonal variations. (7) Deposit money and notes and coins held by business, individuals and foreigners. Except for Greece, holdings of the issuing authority and other banks are excluded. (8) Holdings of the government and central bank at end of period. Foreign exchange figures for Norway exclude government holdings; Netherlands, Norway and Sweden include foreign investments. Ireland includes some long-term securities. (9) Beginning May, 1954, a new drachma equal to 1,000 old drachmas was introduced. (10) Average for second quarter. (11) Average for third quarter.

Financial Statistics

EXCHEQUER RETURNS

For the week ended January 18, 1958, there was an "above-line" surplus (after allowing for Sinking Funds) of £105,434,000 compared with a surplus of £135,490,000 in the previous week and a surplus of £129,848,000 in the corresponding period of last year. There was a net expenditure "below-line" of £50,008,000, leaving a total deficit from April 1st of £715,252,000 (£725,512,000 in 1956–57).

THE MONEY MARKET

At the Treasury bill tender on Friday last week the average rate resumed its decline; the rate fell 8.92d., to £6 5s. 10.33d. per cent. The discount market raised its common bid by rather more than expected, by 3d. to £98 8s. 7d. per cent, and the proportion of applications allotted at this price rose from 45 to 52 per cent. This was achieved despite a decline of £20 million to £240 million in the total allotment and a rise of £5.1 million, to £403.8 million, in total applications. Yesterday's tender was for £230 million of bills, £80 million less than maturities, reflecting the inflow of tax revenue.

In the money market, rates on overnight loans have on the whole been easier than the week before; and the Bank gave help through purchases of bills only on Saturday. On Monday, four houses had to take small loans at Bank rate, but some were renewing loans from the week before.

Sterling closed at $2.81¼ on Wednesday, having gained ⅝ c over the week; and since the dollar price of gold has been steady at $35.01 per fine oz, its sterling value has declined—to 248s. 8d. after the fixing on Wednesday, the lowest level since April 21, 1954, shortly after the market was re-opened.

The United States Treasury bill rate has fallen again, from 2.591 to 2.587 per cent. This week the Reserve Bank of Philadelphia cut its rediscount rate from 3 to 2¾ per cent.

COMPANY MEETINGS

LLOYDS BANK LIMITED

SIR OLIVER FRANKS ON FREE NATIONS' PROBLEMS

CRITICISMS OF PRESENT FRAMEWORK EXAMINED

RESPONSIBILITIES OF CREDITOR COUNTRIES

NEED FOR ADEQUATE LEVEL OF MONETARY RESERVES

The annual general meeting of Lloyds Bank Limited will be held on February 14th at the Head Office, 71 Lombard Street, London, E.C.

The following is the statement by the chairman, The Right Honourable Sir Oliver Franks, GCMG, KCB, CBE, which has been circulated with the report and accounts for the year 1957.

I have to record with deep regret the death of the Honourable Maurice F. P. Lubbock. He first became a Director in 1932 and throughout his long period of service to the Bank was the friend and valued adviser of us all.

I must also record that Sir Frederick Burrows, GCSI, GCIE, DL, on his reaching 70 years of age does not offer himself for re-election. We shall miss his help and cheerful companionship. He will, however, still be with us as a member of the Eastern Committee of the Board and of the South Wales Local Committee.

We welcome as Directors Mr G. Y. Hinwood, The Right Honourable Lord Lloyd, MBE, and Sir James Turner, LLD. Mr Hinwood has been elected to the Board on his retirement after good service as a Chief General Manager. We are particularly glad that Lord Lloyd has joined us: he, like Mr F. N. Lloyd, is a direct descendant of Sampson Lloyd, our founder. Sir James Turner brings to our counsels a rich knowledge of British agriculture.

Time makes changes inevitable on the Local Committees. At Birmingham I must refer with deep regret to the death of Sir Chad Woodward, DL. Mr A. J. Faux, on his retirement as a Joint General Manager, and Mr Evan Augustus Norton have been appointed to the Committee. In Devon and Cornwall, Mr K. C. H. Rowe, MBE, TD, has joined our Committee. In the North-West I have to report the retirement of Mr R. C. Chapple Gill, who also gave long service as a Director of the Bank from 1924 to 1950. Lieutenant-Colonel Albert Buckley, CBE, DSO, has become Chairman of the North-West Committee. At Salisbury, I must mention the retirement of Mr T. J. Score, and in Yorkshire Sir James Turner has been appointed to the Committee.

Mr E. J. N. Warburton and Mr H. B. Lawson, MC, have been appointed Deputy Chief General Managers on the retirement of Mr Hinwood and Mr C. H. Woolley has been appointed a Joint General Manager in succession to Mr Faux.

I wish to make special reference to the retirement of Mr R. F. E. Whittaker, CB, CBE, TD, as General Manager (Administration). Throughout the post-war decade he gave distinguished service to the Bank in a key position. Mr Whittaker takes our good wishes with him. He has been succeeded by Mr K. L. Boyes, formerly an Assistant General Manager.

PROFIT AND LOSS ACCOUNT AND BALANCE SHEET

The profit for the year, at £2,502,391, is slightly lower, by £39,402, than last year and we propose to repeat the 1956 dividend of 13 per cent per annum.

Although high rates as well as a high degree of activity in all sections of our business have again benefited our earnings, our operating costs continue to rise inexorably. This is true not only of salaries and wages but of all the numerous items which go to make up our other expenses, the latest example being the recent increase in postal and telephone charges. We welcome the small relief which will be afforded us by the abolition of endorsements under the Cheques Act, 1957, and we are taking every possible step to effect economies in other directions, including the increased use of mechanical aids. We operate, however, through nearly 1,800 branches spread throughout the country and aim to provide as high a standard of service in the small office as in the large; at the present level of salaries, banking operations on this scale must of necessity be costly.

I am glad to be able to pay tribute to the efficiency and increasing productivity of the staff of all grades, which have such an important part to play in keeping down our costs. I thank them warmly for their work.

Our loans and advances are lower by some £9 million than they were a year ago. We have played our part in the intensive measures of credit restraint called for by the Chancellor of the Exchequer. The reduction would have been greater but for the two particular categories of lending I referred to in my statement last year. Our advances in the East have expanded along with our general business there, and we have continued to interest ourselves in the important and specialised field of medium-term credits to facilitate the export of major capital goods, a category of advances excluded from the operation of the general restrictions upon bank lending.

British Government securities stand in our balance sheet at £326,285,199, being valued at or under cost and below redemption value. Their market value at December 31, 1957, was £317,103,721, a difference of £9,131,478. We have made no transfer from reserves or profit and loss account to provide for this depreciation. All the securities are redeemable at fixed dates, the majority within ten years, when any depreciation will be recovered. In the ordinary course of business the bulk of our investments is held broadly to maturity; when we need to reduce our portfolio, we usually do so in the very short-dated stocks.

LLOYDS BANK (FOREIGN) LIMITED

This subsidiary company has had a satisfactory year and the directors of that company have declared a dividend of 5 per cent per annum, less income tax, on the share capital held by the parent bank.

Economic conditions in France and the devaluation of the French franc have made banking operations in that country especially difficult in the year under review.

To the staff working in France, Belgium, Switzerland and Monte Carlo I would like to express my warm appreciation of the results achieved by their efforts.

EASTERN BRANCHES

A heavy and sustained demand for bank advances has been a pronounced feature of our operations in India during the past year. Both there and in Pakistan, a shortage of foreign exchange has led to a curtailment of imports, the financing of which is an important part of our business.

Our thanks are due to the Eastern staff for their devoted work in difficult conditions.

THE EXTERNAL PROBLEMS OF STERLING

As I am a member of the Committee under the chairmanship of Lord Radcliffe at present enquiring into the working of the monetary and credit system, I cannot comment upon monetary developments at home during the past year. Instead, I propose to discuss some of our problems, certainly no less important, in the sphere of international payments.

I do not mean to imply that our external problems and our domestic policies can be divided into separate compartments; as Mr Thorneycroft recently pointed out, in the last resort the internal value and the external value of the pound are the same thing. We have now had an external crisis, of one kind or another, in every alternate year since 1947, with the sole exception of 1953—and it is at least suggestive that 1953 was the only "odd" year in this period in which the pressure of demand on the United Kingdom economy had manifestly abated. It was an exceptional feature of the 1957 crisis that this was a year in which the United Kingdom had a substantial surplus in its balance of payments. But we cannot argue from this that our payments difficulties arose purely out of our position as a world banker and had no connection with the state of the United Kingdom economy; for the fear that inflation might continue played a large part in disturbing

international confidence in sterling. If the outside world had been satisfied that our internal policies were sound, there would have been no crisis.

POTENTIAL DANGERS

Unfortunately, it is also true that even if we have no further inflation the future can still hold dangers for us because of the low level of the gold and dollar reserves in relation to our total obligations. To avoid further inflation will not automatically ensure success in the vital task of rebuilding the reserves. Sterling being an international currency, we are necessarily affected by the general climate of world trade. The course of events is bound to depend not only upon our own policies but also, in some considerable degree, upon those followed by other countries, above all by the United States and our fellow-members in the sterling area. It is a disquieting thought that the succession of sterling crises has taken place during a decade of general prosperity and of almost continuous expansion in world trade, supported by the North American boom, by recovery in Europe and by rapid progress in many of the less developed parts of the world. It is unlikely that external conditions will always be so favourable.

Nothing can change our dependence upon overseas trade for a living, but our persistent external difficulties have led to suggestions that we should be better off if we shed our rôle as banker to the sterling area. Again, we have undertaken that the relations between sterling and other currencies will be governed by certain principles agreed by us and other nations at the Bretton Woods conference of 1944. Some argue that this system, which found concrete expression in the establishment of the International Monetary Fund, is not really in our best interests.

It is these criticisms of the present framework of world trade and payments that seem to me worth examining. Do the difficulties, actual or anticipated, in fact arise from defects in the international machinery itself, or are they the result of insufficient co-ordination in the policies of sovereign states? For it is clear that no set of international arrangements—whether it is the sterling area or the Bretton Woods rules—can be expected to stand up well if the members of the system are pursuing national objectives at the expense of general order and stability.

OPERATION OF THE STERLING AREA

First, what of the sterling area? Its essential feature is the use of sterling as an international reserve by the overseas members. This in turn implies the pooling, in the central reserve in London, of gold and foreign exchange earned by the area as a whole. Another essential feature of the system has always been freedom of capital transfers from London to the overseas members of the area.

On the face of it, this system is well designed to promote the interests of its members and of the world economy as a whole. It means that individual sterling countries do not have to keep an exact balance either in their trade with each other or with the outside world, provided that deficits are matched by surpluses elsewhere in the area. The use of sterling as an exchange reserve keeps down competition for the world's limited supplies of monetary gold. Both these features tend to promote the expansion of world trade, as does the natural alliance of the financial machinery of the City of London with the use of a common currency for the settlement of transactions. And that is an objective of special importance to the United Kingdom, as we rely on an expanding market for manufactured goods. For us, too, it is a great advantage that we can earn gold in trade with sterling countries, and are not wholly dependent upon success in working up sales of our goods in dollar markets.

The following table shows in summary form how the system has actually functioned over the five and a half years from the beginning of 1952 to the middle of 1957:

	Jan. 1952 *to* *Dec.* 1955 £m.	*Jan.* 1956 *to* *June* 1957 £m.	*Jan.* 1952 *to* *June* 1957 £m.
THE REST OF THE STERLING AREA had a *current deficit with the U.K.* of	1,024	416	1,440
This was covered as follows:—			
by sales of gold to the UK of	463	325	788
by a surplus with non-sterling countries of ..	308	−15	293
and for the rest by an outflow of capital from the UK (other than additions to sterling balances*) of.....	253[1]	106[2]	359[3]
	1,024	416	1,440
THE UNITED KINGDOM had a current surplus in trade with other sterling countries of	1,024	416	1,440
partially offset by a deficit with other countries of	−437	−46	−483
to give an *over-all current surplus* of	587	370	957
Taking into account drafts on, or repayments to, the International Monetary Fund, etc., of	−97	191	94
we had available for new investment, repayment of debt or additions to gold reserve	490	561	1,051
This was absorbed by:—			
an outflow of capital to sterling countries (other than additions to their sterling balances*) of	253[1]	106[2]	359[3]
repayment of sterling balances held by non-sterling countries to the extent of.....	244	128	372
and other capital transactions with non-sterling countries amounting on balance to.....	70	234	304
	567	468	1,035
Hence, we lost or gained gold to the extent of	**—77**	**93**	**16**
	490	561	1,051

* Additions to sterling balances were (1) £243 millions, (2) £46 millions, (3) £289 millions, making the total outflow of capital from the UK £496 millions, £152 millions and £648 millions respectively.

It will be seen that the overseas members, as is quite proper for a group of developing countries, had an overall deficit during this period of £359 million in their balance of payments, covered by a capital outflow from the United Kingdom. That cannot be considered an undue burden upon this country. So far from running down their sterling holdings, moreover, the overseas members of the area, taken as a group, in fact increased them on balance by nearly £300 million over the period (and, after very slight withdrawals in 1955 and 1956, were adding to them during the first half of 1957). The advantage of the pooling system is manifest. Even the recent heavy withdrawals by India have been largely compensated by the current surpluses of Australia and some other members.

STRESSES AND STRAINS

It is when we look at the United Kingdom section of the accounts that we find evidence of the strains to which the system has been subjected. Over the period, we have been called upon to redeem no less than £372 million of sterling balances held by the outside world and have reduced by £51 million our debt to the European Payments Union. The result is that no more than £16 million of the gold acquired from the overseas sterling countries has been retained in the central reserve. Indeed, but for the timely help of the International Monetary Fund and the waiver of interest payments on the North American loans we should have lost gold heavily on balance. At the same time, it is clear that if the outside world had possessed more confidence in our policies, substantial sums would have been available for the rebuilding of the reserves and for quicker development in the Commonwealth.

This picture contains light as well as shade, for by the middle of 1957 balances held by countries outside the area were already down to a few hundred million. At this level they bulk fairly small when compared with the balances of nearly £3,000 million held by overseas sterling countries. That a large proportion of these latter balances is earmarked for such purposes as currency reserves affords no great comfort, since the example of India has shown that local currency laws can easily be amended. Still, the fact that all the members of the area have a common stake in the preservation of the pound is some safeguard.

COLLECTIVE AND SECTIONAL INTERESTS

The difficulty is that during the next few years the conflict between the collective interest and sectional interests is likely to be acute. From the collective point of view, nothing could be more urgent than to build up the reserves again (and it must be remembered that over the next two or three years we have to repay $560 million to the

International Monetary Fund.) Yet individual governments may find it difficult to believe that any objective can really merit a higher priority than the rapid fulfilment of their own development programmes; and unfortunately these two objectives—physical investment and the rebuilding of the reserves—stand in direct competition with each other.

It may be that the methods of informal consultation that have served us in the past will be proof against such stresses and strains. It may be, on the other hand, that the organisation of the sterling area requires to be tightened. For the unofficial observer it is extremely difficult to judge. What is clear is that the stability of sterling will depend to no small extent upon the co-ordination of the investment plans and general policies of the member countries, including the United Kingdom. In a very general way, no doubt, this is promoted by the periodic exchanges of views at Commonwealth conferences, and by discussions between central banks and within the international organisations. But we ought not to trust to good intentions alone; appropriate financial arrangements and incentives can be of great help.

Until fairly recently, the level of interest rates here offered the overseas members little apparent inducement either to hold on to their sterling balances or to moderate their demands on the London capital market. I suggest that in this respect the authorities should have two objects in mind. The first is a level of long-term rates that will help in preserving a balance between the available savings and the total demands on our capital resources, from home and overseas together. The second is a level of short-term rates (once the crisis is past) that will discourage the holding in short-term form of balances that ought not to be required for some considerable time.

EXCHANGE PARITIES

What of the relationship between sterling and other currencies? Is there any force in the contention that membership of the Bretton Woods system is not to our advantage? Since the prompt action of the International Monetary Fund at the time of Suez did so much to tide us over a major crisis in sterling, it may seem curious that this view should be put forward in this of all countries. To the extent that opposition to the Bretton Woods rules of the game is based upon a positive liking for discrimination and controls, it would seem to me clearly wrong-headed. There is one school of thought, however, which must be taken more seriously. There are those who sincerely desire freedom and expansion in world trade and yet have grave misgivings about one feature of the Bretton Woods system: namely, the maintenance of exchange parities that are altered only at rare intervals, as opposed to rates that are allowed to vary from day to day in response to the pressure of supply and demand in the exchange markets.

On this difficult issue I wish only to draw attention to one or two thoughts. It seems to me that there are some solid arguments in favour of fixed exchange parities that ought not to be overlooked in any assessment of the balance of advantage. There is the consideration that stability, especially of the key currencies, is of great value to overseas traders: indeed, the Bretton Woods rules are an attempt to preserve as much as possible of the stability that was so valuable a feature of the gold standard, while avoiding the threat to employment, under modern conditions, from seeking to defend too high a parity. There is the consideration that a depreciation in the exchange brought about by temporary influences can produce a permanent fall in the value of the currency and that the threat of enforced devaluation may be a more effective spur to action than the downward drift of a floating rate.

Moreover, the proponents of fixed and of floating rates are at one in believing that rates of exchange should be maintained at realistic levels. This means renouncing such practices as the bolstering up of an over-valued currency by import restrictions. It means refraining from competitive depreciation and from retaliating against a devaluation by another member of the system when that is justified by a rise in its cost and price-level. By outlawing beggar-my-neighbour policies of this kind and helping to clear the jungle of exchange restrictions left over from the war, the Bretton Woods system has rendered the world good service, to the benefit of Britain at least as much as any other trading nation.

POSSIBLE DEFLATION AHEAD

To say that the system has served us well hitherto is not, of course, to say that this must always be so. For years past, the chief problems of the world have been those of inflation. There are now some indications, such as the decline in some basic commodities, of a change in the weather. For the time being, the post-war boom in the world as a whole has lost much of its impetus. That being so, our preoccupations during the next phase may become those of deflation rather than inflation. I am not, of course, predicting that this will in fact happen; I merely suggest that we must take the possibility into account. Should the course of events take this direction, it means that, if the Bretton Woods system is to work successfully, the policies followed by creditor countries will be of decisive importance.

It is true that a deficit country persisting in inflationary courses will not only aggravate its own difficulties but tend to infect other members of the system with the inflationary virus. The sanctions against such behaviour, however, are quite strong: the country in question is liable to get into a bad crisis in its balance of payments, involving the loss of gold or other reserves. It is the lack of any sanction of similar strength against over-restrictive policies on the part of surplus countries that is perhaps the least satisfactory of the Bretton Woods rules. There is, of course, the so-called "scarce currency" clause, but a deflationary trend might already be fairly advanced before that became operative and would not necessarily be reversed by it. In the meantime, a country with gold coming in is not absolutely compelled to expand credit; it can sterilise the addition to its exchange reserves and may in this way inflict more damage upon the rest of the world trading community than lies within the power of any deficit country. One might say that, if over-expansionist policies can be suicidal, over-restrictive policies are undoubtedly fratricidal.

CONFLICT OF AIMS

At first sight, it seems plausible to argue that the universal aim of monetary policy, for deficit and surplus countries alike, should be to keep the value of money stable and that if this is achieved there will be no international currency problems. But that is not the case. For a surplus country merely to prevent its price level from falling may not be good enough: there are circumstances in which a country single-mindedly pursuing the goal of internal price stability will exert a deflationary pressure upon the other members of the system.

There is nothing new in this doctrine. Even the old-fashioned gold standard did not mean, as is so often supposed, stability of prices in each individual country. If the supply of gold were about right, the gold standard rules of the game would ensure approximate stability in the value of money throughout the system taken as a whole; but in the typical case that stability would be the result of rising prices in the countries receiving gold, offset by falls elsewhere.

Nowadays, deficit countries will not bring about a major reduction in prices through deflationary policies, for in the industrial countries, at any rate, that could be done only at the cost of heavy and prolonged unemployment. It follows that countries gaining exchange reserves have a greater responsibility than ever to allow money incomes to expand, even if that is not compatible with absolute stability in their internal price levels. The goal of price stability, seemingly so obviously right from the national point of view, may not in all circumstances be consistent with good creditor behaviour from the point of view of the outside world. The obvious retort is that creditor countries will be just as reluctant to see prices rise as deficit countries to see rising unemployment, and many will feel they are just as entitled to refuse to countenance such a policy. In that event, it may be impossible to maintain the existing exchange parities. And the responsibility for a breakdown, provided the deficit countries are avoiding inflation, would in the circumstances we are envisaging rest squarely upon the surplus countries.

We are indeed fortunate that for many years past the United States, which might so easily have become a persistent creditor has avoided placing pressure on the other members of the system. This has been accomplished by the maintenance of a high level of internal prosperity, by the export of capital and for the rest by means of large unilateral transfers which have the effect that part of her exports are received free of payment. Notwithstanding the American boom, however, American exports have recently been outstripping the growth of imports and the American gold stock has been rising. A difficult situation might clearly arise if American imports fell off sharply because the general level of trade was not quite so good for a time.

GERMANY AS A CREDITOR COUNTRY

Meanwhile, we have seen the emergence of another important creditor country in the shape of Germany. There is little disposition in this country to criticise the policies of another nation which has achieved so admirably what we should have been doing ourselves: namely, the rebuilding of its exchange reserves. On the contrary, there is widespread appreciation of the liberalism which animates Germany's economic policies and of the various helpful gestures that have been made to ease the international payments position. Nevertheless, the fact remains that, however justified they may have been hitherto, Germany's monetary and credit policies would be quite inappropriate for a surplus country already in possession of abundant exchange reserves and, unless the German economic position itself changes radically, would threaten to disrupt the whole system of European payments.

It may be that such a fundamental change in the German position is taking place, though the OEEC unequivocally took the view, in its recent study, that "it is unlikely that the overall imbalance between Germany and other Member countries can adequately be brought under control without further action by Germany." Whether this is so or not, we can surely agree upon the considerations that should guide the policies of creditor countries. The most important point is that

the first safeguard against inflation for a country with a large surplus in its balance of payments is not to raise interest rates and restrict credit; it is to expand incomes and allow the external account to swing back into balance again, thus obtaining additional real resources on which the larger money incomes can be spent. Moreover, an expansive credit policy will mean a lowering of interest rates that will at best encourage an outflow of capital and at worst discourage an inflow.

There are in fact three broad lines of action, apart from a liberalisation of commercial policy, which a surplus country can adopt in order to return to a balanced international position. Probably the best solution of all is to re-lend the surplus abroad, as Britain did during the nineteenth century, for in that event there will be no pressure upon the exchange reserves of other countries at all. In Germany's case that solution is hampered by the level of interest rates and the absence of specialised financial institutions. Failing that, the currency could be allowed to appreciate; but this Germany has firmly and finally rejected. The only remaining recourse, if the surplus continued, would be to allow money incomes and the standard of living to rise, even if that meant abandoning the dogma of absolute stability in internal prices. Any country, clearly, is entitled to decide which of these remedies, or which combination of them, it prefers to adopt; but it is not entitled, if it wishes to act as a loyal member of an International system, to reject all of them.

NEED FOR ADEQUATE RESERVES

Another condition for a smooth functioning of the Bretton Woods system is an adequate level of monetary reserves. It is the essence of the Bretton Woods principles that changes in parity should be few and far between and should take place only when the price level in a particular country gets seriously out of line with the world price level. If that is to be achieved ample exchange reserves are indispensable, to enable countries to ride out disturbances to their balances of payments brought about by transitory causes and to ensure that changes of parity are not precipitated by lesser disorders that ought to be corrected by internal measures.

Between 1937 and 1956, world gold reserves rose by no more than one-half ($12.4 billion), and about three-quarters of the increase accrued to the monetary gold stock of the United States. If the world had to rely exclusively upon gold we should have had a shortage of international reserves for many years past, because of the universal rise in costs and prices that took place during the war. The important thing that has happened is an enormous increase, from $2 billion to over $23 billion, in exchange reserves other than gold. In this movement the chief elements have been an accumulation of short-term US dollar assets by the outside world to a total of some $15 billion, the mutual extensions of credit by the members of the Bretton Woods system in the form of the International Monetary Fund quotas and, of course, the growth of sterling balances.

In spite of this the growth of international reserves (since 1937 little more than doubled) has lagged well behind the growth in the money value of world trade (since 1937 nearly quadrupled). Admittedly, this is only another way of saying that the existing reserves have sufficed hitherto to finance an almost continuous expansion in world trade on a rising price level. But the question is whether they are now spread so thinly over the system as a whole that shortage of reserves might aggravate other deflationary tendencies, if these were to accumulate, and a minor recession be magnified into something more.

THE PRESENT PROBLEM

At present, however, the problem centres upon the distribution of existing exchange reserves rather than their absolute magnitude. Nearly half the total is now held by the United States and Germany, though the United States, as we have seen, has large short-term liabilities to the outside world. By contrast, sterling finances perhaps 40 per cent of world trade, yet the United Kingdom reserves are about half those of Germany and less than 4 per cent of the world total.

That is the most important single fact in the world currency situation. Measures to ensure the stability of the sterling area and measures to ensure the smooth working of the Bretton Woods system must alike be directed to the removal of that anomaly. In the first instance, it is the plain duty of the United Kingdom and other sterling countries so to arrange their affairs that a reasonable rate of rebuilding of the reserves takes clear precedence over other objects of policy, however desirable in themselves. This is a task in which nothing will succeed like success: for once the reserves have been raised comfortably above danger level confidence in sterling will revive and funds will flow in again from the outside world.

So long as the reserves are being rebuilt by the painful process of saving out of our current surplus, however, there is some danger that we should be exerting a downward pressure upon world trade as a whole. The internal policies necessary to the accumulation of a reserve must aim at restraining both our imports for current use and the outflow of capital for purposes of physical investment overseas. If the general climate of world trade should cease to be expansionary, it is clearly contrary to the general interest that other deflationary influences should be reinforced in this way.

POWERS OF I.M.F. MIGHT BE WIDENED

Once we have brought about a substantial increase in the reserves by our own efforts, therefore, the question may arise of their being further fortified by some kind of stabilisation operation. This might take any one of a number of forms, but the fundamental fact is that the only ultimate source of dollars is the dollar area. In a recent speech, Vice-President Nixon spoke eloquently of the need for a spectacular increase in the outflow of American capital, especially to the developing nations of the world, and set before the American people as a reasonable goal the doubling or trebling of American investment abroad in the next ten years. It is true that the Vice-President was thinking primarily of private investment. But, as we have seen, the rebuilding of the sterling reserves stands in direct competition with rapid development in the countries of the sterling area. It may be, therefore, that a stabilisation loan for sterling could provide an indirect yet most fruitful means of achieving the ultimate aims he had in mind.

On the other hand, it might be more suitable that an operation of this kind should take an international rather than a national form. In that case, the International Monetary Fund would be the obvious instrument. At present, the credit-creating powers of that institution are rigidly limited by the size of quotas; nor would an all-round increase in quotas be a suitable remedy for the situation we have in mind. There might be general advantage for the world, however, if the Fund could move in the direction of becoming a super-central bank. This implies that the controllers of the Fund should be permitted greater discretion in their operations than is accorded under the present articles. Secondly, it means that countries should be prepared to deposit exchange reserves with the Fund and treat the Fund's certificates of indebtedness as exchange reserves, in the same way that some European countries already treat as part of their exchange reserves their stake in the European Payments Union. By these means it would be possible to expand world exchange reserves on the basis of the existing gold supply, while channelling the additional credit in those directions where it would do most good. And, it may be added, this would be a logical extension of the process of creating "man-made" exchange reserves that has done so much to preserve an expansionary climate for world trade since the war.

POSITION SUMMED UP

To sum up, the problems of the sterling area and of the world economy as a whole are essentially those of reconciling the aims of individual nations and their governments with the general requirements of an international order. They are therefore merely one aspect of the far wider problem which the free nations have to solve: that of adapting their political ideas and political institutions to the facts of their growing interdependence, in economic as in military affairs. By and large, our forms of government are derived from earlier models and make it easy for us to think in terms of national solutions to our problems on lines of self-sufficiency. The order and stability of human society in our lifetime are likely to depend on the skill, resolution and speed with which we reconcile the national texture of political government with the international scale of the pattern of interdependence.

BROOME RUBBER PLANTATIONS

The twenty-fourth annual general meeting of Broome Rubber Plantations Limited was held on January 15th in London, Sir Lionel Smith-Gordon, Bart (the Chairman), presiding.

The following is an extract from his circulated statement:

The trading profit for the year was not as good as for the previous year. The chief reason for this was a fall in production from 3,364,900 lb for 1955/56 to 3,078,200 lb for 1956/57. This shortfall was caused by bad weather in November, 1956, by the cutting out of areas for replanting, and by a series of labour strikes on Broome Estate during the last quarter of the year. At the same time, there was a fall of 1.6d. per lb in the average selling price.

During the year under review we replanted 327 acres, and since then we have completed the replanting of a further 297 acres. Thus we now have over 1,000 acres of young rubber to bring to maturity, but more than half of the total acreage is still under old seedling rubber. The crop for the five months to November 30, 1957, was 1,529,100 lb, against 1,272,000 lb for the same period last year. If we experience normal weather, and there are no unforeseen setbacks, we anticipate that the final crop for the current year will be in the neighbourhood of 3½ million pounds.

The report was adopted and the final dividend of 12½ per cent, making 17½ per cent for the year, was approved.

MIDLAND BANK LIMITED

Changing Economic Situation—A "Crisis of Confidence"

NEED FOR WIDER UNDERSTANDING OF FINANCIAL POLICY

Essentials for Maintaining Sterling's Value in World Markets

VISCOUNT MONCKTON ON COUNTRY'S POLICY OF RESTRAINT AND BANK ADVANCES

The One hundred and twenty-second Annual General Meeting of Midland Bank Limited will be held on February 14th, at the Head Office, Poultry, London, E.C.

The following is an extract from the Statement by the Chairman, The Right Honourable The Viscount Monckton of Brenchley, P.C., K.C.M.G., K.C.V.O., M.C., Q.C., on the report of the directors and balance sheet for the year to December 31, 1957:

On the record of economic affairs, the year 1957 turned out to be more disturbed than at the outset it seemed likely to be. In the early part of the year confidence had been strengthened by passage through the Suez difficulties with less damage to the national economy than had been officially and unofficially foreseen. The February reduction of Bank rate was followed by a fairly reassuring Economic Survey and what might be called a comfortable budget. The barometer was moving towards "set fair."

Quite suddenly, however, it switched to "stormy." A wave of uneasiness, particularly abroad, about the future value of the pound sterling led to a repetition of acute balance of payments difficulties notwithstanding a considerable surplus on current account transactions and an encouraging trend in exports The gold and dollar reserves were drawn down with alarming rapidity. Once again we were caught up in a "crisis of confidence" which demonstrated, not for the first time, that Britain's fine postwar record as trader had been accompanied by over-expansion of her activities as a provider of capital and by the comparative illiquidity of her position as international banker. The impact of the disturbance was thus concentrated on external financial arrangements. Yet the cumulative uneasiness which precipitated it was attributable largely to inferences drawn at home and abroad from the record of events over the past decade and from anxieties about future domestic conditions and policy. To meet this situation, drastic measures were taken in September. The results, judged by the immediately critical tests, were reassuring; but the measures themselves entailed awkward readjustments of business plans and arrangements, and the year ended in an atmosphere of quiet hesitancy.

THE NEED FOR WIDER UNDERSTANDING

When the Bank rate was reduced, last February, both the Chancellor of the Exchequer and the Governor of the Bank of England were at pains to emphasise that the movement did not imply any modification of the restrictive credit policy then in force. Even so, the reduction was widely read as a signal of relaxation, one result being that the banks were faced by an inflow of hitherto pigeon-holed applications for credit which, having regard to the unchanged official requests, they had necessarily to refuse. More important than any embarrassment to the banks is the possibility, suggested by the subsequent course of events, that the misreading of official action at that time may in itself have necessitated more drastic action later on than might otherwise have been necessary. Further, the apparent change of front a few months later made the measures then taken all the more difficult to understand.

A second example is provided by the September measures themselves, embodying the sharp rise in Bank rate, the quantitative restriction of bank advances and a further review of Government and other Government-financed expenditure. The steps thus taken were presented in an atmosphere of acute emergency, created by the rapid draining-away of gold and dollar reserves. In the circumstances a tendency appeared in public discussion to overstress the part played, in precipitating the "crisis," by foreign speculation in sterling. Moreover, it was not sufficiently recognised that overseas opinion sprang largely from a perhaps unduly sceptical assessment of the authorities' will and power to correct conditions threatening further depreciation of the purchasing power of the currency. In the face of such scepticism, official denials of any thought of devaluation proved unavailing until supported by more dramatic action than the domestic business situation, considered by itself, appeared to demand. Accordingly the measures adopted were a subject of some confusion and misunderstanding. It was not easy for the public to grasp, for instance, just why restrictive measures should be necessary at a time when activity in some branches of industry had already shown signs of flagging a little; or why some curtailment of capital outlay should have to be imposed while everybody was agreed that, in the long run, the country's competitive efficiency required still more capital extension and re-equipment in industry. The penalties of the higher level of interest rates, moreover, were all too easy to see—especially the encroachment on the prospective budget surplus on revenue account and the additional outgoings on the balance of payments in respect of interest paid to overseas holders of sterling. Here too, then, the measures taken might have been more generally approved if the reasons for them had been more widely understood.

NEW INVESTIGATIONS

Happily, two welcome developments in the direction of fuller understanding of the monetary system and the way it operates have taken place within the past year. Their timeliness is reinforced by the fact that both steps were announced before the events of September following the run on sterling. The need for comprehensive review of our monetary arrangements was thus realised and acted upon before it received such conspicuous fresh demonstration; and realisation had doubtless been sharpened, and action hastened, by the evidence of misunderstanding of the lowering of Bank rate early in the year.

First, then, a general welcome was given to the appointment of the Radcliffe Committee. Although the major task of this body is to advise the Government on the working of the monetary system, there can be no doubt that the results of its labours will have an important educative influence. There are many things about the monetary system, after all the modifications that have taken place in recent decades in both the system itself and the circumstances in which it operates, that need elucidation. Accordingly, all of us should profit from the findings of the Committee and be stimulated by its recommendations when they appear.

Secondly, and perhaps more directly relevant to the subject of public information, came the setting up of the Council on Prices, Productivity and Incomes. This very small body is something quite new in its form and functions. For one thing, it is not a transitory body designed to examine some particular problem and disband on the completion of its inquiry. It is established rather as a standing committee, with a wide-ranging commission. Moreover, in two respects it is unusual if not unique. The members have been chosen for their individual qualities, and not in any representative capacity; and the task of the Council is not to advise the Government, but to inform the public. The complete objectivity of the Council is manifest, and it can be relied upon to choose wisely the time, manner and subject of its expositions. If, further, it succeeds in formulating its views in a way that appeals to the general public as sensible and forthright, it may come to have a strong and healthy influence upon the trend of opinion and the course of affairs. It is not enough that the authorities should consistently pursue a monetary policy that is thoroughly objective and far-seeing in its purposes and manner of execution; it is necessary also that both policy and measures should manifestly possess these qualities.

BRITAIN'S INTERNATIONAL POSITION

Much of the prevailing confusion and misunderstanding about the matters I have discussed results from imperfect appreciation of the unique international position of our national economy. No country is involved in so intricate and complex a manner and degree as is the United Kingdom in the course of business affairs in other parts of the world; in no highly industrialised country are the factors determining her economic condition and policy more powerfully shaped by external forces. With this fact in mind, developments during the past year give warnings which can only be disregarded at our peril.

First, we have been rightly encouraged by the maintenance, despite all the disturbances to steady expansion of trade, of a substantial surplus on the current balance of payments. Events have shown, however, that the surplus is not as large—taking account of other commitments—as is required to build up a strong international position in terms of the relation between external liabilities and liquid assets. Moreover, the achievement of a surplus, while resulting largely from perseverance and enterprise in overseas markets, has been favoured by a general expansion of world trade, and there are disquieting signs that the expansive process may have reached or be approaching an interval of hesitancy. Doubts about the course of business in the United States in the immediate future, the re-appearance during the past year of the "dollar gap," the difficulties encountered in financing capital projects in under-developed parts of the world, and disturbances of the relations among European currencies—all these things suggest that world conditions as a whole may not be so conducive to the enlargement of British exports in the near future as they have been almost continuously since the end of the war.

To some extent the treatment of disturbances arising from broad international factors is a test of the reality of international collaboration in a world that has devised elaborate machinery for the purpose of action or consultation. In contrast to the intensely nationalistic relations existing between the wars, we have now the working mechanism of the International Monetary Fund, the European Payments Union and the International Bank for Reconstruction and Development, as well as standing organisations for consultation such as the General Agreement on Tariffs and Trade and the Organisation for European Economic Co-operation. Admittedly the scope of such arrangements is limited, and the existence of machinery is no guarantee that it will be operated with such decisive effect as to overcome powerful elements of disturbance. Perhaps, indeed, their chief value lies less in their direct operative results than in the encouragement they give to individual countries to take appropriate measures leading in the same general direction but suited to their own particular circumstances. For ourselves, what is obviously essential in the world conditions now prevailing and as far as can be foreseen is to avoid monetary over-expansion and any further diminution in the real value of the pound which would impair the competitive strength of our industry in overseas markets.

BANK ADVANCES

A year that has brought so much disturbance in financial affairs generally can hardly have been other than difficult for bank management. To a minor extent the pre-occupations of bankers have been with technical matters including the new legislation affecting the treatment of cheques. Mostly, however, they have been directly related to the measures taken by the authorities in pursuit of national policy.

In February, as already noted, the banks were required to maintain their discriminatory standards of judgment towards applications for advances in face of the widespread supposition that the "credit squeeze" had been relaxed. In September they were called upon to adopt an even more restrictive attitude, following the requirement that the average amount of advances during the ensuing year should not exceed that of the preceding twelve months. Accordingly, they were again confronted with the task —which becomes no easier with the lapse of time—of satisfying many credit-worthy customers that the refusal of credit facilities was not of their own choice but was imposed by authority in the national interest. It is not a happy position for a banker to have to sustain for any long period.

The figures of bank advances year by year give some idea of the magnitude of the relative contraction of bank credit, enforced in response to official requests. Whether advances be calculated in relation to national income, as a rough measure of the total turnover of business, or in relation to bank deposits, the proportions are much lower than they were before the war. The movements since 1951 are of particular interest as covering the period in which, while old-established monetary instruments were brought back into use, the practice of officially directed restraint in bank lending was intensified with the addition of quantitative to qualitative "directives." Comparing the figures for 1957 with those for 1951, the national income has expanded by nearly one-half, while bank advances have risen only slightly. As to selectivity, advances to the export and other industries enjoying priority have shown a sustained increase throughout, and those to the remaining branches of industry and trade are roughly unchanged in amount, while advances to other borrowers have undergone a substantial decline which is particularly marked under the heading "personal and professional."

It should not be assumed that these movements, appropriate as they are to the requirements of policy, are wholly to the long-term national advantage. The withholding of credit here and there must have delayed some business development which on its own merits was to be desired on considerations of ultimate benefit to the national economy in a competitive world. Further, there have been many instances in which failure to obtain credit from a bank, for purposes which were officially regarded as standing low in the order of priorities, has been followed by resort to other, largely unregulated and probably less economical sources of finance.

Much has been said by my predecessor in the chair of the difficulties encountered by the banks in enforcing an officially directed policy of extreme restraint; but there are three points I would wish to make on this occasion. The first relates more especially to the "qualitative" requests, expressed in terms of the purpose of borrowing. The requirements of many business borrowers have to be judged in relation to their total financial position, and it is therefore not always easy to deal with an application by reference to any particular requirement of the business. Additional credit for some explicit capital purpose may be refused; but an indirect reaction from the refusal may be a tendency by the customer to use more fully the overdraft facilities he has at his disposal for ordinary day-to-day business operations. To this extent selective credit control may prove to be—as is commonly said of a high Bank rate—a "blunt instrument" of monetary policy.

Secondly we have to reckon with some lack of harmony between the two kinds of official "request." The qualitative requests are not wholly negative; while some purposes for which bank credit may be desired have for the time being to be frowned upon, others are to be favoured in a positive way by ensuring that all necessary facilities shall be available. But the further a quantitative request is pushed, the more difficult it becomes to meet expanding demands of highest priority except by curtailing the borrowings of customers whose needs, on the tests of the selective requests, have a legitimate case against actual reduction.

Finally, just as, on the record of the past six years, successive upward movements of Bank rate have been no more than partially offset by later reductions, so the tendency is for requests to the banks on lending policy to remain in cumulative force. If the best use is to be made, in the long run, of this particular instrument of policy, then there is need for flexibility to be practised in its operation from time to time. There should be some assurance that, as conditions calling for severe restrictions become less exacting, the severity of the restrictions will be promptly relaxed. A phase might indeed come in the economic situation of the country at which restriction of any externally imposed sort upon bank lending could be positively harmful and obstructive to business recovery. We may therefore hope that the authorities will be watchful to ensure that the restraints are lifted, as opportunity offers, to accord with changes in national conditions and prospects.

DEPOSITS AND TURNOVER

Deposits have again shown only a trifling growth, but there composition has changed, a considerable shift having taken place, particularly since September, from current account balances to deposit accounts.

A new contribution to published statistics is included in a table, covering the postwar period, showing broad indices of business activity. A "business turnover" index has been calculated from annual totals of turnover on current accounts with the Midland Bank after deducting the figures of a few branches which are heavily affected by purely financial operations. The figures indicate that business turnover rose faster than national income in the immediate postwar period, with the dismantling of war-time controls and the return of trade in many commodities from Government departments into private hands. Thereafter, the comparatively slower rise may reflect the gradual increase in that part of the national income finding its way into the possession of people not ordinarily operating bank accounts.

For roughly a decade the amount of current account balances has remained on a level, with only small divergences either way; yet business turnover has increased more or less markedly year by year. The same amount of "bank money" has been doing more and more work. It would be difficult, in the light of these figures, to attribute the postwar inflation, as expressed in rising prices, to the availability of bank money, whether in the form of pure credit moneys or of balances newly created by the use of bank advances

EUROPEAN FREE TRADE

We are naturally giving close consideration to possible effects upon our business of the inauguration and development of the European common market and to the implications of the proposed Free Trade Area. These are two distinct though related projects, and we find that industrial and trading customers of the Bank sometimes experience difficulty in obtaining all the information and guidance they need in assessing the likely reactions upon their own businesses and visualising the steps they might take to seize every opportunity of expansion. Within our own Bank we have accumulated much information, both general and particular, which is relevant to such investigations, and on a number of occasions we have been able to provide some assistance. We welcome inquiries relating to these matters and are ready to give them the specialised attention that the details of each case require. The services of experienced officials are available by inquiring at any of our branches.

WESTMINSTER BANK LIMITED

SATISFACTORY EXPANSION OF DEPOSITS

EFFECT OF INCREASED STAFF COSTS

CAUSE OF DRAIN ON COUNTRY'S RESERVES

CHANCELLOR'S "UNPLEASANT AND EXPENSIVE" REMEDIES

LORD ALDENHAM ON PROBLEMS AHEAD

The annual general meeting of Westminster Bank Limited, will be held on February 12th at the Head Office, 41 Lothbury, London, E.C.

The following is the statement by the chairman, The Right Honourable Lord Aldenham, which has been circulated with the report and accounts for the year ended December 31, 1957:

In the course of the year we have lost the services of Sir William Coates through ill health: he has been an admirable Deputy Chairman since 1950. Lieutenant General Lord Weeks also had to leave us on his appointment as Chairman of the Finance Corporation for Industry Limited, and Mr A. G. Stewart is now leaving the Board owing to his other heavy business commitments. We shall greatly miss the benefit of their valuable experience and wise advice.

During 1957 we were very glad to welcome Lord Salisbury on his return to the Board, and also Sir Arthur fforde, the Chairman of the British Broadcasting Corporation, both of whom have had wide experience in many fields. One of our colleagues, Mr W. J. Worboys, received a knighthood in the New Year's Honours list—a well-deserved recognition of his services to the country.

TRIBUTE TO MANAGEMENT

I am glad to tell you that the General Management of the Bank remain unchanged. The results now placed before you are a clear indication of their devoted and untiring efforts on behalf of the Bank.

Mr W. A. Dry, Secretary of the Bank and of Westminster Foreign Bank Limited for the last seventeen years, retired in September and was succeeded by Mr L. R. Murray.

I would like to thank Stockholders and Shareholders for the support given to the Board's proposals for the reorganisation of the Bank's Capital structure. The elimination of the uncalled liability on the shares was desirable, especially as it was accompanied by a considerable strengthening of the paid-up Capital. That the Board have continued to hold the balance true as between "A" Stockholders and "B" Shareholders seems to be indicated by the fact that over 99 per cent of the votes cast by both classes were in favour of the proposals.

FACTORS AFFECTING INCOME AND OUTGOINGS

The Accounts for the year show a decrease of £12,569 in our profits. There have been a number of factors affecting our income and outgoings, among them two Bank rate changes, but our trading result has been mainly influenced by the increase in our Staff costs to which I shall refer later.

We have again transferred £800,000 to Published Reserve, which was reduced by £2,400,000 when, in strengthening our paid-up Capital we capitalised £5,303,243, £2,903,243 of this sum being provided by a transfer from Contingency Account. After payment of the dividends foreshadowed at the time of our Capital reorganisation, and after this transfer of £800,000 to Reserve, our Profit and Loss carryforward is down by some £24,000.

DEPOSITS

Our Current, Deposit and Other Accounts have risen by over £30 million. This is a satisfactory result, particularly as stringent monetary measures have been in force throughout the year and as institutions other than the large Commercial Banks have continued to advertise for Deposits at very high rates. From the point of view of our profit, however, it is as well the Shareholders should know that virtually the whole of this increase is in our customers' Deposit Account balances, upon which we are at present paying interest at the rate of 5 per cent.

Such Deposit Accounts have increased very materially in number as well as in amount. It is noteworthy, although not surprising, that well over half this increase, both in number of accounts and in total balances, has taken place since the rise of 2 per cent in the Bank rate on September 19th, when Deposit interest was similarly increased.

ADVANCES

On the assets side of the balance sheet, Advances have decreased, reflecting the expected pattern in a year in which the credit squeeze has operated throughout and has been reinforced, in the minds of bankers and public alike, by the Chancellor's statement in September and by higher borrowing rates.

The amount we earned on our Loans and Overdrafts during 1957 was only moderately higher than the comparable figure for the previous year, as the higher interest rates ruling during the last 3½ months were accompanied by a decrease in Advances. In the event we were able to make profitable use of the funds so released, and of the increased funds available to us from higher Deposits, by the purchase of Treasury Bills. The rates so earned have lately been favourable and this factor, together with our desire to remain rather more than usually liquid, influenced us towards this means of employing our funds in preference to additional investment on any large scale in short-dated gilt-edged securities, which continue to be subject to material fluctuation in value from time to time.

Investments, however, are, with Advances, our main earning asset, and we have taken a favourable opportunity to add £11 million to our portfolio. You will observe that the deficiency in the market value of our British Government securities was rather greater at the end of 1957 than it was in December, 1956, but, as I have told you in the past, all our Government securities are dated and the great majority will mature within the next few years; thus the deficiency should be more than recovered.

STAFF PAYMENTS

Our largest single item of expenditure—payments made to or for the benefit of our Staff—has risen again. This increase, despite the fact that we have added but a few to our Staff numbers, has been of significant size, due to our making a cash payment to the active Staff in the early part of the year and following this up with the introduction from July 1st of a new basis of remuneration. It is pleasing to record that during the course of the year we have also been able to make some addition to pensions of less than £750 per annum.

These benefits for members of our Staff, both present and past, together with the several other improvements in conditions of service that have been brought into effect during the year, emerge primarily from the many frank discussions which the Board and Management of the Bank have had with the Staff Associations, both Clerical and Non-Clerical.

THE CLERICAL GUILD

You may be interested to learn a little about the Staff Associations in this Bank, and particularly about the Clerical Guild, since the occasional press references which appear on this subject are often misleading and often directed towards the discrediting of a system such as that obtaining in Westminster Bank. The Guild was established in 1919 and is very representative of the clerical Staff at all levels. It enjoys a 70 per cent membership of the total of our active clerical Staff and if one leaves out those with less than three years' service—that is to say, the bracket in which there is a considerable turnover in present conditions—the proportion of possible membership is approximately 80 per cent. It can thus be seen that the Guild is a truly representative body and that its elected representatives, who come along to Head Office on a variety of problems, speak with a great weight of opinion behind them. These meetings, I must say, take place quite frequently and can be called by either the Bank or the Guild. They are conducted in such an atmosphere as to permit of a very full and frank exchange of views on both sides of the table and, although agreement on all points cannot always be achieved, a better understanding of the other side's point of view invariably results. In addition, there is in being a formal Arbitration Agreement completed in 1956 by the Bank and the Guild which can be invoked by either party, although I hope the need will never arise.

The Non-Clerical Staff Association, which was also founded in 1919 and has a membership of 71 per cent, has the same facilities for coming to Head Office in order to discuss its problems.

BRANCH EXTENSION

During the past year we increased our branch representation throughout the country, bringing the total number of banking offices to 1,191. I mentioned in my statement last year that our programme of branch extension had had to be curtailed in view of the economic restrictions then obtaining and, of course, the same stricture has applied during 1957. Our programme, which is based on a great deal of careful research and investigation, is constantly reviewed and it is my hope that when the situation permits we shall be able to advance rather more rapidly than we have done in recent years in order to take every suitable opportunity of expanding our business.

On October 1, 1957, the Foreign Branch of our Bank celebrated its Fiftieth Anniversary and it is therefore particularly gratifying that our foreign business as a whole has continued at a very high level and has again made a handsome contribution to our Bank's profits.

OVERSEAS VISITS

Notable efforts continue to be made by our senior Staff in journeying overseas as ambassadors of the Bank and I am more than ever convinced that this plays a very important part in the furtherance of our desire to be among the leaders in the field of overseas business. In 1957 representatives from the General Management and the Foreign Branch Management covered a great deal of Europe, including the Balkan countries, as well as extensive areas in the Middle and Far East. These visits go a long way to ensuring that Westminster Bank shall lose no ground in the very competitive field of overseas business and I again warmly commend the initiative and efforts of these Officers on the Bank's behalf.

You will have observed that the Report does not on this occasion contain the separate balance sheets and accounts of our subsidiaries. We decided, in the interests of simplicity, that a Report giving particulars of the parent company's affairs together with particulars of the group in the form of a Consolidated Statement would be more suitable and we have accordingly introduced this form for the first time. We hope it will appeal to our Shareholders.

Both Ulster Bank and Westminster Foreign Bank have enjoyed a very satisfactory year's trading and their respective profits have increased significantly.

AFTERMATH OF SUEZ CRISIS

In any review of progress or retrogression made each year it is natural to consider first whether the free nations of the world are any nearer to a lasting peace with the countries behind the Iron Curtain, and it would seem that during 1957 some progress has been made. At the beginning of the year the Suez difficulty had done much damage to the NATO alliance. That damage was to a great extent repaired during the year, and in October the launching of the Russian satellite into outer space shook the NATO countries out of their complacent belief that in all branches of science the Russians still lagged behind, and thus helped to close their ranks.

The blocking of the Suez Canal was believed a year ago to be a much more serious threat to the economic position of this country than in fact it proved to be. It was a great surprise to us all to find that in the first six months of 1957 almost as much had been added to our gold and dollar reserves as had been added in the first six months of 1956; though it must not be forgotten that the first impact of the Suez incident caused a heavy drain on our reserves, even though the damage was much less lasting than we feared.

But in July last the position changed very rapidly and July, August, September saw a drop of £189 million in those reserves, over one-fifth of their total. This was not due to any sudden worsening in the trading position of this country, for we had earned a surplus on our own balance of payments of £200 million in the twelve months ending in June, and it seems probable that we are still earning a surplus at approximately that annual rate.

GOVERNMENT'S ENERGETIC STEPS

The fundamental cause of the drain on our reserves was the widely held belief that those reserves are quite inadequate to support the value of the pound sterling if there is any prolonged distrust in it abroad; and until those reserves are built up, there is always the possibility of the disaster of another devaluation. Energetic steps were taken by the Government to supplement the reserves by credits from the International Monetary Fund and the Export-Import Bank, and most important help was also given by the impartial opinion expressed by Mr Per Jacobsson, the managing director of the International Monetary Fund, that the pound sterling was not overvalued at present rates of exchange. But these credits are loans which in due course must be repaid: they must only be used to give us a breathing space, during which we can build up our real reserves.

Other causes of the fear of devaluation of sterling were the reappearance of the dollar gap, the great and growing improvement in the West German balance of payments, the devaluation of the French franc, and the constant deterioration in the purchasing power of the pound at home. Year after year we are told in Parliament, and indeed we all know to our cost, how far that purchasing power has slipped. Nearly twenty years of continuous inflation have taught us to buy now whatever we want because next year it will be more expensive. Just think what a difference it would make to the Savings Movement if we all felt sure that postponing expenditure would let us buy cheaper.

DRASTIC BANK RATE RISE

On September 19th, drastic action was taken by the Bank of England and by the Chancellor of the Exchequer. Bank rate was put up to 7 per cent, the credit squeeze was tightened, and limits were set to the amounts to be invested by the public sector—the central government, the local authorities and the nationalised industries. All were unpleasant and expensive remedies, which need never have been so severe if remedial action had been taken earlier; but they should help to check and even to reverse the inflationary spiral.

This regret that remedial action was not taken earlier is not just being wise after the event—from the very beginning of the credit squeeze in July, 1955, the banks have made it abundantly clear to the Government that in their view the credit squeeze by the banks without complementary action on the Government side would not be sufficient to halt inflation.

INDUSTRY'S NEED OF CAPITAL

But this limit on investment by the public sector is £1,500 million per annum for each of the next two years. It is surprising to hear that the expenditure of this vast sum has in some quarters been called an investment freeze: rather is it puzzling to know how the money is to be found without further inflation. Taken as a whole the nationalised industries have no true profits to plough back into increased investment: in contrast to the industries in the private sector which have been ploughing back about two-thirds of their net earnings after tax into strengthening their own positions. The April Budget provided for an ordinary surplus of £560 million, most of which (if achieved) could go towards "below the line" capital investment: in addition, there are "small" savings such as Savings Certificates and the like, and there are the "large" savings in the form of Life Assurance and Pension Funds.

But private industry, in spite of all the ploughing back of earnings, also needs fresh capital from the public, witness the £40 million and £41 million which Imperial Chemical Industries and British Petroleum have recently raised. Private industry has a fair claim on some of these savings, and we cannot ignore the needs of Commonwealth borrowers who come to the London market. If the future claims of private industry and of the Commonwealth are also to be met, it really seems that the Chancellor will have to set his sights for public sector capital expenditure rather lower than £1,500 million per annum if he is determined to have no recourse to inflation and thus to maintain a stable pound.

During 1957 it has been heartening to note a continuation of agriculture's contribution to the economy of this country. It is not always realised that just over 3 per cent of our workers produce half the food requirements of our population of fifty million.

BANKS' LOYALTY

There is really no need to put the words credit squeeze in inverted commas nowadays: the thing has been with us for such a lamentably long time. But it must be recorded how loyally the banks as a whole have played their most unwelcome part in maintaining it, when for so much of the time they have watched the Government's deficit financing far outweighing the restriction they themselves have been able to enforce. It would be ungracious to fail to record here our appreciation of the co-operation we have received from our customers in the squeeze.

Last September the Government asked the banks to keep the coming year's average level of advances down to the average of the preceding twelve months and the banks have agreed to try, though it will be unprofitable to us and difficult to achieve. If we do achieve it, I see no reason why we should not subsequently get back to more free competition amongst ourselves, curbed only by the need for each individual bank to conform with the Government request, a curb which we must hope is only temporary.

IMPORTANCE OF STABLE POUND

A most important declaration was made by the Chancellor of the Exchequer in October that "a stable pound is the prerequisite of full employment"; and it would seem that there is a growing acceptance in the country of the view that it is more important to us all to have a stable pound than to have conditions of artificial boom created by inflation. Certainly it is more honest to our creditors abroad.

We are, and have been, spending a larger proportion of our national income on consumer goods, and a smaller proportion on research and improvements to our factories, than have our principal competitors in the export markets: even the lure of Premium Bonds has failed to provide sufficient savings to alter these proportions. For the sake of our future level of production it will be most unfortunate if for lack of savings a limitation on fixed investment in productive assets has to be continued for long.

A further danger to our competitive position lies in the fact that our costs per unit of output have increased in the past few years

more rapidly than those of West Germany and the United States.

BRITAIN'S SHARE OF WORLD TRADE

These two considerations, a lesser proportionate expenditure on new factories and plant, and a greater rise in labour cost per unit of output, may help to explain why our percentage share of total world trade has each year for the past seven years been declining. This fact has been masked by the growth in total world trade, but it will become of increasing importance if in 1958 there is some contraction in the total volume. We cannot ignore the possibility of some contraction under the influence of the recession in North America, and the diminution of the income of primary producing countries such as Australia and New Zealand: both these countries have suffered from falling commodity prices and Australia has experienced adverse seasonal conditions.

The economists tell us that, when the prices of the goods we sell have moved up and the prices of the raw materials we import have moved down, the terms of trade have moved in our favour; but it does not seem to be so much in our favour as all that, when the primary products of Australia and New Zealand fall in value so far that they have to restrict their purchases of our manufactures.

CANADIAN TRADE MISSION

All the more welcome, therefore, was the recent visit of the Canadian Trade Mission, entrusted with the task of switching more of their purchases to this country, in order to enable us to earn more Canadian dollars with which to buy their metals or their surplus wheat. I could wish that we might see a similar mission coming to us from the United States, for we shall need all the US dollars we can earn if, after repaying recent credits, we are also to be able to buy all the commodities we need from them.

Conversely, I would like to see a UK mission visiting Australia and New Zealand with the object of finding what more we can buy from them in order to maintain their ability to buy from us.

EUROPEAN COMMON MARKET

The six "Messina" countries, France, Germany, Italy, Belgium, Holland and Luxembourg, have formally established a Common Market as from the beginning of 1958. Nevertheless, little definite progress has been recorded towards the establishment of a Free Trade Area to include this country and the Scandinavians in agreements with the Common Market countries, although there have been important pronouncements in its favour by the British Government and several detailed studies are being carried out by OEEC committees. There are, of course, countless difficulties in reaching agreement, and there will be hard bargaining on all sides, but it would seem that for all countries concerned the advantages of so large a Free Trade Area must outweigh the disadvantages. Certainly the performance of many of our great industries in the export markets in recent years gives us good grounds for hope that they could more than hold their own in any Free Trade Area.

THREE MAIN ANXIETIES

At the beginning of 1958 three main anxieties remain with us, the maintenance of world peace, the stability of the purchasing power of the pound sterling, and the continuance of our ability to compete in price and quality in the export markets of the world.

CLYDESDALE & NORTH OF SCOTLAND BANK LIMITED

THE FIGHT AGAINST INFLATION: NEED FOR RESOLUTE ACTION

SIR HAROLD E. YARROW ON COUNTRY'S INHERENTLY STRONG POSITION

The 120th Annual General Meeting of Shareholders of Clydesdale & North of Scotland Bank Limited will be held on February 12th in the Head Office, St Vincent Place, Glasgow.

The following are extracts from the circulated statement of the Chairman, Sir Harold E. Yarrow, Baronet, CBE, LLD:

Having regard to the difficult conditions which obtained throughout 1957, the results disclosed are highly satisfactory. Our Deposits at £175,416,371 show an increase of £2,422,383 as compared with last year. Our Note Circulation continues to be influenced by the inflationary trend, and with an increase of £1.1 million on the year it now stands at the new high level of £25.4 million. The total outstanding for Acceptances, Confirmed Credits and Engagements on account of Customers is down this year by £647,000 to a total of £8,763,286. I am pleased to say that our Foreign business continues to expand very satisfactorily and good progress is being made by all our Overseas Branches.

On the Assets side, you will note that we maintain a highly satisfactory level of liquidity. Cash, Balances with Other Banks, Money at Call and Short Notice at London and Treasury Bills amount to £75.7 million and represent 37.7 per cent of our liability to the public in respect of Notes in Circulation and Deposits. Our holding in British Government Securities at £82,049,185 shows a small increase of about £900,000. The Book Value of our Investments at the time of making up our figures was £6.6 million in excess of Market Value. Advances to Customers and Other Accounts at £42,583,726 show an increase on the year of £1.5 million, which follows upon a decrease of over £1 million in the previous year.

Our Net Profit for the year at £486,466 shows an increase of £4,634. Running costs have again shown quite a substantial increase which has been off-set by the income derived from the larger resources at our disposal throughout the year. If the present high rates continue, however, we must expect a downward trend in profits.

The Dividend is maintained at 18 per cent, and we have again allocated £32,500 to the Staff Widows Fund, £100,000 to Staff Pension Fund, and £100,000 to Reserve for Contingencies, which leaves £202,054 to be carried forward to 1958.

CREDIT RESTRICTIONS

Our affairs have again had to be conducted in a regrettable atmosphere of restriction. A year ago I said that I felt the time had come when consideration might be given to relaxing the restraints on lending which the banks have been asked to exercise for so long, and which they have willingly accepted at the request of successive Governments, without regard to the effect upon their earnings. Unfortunately the past twelve months, far from witnessing a move towards this happier state of affairs, have seen the Chancellor of the Exchequer ask the banks on two occasions for even greater restraint.

In spite of the difficulties, however, we must welcome the Government's obvious determination to achieve and maintain stability in the currency, and if the measures now in force meet with success, I would hope that the day may not be far distant when artificial restrictions on lending will be unnecessary and the banks will once again be permitted to play their rightful part in a healthy, expanding economy.

THE NATIONAL ECONOMY

The features of 1957 which stand out most strongly in the affairs of the United Kingdom as a whole are the drain on our reserves which occurred in early autumn and the policies which were initiated at that time to deal with it and to prevent a recurrence.

The cause was not far to seek. It was a lack of confidence in sterling both at home and abroad, and the underlying cause of that lack of confidence was likewise not difficult to discover. It was inflation, a condition in the economy which has given rise to financial crises in one form or another far too frequently since the war.

It is universally agreed that inflation, although favourable in its immediate effect to some sections of the community, is potentially dangerous; it must be eliminated if real progress is to be made. Not everyone is agreed on the action which would best achieve that end. But what is really disappointing is that in the past no determined remedial action has been pressed home.

The steps which were taken last September were, I believe, necessary both as an immediate expedient to reverse the flow of funds abroad because of the speculative drive against the pound, and in the longer run to exorcise inflation from the economy. It is essential to realise that any action which achieved the first objective without securing the second would be largely futile.

The measures taken appear to have been successful in their first objective. It now remains to convince the world at large that we mean to hold our position by achieving the second objective, and we will be believed only when it is seen that our actions are matching our words.

It is the Government's duty to press through its policies to create the climate in which this fight against inflation can be won, and the consequences of failure could be so serious that it has the right to look for the support even of those who may disagree with its policy in detail; employers must be prepared to accept moderate profits and to be satisfied with nothing less than the highest standards of management techniques and the adoption of all the resources placed at their disposal by modern research; and employees must give an honest day's work for an honest day's pay, ready, in particular, to dispense with restrictive practices which are damaging to maximum production, in the knowledge that what they earn, and save, will maintain its value. Our position is inherently strong—I do not think this can be overstressed—and only resolute action is required to establish in the eyes of the world that it is so. What is wanted is less controversy and confusing advice on means, and more concerted action towards securing the agreed ends.

BOWMAKER LIMITED

ALL PREVIOUS RECORDS SURPASSED

The thirtieth annual general meeting of Bowmaker Limited will be held on February 14th, in London.

The following is an extract from the circulated statement of the chairman, Sir Arthur Morse, CBE:

The report and accounts reflect the highest volume of business transacted and the biggest profit in the history of the company, which is particularly satisfactory in the thirtieth year of its existence. Business during the first two months of the financial year was at a low ebb but at the end of December, 1956, restrictions on hire purchase were eased and from January onwards there was a steady increase. Underwriting reached unprecedented proportions in the spring and early summer months and continued at a satisfactory level until the close of the financial year.

In the result the group profit before tax amounted to £750,289 compared with £491,227 in the previous financial year. Taxation requires £356,625 and there remains a group profit after taxation of £393,664. A final dividend of 17½ per cent less tax, making 27½ per cent for the year, is proposed.

Your Board is of the opinion that the reserves of the company have become unduly large in relation to the issued capital and it is, therefore, proposed to apply the sum of £303,500 standing to the credit of share premium account in paying-up in full new ordinary shares of 5s. each and to distribute these shares in the proportion of one new ordinary share for each three ordinary shares of 5s. each held by the shareholders on the register on February 14, 1958. In view of the fact that after the proposed bonus issue all but £36,000 of the existing authorised capital will have been issued, it is proposed to increase the authorised capital of the company from £2 million to £3 million.

After reviewing the progress of the operating subsidiary and associated companies, the statement continued:

FULL UTILISATION OF FINANCIAL RESOURCES

The year under review has involved the full utilisation of our financial resources. In the past we have relied mainly on the generous facilities which we have received from our bankers and from other financial institutions. In present circumstances, however, if, as is our intention, we are to continue to develop our business we must look to a greater volume of deposit money. With this in mind we have, since June last, been inviting new deposits and I am glad to report that this change in policy is already bearing fruit to the extent that in the last six months of 1957 our deposits have increased considerably. A deposit with a well-established finance house provides first-class security with a most attractive rate of interest.

The current financial year is little more than two months old and the flow of business to date has been at a higher rate than in the same period last year. As far as profitability is concerned, the rise in the Bank Rate has inevitably and materially increased interest charges and there is no mitigating factor in respect of agreements entered into prior to the rise. Taking into consideration the overall picture, your Board is of the opinion that the current year's trading should prove satisfactory unless circumstances outside our control adversely affect turnover.

ALEXANDERS DISCOUNT COMPANY

SIR ERIC GORE BROWNE'S STATEMENT

The ninetieth annual general meeting of Alexanders Discount Company Limited will be held on February 13th in London.

The following is the circulated statement by the chairman, Sir Eric Gore Browne, DSO, OBE, TD:

Before dealing with the accounts there is one matter concerning the composition of the Board: it is with very great regret that I have to report the resignation through ill health of Mr Robert Alexander. Mr Alexander has given over forty years of his life to the service of the Company, on the management for 20 years and for 25 years on the Board. He is the great-great-grandson of the founder of the business. We shall miss him much.

Nineteen-fifty-seven, the year for which we now account, was a very difficult one for your Company.

At the beginning of the year the Bank Rate stood at 5½ per cent while the rate for Treasury Bills was about 4¾ per cent. By February 7th, when the Bank Rate was reduced to 5 per cent, the weekly tender rate had fallen to 4⅞ per cent, and, after this reduction in the Bank Rate, the Treasury Bill Rate, starting from 4¾ per cent, at the next tender, fell to 3¾ per cent in early May, and remained fairly steady at around 3¾ per cent until the middle of August. Then the rate rose steeply until it reached 4½ per cent in the middle of September. On the 19th of that month the Bank Rate was raised to 7 per cent and the Treasury Bills, at the first tender thereafter, were allotted at just under 6½ per cent. At the end of the year this rate was 6¾ per cent.

ACTIVITIES OF A DISCOUNT HOUSE

As you know, in addition to its traditional and primary role of buying and selling Bills of Exchange, a secondary role, which through force of circumstances, has of recent years fallen to the lot of the London Discount Market, is to provide a free market in short-dated Government Bonds. Your Company entered the year 1957 with £32¼ million of these Bonds. The fall in their market value, as a result of the varied use of the Bank Rate instrument during recent years, is clearly shown by the figures given in Note 3 of the Balance Sheet which is now before you.

A Discount House makes its living by dealing in differences; by which I mean the margin which obtains at any time between the rate at which it can borrow money from the Banks and the rate at which it can invest that money in the purchase of Bills and of short-dated Government Bonds. The profits which a Discount House can make depend in the main on the width of these margins.

The influence of a steep rise in the Bank Rate on both these elements in its business will be apparent to you. The Market values of short-dated Government Securities suffer serious depreciation in value; the borrowed money by which both Bills and Bonds are financed costs more to the borrower, while the interest on those funds already invested remains the same. This increased burden is, it is true, of shorter duration in respect of the Bill holdings than it is in the case of the Bond holdings.

I hope that what I have said serves to emphasise to you the truth of the statement which I made to you in respect of the 1953 Accounts, "that in fulfilling the present role

ALEXANDERS DISCOUNT COMPANY LIMITED.

Statement of Accounts, December 31, 1957

LIABILITIES

	£	£
Authorised Capital:—		
100,000 Preference Shares of £2 each and 2,400,000 Ordinary Shares of £1 each		2,600,000

	£104,136,835

24, LOMBARD STREET, LONDON, E.C.3

of the London Discount Market there is a serious element of risk," and in my statement in respect of the year 1954 you may remember that I told you that the Discount Market as it exists today "is a sensitive instrument and subject to influences over which it has no control and which may at any moment considerably influence its current position."

THE ACCOUNTS

Now if you will turn to the Balance Sheet to which this statement is attached, you will see that your Capital, Share Premium Account and General Reserve, subject to Note 3, remain unchanged, that the balance carried forward is reduced to £142,000, and that our holdings of Government Securities to which I have already referred is £31,757,287, and of Bills is £70,597,862. The Profit and Loss Account shows a profit of £62,900 after providing for rebate and taxation, and after making a provision towards securities depreciation.

As I have so often told you, our dividends must depend on the result of the year's working. On this occasion we propose to recommend a Final Dividend of 3 per cent less tax on the Cumulative Preference Shares, a Final Dividend of 2½ per cent less tax (making 5 per cent less tax for the year) on the Ordinary Shares, and to reduce our carry forward from £167,000 to £142,000. My colleagues and I have had long and anxious deliberations on the rate of dividend which we now propose. I am sure that you will realise that if the Bank Rate continues at its present high level our profits will be seriously and directly affected for some time to come, and that future dividends are in jeopardy. In making our proposal we have in mind two cardinal factors, each of which has a bearing on the future prospects of your Company. The first is that the bulk of our holding of Government Securities is short-dated, and the second is that in spite of the doubts which I have expressed to you before as to the efficacy, in the absence of an Exchange Standard, of the Bank Rate instrument operating in the controlled economy of a Welfare State, there are some grounds for hope that the existing high Bank Rate will not long continue. If only we as a nation can restore, by Government economy, by hard work and the absence of trade disputes, not only national but international confidence in the pound sterling, the fortunes of your Company will once more rest on a sure foundation.

In conclusion I have to thank the Banks for their unfailing support, and Sir Antony Macnaghten, Mr Dawkins and all our staff for their devotion to your interests in these difficult years.

RUSTENBURG PLATINUM MINES LIMITED

(Incorporated in the Union of South Africa)

Statement to Members by the Chairman, Mr. D. A. B. Watson, on the Directors' Report and Accounts for the Year Ended August 31, 1957

(Issued to Members prior to the Twenty-sixth Annual General Meeting to be held in the Board Room, Consolidated Building, corner of Fox and Harrison Streets, Johannesburg, on Thursday, January 30, 1958, at 9.15 a.m.)

The Report of the Directors for the year ended August 31, 1957, reviews in detail the operations of the company during that financial year. Trading results were satisfactory, sales of platinum and by-product metals exceeding those of the previous year. Net revenue before tax amounted to £4.48 million, which was £1.26 million, or nearly 40 per cent, greater than that earned during the previous year.

The appropriation from current profits towards meeting capital expenditure incurred during the year was £224,000. The appropriation to the Stock Realisation Reserve to finance increased stocks of metal in transit, in treatment and in a refined state amounted to £895,000, and the appropriation to General Reserve to finance the increase in the value of stocks of stores and materials was £73,000. The cost of the increase in pipeline and refined stocks of metals and in stores and materials during the past two years has been £1,185,000. An amount of £1.9 million was distributed in dividends during the current year.

The technical programme for the period was carried out as planned and by September, 1957, the mines were in a position to mill at the increased rate of 2.6 million tons per annum as provided for by the 1956/1957 expansion programme.

The shortage of platinum which had prevailed during 1955 and 1956 continued into the early months of the calendar year 1957. Up to the end of February, 1957, marginal supplies of the metal on the open market were commanding prices above the official price quoted by the major platinum refiners. By July demand showed signs of slackening, but it was only three months later, in October, that it became clear that a complete reversal in market conditions was taking place and that the world over-supply of platinum had reached serious proportions. Steps were taken at your company's properties to reduce the current scale of operations to a rate commensurate with the then estimated market requirements for platinum. During November and December, 1957, the position deteriorated further and another and material reduction in the rate of production on the mines was arranged. Members have been advised from time to time by the Board of these changes and of the action taken to meet the changed circumstances. The steep decline in the demand for, and the fall in the price of, platinum during the second half of the calendar year and the consequential adverse effect on the affairs of the company were very considerably greater than had, in August, been regarded as likely from the information then available.

THE PLATINUM MARKET

Demand.—The reduction in demand for platinum has up to the present arisen mainly from the drastic curtailment and, in certain cases, the complete withdrawal of orders placed by oil companies for platinum for use in the platforming process, while recently there has also been some hesitancy on the part of other industrial users. It appears likely that the recent reduction in requirements by all users is largely the result of the economic uncertainty arising from the industrial recession which has developed throughout the world and which has led to a hesitancy on the part of users to proceed with capital programmes and to decisions to carry lower stocks for the time being. There has been, furthermore, a recent trend towards the use by the oil industry of a platinum catalyst containing only 0.3 per cent platinum in preference to the alternative type containing 0.6 per cent platinum and this has had a material bearing on the current reassessment of that industry's requirements. It is a moot point, however, whether the current trend towards the use of the lower grade catalyst will continue; informed opinion is by no means unanimous as to the relative merits of the two forms of catalyst. Members will appreciate the considerable difference the eventual adoption of one or other of these types of catalyst will have upon the demand for platinum.

Prior to embarking upon the recent expansion schemes, exhaustive inquiries were made as to the potential requirements of individual oil refining companies over the five years 1956 to 1960. The figure for such estimated requirements was such as to justify fully the expanded rate of production. In point of fact, various oil refining companies have within the past six months withdrawn from the market some two to three years before their stated inventory requirements have been satisfied.

Price.—As stated, the demand for platinum continued to weaken after the close of this company's financial year and the open market price of the metal moved steadily to lower levels. To meet the competition arising from the prior reductions in the prices quoted by our competitors, the official price of the company's platinum was reduced in two stages during the last three months of the calendar year from the price range of £33-£34 to a range of £27 10s. 0d.-£28 10s. 0d. per ounce, which is the same as that which ruled throughout the major part of the year 1955.

The weakening in price has been caused principally by the very considerable fall in demand as a result of which platinum has been in free supply. Offerings from Russia have continued and, being made in a competitive market, have been at prices lower than those quoted by your company and the other suppliers of platinum of non-Russian origin. Some platinum which had been used as a medium in certain currency transactions has also appeared on the market at similar prices.

The open market price, which is being set mainly by the level at which Russian supplies are offered, is now about £1 per ounce below the present official price range. There is at present no indication that offerings from Russia are diminishing nor of any change in their policy of selling platinum below the official price quoted by the main suppliers of the Western world.

The reduction in the official price of platinum by £5 10s. 0d. per ounce during the current financial year has, of course, made serious inroads upon the profit margin of the company. In our opinion the profitability to a primary producer of the platinum price of £34 per ounce, which this company had maintained throughout the greater part of 1956 and 1957, was reasonable and commensurate with the capital invested in the assets of the company, and the large working capital required to finance the necessary considerable stocks of metals in transit and in treatment at the refineries.

In pursuance of our policy of attempting to maintain a steady level of the platinum price, we did not, in July of this year, immediately follow the downward movements which were initiated by the unofficial quotations and followed by our main competitors. It is in the long-term interests of both producers and consumers to avoid, if possible, the disturbances caused by rapid fluctuations in price in either an upward or downward direction, and it was decided that Rustenburg's price should be maintained until it could be seen whether Russian offerings were likely to continue in the face of a falling price. These did in fact continue at gradually reducing prices and, in order to maintain our competitive position in world markets, the price of Rustenburg metal was reduced in October, 1957, and again in December, 1957.

SALES AND PRODUCTION

Sales of platinum by your company during the first four months of the current financial year amounted to little more than 50 per cent of the average monthly sales during the financial year ended August 31, 1957. There is no indication at present of any improvement in the position.

The completion of the various expansion schemes at the Rustenburg and Union Sections provides the opportunity for considerable flexibility in planning operations. The current scale of operations will, if necessary, be further adjusted from time to time to provide for such changes as may occur in the platinum market, and such adjustments will be made with due regard to the desirability of maintaining this present flexibility.

Reductions in the scale of operations on the mines have unfortunately necessitated the retrenchment of some 650 Europeans and 5,000 Natives since October, 1957. Every effort has been made to minimise the hardship caused by these retrenchments, but the effect on individuals and on the neighbouring districts has been severe.

PROSPECTS OF THE COMPANY

It is not possible at this point of time to make a reliable estimate of trading results for the current year. Any such estimate would have to be based on factors which may change rapidly and materially during the remaining eight months of the financial year.

Net capital expenditure during the year will amount to approximately £400,000, which represents expenditure on such work connected with the 1956/1957 expansion scheme as was in progress at the end of August, 1957, notably in respect of housing and of improvements to the smelter plant, which work was too far advanced to be stopped. If production remains at its present low level, capital expenditure in the financial year 1958/1959 and for several years thereafter will be negligible. If it should prove that a material increase in the present rate of production is justified, certain expenditure on shaft sinking and sundry other items will become necessary at that time. The Directors'

Report for the financial year ended August 31, 1957, made it clear to members that, in addition to providing for current capital expenditure of some £400,000, provision will also have to be made for the sum of £1.7 million outstanding at August 31, 1957, in respect of past capital expenditure. When deciding upon the amount of dividend to be paid in August, 1957, the Board anticipated that the amount required to finance past capital expenditure could be met from profits during the next two years, while at least maintaining the 1957 rate of dividend. As a result of the material changes in the immediate prospects of the company which have taken place since August, the profits earned will be insufficient to carry out this anticipated programme. The period over which appropriations necessary to meet the deficit on capital expenditure will be made will be reconsidered in the light of current profits and of the Board's assessment of the future level of profits from year to year. It will be necessary to give careful consideration to the proper balance between the magnitude of such appropriations deemed prudently necessary to extinguish the deficit in the financial position and the desirability of providing some return to members meanwhile. It is too early to come to any conclusion as to where this balance will lie for the current year.

As I have already stated, the present extensive cut in mine production took place some months after the beginning of the current financial year and mine output will exceed to some extent the present anticipated sales for the year. The cost of producing these additions to stocks which have arisen during the first few months of the financial year will have to be financed. Every effort is being made to regulate production as rapidly as possible to a point where the minimum additions to stocks will result. It is at present expected that there will be a diminution in pipeline stocks of all metals, and an increase in the refined stocks of platinum during the current year.

Additions to stocks and stores over the past two years have absorbed approximately £1.2 million, a figure which can incidentally be compared with the carry forward of expenditure on capital assets amounting to £1.7 million. The necessity to finance this considerable increase in pipeline stocks, together with the necessity to finance further increases anticipated during the current year, at a time when metal prices have fallen and the level of sales has materially decreased, places a considerable strain upon the resources of your company. Taking into account all relevant factors, it is clear that under present conditions the dividend for the current year will be sharply reduced. In view of the uncertainty of the position and the necessity to assess the results for the year as a whole before deciding upon the correct appropriations to be made from current profits, the Board regrets that it is unadvisable to make an interim dividend payment in February, 1958.

As regards the future profitability of your company, I have referred to some factors which have brought about the recent fall in demand for platinum and I think it will be appreciated from the nature of these factors and the speed at which the situation has changed during the past six months how difficult it is to attempt to forecast future levels of supply and demand, a difficulty which is enhanced by the present uncertain prospects for world industrial activity in 1958. When the present economic and technological uncertainties have been resolved, it may well prove to be the case that there will be a recovery in demand for platinum to levels appreciably higher than presently obtaining, but I am not prepared to hazard a guess as to the length of time before such a recovery might take place. In the short term this depends primarily upon the oil industry. In the long term it is, in my opinion, reasonable to assume that the gradual growth in demand for industries other than oil refiners which has continued over the past twenty years will continue in future years.

If it is possible to supply any further information or to make any better assessment of the position at the date of the Annual General Meeting on January 30th, a further statement will be made at that meeting.

The following changes have taken place in the Directorate of the Company since the issue of the Directors' Report :

Mr. P. S. Hammond was appointed a Director of the Company with effect from January 1, 1958, in place of Mr. E. S. Hallett, resigned. The Board places on record its appreciation of the excellent services rendered by Mr. Hallett to the Company since his appointment as a Director in 1947.

Mr. W. M. Walker, who was Alternate Director to Mr. Hallett, has been appointed Alternate Director to Mr. Hammond.

January 22, 1958. D. A. B. WATSON, Chairman.

Registered Office:
Consolidated Building,
Corner of Fox and Harrison Streets,
Johannesburg.

DISTRICT BANK LIMITED

INFLATIONARY TRENDS REFLECTED IN ACCOUNTS

SATISFACTORY INCREASE IN NET PROFIT

SIR THOMAS BARLOW ON WORLD FINANCIAL TENSION

The Chairman, Sir Thomas D. Barlow, GBE, has circulated, with the report and accounts, the following statement to the shareholders of District Bank Limited, prior to the 128th annual general meeting to be held on Friday, February 14th, at the Head Office, Spring Gardens, Manchester:

The Directors learned with great regret of the death last November of Sir Robert Norton Barclay, who preceded me as Chairman and was for so long a distinguished member of the Board. We offer Lady Barclay and all members of the family our deepest sympathy.

Since our last annual meeting we have had pleasure in welcoming two new Directors, Mr Henry P. Bibby and Mr Charles L. Hill, both of whom are well known in industrial circles. Their intimate knowledge of business affairs will be of much value to the Bank.

REORGANISATION OF SHARE CAPITAL

During the year a proposal to merge the Bank's three issues of shares, "A," "B" and "C," into a single class of £1 shares was put into effect with the approval of the Shareholders, after confirmation of the High Court had been received in respect of the reduction of capital involved in the reorganisation.

The free scrip issue made to Shareholders as part of the scheme brought about a capitalisation of reserves and as a result the paid-up capital has been increased from £2,976,423 to £3,988,530 in the form of £1 shares all of one class and all fully paid.

The Directors are of the opinion that this simplified and modernised capital structure, with its elimination of uncalled liability, is of advantage to the Bank and also to the Shareholders who now have a wider market for their shares. This would seem to have been recognised by the overwhelming support that was accorded to the scheme.

THE YEAR'S ACCOUNTS

On reference to the Balance Sheet it will be seen that Current, Deposit and other accounts, which have been running at a higher level throughout most of the year, now total £253 million and exceed last year's figure by £11 million. This change, which follows the general run of banking figures, reflects the persistent inflationary trends of the past twelve months.

As a consequence of the increased deposits, Cash, Money at call and short notice, Treasury Bills and Bills of Exchange, have been augmented and are larger in proportion to our deposits than they were at the end of 1956. These liquid assets represent 39.2 per cent of our liability to depositors.

We have added over £3 million to our holdings of British Government Securities. All of these Securities have a definite date of redemption and a high proportion is repayable within ten years. Investments continue to be shown at a figure which is below their market value.

The fall in our advances is due to a sharp decline in the second half of last year. This trend not only accords with the Chancellor's request to the banks to adopt a tighter lending policy in the national interest but also reflects reductions in traders' stocks due to falling commodity prices and some slackening of activity in certain lines of business. The task of implementing official policy would have been far more difficult for us had our customers not been so understanding and co-operative. We naturally regret the continuance of restrictions on our lendings and will indeed welcome the day when more of our funds can be utilised in financing industry and commerce. Meanwhile our advances continue to be well spread over a wide range of industries, and the figures do not call for any special comment other than that the farmers, who are so indispensable to the country's well-being, are still one of the largest classes of borrowers.

Much of the big increase in the figure for Liabilities of Customers for Acceptances, Confirmed Credits and other obligations is attributable to guarantees in respect of exports of capital goods. This Balance Sheet item also provides some indication of the activities of our Foreign Department. Not surprisingly the changing fortunes of sterling and the generally unsettled state of the exchanges have added considerably to the demands made upon the Department by an increasing number of customers. There was considerable forward exchange trading during the late summer and early autumn, but after the increase in Bank Rate this activity much

slated. The continued expansion of the country's foreign trade was reflected in a higher volume and value of transactions in all sections of the Department.

Our Trustee Department has had another active and successful year. It is pleasing to note that a steadily increasing number of customers and others have appointed the Bank as their Executor or Trustee under Wills. There has also been a constant demand for the services the Department provides by acting as Trustee for Pension Funds and for other types of trusts where continuity of administration is desired, such as new Settlements and Declarations of Trust for the supervision of investments. As we have long felt our expanding business in the Midlands demanded a more personal Trustee service for our customers and beneficiaries in this important area, a branch of the Trustee Department is to be opened within the next two or three months at 38 Hagley Road, Edgbaston, Birmingham.

The higher figure for Bank Property is explained by the purchase of premises and by the rebuilding and extension of some of our existing offices. Last year we opened branches at Edgbaston, Uttoxeter and opposite the University of Manchester.

By continuing their regular visits to branches the General Managers were able to gain a more intimate understanding of the problems presented in different areas by the swiftly changing financial conditions of last year. This local knowledge has also been furthered by the regular conferences which permit a personal exchange of views and experiences between senior branch executives and our higher officials.

PROFIT AND DIVIDENDS

Although Bank Rate is at present standing at the high figure of 7 per cent, the average Bank Rate during 1957 was little above that of 1956. Any additional income from this direction and from the larger turnover of cheques has been almost entirely offset by the greatly increased amount of interest paid to our depositors and by the continued upward pressure of operating costs, due mainly to increased salaries and pensions.

In the circumstances an increase of £9,900 in Net Profit as compared with the figure for the previous year may, I think, be regarded as satisfactory. After making the usual provisions this profit amounts to £672,960 and, including the sum brought forward, there is for disposal £1,147,480. Of this we propose to transfer £500,000 to our General Reserve (now designated Reserve Fund) thus restoring our reserves to £4 million, which was the combined total of the General Reserve and Capital Reserve Share Premium Account prior to the reorganisation of our capital. We are, as forecast, recommending a final dividend this year of 7½ per cent, bringing the total to 15 per cent, which represents an increase over the amount received last year by each of the former classes of Shareholder. After allowing for these dispositions there remains £303,470 to be carried forward to the 1958 Account.

The progress made by the Bank during the past year has not been achieved without keenness and efficiency on the part of the management and staff in dealing with the wide variety of problems which has arisen nor without a sympathetic understanding of the requirements of our customers. Before turning from matters of a domestic nature to those of wider interest I should, therefore, like to express thanks to all concerned for their loyal service.

WORLD FINANCIAL TENSION

After a long period of almost continuous expansion in international trade there has been some slackening in activity, and this has aroused anxiety as to the possibility of a serious decline in business. Lack of confidence has contributed to the recent exchange instability, but the inadequacy of currency reserves of many countries has provided the main reason for this weakness and for the steady accumulation of balance of payments problems.

Such a situation could have been alleviated if these countries receiving a steady influx of gold from their growing export surpluses had not continued to maintain restrictive policies, and if those suffering a loss of reserves had been less dilatory in applying deflationary measures. Because of the present maldistribution of reserves many countries are ill-prepared to withstand the impact of a recession in trade and, even if any recession which may occur does not go very far, there will have to be effective co-ordination of national policies if the international currency mechanism is to be kept working smoothly.

DEFENCE OF STERLING

But that is not to suggest that this country should rely upon external events to extricate it from exchange problems. On the contrary the possibility of mounting tension abroad should make us the more determined to protect sterling by our own exertions. The inflationary forces which are ranged against the pound are not difficult to see. Living beyond our means, or in other words spending too much and saving too little, has been the cause of our exchange crisis: housing, industrial investment and consumption, all desirable in themselves, have combined to create excessive demand and with this cost-inflation. To continue on this lavish course would injure the national economy, irreparably, and we cannot too quickly make such adjustments in our internal affairs as will facilitate the establishment of stable prices and a sound currency.

Meanwhile it is encouraging to note that sterling derived strength from the sharp increase in Bank Rate, and to realise that until the middle of this year it should benefit from favourable payments conditions. A high Bank Rate, however, is costly, even if only reckoned in terms of interest payments on overseas holdings of the National Debt, and the pound will have to be put on a secure basis if we are to make good past losses in reserves and provide a margin for the repayment of debts incurred as a direct result of the crisis. It is understandable, therefore, that other measures have been put into operation to suppress inflation and, since costs and prices cannot spiral upwards without an increasing supply of money, the Chancellor made money not only more expensive but "scarcer to get hold of."

Yet these measures will not be sufficient to strengthen the economy if they do not include a check upon the volume of State expenditure. In these circumstances it is reassuring to have the Government's recent reaffirmation that both its capital and current expenditure will continue to be sternly restricted. This should reduce inflationary demand in the public sector of industry where it is most excessive. Equally important is the reduction of excessive demand in the private sector. In so far as these measures are effective they should materially help to bring incomes into line with output and investment with actual savings.

INVESTMENT AND CONSUMPTION

Technical development, greatly fostered by two world wars, is stimulating new methods of production at such speed that modern machinery, costly in itself, is very liable to rapid obsolescence. For this reason alone the consequences of checking investment must be carefully weighed. Yet with capital so hard to come by and potential demands so great there is really no alternative but to keep our industrial development within practical limits: in other words not to attempt too much too quickly.

The merit of any installation is, in the last resort, to be measured by its capacity to raise production and lower costs. Unfortunately it does not appear that industry as a whole has so far been very successful in this respect. According to a recent issue of the Treasury's "Bulletin for Industry" money incomes rose so much faster than output of goods and services in 1956 that costs per unit of output increased by 6½ per cent, and even for the first half of 1957 there was an increase of 3 per cent. The extent to which wages have been outstripping production can be inferred from these statistics, and, when wages are still engendering so much internal purchasing power, there is real danger that in restricting the growth of total demand we may see more consumed and less invested.

Nothing could create a worse impression in a world anxiously awaiting the outcome of the Government's new measures than that capital investment should be sacrificed to consumer demand, for that would leave this country still wrestling with inflation and lagging behind others in the re-equipment of industry. The most urgent need is to restore the balance between money incomes and output. If this were done we should not only reduce inflation but, by lessening the strain upon industry, should increase the strength of the export trades. Indeed the pound has been so weakened by the recent crisis that we are in no position to countenance a policy that would do less than give support such as this to sterling.

OUR WIDER RESPONSIBILITIES

Such action becomes even more necessary when considered in the light of world conditions. It is true that a continuance of the present fall in commodity prices should hold down the cost of living, thereby removing a powerful pretext for higher wages, and that lower prices for basic materials should reduce production costs, thus making it possible for import requirements to be obtained in exchange for a smaller quantity of exports than hitherto. Yet on balance a downward trend in these prices is more likely to work to this country's disadvantage, since a decline in their earnings would make it increasingly difficult for our best customers to purchase our goods.

As far as the primary producing countries of the Sterling Area are concerned, cheaper commodities have in fact very serious implications for us. With most of Western Europe pursuing less expansive policies and America possibly moving into a recession, the foreign exchange earnings of the overseas sterling countries could be severely reduced. If this should cause them to draw heavily on their London balances a great strain would inevitably be placed on the pound. Then more members of the Commonwealth have become self-governing and, eager for economic development, they too may draw on their balances instead of adding to them.

Burdensome as now appear our responsibilities at the centre of this system, it has to be remembered that the great bulk of world trade depends upon the international character of sterling, and justification for any sacrifice which may have to be made lies in the indirect benefits to exports rather than in the direct benefits to earnings, important as these are, that accrue from this country's traditional functions of banking, merchanting

in commodities, shipping and insurance.

Because of the increasing international stresses to which the pound is subjected there would seem to be a need for greater co-ordination of policies within the Sterling Area. However it is neither by co-ordination nor even by help from countries outside the Area that sterling will regain its full strength. Real and lasting support can clearly come only by building up a current trading surplus commensurate with the country's international responsibilities. Although this is a formidable task, especially when some buyers of British goods are having to restrict imports, it does not impose a policy contrary to our domestic economic interest. The price may be heavy in terms of hard work and self-denial, but is one well worth while in that it contributes to the preservation of multilateral trade upon which the prosperity of the United Kingdom so largely depends.

EXPORTS IN A COMPETITIVE WORLD

When considering this task, encouragement can be derived from the fact that for some years a larger part of the country's total resources has been going into exports and that of these manufactured goods record the biggest gain. But perhaps the most significant change is the growing diversity of our manufactured exports. Although to some extent this is due to our speedier reaction to the shifts of world demand, it is also due to the fact that in this scientific age other countries are increasingly looking to us to supply them with complex technical equipment, particularly in the fields of electronic and atomic development. None the less competition is exceedingly fierce. In these circumstances it is reassuring to know that our export performance in the hardest markets has been very satisfactory and that the recent Canadian Trade Mission was impressed by the standard we have achieved in many fields of industry. May we trust that what they have reported to their fellow-countrymen will bring us an increasing share of a market so rich in potentialities.

Far less satisfactory, though it failed through no fault of its own to reach an understanding, was the Cotton Industry Mission to India, Hong Kong and Pakistan to which I referred in my last Statement. To the continued unrestricted and duty-free inflow of cheap cloth and made-up goods from these centres has had to be added until recently arrivals of increasing quantities of grey cloth from China at prices much below the quotations of efficient producers in this country. The retention of such a large proportion of these goods in the home market now constitutes a threat to the cotton industry infinitely more serious than a year ago. It is greatly to be hoped that the obviously critical situation which has developed will compel a workable solution before long.

But to meet this and other aspects of the keen competition ranged against our textiles much has been accomplished in the field of technical development. The utilisation of new fibres and the production of new yarns, new cloths and new finishes account in part for the moderate improvement in business last year. It should, however, be remembered that the trade has been enjoying the benefit of an active home market due to the inflationary rise in consumers' spending power. In itself this is not a condition to ensure lasting prosperity, and there is every need for taking a cautious view of the future. Although the extent to which the industry can modernise largely depends upon the course of events outside its control, it will be placed in a stronger position in so far as it can, despite the inordinately heavy cost, make use of the many developments in machinery and production that have emerged of recent years.

NATIONAL PROVINCIAL BANK LIMITED

HIGH TRADITION OF PUBLIC SERVICE

ECONOMIC SPHERE : VIOLENT CHANGES AND FLUCTUATIONS

POSITION COMPLICATED BY INTERNATIONAL CLIMATE

MR D. J. ROBARTS ON THE PROBLEM OF PRIORITIES

The one hundred and twenty-fifth annual general meeting of National Provincial Bank Limited will be held on February 13 at the head office, 15 Bishopsgate, London, E.C.2.

The following is the statement by the Chairman (David John Robarts, Esq), which has been circulated with the report and accounts for the year ended December 31, 1957 :

BOARD OF DIRECTORS

We have to record with great sorrow the death of Mr Gerald Steel, CBE, who was elected a Director of the Bank in 1956. Between 1949 and 1957 he also rendered valuable service to the Bank as a Local Director for Sheffield.

We also have to record with great sorrow the death of The Right Honourable Lord Riverdale, GBE, LLD, who had served as a Local Director for Sheffield since 1921 and as a Director of the Bank between 1924 and 1951 ; and also the death of Mr Antony Hubert Gibbs, who was appointed a Local Director for Devonshire of the Union of London and Smiths Bank in 1903 and continued in a similar capacity for this Bank following the amalgamation with the Union of London and Smiths Bank in 1918.

In November last we were glad to welcome to the Board Field-Marshal Sir John Harding, GCB, CBE, DSO, MC, to whom we offer our congratulations on the honour of a Barony which Her Majesty has recently conferred upon him.

We also offer our congratulations to Mr Foster Gotch Robinson, a Director of the Bank, and to Mr Ashley Skelton Ward LLD, a Local Director for Sheffield, on the honour of Knighthood which Her Majesty has been pleased to confer upon them.

During the year we were pleased to announce the election of Sir Douglas S. Branson, KBE, CB, DSO, MC, TD, ADC, DL, MA, and Mr John Hadfield, MSc, ARIC, to seats on the Sheffield Local Board.

REORGANISATION OF THE SHARE CAPITAL OF THE BANK

The Scheme of Arrangement dated February 12, 1957, for the reorganisation and simplification of the capital structure of the Bank was duly approved at the meetings of shareholders held March 21, 1957. The High Court subsequently sanctioned the Scheme and confirmed the reduction of capital extinguishing the uncalled liability on the "A" and "B" shares. As a result of these changes and the application of £1,033,742 of the Bank's Share Premium Account, the paid-up capital of the Bank has been increased from £9,479,420 to £10,513,162 and is represented by a single class of shares of £1 each fully paid.

125TH REPORT AND ACCOUNTS

Shareholders will notice that this is the one hundred and twenty-fifth Report and Accounts of the Bank. To mark this occasion a brief account of the history of the Bank has been included, tracing the major developments throughout the long period during which the National Provincial Bank has maintained its high tradition of public service.

COUTTS AND COMPANY

The Balance Sheet of Coutts and Company as at December 31st last accompanies our own Report and Accounts.

STATEMENT OF ACCOUNTS

The Balance Sheet and Accounts of the Bank together with the Directors' Report are before you.

It will be seen that the liabilities of the Bank to its Current, Deposit and other Account holders at £830,705,869 exceed last year's figures by £16,181,900.

The total of our liquid assets—Cash, Money lent at Call and Short Notice, and Bills—represents 39.6 per cent of our deposit liabilities. This compares with 37.3 per cent twelve months ago.

Investments in securities of, or guaranteed by, the British Government continue to be shown at a figure which is below their market value. The Balance Sheet value of £215,237,902 gives a ratio of 25.9 per cent to Deposits as against 26.5 per cent last year. We hold no undated government securities and the majority of our holdings mature within ten years.

Our Advances stand at £240,093,573 which represents 28.9 per cent of our Deposits. The corresponding figures at December 31, 1956 were £256,730,398 and 31.5 per cent.

PROFIT AND LOSS ACCOUNT

The account shows a net profit for the year of £2,061,966 compared with £2,030,483 for 1956.

Together with the amount brought in of £654,875 there is a balance for disposal of £2,716,841. An interim dividend of 9 per cent has been paid, taking £544,056, leaving available £2,172,785.

It is now proposed to deal with this balance as follows:

To pay a final dividend of 9 per cent	£544,056
To appropriate to Reserve Funds	£1,000,000
This will leave to be carried forward	£628,729

The proposed final dividend of 9 per cent makes, with the interim dividend of 9 per cent paid in July last, a total dividend of 18 per cent in respect of the year 1957.

MANAGEMENT AND STAFF

The satisfactory results which have again been achieved have come from the continued hard work and ability of the Management and Staff both in Head Office and in the branches, and I wish to thank them most sincerely for their efforts and for their unceasing loyalty and devotion.

The proportion of ladies we employ continues to grow and, although we do suffer a substantial turnover in our Lady Staff, a considerable number stay with us, some for many years, and their services are of the utmost value to the Bank.

There is one section of the very varied activities we undertake for our customers which I feel deserves special mention this year, namely the big tasks which have been carried out—and most successfully—by our Registrar's Department under the capable direction of Mr J. D. M. Campbell, our Registrar. One such operation certainly made headline news, namely that of the Convertible Debenture Stock Issue of The British Petroleum Company Limited last month. The response to that Issue was unprecedented in the annals of the City and it entailed the handling by our Registrar's Department, with a very much augmented staff, of over 250,000 application forms. Approximately 170,000 Allotment Letters had to be prepared and the vast majority of these were in the hands of the Post Office for transmission to successful applicants within 60 hours of the basis of allotment being decided. This achievement reflects the highest credit on Mr Campbell, the Officers of his Department and all those members of the Staff (many of whom came from country branches) who were concerned in this vast operation. It is fitting that I should pay this tribute to them.

ECONOMIC CONDITIONS

The past year will be remembered as one of exceptionally violent changes in the financial and economic spheres. The early months of the year were overshadowed by the aftermath of the nationalisation of the Suez Canal and the strains upon our economy thereby created. With the resumption of traffic through the canal, these strains were eased. In February the Bank rate was reduced from 5½ to 5 per cent—a change made necessary by the technical position of the money market, rather than by any significant improvement in the economy of the country. Seven months later, however, under the pressure of adverse developments, Bank rate was raised to 7 per cent, the highest level for 36 years.

The Government's Financial Year 1956-57 closed with a realised deficit, taking into account items both above and below "the line," of £331 million, of which £284 million was due to the new financing arrangements for the nationalised industries. The Chancellor framed his Budget for 1957/58 on the basis of achieving an approximate overall balance of income and expenditure both above and below "the line." This was clearly the right objective and is a fundamental necessity if inflation is to be checked.

The balance of payments for the first six months of 1957 showed a surplus on current account of £125 million, which, though not so good as in the same period of 1956, was not unsatisfactory. Adverse capital movements, however, converted this into a net deficit of £43 million as compared with a net surplus of £85 million in the first half of 1956. The position was disguised by a substantial inflow of dollars from sterling area countries, including dollars drawn from the International Monetary Fund by India, and our gold and dollar reserves increased by nearly $250 million, reaching a total of $2,381 million in June. Then, however, a change of trend set in. The reserves fell by some $530 million between June and September, and it was clear that there was a loss of confidence in the position of sterling. It is not easy to analyse the causes of this change. The devaluation of the French franc and the constant strength of the German mark touched off a considerable pressure against sterling which was not justified by any change in the current trade position. Official pronouncements by the Government did not appear to convince the speculators that going short of sterling was not likely to be a profitable operation, and the Government had to show by appropriate action that their words would be supported by deeds. The raising of Bank rate to 7 per cent and the determination to use our dollar resources and credits to meet speculative pressure proved effective and the exchange rate has improved, with the result that our resources in foreign exchange have shown a recovery.

AN UNEQUIVOCAL STATEMENT OF POLICY
