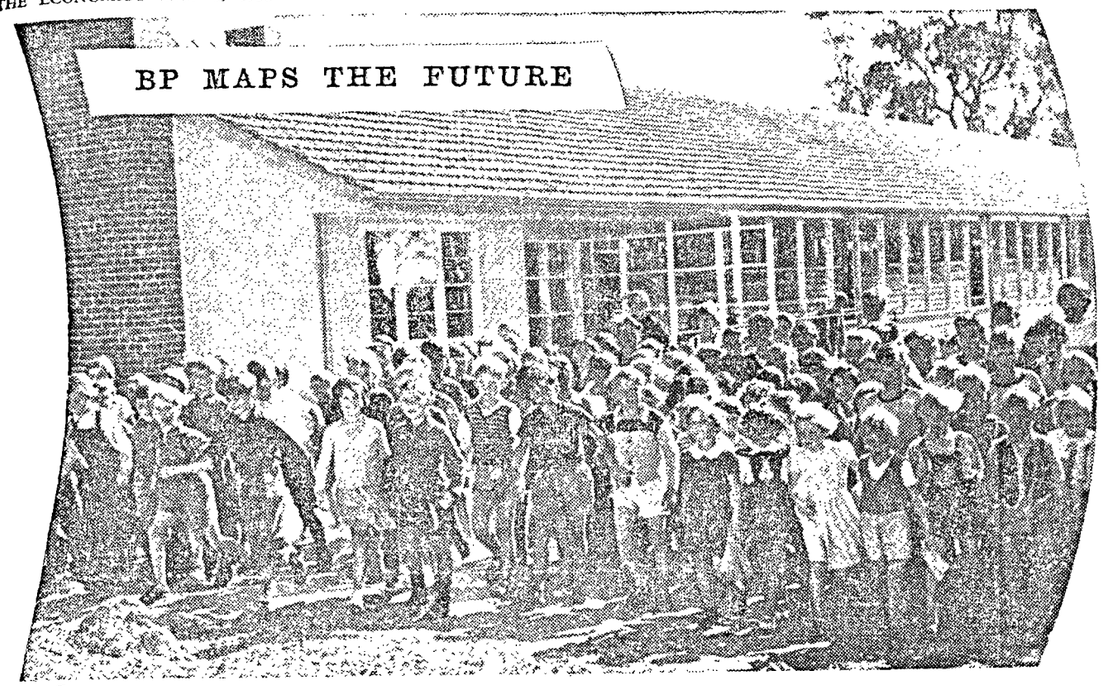
Buying the "call," that is, the right to call for shares at an agreed price, or the "put"—the right to deliver them at that price, or even the "put and call" was an accepted and well developed part of the market's prewar mechanism. The argument for restoring it is first that speculation is not necessarily evil and second that forward transactions are permitted in the foreign exchange and in many commodities. To restore options would almost certainly increase the volume of business, but it is still on balance unlikely that the prewar system will be re-established or that the majority of members want it. It would open the way to some undesirable practices. What, for example, would be the use of compelling company directors by law to expose their transactions in the company's shares to the shareholders, if they had freedom to do the equivalent of share dealing through the option market? It is also doubtful whether the market now could readily support option trading. The jobbers who would sell options have little capital to spare, but they would have to cover themselves at least in part. They used to do so by buying half the shares represented by the options they had sold. It could easily turn out that the market's present resources are not adequate to support a large volume of speculative business. Markets would of necessity be more volatile just because option trading enables the dabbler to get command of a large number of shares for a small money commitment.

MOTORS

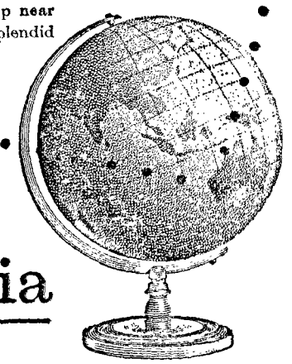
The Gain in Productivity

THE motor industry is making more vehicles—about a twelfth more—than at its previous peak level of output in October and November, 1955. But it is not using any more labour. Much of this apparent increase in productivity is no doubt the result of the various investment programmes that the leading manufacturers went in for in 1954 and 1955 and have now mostly finished; but the industry's recession may also have helped by giving manufacturers the opportunity to take back only the labour they actually wanted, which appears to have been a little less than they were employing before. How much less it is rather difficult to tell. The Ministry of Labour's monthly employment figures are not a great help since labour employed in cycle manufacture, which is still in a bad way, is included with vehicle manufacturing employment and the separate set of figures for the component and accessory side of the industry is combined with the making of parts and accessories for aircraft. Not all of the three per cent reduction in total employment shown by these two figures could be ascribed to the vehicle industry alone.



Another difficulty in the way of calculating the growth in labour productivity in the vehicle industry lies in the way in which it is made up. The extent of bought-in supplies varies between firms and some are more heavily engaged in car manufacture, which is now 16 per cent higher than towards the end of 1955, than in the production of vans and trucks, which is still 12 per cent below the previous peak. Three of the five main firms also make tractors, where output is also up on 2½ years ago. But for four of these five manufacturers—that is excluding the largest, BMC—total employment is now fractionally lower than in October, 1955, while daily output of all kinds of vehicles, including tractors, is 22 per cent higher, which suggests a gain in labour productivity of roughly the same amount. Vauxhall, alone of the five, is using more labour than before and it is the only one of the four whose apparent productivity is lower: its labour force has risen by about a third while output—still below the full capacity of the firm's new plants—has grown by only a quarter. Of the other three it would seem that Standard has achieved the best performance, mainly because of the new tractor plant that has now been fully brought in, with Rootes and Ford (whose expansion programme has still to be completed) following in that order. British Motor Corporation is also employing slightly fewer men than 2½ years ago, but it is not saying how its present rate of output compares.

FINANCING THE COLONIES



Colonial Development Corporation

IN a shrinking colonial empire and in an atmosphere of more stringent financial control, fresh thinking has gone into the organisation and the objectives of the Colonial Development Corporation, the Government-owned corporation which should not be confused with Colonial Development and Finance Corporation supported by money from the City. Two vital changes that affect CDC's report for 1957 issued this week are first the decision about what the corporation may do in the so-called "emergent territories"—countries like Ghana and Malaya that were colonies but have become self-governing. It was decided that existing projects might be continued, but on new ones CDC might only act as managing agent without investment. And though it has thought hard on the subject it has not found it easy to become a managing agent on those terms.

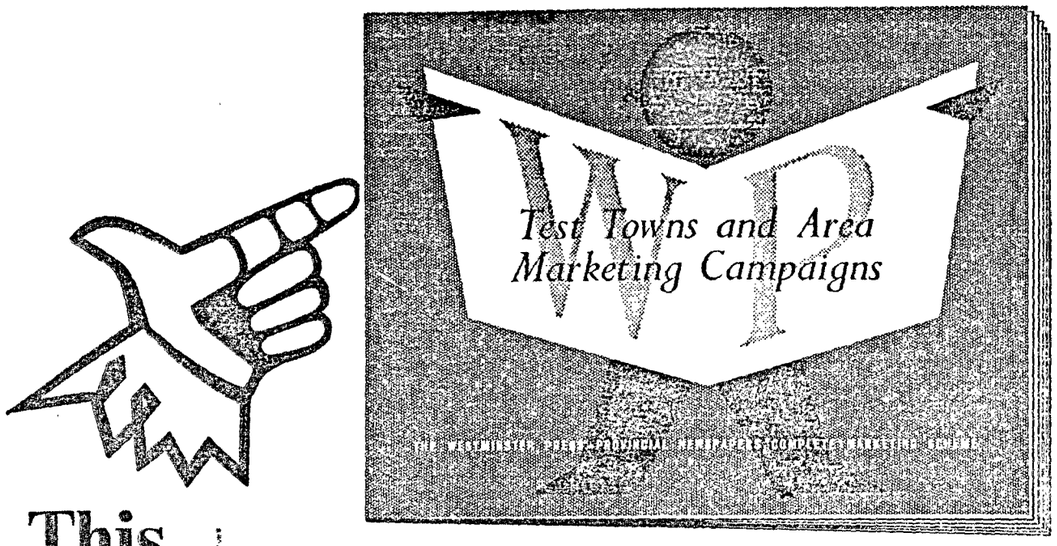
Secondly, the corporation's borrowing powers were raised from £100 million to £150 million, but the Colonial Secre-

Children of Medina, the new township near Kwinana Refinery, outside their splendid modern school.

A new township springs up in Australia

SEVENTEEN MILES south of Fremantle, the main port of Western Australia, is Australia's biggest refinery – Kwinana – owned and operated by one of the British Petroleum group of companies.

Nearby a new township has risen amid the gum trees and casuarinas of the Australian bush. Named Medina, it has been built by the Western Australian authorities as the first part of a large new town to house many thousands of people whose livelihood will be mainly bound up with oil.



This new town has been planned not only for personnel of Kwinana Refinery, but also for employees of the new industries attracted to the area by the building of the refinery, with its ready supply of fuel oil and other products.

Kwinana started operating in 1955, and can now process 3,000,000 tons of crude oil a year. Important new plant is at present being added to meet Australia's ever increasing demand for oil products.

In Australia, as elsewhere, The British Petroleum Company plans the future by taking practical steps today.

THE British Petroleum COMPANY LIMITED

BP

This COMPLETE test marketing service offers:

Pre- and post-operative research

Sales teams

Retailer merchandising service

Newspaper advertising

. . . all in one package

The success of any test marketing campaign depends on the choice of a representative "test town", a thorough knowledge of the market situation, adequate distribution throughout the area, enthusiastic retailer support and well-timed advertising backed by point-of-sale displays.

Few manufacturers are equipped to provide all the necessary information and services from within their own organisations.

To meet all these requirements, the Westminster Press Group of Provincial Newspapers now offers a COMPLETE AREA MARKETING SERVICE. This is the simple, rewarding and economical way of marketing a new product or correcting the trend of one that is slipping down the sales chart.

We will handle the whole operation without disturbing any of your staff. Instead, we will provide you with all or any of these services: Pre- and post-operative Market Research; Teams of competent Salesmen from a specialised selling organisation; Merchandising; Newspaper Advertising; Displays; and, should you require it, a Sample Distribution.

In order to show you, in detail, how the service operates and exactly what it costs, we have prepared a booklet called "Test Towns and Area Marketing Campaigns". You will find it a valuable source of information on the towns covered by our newspapers. Please write for it today to T. G. N. Pearce, London Advertisement Director, Westminster Press Provincial Newspapers Limited.

WESTMINSTER PRESS PROVINCIAL NEWSPAPERS LIMITED

THE NEWSPAPER HOUSE, 167/170 FLEET STREET, LONDON, E.C.4. (FLEet Street 3265)

This service is now available in the following Westminster Press newspapers

NORTH-WESTERN EVENING MAIL (BARROW) · THE BEDFORDSHIRE TIMES GROUP (BEDFORD) · TELEGRAPH & ARGUS (BRADFORD) · NORTHERN DESPATCH (DARLINGTON) · OXFORD MAIL (OXFORD) · EVENING ADVERTISER (SWINDON) YORKSHIRE EVENING PRESS (YORK) AND IN A NUMBER OF OUR OLD-ESTABLISHED WEEKLY NEWSPAPERS SERVING THE SURROUNDING AREAS

tary's lending powers were raised by only £30 million to £130 million, so that for the first time there was a margin of borrowing that CDC could raise from non-Government sources. It is a fact, so far, that it owes the Government only £56 million, though the outstanding capital commitment is £80.5 million, but the possibility of market borrowing has started fresh thinking about the form it should eventually take. It seems clear that CDC could at the moment only raise loan capital, but the possibility of a quasi equity, without a predetermined rate of interest is among the suggestions being considered.

Another (which might make equity financing easier) is of capital reconstruction in which CDC would be allowed to write off its £8 million special losses made in the slap-happy days before 1951, the biggest of these being the Gambia egg adventure. Now CDC with nearly 80 associated and subsidiary companies is much more humdrum. It shows a consolidated profit (after charging loan interest) of £732,868 in 1957, against £572,809 in 1956, and that has been achieved despite the fall in copper which severely hit one of the projects—the Macalder-Nyanze Mine—involving the company in a loss of £207,505 against a loss of £77,168.

BOAC

Well in the Red

FACED with a much bigger deficit on the 1957-58 operations of the British Overseas Airways Corporation than anyone had reason to expect, union leaders intended to try yesterday to talk the corporation's maintenance engineers out of their overtime ban so that they could re-open discussions with the management—not about concessions, for none have been offered but on the sorry subject of severance pay. There has been no change of any kind in BOAC's plans to dismiss 3,000 engineers during the next two years in a general reorganisation of its entire engineering operations and the only room for manœuvre left to the unions is on the way this re-organisation is carried out and the compensation offered to the men. It is a delicate subject that could set awkward precedents for the other nationalised industries, and it is unlikely that BOAC can make any offer without first having it approved by the government.

The financial background against which the talks will be carried out is a depressing one not only for BOAC but for all the major airlines. It had been expected that difficulties with aircraft, particularly the delays in bringing the Britannia into service, would have built up a net loss of about £2 million on operations in the last financial year; but the loss announced by the Minister of Transport last week was "about" £2.75 million, the unexpected increase being due to a sharp setback in traffic during the last few weeks of the 1957-58 financial year. Superficially BOAC appeared to do well; its North Atlantic traffic shot up by 15 per cent when some of its biggest competitors were showing increases of less than 5 per cent. But, in fact, all the North Atlantic airlines had budgeted for a much bigger increase in traffic, BOAC included, and while the corporation has had a much smaller proportion of empty seats than some other operators who have been flying more than half-empty, it built up a loss of £750,000 on this and other routes in an alarmingly short period. It is too early to say whether the third class fares introduced a bare month ago have come just in time to stop the rot from spreading to the summer tourist traffic.

MIDDLE EAST OIL

Standard Indiana's Entrance Fee

IT is always dangerous to comment on new concession agreements before the full details are confirmed. First interpretations of the agreement between Mr Mattei's ENI group and the Persian government last year were well wide of the mark, and many weeks passed before that agreement could be seen in proper perspective. The draft agreement between the Standard Oil Company of Indiana and the Persian government, providing for oil exploration in a 6,200 square mile tract offshore in the Persian Gulf, which has been submitted to the Persian Majlis for its approval, is not yet available for perusal, and the terms which have been reported have not yet been confirmed by the oil company. But if the first reports are correct, and the agreement is eventually confirmed by both parties, then the Persian Prime Minister seems justified in describing it as "unbelievably profitable to Persia and unprecedented in meeting her aspirations."

At first sight the Standard Indiana bid, which has been accepted in the face of keen competition from several larger oil groups, follows the pattern first established by the Italian company last year. Standard Indiana would form a joint operating company with the National Iranian Oil Company and if oil is found the two participants would divide the profits equally. The Persian government would then be entitled to a further half share, on a normal 50:50 profit-sharing basis, of the American company's half of the operating company's profits. Like the Italians, the American company would guarantee to spend a minimum sum on exploration—but the minimum is much higher: $82 million against the Italian $22 million. There the resemblance ceases. The Italian company's exploration commitment was in lieu of a cash bonus; Standard Indiana is said to have offered a cash bonus of $25 million in addition to its exploration commitment. This is certainly a heavy price to pay for unproven offshore acreage, even if the chances of a rich strike are rated high. Other companies may have offered the Persian Government fatter bonuses—but not both participation and a bonus. Why would any oil company offer so much, if indeed the offer is confirmed?

A NEW SERVICE
OF ECONOMIC AND MARKETING RESEARCH

DURABLE CONSUMER GOODS

A series of continuous comprehensive surveys are now being prepared to assist manufacturers and others to estimate the future market for the following goods: Electric washing machines; Tyres; Refrigerators; Car heaters; Vacuum Cleaners; Cycles; Electric fires and convector heaters; Gas and electric cookers; Car radios; Radios and radiograms; Record players and Gramophones; Sewing machines; Television sets; and Passenger cars.

These surveys are being prepared jointly by
THE ECONOMIST INTELLIGENCE UNIT LIMITED
and
THE BRITISH MARKET RESEARCH BUREAU LIMITED
Further information from:
THE ECONOMIST INTELLIGENCE UNIT LTD.,
22 Ryder Street, London, S.W.1. Whitehall 1511, ext. 13

Standard Indiana, one of the most powerful of the American *independents*, has no production in the Middle East, not even in the Iranian consortium. It may, therefore, be willing to pay more for its first foothold than other companies who have to consider the effects of their bids on existing concessions elsewhere in the Middle East. But the key to the deal may lie in an offer, reported from Persia but not confirmed by the company, to find a market for the 12½ per cent of the consortium's production that the Persian government has the right to take as royalty oil. If the Persian government cannot find a market for this oil, it already has the right to sell it back to the consortium companies, but it has long wished to establish other markets independently. For Standard Indiana, if its offer of an assured market would gain for it an assured supply of Middle East oil, the attractions might be greater. In ten years' time, after the current world surplus of oil had disappeared, an assured supply of perhaps 10 million tons a year of low cost oil would be a useful asset—though the Persians would be unlikely to concede much discount off *posted prices*. But if this is in fact part of the off-shore concession agreement, then, while the world surplus of oil lasts, Standard Indiana will have bought itself a costly marketing problem.

NON-FERROUS METALS

Subsidy v. Tariff?

PRESIDENT EISENHOWER and his Administration have good reasons for preferring to subsidise the American non-ferrous metal producers rather than give the lead-zinc producers the higher tariff that was recommended a few days ago by the Tariff Commission. The question is whether Congress will endorse the proposals put forward by the Secretary of the Interior, Mr Fred Seaton. The full details of the project, and so far it is worthy of no more definite name, are not yet clear. But, in essence, the American Government would subsidise American producers—at a notional cost of $161 million in five years—by giving them support payments to make up the difference between domestic market prices and "stabilisation" prices. These stabilisation prices, running above current market prices, would be: copper, 27½ cents per lb; lead, 14¾ cents; zinc, 12¾ cents; $48 per short ton for fluorspar acid grade; and $36 per short ton unit for tungsten. The only apparent limit on the subsidy is that support payments each year would be confined to specific quantities of the metals: copper, one million tons; lead, 350,000 tons; zinc, 550,000 tons; fluorspar, 180,000 tons; and tungsten, 375,000 ton units.

The London metal market has received this plan, as it did the Chilean proposals for a copper price scheme, with sceptical distaste—scepticism because the plan has to get the approval of Congress and distaste because as it stands it might turn the American metal producers as a whole into weak sellers, forcing down the price at the immediate expense of the American government and at ultimate cost to producers outside the United States. If the plan did go through it would have bearish implications for non-ferrous metal prices.

The scheme would help the American lead-zinc producers, particularly the high cost mines, though possibly less than a tariff on imported metals. Recession and the cut-back in defence and stockpile orders leave them in real trouble. The stockpile, which had absorbed about 1,000 tons of lead and about 1,000 tons of zinc a month, has already stopped buying zinc and will stop buying lead in June. Stocks have been piling up at the mines and the smelters and lead is quoted at 12 cents per lb and zinc at 10 cents per lb. The plan will no doubt be scrutinised at the London meeting early in May of the International Wrought Non-Ferrous Metals Council. Will the plan prove to be the precursor of an international stabilisation scheme for lead and zinc, favoured already by a substantial body of opinion within OEEC?

GRAMOPHONE RECORDS

Mixed Platter

THE Board of Trade takes no account of the Hit Parade, and its statistics recording the monthly rise and fall in the production and sale of gramophone records cannot distinguish short-term popularity from long-term trends. In any other industry the fact that production in February fell 12 per cent and sales fell two per cent compared with a year ago would be taken at the very least as a warning signal. Yet it found the two biggest record producers, Decca and EMI who between them control between 80 and 90 per cent of output, in a buoyant mood with rapidly rising production and sales, particularly Decca which has three-quarters of the current Hit Parade records in its catalogues. The prestige of the industry may rest on the high quality of its classical recordings; but its fortunes are decided in the "pop" market, a capricious combination of avid appetite and rapidly changing taste.

This makes the advent of the Rank Organisation in the record business something that both big companies are watching with care. Rank is now busy signing up its own recording artists for discs that it will market not through the normal retailers, but through clubs organised by its own cinemas, the equivalent of a nation-wide distribution chain of 480 shops. Records sold through clubs cost, on average, almost half that of a normal recording—say 22s. 6d. to 25s. for a long-play record compared with 39s. 11½d. to 41s. 9d. for some of the dearest in the normal catalogues; but no club has been organised before on the scale contemplated by Rank. Decca has prepared to meet this competition not by forming its own club, but by re-issuing 7 to 8 year-old recordings under a new label, Ace of Clubs, to be sold by retailers in the normal way but at club record prices.

FINANCE BILL

A Few Small Rabbits

THE Chancellor has not pulled many rabbits from his hat in the Finance Bill. His decision not to make the new dividend stripping regulations retroactive is the most newsworthy of them. The profits tax is thoroughly cleaned up and will at some convenient time require a short consolidating act. The concessions on the allowance of professional subscriptions against Schedule E assessments seem very tightly drawn. The withdrawal of the proposal to tax miner's boots at 5 per cent is a political move to remedy what seems to have been a fiscal inadvertence.

There are a few points of useful clarification. The budget undertaking to deal with certain instalment contracts at present liable to *ad valorem* duty is now explained. The Chancellor is taking the *ad valorem* duty off credit sale agreements. These, like hire purchase contracts, will in future bear only a sixpenny stamp. One other section of

the hire purchase trade—block discounting—still bears an *ad valorem* duty. A retailer assigns a block of his individual hire purchase agreements with customers to a finance house. This is closely parallel to trading in bills, and it will continue to bear a duty that starts at 6d. for the first £5 and rises to 2 per cent when the consideration exceeds £5. The building societies may relax, for the finance bill makes it clear that in assessing the residual profit liable to profits tax the societies may deduct not only the interest they pay to shareholders but also the composite rate tax thereon, which they pay on behalf of their members.

NON-LIFE INSURANCE

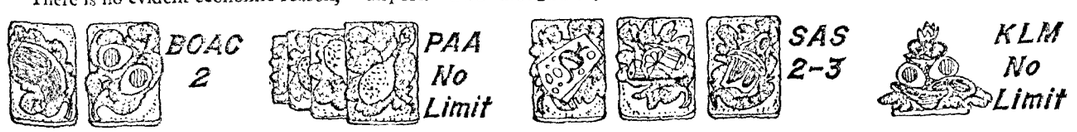
Another Lean Year

LAST year there was little or no relaxation in the squeeze on fire and accident underwriting profits. For the second year running North American business resulted in heavy underwriting losses, though dollar interest earnings were probably sufficient to offset these with a little to spare. The offices that underwrite almost wholly in this country did considerably better than the others. But taking the rough with the smooth is the essence of insurance, and the offices possess massive free reserves; dividends are traditionally paid out of interest income, while underwriting profits are ploughed back.

The main source of trouble in 1957 was, as usual, motor insurance. At home sharply higher premiums since last July have helped to offset the increase in claims. Abroad, and particularly in North America, things have gone from bad to worse, though rates have been increased in some areas. Even more expensive motor insurance is a distinct possibility in this country and a certainty in North America. Sooner or later all premium rates must match claims. The insurance companies are looking for some improvement in fire and accident results this year; in 1959 they hope that the pendulum will swing further towards more normal

Recipe for a Sandwich

IN spite of an austerely-worded note from the Montreal headquarters of the International Air Transport Association listing the six requirements of a "simple, cold and inexpensive sandwich," victory in the three-week old dispute about the ingredients of an airline sandwich, third class, appears to have gone to the gourmets—and to common sense. Only one of the offending European airlines taken to task by their puritan British and American competitors has actually agreed to modify the collation served to third-class passengers in place of a main meal. The sooner the airlines bury the dispute the better, for it adds nothing to their credit or to the case for international regulation of air transport.



When the airlines originally agreed to introduce third-class fares this spring, it was intended that passengers should buy their own lunch boxes at the airport, but some operators, horrified at the prospect of aircraft full of orange peel and garlic sausage, pressed for a slightly higher fare and free sandwiches. The purpose of cutting out meal services was not to save money on food, because the cost of this is negligible even when it is accompanied by free champagne. It was to save the weight and space of a galley and to use the room for extra passengers. The acid test of a suitable third-class meal is whether or not it can be served without having to install a galley.

There is no evident economic reason, unless it is a desire to make a third-class passenger fully aware of his lowly station, why such meals should consist preponderantly of bread, and understandably enough, the sandwiches that have been appearing on third-class services reflect sharp differences in national cuisine. Following two broad principles observed by all airlines—that continental sandwiches based on a single slice of bread are served in place of main meals, and English type sandwiches or split rolls in place of light refreshments—*different operators* have produced very different answers, roughly illustrated below.

British and American airlines hold that a continental sandwich should be nothing more than a normal English sandwich with the top layer removed. European operators like SAS and Air France show that it can be a culinary work of art. KLM follow the Dutch view that a sandwich can make a square meal. Most airlines do allow passengers as many of these sandwiches as they want, but BOAC restrict them firmly to two apiece. Swissair offer them as a running buffet and manage to provide not only protein in the form of meat, fish and cheese, but also a selection of fruit and salad simply by placing these on rounds of bread as the regulations require. Otherwise third-class passengers get no fruit at all, just as they get no cigarettes or drinks unless they buy them at the airport. SAS thoughtfully sell at the airport a pack of wines, spirits and beer to cheer the 12-14 hour crossing.

But all these regulations apply only to services flown across the North Atlantic, not to flights inside Europe. An ingenious operator such as Swissair can therefore serve normal tourist meals and drinks with perfect propriety on the last leg of a third-class flight from New York into Cologne, Lisbon or Zurich provided that it has made a scheduled stop at some point like Shannon on the way. If the flight is made non-stop, it must observe full third-class austerity. A non-IATA operator, Icelandic Airways snaps its fingers at these quibbles and offers full meals and free brandy for a return fare £22 less than the cheapest prescribed by IATA.

KLM has now agreed, as a result of heated IATA discussions, to make its bread thicker and its sandwiches thinner than the multi-tiered offerings it has been serving to date, but only to the extent of bringing them into line with those served by the other main offenders, SAS, Air France and Swissair, who have stood their ground to the last radish and refused to alter their menus. Air France has, however, agreed to give up serving Coca-Cola among its soft drinks, which could involve a different kind of argument. The protesting airlines, predominantly American with BOAC sitting on the fence, have been pace-setters at IATA for so long that they should act as grown men when their continental competitors score a point instead of appealing to a non-existent sandwich standard of fair trade practice.

underwriting results. But transfers of profits from marine departments, which so far have held up, are likely to fall off in the future. Low freight rates and laid-up vessels are anathema to marine underwriters.

ELECTRICITY SUPPLY

Pricing and The Peak

In few industries do capital charges bulk as large in the total costs of supply as in the electricity system; yet the introduction of nuclear generation will make electricity even more capital-intensive. Moreover, electricity cannot ordinarily be stored, and is supplied on demand at the flick of the customer's switch, not at the discretion of the supplier. So the industry must generally aim at having enough capacity installed to meet the utmost demand it expects on the peak hour of the coldest winter day, and must resign itself to the fact that much of this capacity will be idle during the rest of the year and during most of every night. But the sharp step upward in the cost of installing each kilowatt of extra generating capacity—if it happens to be a nuclear power station as against a coal station—is sharpening the industry's desire to improve load factor on the whole of its huge capital employed. During the past year or two there has been much more discussion in British electricity circles of cheap rates for off-peak power, which might make more profitable use of plant now idle at night, deepening the base load of power stations that run more or less continuously.

An OEEC working party has just published a report upon the application of the marginal cost principle to electricity tariffs, which argues that this principle would justify, for example, the application of two or three different rates for different times of the day, and perhaps also for different seasons of the year. The group also surveyed the actual pricing policies of electricity undertakings, both nationalised and private, in ten OEEC countries: it found few except *Electricité de France* making much specific use of the marginal principle in devising tariffs, but most of them aware of the advantages of selling off-peak power cheap. For Britain, the then Central Electricity Authority argued that tariffs should be simple, should broadly reflect costs—"there is obviously room for varying opinion as to what extent off-peak consumers should pay a rent for the plant employed in the production of off-peak units"—and should be "promotional." This last feature of tariffs, which has generally been interpreted as "making the next unit cheaper," has been a ruling principle in electricity pricing throughout the industry's proud history of expansion: in the past, by developing ever new and diverse uses at different times of the day, it has tended to improve the utilisation of the electricity system. Pricing according to when the power is wanted—offering even more "promotional" rates at off-peak hours, but deliberately making power at peak hours—is foreign to the mind of many people in this industry, and repugnant to some. The actual difference in price between peak and off-peak times that can be justified by a precise allocation of costs between capital and running charges, moreover, has always been a matter of controversy in British electricity. Under the new dispensation which separates the generation and bulk transmission of power from its retail distribution in this country, the arguments seem likely to increase rather than abate.

STEEL

Looking Towards Luxemburg

Though it advised against joining the European Coal and Steel Community five years ago, and again thought that participation in the wider Common Market would have more disadvantages than benefits, the British steel industry has on balance supported British membership of a Free Trade Area. It holds that the determining factor is that Britain's steel-consuming industries should not be forced to compete inside Western European markets over tariff barriers that would not apply to Germany and its other competitors within such an area. But it is now urging, in its quarterly *Steel Review*, that if a Free Trade Area is established, arrangements for steel, so far as possible, should be on the same lines as those applying to other products, with as few special rules as possible. How would this alter the position of ECSC?

"The position of steel would not be so complex," the Federation observes, "if it had not been the guinea-pig on which the Common Market was tried out before any rules for industry generally had been worked out." It recognises the impressive progress in output, trade and investment in West European steel since the industries there became associated in ECSC—but also comments that this in any case was a time of boom, and for Germany in particular of recovery. It accepts that ECSC has opened up some natural "trade flows" and removed obstacles to growth, thus contributing to the vast expansion actually achieved. But experience in ECSC is not necessarily indicative of what would happen in a general Common Market if only because many of the elaborate rules, for example on prices, in the ECSC treaty have not been reproduced in the European Economic treaty.

The Coal and Steel Community itself has also given some indications lately that its views on the position of steel and coal in the Common Market or a Free Trade Area are flexible. Luxemburg would not expect the eleven OEEC countries outside the community to adopt all its formulæ. A recent speech by the Vice-President of the High Authority, however, suggests anxiety to put an end to direct and indirect subsidies by governments as well as to discrimination and dumping. And M. Spierenburg has expressed the hope that the Free Trade Area countries would be able to work out means of joint action with the community, in the event of a recession, "to preserve from disruption productive capacity required for normal conditions."

SICKNESS INSURANCE

Cover for Permanent Sickness

The half-dozen offices that offer permanent sickness and accident insurance are led by the Medical Sickness Annuity and Life Assurance Society, a mutual office catering exclusively for doctors and dentists. This society has now formed the Permanent Sickness Insurance Company to do business (on a proprietary basis) for other—largely professional—people. The new office, like its parent, will normally insure up to £50 a week and offers staff schemes as well as individual insurances.

Personal accident and sickness insurance can usually be discontinued by the office on any annual renewal date. Permanent sickness policies, however, bind the insurer to renew up to an agreed age (normally 65) or previous death. This commitment stands no matter how unprofitable the claims experience has been, so that underwriting has to be strict. Benefit is payable during complete incapacity through illness or through accident arising from the policyholder's ordinary occupation. Including receipts from National Insurance, the benefit is limited to three-quarters of normal earnings, which leaves the beneficiary reasonably well off, since receipts from voluntary sickness insurance are not taxed unless they extend for more than a full fiscal year. The lowest premiums charged by the new company are to self-employed accountants and lawyers; women pay rather more than men. A self-employed man of 35 pays about £35 a year, until he is 65, to insure a weekly benefit of £20 starting after four weeks' illness: if the benefit is deferred for twenty-six weeks' illness the premium is £22.

SHORTER NOTE

The line of a further 77 miles of the London-North West motorway has been confirmed, with a few minor changes, by the Minister of Transport—this is the stretch from the Preston by-pass south to what will be the by-pass at Stafford. Actual construction, the Ministry hopes, may start towards the end of 1959 or in 1960. But the middle stretch from Stafford to Birmingham has run into difficulties both in its location and from mining subsidence and the detailed route is being looked at again.

COMPANY AFFAIRS

PRUDENTIAL AND PEARL

Between them, the Prudential and the Pearl insurance companies hold over £1,150 million in assets, though the Pearl is now the third and not the second in size. Sheer bulk circumscribes their investment activity, and the most they can do in a threatening situation, as occurred when Bank rate was jacked up to 7 per cent, is to divert the flow of new money into such safety first holdings as Treasury bills or short term loans to local authorities. But whatever temporary precautions were taken at the height of last year's credit crisis, their 1957 balance sheets show little or no change in the established trend in both offices away from gilt-edged into debentures, mortgages, equities and property. This emerges more clearly in the Pearl, which reduced its stake in gilt-edged stocks both absolutely as well as proportionately, than in the "Pru" which added £12 million to its gilt-edged portfolio, compared with £14 million to its equity portfolio. Whether they have made any change in policy with the advent of a "bull" market in gilt-edged this year is naturally not yet apparent.

Both offices give an impressive display of strength. The market value of their assets was in the aggregate in excess of balance sheet values, after taking into account reserve funds of £34.7 million for the "Pru" and £9.9 million for the Pearl, though some of the separate investment groups of the portfolio may naturally show depreciation. Neither office increased its transfers to investment and contingency reserves nor were the stringent bases of the actuarial valuation of the liabilities eased, as with propriety they could have been.

The "Pru" has increased its bonuses on both ordinary and industrial policies and the Pearl is going to increase its bonuses on ordinary policies. The tax free dividends on the Prudential "A" £1 shares (which are to be split into five 4s. shares) were raised from 26s. 6d. to 29s. 6d. and from 3s. 6d. to 3s. 9d. on the "B" (£1, 4s. paid) paid shares, which are to be split into four 5s. shares (1s. paid). The tax free dividend on the Pearl ordinary shares was left unchanged at 70 per cent; these £1 shares have now been split into 5s. units.

CUNARD STEAM-SHIP

Few decisions taken by the directors of Cunard Steam-Ship Company could have been as unpleasant as postponing the building of a new liner needed to replace the twenty-eight years old "Britannic" on the North Atlantic passenger route. In that service, the chairman, Colonel D. H. Bates, shows, "the real weight" of Cunard's interests lies; to secure the custom of the "American holiday traveller" Cunard has to replace its old ships to keep on competitive terms with other shipping companies and with the air lines. Investment allowances of 40 per cent and liquid assets of over £20 million do not suggest that Cunard's replacement problem is impossibly big. But Colonel Bates explains the postponement by referring to last year's fall in the operating surplus from £8,419,874 to £6,230,030; the fall was big enough to prevent the company from obtaining the full cash relief in 1957 from investment allowances accruing from its current building programme. Indeed, the investment allowance relief came down last year from £802,476 to £248,600 and the unabsorbed allowance which is carried forward amounts to nearly £1 million.

What are the chances that the profit surplus will improve so that Cunard could gain the full benefit of investment allowances? Last year Cunard was hit by strikes in America and this country and it was a net loser in the aftermath of the Suez crisis, which added an extra £750,000 to its oil bill and which contributed to the drop of about £1 million in passenger revenue in the early months of the year. Freight rates have now fallen steeply and Colonel Bates says that Cunard's cargo earnings cannot be expected to give the same support as they did last year. But forward bookings for cruises and main passenger services are "promising" and granted international and industrial peace Colonel Bates is "moderately optimistic." For ordinary stockholders, whose dividend has been shaded from 11 to 10 per cent, that may be moderately encouraging news. But it is also important to them that Cunard should not fall behind in the competitive struggle for the North Atlantic passenger traffic. The £1 ordinary stock at 19s. 6d. yields £11 8s. per cent.

CEMENT PROFITS

Seven months ago the directors of Associated Portland Cement said that the indications were that the trading profits of the British companies in the Blue Circle group in 1957 would be "slightly lower" than in 1956. The

group's preliminary report now shows that last year the consolidated trading surplus rose from £13,672,157 to £14,627,419. It looks therefore as though the increase came from the group's overseas companies, which the directors in their interim report described as "making good progress." This inference finds support in the fall in the profits of the two British subsidiaries, British Portland Cement and Alpha Cement. British Portland's consolidated surplus fell from £3,994,631 to £3,852,877 and Alpha's trading surplus from £1,197,397 to £1,144,630 last year. The two subsidiaries are leaving the dividends on their £1 ordinary units unchanged, at 1s. 6d. and 7s. respectively. So, too, is the parent of the group, Associated Portland, with a repeated payment of 1s. 9.6d. per £1 unit (or 9 per cent); at 34s. 6d. the units yield £5 4s. per cent.

Thus the increase in the Associated Portland group's net profit from £3,798,467 to £4,618,589 has been used to bolster reserves and not to pay a better dividend. The reasons for that policy are not hard to find. They are, indeed, set out in the statement of Sir Halford Reddish, the chairman of one of Blue Circle's rivals, Rugby Portland Cement: "the falling trend [in the demand for cement] is of course continuing in 1958 and has been accompanied by a similar lessening of demand in some, though by no means all, overseas markets normally supplied from this country." Rugby Portland's works are not now producing to capacity, which adds to costs and reduces margins. Are Associated Portland's works in this country in a similar case?

UNITED MOLASSES

AFTER reporting that satisfactory profits had been earned in the first nine months of 1957 but that trading conditions had worsened, the directors of United Molasses said last November that the full year's results would justify dividends at the same rate as in 1956. The full year's tax free ordinary dividend is left unchanged at 1s. 5d. per 10s. unit (or 14⅛ per cent). But there is an unexpected bonus: the directors propose a special distribution from the capital reserve, not subject to income tax, of 4½d. per 10s. unit. United Molasses last made such a distribution in 1954 and there is no knowing whether it will reappear again. The 10s. units were marked up to 30s. 3d. on the announcement, but the yield calculated on the trading dividend alone is £8 3s. per cent. Despite the fall in freight rates last year, the dividend is backed by satisfactory profits. The group's trading profits have fallen by only £528,211 to £6,573,322 and net profits by only £127,815 to £2,180,275. Time charters may have stood this now predominantly shipping company in good stead last year, but presumably earnings now are less satisfactory.

ENGLISH SEWING COTTON

A FEW sums are needed to reveal the meaning of the preliminary statement of English Sewing Cotton for the year to December 31st. The group's trading profits fell from £3,022,634 to £2,909,495; within these totals the profits of the American subsidiary, American Thread, rose from £1,502,874 to £1,543,157. The 1957 profit of that subsidiary however includes a credit of £340,107 arising from a reduction in raw cotton stocks. On trading therefore the profits of the American subsidiary also fell—from about £1.5 million to £1.2 million. That result is not out of line with the experience of the American textile industry last year, as the results of Linen Thread which also has American subsidiaries have shown.

If the profits of American Thread are excluded it appears that the profits of English Sewing Cotton at home fell from £1,519,760 to £1,375,338, after writing £198,000 (against £27,000) off stocks, to bring them down to market prices. Purely on trading, the English side of the business appears to have held its own. The final result is that the group's net profits have come down from £764,831 to £626,153 and the ordinary dividend is left unchanged at 12½ per cent. At 24s. 4½d. the £1 units yield £10 14s. per cent.

London Stock Exchange

FIRST DEALINGS:	April 16	April 30	May 14
LAST DEALINGS:	April 29	May 13	June 3
ACCOUNT DAY:	May 6	May 20	June 10

BRITISH funds behaved uncertainly this week; small losses predominated at first, but these were followed by firmer conditions. The new Zealand issue slipped to a discount of a point in early dealings, but by Wednesday the stock recovered to ⅛ discount. The conversion offer had little effect on prices; 5½ per cent Exchequer 1966 improved ⅜ to 101⅛ and 5½ per cent Funding 1982-84 ⅜ to 99⅛.

Strike threats and industrial uncertainties led to falls in ordinary shares. The decline was halted at the start of the new account, when there was a steep rise in oil stocks and the general tone was better on Thursday. Building shares weakened at first and Wall Paper deferred fell back after the recent advance. Boots jumped 1s. 1½d. to 22s. and Beecham Group made an advance of 1s. 3d. to 34s. 3d. Aircraft producers suffered mixed fortunes; Handley Page lost 1s. 1½d. to 6s. 6d., but Bristol rose 4½d. on the joint venture with Hawker Siddeley though the latter's shares declined. De Havilland improved on the Comet order from Argentina. Finance shares were firm, Bowmaker rising 1s. 10½d. to 21s. 10½d. and Mercantile Credit 2s. 10½d. to 16s. 6d. ex all.

Oils, which were weak immediately after the Shell report, made large gains on Wednesday. Shell rose 11s. 3d. on balance to 145s., BP gained 8s. 9d. to 100s. 7½d., helped by the prospective scrip issue, and Burmah gained 5s. 7½d. to 76s. 3d. Among Kaffirs President Brand and President Steyn suffered only small losses on the announcement that new money will be raised. Lead and zinc mines tumbled on the reduction in dividends, but Central Provinces Manganese rose steeply on the increase in dividend. The sudden fall in the price of rubber caused widespread losses in rubber estate shares.

[1] This covers mining, manufacturing, electricity and manufactured gas with the following exceptions: Denmark excludes mining; Greece, mining and manufactured gas; Ireland and Sweden, electricity and manufactured gas; and Austria, manufactured gas. Germany excludes West Berlin. [2] Special trade (excluding re-exports) with the exception of Ireland which covers general trade with exports seasonally adjusted. Belgium includes Luxemburg. Italy includes Trieste. [3] New drachma introduced May 1, 1954 (1 new drachma = 1,000 old drachmas). [4] Thousand million drachmas. [5] Bizonal area. [6] Average for third quarter. [7] New series; original base 1954 = 100.

Financial Statistics

EXCHEQUER RETURNS

For the week ended April 26, 1958, there was an "above-line" deficit (after allowing for Sinking Funds) of £14,149,000 compared with a deficit of £59,958,000 in the previous week and a deficit of £16,568,000 in the corresponding period of last year. There was a net receipt "below-line" of £32,779,000, leaving a total deficit of £69,205,000 compared with £60,109,000 in 1957–58.

THE MONEY MARKET

THE discount houses made no further increase in their agreed bid at last week's Treasury bill tender, but outside applicants apparently paid a good deal more, since the average discount rate at which the £250 million of bills was allotted declined from £5 4s. 0.93d. to £5 3s. 6.97d. per cent and the market's "basic" proportion dropped from 49 to 40 per cent. Applications rose to £426.8 million, their highest since early December last. At yesterday's tender the amount offered was reduced to £220 million—still, however, £10 million beyond maturities.

Credit throughout the week has been kept on a tight rein. This, together with the maintenance of the market's tender bid, imparted a slightly firmer tone to bill rates. Before the tender, July dates and "hot" bills had changed hands at 5⅛ and 5⅜ per cent; whereas since then the minimum rate has been 5⅜ per cent, and at moments of money stringency at least one clearing bank has consistently tried to work at 5½ per cent—not, however, with conspicuous success. Discount houses have been "in the Bank" for seven-day money at Bank rate on three successive days—two or three of them for a small amount on each of the first two days, and three or four of them for a very small amount on Wednesday, when month-end pressure caused dislocation in spite of large aid from the special buyer. Rates in the market then ranged up to 5¼ per cent.

Suddenly I thought

"Who'd pay the bills for... my widow?"

"Since I can't be certain of living to a ripe old age, how *can* I be certain that, whatever happens, my wife and children will be looked after?"

So I did the sensible thing

I decided it was time I insured my life. And I did. It was as simple as that—so simple that I can't think why I put it off so long.

Luckily—or rather, sensibly—I went to The London Assurance, and really they couldn't have been more helpful. I was pretty vague about the whole business, but when they suggested a Life Policy that not only fits my present position but gives me something to build on in the future, also, I knew I'd come to the right people.

I certainly did the right thing when . . .

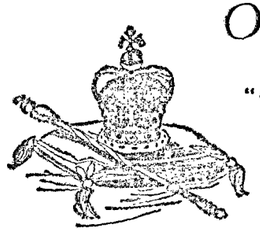
I wrote to

THE LONDON ASSURANCE

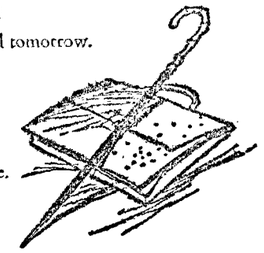
Since 1720

Very good people to deal with

Head Office: 1 KING WILLIAM STREET, LONDON, E.C.4



To get our useful booklet, "How to be Well Assured," simply write and ask for it. If you would also like information about Fire or Accident insurance, just say so.



Address your letter to:

PERSONAL ADVICE BUREAU (Room 16)

On the dearth of Immortals

"O, King, live for ever!" the people cry. But under present imperfect arrangements even kings never quite manage to bring this off. The people's chances aren't too bright, either. Crown and sceptre, umbrella and briefcase, all have to be laid aside in time. The analogy is not exact. National revenues, after all, go on. Private revenues are apt to dwindle and stop . . . Unless the breadwinner puts in his breadwinning to think: to think ahead to the day when, incredibly but inevitably, someone else will be going through the papers in his writing desk, his deed box, his office drawer marked "Private". To find what? With luck, a safeguard for the years to come. An assurance not only of income today, but capital tomorrow.

The SAFEGUARD POLICY means continuing security for your dependants when you are no longer on hand to see to it. It means material comfort for them in the future; spiritual comfort for you in the present. And all for a small additional premium to either Endowment or Whole Life Assurance.

Full particulars, with illustrations of how the SAFEGUARD POLICY *works, may be had from*

COMPANY MEETINGS

THE BRITISH PETROLEUM COMPANY LIMITED

OIL INDUSTRY NOW IN A PERIOD OF IMBALANCE AND ADJUSTMENT

SATISFACTORY RESULTS FOR 1957 DESPITE DIFFICULT TRADING CONDITIONS

1958 CAPITAL EXPENDITURE TO EXCEED £100 MILLION

SIR NEVILLE GASS'S STATEMENT

The forty-ninth Annual General Meeting of The British Petroleum Company Limited will be held on May 22nd at Britannic House, Finsbury Circus, London, E.C.2.

The following is the statement by the Chairman, Sir Neville Gass, KBE, MC, which has been circulated to Stockholders with the Report and Accounts for the year ended December 31, 1957:

Since our last meeting Sir Kenneth Harper has retired from the Board, of which he had been a member for eleven years. During that time we have derived much benefit from his wealth of experience gained from over forty years' association with the oil industry and his wise counsel will be missed at our meetings. He has been succeeded on the Board by Mr R. P. Smith, who is a Managing Director of The Burmah Oil Company and has been in the industry for more than thirty years.

The Board have appointed Mr H. E. Snow and the Honourable M. R. Bridgeman to be Deputy Chairmen.

Our Group Income Statement for the first six months of 1957, published in September last, showed net income one-third less than in the same period of 1956, because of the lower sales and higher expenses caused by the Suez crisis. For the whole year 1957, as forecast last December in the prospectus for our Convertible Debenture issue, Group sales tonnage and net income approximate closely to those for 1956, a satisfactory result considering that the adverse effects of the crisis had to be sustained for a longer period in 1957 than in 1956.

The international oil industry has in recent years been heavily engaged in expanding its facilities for production, refining, transportation and delivery to keep pace with continual and substantial increases in consumers' requirements. Because of the time needed to create these facilities, such development is a matter of long-term planning based on estimates of requirements some years ahead. Its momentum cannot be immediately arrested at any given point, so that periods of imbalance are likely to occur if the tempo of increase in consumption is unexpectedly retarded. The industry is currently in such a period. A combination of various factors has contributed to a slowing down of the growth of consumption, and consequent pressure of supply on demand has resulted in reductions in world prices for oil products and deteriorated trading conditions. While the degree of the current imbalance is such as to indicate the probable continuance of difficult trading conditions, we believe that the present period should be regarded as a phase of adjustment and does not imply a lessening of the important and expanding contribution to be made by oil to world energy supplies.

COMPANY'S 50th ANNIVERSARY NEXT YEAR

The first discovery of oil in Iran was made in 1908, an event which earlier this year was the subject of Jubilee celebrations in Iran, and in 1909 led to the formation of our Company, whose fiftieth anniversary occurs next year. From that beginning has developed the present huge oil production in the Middle East, at a rate now approaching 200,000,000 tons per annum and, given stable conditions to permit the free flow of international trade, confidently expected to continue to increase. Under their 50/50 profit-sharing agreements with the operating oil companies, the Governments of the countries from which this production is drawn benefit from very large revenues, now at a rate nearing £450,000,000 per annum. It is not always realised that in fact the oil companies have to reinvest most of their share in the development of the facilities and outlets on which the scale and continuance of production and revenues depend. The magnitude of investment so needed is such as to require fresh finance as well.

Because of the continuing heavy incidence of capital expenditure, it became necessary for us to seek further finance in 1957, and this was obtained by the issue of £41,000,000 6 per cent Convertible Debenture Stock at the end of the year.

The difficult trading conditions already referred to make it more than usually hazardous to attempt at this early stage to forecast how results from our 1958 operations may compare with those for last year. Having had no increase in sales tonnage in 1957 we are hoping for higher figures in 1958; for the twelve months ended 31st March, 1958, our sales amounted to over 57 million tons compared with 53 million tons in 1957. While prices this year have been depressed by the deterioration in trading conditions, we have in mitigation had relief from the exceptional expenses incurred last year, when we were involved in large and expensive oil purchases, in very heavy freight expenditure and in many other expenses inherent in the Suez dislocation. Thus there are factors which should bear favourably on this year's comparative results, but it is too early to say whether or not they may be outweighed by further depression in market conditions.

ACCOUNTS AND FINANCE

The Accounts of the Company which are now presented fall into three parts.

(1) The Balance Sheet of The British Petroleum Company Limited and the Consolidated Balance Sheet and Profit and Loss Account of The British Petroleum Company Limited and Subsidiary Companies, excluding those referred to in note 11 on page 10 (of the report).

(2) A Group Income Statement showing the income of The British Petroleum Company Limited and all Subsidiary Companies (excluding The Tanker Insurance Company, Limited) and the amount of the net income dealt with in the Consolidated Profit and Loss Account.

(3) The Accounts of The Tanker Insurance Company, Limited, which, owing to the nature of the business, cannot properly be incorporated in the Consolidated or Group figures.

CONSOLIDATED PROFIT AND LOSS ACCOUNT

The trading profit in the Consolidated Profit and Loss Account, after providing for depreciation and amounts written off, totals £113,947,431 for 1957 compared with £124,171,691 for 1956.

Depreciation and amounts written off total £30,268,330 compared with £25,202,874 for the year 1956, the increase being mainly in the amount written off exploration interests, due to increased expenditure in 1957 in searching for new sources of oil, and in the increased depreciation arising from the expenditure on the expansion of the Kent Refinery.

The decrease in trading profit prior to taking into account depreciation and other amounts written off was thus £5,158,804 although the sales tonnage was approximately the same as in 1956. This is mainly due to the heavy expenses incurred in the first half of the year as a result of the Suez crisis.

The total taxation is £67,611,925 of which £63,573,173 is overseas taxation arising mainly in Iran, Iraq, Kuwait, Qatar and Trinidad.

After providing for the amounts mentioned above, for debenture interest on the 5 per cent First Debenture Stock and after deducting the income applicable to the minority shareholders, the Consolidated Net Profit amounts to £52,018,461 compared with £53,014,561 for 1956.

Of the Consolidated Net Profit £5,748,850 is retained by subsidiary companies and £46,269,611 is dealt with in the accounts of The British Petroleum Company Limited.

In the Accounts of The British Petroleum Company Limited your Directors have placed £1,000,000 to Debenture Stock Reserve and allocated £30,000,000 to General Reserve, leaving, with the £7,176,943 brought forward from last year, £20,567,142 available for disposal.

The Preference Dividends, net, amount to £615,960 and the interim dividend of 1/-d. per £1 Ordinary Stock unit free of income tax was £5,052,521. Your Directors have recommended a final dividend on the Ordinary Stock of 2/-d. per £1 stock unit free of income tax, making a total for the year of 3/-d. per £1 stock unit free of income tax. They consider that no increase in dividend should now be paid in view of the disturbed conditions which have developed in the world oil markets.

This leaves £4,793,618 of unappropriated income to be carried forward in the accounts of The British Petroleum Company Limited which, together with the unappropriated

income of Subsidiary Companies, makes a total carry forward of £13,342,667 compared with £10,278,113 in the previous year.

CONSOLIDATED BALANCE SHEET

The Capital Reserve, which at the end of last year amounted to £38,462,162 has been increased during 1957 by £9,396,019. The increase is made up of £2,500,000, being the first of ten equal annual instalments received from the Government of Iran under the terms of the 1954 Agreement, and £6,896,019 being sums payable by the companies with whom we are associated in the operations in Iran.

The Revenue Reserves now total £151,549,632 having been increased this year by a total of £33,358,886 as follows:

	£
In The British Petroleum Company Limited :	
Allocation to General Reserve.....	30,000,000
Less: Reduction in the balance of Unappropriated Income	2,383,325
Total	27,616,675
In Consolidated Subsidiary Companies; Net increase in Reserves and Unappropriated Income	5,742,211
Total Increase	33,358,886

Your Directors recognise that Reserves have reached a level which calls for measures of capitalisation of reserves in part, and they contemplate recommending such action later in the year unless unforeseen conditions arise. The total capital expenditure for the Group was as follows:

	1957 £	1956 £
Exploration and Production	23,250,000	21,750,000
Refineries.....	38,500,000	22,000,000
Tankers	8,250,000	12,750,000
Distribution and Marketing Facilities	30,500,000	29,500,000
	100,500,000	86,000,000

Capital expenditure on tankers which prior to December 31, 1957, were sold after delivery to Tanker Charter Company Limited, has not been included in the above figures. These sales are under the £40 million tanker financing programme entered into in February, 1957, and fully reported in last year's Statement to Stockholders.

The amounts retained in the business in 1957 as shown in these Consolidated Accounts to meet capital expenditure and to provide working capital may be summarised as follows:

	1957 £	1956 £
Capital Reserve increase.	9,396,019	3,695,568
Revenue Reserves increase	33,358,886	36,277,291
Depreciation and amounts written off	30,269,330	25,202,874
Total	73,023,235	65,175,733
In addition there was received in 1957 from the 6% Convertible Debenture Issue	8,200,000	

In addition the non-consolidated Companies retained £15,811,000, consisting of depreciation £13,195,000 and profits £2,616,000.

The Investments in Subsidiary Companies not Consolidated show a decrease of £4,537,619 to a net total of £77,442,253. These Companies are engaged mainly in the distribution of petroleum products overseas and the decrease is accounted for by the consolidation this year for the first time of Trinidad Petroleum Development Company Limited which was included last year under this heading.

The Investments in Allied Companies include our refining interests in Belgium and Italy, advances to the Refining Company in Iran and holdings in The Lowland Tanker Company Limited, in British Hydrocarbon Chemicals Limited and in certain marketing companies which are not subsidiaries. These investments now stand at £44,999,440 an increase of £11,056,205 which represents mainly additional investment in marketing companies.

The heading Expenditure on Exploration and Production interests covers our investments in exploration and producing Companies including those in Canada, Iraq, Nigeria and Qatar and our advances to the Exploration and Producing Company in Iran. Our one-half interest in Kuwait is held by the subsidiary company BP (Kuwait) Limited, which is consolidated in these accounts and whose assets are, therefore, included under the appropriate headings in the Consolidated Balance Sheet.

Under the heading of Current Assets it will be noted that a considerable increase has taken place in Oil Stocks. This reflects mainly an increase in the quantity, the shipping position having enabled us to build up stocks to higher levels.

GROUP INCOME STATEMENT

The Group Income Statement for the year showing the summarised trading figures of The British Petroleum Company Limited and all Subsidiary Companies appears on page 13 of the report and accounts. The net income for the year 1957 is £54,634,000 (compared with a corresponding figure of £56,194,000 for 1956) of which £52,018,000 is dealt with in the Consolidated Profit and Loss Account, and £2,716,000 relates to subsidiary companies which are not included in the Consolidated Accounts.

GENERAL

In December, 1957, the Company issued £41 million 6 per cent Convertible Debenture Stock which, after deducting the expenses of the issue, provides the Company with just under £40 million additional finance of which £8,200,000 was received in 1957.

Contracts for Capital Expenditure at the end of the year were estimated at £131,300,000. £119 million of this commitment relates to shipping on order for delivery over the next five years including contracts for tankers which will be financed under the £40 million Tanker Charter Company arrangements of which £27,500,000 remained to be taken up at December 31, 1957.

The Capital Expenditure of the Company and its Consolidated Subsidiaries is expected in 1958 to exceed again the £100 million level, necessitating the retention in the business of a substantial proportion of the earnings.

PRODUCTION AND EXPLORATION

In 1957 our main sources of crude oil were again Kuwait, Iran, Iraq and Qatar, from which we obtained some 48,700,000 tons. By reason of the Suez crisis this was about 1 million tons less than in 1956 but still some 3 million tons more than in 1955, the last normal year.

In Kuwait there has been further development of the Burgan fields ; good progress has been made with appraisal drilling at Raudhatain in North Kuwait and the stage has been reached when the installation of production facilities there is considered to be justified. Construction was commenced on a new oil loading jetty one mile north of the existing jetty at Ahmadi capable of handling the largest tankers.

In Iran production increased to 34,765,000 tons, the highest total yet reached in that country, and exploration and development continued in the Consortium agreement area. Large-scale projects are now in hand to expand productive capacity in both the Gach Saran and Agha Jari fields where further drilling has indicated substantial increases in proved reserves. From Gach Saran another pipeline is to be built to a new loading port to be constructed on Kharg Island, and equipped to handle the largest tankers. The pipeline capacity from Agha Jari is to be increased by construction of a loop-line to the Bandar Mashur tanker terminal where two new jetties are being added to the four already existing. Apart from the additional production and ancillary plant which these developments entail, plans include the necessary additional housing and welfare facilities.

In Iraq, following the destruction of pumping stations in Syria in November 1956, pumping through the Iraq Petroleum Company's pipelines from Kirkuk and Mosul to the Mediterranean did not recommence until March 11, 1957, and then at a reduced rate. Production from North Iraq was accordingly lower than for some years. In South Iraq production from the Basrah fields, which were unaffected, increased to 9,140,000 tons.

In the United Kingdom, production of crude oil rose from 66,000 tons to 82,000 tons due to continued development of the Eggarton field. Our exploration programme continued throughout the year, mainly in the E. Midlands, and resulted in the discovery of a new oilfield at Langar in Nottinghamshire. Early in 1958, a further oil discovery was made at Bothamsall, also in Notts. Our exploration programme on behalf of the Gas Council was suspended throughout the year, but several minor gas discoveries were made in the course of our drilling for oil and have been offered to the Gas Council for development, in accordance with the terms of our agreement with them.

LOSSES ON SHALE OPERATIONS

Shale oil production in Scotland at 71,000 tons was lower by 6,500 tons than in 1956. As mentioned to you in previous statements, the losses incurred on our shale operations have already necessitated measures of curtailment, but with rising costs, mainly in wages and also for coal, further operating losses have been sustained. After full consideration of representations made jointly by the Company and its employees' Union for an increase in the duty preference, at present 1s. 3d. per gallon, on motor fuels produced from shale oil, the Government was unable to accede to this request and, as recently announced it has unfortunately become necessary further to curtail operations by discontinuing working the poorer seams. We hope that the economies so effected will enable the industry to continue in operation, though on a smaller scale, for a considerable period.

In Canada, Triad Oil Co. Ltd.'s output increased in 1957 despite considerable curtailment of Alberta's production due to restricted markets for Canadian oil. This increase does not fully reflect the increase in potential production which should make itself felt as the outlets for Canadian oil improve. Triad is continuing with its programme of long term evaluation of its holdings and three useful gas discoveries were made in the Central Foothills.

In Trinidad there was a further increase in production from the Soldado field of Trinidad Northern Areas, in which we have a one-third interest. The Trinidad Petroleum Development Company also increased its production.

The property of The Anglo-Egyptian Oilfields Ltd. which was sequestrated in November, 1956, remained throughout the year in the hands of the Egyptian authorities, who continue to operate its fields and refinery.

In Papua drilling under most difficult conditions has continued, two wells being completed and two more begun ; though they have given further evidence of natural gas none of them has proved the presence of an oilfield. In these circumstances we and our partners are taking careful stock of the position, as continuance of this enterprise will largely depend on the results of the wells now drilling.

In Australia, despite widespread effort by many companies, no commercial oilfield has yet been discovered. Last year we participated in drilling one well in Queensland ; we also continued our work of geological and geophysical surveys in parts of Queensland, New South Wales, Victoria and South Australia.

In the North Island of New Zealand geological and geophysical surveys continued throughout the year.

In East Africa core-hole information drilling was carried out in south Tanganyika and drilling a deep test well at Mandawa has begun.

NIGERIAN OIL PROSPECTS

In Nigeria the prospects of commercial oil production have been greatly enhanced by two further discoveries at Afam and Soku ; the first cargo of oil was exported from Nigeria in February, 1958. Appraisal drilling at both Oloibiri and Afam was continued. To enable prolonged test production to be carried out a pipeline has been built linking the latter field to an export terminal at Port Harcourt and a similar pipeline from Oloibiri is under construction.

In Malta, after protracted negotiation, the Government recently granted us petroleum exploration and development rights.

In Sicily, two further wells drilled by us failed to find oil ; experimental production from the accumulation of very heavy asphaltic oil already discovered is in progress.

In Libya we have increased our concessional holdings and test drilling, as well as geological and geophysical survey work, is being carried out.

Our participation in exploration in France and the French Union has continued in the Rhone Valley and Normandy and has been extended to S.W. France. In the Algerian Sahara, where important discoveries have been made, applications have been filed for exploration permits ; the first of these, covering an area of some 1,800 square miles in the Touggourt area, was granted in February, 1958.

In West Africa geophysical surveys were carried out in Senegal and the adjoining British colony of Gambia where we hold prospecting rights in association with French interests. A location for an initial test well was selected in the former territory and drilling began in January, 1958.

In Austria we have entered into an association with the Osterreich Mineralol Verwaltung, for the exploration of certain areas in lower Austria.

In Germany, BP Benzin und Petroleum A.G. has acquired as a wholly owned subsidiary Gewerkschaft Norddeutschland, through which it now holds an interest in the exploration and development of production areas in North-west Germany.

Abu Dhabi Marine Areas Ltd., in which we have a two-thirds interest, began drilling its first off-shore well in the Persian Gulf in January, 1958. This well had reached a depth of 5,800 ft. by April 14, 1958.

At no time has so great and costly an effort been devoted, throughout the world, to the discovery of further reserves of crude oil. In this effort as the foregoing review shows, your company is continuing to play its part.

The following table shows the BP Group's percentage shareholding in companies producing crude oil in various parts of the world and the total production by each company in 1957 compared with 1956.

Company	BP Group Shareholding Per cent	Total crude oil production 1957 Tons	1956 Tons
KUWAIT			
Kuwait Oil Company Ltd.	50	56,376,000	54,117,000
IRAN			
Iranse Aardolie Exploratie en Productie Maatschappij N.V. (through Iranian Oil Participants Ltd.)	40	34,765,000	25,934,000
IRAQ			
Iraq Petroleum Company Ltd.	23¾	11,657,000	21,086,000
Basrah Petroleum Co. Ltd.	23¾	9,140,000	8,439,000
Mosul Petroleum Co. Ltd.	23¾	564,000	1,078,000
QATAR			
Qatar Petroleum Company Ltd.	23¾	6,505,000	5,784,000

Triad Oil Co. Ltd.	42	94,000	77,000
GERMANY			
Gerwerkschaft Norddeutschland	100	3,900	2,600

REFINING

During the early part of 1957 BP Group refinery throughputs and also our processing arrangements at other refineries were seriously affected by the dislocation in crude oil supplies caused by the closing of the Suez Canal and interruptions to the Iraq Petroleum Company's pipeline deliveries to the Mediterranean. In the circumstances it is satisfactory to record that our total throughput for the year of 32,100,000 tons was only 400,000 tons less than in 1956.

Whilst there was little change in the total there were, however, considerable variations in the different areas, the refineries west of Suez suffering a reduction with an almost corresponding increase east of Suez.

In the United Kingdom there was a comparatively severe decrease and the quantity of crude processed at our four refineries (Kent, Llandarcy, Grangemouth and Pumpherston) was only 7,600,000 tons compared with 8,900,000 tons in 1956.

Construction work on the major expansion scheme at Kent refinery is nearing completion and the new units are being progressively brought into operation. The distillation unit to raise the capacity of the refinery to 7,100,000 tons per annum was commissioned in March, 1958, and also the hydrofiner for the production of high quality gas oil. The units for the manufacture of aviation spirit and the catalytic reformer for the production of additional high grade motor spirit will start operation later this year.

The capacity of Grangemouth refinery is to be increased from 2,200,000 to 3,200,000 tons per annum by the erection of a new distillation unit and ancillary equipment which should be commissioned early in 1959 ; construction work on the new terminal facilities for the largest tankers at Finnart, whence crude oil is piped to the refinery, is expected to be completed in September. Work has begun at Angle Bay in Milford Haven on similar facilities for supplying Llandarcy refinery.

In the Republic of Ireland construction of a refinery near Cork to meet that market's requirements, in which we are associated with other oil companies, began in August, 1957, and is expected to be completed in mid-1959.

On the continent of Europe our throughputs were also reduced, crude oil processed at the six BP Group refineries amounting to 8,300,000 tons compared with 9,500,000 tons in 1956.

The new distillation unit at Lavera, near Marseilles, was commissioned in December and modifications to the existing units at Antwerp and Hamburg were also completed during the year. As a result the capacities of Lavera and Antwerp refineries have each been raised to nearly 4 million tons per annum and Hamburg to 1,900,000 tons. The hydrofiner (for refining gas oil) under construction at Hamburg has been commissioned and good progress has been made on the hydrofiner at Antwerp and catalytic reformers (for high octane motor spirit production) at Antwerp and Dunkirk, all of which are expected to come into operation about the middle of this year. In addition, a plant is under construction at Hamburg for the production of butane for sale as a petro-chemical feedstock. The planning stage of our new refinery in the Ruhr, whose capacity is to be 4 million tons per annum, is almost complete and construction should begin shortly.

At the Aden refinery throughput was 4,240,000 tons as compared with 4,615,000 tons in the previous year.

At Kuwait throughput was 1,352,000 tons. New units, raising the distillation capacity to 8,400,000 tons per year, were completed early in 1958.

In Australia throughput of our Kwinana refinery was 2,287,000 tons compared with 2,304,000 tons in 1956. A start has been made on the erection of a second catalytic reformer for the manufacture of additional high grade motor spirit.

In Iran the quantity of crude oil processed for us at Abadan was 5,800,000 tons compared with the 4 million tons in 1956, this substantial increase compensating to a large extent for reductions elsewhere.

SITE FOR REFINERY IN CANADA

In Canada a site has been purchased at Ville d'Anjou, Montreal, for our projected refinery, and arrangements are being made with the Canadian National Harbour Board for the construction of a tanker jetty on the St. Lawrence river. Detailed plans for the refinery are under preparation, and pending finalisation of the complete project, a proportion of its tankage and associated facilities

are being installed to permit the importation of products as a temporary measure to supply our Canadian marketing subsidiary.

In Turkey we are associated with other oil companies in plans for the construction of a refinery with a capacity of about 3 million tons per annum.

The following table shows the BP Group's percentage shareholding in companies with refineries in various parts of the world and the total throughput of each refinery in 1957 compared with 1956.

Company	Refinery location	BP Group Share-holding per cent.	Total throughput 1957 Tons	Total throughput 1956 Tons
UNITED KINGDOM				
BP Refinery (Grangemouth) Ltd.	Grangemouth	100	1,881,000	2,152,000
BP Refinery (Kent) Ltd.	Isle of Grain	100	3,275,000	3,854,000
BP Refinery (Llandarcy) Ltd.	Llandarcy	100	2,311,000	2,777,000
Scottish Oils Ltd.	Pumpherston	100	151,000	143,000
ADEN				
BP Refinery (Aden) Ltd.	Aden	100	4,240,000	4,615,000
AUSTRALIA

LEBANON				
Iraq Petroleum Company Ltd.	Tripoli	23¾	495,000	505,000

PETROLEUM CHEMICALS

Major expansion in the Group's activities for the manufacture of chemicals from petroleum in the United Kingdom, France and Germany took place during the year.

In the United Kingdom, the three companies in which BP participates have operated very satisfactorily with all manufacturing units maintaining a high output of intermediate petroleum chemicals. These companies, all at Grangemouth, are British Hydrocarbon Chemicals Ltd. (in which BP has a half interest), Forth Chemicals Ltd. and Grange Chemicals Ltd. (in both of which BHC has a two-thirds interest). Plants for the production of phenol and acetone using The Distillers Company process are under construction by BHC. Several plants employing this process are in successful operation elsewhere but this is the first of its kind in the United Kingdom. BHC also have a plant under construction for the manufacture of linear polyethylene of improved physical characteristics using the newly developed Phillips low pressure catalytic process. These units are expected to be completed in 1959 at a cost of about £8 million. A further expansion of ethylene production at BHC is being considered.

When plants now being built are completed, the production of chemicals at Grangemouth will approach 200,000 tons per annum and in addition to the products mentioned above, will include large tonnages of industrial alcohol, isopropyl alcohol, monomeric styrene, butadiene, propylene tetramer and detergent alkylate.

In addition to the three companies in which BP participates, Gemec Ltd., a subsidiary of Union Carbide Ltd., has recently commissioned a plant at Grangemouth to produce 12,000 tons per annum of polyethylene using ethylene purchased from BHC.

Our French associate, Société Française des Pétroles BP, has a substantial holding in Naphtachimie whose chemical works are near Lavera refinery. The capacity of the cracking plant at Naphtachimie was enlarged during 1957 and its production of ethylene increased from 10,000 to 18,000 tons per annum. The production of polyethylene using the Ziegler low pressure process will start shortly and extensions are in hand which will include increasing the ethylene production capacity to 48,000 tons per annum. Total production of chemicals is then expected to reach 80,000 tons per annum. These include ethylene oxide and its derivatives such as glycols, ethanolamines and glycol ethers, and also acetone and isopropyl alcohol. The expansion now in hand is expected to cost £16 million.

A joint company (Erdölchemie GmbH) has been formed by our subsidiary company in Germany, BP Benzin und Petroleum AG, and Farbenfabriken Bayer of Leverkusen to manufacture intermediate petroleum chemicals. Present plans call for an expenditure by Erdölchemie of about £25 million, over a period of four years and each partner will have a 50 per cent participation. The site of the new company's operations will be adjacent to the Bayer works at Dormagen, Cologne; some production units are already under construction. About 250,000 tons per annum of petroleum feedstock will be required by Erdölchemie and this will, in due course, be supplied from the new BP refinery to be built in the Ruhr.

SEA TRANSPORT

At the end of 1957 BP Group tankers, comprising the fleets of BP Tanker Company, Tanker Charter Company, and Société Maritime des Pétroles BP, totalled 157 ships (2,411,000 deadweight tons), compared with 154 ships (2,227,000 deadweight tons) at the end of 1956. The Group also had over 3 million deadweight tons of tanker shipping on charter, approximately the same as a year previously.

BP Tanker Company's fleet is now 133 ships (1,920,000 deadweight tons), compared with 143 ships (2,016,000 deadweight tons) at this time last year. Owing to the very large size of the fleet under that Company's operational management, in the interests of

administrative efficiency we have arranged for the operation of part of its fleet to be transferred to BP Clyde Tanker Company Limited (as our subsidiary the Petroleum Steamship Company Limited has been renamed). Seven vessels have already been so transferred and others will follow later. The present position as regards these ships, and also those financed to date by Tanker Charter Company Ltd. (as described last year) which operate as part of our fleet, is as follows:

BP Tanker Co. Ltd.
133 ships (1,920,000 dw tons)
BP Clyde Tanker Co. Ltd.
7 ships (90,000 dw tons)
Tanker Charter Co. Ltd.
9 ships (255,000 dw tons).

We have 55 tankers under construction or on order for delivery over the next five years for these companies; they comprise 7 ships of 65,000 deadweight tons each, 12 of 50,000 tons, 7 of 42,000 tons, 15 of 34,500 tons and 14 of 15,500 tons. Through our marketing subsidiary in Denmark we have made a partnership arrangement with East Asiatic Company Ltd., of Copenhagen, whereby the construction of two further tankers of 34,500 deadweight tons each already on order for us in this country will be mainly financed in Denmark.

Our French associated company's shipping affiliate, Société Maritime des Pétroles BP, has now 10 ships totalling 209,000 deadweight tons. It has also on order 1 ship of 33,000 deadweight tons due to be commissioned shortly, 2 of 47,000 tons each and 1 of 68,500 tons for delivery between 1960 and 1963.

The 10 ships each of 16,000 tons belonging to The Lowland Tanker Company, in which we have a 50 per cent interest, continue to give us excellent service and as previously announced will be joined in 1960-61 by five others each of about 19,000 tons.

Tanker freights, which before the reopening of the Suez Canal had reached record high levels, subsequently declined steeply, the diminished rate of growth in oil demand and the increase in available tonnage accelerating their downward trend. There was no seasonal recovery in the winter months and the freight market has remained depressed.

World tanker tonnage is currently surplus to requirements and we, like other companies, have some tonnage withdrawn from service. We are also routing some of our larger ships to and from the Persian Gulf via the Cape.

The re-routing of our tanker traffic due to the Suez crisis laid an extra burden on the personnel concerned on ship and ashore, and to them special credit is due.

DISTRIBUTION AND SALES

The BP Group's sales of crude oil and refined products in 1957 totalled, as in 1956, approximately 53 million tons; a reduction in the first half of the year, due to the effects of Suez, was made good during the second half of the year.

Crude oil prices throughout the USA, Canada and the Caribbean were increased at the beginning of the year by, generally, 25 cents per barrel, although with somewhat higher advances for certain qualities and locations. This increase, the first since 1953, was not unexpected and was by many producers in the Western Hemisphere considered long overdue. It was not until May that, with the reopening of the Suez Canal and the return to more normal patterns of trade, Middle East crude prices could be adjusted, and they were then increased by 13 to 15 cents per barrel. Throughout the remainder of the year crude oil prices broadly remained unchanged at these levels.

Product prices at the sources of supply in the Western Hemisphere varied a great deal during the year. They were carried to high levels in the early part of the year as a result of the extra demand on these sources due to the enforced change from the normal transportation pattern. By the end of the year, progressively easier supply conditions had brought a marked downward trend in product prices in all the main supply centres. In May, with the return to more normal conditions, we initiated the posting of product prices in the Persian Gulf.

In the United Kingdom consumption of petroleum products, severely curtailed in the early months of the year by the motor fuel rationing schemes and other restrictions in force from December, 1956, to May, 1957, showed a decrease of 2¼ per cent in 1957 compared with an increase of 8¼ per cent in 1956. Motor spirit consumption, which in the first four months of the year was restricted to 23 per cent below the 1956 level, recovered in the later months of the year. Fuel oil consumption, which was affected not only by restrictions due to the Suez crisis but also by improved coal supplies, nevertheless showed an increase of 7 per cent over 1956. Our associated marketing company, Shell-Mex and B.P. Limited, maintained their leading position in the market, their sales showing only a small decrease in line with the decrease in consumption.

Our trade on the continent of Europe was also affected by supply difficulties and restrictions on consumption, and for the year our deliveries fell short of the 1956 level by some 7 per cent.

East of Suez our markets were not subject to the same restrictions. Our marketing company in Australia, which last year changed its name from The Commonwealth Oil Refineries Limited to BP Australia Limited, had a successful year's trading and achieved an increased share of the market.

In New Zealand the development of BP (New Zealand) Limited's plans to expand its organisation made good progress, and its share of the market increased.

Our marketing associates' sales in South Africa, East Africa, India and Pakistan have continued to expand.

We have, however, lost our former outlet in Egypt where our interests remain sequestrated by the Government.

As announced in the Press on April 2, 1958, we have disposed of our associated marketing company in Israel, in which we had a 50 per cent interest.

In Canada BP Canada Limited opened its first service station to the public in May, and since then has continued to expand its activities in the highly competitive Canadian market where its appearance as a marketer has had an encouraging reception.

Since early in 1958 our products have been available under our trade mark in the Belgian Congo, where we have formed a marketing company called the Société des Pétroles BP du Congo; the area in which this has commenced its activities is in the Eastern Congo in the territory of Ruanda Urundi.

OIL BUNKERING AND AVIATION SERVICES

The BP International Oil Bunkering Service was also considerably affected in the early months of the year by the Suez emergency and in the latter part of the year by a slackening in world shipping activity. Despite this our bunker sales reached a level equivalent to the average of the preceding two record years.

The BP Aviation Service has further extended its field of operations and our sales of aviation fuels have continued to increase. We are continuing our research into new techniques for aircraft fuelling and in developing special equipment to deal with the demands of jet aircraft traffic in the near future.

The demand for BP Energol branded lubricants continues to increase.

Our bitumen trade, particularly in Europe, was seriously disturbed during the early part of the year but has subsequently made a good recovery.

We have recently concluded agreements with two refining and marketing concerns in Italy to acquire their market networks. From these we intend to develop an organisation marketing BP products in Italy, where hitherto we have not sold to the general public under our own trade mark.

In North Africa we have acquired an independent marketing organisation in Algeria which will assist in developing our existing business.

In West Africa our trade has continued to expand, as also our share in the market.

We have formed a new wholly owned subsidiary BP (Eastern Agencies) Limited, to conduct the marketing of BP products and the BP Aviation Service in the Persian Gulf.

As reported last year, both the Commonwealth Trans-Antarctic Expedition and its New Zealand contingent, were exclusively supplied with BP petroleum products. We are proud of having contributed to the historic achievements of Dr Fuchs and Sir Edmund Hillary, and that the party which made the first land-crossing of the Antarctic included one of BP's geophysical staff. The Australian National Antarctic Research Expedition has also been exclusively supplied with BP products.

In the field of motor racing every Formula I Grand Prix race counting for the world Championship in 1957 was won on BP products. This is a remarkable achievement unequalled hitherto. Among leading drivers who regularly use our products are Fangio, present World Champion, Stirling Moss, the runner-up and Jean Behra, the French Champion.

RESEARCH

Both the major new buildings at Sunbury Research Centre mentioned in last year's statement have been completed and occupied. The first of these provides increased facilities for geophysical, petroleum engineering, and geological research, and includes accommodation for the staff and equipment transferred from Kirklington Hall, which has been vacated and sold. The second building is most comprehensively equipped for analytical research, applied physics, chemical engineering and development of new instruments.

A linear electronic accelerator, required as part of the programme of work on the possible application of radioactive by-products from nuclear power to petroleum and chemical processes, has been installed at Sunbury and is now operating.

As in previous years we have continued to study and improve our manufacturing methods, particularly with regard to the production of motor spirit and lubricants. Investigations are in hand to determine the optimum quality fuels which will be required for motor car engines of increasingly high compression ratio. We are also expanding the range of our lubricant products, and the many motor racing successes which have been obtained using BP Energol lubricants testify to the success of our research in this field.

A considerable effort has been made at the Research Centre in recent years to get more accurate and quicker measurement of wear in engines. The latest success resulting from these investigations is a new lubricant, which considerably reduces wear, for large marine diesel engines. This lubricant, BP 103, has been placed on the market following successful trials in our own tankers and other vessels.

In petroleum engineering, studies have been completed of two major reservoirs of the Middle East type, and valuable research has been undertaken in the study of mechanisms by which oil is recovered from its reservoir. Geophysical research on seismic wave propagation has progressed satisfactorily, and useful advances have been made in the design of instruments both for geophysical and petroleum engineering work.

The electronic computer referred to in last year's statement is now in operation and is proving of great value in reducing the time required for repetitive calculations for development and research work.

PERSONNEL

The BP Group has remained practically free from labour disputes, both in the United Kingdom and in the thirty-five other countries where its employees are working. This may fairly be attributed to the good relations which exist, and which it has long been our aim to maintain, between our managements and employees both as individuals and collectively.

Throughout the world we continue to devote particular attention to the training and advancement of nationals of the countries in which we operate. In this respect we are putting much emphasis on internationalising our training; not only do many British staff now have periods of training abroad but nationals of the countries in which we operate are increasingly serving for periods in this country. This is of direct value to us as an international group and also contributes to the general cause of international understanding.

Recently the Carr Committee recommended an increase in the number of apprentices in British industry and an improvement in their training. Having some years ago appreciated the situation outlined by this committee, the number of our apprentices under training in the United Kingdom has been increasing steadily during the last few years and the quality of their training is maintained at a high standard. With training are combined opportunities for employees to make the best use of their talents, and exchanges of staff between our different centres of activities provide an aspect of career planning of benefit both to the BP Group and to the employees concerned.

We have started to hold selection boards for the recruitment of regular members of the Forces whose Service engagements are terminating.

It is much more than a convention that this statement should end with an expression of thanks to the Group's personnel, for the success of our operations is principally due to the enthusiasm and ability of the whole body of our employees. I am sure, therefore, that you would wish me on your behalf to record our high appreciation of their work wherever they may be.

THE RUGBY PORTLAND CEMENT

RECORD PROFITS

SIR HALFORD REDDISH'S REVIEW

The Annual General Meeting of The Rugby Portland Cement Company Limited will be held on May 30, 1958.

The following are extracts from the speech of Sir Halford Reddish, the Chairman:

I view the long-term outlook for our interests in the United Kingdom with much more optimism that I have felt for some years. I say that because I believe that at long last our political leaders are showing real determination to tackle our two major inter-related problems: maintenance of the external value of sterling and the stability of the internal value of the £, or, in other words, halting inflation.

At home the building and constructional industries have naturally been affected by the restriction of credit, with a consequential fall, intensified as the year went on, in the demand for cement. Although the cement industry in the United Kingdom has always made every effort to keep the price of cement to the consumer as low as possible consistent with maintenance of the industry in a sound financial position, up-to-date and efficient, and able to compete effectively in world markets, an increase in the price of coal and other costs last year made an adjustment of selling prices on July 1st unavoidable. The rise in the delivered price of cement averaged just under 7s. a ton, but did not fully cover increased costs.

The profits of the parent company from the manufacture and sale of cement therefore showed some contraction in 1957, but the profits of our subsidiary companies as a whole, from cement and from other activities, showed an increase. The Group net profit of £1,106,385 is slightly ahead of that for 1956 and is a record for the twelfth successive year. In the circumstances of a difficult year this must be regarded as reasonably satisfactory.

DIVIDENDS MAINTAINED

We have decided to recommend to you that the dividends on the Ordinary and "A" shares should be at the same rates as last year: 1s. 1½d. a share on the Ordinary shares and 1s. 3d. a share on the "A" shares.

A dividend on the Ordinary shares of 1s. 1½d. a share is in reality one of 5.84 per cent on the book value of the equity capital employed in the business. This compares with 6.36 per cent for the previous year, which illustrates the fact that a mere maintenance of the amount of 1s. 1½d. a share is a reduction of the rate per cent on the capital employed for the simple reason that the holders of the Ordinary shares added to their investment in the company by leaving a substantial portion of their profits in the business. If the present-day value of the assets were substituted, the real rate of dividend for 1957 would be about 3.4 per cent.

An active building and constructional industry is the backbone of a sound national economy. Most sections of the building materials industry today are producing below capacity, but they should be amongst the first to participate in the forward surge of an expanding economy which I feel sure will soon follow when inflation has been halted.

Copies of the full speech may be obtained on application to the Secretary, Crown House, Rugby.

COMMERCIAL UNION ASSURANCE COMPANY LIMITED

PROGRESS IN A DIFFICULT YEAR

LIEUTENANT COLONEL JOHN LESLIE'S REVIEW OF OPERATIONS

The Annual General Meeting of the Commercial Union Assurance Company Limited will be held on May 19th in London.

The following are extracts from the circulated review by Lieutenant Colonel John Leslie, DSO, MC, DL, the chairman:

In many respects 1957 closely resembled its predecessor and I can say without hesitation that we have again passed through a difficult and arduous period.

Most of our difficulties arose in North America, where the fire and casualty results were particularly adverse, and, although we made an overall underwriting profit in most other territories, this was sufficient to offset the losses in North America by only a small margin.

Fire Department.—Net Premium Income, 1957, £24,870,686 (1956, £23,632,462); increase £1,238,224.

The ratio of claims paid and outstanding was 54.20 per cent, commission absorbed 21.15 per cent, and expenses of management accounted for 22.02 per cent. After adjustment of the provision for unexpired risks there was an underwriting profit of £160,012 (.64 per cent), which has been left in the fire revenue account, to strengthen the fire fund, which now amounts to £22,137,981, or 89.01 per cent of the premium income

At home the development of income continues steadily. The ratio of losses to premiums is satisfactory and shows a slight improvement on the previous year.

In the overseas field the premium income continues to expand and it is satisfactory to know that the majority of the territories in which we operate have contributed towards this improvement.

Accident Department.—Net Premium Income, 1957, £36,066,629 (1956, £31,854,452); increase £4,212,177.

The ratio of claims paid and outstanding was 61.06 per cent, commission 17.36 per cent, and expenses of management 18.57 per cent. After adjustment of the provision for unexpired risks there remained an underwriting loss of £599,595, or 1.66 per cent of the premium income. The sum of £650,000 has been transferred from profit and loss account and the accident fund now amounts to £22,594,089, or 62.65 per cent of the premium income.

The home revenue once more showed satisfactory progress and the expansion seen throughout the postwar years continued at an accelerated pace.

Too often in recent years it has been necessary to refer to unprofitable results in the home motor account, but the position last year was somewhat healthier and this is mainly due to the increase in premium rates which insurers were obliged to bring into effect during the year.

In the United States of America our casualty business, conducted by our associated offices, The Ocean Accident and Guarantee Corporation Limited and the Columbia Casualty Company, has continued to expand generally.

Marine Department.—Net Premium Income, 1957, £3,155,498 (1956, £2,682,215); increase, £473,283.

The claims paid after deduction of reinsurance and salvage amounted to £2,276,357, and, out of the surplus of the 1955 underwriting year and previous years now closed, the sum of £450,000 has been transferred to profit and loss account.

The year 1957 brought no noticeable improvement in the casualty experience, and the hull account for 1957 shows that the first year's settlements were higher than last year's record figure.

Life Department.—After a temporary setback last year, the Life Department production has resumed its upward course, and the totals of both Life Assurances (£24,148,629, an increase of £2,127,196) and Annuities (£1,509,184, an increase of £521,900) constitute new records.

During the year the life fund increased by £2,937,218 to £60,198,483, after providing a further £2,670,000 in addition to the sum of £2,250,000 held at the beginning of the year to cover depreciation in the value of investments and properties. The average earned rate of interest was £4 4s. 8d. per cent net, an improvement of 8s. 4d. per cent on the previous year's figure.

Before providing for the further depreciation of investments the life fund exceeded the total liabilities by £6,832,784, and in addition £354,320 was paid to policyholders during the quinquennium by way of interim bonuses. The directors have decided to dispose of this balance as follows: £2,670,000 as provision for depreciation of investments, £3,134,579 to be distributed to holders of participating policies, £387,655 to stockholders, £300,000 to be carried forward against special contingencies in the valuation reserve, and £340,550 to be carried forward unallocated.

The policyholders' share will provide a compound reversionary bonus for new series participating policies of 50s. per cent per annum and in respect of policies under the old series (which was closed to new entrants on December 31, 1939), a reversionary bonus corresponding to a minimum cash bonus of 40 per cent of the whole term premiums paid or deemed to have been paid during the quinquennium.

These rates of bonuses are the highest in the Company's history.

* *

PROFIT AND LOSS ACCOUNT AND BALANCE-SHEET

Gross interest, dividends and rents amount to £4,104,202, an increase of £162,594 on the figures of the previous year. There is no transfer from the fire department, the whole of the underwriting profit in that department having been added to the fire fund, but the marine department has again contributed £450,000. The underwriting loss in the accident department has been more than made good by a transfer to that department of £650,000.

The directors recommend a final dividend of 2s. 2d. per 5s. unit of stock, making, with the interim dividend of 1s. 6d. paid in October last, a total of 3s. 8d. per 5s. unit.

THE ROYAL LONDON MUTUAL INSURANCE SOCIETY LIMITED

A RECORD YEAR

INCREASED ORDINARY BRANCH INTERIM BONUS

The ninety-seventh annual general meeting of The Royal London Mutual Insurance Society Limited was held on April 29th at the Chartered Insurance Institute, 20 Aldermanbury, E.C.

Mr E. H. Haynes, FIA, chairman and joint managing director, who presided, said:

The country's future ability to provide capital investment and at the same time build up reserves must depend on a high measure of saving, and it is to this end that Government policy must be directed.

CONTRIBUTION TO SAVING

In this field the value of life assurance is illustrated by the fact that the funds of the life assurance offices and collecting friendly societies, which represent a fair measure of the net saving arising from this type of business, increased steadily between 1951 and 1956 alone by the sum of £1,195 million, an increase of over 40 per cent.

Of this total no less than £258 million represented the contribution of the home service branch of the business. This figure illustrates vividly the aggregate effect of the regular collection of small sums week by week by the 50,000 home service agents operating throughout the length and breadth of the land. There can be no doubt that but for the activities of these agents, by far the greater part of this large sum of money would have been spent. Instead of providing capital for industry and public works it would have added to the pressure of demand and served to give additional strength to the inflationary forces which have, throughout the whole of this period threatened the economic life of the country.

BALANCE SHEET
ON DECEMBER 31, 1957

1956 £	Liabilities	£	£	1956 £	Assets	£
	Life assur. funds :					
36,254,894	Ordinary branch	37,571,838		8,439,819	Mortgages	8,915,218
84,877,954	Industrial branch	85,358,332		2,530,701	Loans	2,173,008
9,242,848	Reserves	14,334,405			Stock Exchange	
				113,737,814	Investments	119,484,514
				3,931,995	Property investm'ts	4,467,935
130,375,696		137,264,575		128,640,329		135,040,693
109,737	Outst'ding Claims	122,282		1,861,483	Sundry debtors	2,045,591
327,568	Sundry creditors	327,389		311,189	Cash	627,962
£130,813,001		£137,714,246		£130,813,001		£137,714,246

An entirely new proposal which has been under discussion during the last year is the suggestion that the State scheme should provide a pension greater than would be sufficient to meet the basic needs of the elderly. Any supplementary pension in excess of this basic minimum should, in my view, be strictly related to the contributions of the individual and should not, in the case of the smaller pensions, be augmented from the contributions of the better off. Neither should such pensions be subsidised, directly or indirectly, through taxation. To depart from any of these principles would be inequitable.

If this view is accepted there would appear to be no advantage accruing from a State scheme of this nature which is not available under private schemes already in existence and designed to enable the public to make provision for retirement. That such schemes meet a public demand is evidenced by the fact that, quite apart from the millions who have effected life assurance policies for this purpose or who are saving for old age in other ways, over nine million people are covered by occupational pension schemes. The amounts set aside by these members of the public and by employers on their behalf constitute a most valuable part of the nation's savings. In the light of these considerations I am convinced that the State should confine itself to providing only for the basic needs of the elderly and at the same time encourage those members of the public who wish to make their own provision to supplement the State pension.

The autumn crisis has resulted in a substantial rise in interest rates over the level obtaining a year ago. This increase in interest rates is of advantage to our policyholders since the Royal London has large sums of money available for investment each year and at the present time is able to place this money most remuneratively. At the same time the consequent fall in the value of fixed interest securities, coupled with a decline in the price of ordinary shares, has created an immediate problem in regard to funds already invested.

As a result of these changes in the prices of Stock Exchange securities the market value of the Society's investments at the end of last year showed a substantial depreciation as compared with the corresponding figure at the end of 1956. Accordingly, as you may see from the accounts, a total of £5,075,000 has been transferred to Investment Reserve.

In July, 1957, the rates of premium for new without-profit contracts in the Ordinary Branch were further improved. This was found possible as a result of a satisfactory mortality experience and increased yield on investments and has resulted in these contracts proving a very attractive proposition for which there is a substantial demand. In October an improvement was announced in the terms of the Society's Adaptable Pension Policy and Married Man's Pension Policy, an improvement which considerably enhances the attraction of these policies as a means by which those men and women whose jobs do not carry a pension can make their own provision for an assured income in old age.

I would now like to refer in detail to the position of each of the Society's branches.

ORDINARY BRANCH

The premium income in the Ordinary Branch (including consideration for annuities granted) amounted to £4,206,000, an increase of £126,000 over the previous year. The transfer to Investment Reserve Fund in this Branch is £325,000 bringing the total Ordinary Branch Investment Reserve Fund up to £2,825,000 (excluding the Auxiliary Life Fund Investment Reserve). The Fund at the end of the year amounted to £37,571,000, an increase of £1,317,000.

The amount paid by way of claims and surrenders during the year was £3,360,000.

I am very happy to report that the amount of new Ordinary Branch business written in 1957 again showed an increase. During the year 17,300 policies for the amount of £13,085,000 were issued, this being an increase of £2,461,000 over the figures for the previous year, and, as I have indicated, a record for the Society.

On with-profit policies becoming claims, etc., during the current year the Interim Bonus will be at the rate of Two Pounds per cent in respect of each of the years 1956 and 1957 and Two Pounds Four Shillings per cent in respect of the year 1958.

I should like to draw attention to the fact that in the last five years the Society has been able to increase its bonus rate by no less than fourteen shillings per cent to a figure higher than ever before in our long history. This is a record in which we may well take pride.

INDUSTRIAL BRANCH

In the Industrial Branch the premium income for the year amounted to £10,234,000 an increase of £333,000 over the previous year. Claims and surrenders amounted to £5,583,000. The amount of £4,750,000 has been transferred to the Investment Reserve Fund, bringing this Fund up to £11,250,000. The Fund at the end of the year amounted to £85,358,000 an increase during the year of £481,000.

The sum assured on new policies issued in the Industrial Branch has shown an increase for the seventh year in succession. In 1957 new sums assured increased by £3,699,000 to the figure of £21,470,000.

Interim Bonus will be continued during the ensuing year at the same rate as the Reversionary Bonus declared for the period 1951-1955, namely One Pound Three Shillings per cent per annum upon the sum assured, in respect of all premium paying policies issued before December 31, 1952, under tables which participate at the full rate.

GENERAL BRANCH

The premium income for this Branch for 1957 was £881,000, an increase of £77,000.

1957 has proved in all respects a record year for the Royal London Mutual Insurance Society Limited. The total income of the Society during the year was £21,096,000, while benefits paid to policyholders amounted to £8,943,000. The total payments to policyholders since the inception of the Society amount to more than £157 million.

The report and accounts were unanimously adopted.

THE RHODESIA BROKEN HILL DEVELOPMENT COMPANY LIMITED

(Incorporated in Northern Rhodesia)

RECORD ZINC PRODUCTION

MR H. F. OPPENHEIMER ON ADVANTAGES OF LOCAL MARKET

The following are extracts from the statement by the chairman, Mr H. F. Oppenheimer, which has been circulated with the annual report and accounts for 1957:

Towards the end of the year the death occurred of three men who had been actively associated with your company for many years. My father, Sir Ernest Oppenheimer, Chairman of the company, died on November 25th, Mr W. N. Watson earlier in the same month and Dr J. A. Bancroft on December 11th.

My father joined the board of directors in 1925 and became chairman in 1951. Much of his confidence in the mine, which suffered several serious setbacks, was due to the unshakable opinion of Dr Bancroft, our then consulting geologist, that the mining problems could be overcome and that the orebody would prove to be far greater than was originally estimated. It was on Dr Bancroft's insistent advice that the mine was thoroughly explored and new mining techniques developed to exploit the ore exposed. Much of the work entailed was carried out at the mine by Mr Watson who served the company loyally and energetically for thirty-three years and, at the time of his retirement in April 1957, was Manager at the Mine. It was largely because of the determination and perseverance of these men, through many difficult times, that Broken Hill is today a mine with many years of fruitful activity ahead of it, and we owe them a debt of very real gratitude.

MARKETS AND PRICES

I am privileged to assume the chairmanship of the company at a time when it has an important part to play in a rapidly developing country. Most of the output of lead from the mine is now sold in Southern Africa and, although some of the zinc has still to be sent overseas, I believe that our entire production will in the not-too-distant future find ready markets close at hand. Thus, although the price for our metals must clearly continue to be affected by world conditions, we shall be in an advantageous position because of our local market.

During the year, there have been heavy falls in the price of most non-ferrous metals, and lead and zinc have not escaped. The price of lead, which in January 1957 was around £116 a ton, followed the downward trend of other metals to about £73 at the end of the year. Zinc suffered similarly, dropping from £103 a ton in January to about £61 a ton at the end of the year.

The sharp decline in the prices of these metals was due basically to world overproduction which was emphasised by falling consumption in the United States. Contributory factors were the possibility of tariff increases being imposed and the uncertainty regarding continued stockpiling activity in the United States. It seems unlikely that the markets will stage any significant recovery until world production and consumption are more closely balanced.

Our production of zinc in 1957 reached a record level of 29,500 tons, all of which was sold, and despite the world market situation, we can confidently expect that the 1958 production, which is expected to be of the same order, will find a ready market.

Lead production at 15,000 tons fell slightly short of last year's record. This production was also disposed of without difficulty and the outlook for 1958, when our production will be at a lower level, is such that we shall not be able to satisfy the full requirements of our customers.

Problems connected with sintering, together with current metal prices, have so reduced the profit margin when producing through the lead-blast furnace, that the decision has been taken with some reluctance to revert to the Newnam hearth plant, and to accept a lower level of production in order to achieve lower costs. In consequence, lead production during 1958 will be about 12,000 tons, which is considerably less than the demand in Southern Africa for the metal. The improvement of sintering methods and, more generally, the search for more efficient and more profitable techniques are being constantly studied by the consulting engineers. Research projects which may be applicable to our mine's requirements are being undertaken, but insufficient progress has yet been made for us to say whether or not these will be of economic importance.

REDUCTION IN COSTS

It is gratifying to be able to report that the efforts my father mentioned last year to reduce costs have met with a measure of success. The persistent upward trend of operating costs has been reversed and a slight but significant reduction achieved during the year. I hope that with the co-operation of everyone concerned a further reduction in costs will be possible.

The profit after taxation for the year (excluding a profit of £66,000 on the sale of the Iron Duke Mine) was £909,000, which was £400,000 less than in 1956. Capital expenditure, largely in respect of Mita Hills Dam, was £875,000. Against this, we have been able to take account of the forward provision of £150,000 at the end of the previous year, of the revenue from the sale of the Iron Duke Mine, and of £200,000 so far drawn against the Broken Hill municipal loan, and we have therefore only had to appropriate £450,000 from profits for capital expenditure. In the present situation of the metal market, it would have been imprudent not to make some provision towards reducing the incidence of capital expenditure required to complete the work in hand, and this amount includes about £50,000 for that purpose.

It is estimated that expenditure of a capital nature during 1958 will be of the order of £400,000 of which half will be provided from the balance of the municipal loan.

It is satisfactory in the circumstances that your directors have been able to recommend a net final dividend of 7d. per unit which, together with the interim dividend of 4d. makes a total of 11d. net per unit of stock for the year.

MITA HILLS DAM

The work on Mita Hills Dam was geared to a target—the advent of the rains at the end of 1957—which left little room for error. It is a credit to the consulting engineers, the mine personnel involved and the contractors that this target was achieved. The dam is filling rapidly and will enable the Lunsemfwa Hydro-Electric Scheme to continue delivering power at full capacity throughout the year.

SECOND COVENT GARDEN PROPERTY

SIR BRIAN MOUNTAIN'S STATEMENT

The twenty-fourth annual general meeting of Second Covent Garden Property Company Limited was held on April 24th in London, Sir Brian Mountain, Bart (the Chairman), presiding.

The following is an extract from his circulated statement:

Since the acquisition early in 1956 of the Ordinary Share Capital of Covent Garden Properties Company Limited, the capital structure and administration of the Group has been simplified by the reduction of the number of active companies and the assimilation of the properties into larger groups where appropriate.

The recommendations of the Runciman Committee as regards Covent Garden Market emphasised the urgency of a statement by the Government on the future of the Market, and your Board has subsequently written to the Ministry of Agriculture, Fisheries and Food with their comments on the proposals. In the interests of all who are connected with the Market, whether as tenants, as customers, or in our case as landlords, I would like to emphasise the necessity of getting a firm decision as to its future with the minimum delay. Until this is made, no long-term planning or investment in this area is possible.

The introduction of the Rent Act 1957 is taking effect quite smoothly as far as the Group is concerned, and only a very small proportion of the value of the Group's properties is affected. Satisfactory arrangements have already been made with most of the tenants, and every effort is being made to avoid causing any hardship. Whenever possible, in cases where this might otherwise occur, tenants are being offered an opportunity to transfer to other accommodation owned by the Group.

During the year the Directors have had made a valuation by Messrs Goddard & Smith of all the properties of the Group, with the exception of the Covent Garden Market. The effect of the valuation, which took place at June 30, 1957, has been to show an aggregate surplus over book value of £1,759,460. No revaluation has been made of the market as your Board feel that the ultimate value of this is too much dependent on political and other factors over which they have no control.

Your Board recommend a final dividend of 6 per cent less Income Tax, making a total of 10 per cent for the year. This is at the same rate as last year; but as it is payable on the Ordinary Share capital as enlarged by the recent Scrip Issue, is equivalent to an increase of just over one per cent on last year's dividend. The retained profits of the Group amount to £47,171.

The report was adopted.

UNION CORPORATION LIMITED

(Incorporated in the Union of South Africa.)

ABRIDGED REPORT OF THE DIRECTORS FOR YEAR 1957

In submitting the Accounts for the year ended December 31, 1957, the Directors state that they consider it more appropriate to refer to the Consolidated Accounts than to the Corporation's own Accounts. After providing for taxation and for outside shareholders' interest in profits of subsidiary companies, the consolidated net profit for the year was £1,578,431 plus £712,312 brought forward, making a total of £2,290,743. From the amount available for appropriation by subsidiary companies, £45,332 has been placed to General Reserve Accounts, £7,708 to Exploration Reserve Accounts and £384,717 carried forward as unappropriated profits, leaving £1,852,986 available for appropriation by the Corporation. The Directors have placed £350,000 to General Reserve Account, £300,000 to Exploration Reserve Account and have declared a final dividend of 2s. 0d. United Kingdom currency per share less United Kingdom Income Tax, absorbing £534,750. The final dividend was declared on March 19, 1958 and makes, with the interim dividend of 1s. 0d. per share less tax, a total dividend of 3s. 0d. per share or £802,125 for the year, thus leaving an unappropriated profit in the Corporation's Accounts of £400,861 to be carried forward. After adding the unappropriated profits of subsidiary companies (£384,717) and parent company dividends receivable within the Group (£60,510) there is a consolidated balance of £845,888 to be carried forward.

Holdings of shares, debentures and other securities have been taken into the Accounts at cost or under but in no case above the market value of December 31st last, or where no market price exists, above the Directors' valuation. The Directors, as on other occasions, have thought it expedient to write down the book cost of certain holdings below both cost and market price to allow for the wasting nature of a substantial part of the Corporation's portfolio. To this end they have charged the Profit and Loss Account with £150,000, of which £25,000 has been charged in a subsidiary company's Accounts.

Since the end of the financial year arrangements have been made to provide additional finance for the Corporation's business (including the further exploration of the Kinross goldfield) by placing privately in the Union of South Africa £2,000,000 of Unsecured 6½ per cent Notes at par repayable in instalments 1974/1983. The money will be made available in eight equal quarterly amounts commencing March 31, 1958, the final payment being receivable on December 31, 1959. The arrangements permit the Corporation to make further borrowings without consent of the Noteholders provided the total borrowings do not exceed two-thirds of the issued capital and agreed reserves as disclosed in the Consolidated Balance Sheet from time to time.

A copy of the Corporation's Annual Trade Cycles Chart, revised to date is enclosed with the Report

GOLD MINING INTERESTS.

Summary of the operating results for the past year of the Companies operating in the Transvaal and Orange Free State in which the Corporation is largely concerned:—

	East Geduld Mines, Ltd.	Geduld Proprietary Mines Ltd.	The Grootvlei Proprietary Mines Ltd.	Marievale Consolidated Mines Ltd.	St. Helena Gold Mines Ltd.	Van Dyk Consolidated Mines Ltd.
Tons milled	1,625,000	1,144,000	2,357,000	854,000	1,392,000	919,000
Yield per ton dwt.	6.14	3 17	4.27	5.25	5.83	3.54
Working Costs per ton	33s. 7d.	35s. 2d.	31s. 0d.	42s. 2d.	41s. 0d.	40s. 0d.
Working Profit per ton	43s. 5d.	4s. 10d.	22s. 8d.	23s. 11d.	32s. 4d.	4s. 6d.
Total Working Profit	£3,523,000	£275,000	£2,676,000	£1,022,000	£2,250,000	£184,000
Net Profit	£1,760,000	£913,000	£1,348,000	£558,000	£2,199,000	£201,000
Dividends—Total	£1,800,000	£931,000	£1,335,000	£506,000	£762,000	*
Per Stock Unit or Share	4s. 0d.	12s. 9d.	2s. 4d.	2s. 8d.	1s. 7d.	*

* Return of capital in 1957 of £277,000 or 1s. 0d. per share

The net profit figures include revenue from other sources. Thus East Geduld Mines' dividend income in 1957 on its stockholding in The Grootvlei Proprietary Mines was £62,720 and Geduld Proprietary Mines' dividend income in 1957 on its stockholdings in East Geduld Mines and The Grootvlei Proprietary Mines was £703,498.

ST. HELENA GOLD MINES.—The sinking of No. 2 Shaft was completed in October at a depth of 5,528 feet and good progress was made with station cutting preparatory to starting development from this shaft. In March of this year a further dividend of 1s. 0d. per share was declared.

WINKELHAAK MINES.—During the year the two small vertical shafts, Nos. 1 and 3, were completed to depths of 1,590 feet and 1,584 feet respectively. In order to increase hoisting capacity a further small vertical shaft has been started some 350 feet north of No. 3 Shaft and by the end of the year had been sunk to a depth of 90 feet. Development footage during the year totalled 29,683 feet. Of this 10,365 feet was on reef and sampled, disclosing 6,645 feet or 64 per cent, payable averaging 379 inch-dwt. The building of the Reduction Works commenced early in the year and is now nearing completion. It is anticipated that it will be possible to start trial crushing in the second quarter of 1958.

Interests in Gold Mining Companies not under the administration of the Corporation:

STILFONTEIN GOLD MINING COMPANY.—Profits from the production of gold and uranium increased substantially during the year and two dividends totalling 2s. 10½d. per share were declared.

WESTERN HOLDINGS.—Due to the milling of a greater tonnage and a rise in the grade of ore milled a marked improvement in operating results was achieved during the year ended September 30, 1957. The working profit was £3,726,924 and two dividends totalling 5s. 0d. per share were declared. A further dividend of 3s. 0d. per share was declared in March of this year.

OTHER MINING INTERESTS.

SAN FRANCISCO MINES OF MEXICO.—This Company earned a Working Profit of £1,018,000 in the year ended September 30, 1957, and paid a dividend of 4s. 6d. per 10/- stock unit in respect of that year, the same as for the previous year. In spite of the decline during the year in the prices of base metals produced, revenue fell by only £91,000, because not only was the production of lead and zinc greater, but sales exceeded production. Although Working Profit fell by £479,000, Net Profit was only £40,000 lower, owing to a considerably smaller charge for Mexican and United Kingdom taxation. The tonnage of ore milled set up a new record for the sixth successive year, the grade being slightly higher than in the previous year. Owing to the fall in the prices of lead, zinc and copper, the Company's operations are now barely profitable.

CHROME MINES OF SOUTH AFRICA.—Due to a further improvement in the world demand for chrome ores with a consequent increase in market prices, the net profit for the year ended June 30, 1957, was in excess of that for the previous year. The Company declared a dividend of 9d. per share in September last. Since the end of the Company's financial year, despite some softening in the market, the Company has obtained satisfactory orders for future delivery.

The Corporation is also interested, *inter alia*, in the following Companies:

SELECTION TRUST.—This Company paid a final dividend of 5s. 3d. per Ordinary Stock Unit for the year ended March, 1957, and has since declared an interim dividend of 1s. 9d. per Unit for the year ended March, 1958.

TSUMEB CORPORATION.—The net profit for the year ended June 30, 1957, was £7,012,875 as compared with £8,021,916 for the previous year and dividends totalling 42s. 6d. per share were declared. Dividends declared during the first nine months of the current financial year totalled 13s. 9d. per share. Due to a decline in the market prices for its products since the close of the Company's financial year it has recently been decided to curtail production by 20 per cent.

OTHER INTERESTS.

BAY HALL TRUST.—The net profit for 1957 was £136,244. A dividend of 17 per cent less tax was declared absorbing £103,063. The sum of £25,000 was placed to General Reserve and the amount carried forward increased from £130,144 to £138,325. The Trust's investments as at December 31st last showed at current market prices an appreciation of £911,268 over book cost of £1,808,142.

SOUTH AFRICAN PULP AND PAPER INDUSTRIES.—After providing for taxation and depreciation and the remaining items of revenue and expenditure, the net profit for the year ended December 31, 1957, was £486,835 as compared with £489,078 for the previous year. Provision has been made for a dividend of 2s. 0d. per share. The Company's output of paper and board increased further during the year. Work on the additions to the pulp plant and the new multi-purpose M.G. paper machine at the Tugela Mill is well advanced and production may be expected by the middle of 1958.

THE WITHOK PROPRIETARY COMPANY.—Towards the end of the year the Corporation, which already had a substantial interest in this Company, made an offer to the other members to purchase their shares at £10 1s. 6d. per share with the object of acquiring the entire share capital of the Company. Sufficient acceptances have been received to enable the Corporation, if necessary, to acquire any outstanding balance of the shares under the provisions of the South Africa Companies Act. Taking its investments at market value the Company's total net assets at the end of the year amounted to £690,887.

EXPLORATION.

The exploratory drilling in the Kinross area is now virtually complete. Though drilling at a greatly reduced tempo is still in progress, this work is now largely confined to defining geological structures in more detail or to following up indications from previous boreholes of the pattern of values with a view to framing in due course an application to the Mining Leases Board of the Government of the Union of South Africa for the next mining lease in the area.

The Corporation continues to be active in exploration in other parts of Southern Africa and elsewhere.

Copies of the full Report and Accounts can be obtained on application at the London Office, Princes House, 95, Gresham Street, London, E.C.2.

SOCIÉTÉ D'INVESTISSEMENT DU NORD

PARIS (France)

SUMMARY OF 5th ANNUAL REPORT.

The following is a summary of the report presented by the Board of Directors at the annual general meeting on April 17, 1958:

The increase in capital authorised by your meeting of March 29, 1957, was carried out satisfactorily.

Comparing the composition of the portfolio with the previous year the proportion of French securities is hardly changed (48.81 per cent against 48.88 per cent), but on the other hand there is an appreciable increase in the percentage of liquid assets (16.08 per cent against 0.74 per cent); as a result there is a reduction in the proportion of foreign securities (35.11 per cent against 50.38 per cent).

Furthermore, when considering the various categories into which the investments fall, you will notice a relative decrease in mining, oil and chemical securities and an increase in those of financial trusts, banks and insurance companies.

Passing to the examination of the profit and loss account, you will note that revenue from the portfolio and from sundry sources is 327,708,611 Francs. One cannot usefully relate this figure to that of the preceding financial year, in view of the increase in capital during the year. The profit from sale of stocks and shares is 347,455,537 Francs. Total revenue for the year is thus 675,164,148 Francs.

General expenditure, still well below the legal maximum, is as follows: management costs, 11,553,882 Francs; financial charges, 10,924,434 Francs plus taxation and duty of 2,174,756 Francs plus a provision for future tax of 1,922,100 Francs and amortisation of 9,252,836 Francs; total 35,828,008 Francs.

The net profit for the year is thus 639,336,140 Francs.

The profits available for distribution for the year would be 291,880,603 Francs, but we propose to deduct, from the balance carried forward, 42,619,397 Francs, to make a grand total of 334,500,000 Francs to be distributed in accordance with the terms laid down for the increase in capital.

The maintenance of the balance to be carried forward no longer appears essential to us now that your Company is based on a solid financial structure. It will be reduced to 53,455,000 Francs.

THE CUNARD STEAM-SHIP COMPANY LIMITED

AN EXTREMELY DIFFICULT YEAR

Colonel Denis H. Bates, Chairman of the Company, in a statement to stockholders for submission at the eighty-first Annual Meeting to be held on May 21st, says:—

I regret to report that the forebodings in my statement a year ago under the heading of "Prospects for 1957" proved all too well founded and group operating surplus at £6,230,030 is down by £2,189,844 and the balance surplus at £1,287,620 is down by £973,351, reflecting the reduction in operating surplus and lower taxation liability. In raising the dividend to 11 per cent for 1956 it had been hoped at least to retain that payment, but with the voyage estimates last October pointing to a serious reduction in operating surplus it was felt imperative to reduce the interim dividend to 2 per cent against 3 per cent the previous year. Now recommended is a final dividend of 8 per cent, making 10 per cent for the year. Whilst I fully realise it is no satisfaction to our stockholders to be told that the heavy decline in operating surplus was due to circumstances over which the Managements have no control, I nevertheless feel an explanation is called for.

During 1957 all our services without exception suffered grave disturbances from labour troubles at home and abroad. For example, the 27 vessels of Brocklebank's cargo fleet lost 1,015 ship days in the twelve months, the equivalent of having three ships laid up for a whole year doing nothing. Though the Group's cargo business is considerable, the real weight of our interests lies in our passenger services on the North Atlantic and in particular in the American holiday traveller. Events in Hungary and Egypt deterred such travel, especially in the first few months of the year. While we fully maintained our normal passenger services we were short of some 11,000 passengers and about £1 million revenue. We also had to cancel the BRITANNIC's usual Mediterranean Cruise. To add to these difficulties the closing of the Suez Canal heavily raised the price of oil bunkers; for Cunard ships alone it amounted to an extra £750,000. After the early months passenger traffic became more normal, but the lost ground could not be made up. On the other hand, the Brocklebank Management were largely able to mitigate the financial effects of the first impact of the closing of Suez and a freight surcharge more or less covered the additional cost of the longer run via the Cape. The Port Line Management similarly were able to take the closure in their stride and they report an improved turn round of their ships.

MODERATELY OPTIMISTIC FOR 1958

What of prospects for 1958? There has been a steep fall in open freight rates which already has had a marked and severe effect on all cargo carriers. Though liner cargo interests are not normally subject to wide fluctuations in freight rates as in tramp business, I cannot expect that our cargo earnings will give us the same support in 1958 as last year. On the other hand, the North Atlantic passenger trade can be very resilient, and if only we could be spared industrial strife, let alone near war troubles, the outlook could be painted in reasonably bright colours, despite the black cloud of the trade recession overhanging the U.S.A. The margin is very small between factors which cause famine or abundance in our accounts. Forward passenger bookings are promising, and I am moderately optimistic as to our 1958 prospects.

I greatly regret to record that Mr Frederic A. Bates died in June last. He had been a Cunard director since 1921 and was Chairman from 1946 to 1953. He was actively and intimately concerned with the building of the two "QUEENS" and was devoted to the Company's interests.

After heavy losses of ships in the war the Group has to date financed new construction of 465,000 tons at a cost of some £60 million besides a substantial programme of refitting existing ships. This is no mean achievement in the face of ever rising building costs and high taxation based on a tax computation of profit which merely allows for the original cost of ships instead of the inflated current replacement costs. The problem of replacement is never ending. The next major operation is a 28,000-ton passenger liner for our North Atlantic service to replace BRITANNIC and, as announced, the Board had planned to lay the keel this autumn, but owing to the setback in our fortunes last year which does not enable us to obtain the full cash relief under the investment allowance it has been considered prudent to postpone the reservation of the berth. Warnings have been given annually in these statements ever since 1947 that the full replacement of the fleets was being jeopardised by penal taxation. Having been denied the means to make adequate provision for replacement during the years of plenty our endeavours are now frustrated by a lean period, which does not even permit us to make full use of the increased investment allowance granted in 1957.

AIR TRANSPORT ECONOMICS

The hard force of economic law in air transport to which I referred last year is apparently gradually emerging and Governments have at last met, at least partially, the increases in fares requested by the International Air Transport Association. Though the Select Committee on Estimates reported to the House a year ago that they could "see no reason why air travel and the air companies should be in a favoured position compared with bus, railway, shipping and harbour companies," I.A.T.A. apparently is still expressing the opposition of the air lines to the imposition of further charges to the customer and at a recent conference of Government representatives discussing "air navigation facilities and services used by air lines en route and the payment for these facilities," it was stated "if more charges are imposed on international air lines when they are striving to get lower fares and bring in jet air liners it will be necessary to pass on these extra charges to the customer."

And "Why not?" appears to be a logical question. Why should people who want the speed of travel NOT pay the economic price for it? Why should they expect to be subsidised by their fellow taxpayers? In sea transportation harbour authorities make charges to balance their costs and in 1957 we met a bill of £4½ million to enable them to break even on their "facilities." Why should air transportation expect favoured treatment in this respect?

In conclusion I express warm and appreciative thanks to all the staffs of the Group and to our many agents. It is a grand team; all play their parts in a great endeavour and I thank them all for their ready help and loyalties.

THE BRITISH WAGON COMPANY LIMITED

SATISFACTORY VOLUME OF QUALITY BUSINESS

The Annual General Meeting of The British Wagon Company Limited was held on April 25th at the Company's Head Office, 23 Moorgate, Rotherham, Mr R. A. Dyson (the Chairman) presiding.

The following is an extract from his circulated statement:

The Group Net Profit, after taxation, of £180,083 is £49,134 less than that for 1955. Some reduction was anticipated in the Report at this time last year. The hire-purchase investment had decreased by £2 million during the year 1956 largely as a result of Government restrictions making a 50 per cent initial payment obligatory, and partly as a result of the Suez Crisis.

It is the Company's practice to apportion hire-purchase charges over the life of each agreement, taking the revenue month by month as each agreement runs its course of, on an average, twenty months. It is inherent in hire-purchase that periods of restriction and activity have a delayed action. For instance 1956 profited from the activity of 1955, and the earnings of 1957 reflect the reduced hire-purchase investment of 1956. In addition, the latter part of 1957 trading had to bear sharply increased money costs which followed the Bank Rate increase from 5 per cent to 7 per cent in September, 1957.

While therefore the profit for 1957 is less than that for the previous year, 1958 has started well with the deferred income, to which previous mention was made, standing at £1,190,195, an increase of £451,080.

A controlling interest was purchased towards the end of 1957 in the Ross Finance Company Limited of Vancouver, British Columbia. Permission to make this purchase was granted by the Bank of England.

At the end of 1957 the Company had increased its hire-purchase investment to the record figure of some £11 million and much of this increase had been financed by the help of deposit loans.

Over the years the Company has shown a steady rather than a spectacular rate of growth largely because it is the policy of the Board to put quality before quantity in underwriting hire-purchase business. To maintain this progress it is essential that the necessary funds are available.

Shareholders do not need to be reminded that the Company has been providing Debenture and Deposit loan facilities for nearly ninety years.

Taken over all, 1957 was an exceedingly active year in which a satisfactory volume of good quality business in the face of keen competition had been obtained.

Copies of a brochure enclosed with the report and accounts in regard to the Company's deposit facilities can be obtained on application to the Secretary.

ADAMS (DURHAM) LTD.

(Manufacturing Confectioners)

The sixth annual general meeting of Adams (Durham) Limited, was held on April 28th in London, Lieutenant Colonel W. D. Gibbs (the chairman) presiding.

The following is an extract from his circulated statement:

During the year under review your Company acquired the remaining interest in Andrew Buchanan and Sons, Limited, which is now a wholly owned subsidiary and has been given a temporary home at Durham. It is now a matter of paramount importance that the Group finds itself a new and more modern factory to accommodate both Companies.

Now, whereas Adam products have mainly been sold in the North of England, Scotland and Northern Ireland, the main outlets of Buchanans are in the South, and joint marketing arrangements can now be made to effect a far wider field of representation for both Companies.

At the last annual general meeting I sounded a word of warning on the possible effect of the Sugar Act and, as forecast, the price of sugar was an average of some £8 per ton higher than the previous year. The effect of this on the Industry generally was a sharp contraction of profit margins and in some cases heavy losses were made.

In the case of your Parent Company a small loss of £290 was made and the Group made a net loss of £6,000 which should be regarded as the price paid for the extension of its outlets.

Your Company's export business continues on the up-grade.

A new price schedule became operative on February 1, 1958, and its effect is to give a larger profit margin to the Confectionery Wholesaler and Retailer without increasing the Consumer prices. The result, therefore, is a still lower profit margin for the Manufacturer, who must accordingly look for extra production and sales. Your Directors have achieved this by the acquisition of Buchanans, but only when the Group is established in new premises and manufacturing by more up-to-date and economical methods can the position be regarded with greater confidence.

The report and accounts were adopted.

Representatives of the Staff: Otto Altendorf, Bielefeld; Heinrich Braun, Frankfurt (Main); Hans Helmut Buchner, Mainz; Bernhard Drewitz, Berlin; Joachim Feldmann, Düsseldorf; Edmund Herbst, Hamburg; Margarete Klein, Düsseldorf; Heinrich Kuss, Köln; Hanns Meiller, Mannheim; Werner Muthmann, Wuppertal-Elberfeld; Albrecht Paechter, Stuttgart; Ludwig Reiss, Monnheim; Arthur Riester, Freiburg (Breisgau); Hugo Schürhoff, Hagen (Westfalen); Paula Stenger, Stuttgart; Ludwig Stiffer, München.

TRAWLERS GRIMSBY LIMITED

(The Ross Group)

The following are salient features of the Accounts for the year ended 30th September, 1957, and of the report by the Chairman, Mr. J. Carl Ross, to the Annual General Meeting on 30th April, 1958.

"The results submitted are the best your Company has so far achieved."

PROFITS

The trading profits of the Group were £570,914 (£441,860). The net profit of the Group is £140,923 (£107,661). After crediting items of an exceptional nature £23,825 and deducting proportion of profits attributable to Outside Shareholders £19,992, the balance available for distribution is £144,756.

Preference Dividend (6%) takes	£8,194
Ordinary Dividend (16%) takes	£57,500
Retained for development	£79,061

The total turnover of the Group was £10,000,000.

"In reporting upon the year's trading to 31st March, 1951, I said that 'Your Company with its wide field of activities will continue to make further progress.' That is the key to this year's results, our field of activity having continued to broaden and develop.

TRAWLING

This year under review has embraced the peak of our New Ship Programme, four vessels having been delivered during the period of the Accounts, and five new vessels have since been delivered in the current year to September 30th, 1958. We are very proud of our Fleet of new vessels and they are quite a feature at Grimsby. Last year our Fleet landed in total 100,000,000 lbs. of fish.

"Conditions of trading during our financial year were difficult. The fall in the rate of catch from Distant Water Grounds in 1957 was quite catastrophic causing an acute shortage of fish from those waters. This problem persisted until February of this year when for the first time since August, 1956, the catch per day was better than the corresponding month of the previous year.

Your Fleet fishes all waters and therefore reaps some benefit in that the shortage of Distant Water fish assured a good market for fish caught in the Near and Middle Waters.

The net increase in Capital Employed at the year end amounted to £764,579. The vessels included at a written down value of £1,690,088 were insured at that date for £3,114,800.

The Net Tangible Assets attributable to the Ordinary Stockholders (£625,000) now amounts to £1,550,355.

WESTWICK FROSTED PRODUCTS LIMITED

This important wholly owned Subsidiary Company had a good trading year, a large increase in turnover and a substantial increase in profits.

FROZEN FOODS

We are building up a specialised marketing organisation bringing to the consumer and user the best quality products in their respective field. In our SeaSparkle brand of fish products and our Westwick fruit and vegetables we can guarantee top quality products.

CURRENT TRADING

So far this year trading conditions generally have continued difficult, the experience of some Companies having been a little better whilst others have been less satisfactory. There has been a welcome reduction in the price of marine fuel oil (which, however, is still above pre-Suez level), but we are somewhat concerned lest this reduction be nullified by an increase in the price of coal.

The industry is in no state at the present time for further increased costs of any description at sea or ashore."

Copies of the Annual Report are available from the Secretary,

1 HUTTON ROAD, GRIMSBY

NATIONAL BANK OF PAKISTAN

ALL-ROUND PROGRESS AND EXPANSION

The Ninth Annual General Meeting of the National Bank of Pakistan was held on April 24th at Lahore.

Mr Hoshang N. E. Dinshaw (the President) presided and, in the course of his speech, said: The Bank has again made appreciable progress in all spheres of its activities.

The Bank's total deposits reached the peak figure of Rs. 63.73 crores in 1957, indicating a substantial rise of 23.41 per cent over the highest level of Rs. 51.64 crores in the previous year. At the end of the year deposits stood at Rs. 58.04 crores as against Rs. 48.53 in 1956—an increase of 19.47 per cent.

The Bank's total advances reached the peak figure of Rs. 43.93 crores during 1957 as against the corresponding figure of Rs. 38.25 crores in 1956, an increase of 14.85 per cent. The Bank's advances, including Bills Rediscountable with the State Bank of Pakistan, stood at Rs. 42.39 crores on December 31, 1957, registering an increase of 31.32 per cent over the corresponding figure in the previous year. Its advances in Pakistan, which stood at Rs. 31.00 crores in the beginning of the year, were up by 34.19 per cent as against a decrease of 7.98 per cent in the case of other scheduled banks. The extent of the Bank's contribution to the development of Pakistan's economy can be gauged from the fact that its advances in Pakistan constitute 32.79 per cent of the total bank credit in the country.

The total foreign exchange business handled by the Bank showed a gratifying increase—from Rs. 114 crores in 1956 to Rs. 184.30 crores in the year under report—a rise of 61 per cent.

PROFITS

I am happy to report that the Bank recorded a sizeable increase in its profits—from Rs. 79.52 lakhs to Rs. 92.66 lakhs in 1957. This increase of 16.52 per cent was the result of an all round expansion in the Bank's activities and a discreet check over expenditure.

The Reserve Fund further increased with an allocation of Rs. 25 lakhs from Rs. 85,00,000 to Rs. 1.10 crores which represents 73.33 per cent of the Paid-up Capital. The rate of dividend remained at 5 per cent as in the previous years.

During the year under review, the Bank opened 13 offices, including one at Baghdad, bringing the total number to 85 at the end of the year.

1957 was a difficult year. The country recorded improvements in certain directions but the deterioration in others subjected the economy to serious strains.

The chairman then reviewed general economic conditions in Pakistan and continued: To sum up, the country has passed through a difficult period and its economy is still far from satisfactory. But there is no reason to be disheartened; prospects hold out a better future. We must continue our efforts with renewed vigour to surmount the present difficulties and place our economy on a sound footing. I must again emphasise that to achieve this end we must concentrate on raising the production—specially food production—to the maximum, stopping smuggling completely and increasing foreign exchange earnings. This is the real remedy of our evils and will open a new chapter of prosperity before us.

The report was adopted.

TRADE INDEMNITY COMPANY

HIGHER GROSS PREMIUMS

SIR JOHN MAKINS ON THE ECONOMIC OUTLOOK

The fortieth ordinary general meeting of Trade Indemnity Company Limited was held on April 24th in London, Sir John Makins (the Chairman) presiding.

The following is an extract from his circulated statement:

The gross premiums earned in 1957 amounted to £1,807,885, an increase of more than 9 per cent on 1956, and we retained £574,544 for our own account. The increase was confined to the current year's policies, additional premiums on earlier years showing a decline. The same pattern may be expected this year, which has started well as regards new business, but with a fall in additional premiums on 1957 Account.

During 1957 the turnover of transactions underwritten exceeded the thousand million mark, showing an increase of nearly 15 per cent on 1956 and a slight fall in our average rate of premium.

The claims paid, less salvages, in 1957 were substantially lower than in 1956—£449,704 against £756,889. Our retained share was £116,011 against £192,115. The improvement was largely due to salvages on claims paid in earlier years.

The expenses of management in 1957 came to £219,210, compared with £206,449 in 1956. The percentage increase in expenses was less than the corresponding increase in premium income, but, with rising costs and the growing complexity of the business, it may be difficult to maintain that trend in future.

The provision for our retained share of outstanding claims on 1955 Underwriting Account, which we have closed, is £43,170—considerably less than we required last year, but, to the best of our knowledge and belief, fully adequate. The balances of the 1956 and 1957 Accounts, which are carried forward, are £233,181, compared with £200,792 last year, and £101,256 compared with £66,361. As regards 1955 Account, I expressed the view, in my statement to you a year ago, that the closing balance at the end of 1957 would probably be lower than the closing balance of 1954 Account at the end of 1956. At £241,404 it is lower, but only to a small extent. This is due, however, to higher Profit Commission earned under our Reinsurance Treaties as a result of the salvages which I have already mentioned. The figure of Profit Commission is £40,682, compared with £32,133 in 1956.

PROFIT AND LOSS ACCOUNT

Turning now to the Profit and Loss Account, interest on investments and other income (gross) comes to £45,612, which, added to £241,404 transferred from Underwriting, produces £287,016. Taxation on income within the Account is estimated at £142,588, so that the profit for the year, after providing for tax, is £144,428. The amount brought forward from 1956 is £99,680, giving a total of £244,108 for disposal. Against this total we have written £25,000 off the book value of the investments. Your Directors then recommend payment of a dividend of 12½ per cent less Income Tax, which will absorb £35,937 and leave a carry forward of £183,171. In arriving at the decision to leave the dividend unchanged and roughly double the carry forward, your Directors have been influenced by the prevailing uncertainty as to the economic situation over the next twelve months and its effect upon our business.

GENERAL REMARKS

As usual, the bulk of our business in 1957 has been in connection with credit risks in the United Kingdom, but we have again insured an appreciable volume of short-term credit risks in Commonwealth countries and in Western Europe.

With regard to the future, as I have already indicated, it is difficult to express any positive views concerning the manner in which the economic situation is likely to develop over the next twelve months. While there is still, in some degree, inflation in this country, signs of a recession have already made their appearance in the United States of America and elsewhere, and there is no doubt that the expectations of business men are not as hopeful as they have been in recent years. New investment orders for plant, building and equipment are far from sufficient to replace those which are being completed, and abroad there are indications that the demand for our goods may be on the decline.

In some countries the investment boom, like our own, is coming to an end, with a consequent rise in unemployment and unused industrial capacity. Other countries have outrun their ability to pay for the goods which they need, and this is particularly noticeable in primary producing countries, where the fall in world prices has reduced earning power. In some ways the uncertain outlook is good for our business, as was demonstrated in 1956 and again last year, but there is always the possibility that the overall decline in business activity may reduce the volume of transactions under current policies to a greater extent than we can replace by new business. I think it would be wrong to expect the rate of increase in premium income in 1957 to be maintained in 1958, and the possibility of claims arising is greater than at any time since the war. Credit insurance is particularly susceptible to the effects of a business recession and the signs and portents being what they are, it would be most unwise to ignore them.

The report and accounts were adopted.

THE LIVERPOOL & LONDON & GLOBE INSURANCE COMPANY LIMITED

A statement by the Chairman, Mr T. H. Naylor, circulated with the Annual Report and Accounts, indicated that in 1957 Fire, Accident and Marine premiums reached a new high level at £48,622,254. The underwriting surplus of £546,490 reflected the difficulties which had faced insurers, especially in North America.

Premium Income in the Fire and Accident Departments increased to £21 million and £25 million respectively, the former earning a surplus of £583,686, the latter suffering a loss of £178,203.

The Marine Department, with premiums of £2,336,631, had transferred £141,007 to Profit and Loss Account.

New Life business again reached a substantial total with new sums assured of £13,351,296.

In spite of the fall in security prices generally in 1957 the aggregate market value of the Company's investments at the year end still exceeded their Balance Sheet value by a satisfactory margin.

The Directors were recommending a final dividend of 30s. making 60s. for the year—an increase of 3s. on 1956.

THE EMPLOYERS' ASSURANCE

LARGER PREMIUM INCOME

The seventy-seventh Annual General Meeting of The Employers' Liability Assurance Corporation Limited will be held on May 28th in London. The following are extracts from the statement by the Chairman, Lord Knollys, which has been circulated with the report and accounts for the year ended December 31, 1957:

The combined premiums of our group of companies amounted to £38,432,000, an increase of £3,836,000 on those of 1956. The result of our year's trading, after taxation, was a loss of £313,589. On the other hand, our interest income was much higher and our investments, in total, continued to show a large appreciation.

The Directors recommend the payment of a final dividend of 3s. per share, making, with the interim dividend of 2s 6d. per share, a total of 5s. 6d. per share for the year, the same as last year.

The results of the year were dominated by the unfortunate underwriting experience in the North American continent—an experience which was almost universal.

We are satisfied, however, that our North American portfolio is basically a sound one and that, given more realistic rates, we shall not fail to revert to our usual profitable trading.

Fire.—Fire business in the United States continued to be unremunerative, although our own experience showed some improvement over 1956.

In Canada the position deteriorated further. The continuing sharp rise in the loss ratio in this class has made it essential to reconsider rates, and certain increases have been put into force.

In the United Kingdom we were able once more to show a good profit, while the business from other overseas territories again gave satisfactory return.

Accident.—In the United States, Motor business became even more unprofitable. Rate increases, averaging about 20 per cent for the personal injury cover, were obtained throughout almost the whole country, but even the new levels were soon found to be insufficient, so that further substantial increases in rates will be applied for in 1958.

In Canada, as in the United States, it was the Motor business that produced the most unfavourable results. The experience in this class deteriorated so rapidly in 1957 that the rate increases introduced on January 1st were supplemented in many parts of the country by additional increases from August 1st.

The new rates still prove insufficient, however, and they were accordingly raised to an even higher level at the beginning of 1958.

Our United Kingdom Accident account provided a further satisfactory advance in premium income, and we again made a fair profit overall.

Life.—The net new business of our associated Life Office, the Clerical, Medical & General Life Assurance Society, included sums assured of £10,514,592 and deferred annuities of £604,889 per annum.

Investments.—The Corporation's total investments, including property and associated and subsidiary companies, show, at £43,891,443, an increase of £2,169,010.

The value of our investments at market prices remained well in excess of their Book Value in our Balance Sheet.

NORWICH UNION INSURANCE SOCIETIES

ANNUAL MEETINGS

LIFE SOCIETY

Speaking at the Annual Meeting of the Norwich Union Life Insurance Society held in Norwich on April 29th, the President (Sir Robert Bignold) referred to the fact that this was the one-hundred-and-fiftieth meeting, the Society having been founded in 1808. Without doubt the Society combined with its age and experience a youthful vitality which augured well for the future.

Sir Robert reported expansion in all sections of the Society's business. New life insurances at £77 million showed an increase of 10 per cent over 1956, whilst deferred annuity business at £54 million also showed a marked rise.

Total funds, which only four years ago had passed the £100 million mark, were now over £150 million. The net rate of interest earned had risen from £4 7s. 9d. per cent to £4 8s. 9d. per cent, whilst the expense ratio had been reduced from 17.9 per cent in 1956 to 17.5 per cent last year.

Rates of intermediate bonus for the United Kingdom and Eire were increased by 3s. per cent from January 1, 1958.

FIRE SOCIETY

At the one-hundred-and-sixtieth Annual Meeting of the Norwich Union Fire Insurance Society Limited, the Chairman (Sir Robert Bignold) said 1957 was a year of expansion in which the total premium income increased by £1,990,633 to £19,903,408, but the profit, whilst showing a welcome over-all improvement on 1956, was disappointing in comparison with the volume of premium involved.

Fire premiums totalled £7,822,212, an increase of £503,891, and the profit before taxation was £148,929. Accident premiums advanced by £1,329,753 to £10,665,830, but the account showed a loss of £37,147. Marine premiums totalled £1,415,366, an increase of £156,989, and the transfer to Profit and Loss from the Marine Account was £30,000.

Net interest earnings increased by £15,086 to £394,434, being £141,434 in excess of dividend requirements.

Total assets amounted to £25,351,392, an increase of £1,316,767.

INTERNATIONAL NICKEL COMPANY OF CANADA

YEAR OF SUBSTANTIAL PROGRESS

The annual meeting of the International Nickel Company of Canada Limited was held on April 30th in Toronto.

Dr John F. Thompson, the Chairman, presided and, in the course of his speech, said: Although 1957 was a year of sharp contrasts, the Company made substantial progress and earnings were the third highest in its history.

The Company's nickel deliveries were close to the all-time peak and copper deliveries attained a postwar high. Proven ore reserves were at a new high level at the year-end. Work on our new nickel project in Manitoba proceeded on schedule.

The market for nickel started the year with an over-demand so substantial that some consumers continued to pay premium prices to obtain the supplies they urgently needed. It ended with nickel in over-supply.

Commenting on the Company's search for a nickel deposit large enough to make a real addition to world supply, the chairman said: After a 10-year search and expenditures of $10 million in Manitoba a commercial deposit was finally located. The Manitoba development has now been under way for over 16 months and will be carried to completion.

Our exploration in Manitoba is only part of the world-wide exploration which we have been carrying on for years in recognition of the need for further sources of supply. In 1957 our exploration expenditures were the highest in our history. This large-scale exploration programme is being actively pursued.

The progress that has already been made in Manitoba is of vital importance to the future of the Company and is on schedule. Our expansion in Manitoba and Ontario will increase our annual nickel production capacity to 385 million pounds by 1961.

In summary, the past year was one which saw temporary conditions reduce our immediate profits, but also one which afforded us the opportunity, particularly in the latter part of the year, to do those things essential to the development of a future increased market for nickel and the preparation of our production facilities to take care of this anticipated increased demand.

FINANCIAL EARNINGS

Net earnings for 1957 of $86,100,000 or $5.50 per common share, were the third highest in our history, and the Company's strong financial position was well maintained.

Common dividends paid in 1957 totalled $3.75 per share, the same as in the two preceding years. Total disbursements for the year were nearly $55 million.

It is estimated that capital expenditures in 1958 will be between $60 million and $70 million. In 1957 they were $43,900,000, the highest for any year, as compared with $23 million in 1956.

The final figures for operations in the first quarter of 1958 are not complete, but it can be stated that earnings will be substantially lower than the $20,100,000, or $1.38 per common share, reported for the preceding quarter—the three months ended December 31, 1957. The reduction in earnings is due principally to the sharply reduced demand for nickel and rolling mill and foundry products, and a further slight decline in copper prices.

The report and accounts were adopted.

JOSIAH PARKES & SONS LIMITED

(Manufacturers of Union Locks and Brassfoundry)

The ordinary annual general meeting of Josiah Parkes & Sons Limited was held on April 28th at Willenhall, Staffs, Mr Cyril W. Parkes, JP (Chairman and Joint Managing Director), presiding. The following is an extract from his circulated statement:

During 1957 your company has again had a successful year, although trading profit was slightly lower than in 1956. Group turnover showed a small increase, but costs continued to rise, whilst the general level of selling prices was held steady. There were falls in non-ferrous materials but these were offset by rises in iron and steel prices, wages and other costs, causing a slight contraction in profit margins.

Being alive to the necessity of keeping abreast of modern tastes and styles, we devote much time and thought to the extension of our range of products and the improvement of existing patterns. This is a continuing process, and during the past year various new and improved lines have met with a gratifying response.

The year 1958 has got off to a good start, and I know that everyone in the organisation will strive their utmost to obtain all the available business and to give our customers satisfaction in quality and service. I think, though, that trading conditions will be more difficult. Costs have continued to rise, and apart from a possible fall in output profit margins are likely to narrow still further.

The report was adopted and a final dividend of 7½ per cent was approved.

PEARL

ASSURANCE COMPANY LIMITED

Chairman: **GEOFFREY KITCHEN, T.D., M.A.**

Points from the Annual Report and Balance Sheet for the year ending 31st December, 1957

TOTAL ASSETS £257,740,397 **GROSS INCOME £55,133,940**

INVESTMENTS

The Assets show an increase of £13,914,037. The valuation of the investments taking Stock Exchange securities at middle market prices showed a comfortable margin compared with the values shown in the Balance Sheet after taking into account the Investments Reserve Funds.

LIFE BRANCHES

In the two Life Branches the total sums assured on new policies issued amounted to £74,644,530 compared with £72,168,907 for 1956 and the total sums assured and bonuses in force (including the Capital Redemption Fund), amounted to over £620 millions (an increase for the year of over £38 millions). The total new annuities of all kinds amounted to £1,468,746 per annum.

FIRE AND ACCIDENT

In this Branch the premium income was £10,630,192.

REVERSIONARY BONUSES

ORDINARY BRANCH.—A reversionary bonus of **£2 2s. 0d.** per £100 sum assured or annuity on United Kingdom policies entitled to participate in full profits.

INDUSTRIAL BRANCH.—A sum of **£2,543,214** has been allocated to provide bonuses and other benefits to policyholders in the Industrial Branch making a total allocation up to date of **£31,303,493.**

CHIEF OFFICES: HIGH HOLBORN, LONDON, W.C.1.

INNS & COMPANY

(Public Works Contractors, Asphalters, Sand and Gravel Pit and Quarry Owners)

CURRENT TRADING IMPROVEMENT

The twenty-third annual general meeting of Inns & Company Limited, was held on April 25th in London, Mr Walter Wallace (Joint Managing Director) presiding.

The Chairman, in the course of his speech, said:

Trading continued at a satisfactory level for the first half of the current year under review, that is to June, 1957, but since then, owing to various National and other conditions not controllable by your Board, there has been a slowing up in demand during the second half of 1957, with a falling off in the trading profit for the year.

This trading profit amounted to £508,315 against the trading profit of £684,050 of the preceding year. The net profit amounted to £399,071 compared with £522,366 for the year 1956.

There was a general curtailment of work by Government and Public Authorities which affected your Company's servicing department, together with a general falling off in Government and Municipal Works and private building and road making. This was experienced during the latter half of the year and was largely attributable to the credit squeeze and the higher Bank Rate.

Since the end of January of the current year the volume of trade has shown some improvement, and as I have on several occasions pointed out to you your Company is well placed to participate in the new road programme and to meet any other demand which may arise.

Shareholders' attention is called to the fact that the Company owns 8,773 acres of land which stands in the Company's Balance Sheet, after depreciation, at about £1,193,000, which value is almost equal to the total issued share capital of your Company.

The Company's Plant and Machinery has been kept in an efficient and well-maintained state in the current year.

The total amount spent on the Plant, Machinery, etc., since incorporation amounts to £966,630 and after being depreciated leaves a balance of £310,912 as the value appearing in your Balance Sheet.

The liquid position of your Company is very satisfactory, there being £556,329 balance at Bank and cash in hand.

The report and accounts were adopted and the total dividend of 20 per cent was approved.

At the subsequent Extraordinary General Meeting the proposed new Articles of Association were adopted.

Gestetner

LIMITED

TOTTENHAM, LONDON, N.17

The Company manufactures the world-famous Gestetner Duplicator and accessories It has branches throughout the United Kingdom and subsidiary companies or representatives in all parts of the British Commonwealth, in the Americas, the Far East, and many countries in Europe. Extensive servicing facilities are available throughout the organisation.

SUMMARISED CONSOLIDATED ACCOUNTS AT 30th MARCH, 1958

THE LONDON & LANCASHIRE INSURANCE COMPANY LIMITED

THE HONOURABLE R. M. PRESTON'S STATEMENT

The Annual General Meeting of The London & Lancashire Insurance Company Limited will be held on May 22nd at 7 Chancery Lane, London, W.C.2.

The Chairman, the Honourable R. M. Preston, DSO, has issued a statement to Stockholders, from which the following has been taken:

The net world figures for the combined Fire, Accident and Marine Departments were:

	1957	1956
	£	£
Premium income	33,291,218	30,162,188
Underwriting loss	547,399	425,119
Ratio	1·64%	1·41%

The increase of £3,120,000, in round figures, in the premium income was not unsatisfactory.

Fire Department.—The net underwriting results of fire business were:

	1957	1956
	£	£
Premium income	12,926,296	11,797,133
Underwriting loss	455,629	231,725
Ratio	3·52%	1·96%

Insurance experience in the United States and Canada has been deteriorating for some years. Outside the North American continent, premium income increased in all important territories and earned a reasonable margin of profit.

Accident Department.—The net underwriting figures were:

	1957	1956
	£	£
Premium income	15,673,637	14,450,610
Underwriting loss	441,770	593,394
Ratio	2·82%	4·11%

Motor vehicle insurance income represents rather more than one half the total premium income of the Department and has incurred an underwriting loss.

Marine Department.—The figures were:

	1957	1956
	£	£
Premium income—current year	4,631,285	3,914,443
Transfer to profit and loss account	350,000	400,000
Balance of underwriting funds—all years	5,129,384	4,700,301
Ratio	109·57%	120·08%

There was a considerable increase in first year premiums in 1957 and the balance in hand at the end of the year, amounting to £3,086,965, was in reasonable relation to premiums at 66 per cent. The second year figures, that is to say, on account of 1956 underwriting to the close of 1957, had a balance in hand of £674,839, which was rather less favourable than for the previous year.

Profit and Loss Account.—The Company's total profit for the year from underwriting and investment, before deduction of taxation, was £1,061,883. On the financial side, interest and life profits, after deduction of British income tax, amounted to £988,984, an increase of £47,885 on the previous year.

In accordance with usual practice, interest earnings are shown in the accounts, net of British income tax, so as to conform to the recognised practice in British insurance of relating net dividend to net interest and life earnings rather than to aggregate profit. The underwriting profit is, in general, added to reserves to meet possibility of heavy underwriting loss, a possibility which is always present and has been realised in the past two years.

It is that practice which justifies the recommendation of a dividend of 35 per cent, same as previous three years. Should underwriting experience prove more favourable, an increase in Dividend may well be justified.

The Chairman closed his statement by thanking the General Manager and Staffs for their service during the year.

GILBEYS LIMITED

(Wine Merchants and Distillers)

FURTHER PROGRESS IN WORLD MARKETS

The annual general meeting of Gilbeys Limited was held on April 29th in London, Mr R. D. Gilbey (the chairman) presiding.

The following is an extract from his statement:

I am once again pleased to report an increase in the trading profit of the Group. A part of this increase is due to the inclusion this year of royalties received from the USA, but nevertheless the ordinary trading profit showed a substantial increase, particularly in Canada.

At the time of writing neither the business of our Canadian subsidiary nor the trade in our products in the USA appear to be affected by the generally adverse trade conditions in the latter country. Sales of gin and vodka are well maintained and sales of Spey Royal Whisky are showing a marked improvement. The results in Canada in 1957 were even better than had been expected.

Our subsidiary in South Africa continues to expand. In Australia, sales of gin and whisky were very satisfactory. Recent restrictions upon the import of spirits into New Zealand are likely to have an adverse effect.

At home, table wines generally have been increasing in popularity recently, and it is gratifying to find how well our brands are participating in the resurgence.

Last year I referred to the acquisition of the agency for "Old Grand-dad" Kentucky Bourbon Whiskey, one of National Distillers' leading products, and this is finding a ready sale. Now, as from last Christmas, we have been proud to market the famous Eau Perrier; and we have plans, as opportunity affords, to list other imported lines of similar prestige.

Since the war we have set up new organisations in South Africa and New Zealand and have expanded greatly in Canada and Australia. We have rebuilt and extended our Bottling Stores in Edinburgh and modernised the equipment in our establishments in Camden Town and Dublin. We were pioneers in marketing inexpensive table wines from Southern France, while at the other end of the scale our "Smirnoff" brand was the first vodka to be manufactured in England. With "Crock O' Gold" we have blazed a successful trail in "blended" Irish Whiskey. Meanwhile, in collaboration with Messrs Cinzano, our gin is now being made in eight foreign countries, the latest being Uruguay and Germany.

The report was adopted.

THE ASSOCIATION OF CERTIFIED AND CORPORATE ACCOUNTANTS

MR A. C. S. MEYNELL'S ADDRESS

The Fifty-third annual general meeting of The Association of Certified and Corporate Accountants was held in London on April 29th. Mr A. C. S. Meynell, FACCA, was in the chair and in the course of his address said:

MEMBERSHIP

The problem of recruitment is not one which is restricted to the Association and so far as one may judge from reports, it is a difficulty with which all the professional bodies are having to cope. Its existence seems attributable mainly to the glittering enticements which are held out to school-leavers by industry, both in the form of free academic or technical training and attractive career prospects. We must seek to persuade the new generation that accountancy is not the dull business they think it and that it can offer an interesting and rewarding career for most people of average ability and a stimulating and highly remunerative one for those of the highest capacity.

With this object in view we have recently produced a small booklet entitled "Accountancy—A Career of Opportunity," which provides a good deal of helpful information about the Association for those who may be contemplating entering the profession and will—we hope—help to dispel some of the misunderstanding which exists about the work of an accountant.

CHEQUES ACT

A piece of legislation which proved to be of more than passing interest to accountants was Mr Graham Page's Cheques Act, which took effect from October last. The object of the Act was the relatively simple one of saving the time spent on endorsing and examining order cheques and this object has been achieved without undue fuss or bother.

It has, however, had consequences which few people perhaps anticipated, at any rate in quite the degree to which they developed. Many organisations, both large and small, were greatly attracted by the idea of saving not only the time spent on cheque endorsement but also the time and money involved in the issue of receipts. As a result, there has been a very strong movement indeed towards the elimination of receipts, except in a few special cases.

It is clear also that the effect of the Act has been widely misunderstood and there can seldom have been a topic upon which quite so much uninformed comment has appeared in letters to the press and elsewhere. Indeed, I can tell you from my knowledge that there are industrial and commercial concerns, some of them quite large, who apparently believe that the Cheques Act authorises them to issue a receipt for £2 or more without any stamp or, alternatively, to refuse to issue a receipt at all. This is, of course, quite wrong. The law relating to the issue and stamping of receipts has not been altered in any way and accountants who find their clients issuing unstamped receipts for £2 or over could usefully point this out. I do not think the accountant can reasonably be expected to do more, but it should be borne in mind that failure to stamp a dutiable receipt carries with it a penalty of £10 in respect of every default and it seems to me not unlikely that in due course the Revenue may turn its attention to this matter.

ENGINEERING COMPONENTS LIMITED

The twenty-third annual general meeting of Engineering Components Limited was held on April 29th in London, Mr C. C. Griffith, MC (the chairman), presiding.

The following is an extract from his circulated statement:

The turnover for the year has, of course, been affected by the fall in the price of our principal raw material (Copper), although output of the main Departments here in Slough has shown an increase over the period, in line with Automobile production. Today we have cost-inflation due to wages increasing at a greater rate than productivity, and in spite of our constant endeavours to find new production techniques profit margins have tended to narrow.

Out of the profit of £409,279, taxation takes £229,200 and the Subsidiary Companies retain £10,984, leaving your Company a net profit of £169,095.

After reviewing the activities of the subsidiary and associated companies at home and overseas, the statement continued:

Export sales during the year have been maintained, and no efforts have been, or are being, spared to augment them.

Prospects: **At the moment the activity of the Automobile Industry is high, and provided this continues we should obtain our share of the resultant business.**

We are hopeful that the fields we are exploring outside the Motor Industry will help to enhance the position your Company has enjoyed for so many years.

The report was adopted and the dividend of 15 per cent approved.

THE RIO DE JANEIRO FLOUR MILLS AND GRANARIES

MR G. McT. SHEPPARD'S ADDRESS

The seventy-second Ordinary Annual General Meeting of The Rio De Janeiro Flour Mills and Granaries, Limited was held on April 28th in London.

In his Address, Mr G. McT. Sheppard (the chairman), said that the Accounts for the year ended September 30, 1957, showed in terms of Brazilian currency an increase in the Group Trading Profit of approximately eighty-four million cruzeiros compared with the previous year. Upon conversion at Cr. $232,00 to the £ sterling, the free rate of exchange applicable at September 30, 1957, the sterling Group Trading Profit was £910,084 as against £665,282 for the previous year when the free rate was Cr. $191,00 to the £.

The trading results of the four Flour Mills of the Group had proved satisfactory during the year under review. In spite of rising working costs and wage adjustments flour prices were unaltered during the whole of this period and continued to be the same as those in force in July, 1956.

Having in mind the less favourable trading results in the first six months of the Company's year 1957-58 and the continued weakness of the cruzeiro/sterling exchange, it was not the Directors' intention to declare an Interim Dividend as they had done in previous years. Their Final Dividend policy must depend on the result of a full year's trading, but it was clear that they should husband their resources with the object of consolidating their position in Brazil.

The report was adopted.

THE MERCHANTS MARINE INSURANCE CO.

The Annual General Meeting of The Merchants Marine Insurance Company Limited will be held on May 28th in London.

The following are extracts from the circulated statement by the chairman, Lord Knollys:

I am able to report a further growth in our business both for the Marine and Fire and Accident Accounts. Our Marine premium in 1957 amounted to £502,070, an increase of £13,573 over 1956. Bearing in mind the continuing downward trend in Cargo rates and the fall in shipping values, this increase, though comparatively small, represents further development in our worldwide Marine business.

The premiums on our Fire and Accident and General business amounted to £466,341, an increase of £210,147 over 1956. However, these Accounts show an overall loss of £68,162.

We have transferred £20,000 from our Marine Account to the Profit and Loss Account and after bringing in interest on our investments, the net deficiency is £12,939.

The Marine Fund amounts to £617,261, or 122.9 per cent of the premium income and is, in our view, adequate to meet all calls upon it.

This is the first time we have shown a loss on our non-marine business since we entered this field in 1921. There are special reasons for this. In the past, the bulk of our Fire and Casualty business came to us by way of reinsurance ceded from our Parent Company, but last year it was decided that in Canada this business should be underwritten for our direct Account. This resulted in an addition to our income of nearly £200,000. This increase made it necessary for us to make considerable additions to our reserves, which partly accounts for the magnitude of our book loss. I am sure it will be appreciated that we have, by direct writing, acquired a large amount of additional premium on which we expect to earn profits in the future.

AMBER CHEMICAL INDUSTRIES

ENCOURAGING RESULTS

The tenth annual general meeting of Amber Chemical Industries, Limited, was held on April 30th in London.

Mr D. G. N. Lloyd-Lowles, chairman, in the course of his speech, said: At the last annual general meeting I closed by saying that we expected soon to be able to show solid achievements reflected in profits, and not merely hopes and forecast of good things to come. Our 1956 accounts showed a loss of £34,102; those of 1957 show a profit of £17,472, which means a turn round of £51,574. In every section of our business profits were earned, although the cost of development of new projects has not yet been entirely absorbed in the accounts now before you.

The net assets of the company including Reserve for Future Income Tax have improved from £122,902 to £141,384, and the net current assets now show a surplus of £90,137 over Current Liabilities as against £64,146 last year. Generally, our financial position is healthier than it has been for some time, but during the next two years or so we can expect capital expenditure totalling approximately £50,000.

Four months have passed since the end of our financial year. Both trade and profits have shown further improvements and generally speaking, we should not be too vulnerable to temporary fluctuations in industry. We cannot claim complete immunity, of course, from a major depression. We have budgeted for a profit in excess of that for the year ended December 31, 1957, and figures show that we are proceeding as planned. Our recovery however will be gradual.

We paid one year's arrears of dividend on the Preference shares in December last, and propose, all being well, to make progressive reductions in the arrears as rapidly as possible, having regard not only to profits but our financial situation. The reduction in Distributed Profits Tax will be of some help.

PARKINSON & COWAN LIMITED

ANOTHER SATISFACTORY YEAR

MR HUGH P. BARKER'S REVIEW

The fifty-eighth Annual General Meeting of Parkinson & Cowan, Limited, was held on April 28th in London. Mr Hugh P. Barker, the Chairman, in the course of his address, said:

I should like to tell you briefly about the scope of our manufacturing business. It embraces Fluid Metering and "Fluid Automation"; Gas Metering; Electrical Control and Instrumentation; Home Equipment; Radiant Heating for Industry; and Leather.

This widely diversified range contains several growth points about which I hope to have more to say in future years.

TRADING RESULTS

The gross trading profit was £583,165 compared with £597,497 in 1956 and the net profit of £159,306 compared with £173,739. After allowing for Preference dividends, but before providing for annual debenture redemption and profits tax on dividend distributions, this represents a return of 19 per cent net on our Ordinary stock.

An Ordinary dividend of 9 per cent is again recommended.

THE FUTURE OF THE GAS INDUSTRY

The manufacture of gas appliances and meters forms about a half of our activity. Some people ask what future lies ahead for the Gas Industry. I would like to assert that the Gas Industry has certainly a vital and permanent place in Great Britain as in many countries overseas. The Industry has started to exploit revolutionary techniques in gas making, using cheaper grades of coal and oil as basic raw materials, and as the years go by manufactured gas of superior properties and competitive prices will arrive on the scene. I have no doubt that the Gas Industry will then resume its upward climb.

The Report and Accounts were adopted.

APPOINTMENTS

CITY OF NAIROBI

APPOINTMENT OF ACCOUNTANT GRADE II—CITY TREASURER'S DEPARTMENT

Applications are invited for this permanent non-established post (consolidated salary scale £1,427 x £50-£1,577 x £54-£1,627 per annum).

Tanganyika Concessions Limited owns all the Debentures and 90 per cent of the equity of the Benguela Railway.

ROYAL TECHNICAL COLLEGE, SALFORD

Principal: C. WHITWORTH, M.Sc., Ph.D., F.R.I.C., F.Inst.F.

Applications are invited for the new post of HEAD OF DEPARTMENT OF LIBERAL STUDIES. Applicants should hold a suitable degree and/or professional qualifications and have wide interests in modern development.

The successful candidate will be expected to co-ordinate and supervise all classes in English, Languages, Social Studies and other peripheral subjects in courses leading to professional qualifications in a wide variety of technological subjects.

This will be a Grade III Department, the salary scale for which is:—£1,600 x £50-£1,750 (men); £1,280 x £40-£1,360 + £70/£35 differential (women).

Further particulars and forms of application may be obtained from the Principal, Royal Technical College, Salford 5, to whom they should be returned as soon as possible.

R. RIBBLESDALE THORNTON,
Clerk to the Governors.

DOMINION OF CANADA

THREE-AND-A-QUARTER PER CENT. REGISTERED STOCK, 1958/63.

For the purpose of preparing the Interest Warrants due July 1, 1958, the BALANCES will be STRUCK at the close of business on June 2, 1958, after which date the Stock will be transferred ex-dividend.

For the Bank of Montreal, Financial Agents of the Government of Canada, in London.

A. P. HARPER,
Manager.

47, Threadneedle Street, E.C.2.
May 1, 1958.

THE CUNARD STEAM-SHIP COMPANY LIMITED

NOTICE IS HEREBY GIVEN that the Eighty-first Annual General Meeting of The Cunard Steam-Ship Company Limited will be held in Cunard Building (Fifth Floor), Pier Head, Liverpool, on Wednesday, the 21st May, 1958, at 11 a.m.

(1) To receive and consider the Statement of Accounts for the year ended December 31, 1957, with the Reports of the Directors and Auditors.

(2) To sanction the declaration of final dividend for the year 1957.

(3) To elect Directors in place of those retiring but who, being eligible, offer themselves for re-election. In accordance with the provisions of the Companies Act, 1948, special notice has been received of the intention to move at the above Meeting a resolution for the re-election as a Director of the Company of Sir Alan C. Tod, who at the date of the Meeting will be aged 70 years and who retires and offers himself for re-election.

(4) To confirm re-appointment of Auditors and to fix their remuneration.

By Order of the Board,
C. C. TOMLINSON,
Secretary.

Offices:—Cunard Building, Liverpool.
26th April, 1958.

Note to Members.—A Member entitled to attend and vote is entitled to appoint one or more proxies to attend and vote instead of him. A proxy need not also be a Member.

ROYAL DUTCH PETROLEUM COMPANY
(N.V. KONINKLIJKE NEDERLANDSCHE PETROLEUM MAATSCHAPPIJ)
established at The Hague

ANNUAL GENERAL MEETING OF SHAREHOLDERS

to be held on TUESDAY, MAY 20, 1958, at 11.30 a.m., in the large hall of the CARLTON HOTEL at AMSTERDAM, THE NETHERLANDS.

AGENDA.

1. Appointment of a Director owing to retirement by rotation.
2. Annual Report for 1957.
3. Approval of the Balance Sheet and the Profit and Loss Account for 1957.

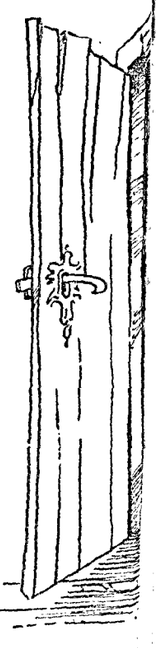
The case of the Vanishing Secretary



The Managing Director was distracted. "The best Secretary I've ever had . . . and she just walked out and disappeared after a fortnight here. She was wonderful. Why should she do it?"

Well, I soon tracked her down. Secretaries don't just vanish. After careful investigation I found her address from the Company Secretary's office. Two days later (we work fast in the sleuth business) I was interviewing her.

"Oh, he was a charming man", she said, "and a most considerate boss. But I just couldn't stand those dirty offices. They hadn't been painted for years".

The moral is "keep your staff happy and busy in congenial surroundings" —and, as a brilliant first step, ring Bishopsgate 3717 and put your problem to us. Our Technical and Colour Advisory Service can help you in many ways to make your business outlook brighter.

For the smaller business or larger concerns with decentralized systems or branches, the Director 600 brings all the advantages of modern machine accounting.

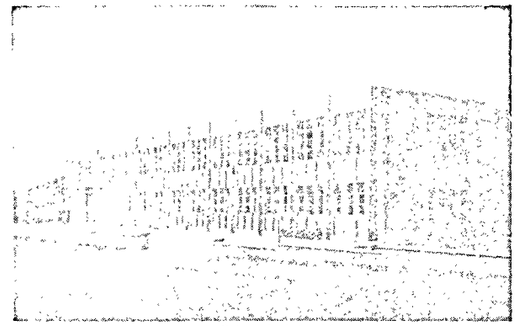
The Burroughs Director 600 can be applied to a wide variety of book keeping operations. Ledgers of all types—for example Sales and Purchase, Stock Records, Hire Purchase; Payroll and Costing; Statements and Remittance Advices.

Its many automatic and protective features not only ensure speed and ease of operation but simplify operator-training. It can be used as a fast adding or listing machine at any time.

A Director 600 in your office would lower costs and increase productivity: and your investment would be protected by Burroughs' unparalleled service. Contact your local Burroughs Office or write direct to Burroughs Adding Machine Ltd., 356-36 Oxford Street, London, W.1

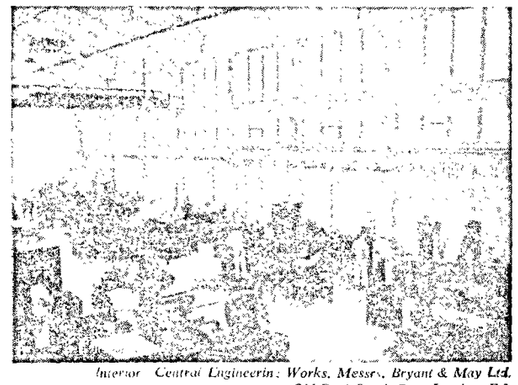
MODERN ACCOUNTING WITH THE BURROUGHS DIRECTOR 600

Money is dear but . . . today BEECHAM BUILDINGS cost less



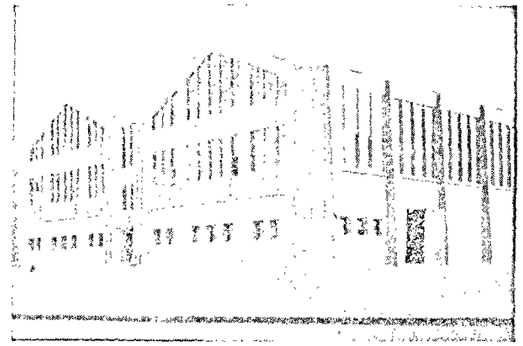
Beecham Buildings construct high-quality commercial and industrial buildings—from office blocks and small factories to large industrial layouts covering many acres at prices which, over the past twelve months, have actually fallen. We accomplish it in these days of 6% by working quickly and eliminating waste.

WE STREAMLINE PRELIMINARIES



We in Beechams have the *complete* building organisation, including departments for every phase of building from first design to final finishing. Consequently we can quote firm prices as soon as sketch designs are agreed, saving much valuable time over the usual procedure when outside contractors must be consulted for quotations, and enabling us to move on to a site months earlier.

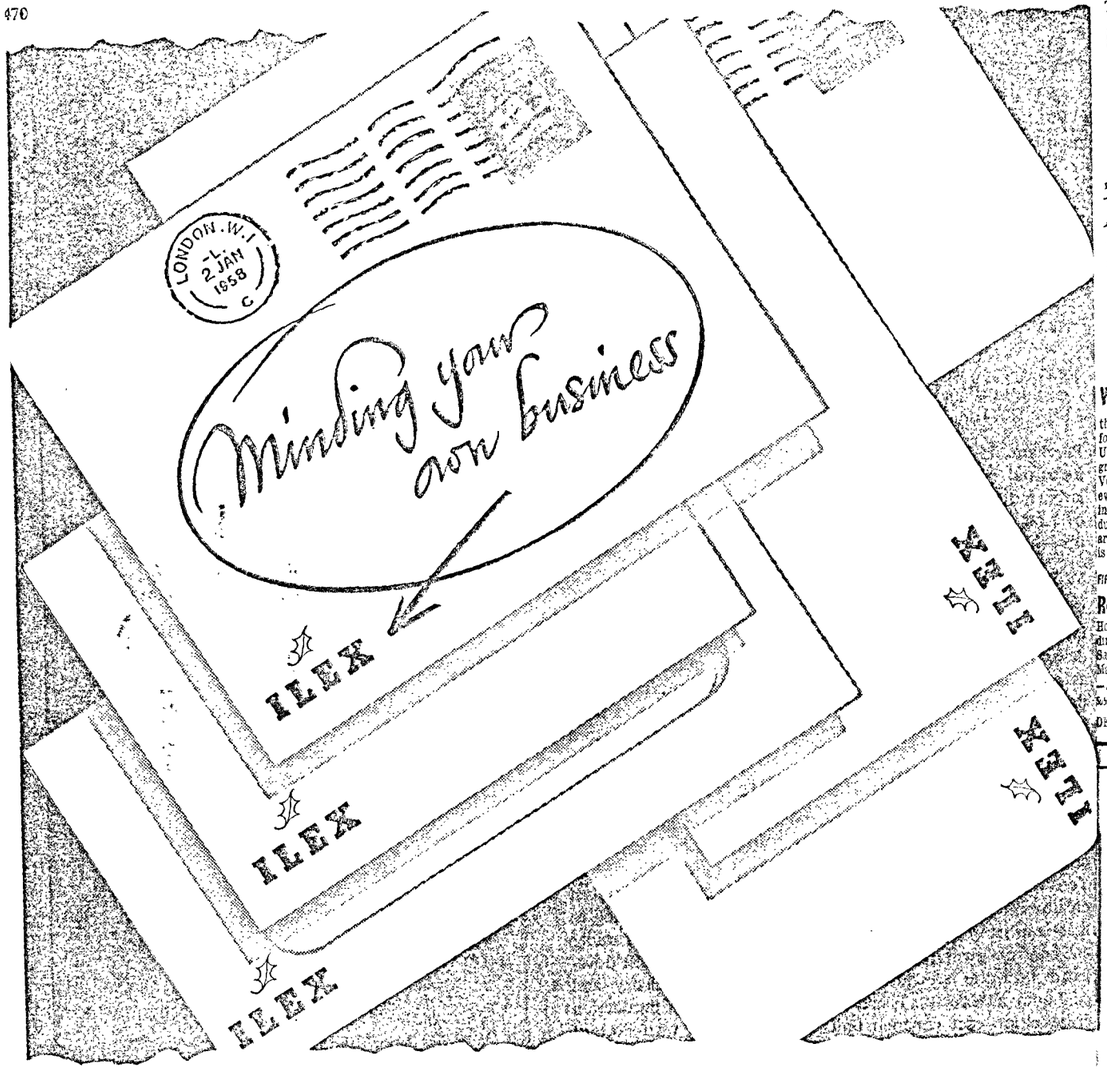
WE BUILD BY MODERN METHODS



Because we employ advanced techniques, we are able, without sacrificing quality,* to put up your factory faster, perhaps in only half the time you could have it built by older methods. You will get into production months earlier with a quick return on invested capital. With capital tied up at 6% this saving in time is a heavy saving in money. Every contract is kept under one control. Every operation is timed and its completion dovetailed into the schedule, ensuring maximum efficiency and minimum site delay. The use of planned factory production of precision cast concrete units, served by our own fleet of specialised transport—ensures control of quality, free from the hazards of the weather. Beecham methods mean rationalisation; and rationalisation means economy.

Office block for Messrs. Nortons-Tividale Ltd. Tipton, Staffs.

Interior: Central Engineering Works, Messrs. Bryant & May Ltd. Old Ford Road, Bow, London E.3.



Exterior: Messrs. Bryant & May Ltd.

Beecham quality signifies

1 A PERMANENT STRUCTURE, EASILY MAINTAINED
2 THE USE OF FINEST MATERIALS
3 AN INDIVIDUAL DIGNITY OF DESIGN
4 A FUNCTIONALLY APPROPRIATE BUILDING
5 A HIGH DEGREE OF NATURAL LIGHT AND THERMAL INSULATION

Strife?

ON Thursday, the House of Commons was debating a motion that sought to censure Mr Macleod for not fulfilling what one member of the Labour shadow cabinet actually called his "statutory duty" of attempting "to bring about a settlement of the London bus dispute." Into this debate is being thrown the demand that Mr Macleod should regard it as an even bigger duty to bring about a settlement of the railway dispute. What this demand implies, of course, is that it must always be in the nation's interest for ministers to try to influence employers into making further wage concessions in order to avoid a strike.

How can politicians—and a lot of the public—reach this conclusion? In general, no doubt, many well-meaning people reach it by emotion rather than by reasoning. There is a very common impression that those who call for resistance to wage inflation are all black reactionaries at heart: that they positively wish to grind the faces of faithful public servants, to be antagonistic to Mr Cousins for antagonism's sake, to be deliberately rude to the moderate Mr Greene, and to deny to trade unions their hard-won rights. But most of those who call for resistance are doing none of these things. No doubt, there are some old reactionaries who need to be reminded this week that trade unions in a free society have the inalienable right to strike; but there are apparently many more new reactionaries who need to be reminded that the corresponding right and duty of ministers, when the balance of the public interest demands this, is to let some strikes happen rather than to buy them off.

The sole question before Parliament on Thursday should have been where this balance lies in the bus and railway wage claims. Anybody who believes that Mr Macleod should intervene now to work towards a settlement in either dispute must presumably support his argument on one of two grounds. Either he must think that a further retreat before the unions would be good for the living standards of the British people as a whole, or he must think that social justice to the busmen and railwaymen demands such an intervention.

The first of these arguments, at any rate in its simplest form, hardly arises in the present disputes. Nobody, surely, can think that an inflationary settlement in the transport services would of itself improve the prospect for British living standards; everybody knows in his heart that it would lead to continued price increases, continued restriction on total production and a weak pound. If nationalised industries in deficit are going to continue to expand their deficits by expanding their total wage bills—instead of, at the most, keeping those wage bills stable and spreading them more generously over fewer men—then there is going to be no mechanism for getting people and resources to move into profitable businesses and out of businesses that are operating at a loss. This cannot be good for the British economy, any more than to take out essential parts of the engine can be good for a motor car.

Those who say that a retreat by Mr Macleod would "remove hardship

from the British people" really mean that while an inflationary settlement now would be bad for the economy, they think that a strike would be even worse. This is a matter of opinion, to be weighed on the balance of evidence. So long as only the London busmen are on strike, that balance seems obvious; the temporary inconvenience now being suffered by Londoners is a bagatelle compared with the permanent ills that have been suffered by the whole country in these last inflationary years. If a railway strike looms nearer, and threatens to interfere gravely with production, the balance of disadvantage might seem more difficult to assess. Yet even if every single industrial and commercial worker were prevented from doing any work at all for two weeks—and if none of this work were made up after the strike was over—that would, after all, cut the national income for the year by less than 4 per cent; the restriction of production that has been forced upon Government policy by the fact of annual wage inflation, over several years, has been much bigger than that. On a hard-headed calculation, not on any calculation of class war, it still seems that it will be better for the British people as a whole to stand than to deliver.

THE second argument of those who think that a retreat before the unions is desirable is the social argument; whatever hard-headed (or hard-faced) economists say, the ordinary man avers, skilled omnibus and railway workers getting only £11 or so a week deserve to be given more money to live on. Now, there may be a case for saying that these depressed workers should be given more money at the expense of richer workers, or richer executives, or richer profit-makers; this is the stuff of redistributive politics, although many craft unions would join their fellow better-off in not agreeing with it. But does anybody believe that to yield in the present struggle, and thus start the spiral winding upwards again, would lead to such a redistribution? Has it done so in the past?

The point here is not simply that these poorer workers in the public services can gain disdainfully little from the annual twist of the spiral: it should be obvious by now that the only way in which railwaymen and busmen can be lifted out of being a depressed class is not by continuing this system of a small percentage increase for all union workers every year, but by re-organising the transport services so drastically that an economic (which means a radically reduced) number of transport workers can profitably earn better wages. The still more important point is that such redistribution of income as an annual wage inflation does cause is not a redistribution at the expense of the active and better off: most active people at work (whether they are union members or not) can usually protect themselves in an inflationary age by salary or profit increases in some way. The only real redistribution is at the expense of those living on fixed incomes; and of these, the retired and those living on state transfer incomes of one sort or another are by far the most numerous. This "reasonable man's view" that some wage increases ought to be granted to bus or railway workers at the present time is one of those nicely balanced arguments which has one foot on the widow and the other on the orphan.

Socially as well as economically, therefore, those who felt drawn to support this week's Labour party motion cannot preen themselves that they are on the side of progress or the poor. Under both heads, they have got their arguments the wrong way round. Any settlement, they assume, is preferable to any strike; in reality, any strike is likely to be preferable, socially as well as economically, to an inflationary settlement. This spring will prove to be a turning point for the British economy only if the Government can lead the public into recognising this trying but simple fact of life. To that decision the nation now comes very near

A Test for Testers

The West has not taken up Mr Khrushchev's offer to stop nuclear explosions. But an effort ought to be made to discover whether he means business or not.

NEED there be any more bomb tests after this summer? The present United States series in the Pacific began on April 28th. And Britain's latest big bomb was exploded at Christmas Island on the same day. This is the western governments' answer to Mr Khrushchev, and he (unlike Lord Russell) probably expected no other. The tests were planned months before the Russian offer and, after all, as President Eisenhower and Mr Macmillan say each week the seismographs did rattle badly during Mr Khrushchev's own, intensive series in March. Admiral Strauss and Dr Teller being the men they are (and the pressure in London to reach senior status in the nuclear club being what it is), an immediate western halt was impossible.

But what happens next? Mr Khrushchev's offer still exists. He has for the time being stopped testing. He can, of course, resume tests if he thinks the Americans have got dangerously far ahead of him in the Pacific in the next month or so. But retracting so open-handed a gesture may be tricky. Going back might be made almost impossible for him if the West were now to put a positive, and negotiable, scheme on the table for discussion at, or near, the summit. But Mr Khrushchev should not be ignored for too long; the West has lost enough points as it is by affecting unawareness of the chance he has given it to propose a way of stopping the arms race.

Mr Dulles seems to have grasped this and is moving toward a negotiated cessation of tests; he seems, too, in Dr Killian and Dr Bethe, to have found expert scientific backers within the administration itself. A fair measure of the pressure Mr Dulles is building up in Washington is Dr Teller's own proposal that the nuclear powers should work out a scheme to ration their radioactive fall-out. After all that Dr Teller and the Atomic Energy Commission have said about the smallness of the hazard which fall-out presents to health and genetics, this is a substantial admission. But it is not (*pace* the 618 scientists who wrote to Mr Macmillan) radioactivity that really matters in stopping the tests; after all, there have been no rallies grinding luminous watches underfoot in Trafalgar Square. What public opinion in the West and elsewhere desperately fears is that any chance of reversing the arms race itself may be missed.

Dr Teller would be hard put to it in any event to muster scientific agreement about the rate of fall-out that is tolerable. But as he wants testing underground and in outer space to go on unchecked, he is still very evidently committed to pursuing the arms race to a victorious scientific, and political, conclusion. It is his job to ensure that the United States could win such a race. The present Pacific tests, in which a principal purpose is to develop clean defensive weapons capable of intercepting Russian missiles coming across the Arctic and of interdicting Russian divisions from rolling to the Channel ports, are part of that policy. But the decision to race at all is a political, and not a scientific, one. Is the West prepared to say that it has no policy but Dr Teller's? If it goes on much longer simply talking about the need for clean bombs, the rest of the world is liable to assume that it has not.

AT present two other policies hold the field of discussion in this country. One, propagated by Lord Russell and the rest of the nuclear disarmers, by the *Daily Herald* and by the left wing of the Labour party, is that Britain should stop testing, unilaterally. Mr Macmillan can reasonably reject this. (Whether Britain should, on quite other grounds, have the bomb at all is another matter.) The saving in fall-out from a unilateral suspension would be minimal; the renunciation would not affect the big two who, in the last resort, are only concerned to watch each other; and Britain would still depend for its defence on the American deterrent. Mr Bevan has already put his foot down about moral responsibility. It is even doubtful if a unilateral British renunciation would really deter a fourth power from exploding its own bomb. There is little progress that way.

The other alternative is the official western policy in the United Nations sub-committee debates last year, tying a cessation of tests to a complete and controlled cut-off of production of fissile material for war purposes. This would be splendid, no doubt, but it would require a system of inspection of Russian industry so elaborate that the Communist regime cannot seriously be expected to accept it, initially at least. Mr Khrushchev has been at pains to make it depressingly clear that widespread inspection, in the Arctic as in the full open-skies project, is not to be considered; and if the Russians were to accept inspection for the cut-off, they could not well refuse inspection for general disarmament.

BUT can Mr Khrushchev be persuaded that to allow a little inspection is not necessarily to throw his cupboard door wide open to the Americans? It is, at least, worth trying. And if he had once experienced a monitoring system whose officials were not so numerous or so mobile that the energies of his Ministry of the Interior were quite taken up in keeping track of them, might he not be ready to go a step or two further after a time? This is the prospect—or, at any rate, the possibility—which a limited monitoring scheme to supervise the cessation of nuclear explosions could open up. Scientific estimates put the number of seismological stations which would have to be installed on Russian territory to detect major experiments at twenty-five or a little more. (To detect minor atomic explosions underground within the range of two kilotons—2,000 tons of TNT—might require up to a hundred stations, but this could be considered as a second stage.) No inspection scheme in any other sphere of disarmament would cause so little interference in Russian internal affairs. If anything ought to be acceptable—and, admittedly, nothing may be—this should be. For it is exactly on the issue of stopping bomb tests that Mr Khrushchev has chosen, dramatically, to marshal world opinion behind him. If he were to back down before a fair offer his defeat would be many times more crushing, in propaganda terms, than the ten-to-one Security Council vote on the Arctic last week.

The terms of such a western offer could be as innocuous as a two-year suspension of testing, with a minimum monitoring system, to which all powers (to preclude surreptitious testing in Mongolia or in the Sahara) would be asked to adhere. The period would be long enough to interrupt the present progression from the drawing board to the proving ground, and long enough to allow both sides to get worried and still recover their nerve. The time limit would allow testing to be resumed if the system clearly broke down, but it would be very hard for either side to back out after the two years were up unless public opinion were genuinely convinced of the need. To the objection, already being voiced in Washington, that stopping tests does not stop stockpiling, it can be answered that there are already, on every guess, more than enough bombs on both sides

to destroy the urban centres of the world. Quite possibly the small British stockpile could do it alone. What is needed is not foolproof schemes for ending war, but a practicable pilot scheme to create the kind of atmosphere in which the disarmament programmes the powers have been pushing at each other up to now might profitably be discussed. It is the old theory of the first step, revived by Mr Khrushchev's own words.

All this would involve western sacrifices of one kind or another. It may mean that Nato, despite the Pacific test series, will not get the wholly pure tactical weapon it wants. But can the convention of a limited, clean, nuclear war be established at all? It may mean that the American prospect of safely picking off Russian missiles over the Arctic will not materialise. But one of the big dangers of the arms race has been precisely that one side, believing itself immune, would step too close to the brink—for everyone's safety. Why not let the deterrent operate, until it can be dispensed with altogether? To stop tests now would mean that Britain cannot catch the other two nuclear warriors up, and that France and others could not even enter the race. But would the sacrifice be so intolerable if it induced the Soviet Union, in return, to give up for the first time its constant refusal to allow international inspectors to be stationed across its territory? It is all very well asking the Russians to send experts to discuss inspection systems; it would be far better to impress on the Russians and on the world right away how few inspectors the West is asking for in the first stage. Then it will be up to Mr Khrushchev to show whether he means business or not. What the West, or individual western powers, cannot afford is to let the rest of the world think that it does not mean business itself.

Gaining on the Roundabouts

Travelling fun fairs in Britain are now a very prosperous, and monopoly-minded, trade.

THERE was again a prosperous start to this year's season for Britain's travelling fun fairs. In London alone, in spite of grey skies and cold winds, more than half a million people went to the Easter fairs on Hampstead Heath, Wormwood Scrubs and Blackheath; and from now until late October some five thousand showmen will be travelling the country with their bright lights, bumper cars, candy floss and amplified rock and roll, holding between 250 and 300 fairs a week. At some individual fairs, notably at Newcastle, more than a million people attend, a high proportion of them teenagers with money to burn; and it is largely on this rock of teenage spending that the prosperity of fair business is now built.

The centre of a modern fair is usually ten to twenty "riding machines" (as all power-operated fair equipment is called). These machines include dodgems, roundabouts, switchbacks, octopuses (in which the cabin itself spins at the end of a long rotating arm), speedways, and, most recently, "jet rides" of various sorts. Their popularity was explained by the owner of a large (£14,000) dodgem machine, a man whose wealth is sufficient for him to be known in the trade as a "master rider." "Dodgems are always in demand," he said, "but more so in upper class districts. Working class boys and girls prefer the switchbacks." Asked what changes of taste were taking place on the fairground, he was emphatic. Mild amusements such as tunnels of love and ghost trains are on their way out. "Today you can't get people to pay for anything that doesn't look as if it can kill them." "And," he went on, "that presents quite a problem, because, although it must not look it, our machinery has got to be 100 per cent safe."

Prices for rides vary, but they are usually a shilling a time. This is the maximum charge that the LCC (which lets out London's bank holiday fair grounds) allows on all large machines, including the Big Wheel. In country districts, where prices are not under statutory control, charges are much the same as in London, since a shilling seems to be what the public expects, and is willing, to pay. Occasionally at a very busy period, such as a bank holiday Monday, prices are raised, but more often this is done indirectly by shortening the length of the ride, which in London (by LCC ordinance again) may not be less than two minutes. These prices have increased by less than the rise in the general cost of living since the 'thirties, and on the face of it, showmen would seem to have been squeezed by inflation. "But we mustn't complain," one said, "because youngsters have more money to spend."

But the master riders do complain about some other things. Prices of their equipment (made by only half a dozen firms) have risen sharply, much more than the increase in the general price level, and today individual bumper cars cost £350 (including 30 per cent purchase tax) compared with £70 before the war. The prices of superstructures and other mechanical fair equipment have risen in the same proportion, while obsolescence, due to rough handling and changes in public taste, can be fast and costly. Crowd control is another problem, and one on which a good showman must be an expert. "Of course, you get people who are tough" a jet ride operator said, "although they are not the people you might expect. Students are the worst for causing damage, while teddy boys fight among themselves more than on the machines." Litter, which gets worse every year, is a constant trouble.

Encircling the riding machines are the side shows, which vary from batteries of penny-in-the-slot machines to hoopla, bingo, rifle ranges, coconut shies and stalls selling toffee apples (and pears), hot dogs and doughnuts. These are mostly owned by "master men", who are employers (as often as not of their own children), but not on a sufficient scale to be known as "riding masters." The trend in their business is towards the rifle ranges and hoopla, and away from the more energetic sports. "The reason is" said a woman standing dejectedly by her empty coconut shy, "throwing is too much hard work for people nowadays." But is not at all certain that she was right.

A more evident reason is that, as coconuts are expensive, coconut shies have become dearer too; and it is not so easy to keep costs down by rigging the coconut stands, because a beefy East-ender who hurls his ball squarely at his target, and then finds that it does not fall, is apt to become very annoyed. In other sideshows, it is easier to keep charges low but deceive the customer's eye. At some hoopla stalls, tempting prizes are on view which the hoops will not really go over; and the sights of many rifles on ranges where prizes can be won are well out of true. There is no real check on these practices, even at fairs in London where LCC inspectors and plain clothes men patrol the fairgrounds; the officials are there to see that price controls are obeyed, that crowd control is efficient, that pickpocketing is prevented—not to protect the mugs.

THE showmen, of course, put this problem of prizes the other way round. "Until I caught on," a rifle range operator alleged, "a guardsman could come along and easily win £1 of prizes for 6d." So now he runs two stalls: one for experts with no prizes, and another where you can can win by knocking over a prize with a cork (a matter of luck heavily weighted in the showman's favour). A system used at other stalls is to make it easy to win something, but to see that the something is so cheap that to give it away makes little difference to the showman's profits. An increasingly frequent prize at sideshows is a goldfish in a jam-jar; these are very popular with children, even if less so with parents who have to carry the fish home.

These are the showmen as the public sees them. But at other times, their life forms a strong contrast to the spirit of holiday at the fair, for the showman's life is first and foremost one of hard work. At least once (and at the height of the season as many as four times) a week they must take down their large machines, pack them on to lorries, drive to the next fairground and put them up again. Work may go on for sixteen hours a day at such times, so that casual employees hired from the Labour Exchange will rarely stick to the job for more than a few weeks; the showman has thus to rely largely on his family for help. This does have the advantage of keeping the money in the family. That there is a lot to keep is shown both by the splendid caravans in which most showmen live, and by the fact that many have houses as well in which they spend the winter, recuperating after the summer's work.

But if hard work is one reason for the showmen's prosperity, another is the tight monopoly that has been established over the trade. This is exercised through the Showman's Guild, to which more than four fifths of Britain's showmen belong. It has been said that to be admitted to the guild (originally the Van Dwellers' Protection Association) you have to be born in a caravan, and this is very nearly true. Every application for membership is carefully vetted, in such a way as to make it nearly impossible for anyone with no experience of fair business to enter it; and anyone not in the guild will find it difficult indeed to get his tender for a fairground site accepted. Often a whole ground is taken over by the guild, and let by them to individual showmen.

As well as protecting its members from outsiders, the guild protects them from themselves. The country is split up into ten areas, and no showman may take his fair out of his section. When any member has used a site at a fair for two or more years, no other member may take it away from him by bidding a higher price. If a showman thinks that he has been "unfairly" outbid, the guild gives him a right of appeal, first to his area committee and then, if he is not satisfied, to a central tribunal.

The guild helps its members in many other ways, by bargaining energetically with local councils and by forming a pressure group for showmen's interests in Parliament. It also prescribes minimum living standards for fairground workers (every one of whom must have a

dustbin with lid, lavatories and fire fighting equipment), and in this way helps to keep clean the trade's employment record which would otherwise easily be open to abuse. The guild is therefore not an unmixed misfortune. Although many hard things are said about fairs, and sometimes rightly, they do provide a much-needed outlet for the energies of the town adolescent as well for children of all ages. And their vulgar vitality probably comes as close to the spirit of their customers as does any other entertainment there is.

NOTES OF THE WEEK

NATO AT COPENHAGEN

The Play's the Thing

In customary suits of solemn black, the fifteen Nato foreign ministers met this week to peer from Christiansborg at the cloudy summit. What they could see of it looked very like a whale. The battlements at Elsinore, a few miles along the Sound, might have yielded a better view —and a forceful ghost to help them to make their minds up. As it was, their native hue of resolution seemed just as sicklied o'er with the pale cast of thought when they parted, as when they met ; and the solidarity they expressed is still liable to be more honoured in the breach than the observance (certainly the French, whose sorrows now come not single spies, but in battalions, will continue to regard Anglo-Saxon attitudes to North Africa as most foul, strange and unnatural).

Yet many a Polonius is ready with advice for the allies. Rather bear those ills we have, cautions M. Spaak, than fly to others that we know not of. Look here, upon this picture, and on this, urge the Shape planners as they contrast Nato's forces with the Red Army ; pity 'tis, 'tis true. Mr Khrushchev's antic disposition may set some tables in a roar, but those who feel that he protests too much his desire for a settlement merely comment that one may smile, and smile, and be a villain. The ministers assembled at Copenhagen seemed agreed that he would have to produce more matter, with less wit, if a summit meeting was to yield anything more than words, words, words.

Some fretful porpentines, however, find the ministers' views all weary, stale, flat and unprofitable. To them, Mr Dulles looks more like an antique Roman than a Dane now that the glass of fashion reflects shorter skirts. While he condemns the Soviet veto on Arctic inspection as a rank offence that smells to heaven, they plead that there is nothing either good or bad, but thinking makes it so. On the first day of the Copenhagen meeting, Mr Walter Lippmann (cruel, no doubt, only to be kind) gave warning that " the time is bound to come when the foreign armies leave the soil of Europe "—a very palpable hit. Those who share his views about disengagement feel, in effect, that there's a divinity that shapes our ends, rough-hew them how we will.

Against this, the statesmen who have to bear the free world's fardels contend that there is method in what others call " nuclear madness," that conscience must not make cowards of us all, and that even to accept the Rapacki plan would leave the Red Army with a dangerous superiority in bare bodkins. Mr Kennan's doctrines may be caviare to the general German, but Mr Acheson's verdict on them amounts to saying " Oh, what a noble mind is here o'erthrown." The dispute is an honest one ; neither party wants to see mankind hoist with his own petard, all are agreed that the time is out of joint, and there is general acceptance of the distinction between a hawk and a handsaw. But meanwhile the Copenhagen communiqué may evoke two comments from the gloomy ghosts of Elsinore: that brevity is the soul of wit, and—apropos of the slow march to the summit—that by and by is easily said.

Italy and Eleven Others

The Copenhagen communiqué seemed unduly complacent about the allies' success in shaping common policies by consultation. Something has indeed been done in this direction, but not enough ; and disconsolate Scandinavians and other representatives of the smaller allies were muttering about it in the corridors of Christiansborg this week. The mistakenly unqualified rejection of the Rapacki plan by the United States on the eve of the Nato meeting was a case in point. True, the good habit is growing of tabling a projected move in the permanent Nato council before making it. But if the initiating government gives its partners scant time to digest its project, they may have to choose between invidiously blunt opposition and reluctantly hasty agreement. Both the mechanism of consultation, and the spirit in which it is used, need further improvement.

That the American, British and French governments are not unaware of their twelve partners' dissatisfactions was indicated on Wednesday, when they publicly stressed the possibility of other western nations, " as for instance Italy," taking part in ministerial meetings with Russia. Nato's " other twelve " are most unlikely to insist on making future dealings with the Russians cumbrous by all sitting in on them together ; but they naturally do not want the working practice of western interests being represented by Britain, France and the United States to develop into a kind of divine right. They could perhaps more easily agree to be represented, when it comes to the point, by the United States alone ; but that would mean a real summit meeting.

POLAR DIPLOMACY

Skates Suit Mr Dulles

Poles of both kinds have taken a prominent part in American diplomacy this week. The human kind have been told as gently as possible why Mr Rapacki's proposal for the denuclearisation of central Europe is unacceptable to the West unless the Russians accept some degree of de-bayonetisation as well. The language of the American Note to the Polish government, if not its content, was warm ; at the moment the diplomatic cold fronts stand at the upper and nether polar extremities of the earth.

It is still a mystery why the Russians should have rejected the American plan for an Arctic inspection system so brusquely, against the raised hands of all the other members of the Security Council and the raised eyebrows of most of the world, including, it is said, the Poles and the Czechs. One possible explanation, fractionally more hopeful than the others, is that they are waiting to make a concession on this until they can try to exact their price for it at the summit. Mr Khrushchev's published tariff list includes terms ranging from the impossibly stiff, like the winding-up of American overseas bases, to the merely stiff, like a tacit western acceptance of the political *status quo* in central Europe ; it would be the West's task to seek the best bargain it can. A gloomier hypothesis is that the Russians are unable to endure the thought of any kind of effective inspection of any part of their territory, whether by American observers or neutral ones, whether operating from aircraft or radar posts, however mulish this makes them look in the eyes of world opinion. This indeed blackens the prospects for any kind of disarmament agreement ; but it also means that the West has only to go on making reasonable proposals for inspection and Mr Khrushchev's propaganda edifice will crack about him.

The American proposals for keeping Antarctica free of conflict are fresh evidence of Washington's rediscovered imaginativeness. Mr Dulles has revealed new graces since he moved out on to the polar ice of diplomacy. It has become plain that the nations taking part in the work of the International Geophysical Year round the south pole would be most unlikely simply to go home at the end of it. The problem is to keep them out of mischief. Like the Americans, the Russians no doubt want to reserve their right to stake territorial claims in Antarctica. But they would find it embarrassing to go ahead and stick their flag in the snow while engaged in a project sanctified by the holy names of science and international co-operation. They may also want to establish new stations in the region ; but under the treaty it would be difficult for them to use these for any purposes but peaceful exploration. Here, at least, the concept of the *status quo* works to the West's advantage. Mr Khrushchev may be a dab at punting a diplomatic football around the muddy fields of Europe ; put him on skates, and so far he does not compare with the Secretary of State.

STRIKES

London Without the Buses

The complete stoppage of London buses this week has not prevented most Londoners from getting to work on time. The bulk of the nine million journeys that are normally made by bus every weekday have been made instead by underground, by suburban railway, by private car or on foot. Very rarely, except in the case of casual shoppers, have they not been made at all. Meanwhile the Government's emergency measures to allow extra parking space in central London, and to enable owners of private vehicles to give lifts without incurring extra insurance liability, have paid quick dividends. The Automobile Association reported 10,000 extra cars coming into London on Monday, and traffic congestion was at times severe in and around the City and at heavy traffic points such as Hammersmith, Clapham and the Oval. But after the first day, motorists avoided the black spots as much as possible. On the former bus routes themselves, certainly in the middle of the day, traffic has if anything flowed faster than usual. The absence of London Transport's 8,400 buses and trolleys has thus been much less crippling than some people imagined.

However, the test for both the public and the busmen will really begin next week, when the novelty of the strike has begun to wear off. Especially if it starts to rain, the public can be expected to complain much more loudly than it has so far. The busmen too have their problems, existing as they are now on strike pay of £2 a week, plus 10s. for their wives, and 5s. for each child under 15 ; many of them are committed to regular hire purchase instalments and have already begun to tighten their belts. As this becomes general, some observers suggest that more men can be expected to join the hundred-odd workers (only eleven of them drivers or conductors) who have reported for duty already ; but London Transport, though it is paying these strike-breakers, has not yet dared to send any of them out in a bus.

One disturbing feature stands out in what has otherwise been a most orderly dispute: the decision of the Transport and General Workers Union not to allow its 3,000 oil and petrol truckers to make deliveries to coach depots, or to service stations where coaches regularly refuel, until these depots have obtained a release from a local union official. The release is granted only if the company promises not to run additional services during the strike. As yet few of the larger undertakings have agreed to this. There is indeed some question about how far firms and garages that refused to supply coaches with existing stocks of petrol, even though they might be under the shadow of union intimidation, would be acting within their legal rights.

WAGES

The Engineering Claim

As was to be expected, the fifty-two members of the national committee of the Amalgamated Engineering Union, who have been meeting at Great Yarmouth for the past fortnight, decided to ask the other unions in the Confederation of Shipbuilding and Engineering Unions to join in presenting a substantial pay demand for the country's three million engineering and shipbuilding workers as soon as possible. As was also to be expected, the other unions have agreed. The twelve-month standstill on engineering wage demands, which was accepted as a condition of the wage increase given last May, runs out in two weeks' time. Since the confederation is also committed to continue bargaining for a shorter working week, and since the AEU now wants it also to plead for an agreement over redundancy that would make it all but impossible for a firm to dismiss workers however overstaffed it might be, the leaders of the engineering unions will have an almost embarrassing scope for their negotiations in the next few months.

But although the resolutions that were passed by the AEU committee were conventional enough, two points of interest emerged at Great Yarmouth. The first was further evidence of the struggle that is going on inside the union between the communists, led by Messrs Birch and Berridge, and the moderates whose leader, Mr Carron, is president

of the union. Two years ago the communists seemed to have a good chance of getting control of the union's central policy-making body, the seven-man executive council, but now they are losing ground. Two leading communists, Mr Scott of London and Mr Howarth of Sheffield, have been voted out of office and Mr Ullyat, also from Sheffield, was recently suspended after being accused of infringing union rules. Thus it was that Mr Carron felt strong enough to say some reasonably sensible things last week. What happens to the engineering wage claim will no doubt largely depend on what happens on the railways. But one's guess after Great Yarmouth is that, in certain circumstances, some leaders of the AEU might accept shorter hours as an alternative to higher pay; and that the militants' call for direct action if the wage demand is not quickly met need not yet be taken too literally.

It was just this sense of urgency over the pay claim, however, that provided the conference with its second point of interest. For many delegates are afraid that, by the time that the claim is finally settled, the autumn will have arrived and negotiations on the 1959 cycle of wage demands will already be under way. This would mean that the engineers' claim had virtually skipped a year and that the standstill agreed in theory a year ago had become a standstill in practice. There is at any rate likely to be a lag of 16 months between one increase for the engineers and the next, only a little shorter than the period which the British Transport Commission is trying to get the railwaymen to accept. The gradual spinning out of the time between wage settlements in the last two years has already extended the twelve-month cycle for wage increases into a 13- or 14-month one in many cases. It is not inconceivable that one consequence of this year's wage battles could be to extend the cycle to three or four months longer. And some observers are suggesting hopefully that a 4 or 5 per cent wage increase every 16 or 17 months might be approximately the sort of average increase that the economy could afford without inflation once industrial expansion is resumed.

FRANCE

French Socialists Reconsider

M. PLEVEN'S unavailing effort to form a government has had the centre of the Paris stage this week, but it is the evolution of Socialist party thinking on Algeria that may prove to be the year's most significant news from France. Willingly or unwillingly the leading men of the party seem to have agreed that change must come; if not, it might be imposed on them from below. M. Mollet's advice against participation in a government which must still be dominated by the Right is the first step back. This decision means, immediately, the prising loose of M. Lacoste from his ministerial seat in Algiers, without which nothing new could be done. It also means the departure from the Quai d'Orsay of another semi-fixture, M. Pineau, whom M. Lacoste has now accused of diplomatic bungling after the bombing of Sakiet.

What finally made up M. Mollet's mind against participation is not certain. In view of his personal penchant for M. Pleven, it must have been a powerful motive. There was an opportunity for plain speaking at the Socialist International meeting in London a week ago (after which *Le Populaire*, in reporting the resolution that was passed, still saw fit to delete the suggestion of Algerian independence). M. Mollet's tactics will have been influenced by the realisation that the party can no longer accept conservative ideas of how to pay for the war in Algeria. The nationalised industries are restive enough already. Once in opposition, the party can be more choosy in what it votes for and can rally the ranks which, as M. Daniel Mayer's resignation of his Assembly seat emphasises, have been hard pressed to remain steady under the discipline of office. The Socialist congress in June could be a decisive turning-point in the party's fortunes—and in the fortunes of North Africa.

ADEN

Arabia Infelix

IT is now clear that the Yemen's contribution to the United Arab State is in the form of trouble for the British Government in Aden and the protectorates. This week's crossing of the border by the RAF will make it clear to the Imam of Yemen that he is not to have it all his own way.

In Aden Colony, meanwhile, a state of emergency has been declared after bomb outrages in two restaurants and the large Yemeni portion of the population naturally comes under suspicion. For years these Yemenis have been useful workers and law-abiding residents in the colony. They have enjoyed the blessings of peace, a relative prosperity, and a lack of the oppression they left behind in Yemen. It has probably never occurred to them that Aden is not the showplace of the British Commonwealth. Whether politically-minded or not, they have been content to have a refuge from the system of crushing taxes and hostages that keeps the Imam and his family in power.

As the junior partner in President Nasser's state, Yemen has powerful help from Cairo radio and a supply of Russian arms. Its actual claim to Aden and the protectorates is a flimsy one. It is true that the greater part of southern Arabia fell into the hands of the Imams of Yemen in 1630, but by 1730 they had been expelled from Aden and the other districts by the indigenous Arab tribes who assumed independence. It was with the leaders of these tribes that the British made the series of treaties on which the Colonial Office system in southern Arabia rests. The term "occupied Yemen," as now used by carefully tutored Yemeni officials, comes from the jargon of Cairo radio.

The problem of Aden and the protectorates cannot for long be detached from the political problem which confronts Britain all around the coasts of Arabia. Perhaps it is not too late for the British Government, while sheltering the protectorates from the ambitions of a medieval theocracy, to set up the framework for a wider settlement which may, one day, result in the establishment of a common cause with modern Arab nationalism.

DEFENCE

Whose Hand on the Policy?

A POLITICAL row is obviously in progress behind the scenes about who should determine this country's defence policy, and how. When the Prime Minister was Minister of Defence, he is known to have become firmly convinced that the holder of that office should be the decisive overlord, and that the Admiralty, War Office and Air Ministry should gradually dwindle into being very subordinate departments; Mr Macmillan never took kindly to the process of settling a defence policy by a split-the-difference arbitration award based on the competing shopping lists of the three separate services. When Mr Sandys succeeded Mr Anthony Head at the Ministry, his first white paper came much nearer to being an imposed policy, and departed much further from being a horse-bargained one, than any annual defence statement before. But the objective of many senior serving officers since then has been that some of the sweeping theories that Mr Sandys set down on white paper should not be too brutally translated into practice. Now that changes in the Chiefs of Staff Committee are imminent, in the normal process of service retirements, it would not be surprising if a certain jockeying for position was going on. The struggle may be, and is being, loosely called a struggle between those who want greater "unification" of the services (i.e., greater power for the Ministry

The Air Force Shows Its Shopping List

Our special correspondent writes:

IT would be an exaggeration to describe the remarkable conference held by the Air Ministry on Tuesday as a direct appeal to public opinion over the fiery head of the Minister of Defence. Yet the policy that was outlined to 300 guests—including the Duke of Edinburgh, six clergymen, eight mayors, several members of the general council of the Trades Union Congress, some headmasters and a representative of the Rugby Football Union—will not be found in Mr Sandys's white papers on defence. It was too boisterous, ebullient and expensive to fit into that austere framework; it filled the air from tree-top level to outer space with bombers, fighters, missiles, freighters, helicopters and undefined vehicles. It was, in short, the Air Staff's shopping list which it presents every autumn, along with the other services, to the Ministry of Defence—and which appears sadly mangled and cut down to size in the defence estimates the following spring.

If this had been firmly stated at the conference, a public exposition of the tasks and working methods of the Royal Air Force might have done nothing but good. The arguments behind the deterrent strategy and about the need for nuclear and thermonuclear weapons certainly made a profound impact on sections of the audience. But for reasons of their own, the chiefs of air staff chose to play down the coming role of guided weapons, while emphasising that of the piloted fighter and bomber—in such a way that they have only themselves to blame that many people left the conference with the impression that they were out of sympathy with Mr Sandys's basic policy.

This is unfortunate because it is not the case. The Air Ministry would be the first to complain if no ballistic weapon were being developed in this country—or no anti-aircraft missiles. It has been one of the principal advocates of the theory that a bad missile is still more deadly than a good aircraft. Yet the Air Council, and in particular the Chief of the Air Staff, are extraordinarily reluctant to accept the logic of their own strategy, and they have devoted a great deal of energy to trying to carve out a niche for the redundant pilot. A case was argued on Tuesday for studying, if not actually developing, a manned replacement for the present V-bombers and a manned fighter to replace the P.1 fighters at the end of their life. These are aircraft which could not come into service until 1965-70; by then, the outsider would suppose, missiles might reasonably be expected to have reached a higher standard of reliability and accuracy than they possess today. But the RAF's denunciations on Tuesday made no mention of this. The pilot, they argued, has "discretion" that a missile can never possess; they did not say that a pilot also has a soft, weak human body that is pulverised, and a brain that is blacked out, by the kind of operations that a missile's electronic brain can carry out from sheer *joie de vivre*.

There is no reason for thinking that the RAF's arguments on this point will cut any ice with the Ministry of Defence. The crude object of the deterrent is to be able to hit the Kremlin if and when the Kremlin hits Whitehall, and it will only be necessary for this purpose to be able to hit it once. If a ballistic rocket fired out of a rabbit-hole in the ground will do the job in about thirty minutes, there is no strategic reason for backing it up with the elaborate insurance of a fleet of relatively slow manned machines. And there is every possible economic argument against dissipating scientific resources and taxpayers' money.

At the other end of the scale, however, the RAF was fully justified in hinting at the coming expansion of Transport Command, even though this is likely to mean building an ultra-heavy military freighter with little or no civil application; and also in forecasting the purchase of new, bigger helicopters and small, light fighters. All these machines are needed to back up those operations where the RAF has to act, not independently, but in support of the army—whether it is moving tanks and troops across the world, dropping them in awkward places, or shooting up forts in the Persian Gulf. In these circumstances, however, the Lords of the Air become the servants of the ground. Understandably, it is not a function to be relished as its main job by any fighting service. And, subconsciously, the RAF fears that the Sandys doctrine may eventually condemn it to concentrating on this function alone. The real difference between a strategic deterrent based on a missile and a manned aircraft is that the former could, strictly speaking, be maintained on a civilian basis and fired, not by a pilot in a space suit twelve miles above the earth, but a Prime Minister in a bunker in Downing Street. There will be no more Battles of Britain for the RAF.

Between these two extremes of function lies an area of genuine argument: it turns on the extent to which the RAF should be equipped to support the ground forces of Nato. At bottom, the Sandys doctrine assumes that these forces would never be used—because aggression in Western Europe would be the signal for a thermonuclear free-for-all. It follows that expensive "conventional" aircraft such as low-level bombers, massive interceptor and strike fighters are unnecessary and that it would be foolishly wasteful to develop them. But in the interests of keeping the Nato alliance together, Mr Sandys may feel that a gesture in this direction is becoming necessary. It is conceivable that the RAF may get a tree-top level replacement for its Canberra bombers and/or a new photo-reconnaissance aircraft, either of which would perform this window-dressing function for Nato. The RAF this week told the public eloquently, and sometimes wittily, what it would like to have; understandably enough it took the occasion to ask for the moon. Perhaps the Treasury should enter into the spirit of the thing by staging its own one-day conference to explain to the public what the country can afford.

of Defence) and those who bitterly resist it. In these circumstances, some people have read a special and undesirable significance into the extraordinary public "conference"—it might better be called public advertising campaign—mounted by the Royal Air Force at the Royal Empire Society's headquarters in London on Tuesday. This conference was not necessarily quite as unconstitutionally novel, nor as undesirable, as some commentators have suggested. The different services, with the navy conspicuously not the most silent, have for long privately (and not so privately) touted their cases for being given more money; they have spread their arguments freely among all those whom they think might help them with propaganda support. If this touting were now to become more open, that openness might be a good thing; the proper way to run a defence policy may well be for the Minister of Defence to make decisions after the widest and most informed public debate that security considerations will allow. Perhaps the RAF should be encouraged to put its case for expansion as openly as, for example, the British Transport Commission does in its annual reports. The distinction that has to be drawn, however, is between a service that is desirably putting forward its case for public debate, and one that is undesirably trying to steamroll it through by what might be called American pressure group tactics. Into which category did the RAF's "conference" on Tuesday fall? The reader can perhaps be helped to make up his mind by our special correspondent's report on the preceding page.

POST OFFICE

Everything Slows for No Tea

For more than a fortnight, post office sorters in the Strand, Bloomsbury and the City of London have been working to rule. The go-slow, which is recognised neither by the men's union (whose rule book specifies that no action of this sort should be taken until after a ballot of union members) nor by the post office, has delayed letters either posted in, or delivered to, the parts of London affected (all the EC and WC postal districts, and also W1). It has also held up incoming foreign mails, which are dealt with in these offices; and has thus caused inconvenience to many people, caused losses from delayed orders to some City firms, and aroused especially vociferous complaint from those press reporters who rely for their news on posted dispatches from abroad. Officialdom has unwisely tried to play down the importance of the dispute, and the carefully phrased announcement put out by the post office last week that there were hopes of a quick recovery has proved over-optimistic. The dispute has not yet been resolved.

The cause of the trouble is the package agreement on wages and hours of work which was negotiated between the union and the post office last July. By this agreement, which was backdated for a year, the post office workers were given increases of up to 22s. a week, and another 10s. a week was added to this last October; they were also allowed longer holidays and a higher bonus for night work. In return for these concessions, the union agreed to a reorganisation of the men's schedules to allow streamlining of services (such as fewer deliveries on Saturday); it also agreed, and this is the point at issue, to the working week being changed from one of 48 hours (including meal breaks) to one of 44 (excluding them). Because of some very unstreamlined organisation, these changes in hours came into effect only on April 16th, nine months after the general increase in pay.

The sorters now claim that the new arrangements about meal breaks, instead of shortening the working week by an hour as their union had imagined, have actually lengthened it. This, of course, is another way of saying that the meal breaks that were being taken before the change were much longer than they were officially supposed to be—a fact that will be borne out by most people who have worked temporarily in the post office—and a phenomenon that is not entirely unknown in the rest of British industry and commerce. The men also say that the new agreement has been interpreted too strictly by local controlling officers who, seeing no provision in it for tea breaks, have kept the men hanging around the office even when there was nothing particular to do—and when they would formerly have nipped out for a quiet smoke. This trouble has been mitigated by an undertaking given last weekend by the post office that short breaks in the morning and afternoon would be allowed as part of the "net" working week. But some sorting offices are still going slow; and efforts to redirect mail to offices outside the trouble areas have aroused resentment from workers who object to "black mail." The moral of the story for other employers is that, in making a package deal, it is much better to give the pill at the same time as the sugar, not nine months later.

EAST ASIA

Divided Countries

Three of Asia's problem children are in the news. There have been elections in the southern half of divided Korea; a more than usually outspoken exchange of compliments between north and south in divided Vietnam; and in neighbouring Laos, happily now reunified, partial general elections have given the communist-line Hakhsat party its first chance at the polls. The Laotian results are not yet known.

President Rhee's Liberals evidently hoped to win a two-thirds majority in the National Assembly at Seoul. This would have enabled them to amend the article in the constitution that provides, on the American model, for the accession of the vice-president if the presidency falls vacant through death or incapacity. Vice-President Chang is the leader of the opposition Democrats and Dr Rhee is credited with the desire to make sure that Mr Chang does not step into his shoes if he, Dr Rhee, does not last the course until the next presidential elections in 1960.

At last week's elections, the Liberals retained a working majority, with 122 seats out of 233. But the Democrats increased their representation from 46 to 77; the remaining seats are filled by independents. Since there is no discernible difference in political philosophy between Liberals and Democrats, the vote must be interpreted as an expression of dissatisfaction with Dr Rhee's regime and of a desire for a change. The size of the opposition vote, however, argues that the elections were reasonably free, in the towns at any rate.

In Vietnam the communist north, in a letter dated March 7th, proposed that the two zones should establish normal relations, discuss reunification, reduce their armed forces, and open north-south trade. South Vietnam's reply is of a vigour calculated to discourage further correspondence. President Diem's government reminds Hanoi that

"ALL THESE FIRES must be costing the country a terrible lot, in capital, lost production and so on. Can't anybody do anything about it?"

"Well, we reckon our new factory's about as safe as possible, you know."

"Special design and materials, I suppose? Our place was built too long ago!"

"Not only that. We've also installed one of those A.F.A. automatic fire alarm systems, whereby any fire sets off a little detector and calls the brigade automatically. You can do the same, however old the building."

"You're satisfied it really works?"

"Oh definitely. What's more, before we bought it we consulted our architect and the local fire brigade chief and they were all for it. All the best people have it, you know—like I.C.I., Metal Box, Cadbury's—and the Insurance Companies like it, too. We get a rebate."

"Do you now? Then I *must* look into it."

AFA

AUTOMATIC FIRE ALARMS

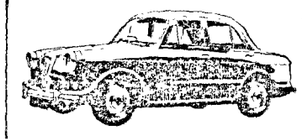
THE NEW Riley Two-Point-Six



With fully Automatic Transmission

The clean-cut elegance of continental lines combines with superb six-cylinder power and luxury equipment in the new 'Two-Point-Six'. And with fully Automatic Transmission, driving is effortless and safe.

The new six-cylinder engine gives its willing power with hardly a murmur. An entirely new suspension adds still further to Riley's traditional excellence in road-holding harmony. Brakes are power assisted. And there is comfort for six in rich two-tone leather seating surrounded by such top quality features as polished walnut veneer instrument panel and door cappings.

Three transmissions to choose from. A synchromesh gearbox with short sports type manual gear shift is standard. Optional equipment, at extra cost, includes overdrive or a completely automatic transmission.

Price **£940** *plus £471.7s. P.T.*

The new Riley One-Point-Five — *a compact 4 seater with brilliant performance, and low running costs. Price £575 plus £288.17s. P.T.*

Riley for Magnificent Motoring

the communist authorities have themselves hampered free movement between the zones, terrorising people wishing to join the million refugees who fled to the south after the end of the Indo-China war. Reductions in military strength in the south are contrasted with the retention of much larger forces in the north ; and the communists are asked to grant their people freedom to trade and "abolish the economic monopoly held by the Communist party." As for reunification (which, under the Geneva agreements that ended the Indo-China war, was supposed to follow country-wide elections) the north is asked why it has not, in contrast to the south, held elections in its own zone.

Though the letter is polemical, these points are well taken. The south is sometimes rightly criticised for lapses from western democratic ideals, but it cannot compete with the north in terms of repression.

GREECE

Athens, Cyprus and Nato

GREECE goes to the polls this Sunday, none too soon. It is just over two months since Mr Karamanlis resigned after defections within his own party deprived him of a stable parliamentary majority. Since then Greece has had a caretaker government and negotiations on Cyprus have perforce been virtually at a standstill. With the situation in the island (described by our correspondent on page 505) gravely deteriorating, positive efforts by the British Government for a settlement can hardly make things worse and may possibly arrest the present slide towards chaos. Sir Hugh Foot's return to London this week, in spite of the explosive situation in Cyprus, suggests that he at least is anxious to lose no time once a new Greek government is formed.

There is a reasonable chance that Mr Karamanlis will again be prime minister ; but his chances of increasing his majority (in 1956, his National Radical Union (ERE) won 165 out of 300 seats) or even of getting an absolute majority at all, are believed to have diminshed during the last two months. He has four main opponents: the Liberal party, led by Messrs Venizelos and Papandreou, which was the main opposition party in the last parliament ; an ill-assorted coalition of four parties, known as the PADE, which includes Mr Markezinis's Progressive party ; the Populist Party Union, a right-wing coalition led by Messrs Tsaldaris and Canellopoulos ; and, finally, the extreme left-wing EDA, which early in the campaign tried hard but unsuccessfully to form a popular front grouping.

As usual in Greece, the electoral fight is more over personalities than policies. On the domestic front, Mr Karamanlis has, in general, stood on his record, while his opponents have all promised the moon. On Cyprus all parties press, either truculently or merely firmly, for the same thing. Nor are they directly opposed on the question —which, thanks largely to communist agitation, has aroused a good deal of attention—whether Greece should agree if Nato were to ask it to allow nuclear missile bases to be stationed on its territory ; while Mr Karamanlis remains somewhat non-committal, the other parties are either frankly opposed to bases or else would only have them with serious reservations. But all, except the EDA, profess loyalty to Nato. One cannot help suspecting, however, that it is not missile bases, but Cyprus, that is most likely to strain the Nato link.

ELECTION STATISTICS

Which Tories for the Tumbrils?

THE *Liberal News* has now published a list of the 170 Liberal candidates who are already in the field for the next general election. By the time the election comes, some new Liberal candidates in other constituencies will no doubt have been adopted ; on past experience, some of these listed 170 may also have fallen out. The list, however, provides a starting point for study of a question that has recently been a subject for much pontification but very little analysis: namely, how far Liberal interventions seem to be a principal factor in threatening a massive Conservative electoral defeat. As an exercise in notional arithmetic, let us make the following assumptions about an immediate general election, assumptions that seem tolerably well in line with recent by-election results:

(a) In seats with a straight Labour-Tory fight, assume a 6 per cent swing Tory to Labour.

(b) In seats with a Liberal candidate, assume that Labour does not add to its vote, but that this Liberal candidate picks up (entirely from the Tories) *either* 20 per cent of the total vote, *or* 15 per cent more of the total vote than a Liberal got last time he stood in this constituency, whichever is the greater. (This is a pretty harsh anti-Tory assumption, about as bad for the Tories as Rochdale or Torrington.)

With a 6 per cent swing, and no Liberals intervening at all, one would expect about 100 Labour gains of seats from the Conservatives: that would give a Labour majority of up to 150 in the Commons. The candidacies now announced in *Liberal News* would, on assumption (b) above, cause an additional 39 Conservative casualties ; of these, 30 seats would go to Labour on the split vote, and the other 9 (including Torrington) to the Liberals. The Liberal interventions would therefore make a Tory defeat worse, but they would not be the most massive electoral factor.

It may be of some morbid interest to list the names of the Conservative cabinet ministers and prominent junior ministers who would lose their seats on the above assumptions. The most interesting Conservatives who would be unseated by a straight 6 per cent swing are, in order of vulnerability: Messrs Julian Amery, Heath (chief whip), Lennox - Boyd, Maclay, Sir Reginald Manningham - Buller, Messrs Alport, Soames, Dr Hill. Those added to the potential execution list by announced Liberal interventions, on assumption (b) above, are: Messrs Simon, Walker-Smith, and (so narrowly that one suspects that in practice he would just avoid it) Mr Heathcoat Amory. One other prominent minister who would be vulnerable, but who must have read *Liberal News* with great relief (as no Liberal candidate is yet listed for Saffron Walden), is Mr Butler. This list is, of course, in no way a forecast ; but it may be of some topical interest to others beside the gentlemen themselves.

LOCAL ELECTIONS

Bogey for the Boroughs

THE annual elections whereby the 401 boroughs of England and Wales renew a third of their strength were taking place on Thursday. The seats being contested were those last fought over exactly a fortnight before the

general election of 1955. The Labour gains that will be announced in the newspapers at the time that this issue of *The Economist* appears in readers' hands will therefore be a direct sign of the fall in Conservative popularity since that general election. To get back to its previous (1952) highwater mark in local elections, Labour will need to mark up more than 350 net gains of seats in the boroughs; most people expect it to do so. If it secures between 400 and 450 net gains, which some would say is a reasonable bogey, that might indicate a swing which, if spread evenly across the country, would bring Labour a majority of about 150 in the Commons in an early general election. If Labour's net gains go very much above 500 seats in the boroughs, that could be read as a sign that a Labour majority in an early parliamentary general election might go even above 200. The recent county elections suggested that the defection from the Conservatives in the more heavily populated areas (c.f., London) was even greater than in the partially rural ones; it will therefore not be surprising if Labour victories in the boroughs are near to the top of the party's best hopes.

As a sort of *hors d'œuvre* to the borough elections, however, the Scottish cities and towns, and the English and Welsh urban districts, rural districts and parishes have been voting this week. These results are always very difficult to analyse, because the non-party labels under which most councillors still stand are not always what they seem. For what the sum is worth, however, Labour needed to mark up rather more than 300 net gains in the English and Welsh urban districts to get back to its 1952 tidemark. By Thursday morning, with results from just over 2,000 of the 4,500-odd seats to hand (but admittedly many of them the safer seats), the Conservatives were conceding only about 30 Labour net gains in these urban districts so far. There does seem to have been a smaller swing to Labour in these urban districts than in the counties last month; one might also have expected rather more than the 30-odd net Labour gains in the Scottish urban elections on Tuesday. But Scotland often tends to be more stable than England in local government affairs. It is the results in the English boroughs that will be a more interesting indication of trend.

LOCAL GOVERNMENT BILL

Blocked Amendments, Wrong and Right

CONSERVATIVE backbenchers have demonstrated this week both the wrong way and the right way to kick over the traces. The occasion was the recommittal of the session's biggest measure, the Local Government Bill, which has reached the floor of the House again after thirty-one gruelling days in standing committee. The various major changes which it makes in Exchequer aid for local government will entail gains and losses for individual rating authorities. Broadly speaking, most of the poorer authorities will gain, and most of the losers will be either better off authorities or ones that spend part of their rate money on such things as advertising for visitors (which, as it is in these areas' own local commercial interest, the central taxpayer should not be asked to subsidise); in any event, the wind will be tempered to the losers by transitional arrangements under which in the first year they will bear no loss at all and for some years after only a portion of the loss. On Monday and Tuesday, however, a losers' demonstration was staged, led by the Members for Blackpool, on behalf of what were called "the Backbone of Britain": namely, the seaside resorts, spas, and watering places and cathedral cities, which were said to make up "the heartland of the Conservative party." This piece of constituency logrolling, which was surprisingly carried as far as the division lobby, may be good for local politics; but it makes for bad legislation, and Mr Brooke was right to resist it firmly.

There is, however, all the difference in the world between special local pleading and genuine national considerations; and the Government would do well even at this late stage to consider again some concession to the real anxieties of educationists, including many on their own side of the House. It was argued in these columns when the bill was first published that the case against the block grant would be much less strong if the formula for its distribution were made more flexible and purposive—purposive enough, in particular, to enable the Government to give incentives to local education authorities to improve below-average facilities. A very widely drawn enabling amendment on these lines was perfunctorily debated and dismissed on committee stage on April 22nd. A more narrowly drawn amendment, limiting the grants payable in respect of "special factors" to 5 per cent of the total, was tabled this week by a number of Conservative members. It was not accepted for debate: if it had been, the backbenchers would on this occasion have been right to press it and Mr Brooke wrong to resist it. It would be a sign of strength if the Government were now to adopt it or something very like it.

GATT

Judge on Trial

SACRED cows are entitled to respect, but they can trample on a lot of toes. Certainly last autumn, when the European common market faced trial in the world forum of the General Agreement on Tariffs and Trade, the six member countries of the new community left some sore feet behind them. Taking their stand on what seemed a pretty narrow legalism, the common market spokesmen appeared to challenge Gatt's fundamental claim to question the effects of their treaty and ask for changes in it. Their view of the sanctity of the treaty of Rome has caused many friends of Gatt to wonder whether it was the judge or the defendant who was on trial. Gatt has now held another meeting, which is described on page 508. It is welcome news that this time the Six have been more accommodating, recognising that it is in Gatt that the problems which their community poses for the world outside must be talked over.

Agreement to talk, however, has not solved the problems. Will the common market's common policies be determined by high-price (and hence protection-minded) members, with all the political implications that follow—or will the free traders and those who practise monetary discipline triumph? Or—to take a third possibility—will the differences between, say, an inflating France and the rest be so great that no community of policies will emerge at all? These are the considerations that lie beneath the anxious questions that the outsiders are putting. Will the external policies of the Six be restrictive? Will one country's payments difficulties lead to quota restrictions by the whole community? What does the "managed" market for agriculture mean? Major political questions which will remain

alive for many years are at stake. At the latest Gatt meeting the United States, which last autumn seemed to give the Six *carte blanche*, has taken up a more critical, though still moderate, position. The broader world interests which Gatt has to protect are beginning to be appreciated more.

Most of the issues between the common market and its critics are long-term in nature; but one of them has immediate significance—the dislike of primary producing countries, many of them from the Commonwealth, for the new preferences the Six are giving to their overseas territories. In the free trade area talks some of the Six still hope for a share in the system of Commonwealth preferences. The best start they could make would be to get on better terms in Gatt with the Commonwealth governments which give preferences to Britain.

PORTUGAL

Two-Way Warnings

HERALDED by the customary series of political trials, another of Portugal's odd election campaigns officially began this week. The only office at stake is the presidency of the republic, a post that has carried scant authority since Professor Salazar became prime minister in 1932; and it will evidently go to the official candidate, Admiral Americo Tomaz. Still, as a timely warning, several Portuguese who had espoused the opposition cause in previous elections have lately been brought to trial. Their fate will no doubt have some inhibiting effect.

But some of the cases have also aroused indignation—in particular, that of Captain Galvão, who had already been in jail since 1951. His new trial, and that of three associates, was held in secret, on the not implausible pretext that their crime was defamation of public figures (in leaflets smuggled out of prison). But the 16-year sentence imposed on the captain, a sick man aged 64, far exceeded the maximum penalty for such an offence. Only a month later, in late April, was it revealed that he had also been convicted of incitement to civil war. The secret procedure applicable to a defamation case thus conveniently enabled the government to avoid giving Captain Galvão even the smallest chance of recalling why he originally broke with it in 1947, when his report on slave labour in Angola was suppressed.

Meanwhile, the liberal opposition has, as usual, demanded specific guarantees of free and fair electoral procedures; as usual, it has been rebuffed; and, as usual, it has scratched its candidate, Admiral Quintão Meireles. But, against all Salazarian precedent, two other candidates remain in the field. Senhor Vicente is backed only by a small faction. General Humberto Delgado is more formidable. He has long served the government with distinction, and his candidature reflects the restiveness of a sizeable splinter group within the ruling National Union party itself. He has declared for the revision of electoral rolls and methods and against penalising opponents of the regime.

General Delgado will not obtain all those opponents' votes; apart from Senhor Vicente's followers, there are others who regard the general as tainted by his official career and who would have preferred a candidate such as the veteran ex-premier, Senhor de Cunha Leal. Yet many Portuguese will be impressed and heartened to see a challenger for the presidency emerge from the official hierarchy itself (the general has not, as yet, lost his post as director-general of civil aviation). They have also noted the refusal of the retiring president, General Craveiro Lopes, to stand again. In these various developments there are clear warnings for Dr Salazar.

PRISONS

Fewer First Offenders to Gaol?

SIR GEORGE BENSON'S First Offenders Bill, which received its third reading in the Commons last Friday, is a small but sensible measure which deserved its general welcome. Its effect will be to extend to adult first offenders two provisions that two postwar acts (one in 1948, the other in 1952) have already applied to juveniles: that first offenders should be sent to prison only if all other methods of dealing with them are unsuitable, and that magistrates must state in writing their reasons for sending a first offender to prison rather than dealing with him in any other way. The rather startling effect of the 1948 Act was to reduce the numbers of juvenile offenders sent to prison by 60 per cent. Evidently the more explosive type of magistrate finds that the need for self-justification in black and white has a calming effect.

The statistics suggest that this calming effect may sometimes be salutary. There is an astonishingly wide divergence of practice among the 1,000 odd magistrate courts in this country. Over the past six years Bootle Magistrates' Court has sent only 8 per cent of those indicted before it to prison, while Bournemouth and Eastbourne have apparently sent more than 40 per cent. As the maximum prison sentence imposed by a magistrates' court is usually six months, the Government spokesman last week declared

> We are faced with the fact that many people are serving sentences varying from two to three weeks or a month to six months, and we are advised by the Prison Commissioners that periods of that kind are of very little value for reformative training.

If Sir George Benson's bill really worked as well as the corresponding measure for juveniles did, there would be a reduction in the number of prison sentences on adult first offenders of 2,000 per annum—to the advantage of offenders, the prison service and the public purse.

Of the misgivings expressed in debate, some deserve to be taken more seriously than others. Critics who saw in the Bill evidence of a dangerously sentimental leniency towards criminals and of indifference to their victims should be reassured by the reminder that no court is constrained to keep out of prison an offender—adult or juvenile—who ought on due consideration to be shut up; the Bill merely demands that due consideration shall in fact be given. One point that deserves emphasis, however, is that more selective use of the prison penalty is going to mean more offenders on probation and an added urgency for the job, already overdue, of strengthening the overloaded probation service. Also, unless the notion is to spread around that every thug or petty swindler can reasonably hope to get one piece of thuggery or swindling for free, it is important that the penalties imposed in lieu of prison should carry a sufficient sting. Inflation has taken the sting out of a good many maximum fines; the scale should be stepped up. A tougher policy concerning restitution for the victims of theft, violence and malicious damage would also have a salutary effect. This bill is a sound move; but it needs to be balanced by others.

DEPORTED ALIENS

A Nasty Story

THE case of Mrs Anna Marcovic should not be allowed to pass without a lot of parliamentary questions. Deportation, unless it is being applied to a known undesirable, is always a distasteful procedure ; the breaking up of a newly reunited family under the notoriously illiberal immigration laws is more distasteful still ; and the circumstances of the Marcovic affair—the police irruption in the small hours, the confinement in a cell, the whisking off, in the physical grip of a hefty official escort, by the first available plane—are unqualifiably odious. The suspicion that has been aroused, of course, is that someone at the Home Office has been smarting, and out to reassert himself, after a couple of wounding defeats at the hands of liberal opinion and the human decency of his political chief. There was the case of the Hungarian Mrs Farkas and her fellow refugee ; the Home Office said they should go, the police came within an ace of successfully enforcing the order, and then Mr Butler let them stay. There was the more recent case of the Spanish conscientious objector ; the Home Office said he should go back forthwith to Spain, Mr Butler allowed him sufficient time to get himself accepted by a state where he would be safe. On both occasions Mr Butler got a good press ; the Home Office—and, in the first instance, the police—did not. This time, it seems, no risks were taken. Any protests, from press or Parliament, have come too late ; and the danger that a too kind-hearted Mr Butler might once again intervene was forestalled by a *fait accompli*.

No doubt the law has been literally enforced: as it used to be, in the days of the Settlement Acts, by those worthies who pushed women in labour across the parish boundary in wheelbarrows, so that their babies might not acquire a settlement by being born within their jurisdiction. But the spirit of the Settlement Acts, however congenial to the Home Office departmental mentality, does not much commend itself to public opinion today. However many warnings Mrs Marcovic had been given—and on this sort of point parliamentary questions are still awaited as we go to press—the technique of the early morning call does not commend itself either.

POLIO VACCINE

How Many Want It?

ONE of the mysteries about the dispute over the Government's polio vaccination programme, which reached its peak of acrimony in last week's debates with phrases like "manslaughter" and plumbing "depths of squalor," is how many children are actually registered and waiting for their first injection. At the end of February, fewer than half of the 10 million children entitled to register had actually done so and 2.7 million of them were waiting for their first injection. The proportion of expectant mothers who had registered was even smaller. This is a disappointing response, comparable with the bare 40 per cent of mothers who bother to have their babies inoculated for diphtheria. A sample taken by the Ministry of Health in March indicated that the proportion of children registered had then risen to 53 per cent of all children ; there have been more registrations since then but until full returns to the end of April are available (they should be available next week), it will not be possible to say whether or not the Government has misjudged the extent of public demand.

In the meantime, the Medical Research Council has not made Mr Walker Smith's task of explaining his arrangements to the House any easier. Doctors were sharply critical of the Government when the decision to issue vaccine was first announced two years ago ; they argued that it had been sprung on them without adequate consultation and they have remained fairly hostile ever since. Now that the Medical Research Council has lifted its last restriction on the use of American Salk vaccine in this country—the insistence that it must go through a separate 3-month safety test here as well as in the United States—the Ministry is free to draw on substantial American stocks of tested vaccine instead of being exposed to the uncertainties of current production. (The reasons why four separate batches failed to arrive from four different suppliers last month and so precipitated the present crisis were described in a Business Note on April 19th.) The waiving of the separate safety tests has come too late to prevent many people from feeling that once again the inoculation programme has been badly bungled. But another problem looms ahead. The real threat to the programme is not going to be the temporary dislocation of vaccine supplies, but the burden that inoculation throws on the doctors and nurses of the health service, who have to see that each child has two, and possibly even three, injections apiece.

PRE-SCHOOL CHILDREN

One Nursery and Another

IN 1946, as part of the material collected for the Royal Commission on Population, a survey was made of the circumstances and costs of all confinements occurring in Great Britain in the first week of March. A sample of the legitimate children then born has been periodically studied ever since, and the results of the investigations made in the first five years of their lives has now been published.*

The report is full of interest. It throws some light on why there are still big differences in the infant mortality rates of the various social classes, even though all the rates are much lower than they were before the war. By providing the facts, it also enables one to test some of the theories about the care of young children that have been put forward as explanations of delinquency or emotional instability and so on. For instance, the survey found that over half of the children had been separated from their mothers in their early years, and 14 per cent for four weeks or longer. When this 14 per cent was studied, it was found that separation did not affect the children adversely in any way provided they remained at home. Children sent away from home were more likely to have nightmares or other signs of instability, but the differences were not great. Similarly, no serious disturbances were found among the children of broken homes, and there was no evidence that children of working mothers are emotionally less stable than other children. Their only disadvantage seems to be that when ill they have more often to be sent to hospital—because, presumably, they cannot be cared for at home.

It is true that emotional instability may take longer than

* Children Under Five. By J. W. B. Douglas and J. M. Blomfield. *Allen & Unwin.* 177 pages. 21s.

Your expansion plans can be bedevilled by one or more of three great shortages – not enough money; not enough men; not enough space. Only Northern Ireland can offer you all three, in plenty. You will learn much by going and seeing for yourself.

MONEY – *to cut the need for investment funds*

Outright grants of 25% and/or loans for plant, machinery and buildings are available, also removal and training grants.

MANPOWER – *first-class and plenty of it*

Over 9% of the labour force – over 30,000 of them men – are looking for jobs. They are hard-working and loyal; absenteeism and labour turnover are low: output is high and shift-working is practicable.

PRODUCTION SPACE *in modern factories ready now*

If you employ mostly men you can rent a standard Government factory for about 9d per sq. ft. p.a. – room for at least 100% expansion. Or the Government might build you a special-purpose factory on amortization terms. Sites of all sizes are available.

EXCELLENT SERVICES

Modern transport services make delivery quicker and easier than ever before. Ample water, gas, electricity and housing.

SUCCESS STORY

Since 1945, over 130 new factories have opened in Northern Ireland, and many have expanded. Courtaulds, British Tabulating Machines, Metal Box, Du Pont, Chemstrand, Hughes Tool and many others will tell you of their experiences.

YOU CAN BE THERE IN A COUPLE OF HOURS!

Get in touch with THE NORTHERN IRELAND DEVELOPMENT COUNCIL (*Chairman : Lord Chandos*)
Dept. E7, 13 Lower Regent Street, SW1 *Tel : WHitehall 0651* (U.S. Office : 99 Park Avenue, New York 16, N.Y. U.S.A.)

five years to manifest itself, and it is therefore good news that the survey is continuing so that a picture will be obtained of the same children in early adolescence. The investigators have already had to modify their originally favourable view of the progress of premature children, who seemed to have caught up full-term children—except in height and weight—at the age of five, but who at eight years old were found to be backward in reading compared with other children. It may be, therefore, that the apparently favourable picture of "separated" and "broken home" children will later have to be modified as well. The important thing is that the facts are now available: a complete account of the environmental circumstances, conditions of living, illnesses and growth of Britain's children, normal and abnormal. The organisers of this survey have earned the thanks of all concerned with the welfare of the young.

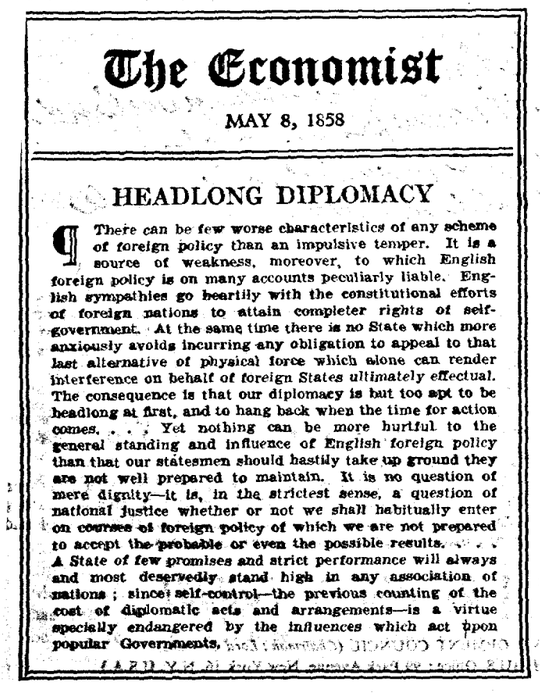
SOVIET UNION

Russia's Problem Children

Moscow's zeal in preaching orthodoxy to the communist parties of eastern Europe—which led it last month into the renewed clash with Marshal Tito—is not inspired only by fear of the disruptive effects of "revisionism" on the Soviet block. The Kremlin is aware that its own citizens, and the young ones in particular, are not heresy-proof. The impression of a state of ferment among the young has been strengthened by the recent congress of the Union of Communist Youth—the *Komsomol*, as it is called. In the early nineteen-fifties this giant organisation used to absorb more than a million new members every year. It reached a total of 18.5 million in 1956. But the membership in 1958 is exactly the same. This surprising stagnation is the combined result of expulsions, and stricter sifting of newcomers. The reason for such caution can be gathered from official pronouncements. It is admitted that unrest had made its appearance concurrently with the campaign against the cult of personality: "Some young people, mostly students, indulged in nihilistic attacks, playing down the achievements of the Soviet people and distorting our Soviet reality."

The restlessness of the young Russians has been aggravated by the fact that large numbers with matriculation cannot find university places. Despite the rapid expansion of universities and higher technical schools, the number of vacancies has not been keeping pace with the mass production of aspiring students by the secondary schools. At one stage, Mr Khrushchev tried to use the scarcity of vacancies in institutions of higher learning as a threat to curb the unruly, but apparently intimidation did not prove enough. Another line of attack is now being discarded: the attempt to discredit the intellectual rebels by identifying them with the *stylagi*, the Russian brand of teddy-boys. *Komsomolskaya Pravda* now admits that the wearing of a goatee is a question of personal taste, while narrow trousers may be suited to modern conditions of work.

Stalin, who had to purge the *Komsomol* wholesale when he established his rule, sought to channel the bold spirit of youth into pioneering work in distant lands. Mr Khrushchev, too, has tried to divert young energies into pioneering activity, but the problem of restless youth remains unsolved. It will not be solved, either, by cutting off contact with contaminated countries; the roots of Soviet "revisionism" are at home.



IRISH REPUBLIC

Standstill Budget

Our correspondent in Dublin writes:

The second budget produced by Mr de Valera's present government has been a very unspectacular one. No changes of any consequence were made and a budget speech of forty minutes was sufficient to dispose of the whole affair. This standstill in public finance comes after the Republic has had one of its best years for a long time. Exports in 1957 achieved an encouraging expansion and, quite against post-war practice, the balance of payments showed a small surplus. The national income, which had fallen in 1956, rose in 1957 to £468 million. Possibly most encouraging of all, the Republic has imitated Britain in showing a sharp recovery in savings: from £32 million in 1956-57 to £57 million in 1957-58. Nevertheless, the Minister of Finance wisely ruled that no reliefs could be given, although income tax has been at its war-time rate of 7s. 6d. for the last six years and the traditional taxes on consumption are at record levels.

This does not necessarily mean that any internal drop in spending is to be expected. Last year's high cattle prices should mean that private finances are better than they have been for some time. A great deal depends on whether such prices can be maintained. The opening months of the present year have seen a drop in cattle exports. This will also affect the balance of payments; and it cannot be expected that imports will remain much longer at their comparatively low level of the last two years.

HEADLONG DIPLOMACY

There can be few worse characteristics of any scheme of foreign policy than an impulsive temper. It is a source of weakness, moreover, to which English foreign policy is on many accounts peculiarly liable. English sympathies go heartily with the constitutional efforts of foreign nations to attain completer rights of self-government. At the same time there is no State which more anxiously avoids incurring any obligation to appeal to that last alternative of physical force which alone can render interference on behalf of foreign States ultimately effectual. The consequence is that our diplomacy is but too apt to be headlong at first, and to hang back when the time for action comes. . . . Yet nothing can be more hurtful to the general standing and influence of English foreign policy than that our statesmen should hastily take up ground they are not well prepared to maintain. It is no question of mere dignity—it is, in the strictest sense, a question of national justice whether or not we shall habitually enter on courses of foreign policy of which we are not prepared to accept the probable or even the possible results. . . . A State of few promises and strict performance will always and most deservedly stand high in any association of nations; since self-control—the previous counting of the cost of diplomatic acts and arrangements—is a virtue specially endangered by the influences which act upon popular Governments.

LETTERS

Kenya

Sir—In your article "Kenya in Context" you say "there can be no surrender to Mr Mboya in his present mood," and I would certainly agree with you if there were any evidence that Mr Mboya's mood were anything like your reading of it suggests. Since I have discussed the situation with Mr Mboya at various stages of the prolonged constitutional crisis and have some idea of his attitude towards multi-racialism, I wonder whether you would permit me to make the following points.

First, whatever the Europeans may think, neither they nor Mr Lennox Boyd have made him a fair offer. Mr Lennox Boyd offered the Africans six extra seats on the old Coutts franchise, deliberately designed to keep extremists out, and in return for this Africans were asked to accept twelve further members elected by an electoral college in which they would have less than a quarter of the votes. Moreover, Mr Lennox Boyd explicitly refused to make any declaration whatsoever which might remotely suggest that Kenya would ever become a democratic state. It is surely irrelevant to quote Mr Vasey as supporting an African majority, since he did not openly support such a proposal when he was a nominated Minister and failed to get elected on such a platform when he stood for a crossbench seat.

Secondly, Mr Mboya has always advocated a policy of gradualism in working towards the long term objective of full democracy. He has also made it clear that he would enter into genuine negotiations to work out appropriate safeguards for European rights even at the later stages of political evolution. By contrast Mr Blundell's electoral appeal in 1956 was that he sought to get the settlers into "the actual seats of power" before Britain got a Labour government. Clearly while Mr Mboya might go far to meeting the settler case he could not agree to this without utterly betraying his people. It is by no means perverse of the Africans to fear any policy which might lead to settler rule. Many white South Africans like myself must wish that there had been some African leader like Mr Mboya in 1910 to dig his heels in and prevent the setting up of a state which was destined from the start to be governed by some racial dictatorship like Strijdom's.

Thirdly, is there really any difference between your proposed policy and Mr Lennox Boyd's? Do you really imagine that after Mr Mboya's complete success in two elections among the richer, more educated Africans and after the resounding defeat of Mr Changa last year, there is really any hope of the four "special" Africans ever commanding support, however much authority they may be given? How much easier to give a pledge now that Kenya is destined to become a democratic state, to give the Africans a small unofficial majority in Legco, and to abandon the foolish attempt to impose settler ministers on the Africans. These, after all, were Mr Mboya's demands when he was elected last year.—Yours faithfully,

West Riding Council for African Affairs — John Rex, Chairman

Foreign Aid

Sir—We were most astonished to find, in a recent article in *The Economist* on assistance to underdeveloped countries, that you cite the United States, the Soviet Union, Great Britain, and Switzerland as contributing countries, but make no mention of France.

A report of the United Nations Economic Commission for Asia and the Far East, for example, places France second only to the United States in amount of financial aid given to underdeveloped countries. Despite its own need for capital to repair and replace the destruction wrought by the war and occupation, and to expand its own economy and living standards, France since the war has granted nations in need something like the franc equivalent of $600 million.

Furthermore, in response to the call of foreign governments, some 450 French experts today are serving as advisers and engineers in the development of 54 nations all over the world.—Yours faithfully,

Conseil National du Patronat Français — Bertrand Hommey

Liberals

Sir—Mr Bonham Carter refers me to the resolution of the Liberal Party Assembly passed in 1955. This resolution, of course, opened by expressing "great misgiving" that British agriculture was dependent on "Treasury grants of over £200 million per annum." It went on to detail six points about monopolies, import duties on agricultural requisites, credit facilities, adequate slaughtering, storage and distribution facilities, electricity development, and cheaper inland transport, and then added "until such time as these measures become effective, the need for some form of government aid is fully recognised." The words "some form of government aid" can hardly be said to constitute the precise endorsement of price supports which Mr Bonham Carter claims makes the position of the Liberal party quite clear. As Mr Alexander and his four Liberal colleagues in their earlier letter pointed out, the Liberal Assembly in 1953 pledged itself to the gradual abandonment of price supports subject to certain conditions which, Mr Alexander says, the Government is in process of meeting.

I presume Mr Alexander and his friends were also aware of the resolution passed in 1955 and yet they say, in April 1958, that "Liberals should now firmly advocate the abandonment of guaranteed prices."

I am not surprised that Mr Bonham Carter, fresh from the hustings at Torrington where farmers' votes were of some importance, has found it necessary to hedge. The kindest thing that can be said is that the position of the Liberal party on this matter remains obscure.—Yours faithfully, Bernard Braine

House of Commons

Systems of Voting

Sir—There is no doubt that the introduction of the alternative vote, as suggested in your article of March 8th, would improve the present electoral system. However, since it is almost true to say that any other system would be an improvement on the present method, the question surely is whether the alternative vote is the best possible reform. My answer would be that it is not, and that the ideal solution lies in the introduction of the single transferable vote in multi-member constituencies.

Now, this system was summarily dismissed in the second paragraph of the article, but several points made there deserve reconsideration. In the first place, there are some 300 different systems of proportional representation; the single transferable vote just happens to be the only one which fulfils all the requirements of a democratic electoral system without departing unnecessarily from traditional methods, and it is therefore quite wrong to suggest that proportional representation can be "more technically described as the single transferable vote."

Furthermore, to get the best results from the system, the country would be divided into about 125 constituencies, each returning between three and seven members to Parliament, not "gigantic districts with several members each," and would certainly not give all small parties a representation in Parliament exactly proportional to their vote in the country. A candidate would need about 35,000 votes in his constituency in order to obtain a seat. Therefore, while multi-member constituencies will ensure more accurate representation of the state of political opinion in individual areas and will therefore lead to a more representative House of Commons than the present system, and indeed than the alternative vote, it would still be theoretically possible for a party to receive 34,000 votes in each of 125 areas, a total of over four million votes, without securing a single seat.

In a study of the 1955 general election, I concluded that, if the single transferable vote had been in operation at that election, the distribution of the seats would have been something of this order: Conservative 247, Labour 261, Liberal 118, others 4. This would appear to make nonsense of the assertion that the House of Commons would be inundated with small parties.—Yours faithfully, Eric W. Crowhurst

University of Southampton

BOOKS

Washington's Last Years

George Washington, Vol. VII

By J. A. Carroll and M. W. Ashworth, completing the biography by Douglas Southall Freeman.

Eyre and Spottiswoode, 729 pages. 70s.

"HIS was the singular destiny and merit, of leading the armies of his country successfully through an arduous war, for the establishment of its independence; of conducting its councils through the birth of a government, new in its forms and principles, until it had settled down into a quiet and orderly train; and of scrupulously obeying the laws through the whole of his career, civil and military, of which the history of the world furnishes no other example." Thus Jefferson, no indiscriminate eulogist, and the verdict still stands. That American historical scholarship would wish to raise an appropriate memorial to such a *pater patriæ* is not surprising; that a Virginian should be the architect was particularly appropriate. But Douglas Southall Freeman, having established himself as the leading Washington scholar of his time, was denied the satisfaction of bringing his own splendidly conceived biography to a close. He died with one volume still unwritten, the one that was to chronicle the final years from 1793 to 1799.

Fortunately two of his most trusted assistants have rallied to complete the opus, writers who had so completely absorbed the objective, "What actually happened, as it happened," style and method of their master, that the seventh volume is virtually indistinguishable in temper and texture from the preceding six. It moves with the same kind of unhurried directness and dignity as Washington himself and makes its effects by its scrupulous precision, fairness and balance. Also, like Washington, it eschews the services of imagination and pursues the ideal of self sufficiency; the man, not his age, not his milieu, is the author's theme. And even in writing of the man, it is the conscious, the explicit, the self-documenting man that we are shown. The lighting too is even; there is no attempt to stress this or throw a shadow over that. This is surely as it should be. No subject, as has repeatedly been demonstrated, so ill repays the psychological or speculative approach as Washington. Few subjects present so few "problems"; none gain more by being given to us straight, as he is here. It is a matter for deep gratification that Freeman's great life is thus finished on the same principles as it was begun.

This last volume opens on a note not without its contemporary overtones. The great soldier is entering upon that second term as president which, as the story unrolls, is seen to be so much less serene than the first. He becomes involved, willy-nilly, in the clashes of faction, has to take sides in disputes within his own official family, finds his foreign policy an object of intense controversy, clashes with Congress and the Senate and finally is exposed to the bitter shafts of a malicious press. He is, in fact, during these years engaged in pretending to a supra-party role which it is impossible to sustain. The country has moved too far from the perils and ideals of the war years to resist the democratic imperative to take sides. Yet it still needs a unifying symbol and influence and at the price of accusations of hypocrisy and duplicity Washington provides them. It is his last great service. For the rest, there was the legacy of the farewell speech, and what should have been the graceful coda of retirement at Mount Vernon. In fact, of course, there was no rest on the plantation. The whirlpool of the French war threatened to engulf neutral America and once again Washington became Commander-in-Chief—he might even once again have been called to the Presidency, were it not that death called him first.

Pacific Mystery

Aku-Aku: *The Secret of Easter Island.*

By Thor Heyerdahl.

Allen and Unwin. 355 pages. 21s.

AKU-AKU is magical power and clairvoyance in the Polynesian dialect of Easter Island. One of Mr Heyerdahl's tricks of mystification in telling his story is to pretend that he was able to penetrate the secrets of the Easter Islanders by luck which they interpreted as magic. In fact, as the reader who is willing to overlook the tedious romantic trappings of the story soon finds out, it was due to his courage and charm.

Easter Island is the remotest corner of the Polynesian archipelago. Its colossal stone statues have been a mystery to archaeologists ever since they were brought to the attention of modern scholars by Mrs Routledge fifty years ago. Its present inhabitants, a mixed-blood remnant of a population harshly reduced by Peruvian blackbirders in the eighteen-sixties, have no knowledge of the history of the statues, and speculation about them has been wild and futile. Summing up the most recent researches, Alfred Métraux, an authority of high standing, came down on the side of a purely Polynesian origin for the traditional culture of the island. He thus disagreed with the theory, put forward a little earlier by Mr Heyerdahl, that attributes the island's extinct culture to South American sources. This book is, in effect, the story of Mr Heyerdahl's attempt to prove his hypothesis by excavation and experiment.

Mr Heyerdahl chartered a Greenland trawler, equipped it as an archæological laboratory, recruited a team of skilled research workers and got to work on the island. His excavations were guided in part by his theories but also by the somewhat unusual criterion of native legend treated as history. This led him to some spectacular discoveries. Thus native legend relates that the island was once inhabited by two stocks, a "long-eared", fair-skinned, red-haired aristocracy (later by implication equated by Mr Heyerdahl with South American immigrants) and a "short-eared" dark primitive stock (equated by Mr Heyerdahl with Polynesians). The "long ears" are said to have built a great ditch in which they kept fires going, in order to defend themselves against the "short ears." But the latter circumvented the defences and drove the "long ears" to their death in their own ditch of fire. Previous investigators had dismissed this legend as a myth about a geological fault. Heyerdahl dug and found carbonised material. Following similar clues he gained access to caves full of secret family hoards of sculptures quite unlike contemporary carvings. Again, Mr Heyerdahl persuaded some of the islanders (reputed to be descendants of the "long ears") to demonstrate the techniques of carving the stone statues using only stone implements, and to haul and erect them by means of stone ramps. He also got them to build a boat of fresh water reeds which he discovered growing in a volcanic crater on the island. The reeds are of undoubted South American origin and the boat is of a type that he believes might have been used by the South American founders of Easter Island culture.

In all the material thus newly revealed Mr Heyerdahl sees parallels with pre-Inca Peruvian culture. He concludes that there were three epochs in the history of Easter Island. The Peruvian "long ears" came over in the first period and were the creators of the classical buildings and statuary. Then came the "short ears" who overthrew them with warfare and cannibalism. Mr Heyerdahl's original hypothesis thus seems to be confirmed. But until the full records of the expedition are published the experts will have reservations. They will welcome the discovery of the different strata of Easter Island culture. They will not be wholly convinced by the parallels adduced by Mr Heyerdahl between the new material he has found and pre-Inca Peru; for this material has many features that can be just as plausibly attributed to a purely Polynesian origin. No controversies between the experts can however diminish admiration for Mr Heyerdahl's single-minded persistence and intrepidity.

Twisting the Dragon's Tail

Zeebrugge, St. George's Day, 1918

By Barrie Pitt.

Cassell. 237 pages. 18s.

ZEEBRUGGE was a commando raid, long before the technique of that sudden, dashing foray was perfected and long before it could be categorised with a name. Thus, set against the exploits of the second world war, it has an air of improvisation and makeshift. All the more credit, then, to the skill and valour which were there displayed. It heartened Britain at the right moment: the slaughter on the western front had produced three years of stalemate and then, in March, the Germans had broken through the British line. Morale needed a shot in the arm; at Zeebrugge the navy, which since Jutland and under the mounting pressure of the U-boat campaign had lost some of the nation's confidence, provided it.

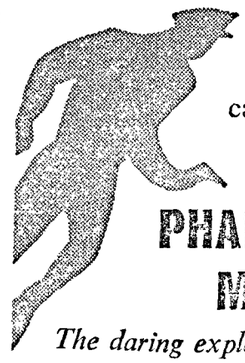
The account of the single action or battle has become popular, and Zeebrugge is an ideal subject for this kind of historical reconstruction. Mr Pitt has done his task well, leaning heavily on British accounts and drawing very little from German sources. His is a minute description: he records almost every burst of machine-gun fire. For those who enjoy the high heroic vein, his book will be thought to be well written. For those who do not, it may appear a little jingoistic. But none will deny Mr Pitt's descriptive powers, to which he here gives full rein. His hero is Admiral Keyes, a bold and forthright leader who showed his worth at Gallipoli and justly earned his fame in naval history at Zeebrugge. Mr Pitt has no villain, though he is critical of Admiral Bacon, who commanded the Dover Patrol before Keyes.

But, in his enthusiasm, Mr Pitt overstates his case. The strategical impact of the gadfly attack on Zeebrugge was surely not so great on Ludendorff as he claims it was. Nor do Mr Pitt's arguments refute the judgment that the raid did not produce the tactical success first claimed for it, in the sense that the sinking of the blockships at Zeebrugge and the abortive attack on Ostend failed to disrupt for long the passage of the German U-boats. Mr Pitt, on the evidence of two aerial photographs, claims that the raid did upset the U-boat operations. He dismisses German reports quoting the number of U-boats passing out of Zeebrugge and Ostend after the raid with the curious argument that as German reports on some of the details of the action at Zeebrugge were demonstratively false, then other reports must be suspect. But there is a world of difference between a report of the numbers and movements of one's own fleet, absolutely vital information for any naval staff, and a battle report from a subordinate on the enemy's actions in a confused night battle. It is a pity that Mr Pitt exaggerates the strategic and tactical importance of the Zeebrugge raid, for he could have rested a good case on the gallantry displayed and on the stimulus it gave to morale.

New Critic in Old Pastures

The Shaping Spirit: *Studies in Modern English and American Poets*

By A. Alvarez.



Chatto and Windus. 191 pages. 15s.

MR ALVAREZ is perhaps the most promising of the younger English critics. No one has written with more responsible insight of the "Americanism" of Ezra Pound, of the specific range of W. H. Auden's verse or of the achievements of William Empson. Time and again this collection of essays is enlivened by a definition, a happy phrase or glint of humour: Ezra Pound "is the only poet in the last three hundred years to write English as though he had never read Shakespeare"; "If Pope is on one side of Auden, Alistair Cooke is on the other"; "For verse is a means and poetry an end."

Even where one cannot wholly acquiesce in Mr Alvarez's conclusions—did Poe really lack the creative autonomy of a great artist, and is D. H. Lawrence's poetry really that good?—the arguments which he marshals command respect. Constantly he exemplifies a critic's true function: to bring the reader back to the literary text by focusing on it a high degree of awareness. And because he writes so well, Mr Alvarez affirms a truth sometimes neglected by contemporary critics: the language of literary criticism should set for itself ideals of clarity and force no humbler than the ideals set by the great poets and prose writers with whom it is concerned.

But, by the very virtues of its attainment, this volume raises two disturbing questions about the health of contemporary criticism. Mr Alvarez plays very safe. The authors he deals with—Hart Crane being the possible exception—are in every sense canonic. They constitute the poetic Establishment. Quarterlies and critical journals are filled, and have been for several years, with essays on T. S. Eliot, Yeats, Auden and Wallace Stevens. One would have supposed that a young critic of Mr Alvarez's calibre would live more dangerously and venture into latitudes less thoroughly charted. Much of what he says has been said before, though less finely. Perhaps his next book will be less orthodox. There are fresh and difficult topics awaiting his scrutiny—the prose of John Cowper Powys, for example, the novels of C. P. Snow, the complex genius of Robert Graves or the true stature of Sean O'Casey.

The second question is not so much one of range as of attitude. There is in too much of present-day English criticism a touch of the provincial. Literature is really a bigger and more dæmonic affair than Mr Alvarez would, at times, lead one to believe. As Edmund Wilson and Lionel Trilling incessantly remind us, it engages the central political, philosophic and historical energies of an age. When Trotsky entitled a book "Literature and Revolution," he meant to suggest that the chaos of the human condition and the play of the shaping spirit of imagination are

NEW EDITION (1957)

ATLAS

International

LAROUSSE

Everyone whose work depends on full, accurate geographical information will welcome this atlas. Based on today's economic and political realities rather than traditional physical divisions, it meets the everyday needs of economists, businessmen, journalists, diplomats, and students.

★ *Note these features* ★

Up-to-date maps of U.S.S.R., China, and Mongolia providing information not easily found elsewhere ● Polar Projection applied for the first time to the whole northern hemisphere ● 47 pages of Statistics on agriculture, population, power, minerals, industry and commerce ● Information on new roads and railways in Soviet bloc ● Long commentaries on maps in English, French, and Spanish ● 42,000 entries in gazetteer (7,000 added since last edition) ● Completely new agricultural map of Europe in four colours ● Special 'screw' binding so that maps can be taken out and hung up or laid flat.

19" x 16½" 260 pages 13 gns.

HARRAP

inseparable. When Sartre asked "*Qu'est-ce que la littérature ?*," he was asking whether literature itself, in the old sense, could lay claim to meaning in a world that had known gas ovens and which lived under the peril of nuclear destruction. Such inquiries are in no manner unrelated to the poetics of Yeats or the imagery of Wallace Stevens. But in the perception of the relationship lies the mark of major criticism. Young critics endowed with Mr Alvarez's gifts should, one feels, be angrier.

Wilson Reassessed

The United States and East Central Europe 1914-1918: *A Study in Wilsonian Diplomacy and Propaganda*

By Victor S. Mamatey.
Princeton University Press. London: *Oxford University Press.* 431 pages. 60s.

TODAY Woodrow Wilson is already a shadowy, and in Central Europe a legendary, figure. The conventional picture we have of him is of a starry-eyed political innocent, who was forced into the first world war by the diplomatic intrigues of the Entente powers, eager to have a powerful ally with clean hands to pull their chestnuts out of the fire. Professor Mamatey's authoritative work allows the reader to make a more realistic assessment. Wilson certainly did not like the Allies' war aims, but his statement that, "When the war is over we can force Britain and France to our way of thinking because by that time they will be financially in our hands," does not sound very idealistic. Yet high-minded sentiments about the right of all peoples to choose the sort of government under which they wished to live were constantly on his lips. It appears that Wilson had no preconceived ideas about the future boundaries of Europe and was faced with the dissolution of the Hapsburg Empire virtually as a *fait accompli*. Indeed he had little knowledge of European affairs and was ill served by a Diplomatic Corps whose senior members' only qualification was often loyalty to the Democrats.

It seems clear that Wilson would have preferred a negotiated peace, and with this in mind tried to wean Austria-Hungary away from Germany. He was unsuccessful because he could not offer the Austrians reasonable terms without treading on Italy's toes. Eventually further negotiations were rendered impossible by Clemenceau's foolish publication of the "Sixtus letter." It was only at this stage that Wilson began openly and actively to encourage the minorities to hope for independence. Although his policy encouraged the aspirations of the subject peoples, it emerges clearly from this work that he regarded it as a means to victory rather than as an end in itself. Despite his high principles Wilson usually managed to keep both feet firmly on the ground.

The fall of Austria-Hungary was a necessary corollary of military defeat, dissension of its subjects and the ...da of its enemies, but the ...he successor states created at least as many problems as it solved. With the exception of Czechoslovakia, the administration of the new states was generally corrupt and incompetent and their social and economic progress negligible. Even the hopes of allied statesmen that they would form a cordon sanitaire between Germany and Russia were soon disappointed. When the power of Germany and later of Russia revived, each picked off the small states as soon as they were ready for them. We may agree with Professor Mamatey that a militarily and economically viable Central European federation would have been a better solution; unfortunately, in the climate of 1918 it was quite unrealistic.

The extent of the author's research is impressive. He lived for many years in Czechoslovakia and his mastery of Slavonic languages has allowed him to make full use of original sources. His style is uneven, but redeemed by the occasional Tacitean touch. There is an exhaustive bibliography and an excellent index.

Awaiting an Answer

The Question

By Henri Alleg (with a preface by J. P. Sartre).
John Calder. 96 pages. 10s. 6d.

THIS small book sold 60,000 copies in France within two weeks of its publication. But it is not a best-seller of the sugar-coated variety. By comparison with M. Alleg's nightmarish experience, Kafka's world appears idyllic. M. Alleg had been the editor of a Communist newspaper in Algiers. In June of last year he was arrested by paratroopers and for a whole month he was "interrogated" by torturers in French uniforms. Their exploits with water, electric current and other gadgets of modern civilisation would have impressed veteran torturers of the Gestapo. That M. Alleg did not break down in the process seems an extraordinary victory of the human spirit over physical pain. The outcry caused in Paris by his disappearance led finally to his transfer to an ordinary gaol. It is there that he wrote this brief but terrible account.

M. Sartre, in his preface, recalls how Frenchmen in 1943 believed it to be unthinkable "that one day men should be made to scream by those acting in our name." It is now clear that torture has no nationality. The discovery may be belated. The novelty, as far as Algeria is concerned, is that the mass of Frenchmen can no longer plead ignorance of the facts. The government has tried to hush up this case by seizing newspapers which wrote about it. But by the time it decided to seize the book itself, so many copies had been sold that a Parisian now requires sublime hypocrisy to pretend that he has never heard of M. Alleg.

To seize is not to answer. The charges in this indictment are precise and circumstantial. In refusing to answer them the French government condones the crime and, like blotting paper, absorbs the guilt of its subordinates. Silence is complicity. This horrible testimony of one man's resistance to physical pain is not easy reading. But, whatever one's views on the Algerian conflict, it should be read by all those who do not want to preserve an easy conscience merely by pulling over their eyes wool impregnated with high-sounding liberal principles.

Policemen in the Lab

Science and the Detection of Crime

By C. R. M. Cuthbert.
Hutchinson. 244 pages. 25s.

THE part played by the laboratory in the detection of crime is more recent than is popularly supposed. The Metropolitan Police Laboratory and the Home Office Forensic Science Laboratories were not started until 1935. Before that, the Criminal Investigation Department of Scotland Yard and the provincial police forces had, it is true, frequently used so-called experts to help them in the preparation of their cases for the prosecution. But it was Sir Arthur Dixon at the Home Office who first pressed for, and secured, the establishment of regular laboratories as an essential aid to the detective.

The author of this book was one of the original staff of the first Department of Forensic Science and ended his career as superintendent of the Metropolitan Police Laboratory. His experience is unusually wide, and he has collected together a number of cases which he uses to illustrate the different facets of scientific detection. There are chapters on blood, poison and fraud, on drunken driving, arson and forgery. No crime seems to have eluded his attention or his microscope, and all who are interested in criminology will find ample material for study.

For the layman, the book suffers, as do so many books written by policemen, from attempts to shock the reader. But policemen, in print, lack the Rabelaisian wit of doctors and the descriptive skill of professional authors, and the result is a slightly sordid flatness, which seems to have neither point nor purpose. This is a very minor criticism, however, of a book that is full of merit and which deserves to be widely read by all criminologists—and burglars.

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

What's Good for General Motors?

DETROIT

IN the "capital of the recession" the United Automobile Workers' Union, with 400,000 of its members unemployed, is negotiating with the big three motor companies, which have 850,000 cars unsold. On the face of it Mr Walter Reuther, the union's president, who is the labour leader whom most businessmen would most like to see put in his place, is in an awkward position. He is having to face what he once demanded and what he now rather scathingly impugns, bargaining which is virtually industry-wide. The General Motors Corporation, which occupies about half the car market, has declined to allow him to tackle the weaker Ford and Chrysler companies first. It has taken the highly unusual step of giving notice that its labour contract will terminate on the first possible day, midnight on May 29th. When the union's negotiators first presented their demands in the bargaining room in the Ford company's headquarters they saw a large white Cadillac—GM's highest prestige model—pull up outside the main entrance during a recess, and shortly after they got the same dusty answer that their colleagues were receiving simultaneously at General Motors.

At the same time Mr Reuther is under harassing fire from the skilled craftsmen within his union, many of whom staged wildcat strikes in 1955 against the contract which he had negotiated, on the ground that it reduced traditional differentials. Although he took care before going into the present battle to reorder his procedures so that the craftsmen would be able to vote separately on contract provisions which specially affect them, no fewer than four craft unions are actively chipping away at his membership.

Finally, Mr Reuther can scarcely help reflecting on the ill fortune which has timed the running out of his contracts for the middle of a recession when his great rival, Mr McDonald of the United Steelworkers Union, is effortlessly collecting a nine cent an hour automatic increase for his men in July under a contract that will carry them on until June of next year. Counting this increase, the steelworkers will be twenty cents an hour ahead of their fellow mass producers on the car assembly line. Since Mr Reuther has $40 million in his strike fund he could afford a two-month strike. But this would be just the length of stoppage that would be convenient for the employers.

When GM gave notice of ending its contract Mr Reuther declared that "they can't make us strike." But it is scarcely surprising that the companies rejected scornfully his own proposal to continue the existing contract temporarily for three months, even forgoing the automatic increase due in June. This would simply shift the deadline for negotiations to the critical moment in September when the great punters of Detroit are again about to risk their luck on the calculation that a new year's customers will prefer "a showboat named desire" to what a leading manufacturer has caustically dismissed as "mere transportation."

The extent, however, to which the big corporations really want to push the union to the wall is still a closely guarded secret. If there is no contract in June they could, of course, lock out their workers; but, since this would be thought particularly anti-social in the middle of a recession, it is doubtful if they want to make themselves, not to mention the Republican party, that unpopular. They might exert pressure by stopping payments into the various welfare funds. If they do not do anything along these lines the negotiations might just drag on through the summer anyway and leave the companies no better off than if they had accepted Mr Reuther's loaded offer.

THERE is no doubt that the leaders of the automobile industry are under great pressure from their fellow businessmen and from some economists not to lose this chance to administer a decisive setback to the cost-push element in inflation and to Mr Reuther. For the automobile workers' leader has a unique capacity for infuriating his opponents. Although he freely pillages the vocabulary of capitalism to back his campaign for "the worker's equity," management considers him basically uncapitalist. He has had the effrontery to suggest that, since the car companies have large quantities of unsold stocks on their hands, they should cut prices. He has demanded that at the end of the trading year the workers should have a share of the profits analogous to the enormous bonuses that are distributed among the charmed circle of top executives who fix the "pricing policy" for the whole of a new car year. He has even printed an impertinent chart comparing the $3,930,000 in bonuses which Mr Harlow Curtice, the president of the General Motors Corporation, has received during the last ten years on top of salary totalling $1,630,000, with the bonus of $6,406 on top of wages of $39,272 which an average automobile worker would have received during the same period if the union's proposed profit-sharing scheme had then been in effect. In short, Mr Reuther has no respect for the mysteries of Detroit; he wants to usurp the prerogatives of management.

The last straw for the choleric employers, and a difficult pill for most neutral economists to swallow, is Mr Reuther's claim that the "dual package" he has demanded this year is his own special contribution to the fight against the high prices which persist despite the recession. Arguments about the first instalment revolve around the frustrating question of productivity. Mr Reuther has found in an appendix to the President's Economic Report this year a figure of 3.9 per cent which is said to be the average annual increase in the output a manhour worked in the decade 1947-56. He has compared this with the "improvement factor" in the standard contracts in the motor-car industry

which is supposed to give workers an annual rise equivalent to a 2.5 per cent rise in productivity. Since, the union says, the technological advances in the automobile industry are obviously greater than the average for the country, the worker has clearly been cheated of his "equity."

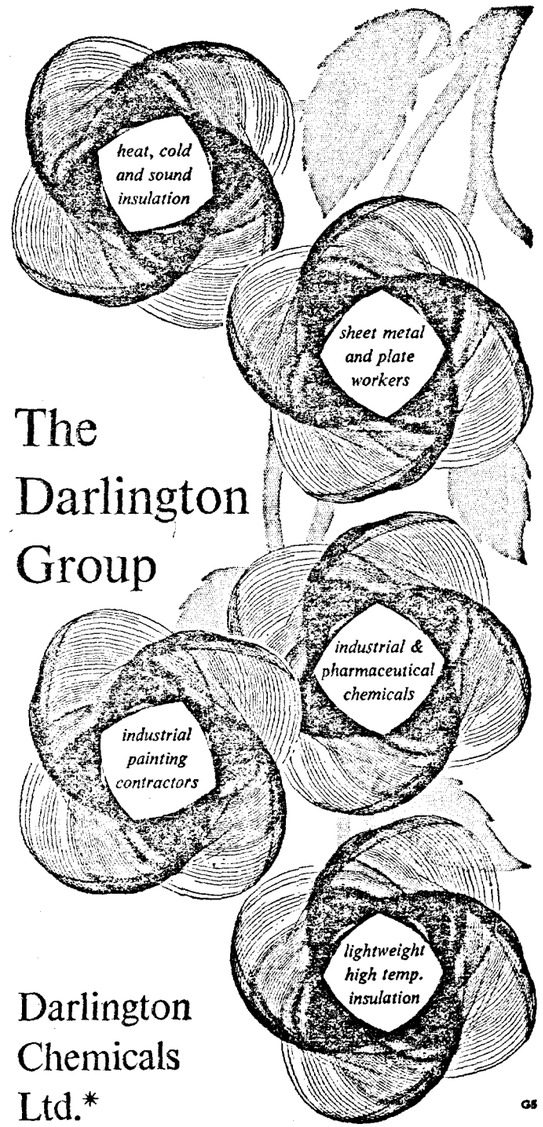
Therefore the union wants immediate pay increases, to which it has not yet put a precise figure, which will make up the balance, together with some improvements in welfare benefits which will compensate older workers for past rewards they should have had. On top of this the union includes its usual so-called "non-economic demands," such as a request for company pay for full-time shop stewards. The second instalment—likely to be delayed indefinitely—would be the splitting of gross profits, after deducting the first ten per cent, half going to the company, a quarter going in rebate to the customers, and a quarter going as bonus to the workers.

If raised eyebrows are the correct reaction to Mr Reuther's claim to be saintly about inflation, the selfsame reaction seems appropriate to the companies' claim that the first "package" would cost at least 73 cents an hour extra and their more general contention that, while indices of productivity are not really meaningful anyway, there has in fact been no increase at all in the output of cars a manhour since 1950. The culprit, as usual in all conversations in Detroit, is that infallible dictator of taste, the customer. All the improvements of technology, it is said, have gone into giving him more car. And, despite anxious thoughts that Americans may really be buying more small cars because they are easier to park and symbolise "conspicuous reserve" as well as being cheaper, the manufacturers know that it is now too late to turn back. The 1959 models are going to be long, wider, and shinier, and, if the country is to prosper and there are to be any profits to distribute to anybody, the "motivational researchers" who said two years ago that this was what the public wanted had better be right.

Sword and Pen

CONTINUING fair on land and in the air, depression out to sea: so runs the weather report from the armed forces for President Eisenhower's proposals to strengthen the powers of the Secretary of Defence over the individual services. Both the army and the air force have expressed their approval to the House Armed Services Committee. The navy and the marines, however, who fear that they may suffer most from the streamlining powers which the Bill gives to the Secretary of Defence, have been more critical. For the navy, Admiral Burke politely supported the President's "intent," but then declared his belief that the Bill was written in such a way that a less scrupulous Secretary of Defence that the present one might make dangerously radical changes in the structure of the services. The marines fear demotion to a ceremonial drill squad.

The chairman of the Armed Services Committee, Mr Carl Vinson of Georgia, and his fellow-critics have concentrated on two aspects of the plan in the past week. One is the central staff of officers who will aid the Joint Chiefs of Staff in strategic planning. Mr McElroy, the Secretary of Defence, thinks about 400 officers will be needed, about twice as many as at present, but the number is not specified in the Bill. Mr Vinson says bluntly that the Joint Chiefs will not get "a blank cheque." Similar alarm over the broad wording of the Bill has been aroused among the sailors and marines by the provision which would enable the Secretary of Defence to change the combat functions of the various services. In theory, this could empower Mr McElroy to emasculate a service, for instance by taking away the navy's air component.



Mr McElroy, who charmed the committee by his precise and deferential replies during his four-day appearance, concedes that the language is loose and has offered to see if it can be improved without sacrificing the flexibility which may be needed in the unknown future. He has already retreated on two comparatively minor matters. But on the principles of the plan neither he nor President Eisenhower shows any signs of compromising. Henceforth promotion for senior generals and admirals is to depend on their showing themselves "objective" in inter-service matters; and the President, in a "surprise" appearance at a US Chamber of Commerce dinner last week (which cannot have surprised the diners, who saw the presidential seal affixed to the speaker's place and the cordon of security guards), once more strongly commended his plan. The committee's fingers are clearly itching to re-write the Administration's Bill; it remains to be seen whether Mr McElroy's display of co-operative sincerity, and the President's willingness to fight for his plan, will keep congressional pens away from the essentials.

Leaden Reception

THE Secretary of the Interior, Mr Seaton, has not yet made public the details of his subsidy scheme for depressed non-ferrous metals which the Administration hoped would stem the demand for higher tariffs and quotas and thus would make it easier to extend the Reciprocal Trade Agreements Act without concessions to domestic interests that would hurt and antagonise foreign countries. But already most of the mining companies and the members of Congress from the mining west have denounced the proposal as a poor substitute for the tariff increases and quotas which they feel would bring permament benefits to metals. Mr Seaton proposes to help the producers of copper, lead, zinc, tungsten and acid-grade fluorspar by paying them, over the next five years, the difference between the market price and fixed stabilisation prices on given amounts of annual production; these are approximately equivalent to output in 1957.

One of the reasons why the industry is looking at this gift horse so critically is that Congress would have to vote the subsidies anew in each of the five years and might well refuse to do so; in any case, uncertainty would be continuous. Mr Seaton, who puts the cost at $161 million for the first year, thinks that later it would diminish as the economy revives and demand picks up. But the producers suspect that the subsidy will be a standing temptation to cut prices, since the government is pledged to make good any difference, however large. This would tend to increase the subsidy—and congressional reluctance to pay the bill. So far the Administration opposes the idea of discouraging price cutting by fixing minimum prices below which it would not pay the subsidy. But the fears of foreign producers, who might have to choose between being driven out of the American market or cutting their own prices, may lead it to reconsider.

Although the stabilisation prices are above present mar-

ket prices for four of the metals—fluorspar for the moment is a special case—the producers, as is only natural, think them too low. Certainly those for lead and zinc are lower than those proposed last year in the Administration's short-lived long-range plan as "peril-points"; the scheme would have authorised tariff increases when prices fell to this level. The mining companies also feel that the Seaton proposals would be hard to administer efficiently and equitably and might lead to government control. If Congress approves the scheme before the end of June, the President will be able to regard the recent recommendations of the Tariff Commission for a rise in the duties on lead and zinc as academic. But at the moment it does not look as though he would escape this embarrassing decision, with all its repercussions on the Trade Agreements Act.

Make Way for the Arts

WITHIN the next month or so tenants in the deteriorating neighbourhood of Lincoln Square will have to begin to move out before the bulldozers and demolition crews, for the most ambitious slum clearance project in New York City has at last been given the signal to go ahead. By 1963 in place of rotting tenements north and west of Columbus Circle there will be one of the great cultural centres of the world, the Lincoln Centre for the Performing Arts, which is to occupy three and a half city blocks in the thirteen-block redevelopment project. What has been holding up the planners is the contention that the sale of two of these blocks to Fordham University, a Roman Catholic institution, is illegal because it violates the constitutional guarantees of separation of church and state by giving a subsidy to a sectarian institution. The State Court

of Appeals has just turned down this plea, and another similar suit seems certain to be rejected.

Fordham, like Lincoln Centre, the Red Cross, and Webb and Knapp, who are to put up new blocks of flats in the area, has been allowed to buy the land at a greatly reduced price under Title I of the Federal Housing Act; to make this possible the federal government has provided $28 million and the city $14 million. But private donors are having to find all of the $75 million which it is estimated it will cost to rehouse fittingly three of the city's great cultural institutions, the Metropolitan Opera, the New York Philharmonic Orchestra, and the Juillard School of Music, to provide a museum and a library of the performing arts, and several theatres. Just this week Mrs Vivian Allen, by a gift of $3 million toward the repertory theatre—which it is hoped will become the home of a company comparable to the Old Vic or the *Comédie Française*—brought the funds on hand to $28 million. The other $25 million has been pledged by three foundations, the Ford Foundation ($12.5 million), the Rockefeller Foundation ($10 million) and the Avalon Foundation ($2.5 million).

The most urgent task, and the one which will be tackled first, is to build a new home for the New York Philharmonic, for its present building on 57th Street is scheduled to be torn down this year and it is not certain that even a year's extension of the lease can be obtained. The new concert hall, which is expected to cost $7 million, should be complete in July, 1960. The Metropolitan Opera, which finds its present quarters antiquated and cramped, is expected to move in 1961 into its new opera house, which will give every one of the 3,800 opera-lovers it can seat a full view of the stage. In 1962, it is hoped to bring the Juillard School down from its present quarters near Columbia University, and to dedicate the repertory theatre. By that time the centre should be set in a gleaming new complex of parks, blocks of flats, new offices, hotels, and commercial theatres, an ornament worthy of a great city—and worthy of imitation by other American cities.

Stop-gap for the Unemployed

FROM A SPECIAL CORRESPONDENT

IN the House last week conservative southern Democrats slipped back into their old habit of collaboration with the Republicans; together they defeated the Democratic Bill to give direct federal aid to all the unemployed by the substantial margin of 223 to 165. Instead the House passed by 370 votes to 17 the President's proposals which only provide supplementary insurance payments for workers who have exhausted their rights to benefit under the various state insurance schemes. This was the first victory for the Administration's cautious approach to the problems of the recession and it seemed to justify the President's decision not to tamper with states' rights or to provoke, by too great a show of generosity, the conservatives who would have preferred the federal government to do nothing for the unemployed. Democrats from the industrial states, on the other hand, have demonstrated to voters that they put human values first.

Senate hearings on the Bill will start next week. Congress cannot afford to delay as, even if all goes well, the unemployed will probably not begin to receive their additional benefits until August. And this month and next the number exhausting their benefits, which in most industrial states last for 26 weeks, will be swollen by the heavy lay-offs, particularly in the steel and motor industries, which began last October and November. Already, with about 200,000 coming each month to the end of their benefits, hardship is mounting, and so is the risk that consumer buying—the life-belt which is keeping the economy afloat—will not be maintained.

To understand the issues in the debate, it is necessary to look back at the Social Security Act of 1935, which established the present federal-state system of unemploy-

ment compensation. The law levied a 3 per cent pay-roll tax on employers with 20 or more workers; it applies only to the first $3,000 paid to each employee. Ten per cent is kept by the federal government for administrative expenses. In states which set up their own insurance scheme, however, employers who contribute to it are forgiven the remainder—90 per cent—of the federal tax. This remains true even if the states choose, as most do, not to charge the full tax.

All the states and territories consequently have unemployment compensation laws, which now cover firms with four or more employees. But covered employment includes only about 60 per cent of the labour force; it excludes workers in very small businesses and fisheries, agricultural labour, domestic service, casual labour, government employees and servants of certain tax-exempt organisations. About 2 million of the 5.1 million unemployed are not insured. Moreover, the variation among the schemes is as broad as the continent. Benefits are kept low in states where incomes generally are small; in states trying to attract new industries, and in those where agricultural employers wield political influence; they are higher where organised labour is strong. The states vary, also, in the tax rates they levy, in the qualifications demanded of workers, in the methods of computing benefits, and in the number of weeks for which they are paid. Florida pays benefits, in some cases, for only five weeks; Pennsylvania pays everyone for 30; many states vary the duration according to the past earnings of an individual. Benefits go as low as $3 a week in Mississippi and as high as $45 a week in New York; when allowances for dependants are included, Illinois is equal to New York, and Connecticut, Washington, North Dakota, Wyoming and Alaska do even better.

Only Rhode Island and Alaska now tax employers at the full rate of 2.7 per cent envisaged in the original law. In Washington, Kentucky, Michigan and Nevada the tax is 2 per cent or more; elsewhere it goes as low as 0.5 per cent in Colorado and Virginia. The national average is 1.3 per cent. States eager to attract new industries compete to keep down their taxes on business—including those for unemployment insurance—just as other states compete for the divorce trade. Moreover, in most states rates of tax vary with the "employment record" of individual firms, as an incentive to them to stabilise employment. Recessions have been so short-lived since 1940, when benefits were first paid in all states, and total reserves have become so large—they are now over $8 billion—that such concessions to industry have only just begun to seem dangerous. Even now, the reserves of all the states and territories are large enough to pay benefits for four years at last year's rates—if they were pooled. But they are not. Each state's reserve is separate and six of these funds are down to danger level, which is defined as 2½ times the amount needed to meet the benefits paid out the previous year. Alaska and Oregon have had to borrow.

Despite the repeated exhortation of the state governments by Mr Eisenhower and his Secretary of Labour, Mr Mitchell, levels of benefit have not been raised to take account of the postwar increase in wages. In 1957 only seven states paid as much as 50 per cent of the average wage. For the country as a whole in 1956, average wages in covered employment were $81 a week, but the average weekly benefit paid in 1957 on the basis of those wages was $28. Workers in the steel and automobile industries have won, through collective bargaining, supplementary unemployment benefits which, when added to state payments, provide 60 to 66 per cent of their usual wages. But the drop in living standards when both of these sources of income dry up, and workers are forced back on public assistance, is correspondingly sharp.

When the Secretary of Labour presented the President's proposals for extended benefits, he opposed the setting of any minimum federal standards for such insurance as a condition of receiving the new money, on the ground that this would infringe the prerogatives of the states and delay the passage of the Bill. This temporary measure would extend benefits at the rate existing in each state for a period equal to half the number of weeks to which the recipient had been entitled originally—for 13 weeks, for example, when he had already received benefit for 26. The cost would be met out of federal funds, but beginning in 1964 the states would be expected to repay the Treasury, either directly or by an increase in the tax on employers; this explains the opposition of such liberal Democrats as Mr Meyner, the Governor of New Jersey.

The Democratic bill also made no effort to raise state standards. It would have extended, for 16 weeks in each state, the going rate of benefits; the great difference is that it would have applied to workers in uncovered employment, who otherwise met the requirements of the state programmes, as well as to those who had exhausted their benefits. The cost, which would not have to have been repaid by the states, would have amounted to $1.47 billion, on the assumption that 3.1 million will have exhausted their rights to benefit between June 30, 1957 and July 1, 1959, and that 1.7 million from uncovered occupations would have been eligible for help. Would this have amounted to a dole, as the President said? Certainly the Democratic bill would have obscured the difference between employment and assistance which it was a purpose of the original legislation to establish. At least, however, it required no means test.

Only 17 Republicans—all from industrial states where unemployment is heavy—voted with the Democrats for the more generous Bill; once it was defeated, the President's proposals were passed without delay. In their haste to meet the emergency, members turned a deaf ear to Mr Eugene McCarthy, who wanted to seize the opportunity to reform the whole system, and who demanded, not without justification, "Have any of the basic social laws which we have been passed in a time which was not labelled an emergency?"

Disappointment on Rails

The proposals put forth recently by the Administration and a sub-committee of the Senate Commerce Committee to aid America's financially shaky railways fall somewhat short of the companies' hopes. The President suggested four changes in the plethora of Interstate Commerce Commission regulations, under which the railways operate; and to provide more immediate help, he proposed that the government should guarantee loans to the railways for the purchase of new equipment and for the improvement of facilities. The changes would make it easier for railways

to discontinue unprofitable services, which state authorities, under pressure of local interests, often force them to maintain; would impose stricter controls on private lorries which, it is said, now illegally carry "public cargo" (goods other than their own) in competition with the railways; and would bring under tighter ICC control those road haulage companies which carry agricultural products. Finally, the Administration recommended changes in the present rate-making system employed for the railways by the ICC, to permit them to meet competition from road transport more effectively. The proposals are now being considered by the sub-committee, whose own recommendations are more to the railways' taste, since they go a good deal further.

The railway companies are distinctly unhappy about the Administration's proposals which, in their view, will not accomplish enough quickly enough. Above all, the companies had hoped for removal of the 3 per cent tax on freight charges, and of the 10 per cent tax on passenger fares. The subcommittee suggested repeal of these taxes, which were imposed during the war to curb excess travel, and there is some possibility that they may be at least partly removed in the general tax legislation which is coming later in the year. The railways have also asked for loans to cover operating expenses and for increased depreciation allowances to help them to purchase new equipment (requests which the sub-committee endorses); some of their spokesmen consider that the conditions of the guarantees proposed by the President would prevent them being used by those lines whose need is greatest. Moreover, the proposals must still pass Congress to become law; there they may meet stiff opposition from road transport and agricultural interests.

The railways need as much aid as they can get; their chronic financial plight, particularly that of the lines in the eastern part of the country, has been heightened by the recession. The profits of practically every major railway company fell sharply during the first three months of this year; the New York Central Railroad lost $17.5 million and the Pennsylvania Railroad $14.9 million. Their troubles are symbolised by the discontinuation last month by the Baltimore and Ohio Railroad of its famous Royal Blue passenger train, which had run between New York and Washington for 68 years, and which lost $5 million in 1957. The railways have suffered heavily in recent years from the competition of road transport and the airlines; and many of the companies even feel that, unless help is given, they are faced with the Scylla of bankruptcy or the more ominous Charybdis of nationalisation.

Fading Blacklist

FROM A CORRESPONDENT IN LOS ANGELES

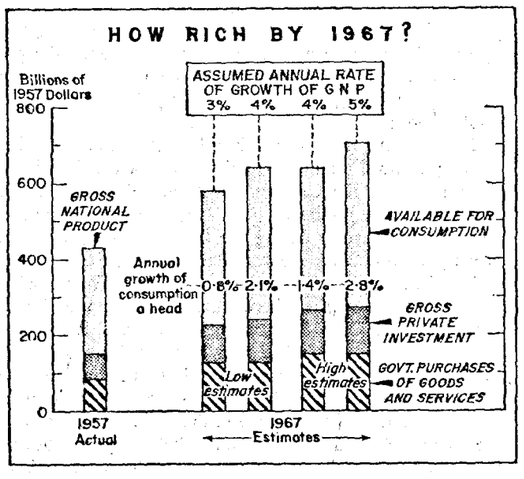
Reflecting perhaps its poor economic but better political health, the film industry has been slowly but steadily re-engaging many of the writers, actors, producers and directors who were blacklisted, for political reasons, during the McCarthy era. A growing number of names and faces are reappearing on the screens from which they had been absent for years because the film companies had succumbed to pressures from ex-servicemen's organisations and from "patriotic" groups whose purpose was "to combat the communist conspiracy in entertainment, communications and the fine arts." Elsewhere in the entertainment world, too, the political beliefs, real or alleged, of artists have ceased to be the sole factor determining whether or not they should be allowed to make public appearances. Mr Paul Robeson, long identified with communist causes, recently gave two very successful public concerts, without provoking any protest, and a new album of his songs is soon to be released by a leading recording company. So, even though the Supreme Court has rejected the suit for $52 million in damages which had been filed by twenty-three Hollywood personalities who had allegedly been banned by the film studios, the blacklist itself appears to be fading without legal action.

The blacklist began about ten years ago, after the appearance before the House Un-American Activities Committee of those writers, producers and directors, later known as the Hollywood Ten, who served six months in prison for contempt of Congress because they had refused to answer the committee's questions about their alleged communist connections. This shock caused the film industry, which had originally opposed the investigation into communist influence on the cinema, to co-operate, although sometimes reluctantly, with the committee. To begin with, employment was denied only to those Hollywood figures who had either been openly identified as Communists or had refused to answer the committee's questions. But the ex-servicemen's organisations and other vocal Hollywood "patriots," encouraged by their success in helping to establish the original blacklist, pressed for even more rigid standards of political behaviour as a condition of employment in the industry. By 1953, anyone identified as an active or former Communist, or as having associated with groups suspected of being communist fronts, was denied employment unless he took steps to "rehabilitate" himself, as the pressure groups called it.

In order to do this, those who had been identified as ex-Communists had to appear before the House Un-American Activities Committee, repudiate their past and give the committee the names of all the party members they knew. It then became possible for these people to work again, although for a long time Hollywood was extremely reluctant actually to re-employ them. In fact, the "friendly" ex-Communists only began to get jobs after Mr Edward Dmytryk, a director and one of the original Hollywood Ten, had openly broken with the Communists and testified willingly to the committee after serving his prison sentence.

But "rehabilitation" was much more difficult for those who had not actually been members of the party but had only associated with communist-front groups or with groups opposing the Un-American Activities Committee. Since they could not "confess" that they had been Communists, it was necessary to devise some other way for them to expiate their sins. They had to join anti-communist groups, praise the work of the Un-American Activities Committee and publicly declare that they had been foolishly involved in doings which they later realised to be unpatriotic. A thriving business, giving advice on "clearance," sprang into existence and for three or four years the clearance experts were among the most influential people in Hollywood. But the number of clients requiring such clearances was not unlimited, and by 1955 the market for the experts' services was exhausted. By then almost all the ex-Communists or party sympathisers were either cleared and eligible for work or totally unemployed in the industry—at least publicly.

In fact, however, some of the more successful writers who had been blacklisted worked steadily throughout this period, selling scripts under assumed names or under those of other, perhaps less talented, writers, and being paid a great deal less than in former years. It was, of course, considered impossible for a blacklisted actor, easily identifiable, to appear on the screen. But Mr Dalton Trumbo, one of the Hollywood Ten, stated in an interview in 1957 that a number of scripts he had written had been nominated for an "Oscar," the annual award of the Motion Picture Academy. This whole problem of the under-cover market in scripts came to public attention in that year when the Oscar for the best original screen play was given to a non-existent Mr Robert Rich, who turned out, much to the embarrassment of the Academy, to be a blacklisted writer. Another film, "Friendly Persuasion," which was nominated for an award, had to be declared ineligible because Mr Michael Wilson, its author, was also blacklisted. After the Screen Writers' Guild, which is the final authority in case of dispute, had determined that Mr Wilson was responsible for most of the script—which had been challenged by the film's producers—the picture was released without any screen credits.



But there have been gradual changes in the situation in the last year. Mr Foreman, the well-known writer-producer of such films as "High Noon," an "unco-operative" witness who had been identified as a former Communist, has been openly employed as a producer in England for Columbia Pictures. In 1951 he had told the House Un-American Activities Committee that he was not then a Communist but had refused to discuss his previous membership, because he did not want to appear in the role of an informer or to give the committee the names of people whom he had once known in the party. In 1957, however, Columbia engaged Mr Foreman on condition that he would testify again before the committee and last August he did so. He discussed his own activities in the party but refused to give the names of persons he had known as Communists; in an amazing reversal of the habitual practice of the committee this refusal was accepted. Such a reversal had obviously been established by Mr Foreman in advance as an absolute condition of appearing and giving evidence. The committee received some protests over the preferential treatment which it had given to Mr Foreman and Columbia Pictures was also criticised for employing him. However, the company has held firm to its contract with Mr Foreman and his first picture is soon to be released; there has also been a persistent rumour that he wrote the script for the prize-winning "Bridge on the River Kwai," even though he has not been given public credit for it.

The Foreman case has undoubtedly accelerated the return to work of others formerly blacklisted, including actors and actresses, some still in Europe but others in the United States. They are even appearing on television programmes, whose advertising sponsors have been notoriously sensitive to protests from anybody who might possibly buy their products. Indeed, the protests themselves now lack much of their former fire and vigour; it is almost as if everyone, except a few fanatics, was bored with the whole argument. For its part the film industry, with its ever-worsening economic problems, is in no mood today to question people with talent about their political beliefs; the only question now being raised is whether their employment will help to make money.

Committed to Expansion

The chart below illustrates the central theme of the second report of the Rockefeller Brothers' Fund: that unless the growth of the American economy can be accelerated during the next ten years, Americans will be faced with painful choices. Defence must be paid for out of the gross national product; so must private investment if the economy is to continue to grow. The claims on the remainder come from private citizens, who have been accustomed to see their standard of living rise by about 2 per cent a year, and from the government, which is responsible for social expenditure on education, on roads, hospitals, social security, research, and rebuilding the blighted centres of America's great cities.

If productivity can be increased by 5 per cent a year, adequate provision can be made for the social needs which only government can satisfy without interfering with the steady growth in the standard of living. If the rate of growth remains at the 4 per cent a year which it has averaged in the last decade, individual Americans will have to reconcile themselves to a slower increase in their consumption, or social investment will have to be held back below the levels which are desirable. If the United States

should slip back to the 3 per cent rate of growth which it experienced between 1870 and 1945, even strict economy in government spending would not make possible a significant increase in the standard of individual consumption.

Suggestions for immediate action to meet the recession were forced upon the panel by events. But its original task was to make an economic audit of the next ten years, and to recommend a programme which would enable the United States to meet its unavoidable commitments and still afford the social assets and individual progress it desires. To this end the committee has put its finger on a long list of rigidities and mistaken policies which hamper growth: taxes which are too high and which inhibit initiative; tariff policy; inadequate enforcement of competition; ill-advised subsidies for ex-servicemen and farmers. And it urges that better methods of moderating recessions and controlling inflation, both of which interfere with sustained economic growth, should be sought.

THE WORLD OVERSEAS

Cyprus in Despair

FROM OUR CORRESPONDENT IN NICOSIA

If diplomatic exchanges about Cyprus are still shrouded in secrecy, events in the island have been moving with a clarity that is alarming. The murder of two British soldiers by Eoka last Sunday was the climax to a month of mounting tension and turbulence marked by an insane campaign of sabotage, the killing of a police interrogation officer, an intensification of the commercial boycott of British goods, a breakaway movement by the Turks to set up their own municipal councils, and a sharpening of the deep-seated conflict between Right and Left. Even as the Governor was boarding his aircraft for London on Tuesday, both the Greek and the Turkish resistance organisations were circulating leaflets announcing that if their (mutually irreconcilable) demands were not met, terror campaigns would be launched. It is perhaps hard for those who are dealing with the Cyprus problem at long range to grasp the degree to which the island is blighted by fear, frustration and despair. On all sides there is criticism that "London has taken too long." In the ordinary conversation of intelligent people, the grim prospect of civil war is seriously discussed.

It is indeed a miracle that Eoka has stalled for so long. There is little doubt about its striking power; recent leaflet warnings are not treated by the authorities as mere bluff. They are not yet sure, however, if Sunday's murders in Famagusta mark the start of a general outbreak, or were selective killings into which personal motives entered. Famagusta is the worst terrorist pocket in the island, and it is whispered that even Grivas's writ no longer runs effectively there; some hope, therefore, is felt that the full-scale Eoka offensive, so much feared, may somehow be averted.

Certainly all well-informed Greeks are unanimous in asserting that the recent killings do not have the blessing of Archbishop Makarios. They point out that at present his deputy, Bishop Anthimos of Kitium, is conferring with him in Athens, and they argue that it would be preposterous to launch a major new Eoka campaign at this juncture. From many quarters it is urged that the best way for the British to check lawlessness and terrorism would be to bring the Archbishop back—even at the risk of some days of hell in Ataturk Square.

Among the security forces there is, understandably, a strong current of thought which would relish an all-out drive to extirpate Eoka once and for all—and let the politics sort themselves out afterwards. The tragic irony is that this might just have been done over a year ago, or perhaps even last autumn when Eoka became active again; but it is extremely questionable whether it could be done now, after the relative *détente* of Sir Hugh Foot's first months, without antagonising the entire Greek population permanently. For, much as the ordinary Greek dreads a renewal of "the trouble," he will blame the British for causing it, not Eoka for doing the killings. Yet this course may prove unavoidable. The Governor has been striving hard to avert a return to repression, in the belief that if he can hold out, for perhaps a matter of weeks, a policy decision will clear the air.

The Turks, for their part, show little sign of willingness to compromise. Their concept of partition is almost being elevated into a Balkan version of apartheid—as is illustrated now by the plan to set up separate municipal councils. In a purely administrative way this might prove practicable in one or two of the larger towns, but it is a disturbing plan for the government, all the same. Legally, the mere act of setting up the councils could perhaps be said to be permissible, but the moment the Turks try to exercise the functions of the existing municipalities they will be liable to prosecution. Worse, the danger of a head-on clash between Greeks and Turks—which the government has always striven hard to avoid—is obviously heightened if the Turks try to usurp the functions of a Greek nationalist mayor or refuse to pay rates to the Greek-dominated councils; the whole development may perhaps be regarded primarily as a propaganda move by the Turks to impress the world with the alleged incompatibility of the two races, on which the whole concept of partition is based.

Ever present in the background, though temporarily overshadowed by the Eoka threat, is the ideological conflict between the Right and the Left. In recent weeks it has grown more acute, especially over the issue whether the Left will accept Archbishop Makarios as the sole representative of the Cypriot people. Mr Ziartides, the left wing leader, has lavished professions of allegiance on the Archbishop, as the obvious leader of the Greek Cypriot community—but at the same time has doggedly maintained that, whenever negotiations take place, the Left must have a share. His attitude has brought on his head the fury of the extreme Right and much vilification—in face of which he has shown remarkable forbearance. During recent weeks, indeed, he has strengthened the impression that he is one of the few people in Cyprus who know what they are doing.

Lebanon's Allegiance

FROM OUR MIDDLE EAST CORRESPONDENT

Tension is mounting in the Lebanon as the last few days slip by during which President Camille Chamoun must decide whether he is to stand for a second term of office. The present Lebanese constitution forbids two

successive terms in the presidency. Therefore Mr Chamoun must seek revision of the constitution if he is to stand again. The required procedure for revision is that ten deputies should present a motion to that effect in the Chamber; and the motion must be carried by a two-thirds majority, that is, by at least 44 deputies out of 66. The present Chamber goes into recess at the end of May; and the president must make up his mind in time for the necessary amendment to be proposed, debated and carried before the deputies disperse for their summer holidays.

The issue has a bearing on the whole intricate pattern of the Arab world. The leaders of the opposition to the president, notably Abdullah al-Yafi and Saeb Salam, were in power at the time of the Suez crisis. They resigned—in the middle of an Arab summit meeting in Beirut—because the president refused to break off diplomatic relations with Britain and France. A few weeks later, Mr Chamoun accepted the Eisenhower Doctrine. Thus the president and the governments of Sami al-Solh, who succeeded Abdullah al-Yafi as prime minister, have been identified with the pro-western policies incarnate in the person of the foreign minister, Dr Charles Malik. By contrast, the opposition, in particular the largely Moslem National Front, has identified itself increasingly with the nationalist trends of President Nasser and his Syrian allies. The frequency with which opposition delegations travel the paths to Cairo and Damascus is the subject of bitter jibes among adherents of the government.

Whatever happens, the Lebanon is likely to walk more warily between the power blocks in future. If President Chamoun succeeds in getting himself elected, his first care must be to heal the wounds caused by the Great Debate. He can do this best by observing a stricter neutrality in the cold war between the two Arab unions, which reflects, though with important nuances, the greater cold war between East and West. In one respect, his task may be eased in the ordinary course of events. Dr Malik goes to New York this summer to seek election as chairman of the United Nations General Assembly. His departure may open the way for the appointment of a less controversial figure as foreign minister.

As might have been expected, both sides have turned on the unlucky Americans: the opposition in pursuance of their Nasserist line, the government in order to show that it too is truly nationalist. The quantity and quality of aid under the Eisenhower Doctrine has been under heavy fire for some weeks. Supporters of the government take the line that American aid is an issue of such delicacy that it is worth accepting only if its results are immediate and obvious. That has not been the case hitherto; though whether the blame rests with the Point Four administrators or with their Lebanese partners is a question better left to those mainly concerned. The fact is that the Lebanese government is pressing the Americans for more aid on more favourable terms, while keeping up a critical barrage in press and parliament.

The vigour with which the opposition have attacked the proposed amendment of the constitution shows their fear that the president may indeed have no difficulty in mustering the required majority. Accusations have been made freely that last year's elections were rigged to suit the president's interests. Little convincing evidence has been produced to support the accusations; though there is real ground for supposing that the government has lost popularity during the past year, and that the Chamber may no longer reflect the true balance of opinion in the country.

But Mr Chamoun's chief fear is that the dispute may be carried from the Chamber into the streets and into the mountains. There have been strikes, demonstrations and one or two ugly clashes involving loss of life; illicit arms smuggling is said to have reached a disturbing level. The president's final choice is likely to be determined by his estimate of the degree of violence that a decision to stand again would cause. If he thinks that it is possible to keep unrest within bounds, he will doubtless press his candidature. If he believes in the likelihood of it getting beyond control of the security forces, he will step aside. That will raise problems of a new order. For one of the most noteworthy features of this pre-electoral struggle is that there is no obvious contender in sight.

The Boer and the Bias

FROM A SPECIAL CORRESPONDENT

After the South African election, the prime minister, Mr Strydom, gave thanks to the Creator for willing the government's victory. He failed, however, to express any public gratitude to three gentlemen whose contribution to the triumph was far less disputable: the members of the Delimitation Commission. Had the election been fought on the 1953 boundaries, his 70,000 extra votes would have brought him only three more seats: on the new delimitation, he gained a resounding nine.

The South African electoral system operates at two distinct levels of fantasy. First, only one-fifth of the population can vote: second, a majority of that fifth is likely to be on the losing side. Criticism of the system has tended to concentrate on the traditional "loading" of urban against rural constituencies, and the disparity between the seat-to-vote ratios of government and opposition. But both can be overstressed. The "bias" of a system may rather be measured by comparing the percentage of votes each party requires to win a bare majority of seats. In Great Britain, the difference is at present about one per cent in favour of the Conservative party—in 1945, the Labour party had the advantage. In South Africa, the difference is twenty times as great, and has consistently favoured the Nationalists. They could control Parliament with about 40 per cent of votes, while the United party would require up to 60 per cent. With votes around fifty-fifty, seats were 103 to 53.

The mechanism of this anomalous result depends far less on "loading" than on the more subtle working of distribution. Consider three Pretoria constituencies in 1953:

Pretoria East:	U.P. 6,600	Nat. P. 3,400
Pretoria City:	U.P. 4,000	Nat. P. 5,000
Pretoria West:	U.P. 4,000	Nat. P. 5,400
	15,400	13,800

Here, though the constituencies are almost equal, and the United party has an overall majority of 1,600, the Nationalists won two of the three seats. This situation, repeated across the country, accounts for the major part of the United party's disadvantage.

In principle, a party with 26 per cent of votes could control in this manner an absolute majority of seats, even if all constituencies were of equal size. (It would have 51 per cent of the votes in 51 per cent of the seats—and it would need none anywhere else.) Such manipulation would have disadvantages, since the slightest adverse swing would reduce the party's seats, not to 25 per cent, but to zero. Still, there is plenty of leeway for a party of moderate size to achieve an unjustified majority without undue risk: and the present delimitation comes as close to being optimal for the Nationalists as any party could reasonably wish.

The existence of some bias is not necessarily an indictment of the commissioners. The South Africa Act requires them to consider "sparsity or density of population" (the phrase relied on by successive commissions as justification for smaller rural than urban seats) as well as "community or diversity of interest," but of course does not mention parties. The United party's voters possess a natural concentration, which just so happens to be of the most disadvantageous degree for the party. If there were a migration of United party voters either from town to country or from country to town, the party would be better off.

Though even an impartial delimitation would thus preserve some disparity, the commission has not gone out of its way to remove anomalies, and has indeed introduced some new ones. The salamander-shaped constituency which immortalised Elbridge Gerry of Massachusetts could not be more bizarre than the new seat of Kimberley North. The old seat was compact, urban and United party: the new is 97 miles long, and achieves a Nationalist majority by the inclusion of a thin, wriggly swath of countryside—on the map it looks like something between a triffid and a Scotsman with a tam o'shanter. The English seat of Albany (Grahamstown) has been made to extend a pseudopod into the suburbs of East London, 120 miles away: the main road between two parts of Bellville (Capetown) passes through three other constituencies. Repeatedly, the commission rejected United party submissions in favour of ingenious Nationalist plans. The effect has been that no Nationalist vote is wasted: its natural consequence is that the Nationalists, holding their seats by more economical majorities, are theoretically in a more vulnerable position. A swing of ten per cent against the government now would lose them 28 seats and put the United party in power—a swing of ten per cent in favour of the Nationalists would win them no more than four extra seats, and elsewhere simply increase majorities in seats already held.

The actual swing in this election was just under five per cent; such a swing on the 1953 delimitation would have cost the United party only three seats: Boksburg, Edenvale and Vereeniging. With four opposition seats contributed by the Coloured representatives, elected for the first time on April 3rd, the government's net majority would have increased by only two. Hottentots-Holland, Fort Beaufort and Kimberley South would almost certainly not have fallen but for redistribution; in all of them, the 1953 United party majorities exceeded a thousand. Of seven seats abolished by the electoral commission, five were United party, two Nationalist—of the seven new seats, five are Nationalist and two United party. Of these, only one is marginal (Northwest Rand, with majority 500)—the other four would probably have fallen even without a swing.

Thus the total Nationalist gain of nine seats is made up as follows:

Direct gains	3
Delimitation assisted by swing ...	1
Delimitation alone	5
Total	9

Undoubtedly a considerable proportion of the swing was not change of opinion, but the effect of demographic change. The old school of politically active Afrikaner members of the United party is dying out—of the new voters, close to two-thirds are Nationalists. The government hopes to derive increased support from the promised enfranchisement of 18-year-olds. If a change of government is to come, the United party has more to hope for from a split than from any returning swing—the pendulum, as it were, has been permanently tethered.

Hanover as Vantage Point

FROM OUR BONN CORRESPONDENT

For business men of all kinds and countries there was a special reason this year for going to the German Industries Fair, which ended on Tuesday. It was to spy out the promised land of the European common market—if not of the free trade area—and appreciate the significance of as much of it as might be seen or divined in Hanover's halls and thoroughfares.

Hanover is probably as good a single vantage point as any at the moment for obtaining an idea of what the western world's industrial scientists, technologists, engineers, manufacturers and salesmen are up to. It has become the general technical fair in western Germany; and, after the United States, the German Federal Republic is now the world's biggest exporter of manufactured goods, obviously destined to set standards influencing quality and price in many branches of European industrial production. Of the 4,319 exhibitors—256 more than last year—some 3,700 were German. Nearly 600 were foreign firms from 20 different countries, France leading with 120, Austria following with 95, Britain coming third with 74, and Switzerland fourth with 70. But there are no national pavilions at Hanover: the visitor can conveniently see in one hall, jostling side by side for attention and comparison, all that is being offered in any one particular class of goods. Thousands came this year, not to buy or to sell, but to reconnoitre.

The most conspicuously troubled of the foreign visitors were the Latin Americans. A Latin-American Day was staged on May 2nd by the Ibero-America Association with the object of allaying their anxieties. It can scarcely have fulfilled this purpose. Latin America suspects that an economically-integrated Europe will promote a high degree of autarky to the detriment of the Latin-American export trade; or, if not autarky, then a French-inspired tendency to turn increasingly to Africa for the primary commodities from the exploitation of which Latin America chiefly lives. It suspects further that new interests and obligations will deflect from Latin America the foreign capital so urgently required for investment.

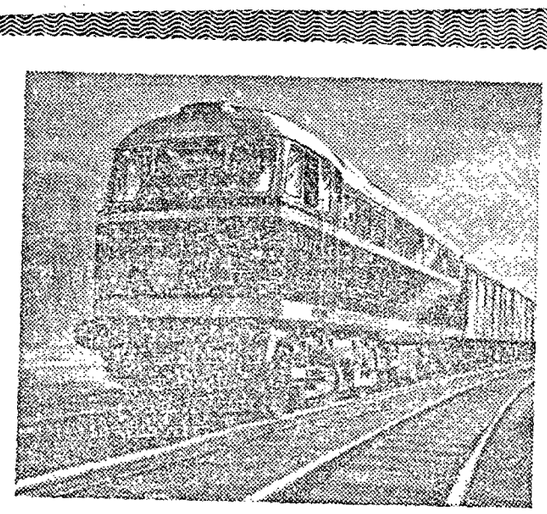
In his open and sympathetic way Herr Erhard, the West German economics minister, told the twenty-two official Latin American delegates that their misgivings were justi-

fied. (He would have his own, he said, until the complementary free trade area had been safely begotten.) And he had no more solid comfort to offer than an assurance that he would use his personal influence within the European community to maintain and cultivate economic and political relations with Latin America. Airily he promised that the sales of Latin-American coffee would not diminish, since the German housewife could never be persuaded to change over to what he deftly disparaged as "cocoa-coffee." Herr van Scherpenberg, who until his recent appointment as State Secretary directed the foreign trade policy department of the foreign ministry, was a shade more positive. Affirming that Europe had no desire for autarky, he predicted confidently that an integrated Europe's imports from Latin America would be appreciably more than they have been in the past. Herr van Scherpenberg urged the Latin-American countries to get on with the various schemes for creating a common market of their own; its existence would facilitate dealings with an integrated Europe. Dr Stille, of the Deutsch-Südamerikanische Bank, conceded that there was little chance of much German investment in Latin America for the time being. Corporate and private taxation would continue to be cripplingly high in Germany. What funds were left over would be required for internal adjustment to the competition of the common market.

More British firms exhibited at Hanover this year than ever before; which is not surprising, since west German imports from Britain have doubled within the last five years. But there were many more British investigators than exhibitors. Conscious that, whatever happens next, they can no longer afford to neglect the Continent as they have done in the past, they tried unobtrusively to discover what is being made and sold and how it is being marketed.

Some of the old British hands at Hanover were obviously well aware of the importance of good presentation. Napiers, for example, had taken infinite pains to make their stand attractive and were rewarded by a steady show of interest. Under the ægis of the Board of Trade, the Atomic Energy Authority and the Nuclear Energy Trades' Association Conference also took immense trouble to make themselves intelligible and convincing. In the still unique position of being able to offer proven atomic power plant they might have been tempted to be lazy. They worked with zest all round the clock, and it seems likely that some new orders will be placed as a result of the constant stream of enquiries made at Stand 410.

Gatt's Siamese Twin

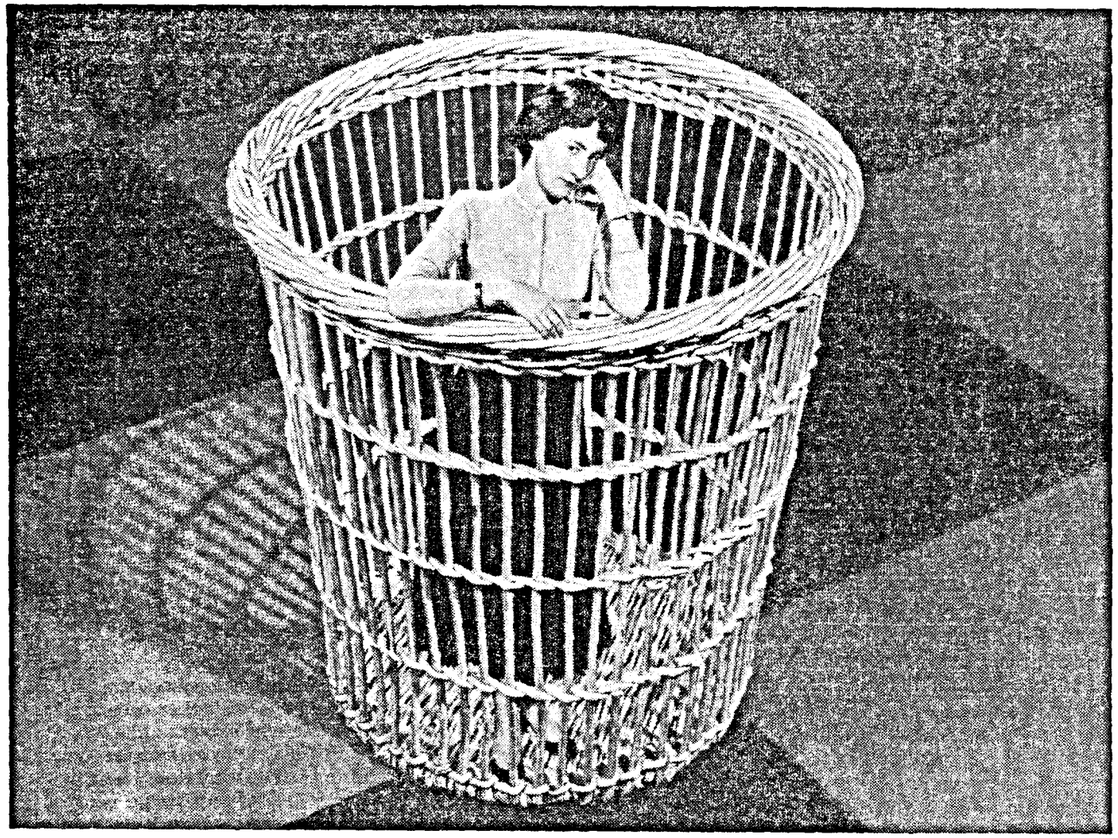


FROM A CORRESPONDENT IN GENEVA

THE birth pangs of the common market have caused a great deal of excitement in the family of the General Agreement on Tariffs and Trade. At its meeting last November congratulations were drowned in fears and forebodings about the damage the giant baby of the Six might inflict on world trade. Four working parties were set up to report on the implications of the new common tariff, agriculture, quantitative restrictions and the association of the overseas territories. And it was decided to hold an early intersessional meeting this spring to examine the effects of the common market on members' trade and to discu measures to check any ill effects.

At this meeting, which ended last week, the comm market countries were for the first time represented by single spokesman, the Belgian Baron Snoy, who ably allaye many of the fears expressed by the speakers of twenty-o countries. The three weeks' discussion did not solve a fundamental problems, but it helped to clear the air an brought a measure of understanding between the Six a their critics. In November the common market countri were still maintaining a purely legalistic attitude to t General Agreement, arguing that customs unions were pe mitted under its articles, and that they were prepared obey its rules to the letter. They now seem to take up rather more flexible position; they seem to agree, f instance, that a common market tariff based on the no weighted arithmetic mean of the present legal tariffs (mar of which are in any case higher than the tariffs actually force) might be against the spirit of Gatt. It is, howeve too early to discuss these questions as the common tariff the Six has not yet been completely worked out. It has be promised for July 1, 1959, but since extensive tariff negoti tions are to follow until well into 1961, the Six have be asked to submit it still earlier. All comments made by eith side on the managed market for agriculture which is to operated by the Six are equally hypothetical. Baron Sn announced that a conference would be held in Stresa la this summer at which the Six will try to work out a joi agricultural policy.

The main discussion centred upon a report by t working party which has been studying the proble raised for other countries by the association with common market of the overseas territories of the S Statistics on the main commodities affected, like coc coffee, tea, bananas, sugar and tobacco, were assemb here for the first time. But the working party's report g a practical demonstration of how one set of figures can interpreted differently by two different interests. The re is a sort of Siamese twin with the Six holding one poin view and their critics another on all major questions. shows how difficult it is to isolate the trade-creating and trade-diverting effects of a customs union. It is doub whether in the long run the commodity problem can solved in relation to the common market alone and appointment by Gatt of four wise men, Professors Cam Haberler, Meade and Tinbergen to study the proble commodity trade on a world basis suggests that this been realised. Agriculture, like the problem of over territories, seems less and less to fit into the framewo the General Agreement. While the exchange of view the common market was cordial, the discussion of Germany's refusal to liberalise the last 18 per cent imports, when it certainly cannot plead balance of payn difficulties, was bitter. Most of the German quotas a agricultural products.

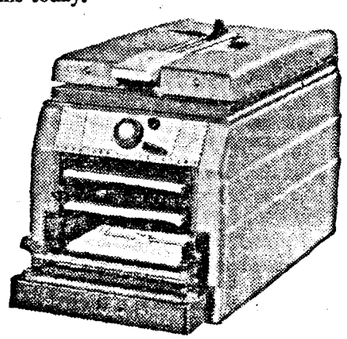


Yet on one vital matter the Six and their critics see have agreed—that Gatt should be the forum for all fu discussions between the common market countries an other Gatt members. The European economic comm will first have to work out its own problems, such a common tariff and the nature of common agricul commercial and financial policies, before headway c made in the Gatt negotiations. But it is something th Six do appear to have acknowledged the princip economic multilateralism for which Gatt stands.

NEXT-DAY DELIVERY BY EXPRESS FREIGHT

This map shows some of the many towns to which British Railways Express Freight Services can give next-day delivery for wagon-load traffic. It is a time-table service—and door-to-door transport can be provided. Express Freight charges are competitive with any other form of transport. For further information get in touch with your local Stationmaster or Goods Agent. He'll supply you with all the details you need.

BRITISH RAILWAYS EXPRESS FREIGHT



Why throw away
a good secretary on copy typing

Copying is no job for a secretary. She doesn't like it. And it's uneconomical. What you need is a Kodak 'Verifax' Copier. It copies seven times faster than a typist. Every copy is completely accurate, and it's made on inexpensive paper.

Anyone can learn to use the Kodak 'Verifax' Copier in five minutes. It is clean, self-contained and takes up little more desk-room than a typewriter.

Whatever your business, no matter how big or small, there's room in it for the 'Verifax' Copier. Send for details today.

A FRENCH JOURNEY—IV

Catholic Liberalism

FROM OUR SPECIAL CORRESPONDENT

THE great technical progress and political disillusions of the postwar years have, all observers agree, bred in France a new generation of "utilitarians" (*positivistes*) who bewilder their romantic seniors formed in the ethos of the Resistance. "The young are so much more *reasonable* than we." Perhaps, significantly, the only similar period was the Victorian heyday of the Third Empire after the fiasco of the 1848 revolution, when Progress alone seemed to ride high over the wreck of radical hopes. There are dangers in the nascent attitudes: scepticism hardly fits them to reform the Palais Bourbon—and this could encourage the drift to unparliamentary technocracy. But the price France has paid for doctrinaire politics is such that the development must, until further notice, be counted as healthy. This is why more attention should be paid to the great variety of Catholic movements, which curiously enough, may have better chances than other groups of shaping this spirit

That French catholicism, which has gained more in freedom than it lost in funds by disestablishment in 1905, has had a renaissance since the war is well known. But the familiar aspects—the rise and partial fall of the Catholic party (MRP), anticlericalism, the schools question, the worker priests—are now perhaps not the most significant ones. Two less obvious features are probably more important. One is that politically minded Catholics provide more of the people who actually run the country than any group, including the Communists. One gradually becomes used to finding that not only Mauriac and the intellectuals of *Esprit* or *Témoignage Chrétien*, but also many of the journalists on *Le Monde*, of the administrators in the Commissariat for the Investment Plan, of the members of the Young Employers' Association—innumerable individuals in all influential walks of life—are very active Catholics. The other feature is the strength and vitality of the Catholic organisations in key sectors, like the Christian trade union body (CFTC) which has probably the best young labour leaders in the country, or the Young Catholic Farmers who in the next ten years could capture the extremely powerful Farmers' Union.

The CFTC, not the aged Socialist *Force Ouvrière*, is the trade union competitor of the Communist-led CGT. It probably musters little over a fifth of union members against the CGT's 60 per cent, but it is at its strongest in the industries, like engineering, and the areas, like Nantes and St. Nazaire, where the union spirit itself is strongest. Its strength comes largely from the youth and dynamism of its active branch members—the average age at a recent congress was 31—an achievement due to a long standing leadership training programme. In some places, like Nantes, the CFTC leadership is of remarkable quality. And everywhere the Christian leaders are freer than their Communist or Socialist rivals. Professionally, they do not, like the Socialists, refuse to strike with the Communists on principle, nor do they (like the Communists) often refuse, also on principle, to sign advantageous contracts with the employers. Politically, they have neither Budapest nor Algeria and Suez to explain away. The result is that where they gain votes they usually keep them (unlike the Socialists). Their advance has been slow but sure. And it has been done by stressing bread-and-butter bargaining. Some trade unionists object that the Christians like neither a good fight nor the class war; but recently employers have paid them the compliment of often picking on their shop stewards as ringleaders of "labour unrest." Also, revolutionary opposition has produced so few benefits that their pragmatic, almost Anglo-Saxon, approach increasingly fits the apolitical mood of the workers.

The Young Catholic Farmers' movement (JAC) is still more striking. It was formed around 1930 as one of the youth movements to evangelise peasants, workers and students by organising, or rather helping them to organise, their leisure. Before the war, the workers' movement (JOC) was prominently anti-fascist, but since the war the JAC has proved immeasurably more alive. It had two advantages: the Communists were not an overwhelming opposition rurally; and country folk need leisure activities. Now its two papers together sell 150,000 copies, and it has educated half a generation in the problems of agriculture so that, for instance, many of the members of the important farmers' research groups (that were mentioned in an earlier article) were members of the JAC when they were younger.

The powerful Farmers' Union, realising that the JAC has a better network than its own in the villages, last year agreed to a merger with it of its own weak young farmers' association, and to the representation of the merger on the directing board of the Union itself. In many places the Union, despite its anti-clerical "republican" bent, has had to find ex-JAC members to run its secretariat. All this leads observers to conclude that the JAC should gradually transform the Farmers' Union in the next ten years. Here again this implies a reform of the traditional spirit. The Union has always been a lobby run by the big farmers of the north. The JAC, though its membership is mostly drawn from the supposedly retrograde peasantry of the south and west, is more conscious of the need to settle the technical and social problems of farming—to shoulder responsibilities as well as agitate for higher price supports.

The distinctive mark of the Catholic cadres is not politics (many would vote against the MRP) but the anxiety to spread responsibility for social action. The "Reconstruction" group in the CFTC, the dynamic minority which controls the Christian engineering, building and chemical unions, lays tremendous stress on discussion at the base; the Young Farmers' leaders, all of whom are peasants' sons and left school at fourteen, are themselves impressive testimony to the success of the JAC's practical educative effort. Allied with this is a desire to find the bonds between individuals and groups rather than divide them.

These attitudes break with post-revolutionary individualism and with the traditional compulsion to oppose, or profiteer, by government. They also break with traditional Catholic authoritarianism. Though the catholic electors are mostly of the Right, the cadres are mainly of the Left ("We want a Labour party"), Christian but not clerical. "Yes", said a delightful anarcho-syndicalist, "but when D.... (a prominent Christian labour leader) campaigned for the Socialists at the last elections he consulted his bishop first." True. But the Church, disestablished, prudently anti-colonialist to serve its overseas interests, and systematically partisan in France only in its anti-communism, has so much broadened in sympathy that the Catholic's claim to act individually can mean almost what a Protestant would think it ought to mean.

The Catholic cadres are conspicuously anti-authoritarian in politics: Catholic professors, conscripts and even bishops

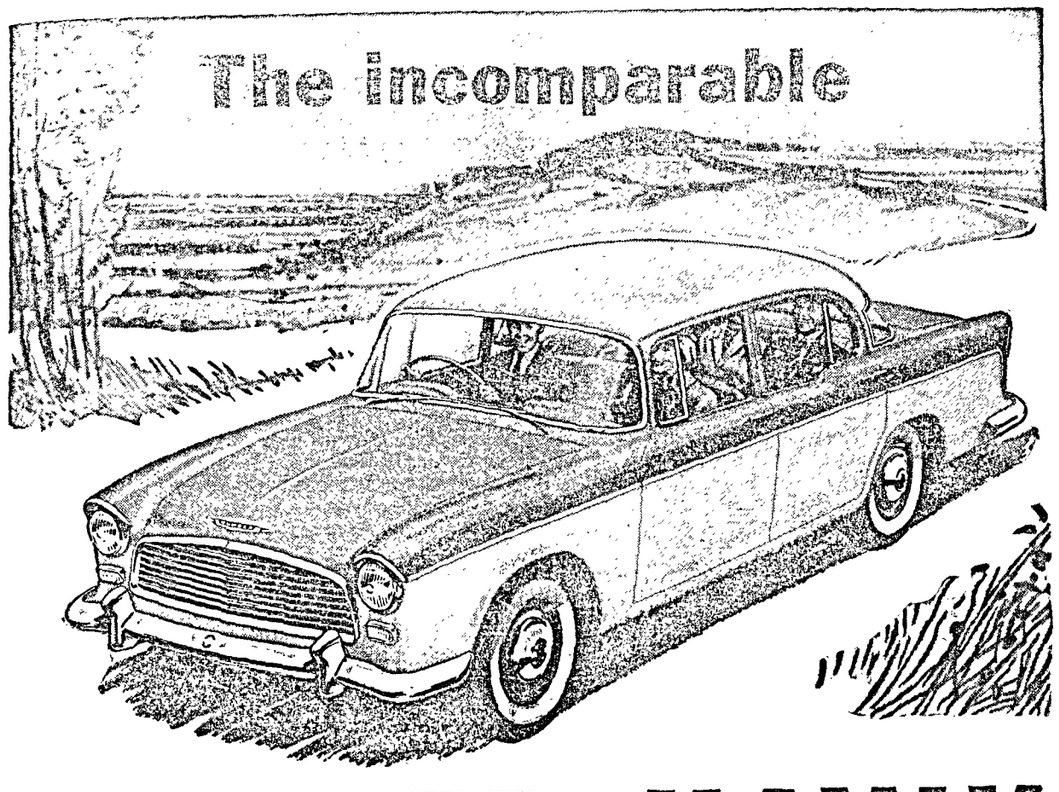
have led the campaign against repression and tortures in Algeria. It is equally hard to attack the Catholics for "clericalism" today: the word is more and more reserved for abusing the obscurantism of Communist and Socialist bureaucrats. In fact, the belief in reform, in the spreading of responsibility, and in opposing self-constituted authority add up to something strangely like liberalism. Politically, one could almost speak of many of the French Catholic cadres today as neo-Protestants: they have removed their heaven from the arena of politics. That is an element of democracy that France has always lacked, and it could mean more for the future than several reforms.

(To be continued)

North Africans in Conference

FROM A CORRESPONDENT IN TANGIER

No doubt the choice of Tangier as the scene of the conference on the unity of the Maghreb (the Arab West) from April 27th to 30th, was influenced by the fact that Allal al Fasi, president of the Istiqlal party and its principal theorist, has made his home there. Something of the friendliness of the most welcoming of Moroccan cities could be felt in the closing words of the oration which introduced the reading of the final resolutions. Appealing to France "to return to herself" and serve her true interests by recognising the right of Algeria to independence, the Istiqlal leader declared that North Africans bore no enmity to the present "occupiers" of Algeria or of certain other portions of the Maghreb, beyond what is the inevitable accompaniment of any struggle for liberation.



For two days before this the journalists had had to wait while debates went on behind closed doors. The Algerians were said to be delivering a sort of ultimatum to their more hesitant Tunisian and particularly Moroccan colleagues. We shall look outside the Maghreb for allies, they were held to be saying; and we shall turn to the Egyptians or the Russians, unless you give us such practical support as will, we admit, involve a risk of war with France. There was indeed a certain difference in tone between the opening speeches of the three delegations. The Moroccan statement dwelt with some complacency on the degree to which Maghreb unity had already "been forged and cemented by common hopes and common sufferings." The Tunisian statement urged that aggressive attitudes should be avoided, and maintained that it would be quite wrong to ignore results already attained "thanks to the political realism of the adversary," or to imperil the continuance of international support which had undeniably been a help in the past. The very brief Algerian statement sounded a more urgent note; it opened with an emphatic assertion of the right of the National Liberation Front (FLN) to speak on behalf of the Algerian people, and deplored the financial and material support given to France by certain of its allies. It relegated to a final sentence the conventional expression of thanks to the rulers of the two independent states with which the other delegations had opened their remarks.

Whatever significance these nuances may have had, they seem to have been ironed out. On the theoretical side, the conclusions, for all their moderate wording, insisted emphatically on the things that the leaders of the Maghreb regard as essential for their future co-operation with the western, and other, powers in the community of free nations. These were threefold—recognition of the right of Algeria to independence; evacuation of foreign troops, since these are incompatible with the sovereignty of independent countries; and immediate cessation of the use by French troops of Tunisian and Moroccan territory as bases "for aggression against the Algerian people." As a corollary, "active solidarity" was expressed with the struggle for independence in Mauretania and for the fulfilment of what was described as the "profound longing" of the Mauretanians for union with Morocco. As evidence of this, half a dozen Mauretanian notables were present in the front row of the visitors' gallery. There were also three practical recommendations: the formation of an Algerian government, after consultation with the Tunisian and Moroccan governments; the establishment of a consultative assembly drawn from members of the national assemblies of the two independent states and from the council of the Algerian revolution; and the formation of a secretariat with two members from each of the three countries, to meet either in Tunisia or in Morocco. The functions of the assembly were not defined, but the Tunisian and Moroccan governments were requested not to enter into foreign commitments without consulting it first—though at a final press conference the Algerian spokesman expressly reserved the right of the Algerians to take any step which they thought necessary for their safety as a nation.

These emphatic and public declarations of solidarity undoubtedly mark a new stage in the history of North Africa and its emancipation from French political control. The publicity on this occasion contrasted strikingly with the half-furtive way in which the Algerian leaders were received in Morocco, out of deference to French susceptibilities, in the period immediately before the kidnapping of the five leaders in 1956. The Algerian requests have been met to the largest possible extent, even if the creation of an Algerian government has been expressly subordinated to consultations with the Moroccan and Tunisian governments—no doubt so that diplomacy can ensure that, when it is done, the maximum consideration is shown for the anxieties of the British and American governments. Another mitigating gesture, of which there is no reason to doubt the sincerity, was the basing of the appeal to cease monetary and material support for France not on a blackmailing threat to secede from the world of western democracy (to which the North Africans are genuinely attached), but on the liberal traditions of the powers to which it was addressed.

Though no Libyan delegation appeared, the resolutions expressed the hope that Libya would eventually adhere. In answer to a question about the Libyans' absence at the final press conference, it was merely explained that they had not been invited in time. This would be unbelievable if it were a western European conference of comparable importance; but it is quite in accordance with the extreme improvisation of Arab affairs, sometimes with unfortunate results in dealings with the West where these Arab ways are not understood; but sometimes with remarkable success.

In the sphere of the internal affairs of Morocco, the conference was remarkable for the assurance with which the Istiqlal party—still, in theory, only one of several such organisations—assumed the right to commit both the people and the government to its resolutions. The attitude, in fact, represents the ever-increasing influence which the Istiqlal wields in the country. Nothing was revealed on how monarchy and republicanism could be linked in the federal system that is envisaged as the ultimate goal for the Maghreb.

HUMBER HAWK

The features of safety, luxurious comfort, and smooth, sparkling performance have never been more successfully combined than in the distinguished Humber Hawk

Comfort

Exceptionally wide doors plus a 'step-down' floor give remarkably easy access to the luxury of a 6-seater interior that is inches more roomy in every direction.

Performance

The powerful Humber engine, reliable and economical, gives an excellent all-round performance—smooth power at your command.

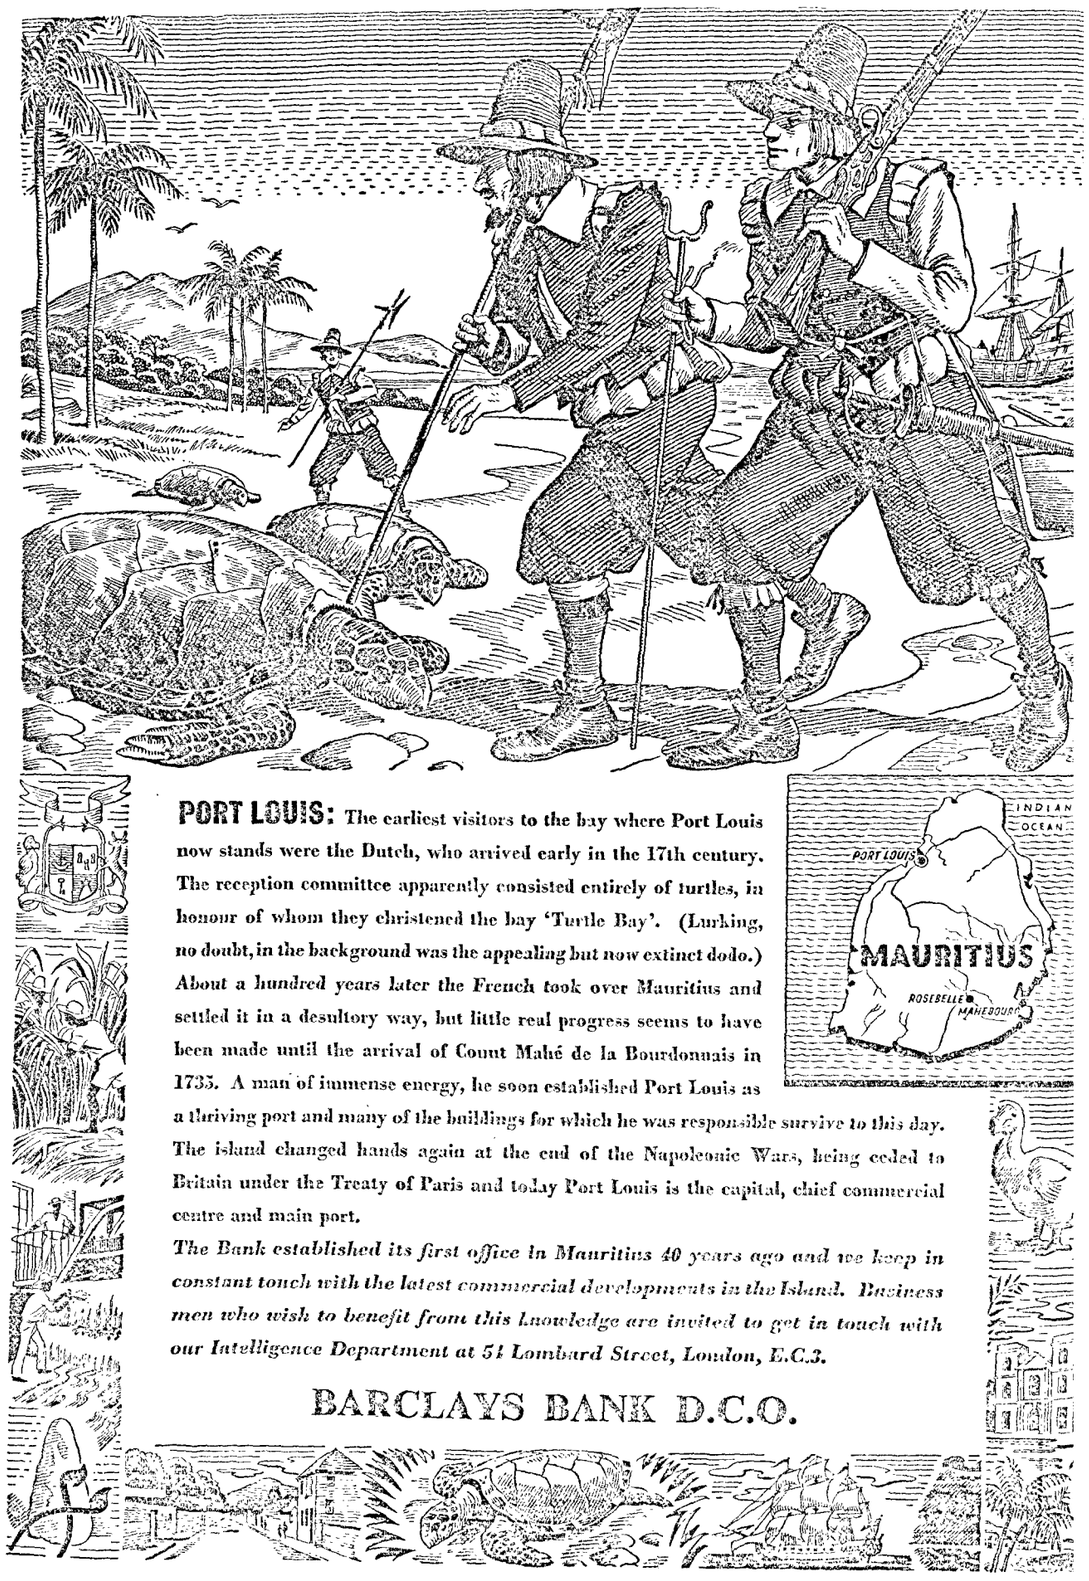
Safety

Tough unitary construction ★ panoramic visibility ★ balanced weight distribution ★ precision steering ★ instant response ...vivid acceleration and powerful brakes.

TOURING ON THE CONTINENT Continental Touring Scheme vouchers are available to all owners of Humber, Hillman and Sunbeam cars to cover repairs and replacements on the Continent. They are obtainable for sterling in the U.K. leaving your travel allowance intact. Ask your Rootes Group dealer for full details.

£840 *plus £421.7.0 purchase tax*

White-wall tyres, and chromium rimfinishers available as extras.



WITH FULLY AUTOMATIC TRANSMISSION OR OVERDRIVE AVAILABLE AS AN EXTRA

(Available also as a Limousine or Estate Car)

PORT LOUIS: The earliest visitors to the bay where Port Louis now stands were the Dutch, who arrived early in the 17th century. The reception committee apparently consisted entirely of turtles, in honour of whom they christened the bay 'Turtle Bay'. (Lurking, no doubt, in the background was the appealing but now extinct dodo.) About a hundred years later the French took over Mauritius and settled it in a desultory way, but little real progress seems to have been made until the arrival of Count Mahé de la Bourdonnais in 1735. A man of immense energy, he soon established Port Louis as a thriving port and many of the buildings for which he was responsible survive to this day. The island changed hands again at the end of the Napoleonic Wars, being ceded to Britain under the Treaty of Paris and today Port Louis is the capital, chief commercial centre and main port.

The Bank established its first office in Mauritius 40 years ago and we keep in constant touch with the latest commercial developments in the Island. Business men who wish to benefit from this knowledge are invited to get in touch with our Intelligence Department at 54 Lombard Street, London, E.C.3.

THE BUSINESS WORLD

Dumping in the Open

Two important decisions are about to be made by the Board of Trade under the Customs Duties (Dumping and Subsidies) Act of 1957, otherwise known as the Anti-Dumping Act. One concerns a complaint by Canadian producers of aluminium about the alleged dumping of Russian aluminium in Britain; the other a complaint by New Zealand producers of butter about the alleged dumping in Britain of Irish, Finnish and Swedish butter. Three other cases have already been decided: an anti-dumping duty was imposed on imports of French silicones; a complaint about tomatoes from the Canaries was rejected; and a third was settled out of court when the French were persuaded to withdraw a subsidy on new potatoes. The Board of Trade has advertised that it is considering complaints about lighter-flints from Germany and Austria, and worm powders from Sweden, Italy and France; in a number of others it is not yet satisfied that a *prima facie* case of dumping has been made.

This shows that considerable use is already being made by British industry—and by Commonwealth producers—of an act that was passed barely a year ago. But is it certain that the decisions made under it can satisfy the over-riding test that Parliament decreed—the British national interest? The points at issue in the anti-dumping complaints that have already been lodged reveal the difficulties of the task that the Board of Trade has been given.

First, there are the technical questions. Can dumping be proved by any of the tests allowed in the Act—by reference to the fair market price in the country of origin or consignment—that is, the domestic price, or, if that cannot be determined, by reference to costs of production in the supplying country, or to the price that it charges for exports to countries other than Britain? When complaints are made against Russian or Eastern European producers, such questions of fact are particularly difficult to establish. What is the fair market price in a country that has no open market? And if prices or costs can be established only in local currency, then at what exchange rate should they be converted into sterling? Clearly, if protection is to be given to British producers against dumping from *communist* countries highly arbitrary decisions will have to be taken.

Next, if dumping, so defined, can be proved against a country that is a fellow member of Gatt, then before it takes further action the Board of Trade must satisfy itself that the dumping is causing or "threatening material injury" to an established industry in the United Kingdom, or materially retarding the establishment of such an industry here. When the complaint is made, not by a British firm, but by an overseas producer exporting to Britain in competition with the dumped goods, then an anti-dumping duty may still be imposed, but only if the complaining supplier can convince the Contracting Parties of Gatt as well as the British Board of Trade that it has suffered material injury as a result of the dumping. Thus the New Zealand producers of butter can obtain an anti-dumping duty only if, as a first step, they can satisfy the Board of Trade that Irish, Finnish and Swedish butter is being dumped in Britain; and then if they can prove to the satisfaction not only of Britain but of the other members of Gatt as well, that they are being caused or threatened with material injury as a result of the dumping.

Russia is not a member of Gatt, so the Russian aluminium producers are not formally entitled to this extended consideration. But the Board of Trade in fact proposes to apply the same criteria to Russian goods as it would to goods originating in a member country of Gatt. In the aluminium case, it is difficult to establish how much of the Canadian producers' difficulties are due to a falling demand for aluminium in Britain, as elsewhere in the world, and how much specifically to competition from Russian aluminium in the British market. A crucial point is likely to be whether the guarantees said to be included in many of the Russian

sales contracts, that supplies will be delivered at so much below the delivered cost of Canadian aluminium whatever happens to the Canadian price, are sufficient evidence of "a threat of material injury."

The Board of Trade must satisfy itself on all of these grounds before it can impose an anti-dumping duty; but even then it can do so only if it is also satisfied that the imposition of the duty would be in the British national interest, in an undefined, but also widest possible sense. The Board is free, and indeed obliged, to take into account wide political considerations, such as Britain's relationship with the other members of the Commonwealth, and the effect on the future of Commonwealth trade of a refusal to impose anti-dumping duties (once the tests of dumping and material injury have been satisfied). If the dumper were a member of the European common market or a potential member of a European free trade area (whose support in the current negotiations Britain could use or whose antagonism could be mollified), then the national interest might require that no anti-dumping duty should be imposed.

Other questions concern more directly the level of costs and the degree of competitive flexibility of the British industry affected, or the complaining supplier from the Commonwealth. Are the British fabricators, exporters, and consumers of goods made in Britain from imported aluminium better served by an assured supply of aluminium at a stable price from the dominant Canadian producers than by a less certain supply at high prices in times of shortage which however come down to much lower levels in times of surplus? (The argument recalls one over the price of copper a year ago, when the choice was between managed price stability and a freely fluctuating market price: it is rather odd to find the Russians in the role successfully played then by the London Metal Exchange). These are only a few of the arguments that the Board of Trade must weigh in deciding whether or not to impose an anti-dumping duty. And in practice, though the Board is given this responsibility under the Act, its decisions are taken only after the normal process of inter-departmental consultation culminating, in all big cases, in a decision by the Cabinet. It is not surprising that the Government takes some time to come to a decision. Indeed it would be disturbing if it took a decision lightly.

WHAT is disturbing about the present procedure is that nobody outside the Government—not even the members of Parliament who have to approve the Board's decision on each issue—can as things stand discover the full evidence on which the decisions are finally made. Comment by disinterested observers while the decision is pending can be based only on the information or propaganda that the complainant chooses to make public; on the public reactions of the alleged dumper, and other suppliers and consumers of the commodity in question; and on such additional background information as is available privately. Even after the decision has been taken, the facts of the cases, and the Board of Trade's interpretation of them, are made public only in so far as the President of the Board of Trade chooses to disclose, or can be pressed in Parliament to disclose, or in certain cases may be obliged to disclose in defending Britain's action in imposing anti-dumping duties before the other members of Gatt. Is this not carrying a regard for commercial secrecy too far? A comparison with procedures followed across the Atlantic suggests that it may be, and that the national interest may be better served in Britain if this Act were amended.

When an American manufacturer submits his case for higher tariffs to the US Tariff Commission he does so in the full knowledge that these will be made public; the same applies to the counter-arguments put forward by foreign suppliers and their American importers. Both sides of the case are thus given a full and public hearing, and the Commission also makes public the full reasons for the recommendations it makes. These recommendations are not binding on the President; but he in turn is obliged to make public his reasons for rejecting or modifying the public advice he has received. But in making the British procedure less secret it would not be necessary, and would probably not be desirable, to require publicity for all findings to this extent. The British Government's view of the national interest in matters affecting negotiations on the European free trade area, or in Britain's relationship with other Commonwealth countries, might gain something in clarity if it had to be published, but such frankness could reasonably be considered embarrassing at times. And provided both sides of the case were made public, members of Parliament and outside observers could apply their own concepts of the national interest to anti-dumping complaints, both before and after the Board's decision became known.

The objection to even this limited aim of making public only the arguments of the complainant and the defence raised by the alleged dumper, together with any other evidence—from, say, the consumers concerned—is that dumping and material injury can sometimes be proved only by disclosing details of a complainant's costs of production or other figures that he feels would help his competitors. That is the burden imposed on any industry seeking protection in the United States: on balance, it is rightly imposed. The complainant supplier is asking the Government deliberately to restrict competition in his favour and support his price. In any society where competition is generally presumed to be in the public interest, there can be no good reason for making it easy for him. If a firm—or, as in the present cases, an industry abroad—is really suffering material injury because British customers get something cheaper than he wants to sell it for, the embarrassments of disclosure ought reasonably to be weighed against the advantage of securing protection against dumping. If they outweigh the possible advantage of protection, then perhaps the complaint should never have been made. And if a change in the procedure followed in hearing the arguments were to lead to fewer complaints of dumping, the national interest might well be better served. British and Commonwealth industries have such strongly protectionist traditions, and Britain's trade relations with both Continental and Commonwealth countries are now so delicate, that justice must openly be seen to be done, and with a courageous degree of economic liberalism.

Can the Co-ops Compete?

A movement born in social aspiration is losing ground in an epoch keynoted by social progress

TOAD LANE, ROCHDALE, in 1884 saw the birth of the retail co-operative. From there the movement, giving the consumer a share in the disposable profit and a say in the management of a business organisation without any equity capital, strode round the world. Up to the nineteen-twenties it flourished, gathering a steadily increasing share of retail trade. But since the thirties the co-ops, in spite of real advantage of offering a sizeable discount, through the "divi" on branded goods of which prices are usually maintained, have failed to maintain this momentum: their share of retail trade in Britain has remained stable, at about 11-12 per cent. The movement in this country is massive. Within it, there are over a thousand retail societies with over 12 million members; they own over 30,000 shops, selling nearly £1,000 million of goods a year. The movement also owns about 250 factories, making a wide and disparate range of products and the biggest wholesale organisations in the country, with an annual turnover of over £500 million. This gigantic complex is showing unmistakable signs of decline.

In 1955, the co-operative movement asked an independent commission to survey its economic operations. This commission was of high calibre, including among others some of the best known economists concerned with distribution in Britain, and its report*, for which Mr C. A. R. Crosland is primarily responsible, is an impressive document. The co-operative movement deserves credit for its courage in publishing such a dispassionate appraisal of its operations; it deserves little credit for the many weaknesses and failings that are revealed.

What has gone wrong? By the skin of their teeth the co-ops have just about held on to the share of total retail trade that they reached in the thirties; but private multiple retailers, which had only about the same share before the war, have doubled theirs. The co-ops have lost ground to the multiples and have failed to attract young customers, despite the fact that they own about 60 per cent of the self-service shops in this country. Food makes up about three-quarters of the co-ops' trade and they have slightly increased their share of total food sales. But that is due "entirely to a spectacular expansion in the milk trade," for the co-ops are still powerful in the door to door delivery of such foods as milk and bread. Where the co-ops have lost most ground is in dry goods. This is particularly true of clothing and footwear (where co-operative wholesaling and production is substantial) though hardly evident in household durables. Some societies are far above the average, but some are very, very bad.

In any case, there are too many of them, too many dowdy shops selling dowdy goods, and too often badly sited away from main shopping centres, which tend to be monopolised by the multiples. Too many co-ops are in small towns and too few in big ones. About 750 societies own fewer than 15 shops; they impede each other's trade without effectively bothering their rivals, the multiples. Trade between the retail and wholesale societies seems to be conducted in some vague spirit of co-operative loyalty rather than of hard-headed business—though that does not prevent mutual recriminations. The wholesale societies have failed to be as "skilful and dynamic as the central buying organisation of a large multiple." From the English and Scottish wholesale societies, the retail co-ops still buy much the same proportion of their food supplies as they did in 1938, but they buy a smaller proportion of their dry goods. Through these societies, the co-ops have bought more co-operatively produced milk and meat but less of the footwear, furniture and hardware made in co-operative factories. The wholesale societies, however, have increased their productive capacity and operating from 20 to 50 per cent below capacity, a number of the factories are now "seriously underutilised."

In one sense, the co-operatives have been left high and dry by the tide of social change. A movement created to serve the needs of a poor working class has failed to link itself with a prosperous working class. Some of the movement's failures are the penalty of

being first in the field, but in general its appeal is to old-fashioned customs and loyalties, whereas working people today think of themselves as part of a vast middle class of consumers. This old-fashioned air hangs about the "democratic organisation" by which the movement, commercially as well as politically, is run. This has led to the rule of the tiny minority: the "do-gooder" and the busybody are more likely to get elected than the man with business sense who nowadays does not lack other opportunities. This organisation creates diffusion and parochialism without necessarily breeding genuine co-operative control. There is little chance that the man with real managerial skill will emerge from such a semi-political process. Worse, this structure has inhibited the co-ops from recruiting professional managers as capable as those employed by their rivals.

THIS is a crippling institutional weakness for any organisation competing in commerce. At one extreme, it has led to the establishment of uneconomic factories; at the other to too much concern with the size of the "divi." Few managers in the movement seem to have bothered to look ahead and those that did found their power to reform and to expand hampered by the dispersion of control in a large number of weak hands. Thus out of their net disposable surplus the co-ops, though they make generous depreciation provisions, retain only 4 per cent for capital expansion and pay the rest out in dividends to their consumers. The multiples retain nearly half of their net earnings towards expansion.

From the mass of recommendations urged in this report, it is possible to isolate four major strands of reform. First, though democratic control by members should be retained, the whole structure of management must be revised. In retailing, wholesaling, and production the aim must be to secure full-time executive managers of real ability; these should take the day to day decisions, leaving any broad questions of policy and of overall control to boards elected from the members. That will mean, as the commission sees, paying higher salaries, recruiting more widely, and dismissing the slack and incompetent.

The second strand is that the co-ops must conduct their operations by unswerving reference to the laws of the market place. The retail societies should amalgamate, bringing their number down to between 200 and 300; they may then enjoy the economies of scale at present achieved by all the multiples but only by a few co-ops. They should match the prices of their most successful private competitors in each trade and area. They should buy the goods the customer wants—whether these come from the CWS or from a private manufacturer. And they should maintain the highest standards of location, lay out, appearance and service. The wholesale societies should become more conscious of their obligation to serve the retail co-op not as a fellow co-operator but as a trade customer. They should charge economic prices, varying these and their margins (which so far they have for no good reason seemed reluctant to do) according to the actual services they perform. The wholesale societies should also narrow the range of their production and base all decisions about production on a comparison of the relative return on capital.

Thirdly, the commission recommends the formation of a Co-operative Retail Development Society, standing in its own right and financed by bigger subscriptions from member societies to the Co-operative Union. This would provide common consultancy services on selling, business and managerial methods and techniques; act as a channel for development finance (at some cost, it would seem, to the status of the CWS bank); and be responsible for the formation of national co-operative chains of specialist shops, of which the first should be a chain of footwear shops.

It is largely but not entirely through this body that the commission hopes to attain its fourth major object: an expansion of co-operative retail trade in general, to which any expansion in wholesaling and production would have to be subordinated. The aim in the next ten years, the report suggests, should be to increase food sales by one-third and to double non-food sales. The capital investment required is put at £200 million, or about twice the current annual rate of capital expenditure. To meet that cost the societies would have to build up their reserves—at some cost to their dividends, which the commission would prefer to see stabilised rather than increased. The societies should also raise interest rates on their capital, with the object not so much of attracting new money as of discouraging withdrawals, and reduce the big fund of investments (not all of which are truly liquid assets) that they hold outside the movement, thus bringing down their liquidity ratio. Only in these ways could expansion on the scale hoped for be made possible.

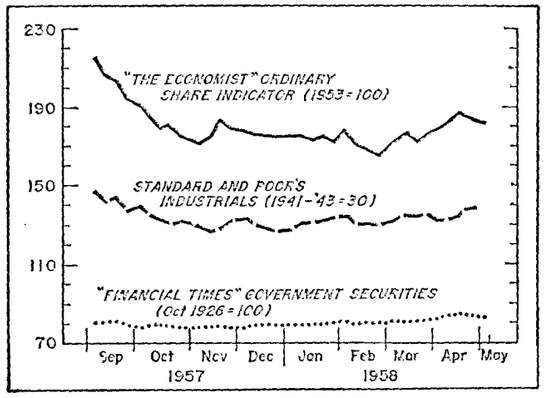
WILL these fairly rosy hopes lessen the sting of the goad of internal reform urged in the report? The commission has not found it easy to reconcile its refreshing insistence on the need to live with and by the principles of economic competition with co-operative ideals. Sometimes it seems to have stopped short of the logical conclusions. It does not recommend a separation of the wholesale side from production, though some members were in favour of such a split in spite of the administrative upheaval it would cause; and it does not say explicitly—though some of its recommendations point clearly that way—that the societies should specialise in what they do well and cut out what they do not. The underlying assumption seems to be that given effort and investment (which have been so conspicuously lacking) expansion in the co-op share of business is possible in almost every field of retailing. That seems inherently optimistic, but it is a prospect which might encourage the co-operative societies to accept the structural recommendations that are designed to make them economically efficient units. This is a radical report aimed at a stuffy, conservative organisation which has fallen badly behind the times. After such a report no movement could possibly sit back and do nothing.

BUSINESS NOTES

IN THE MARKETS

Conversion Success

BEST hopes in the gilt edged market were that the conversion operation would result in about £600 million of the maturing £676 million of 4 per cent Conversion stock 1957-1958 being exchanged into the new 4¾ per cent Conversion stock 1963 or the 5¾ per cent Conversion stock 1974. In fact no less than £650 million of the maturing stock was converted—£352 million into the 1963 stock and £298 million into the 1974 stock, so that a mere £26 million will have to be repaid on June 15th. This approximate result, to which the small amounts on the Post Office register have still to be added, exceeds all expectations.



Clearly the money market and perhaps the banks, hungry for short dated stocks, were responsible for it. In hoping for a total of £600 million the authorities had already reckoned on the conversion of the Government's own holdings and they can have added little to them between the announcement of the conversion offer and last Monday, when it closed, for the market price remained above the Government broker's price. Big quantities of the maturing stock were bought for conversion, presumably mainly into the 1963 stock. The success of the conversion operation marks the fact that the maturing 1957-1958 stock was largely a "City stock" held in the banks and discount houses.

The Government broker now has a supply of both the new stocks, and the shorter dated of them looks likely to encounter an active demand when the gilt edged market resumes its strength. The nature of the response to the offer however seems to suggest that a large part of the £352 million of 1963 stock must already be held in investors' hands.

The Morning After

THOSE who guessed that when the Government's conversion operation was out of the way and the strikes and threatened strikes held the field, the gilt-edged market might be ready for a reaction, were certainly right. Gilt-edged prices have tumbled, particularly pronounced on Wednesday and on Thursday morning. The *Financial Times* index of Government securities which stood at 83.52 at the end of last week had reached 82.32 by Wednesday evening. Naturally, solid investors like the banks that had bought heavily over previous weeks have not sold. But the speculative and semi-speculative fringe of the investing public quickly changed step, and soon landed the jobbers with far more stock than they expected and prices were widened. An oddity of this move is that the 5½ per cent Exchequer stock of 1966, recently the most popular counter in the market, was among the most heavily sold. In the first three days of this week it has fallen ⅞ to £101⅛. This stock had attracted speculative buying because it was generally believed that the Government broker was near the end of his supply and that a quick rise might follow the closing of his "tap." But it is still open; the turn in the market has arrived first.

This setback in gilt-edged, which with wisdom may prove to be short-lived, is based on the same reasoning as the weakening of sterling: confidence in the British recovery is under test; the firmness of the Government and the common sense of the trade unions are the two indicators by which it will be reassessed. Some of the same thinking applies also to the industrial share market but with two important points of difference. A sign of weakening on the wage issue might also be a forerunner of renewed inflation and that should not be bad for equities. Moreover, through most of the past week Wall Street has held its ground well and taken investors' thoughts off American recession. Therefore the decline on the industrial side of the market was small. On Wednesday, a thoroughly bad day for gilt-edged, hardly any decline occurred in industrials, and over the whole week *The Economist* indicator shows a fall of only 2.3 at 181.3.

THE STRIKE FRONT

Sterling Loses Ground

DESPITE the April gold and dollar gain sterling has lost ground this week. From $2.81¼ the spot rate in the official market against the dollar has this week slipped to $2.81¼. The selling has reflected the news from the strike front, but not because the sellers feared the bus strike or the threatened railway strike. Sellers of sterling feared only that the Government's nerves might snap and concessions might be given that would undermine the growth of confidence so laboriously built up since last September. Hot money is not flowing into London now, since the forward discounts on sterling approximately straddle the interest rate differential between the London and the New York markets and that may be small loss. But there has also been evidence of an ebbing in the commercial demand for sterling.

Furthermore, as long as the rate against the dollar is over $2.81 there is no particular incentive to rebuild working balances. The rate has been allowed to crumble with little intervention on the part of the authorities until it momentarily touched $2.81. It is not their habit to intervene in support of sterling on any appreciable scale when the rate is still above the nominal parity. The rate for transferable sterling has yielded correspondingly to around $2.7922 and that for security sterling though it showed more resistance at first has fallen to $2.79.

Sterling has also lost ground against most Continental currencies. At this time, demands by British tourists begin to weigh appreciably on the market. The German mark is still exceptionally strong, both on commercial and capital account. An appreciable part of the movement of capital out of dollars is finding its way to Germany where the attraction of high rates of interest does not have to be minimised by forward sales of the currency at a discount.

Looking for the Pence

THE Transport Commission is not likely to be able to finance an early increase in railwaymen's wages from the programme of economies and faster re-equipment that was announced this week. The commission's refusal to make a firm commitment to the unions would seem to imply that it has doubts, too, whether this programme will achieve all the economies required. To pay, say, the 3 per cent increase that the trade union nominee on the wages tribunal recommended in his minority report on cost of living grounds (the unions have now asked for 4 per cent) would cost roughly £11 million a year. But the commission has already been searching for savings amounting to £15 million a year to off-set the recent fall in traffic receipts and keep its current rate of loss within the limits set by the half-used Government loan. So the combined cuts ought to find at least £26 million a year—roughly 5 per cent of the railways' annual revenue outlay.

There are three main directions in which the commission is setting out to try to achieve this, but it is not saying how much it hopes to get. The present traffics preclude any further general increase in railway charges, but a selective raising of certain freight and, later in the year after an application has been made to the Transport Tribunal, of a few passenger fares is intended. Secondly, it has instructed the regional managements to cut down further on their working expenses, including:

(i) tailoring freight and passenger services more closely to the movement of traffic;

(ii) closing more uneconomic branch lines more quickly, with the help of the Government; consideration is now being given to the closing of 30 lines, involving a net annual saving of about £500,000;

(iii) again with Government help, the commission hopes that it may be able to shift responsibility for the upkeep of road bridges and level crossings, presumably to local authorities;

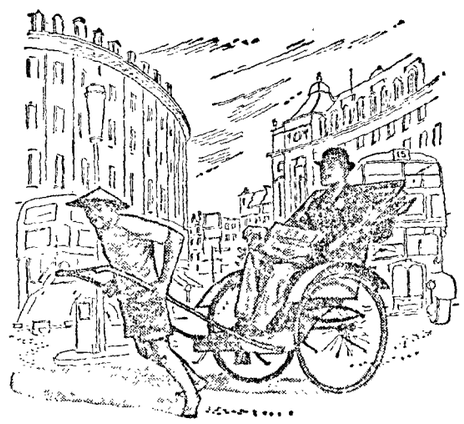
(iv) abandoning those boat train services to the continent that incur big losses;

(v) pruning maintenance expenditure and scrapping 100,000 wagons this year;

(vi) cutting manpower, mainly by not replacing the railwaymen that leave the service.

The third way in which the commission is hoping to improve its finances this year is by re-accelerating its re-equipment programme, and the Government has agreed, on the understanding, however, "that the unions will play their full part," to authorise the spending of £170 million this year and next, instead of the £145 million in both years to which the railways were cut back last autumn. But much time has already been lost and, except perhaps for the main-line diesel and multiple unit train set programmes, on which an extra £6 million may be authorised, this investment was never expected to produce significant returns as early as this year. Presumably, too, the decision to allow this increased spending still hinges on the actions of the unions. Even if a strike does take place after all, and it would cost the railways dear, the economies and the accelerated rate of modernisation would still be worth pursuing.

GOLD RESERVES



April's Good Increase

THOUGH the bus strike and the threats of wider disturbances had cast some shadow ahead in the exchange markets—notably upon sterling's performance vis-à-vis European currencies—they did not prevent Britain from achieving last month another notable increase in the gold and dollar reserves. These rose during April by $144 million, to $2,914 million, the equivalent of more than £1,000 million. At first glance the increase may appear to compare unfavourably with the achievement of the previous month, when the reserves rose by $231 million. Most of that movement was, however, attributable to the exceptional surplus earned on EPU transactions during February—which, following the customary lag in settlements, contributed $94 million to the reserves in March. The corresponding gold receipt from EPU last month, in respect of the surplus actually earned in March, was only $11 million, and the receipt due this month (representing 75 per cent of April's surplus of £2 million) will be $4 million. Hence, if the figures are adjusted so as to include the EPU gold payments in the months in which they were earned, the true dollar balance for April is seen to have been little different from that for March. As the accompanying table shows, it declined only from $148 million to $137 million, but was substantially less than the peak earnings achieved in February. The prospect for the reserves is now clouded by the strike. It should be emphasised also that the good gains of recent months are partly seasonal.

RESERVES SINCE THE CRISIS

	True dollar balance in period*	Actual change in reserves	Reserves at end of period
1957 :—			
August	−300	−225	2,142
September	−296	−292	1,850
October	+141	+243	2,093
November	+ 71	+ 92	2,185

The cow is **DANISH**

the tractor is **BRITISH**

Why? Because Denmark sells to buy and buys to sell with a record of nearly a century of fair trading.

About two-thirds of Denmark's exports are agricultural products and reciprocal trade with Britain is the very foundation on which Denmark's economy is built.

Denmark sold to Britain last year products to the total value of £114,629,187—£25,757,110 in butter.

Denmark bought, in total, £85,737,973 in raw materials and manufactured goods from Britain, among them tractors and other machinery — almost the same ratio of purchases to sales as New Zealand.

It is of vital importance to Denmark's farmers that these facts should be clearly understood at a time when there is much discussion of 'dumping'.

No Danish products are 'dumped'

The price of butter in the Danish home market is the average of the export prices. Furthermore, far from unloading surplus butter on the British market below the cost of production, Denmark sent somewhat less last year than the previous year.

The Danish surplus of the past year is at this moment being sold in Denmark's home market at a substantial loss to the producers. Denmark's home consumption of butter has, in fact, been increased by 52 per cent since the beginning of this year.

DENMARK *stands for efficient production and fair trading with* **BRITAIN**

ISSUED BY DANISH AGRICULTURAL PRODUCERS

STEEL

Are Stocks Coming Down?

During the first quarter of this year demand for steel in Britain held up rather better than might have been expected, but in recent weeks it has fallen off more sharply. The motor industry still wants increasing quantities of steel, and this is also true of some of its suppliers such as the drop forgers, though not all. But the car manufacturers are no longer ordering as far in advance as they have had to do during most of the postwar period. This process, by which the maturing of extra capacity is making it possible for the producer to offer shorter deliveries, which in its turn enables the customer not to commit himself too far in advance, is at work throughout the steel industry (and others); but for certain products the fall in demand has more specific causes. The slackening of building activity is being reflected fairly quickly in demand for structural steel (which tends to be wanted in the early stages of any building project). Cuts and delays in railway investment have cut the top off the planned peak in wagon building, as have difficulties in introducing continuous braked wagons; this has softened demand for light steel plate. For many medium and light steel products, demand had already weakened; it is being affected further by some slack in general engineering.

The steel industry is beginning to feel that for some products at least demand has fallen well below the quantities that customers must still be consuming—and that at last customers are beginning to run down stocks. It is no longer so easy to be confident that steel is better than money: the last change in steel prices, after all, was the first reduction in 19 years. The latest indications were that consumers had in stock 16-17 weeks' steel (the stocks indeed seemed to have increased since the beginning of the year). It would not be out of line with normal operations if those were gradually to be brought back to say 12 weeks' supplies; but it could make a difference of more than a million ingot tons of steel to the industry's output this year. The industry's own operating stocks, too, are high at present; but these seem so far plausibly explainable in terms of plans for closing down certain parts of steel works later in the year, or of building up ingots for new finishing capacity to come in.

ATOMIC ENERGY

The First Export Order

The first of two agreements was signed in London last week covering the building of a British-designed nuclear power plant in Italy. The Nuclear Power Plant Company, a consortium of nine companies including C. A. Parsons, Head Wrightson, McAlpine's, and Whessoe, signed a seven-year collaboration agreement with AGIP Nucleare, subsidiary of the Italian state-owned ENI group, and on July

Hard Core of Unemployment

All being well, unemployment falls in April. But last month the number of people out of work in Britain rose by 11,000 to 444,000. This figure still represents no more than 2 per cent of all employees and the increase between March and April was entirely among juveniles, presumably mainly school-leavers who had registered at the employment exchanges only shortly before the count was taken in the week following the Easter holidays. Moreover, the general level of unemployment is below that in April 1952, when the textile recession had brought the total up to 468,000. But last month 45 per cent of all the names on the unemployment registers, including those recorded as only temporarily stopped, had been there for over 8 weeks; six years ago the corresponding proportion was only 30 per cent.

Recently, however, and even going back three years, the hard core of unemployment has been growing only slightly faster than the softer core around it. In April, 1955, 40 per cent of the unemployed had been idle for over 8 weeks. But because of the rise in the total numbers unemployed, in April more people had been out of work for longer than 8 weeks than at any other time in the postwar period. They now represent nearly 1 per cent of the total of all employees. Some of them would seem to be virtually unemployable. A more detailed count taken in March showed that out of the total of 433,000, 25,000 had been out of work over a year and another 26,000 for between six and twelve months.

This is the general picture of unemployment and on a nationwide basis in Great Britain it does not give cause for concern. But in Northern Ireland the average unemployment rate is 10.8 per cent, at no unemployment exchange is it under 5 per cent and in Belfast and Londonderry it is 20 per cent. In Scotland the rate is 3.6 per cent and in Wales 3.9 per cent. As one of the accompanying tables shows, only 38 per cent of the Welshmen who were wholly unemployed in January had found a job two months later, whereas in the London region, the corresponding proportion was 56 per cent.

There are particular towns and areas in England, as well as in Scotland and Wales, where unemployment is particularly high. Among the development areas, Merseyside has the highest rate —5.7 per cent among men in the Liverpool area and 2.4 per cent among women—although the duration of unemployment is comparatively low. In Plymouth, where the average level is the same as in Liverpool, the record is worse among women than among men. This is true, too, in Greenock where 11 per cent of women are out of work and where unemployment is certainly persistent—nearly two-thirds of all those unemployed there in April had been looking for a job for over eight weeks.

GETTING BACK A JOB

Proportion of those wholly unemployed in January, 1958, who obtained work within two months

* Including temporarily stopped.

1st building work will start on a 200 megawatt nuclear power station 40 miles south of Rome. Details of the building contract are still being settled but equipment valued at about £10 million will be provided from this country, representing half the total cost of the station.

This is the world's first export order for a full-sized nuclear power station, and it is likely to provide the template for future contracts. Three features are important. The first is that it is linked to a collaboration agreement by which the British contractor undertakes in effect to train the foreign company in nuclear design so that it will become progressively less dependent on outside technical aid. The second is the relatively small size of the station. Few foreign countries have as highly developed a national electricity transmission grid as Britain; the size of their power stations is therefore geared to the level of regional demand. The cost of electricity from Calder Hall type plants is closely linked with size; capital costs per kilowatt for a 400 megawatt reactor would by some estimates be 20 per cent less than that of the 150 mW reactors now being built. But Senor Mattei explained when he was in London that the 200 mW reactor he was buying for Italy was the biggest that could be used economically in the Rome region—particularly since such power stations are only suitable for base-load generation. The third feature of this contract is that it has apparently kept the Nuclear Power Plant group too heavily employed to bid for either the World Bank power station contract in Southern Italy or the Japanese contract for which tenders have been invited from three of NPPC's British competitors.

MIDDLE EAST OIL

Kuwait Oil for Japan?

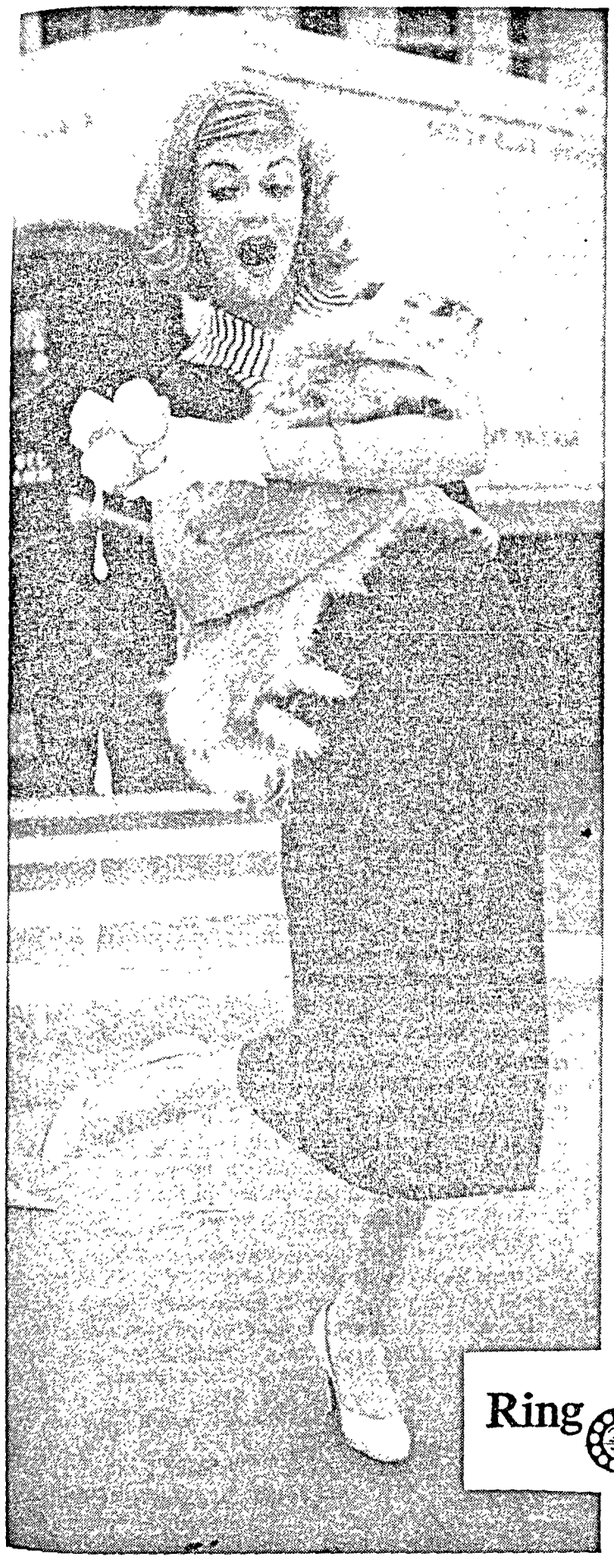
THE Ruler of Kuwait has finally decided to grant the right to search for and exploit oil reserves offshore in Kuwait's "undivided half" of the Kuwait-Saudi Arabian Neutral Zone to the Japanese consortium that has already secured the Saudi Arabian rights there. The terms offered by the Japanese to Kuwait are thought to be similar to those already accepted by Saudi Arabia—with 56 per cent of the profits going to the host government. Both governments will have the right to insist that the profits be calculated not only on production, but also on a completely integrated operation of refining, transporting and distribution in the consuming country, though Kuwait may have been more prudent than Saudi Arabia in providing that it need not exercise this option until it is satisfied that these later phases are being carried out at a profit.

With concessions from both host governments of the Neutral Zone the Japanese can now start work offshore. Among sixty or so Japanese firms which make up the consortium there are no oil companies with experience of offshore drilling, but qualified American drilling contractors will not be hard to find. The chances of finding oil in quantity in this area, so near to the large Safaniya field off the Saudi Arabia shore, are rated high. And if oil is found, the combined resources of the Japanese consortium may prove more capable than they appear on paper of transporting, refining and selling the oil to Japanese consumers. Much will depend on the share of the Japanese market—which now consumes some 12 million tons a year—they are able to win, either by price competition or by securing preferential treatment from the Japanese government.

For the unsuccessful bidders for the Kuwait concess the only solace is that they are now saved from t embarrassment of co-operating closely with an oil compa that has conceded to Saudi Arabia terms that they wo not be willing to concede themselves. By accepting t Japanese offer, to the discomfiture of the British a American oil companies, the Kuwait government has c tainly proved its independence of Whitehall and Washingt Whether its revenue will benefit or suffer in the long r remains to be seen.

TIN

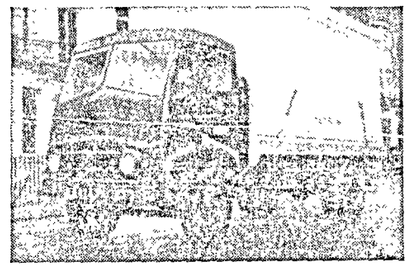
The Russian Threat



NO one was surprised by last week's decision of th International Tin Council to hold the rate of produ tion at 23,000 tons for the next (July-September) quarte and thus to continue to apply restriction at a rate of abou 40 per cent. In the market where cash tin hovers jus above the "floor" price of £730 a ton the decision ha negligible effect. Nor is there any significant change in th allocation of the quota among the producing countries, minor alterations have been accepted. Thailand's quot goes up from 1,690 tons to 1,920 tons, and Nigeria's fro 1,228 tons to 1,357 tons. Indonesia on the other hand takes a cut of 235 tons to 4,464 tons and Bolivia one o 120 tons to 4,580 tons; the Malayan quota remain unchanged at 8,625 tons.

Nevertheless the chairman of the Committee, M. George Peter, has expressed his belief that public confidence in th restriction scheme has increased since the beginning of th year. If his diagnosis is right that confidence must be base upon the existence of the special fund to which some coun tries agreed to subscribe after their third and final contribu tions to the buffer stock (which had brought its buying power to approximately 23,500 tons) had been called Neither the amount of the fund nor even the names of th countries contributing is to be disclosed. But it is clear that without it the buffer stock and therefore the whol international scheme would be in jeopardy. The tug of war is now between the metal coming forward from the largest non-restricting producer—Russia—and the buffer aug mented by the special fund. The Tin Council expects Russian exports in the second and third quarters of this year again to be a little higher than in the corresponding period of last year. In the first two months of 1958 imports into West Europe from Russia and Poland (swelled possibly by some transit trade in Chinese tin) amounted to 3,100 tons against 9,300 tons in the whole of 1957. That suggests that Russia is now a bigger exporter than Nigeria and about level with Thailand.

CYCLES



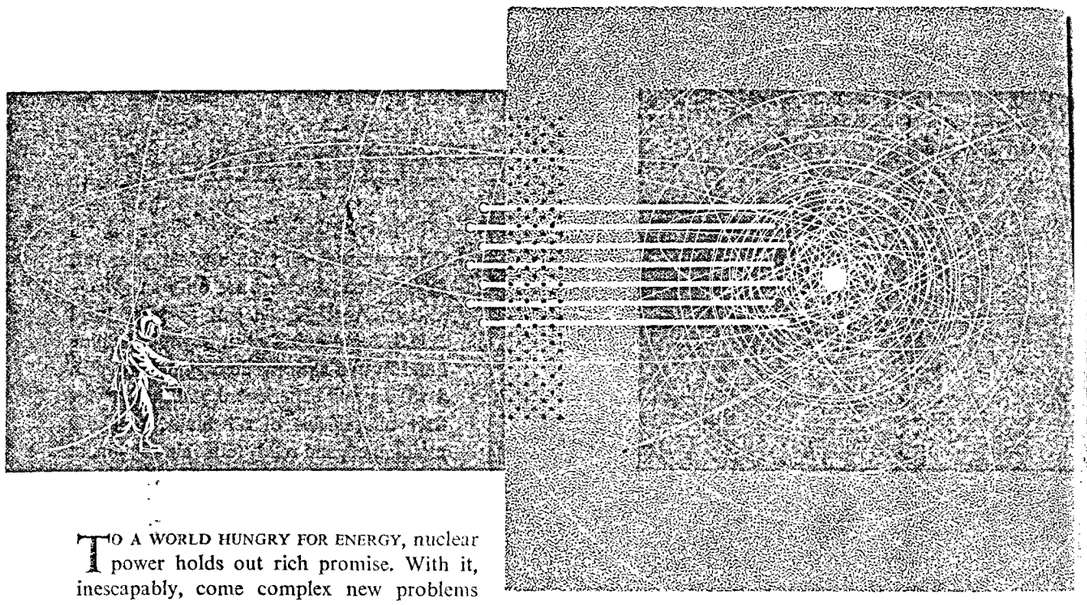
A New, Lower Level?

THE bicycle industry has been up against it for quite time. But the news that one of the British Cycle Cor poration's factories in Birmingham is to close down becaus there is "no alternative but to accept the situation that new level of trade exists" marks a public change of think ing for one, at least, of the two remaining leading producer of bicycles in this country. Both home and overseas market

However tricky your transport problem, B.R.S. can handle it

Circumstances may be against you. But British Road Services are on your side — always. A telephone call to your local B.R.S. depot quickly brings you a helping hand from a nationwide organisation with a willing and experienced staff and a vast fleet of vehicles of all kinds, regularly maintained, and ready to tackle any job, at any time. Modern methods and equipment ensure careful attention to every load, and the B.R.S. teleprinter network provides the means for rapid transmission of your special instructions.

A B.R.S. vehicle with an insulated container for the carriage of fresh, chilled, and frozen meat, frozen foods and other commodities which have to be kept at an even temperature. This container has a capacity of 735 cubic feet and 6 tons — just one of the many and varied services B.R.S. render to Trade and Industry.



If you find transport something of a problem...

WITHIN THE LETHAL ZONE

Shell meets the challenge

TO A WORLD HUNGRY FOR ENERGY, nuclear power holds out rich promise. With it, inescapably, come complex new problems which can be mastered only by new thinking.

Conventional lubricants, for instance, are useless when exposed to radiation. They break down, thicken and form harsh solids. Yet the lubricants needed for mechanisms close to the reactor may have to withstand radiation 4 million times stronger than would kill a man. Some of them have to take such punishment continuously for two years or more, for the complicated mechanisms they lubricate cannot be serviced without closing down the reactor altogether—a costly business with plant involving a capital outlay of some £50,000,000.

Here was the challenge... Where was the answer? Shell was first to foresee the problem. In 1953, a special group was set up at Shell's Thornton Research Centre to study the effects of atomic radiation on lubricants. Searching tests took place there and under actual reactor radiation at the Atomic Energy Research Establishment at Harwell; and in 1957, after four years of research, Shell introduced the first-ever range of Atomic Power Lubricants, named Shell APL.

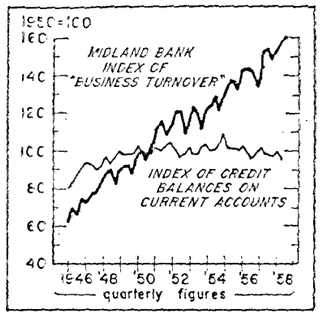
This is the only range of proved radiation-resistant lubricants on the market today. Oils and greases from this range, as well as other Shell Industrial Lubricants, are in daily use both at Harwell and at Calder Hall, England, the world's first full-scale nuclear power station. They have also been chosen for the new British atomic power station now being built at Bradwell, Essex.

Here is Shell "Leadership in Lubrication" in action—anticipating a need, undertaking fundamental research, and finally developing the products to solve a problem of world-wide importance.

SHELL ISSUED BY THE SHELL PETROLEUM COMPANY LIMITED, LONDON

have been shrinking since 1955, when some 3½ million cycles were made. Last year the total was only 2½ million, and though home sales picked up a little in 1957, both home and overseas markets have declined further during the last few months.

The reason for the fall in exports is fairly clear. Primarily it is because more of the countries that formerly bought large numbers of British bicycles have been following the usual policy of protecting their own nascent domestic industries. The manufacture of bicycles does not call for a complicated or heavy engineering industry and it is often one of the first things to which a country reaching out for quantity production in industry sets its hand. Local, and small scale, assembly can be developed using, perhaps, imported parts, and in the last couple of years the Japanese have begun to reappear as serious competitors supplying these components—as well as finished models—to countries in South East Asia and east Africa. In other Asian countries, such as India, recent balance of payments troubles have reinforced the arguments for stronger protection of the growing home industry. Several countries in South America have stopped importing altogether, while the United States, which once took a sixth of the British industry's entire output, raised its tariff by a third three years ago. But import controls do not explain all of their industry's export difficulties. Failure to meet the competition of other exporting countries has also played a part, as is shown by the successes of the Japanese and more recently, on a smaller scale, by those of the Czechs, too. After the American tariff was raised, British exports were halved while the Dutch and the Germans rose, and the German producers replaced this country as the largest supplier both of complete machines and of parts and accessories. Last year however American imports from all countries fell, those from Germany more than any other, and the German industry fared altogether even more badly than the British manufacturers.



The weakness of the home market is more difficult to explain. Sales fell away first after hire purchase controls were tightened just over two years ago, but the market recovered only moderately when they were later relaxed, and the present state of decline has spread to sales of powered machines and scooters as well. Are people now spending what money they have on more ambitious kinds of consumer hardware? It may be significant that the Dutch and German home markets have also turned sour. At any rate, the largest British producer does not appear to expect a quick return to the level of business of only a few years ago.

MONEY TURNOVER

A New Index

A USEFUL addition to regular series of financial statistics has this week been announced by the Midland Bank. Last January, in his first annual statement as chairman of the bank, Lord Monckton explained that the bank had been studying the behaviour of current account balances, and then published some of the results of that investigation in the form of an annual index number reflecting the fluctuations since the war in the aggregate turnover on such accounts at the Midland Bank. To prevent the figures from being dominated by financial transactions arising from the activities of the money and new issue markets (as the "Town" clearing totals published by the Bankers' Clearing House are), the bank excluded from the calculation the whole turnover at the "handful" of its branches where that sort of business is mainly concentrated. The interest aroused by these statistics has encouraged the bank to rework them on a quarterly basis, with adjustments for differences in the number of working days in each quarter; to present the whole quarterly series for the period since 1946; and to arrange to continue it at quarterly intervals in future.

The series is described as an index of "business turnover," but it reflects money turnover rather than business activity. Subject to the special exclusions already noted, the index embraces every sort of transaction that gives rise to a debit to a current account at the bank. During the twelve years, years of continuous rise in the national income in money terms, covered by the figures, there has also been, as the accompanying chart shows, a continuous rise in the annual drawings on current accounts. But there is no close correlation between the two. In three of the past seven years the drawings have expanded faster than gross national income; in four years they have lagged behind it. The new series is therefore most likely to be used for the light it can throw on the velocity of turnover on current accounts. By combining it with an index based on the average balances held on such accounts by the clearing banks as a whole (shown in the lower line in the chart) it is possible to derive an index of rate of turnover. An index of that kind will certainly be much superior to any that can be computed from the figures published by the clearing house, since these naturally take no account (*inter alia*) of the large proportion of bank debits that arise from transfers between accounts at the same bank.

AIR TRANSPORT

Was Cassandra Right?

SINCE the war, the international airlines have been drafting their plans on the assumption of a straight-line increase in traffic of 15 per cent per annum and their present heavy re-equipment plans are geared to these estimates. Isolated voices have warned them that this might be an optimistic foundation for capital investment programmes running, as in the case of BOAC, to more than £250 million during the next few years. Looking at the latest traffic results, the airlines are beginning to wonder whether those Cassandras might not be right.

Many of the airline results that are now being published relate to the calendar year 1957, when air traffic was booming. Among the big operators, Pan-American, which handles more international traffic than any other airline, carried nearly 15 per cent more traffic than in the previous year and for the first time in its history required no government subsidy. The Dutch airline, KLM, whose business depends largely on carrying traffic between foreign countries, increased its revenue by 15 per cent, but higher

operating costs absorbed most of the increase and profits remained roughly the same as in 1956.

The accounts of the two British air corporations run to April 1st and the first rough estimates of their results reflects a rather different state of affairs. BOAC has made a net loss of £2¾ million, nearly a third of it due to poorer traffic in the last few weeks. BEA made its highest profit yet, slightly more than £1 million compared with £600,000 for 1956-57. But this profit was achieved because of "important savings in expenditure" and in spite of "disappointing traffic trends." BEA puts the increase in traffic this year at 10 per cent, whereas a year ago it was showing increases ranging from 18 to 25 per cent.

This smaller increase than the airlines have catered for may be cushioned by the introduction of third-class fares on the North Atlantic this summer (and probably inside Europe next year) and also, oddly enough, by a revival of first-class travel. First-class services disappeared almost entirely inside Europe following the introduction of tourist fares; this week BEA put the first of several mixed-class Viscounts into service, carrying a separate cabin with 12 first-class seats to 47 tourist. The ratio of first to tourist seats BEA intend to offer on different routes varies from roughly one in four on flights to Paris to one in eight on Swiss services.

SOUTH AFRICA

The Union Defends its Gold

THE South African government has this week announced a series of measures to check the loss of gold and foreign exchange and to try to discourage the outflow of capital. The Reserve Bank's gold and foreign assets on May 2nd were £79,656,000, showing a loss of £1,214,000 on the week, of £22 million since the beginning of the year and of £38 million since July 1957. The Finance Minister, Mr Maude, has now ordered the commercial banks to increase their ratio of liquid assets to deposits by four percentage points over a period of two months. The banks have also been instructed to concentrate the reduction in advances implied by this move on those credits that would be used to finance imports.

In addition there is to be stricter control on exchange transactions with other sterling area countries by residents of South Africa. The previous permission to retain up to £10,000 in another sterling area country is withdrawn. Currency allowances for travel in sterling countries will henceforth be subject to the same restrictions as those applying to non-sterling countries. Finally, dealing with the problem nearer its roots, the South African authorities are increasing rates of interest. The previously announced conversion terms for the 3½ per cent stock due for redemption this year are being amended in favour of the holders and this move is likely to affect the terms for all domestic borrowing in the Union.

CREDIT SQUEEZE

Stultified Initiative

AN outspoken criticism of the principle of direct control of bank advances was made this week by the outgoing President of the Institute of Bankers, Mr T. M. Bland, in his annual address. Mr Bland regards a "mandatory limitation on the volume of advances, whether quantitative or proportionate" as the "worst of all weapons by means of which a modern state can circumscribe the full freedom of action of its banks."

> It is frustrating alike to the bankers and to the public we serve; it stultifies initiative; and, worst of all, it inevitably reduces almost to vanishing point the element of competition in British banking, which, in my opinion, is essential to the health, not only of banking, but of our whole economy.

In this criticism, which most bankers would endorse, Mr Bland is distinguishing between the "directive" type of control and more general pressures exerted through the natural processes of monetary policy. He wondered, indeed, whether, if the screws had been turned at every stage a little sooner and a little tighter, the necessity for the quantitative limitation to which the bankers "reluctantly subscribed" last time would ever have arisen.

CAPITAL ISSUES COMMITTEE

Home but Not Colonial

THE Capital Issues Committee is evidently treating applications by overseas borrowers to raise new money in this country more firmly than domestic applications. In the second quarter of last year the CIC turned down three overseas applicants who sought to raise nearly £223 million.

CAPITAL ISSUES COMMITTEE

	Applications £ mn.	Allowed £ mn.	Refused £ mn.	Refusals per cent.

In March the proposed Rhodesian Anglo-American issue was pared by the CIC. In the first quarter of this year the CIC refused four applicants and cut two others (blocking projected issues of over £91 million by overseas borrowers.) Fourteen other overseas applicants were allowed to raise £9 million between them.

RESTRICTIVE PRACTICES

Sitrep in the Lords

IN a delightful exchange of wit and courtesy with Lord Lucas in the House of Lords last Wednesday, the Lord Chancellor gave their Lordships a clear explanation of the stage now reached by the Registrar and the Court in implementing the Restrictive Trade Practices Act of 1956. Three "heavy and important" cases—concerning the agreements of the Chemists' Federation, the Cotton Yarn Spinners' Association and the Cotton Yarn Doublers' Association—are to be heard by the Restrictive Practices Court during the Michaelmas Term. They have taken nearly eighteen months to prepare and will probably take as long as three weeks each to hear. In order to ensure a common approach to the new procedure the Court will sit in one division, but it will expedite its later hearings by splitting into two or even three divisions "fairly soon."

The Registrar has notified the parties to over 70 agreements that he proposes to refer them to the Court. Of these 70 agreements, 23 have either been abandoned or had all restrictive provisions removed before coming to Court. The Lord Chancellor feels that if one third of all restrictive agreements proceeded against continue to fall by the way before coming to Court at all, then the Act is "doing fairly well."

A puzzling question to which the Government has not referred is whether all the parties to an agreement that is abandoned or changed in this way are informed that it has been abandoned, and that they can henceforth change their trade practices without fear of penalty from their fellows. A comprehensive agreement concerning the servicing of typewriters, for example, has been abandoned. Do all the small servicing agencies know this? If they do not, neither the Court nor the Registrar has the power to order anyone to tell them.

DEALINGS SUSPENDED

Paragon Holdings

FOR a company to declare a 10 per cent interim dividend and a few days later to rescind it is fortunately rare. In doing just that the board of Paragon Holdings and of its subsidiary United Patani (Malaya) Rubber Estates has stated that: "without its authority the entire liquid resources of the company and its wholly owned subsidiary Cressta Holdings were recently deposited with another concern . . . the amount involved is over £300,000. . . . It appears that they are not readily available." It will occasion no surprise that in making that revelation the board of Paragon Holdings should also have suggested to the Stock Exchange Council that the quotation for and permission to deal in the company's shares be suspended. The Stock Exchange Council adopted that suggestion and went further. It withdrew on Wednesday permission to deal in the shares of six companies in one way or another considered to be associated with Paragon Holdings:

Jong Landor Rubber Estates (*now* Jon Landor Ltd.)
Kuala Muda Rubber Estates
Paragon Holdings
Pena Industries
Sunnygama Company
United Patani (Malaya) Rubber Estates

It follows that the Stock Exchange Council's action cannot possibly be the end, and is more likely to be the beginning of this distressing affair. The directors of Paragon and of United Patani have indeed already said that legal proceedings are being taken to recover the sum of over £300,000 involved. Kuala Muda has also reported that about £150,000 placed with Paragon was not now available. Paragon Holdings—formerly Pahang Para Rubber Syndicate—has been active in the rubber share takeover market, acting on occasion with or through a company called Comcor. A point was often made in negotiation that in the companies taken over the holding company would leave the estates, the agencies, and the managements in being and provide financial knowledge in redeploying the financial assets to advantage. How then have these financial surpluses been deployed?

On April 28th Col Christian de Lisle, the chairman of Paragon, resigned from the board, because of "serious differences" with the board. On January 22nd Mr Eli Karlin, already a director of Comcor, was appointed a director of Paragon.

CARIBBEAN BANKING

New Anglo-Canadian Venture

AN important landmark in British banking overseas comes in the announcement that the Bank of London and South America has agreed in principle with the Bank of Montreal to establish a new banking company to develop financial and banking operations in the Caribbean area. The new Bank of London and Montreal will be jointly and equally owned, the Bank of London and South America contributing 14 branches in that area and its staff and management and the Bank of Montreal putting in dollar capital with the expectation that the bank will ultimately need a total capital equivalent to $20 million (Canadian). The Bank of Montreal has no branches in the Caribbean but it has an important and growing business there.

Two points of interest emerge. The manifold exchange control difficulties will involve the registration of the Bank of London and Montreal outside this country, with the approval of the Treasury and the Bank of England. It might be registered in the Bahamas; if so, it would be an example of a British bank taking a leaf from the shipowners' book. Secondly an Anglo-Canadian banking link is being arranged at a timely moment.

For bank shareholders there are also important implications. Banking competition in the Caribbean will be intensified. Barclays (DC and O) is well established there and so is the Royal Bank of Canada. The Bank of London and Montreal, when it gets into operation perhaps in six months' time, should be a worthy competitor. Shareholders must expect the disappearance from the Bank of London and South America's profit and loss account of that part of the earnings of the Caribbean branches previously remitted home, and in the first few years the new bank will need to build up its own strength before it starts to pay dividends.

SHORTER NOTES

The World Bank has approved a loan of $10,765,000 for 18 years at 5½ per cent for the modernisation and expansion of 11 private industrial enterprises in Austria. About two-thirds of the loan will assist firms in the pulp and paper industry, and the remainder will be for textile, chemical and engineering manufacturers. Three American banks are participating in the loan, which is being made to the newly established Austrian Investment Credit Corporation.

* * *

Trust Corporation of the Bahamas announces that its authorised capital has been raised to £1,500,000 and with its shareholders now including Morgan Grenfell and Co. as well as the Royal Bank of Canada and the Montreal Trust Company paid up capital and reserves exceed £900,000.

COMPANY AFFAIRS

BRISTOL AEROPLANE

With luck the best an investor in aircraft shares can hope for is that his dividend will be left unchanged. Ordinary stockholders in Bristol Aeroplane have that good fortune and again receive 10 per cent even though net profits last year fell from £1,065,028 to £806,296. The gross profit last year actually rose from £2,228,057 to £2,581,276 but the increase was more than offset by the decline in tax relief arising from investment allowances (from £265,000 to £77,000) and by the sharp increase in interest payments from £381,080 to £967,611. The first suggests that the company has cut down its fixed capital expenditure but the second suggests that its bank overdraft has again risen, presumably because of an increase in working capital commitments. Bristol Aeroplane has a tough financial problem to settle and that rests on securing more orders for *Britannias*. The 10s. ordinary units yield 9¼ per cent at 10s. 3d.

DE HAVILLAND

De Havilland, too, has a financial problem but it has a fairly plump order book for Comet IV's, contracts for missiles, including the 2,500-mile-range ballistic missile, and expectations from the *DH 121*. These factors offer some promise for the future and some recompense for its present troubles. Last year saw a serious fall in trading profits from £5,558,121 to £3,546,701 and the chairman, Mr W. E. Nixon, does not expect this to be reversed "before the end of the current financial year." De Havilland has completed its contracts for aircraft and engines being used by the forces before it can start to deliver the new generation of aircraft, engines and missiles. The demand for its smaller civil aircraft has also fallen off well before it can start to deliver Comet IV's. It must lock away its own money now in work-in-progress and in jigs and tools since the Government has cut the research and development grants.

De Havilland's stock and work in progress have risen from £18.8 million to £23.7 million, reducing its net liquid resources from £2.9 million to £1.1 million, and the group has had to carry forward as a charge against future profits nearly £1.3 million of expenditure on jigs and tools. Mr Nixon says that "to a great extent the current year will again be one of further development and build-up of stock and work in progress prior to its realisation in the form of sales." The £1 ordinary units stand at 15s. 9d. to yield 9½ per cent on the maintained dividend of 7½ per cent.

BOWATER PAPER

Sir Eric Bowater and his fellow directors cannot be dissatisfied with the 1957 trading results of the Bowater Paper Corporation. Sales rose from £95.3 million to £102.5 million; gross profits, thanks in part to the consolidation of the results of Bowater-Eburite in the last months of the year, advanced from £16.1 million to nearly £17.2 million; and the ordinary dividend was left unchanged at 12½ per cent. But they are not overjoyed, for profit margins have been squeezed and global demand has not increased. It was in the expectation of such an increase that Bowater Paper embarked on a massive capital development programme both here and in North America; much of that development has been financed by prior charge capital, putting a high gearing into the equity.

The next two years will be difficult for the Bowater group and the development programme (in which £19 million has already been spent on assets not yet earning) is being stretched out over five to six years instead of three to four years. Much of the new development is concentrated on newsprint, which currently makes up about 70 per cent of Bowater's total production. The corporation now seems to be trying to lessen its dependence on newsprint; the formation of Bowater-Eburite and the turning of a newsprint mill at Ellesmere Port over to kraft paper point in that direction. But competition in packaging papers is also fierce, and Bowater's challenge comes a little late in the day.

Of Bowater's total production of 1¼ million short tons of newsprint a year, about 700,000 short tons is produced in North America. The directors refer to a "sharp falling off in demand in the closing months of the year" in that market. But as yet there seems to have been no softening in the prices of newsprint sold under long-term contracts (though not at fixed prices) by Bowaters Southern. The Southern company's mill in Tennessee is the biggest item in Bowater's expansion and though the outlook looks "less favourable than for some years past" the directors still think it should be possible to begin payments on the subsidiary's common stock in 1959.

Provided there is no further deterioration in trading conditions, the directors hope the results for the group as a whole this year will be "comparable" with those of 1957. So far, production at the mills seems to have been reduced from over-capacity working to "normal full capacity"; only the Corner Brook mill which suffered from fire is on a five-day week. But the Bowater Paper Corporation has still more new mills and machines to come into production and the capital that financed them has to be serviced. The £1 shares at 28s. 9d. xd yield 8.7 per cent.

WIGGINS, TEAPE : SPICERS

Last year as production of paper caught up with demand and then passed it, few paper makers were even as modestly fortunate as Bowater. Two of them not concerned with newsprint, Wiggins, Teape and Spicers, have reported lower profits in 1957. Gross profit of Wiggins, Teape came down from £4,157,880 to £3,373,555 but the ordinary dividend was left unchanged at 17½ per cent. Gross profit of Spicers fell from £751,414 to £672,968 and the ordinary dividend was reduced from 10 to 8 per cent. Over the last two years the half-yearly profits of Wiggins, Teape have run: £2,370,000, £1,893,000, £1,910,000 and £1,740,000. The trend in Spicers' half-yearly earnings is: £455,000, £297,000, £351,000 and £322,000. The dividend yields on the £1 ordinary units of these companies reflect the competitive conditions in the paper business. Spicers at 18s. yield 8.9 per cent, and Wiggins, Teape at 44s. 9d. yield 7.8 per cent.

RIO TINTO

When the Rio Tinto Company came to terms with the Spanish government it energetically started a new life as a mining finance house with a bias towards uranium, but with a current income on its Rhodesian copper portfolio. More recently the steady income has been buttressed by the purchase of the Kern Oil. The growth possibilities caught the imagination particularly of the French (who own about half the ordinary shares) and the 10s. shares paying 26 per cent defiantly yield no more than 4½ per cent. On what terms can this be set against 6½ per cent from Anglo American Corporation of South Africa or nearly 8 per cent from Union Corporation? Between the lines of Mr Gerald Coke's statement this year it seems clear that the company is now on "a plateau of consolidation." Is this a plateau with a gentle downward slope? A declining income from the Rhodesian copper portfolio and probably also from Kern Oil this year are clearly factors that investors must weigh. Income to the parent company from the Canadian uranium ventures is unlikely to arrive before 1960.

The uranium contracts in Canada and Australia should be a good medium run prospect. The company is to supply fixed quantities on terms subject to revision only in respect of wage movements and calculated to extinguish the cost of the plants over the five year contract period. But they are not quite riskless contracts. If the company overspends on capital (as the report shows it has done at Northspan in Canada) that extra cost is borne by Rio Tinto. If it produces more uranium than the calculated quantity, there is no right to deliver it to the American buyer unless he wants it and in fact Mr Coke expects to have some surplus uranium to sell this year. If production is less than the contract quantities (which does not at the moment look likely) the under-production is the company's loss.

After the rights issue of last year, the board has no present intention of seeking further capital. Liquid assets have in fact been expanded from £4.3 million at the end of 1956 to £9.6 million at the end of 1957 largely as a result of that issue. And future expansion should be partly self-financed. The company is now highly geared with prior charges in its subsidiaries. As it liquidates those prior charges out of profits in the years to come it will also be financing further development to the considerable extent that it holds those charges itself. With the fall in the value of the base metal investments the uranium proportion of Rio Tinto has risen. This year it is 30 per cent uranium, 40 per cent base metals and 20 per cent oil. Last year it was 60 per cent base metals and only 20 per cent uranium. It is for shareholders to decide the right price for an important stake in the uranium business and for the prospect of moving off the "plateau of consolidation" after 1960.

GUEST, KEEN AND NETTLEFOLDS

The £1 ordinary stock units of Guest, Keen and Nettlefolds moved up ahead of the company's final dividend announcement, but the hopes of a scrip issue were not fulfilled and the stock has since fallen by a few pence. The preliminary statement was eminently satisfactory. The interim ordinary dividend, paid on the capital as increased by the three for ten rights issue at 46s. a share, had been raised from 3½ to 5 per cent as a move towards more equal interim and final payments. But with the final payment maintained at 10 per cent, the total payment for the year has been raised from 13½ to 15 per cent, on which the stock at 53s. yields 5¾ per cent.

That yield reflects satisfaction with current trading results and with the prospects of the group's development programme, which had not progressed far enough to make any marked effect on the 1957 profits. The group's profit before all charges nevertheless rose from £27,052,187 to £30,564,584. The statutory depreciation charge is up from £4,656,836 to £5,462,414 and the extra provision for replacement is up from £1,086,044 to £1,351,950. The tax bill has risen from £11,085,379 to £13,255,574, with the result that net profits are only £643,208 higher at £16,199,747. From these profits the net ordinary dividend takes only £2,620,147, so that there should be plenty of room for a bigger dividend when the new developments begin to make their full contribution.

CAMMELL LAIRD

"Profits will be more difficult to earn and orders more difficult to obtain." That simple diagnosis by Mr J. C. Mather, chairman of Cammell Laird, the Birkenhead shipbuilding group, does not imply that he expects a world slump; it does imply that he thinks the time has come to reconsider capital expenditure. In particular the plan of a year ago for reconstructing the shipyard over eight years at a cost of £17 million is to be spread over a longer period and split into three stages. The first is to cost £8 million and should be completed by 1960. On the steel making side of the business investment has continued. Cammell Laird has agreed to subscribe for a further million of "B" ordinary shares of £1 each at 25s. in English Steel Corporation. English Steel is a Vickers' subsidiary in which Cammell Laird has a 25 per cent stake and its report shows that its capital is being raised to £17 million, Vickers subscribing an additional 3 million "A" shares at the same price. In Patent Shaft and Axletree Company, which is owned by Cammell Laird and Metropolitan Cammell Carriage and Wagon Company, the two shareholders have now subscribed in full their agreed advance of £1.6 million. That subsidiary has taken up the first £500,000 under its £6 million loan agreement with Finance Corporation for Industry. Even on the steel making side of Cammell Laird's business Mr Mather has to report recession. Patent Shaft and Axletree still has a good order book for plate, but there are signs of a falling off in the demand for that company's other products such as sheet, sections and bars.

ROYAL MAIL LINES

Shipping share experts explain current variations in shipping companies' profits in terms of several variables. Is the company mainly in tramps and did it therefore receive the benefits of the freight boom? Or is it mainly a liner company that had to pay much more in extra fuel costs without being able to recoup them from the slow moving "conference" freights? The most important point of all is the accounting date. The freight boom evaporated as last year wore on and Royal Mail lines, largely in cargo liners and largely in South Atlantic trade, was just on the wrong side. The December companies have not done well and Royal Mail's operating profits fell from £3,329,907 to £3,090,537.

How much did profits really fall? The company uses the Shipping Company's Exemption order of 1948 in framing its accounts. The profit for 1956 figure was struck after providing £150,000 for staff pensions. The 1957 figure repeats that provision and adds an undisclosed amount for contingencies and for "maintenance of fleet." British tax was lower at £312,855, against £453,265, which suggests that the true profit was indeed lower; but with investment allowances depending on the rate of building and not of earning even that figure is not a reliable guide. After depreciating the fleet and buildings and writing £200,000, against nil, off the Government securities—a total plough back of £2,761,650, against £2,864,933—the company shows a small increase of £42,696 in its net profit of £429,365. The dividend on the doubled capital is to be 9 per cent, against the equivalent of 7½ per cent. The fair assumption is that earnings were indeed lower—sufficiently so to prompt the board to tuck something away into inner reserves, but not so much lower as to sway them from paying a higher dividend.

SCHWEPPES

Competition in the expanding market for soft drinks has been severe, and advertising expenditures have been heavy, but the rewards to the successful have been handsome. The Schweppes group crowned its postwar progress with an outstandingly good performance in 1957: trading profits jumped from £1,740,323 to £2,766,223. Home sales were boosted by the "unexpected" popularity of the two new carbonated drinks, "Bitter Lemon" and "Bitter Orange"; the Kia-Ora subsidiary sold its squashes at higher prices; and the United States subsidiary, the terms of whose franchise have been amended, traded at a profit for the first time. L. Rose and Company was acquired during the year and it earned £337,986 in 1957, compared with £227,921, but of this only £63,194 was taken into the group's 1957 profit and loss account. This year's earnings will therefore include a full contribution from the newly acquired business. Sales by the parent company at home rose by 22 per cent in the first three months of 1958. The ordinary dividend has been raised 2½ per cent to 20 per cent; it absorbs £294,006 from the net profits of £935,718 (almost exactly double the £467,364 profit of 1956). At 19s. 10½d. xd. the 5s. shares yield just over 5 per cent, which goes a good way in discounting further growth.

F. PERKINS

Shareholders in diesel engine companies had been forewarned that all was not well. Preliminary figures of F. Perkins, a vigorous company that for twenty years had not shown a loss, now reveal the full extent of last year's difficulties. A profit of £768,934 in 1956 was turned into a loss of £327,478 in 1957, and turnover was cut by a third to £14 million. The company is in need of finance at the very moment when its results make finance impossible to raise. It has passed an ordinary dividend (having paid 10 per cent in 1956). After bringing back £151,000 from replacement reserve the carry-forward is no more than £7,300, compared with £211,536. Three reasons account for the company's misfortune:

> The decision of some motor manufacturers to make their own diesels.
>
> The failure of the tractor manufacturers to call for deliveries as fast as had been hoped.
>
> The impact of the Suez episode and of India's financial stringency on overseas business.

It is a depressing story, lightened only by the fact that the chairman now announces a record turnover in April and hopes for a profit this year. The 10s. ordinary shares stand at 9s. 7½d. against last year's high of 19s. 3d.

BURMAH OIL

BEFORE the 1957 results were announced Burmah Oil ordinary units stood at 78s.; they are now 70s. That sharp fall reflects hopes dashed as well as the current uncertainties common to all oil shares. Last year Burmah Oil decided to declare its ordinary dividend free of income tax; the market had hoped that the change would result in a rounding of the payment upwards. The dividend has indeed been rounded, but by a tiny fraction downwards; for 1957 it is set at 2s. 7d., tax free, per £1 stock and compares with the equivalent of 2s. 7 1/20d., tax free, in 1956.

There is another cause for disappointment: the fall in Burmah Oil's trading profit, earned mainly from marketing in India, Pakistan and Burma, has more than offset the increase in investment income. The trading profit after depreciation is down from £6,341,670 to £4,622,181 while "dividends from trade investments," arising largely from joint marketing arrangements, have risen from £2,314,433 to £2,641,115 and "other dividends and interest," largely made up of the dividends Burmah Oil receives from its big holdings in Shell and British Petroleum, have gone up from £8,018,336 to £8,517,208. As a result Burmah Oil's total gross income has fallen from £16,674,439 to £15,780,504 and its net income from £7,123,896 to £7,056,056. Its ordinary stock at 70s. yields 6.4 per cent, which as so often happens is a higher yield than can be obtained from Shell or British Petroleum into which stocks Burmah Oil provides an indirect route.

BABCOCK AND WILCOX

LAST year the turnover of Babcock and Wilcox, the boiler makers and members of the nuclear power consortium that secured the Hinkley Point contract, rose from £32.7 million to nearly £35.9 million. Yet gross profits advanced by a mere £119,572 to £3,680,380. As the chairman, Mr Lionel Fraser, admits, the group has had to work to finer margins of profits. Orders, he says, are obtained "in the face of very keen competition and not always at attractive prices." Competition to secure the big contracts is particularly fierce and Mr Fraser draws attention to the difficulties caused "by the trend towards massive single boiler units of higher technical rating involving a greater risk factor."

Such orders can be obtained only if the company is willing to spend heavily on its own capital equipment. Babcock and Wilcox has been willing to do so and last year it raised £3.8 million by an issue of debentures and ordinary shares. At the time of the issue the directors said that the 1958 ordinary dividend would be 13 per cent (as effectively was paid for 1957) but that earnings might be lower. Mr Fraser now repeats the warning, saying that it will be a "tussle" to maintain earnings "on anything like previous levels." The £1 ordinary units, which were among the leaders of the nuclear power boom, stand at 48s. xd and yield 5.4 per cent; investors are apparently still thinking of Hinkley Point rather than of the competitive tussle.

UNITED DRAPERY STORES

SINCE the war United Drapery Stores has grown fast, through a series of acquisitions. But that does not mean that the directors now think it time to consolidate. They propose to create £5 million of unsecured loan stock which will enable this multiple empire to take immediate advantage of "opportunities as they arise to expand the business." The group is negotiating for "certain businesses" but there are at present "no definite arrangements for the issue of any of the proposed loan capital."

CONSOLIDATED ZINC

THE collapse of the metal markets had led shareholders of Consolidated Zinc to expect lower profits and dividends. The gross profit for 1957 indeed fell from £7,432,932 to £5,728,017, and the net profit from £2,044,283 to £1,769,936. The final dividend of 12½ per cent. makes 18¾ per cent for the year, against 22½ per cent, which is a reduction less severe than had been foreseen and prompted a rally of 2s. 3d. to 45s. 9d. per share.

London Stock Exchange

FIRST DEALINGS: April 30 May 14 Jun
LAST DEALINGS: May 13 June 3 Jun
ACCOUNT DAY: May 20 June 10 Jul

TRANSPORT disputes were the domin influence in the markets; pattern of the decline was similar in edged and industrial stocks. Both tions were generally firm up to the of last week, industrial stocks mak widespread gains on Thursday, w gilt-edged were helped by the impro ment in the reserves announced Friday. On Monday a predominanc small sellers caused prices to rec slightly, but heavier losses were s tained on Tuesday and gilt-edg suffered a further sharp setback on W nesday. The *Financial Times* index Government securities fell from 83.43 82.32 over the week, 3½ per cent W Loan lost 1⅝ to 65¼ xd and short-da issues eased after rising to their high points so far this year. Dollar stoc improved with the rise in Wall Stre quotations, and the dollar premium ro to 6 per cent over the rate for the day.

Bank shares receded, Midland Ba losing 2s. to 59s., and the declin extended to insurance stocks. The loss caused by the labour troubles we spread over the list of leading equiti but with last week's firmness the overi losses were relatively small. Th *Economist* Indicator falling no mo than 2.3 to 181.3. F. Perkins was wea on the passing of the dividend and fe 1s. 3d. to 9s. 7½d. Cammell Lai dropped 9d. to 7s. 6d. xd and Londo and Overseas Freighters were 1s. 6d lower at 15s.

Shell and BP remained firm among oi shares, but Burmah reacted sharply whil Apex (Trinidad) fell 5s. 7½d. and Ultra mar dropped 4s. 6d. Among Kaffirs uranium producers were weak, Randfon tein falling 1s. 3d. to 23s. 9d., Buffelsfon tein 2s. 3d. to 36s. 6d. and Vaal Reefs 2s. 1½d. to 36s. 7½d. Rubber shares con tinued to decline, United Sua Betong losing 2s. 6d. to 46s. xd.

[1] For a rough conversion to basis of June, 1947, multiply throughout by 1·534. [2] The interim index of retail prices has been linked back to 1938 with the aid of calculations made by Professor R. G. D. Allen for the London and Cambridge Economic Service. [3] For a rough conversion to basis of June, 1947, multiply throughout by 1·561. [4] Surveys made twice a year; annual figures relate to October survey. [5] Figures for April 1st and April 8th respectively were: all items, 85, 85; food, 95·0, 94·3; fibres, 79·6, 79·3; metals, 68·3, 67·2; other items, 95·9, 95·7.

[1] 1939 figures calculated on the basis of a smaller sample. [2] 1939 figures not strictly comparable with rest of series; stocks are at end of period. [3] All commercial banks. [4] Annual figures are total for the fiscal year ended June 30th. [5] Figure for fourth quarter. [6] Bonds due or callable from 10 to 20 years.

Financial Statistics

EXCHEQUER RETURNS

For the week ended May 3, 1958, there was an "above-line" surplus (after allowing for Sinking Funds) of £20,332,000 compared with a deficit of £14,149,000 in the previous week and a surplus of £61,526,000 in the corresponding period of last year. There was a net expenditure "below-line" of £25,796,000, leaving a total deficit of £74,668,000 compared with £14,551,000 in 1957–58.

THE MONEY MARKET

THE pause in the fall in the Treasury bill rate proved short-lived. At last week's tender the discount houses raised their agreed bid for 91 day bills very sharply, by 9d. to £98 14s. 9d. per cent, in order to keep pace with the increased bids made by outside tenderers in the previous week. Total applications for the reduced offering of bills (which included 92-day bills maturing after the August holiday) rose further, so that the market still secured no more than 40 per cent of its tender for 91 day bills; it obtained a full allotment, however, of its application for the longer bill. The average allotment rate dropped by nearly ⅛ per cent, to £5 1s. 1·93d. per cent, which is roughly ½ per cent below the rate established immediately after the reduction of Bank rate to 6 per cent in late March.

There was a corresponding adjustment in market rates: July dates and "hot" bills, which before the tender had changed hands at 5⅛ and 5⅜ per cent, were later dealt in at 4⅝ per cent. This has been the basic rate through the week, since credit has on the whole been distinctly easier; only on the Monday, when the market's bill take-up was large, was it constrained to sell less advantageously—a small amount at 5 per cent. On Tuesday, on the other hand, when credit was comfortable in spite of the absence of official aid, some non-clearing banks were bidding down to 4⅛ per cent. Rates for new money have generally not exceeded 5 per cent.

An exceptional investment opportunity

offering high interest with maximum security

Rarely before in this century have investment yields been as high as they are to-day, but equally rarely has the investor stood in so much danger of capital loss.

Within the past twelve months the prices of Government securities have fallen on average by 12 per cent, and those of industrial ordinary shares by almost twice as much; and, with the economic outlook so uncertain further wide fluctuations in share values cannot be ruled out.

INTEREST 7½% PER ANNUM

An investment free of these risks is offered by Awley Finance, a company specialising in the financing of hire purchase and credit sale transactions; the investor depositing his money with Awley Finance can assure himself of the exceptionally favourable return—even by present-day standards—of **7½ per cent per annum, without exposing capital to erosion by Bank Rate adjustments, Stock Market upheavals,** and so on. Deposits can always be encashed at their full face value at agreed periods of notice of six months or less, while arrangements can be made for substantial withdrawals on demand, and this investment does not entail any costs of stamp duty, brokerage fees, or legal charges. The interest rate is **FIXED** under the terms of the Company's deposit receipt, and is **not automatically reduced in the event of a reduction in Bank Rate.**

Assets exceed £1,500,000
Capital and reserves exceed £750,000

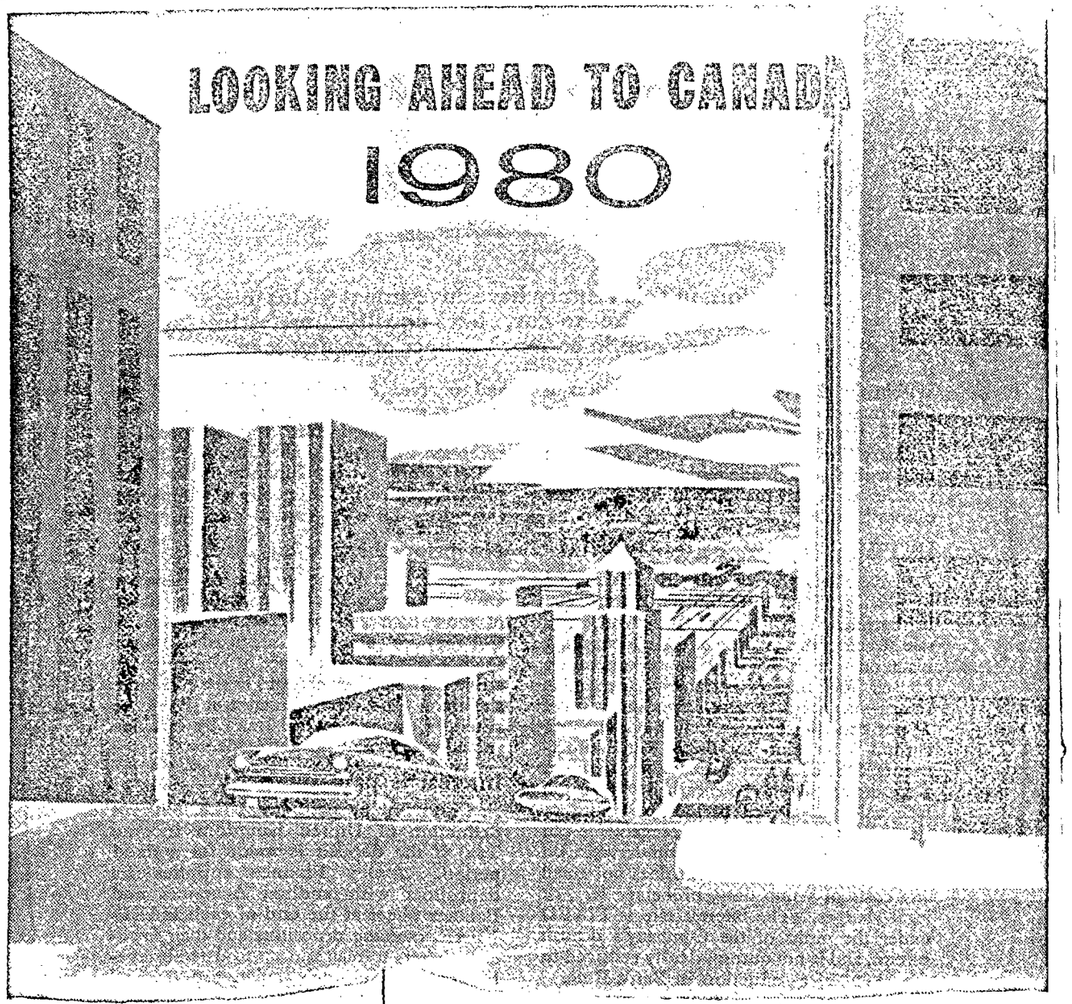
But, it may be asked, is the money deposited with a hire purchase finance company safe, especially at a time when a recession may be on the way? The answer is that it enjoys complete security under any conditions with Awley Finance. The Company's total assets exceed £1,500,000, it has capital and reserves exceeding £750,000, and its earnings record is excellent; but in addition to the protection given to the depositor in the exceptional strength of the Company's financial structure, **Awley Finance follows the practice of limiting deposits to a sum not exceeding its own capital and reserves.**

No prior charges on assets

As there are no prior charges, deposits are therefore covered by assets to the extent of more than 200 per cent, which means that they are completely safeguarded against any conceivable disturbance of hire purchase activity arising from changes in the economic situation. And deposit interest, it should be noted, is covered several times by earnings and takes priority over dividends.

Interest is paid quarterly . . .

. . . and can be paid gross (i.e. without deduction of United Kingdom Income Tax) if the deposit is made for a fixed period. Awley Finance supplies its depositors with audited Accounts and Balance Sheet at the end of each HALF-YEAR, enabling depositors and their financial advisers to maintain up-to-date observation on the Company's trading progress and financial soundness.



* * * * *

Because of its own restriction on total deposits, Awley Finance can accept only a limited amount of new money, and early applications are therefore invited from those wanting to take advantage of this exceptional investment opportunity. **Balance sheet and earnings record will be supplied on request.**

AWLEY FINANCE CO. LTD.

35 DALE STREET · MANCHESTER 1

Labour Force to Grow 30%

National Income to Triple

Per Capita Income May Double

We all know just how rapidly Canada is growing, but the Gordon Royal Commission was the first to make any studied forecasts of that development. The growth predicted by 1980 will mean constant changes in Canada's economy. Through our more than 480 branches of the Toronto-Dominion and by our close participation in that economy, we're right at the centre of all Canadian business activity . . . able to assist any manufacturer planning market expansion in prosperous Canada by supplying such information as:

- market statistics
- corporation procedure
- information on plant sites
- advice on customs problems
- data on market distribution
- incorporation procedure

ROYAL EXCHANGE ASSURANCE

238th ANNUAL REPORT

SUCCESSFUL RESULTS IN ALL DEPARTMENTS

LORD KINDERSLEY'S STATEMENT

The Annual General Court of the Royal Exchange Assurance will be held at the office of the Corporation at the Royal Exchange, London, EC3, on May 28, 1958.

The following is the statement of the Governor, The Right Honourable Lord Kindersley, CBE, MC, which has been circulated with the report and accounts:

Before I review the Report and Accounts for 1957 I must refer to the sad loss which we sustained during the year through the death of two members of the Court of Directors—Admiral Sir Aubrey Smith and Mr Arthur Leather—each of whom gave the Corporation many years of devoted service. Both of them will be sorely missed by their colleagues. Mr Leather was also a director of our associated office, the "State," for thirty years, for the last seventeen years of which he was the Chairman. Mr H. A. Walters, our General Manager, has succeeded him in this capacity.

During the year two new appointments were made to the Court—Mr J. E. H. Collins, MBE, DSC, and Mr Charles E. A. Hambro. Not only will they make valuable colleagues but in joining the Court they consolidate the long standing friendship that has existed for so many years between those two great banking houses, Morgan Grenfell and Company Limited, and Hambros Bank Limited, and the Corporation.

There have also been some changes among our overseas managers. To our deep regret, Mr C. W. Spencer, our Manager for West Africa, died in July last year at the early age of 52. He had spent more than 28 years in that territory where for seven years he was the Manager. There was no more popular figure on the Coast and his energy and enthusiasm laid the foundations of the substantial business which we now have there. The post of Manager for West Africa was not retained after Mr Spencer's death and our affairs in that territory are now cared for by Mr E. C. McNestry as Manager for Nigeria and Mr F. R. Handscomb as Manager for Ghana.

During the year, Mr H. F. Gaspard succeeded Mr J. H. Purrier as Manager for South East Asia. Mr Purrier joined the Corporation in 1918 and having spent over 30 years in the East he well deserves to enjoy his retirement.

In March this year, Mr Alan Wolfe, the Manager of our Eastern Branch, retired after 33 years of loyal service with the Group and here again the territory has been divided. With effect from April 1st, Mr H. J. Burt was appointed Manager for India and Mr C. S. Woolmer as Manager for Pakistan.

THE YEAR UNDER REVIEW

The period covered by the accounts saw exceptional economic changes not only in the United Kingdom but also in many of the overseas territories in which our group of companies operates.

In the early months of 1957 the consequences of the Suez incident caused us considerable anxiety but happily the impact upon our trade was surprisingly small. In the event, Suez and its aftermath created temporary artificial boom conditions in some trades and for a number of commodities, thereby halting the decline in postwar world trade which seemed then to have set in. But unfortunately it also imparted a rise to the cost of living index and an even greater twist to the wages spiral unaccompanied by an appropriate increase in national productivity. These unfavourable tendencies at home were quickly appreciated in the international financial markets and coincided with rumours of an impending upward revaluation of the German mark. Reassuring statements by HM Government during the summer failed to check the run upon sterling by international traders with the consequence that in mid-September Bank rate was raised to the crisis level of 7 per cent and other belated counter-inflationary measures had to be introduced.

I expressed the opinion on a previous occasion that insurance had entered a highly competitive era in which profit margins would look slender when compared with those of the earlier postwar years, and the events to which I have briefly referred above created an unfavourable climate both for our primary business of insurance and our secondary activity of investment. In these circumstances I regard as most creditable the further material increase of nearly £2 million in the aggregate premium income of the accident, fire and marine departments bringing the total to £32,627,214. I am sure you will agree that each of our underwriting accounts, to which I refer in greater detail later in this statement, have provided results that deserve the label of success.

INVESTMENTS OF OUR GENERAL FUNDS

Let me now turn briefly to the invested funds of the group. A year ago I referred to our need to have large investments in fixed interest bearing securities—particularly in loans of the governments of Australia, Canada, New Zealand, Rhodesia, South Africa and the United States of America, in addition to the United Kingdom : and equally to the need to match overseas liabilities with assets expressed in the appropriate currencies.

I do not apologise for the fact that we held these traditional and logical investments as they ensure that at all times and at short notice we can meet the just claims of our policy holders all over the world. But during 1957 the market quotations for fixed interest securities, especially the loans of the United Kingdom, Canadian and United States governments, were materially and adversely influenced by monetary policies designed to curb inflation and which raised interest rates to historically very high levels.

Reference to the Profit and Loss Account, however, will disclose the fact that it has only been necessary to provide a sum of £460,800 in reduction of book values of investments and the whole of this amount relates to certain of our associated companies. In only one instance is the depreciation at all material and in that case some £200,000 can be attributed to the shrinkage in the sterling values of investments expressed in French francs and Brazilian cruzeiros. The balance is directly due to reduced market quotations and should be recovered in the accounts of those companies as interest rates in this country revert to more normal levels. Indeed a substantial measure of price recovery has already attended the relaxations in credit restraints introduced in the early months of this year ; even so I am able to say that on December 31st last the margin of market values of investments over the values at which they appear in the consolidated balance sheet was more than sufficient to offset the needs of all members of the group.

One favourable outcome of last year's low market prices for securities was our ability to increase the income earning capacity of our general funds, and the year's total of interest dividends and rents rose by over £156,000 to the record level of £1,698,382.

INVESTMENTS OF THE "ROYAL EXCHANGE" LIFE AND ANNUITY FUNDS

The long-term nature of the contracts issued in the life department has justified over the years an investment policy much less rigid than that suited to the shorter term fire, accident and marine contracts. Nevertheless the 7 per cent Bank rate that still ruled at the year end imposed exceptionally low quotations on the fixed interest bearing securities of our life and annuity funds. As a set-off to this severe market depreciation of fixed interest securities, however, we had not only the market appreciation shewn by our investment in equities but also the inner investment reserves accumulated over the years. At the end of last year we were therefore still able to shew the investments of the life and annuity funds at aggregate figures substantially beneath the low market values at that time.

These funds also have benefited from the low market quotations prevailing in the latter part of 1957 and early in 1958 in the sense that there have been excellent opportunities for improving the income earning potential of existing and newly accruing capital. The upward trend of the annual yield of recent years is quite unmistakable—

GROSS YIELD PER CENT

Year	Life Fund £ s. d.	General Annuity Fund £ s. d.
1952	4 16 1	5 7 5
1953	5 1 10	5 14 0
1954	5 4 9	5 17 1
1955	5 8 5	6 2 0
1956	5 11 4	6 2 5
1957	5 17 3	6 7 6

and I see no reason why it should not continue in this the first year of the new triennium.

On our pension annuity fund, the gross yield for 1957 was £5 9s. 3d. per cent compared with £6 1s. 10d. in 1956 which was its

first year of existence. The 1957 yield is artificially low due to accelerated growth in a small fund so that a relatively large part of the fund did not become available for investment until the latter part of the year. A much better guide to this fund's capacity to earn interest income is the fact that its investment portfolio on the last day of 1957 could be expected to yield 6½ per cent per annum in a full year.

LIFE DEPARTMENT

Year	Nett new sums assured	Premiums	Fund at end of year
	£	£	£
1952 ..	6,121,697	2,214,801	22,421,999
1953 ..	7,414,284	2,343,102	23,345,690
1954 ..	8,869,438	2,433,357	24,232,051
1955 ..	9,559,132	2,730,209	25,550,794
1956 ..	9,536,520	2,917,615	26,869,624
1957 ..	10,956,434	3,094,497	28,214,241

The foregoing figures summarise the excellent progress made by our life fund not only in 1957 but throughout the latest triennium which is also compared with the previous three year period. The expansion in new business was appropriately shared by the participating and non-participating sections of the fund and claims were satisfactorily within the expectation.

The good prospects upon which I commented last year regarding the outcome of the valuation to be made at the end of 1957 were realised by the declaration of a bonus on the sum assured under participating policies at the rate of 50s. per cent per annum which is of course the highest rate of declaration in the history of the Corporation and its announcement was well received by our policy holders.

ANNUITY DEPARTMENT

Increased activity occurred in both the general and pension sections of this department and the new business written was greater than in recent years. In the pension annuity fund our first bonus declaration was made at rates which, maintained in future years, would shew very satisfactory results to the participants.

FIRE UNDERWRITING ACCOUNT

Year	Nett Premiums	Surplus transferred to Profit and Loss Account	Ratio
	£	£	%
1953	9,541,454	1,142,952	12·0
1954	9,763,652	700,944	7·2
1955	9,597,570	998,408	10·4
1956	10,831,189	305,924	2·8
1957	10,907,781	383,011	3·5

In the United Kingdom the national fire wastage in 1957 was somewhat less than in the previous year and we were fortunately spared a repetition of the severe frost claims paid in 1956. On the other hand the year was marked by several fires of spectacular dimensions including one of the largest ever to occur in this country.

In spite of the efficiency of modern fire brigades, there is a practical limit to the fire load which they can control and much could be done to restrict the magnitude of these occurrences by the installation of sprinkler systems and the sub-division of risks by adequate fire breaks. This is a matter to which I have previously drawn attention and I do so again because the country can ill afford the material loss and dislocation caused by these large industrial fires.

In the United States the year was one of unparalleled difficulty for the whole insurance market and heavy underwriting losses coincided with a substantial fall in the value of investments. The best that can be said about this state of affairs is that it has produced an atmosphere favourable to the introduction of measures to improve underwriting conditions and we earnestly hope that they will not be too long delayed. As far as the Corporation is concerned we pruned our commitments as much as we could and thereby kept our losses within reasonable bounds.

Elsewhere in the overseas field our efforts were better rewarded and although in Canada the results were again poor we may find some encouragement for the future in the steps which have now been taken to redress the present unsatisfactory situation in that country.

In spite of intense competition in both the home and overseas fields, we were able to show a modest increase in our premium income. But, to the extent that the tendency towards reduced rates cannot be met by low expenses and a reduction in the annual fire wastage, future underwriting profits must be adversely affected. To put it bluntly, we are assuming the same or perhaps greater liability for less premium.

GENERAL ACCIDENT UNDERWRITING ACCOUNT

Year	Nett Premiums	Surplus transferred to Profit and Loss Account	Ratio
	£	£	%
1953	14,188,459	942,925	6·7
1954	14,485,940	867,910	6·0
1955	15,749,862	611,736	3·9
1956	17,996,055	— 57,468	— 0·3
1957	19,749,462	456,676	2·3

A very great variety of risks is written by our accident department but by far the largest section relates to our world-wide motor insurance account. The primary factors governing the incidence and cost of motor accidents—increased traffic on the roads, greater speeds, higher values, more elaborate and vulnerable car design—are beyond our control; but they continue to cause us anxiety and have inevitably led to increased rates, not only in this country but in most of the other territories in which we work.

Much has been said and written about motor insurance rates but it is a fact that in general, the price of a comprehensive motor car policy to-day, expressed as a percentage of the capital investment represented by the cost of the car, is very substantially less than it was before the war. In other words our premiums have not yet risen proportionately to the decrease in the value of money as reflected by the higher damages awarded by the courts and the increase in the cost of repairs.

The premium income in the accident department as a whole showed a healthy increase—some of which of course was due to the increased motor rates to which I have just referred—and after making the necessary substantial addition to the reserve for unexpired risk, the disclosed profit was £456,676—a modest 2.3 per cent of the total premiums.

MARINE UNDERWRITING ACCOUNT

Year	Nett Premiums	Surplus transferred to Profit and Loss Account	Fund at 31st December	Ratio to Nett Premiums
	£	£	£	%
1953	1,683,979	208,525	3,753,396	199·2
1954	1,766,950	289,548	3,771,715	213·5
1955	1,829,182	275,091	3,775,020	205·4
1956	1,836,829	233,375	3,761,856	201·8
1957	1,969,971	274,213	3,727,972	189·2

The out-turn of the 1955 underwriting account at the end of last year proved satisfactory and has permitted a transfer of £274,213 to the Profit and Loss Account.

For the first time since the war we are faced with a very substantial fall in the value of ships, and this has been most marked during the last few months. If it continues we shall certainly find in the current year a fall in hull premiums, particularly as many vessels are now laid up in port owing to freights not being available.

It is clear that, with the cost of repairs to ships still on a very high level, the problems facing the marine insurance market are considerable, especially with the keen competition for business which exists in London and in many centres overseas. If we are to avoid a repetition of the severe losses which the market suffered in the "thirties" then will have to be much more co-operation than was shown then. Fortunately, this bad time is still in the minds of many of the more experienced underwriters, and I hope they will be able to make their influence felt in the market.

After a period of comparative freedom from major casualties, we have lately seen a return to a more normal experience of total losses and in the closing months of 1957 casualties were numerous and heavy. Last year was in fact probably the most difficult of the post-war years but it is too early yet to make any forecast of the underwriting result.

TRUSTEE AND EXECUTOR DEPARTMENT

The number of new trusts accepted by this department during 1957 compared favourably with that in past years and included several important debenture issues and at the end of the year the aggregate trust funds including debenture and loan stocks for which the Corporation acted as trustee exceeded £300 million for the first time in our history. The personal service provided by this department in connection with the supervision of investments of private individuals is particularly popular.

The amount transferred to Profit and Loss Account for 1957 amounted to £4,714. The lower figure transferred this year compared to last year is accounted for mainly by the special fees of a non-recurring nature received in 1956.

CONSOLIDATED PROFIT AND LOSS ACCOUNTS

On the revenue side of these accounts the principal items are £1,698,382 investment income, £1,113,614 aggregate net transfer from the departmental revenue accounts and the final instalment of the Proprietors' share of the life department's valuation surplus relating to an earlier triennium.

Turning next to the expenditure side you will see that the largest item is £1,317,06 representing taxation of various types. Two unusual items are £460,800 applied in reduction of the book value of investments, to which I referred in some detail earlier, and £90,000 in respect of office premises. When allowance is also made for the usual pension fund transfers, a favourable balance of £632,024 emerges. To this falls to be added £105,000 over-provision for taxation in previous years and the 1956 carry forward, resulting in a disposable sum of £4,007,440.

After allowing for an additional transfer of £454,000 to the group pension funds, the interim dividend and the recommended final dividend, the sum of £3,029,040 remains as the balance to be carried to the balance sheet.

DIVIDEND

Despite the measure of success which attended the Corporation's activities during the year, the Court of Directors, taking account of the many uncertain factors in the world picture to-day, felt that on this occasion there should be no increase in the dividend distribution.

Accordingly it is the recommendation of the Court that the final dividend should be 8 per cent making, with the interim of 8 per cent paid in November last, a total distribution of 16 per cent for the year.

THE GROUP ORGANISATION—HOME AND ABROAD

The "Royal Exchange" group of offices is now one of the most powerful in the British insurance market and the growth of our business has placed a great strain on the office accommodation not only at our headquarters in the Royal Exchange but also at our branch offices at home and abroad. Moreover, in the interests of economy and efficiency, we are constantly moving towards a greater measure of integration among the companies comprising the group, and this has had to be taken into account in deciding our requirements in the matter of office space.

The transfer of the life and trustee departments from the Royal Exchange to the Bank of London and South America building in Queen Street—to which I briefly referred last year—was effected during 1957. Our new offices there are attractively laid out and we are now in the process of redesigning, redecorating and refurnishing the space available in the Royal Exchange. When this has been completed, the whole of our head office staff will be housed under much improved conditions which I am sure will lead to greater efficiency.

This work of modernisation has not been confined to Head Office, and during the past eighteen months substantial structural alterations have been made at many of our branch offices in the United Kingdom. Although the cost has been considerable, it is work that was long overdue and the process will continue during the current year.

In September we opened in Dundee a new office which we erected on the site of the old Merchants' Exchange in the centre of the commercial quarter of the city. This fine building, which houses the branches of the "Royal Exchange" and several of our subsidiaries, has been commented on most favourably by all who have seen it.

In line with our policy of keeping ourselves properly informed about conditions in overseas territories, many of the group branches and agencies were visited during the year by senior officials from Head Office, and the General Manager again went to the United States and Canada. Later he spent some time in Australia and New Zealand and not only did this enable him personally to meet many of our friends in these far-off territories but it was also a source of great encouragement to our staff working there.

During the past few years we have modernised several of our branch offices in these two countries and in Australia we have put up a new building in Newcastle. We have recently acquired a first-class site in the centre of Sydney and it is our intention to develop this on lines in keeping with our important interests there.

In Kano, Northern Nigeria, we are erecting a new office building which it is hoped to open before the end of this year and, having opened a branch in Ibadan in the Western Region, we are arranging to do the same in the Eastern Region. We also have plans for further expansion in Ghana. We do not in fact regard the attainment of independence by the colonial territories as a bar to our progress: indeed we feel that we have a substantial contribution to make to their future development.

STAFF

The constant changes in the political and economic scene throughout the world have confronted the management with many problems during the past few years, and 1957 was no exception. I therefore feel sure that the proprietors will wish me to express their sincere thanks to our General Manager, Mr H. A. Walters, for the skilful manner in which he has directed the affairs of the group, and to his executive assistants, branch managers, and all the staff throughout the group both at home and overseas for the loyal support which they have given to him. Without their loyal co-operation the name of the "Royal Exchange" would not stand so high in the City of London and in the other insurance markets of the world as it does today. Although it has been necessary for me to draw attention to the unsatisfactory results of our operations in certain countries, this has been due to circumstances over which we have little or no control and is no reflection whatever upon our managers in these territories.

I would also like to thank all those who have supported us, our agents, the brokers and our local boards in this country and elsewhere: we greatly value the advice the latter have so willingly given us about matters of which they have special knowledge and on this occasion I would particularly like to mention our United States Investment Advisory Committee to whom we are greatly indebted. You will be glad to know that they are to be joined by Mr Henry C. Breck whose wide experience will be a great asset to us. We bid him a hearty welcome and look forward to many years of close co-operation with him.

Finally I would like personally to thank the Sub-Governor and the Deputy-Governor and all the members of the Court for their unstinted help throughout a trying and difficult year.

CROFTS ENGINEERS

Essential machinery for world's vital industries

Since 1887 when Crofts pioneered power transmission engineering, the products manufactured by the Crofts Group of companies have given service to industry the world over. In these days when economy through mechanisation is so vital there is a great demand for Crofts power transmission equipment in virtually every field of industrial endeavour.

Summarised Consolidated Balance Sheet as at 31st December, 1957.

	£		£	£
Issued Capital	2,500,000	Fixed Assets	3,258,404	
Revenue Reserves and Surplus	1,320,313	*Less:* Accumulated Depreciation	1,075,574	
Income Tax 1958/59	567,238			2,182,830
Liabilities	1,371,747	Trade Investments, etc.		19,666
		Current Assets		3,556,802
	£5,759,298			£5,759,298

Summarised Profit and Loss Account For the Year Ended 31st December, 1957.

	£	£
Profits for the year before Taxation	1,569,646	
Less: Provision for Taxation	714,273	
		855,373
Net Distribution for the year to Shareholders		186,875
Retained in the Business		£468,498

EXTRACTS FROM CHAIRMAN'S STATEMENT:

The good results obtained are due to the splendid efforts of the whole of our Group of Companies, each individual firm has increased its turnover, helped by the continued demand for its products, and this combined with increased efficiency all round, is the reason for the improved profit position. Great progress has been made with our building and re-equipment programme, which has enabled us to deal more effectively with our manufacturing generally, and particularly with the new products we are marketing.

OVERSEAS TRADING: This is being extensively developed with very satisfactory results, we are constantly opening out new areas in the world, and all the time are looking for more and more markets for our products.

PROSPECTS: At the end of 1957 our order book was lower than at the beginning of the year: this was mainly due to the constantly increasing outputs from our Factories which, as a result of extensions to our buildings and plant, now deal with a greatly increased amount of work. Our Sales Department is fully alive to the position, and we confidently expect them to expand our Trade.

The new products we are now marketing will in time bring in a greatly increased amount of business, and these, combined with our general trade, will ensure continued success and prosperity.

CROFTS ENGINEERS (HOLDINGS) LIMITED

Empire Works, Thornbury, Bradford, 3

Subsidiaries and Representation throughout the world

DE HAVILLAND HOLDINGS LIMITED

THE DE HAVILLAND YEAR REVIEWED

CHAIRMAN'S REPORT ON THE ACTIVITIES OF THE COMPANY AND ITS SUBSIDIARIES

The Thirty-eighth Annual General Meeting of de Havilland Holdings Limited, will be held on May 28 at Hatfield Aerodrome, Hatfield, Hertfordshire.

The following is an extract from the statement by the Chairman, Mr W. E. Nixon, which has been circulated with the Directors' Report and Accounts for the year ended September 30, 1957:

You will notice that in the Accounts of the Group for the year ended September 30, 1957, there is a reduction in the net surplus for the year of over £1 million and before dealing with the accounts in detail I feel I should make some observations on the reasons for this reduced profit and on the general Group position.

During the past year we have completed our main contracts for aircraft and engines of the generation now being used by the Royal Air Force and Royal Navy, and although there has been continuing interest from overseas in certain of these products, this has been at a much reduced level. While we are fortunate in having new breeds of aircraft, engines and missiles for the British Services, last year was a period of change during which, broadly speaking, we completed deliveries of existing types but did not gain any appreciable benefit from our expenditure on new products as deliveries had not started to flow.

In the civil field the present credit stringency both at home and abroad has slowed up business for our smaller civil aircraft. It will not be until later this calendar year that we will start to deliver Comet 4's.

A further major factor is that with less support from the Government in meeting the cost of research and development, an increasing proportion now has to be borne directly by the manufacturer. Our home companies have been affected in varying degrees and last year the Group's burden of research and development was exceptionally heavy. We feel confident that this expenditure serves to keep us in the forefront of the industry but I must add that the results of these efforts will not start to give any appreciable return until our financial year 1958-59 and to a great extent the current year will again be one of further development and build-up of stock and work-in-progress prior to its realisation in the form of sales.

The length of time now required to develop and produce a new type of aircraft or engine, the very large sums of money which have to be expended prior to manufacture and delivery, and the obligation to report annually on the financial situation of the Company, make it now advisable to consider, in the preparation of the year-end accounts, the need to carry forward some part of such expenditure, having regard to the sales achieved and in prospect. This was not so necessary when the majority of such expenditure was covered by Government contract and repaid as subsequent sales were made. It will be seen in this connection that there is a note in the Accounts mentioning that the Directors of the Aircraft Company have thought it advisable to include in the value of work-in-progress a proportion of certain jigging and tooling expenditure at September 30, 1957, after writing off very substantial amounts of such expenditure incurred during the year.

GROUP'S SOUND ORDER POSITION

I am glad to be able to report that despite the circumstances I have mentioned at present our various companies in the Group are fully occupied with their different activities as they have been in the year under review. In fact, although at home there have been adjustments in our labour force at certain individual factories, we are still at some units in need of skilled production labour to carry out our programmes. The Group order position is sound and we confidently expect further additions in the future.

We are naturally delighted that the D.H.121 was chosen by British European Airways and we are looking forward to carrying out this project with our associates, Hunting Aircraft Ltd., and The Fairey Aviation Co. Ltd., through the medium of the newly formed Aircraft Manufacturing Co. Ltd. We have had a very close association with these companies over the years since the war when they have assisted us considerably with our production efforts and for some time we have had an arrangement with Hunting Aircraft Ltd., to help with their overseas sales. The closer co-operation which has now been arranged with these companies is a natural and practical outcome of these events, which we confidently hope will prove of mutual benefit.

As you will see, the Accounts are generally drawn up in the same way as in previous years, and as in the main any changes are evident by comparison with last year's figures, I need mention only those items which are of particular importance. The Consolidated Balance Sheet shows that Fixed Assets increased by £1,381,787 which was foreshadowed by last year's reference to outstanding commitments for capital expenditure of £1,950,000. The comparable figure at September 30, 1957, is £1,040,000, but so far as can be seen at present from examination of our fixed asset requirements it should be possible to reduce the volume of this expenditure in subsequent years.

It will be recalled that in my address last year I mentioned that towards the end of 1956 we had acquired a shareholding in Saunders-Roe Limited, and this is reflected in the increase under Trade Investments. As you will probably be aware Saunders-Roe had a contract from the Government to develop and manufacture a new fighter aircraft, the S-R.177, which was unfortunately cancelled at the end of 1957. This was naturally a great disappointment to Saunders-Roe especially as had it been ordered at home it would appear to have had a very promising export potential. It was also a considerable disappointment to our Engine Company who were providing the engines and rocket motors used to power what everyone considered to be a very exceptional new aircraft. In the coming months Saunders-Roe will obviously face a difficult period of readjustment, but they are fortunate in having other interests not directly connected with aircraft, which they may be able to expand, and thus minimise the effect of the cancellation of their major aircraft project.

The value of Stock and Work-in-Progress after deducting Progress Payments, has increased materially, as has the total of Customers' Deposits and Advances, and is some measure of the work being undertaken for future delivery.

The Cash at Bank and in Hand has been reduced by £1,853,248 which is approximately the amount of the increase in Fixed Assets and Trade Investments. In the outcome Net Current Assets at £10,937,218 are £2,239,857 less than in the previous year.

The Net Trading Revenue in the Consolidated Profit and Loss Account is, for the reasons already explained, some £2 million less than in the previous year. This results in a reduced liability for Taxation, and after taking into consideration other credits and charges, there is a reduction in the Net Surplus attributable to the Group of over £1 million.

The Profit and Loss Appropriation Account sets out the appropriations already made together with the proposed Ordinary Dividend and after taking into account the amount brought forward from the previous year there remains £357,256 to be carried forward to next year.

The last financial statement to which I should draw attention is the Balance Sheet of the Holding Company, and it will be seen that Shares in Subsidiary Companies have increased to a small extent. This arises from the purchase of further shares in The de Havilland Aircraft of Canada Limited, following the offer made by our Company to the remaining outside Shareholders in January, 1957, and as a result of this we now have a 96 per cent holding in that Company. The loans to and from Subsidiary Companies fluctuate, of course, according to their respective needs.

Net Current Assets are £777,411 less than in the preceding year due largely to the increase in Investment in Subsidiary Companies and Trade Investments. The total Net Assets, representing Capital and Reserve, at £14,136,168 is little changed from the year before.

I would now like to deal briefly with the activities of each de Havilland Company during the year under review before attempting to discuss matters of more general interest.

SEA VIXEN AND COMET PRODUCTION

In the year to September, 1957, the manufacture of the Comet airliner and of the Sea Vixen all-weather fighter for the Royal Navy occupied the main factory resources of the de Havilland Aircraft Company and we had a smaller flow of work on Sea Venoms, Vampire jet trainers, Heron and Dove light transports. Sea Venom output has since ceased.

In August British European Airways decided to introduce jet airliners on their longer routes and ordered six Comet 4B's for delivery in 1960. Incidentally, we expect that by that date British Overseas Airways Corporation will have had a year of public service with their Comet 4's, delivery of which is due to start later this year. Since last September the Corporation has been operating two Comet 2E's to gain experience with the Rolls-Royce RA.29 engines which will be the power units of the Comet 4. In so doing they have completed over 3,000 hours of trouble-free flying, which we and the Corporation feel augurs well for the smooth introduction of the Comet 4.

The Comet 2's of Royal Air Force Transport Command also completed 10,000 hours between June, 1956, and March, 1958.

JET AND ROCKET ENGINES: NEW PROPELLER TURBINE

Our Engine Company had a satisfactory year both in the production of Goblin and Ghost engines and in the Company's vital research and development programme which included some work in the nuclear energy field.

Development of the Gyron family of engines, with versions whose output ranges from 7,000 lb to 30,000 lb static thrust, continued satisfactorily. One of these engines has been chosen and was developed for the new twin-engined Blackburn NA.39 strike aircraft for the Royal Navy.

A further step towards broadening the basis of their turbine business is a recent decision to produce the Gnome, a thousand-shaft-horsepower turbine engine. This is the outcome of close collaboration over the past seven years with the General Electric Company of America.

The Super Sprite rocket engine was put into production as a take-off aid for the Valiant bomber, and preparations are in hand to produce the much more powerful Spectre for the Victor and Vulcan, so that all British V-bombers will rely upon de Havilland rocket assistance.

Manufacture also continued of Gipsy engines for Dove and Heron aircraft and during the year a new and more powerful version of the Gipsy Major was put into production for Saunders-Roe Skeeter helicopters ordered by the British Government and West German Armed Forces.

WEAPON AND PROPELLER PROJECTS

Since 1949, the interests of our Propeller Company have been steadily widening. The Firestreak air-launched anti-aircraft weapon, which has been under continuous development during the past six years, is now completing its acceptance trials. Final release for quantity production is expected shortly and our factories are fully equipped to handle the flow required for the British services as well as for the quantities which may be required for overseas sales, where interest is active.

Propeller business remained good. The range of aircraft on which our propellers are installed has been increased further by a number of important contracts received during the year from home and export markets.

Air-conditioning equipment for a number of civil and military aircraft went into full production, and our turbo-alternators and radar scanners reached the production stage against good orders.

OVERSEAS COMPANIES

Our Canadian Company continued to produce the military and civil versions of the Beaver and Otter aircraft and orders on hand will maintain steady manufacture through 1958, but civil sales in the period reviewed reflected the unsettled international situation and credit stringency in Canada.

Production of the CS2F-1 aircraft for the Royal Canadian Navy continued on schedule and will extend through 1958 and 1959 on present orders.

Development work on the new transport aircraft, the Caribou, continued according to plan; the first flights are scheduled to take place later this year.

The guided weapons division which was started in 1954 continued to develop to meet future requirements.

Our Australian Company commenced delivery in September, 1957, of the further Vampire Trainers which are being built there for the Royal Australian Air Force, and recorded a generally successful year. It is of interest to report that our Australian Company is now finding a good market for the products of our Canadian Company.

Our Companies in South Africa, New Zealand and the United States of America showed trading profits in the year under review and continue their distributing and servicing functions for the products of all the de Havilland Companies.

The de Havilland Aeronautical Technical School has continued to train about three thousand young men and a few young women for industrial careers. They include craft apprentices, engineering apprentices, undergraduates and graduates.

So much has been said and written about the future of military aviation and its effect on the aircraft industry in this developing era of guided weapons, that it is unnecessary for me to repeat what are now well-known arguments. I must, however, try to tell you how we feel this changing position is likely to affect the future of your Company.

You will all be aware of the trend which is taking place in the aircraft industry towards civil aviation. There can be no question that the demand for commercial aircraft is rapidly rising, although in a highly competitive market. We in de Havillands have recognised for some time past that this swing from military to civil work was inevitable. We have from the earliest days of airline operations devoted much study and care to the economics of the problems involved.

We can, I think, claim to have unrivalled experience in the design, development and production of jet airliners, and today we have orders for versions of these aircraft which are capable of covering typical operations over most of the route patterns of the world.

We have seen, during the time that we have been engaged in the aircraft business, many swift and fundamental changes both in the world demand for civil and military aircraft and in the direction of technical development. Many of these advances we have ourselves pioneered, and in so doing we feel we have built up a spirit and experience which will enable us to meet whatever further challenges may come along.

FUTURE TRENDS OF THE AIRCRAFT INDUSTRY

However complicated the aircraft, power units, or weapons upon which we are engaged, and we believe that they are as advanced as any in the world, we are convinced that we have the people and the knowledge to tackle the job. The background of our experience in other directions has undoubtedly contributed to the progress we have achieved with guided weapons, which in turn has led to our being entrusted with a major task—that of the development of the British Intermediate Range Ballistic Missile.

At the same time we have no illusions about the magnitude of the task of selling British commercial aircraft in the face of competition from the USA, even with the advantage of a world-wide selling organisation. We are fortunate in having two types of commercial jet aircraft selected by our own national Airways Corporations.

There is, however, the problem of being able to offer extended terms of payment, competitive with those available from the USA and other countries. The airlines of the world today are almost without exception struggling hard to make ends meet. Air transport fares, which are severely controlled, have increased relatively little during the past 10 years. The average profits of airlines are marginal and quite incompatible with either the greatly increasing turnover or the total capital investments. The result is that almost every airline is under-capitalised and in the circumstances has the greatest difficulty in raising additional capital. Even many which are Government owned are finding it more difficult to obtain approval for the huge additional amounts of capital needed for the investment in new fleets.

The buyers' market as it exists today has led to considerable competition as regards terms of payment. We are not as a country at present able to offer long periods of credit, and generally we have available less facilities than those, for example, which are provided by the Export/Import Bank. This is a severe handicap and can often result in loss of business. There is, however, a Government Committee at present studying this whole problem, and I hope that as a result of this study Government action may be taken to help remove these disadvantages.

Although our main activities are still concentrated on aviation interests, in which we are well represented in every sphere, we are studying very carefully other fields of industry in which our experience can be put to useful purpose.

The task ahead of us is not an easy one—no job which is worth doing ever is—but with your faith in us, and backed by the continued efforts and enthusiasm of everyone within, or associated with, our organisation, I believe that we can look to the future with confidence.

I have deferred reference to the directors' dividend recommendation until now, so as to give you as clear a picture of the position as is possible. You will, I am sure, realise that the decision has not been an easy one. We have on the one hand a reduction in profits during the year under review, and it is unlikely that this downward trend will be reversed before the end of the current financial year.

We have, on the other hand, a good programme of work ahead of us on which we have every hope of ensuring a profitable return in due course. Having had regard to all the circumstances as they appear today, your Directors have decided to recommend the payment of the same rate of dividend as in the previous year.

I am pleased to have this opportunity of thanking all our staffs for their past support, whilst at the same time asking for their even greater efforts in the future.

Babcock & Wilcox

COMPLETE STEAM-RAISING PLANTS OF EVERY DESCRIPTION

MR. W. LIONEL FRASER REVIEWS THE ACTIVITIES OF THIS WORLD-WIDE ORGANISATION

The 59th Annual General Meeting of Babcock & Wilcox Limited will be held on 29th May, 1958, at 21 Tothill Street, London, S.W.1.

The following are extracts from the circulated Statement of the Chairman, Mr. W. Lionel Fraser:

Board of Directors

Mr. Fraser prefaced his remarks by referring to changes in the Board of Directors. Sir Kenneth Hague, Deputy Chairman and Managing Director, had relinquished the Managing Directorship and had been succeeded in that appointment by Mr. Hector McNeil. The Chairman also referred to the retirement of Mr. C. H. Sparks and the appointment to the Board of Mr. J. Stewart Robertson, Mr. I. M. Stewart and Lord Bridges.

Staff

It is with gratitude that your Board constantly remember that it is by the combined efforts, year by year, of the men and women who work in your Company and its subsidiaries, all over the world, that the organisation is enabled to function effectively and smoothly. Once again I wish to record our continued appreciation of their devoted and loyal services.

Finance

The profits of the Group, subject to United Kingdom taxation, but after setting aside the sum of £1,956,914 for depreciation, were £3,865,812. After providing for United Kingdom taxation and making other necessary adjustments, the balance standing to the credit of the Consolidated Profit and Loss Account is £1,696,725. Your Directors recommend a Final Dividend of 6¼ per cent., less tax, on the Ordinary Stock, making the equivalent of approximately 13 per cent., for the year on the increased capital.

Your Directors also recommend that £381,768 be transferred to General Reserve, raising that Reserve to £8,117,151 and £250,000 to Special Research and Development Reserve.

Manufacture

We have again been able to devote substantial sums to the provision of new plant and equipment in all the Group Works at home and overseas. In addition, the purchase from the Ministry of Supply of the greater part of the plant and machinery at the Dalmuir Ordnance Factory and the leasing of the premises from 1st January, 1959, put into effect our intention to increase our facilities for the fabrication of heavy pressure vessels, as well as other activities.

Turnover, Sales and Profit Margin

Turnover last year constituted a new record, but as there has been no halt to the rises in wages or, for that matter, in many other items which make up total cost, profit margins have been correspondingly reduced. Admittedly the Order Book for the year remains high but it was achieved in the face of very keen competition, and not always at attractive prices.

Atomic Energy

It was very gratifying that, during the year, the English Electric, Babcock & Wilcox, Taylor Woodrow Group was awarded the contract for a 500 Megawatt Nuclear Power Station at Hinkley Point, in Somerset, which will be the largest Atomic Station in the world. We shall manufacture and erect the two reactor pressure vessels, which are welded spheres each of 67 feet diameter, together with the 12 nuclear boilers developed from designs originated by the Company for the Calder Hall installation. Other notable items supplied by your Company include some 13 miles of pipework, hundreds of large and small valves, and the provision of a 400-ton Goliath crane, the largest in the world, to be used in the erection of the station.

Your Company is organised not only to play its full part in carrying through the construction work required of it in implementing the nuclear power plan in the U.K., but also to make a substantial contribution in the same field for export.

Research

While spectacular nuclear power developments have tended to overshadow advances in conventional power plant, these have still been very considerable. The astonishing increase in boiler sizes in recent years, and, if I may refer to it as such, the breaking through the barrier of critical pressure have been most significant. These achievements will, undoubtedly, have a marked effect on the future costs of power generation and the Company are proud to have contributed much to this work.

General Review and Prospects

I will now try to outline the overall situation as I see it. On the one hand we have a Group of Companies, world-wide in nature and outlook, magnificently equipped, and managed by teams of men of intelligence and high technical skill. No Company could be better supported, I am sure of that.

On the other hand, the whole of industry—and we are no exception—has of late been encountering in all parts of the world intense competition, incessantly rising costs of labour and materials, not to mention restrictions and burdensome taxation. Emphasis is given to this situation by our figures for the past year, for, despite every effort—evident in the higher turnover—we could only achieve a slightly higher total profit than that of last year. We are fully alive to these problems and are ever striving towards greater efficiency. But we have to contend with world conditions as they are, and we cannot disguise the fact that these could retard our progress for the time being if there were no improvement.

It is new vision on an international level that is needed today, and until it emerges, there is bound to be confusion and instability. Nevertheless, I remain hopeful and confident, because it is out of just such perplexity that new vision is always generated.

MANCHESTER OIL REFINERY (HOLDINGS)

SUEZ AFTERMATH AFFECTS PRICES

SLIGHTLY LARGER GROUP PROFIT

MR R. E. F. DE TRAFFORD ON THE OUTLOOK

The tenth annual general meeting of Manchester Oil Refinery (Holdings) Limited, will be held on May 30th at Winchester House, Old Broad Street, London, E.C.

The following is an extract from the statement by the Chairman, Mr Rudolph E. F. de Trafford, OBE, which has been circulated with the report and accounts:

The twelve months ended December 31, 1957, proved a difficult year for your Company in common with much of British industry. The reaction after Suez resulted in a considerable decrease in the prices of most finished products without a corresponding fall in crude oil prices. Margins of profit have, therefore, narrowed considerably. I am sure you will agree that in these circumstances our slightly increased Group profit before taxation can be considered satisfactory.

GROUP PROFIT AND DIVIDEND

The Group profit for the year before taxation was £209,520 as compared with £204,820 for 1956. Taxation, other than profits tax arising from distribution of Preference and Ordinary dividends, absorbed £103,864, and the profits attributable to outside shareholders of subsidiary companies amounted to £2,399, leaving a net profit attributable to the parent company of £103,257 as against £108,154 for the previous year. An amount of £8,100 has been transferred to Debenture Redemption Reserve and Preference dividends and the interim Ordinary dividend, together with the Distributed Profits Tax attributable thereto, have absorbed £28,289. Your Directors recommend the payment of a final dividend of 8½ per cent less tax, making a total distribution for the year of 12½ per cent less tax. If this distribution is approved there will be carried forward on the Consolidated Profit and Loss Account the sum of £132,639, which compares with £93,782 as at December 31, 1956.

During the year the Group incurred net expenditure of £350,057 on capital account and the net book value of the fixed assets as shown in the Consolidated Balance Sheet as at December 31, 1957, amounted to £1,050,008 as compared with £824,183 at the end of the previous year. This expenditure was principally related to the new sulphonates plant, and the necessary ancillary plants and additional storage facilities, which I mentioned in my Statement last year. I am happy to tell you that these new plants are now completed and working satisfactorily and profitably.

INCREASED OIL STOCKS

The difficult trading conditions encountered throughout our industry during the latter part of the year were principally responsible for the increase of over £150,000 in the value of the Group's oil stocks; since the end of the year we have made progress in reducing these stocks to a more normal level. During the year our wholly owned subsidiary, Raven Oil Company Limited, extended the scope of its activities to include transactions in fuel oil abroad and the increase of some £200,000 in the amount of the Group's debtors is almost entirely attributable to this business. The addition to the Group's trade investments consists largely of an investment which was made during the year in PAM Oil Storage, SA, of Antwerp, to which I will refer later.

The amount due to sundry creditors has risen principally because of a fortuitous difference in the dates on which payment was due for crude afloat at the balance sheet date as compared with the position at the end of 1956, while the increase of over £250,000 in the amounts owing to bankers is due to the necessity to finance the higher levels of stocks and trade debtors.

BORROWING POWERS

The Company's Articles of Association provide that the amount which may be borrowed by the Group shall not, without the sanction of a general meeting, exceed twice the nominal paid-up share capital of the company. This limit is at present £1,430,000. The Directors recommend that this limit should be increased to £2,750,000. Details of the proposed new provisions are contained in the special resolution which is set out in the notice convening the annual general meeting of the company to be held on May 30, 1958.

Following upon the changes in our senior executives to which I referred last year, there has been a further reorganisation of our sales companies, which are now concentrated in London. Mr J. E. Harvey, MP, while continuing to act as Manager of Marine and Industrial Lubricants Limited, has also been appointed Manager of the home sales company, Manchester Oil Refinery (Sales) Limited. I feel confident that the changes will make for more efficient and economic marketing. We have also been enabled, by centralising our sales organisation on London, to establish closer contact with the oil industry generally.

SULPHONATES

I have referred previously to the additions to the sulphonates plant and I am glad to say that we can already foresee sales for the whole of its production for 1958. We are now firmly established in this important and growing market. The chemical products plant, which manufactures alpha and gamma picolines, made a satisfactory contribution to our profits in 1957 and its entire potential output for 1958 is already sold forward.

NEW TYPE OF TRANSFORMER OIL

Your company has devoted much effort to research work on transformer oil. As a result, some years ago we began production of a new type of oil passivated against metals. This grade is now beginning to be widely accepted, particularly for overseas service where operating conditions are more severe. A further development of our transformer oil marketing has been the introduction for the first time in this country of mobile equipment capable of testing the oil component and of servicing all forms of transformers on site.

Marine and Industrial Lubricants Limited continues to expand and to make a satisfactory profit, giving us a useful standing in the marine field.

FLEXIBOX LIMITED AND OTHER INTERESTS

Flexibox Limited, in which we have a two-thirds interest, felt the effect of the engineering strike and other labour troubles in 1957. I am glad to say that these troubles are behind us and excellent labour relations now exist. Our new factory at Ballymena in Northern Ireland is getting into its stride and I am sure that it will become increasingly profitable. I would like to take this opportunity of thanking the Government of Northern Ireland and its officials for their constant helpfulness and the interest they are taking in our development.

The value of orders on hand, both for home and foreign markets, shows a further increase, and you will be pleased to learn that the output in Manchester and Ballymena is largely sold forward for 1958. We are satisfied with the progress made by our foreign licensees and subsidiaries, which should again this year contribute substantially to the profits of Flexibox Limited.

Turning now to the other Companies in which we have financial interests, Petrocarbon Developments Limited has completed the alcohol recovery plant which they designed and constructed for Manchester Oil Refinery Limited and this plant is working well; it has also obtained important new orders in the chemical engineering field during the last twelve months, including a second research contract for the Atomic Energy Research Establishment, Harwell, and the design of a polystyrene plant for Poland.

Stratton Chemicals Limited continues to make good progress both as a trader in chemicals and as an agent for the sale of chemical plant.

The refinery in Belgium, Albatros S.A. Belge pour le Raffinage de Pétrole, S.A., which continues to operate under its processing agreement with the British Petroleum Company Limited, had a satisfactory year.

Your company has become a partner in a new Belgian company, PAM Oil Storage, S.A., in which we have made an investment of B. Frs.2,500,000 (£17,981). This company has been formed to build an ocean storage installation in the new Petroleum Port of Antwerp capable of discharging large ocean-going tankers. PAM Oil Storage, S.A. is owned as to one-third by Steenkolen Handelsvereeniging N.V. of Utrecht (known in the United Kingdom as Coal Trading Association), one-third by BRUFINA, S.A. (one of the leading Belgian industrial and financial investment trusts) and one-third by your company. This investment should strengthen our trading position on the Continent.

THE FUTURE

So far as future prospects are concerned, the recession in the United States and the world over-production of oil which has resulted in the existing low profit margin on most oil products, and in particular on lubricating oils must cause some anxiety. I have already referred to the broadening of the basis of our activities and your Board are confident that, provided there is no further serious deterioration in conditions, either in the oil industry or in the country's general economy they will be able to maintain the profits for 1958 at about the level achieved for 1957.

ROYAL INSURANCE COMPANY LIMITED

A statement by the Chairman Mr T. H. Naylor, circulated with the Annual Report and Accounts of the Royal Insurance Company Limited announces that the total premium income (excluding Life Assurance) rose in 1957 to a new high level of £131.4 million, almost £10 million more than in the previous year and rather more than six times the prewar level.

THE YEAR REVIEWED

At home there had been a satisfactory increase in premiums accompanied by a very welcome improvement in underwriting results.

The premium income in the General Overseas field showed a steady increase and a good return had been earned but in North America a substantial increase in premiums had been more than offset by the rise in claims and the Company's overall underwriting operations there, for the first time in many years, resulted in a loss on its customary premium reserve basis. Fortunately, as reflected in the overseas tax figures in the accounts, the unfavourable experience was to some extent mitigated by substantial US tax credits.

The Company's very large interests in the United States naturally weighted the world-wide result, and the total surplus on the year's underwriting had fallen by £364,274 to £1,591,613 or 1.2 per cent of premiums; this was a lower percentage than had been recorded in any year since the San Francisco earthquake of 1906.

It was a source of satisfaction that during this difficult year the total expenses, excluding commission and overseas taxes, were held to the 1956 ratio of 16.1 per cent.

Apart from underwriting, the other principal source of income was the interest earned on the investment portfolio, and this item, after deducting both overseas and UK taxation, had increased by £150,000 to £3.4 million.

After allowing for the usual contributions to the Staff Pension Funds and for UK taxation the net consolidated profit for the year amounted to a little under £3.3 million compared with £3.7 million in 1956.

DIVIDEND

The Directors were recommending a final dividend of 1s. 11d. per 5s. unit, making a total of 3s. 10d. for the year, and carrying forward unappropriated an additional £716,000 thereby increasing the balance of the Profit and Loss Account from £9.2 million to £9.9 million.

FIRE DEPARTMENT

	Net Premiums	Underwriting Surplus	Percentage of Premiums
	£	£	%
1957	55,128,645	1,509,070	2·7
1956	52,599,302	1,217,970	2·3

At home, premiums increased slightly. A welcome reduction in the national fire wastage and relief from the severe weather conditions of 1956 were reflected in a substantial increase in the surplus earned on the home account. The major part of the £2.5 million increase in premiums had arisen in the United States, but deterioration in the experience there had led to a small trading loss compared with a small trading surplus in 1956.

In Canada an underwriting loss had been suffered but in Australia the results and those of other overseas territories generally were broadly similar to the previous year and the Company had secured a satisfactory surplus on the year's trading.

The total underwriting surplus of £1,509,070 represented 2.7 per cent of premiums written and was nearly £300,000 higher than in the previous year.

ACCIDENT DEPARTMENT

	Net Premiums	Underwriting Result	Percentage of Premiums
	£	£	%
1957	69,618,767	—291,848	—0·4
1956	63,045,235	737,917	1·2

There had been an increase in premium income in all the major countries in which the Company operated but the account, dominated by unfavourable Motor experience in North America, resulted in a deficit of £291,848 or 0.4 per cent on the year's operations. The difficulties experienced in Motor insurance could be attributed partly to the effects of inflation and partly to the increasing number and performance of modern cars together with the current trend in design and construction which led to quite disproportionately expensive repair bills for simple cases of damage. In addition, in countries such as the United States complications and delays in obtaining official approval to necessary rate increases made the task of wresting a profit from the business extremely difficult.

MARINE DEPARTMENT

	Net Premiums	Fund as at December 31	Percentage of Premiums
	£	£	%
1957	6,681,038	14,013,980	209·8
1956	6,046,875	13,546,933	224·0

The 1955 underwriting account had disclosed a balance of £374,391 or 5.6 per cent which could be regarded as satisfactory. This was the first transfer to Profit and Loss Account since the Company's decision to keep Marine Accounts open for three years instead of two.

1957 was another year marked by several major casualties to large modern vessels bearing valuable cargoes and the present indication was that the 1956 and 1957 accounts would show less favourable results than 1955.

LIFE DEPARTMENT

	New Sums Assured	New Annuities (per annum)	Claims by Death	Matured Endowm't Assur'nces
	£	£	£	£
1957	41,407,585	2,164,924	1,392,179	2,276,177
1956	35,995,786	1,524,999	1,442,072	2,282,056

Higher new life business had again been recorded, an appreciable part of the increase flowing from the continued expansion of business in Canada.

The considerable increase in the Funds during the year had been invested on very favourable terms and the present high rates of interest made future bonus prospects particularly favourable for with profit policyholders. Furthermore it had been possible

to reduce quite appreciably premium for without profit contracts.

INVESTMENT DEPARTMENT

In spite of the fall during the year in market value of fixed interest securities of ordinary shares and common stocks, market value of the Company's investments in the aggregate, at the end of 1957, exceeded by a satisfactory margin the at which they appeared in the Balance S

The ability to obtain attractive return new investment was a much more impor consideration than the temporary fal values.

REFUGE ASSURANCE COMPANY LIMITED

The Chairman, in a statement subm with the 1957 accounts, mentioned that was the Centenary Year of the Comp He traced briefly the nature of the Comp business from its inception.

In the Industrial Branch where origi benefits had been primarily for the prov of funeral expenses some three-quarte the premiums received now arise policies containing endowment benefits, of the new business ninety per cent this class.

In the Ordinary Branch, as for the seventy years, the emphasis is on endowm assurances effected by individual po holders, frequently to supplement pen receivable from other sources.

He referred to the increasing prov made by the state for old age and sugg that any Government scheme should st the provision of pension benefits suffic to cover reasonable basic needs, benefi excess of these being left to the free choic individuals to spend their income as like, there being ample facilities availabl savings to supplement State pensions none better than those provided by the Assurance Companies.

The combined new sums assured of £36 million in the Life branches were greatest yet written by the Company in year, and the total sums assured and bon in force were now £368 million. The assets of the Company were £150 mi

ALLOCATIONS TO POLICYHOLDER

In the Ordinary Branch surplus £1,786,000 was allocated to policyholder provide a bonus on with-profit policie the rate of £1 18s. 0d. per cent on the assured in respect of each year's prem due in 1957 and paid.

In the Industrial Branch £1,200,000 allocated to policyholders to provi reversionary bonus to premium pa policies (with certain exceptions) at the of £1 per cent on the sum assured policies dated 1952 and earlier, and £4 8 per cent for policies dated 1953, it the first time that the latter class has ticipated. The conditions under which up policies are granted at advanced ages also been improved and certain increases in benefits continued.

INVESTMENTS

The Company's assets include £50 m invested with the British Governmen Local Authorities, £38 million in Deben and Preference stocks, and £18 millio Ordinary stocks. Mortgage advances, la in connection with House Purchase, £30 million.

Albright & Wilson Ltd

The following is a digest of information appearing in the Annual Report for 1957, posted to stockholders on 6th May. The Secretary of the Company will be glad to supply copies of the Report on request.

	1957 £	1956 £
Group trading profit	4,754,000	4,416,000
Depreciation	1,847,000	1,822,000
Taxation	1,295,000	1,362,000
Minority Interests	59,000	28,000
Net profit	1,553,000	1,203,000
Dividends	585,000	532,000
Retained profit	968,000	671,000
Group net assets	25,961,000	24,850,000
Ordinary dividend — rate	20%	18%
— times covered	2.8	2.4

The issued Ordinary capital in both years was £4,564,000. It is proposed to increase this to £5,705,000 by the issue of fully-paid shares in the ratio of one unit for every four held.

TRADING Sales of all companies in the Group expanded in 1957, the total being about 10% higher, at £30 million compared with £27 million in 1956. In the United Kingdom, the measures taken by the Government to halt inflation do not appear directly or indirectly to have influenced sales to home customers. Exports continued to account for between a fifth and a quarter of total sales. In Canada, the growth in sales and profits, although encouraging, was somewhat less than had been expected: there were strikes affecting transport and some customers, and there was intensified competition from United States producers, aided by the premium on the Canadian dollar. A considerable increase in sales and profits was achieved in Australia, where the synthetic detergent market is in the phase of rapid expansion experienced earlier in North America and the United Kingdom; sales of phosphate esters to the oil and plastics industries also increased significantly. From the Group's investment in the United States, now represented by its holding in Hooker Electrochemical Company, dividends of $378,000 were received during the year.

DEVELOPMENT In 1957 Group capital expenditure amounted to about £2 million. Among the projects in the United Kingdom were the extension of Marchon's phosphates plant, the building of a ship for Astoria Shipping and Transport Company, and plants for a number of new phosphorus compounds made by Albright & Wilson (Mfg.). In Canada, the new sodium chlorate plant at Vancouver was completed and work was begun on extensions to the plant for this product at Buckingham, Quebec. In Australia, the main items of expenditure were the building of an additional phosphorus furnace and the purchase of new office premises. Projects for 1958 include additions to research and development facilities in the United Kingdom, further phosphate and sodium chlorate manufacturing extensions in Canada, and a plant for detergent sulphonates in Australia.

PROSPECTS FOR 1958 In the first three months of this year Group sales and profits have been higher than for the corresponding months of 1957, but not as high as had been hoped at the time of budgeting. It seems likely from information so far available that this pattern will persist for much of the year.

The Sixty-sixth Annual General Meeting of Albright & Wilson Limited will be held at the Company's office at 1, Knightsbridge Green, London, S.W.1, on 29th May, 1958 at 3 p.m.

BADENOCH RUBBER ESTATE LIMITED

ADDRESS BY THE CHAIRMAN, MR A. P. HAMILTON, AT THE ANNUAL GENERAL MEETING HELD ON MAY 6th, 1958

The profit earned during 1957 before allowing for taxation amounted to £105,697 as compared with £100,989 earned during the previous twelve months. Due to the concessions allowed to Overseas Trading Corporations taxation on last year's profits amounted to £28,250 as against £42,272 in 1956.

We are transferring £25,000 to our Development Reserve and recommend a final dividend of 20 per cent less tax, which if approved, will make a total dividend of 30 per cent for 1957 and allow us to carry forward £50,828 to the current year.

The increased profit earned before taxation can I think be considered very satisfactory in view of the fact that the average price for No. 1 Ribbed Smoked Sheet was 2¼d. a pound lower in 1957 than in the previous year. This increase can largely be accounted for by the excellent crop which at 2,782,000 lbs. showed an increase of some 22 per cent as compared with 1956.

The crop for the first four months of the current year amounted to 913,000 lb which is 42,000 lb in excess of the estimate.

As mentioned in the Report the balance of the area of reserve land suitable for the cultivation of rubber was planted up during the year under review. This land totals 1,125 acres and the first area which was planted in 1953 should be ready for tapping next year. From then on additional areas will come into production each year which should result in a considerable increase in our crop.

Now that the jungle reserve has been planted up it is proposed to replant year by year the older areas of the estate and 364 acres are to be dealt with during 1958.

Both Mr Karsten and I visited your property earlier this year and we were very satisfied with the general condition of the estate and in particular with the appearance of the new plantings to which I have just referred.

We are continuing to manufacture our crop in the form of concentrated latex and have so far contracted to sell 57 per cent of our estimated latex production during the last eight months of the current year at a satisfactory premium over the price of No. 1 Ribbed Smoked Sheet. The premium on concentrated latex over sheet rubber has been declining during recent months and although it is still profitable to manufacture our rubber in this form we appear unlikely to obtain as much benefit from concentrated latex as has been the case in the previous two years.

Since the Report was issued we have been notified that it will be necessary to renew the main water supply to the Estate which is piped from a reservoir from the jungle. The existing pipeline was laid in 1934 and has unfortunately become corroded beyond repair. The cost of renewing this pipeline will amount to approximately £14,000, a heavy but unavoidable item of capital expenditure.

I would like in conclusion to pay tribute to our Eastern Agents and the Staff on the Estate. The satisfactory results before you today are in no small measure due to their efforts. Although there was no terrorist activity on the Estate during the year Badenoch is situated in a "red" area and the necessary restrictions imposed on the labour force add considerably to the difficulties of Management and Staff.

BLACK-CLAWSON INTERNATIONAL LIMITED

Wholly Owned Subsidiary of The Black-Clawson Company

(Manufacturers of Pulp and Paper Making Machinery)

CONTINUED EXPANSION

The ninth annual general meeting of Black-Clawson International Limited will be held on May 29th at the registered office of the Company, Black-Clawson House, 18-19 Savile Row, London, W.1.

The following is the circulated statement of the chairman, Mr K. F. Landegger (USA):

I have pleasure in presenting the Accounts of Black-Clawson International Limited for the year ended September 30, 1957.

In view of the continued expansion of the Company's business, it was considered essential that the Company should control its own manufacturing facilities. For this purpose the Company acquired in May, 1957, from The Whitehead Iron and Steel Company Limited, the whole Share Capital of W. A. Baker and Company Limited, Newport. Before the acquisition the Baker factory acted as major sub-contractor for our Company's pulp and paper making machinery and equipment. The works at Newport, Monmouthshire, have a site area of 13½ acres with a working floor space of over 260,000 square feet, are equipped with modern plant and machinery, and will be able to carry out the programme of increased production which has been initiated. The works recently produced the largest paper machine drying cylinders in the world.*

TOTAL ASSETS EXCEED £3 MILLION

The total assets of the Group now exceed £3 million, of which £914,000 is represented by the share capital and reserves and £800,000 by loan capital, including £600,000 6 per cent Debenture Stock 1972/82 which in 1957 was sold to institutional and professional investors in the United Kingdom. For the first time, therefore, the capital of our Company is not held entirely by The Black-Clawson Company of America.

The value of the fixed assets of the Company and of W. A. Baker and Company Limited at September 30, 1957, on the basis of cost less depreciation, was £1,037,434.

The Net Consolidated Profit for the year ended September 30th last, before taxation but after depreciation of fixed assets and interest on the Loan Capital, was £243,126. The amount provided for taxation on the above profits is £118,724.

The value of the unfulfilled orders at September 30, 1957, was in excess of £4,800,000. With our increasing productive capacity and efficiency we are confident that we shall be able to maintain our position in the pulp and paper making machinery field.

I would like to express my sincere thanks to my colleagues and the whole of our staff and employees for their support and co-operation during the past year which has marked an important expansion in the Company's development.

BLACK-CLAWSON COMPANY OF AMERICA

As this is the first year in which the public have an interest in Black-Clawson International Limited I thought it would be appropriate to end my Statement with certain information regarding The Black-Clawson Company of America which owns all the issued Share Capital of Black-Clawson International Limited. The Capital and Reserves of The Black-Clawson Company as shown in its Consolidated Accounts at September 30th last were US $12,839,520. During the three years ended September 30, 1957, the Black-Clawson Group has carried out a programme of expansion of its manufacturing facilities and its technical knowhow. During this period the Group expended upon capital equipment some US $7,766,000 and upon engineering, patterns, jigs and fixtures approximately US $9,750,000. The Group has four manufacturing plants in the Un States and one in the United Kingdom; factories have over 1½ million square fe production space on 42 acres of land and total number of employees amounts to ne 3,000.

The sales of The Black-Clawson Comp in the year ending September 30th last w US $45,304,378.

*Note.—These cylinders form part o machine built by The Black-Clawson Co pany which is the largest newsprint mac ever built. It is a 342 inch wide giant cap of producing in one day a continuous high of newsprint 27 feet wide and 500 miles l

HUMPHREYS LIMITED

(Building and Civil Engineering Contractors)

HIGHER TURNOVER OFFSET BY RISING COSTS

The 66th annual general meeting of Humphreys Limited will be held on June 3rd, at Winchester House, Old Broad Street, London, E.C.2.

The following is an extract from the statement by the Chairman, Mr A. V. Bridgland, CBE, which has been circulated with the report and accounts:

Our trading profit for this year is £132,935 as against £133,125 last year. Although our turnover has increased, the profit has been affected by rising wages and increased charges for rent and rates arising from our move to our new offices.

The Balance Sheet shows that current liabilities of £1,008,050 are covered by current assets of £1,283,951, giving a surplus of current assets over liabilities of £275,901, of which £186,253 is in cash.

SOUTH AFRICAN SUBSIDIARIES

Dealing with the South African Subsidiaries, the statement continued: Much has been done by its Board to improve the organisation and efficiency of R. H. Morris (Pty.) Limited. We have received slightly increased dividends this year and it is encouraging to report that the ensuing year should be profitable as the Company is engaged on several remunerative contracts. There are indications that a considerable amount of both building and civil engineering work will be offering in and around Cape Town during the next few years.

R. H. Morris (Pty.) Limited are this year paying a dividend of 5 per cent on the Ordinary Shares and the Board are hop that profits should show a steady ris our subsidiary benefits from the reorgan tion to which it has been subjected. T situation could be improved more specta larly and more speedily if the highly co troversial national political situation co be resolved in a manner that would resto confidence both in South Africa and overs

As to the other South African subsidi National Quarries (Pty.), Limited, I have report that the Administrator of the C Province has issued a closure order wi is to take effect from October 31, 1961, the ground that the quarry in the Tygerbe Hills is spoiling the scenery. A claim f full compensation has been prepared. Mea while, another site, over which the Compa had previously obtained quarry rights, being prospected with a view to opening new quarry on the closure of the pres one.

It is, however, clear that the closure the quarry will result in there being shortage of stone against demand and th the closure order will deprive the Cape Tow area of a quarry that not only produces th highest quality stone but also has the great output and is closest to the city.

National Quarries (Pty.) Limited has th year raised its dividend to 25 per cent.

So far as our own future is concerned, would say that despite the higher Bank Ra and the more stringent financial condition prevailing, your Company, by virtue of it close and varied associations, has good reas to be hopeful.

POSITION IN BRIEF
Year ended November 30, 1957.

	£
Earned profit before taxation	117,827
Less taxation	62,400
Net profit after taxation	£55,427
Appropriated as follows:—	
Preference dividend net	3,163
Ordinary dividend net	21,562
Balance retained	30,702
	£55,427

Issued capital	£100,000
Gross dividend covered by taxable profits	21.4 times
Capital covered by net assets	6.4 times
Ordinary Shareholders.	
Issued capital	£250,000
Gross rate of dividend paid	15%
Gross rate earned on present capital excluding Reserves	44%
Net assets attributable to each 5s. Ordinary Share	10s. 10d.

ATLAS ASSURANCE COMPANY LIMITED

150 YEARS OF PROGRESS

The Annual General Meeting of the Atlas Assurance Company Limited will be held n May 30th in London.

The following are extracts from the Statement to Shareholders by the Chairman, Mr Rudolph E. F. DE Trafford, OBE, which has been circulated with the Report, Accounts and Balance Sheets, for the year ended December 31, 1957:

The present year is a notable one for the "Atlas" in that it will be 150 years on June 24th next since we first opened our doors for business.

Your Directors decided that it was appropriate to mark the occasion in a tangible way for the shareholders and they have accordingly declared a special anniversary distribution of 1s. per share in addition to the normal dividend.

During our long history and by the very nature of our business we have, of course, known good times and not so good ones but it is nevertheless a disappointment to us that in this anniversary year we have to report a trading loss on our fire insurance account for the first time since 1906, the year of the great San Francisco earthquake. On this occasion it was a generally adverse experience in the United States, common to practically all companies, rather than a single catastrophe as was the case in 1906, that largely gave rise to our loss.

I now turn to our Accounts.

FIRE DEPARTMENT

Net Premium Income 1957	£6,414,414
Net Premium Income 1956	£6,265,398
Increase	£149,016

Following upon an indifferent year in 1956, when we showed a profit of only £34,129 (.5 per cent), we had an even worse time in 1957 and have to report a loss of £129,880 (2.03 per cent).

Our home business, which struck a bad patch in 1956, recovered and showed a satisfactory profit.

In the overseas field too, apart from the United States and Canada, we fared well though it seems clear that intensifying competition and other circumstances of one kind and another are having their effect on profit margins in many territories.

In the United States, as I have said, we, like other companies, again had an unfortunate experience.

In Canada also 1957 was a difficult year for everyone.

ACCIDENT DEPARTMENT

Net Premium Income 1957	£3,815,015
Net Premium Income 1956	£3,311,714
Increase	£503,301

Of the increase in premiums roughly one-third came from the home field and the remainder from territories overseas.

Rates of premium for motor business were increased during the year both in this country and in some countries overseas and we made a profit—albeit an extremely modest one—on our home motor business for the first time for some years. Our overseas motor account, however, again showed a loss overall and there can be no doubt that rates are still too low in many areas.

Our casualty operations in the United States have developed steadily along controlled lines and they were satisfactory notwithstanding the very difficult market conditions.

We closed with a profit of £207,382 (5.44 per cent) against £102,565 (3.10 per cent) in 1956.

MARINE DEPARTMENT

Net Premium Income 1957	£828,739
Net Premium Income 1956	£798,221
Increase	£30,518

The trend which I mentioned last year of an increasing income from hull business continued for much of 1957, and the account as a whole showed a moderate expansion. However, difficult conditions in the freight market began to manifest themselves towards the end of the year and these developments must, at least, temporarily, have a depressing effect on hull premiums.

The very wide forms of cover which have now become commonplace, coupled with the present low level of rates, make it problematical whether there can be a sufficient margin for profit on cargo business.

A sum of £100,000 has been transferred to Profit and Loss Account, as against £150,000 last year, and the Marine Fund at the end of the year was £1,335,695.

LIFE DEPARTMENT

The net new sums assured in 1957 amounted to £9,814,910 compared with £9,477,260 in 1956. New deferred annuities were issued for £912,526 per annum.

Premium income rose by over 10 per cent. Purchase prices of immediate annuities were £543,267 against £88,482 in 1956.

Gross interest income increased by very nearly £200,000 and the gross rate of interest earned on the Fund increased by 3s. 10d. to £5 11s. 5d. per cent.

The total surplus, including £382,093 brought forward from the previous year, amounted to £1,506,800. The sum of £500,000 has been transferred to the Investment Reserve and £21,809 was required to provide for interim bonuses and bonuses on reassurances received from other companies. The very substantial balance of £984,991 has been carried forward.

APPROPRIATION ACCOUNT

After providing for the dividend for the year at the rate of 3s. 6d. per share, 1s. 6d. per share of which was paid in November last, and the special anniversary distribution of 1s. per share, the carry forward amounts to £1,322,466.

BANCO DI ROMA

Paid up Capital: Lire 1,000,000,000
Reserve : „ 4,250,000,000

The Meeting of Shareholders of the Banco di Roma, held on April 21, 1958, under the chairmanship of H. E. Professor Costantino Bresciani Turroni, approved the Balance Sheet, Profit and Loss Account and the allocation of the profit for the financial year 1957.

Against the increase of 50,000 million lire in available funds bringing them up to approximately 613,000 million lire, there was a rise of 49,000 million lire in liabilities, bringing them up to 430,000 million lire. Arising out of these increases and the expansion which occurred in other sectors, the grand total of the balance sheet items shows an increase of 132,000 million lire and now stands at 1,260,000 million lire.

The balance of the net profit of Lire 873,154,604 has made it possible to increase the rate of dividend from 9 per cent to 10 per cent and to allocate Lire 750 million to reserve, which thus amounts to 4,250 million lire.

The Meeting further approved the appointment to the Board of Directors of Dr Luigi Chialvo, whose term of office will last until the approval of the Balance Sheet for the Financial Year 1958 in order to bring his term of office in line with those of the other Directors.

The Board of Directors met immediately after the Meeting of Shareholders and confirmed the appointment of H. E. Professor Costantino Bresciani Turroni as Chairman, Cav. del Lavoro Baron Professor Francesco Mario Oddasso as Vice-Chairman, and Cav. del Lavoro Ugo Foscolo as Managing Director.

A dividend at the rate of Lire 10 in respect of each nominal share of Lire 100 is payable on and after April 22, 1958, at all offices of the Banco di Roma in Italy on presentation of the share certificates for stamping.

THE RIO TINTO COMPANY

MR GERALD COKE ON DEVELOPMENT OF GROUP'S INTERESTS

The eighty-fifth annual general meeting of The Rio Tinto Company Limited will be held on June 5th at Barrington House, 59, Gresham Street, London, E.C.2.

The following is an extract from the circulated statement of Mr Gerald Coke (the Chairman):

Accounts: The increase from £3,270,000 to £15,393,000 in the figure for capital reserves in the balance sheet of the parent Company is due to the premiums arising from the issue of 2,311,200 ordinary shares in exchange for shares of the Kern Oil Company Limited and of the further issue in October, 1957, of 2,085,200 ordinary shares at 50s.

A large part of your Company's income is derived from its Rhodesian investments. The dividend received from subsidiary Companies, which, of course, is principally derived from the Kern Oil Company, has gone some way to making good the fall in income from the copper producing companies in the year to December 31st last. The Kern Oil Company must, however, retain sufficient resources for development purposes and its profits must depend on the future trend of oil prices. On the other hand, the income derived from the Rhodesian investments is bound to be smaller during the present year due to the fall in the price of copper, which was not fully reflected in the dividends received during the year under review, and the total income available to the parent Company will be correspondingly reduced. In due course substantial income will, it is hoped, arise from your Company's uranium investments, but it must be appreciated that both the producing companies themselves and The Rio Tinto Mining Company of Canada, which is the holding company, have heavy prior charges to amortise before the equity can expect any return.

SPAIN

During the year we received a first dividend of 6 per cent on our investment in the Spanish mine.

CANADA

The principal problem which the Canadian Company has had to face during the year has been the over-run in the capital expenditure on the uranium mines of the Northspan Company. Such over-runs are common to nearly all mining enterprises, especially in a time of rising prices, but there is no doubt that in this particular case the speed with which the whole operation had to be carried out inevitably led to under-estimation and some excess of expenditure.

If the rapidity with which the mines have been brought into operation is taken into account, the excess expenditure is not proportionately high, though, when such large sums are involved, it naturally follows that the additional amounts required are large expressed in terms of money.

The parent Company felt that it must ensure the completion to the point of active production of the uranium since under the management and control of The Rio Tinto Mining Company of Canada. The overall financial picture of these uranium mines to the end of the present contracts can be viewed as not unsatisfactory.

In 1956 reference was made to the long-term prospects for uranium. Since then more is known of the long-range possibilities of the fusion process as a means of producing power for civil purposes. This factor was, however, taken into account in the estimates tentatively given and it does not appear that there are any new factors which would suggest any major revision of those estimates.

The expanding requirement for power is the principal factor on which the demand for uranium will be based. Some estimate of the size of this demand was made by Sir Edwin Plowden in an article published in December, 1957, and it would be difficult to find a better authority to quote. His article, which was published in *Optima*, the journal of the Anglo-American Corporation, for December, 1957, may be recommended to all who are interested in the probable future demand for uranium.

The statement then quoted extracts from the article in which it was stated that "It is possible that the total amount of uranium needed by the free world for civil purposes in the 1970s could well be in the region of 50,000 tons a year and still rising. One of the conditions for a continuing high demand is that it (uranium oxide) should be produced cheaply and for those established mines which can do this, and for those who can find economical new sources of supply, there should be an ever-growing market."

The statement continued: After the termination of the present Government contracts and with the background of the experience gained as the world's largest uranium producer, the Group should be capable of fulfilling these conditions and maintaining its competitive position.

In addition to meeting the deliveries of uranium oxide required under existing Government contracts, the Group will, within the next few months, have sufficient plant capacity to supply additional consumers where governmental bi-lateral arrangements permit. The Group is also developing an organisation for research into new methods of processing the oxide and for selling it on a world-wide basis. We believe that the products we have to offer will be found to be competitive and, with the substantial sources of supply which the Group can command, the intending purchaser should have a guarantee of delivery in the quantities and qualities he is likely to require.

AUSTRALIA

The Mary Kathleen mine is expected to begin production earlier than the date originally forecast. We congratulate our Australian associates on this achievement, which augurs well for the future of our Australian organisation.

AFRICA

During a time of falling metal prices a mining group such as the Rio Tinto Group must have special regard to the possible returns from any development or exploration work which they undertake, but your Board feel that it is essential to maintain an active exploration organisation in any area where there are reasonable prospects of such activities bearing fruit, and in particular to ensure that their organisations in the Federation and the Union, as well as in Canada and Australia, are fully prepared to take advantage of any improvement in base metal prices.

OIL

The Kern Oil Company has been a member of the Rio Tinto Group for nearly a year and its organisation is now working as an integrated part of the whole. This acquisition is a most important and valuable diversification of our interests.

AUTOMATIC TELEPHONE & ELECTRIC COMPANY LIMITED

Annual Report and Accounts of the Group for the Year ended 31st December, 1957

PRINCIPAL FEATURES

	1957	1956
	£	£
Profit (after depreciation, etc.)	1,981,905	1,794,081
Taxation	842,761	805,935
Net Profit	1,139,144	988,146
Dividends	338,545	292,127
Retained in the business for Research, Development, Expansion, etc.	797,942	696,019
Issued Capital	4,572,200	3,994,400
Reserves and Amounts set aside	8,809,038	7,848,905
Fixed Assets	4,707,216	3,668,049
Investments	284,445	288,655
Net Current Assets	8,541,446	7,886,601

The following is an extract from the Statement to Stockholders made by Sir Thomas Eades, Chairman:—

"Although we entered 1958 with a full order book, our Manufacturing Programme for this year does not show the expansion over 1957 that was anticipated when I reported to you last year. This is partly due to the fact that the Post Office expenditure programme for 1958 and 1959 has been cut back as part of the Government plan to restrict the expenditure of Nationalised Industries.

"P.O. Telephones are not really large consumers of finance, and they pay their way as profit earners, so that it is unfortunate to restrict expansion, particularly at the present time."

PROVINCIAL INSURANCE COMPANY

STATEMENT BY MR PETER F. SCOTT

The fifty-fourth Annual General Meeting of the Provincial Insurance Company will be held at 100 Cannon Street, London, E.C.4, on Thursday, May 22nd. The following is the statement of the Chairman, Mr Peter F. Scott:

After ten postwar years of planned development at home and overseas, this has been the first year of consolidation with comparatively younger men at the helm.

First, I would like to refer to an important rearrangement in our top management structure. The need to spread the responsibilities of general management on more shoulders has been apparent for some time and received careful study last year. On the advice of the General Manager, from January of this year Mr W. H. Gee was appointed his deputy with particular responsibility for the overall administration of our home business, and three of our senior managers were promoted to the rank of Assistant General Manager: Mr D. W. Holloway, manager of our home motor department, Mr A. Murdoch, manager of our home fire department, and Mr E. H. Paxton, our overseas manager.

I have also to report the retirement of two managers of our home branches: Mr J. G. Davie, who was branch manager in Birmingham from 1937 to 1944 and Manager for Scotland from 1944, and Mr H. N. Gaze, who had been in charge of our business at Reading. I take this opportunity of wishing both these old friends happiness in their retirement.

During the year my two deputy chairmen made visits overseas, Mr Haslam to Australia, where he and the General Manager opened our five new branch offices, and Mr Falk to West Africa. Since then subsidiary companies have been formed in Nigeria as well as Canada.

Our world-wide income advanced by £888,003 at approximately the same rate as in 1956 and is now £7,769,301, on which a profit of £210,182 was earned. Our interest, dividends and rents were £609,182, making total earnings of £819,364. After deduction of £41,320 for expenses not charged in other accounts and £60,182 contributed to the staff pension fund, there is a profit before tax of £717,862, which is reduced by United Kingdom and overseas taxation to a net surplus of £391,651. With the addition of the balance brought forward of £205,888, an amount of £597,539 is available for disposal, of which £580,289 remains after payment of preference dividends. Out of this balance the directors recommend the payment of a dividend of 1s. 9d. per share on the ordinary shares which, less income tax, requires £201,250, leaving a balance to be carried forward of £379,039.

Our dividend payment is more than covered by interest earnings after allowing for the effect of profits tax. Although the value of our investments has fallen during the year, the market value is substantially above the book figure.

Turning now to our results in more detail, in the fire department we earned a satisfactory profit in the United Kingdom but made a small loss overseas, so that our combined account realised a profit of £84,657, compared with £88,674 the year before.

The greater part of the accident department's income, both overseas and at home, comes from motor insurance, which therefore very much influences the final figures of profit or loss. At home, the effect of Suez was to postpone a general increase of motor rates until July, 1957, and greatly to reduce our claims for the first four months; from early summer, however, as the supply of petrol increased, our claims rose to levels we have come to regard as normal. Overseas our profits were insufficient to take care of a loss on motor business in Canada, where there was a further deterioration in the claims experience. The combined result of all accident business was a profit of £75,525, a substantial improvement on last year's loss of £181,720.

In the marine department we continue to show an increase of premium income, which arises partly from our aviation account and partly from the general expansion of our business. After a transfer of £50,000 profit on our 1953 account, the ratio of the marine fund to premium income becomes 130 per cent.

Our Underwriter, Mr Harold Hopwood, has this year been elected Chairman of the Institute of London Underwriters, and we wish him a successful year of office.

To conclude with a brief word of more general interest I should like to allude to the present state of the world economy. It is at a moment like this that we feel how much we miss the wisdom and foresight of the late Lord Keynes, for so many years a Director of our Company, because it may be that the protracted postwar boom which he predicted is drawing to a close. Events in North America appear to confirm this view. If inflation is brought under control in this country investment income may be less remunerative and it will be more than ever important to make our insurance underwriting really profitable.

Any check to rising costs would provide an opportunity to reduce expense ratios and to improve the services our activities provide. We in the *Provincial* accept such a situation as a challenge to management and welcome the prospect. We also hope that with the support of our agents and brokers we shall continue to obtain our share of new business and succeed in showing a healthy expansion of premium income.

BAKELITE LIMITED

RECORD SALES IN FACE OF KEEN COMPETITION

MR H. V. POTTER'S REVIEW

The Thirty-second Annual General Meeting of Bakelite Limited was held on May 1st at the Hyde Park Hotel, Knightsbridge, London, S.W.1.

Mr H. V. Potter, BSc, FRIC, MIChemE, FPI, the Chairman, in the course of his speech, said:

It is recorded with very deep regret that our President, Sir James Swinburne, died in March, 1958, a few weeks after celebrating his 100th birthday. Sir James was connected with this Company and its predecessors for over 50 years.

The trading profit for 1957 before taxation was £431,022 (£474,921). The proposed final dividend of 10 per cent (less tax), together with the interim dividend of 5 per cent (less tax), already paid, makes a total of 15 per cent for the year.

TRADE REVIEW

The total sales during the year, both in value and in weight, were a record. Costs continued to rise in spite of increased efficiency and we were unable to pass these costs on owing to the very competitive conditions, both at home and abroad.

Sales of industrial and decorative laminated sheet continued to expand and we have widened the range of our WARERITE products by introducing a new WARERITE wall board to provide a durable and alternative material for interior walls and ceilings. Our manufacturing capacity for those products has been increased by the installation of new plant in readiness to meet an expansion in sales as soon as market conditions allow.

We continued to be the largest supplier of phenolic moulding materials, the market for which is widely spread throughout industry, and our special grades still provide combinations of properties not matched by any other materials.

Our vinyl resin plant at Aycliffe, Co. Durham, has continued to operate throughout the year and improvements have been made both in quality of product and efficiency of operation, but further improvements are still necessary in order to meet the acute competitive market situation which has arisen, especially from the importation of low priced resins. The market for VYBAK extrusion compounds, based upon resins of our own manufacture, continued to expand and further progress has been made in the marketing of pressed pvc sheet and monofilaments.

We have continued to increase our market for polyethylene, and now that the new Grangemouth plant has come into operation we look forward to further expansion in this field. Bakelite polyethylene is used in numerous ways, such as packaging film, moulded household goods, water pipes and cable.

Referring to our export trade, we have encountered difficulties in selling our products overseas, and although these sales have increased, this has only been achieved at the expense of profit margins.

Our subsidiary and associated companies have made good progress during 1957 and we look forward to further expansion by these companies.

Our research and development departments are continually investigating the latest techniques and discoveries. An increasingly large part of this development effort is concerned with our latest products, such as polyethylene and epoxide resins, but work is also in progress to keep us in the forefront with all our main products.

Relations between the Company and its employees had continued to be satisfactory throughout another difficult year.

CURRENT TRADING POSITION

The Company's turnover has continued to increase during the first three months of this year, but it is significant to note that this increase has been brought about by the newer products in which the Company is now more extensively engaged. We are not yet reaping fully the benefits of our large capital expenditure of recent times, but we now have the plant capacity and the selling organisation available to take advantage of any general trade improvements. Meanwhile a very competitive situation exists which, if it continues, could affect the trading results for the current year.

The Report and Accounts were adopted.

INSTITUTE OF CHARTERED ACCOUNTANTS

ANNUAL MEETING

The seventy-seventh annual meeting of the Institute of Chartered Accountants in England and Wales was held on May 7th in London. Mr W. H. Lawson, the President, in the course of his address, said:

SCHEME OF INTEGRATION

The outstanding event of the year was the implementation of the Scheme of Integration of the Society of Incorporated Accountants with the Institute. It has been impressive and heartening to find that once the scheme was approved, all concerned have co-operated to make it a success. It is much too early to judge the full effect of the Scheme, but it is already apparent that it is bringing about a sense of unity in the profession which did not previously exist.

Our enlarged Institute, with the Institute of Chartered Accountants of Scotland and the Institute of Chartered Accountants in Ireland has set up a Joint Standing Committee to co-ordinate policy on matters arising in connection with the Scheme of Integration and to consider any matter of common interest which may be referred to it by any of the Institutes. We value highly this opportunity for regular consultation with Scotland and Ireland and I believe that this arrangement will go far towards meeting criticisms which were previously heard that it was difficult to obtain the views of the accountancy profession. We have achieved much of what was needed in the way of rationalisation and time is now required to see how the new structure operates before deciding what further steps, if any, may be possible in the interests of the profession.

CHEQUES ACT, 1957

Considerable misconceptions have arisen in connection with the Cheques Act, 1957. The main purpose of the Act was, of course, to render unnecessary the time-consuming task of endorsing cheques. As a by-product it has caused widespread discontinuance, as regards payments made by cheque, of the custom of giving individual receipts. We have, through our Taxation and Research Committee, made inquiries as to the experiences of businesses in operating under the new conditions. On the whole the evidence is reassuring. It was inevitable that some difficulties should be experienced in individual cases, but these will undoubtedly be overcome in time.

Some changes in office organisation are required, but these can readily be made with the assistance of the auditors. There is more difficulty in persuading the public to adopt the new system. It is natural that those who have been in the habit of filing their receipts as part of their domestic accountancy system should be reluctant to change their methods. However, no great difficulty should arise if shops and other suppliers make suitable arrangements, for example by means of tear-off remittance slips so as to enable the customer to retain the original bill or a detailed statement.

Individual receipts will still be required for a limited number of purposes and it remains the law that if the amount is £2 or over receipts must be given when demanded and, with few exceptions, must be stamped with a twopenny stamp. It is hoped, however, that receipts will not be demanded unless they are really necessary.

HUDSON'S BAY COMPANY

SUCCESSFUL TRADING

The two-hundred and eighty-ninth annual general Court of The Governor and Company of Adventurers of England trading into Hudson's Bay was held on May 2nd, Mr W. J. Keswick, Governor, presiding.

The following is an extract from his statement circulated with the report and accounts for the year to January 31, 1958:

Trading results for the year were again satisfactory. Net profit after taxes was 8s. 3d. per share, compared with 6s. 10d. per share the year before.

Trading dividends paid and proposed amount to 20 per cent being 4s. 0d. per share gross or 2s. 3½d. net after U.K. Tax. The same distribution as last year is proposed from the Land Account of 2½ per cent, half of which was paid last November with the interim trading dividend of 4 per cent.

Hudson's Bay Oil and Gas Company Limited recently issued its first published Annual Report and Accounts which showed operating earnings of $3,073,000 and non-recurring gains of $4,742,000 which together resulted in converting the deficit account brought forward from previous years into a surplus of $629,000.

All Departments did well, although last summer saw the start of the retreat from the peak of the inflationary boom in Canada.

The rate of increase in sales of the Retail Stores Departments achieved during the buoyant months of spring and early summer was not maintained.

The report was adopted.

UNITED BISCUITS LIMITED

GROUP SALES EXCEED £17 MILLION

The tenth annual general meeting of United Biscuits Limited, will be held on May 29th in Edinburgh.

The following are extracts from circulated statements by the Chairman, Mr. Peter G. Macdonald, WS, JP, for the year ended December 31, 1957:

It is now ten years since McVitie & Price and Macfarlane, Lang & Company amalgamated under the name of United Biscuits Limited. These two family businesses have each more than one hundred years' experience in the manufacture of biscuits, McVitie & Price having been established by Robert McVitie in 1839 and Macfarlane, Lang & Company having been founded by James Lang in 1817. The marriage of these two important and long established companies has been an outstanding success as the figures in the survey testify.

The production of biscuits in this country increased in 1957 by over 10,000 tons and we as a group have taken substantially more than our proportionate share of this increase. Our group sales exceeded £17,300,000, an increase of £1,800,000 over last year. Undoubtedly the most powerful factor behind the continuing rise in biscuit sales is the fact that biscuit prices have been held at a much lower level than the prices of any other foodstuff. While retail prices of most of the latter have risen by between two hundred and three hundred per cent since 1938 our biscuit prices have risen on average by only some sixty to seventy per cent.

PROFIT AT NEW RECORD LEVEL

I am also glad to inform you that our profit figure has again reached a new record level.

The group profit for the past year amounts to £2,510,069 as against £2,309,841 in 1956, an increase of £200,228. The directors recommend that the final dividend on the ordinary shares be 12 per cent, *less* tax, making a total of 17 per cent for the year, an increase of 2 per cent over the previous year.

The consolidated balance sheet shows the continued growth of the financial strength of the group. Revenue reserves now amount to £3,398,178 and current assets exceed current liabilities and provisions and future taxation by £2,685,448, which represents an increase of £654,243 over the corresponding figure last year.

Our efforts in the export market are being maintained and despite intense competition, particularly from local manufacturers, our sales in the overseas market continue to grow steadily.

The country's present economic and industrial uncertainty makes it difficult to forecast future prospects, but the group sales in the first three months of the current year have continued to expand. I am sure that the quality of our biscuits for which we have always been famous will keep us in a strong competitive position.

TEN YEAR SURVEY 1948-1957

The following is a Ten-Year Survey for the years 1948-1957 incorporated in the Report and Accounts:

United Biscuits Limited, which was incorporated in Scotland in March, 1948, with a share capital of £3,500,000, acquired the whole issued capitals of McVitie & Price and Macfarlane Lang. The average of the profits for the years 1946 and 1947 amounted to approximately £350,000 before providing for taxation. There has been an impressive growth of the profit figures over the past ten years, the profit having increased during that period from £454,000 to £2,510,000.

The group owns the most up-to-date biscuit factories in Britain, if not in the world, and has successfully met the competitive conditions which prevail and which no doubt will intensify.

GROUP SALES

The group sales in 1948 were £3,800,000. By 1957 they had increased to £17,300,000. One of the chief reasons for the group's success was undoubtedly due to the manufacturing companies having maintained, even in the adverse war period, the highest standard in quality of their biscuits.

That the group has been successful in restraining the rise in prices to such a marked extent despite increases in the cost of the main ingredients—flour, fat and sugar—ranging from more than double to treble the prewar figures, has been due largely to two factors. Firstly, by the greatest possible use of mechanical and electronic devices combined with the most modern and up-to-date plant, and secondly, to a continuing expansion in production and sales with a consequent spreading of overhead charges.

As McVitie & Price's and Macfarlane Lang's biscuits are sold throughout the length and breadth of this country, it is necessary, to enable orders to be met with the maximum despatch, that depots and railheads be maintained throughout Great Britain.

Since the war industry has been exhorted by the Government to increase their exports and the group has done everything in its power in this connection. Several of the directors have made visits overseas, particularly to Canada, where a subsidiary company was formed in 1955 for the further extension of sales in that progressive country. These efforts met with a considerable measure of success; biscuits are despatched by the group to almost every corner of the globe and some 70 per cent of the export sales is in hard currency, the largest importer being Canada.

BANCO DI SANTO SPIRITO

ROME

Established 1605

Capital and Reserve Funds: Lit. 2,150,000,000

THE ANNUAL GENERAL MEETING of the Banco di Santo Spirito was held in Rome on April 19, 1958, the Marchese Giovanni Battista Sacchetti being in the chair. The following Balance Sheet was approved:—

Balance Sheet at December 31, 1957

ASSETS			LIABILITIES		
Cash and Balances with other Banks	Lit.	6,542,897,232	Capital	Lit.	750,000,000
Bills and Government Bonds	„	34,689,876,681	Reserves	„	1,080,000,000
Securities:			Deposits	„	46,109,724,740

	Lit.	207,147,665,856		Lit.	207,147,665,856

It was further resolved to transfer Lit. 320,000,000 to reserves and to distribute a dividend of Lit. 50 (10%) per share.

COMPAGNIE MARITIME BELGE

EFFORTS TO COMBAT ADVERSE CONDITIONS

The following is an extract from the Draft Report by the Board of Directors which was submitted to the Ordinary General Meeting held on May 7, 1958:

The prosperity in shipping business became less from the beginning of 1957 onwards; and as from the second quarter of that year it gave place to progressive deterioration.

After outlining the causes contributing to this situation the Report emphasised that the facts showed how extremely sensitive the industry was to variations, often unforeseeable, in the world business cycle.

The report continued:

The policy followed by our Company through the ups and downs of the cycle has been to keep the quality of its tonnage high while keeping working costs down. That policy is bearing fruit, the value of which appears more clearly as the general economic situation deteriorates.

A further section of the overall plan based on this policy was put into effect during 1957. The programme for modernising the first five "Ville" boats was completed at the same time as the "Baudouinville," a sister of the "Jadotville," was going into service. Since then the Antwerp-Lobito-Matadi line has been served by seven passenger-cargo vessels with a uniform cruising speed of 17 knots. This allows them to call at Lobito as required, and still to have enough time at Antwerp for systematic overhaul of the ships.

The "Copacabana" and the "Mar del Plata," which were already old ships, were sold when the "Jadotville" and "Baudouinville" were put into liner service. The "Moanda" and "Mobeka" have started to operate as the first of a series of large-capacity cargo ships; another in this series has been ordered, bringing up to nine the number of ships of this type to be delivered by the yards between now and during 1961. The "Capitaine Biebuyck," one of the less efficient ships built since the war, has been sold.

At the Leopold Dock in Antwerp the 20,000 square metre shed, built of metal without interior supports, has been put into use. It has greatly improved the handling of transit goods for the Congo. Twenty-one hectares of further land have been obtained on lease from the City of Antwerp with a view to enlarging storage areas and improving road and rail communication with the docks.

With the same object of quickening the turn-round of ships and rationalising the handling of goods it has been decided to amalgamate our Piers 13 and 14 at New York into one unit, and to give them better equipment.

OPERATIONS

As regards actual operation we have adapted our resources to present needs. Roughly half our ships are now running on our Congo lines, the rest being spread between our various other lines. Among these latter we have restarted our regular South American and Indian services, which circumstances had obliged us to suspend or thin down.

The three latest freighters of the "Lu" series, the "Lukuga," "Lusambo" and "Lulua," have been put on to the South American route. They have a cruising speed of 16 knots, large tanks for vegetable oil cargoes, good refrigeration, high-capacity loading gear and extremely comfortable cabins for 12 passengers. They at once restored to this traditional line the quality which had won its reputation in the past.

We have decided to start a new regular line between certain ports on the continent of Europe and the Persian Gulf. The first sailing has just taken place.

The extension of our fleet and our regular lines requires more officers, both deck and engine room, as well as seamen. Both our officers and our crews constantly give cheering proof of their devotion and ability; but recruiting remains a difficult problem, which we are making energetic efforts to solve.

You will find below the analysis of the Balance Sheet and Profit and Loss Account as at December 31, 1957. With Fr. 1,557,496 brought forward and Fr. 113,674,553 earned during the year, the year's profit is Fr. 115,232,049. If you approve our proposals the dividend for 1957 will be payable at Fr. 265 net.

BRITISH ALUMINIUM

HOME DEMAND RECOVERY

The annual general meeting of the Company was held on May 6th in London.

The Right Honourable Viscount Portal of Hungerford, chairman, in the course of his speech, said: The consolidated profit for the year after tax amounted to £1,247,389, which compares with £1,330,989 for the previous year.

The lack of rainfall in Scotland again to some extent influenced our primary operations. Although Kinlochleven produced a record output, Lochaber was only able to produce about the same tonnage as in the previous year. Our alumina works operated satisfactorily and had a steady load.

At our rolling mills and extrusion works operations again had to be curtailed slightly, due in some degree to a falling off in home demand, but more particularly to difficult conditions in export markets.

During the last decade the growth of the United Kingdom aluminium industry has been quite spectacular and in line with that of the world aluminium industry; but in the latter part of 1956 and throughout 1957 there has been some recession in demand for aluminium products from the high level reached in 1955 and 1956.

AN ENCOURAGING FEATURE

Home demand for aluminium products made a healthy recovery in the latter part of 1957, indicating that manufacturers had absorbed stocks and were purchasing at a rate comparable with the level of production of the country. During this period your company fully maintained its position as a leading supplier and a most encouraging feature of 1957 was the stability of the overall demand from the principal industries using aluminium.

The trend in overseas markets, however, deteriorated considerably during the year. Competition from several sources in many overseas markets during the last year or two has reduced prices to levels which are now quite uneconomic for any exporter. This has been the principal cause of reduction in output of fabricated products in the United Kingdom and is likely to continue to be a dominating factor until world demand begins to catch up with metal supplies.

WORLD SUPPLIES

For a long time we have been in a position where aluminium has been in short supply. This is unsatisfactory to everybody. The whole past history of the aluminium industry indicates concentration on development and expansion, and this must inevitably be hampered unless metal is in adequate supply. After an unsuccessful race to keep production in line with consumption, the time has come when productive capacity has suddenly exceeded demand. How long this condition will last depends on many different factors. Of two things, however, I am convinced. Firstly we had to have an excess of supply before the next round of expansion could come. Secondly, the time will come when not only all the present facilities but all the great schemes upon which active exploratory work is proceeding will be required. We have complete faith in the long-term expansion of our industry.

We recommend a final dividend of 3 per cent on the Ordinary Stock which, with the 4 per cent already paid, makes 12 per cent less tax for the year.

The report and accounts were adopted.

GENERAL ACCIDENT FIRE AND LIFE ASSURANCE CORPORATION LIMITED

TOTAL ASSETS NOW IN EXCESS OF £100,000,000

The seventy-second Annual General Meeting will be held on May 21st at Perth. The following is an extract from the circulated address of the Chairman, SIR STANLEY NORIE-MILLER, Bt, MC, DL, JP:

A year ago I stated that underwriting results in 1956 were less profitable than for some time past. I regret to have to say the same about the 1957 figures. Our results in the United Kingdom and in some areas overseas improved during the year, but in others there was progressive deterioration.

Notwithstanding the difficulties which had to be faced, the accounts now presented reflect material expansion in the business of the Group, with income from all sources for the year at the record total of £63,588,929, an increase of over £8 million on 1956, and the total assets of the Group, after deducting the Reserves for Depreciation of Investments, increased by £9,540,032, to an amount in excess of £100 million.

The Revenue Balance of £1,950,885, a decrease of £206,872 on the 1956 figure, added to the amount brought forward from the previous year, makes an available total of £3,061,286. Of this sum £441,915 has been allocated to Staff and Widows' Pension Funds, and £830,000 has been transferred to the Additional Reserves in the Accident and Fire Accounts, the respective Funds having thus been maintained at percentages of premium income approximating the 1956 ratios.

A final Dividend of 10½d. per 5s. Unit of Ordinary Stock is recommended, making a total Ordinary Dividend equivalent to 10s. as compared with 9s. for 1956 per £1 Unit of Ordinary Stock existing prior to the bonus issue recently made, and the balance to be carried forward will be £1,135,309.

PROFIT AND LOSS ACCOUNT

Gross Interest and Dividends have increased by £266,094, and transfers from the underwriting accounts were lower by £256,066. After deducting United Kingdom Taxes and Overseas Taxes not charged to other Accounts, amounting to the formidable figure of £1,290,672, the balance for the year is £1,950,885.

BALANCE SHEET

We can be proud to regard the attainment of total assets in excess of £100 million after an existence of no more than 72 years as an important milestone in the history of our progress. Investments at £85,358,954 are carried at or under cost less Reserves and the book values before deduction of Reserves were substantially below market values at December 31, 1957.

Though our profit margin is small indeed, we have strengthened our reserves and our financial position is stronger than ever. For these achievements, a high measure of credit is due to our Executives, Managements and Staffs in all parts of the world, who have given of their best wholeheartedly in service to our Companies and to the communities in which they carry out their duties.

THE HOFFMANN MANUFACTURING COMPANY

RECORD LEVEL OF TURNOVER

MR J. W. GARTON ON WELL BALANCED SPREAD OF TRADE

The annual general meeting of The Hoffmann Manufacturing Company Limited was held on May 1st in London, Mr J. W. Garton, JP (Chairman and Managing Director), presiding.

The following is an extract from his circulated statement:

The year under review was one of great activity and the recovery in the motor industry led to increased demands being made upon us.

The profit of the Hoffmann Group for 19[illegible] before taxation, but after all other charges including Debenture Interest, amounts to £1,291,746 and compares with £1,089,885 for the previous year. The net profit of the Group for the year 1957 after taxation is £647,026 and compares with £548,277 for 1956.

This successful result was achieved by the turnover for the year reaching a record level reflecting the increased productivity brought about by the new plant and machinery we have been installing over the last few years and new methods.

The Directors recommend a Final Dividend of 14 per cent, free of tax, which with the Interim Dividend already paid of 3½ per cent, free of tax, is an increase of 5 per cent free of tax, on last year.

Orders for capital commitments at December 31, 1957, amounted to £706,029. An appreciable portion of this sum is in connection with the purchase from the Government of a factory building which was erected several years ago and rented to us. We have in the Agreement an arrangement whereby we could purchase this property after five years and we now intend to exercise the option because its ownership, with the whole of its services, will materially help our development programme in that area, as it will automatically free us from certain obligations regarding the development of an adjacent piece of land.

The demand for certain sizes of bearings has been in excess of our availability to supply with our existing equipment, but we have now been able to purchase several large automatics and these are helping production of the sizes demanded; when these and others which we shall purchase during the present year, are in full operation we shall be able to increase our production appreciably and reduce costs.

Balance Sheet: The liquid resources at the end of the year totalled £2,714,137, which compares with £2,279,569 at December 31, 1956. The excess of current assets over current liabilities at the close of 1957 amounted to £3,873,883, compared with £3,359,078 at the close of 1956.

SUBSIDIARY AND ASSOCIATED COMPANIES

Hoffmann Gloucester Limited has again made a very valuable contribution to the Group turnover and has had a successful year.

Hoffmann Tweedales Limited, in which Hoffmann Gloucester Limited has a 50 per cent holding, continued to operate at a low

level of profit due to its reduced output, which reflects the lower demand for its products from the Textile Machinery trade at home and abroad and keener world competition.

With regard to the outlook for the future, I can say that the Company's plant is very well employed and our trade well balanced over many industries. There is a substantial order book, and although one begins to see a slight falling off in certain directions, particularly in the general engineering industry, there is no reason to suppose, unless anything unforeseen happens, that we should not have a reasonably successful year in front of us. The Company is well equipped to trade successfully in the much harder and more competitive times ahead.

The report and accounts were adopted.

THE KLABANG RUBBER COMPANY LIMITED

SIR JOHN BARLOW'S REVIEW

The Thirty-Eighth Annual General Meeting of the Company was held at Plantation House, 10/15 Mincing Lane, London, E.C.3, on Tuesday May 6th.

The following is an extract from the circulated review of the Chairman, Sir John D. Barlow, Bart, MP.

ACCOUNTS

The profit for 1957 was £19,236 and in addition £20,000 surplus tax provision is available for appropriation. Current taxation required £8,500. The allocation to Replanting Reserve was £17,000. The dividend of 7½ per cent required £8,625, leaving a carry forward of £19,262. As well as the dividend, a special distribution of 2½ per cent, exempt from tax, was paid from the Capital Realisation Surplus Account.

The output of rubber was 825,000 lb. With an all-in cost of 21½d. per lb, a profit of 2d. per lb was earned.

VISIT TO ESTATES

I visited the estates in November, 1957, and was impressed by the high standard of cultivation and by the substantial area of postwar rubber on Klabang Estate. Now that these replantings are coming into full bearing and with more intensive tapping of 400 acres of seedling rubber to be replanted shortly, the crop estimate for 1958 has been increased to 1,135,000 lb.

GENERAL

Malaya is now a self-governing independent Federation and the newest member of the Commonwealth. The "Merdeka" ceremonies and celebrations on August 31, 1957, took place with evident goodwill between the different communities. Malaya has started well in its new status. With peace and a thriving economy there is every prospect that Malayans will continue to enjoy the highest standard of living of any S.E. Asian people. Figures published by the United Nations show per capita income is twice that of Ceylon, and about three times that of Indonesia and five times that of Burma and India. All the Communities in Malaya—Malays, Chinese, Indians, Eurasians and Europeans—have their part to play in the development of a country, which is the same size as England and has a population of 6½ million.

During 1957 production and consumption of natural rubber were balanced at approximately 1,880,000 tons and production and consumption of synthetic rubber were evenly balanced at 1,262,500 tons. Estimates for 1958 show that production and consumption of natural and synthetic rubber will again be balanced, provided there is no steep decline in industrial activity throughout the world.

Events in the USA make it difficult to predict what the general level of business activity will be during 1958. Reduced output of cars and trucks in the USA, due to large stocks, will affect the consumption of all types of rubber; as 60 per cent of the world's natural and synthetic rubber goes into car and truck tyres. On the other hand Russia, China and other Asian Countries are buying increasing amounts of natural rubber each year, as their standard of living rises.

With the considerably increased crop, which it is hoped to harvest in 1958 at a lower cost than last year, we can look forward to a more satisfactory year's trading, providing the price of rubber remains near its present level.

The report and accounts were adopted.

THE SCOTTISH UNION AND NATIONAL INSURANCE COMPANY

MR JAMES A. LUMSDEN'S REVIEW

The One Hundred and Thirty-Third Annual General Meeting of The Scottish Union and National Insurance Company will be held in Edinburgh, on May 28, 1958.

The following is an extract from the Statement by the Chairman, Mr James A. Lumsden, MBE, circulated with the Report and Accounts for the year 1957:

The new life business completed, after deduction of reassurances, was more than £7,700,000, including a substantial increase in contracts effected within the provisions of the Finance Act, 1956, to provide pensions for self-employed persons. The Life and Annuity Funds have increased during the year by £1,798,576, and now amount to £25,391,317. The interim bonus rate has been increased from 42s. per cent to 47s. per cent, subject, as is customary, to review by the Directors.

The net premium income in the Fire Department amounted to £5,385,991, an increase of £105,090 compared with 1956. In Great Britain and in overseas territories, other than the United States and Canada, the premium income continued to advance and there was a marked improvement in the results compared with the previous year. The results in North America, like those of the insurance market as a whole, were again unfavourable, although in the United States the measures taken to improve the situation reduced the loss in that section of the account. After making provision for unexpired risks the underwriting loss of £40,763 was met by a transfer from the Profit and Loss Account.

The net premiums in the Accident and General Insurance Account increased by £229,852 to a total of £2,407,882. The general experience in this Account, apart from the Motor Section, was favourable with a steady advance in premiums and an overall profit. The Motor Section as a whole, although showing a better result than in the previous year, continued to be unprofitable especially in Canada where the experience was again unsatisfactory. An underwriting profit of £58,471 was transferred to the Profit and Loss Account, after making provision for unexpired risks of 50 per cent of the premium income.

In the Marine Department an increase took place in the premium income, but underwriting conditions continued to be difficult with extremely heavy claim settlements, and no transfer was made to the Profit and Loss Account.

The underwriting results as a whole showed an overall improvement of approximately £218,000 compared with those of the previous year.

The past year has been marked by a further increase in interest rates and the gross yield from the Life Fund investments was £5 15s. per cent, nearly 5s. per cent higher than the previous year. The rise in interest rates was, however, accompanied by a substantial fall in the market value of the Stock Exchange investments in the Fund, and the sum of £250,000 was transferred from the Fund to the Investment Reserve. Higher interest rates were also obtained on the General Department Funds and, despite the fall in the value of Stock Exchange Investments, the aggregate market value of these Funds was, at December 31, 1957, in excess of the Balance Sheet values.

The Directors recommend a dividend of 2s. on the "A" shares and 4s. on the Ordinary shares, the same as for the previous year.

The Chairman paid tribute to all the officials and members of the staff at home and overseas who have given wholehearted service to the Company during the past year and to all members of local boards and agents at home and abroad who have continued to give the Company their valuable support.

ABERDARE CABLES (HOLDINGS)

FULL ORDER BOOKS

The twenty-second ordinary general meeting of Aberdare Cables (Holdings) Limited was held on April 25th in London. Sir John Pascoe (the chairman) presided and said: The accounts for the year show profits before taxation of £608,795 as compared with £590,688 for the year ended October 31, 1956, the corresponding figures after taxation being £262,583 as against £253,113.

Aberdare Cables Limited: The amount of cable manufactured was slightly in excess of that for the previous year and we have maintained our proportion of the export trade.

South Wales Switchgear Limited: The year under review has been one of continued expansion. New records have been established in the number and value of orders received, output achieved, and work in hand. The outstanding feature is the extensive demand for our new products, particularly the outdoor 33,000-volt Package Station Metal-clad Switchgear.

Aberdare Engineering Limited: The specialised products of our Associated Companies have provided an excellent "base-load" during the year, but new developments now in progress should prove satisfactory additions to our extensive manufactures. We commence the current year with a satisfactory backlog of orders.

With full order books and loyal, keen, and efficient staff we have reason to anticipate that the present year will be as satisfactory as the two previous years.

The report was adopted and a resolution changing the name of the company to Aberdare Holdings Limited was passed.

TIMOTHY WHITES & TAYLORS LTD.

942 BRANCHES THROUGHOUT GREAT BRITAIN

Extracts from Mr. G. I. RUSHTON'S STATEMENT AT ANNUAL GENERAL MEETING, 1st MAY, 1958

SATISFACTORY TRADING RESULT. The Trading Profit of the Group amounted to £1,745,362 in 1957 compared with £1,670,631 in 1956.

TRANSFERS TO RESERVES. £211,522 to General Reserve bringing to £600,000 in the Company's Balance Sheet and to £733,628 in the Consolidated Balance Sheet. £50,000 to Development Reserve, bringing to £235,987 after providing £67,995 to meet the cost of Goodwill and other charges in connection with the expansion programme.

DIVIDENDS. Final dividend on the Ordinary Share Capital of 10 per cent. less tax, making 16⅔ per cent. less tax for the year, which is the same amount as the previous year.

EXPANSION PROGRAMME. During the year, ten additional branches have been established and further branches have been enlarged and refitted. A further twenty branches, mostly small chemist shops, have been closed.

PENSION SCHEME. From the 1st June, 1958, the Pension Scheme will be non-contributory. Present members will be transferred to the new Pension Fund and will receive similar benefits on retirement as under the old scheme.

PROSPECTS FOR CURRENT YEAR. In the early part of 1958 there has again been an upward movement in the sales of the Company and its Subsidiaries, but expenses including salaries and wages are still showing an increase.

GEORGE MALLINSON AND SONS LIMITED

CAPITALISATION OF RESERVES

The twenty-first annual general meet of George Mallinson and Sons Ltd., held on May 8th in London, Mr Dy Mallinson, chairman, presiding.

The following is an extract from his c culated statement: The accounts show a profit (after making full provision for ta tion) of £123,673, an increase of £530 the previous year.

The plant and equipment has been ma tained in good order.

Liquid assets exceed current liabilities £962,012 (an increase of £30,357), and directors recommend a final dividend of per cent, making a total of 40 per cent.

Further new machinery has been install and the extra depreciation allowed for.

Sales and production have been maintain at approximately the same level as last ye and at present we have orders on our bo which will keep us fully occupied for so months, but in view of the economic sit tion both at home and abroad, we loo to the immediate future with caution.

At an extraordinary general meeting, h immediately after the annual general meeting you will be asked to approve an increas the authorised ordinary capital of your co pany and at the same time approve t capitalisation of £250,000 of reserves.

The report was adopted and the propos capitalisation of £250,000 of reserves for th purpose of paying up in full 1 million ne Ordinary shares of 5s. each to be distribute to the holders in the proportion of one ne share for every share held, was approved.

BUSINESS AND PERSONAL

A NEW SERVICE FOR INDUSTRY

To meet the changing requirements of industry in the European Common Market, and free trade zone, a large and well-established *engineering group in the London area* offers a complete consultancy service to firms who may be faced with increasing development and marketing difficulties. Having ourselves been faced with the necessity of providing facilities for market research, design, development, model shop, tool making, type testing, etc., we are able to offer a complete consultancy service backed by all necessary *engineering and marketing facilities* to assist firms requiring it, and we work closely with American Associates specialising in placing U.S. patents in this country and can, therefore, help in finding new production items. This offer is primarily directed towards firms requiring it for a limited period in order to find new lines and develop them to pilot production state. The total available capacity of this service is estimated at £250,000 per annum, of which approximately £100,000 will become available to firms outside the organisation, in whatever *amounts are required. Principals* please write to Box No. 891. All correspondence will be treated as strictly confidential.

THE Directors of the Maritime Insurance Co., Ltd., announce with pleasure that Mr. Patrick J. Oliphant, Deputy Chairman of the Scottish Union and National Insurance Company, has accepted their invitation to join the Board of the Company, with effect from April 25, 1958

APPOINTMENTS

MULLARD LIMITED

GOVERNMENT AND INDUSTRIAL VALVE DIVISION

SALES MANAGER

A vacancy exists for a Sales Manager in the above division required as a result of the expansion of business in electronic valves of all descriptions for Industrial and Government purposes.

The Sales Manager will be responsible for general sales promotion and will have charge of suitable supply and sales organisations.

Applicants should be between the age of 35 and 45 and should have *held a responsible post* for at least 5 years, with a successful record in sales operations, preferably in the electronic or allied industry.

An arts or engineering degree is desirable but not essential.

Applications in writing should be sent in the first instance, to the *Personnel Officer*, Mullard House, Torrington Place, London, W.C.1.

ECONOMIC INTELLIGENCE DEPARTMENT:

PRUDENTIAL ASSURANCE CO., LTD.

There are two vacancies in this growing department. Applications will be considered from men who have graduated with a good degree in economics, or who expect to obtain such a degree this summer. The work will be largely concerned with forecasting *economic* developments and their impact on investment policy in Britain and the *rest* of the Commonwealth.

The initial remuneration offered is about £650 per annum for men graduating this summer and there is considerable scope for advancement. For men already possessing a degree the initial salary will depend on qualifications and experience. *Applicants* should write in the first instance to the Staff Controller, Prudential Assurance Co., Ltd., 142, Holborn Bars, E.C.1.

THE MANCHESTER CHAMBER OF COMMERCE invites applications for the position of a Deputy Secretary. Prospect of assuming Secretaryship in few years' time. Experience in trade organisational work, or in commerce and industry, with professional (preferably legal) qualifications an advantage.—Full details, including education, business experience and salary expected, in confidence, to President, Manchester Chamber of Commerce, P.O. Box 569, Manchester, 2.

FEDERATION OF BRITISH INDUSTRIES. Assistant required for Europe and Middle East Department, age 25/32. University graduate preferred, with some practical export experience of these markets and knowledge of one or two languages. Starting salary £800/£1,000 *per annum* according to qualifications and experience. Position pensionable subject to satisfactory health and probation period.—Applications, marked "Assistant," to Federation of British Industries, European Department, 21, Tothill Street, S.W.1.

NORTHAMPTON

COLLEGE OF ADVANCED TECHNOLOGY, LONDON

The College is one of the eight Colleges of Advanced Technology. It is concerned with full-time Degree, Sandwich Diploma in Technology and Advanced courses in engineering and applied science.

Applications are *invited for* a LECTURER who will take part in the development of LIBERAL STUDIES activity within the college. Candidates should be graduates and should offer one or more of the following subjects : *Social* Philosophy ; Political Sociology ; Economics ; International Relations. Industrial experience and/or journalistic experience will be an added recommendation. *Experience* in organising and handling discussion groups at both under-graduate and adult level will be particularly useful.

The initial salary will be *determined by qualifications* and experience. Salary scale : £1,236 x £30—£1,398 per annum.

Further particulars and forms of application obtainable from the Secretary, Northampton College of Advanced Technology, St. John Street, London, E.C.1.

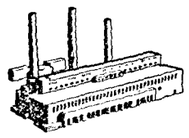
VOLUME CLXXXVII · NUMBER 5986

All is not Game in East Africa

There was a time when elephant ivory was the only major export from East Africa. Today the £177,000 earned annually by ivory pales into insignificance compared with the £38,600,000 which in 1956 came from coffee or the £27,600,000 from cotton. The grand total earned by all exports during 1956 from the three mainland territories of East Africa—Kenya, Uganda and Tanganyika—was £114,200,000.

The day is long past, too, when the imports to the territories amounted to no more than could be carried as head loads by the porters accompanying traders on their up-country safaris from the coast. In 1956 East Africa spent £133,800,000 in the markets of the world, and more and more manufacturers of consumer goods are setting up factories in East Africa to meet the growing demand, coming largely from the 20 million African population, which is taking an increasing part in the new developments.

And just as the East African Railways and Harbours serves the export and import trade at the ports and along 12,000 miles of rail, road and inland water services, so it is serving these new industries by taking an active part in the establishment of industrial areas and in providing them with the necessary sidings and transport facilities.



For details of these industrial areas, and of other business opportunities in East Africa, write to the Commissioner, East African Office, Grand Buildings, Trafalgar Square, London, W.C.2.

A worry shared is a worry halved—
Aunt Amelia is always happy to try and solve those little problems which responsibility brings in its train . . .

AUNT AMELIA'S COLUMN

For men at the top

Dear Aunt Amelia,

I am thinking of resigning my Directorship because my Private Secretary is making life quite impossible. She rushes and fusses around, organising everything so efficiently that I am idle half the day. I can't make a move without her knowing it and this constant spoon-feeding is sapping my initiative. But I can't dismiss her because she has been so good to me in the past. Please help me.

Signed: "WORRIED, WALSALL"

Dear "Worried, Walsall",

I do appreciate your problem. We women just can't help being maternal, can we! What you really want is some way to by-pass your Private Secretary without making her feel unwanted. I think the answer is to install a *Private Internal Telephone System*. With this you can call up any member of your staff, at any time and your secretary need never know. A few weeks should see you firmly in the saddle again!

If you care to write to the organisation whose address is given below, they will send you some literature which will help you a great deal in your problem.

SO MUCH MORE
in mileage, silence and grip.

SO MUCH MORE
in cornering stability, even wear and comfortable riding.

SO MUCH MORE
in all round value.

That is why it was immediately fitted as standard equipment by the majority of British motor car manufacturers.

Walpamur quality paints

Pride of achievement, far from being a declining virtue, is much in evidence at Walpamur Works, Darwen and is reflected in the range of paints, enamels, industrial finishes and varnishes of superlative quality produced by The Walpamur Company Limited for every conceivable need. Meticulous care exercised by craftsmen at every stage of manufacture ensures the maintenance of this high quality which has earned for the Walpamur range an international reputation as the standard by which others are judged.

Not just another Internal Telephone

... but the finest and most comprehensive Internal communication system available to industry today.

The TR Internal Communication System provides for every contingency. The flick of a key connects you with the office of the person you want to speak to. If he is not there, the flick of another key (or dialling) connects you with the speakers, and you can broadcast a message for him to ring you from wherever he may be —or you can indicate an immediate course of action for him to take.

Everybody's time is saved in this way, and money is saved on trunk calls and "calling back".

A TR Internal Communication System is a necessity today in Organisations of every size and we shall therefore be glad to send you details or arrange a consultation to discuss the most suitable type of installation for YOUR business. Write today.

Telephone Rentals
LIMITED
OPERATING TR SERVICES

All TR equipment is installed and maintained under guarantee, on a rental basis, and is an allowable business expenditure for tax purposes.

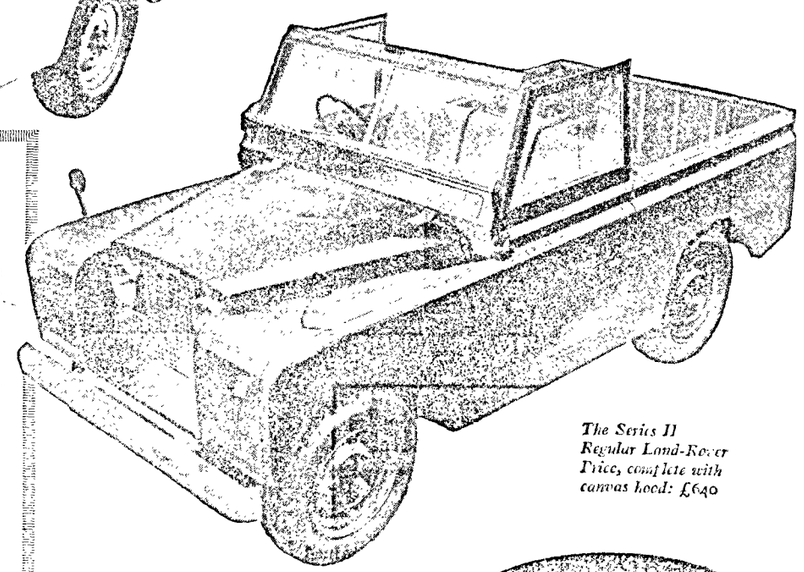
Two new LAND-ROVERS consolidate a 10-year lead

By Appointment to Her Majesty Queen Elizabeth II Manufacturers of Land-Rovers. The Rover Co. Ltd.



Series II models introduce:

better looks... higher performance ... easier handling... greater comfort

The Series II Long Land-Rover Price as shown: £730

During the past 10 years, 4-wheel drive Land-Rovers have won an unrivalled reputation for toughness and reliability. Year by year, there have been modifications and improvements and today, more than 200,000 are in service around the world. Now come the Series II Land-Rovers to consolidate Rover's 10-year lead in the design of go-anywhere vehicles. Both regular and long wheelbase models are now built to the new specification and are available with petrol or diesel engines.

The Series II Regular Land-Rover Price, complete with canvas hood: £640

Important new features

★ The bodies of both models have new lines—smoother, more flowing, easier to keep clean. The successful corrosion-proof alloy bodywork is continued.

★ The long-wheelbase model now has a 2¼ litre, 77 b.h.p. engine for still more impressive performance and a new cab with big rear windows.

★ Deeper, softer seats and squabs on both models give extra comfort, while improved suspension also helps to ensure smoother riding, both on the road and across country.

★ The new designs permit smaller turning circles for extra manœuvrability.

★ Easier bonnet opening is provided by single bonnet catches as fitted to Rover cars, while tail-board fastening is also simplified.

★ Both models are now available in a range of 6 attractive colours—bronze green, light green, fawn, dark grey, light grey and marine blue.

There's no substitute for the 4-wheel drive PETROL or DIESEL

Peace Through Some Inflation?

It is not yet known whether the National Union of Railwaymen is really going to be so silly as to call a strike against the proposals which Sir Brian Robertson has put to it this week. But what can already be seen is that the proposals themselves, to which the Cabinet so artlessly gave the nod last Monday, represent for the country a partial economic defeat.

To say this will not be popular. It is customary to acclaim pieces of paper with which politicians seek to secure peace with honour (with just a little more inflation) in our time. And the railway settlement devised this year, let it be said straightaway, does contain rather more honour and rather less inflation than settlements in previous years. It may therefore seem finicky to insist that this is a sign of how bad were the previous years' forced settlements rather than of how good this one is. But in economic, as in military, affairs it is never wise to be hypocritical about the nature of tactical retreats. To march forward towards one's basic objective is one thing; to turn away from it in a less degree of disarray than when one has turned away from it before is another.

The basic objective for the welfare of the British people at the start of this year's railway wage dispute was simple. Because the railways are in deficit, the best interests of the country would have been served if railwaymen had got no increase in wages at all this year. The most economic outcome would have been for this industry in deficit to fix all its attention on getting out of deficit again—to introduce all possible economies, and to refuse to increase any cost (wage costs, salary costs or any other) until the railways were once more showing a profit. This idea that there should have been a standstill in railway wages this year is not an extreme view thought up, for cussedness's sake, by some impossibly academic reactionary; it is the course that anybody who was unacquainted with the twisted economics of Britain in these postwar years would assume to be the normal course for any industry in deficit. It is also, in effect, the course that was recommended to the British Transport Commission by the majority of the railway wage tribunal last month.

Because the attitude to ordinary economic commonsense in postwar Britain is so very peculiar, the authorities had, even before last Tuesday, already recoiled some way from this pure milk of virtue. They had done so by two steps. First, although the railways were already supposed to be making the maximum possible (£15 million) of economies this year, the authorities decided that there were, after all, another £10 million of economies which could be made; once these were fully in effect, they would suffice to raise the men's wages by 3 per cent, and it was decided that the whole of this sum should be devoted to that purpose and regarded as a saving made possible by increases in the men's productivity. Since not all these economies depended upon union co-operation (c.f. some of those arising from the Government's speeding-up of the investment pro-

gramme and its assumption of responsibility for bridges and crossings), this formula already implied an odd evaluation of what is a management's job ; but one thing could perhaps be said for it. As the scaling down and technical improvement of this antiquated and over-expanded railway industry is the most essential national need, it may at any rate be better that more economies should be made in order to pay more to the men than that nobody should bother to make more economies for any purpose at all.

The second stage of the tactical retreat, however, was much bigger. By last week Sir Brian Robertson had already promised to give the railwaymen some increase next October, even if—as may well happen as freight loadings fall off—the railway deficit is by then bigger than ever. This was the promise that should never have been made. Up to this moment, although the authorities were showing some willingness to buy off the strike, they were at least intent on buying something hard (union co-operation in accepting redundancies and other economies) with it. Now they were offering to pay for that something in advance, and obviously not on a cash or return basis. Once the offer had been made, the terms on which a settlement might be reached without a strike apparently became clear. It looked as if the leaders of the two smaller unions would accept the 3 per cent offer if it were advanced to the end of June ; Mr Greene, of the bigger National Union of Railwaymen, who had a provisional strike notice dated June 1st in his pocket, was committed to demand an immediate increase—but it seemed unlikely that he would really call a go-it-alone strike to try to get these few extra shillings four weeks earlier. To bring the wage offer forward from October to the end of June would require a once-for-all sum of another £2½ million.

THIS was the state of affairs when the Cabinet met to consider such further concessions on Monday. Not surprisingly, in view of the retreat already made, it decided that another £2½ million of economies ought to be squeezable somehow. The result of its deliberations was Mr Watkinson's letter to Sir Brian Robertson, surely one of the most disingenuous letters in industrial history. Mr Watkinson said sternly that he would tip Sir Brian no more money, but anybody who reads that letter can see that he was also tipping him a wink.

The wink was that Sir Brian should try to reach a settlement with the unions, on the basis of an end-June settlement, but that he would be very unpopular if this settlement was pressed past one hazily-defined and two very real points of objection. The hazily-defined objection was that the railway deficit should not be widened. There is a certain element of bluff in this. Not too much credence should be placed on present brave statements that the test of the offer will be whether the promised economies are really carried out. These economies are like the £100 million of cuts in Government expenditure which Mr Macmillan promised in his budget two years ago ; in the year for which they were promised Government expenditure in fact exceeded estimates by £150 million, but the new Chancellor then said (possibly rightly) that it would have exceeded them by £250 million if the promise had not been made. In practice, everybody knows that if the railway deficit does still widen, because of a fall in freight demand or even because of a failure of the listed economies to materialise up to the best paper hopes, then Sir Brian by next year will still be forgiven—provided that the settlement he tries to reach has not run beyond the other two red lights.

The first of these, which no doubt worried the Cabinet most this week, was that the commission's wage offer must not look like a pure give-away, not only to restless Tory backbenchers (who do not very much matter), but to potential domestic and foreign bears of the pound (who matter very much indeed). The second essential was that the commission's new and rather more inflationary offer to the railwaymen must on no account be such as to make it inevitable that new and more inflationary offers should also be made to other unions in dispute—and particularly, of course, to the striking London busmen.

HOW far have these limits really been overrun already ? The answer, no doubt, is that more emollience has now been shown for prudence. Quite clearly, in view of the proposed settlement's wider effects, there can be no question at all of going further than Tuesday's published offer ; if the NUR will not accept it, then it will be necessary to face their lonely strike. But, on the assumption that this is to be the limit of the retreat, the country can now perhaps count some small mercies.

There are two hopeful features in this settlement which have not been part of earlier annual retreats before union threats. One is that the settlement, however strange the story of its negotiation, is tied more firmly to the idea that an attempt to increase productivity should be an adjunct to any decision to raise wages. It would, of course, be vastly better if the adjunct were a precursor. And the importance of what has been done will largely depend on a not easily forecastable question of psychology : on whether the ordinary man comes to regard the productivity clauses attached to the 3 per cent agreement as an essential condition of it or merely as so much guff. The most immediately important ordinary man may very well be Lord Justice Morris, whose arbitration award on the claim of the coal miners is expected shortly. If he now awards a straight and unconditional 3 per cent increase to the workers in this other nationalised industry, which is also faced by currently falling demand, then all that most people will assume to have resulted from this year's manœuvring is a 3 per cent wage inflation instead of last year's 5 per cent one.

The second point, however, is that even if the 3 per ent standard did become undesirably general, the British economy would still have got away this year with a level of wage increases which, for the first time, would possibly be borne without price inflation once ndustrial expansion is resumed. The misfortune is hat these increases are being granted, in industries n deficit, at a time when expansion has not yet been esumed. The opportunity of making this most favourably-placed of all years the one in which to break the wage-price spiral has therefore not been resolutely eized. That may mean that when expansion starts again the union leaders may think that they should again be given much more than 3 per cent each year—and that by threats of strike they can get it. But perhaps—and this may be the one gain from 1958—their presumption will not be quite so automatic: Mr Cousins, for one, may emerge from this year with slightly less confidence in the efficacy of the strike weapon as the ultimate deterrent. It may be a matter for note, where trade union leaders gather, that although soft words about productivity have now buttered some parsnips on the railways, hard deeds on the buses are still breaking no bones.

The Challenge from Algiers

The parliamentarians of the Fourth Republic are closing their ranks in the face of danger; but the trial of strength may only be beginning

THE French Republic has come face to face with its long-awaited vital test ; and, as is the way with such tests, what was long expected has come suddenly with the shock of surprise. On Tuesday night the Assembly was moving towards an orderly, indeed routine, conclusion to a conventional Paris government crisis, when the news from Algiers put the questions: was the capital in Paris, or in Algiers ? Did the Republic, or its generals, rule ? The alliance of settlers and paratroopers did not merely refuse obedience to Paris, it sought to tell the President of the Republic and the National Assembly what sort of government they should choose.

M. Pflimlin's parliamentary day had begun quietly at 3 o'clock in the afternoon, when the 51-year-old Alsatian leader of the MRP (Christian Democrats) climbed the rostrum to present the programme of his prospective government and to ask for the vote of investiture. His programme differed from the programmes of his recent predecessors only in the suggestion that it contained a possible cautious shift in Algerian policy. Because the withdrawal of the socialists from the government meant the departure of M. Lacoste from his ministerial office in Algiers, such a change was in the air. M. Pflimlin's reputation as the supporter of a liberal solution pointed in the same direction ; but he was measuring his words now so as not to give offence. While he did not exclude the use of the good offices of Morocco and Tunisia, he also proclaimed that France would fight until victory. In any case, the presence of the conservative ministers in his cabinet was a guarantee that there would be no abrupt change of direction, and so the debate at first proceeded in wholly conventional fashion, with a long list of orators and numerous breaks to enable the parties to make up their minds. When the Assembly suspended its session for dinner, all still seemed normal. Only the helmeted policemen massed outside the Palais Bourbon, and the lorries blocking the bridge from the Concorde, showed that trouble had been expected.

There had indeed been a little trouble in the Paris streets, but it was under control ; in Algiers on the same afternoon it was out of hand. There the French settlers had felt the sense of power since the day in 1956 when M. Mollet gave way to their clamour in the streets of Algiers. Now seemed the time to use that power. Their conviction had never been shaken that a compromise in North Africa was intolerable and that, in resisting it, they had nothing to lose ; and they could rely, they calculated, on the backing of frustrated and discontented troops. After they had stormed the building of the government-general, the news came that the troops had joined in, and that the paratrooper General Massu was head of a newly formed Committee of Public Safety.

This mixed body of soldiers and civilians at once sent a message to President Coty demanding that a similar "government of public safety" be formed in Paris. The pronunciamento had come. But the deputies in the Palais Bourbon went on for a time as if nothing had happened. To observe their procedure was like watching a ball through glass, without hearing the music. Then a communist deputy broke the pretence and sounded the alarm. He urged, amid uproar, that all republicans should unite in face of a common danger. M. Pflimlin jumped up to reject the communist offer ; the Assembly, he said, would live up to its grave duties.

The make-believe over, the tension rose as the scene shifted between the seats of the Assembly, the

government, and the presidency of the republic. Reports of numerous arrests of right-wing extremists in Paris showed that, in the government's belief, the rising was not entirely spontaneous. Parliament had reached the point where it must close its ranks, or disintegrate, and its reaction was to close its ranks. The parliamentary defence reflexes were set in motion; socialists, radicals and fellow-catholics assured M. Pflimlin of their support and urged him to persist in his bid for office. He did not hide the gravity of the situation; accusing some of the military leaders of insurrection, he said that France was on the brink of civil war. The communists decided that, though they could not vote for a man determined to carry on the war in Algeria, in the circumstances they should abstain. This left the vote no longer in doubt; M. Pflimlin received the investiture by 274 votes to 129 with 137 abstentions; that is, he might have won even against communist opposition. France had a government again, but the question to be answered was what authority it possessed. It has still to be answered.

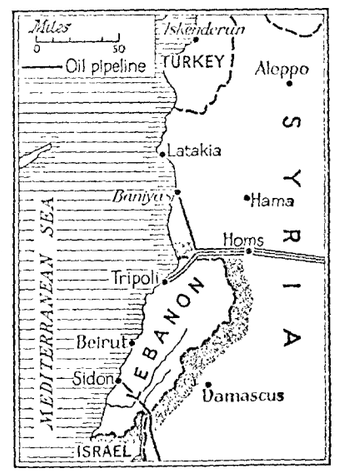
BEHIND the uncertainties of the new government was ample ground for misgiving about the future of French policy in North Africa, and therefore of the western position in the Mediterranean. The settlers and the soldiers had chosen to precipitate the crisis on the mere ground that a prospective new government was suspected, without any very solid evidence, of a more flexible approach to North African problems. What, then, would happen if a French government were indeed to come to the point and make a real attempt at negotiation? Successive French governments for years past have been led by fear of just such an explosion to pass by any opportunities for peaceful settlement or any hope of capturing Moslem opinion. And the effects of these successive refusals reinforced the settlers' intransigence and burdened France with a discontented army of a dangerous size. If civilian authority were to capitulate in the face of the present open challenge—and there are many ways of giving in, with many nuances—then more juntas, more pronunciamentos, and more vetoes upon France's policies would have to be expected. The trial of strength may only have begun.

By Wednesday it seemed that a clear answer would be given to the question: who governs France? President Coty's message to the troops and M. Pflimlin's to the population were being broadcast every hour to the tune of the Marseillaise. It all sounded solemn and serious. By evening there were signs that the insurgents, having over-reached themselves, were climbing down. General Massu, only a day after he had sent the President an ultimatum, was now declaring himself no more than a guardian of order. Reliable reports from Algiers indicated that the military and civilian members of the committee were at odds.

But with events appearing to come within its grasp, Paris may once again be drifting into a compromise

solution which, while it wears the trimmings of succes may contain the seeds of defeat. M. Pflimlin took th decision to widen his government, offering one of th posts of deputy prime minister to M. Pinay, a conserva tive, and another to the socialist M. Mollet. Thi could be pretty close to the government of public safet that the insurgents had demanded. Their hostility t M. Pflimlin was due to fear that he would chang French policy in Algeria. What is formed as a govern ment of national union may be in effect no more tha a wide coalition based on compromise from whic no real change of policy can be expected. The othe fear which roused the Algerian settlers had been tha once out of office, the socialists would rapidly dro the bankrupt policy of which M. Lacoste has been th symbol and upholder in Algiers. But now there wer even rumours (since contradicted) that he might b given a seat in the government. No wonder the cynic are beginning to say that it will all end with anothe medal for Massu.

At the time this is written it is not yet clear wha will emerge from it all, and it would be unfair t M. Pflimlin, who stood so stoutly firm during the nigh of crisis, to prejudge what he will do. All that can b said is that, if the government does not assert it authority now, it will have missed a historic opportunity This week's events could even be made to serve a use ful purpose: is it to be woe to the republic that let its generals cross the Rubicon, or woe to the general who cross? Exemplary measures now might restor some discipline into the forces; but is the Republi strong enough to take them? Certainly it cannot b wholly safe as long as the Algerian war continues t keep the army too big for its boots. But there, too a chance waits to be seized. The rebellious settler in Algeria have not received the support in France or which they evidently counted. In fact, the ostentatior of their defiance has cost them a lot of sympathy. The new government could, therefore, be better placed than its predecessors to carry out the reforms in Algeria which have been prevented, or rendered ineffective, in the past by fear of Algiers. Resolute reforms, if they were sensibly supplemented by the good offices of Tunisia and Morocco, might even now lead to a peaceful solution. Some currents of opinion, an article on page 604 suggests, have been running in that direction.



The cost of hesitation and weakness, on the other hand, will be incalculable. Leniency will encourage more insubordination. More concessions to the Algerian settlers will substantiate their belief that they have the right, and the power, of veto on the composition and policy of the government. The authority of the state will be further undermined. The seeds of rebellion can cross the Mediterranean. It is no accident that the figure of General de Gaulle suddenly stands out again. On Thursday he broke his long silence with a terse declaration of his readiness to assume power. With the soldiers in Algiers now calling for De Gaulle, M. Pflimlin cannot but know that these days are decisive.

Lebanon Seeks an Identity

The need is plain now for the West to come to erms with Arab nationalism even in what has ong been regarded as the safest island of western nfluence in the Middle East

ARAB nationalism has returned to Lebanon to overturn its cradle. It is a long time, and Arab politics have come a long way, since small groups of Beirut university students met secretly to plot independence from the Turks, and since an "Arab" was a nomad of the desert beyond Mount Hermon.

This week's uprisings in Lebanon, set off by the murder of a left-wing newspaper editor, are a further explosion of the spirit released by the Egyptian revolution in 1952. They show clearly how unrewarding it is for the West to found its relations with the Middle East on any concept of a special preserve. The insurrection underlines again the need to recognise that the Arab world is becoming more and more of a whole, no matter how many blocks and how many fence-sitters there may be at the moment.

The rioting and discontent in Lebanon cannot be dismissed solely as the work of agents from Syria and Egypt, however insidious and active. The mountain borders are always open to Syrian infiltration; it is not surprising that Lebanese sympathisers are guiding armed Syrians along tracks ordinarily used by less dangerous smugglers. But to present these events only as a take-over bid by Russian-backed President Nasser—whose henchmen are no doubt busily, and dangerously, fishing in the troubled waters—is to miss altogether the indigenous source of the troubles. A great many Lebanese sincerely feel the need to be identified with the world, the Arab world, in which they live. They may be proud of their veneer of western sophistication, and they certainly regard Syrians and Egyptians as less civilised than themselves; but the time has come when a surprisingly large number of them are ready to trade much for Arabhood.

Since the war, and particularly since the burning of Cairo in the Black Saturday riots of 1952, Beirut has enjoyed uninterrupted growth as the commercial centre of the Middle East. It has offered safety, good communications, and tolerance to foreign business and business men. There is no reason to believe that its hospitality to foreigners need necessarily be changed if it became more closely identified with Arab nationalism on its own terms. Much will depend upon how and under whose pressure, or counter-pressure, the closer identification comes. The diversion of the flow of oil from Tripoli to Baniyas, in Syria, because of sabotage in Lebanon can only remind oil men that their thin lines to the Mediterranean are always vulnerable. The oil industry has often been so reminded, above all at the time of the war in Palestine and during the Suez crisis, but the endless haggling over transit fees has mistakenly led the outside world to believe still that, among Arabs, oil is thicker than blood.

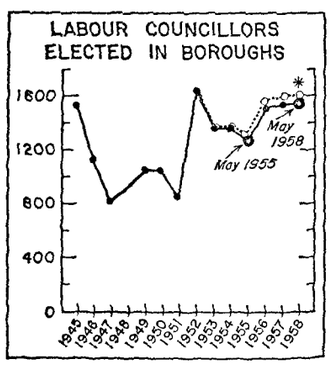
Large sums in American aid have failed to win over the Lebanese because, as they believe, the spirit in which it is given and the spirit of Arab nationalism run opposite ways. By seeming to separate the Lebanese from the prevailing political current, United States policy has made them self-conscious. President Chamoun's fall from public favour really began when he accepted the Eisenhower doctrine, which the other members of the Arab League rejected. In the past it has been easy to dismiss the claims of the opposition leaders in Lebanon and the actions of the excited mobs of Tripoli as mere expressions of political opportunism. Many Lebanese, both Moslem and Christian, are genuinely pro-French, pro-British, or pro-American. It is the historic fear of the Christian Lebanese that they may be swallowed up by the great horde of Moslem Arabs, not only in Lebanon but in the mountains and deserts beyond. Mr Chamoun and his foreign minister, Dr Malik, have tried to win public opinion to their side by promises of prompt and dramatic results from American aid. From a Western point of view this policy may have seemed to make good sense. But Lebanon is still an Arab country; it is in the Middle East, and its people feel the compulsion to behave as a Middle Eastern state on the 1958 model: that is, their political behaviour must be of a kind that Arab neighbours will find acceptable. Too tame a loyalty to the West does not today meet that prescription.

President Chamoun will now have to give up his intention to seek the constitutional amendment which would assure him of a second term. He may even have to leave office without waiting for his first term to end. His usefulness as an honest broker between the forces of Arab nationalism and the West is evidently greatly diminished now that he can rule his country only as a police state, if at all. A possible successor as president of the republic is General Shihab, the chief of staff of the armed forces and former

minister of defence. General Shihab has never been involved in the excitements of Lebanese politics: members of his family have discreetly mentioned his name in the right places during the past few months, and he probably enjoys more personal prestige than anyone in Lebanon today. There is also the possibility that the former president, Shaikh Bishara al-Khoury, may be called in to take over once more; his graft-ridden administration came to an abrupt end in 1952, when he resigned and President Chamoun was elected. For the moment, however, General Shihab is responsible for maintaining enough security for President Chamoun to stay in office; and Shaikh Bishara bides his time in a villa by the Mediterranean.

How will Lebanon find the identity it seeks, without courting still larger perils than its present troubles? In can become, like Syria, a province of the United Arab Republic; it can become an associate member like Yemen, retaining some of its independence; it can try, if it is allowed, to remain independent while hoping to preserve its attachment to the West; or it can really become neutral. Much plainly depends on the real desires, and designs, of its neighbours. But if the Lebanese can indeed make their peace with Arab nationalism, both at home and on their borders, they will find that they have most to gain by becoming a genuinely neutral country.

This would make calls, in turn, upon the desires and designs of the statesmen of the West. It would mean that the tiny state would have to steer clear of the dangerous waters of international politics; and its harbours and airfields would become less hospitable to foreign naval and military units. The value of Lebanon to the rest of the world lies in the freedom of trade and finance that it can offer, and can still hope to offer, in a region where such freedoms are none too common. The Lebanese, in their calmer moments, often refer to their country as the Switzerland of the Middle East; it takes more than scenery to make a Switzerland.



NOTES OF THE WEEK

PUBLIC OPINION

Swing to Conservative

Last week, when the results of the Scottish and of the first few English urban council elections were trickling in, *The Economist* noted that the initial swing to Labour in them seemed to be less than one had expected after last month's county elections; but we said carefully that these urban "results are always very difficult to analyse," and that the borough elections (where the Rent Act was expected to be important) would show the real trend. It is now quite clear that what we were doing last week was to treat too cautiously the first evidence that was appearing before everybody's eyes of a large—and to us quite unexpected—swing of opinion back to the Conservatives compared with a month ago. This sin of omission is perhaps mitigated by the fact that, in the general muddle caused by the comparison of net Labour gains with the equivalent borough and urban elections in 1955, most of the national press—and the politicians themselves—do not seem to have realised the fact of this swing even yet.

It may, of course, have been a temporary swing; but it was also a quite unmistakable one. In last month's county elections, Labour had secured considerably more seats than in its previous peak local elections year of 1952; last week, in both the boroughs and the urban districts, it secured considerably less. The borough results are discussed in some detail on page 579, but the accompanying chart shows them in the most convenient nutshell. In most of these English and Welsh boroughs each ward has three councillors, one of whom is re-elected every year; it is therefore possible to show the approximate change in the number of seats won by Labour each year. The chart shows that the number of seats Labour won last week was no greater than in these same borough elections a year ago. They were still, of course, greater than in the general election year of 1955—and, in fact, than in any year except 1952—but the year-to-year fluctuations in mood which the chart also shows to occur are a sign that the Conservatives need not regard the next general election as by any means a lost cause yet.

* Dotted line includes seats won in new boroughs.

The main reason for last week's surprising Conservative come-back was that, in several places where direct comparisons can be made with the county elections a month ago, anything up to 40 per cent more Tories turned out to vote. The most obvious explanation of this higher turn-out would be that some Tories who until recently were feeling apathetic were now eager to demonstrate that they are feeling cross with the trade unions. This recovery may not have been due to the conversion of any marginal voters, so much as to an uprising of the former Tory faithful, tramping out to vote in the support of their class. Yet it remains surprising that Conservative propagandists, in their present

extremity, have not this week produced more equivalents of the mad Scotswoman of Lucknow: the lady who, it will be recalled, made an excited stir on the walls of that besieged fortress by claiming loudly—and as it happened rightly—that she could hear the first faint skirl of the pipes from the distant relieving columns. Dinna ye hear them? Dinna ye hear them? The abstaining majors are marching home.

Islington Next Stop

Not many abstaining majors live in the rather slummy London district of North Islington, which was holding a parliamentary by-election on Thursday. But as the boundaries of the parliamentary constituency are the same as those of the LCC constituency, the election here will provide a quick test of by how far (if at all) public opinion in London has swung back since Labour's triumph in the county elections a month ago—and since the bus strike started. The percentage votes in the last three elections at North Islington have been:

	Labour Per cent	Conservative Per cent
April, 1955 (LCC)	58·9	41·1
May, 1955 (Parliamentary)	60·3	39·7
April, 1958 (LCC)	70·7	29·3

Compared with the 1955 LCC election, therefore, the 1958 LCC election showed a swing to Labour of 11.8 per cent. If Labour has done as well in Thursday's parliamentary election, that would lift Labour's parliamentary majority here from 7,578 to over 15,000. (This is on the assumption that the intervening ILP candidate gets only about 1,000 votes and that the relatively low, 64.7 per cent, turn-out in the last parliamentary election is repeated.) Before last week's borough elections a Labour majority of this order had seemed quite probable. But now electoral statisticians will be regarding the Islington result with more interest.

PARLIAMENT

Saying Boo to a Goose

Whatever is happening to Conservative opinion in the country, the Government has, within the last ten days, had two useful tactical victories in Parliament. Last week Mr Macleod scored a brilliant success in the debate on the bus strike; this Tuesday Mr Macmillan neatly deflated the alleged constitutional crisis over the RAF's "Prospect" conference. On both occasions the Opposition managed to get themselves on the wrong foot. Over the bus strike Mr Gaitskell and his friends are trying to be restrained in the noises they make in favour of Mr Cousins, because they are not unworried (with their eyes on their own governing days to come) by the spectacle of a trade union striking against an arbitration award. But while the Tories have managed to do some things that greatly annoy industrialists from time to time, the idea has still not occurred to the Parliamentary Labour party that there are occasions when it should go out of its way to proclaim its independence in the House from the interests to which it is tied outside it. The worst impression anybody can give is that of the embarrassed paid hack.

Over the RAF row, the Opposition might have made a better case; obviously limits must be set to the open defiance which Government and Parliament can stand from public employees, whether wearing a bus driver's cap or an air marshal's brass hat. But once again Mr Gaitskell managed to make a union matter of it: this time the union of past, future and present cabinet ministers. He was genuinely surprised that the Conservatives were not automatically joining with him in this demarcation dispute:

> Would it not be most undesirable if there grew up in Britain a custom not unknown in the United States of different defence departments each putting their own point of view independently before the public? (Opposition cheers.)

But, as Mr Gaitskell and every other MP must know, Britain already has intensive service lobbying, and there is a case for carrying on more of what Mr Macmillan called this "free and frank discussion" of service problems in the open rather than underground. Mr Macmillan, by contrast with Mr Gaitskell, seemed to strike exactly the right tone of tolerance, with an underlying warning.

These two Parliamentary successes partially obscured the fact that political difficulties still remain for the Government in both fields. Those Tories, for instance, who were most delighted by Mr Macleod's drubbing of Mr Gaitskell were left anxious a few days later by the railway wage offer. Mr Greene may relieve the Government of any lingering party worries on this score; if he does not, and if there is any adverse effect of the wage offer on the pound, Tory backbenchers will cast many a thoughtful eye on the possible anti-settlement leader, Mr Thorneycroft. Over defence, Mr Macmillan's little parliamentary success has done even less to settle the basic problems. They are problems which confirm that customary underground lobbying is more dangerous for any minister than "Prospects" in the open: the fact is that many senior officers in all services, with increasing support from some influential Tory MPs who may have been listening to them, think—and are complaining—that Mr Sandys has got the balance between nuclear and conventional weapons dangerously wrong.

PAN-AMERICAN RELATIONS

Bad Neighbours

Demonstrators in Venezuela, Colombia and Peru have seized the opportunity of Mr Nixon's visits to display their resentment of the part which the United States plays, or fails to play, in the Latin American struggle against authoritarian regimes. The three republics have recently rid themselves of dictators who appeared, to the people whom they ruled, to have the support of the State Department. It is not surprising that the American Vice President had the worst reception of his tour when he arrived in Caracas on Tuesday; few Venezuelans take kindly to the news that their former ruler, General Pérez Jiménez, has found comfortable refuge in Miami or to rumours that his chief of police has gone back to his old job with the FBI. Venezuelan parties which were suppressed under Pérez Jiménez suspect that they may be suppressed again, and that military rule may get another lease of life with American concurrence. The immediate despatch of American troops to the Caribbean has given some substance to the Venezuelan fear that the country's delicate transition from military revolution to parliamentary government may not be made easier if the United States lends a hand.

At every port of call Mr Nixon has had to stand up to

a barrage of economic grievances. Speeches about mutual goodwill sound more than usually hollow at a time when raw material prices are at their lowest level for many years and when the United States Congress is considering increasing the tariffs on Latin American lead and zinc. Nor has Mr Nixon found much gratitude for his government's aid programme; to the Latin American way of thinking aid is no substitute for enlightened trading policies; too much of it takes the form of arms, and these have been more commonly used in civil than in foreign wars.

The economic tales of woe are sincere, but they alone do not explain the eggs, stones and avocado pears thrown at Mr Nixon. Even in Uruguay, which is not directly concerned with authoritarianism, complaints about the American wool tariff were coupled with the reproach that the State Department is too friendly to Latin dictatorships. Latin Americans are interested in good business; but they also like to enjoy the pleasures of normal party political life. To confuse this aspiration with communism, as Mr Nixon after his Caracas battering was understandably inclined to do, is to miss the point.

BOMB TESTS

One Swallow

A CAUTIOUSLY encouraging western reception of a cautiously encouraging Soviet message is something worth noting in the present atmosphere of deadlock and disarray. One swallow does not make a summer, and the loosening of one log does not always break a logjam; but the prospect of joint Soviet and western discussion of how to police a suspension of nuclear tests is particularly cheering because it happens to be a sensible idea.

Mr Khrushchev's Note of last Saturday was a reply to a letter sent him by Mr Eisenhower on April 28th. The President had begged him to reconsider his repeated rejection of western proposals for a joint study of methods of supervising disarmament, and specifically to agree to a joint study of methods of supervising a halting of tests. The Soviet premier has now accepted this last proposal, although he refers to "serious doubts" about it, and insists that the experts' discussions must not last long.

This was an unexpectedly swift justification of the hope expressed by the Nato allies, in last week's Copenhagen communiqué, that it might still prove possible to embark on a joint study of disarmament inspection techniques. The allied governments cited detection of nuclear explosions as one of the sectors which called for study, and suggested that agreement in one such sector might help pave the way to a general agreement on disarmament. They added that they would in any case think about carrying out, among themselves, studies and experiments on inspection techniques. (This was more of an admission than a promise; it is somewhat appalling to learn, at this late stage, that the western governments have neither carried out these studies nor even made up their minds whether to do so.)

Now they have had Mr Khrushchev's response, and Mr Dulles and the White House have promptly, and quite rightly, made encouraging noises about it. Dark suspicions in other Nato capitals about this being the beginning of a Russo-American *tête-à-tête* should not be allowed to block a follow-through. Now that this little ball has been set rolling, it should be kept in motion. Unexciting though it may seem at first glance, it is a very important little ball indeed—more important than the huge cone-shaped sputnik that Russia has just shot into space to join the three little American satellites already circling there.

WAGE TROUBLES

Rail, Bus, Dock,

THE major industrial question of the hour is, of course, whether the unfortunate Mr Greene and his National Union of Railwaymen are going to be pulled out by their militants on to a lone maverick railway strike. If the NUR do strike they probably cannot do so before June 1st; although they would say they were striking for higher pay, they would really only be hoping to bring the 3 per cent offer forward by four weeks; and to strike to get these few shillings four weeks earlier could not possibly be worth their members' while financially. The real reason for Mr Greene's troubles is the political pressure that has been put upon him by some members of his executive, in order to support Mr Cousins. The signs are that he will be able to resist it. The Government had already made plans to carry on essential services during a national railway strike; with ASLEF engine crews and the salaried staff available, this task would be made much easier in an "NUR only" strike, although the nuisance to the whole country would still be severe. The position about the present pay claim of NUR men on London's underground railway, which obviously assumes especial importance just now, is discussed in a note below.

If the NUR trouble blows over, and Mr Cousins is left to continue his London bus strike alone, what then? The strike is proving such a pinprick to Londoners that Mr Cousins must know that every day the stoppage continues, the less likely is it that London Transport will be able to keep open jobs for all the striking busmen for long. But for Mr Cousins this stoppage has now become a matter of face; he has got the TUC to send out an appeal for extra funds for the busmen, with the plain implication that he will try to drag this stoppage on and on. If it does drag on, and London still shows no signs of flinching, the question is whether he will try to hot up the cauldron by bringing out some of his other TGWU men as well. Chief among his guards divisions are the dockers. Their pay claim was rejected on May 8th and, although they originally decided to take no action until a meeting on May 20th, 3,000-odd men handling meat in and around the Tooley Street area of the London docks decided unofficially to strike on Thursday morning. This, and the unofficial eight-week overtime ban in the Royal and West India docks in London, which was called off last week because it had proved ineffective, shows that, as always, the dockers are restive. But the restlessness of the men and the failure of the overtime ban are perhaps equally significant.

Meat, Petrol, Lorries,

THAT Mr Cousins's Transport and General Workers Union is not at present keen on union-wide action is suggested, however, by the fact that one other related strike in which some of his members are concerned is also unofficial. This is the strike of workers at Smithfield meat market. This strike, which at first was confined to 1,600 meat drivers whose claim for a wage increase had been rejected, spread last weekend to the 6,500 other workers employed at Smithfield and at cold storage depots on the docks. Their walk-out was precipitated by the fact that some of their members had been sacked because the stoppage of meat drivers meant that there was no work for them. There are far too many meat porters at Smithfield, which is a hotbed of restrictive trade union practices; and some of the employers are in a tough mood, saying that they will not necessarily have jobs for all the strikers when they decide to come back. Once again, the threat to supplies from the stoppage has not been as great as might have been supposed, nor has the attempt to spread the strike to Covent Garden so far been successful. London butchers have simply been collecting their meat from outside London; and although by the weekend prices of meat will be higher and the customer's choice restricted because of the lack of imported meat coming from the docks, no severe shortage is expected until the end of next week, if then.

The one card that Mr Cousins might decide to play in support of his bus strike is to tighten up on petrol and diesel deliveries in the London area. His petrol drivers are already delivering supplies only at their own discretion, and not to strike-breaking coach stations if they do not want to. This threat could get very nasty, but there seems less substance in the fears of some people that—if the NUR and London's buses really did come out on strike together—Mr Cousins could tighten up considerably on the activities of lorry drivers in general. His union has not got the complete coverage of lorry drivers that he would like, particularly not of course of the drivers of lorries belonging to private firms. Because of this weakness, and because of the substantial surplus of lorries at present, it is hard to see how the unions could achieve much along these lines.

Coal, Tube, Building, Engineers

WHAT effect is the promised railway wage increase going to have on other claims? The first answer to this question is likely to come in the award, due to be made by Lord Justice Morris in about ten days' time, on the coalminers' claim for an increase of 10s. a week. This claim, which was heard by the industry's final arbitrating body, the National Reference Tribunal, on April 28th, was designed almost exactly to offset the rise in the cost of living since the miners' last award in March 1957. The Coal Board, like the Transport Commission, is in current deficit; it has 9 million tons of undistributed stocks on its hands and is looking for economies everywhere it can; the temptation to find a parallel with the railway settlement is obvious, but it is not at all clear what *quid* could be demanded from the miners' *pro quo*. The real danger to the economy would arise, of course, if Lord Morris recommended an increase without demanding some economies in return.

Two other claims of considerable importance will also be settled within the next month. The first, that for London's 18,000 underground railway workers, will be heard on May 29th and 30th by the London Wages Board—London Transport's equivalent of the Railway Staffs National Tribunal. The Board has five members under the chairmanship of Lord Terrington; its decision presumably will not be announced until at least June 10th, and since the men have an agreement not to strike within 28 days of any award being made, they could not legitimately support the busmen, even if they wished to do so, until July. But, whatever happens, the outcome here is bound to be influenced by the railway settlement because the great majority of the underground railwaymen belong to the NUR. These complications do not apply to the next claim that Lord Terrington will be hearing when, on June 6th, in his capacity as chairman of the Industrial Disputes Tribunal, he arbitrates on the 8d. an hour increase demanded by the builders. They have a cost of living agreement which brought them an extra 1d. an hour in February; but unlike the 70,000 dyers, bleachers and textile workers who this week decided that a cost of living increase was enough, the one million building workers want more than this. Considering the substantial unemployment in their industry, they are not likely to get it.

The last major claim that will make news in the near future is that for 3 million engineering and shipbuilding workers. The Confederation of Shipbuilding and Engineering Unions has already presented a "substantial" demand and will meet the employers on May 24th, the day on which last year's wage standstill expires. Negotiations on wage increases in engineering have in the past taken up to nine months; and, even this year, the unions fear that the employers' promise to "deal with" the claim within three months may only mean that they will reject it during this period. The degree of militancy they show is likely to depend on the extent to which militancy does or does not pay off on the London buses and the railways.

It is perhaps ironic that the only stoppage which shows real signs of hurting the economy at the moment is one which, though taking place in engineering, is well outside the main wage struggle. This is the 18-day-old strike, for higher pay, of 1,500 vehicle builders at the Swindon works of Pressed Steel, the company which makes car bodies for the British Motor Corporation, Rootes, Rover, Jaguar and Standard. Already 11,000 workers at these car firms have had to be laid off; and deliveries of vehicles, which have for some time been the bright spot both in the home and export markets, have been curtailed. The strike at Pressed Steel is complicated by inter-union rivalries and shows no signs yet of coming to an early end.

RUSSIA AND JUGOSLAVIA

Ten Year Itch?

THE muddy waters that appeared between Moscow and Belgrade after the Jugoslav party congress at Ljubljana last month have not, after all, been allowed to settle; and on present evidence it looks as if the Russians mean to keep them well and truly stirred. Marshal Voroshilov, the Soviet president, who should have arrived in Jugoslavia last Sunday on an official visit, did not turn up. It would have been surprising if he had, after the creeping barrage of abuse that has been directed against Belgrade from all round the communist block, from Albania (where it began) to Peking. Moscow's contribution, in *Pravda*, was less fierce than Peking's, but it clearly tried to disabuse the Jugoslavs of the idea that ideological differences need not upset interstate relations; if these differences deepen "they quite naturally lead to political differences too." It also made a scarcely-veiled threat that Moscow would stop its economic aid if the Jugoslavs did not mend their obstinate ways. They, however, have heard all this before—ten years ago—and in considerably more intemperate language. On past form, if the attacks worsen, their attitude will merely grow tougher.

One can only speculate why the Russians should have apparently decided to press home the attack on Jugoslavia when they had already, it seemed, taken adequate precau-

tions to warn their satellites away from the Titoist contagion. There is some evidence for the theory that there are serious differences among the Russian leaders over Jugoslavia ; one group, led by Mr Suslov, is said to think that Mr Khrushchev has been much too soft to Marshal Tito. It might, however, be a mistake to press this theory too far and deduce from it that the renewed attacks on Marshal Tito are simply a result of successful pressure by this group. Mr Khrushchev himself can hardly be feeling very kindly disposed towards the Jugoslavs after the spirited way they rebuffed Soviet criticism at Ljubljana. He, too, may feel compelled to try some stronger measures ; but it will be surprising if he tries—or is forced to try—to turn the clock right back to 1948.

POLAND

Mr Gomulka's Bitter Memories

MR GOMULKA could scarcely be in a mood for rejoicing during his east European tour. His visits to Sofia, Budapest and Bucharest have coincided with the renewed communist campaign against the Jugoslavs, which was bound to revive bitter memories for him. He himself was once the victim of the witch-hunt that spread throughout the communist block after the Cominform's excommunication of Marshal Tito in 1948. As a nationalist heretic, Mr Gomulka was disgraced and imprisoned. He had to wait for the turn of the wheel after Stalin's death to regain first his liberty and then power. The fear cannot be far from his mind that the new Communist breach with Belgrade might foreshadow the end of the Polish experiment in limited independence launched with such hopes in 1956.

The Poles have lately been treading with caution. Less comfortably placed than the Jugoslavs, if only for reasons of geography, they pinned their hopes on a truce to ideological conflict. Indeed, they thought the Jugoslav party programme at Ljubljana unduly provocative. In their view, the time for new challenges to Moscow has not come ; and in the meantime they have been making concessions in the hope of weathering the storm. At home, Mr Gomulka has been attacking "revisionism," curbing recalcitrant writers, and reducing the powers of workers' councils. In Budapest this week he explicitly approved Soviet intervention in Hungary, once the insurrection had become "counter-revolutionary." But it would be wrong to conclude that Poland is falling tamely into line. In all the speeches on his tour, Mr Gomulka criticised not only "revisionism" but "dogmatism"—the euphemistic name for Stalinism—as well. On Wednesday *Trybuna Ludu*, the Polish party organ, contrived to publish a lengthy criticism of the Jugoslav position which at the same time, to anybody who read carefully enough, conveyed a clear impression that the Poles were joining in the anti-Tito chorus only under duress and with distaste.

Nevertheless, the Poles are aware that they cannot simply contract out of the Soviet block ; as they know, their scope for unorthodox behaviour is conditioned by the general state of world relations. The Jugoslav schism in 1948 and the purges throughout eastern Europe that followed were products of the cold war. Hence the intense Polish interest in devices to reduce international tension. Now that the adverse omens are reappearing, Mr Gomulka must be assuring himself that the repetition of history is only on the surface ; the underlying condition of the communist world is not as it was ten years ago.

NASSER IN RUSSIA

Selective Obloquy

PRESIDENT NASSER'S fortnight in the Soviet Union has followed the accustomed sequence for a state visit: banquets, sightseeing, platitudinous speeches. A dash into Moslem Asia was kept as short and as innocuous as possible. In a two-day visit to Uzbekistan and Azerbaijan little was said on the Russian side, and nothing at all by the Egyptians, about the position of Moslems in the Russian empire. In regions less sensitive to a Moslem visitor, President Nasser travelled widely. Only this week, at the end of the tour, was there time for the talks in the Kremlin that presumably were the purpose of the journey.

Throughout the visit the President and his hosts chose the subjects of oratory with circumspection. The public speeches show what were considered safe topics. Chief among these were the Bandung principles and peaceful coexistence, Arab independence and unity, the Sinai campaign, the Port Said landings and the desirability of aid without strings.

When Mr Khrushchev devoted most of a long speech to nuclear tests and American obstructiveness, President Nasser replied with a lecture on Middle East history and the Arab independence movement. The Arab President has several reasons for not wishing to antagonise the Americans just now. He would not want to cause second thoughts in Washington about the gentler economic policy towards Cairo. He may also be aware of the danger of provoking the State Department into action over Lebanon or Algeria that would not suit Egypt's book.

President Nasser did not publicly introduce his quarrels with other Arab states. But the Russians may have been embarrassed when in an early speech he dilated upon Israel as an imperialist invention, perhaps forgetting in his eloquence that the Soviet Union was the second country to recognise the state of Israel ten years ago. Little was said about the Arab-Israeli dispute after that. This does not mean that Israel was not discussed privately, or that the Soviet Union will not raise the question of Israel's frontiers at the time and place most likely to embarrass the West.

KUWAIT

The Ruler's Problem

DREAM castles in the form of dams, roads, schools, and hospitals were in the minds of the Iraqis and Jordanians by the time the ruler of Kuwait, Sheikh Abdullah Salim al-Subah, arrived in Baghdad last week. The Iraqi elections were forgotten (the government won) as preparations were made for the arrival of the rich and distinguished visitor. King Hussein of Jordan has since arrived to present Jordan's case for support from Kuwait. Sheikh Abdullah is, indeed, a very rich man, but during the past few years Kuwait has learned to live the life of a rich country. The vast sums which were formerly put into the ruler's survival kit of foreign investments may not be so large in the future. The upkeep on all the paraphernalia of modernity installed during the recent past will cost more and more.

The Arab Federation of Iraq and Jordan is not popular in Kuwait. The ruler would probably have to face a revolution at home if he joined the Hashemites. The Kuwaitis feel the need for a new system of law and administration ; they want something that will, in an orderly

manner, diminish the absolute power of the ruling family. They would regard membership in the Arab Federation as an attempt to protect out-moded institutions.

While they do have boundless admiration for President Nasser and the United Arab Republic, the Kuwaitis behave as if what they desire most is to become to the Persian Gulf what Lebanon has long been to the eastern Mediterranean, an independent centre of trade, culture and education.

PARLIAMENTARY PRIVILEGE

The Limits of Libel

THE ruling of the Judicial Committee of the Privy Council on the Strauss privilege case does not go as far as some watchdogs for personal liberty have gloomily assumed. The judges were asked to consider only one fairly narrow legal point. They have ruled that the House of Commons would not be acting contrary to the Parliamentary Privilege Act of 1770 if it were to treat the issue of a writ for libel against an MP, "in respect of a speech or a proceeding by him in Parliament," as a breach of its privileges. As a broad principle, no one will challenge the constitutional desirability of the law as now defined by this ruling ; if MPs are to carry out their duties fearlessly, they must obviously be free from the threat of libel actions inside Parliament.

But the Judicial Committee was not asked to consider the other important question that is raised acutely by the circumstances of the Strauss case itself ; everyone knows what is a speech in Parliament, but precisely what is covered by the word "proceeding"? The Committee of Privileges (i.e., a body of MPs themselves) will now consider whether an MP's private letter to a minister is such a "proceeding." This is the point that causes concern to outsiders, even though nobody disputes that the laws of

Conservative Recovery in the Boroughs

IT was Labour, not the Conservatives, which got a nasty shock at last week's borough council elections. It is true that Labour won nearly half the seats contested—1,601 out of some 3,300, exactly the same number as in 1957, and more than in any previous year except 1952. But whereas in April's county council elections the party surpassed its 1952 high-water mark by 75 seats, in the boroughs it fell short (allowing for new seats and new boroughs) by a hundred. Why ?

The main reason was, quite simply, that more Tories turned out to vote, Illustrations must be drawn from the smaller towns, since the county boroughs do not vote in county elections. Often—for example in Aylesbury, Windsor and Wellingborough—the Tory vote last week was 25, 30 or even 40 per cent higher than in the same wards in the county elections in April, with no significant increase in the Labour poll. Of course, there were exceptions: at Kettering the Tory vote fell off compared with April ; at Basingstoke Labour increased its April vote by even more than the Tories ; at Wycombe Labour nearly doubled its April vote (but the Tories more than doubled theirs). Among the bigger towns, at Manchester the two wards with the highest percentage poll both showed Labour gains, and at Oxford Labour won its first majority of city councillors by holding its 1955 vote while its opponents dropped from 15,000 to 11,000 (but then at Bath, where one had expected Labour to rattle the pump-rooms by gaining control, an unusually high turn-out of indignant Tories prevented this). The general picture, however, was plain. Although the turn-out at municipal elections admittedly usually is higher than at county elections, and although the enthusiasm of 1955 and earlier years has by no means been regained, it is quite evident that last week some recently abstaining Tories turned out to vote again. The total poll was higher than in the municipal elections of either 1956 or 1957.

Geographically, the borough elections confirmed a long-term trend which has been evident for some time: the country is slowly shaking itself out into less completely class-conscious districts. Compared with its previous highwater year of 1952, Labour held its 1952 strength almost intact in conservative southern England, and quite unimpaired in the Greater London area ; in the spas, resorts and suburbs, Labour strength is no less than in 1952, and in the Midland equivalents of suburbs (the smaller country towns) it is quite appreciably greater. But these successes since 1952 have been more than offset by a decline in Labour's own strongholds: compared with 1952 it now has 16 fewer seats in the ports, 30 fewer in the heavy industrial centres, and 80 fewer in the light-industry towns—34 of these 80 being in the textile boroughs of Lancashire and the West Riding.

The councillors seeking re-election this year had been chosen in 1955, only two weeks before the Conservatives won the general election. It was therefore not surprising that Labour regained almost 300 seats, and it is these that have led to such general misunderstanding of the results. But even compared with 1955, spectacular Labour victories were few: it had more than three gains of seats in only fifteen places, and more than five in only six. Almost all were in boroughs where—as in Bolton, Dudley, and Nottingham—Labour's 1955 defeat had been correspondingly severe. Indeed in two broad areas—in the ports and industrial towns of the south-west (from Plymouth to Swindon) and those of the north-east (from York to Gateshead)—Labour actually did worse than in 1955 ; in these areas ground recovered before 1957 seems to have been lost again in the last year. For what it is worth, Conservatives may find some comfort in a similar trend in their most vulnerable parliamentary seats. Wards won by Labour in 1957 were lost this time in marginal towns like Doncaster, Plymouth, Preston and York. There are 17 boroughs where a Conservative holds the parliamentary seat (or one of the two seats) by a majority vulnerable to a 3 per cent swing, and a similar number of boroughs which fall within (thirteen) similarly marginal county constituencies. In these 34 places, Labour elected 18 fewer councillors than in 1957—166 against 184.

Tories, however, had other worries. The Liberals did very well indeed, gaining nearly 50 seats (against 10 last year) and electing 119 councillors (against 86). At Blackpool they even ousted the Conservatives as the strongest party. The Liberals had scattered successes in all the non-industrial regions of England (though not in Wales), but penetrated into industrial regions only in Lancashire, Cheshire and the West Riding.

The Communists, incidentally, did not echo this small party success. In Lancashire their candidates averaged about 100 votes each—although in Scotland they gained a seat, perhaps significantly, in slump-ridden Greenock.

England leave it wholly within MPs' competence to decide it. There will be general approval outside the House if MPs decide that their letters to ministers do not lie without the libel law.

CAMBRIDGE UNIVERSITY

College for Scientists

THE appeal that was launched on Thursday for £3½ million to build and endow a new men's college at Cambridge deserves the widest support. The college, like the one already planned at Oxford, which has just received two important gifts from industry, is to be primarily one for scientists and technologists and, as is entirely appropriate in so important a venture, is to be named after Sir Winston Churchill, who heads the list of subscribers and has written the foreword to the appeal.

The detailed proposals for the new college seem thoroughly sensible. It is large (the aim is between 500 and 600 members eventually), but this is justified both because of the country's urgent need for scientists and because by 1965 the population bulge will raise the number of students likely to apply for university entrance by one half. It is of course to be predominantly scientific, but the decision to allow up to 30 per cent of members to be arts students and to have a much higher ratio than usual of post-graduate to undergraduate students should ensure that members of Churchill can get a breadth of training that is seldom the scientist's lot. At a time when the role of the scientist in industry is changing rapidly from that of back-room boy to front line administrator, such extra opportunity at one of the older universities is urgently needed.

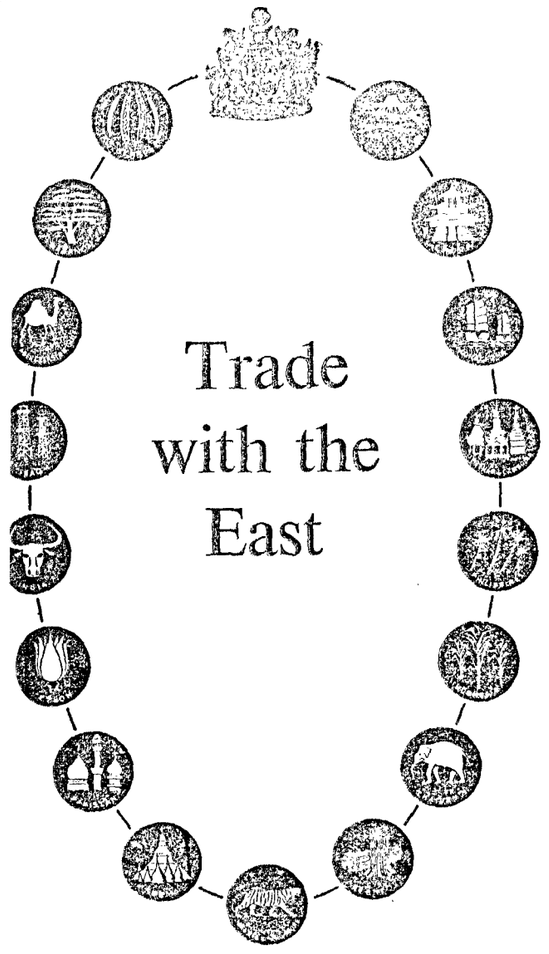
One criticism that is certain to be heard, however, is that the new college is going one step further towards turning Cambridge into a glorified technical college. It is true that the university already has 750 undergraduates in its engineering department (compared with 100 at Oxford) and another 2,000 studying pure science; but 4,500, or 55 per cent, of the university's total membership still reads arts, and even when Churchill College is fully established, this proportion is not likely to drop below one half. For the university to allow a further growth of engineering studies and facilities, which over the last three years has already been marked, is a welcome sign of realism—the more so when, as in the present case, the growth will strengthen the traditional pattern of teaching and residential life. The only question mark that now hangs over the project is how much money will be given and how quickly. The many substantial promises already received, including £50,000 from the Gulbenkian Foundation, give high hopes that the target will soon be reached.

TWELVE-MILE LIMIT

Restraining the Icelanders

THE breakdown of the Geneva talks on territorial waters leaves the initiative to the powers that want to push out appreciably beyond the old three-mile limit. Iceland, which extended its claims to four miles in 1952 and sought to go up to twelve at Geneva, is the one being watched most warily—and not only by the British trawler owners. The Icelanders' talk of unilateral action (their government could act by decree without further recourse to the Althing) seems to have inspired some strong persuasive efforts at the Nato conference at Copenhagen last week to make them hold back. In fact, the Icelanders might be well pleased if Nato were to take the matter up, for they have been far from satisfied with the economic effects of their joining the alliance. They say that the presence of the American air force has put their internal economy badly out of gear, while their British allies' ban on fish landings by Icelandic trawlers after 1952 forced them to seek new markets in the Soviet Union and Eastern Europe if their trade were to survive at all. Nato cannot neglect such murmurings of neutralism in mid-Atlantic.

The Icelanders' argument for a twelve-mile limit is based on the need for conservation of their island's one natural resource. They claim that the imposition of the four-mile zone (which foreign fishermen have disregarded no more frequently than they did the three-mile one) actually increased the British trawlers' catch by improving fish stocks as a whole. They also insist that a twelve-mile limit would apply to Icelandic trawlers as much as to foreign ones. But a unilateral extension which the other powers could not accept would be a serious step into deep waters, particularly if British trawlers were to call for armed protection to ensure their existing fishing rights.



Mr Selwyn Lloyd is understood to have suggested at Copenhagen that Iceland might somehow be compensated for foreign exploitation of its fishing grounds. What is needed is to reduce the Icelanders' total dependance on fishery products, which make up 97 per cent of their exports. The economy has been broadened by the introduction of cement and fertiliser factories, but the Icelanders are hoping for bigger things, such as production of heavy water, under the auspices of the Organisation for European Economic Co-operation, or the use of cheap hydro-electric power to process aluminium. It should pay both the Icelanders and their allies to look at the fisheries problem in this wider context before the twelve-mile limit becomes an ugly political fact.

ITALY

Italy Seeks its Place

THE Italian President's visit to London this week was not merely an occasion for glittering ceremonial and polite speeches. It was also a significant landmark in Anglo-Italian relations, marking the culmination of the long, and sometimes painful, process by which the traditionally friendly ties, frayed and then severed by more than twenty years of Fascism and war, have been renewed. But Anglo-Italian friendship, like everything else, will tend to wither if neglected; and it is upon Britain, the stronger, that the chief responsibility rests. It is a responsibility that British governments have taken too lightly; to neglect it in future may be unfortunate as well as misguided.

After the peace treaty, Count Sforza and Signor de Gasperi guided Italy firmly westward; it became a good member of Nato and embraced a "European" foreign policy. But having got over the humiliations, and digested the consequences, of defeat, Italy felt a natural reaction against American tutelage and an impulse to seek a place of its own in the international scene—an impulse of which Signor Gronchi himself is a chief exponent. Its main outlet has been a groping after authority and influence in the Mediterranean and Arab worlds. Tradition and geo-

From Cyprus and the Lebanon to Japan,
THE CHARTERED BANK
and its wholly-owned subsidiary, The Eastern Bank Limited,
link East and West through a system of one hundred
branches extending to most centres of commercial importance in
the Middle East, South and South-East Asia and the Far East. Those
branches provide complete and up-to-date banking services,
sustained by wide knowledge and long experience of Eastern trade,
finance and industry. In particular an effective credit
information service and skilled assistance and advice are
available to merchants and
manufacturers seeking new business connexions
in Asian markets.

How
to choose
a good
executor

So much will be required of him. Your estate must be wound up quickly, efficiently and in strict accordance with your wishes, yet no worry or responsibility must lie upon the shoulders of your family. Your assets must be safeguarded, yet no friend or relative should be burdened with the technical and administrative problems involved. And always there must be available a sympathetic adviser to whom your dependants can turn in time of need... Those are the requirements; and all of them are fulfilled when you

appoint
MIDLAND BANK
EXECUTOR AND
TRUSTEE CO. LTD

The Manager of any branch of the Midland Bank or of the Trustee Company will gladly give you further details and arrange for confidential discussions; or you may write direct to Midland Bank Executor and Trustee Co. Ltd., Head Office, 6 Threadneedle Street, London, E.C.2.

REGIONAL ADVERTISING SELLS

in the Town and in the Country

Esso MOTOR FUEL sells to town and country, for business or pleasure, in car or tractor. As in all highly competitive markets the local impact, the knowledge of the *precise* location of the local retail outlets, counts for a great deal in the selling.

Kemsley Regionals play an important part in such markets. They give saturation coverage in Britain's major marketing areas and you can tell all your potential purchasers that *your* product is in *their* shopping area and where to buy it.

In the town and in the country the local newspaper is read thoroughly for its news and studied for its advertised opportunities. Accelerate and overtake—use Kemsley Regional Newspapers. Esso does.

A clean stack

means to the plant engineer a chimney emitting little or none of the smoke and fumes which lead to smog, illness, and letters to the press. For many years Simon-Carves research and development engineers have been working intensively (and are still at it) on advanced techniques of electro-precipitation and flue gas washing. At many power stations and industrial plants these methods nowadays remove—and sometimes recover in usable form—the dust, grit, tar, fog, sulphur and other undesirable elements which darken the sky, damage buildings and property, and give the citizen his winter cough.

graphy make this a very natural development. Unfortunately there has been a tendency, inside and outside Italy, to treat it as, at best, a loosening of Italy's western ties; at worst, a swing towards neutralism.

In fact it need be neither, and no country should be more aware of this than Britain, which (although it may have differences over oil with Italy) has the same interest in preventing Soviet penetration in the Middle East and in living with revolutionary Egypt. Italy's interest in the Arab world should be complementary to its place as a valued member of the western community, not a reaction against the frustrations of being a junior and unregarded ally.

GREECE

Mr Karamanlis's Success

MR KARAMANLIS has won the gamble that he took in March when, after defections within his own National Radical Union (ERE) he decided to go to the country in search of a more stable parliamentary majority. At last Sunday's elections he got that majority—and on a more generous scale than had been expected. With just over 41 per cent of the votes cast, he will have 173 out of the 300 seats in the Greek parliament (compared with the 165 seats that he won in 1956). At least this means that Greece will not be the victim of a series of unstable coalition governments. Moreover, in dealing with Cyprus, Mr Karamanlis can be counted on not to forget the importance of preserving Greece's western links intact.

A second outcome of the elections is much less welcome. This is the emergence of the extreme left-wing EDA as the second strongest party with nearly 24.5 per cent of the votes and 78 seats. (The Liberals come a poor third with 20.7 per cent of the votes and 36 seats.) The EDA, as all Greeks know, is controlled by the Communists, whose own party is banned. But a wide variety of motives persuaded nearly a quarter of the electorate to support it: dissatisfaction with the economic situation (although many Greek governments have a worse record there); fear of the consequences if Nato missile bases should be set up in Greece; a feeling that Mr Karamanlis is not tough enough over Cyprus; and general disillusionment with the West bred by the dispute.

Above all, there is no effective, moderate left-wing party in Greece; all those who, for one reason or another, wanted last Sunday to vote for the Left had to vote for the extreme Left. This fact should modify the alarmist picture of a Greece slipping rapidly eastward. It has also inspired suggestions that it might be wise to legalise the Greek Communist party, thus separating, as it were, the sheep from the goats on the Left; but even if that were done, who would guarantee to extricate EDA from Communist control? Some day, it is to be hoped, a successor to General Plastiras will give Greek voters the choice of an effective and moderate left-wing party.

EDUCATION

Sociologically to School

IN some three weeks' time the Labour party will publish its policy for education. The public schools are apparently to be left alone for the time being, but what is to come on the biggest question is still unsure: whether the party's determination to say that it is going to "abolish the eleven-plus" examination is merely to be a slogan about gradual changes in selection methods, or whether it will herald a serious attempt at educational misreform. That the party has been getting little help from its right-wing intellectuals in considering these problems is shown by a pamphlet* recently published by the normally sensible Socialist Union group. Two themes dominate "Education and Socialism": first the need to give every child absolute equality of opportunity; and secondly the passionate desire to reorganise his school life as a training in egalitarian behaviour. In the name of equality of opportunity, the pamphleteers believe, almost everyone ought to go to the same type of school—rich and poor, clever and dull, U and non-U. Once there, organisation and teaching methods will need to ensure that these initial or abiding differences shall not scar the souls of the less fortunate, or unduly puff up those whose abilities earmark them to become the elite of a socialist state. How adequately the socialist educaters face this problem of teaching method, and with what degree of insight into the child-mind, may be judged from their brief exordium on the subject to the teaching profession:

> They have to attempt to train children to ignore behaviour differences as unimportant snobbisms. They can *hardly* do so if there are marked differences in the forms of behaviour expected between one type of school and another; some broad common standard has to be accepted throughout.

Socialist Union's practical proposals for providing teachers with the setting for this levelling process involve spending a great deal more money: by making comprehensive schools large enough, with small enough classes, and with good enough teachers (including a draft from the to-be-nationalised public schools), it proposes to overcome all its difficulties. This, it thinks, would mollify parents who have hitherto sent their children to snob schools, by providing them with a demonstrably better education; and would provide the country with all the sixth forms needed to turn out the necessary elite, while keeping the proletariat under the same school roof with it and thus fostering comradeship between those destined to lead (and to write future Socialist Union pamphlets) and those destined to be led. But this is not a policy; it is a condescendingly superior exposition of the economics of Marie Antoinette.

INDONESIA

A Many-Stranded Fight

INDONESIA is not like anywhere else. There is no close parallel to the present rebellion there. Prediction of the outcome is therefore doubly uncertain. All that can be done is to point out what hands are pulling at the various strands.

President Sukarno, the main target of the rebellion, has been using his natural weapon of oratory. Defending his concept of "guided democracy" in his latest speech, he has denied that he is a communist, complained of American and Chinese Nationalist intervention, and contrasted America's reluctance to help Indonesia with Russia's eagerness to proffer arms and money. There is little doubt that

* Education and Socialism by Socialist Union. *Socialist Commentary Publication.* 2s. 6d.

if Dr Sukarno were subtracted from the equation, it would resolve itself in handshakes; but so long as he retains his power to stir an audience, he will stay.

Major-General Nasution, the able army chief of staff, has less need to protest his innocence of communism. He has banned political activities in South Sumatra and has warned troublemakers against interfering with fuel installations. His measures seem to be aimed against the Communist party (PKI) more than against any other, for it is the PKI that has been extending its activities in South Sumatra, calling at the American embassy in Jakarta to protest against "intervention," and threatening to blow up American-operated oil installations. The rebel government, still breathing defiance, has transferred its capital to Menado in North Celebes, where Colonel Warouw, formerly military attaché in Peking, has taken charge as deputy prime minister. Foreign shipping has been warned that rebel air attacks are to continue and has been advised that unless provided with rebel clearances, it should keep away from Indonesian ports. Amid lively skirmishes for the possession of Morotai and other small eastern islands, a rebel spokesman has claimed that the movement is strong in Celebes and that if it can hold out till the end of 1959, the balance of power in that part of the country would change completely.

Although yet another diplomat, the chargé d'affaires at Saigon, has resigned in protest against the central government's policy, clearly more Indonesians support Jakarta than support the rebels. The prospects of a stand till the end of 1959 seem slight. But there is so little unity in Jakarta that not even military defeat need blot out the rebels' political hopes.

GERMANY AND FREE TRADE

Pressure for Agreement

The Free Democrats have tabled a question in the Bundestag asking what measures are being taken to ensure that trade as a whole will function smoothly while west Germany is entering into its commitments with the common market. They want particularly to know what steps the government is taking to foster a European free trade area, what stage the negotiations have reached, and what the government proposes to do should agreement not be in sight by the end of the year, when the first common market tariff reductions are due to come into force. The question voices an uneasiness widely felt in Germany, of which the minister for economic affairs is himself the weightiest individual exponent. "I fully sympathise with your misgivings about the common market," Herr Erhard told the Latin American delegates to the Hanover Fair. "I shall have misgivings myself until the free trade area comes into being."

In its annual report, published last week, the Federation of German Industries also expresses concern at the possible consequences of failure to establish a free trade area. These, it says, might include the extinction of OEEC and with it the European Payments Union; and for "the six" they would certainly entail exhausting competition with third countries compelled to seek new outlets for exports no longer marketable within the new walls. Pointing out that all the seventeen countries involved agree in principle on the usefulness of a free trade area, the federation puts forward some essential conditions for common acceptance.

These envisage, among other things, prompt consultation between members should anyone act detrimentally to the rest, and, if necessary, adoption of counter-measures; specific clauses designed to prevent abuse of free competition—for example, by subsidies; special status for the less industrialised members (Portugal, Turkey, Greece, Iceland, and Ireland); and long-term import agreements and a system of minimum prices to protect agriculture—and its customers—during the transitional period. It seems that both the German government and German industry are resolved to use their considerable influence to get the free trade area going in time.

The Economist

MAY 15, 1858

LIMITED LIABILITY FOR BANKS?

The Bill for extending the principle of limited liability to the trade of banking has been read a second time in the House of Commons, without even a division. It may, therefore, be considered practically to have been adopted by the Legislature, and that it awaits only the formal remaining stages in order to become the law of the land. Thus one more untenable and exceptional restriction will be removed from our Statute-book. The main reason why this measure has met with all but unanimous support upon the present occasion, while it has upon all former occasions been rejected by large majorities, is, that Mr Headlam has wisely recognised now, for the first time, the essential difference which exists between the position of the involuntary creditor of a bank in the person of a note-holder, and the voluntary creditor in the person of a depositor. . . . But then the condition which Mr Headlam has thus been compelled to introduce into his Bill, in order to afford to note-holders the largest security, has landed him in another difficulty of a practical character, which must go far to defeat its objects unless some means can be discovered of correcting this objection. The Bill, as it stands, exempts from its operation all Banks of Issue, except under the serious penalty of relinquishing the right to circulate notes. Now, considering that the Acts of 1844 and 1845 have given to the then existing banks . . . a monopoly of the profitable privilege of issuing notes, the advantages conferred by the Act must either be purchased at a cost far beyond their value, or remain a dead letter, except as regards the Joint Stock Banks in London, Manchester, and Liverpool, and a few here and there scattered through the country, that may have relinquished their issues under contract with the Bank of England. In Scotland and in Ireland there is not a single bank that would for these reasons be likely to avail itself of the privileges offered by Mr Headlam's Bill. It may, indeed, be said that the Bill will at least be applicable to new banks to be formed, inasmuch as no new bank according to the present law can issue notes. No doubt this is so. But the experience of fourteen years has shown that there is but little probability of new banks without the right of issue, being started in opposition to existing banks having that right.

Encyclopaedia Britannica

The Authoritative Encyclopaedia of the English-speaking Peoples of the World

Over 5,600 authorities from 62 countries throughout the world have contributed to this great new Edition of the Encyclopaedia Britannica—the world's most modern, useful and practical encyclopaedia.

Unequalled in size, scope and scholarship, this new Edition contains 38 million words, *23 thousand illustrations and over 600 maps* in its 27 thousand pages. There are 41 Nobel Prize winners among the 5,600 contributors. With 41,000 articles and monographs, Britannica is so well indexed that each reference takes the reader to the quarter of the page sought.

KEEPING UP TO DATE

Knowing that it is important for those who enjoy using their Encyclopaedia Britannica to keep up to date, the publishers have arranged for the 24 volumes to be supplemented by the Britannica Book of the Year and by the Britannica Library Research Service.

BOOK OF THE YEAR

The Britannica Book of the Year is published each March. Men and women who from first-hand knowledge are able to tell the story factually, accurately and with balanced judgment, view the year in retrospect. The 10th postwar Edition, now available, contains approximately 700 thousand words, 350 illustrations, 500 articles and scores of tables and charts. Among the new titles is SPACE EXPLORATION. The admired map of ANTARCTICA has been brought up to date and retained. This Year Book is available to Britannica Subscribers at a privilege price.

LIBRARY RESEARCH SERVICE

Through the Britannica Library Research Service, membership of which is a privilege reserved for them alone, those who own a set of Britannica obtain reports individually prepared from the best sources by university graduates. This free Service is available for ten years from the time the subscription to Britannica is taken out.

CONTINUOUS EDITORIAL REVISION

During the first 161 years of the Britannica's history 14 separate Editions were published. Many years were required to prepare all the articles published in these Editions, but for the modern world this leisurely editorial system is unsatisfactory. Britannica's present unique policy of continuous revision was therefore introduced.

The 41,000 articles in Britannica are arranged in 57 major classifications—Archaeology, Botany, Home Economics, Law, Psychology, for example. Whole classifications undergo complete revision in turn, thus ensuring that every article is reconsidered periodically in a scholarly way, but any article in any classification is subject to revision at any time. This system enables Britannica to maintain a strong editorial staff in London and Chicago, planning and printing in Great Britain and the U.S.A. the most authoritative, readable, complete and up to date encyclopaedia published to-day.

A WHOLLY SATISFACTORY RESULT

Neither the writing and checking of the articles in continuous revision nor the mechanical processes that follow are hurried, because care is devoted at every stage to ensure at the end a wholly satisfactory result. Nevertheless since the last Edition was published in 1955, over 4,400 articles involving nearly 7 million words have undergone major revision in the light of recent developments in all fields of knowledge. And, since 1950, over 26 thousand articles involving more than 24 million words have been revised, and nearly 4 thousand illustrations have been added.

INQUIRY FORM

For full details of this new Edition of the Encyclopaedia Britannica, please complete and post this Inquiry Form, or write to us at 11, Belgrave Road, London, S.W.1.

ADDRESS

I'll tell you something else about Shell...

Car-conscious men may think of Shell in terms of oil, but we live in a women's world and Shell has a lot to give us—chemicals in our service all day and every day, although we probably don't recognise them in their many attractive disguises. Such as? Practically everything that makes a home brighter, cleaner and easier to run! Plastics in all their gay variety. The gleaming surfaces of refrigerators and other domestic equipment. Paints and lacquers that are easier to apply, quick-drying and better protectors. Wash-day detergents, cleaning aids and polishes. Cosmetics. And lovely fabrics, especially new man-made fibres such as Terylene, which begins life as a chemical ... The fact is that, today, practically all household and personal goods depend somewhere along the line on organic chemicals, more and more of which are coming from petroleum ... and Shell.

Shell Chemicals are everywhere in the home

BOOKS

The Process of Cultural Change

Cultural Foundations of Industrial Civilization: *The Wiles Lectures given at the Queen's University, Belfast, 1956.*

By John U. Nef.
Cambridge University Press. 164 pages. 20s.

THE lectures which Professor Nef of Chicago gave in Belfast in 1956 under the auspices of the Wiles Trust are now published in a compact and attractive form. The title of the book, however, with its explicit reference to industry does not describe its contents accurately or do them full justice. The author himself is a distinguished economic historian, well known in this country by his book on the rise of the British coal industry as well as by his articles on industrial development in the sixteenth century in this country and abroad. To many economists Professor Nef is known mainly by his memorable criticism of the Keynes-Hamilton attempt to make the price revolution and the consequent profit inflation responsible for the industrial progress of the sixteenth century. A great deal of economic discussion could therefore be expected of the present book. And indeed its second chapter is wholly devoted to the economic developments of the sixteenth and the seventeenth centuries, while in the concluding chapter, concerned mainly with spiritual changes, the discussion spills over into economic topics. But in general Mr Nef has been careful not to turn his book into a treatise in economic history. His main preoccupation is not with the rise of the industrial system and not even with what economic historians sometimes describe as the "non-economic causes" of the Industrial Revolution, but with the post-medieval changes in European civilisation in its entirety, and, in the first place, with the moral, intellectual and aesthetic movements of the age.

About some of these movements Mr Nef has a few things to say that have not been said before. His opening chapter, on the movement of mind, deals mainly with the rise of modern science and thus treads familiar ground. Careful readers will, however, notice that the aspect of modern science he singles out is not its experimental and empirical method but its quantitative preoccupations. Professor Nef shows that in this as in some other respects the scientists of the late seventeenth century not only went further than Copernicus and the other pioneers of new science in the sixteenth century, but also detached themselves more fully from the medieval modes of thought.

Professor Nef's personal point of view comes out more clearly in his later chapters dealing with religion, morals and art. In his fourth chapter, on the spiritual basis of civilisation, the author brings out the contrast between the asceticism and intolerance of the age of the Reformation and the spirit of charity and love which religious leaders like Francois de Salis infused into the civilisation of the later seventeenth century. In his penultimate chapter, on the aesthetic bias of civilisation, the author traces a twofold process: not only the secularisation of beauty—a familiar theme this—but also its spread to fields of activity and to social classes hitherto unconcerned and unprovided with the material adornments of life.

Where then, will it be asked, does the new industry come into all this? To answer that it comes in the wake of the new science would be unfair to Professor Nef's main thesis. Yet here and there he himself appears to suggest that scientific discoveries made the technical innovations of industry possible. This is, of course, true of European industry since the second half of the nineteenth century, but it is not wholly true of most of the English industries that were transformed by the industrial revolution of the eighteenth century. Mr Nef is nearer the truth when he lays stress on the part that scientific attitudes in general played in sponsoring the critical and innovating spirit in industrial practice and in economic discussion.

This theme is unexceptional. What is more novel and even unexpected are the links which the author forges between industrial development and the new aesthetic. His argument is that the manufacture of decorative objects for use by royal aristocratic patrons created a new "quality" industry which, like the quantity-conscious industry of Britain, was part and parcel of the new industrial dispensation.

Part and parcel it certainly was. But whether it in fact prepared or greatly facilitated that outburst of economic activity and that transformation in the structure of costs which characterise the industrial changes of the eighteenth and the nineteenth centuries is open to doubt. However, from Mr Nef's general viewpoint this doubt is not at all serious. For, to repeat, his preoccupation is not with the cultural "causes" of the industrial revolution but with the total process of cultural change, of which the rise of new industry was not a product and not even a culmination, but merely a concomitant.

Open Mind

The Autobiography of Charles Darwin

Edited by Nora Barlow.
Collins. 253 pages. 16s.

THIS admirable edition of Darwin's autobiography sets out the complete text for the first time. Lady Barlow, Darwin's grand-daughter, has restored nearly 6,000 words that were left out of the 1887 edition. She has added twenty pages of notes and two interesting appendices: the first on Charles Darwin and his illustrious grandfather Erasmus; the second on the unpleasant misunderstanding between Darwin and Samuel Butler.

The 6,000 words were suppressed in 1887 for various reasons. Some of them were thought to be too astringent; they have now lost all power to shock. Some of them were a touching tribute to his wife, which she probably felt was too personal. Most of them, however, were omitted because they were concerned with religion, and Darwin's family was as divided about religion as the people of late Victorian England as a whole. Mrs. Darwin objected to Charles's "raw" sentences attacking Christianity for teaching the "damnable doctrine" of everlasting punishment—she did not believe that it did—and to his colourful references to snakes and monkeys in relating evolution to morality. Many other key passages were not suppressed, however, and the direction of Darwin's views was clear even from the earlier expurgated edition.

Taking the autobiography as a whole—and it has never hitherto been published in such an acceptable and convenient form—the twentieth-century reader is struck, not by the unorthodoxy of Darwin's views, but by his complete integrity. He was modest. "I have no great quickness of apprehension or wit which is so remarkable in some clever men, for instance Huxley." He was by nature reticent. "I rejoice that I have avoided controversies." He was above all else open-minded, whether in considering the pros and cons of marriage or the cause of human evolution. He distrusted all deductive reasoning in the "mixed sciences", showed unbounded patience in "long reflecting over any subject", collected facts on a "wholesale scale" before turning to theories. This method of thinking and working isolated him from many of his contemporaries, and the least convincing part of the autobiography is his brief discussion of the frequently expressed opinion that the success of the "Origin of Species" proved that "the subject was in the air" or that "men's minds were prepared for it." Lady Barlow sums up the achievement of her grandfather neatly and succinctly: "He altered the whole course of Victorian thought, not by blazoning his discoveries nor by sudden iconoclasm, but rather through searching insight and pondered judgments opening up vast fields for further research."

Second-String Classic

Robert Torrens and the Evolution of Classical Economics

By Lionel Robbins.
Macmillan. 364 pages. 36s.

To the greater number even of those people who could give a reasonable account of the difference between Ricardo and Malthus, Torrens is only a name, at most vaguely suggesting emigration policy, the controversies around the Bank Charter Act of 1844, and the Political Economy Club. Whether, in himself and for himself, he merits study at book length is questionable. What Professor Robbins has written, however, is more than a biography of Torrens or an exposition and critique of his ideas; the second part of his title is as important as the first, and his book gives a lively account, from a fresh angle, of the controversies of the period from the end of the Napoleonic Wars to the Victorian heyday.

In the development of classical value theory Torrens's part was indeed a very minor one, though as a controversialist he usefully stimulated greater men than himself—notably Ricardo—to modify or re-formulate their thoughts. His real importance lies in the field of banking policy. Here, oddly enough, he first appears as an advocate of easy money, rising prices, and never-mind-the-rentier, only to emerge, after a decade of silence on the topic, as a leading architect of the strictest gold-standard orthodoxy. It is this aspect of his work, even more than his theories of commercial reciprocity or of the economics of migration, which brings him into touch with the concerns of the present day. Can a note-issuing authority with discretionary power to meet the "needs of trade" (in twentieth-century parlance, the needs of employment) be trusted so to interpret its mandate as to preserve the gold value (nowadays, the general purchasing power) of its notes? Yes, said the Banking School, providing the notes are convertible; no, said Torrens and his fellows of the Currency School. convertibility does not prevent over-issue, it merely ensures that overissue shall be penalised when it occurs—and both expansion and remedial contraction hurt the public interest. The essential aim is to make a mixed paper-and-metal currency behave, automatically and without discretionary management, exactly as if it consisted of metal only. Torrens did not foresee, when this principle was given legal effect by the Act of 1844, that as an auxiliary means of exchange bank notes would be supplemented by the much larger and less easily controlled mass of bank deposits; but his arguments, *mutatis mutandis*, remain relevant today—and his pessimistic mistrust of the discretion of issuing authorities has not lacked modern justification. There could hardly be a more important job for monetary and credit policy today than to prove him wrong.

Professor Robbins, than who no one is more thoroughly at home among the classical economists, does not claim to have written the definitive study of Robert Torrens; but it is hard to imagine that anyone will do the job better. The text is supplemented by a generous descriptive bibliography in which anyone wanting a change from theory may find, in delightfully dead-pan summary, the plots of what must surely rank among the most endearingly awful novels ever written.

Weighty Source Book

English Historical Documents, Vol. X, 1714-1783

Edited by D. B. Horn and Mary Ransome.
Eyre and Spottiswoode. 972 pages. 95s.

This is the sixth to be published of the twelve volumes designed by Professor David Douglas "to make generally accessible a wide selection of the fundamental sources of English history." Each volume is intended to present "a comprehensive *corpus* of evidence," and the size and cost are considerable. The present volume, like that on the immediately preceding period, is nearly a thousand pages long and 4 lb in weight, but costs fifteen shillings more. But there is much of the eighteenth century here. The selection has been carefully planned and is wide in its range, covering constitutional controversies, Fanny Burney's journey to Teignmouth, naval architecture, India, Africa and the main outlines of foreign policy. There are admirable bibliographies for each section, and a miserably inadequate index to the whole volume.

Nevertheless it is impossible for any individual editor to fulfil the hopes of the general editor of the series. Professor Douglas points out that "historical studies tend too often today to consist of a commentary on documents which are not included in the available books," and hopes to remedy this situation by providing "an authoritative work of primary reference." If verification were so simple the series would be cheap indeed. But it is impossible for anyone wishing to decide the issue between Sir Lewis Namier and Professor Butterfield to find much of the relevant evidence in this selection. Nor is there anything either in the introduction or the texts to illustrate Sir Lewis's views on the outlook and influence of the country gentlemen in politics. It is a commonplace that personality counted for much in eighteenth century politics; but the only character-sketches are those of the three Georges. It is a pity that no use has been made of Lord Shelburne's "Autobiography," with its pungent studies of Newcastle and the elder Pitt. Although the editors write that "it is easy to trace in this period the pressure of public opinion in times of crisis," the texts do not make it so simple. Junius is mentioned in the introduction but not cited in the texts. Parliamentary reform has a section to itself, but economical reform makes a poor showing, apart from the extracts from the reports of the Commissioners of Public Accounts, printed under financial administration. The economic section gives undue weight to Arthur Young, easily accessible elsewhere and no longer accepted by historians as authoritative. And as illustrations of the building of the great country houses a description of Houghton and an extract from Isaac Ware's "Complete Body of Architecture" have to suffice. It would be wrong to criticise the authors for failing to carry out the impossible task of being comprehensive; but it is equally wrong to suggest, as does the general editor, that such a selection can bridge the gulf between the work of the specialist scholar and the student.

Early American Banking

Banks and Politics in America, from the Revolution to the Civil War

By Bray Hammond.
Princeton University Press. London: *Oxford University Press.* 771 pages. £5.

The author of this impressive, corrective and instructive book was, before his retirement, Assistant Secretary of the Federal Reserve Board. A noted writer on the history of banking, he here achieves distinction with a *chef d'œuvre* that is also a *tour de force*. For British readers it has the added attraction of drawing parallels between the early history of American banking and politics and the development of both in Canada as the Dominion entered the later stages of agricultural and industrial development. He takes Lewis Carroll's advice seriously: he begins at the very beginning—the English and colonial banking, currency and credit systems, the Bank of England, the South Sea Bubble, "Continental" bills, the young country's need of paper money—and goes on till the end of his period (1865) where, apart from the appended excursus on Canada (to 1867), he stops.

The book is really on American history as seen from the critical vantage-point of a banker, not on American banking as such, divorced from its socio-political setting. Accordingly it does not contain a single table or diagram: only here and there a list of banks or dates, and then generally in a footnote. The story unfolds as easily and naturally as those of Nevins and Commager, and the reader can follow it without distraction. Moreover, the author's style is clear and concise, by any standards, which is far more than can be said for that of most American academic studies.

The author treats, in an urbane conversational way, of the conflict between Jefferson's ideal American economy and Hamilton's; of the fate of the second Bank of the United States; of the struggles for financial and commercial supremacy between Philadelphia and New York, also between the opening west and the established "colonial" east; of personal and political feuds and influences. He corrects the traditional view that "poor debtors," especially on farms, dominated American history, and

produces evidence enough to show that the predominant debtors were (as one might imagine in a country industrialising under forced draught) businessmen, entrepreneurs in undertakings with borrowed funds. He also demonstrates that Jackson's and his cohorts' assault on "Mr Biddle's Bank" did not spring from ruined or discontented agrarians, but from such entrepreneurs and business interests, politic in their use of an agrarian vocabulary. His relation of American and Canadian banking and financial problems to each other, and to contemporary experience in Britain, is an original and welcome bonus on an otherwise excelling book. Its price will put off personal would-be buyers in Europe, but it should be made widely available in libraries; and so-called "under-developed countries" straining at industrialisation should set it as required reading for their economic advisers.

Jewish Indictment

Advocate of the Dead: *The Story of Joel Brand*

By Alex Weissberg.
Andre Deutsch. 255 pages. 15s.

This is an account of the war-time Jewish underground organisation in Hungary, which rescued some tens of thousands of Jews from the gas chambers. It is also the story, told by Mr Weissberg from the account of the Jewish leader, Mr Joel Brand, of the offer made to him by the SS leader, Eichmann, in the spring of 1944, to exchange one million Jews for 10,000 army lorries. No one will ever be able to decide satisfactorily whether the Allies could really have saved Jewish lives in this deal. It was inevitable that Mr Joel Brand should think that negotiations with the SS should have been started and dragged out without any lorries being delivered until the war was over. It was equally inevitable that the Jewish Agency and the Allies should see the matter in a more orthodox light. The two sides came from two worlds. The Nazi world of mega-murder, corruption, double agents, and the muddle that comes from totalitarian over-organisation, is authentically recalled by Mr Weissberg's story. In the British world, Mr Joel Brand was taken into protective custody, and efforts were maintained to keep the flow of Jewish immigrants from Hungary to Palestine down to fifty a month.

It was naturally hard for the Allies to understand that Hitler and Himmler seriously saw themselves as conducting a racial crusade, and that the extermination of the Jews in Europe was to them a major purpose of war policy. This was too mad for Western interpreters of the Nazi operations to grasp. The opening passages in Hitler's speeches, devoted to threats against the Jews, were often passed over in London in order to find out "what he really meant," whereas it was precisely those threats which he meant most sincerely. One has only, like Mr Brand, to recall the enormous expenditure of manpower, transport and money on the killing of harmless Jews to see practical evidence that this murder was a prime object of the Nazi leaders.

Mr Brand may be wrong in thinking that Himmler and the local SS leaders in Hungary envisaged Germany's defeat and were seeking to reinsure themselves by offering to sell Jews for lorries. Other evidence shows that the Germans for the most part believed to the last that the West would rally to their side and the war would thus end with German victory. Here is probably the most likely explanation of the fantastic offer. It was, as the British thought, an attempt to split the alliance with Russia—hence Eichmann's assurance that the lorries would only be used on the eastern front. Moreover, the SS leaders undoubtedly believed that an influx of Jews into the West would introduce poison into the body of Germany's enemies.

There is some reason, therefore, to think that the SS really meant their proposal. But it remained blackmail, and Mr Brand fails to make out a convincing indictment of the Allies for refusing it. Nevertheless, this book is a valuable contribution to the grotesque history of the great German madness.

Reason and Mysticism

The Manifold and the One

By Agnes Arber
Murray. 157 pages. 18s.

Here is a book that epitomises the quest of a long lifetime for a clue to the inner meaning of the problem of the One and the Many. Mrs. Arber is a distinguished botanist, and the concentrated lucidity of her style gives evidence on every page of a distinguished, scholarly and critical mind. Her postulate here, which she treats as a hypothesis and subjects to rigorous scrutiny, is that there is a unitary whole. Evidences for this probability are drawn from an unusually wide range of eastern and western mystics and poets, as well as from Plato and Aristotle; for Mrs Arber is convinced that contemplation and vision must supplement logical-discursive thought in any search for true wisdom and enlightenment. Her book is, in effect, a plea for a rapprochement between rational and non-philosophical modes of thought. It is also an analytical study of the findings of mysticism.

Mrs Arber's concern as a scientist has been with the Manifold, and she acknowledges that she cannot account, by a wholly logical, inferential process, for her basic belief that oneness is revealed in the many; but she has learnt from a study of the great contemplatives of Persia, India, China and Christendom that there is another way of approaching apparently irreconcilable concepts. This is by learning to make use of that power of intuition which, in her own words, "not only surpasses but also includes both the emotional non-rational elements, and also the discursive reason; it represents a third phase in the upward path, in which the two phases which precede it find their fulfilment." Meditation upon mysteries can reveal truths that are infinitely significant for the mind and heart, whereas if these same mysteries are regarded merely as problems, they baffle the reason, and the spirit is left barren and exhausted.

Far too often it is woolly-minded people who are attracted to mystical writers. Nobody who has tackled these closely argued pages could possibly accuse Mrs Arber of woolly-mindedness or emotionalism. Her book is not an easy one, though it is brief; but it possesses real power to enrich and influence the attentive reader.

Titoism Dissected

Titoism: *Pattern for International Communism*

By Charles P. McVicker.
Macmillan. 332 pages. 36s.

The Triumphant Heretic: *Tito's Struggle Against Stalin*

By Ernst Halperin.
Heinemann. 324 pages. 30s.

The first of these books makes a welcome departure from the beaten track followed by most of the many books on Jugoslavia that have appeared in recent years. It is a dispassionate, objective analytical account of the way in which Marshal Tito and his colleagues have adapted and modified the theory and practice of communism to suit—as they think—the problems of their own country and its independent status in the communist world.

Dr McVicker describes in detail the major economic, administrative, social and legal reforms that have been carried out in Jugoslavia since 1948. He also poses the tricky riddles that the Jugoslav communists have set themselves in the course of their efforts to break away from the rigidities and repression of Stalinism without compromising too deeply their Marxist beliefs or endangering their hold on power. How, for instance, are they to reconcile their belief in the need for central planning with the operation of the laws of supply and demand, which they acknowledge to be an "objective reality"? And in the political field, how can they reconcile their demand that the party should change its tactics from intimidation to persuasion, and their theoretical assumption that the party will eventually "wither away," with their own dependence, to a large extent, on the party to maintain their absolute power? Dr McVicker believes that the Jugoslav regime intends to relegate the party to a secondary role for the present (this seems rather doubtful) while at the same time somehow improving its morale and discipline.

Dr McVicker considers that the Titoists have made some important contributions to the development of a more liberal and acceptable form of communist state. There is their more enlightened attitude towards the individual, their new ideas about the role of the party, and their institution of workers' councils (the "touchstone of

Titoism"), which are the practical expression of a new approach towards the public and private ownership of property. Yet Dr McVicker has no illusions about the glaring discrepancies between much of Titoist theory and practice, or about the basic realities that underlie the regime. He points out, for instance, more than once, that the Titoists have taken no liberal step that might undermine their own power. He hopes that the liberal trend in Titoism will develop until it grants more real political democracy, and believes that unless it makes this concession, it is in the long run doomed to fail. But if the regime did grant full political freedom, would it any longer remain Titoist?

"The Triumphant Heretic" makes much easier reading than Dr McVickers's book, but it is a far less distinguished contribution to the study of Jugoslavia today. Among much that is quite sound and sensible, the author puts forward time and again interpretations of events that are at best controversial, and at worst highly dubious. Is there, for instance, any really satisfactory evidence (that given by Mr Halperin is not) that after the war the Jugoslavs "obviously intended to incorporate the Hungarian economy in the Jugoslav planning system"?

The account of the 1948 split with the Cominform is equally controversial; it suggests that the Jugoslavs were largely responsible for the break, not so much because they wanted to be independent, but because they were deliberately aspiring to wrest the leadership of world communism away from Moscow. And although the need to bolster party morale may have been partly responsible for the reckless pushing of economic development immediately after the break with Moscow, it is surely unfair to take no account of the simple national feeling that at the time rallied support to Tito, both inside and outside the party. Mr Halperin is perfectly entitled to disapprove strongly of Titoist Jugoslavia. But it is not necessary to make use of partisan judgments, omissions and assessments, to build up a good case against the regime.

OTHER BOOKS

DOLLAR SHORTAGE. By E. Hoffmayer. *Einar Munksgaard*, Copenhagen. 232 pages. No price given.

THE BRITISH YEAR BOOK OF INTERNATIONAL LAW 1957. *Oxford University Press.* 394 pages. 65s.

LETTERS

Fall-out

SIR—Your editorial "A Test for Testers" is far too complacent on the dangers of fall-out. It is true that compared with 50 or 500 million killed in an H-bomb war, the 50,000 who will possibly die as a result of the strontium 90 already in the atmosphere may seem trivial. One in 50,000 of the world's population is a very small fraction, but we have to get used to the fact that when we do something affecting the whole world, a very small fraction can mean a great many people. We have to reckon with the possibility that testing so far has been the equivalent of wiping out the whole population of a fair-sized town. It is true that this has not been definitely proved, but the assumption on which the calculation is based has, if anything, rather more of the scanty evidence in its favour than otherwise, and most emphatically it has not been disproved. We have to reckon that testing to date may have been responsible for the murder of 50,000 people and further testing will add to the number. This is a rather weightier argument for ending tests to add to the major one of reversing the arms race than you allow.

I might add, in case any of the editorial staff of *The Economist* now feel like grinding their luminous watches underfoot, that this would be the only way in which their radio-activity might become dangerous. The harmless radio-activity inside the case of the watch would be extremely dangerous if lodged in the bone within striking distance of the blood-forming marrow. This is precisely where strontium 90 does go and accounts for the massive demonstrations against the pollution of the atmosphere by H-bomb tests while the wrist watches go unchallenged.—Yours faithfully, J. W. JEFFERY

University of London.

Co-operation

SIR—You must, I suppose, be pardoned in referring, under the title of your article "Can the Co-ops Compete?", to the co-operative movement in England as though this is identical with the retail shops and factories, the Co-operative Union and the CWS. The structure of most democratic organisations is complex and that of the English co-operative movement is no exception. There are in fact two parts to this movement, the smaller of which, consisting of some 250 agricultural requirement, marketing and service societies is quite distinct, having no affiliations to the Co-operative Union, no connections with the Co-operative or any other political party and, above all, no belief that your sub-title, "a movement born in social aspiration is losing ground in an epoch keynoted by social progress," has any relevance to them.

Co-operation among farmers is on the upward trend; membership has increased rapidly; turnover in both monetary and real terms has grown at a faster rate than the national agricultural business. All this needs, and will one day have, a separate report, but in the meanwhile there is one comment in your article which may serve a double purpose, where you remark that "a movement created to serve the needs of a poor working class has failed to link itself with a prosperous working class." Prosperity is not a present handicap of a considerable section of British agriculture, and therein lies perhaps co-operation's great opportunity.—Yours faithfully, J. A. E. MORLEY,

Chief Executive Officer

Agricultural Central Co-operative Association

Liberals

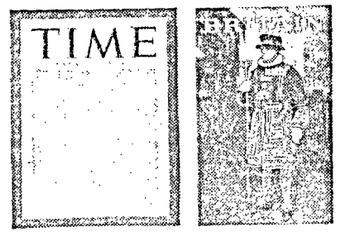
SIR—Mr Bernard Braine is correct in saying that the amendment to the 1955 Resolution on agriculture at the Liberal Assembly, on which Mr Bonham Carter relies in personally favouring price supports, did not alter the resolution passed by the Liberal Assembly in 1953, accepting as Liberal policy the abandonment of price supports for agriculture.

The 1955 amendment was accepted by Major Oliver Smedley on behalf of the Executive on the clear understanding that it in no way affected the determination to abandon guaranteed prices.

Major Smedley was one of the signatories to the letter headed with my name which you were good enough to publish, and throughout he has been a leading campaigner against guaranteed prices.—Yours faithfully, S. W. ALEXANDER

London, E.C.2

Restrictive Practices



SIR—I refer to the last paragraph of your report on restrictive practices in *The Economist* of May 10th. The Restrictive Trade Practices Act, 1956, does not deal with servicing arrangements, but only with the supply of goods. The agreement mentioned in your note refers, I imagine, to the agreement registered by this federation whereby typewriter parts were only to be supplied to qualified mechanics registered with the federation. This agreement was indeed abandoned in 1957. Moreover, all members of the federation were notified of this through the medium of their monthly bulletin in June, 1957. All such changes in arrangements are notified to all members in this way and every opportunity is taken to remind members of current arrangements.—Yours faithfully, S. E. WOOD-HIGGS

Marching in step to prosperity

✻People whistling at their work on the factory floor: office staff obviously enjoying life: management with a smile for everybody . . . no need to wonder what the future holds for this firm.

The secret? A Top Management aware that, if Britain is to hold her industrial place in the world, it is as essential to modernise administrative operations as it is production lines.

Every business wanting to be sure it is marching in step to prosperity should ask Remington Rand to survey its entire administration and report on it. This will make available unique knowledge and experience that may prove invaluable. It will be based on 80 years of technical research and practical work on office efficiency problems in 41 countries.

The world's most comprehensive range of Office Equipment includes: ACCOUNTING, ADDING, CALCULATING, DICTATING, DUPLICATING AND PHOTO-COPYING MACHINES • UNIVAC ELECTRONIC COMPUTING SYSTEMS • FILING, VISIBLE RECORD AND CHARTING SYSTEMS • FIRE RESISTANT EQUIPMENT • TYPEWRITERS (ELECTRIC, NOISELESS, STANDARD) • OFFICE FURNITURE AND SHELVING

Remington Rand

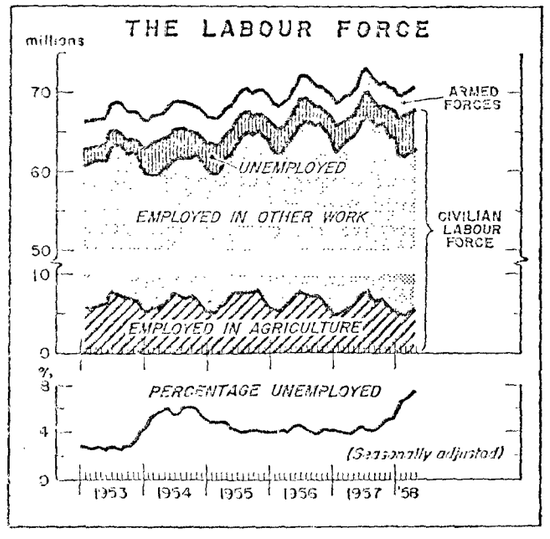
EQUIPS BUSINESS FOR PROSPERITY

REMINGTON RAND LIMITED • 1-19 NEW OXFORD STREET • LONDON WC1 • CHA 8888 Business Equipment Centres in 41 principal cities

AMERICAN SURVEY

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Prescription for Recovery



WASHINGTON, DC

JUST as the economic statistics are beginning to show a glimmer of improvement—or at least of an abatement of the decline—the pressure for cutting taxes as a cure for the recession has, if anything, increased. In the past two or three weeks, the *Washington Post* and the *New York Times* have both resolved their previous doubts and come out for tax reduction. A large majority of the score of economists who recently testified before the Joint Economic Committee of Congress took the same position, although there were almost as many views as there were economists on what kind of tax cut there should be and on whether it should be temporary or permanent. In Congress, without there necessarily being any shift in basic sentiment, the issue has come up again simply because decisions on taxes must be made in any event before June 30th, when corporation income taxes and certain excise tax rates will be lowered automatically unless Congress intervenes. And in the Administration, while again there has been no discernible shift in the basic opposition to a large tax reduction, the practical politics of this deadline have led to renewed thought about the kinds of tax changes that might be most useful, least costly and politically feasible—assuming there have to be any changes at all.

None of this gives any assurance that taxes will in fact be cut. But the reasoning behind the views of experts both inside and outside the government is impressive. In a word, it is that no foreseeable combination of events is likely by itself to produce a vigorous recovery, even if the declining phase of the recession is nearly over. Whether the declining phase is in fact over remains, of course, in doubt. But there is surprisingly widespread agreement that, even if things go well, growth for the next twelve months will be painfully slow and unemployment will therefore remain disquietingly high, unless the government takes additional steps. There is, after all, an increase of some 700,000 to 1 million each year in the labour force, and the rise in productivity also means that new jobs need to be created each year. The staff of the Joint Economic Committee has calculated that the gross national product must be $460 billion in 1958, $475 billion in 1959 and $490 billion in 1960 in order to keep unemployment down to 4 per cent of the labour force; it is now 7.5 per cent on a seasonally adjusted basis. At the moment the GNP is running somewhat below $422 billion—the estimated annual rate for the first quarter—and not even the wildest optimist can foresee a combination of demands that could bring it to $460 billion for the whole of 1958. The prospects for reaching $475 billion in 1959 seem almost equally dim, particularly in the light of the evidence that little help can be expected from capital investment by business next year.

Obviously, there are flaws in this sort of analysis. Demand has appeared from unexpected quarters in the past, and could do so again. What is more, who is to say that unemployment must necessarily be as low as 4 per cent? It might even be that a level of about 6 per cent—or around 4 million—would be possible politically and preferable economically, as a means of reducing the cost-push type of inflationary pressure. In this case, the prospect would be for a gradual improvement in production, employment and incomes, without much diminution of unemployment—a sort of "deficient growth equilibrium," as distinct from a Keynesian stagnant equilibrium. The economy might feel more buoyant and the politics of the economic situation might be more manageable if unemployment became stable, even at a level as high as 4.5 million, instead of increasing each month as it has been, at least on a seasonal basis. Still, outside the Treasury, the view is that such a state of affairs would be intolerable. When this feeling is combined with an awareness of the risk that the downward phase may not, in fact, be over or that it could be resumed, the conclusion is that more federal action is necessary.

Meanwhile, the economic indicators, while scarcely bearing out the statement of the President that the recession is "flattening out," do seem to show a significantly slower rate of decline. Possibly the most important single figure is that for new orders in manufacturing; bolstered at last by a flood of defence contracts, they showed a decline of only $100 million in March after seasonal adjustment, much the smallest since the recession began; the absolute volume increased. In April, non-agricultural employment rose slightly; income from wages and salaries fell less in April

than in any month of the recession and total personal incomes actually increased in both March and April, thanks to higher farm incomes and unemployment benefits ; and the industrial production index declined only two points compared with three in previous months.

The latest figures, covering the last weeks in April, show an encouraging decline in the number of workers collecting unemployment benefit, though the total remains double that of a year ago. Department store sales improved in both March and April and so did total retail sales in the latter month ; steel production finally rose a bit in the first two weeks of May ; advance applications for government mortgage insurance or guarantees foretell a continuance of the upward movement in new housing activity that began at long last in April ; and finally, such weekly indicators as freight carloadings, coal and lumber production, output of electric power and even automobile assemblies have, on the whole, stopped declining. All of this plus, presumably, a determination to "get in at the lows" has produced an astonishing bullishness in the stock market, whose averages today are far higher in relation to earnings or broad measures of economic activity than they were at the same stage in the recession of 1954.

EVEN though many forecasters feel that the current second quarter of the year will see the low point of the recession, the pessimists are by no means in retreat. Their most ominous argument relates to business stocks and backlogs of orders. Despite a record rate of liquidation of stocks at all levels of business in the first quarter, sales declined even faster, with the result that ratios of stocks to sales were higher at the end of March than they were when the liquidation began. It is clear that reduction of stocks still has some way to go. Although new orders rose in March, they remained well below current sales and backlogs of orders experienced their fifteenth successive monthly decline. Awards of contracts for future construction, as reported by the F. W. Dodge Corporation, a highly respected private service, show a notable decline for the first quarter compared with a year earlier across most of the entire field of construction. The pessimists also note another decline in April (largely seasonal, it is true) in the average work-week in manufacturing—the indicator that some of the more successful of the crystal ball gazers swear by as the best single harbinger of things to come. Even the decline since last September in the rate of marriages has provided sustenance for the gloomy—though not for the diamond merchants. In the back of some minds is the fearful thought that 1930 also showed a bullish stock market in its early months and that a big collapse in prices of shares in a month or two could provide a psychological *coup de grâce* to the fragile recovery.

At the moment the only certainty of the economists is that the middle of the nineteen-sixties—when at least some of us will be dead—is going to provide one of those happy "long run" booms, probably accompanied by inflation. The immediate outlook remains cloudy. But to their credit, a clear majority of the economists have, when asked, been willing to give a judgment—namely, that it is more risky not to cut taxes than to cut them. So far their counsel has not prevailed and the outlook is for a very modest tax reduction at most. According to the best current advice this will leave the economy with the interesting prospect of remaining sluggish more or less indefinitely—for worse or, only possibly, for better.

Turning the Other Cheek

VICE PRESIDENT NIXON'S stubborn courage and iron self-control under showers of stones, spit and catcalls have won him not only new respect and a hero's welcome in Washington but also new strength and prestige for the 1960 presidential election. His visit to South America, originally a recognition that the United States must mend its neglected fences there, turned into a dramatic revelation that those fences need almost complete rebuilding. The United States might have been forgiven if its first reaction to this shock had been to condemn the Latin Americans for pulling the fences down, but in fact both the Administration and Congress, led by Mr Nixon himself, are already discussing how to put them on a firmer foundation. Unfortunately, however, this task has been made more difficult by this week's tactlessly publicised dispatch of Marines and paratroops to Caribbean bases for use should the Venezuelan government be unable to protect Mr and Mrs Nixon effectively. This anachronistically "imperialist" move is a gift to the Communist agitators who, it is generally assumed, organised the demonstrations against the Vice President.

But there were plenty of non-Communist South Americans who were willing to be organised for this purpose, partly because they blame the United States for their present economic difficulties and believe that these are about to be accentuated by changes in American tariff policies, but even more, it seems, because they resent the support which those dictators who are still in power in Latin America receive from the United States and the asylum which it gives to those who have been turned out. Such political considerations weigh particularly heavily in intellectual circles, and Mr Nixon was attacked most fiercely when he tried to speak to university students.

His insistence—unwise and ill-advised, according to some commentators—on these personal meetings was inspired by his determination to explain the case for the United States directly to the people and to provide an example of democratic government at work. He has come back appalled at the lack of understanding which he found and insisting that there must be a great increase in United States information efforts and in direct contacts with the other peoples of the hemisphere. He also held out hopes, although very limited ones, of more of the economic encouragement which is the chief interest of officials and businessmen whom he met. But the final word on all this rests with Congress, and many members are less ready than are Mr Nixon and President Eisenhower to turn the other cheek or to excuse the South American governments for the disgraceful and unneighbourly behaviour of many of their citizens.

Aid, but not Trade?

LAST week, to the dismay of Republican candidates for the Senate and the House, the President opened the drive for a Republican Congress next November by putting a non-partisan pistol to their heads. He will, he said, support any Republican—and anyone else—who stands by the Administration's Bills on defence re-organisation, foreign aid, and the extension of the Reciprocal Trade Agreements Act. The non-partisan line the President chose to take at a meeting billed as a political jamboree shows how much he has at heart the three measures which underpin his foreign policy and whose shape is about to be decided by Congress. But if the Republicans are the traditional core of the opposition to foreign aid and lower tariffs, this year it is the defection of the Democrats which is causing the trouble and the Trade Agreements Act which is in it. The new foreign aid authorisation has been approved by the House with only $339 million cut from the President's request for $3.3 billion in new money and $644 million carried over from previous years. The appropriations committees present another hurdle, but the prospects seem reasonably fair.

Unofficial polls in the House suggest, however, that renewal of the Trade Agreements Act on the President's terms—a five-year extension with authority to cut tariffs by an additional 5 per cent a year—faces defeat by eighty votes or so. The Republicans are 80 per cent opposed ; so are more than a majority of the Democrats, whose loyalty to what for most of its life was a Democratic programme has been eroded by the recession and its effect on mining, oil and textile interests in the South and West. The Democratic chairman of the Ways and Means Committee is reluctant to send the Bill to the floor unless the President authorises concessions. Some congressional friends of reciprocal trade agreements favour a simple one-year extension, hoping for better times to come ; but the Administration, which so far has refused to order a retreat, is said to be considering other possibilities.

One would allow Congress to over-rule the President when he rejects recommendations from the Tariff Commission ; for increases in rates, a two-thirds vote would be required. Presumably the Administration thinks that in practice this would prevent the tariff-making power from passing back to Congress, something that would undo the chief achievement of the reciprocal trade programme—taking the tariff out of local politics. In public, however, the Administration is talking boldly of vetoing an unsatisfactory Bill and letting the trade agreements programme lapse if it is reduced to a caricature of itself.

Rockets for Today and Tomorrow

Our defence correspondent has been visiting military establishments in the United States

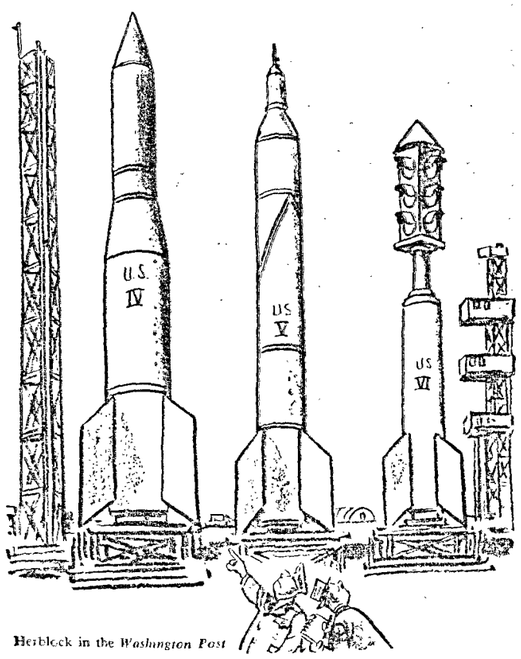
WHITE SANDS, NEW MEXICO

A NEW defensive weapon is now graduating, *summa cum laude*, from the United States Air Defence Centre at Fort Bliss: the Nike Hercules, a ground-to-air missile which is credited with the ability to destroy not only any operational aircraft now in existence, but also any aerodynamically-supported aircraft or air-breathing missile which could possibly be devised. This diploma is being awarded after one hundred odd firing tests, of which your correspondent has just witnessed two of the latest, both kills on drone targets one hundredth the size of an aircraft. Both the thunder of the rocket and the triumphant thump of the briefings on it are stunning. The Nike Hercules has apparently been demonstrated deliberately to European journalists, before more than a select group of American journalists have seen it, because it is intended to come into operational service in Europe at the same time as it is being incorporated in the North American defence system. The performance of Hercules, the Army clearly believes, will ensure that this system of locking a missile onto a marauding aircraft from a ground radar installation will become standard not merely for America but probably for the whole West. Some 500 or more allied "students" have already passed through the training school here.

The Army's sister services have made no bones about their scepticism regarding the efficacy of the system in operational conditions. But the Army has its answers to every objection. Nike Hercules grew out of the Nike Ajax missile which only became a standard weapon in 1955 ; it already has a range (about 100 miles) three times greater than Ajax, twice the altitude (up to 40,000 feet), twice the speed (3 three times the speed of sound), and hundreds of times the punch ; it can carry an atomic warhead against bombers flying in formation or releasing decoys to upset the system. These are selling points ; but they are backed up by dark references to the possibility of stretching the system, either as "Nike Zeus" or even "Nike Hera," to handle incoming ballistic missiles.

It is certainly impressive to be told these things, but even more so to tour this range, of 4,000 square miles, set in a desert along the Rio Grande, between El Paso on the Mexican border and the scarred area where the first atom device in 1945 turned the sand to glass, in a climate ideal for missiles and not impossible (at least not in May) for men, incorporating a national monument and about $50 million worth of electronic instrumentation. Among the thornbushes and cacti sprout the great flowerlike cups of radar equipment, providing the most intimate information about what is happening inside the skin of rockets large and small, even far outside the stratosphere. About 2,000 rockets were fired last year ; firings are now "scheduled"—though not necessarily completed—every fifteen minutes or half hour. All three services and all thirty or more missiles in use or under test (other than the biggest) are catered for. It costs $200,000 to $500,000 to fire a round and the cost of running the range is $50,000 an hour. Every now and then a white shape—a Corporal or something even larger—rises majestically out of the ground to disappear suddenly until a white streak appears far in the blue sky ; after that the air is shaken by a rumble.

At White Sands the Army thinks that it has made a decisive contribution to air defence. Whether it has or not, it has certainly made many notable ones to "the state of the art" as the rocketeers, uniformed and civilian, call the technology to which, one suspects, they are almost as attached for its own sake as for its grimmer applications.



★

CAPE CANAVERAL, FLORIDA

Major-General Yates, the commander of this base where the United States tests its big missiles, is cheerfully confident not only that the eighth Vanguard will in a few weeks hurl a new satellite into orbit, fully instrumented to the International Geophysical Year's requirements, but that two or more varieties of three-stage rockets will make "lunar probes" before the year is out. Perhaps more important, however, this year tests will be completed on three important atomic weapons for the services: the Army's

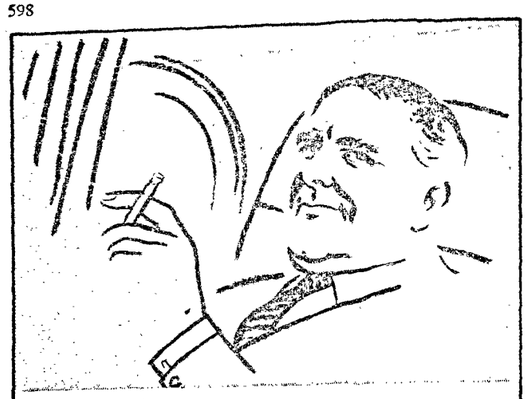
Redstone, a tactical 200-mile guided rocket ; the Air Force's Bomarc, a ground-to-air long-range interception missile designed to home onto incoming bombers far out to sea ; and the Air Force's Snark, the 5,000-mile air-breathing missile, which, though relatively slow (it would take up to 13 hours to complete its mission) can be guided on evasive courses to its target and is the main supplement to the Strategic Air Command's bombers until the true intercontinental ballistic missile is, in its turn, passed over to the services, perhaps in 1961. These three are said to be just about at the end of their growing pains and a training range is being constructed at Cook base, off the Pacific Coast, so that practice firings—which are much simpler things than test firings—can begin. So far, apart from getting its two strictly test satellites into orbit, Cape Canaveral has only the tactical Matador missile to show for its labours.

To visit the scene of those labours, one must traverse a ribbon of service subtopia that extends for miles along a

Herblock in the *Washington Post*

narrow palm-fringed strip of undistinguished shoreline between the Atlantic Ocean and the Banana river on the east coast of Florida. This once almost waste land is now erupting in bungalows, motels, shopping centres and "facilities" of all kinds and at the centre the skyline is suddenly broken by three clumps of metal structures, reminiscent of dockside cranes, oil-drilling rigs and very stunted versions of the Eiffel Tower. These are the gantries designed to give access to the missiles of various types. Closer in, they identify their purposes: the latest Vanguard appears to be about to be slung up to a monstrous yardarm ; Jupiter stands beneath a complex gallows ; Thor resembles a prisoner between the sturdy pillars of a 150-foot guillotine.

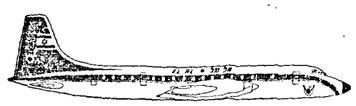
Farther out, fronting the sea, and facing down range to Ascension Island, nearly 5,000 miles south-eastward, stand four squat towers, red and white and surmounted by chequered canopies which make them look like outsize castles on a chess-board—as perhaps they are, for each contains the huge 80-foot tube of an Atlas ICBM, the penultimate nuclear weapon until the queen of them all, the Titan (or maybe the Polaris ?), reaches its mounting. Below and around them are low buildings containing equipment for fuelling, measuring, photographing and maintenance, and between them the blockhouses, like the shells of great limpets, into which, for the "count-down" before launching, those who fire the missiles retire to their instruments, television screens and periscopes.



It is then that the scaffolding splits open and is drawn away on rail-mounted bogies from the rocket, standing free on its concrete and steel "pad" which it roasts with flames of 4,000 degrees Fahrenheit as it leaves the ground and which can only be preserved by the injection of 30,000 gallons of water at the same moment. Down range, on a chain of islands, stretching across the Caribbean Sea into the South Atlantic Ocean, ten stations measure and report back "performance data" to the central control building where the computers answer vital questions, whether the rocket flies 5,000 miles or five. "Success" here (satellites apart) is not a matter of distance, but of answers to questions, delivered on magnetic tape, on screens and on film.

THE British visitor inevitably studies the Thor and its launcher, which will presumably soon become a familiar, if intermittent, landmark in the home counties, as it is raised and lowered in practice. The commander at Canaveral seems confident that delivery will begin on schedule next December and the lieutenant in charge of the "launch complex" tries to be reassuring on its performance. He maintains that it is beautifully manœuvrable on its trailer-type launcher ; though it must fire from a fixed known position to strike its target, its guidance system will in fact have built into it three alternative targets which Thor can hit from this predetermined position.

At SAC headquarters, at Offut base, Nebraska, your correspondent was told that the time taken to fire Thor was "*getting near*" to the fifteen minutes which is the desired performance for the weapon ; at Cape Canaveral, there is no hesitation in selling the hardware on fifteen minutes here and now. Everything is going to be easy, manœuvrable, "trailerised"—the liquid oxygen here, the propellant tank there ; even the blockhouse will be supplied ready for use. All this is promised on about twelve test firings: but the customer, one gathers, will be able to try Thor out at Cook base before he takes it home.



He, that is, the British taxpayer, should also ask himself one question. Unless he intends to fire Thor fifteen minutes after merely feeling sure that blips on the early warning radar screen really do mean a massive attack, what use to him as a retaliatory deterrent weapon will be this fragile, deadly metal pencil 65 feet long exposed to the jar of an atomic blast a score of miles away ? If he is prepared to spend £10 million to instal about 60 of these, ought he not to spend considerably more to put the launcher at least behind, and preferably under, a hard, concrete casemate ? At Cape Canaveral nobody who thinks about the interaction of missiles and strategy has the least doubt. "This isn't world war II," says the lieutenant. "There's your target, primary, secondary or tertiary, pre-set. There's your missile. You don't take chances. This is the nuclear age . . . it's real interesting. . . ."

Empire State Building

SOUNDS of hammering and tinkering in New York come not only from the massive construction projects along the city's avenues. The state's politicians are also at work building support and shaping bricks for next autumn's elections. All the state offices except Senator Javits's seat will be up for contest. The most interesting preparations centre around the second Senate seat and the Governorship. In the race for the latter it is virtually certain that the Democrats will be represented by the incumbent, Governor Harriman. Four years ago he scraped home by 12,000 votes, a margin so thin as to be almost transparent in a state which gave President Eisenhower a majority of a million and a half two years later. This time, in a year of ebullient Democratic hopes, he aims to acquire the kind of majority that will impress the Democratic delegates who assemble to pick a presidential candidate two years hence. Mr Harriman is 66, and has acquired the craft of politics by hard labour rather than by natural aptitude, but his ambition to be President is as strong as ever.

Among his possible Republican opponents this autumn is Mr Leonard Hall, the former Republican national chairman. The candidate whom an increasing number of supporters are now pushing to the front, however, is Mr Nelson Rockefeller, the first member of his family to get within sniffing distance of politics. Mr Rockefeller, who played a prominent part in preparing the President's plan on defence reorganisation, will be kept in the public eye, while the campaign for him is organised, by his appointment as chairman of a committtee to examine the State Constitution.

In the Senate race, the following among liberals commanded by the popular Republican incumbent, Senator Ives, makes him the obvious choice if he is in good enough health to run. On the Democratic side things are not so simple. One possibility is the ex-Secretary of the Air Force, Mr Thomas Finletter, who was not long ago said to be the preference of Governor Harriman. Recently, however, Mr Harriman declared somewhat ambiguously that the " best-known " of the possible candidates was the Mayor of New York, Mr Robert Wagner, who has also received a public commendation for the race from the leader of the Democratic machine, Mr de Sapio. Unfortunately, Mayor Wagner said on his re-election last year, in terms too unambiguous for even a New York politician to evade easily, that he meant to stick to his mayoral duties for the full four years. And he may be in political trouble. Frauds have been discovered in the city's Bureau of Real Estate ; the chief accountant has been arrested and the director has resigned. Allegations that the Mayor was told two years ago about irregularities in the bureau—and ignored many suggested reforms—have visibly brought a gleam to his opponents' eyes.

Not So Peaceful Atoms

ANOTHER conflict is beginning to rumble about the ears of Mr Strauss, the chairman of the Atomic Energy Commission. Last weekend the Administration sent to Congress its proposals for the coming fiscal year's atomic power programme, which turn out to be substantially smaller than the Democrats on the Congressional Joint Committee on Atomic Energy had been hoping for. The difference seems certain to revive the quiescent civil war between those who want the government to play a bigger role in the development of peaceful atomic energy and those who—as in the field of hydro-electric power—want to leave as much as possible to private enterprise.

It had been thought that a conflict over next year's programme might be avoided. Mr Strauss is one of the stoutest advocates of private enterprise, but a series of informal meetings between his commission and the joint committee had worked out a compromise which would have given the Democrats at least two of the three government-built reactors they wanted to include in the new construction projects. However, the Bureau of the Budget refused to sanction the compromise plan, despite a reported appeal by Mr Strauss to the President. The proposals now made by the Administration call for an authorisation of $193 million, compared with the $300 million informally agreed to between the Atomic Energy Commission and the Congressmen. The Democrats on the joint committee will get neither the reactor they sought for making plutonium (which the services want more of for warheads) nor the reactor fuelled by natural uranium, which they would like to develop as a rival to the British Calder Hall model. The solitary power reactor to pass the Budget Bureau's eagle eye is one using slightly enriched uranium.

Mr Strauss's term of office on the Atomic Energy Commission expires on June 30th, and he has yet to announce whether he will accept the President's invitation to stay on for another five years. His belief that American nuclear tests should be continued has recently run counter to Mr Dulles's reported desire to seek agreement with the Russians on a policed suspension. Now Mr Strauss is liable to find himself involved in a bitter fight before Congress over the power programme. The chairman of the joint committee, Mr Carl Durham, said in March that Congress would pass its own programme if a compromise could not be reached. If Mr Strauss defends the Administration's proposals, it is unlikely that it will do him much good to plead that he tried to meet the joint committee's demands and that it is all the fault of the Budget Bureau. Senator Anderson, an influential member of the committee, has already announced that he would oppose Senate approval of an extension of Mr Strauss's term of office.

Battle of Flowers

FROM A CORRESPONDENT IN NEW YORK

AFTER two seasons that would have withered a creeping burdock the New York flower show expects to emerge solvent this year. While London's flower show is held in tents in May, New York's is held indoors in March, when gardens on the city's roof-tops and in the surrounding suburbs were this year buried under snow ; it owed part of its success to the contrast between the spring magic it presented and the bleak scene outside. As the official name is the International Flower Show Incorporated, tropical fantasies flown in from Hawaii and South America were not out of place, but the crowds lingered longest over daffodils and roses that came within the realm of possibility for the home gardener when spring finally arrived outdoors.

The contrasts between the Chelsea flower show and the New York one reflect differences of habit as well as of climate in the two cities. London has the advantage of gentler weather and a population that not only cherishes flowers but also grows them. New York's somewhat artificial advantage is that by holding its show in a permanent heated building it ensures petals against being frost-bitten or wind-blown. Attendances may be reduced by bad weather, but not as much as at Chelsea. Otherwise, the city, with less open space in its centre than London has, fewer window boxes, and an endemic battle against climate, concrete and commerce, carries on its flower show almost in spite of itself.

The actual production is a complicated enterprise involving a great many people, a surprising number of whom are unpaid amateurs working for love and for prizes. This year 4,000 men and women helped to set up exhibits, and 1,600 passes were issued to members of participating garden clubs alone. The budgets for the past two years have been running close to $200,000, of which half comes from the sale of tickets (the entrance charge for adults is $2) and about a third from renting space to the trade. On the disbursement side, $33,000 goes for rent for the exhibition hall, $16,000 for labour, while $72,017 was allowed this year for prizes, trophies and certificates. The amount of business done by commercial nurserymen at the show is a trade secret, but they would hardly support an unprofitable undertaking. An informed guess is that $500,000 worth of orders is placed during the week and more flow in later as suburbanites and penthouse dwellers pore over the catalogues which they have brought away.

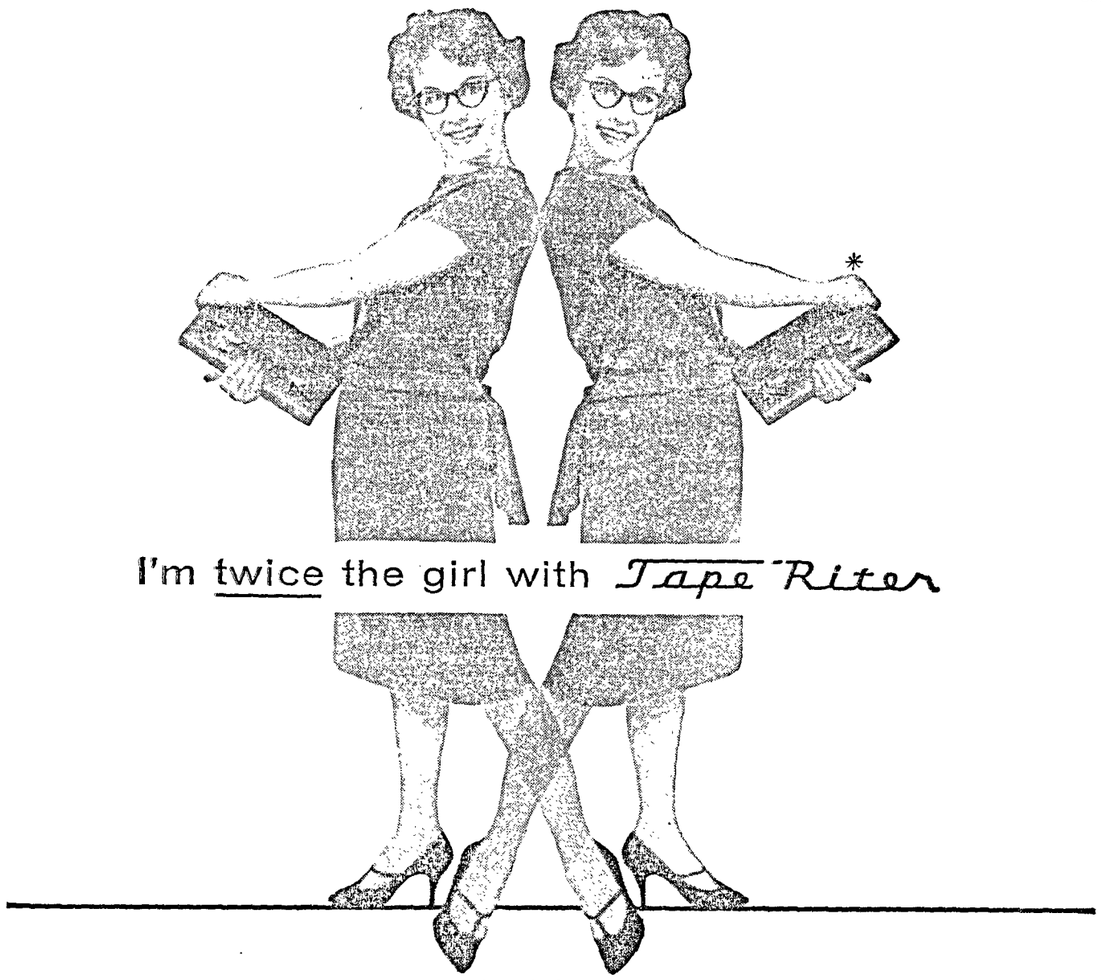
Behind the week-long spectacle and the swarming crowds there is, of course, a corporate entity that carries on throughout the year. The International Flower Show, Inc., is made up of two older organisations, the Horticultural Society of New York with 3,700 members which represents amateur interests, and the New York Florist's Club whose 800 members are professionals. For most of four decades this interesting marriage has brought forth a spring show which not only delights flower lovers but also provides funds for research and scholarships.

ALTHOUGH it occupies three and a half acres of floor space in the Coliseum, this show is second in size to the biggest, which is the Massachusetts Horticultural Exhibit in Boston, and only an acre larger than the Philadelphia show. About a dozen cities in the country now boast their own flower shows, in addition to gardening activities organised in other ways, such as the Japanese cherry blossom festival in Washington, the dogwood show at Valley Forge, the week-long showing of private gardens in several of the southern states, and other similar attractions which hold places in the tourist calendars.

So far the flower shows, unlike so many American enterprises, have managed to remain decentralised and to keep their local character and control. Fed and supported by an intricate web of garden clubs, plant guilds, plant name societies (the newest of these is the International Ikebana Society, organised to promote Japanese flower arrangements), they have managed to escape any movement toward a holding company for flower shows. Indeed, the trend seems to be in the other direction. The New York show is encouraging amateur exhibitors, and is proud to have doubled such entries since 1956.

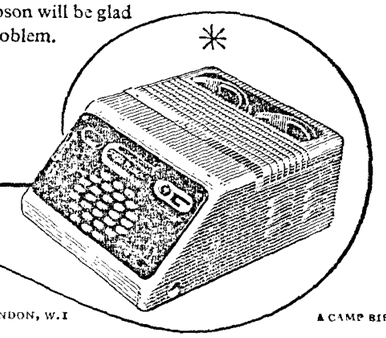
The amateur's lot, however, is far from easy at any show of this size, and in New York the traffic conditions and the demands of the trade unions try the exhibitors' patience. Union rules forbid entrants to use their own gardeners, chauffeurs or handymen to do any part of the work of setting up exhibits. They can drive estate cars to the entrance of the Coliseum, but there they stop. Union men must be paid to unload, to place exhibits, to build fences, provide a bit of paint, or help with any construction. But so far the unions have not tried to bar members of garden clubs or their relatives from carrying in their own plants or arranging their own blossoms.

Since the war the New York show has been changing in character and composition and more changes lie ahead. In addition to rising costs of labour and high income taxes, the invasions of the speculative builder make life hard for the owners of large estates who used to dominate the show. The best growing land around New York lies on Long Island and in New Jersey, and twenty years ago private exhibitors in these regions sent beautifully planned gardens to compete for prizes in the best areas in the show. Today such private competition seems too expensive a luxury. Fashions in spending have changed, private greenhouses are shrinking, private fields are yielding to bulldozers which cover fertile soil with split-level ranch houses. It is true that some of these houses will sprout small gardens, but most of them boast only a lawn planned to be cut by a motor-mower and a pair of shrubs able to withstand children and dogs.



As a result of these economic and social pressures, the choice centre spaces at the flower show now go to commercial growers, who exhibit there as part of their regular advertising efforts. Their signs are limited in size and their gardens are beautiful, but they lack the variety and the interest of the older private achievements. Meanwhile, the individual grower falls back on smaller, less desirable locations, or shows his or her prize plant along with such institutional exhibitors as the famous Garden Club of America or the specialising Bromeliad Society. Hence the emphasis shifts to front gardens, hydroponic gardening, ways to encourage blooms in a sunless apartment, or wiles for persuading African violets that they like central heating.

SHORTER NOTES



The recession seems to have done no harm to New York's World Trade Fair, being held for the second time this year. It is expected to draw a million visitors, compared with 700,000 last year, and luxury articles, which include a British brush specially designed for cashmere jerseys, are holding their own. Business in soft goods was said to be excellent, in capital goods satisfactory and in hard consumer goods, such as wireless sets, adequate. There are 3,000 separate displays from 60 different countries.

* * *

Both Houses of Congress have now agreed on a Bill which will encourage men to make their careers in the armed forces by increasing the rewards for skill, experience and responsibility at all levels. Every man with over two years' service will get a rise of at least 6 per cent, with top-ranking officers getting an extra 33 per cent and top-ranking enlisted men 41 per cent.

At least that's what my boss tells me. Since Tape-Riter was installed I get through twice the amount of work. Why? Because with Tape-Riter there's no waiting to take down letters; no lost trains of thought; no fiddling with discs, tape reels or recording sleeves . . . just straight on the machine for me to type. And with Tape-Riter my boss dictates at his speed and I can type at mine . . . *and right first time.* Of course, the Tape-Riter people really scored in our Typing pool. They installed a centralised automatic system that stepped up our typing output from the word go—*and with no extra staff.* Why don't you have a word with the Tape-Riter people today? Their Mr. Simpson will be glad to arrange for an executive to discuss your problem. The telephone number is HYDe Park 8292.

Cargoes sweat too

And when they do, rust, staining and other damage may be the result. "Cargo sweat" occurs when ships pass from cold to warm climates. A change from warm to cold can cause condensation on the ship's structure, known as "ship sweat". Shipowners have found the answer to both problems is Thermotank Drihold equipment. This maintains close control of ventilation and drying to ensure that condensation cannot occur. Control of the atmosphere for comfort or industrial processes is the business of Thermotank—on land, sea and in the air. The Company pioneered the first air conditioning of ships more than fifty years ago. Today Thermotank maintain an unequalled service covering every major shipping route throughout the world.

THE WORLD OVERSEAS

Honest Broker of the North

FROM OUR SPECIAL CORRESPONDENT LATELY IN STOCKHOLM

SWEDISH diplomats must often be the envy of their western colleagues. The foreign policy they implement, by comparison with that of Britain, the United States or France, is as clear-cut and uncomplicated (if also as prosaic) as the landscape of their bare northern uplands. The Swedes can afford to do what seems reasonable in the circumstances, without having to worry about what their allies will say—since they have none—or whether their course of action will endanger their "great power status," or be interpreted as a "sign of weakness," or unknot some previously parcelled diplomatic "package." This is diplomacy stripped to its essentials; small wonder that Sweden sometimes seems to offer a rational man's guide to international behaviour.

A good example was provided by the recent Security Council debate on the Arctic. The Swedish representative, Hr Jarring, cast his first vote as the solitary ally of the Russians when the Americans sought to bring the discussion of the original Soviet complaint to an abrupt end. His choice of friends brought an indignant protest from *Dagens Nyheter*, the newspaper which functions as a kind of standing leader of the opposition in foreign affairs (a compliant parliament being yet another of the blessings enjoyed by Swedish foreign ministers). But the Swedes' argument was that the situation in the Arctic was dangerous enough to warrant further discussion, both in the Security Council and at the summit, and that an attempt ought to be made to set up some joint American-Russian machinery to examine the danger of an attack across the North Pole. In the end the Americans came round to a point of view very close to this, even to the extent of accepting a Swedish amendment which linked their Arctic inspection plan to the agenda of a summit meeting.

Another demonstration of how to dispose of modest weight to the best effect is afforded by Sweden's approach to the European free trade area. Some industries, notably textiles, are apprehensive about their ability to swim if flung into the deep end of a free trade pool. After some early murmuring, however, most of them now seem to have been persuaded to stiffen their lips for the general good. Meanwhile, the Swedes are applying indirect leverage to the French; they are pointedly reminding Germany of what it stands to lose in the Nordic countries unless it can prevent Paris from splitting the European economy in two.

Sweden is a founding member of the group of "intermediary" states in the United Nations. Now that the diplomatic market is opening up again between East and West, there is a special value in being a broker who is allied to neither side and is by common consent among the most earnestly intelligent of the neutrals. If a visitor to Stockholm mentions the ideas about disengagement now current in Britain, he is liable to receive the kindly smile that a late convert gets from those who were born into the faith, even though he protests that the advantages of disengagement did not become obvious until the east European events of 1956. Nevertheless, if these ideas ever come to anything, it is a fair bet that the Swedes will have a hand in the arrangements.

It would be sensible for the West to suggest their inclusion on any body charged with working out a plan. Like everyone else, they are worried about the problem of keeping the peace inside a central European zone of disengagement, particularly since the world expects these seven million people to provide an endless supply of international constables. Swedish law, alas, does not permit conscripts to be ordered abroad in peace time; and although plenty of snowbound young volunteers can be found willing to winter at Suez, they might be more reluctant to face boredom on the Bug or the Oder. Nevertheless, officials in Stockholm say confidently that, if an international force is called for, the Swedes will provide their customary nucleus.

In a way, Sweden is being pulled willy-nilly closer to the centre of the world conflict. A Copernican revolution is taking place in military geography as strategy in both America and Russia comes to depend more and more on home-based missiles. The west European mainland now lies on the long route round between the two rivals. The heart of the matter is the Arctic; and Sweden is one of the five independent countries, and the only wholly neutral one, to share occupancy of the region with the twin giants. The diplomatic opportunities are obvious. For instance, if the Americans and Russians fail to agree on a joint Arctic inspection scheme, the three Scandinavians might suggest keeping a watch on their slice of the zone, providing information to both sides and inviting them to join in if they thought it a good idea.

It is ironic that, as Sweden's neutrality grows more valuable, the military strength on which it was founded is being depleted. The armed forces are now preparing themselves for the cuts demanded by the "Adam" plan, which was drafted last autumn (along with its even more stringent brothers Bertil, Cesar and David) and was approved this spring. It will involve a 15 per cent reduction in the number of troops, and will cut naval expenditure by half; but its strategic implications are even more serious. There are two main routes for a possible Russian attack: one by land along the few roads through Finland, the other by sea into the plains of southern Sweden. Hitherto the Swedes have been able to guarantee a major fight on both fronts simultaneously. Now they will be able to put up serious opposition only on one, and merely a delaying action on the other. Their generals say that

this situation can be remedied only if they are given tactical atomic weapons.

Conversation with Social Democrats suggests that, for the moment at any rate, opinion is hardening against the generals' wishes. And even if a non-Socialist government comes to power after the June elections, the Liberals are still too divided to take an immediate decision in favour of nuclear arms. In any case, Sweden makes virtually no plutonium at the moment, and the reactors which it has planned up to 1963 are unlikely to produce a surplus of high-grade material suitable for warheads. If Sweden wants atomic weapons, it will have to establish a special programme, and the odds are that it could not create even the most modest stockpile until about 1967. And this would create a new problem. The most obvious vehicle for delivering tactical atomic bombs is the Lansen fighter bomber; but, since this has the range to reach Leningrad, it would automatically become, in Russian eyes at least, a potential strategic weapon as well as a tactical one.

Thus, if the Swedes decide in favour of nuclear arms, they run the risk of promoting themselves into the unenviable class of countries which, in case of war, the Russians would destroy because they are dangerous, whether or not they wish to invade them. But if they decide against nuclear arms, their defences may not be strong enough to deter the Russians from popping Sweden into the bag as a kind of side-show to a larger European attack. At the moment opponents of the bomb are pinning their hopes on the belief that Scandinavia, which possesses no immediately usable submarine harbours, lies low on the list of priorities for Marshal Malinovsky's divisions; and that even after the "Adam" cuts the conventional forces will be powerful enough to make it not quite worth the Soviet army's while to put a right hook through Sweden. Even if a conventional war does not stay conventional, the advent of long-range missiles—say the optimists—may make it possible for Sweden to rest safe under the arch of the rockets rising and descending on either side. But it takes a rare optimism to believe in the possibility of an oasis in an atomic desert. Sweden's best chance still lies in the preventive work of its diplomats.

A FRENCH JOURNEY—V

Algeria and the French Mind

FROM OUR SPECIAL CORRESPONDENT

If Algeria did not exist, it would be possible to say that the prospect for France was good. Despite the sad state of Parliament, the postwar economy has made up many lost years; France is less vulnerable than most countries to fluctuations of trade. But Algeria is the mental illness that makes the physical prognosis unreliable.

A French friend, a university lecturer, who has lived in and admired Britain, America and Germany and is a convinced "European," was posted last winter in Algiers. I saw him for a few hours at the time of the Anglo-American arms deliveries to Tunisia. He was understandably angry: "Of course, we must ultimately give the Algerians prospects of independence. But not now, in our own time. We will *not* be pushed around. We'll drop Nato and Europe rather than be kicked around. Pacifying Algeria will take ten years." It was magnificent, but not even war: it was like Dr Mossadeq declaring that Persia's oil would flow into the sea.

A similar note of defensive defiance was struck at a lunch not long ago by a civil servant who suddenly brought a conversation on Algeria to a climax by bursting out: "That man Mendès-France, if he had his way, there would be a disgraceful sell-out in North Africa. It would be 1940 and Pétain all over again." You have to be highly educated to talk like this. But everywhere on my journey, in the Nord, the Auvergne and Lyons, or Nantes in the west, I found signs of a split mind. The Christian employer thought that Algeria must remain French, though he deplored the "methods" of repression. The steel representative hinted at "our lack of realism," but considered it "hard, perhaps impossible, to find a solution." The trade unionist opposed official policy, but added bitterly: "Before the war we were the greatest country in the world, everything revolved round *us*. Now we are hardly independent." Nearly everywhere one finds a conflict between people's feelings and their feeling for facts; the conflict leaves them partly acquiescent, partly despondent

The fact is that over Algeria the French are wrestling with their consciences and their pride, in a personal, intimate way alien to mercantile communities tackling foreign policy questions: it is a sign of just this that they even deny that Algeria is an external question. In a sense they are right: many French families have cousins in Algeria. But the attitude goes beyond the obvious facts of a difficult situation, the million settlers over the water, the complexes of 1940 and the rest. If President Bourguiba really told Mr Robert Murphy: "You are traders, you want to clinch a deal. The French are peasants, they want to hold on to their land"—*then* he came nearer the truth. But there is also the question of honour.

The army, not the trader, has planted the tricolour round the world. Even pride in the declaration of the Rights of Man is swathed in memories of Napoleonic conquest. Algeria itself was the first of those relatively easy colonial epics which maintained the heroic tradition through the top-hatted Victorian era. The school books ensure that these mental associations live on. The result is the obfuscatory chorus from the Right about France's honour which overlays the discords of Algeria. Even the Mendèsist editor of *Express*, M. Servan-Schreiber, has described his experiences as an officer in Algeria in terms of romantic military camaraderie. Glory dies hard, and sometimes, when one listens to Frenchmen talking of themselves as men holding off Communism single-handed, despite the folly of indifferent allies, one feels that they draw bitter satisfaction from fighting a hopeless rearguard action, Marshal Neys in another retreat from Moscow; all is lost save honour. There is a profound sense in which the French are fighting the rebels not as political opponents but as personal aggressors in a duel.

This also takes subtler forms, for many cultivated people who have rejected military pride assume, in part excusably, that France is synonymous with civilisation. The New Rome is across the ocean, but the modern Athens is France, the home of Liberty in capital letters, the Word which was the beginning of contemporary history. The Algerian rebels are in revolt against civilisation—and, murdering each other in back streets, they do what they can to maintain the illusion. A "Voltairean" conte, *Our Ancestors the Gauls*, published recently by André Chamson, who will be familiar

to former readers of Penguin *New Writing*, is revealing: a Gaul suddenly turns up at the United Nations declaring that the French have usurped his country. The Americans, the Russians and the newly-emancipated Afro-Asians are delighted to find that France with its trying personality, so irritating to their uncultured or unfinished selves, does not really exist and is an under-developed country after all, to be reshaped in their image. They accord recognition to Gaul; France disappears from the map. Some scattered intellectuals in centres of true culture, like Japan and Greece, weep for "Homer and Racine."

Most Frenchmen share something of these preconceptions and wish in shielding them to protect their wounded self-esteem. The war has cemented this basic community of feeling. Arabs murdering each other in French towns, Saharan oilstrikes, offences real or imagined by foreigners, from Colonel Nasser to Good Officers, the return of conscripts, ex-Communists included, who (when they are not struck dumb by what they have witnessed or done) tend to express racialist views, all add up to one Auvergnat's conclusion: "There is more unanimity over Algeria now than two years ago." Yet the French are not convinced or complacent colonialists: that would offend the teachings of generations of liberals. They are also acutely aware of Europe's retreat from universal empire and of the way the war drags. So what another informant said: "We might all be surprised how many people would vote for peace in Algeria if party loyalties were not involved," may also be a shrewd assessment. Little wonder that on the whole French opinion is torpid but, beyond its normal distrust of politicians, sceptical of the outcome.

In this split mentality there are striking resemblances with the affair of the European Defence Community. During the EDC crisis even General de Gaulle and M. Mendès-France proclaimed their "European" convictions. Similarly today, M. Soustelle is ardently non-colonialist in his own eyes; and M. Mollet distinguishes the "liberation of the individual" from the "fallacious independence of nations." More significantly still, it was at the height of the Algerian war that sweeping reforms, which are already leading to something near independence, in black Africa were voted by the right as well as the left. In the Nord, I was told that "Vietnam's recent tendency to turn away from the Americans and seek more trade and contacts with the French is making people wonder whether an independent Algeria might not soon do the same." Finally, the doctrine that colonial responsibilities are too costly is steadily gaining ground. In the case of the EDC, the surprisingly easy acceptance of the new European drive ending in the common market shows that the bitter debates of 1954 were the cathartic crisis of traditional French anti-German feeling, purging generations of pent-up resentments. Will Algeria similarly be the catharsis of colonialism and of the cult of *la grande nation*?

One is tempted to answer that it will, and to add that when Algeria is out of the way, the prospects for a France reduced to the European mainland are very bright. But the amputation must be painful. Now, as in 1954, but more so, the running is being made by the most hysterical elements, this time on the right. Even the leaders of the regime agree that it is direly threatened. The danger of Parliament handing over to General de Gaulle is ever-present. Alternatively, one journalist thought, "we will have a right-wing coup to carry on the war, followed by a Popular Front dominated by the communists to end it." Yet after speaking to a good number of people, I find it hard to believe in the power of the communists to dominate a French government; and no one seems to believe that General de Gaulle, either, could do so for long. "People today are not such decided republicans as their fathers, but they are far more stubbornly democrat." Also, talking to individuals, one cannot help realising that beneath emotional appearances French opinion is becoming more, not less, aware of contemporary realities. This is a fact, not a prophecy: the Algerian crisis can have disastrous repercussions both on European unity and on Nato. But the storm could also blow over faster than one has a right to fear.

(Previous articles appeared on April 5th, 12th, and 19th and on May 10th.)

Loose Reins in Lebanon

FROM OUR MIDDLE EAST CORRESPONDENT

Beirut, Wednesday

President Chamoun seems determined to ride the storm now raging in many parts of Lebanon. For the first few days the government moved cautiously as if probing the extent of the trouble. It has now decided that it is confronted with a serious uprising enjoying aid and comfort from abroad on a scale that threatens Lebanese independence.

Disturbances which began with rioting in Tripoli on May 9th changed character with dramatic suddenness on Sunday night when the strike movement gripped the capital. From that moment the trouble spread rapidly and only the south has so far escaped serious bloodshed. At first, some members of the government were reported to have inclined towards a compromise solution. With the growth of the movement to the size of an insurrection they have cast aside their doubts and the government now stands solidly behind the President. The common assessment of the situation here is that it is no longer a question of a constitutional amendment to permit the President to stand for a second term of office. It is the future of Lebanon as an independent state that is in the balance.

The most important single factor in determining the government's attitude is the accumulating evidence of outside intervention in the civil struggle. Captured material, which includes heavy machine guns and grenade throwers, suggests that arms which have been brought into the country are of a type and on a scale that the traditional arms smuggler could never handle. The government has replied by preparing a bill of indictment against the United Arab Republic for presentation to the United Nations. The form of presentation has not yet been decided on; it raises various legal and technical questions which are still under discussion. Since the outbreak began the President has maintained close contact with the principal western ambassadors. But all concerned are anxious that the government should master the rising with its own resources, since a call for western aid at this stage would lend colour to the opposition charge that the President is a western stooge, and it would reawaken dangerous passions in Jordan, Iraq and elsewhere in the Arab world.

It is perhaps fair to assume that the opposition leaders, when they launched their fateful call for a general strike

on May 8th, intended only to force the President to withdraw from the presidential contest next September. But a popular rising for limited objectives is one of the most difficult and delicate of operations; and there is no evidence that the opposition leaders possess the skill or the organisation to carry such an operation to a successful conclusion. In the event, the movement got out of hand and many observers believe that an opposition victory at this stage would result in Lebanon becoming at least an appendage, if not a part, of the United Arab Republic.

The struggle carries the seeds of another danger. The strike call was issued not merely by the predominantly Moslem "national front" but also by a group of Christian independents opposed to the President, calling themselves the Third Force and known to their enemies as the "third farce." There is some evidence that this group is taking fright at the extent of the damage and contemplating withdrawal from the movement. That might lead to a situation which the Lebanese leaders, including the opposition, dread above all things: a cleavage of the nation along confessional lines with the Christians on one side and the Moslems on the other. Fears of such a development have been a persistent undertone to the politics of the country since it became independent. But the choice does not lie wholly with the government.

Hungarian Communists at Ease

BY A CORRESPONDENT

MR KHRUSHCHEV may have said many startlingly different things during his tour of inspection of Hungary, but Hungarian Communists, albeit after some initial pains of interpretation, have firmly decided that he meant to convey one important thing; that is, that the Soviet Union would never leave them in the lurch. They now seem relieved of any gnawing doubts, and the occasional note of sobriety detectable since 1956 is largely gone. While in economics the party line is cautious and canny, in politics it has become lyrical and intoxicated by blissful certainty. Hungarians who remember the German occupation in the last war find fascination in comparing the present mood with what it was in 1944. Then as now the little band of faithful knew that they would win "because they must," because they have a great and invincible ally. In 1944, it was the Great German Reich and the Secret Weapon, today it is the Great Soviet Empire and the Immutable Law of History. Even the feverish and foggy vocabulary now used recalls that of the 1944 Arrow Cross.

The Soviet delegation is, however, said to have laid it down that Mr Kadar's regime must in turn use its guaranteed tenure with care. The earthy Mr Khrushchev, in particular, apparently persists in believing that the 1956 revolution could not have broken out if Mr Rakosi had not tried to "build socialism" at the expense of real wages. The Hungarian party must not repeat the same mistake, even if concern for the standard of living involves a low rate of investment and a slow rate of industrial growth. For the Stalinist majority, in particular, still dreaming of Rakosi's cherished goal of transforming Hungary into "the country of iron and steel," the Soviet assumption of responsibility for internal security is a great temptation; by curbing the present extravagant level of wages and consumption, large-scale investment could be resumed, with the Russians making sure that the discontent of the workers does not lead to a second counter-revolution. While he showed some sympathy with these aspirations, Mr Khrushchev is understood to have vetoed the idea. He wants the standard of living to be held; moreover, this must be done without further Soviet aid. These basic rules of conduct confirm the cautious line taken in the 1958 "people's economic plan," and are reflected in the State budget introduced last month by Mr Antos, the able minister of finance.

★

Industrial production is to be maintained at its present level. Enterprises have been warned not to overfulfil their gross *output* plans, as this would aggravate the shortage of raw materials. Imports must somehow be reduced by a sixth and exports pushed up by a fifth, and both external payments and the budget must be balanced without Soviet help. A modest Russian loan of 200 million roubles (in contrast to the more than 1,000 million spent on extra consumption in 1957) will nevertheless be forthcoming for investment in selected industries over the next three or four years. It is to be devoted to the dieselisation of railways, the development of the heavy electrical, telecommunications, instruments and roller-bearing industries, as well as to the completion of some partly finished steelmaking projects in Sztalinvaros and Diosgyör. Apart from this, planned net investment seems to be virtually zero. Expansion, it is said, must await the improvement of labour productivity (which is back at its 1952 level), and must be concentrated in branches where Hungary has clear comparative advantages. In marked contrast to the Stalinist era, the intention now is to rely on skill and ingenuity rather than on the sheer momentum of capital accumulation.

Probably in self-defence against orthodox charges of letting investment stagnate, the present leaders have cast a revealing light on capital accumulation under Mr Rakosi. They let it be known that the average age of equipment in Hungarian industry has lengthened to 18 years. While pressing on with showy new projects, the former leaders had shut their eyes to capital consumption, and never provided enough for replacement; they increased the stock of equipment by the simple device of not retiring old machinery as it became obsolete or worn out. Coupled with the misdirection of new investment into heavy industry, this preponderance of ancient equipment, dating back to the twenties and thirties, must act as a drag on the Hungarian economy for a long time to come.

Nevertheless, Hungary's remaining Communists are happy enough now with what they have got: it is a small and poor demesne, but safely theirs. It looks as though the majority of the population agrees with them; there is a widespread feeling that Russian colonial policy has become set in its ways, and people take a masochistic delight in saying how futile it is to think otherwise. Only the writers continue to resist by means of their eloquent silence. Until recently, Mr Kadar kept on appealing for the support, or at least the "positive" neutrality, of such national figures as Mr Gyula Illyes and Mr Laszlo Nemeth. But to judge by recent pronouncements in the field of "cultural policy," these have now been written off. It has even been stated that "only from the new generation, untouched by the agitations of October (1956) . . . can we expect a rebirth of progressive Hungarian literature." Much else besides is expected from that new generation.

A Fracaso in Madrid

FROM OUR MADRID CORRESPONDENT

RADIO España Independiente, the Communist station broadcasting in Spanish from behind the Iron Curtain, claims that the boycott of Madrid's public transport arranged for May 5th was a big success and a telling blow against the Franco regime. It is not surprising that the claim should be made. Communists seldom publicly admit defeat. Nor do they often miss a chance to exploit their opponent's weakness—in this instance the Spanish press and radio, which are so tightly controlled and censored that the most improbable rumours have free play throughout the land. Residents of Madrid may know what actually happened in their city on May 5th, but in the provinces there are plenty of doubters more inclined to believe, and to circulate, reports from abroad than passively to swallow the domestic, officially processed product. Thus it can be worth while for the Communist radio to tell the Spaniards generally of the success of the Madrid boycott, even though the boycott was in actual fact a failure: what the Spaniards call a *fracaso*.

Up to nine o'clock on the morning of B-Day one had the feeling that the scheduled display of collective passive resistance to the regime might develop into something quite spectacular. In the suburbs industrial workers had got up earlier than usual and were walking to work, shunning the buses and trams. But there was no follow-up to this impressive first wave. By ten o'clock it was evident that the boycott was a failure, office workers and civil servants having failed to respond to the strike call. Buses, trams and underground were carrying their usual quota of passengers. Police patrols, which had been much in evidence till then, were withdrawn. The city took on its normal aspect. When evening came, those who had walked to work in the morning threw up the sponge and rode home.

Madrid is regarded as a difficult place in which to set in motion outbursts against the regime, because of the large number of government workers who think twice about risking their jobs. The number of industrial workers is comparatively low; the middle class, though not slow to anger, is slow to action. These considerations partially explain the *fracaso* of May 5th, along with the fact that the government made a strong show of force, cancelling police leave and bringing out the grey-uniformed Policia Armada.

But there are political explanations, as well, for the lack of response to the boycott call. The non-communist opposition groups say that for quite a long time they had considered staging an anti-Franco strike in Madrid, but the Communists tried to cash in and to set the pace under the slogan: "Day of National Reconciliation." For many months the groups in opposition to General Franco have been seeking agreement among themselves with a view to forming a common resistance front which would exclude the Communists. These people say that they shelved their boycott plan and decided to let the Communists go on by themselves; and it is a fact that a good number of Spaniards who have no reason to love the regime became wary when they realised this. The fact that Radio España Independiente on May 4th urged Spaniards to "prepare for the great day tomorrow" put off a lot of people who until then were not at all clear just who was promoting the boycott. Plenty of Spaniards, disgusted with the way they are governed and angered by the rising living costs, are willing enough to take part in demonstrations against the regime, so long as these are non-violent. But they tend to avoid anything with a party label on it, and their instinct is to shy violently away from anything that appears to have been conceived abroad. The moderate opposition groups are not sorry that a Communist attempt to assume control of dissidence in Spain has fallen flat.

Arabs and Africans

ZANZIBAR really means cloves. But it is a political curiosity because it gives Colonel Nasser his southernmost nucleus of agitation. In July last year the Omani Arabs, the islands' chief landowning class, suffered a complete defeat in the first elections to the Legislative Council; their pro-Nasser Nationalisist party won only one of the six elected unofficial seats. To the delight of the East African British, who prefer their nationalism in Africa to be actually African if exist it must, the Afro-Shirazi party, under Mr Abed Amani Karume, swept the board.

On May 8th the Labour party's Africanist, Mr James Johnson, pressed Mr Lennox-Boyd in the House of Commons to give more support to the African population of Zanzibar and to the smaller island of Pemba, which is also the Sultan's and belongs to the protectorate. Mr Johnson argued that the Africans, who form 75 per cent of the population, should have more members on the legislative council. Better education should be provided for them, administration should be gradually Africanised, and the political future of the islands made plain. Mr Lennox-Boyd replied that Zanzibar was to be a "multi-racial state ruled by an Arab dynasty, whose position is supported and guaranteed by Her Majesty's Government." The Minister stated that it was too soon either to alter the composition of the council or to introduce a ministerial system.

★

Our special correspondent lately in Zanzibar writes: Sheikh Ali Muhsin Barwini, the Nationalist leader, is favoured by both President Nasser and Dr Nkrumah. Despite his eclipse in the elections Dr Nkrumah invited him and not Mr Karume to attend Ghana's first anniversary celebrations in March. The Zanzibari Arab Nationalists demand the end of the protectorate and the return to Zanzibar of Kenya's coastal strip, including the port of Mombasa, which is now leased by the Sultan to the Government of Kenya for £11,000 a year. A Nationalist victory would almost certainly mean the end of the dynasty.

Zanzibar is no Cyprus. Almost everyone is a Moslem and a Swahili-speaker, whether he originates from the African mainland or from Arabia. The distinction is not one of language or religion but between an Omani Arab land-owning minority, which opposes the British protectorate, and the African majority, four and a half times as large, which, while it wishes to secure responsible government, does not want independence at the cost of domina-

tion by Arabs. The livelihood of monocultural Zanzibar and Pemba lies neither in the Middle East nor in Africa but in Indonesia, which takes 80 per cent of their cloves to make scented cigarettes. The subsidiary industry of tourism has not excited anti-European feeling; the atmosphere is jolly in the extreme. The hotel servant will even tell you if you have soap behind your ears (almost unthinkable on the mainland). President Nasser might find Zanzibar a useful stepping-stone to Africa proper. Mr Khrushchev might like it for a winter palace. But, if the two islands are not ruined by a slump in cloves, it should not be easy for outside Caesars to disrupt the present regime. There are only two or three hundred resident Europeans in Zanzibar and Pemba.

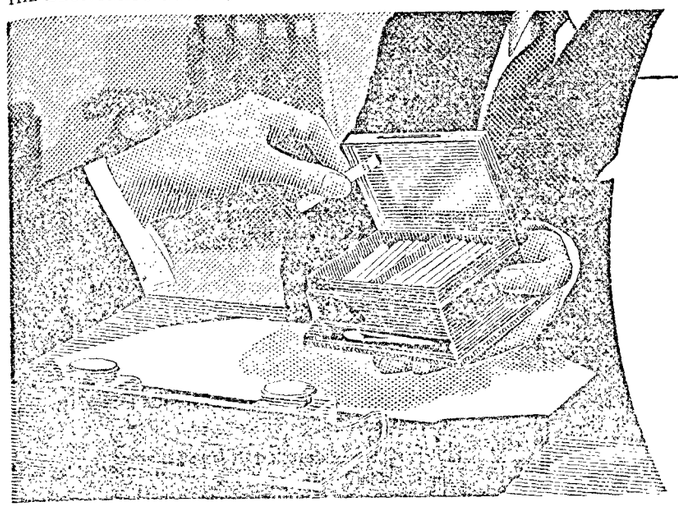
The two important economic tasks before the islands are the planting of fruit trees and an improvement in the technique of sea fishing, which would add greatly to the Zanzibaris' food supplies.

Sausage

FROM OUR BONN CORRESPONDENT

THEY tell in Germany of a dying butcher who seemed anxious to communicate a last message to the family (or maybe to all mankind). Gathered expectantly around his bed they heard the old man gasp out in unconveyable dialect: "Children, don't eat sausage!"

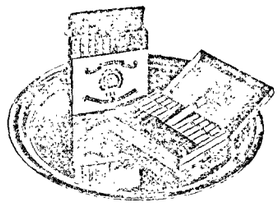
The family would not have been surprised today. For several weeks the newspapers have been reporting, many with undisguised *Schadenfreude*, the penalties imposed on butchers who have been caught alluringly reddening their galaxies of *Wurst* with the forbidden help of sodium nitrite, only four grammes of which are said to be sufficient to kill. The police have been carrying out innumerable raids up and down the land on butchers' secret places. A cartoonist has written the caption "Butchers' congress at Stuttgart" beneath his drawing of a handful of zebra-striped convicts exercising in a prison yard. The general uproar, loaded with insinuations all the more disquieting since supermarkets and ingenious packaging are still something of a novelty, has provoked the government to review the whole law affecting the adulteration of food.



To most Germans, sausage is a serious subject, as well as one of occasional merriment and figure of speech. ("It's all *Wurst* to me," is a common reaction to superfluity of choice.) The manufacture and distribution of *Wurst* and *Wurstwaren* is an important industry. In some shape or form *Wurst* accounts for just over 60 per cent of the country's total meat consumption. This is approximately 2,600,000 tons a year; of which, therefore, some 1,560,000 tons are made up of *Wurst*. The proportion was less before the war, when housewives had more time and help for coping with fresh meat. Nowadays they rely much more on this ready, manageable, and more or less durable standby in all its infinite variety. Their custom is competed for in western Germany by some 42,000 retail butchers, each with his train of assistants, apprentices and womenfolk. Some of the busier town butchers employ ten or twelve girls—often all dressed alike in *Dirndl*—slicing, weighing and wrapping at their counters.

Butchers' shops in Germany are usually so abundantly stocked, and so crowded with customers, that it comes as a surprise to learn from the statisticians that the British eat more meat. According to the latest figures of the Federal Ministry of Food and Agriculture, the west Germans are now consuming 100 lb of meat, including poultry, per stomach per year (104 lb before the war), compared with 118 lb per stomach in Britain. Indeed, Britain was Germany's largest foreign customer for *Wurst* during the economic year July, 1956 to June, 1957, buying 142 of the 357 tons exported to altogether 44 different countries. But rather than the finished article, Germany often exports the maker with his secret. Taking this tendency into consideration, it is probably true to say that the United States, which bought only 102 tons during the same period, is really the biggest foreign patron of German sausage.

The catalogue of *Wurst* deserves a Homer or a Milton to orchestrate the music of its names. Some of these evoke old cities such as Frankfurt, Brunswick, Regensburg, Nuremberg, Munich, Vienna, or Cracow; others the pleasant slopes of Westphalia, Franconia, the island of Rügen, or the Black Forest. Whatever their names the contents should be no mystery. The standard butchers' manual reveals that most *Wurst* consists of a mixture of beef, pork, ham, and various flavourings, among which are sugar, pepper, salt, herbs, and sometimes a little garlic or ginger. The difference between sorts lies mainly in the quantities of the ingredients, in the manner of blending, cooking and smoking, and in the final shape. Sometimes distinctive character is attained by using the meat of young animals, sometimes by that of older. (Hungarian salami owes its exclusive excellence largely to the meat of a special breed of pig whose export from the country is jealously forbidden. Hence Germany's "Hungarian-type" salami.) German butchers are prohibited from adding bread, soya flour, or the like to their concoctions, and the law lays down in what proportions heart, rind, lungs, and so on, may be worked into duly publicised inferior grades.



★

It has always been fairly easy, in the very nature of the business, to conceal from the ordinary buyer exactly what a sausage is made of. The trouble now is that the wider use of chemicals for preserving and colouring, along with the improvement of cutting and blending machines, have made adulteration even less discernible. The realisation that hundreds of butchers have been using, in addition to permissible doses of preservative saltpetre, also appreciable quantities of the forbidden sodium nitrite, has set the country by the ears. Suspicion has extended understandably to the whole contemporary range of prepared foods in their persuasive but often misleading wrappings and containers. What exactly are they? What has been added to keep them fresh, give them an attractive colour, or make them more tractable in the kitchen? The government has acted quickly. A draft of amendments and appendages to the Reich Food Law of 1927 (revised 1936) has already been passed from the Bundesrat to the Bundestag for further discussion. Among the changes projected is the introduction of a standard Food Book after the Austrian model (*Codex Alimentarius Austriacus*). Based on the findings of a commission on which scientists, food inspectors, producers and consumers are to be represented, the Food Book will establish a common meaning for names and newly define the limits of adulteration in whatever cause.

A matter of taste

You know just what you like in wines, spirits and liqueurs. The tastes of your business guests may be—often are—very different.

We have the closest experience of that form of hospitality. We choose the wines, spirits and liqueurs for many important companies' entertainment—have been doing so for 137 years.

If you will come to our cellars, you can taste, choose and compare. We will help if we may. You will find it a short cut to thoroughly pleasing your business guests.

If time prevents your visit, we can send someone to you who is *au fait* with all forms of business entertainment.

THE BUSINESS WORLD

Research in the Air

In a statement of five hundred words Mr Aubrey Jones on Tuesday introduced a radical alteration of the status of the Ministry of Supply, restoring to it a freedom of action and a power to make or break in the aircraft industry that it has not enjoyed for some years. The government, he said, "intend to continue to make a financial contribution to aeronautical research in the expanding field of civil transport where this is not already covered by the research necessary for defence purposes." Being translated, that might read: "The Ministry of Supply will initiate its own aircraft research programme which will be wholly independent of the service departments, including the Ministry of Defence." Mr Sandys's fourth satellite is breaking out of orbit.

This is very much the mixture as before—the tonic that stimulated the British aircraft industry to build its greatest successes and its worst failures, that gave the country the Viscount and the Brabazon. The conditions in which this policy of independent sponsorship by the Ministry of Supply is being revived are today very different; it remains to be seen whether the margins of error that made the choice between the designers' more interesting doodles such a hit and miss affair in the past will be any narrower under the new formula.

Up to a point, the changes that Mr Jones has secured are inevitable; beyond that point lies a zone in which he has retained for the Ministry considerable room for manœuvre and for controversy. It has been plain since Mr Sandys's first, definitive white paper on defence in February last year that the waning interest in manned aircraft on the part of the defence services raised a research problem of the first order. Until a year ago, designers of both civil and military aircraft drew on a common pool of knowledge, in this sequence:

(a) Theoretical calculations checked against the behaviour of models in wind tunnels.
(b) Practical trials building a small research aircraft to the new theory.
(c) Embodiment of best features in "revolutionary" new military aircraft.
(d) Military experience incorporated in new civil airliner.

Between (a) and (d) there may be twenty years. But the services now have no requirement for manned bombers or high performance fighters to replace those in production and no assistance to offer to designers of civil aircraft on problems of structure, shape, take off and landing, and navigation.

This creates the situation in which the Vickers-Armstrongs Swallow was cancelled. This was a research aircraft in category (b), a small-scale prototype intended to test the theory of Dr Wallis that a fast, long-range aircraft could be greatly reduced in size, and greatly improved in performance if its wings could be moved from the straight to sweep back at a sharp angle during flight. If this idea worked, stage (c) of the programme was to have been a "third-generation" bomber to replace a manned supersonic bomber that was to replace the V-bombers. But ballistic missiles came into fashion and manned bombers went out. The Swallow lost its immediate purpose and hung on as a research project for a few months until it was cancelled last August. Cancellation followed automatically from the fact that all research done by the Ministry of Supply was obliged to have a military sponsor. (It was also inevitable because of the ambitious scale on which the Swallow was conceived.) Yet Mr Sandys's decision to buy no more bombers does not decide the merits of Dr Wallis's calculations about aeroplane shapes, which may still be of great importance to future airliners. So are many other matters, such as laminar flow, vertical take-off, kinetic heating and high speed flight.

In effect, Mr Jones has done a deal between the Treasury and the aircraft industry. He can now institute research on civil aeronautics without reference to the services or to Mr Sandys. His one limit is that the total sum to be spent on aircraft research of all kinds must remain roughly at today's (undisclosed) level. He has told the aircraft industry that the Ministry of Supply is prepared to undertake functions (a) and (b)—that is, research and the flight proving of research aircraft—if the industry will undertake sole responsibility for (d)—that is, the development of airliners—and if the companies will re-organise and re-group so

that they have adequate financial resources to carry out their promises.

This looks like a fair bargain. The industry is not hurrying to amalgamate into the two-engine companies and three or four airframe companies that is the likely limit of what the market will support, but it is at least tending to form some rational co-operative groups. One such is the Bristol-Hawker Siddeley association; another is the less clearly defined triangle between Rolls-Royce, Vickers-Armstrongs and de Havilland.

HARD facts of the aircraft business are working on Mr Jones's side. Government support was first withdrawn from the development of civil aircraft, but up to the Vickers-Armstrongs VC10 private ventures in civil aircraft still used engines for the development of which the government had paid—which is a far more costly business than developing an airframe. The engine for the jet airliner that BEA have ordered will be the first to have no Government aid, being financed wholly by Rolls-Royce. When engine and aircraft manufacturer each has a direct financial stake in the success of a new airliner they may be expected to work far more closely (and more willingly) than if the costs were being paid by the government. That incentive should be all the stronger when they are working, as now, in a contracting industry.

By 1960, if military demand for aircraft (as distinct from missiles) continues to contract at the forecast rate of 9 per cent a year, production of manned military aircraft will almost be halved. Missiles will not provide the same volume of employment and the expanding market for civil aircraft cannot take up all the slack. The government expects that the industry's employment will slip from its peacetime peak of 266,600 in January, 1957, to its pre-Korea figure of about 150,000. When this happened in the late 1940s, the government put aircraft companies on a kind of national assistance that kept them until the Korean armament boom swamped the factories with orders. This time the government actively hopes that the aircraft industry will reduce its capacity and tighten its structure. The new research policy is designed to give the industry technical help, in place of financial help.

THIS week's decisions were inevitable, if this country wished to retain an aircraft industry of international status. But, although the basic policy of the Ministry of Supply is to finance civil research and leave the industry to finance development, the door has not been shut entirely on government aid in civil aircraft development. The Ministry argues, rightly, that there are cases today, and there will be more in the future, where designs for radically new civil airliners are either too experimental or too expensive, to be financed by any one company or even by an industry-wide consortium. A current example is the Fairey Rotodyne, an ungainly cross of an aeroplane with a helicopter that might have a great commercial future, but which no airline is at the moment bold enough to order. Another could be the supersonic airliner, which will need at least two more years of discussion in committee at Farnborough. Others might be the vertical take-off airliner built around the ideas of Dr Griffiths at Rolls-Royce or a machine based on Dr Wallis's Swallow.

Here the difficulties start. There is nothing basically wrong with the reasoning, but all past experience suggests that those with high technical experience—even those at the Ministry of Supply—are not always the best judges of embryo aircraft. Like lesser men, they sometimes have to gamble, and like some gamblers they sometimes become involved and plunge desperately. No expert judgment in this field is necessarily safe or economic.

The intention is to assist individual airliners with the greatest caution, to keep it in reserve for exceptional cases. But many people feel that exceptional aircraft are not ones on which this country can afford to chance its arm. The commercial successes of the British industry have been essentially conservative aircraft, the Viscount, Meteor, Vampire, Canberra—even the Hunter, which of its kind is positively old-fashioned but sells abroad in quantity. Opinion in the industry is sharply divided on whether it is wise even to study the possibility of a British supersonic airliner.

A BETTER solution than leaving these decisions with the Ministry of Supply might be to enlist the aid of Transport Command. This operates much as any airline, except that it does not have to show a profit at the end of the year and its schedules are not seriously thrown out if an aircraft develops teething troubles en route. Nothing brings out the hidden flaws in an aircraft like normal commercial flying. The Britannia can go into service with a clean test sheet, but that does not stop a succession of minor troubles in service. The experience acquired by Transport Command with Comet IIs has made all the difference to the new Comet IV, and many people feel that if the RAF had ordered Britannias before, not after, they went into service with BOAC, their troubles would have been fewer.

The RAF, moreover, has experience of handling radically new aircraft—swept wings, deltas, high- and low- flying, sub- and super- sonic, all with different flying characteristics. Transport Command might, therefore, be a better judge than the permanent civil servants of the Ministry of Supply of a supersonic airliner on the drawing board, or one that waved, flapped, blew air on, sucked air into, or did other strange things with the standard aircraft wing. It would be the ideal organisation for trying out the capabilities and reliability of the Rotodyne. Evidence from the United States, where military air transport has been the proving ground for almost every new airliner built there, including the big jets, suggests that this is perhaps the biggest single contribution that the government can make to aircraft development.

Gentleman's Agreement On Coal

LATE in July last year Mr James Latham, deputy chairman of the National Coal Board, who was giving evidence before the Select Committee on Nationalised Industries, was asked whether Government control of the price of coal had ever contributed to the financial deficits which the board has had to show in six out of the eleven years that it has been running the British coal industry. Mr Latham was embarrassed: he had reason to be. It was not merely that an answer would disclose how many governments in the past—and which governments—by a control that has no standing in law, and rests simply upon a "gentleman's agreement," had prevented the Coal Board from fulfilling its statutory duty of breaking even, taking one year with another. At that time, Mr Latham may already have had reason to suspect that the present Government, effectively if unwittingly, had probably done so in 1957 too.

In March last year, as the board records in its annual report this week, it sought Government approval for increases in the prices of coal averaging 7s. 10d. a ton from July 1st. This increase was virtually agreed, but at the last minute the Cabinet took fright. It reduced the increase to an average of 6s. 6d. a ton, which it reckoned would bring the board an extra £32 million in the second half of 1957 and £66 million in a full year. The actual tonnage of coal sold in the months in question does not appear to have been much less than in the second half of 1956—say, 103 million tons, against about 104½ million tons the year before—which would fit into the crude arithmetic of the price increase. The board this week, indeed, made no suggestion that it in fact failed to get the extra £32 million; its emphasis was all upon unforeseen increases in costs, mainly through lower efficiency, during the second half of the year. As a result, its operating profits of £21 million for 1957 were insufficient to meet its interest charges: it showed a deficit of £5.3 million. If the Government had conceded the 7s. 10d. a ton which the board had asked for in March, the coal industry would almost certainly have broken rather better than even.

It should be admitted at once that the National Coal Board originally expected its 7s. 10d. a ton to enable it to do better than to break even; it thought the increase would provide a small surplus in 1957 and a larger one in 1958 to help finance its capital investment. Even the 6s. 6d., it reckoned at the time that it announced the price increases, would give it a fractional surplus. So the Government cannot be accused of knowingly denying the board the power to fulfil its statutory duty, as on occasion previous governments may have done.* And the fact that it denied the board a margin for self-financing which, in the event, would have been needed for a bare current balance, because the industry fell down on its budgeting, can be argued to be incidental. In any case, it may be asked, why should the board provide for self-financing? Ought the government to allow today's consumers to be mulcted for the benefit of tomorrow's?

There can be plenty of arguments about the principle of self-financing in industry, nationalised or private. But there are special arguments about what self-financing means when it is applied to coal, or any other mining industry. Conventional accounting, in the Coal Board, makes the usual arbitrary but confident distinction between current costs and capital charges. How closely does this correspond with the realities of an extractive industry?

In practice, the National Coal Board makes the usual provision for the depreciation of its fixed assets (£47.5 million in 1957, of which £37 million was on account of assets in collieries). In principle, it told the Select Committee last year, it holds that its prices should be enough to provide for replacement of its assets at current costs, regardless of the accounting convention employed: this is unexceptionable and indeed advanced doctrine for a nationalised industry. But, in an extractive industry, the maintenance of productive capacity in being takes more than that.

To maintain output at currently producing mines—and this seems to apply whether or not a pit is under reconstruction, whether it has five years ahead or fifty—requires a substantial slice of the industry's general development programme on capital account: in 1957, some £40 million out of the board's total capital expenditure of £103 million, or nearly half of the £84 million invested in collieries. That corresponded, indeed, reasonably well with what the board provided for depreciation. But against the other £44 million spent in 1957 on major reconstruction schemes which are reckoned to bring new capacity into being, one has to set off the further steady loss of capacity from old mines going out and worsening conditions, which are generally reckoned to run output down by some 4 million tons a year. Prices should certainly cover this loss too.

That, indeed, is outside any argument about self-financing as such. There, the real argument probably has less to do with how much the consumer ought to pay today for coal produced tomorrow than with the gross return that nationalised industries ought to aim at earning on their capital, in comparison with the gross return that private industry, in today's circum-

* Out of ten applications made for a price increase since nationalisation, one request was refused outright, four of the increases were for less than was requested, and five began later than the date asked for.

stances, reckons to look for before investing its money. In no year, reckoning capital at historical book values, has the National Coal Board earned more than 7½ per cent on its net assets, at times when private industry was required to show returns of about 20 per cent on total capital employed to retain good standing in the capital market. The board, in considering colliery projects, today may look for marginal returns of roughly that commercial order when it invests new capital; but it pays the Treasury only a gilt-edged rate on its new capital, as on its old.

THOUGH it may have been the gentleman's agreement with the Government that tipped the board into deficit in 1957, not even that extra 1s. 4d. a ton would have allowed it to break even this year—the collapse of demand and a much more than corresponding fall in efficiency have left it in danger of "a much larger deficit." It has stopped adult recruitment in most mines, allowing the labour force to run down by 8,000 since mid-February; that gives some saving on labour costs, its biggest single item of cost. It has cut production by ending the Saturday shift agreement, which last year produced about 11 million tons of coal. It is speeding up the closing of the highest-cost collieries. And it has frozen "non-operational expenditure" and staff establishments. Even so, Sir James Bowman this week reckoned it cannot avoid some deficit this year.

In January, Sir James was hoping not to increase prices this year—unless awards upon outstanding claims from labour force the board to do so. In certain markets and for certain kinds of coal, readily available competitive fuels have made consumption of coal more price-elastic than for many years. Abroad, price competition is bitter. It would clearly be unwise to judge the trend of demand simply upon the special circumstances of the last 18 months; equally clearly, even if expansion and cold weather should return, the industry generally has moved into a more competitive market. The prices at which it is selling are meeting some resistance; yet they are insufficient to meet costs and interest charges, and insufficient by a larger margin, as has been shown, to maintain its productive capacity intact. This does not necessarily prove that its plans for future output are too ambitious. What it does imply is that coal, like other nationalised industries, has moved into a situation where it will need all the commercial freedom to manage its own affairs that the concept of the public corporation in Britain theoretically guarantees—but which in practice, no postwar government has ever been prepared to concede.

BUSINESS NOTES

FOREIGN EXCHANGE

Prop for the Franc

EVENTS in France and Algeria have brought a little pressure on the French franc. The rate in London has moved from Frs. 1,179½ to Frs. 1,180½, the French authorities giving their currency some support. If the movement in the rate does not match the size of the crisis that now assails France, that is partly because there are few foreign held franc balances liable to sudden withdrawal, and partly because the Ascension holiday closed the Continental markets at the height of the crisis. There has also been some widening of the discount on forward francs, which are now quoted at Frs. 20 for three months, equivalent to 6 per cent per annum. This is well short of a panic rate, but the market is extremely thin and essentially "one way." The real measure of the weakness of the franc has been provided by the jump in the gold price in Paris and the weakening in the rate for French bank notes in Switzerland. On Wednesday the price of the kilo gold bar in Paris rose from Frs. 524,000 to Frs. 532,000 and of the Napoleon from Frs. 3,850 to Frs. 3,940. The rate for French bank notes in Zurich has weakened from 94 Swiss centimes to 91½ for 100 French francs.

Official sterling has been in good demand from New York this week, the rate improving to over $2.81½. On the other hand, there has been a slight weakening in the rate for transferable sterling which has slipped back from $2.7960 to $2.7945. The progress of negotiations on the wages front in Britain is being followed with nervous interest in Continental markets, and meanwhile the rebuilding of sterling working balances, which was making good progress in the earlier months of the year, has been halted. The strength of the D-mark continues to dominate the market in Continental currencies.

IN THE MARKETS

Pause for Digestion

A PAUSE for reflection in the markets was not less apparent at the opening of the new Account (which will cover the Whitsun holiday) than it had been for the previous ten days. On the gilt edged side, prices have held steady, the *Financial Times* index of Government securities improving from 82.32 to 82.53 in the week ended on Wednesday. But there is still evidence of surfeit; some of the New Zealand stock has yet to find a permanent home and there have been sellers of the medium dated British Government stocks. The remedy must be to keep would-be borrowers—principally the local authorities—waiting a few weeks until the market's dyspepsia has passed. Many local authorities, hoping for a further reduction in Bank rate, are now relying on a higher proportion of temporary money than they would wish, and rates in the mortgage market are fully firm. Nevertheless a moderate pause from gilt-edged borrowing now seems the best hope of preventing a much longer pause later in the year.

On the industrial side the new account has tempted few operators in but there too prices held a little better than steady. Over the week to Wednesday, *The Economist* indicator rose 1.1 to 182.4. The sharp drop on Wall Street on Wednesday night naturally did not help the market on Thursday morning. The flow of industrial issues could also damp down activity. Those shortly to come include the £25 million of a straight (not convertible) debenture for Associated Electrical Industries. This, if it carries a 6 per cent coupon and is priced a few points below par, should attract the institutions. But the capacity of the market to put up big money for new issues is not unlimited. The first day's dealings established a modest premium of about ½ on the Gallaher loan stock. It was well "stagged" and two and a half times subscribed, the largest public applicants receiving 20 per cent of their applications, and the largest stockholders' applications 30 per cent. The stock is obviously a useful investment and expectations are for a higher premium when the stags have finished selling.

PRODUCTION

Steel Feels the Recession

AS was to be expected, figures of steel production in April show a marked fall; at 407,800 tons a week, output was nearly 6 per cent lower than in March and 5 per cent lower than in April, 1957. Output of pig iron fell accordingly; this is indeed now more than 7 per cent lower than a year ago, because apart from the slackening in steel demand there has been a falling off in demand for foundry iron for the castings used in building.

In the first quarter of this year high demand for steel from the motor industry, which was taking nearly 50 per cent more than in the first quarter of 1957, held total steel deliveries about one per cent higher than at that time. For most other industries, except electrical engineering, steel deliveries were lower. Since the end of March there has indeed been a further sharp fall in demand.

Nor have the steelmakers this time been able to cushion fluctuations in home demand by selling more steel abroad: in the first quarter of this year exports of iron and steel were 19 per cent lower in tonnage than in the first quarter of 1957. Foreign demand for most products has continued to slacken: the one product for which the industry could still have found ready buyers was strip mill sheet—which is what the motor industry happens to be mopping up at home, and still, even, buying in substantial quantities from abroad.

KUWAIT OIL

A Costly Concession

FURTHER details now available of the agreement between the Ruler of Kuwait and the Japanese consortium, Arabian Oil, show that the Japanese have accepted from Kuwait terms that are even more onerous than those exacted by Saudi Arabia. The exclusive concession secured by the Japanese from both host governments runs for 44½ years, but if no oil is found within 4½ years it may be terminated. An annual rental of $1½ million is to be paid to each government, followed, on discovery of oil in commercial quantities, by a further $1 million a year back dated to the start of the agreement. No minimum exploration expenditures are stipulated, but the company undertakes to search for oil "with all proper zeal and diligence" and to maintain at least two drilling rigs in continuous operation offshore. Each host government has the right to appoint one-sixth of the board of directors, and to subscribe at par for 10 per cent of the capital of the company if oil is discovered.

Kuwait's share of the profits is to be fractionally higher than Saudi Arabia's—57 per cent against 56 per cent—and a production bonus of $5 million is to be paid to Kuwait (but not to Saudi Arabia) when the company achieves a production rate of 2½ million tons a year. The company has given an undertaking to both governments to operate as an integrated enterprise, carrying out its own refining, transportation and marketing, but neither agreement is specific about the share of output that may be sold outside the group at each stage of the operation. Under the Saudi agreement, the Japanese are obliged to construct a refinery after crude oil production has averaged 1½ million tons a year for a period of 90 days, and after output has reached a rate of 3,750,000 tons a year for 90 days the capacity of the refinery must be raised to not less than 30 per cent of the company's production of crude oil. This is to be no mere topping plant, but a complete refinery producing high octane gasoline, lubricating oils and other high value products, with ancillary plant for the utilisation of natural gas in the manufacture of petroleum chemicals. Under the Kuwait agreement, the Japanese also have to erect and maintain at their own expense a research institute for the study of the natural resources and water supply of Kuwait.

Each host government may buy ten per cent of the company's output at a five per cent discount for local use, and a further ten per cent at posted prices for sale to friendly Arab countries. The company must post export prices not less than those current in the Persian Gulf area—which implies that any price shading below posted prices will have to come out of the company's share of the profits. In computing the profits to be shared, however, the Kuwait government has prudently stipulated that the profits on crude oil shall be kept separate from the results of the company's other operations, which seem likely, initially at any rate, to be run at a loss. On the face of it, the Saudi Arabian agreement would allow any losses on refining, transportation and marketing to be offset against profits earned on crude oil.

PETROL PRICES

Price Cutting at the Pump

PRICE cutting in the oil industry, which is now widespread at almost every stage of the business from the oilfields onwards, and which has long been enjoyed by the large commercial consumers of petrol, has at last begun to filter through, though on a very small scale, to the dealer's pump. A few garages in the Midlands and East Anglia have begun to sell petrol a penny or twopence a gallon cheaper than the official prices recommended by the oil companies.

Oil companies look upon their sales of petrol through dealers, which they have attempted to secure against com-

petition by means of elaborate networks of tied service stations, as the one stable element in the uncertain profits they can now obtain on their refining operations in Britain. A cut by one major company in the wholesale price of its petrol is sure to be met, almost immediately, by its competitors. So it hardly stands to increase its share of the market: the cut would be profitable only if it stimulated total consumption of petrol. And because of the high rate of tax on petrol, a given price cut at wholesale is likely to induce a less than proportionate increase in consumption. The only net result, the oil companies feel, would be lower profits all round. To a large extent, the dealers have the same philosophy, and the preference of many motorists for the higher-priced premium grade petrols suggests to most dealers that they have little to gain by cutting prices.

But because some dealers have a below average throughput, their overhead costs per gallon of petrol sold are very high, and they are tempted on occasions to try to spread overheads over a larger volume by cutting prices. Dealers' gross profit margins, which range between 5d. and 6¼d. a gallon, with an additional margin of up to 1½d. a gallon for tied service stations, are high enough to make chancing a penny or twopence a gallon worth while. If other dealers were to follow the price cutters, pressure could build up for dealer margins to be re-established by a cut in the wholesale price: however, the oil companies do not expect the movement to spread far. Although the price cutter who wants special favours from his suppliers in future may be out of luck, the oil companies claim that they would not withhold supplies from price cutters, even in the case of tied service stations. Each company has the power, under the Restrictive Practices Act of 1956, to enforce resale price maintenance individually through the Courts on its own brand of petrol. But, unlike the tyre and sparking plug makers that also supply garages, no oil company has shown any desire to use this power. The shadow of the American anti-trust laws, which can reach out to British subsidiaries of American companies, may be a factor here: if the American companies do not enforce resale price maintenance their British competitors could gain nothing by doing so alone.

GERMAN BONDS

The Problem of Sinking Funds

THE sinking fund on the German Dawes loan was due to start at 2 per cent per annum in monthly instalments on Thursday of this week; the sinking fund on the Young loan is due to start shortly. So far the market has seen none of the buying that might be expected for sinking fund purposes and it would feel happier if it was clear that the sinking funds would be applied in what it regards as the proper manner. That is by purchases in the market, made presumably by the appointed agents—the Bank of England for the Dawes and Young bonds and various merchant banks for the state bonds. The principle should not be in doubt. The British Government in applying its sinking funds would never do so otherwise than by purchase in the market even if a Government department happened to hold that particular stock and wanted to sell it.

The practice may be more complex. German bonds have been heavily bought and repatriated partly on semi-speculative account in expectation of an expedited scheme of German external debt redemption, and partly because in the hands of a German resident they have substantial tax advantages. That however would not justify Germany in taking any action that might call in question the high status of its bonds in London. It seems reasonable to hope that the right course will be pursued on the sinking funds.

"EX-CIC"

A Tailor-made Shell

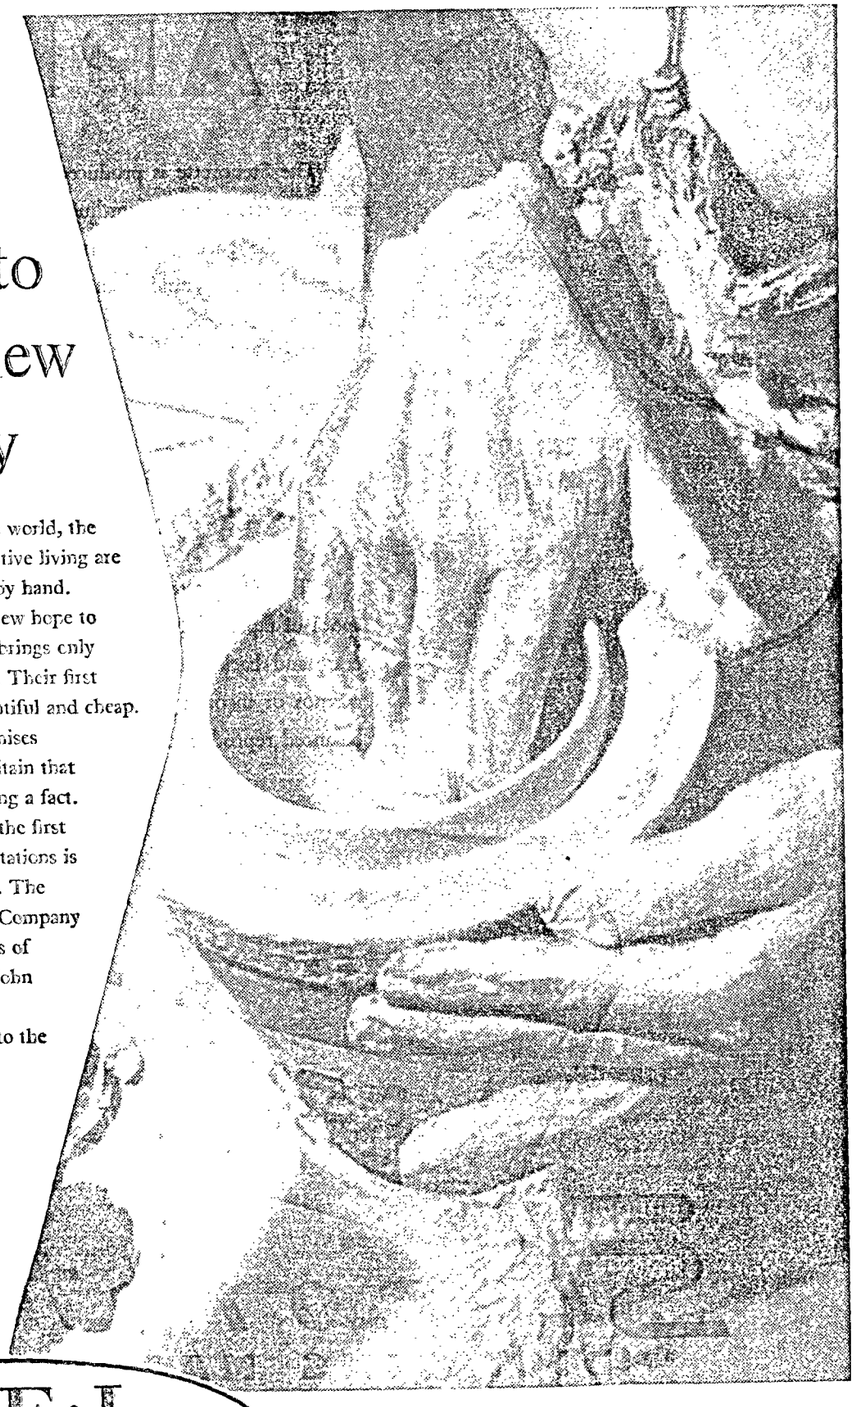
WHY search the lists for companies with too much cash? Why scrape the barrel in search of some obscure rubber company that has sold its estates? If the Capital Issues Committee will not let you make an issue, then your issuing house will make you a "shell" tailored to your own figure. The CIC turned down an application by British Relay Wireless to raise money. Now the company, following the footsteps of Radio Rentals, is raising it "ex CIC" by acquiring a shell. But it is a shell with a difference, one specially made for the job. About three weeks ago Philip Hill, Higginson and Company registered a wholly owned subsidiary—Sysbine Ltd.—with a capital of £7,500. A company can subscribe for shares in its own subsidiary without CIC consent, and Philip Hill recently put a further £1 million into Sysbine by subscribing 500,000 shares at £2 a share. (Why capital duty was not also saved by subscribing for one share of £1 nominal priced at £1 million has not been explained.) Sysbine has not traded and has no liabilities—just cash. It has now been sold to British Relay Wireless, which thus raises its £1 million.

The consideration is 900,000 5s. ordinary shares of British Relay Wireless, and £500,000 7 per cent convertible loan stock 1957-63. Philip Hill will offer the ordinary shares to shareholders of British Relay Wireless at 12s. per share as rights in the proportion of 1 for 3. Associated Television will take up the loan stock at par. Conversion rights on the loan stock permit exchange into ordinary shares at 14s. 11d. per share in September of 1962 or 1963, a price that compares favourably with the current "ex rights" price of 15s. 9d. British Relay Wireless will meet incidental expenses of £3,500.

This is the arithmetic. The premium paid for raising just over £1 million of cash is £32,500 of which £18,750 goes to the issuing house, £10,000 to the brokers and £3,750 on other expenses. The cost thus works out at about 3¼ per cent of the money raised and it is not proving markedly if at all more expensive to raise money without the CIC's permission than it would have been with it. The risk to the issuing house is the normal underwriting risk—that shareholders may fail to exercise their rights. For this service the issuing house is paid the equivalent of a commission of approximately 5d. per share on the ordinary shares. And when shareholders have exercised their rights and Philip Hill, Higginson has its £1 million back, there will be nothing to stop the formation of another subsidiary using the same money.

OVERSEAS TRADE

Britain's Trade Gap Widens



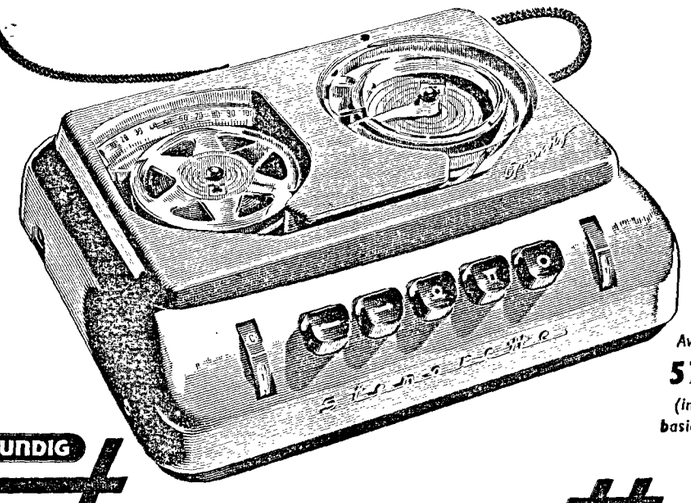
WITH both imports and exports slightly reduced in value, Britain's trade gap widened last month from £27 million to £33¼ million, according to the preliminary returns. The deficit, however, is still well below that of a

Power to foster new industry

In many corners of the world, the bare essentials of primitive living are still laboriously made by hand. Industry could bring new hope to such places; lack of it brings only bitterness and distrust. Their first need is for power, plentiful and cheap.

Nuclear energy promises such power, and in Britain that promise is fast becoming a fact.

At Berkeley, one of the first of our nuclear power stations is making rapid progress. The AEI-John Thompson Company has harnessed the skills of such mighty firms as John Thompson, BTH and Metropolitan-Vickers to the task. Today, this consortium of talents is at the service of the world.



A·E·I
JOHN THOMPSON

TAPE IT FROM HERE

The Stenorette is produced by the world's largest manufacturers of tape recording instruments. Designed to meet the pace of modern business, it has all the features anyone could want in a dictating machine *at a fraction of the cost.*

The Stenorette takes 25 minutes' dictation for each spool of tape. It has instantaneous playback, automatic erase and back-space facilities, will record conferences, memos or incoming telephone calls and provide clear, balanced reproduction for transcription.

reflects a real reduction in volume. There was a disappointing falling-off in exports to the United States in April which were 13 per cent less than the monthly average in the first quarter. Exports to North America as a whole, however, were maintained because of the rise in shipments to Canada which always coincides with the unfreezing of the St Lawrence river.

Overseas Sterling Exports

THE United Kingdom does rather less than half the visible trade of the whole sterling area. An analysis by the Board of Trade now shows what happened in the rest of the sterling area last year. Exports from this area, after rising fast in value in the first nine months of 1957, were 3 per cent lower in value in the fourth quarter than in the same months of 1956. This decrease was more than accounted for by falling prices—the same falling prices that, on the other side of the coin, have improved the United Kingdom's trade balance. At the same time imports into the overseas sterling remained buoyant. Some drawing down of sterling balances seems to be implied.

EXPORTS FROM THE OVERSEAS STERLING AREA
(Value in £ million)

	1957 totals	Changes between 1956 & 1957: First nine months	Fourth quarter	Year

* First nine months only.

The accompanying table shows that the excellent wool market in the early part of last year and its subsequent weakening was a major influence in the change in the trend of overseas sterling exports last year. Higher wool earnings were also largely responsible for the rise in overseas sterling area exports for the year as a whole, although the Board of Trade's analysis does not fully explain that rise. The figures exclude Middle East oil but include petroleum exports from Brunei and Sarawak and additional shipments from there may explain much of the remainder of last year's increase. By the fourth quarter the only other major sterling commodities showing strength were sugar, cocoa and jute.

The trend shown in the fourth quarter's figures continued, and gathered speed this year. The fall in the exports of the overseas sterling areas in the early months of this year must have been substantial. In the first quarter, Australia's exports were nearly one-third lower in value than in the same months of 1956 and South Africa's exports were reduced by 13 per cent. Wool exports from both these countries were down by one-third. The initial trade returns for this year from New Zealand, Ceylon, and Rhodesia and Nyasaland likewise show a fall in exports. *Although the fall in prices accounts for much, it does not* explain the whole of the drop. There are clear signs in these trade returns of a recession in world trade.

LOMBARD STREET TACTICS

Volte-Face in Bill Rates

LAST week's Treasury bill tender produced an abrupt reversal of the fall in bill rates that had been almost continuous since the beginning of this year. The average rate recoiled from £5 1s. 1.93d. to £5 3s. 10.81d. per cent. The apparent justification for this movement lay in the weakening of sterling during the first few days of the London bus strike ; and hence in the market argument that the long-discussed further reduction of Bank rate would have to wait upon a clearing of the horizon on the wages front. But it is far from sure that any real change of trend in rates is taking place ; purely tactical influences have played a very large part in the bill tenders in each of the past three weeks.

The key to these tenders, as indeed to most tenders, lies in the efforts of the discount market to outwit the so-called " outside " tenderers. At the end-April tender, the discount market unexpectedly halted the progressive increase in its bid that had marked the four tenders following the reduction of Bank rate to 6 per cent on March 20th. In consequence, the " outside " applicants paid more than was necessary. Then, in the following week, in order to maintain its share of the bills, the discount market brought its agreed bid approximately into line—raising its price for 91-day bills by 9d. per cent and securing roughly 45 per cent of its total applications (including a full allotment of the 92-day bills in that week's issue). Last week, by reducing its agreed price by 1s. per cent, the market again took the outside competitors by surprise ; they apparently paid much the same as in the previous week, since the average rate of discount on the whole issue was almost ⅛ per cent below the discount rate equivalent (5¼ per cent) of the agreed bid. At that bid the discount houses secured only 20 per cent of their applications—an exceptionally small allotment. In these circumstances there is clearly a possibility that the pendulum may swing again. Demand for bills remains strong. At last week's tender total applications reached £417.6 million ; this, with one exception, was the biggest tender in recent years.

DSIR

Research in Industry

THE first report of the re-organised council of the Department of Scientific and Industrial Research covers fourteen months, from November, 1956, to last December, in which much hard thinking has been done about the value of the department to industry today. When it was founded 40 years ago, the DSIR carried a scientific torch for industry; now industry's laboratories dwarf the department's. It was built up on research associations founded in the days when the scientists' most important tools were the test tube and the bunsen burner. The tempo of modern industrial research is very different.

The council is making a valiant attempt to shake out the old organisation and give it a new lease of life. Its efforts may or may not succeed, but a start has been made on three of the bigger research stations dealing with timber, food and fuel research respectively. All of the work done in these three that overlaps that of other organisations has been cut out. Responsibilities that can be more suitably taken by other organisations will go, too—for example an attempt is being made to persuade the Agricultural Research Council to take over the DSIR's Low Temperature Research Station. In principle, the idea is to leave the DSIR's own stations with work for which they are the only appropriate organisations—the report quotes air and water pollution, or road research—and with research programmes within their limited means. Industry, too, is being urged to take over more of the cost of the research associations, at present shared by the Government. A week ago Lord Hailsham criticised the electrical industry for not giving more financial support to its DSIR-sponsored research association—ignoring the fact that this industry is one of the heaviest spenders on research in its own laboratories. How much use co-operative research is to an industry depends very much on the structure of the industry, and whether firms are able and willing to do their own. The tone of the Council's report suggests that this one is the type of association that the DSIR is minded to wind up.

BUILDING SOCIETIES

Questions at Scarborough

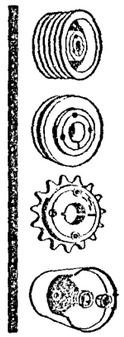
MEMBERS of the Building Societies Association meeting in Scarborough this week have seen the end of Mr Fred Bentley's memorable chairmanship and the beginning of that of Mr Alexander Meikle (the Woolwich general manager). They have again had the benefit of the Chief Registrar's report, produced as usual just in time for the conference. From outside the conference precincts, too, the most important non-member, Mr Algernon Denham, President of the Halifax, has produced his society's quarterly figures to remind members of yet another problem.

The salient figures of the Chief Registrar's report are summarised in the table below. Last year, though difficult, turned out well. Only twice had the sum advanced on mortgage been exceeded. One point of warning comes from Sir Cecil Crabbe's report. Most mortgage deeds contain power by the lending society to vary the interest rate. But the Registrar will not register a new rule providing for power to change the rate charged to borrowers unless that power is confined to cases where it is consistent with the mortgage deed. Nor can the power to vary interest rates be created by a transfer of engagements from one society to another.

	1955	1956	1957
		(£000)	
Mortgage Assets	1,752	1,879	2,026
Investments (book value)	240	275	304
Cash	57	60	59
Other	16	16	19
Total	2,065	2,230	2,408
Shares	1,732	1,909	2,079
Deposits	217	193	189
Reserves	96	101	108
Other	21	26	33
Advanced on Mortgage	394	335	371
Shares subscribed	377	378	391
Shares withdrawn	223	256	285

At first glance a net rate of share interest of 3½ per cent (equal to £6 1s. 9d. gross at the standard rate) looks attractive. Money, it may be thought, should be flowing in freely from investors. Quarterly figures from the Halifax society for the three months ended April 30th show that even in the 7 per cent atmosphere that governed most of that period it did indeed flow in well but that it also flowed out in unusual volume. The growth of the society continued; its total assets rose by £10.7 million to £354.7 million (3.1 per cent). The inflow from investors was £22.6 million (against £21.5 million in the corresponding months of last year). But withdrawals jumped from £12.4 million to £15.2 million, so that net investment was only £7.4 million, against £9.1 million and was indeed the lowest figure since the Halifax society moved on to interest parity with its competitors two years ago. The smaller pay packet with less overtime money in it must be the answer.

Another problem is now engaging the attention of building society men—reserve ratios. Mr Fred Bentley's presidential address emphasised the drop in the average reserve ratio over the past decade from 6.03 per cent of total assets in 1948 to 4.44 per cent last year. As he pointed out, over that period the association has not altered its recommendation that the ideal is 5 per cent. And though he did not make the point, the true figure, if investment depreciation were deducted from the reserves before the calculation was made, would almost certainly have been lower for the latest two years of the decade. Mr Bentley's proposal—and it is difficult to see an alternative—is that next time the structure of interest rates is revised the margin between interest charged and interest paid should be widened, so that societies may add more adequately to reserves.



VEHICLE TESTS

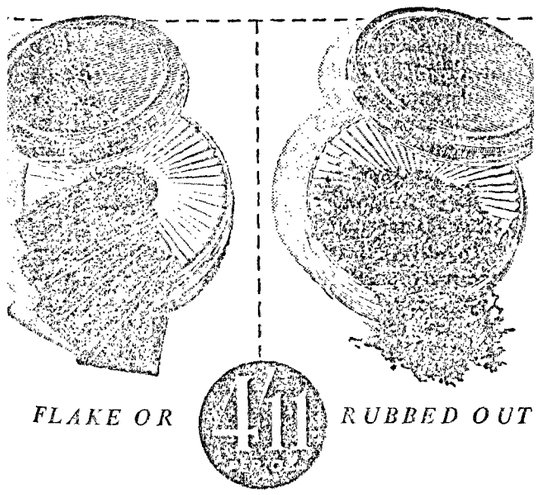
Avoiding Abuse?

THE main point of interest in the further details the Government has now published about its plans for vehicle tests lies in the safeguards it will be relying upon to prevent the kind of abuse that has arisen in other countries—where garages have also been used to conduct these tests and have made quite a good living out of repairs

Save money—
make TAPER-LOCK your standard method of fixing to shafts

Use a TAPER-LOCK Bush and fix your pulley to its shaft in less than a minute. TAPER-LOCK Bushes are interchangeable too; you can fit them to any diameter shaft. They cut out keyways, save space and have no dangerous projections.

TAPER-LOCK Bushes are off-the-shelf stock at 19 Fenner Branches. Many Distributors at Home and overseas also stock them.



J. H. FENNER & CO. LTD. HULL

Branches at: Belfast, Birmingham, Bradford, Bristol, Burnley, Cardiff, Glasgow, Hull, Leeds, Leicester, Liverpool, London, Luton, Manchester, Middlesbrough, Newcastle-on-Tyne, Nottingham, Sheffield, Stoke-on-Trent.

SCANDINAVIAN AIRLINES SYSTEM

Children of Medina, the new township near Kwinana Refinery, outside their splendid modern school.

A new township springs up in Australia

SEVENTEEN MILES south of Fremantle, the main port of Western Australia, is Australia's biggest refinery – Kwinana – owned and operated by one of the British Petroleum group of companies.

Nearby a new township has risen amid the gum trees and casuarinas of the Australian bush. Named Medina, it has been built by the Western Australian authorities as the first part of a large new town to house many thousands of people whose livelihood will be mainly bound up with oil.

This new town has been planned not only for personnel of Kwinana Refinery, but also for employees of the new industries attracted to the area by the building of the refinery, with its ready supply of fuel oil and other products.

Kwinana started operating in 1955, and can now process 3,000,000 tons of crude oil a year. Important new plant is at present being added to meet Australia's ever increasing demand for oil products.

In Australia, as elsewhere, The British Petroleum Company plans the future by taking practical steps today.

THE British Petroleum COMPANY LIMITED

found "necessary" in the vehicles they say do not come up to scratch. Many car and motor cycle owners, especially the ones running the older types that are to be brought first into the testing scheme, are not large customers for garages doing repair work—they either tackle it themselves or simply do not repair their vehicles. The Ministry of Transport opted to rely mainly upon the garage trade for its testing stations, rather than upon local authorities or its own stations such as the one at Hendon, because of the cost of setting up and running a chain of Government places, each with the range of facilities needed.

The safeguards spelled out in this week's white paper* fall into three parts. First, a testing station can lose its authorisation if the way it is being run is "unsatisfactory in any way." Among the specific requirements each station must observe, it is obliged to keep full records of each test it does, the result, any repairs it does to a vehicle it has tested, and the charge levied for those repairs. These records, and the premises, are to be "regularly inspected by technical officers of the Ministry." Secondly, a motorist whose vehicle has been failed can appeal, within two weeks, and if his appeal is successful he will get back all or part (why possibly only part ?) of the 25s. he has to send in with the appeal. The third safeguard seems, however, to strike more directly at the root of possible abuse. An owner will not be obliged to have repairs to his "failed" vehicle carried out at the garage that tested it. He will be able to drive it away (failure of the test only precludes renewal of the annual excise licence; it will not operate to keep a legally licensed vehicle off the road) and the motorist can have the repairs done elsewhere or decide to do them himself. If, moreover, he returns his car, van, or motor cycle for re-testing, or repair and re-testing, within a fortnight, or has the repairs done at another testing station, he will be able to have a free second test. These precautions might be sufficient to keep sharp practice out of this business of testing: at least it seems difficult at this stage, with no actual experience in this country of official vehicle tests, to see any obvious loopholes.

COAL

Unsold Stocks

FROM the beginning of the year to the end of April, stocks of coal in Britain have come down by about 3 million tons: but this seasonal reduction has been entirely in the stocks distributed among consumers and merchants. The National Coal Board still has more than 9 million tons of unsold coal in stocks at its own pitheads and opencast sites, in spite of the fact that production in the first four months of this year was 2½ million tons lower than a year before. In the first two months of this year the country used significantly less coal, in spite of the fact that average temperatures were much colder than in the exceptionally mild winter of early 1957. Since then, inland consumption has turned upwards; but exports have fallen by about half, and the Board's sales have been lower than in the same months of last year.

The miners did not work on Saturdays, nor will they for the rest of the summer at least; and adult recruitment has ceased. These measures are not likely to reduce production quite to the levels of declining summer consumption; coal stocks will presumably rise from now on, though not as much as usual, and since customers are certainly not short of fuel the extra coal will accumulate in the board's stocks. These cost the board 13s. 6d. a ton in the first full year they are on the ground, to cover the extra handling charge, the cost of space, and the interest on the working capital they tie up: in later years, only a few shillings a year.

* *Periodic Vehicle Tests.* HMSO. Cmnd 430.

A Surfeit in Europe

BRITISH small coals, now readily available for export to the Continent, find no trace of the hungry market that urgently wanted, but could not get, increased exports of British coal in the immediate postwar years. The demand for coal on the Continent has been affected, as it has in Britain, by mild weather and slackening industrial activity, and—to a greater extent than in Britain—by rapidly rising sales of fuel oil.

American coal, contracted for on a long-term basis when continental demand was rising fast and Britain could not supply, has helped to push up pithead stocks in the Ruhr to uncomfortable levels, and the sharp fall in transatlantic coal freight rates, which brought the single voyage rate down from 100 shillings a ton in January to 25 shillings a ton in December means that American coal shipped under one-year contracts can now sell even in the Ruhr for less than Ruhr coal. Low freights have also made Polish coal much more competitive in Western Europe, where some grades are now being offered at 30 shillings a ton below the British home price.

Imports of fuel oil, as well as coal, have gained from low freight rates, and are making sharp inroads into traditional coal markets, especially in Germany, where a sixfold increase in the consumption of fuel oil has occurred in little more than four years. Caribbean fuel oil is now selling in Germany at a lower price per ton than Ruhr coal, without any allowance for the higher calorific value of oil. And supplies of fuel oil will become more ample still as deliveries are made under recent trade agreements which provide for increasing exports of Russian crude and fuel oils to Germany and France. The Coal Board has recently sold some coal to Argentina, and has managed to sell smalls in Ireland against Polish competition (where, indeed, these

Pensions from the Firm

EIGHT and three-quarter million people (7 million men and 1¾ million women) have some provision for pensions to boost their rights under national insurance. Of this total about five million people are provided for under the private pension schemes of firms. The remainder are covered under the schemes of the public services, including the armed forces, and those of the nationalised industries.

The Survey of the Government Actuary* from which these figures are taken thus suggests that nearly half the employed men in Great Britain and Northern Ireland have an interest in an occupational pension scheme. The figure is an estimate based on a sample drawn by the Government Actuary which showed 8.1 million people—4.3 million in private schemes, 1.5 million in nationalised industry and 2.3 million in public service—covered at the end of 1956, and allows for probable growth since.

Clearly ample opportunity for the further development of occupational pension schemes remains. That in itself is a challenge to those who believe that the best answer to political pressures which would make the state scheme ever more burdensome and less solvent is to build up industry's own effort. Some gaps in the present pensions coverage are painfully obvious.

Coverage is much higher for men than for women, and much higher for the salary earner than for the wage earner. Even the firms that reported on their schemes showed that they covered only 4.3 million out of 10.2 million employees. Coverage runs down steadily from 71 per cent of salaried men through 38 per cent of wage-earning men and 34 per cent of salaried women to 23 per cent of wage-earning women. Since the 10.2 million in firms with pension schemes (excluding public service and nationalised industry) represent about half the total privately employed population, the national proportion would be lower.

What do the schemes offer to the pensioners? And at what cost? Already in 1956 about 300,000 pensioners were drawing benefit under private schemes. As the schemes mature, the outpayments will steadily increase. The pensions paid in 1956 were about £50 million, averaging about £190 a year in non-insured and about £100 a year in insured schemes. The public service, where the pension tradition has older roots, and the nationalised industries, present a different picture. There a pensioned army of 800,000 was carried in 1956 at a cost of £150 million (£188 a head).

In the private schemes the amount of the contributions greatly exceeded the pension drawings. Contributions in 1956 were £246 million, of which employees paid £72 million and employers £174 million. Both the size of the total contribution and the large excess of the employers' contribution over that of the workers, are symptoms of young pension schemes. Payments were being made by employers not only to supplement insurance company payments in the insured schemes, but also to extinguish deficiencies, notably those that arose from granting existing staff "back service" rights in new schemes.

Some of the conclusions based on information from the Inland Revenue department are striking:

> Just over half the 4.3 million employees covered—53 per cent—were in schemes administered by insurance companies and only about a quarter of the non-insured schemes include a guarantee of solvency from the employer.
>
> At least 44 per cent of the non-insured schemes and nearly a third of the insured ones are non-contributory.
>
> Normal retirement age tends towards 65 for men and 60 for women. Doubtless it has to because those are the ages in the state scheme. But a high proportion of the insured schemes and about half the non-insured ones make some provision for earlier retirement.

Most important of all is the extent to which status under a pension scheme is portable from job to job. Socially it may be desirable that labour should be mobile; and the employees' interest is doubtless to be able to take his pension with him. The employer—especially if he is paying all or nearly all the pension contributions and if he uses a generous scheme as a bait when the right sort of labour is scarce—may hold the opposite view. The picture of what degree of portability really is permitted is necessarily complicated because portability is of different kinds. No pension scheme will deprive the withdrawing contributor of his own contributions, even if he has been dismissed for fault. Some, but by no means all, allow the alternative of a deferred annuity representing the contributions. But in the private non-insured schemes only about a quarter of the members are offered any opportunity to benefit from transfer arrangements and this is almost invariably at the employer's discretion. Is this not an important factor limiting the value of non-contributing schemes?

smalls are to replace fuel oil): it can still sell anthracite abroad at a premium. But these are scattered successes. In general, the export market is at its softest since the war.

COPPER

Consumers Reject Stabilisation

IT looks as if Señor Lagarrigue, Chile's energetic copper envoy-extraordinary, has been unable to convince leading copper producers and consumers of the attractions of a price stabilisation scheme. A communiqué issued last week after the meeting called by the International Wrought Non-Ferrous Metals Council said that it was decided that the long-term interests of copper could best be served by leaving the industry free to look after its own affairs. Rejection of the stabilisation plan came as no surprise to the London metal trade, where the original proposals had been received with scepticism.

The London meeting was fairly representative of the industry. The council itself is an organisation of European fabricators and consumers. On the producing side, representatives from Belgium, Canada, Chile and Rhodesia were present. Besides discussing and rejecting the Chilean control project the meeting considered means of promoting copper consumption by extending its uses in industry.

MANAGEMENT

Work Study on the Farm

THE notion of "work study" as applied to agriculture is liable to conjure up an incongruous image of a Bedaux-trained expert, stopwatch in hand, vainly deploring the difference between the behaviour of cows going through a gate and that of car bodies on a production belt. In fact, an interesting pioneer venture just completed, for which the credit is shared between Imperial Chemical Industries and the Ministry of Agriculture, has shown that work study techniques originating in industry are eminently adaptable to the farmer's job. Apart from such purely routine work as the packing of horticultural produce (in which, given the importance of freshness, improvement is by no means to be despised) their is indeed little scope on the land for time and motion study in the narrowest sense. There is, however, no intrinsic difference between agriculture and industry when it comes to the effect, in economising or squandering human effort, of well- or ill-laid-out buildings and equipment; or, for that matter, of work-sequences carefully thought out in relation to the human energy and equipment available, or carried over haphazard from the days of cheap and plentiful hired labour. Despite all technical differences the art of management is essentially the same everywhere.

In animal husbandry in particular—on the face of it a decidedly unpromising field—the experience of the work study teams has shown that spectacular economies of labour can be achieved by comparatively simple changes: in, for instance, feeding procedures, as well as by the initially more expensive remodelling or actual re-siting of buildings. There is particular hope here for that problem child of British agricultural policy, the small farmer. He is typically forced to rely on family labour (and families, these days, are apt to get restive on a dawn-to-dusk regime) or on an absolute minimum of paid help; he is typically short of capital for major building (in spite of improvement grants) or for mechanisation; and he is often, despite a high degree of technical ability, little endowed with managerial skills—a deficiency which the existing, mainly technical, advisory services can do little to remedy. Work study cannot save the hopelessly sub-marginal farmer wholly dependent on a wildly uneconomic guaranteed price; but it should help a considerable proportion of small farmers to viability.

So far, only a handful of Ministry of Agriculture nominees have passed through the ICI training course, which was in any case a once-for-all affair; and no detailed official decision has been taken on the use, and the transmission to others, of their new expertise. The welcome which they received, not only from farmers but from farm workers, shows that this expertise meets a felt want. Applied at this point, a small expenditure of public money could exert a lot of salutary leverage.

RETAIL TRADE

Shops without Buses

THE immediate effect of the London bus strike was to empty casual shoppers not only out of the West End, which might have been expected, but from many suburban shops, too. At this time of the year, business depends very much on catching the eye of the window shopper; it is a traditionally good period for selling fashions. But the strike has kept the window shoppers at home and those who have come up to the shops are "buying customers," with definite purchases in view. The level of sales in and outside central London was noticeably lower than for the corresponding week last year and fluctuated according to whether a shop was near a tube station.

It is too early in the summer season to say that sales lost last week cannot be made up if the strike ends fairly soon, but the loss of business comes at a time when retail trade needed a shot in the arm. The Board of Trade reports that the value of sales was three per cent higher in the first quarter of the year than they were in the corresponding period of 1957, a much smaller increase than usual and at least half of this increase could be attributed to price increases. Electricity showrooms reported lower sales of all electrical equipment except water heaters and wash boilers (as distinct from washing machines). Changes in purchase tax should do something to encourage sales of big household equipment, but the Budget did nothing that might stimulate sales of clothes, which were only one per cent up in the first quarter.

RUBBER

Russia Out; Indonesia Batting

THE London price of spot rubber has come down from around 2s. in the middle of April to 1s. 9½d. a lb. The decline may have been triggered off by a legal decision in Singapore which cast doubts on the liability of speculators there to pay their losses. But a lower price level now recognises more basic changes. Russia, a heavy buyer in London early this year and more recently in the East, seems to have stopped buying; peace moves by the Indonesian rebels seem to promise that supplies from that country—

often in doubt but never really interrupted—need be in doubt no longer. A third minor sentimental influence may be the coming on stream of Europe's largest synthetic rubber plant at Ravenna. The long-term trend is clearly in favour of synthetic. As the chairman of the Rubber Trade Association pointed out last week the proportion of natural to synthetic consumed throughout the world fell from 62½ in 1955 to 56½ last year. If supplies flow freely and Russia stands aside, the depressed state of the US automobile industry does not suggest high prices.

With Russia out of the market, the nearby supplies of high grade rubber cease to command a premium, and recently forward rubber has begun to command a small premium over near dates. Russia's dominating influence on the London rubber market this year is shown in the export figures. UK rubber exports to the Soviet Union for January, February and March were 12,117, 13,812 and 19,119 tons respectively. Recent purchases have been largely in the East; about 18,000 tons is believed to have been taken in April. These figures greatly exceed the average Russian takings of around 10,000 tons a month over the last two years.

DIAMONDS

Strength of the Syndicate

MR HARRY OPPENHEIMER, making his first statement as chairman of De Beers Consolidated, spends little time on last year's achievements of record diamond sales, of a gross income of £31.6 million (against £29.8 million) and of a maintained dividend of 200 per cent. He looks mainly to the future and concludes that though the market for diamonds has weakened, the strength of the diamond syndicate is unimpaired. That strength is not merely a matter of financial resources, impressive though these are. At the end of last year De Beers held about £27 million in cash and £9½ million in gilt-edged securities; it had invested over £52 million in interests other than diamonds; and the gem and industrial marketing companies possessed in addition resources of nearly £15 million.

The demand for gems has fallen off and the central selling organisation has reduced the offerings at the sights. The market for industrials is "still very weak"—it has been hit by the American recession, by the cessation of American stockpile buying (except for crushing boart) and by a miscalculation by dealers who did not foresee the end of stockpiling and now have surplus stock to sell.

Weakness at this stage merely strengthens the need of the members of the syndicate for common shelter; it is those outside the shelter of the syndicate's umbrella who have cause for worry. Mr Harry Oppenheimer points to indications that "uncontrolled" production in Sierra Leone, though still large, is now declining and that Diamond Corporation Sierre Leone "increasingly enjoys the confidence of the African diggers." Nor is he worried by the threat of competition from the synthetic industrial diamonds (equivalent to crushing boart) produced by the General Electric Company in the United States. So far, he says, there is no question of the synthetic production of better grades of industrials and the production of synthetic gems he describes as "entirely impracticable."

Productive capacity of crushing boart in the Belgian Congo has been increased, but in present circumstances the central selling organisation does not contemplate any change of its price for boart; Mr Oppenheimer says he "would be very surprised indeed if the synthetics could be produced as cheaply as the natural stones." The syndicate's contracts, which run on to 1960, "will continue to work smoothly to the satisfaction of all concerned." Nor is he deterred from extensive and expensive developments in the Kleinzee Annex, Namaqualand and Van Rhynsdorp districts.

PLATINUM

Price Again Cut

JOHNSON MATTHEY AND CO. this week reduced the price of South African platinum from £26¾ to £25 per troy ounce. This followed a weekend cut in the official US price by $5 to $67-$70 per troy ounce, as a result of sharply reduced demand from the US chemical and electronics industries. After heavy offerings in the first quarter of this year Russian sales have abated in the past month. The state of the "free" market is such that little metal can at present be absorbed. The "free" price at about £22-£22½, against £27 six months ago, is substantially below the official quotation.

SCRAPPING OLD SHIPS

Breaking-up Yards Less Busy

THE long slump in shipping freights, which has recently been showing some glimmerings of picking up, has not made the breaking-up yards any busier. The owners of dry cargo and tanker ships have been more inclined to lay up their vessels rather than scrap them. Indeed, until the Admiralty announced its recent scrapping programme many of the thirty or so ship knacker yards in this country had been almost desperately short of work. But most of these berths are now reasonably well occupied—for the time being at least; the largest yard, that of Shipbreaking Industries, Ltd., a Metal Industries' subsidiary, at Faslane on the Clyde, expects to be busy for the next eighteen months dismantling two of the four battleships that the navy has decided to do away with. But unless a larger volume of merchant tonnage is sold for scrap soon, shipbreakers generally expect again to face a rather lean time.

The immediate problem, however, is not so much that of getting ships as of finding a market for the materials that are recovered. Roughly four-fifths of the tonnage recovered is scrap steel, and the supply of that is no longer short. Imports by the steel industry have been cut savagely, but stocks have gone on mounting. They are now half as high again as a year ago. Scrap supplied by the shipbreakers declined from 293,000 tons in 1955 to 225,000 tons in 1956, and to a lower volume still last year. As the price of ships due for breaking up is determined primarily by the demand for steel scrap and the level of freight rates, both of which are very low, scrapped vessels are now fetching only £5 a gross ton or less, against £20 a gross ton or more as recently as two years ago.

But this fall in ship prices has still not made the breaking up business a paying proposition. The yards themselves work on a commission basis under a system that has been operating since the early 1940s. The British Iron and Steel Corporation puts in the bid for merchant vessels due to be scrapped and if it succeeds (should a

PROBLEM: *To meet the demand for more efficient high capacity load handling*

SOLUTION: **Yale High Capacity Petrol Trucks**

Provide more visibility . . . stability . . . and manœuvrability

New Yale High Capacity Petrol Trucks solve the problem of heavy load handling. They solve it safely, too—by offering an exceptionally clear, unobstructed view to the operator. Power steering, power brakes and separate inching control provide fast cycle operation. Low centre of gravity, big pneumatic tyres and broad lifting base assure greater load stability. Yale High Capacity Petrol Trucks are available in capacities of 15,000 to 20,000 lbs. with choice of fully automatic torque transmission, fluid coupling or standard transmission.

All Yale Petrol, Electric, Diesel and Hand Lift Trucks are available in currencies of the Free World. All are built to the same high quality standards, no matter where you buy them. Let your Yale Sales and Service Representative help select the Yale Truck best suited to your requirements.

Licensed Manufacturer: FENWICK SAINT-OUEN, SEINE, FRANCE • MILAN, ITALY and BARCELONA, SPAIN

foreign bidder quote a higher price for a ship registered under the British flag the Ministry of Transport usually grants the necessary permission for the ship to be exported) it then allocates the vessel to one of the breaking-up yards and arranges for the disposal of the recovered material, meeting the loss on the whole transaction. This system arose out of the need to preserve all indigenous sources of scrap steel, and the corporation is still obliged to sell the recovered steel—which on average amounts to between a half and three-fifths of the gross tonnage—in this country at the controlled price. This is still some way below the world price, which often gives foreign knackers an edge in bidding for vessels.

SHORTER NOTES

Sir Robert Hall and Sir Leslie Rowan of the Treasury are now engaged in Washington in a renewal of the discussions on which they embarked last February.

* * *

Apologies are due to the Commonwealth Development Finance Corporation for the misnomer in a business note on page 430 of the issue of May 3rd.

An issue of $150 million International Bank for Reconstruction and Development 3¾ per cent Ten-Year Bonds is being made at par by an underwriting group of 179 investment firms and commercial banks headed jointly by Morgan Stanley and Company and The First Boston Corporation.

* * *

The Minister of Transport has announced that the British Overseas Airways Corporation is considering reopening services to South America in 1960, using Comet IVs. British operators have not flown on this route since the Tudors were withdrawn from service, partly because BOAC lacked the aircraft but also because neither the corporation nor the independent operators, who have been free for several years to bid for traffic rights on this route, had formed a particularly optimistic estimate of the volume of traffic.

* * *

Following a meeting of principal creditors, Penn Industries has petitioned for compulsory winding up. The petition will be heard on June 9th, application for the immediate appointment of the Official Receiver as provisional liquidator having been refused.

COMPANY AFFAIRS

MARKS AND SPENCER

GROWTH potentialities in the multiples, whether they trade for cash as does Marks and Spencer or also on credit terms like the big drapery and furniture combines, are not exhausted. Marks and Spencer's results for the year to March 31st show that. Sales by the Marks and Spencer stores rose by 4 per cent, from £125 million to £130 million, and, thanks to modernisation and rationalisation policies, gross profits from these sales rose by over 10 per cent, from £12,806,029 to £14,142,665, although in the last few weeks of the period some prices had been cut. Shareholders are not forgotten: the ordinary dividend is raised from 30 to 32½ per cent.

But that does not imply that growth will not be checked by a fall in consumers' income. And if growth continues its pace may change. The thin yield of 3.9 per cent on the 5s. "A" ordinary shares at 41s. 9d. suggests that some investors still expect the pace to be rapid. But must there not be some slowing down even for such a well managed concern as Marks and Spencer? The multiples were until recently increasing their share of total trade at the expense of the department stores and the co-operatives, but these stores are anxious to win back some of their lost trade and competition between the multiples themselves is fierce. In this struggle, it may be that Marks and Spencer found that it was aiming a little too high for custom and lowered its prices accordingly. And how far is it becoming necessary to employ the device of the "loss leader" to attract customers?

BOOTS PURE DRUG

BOOTS PURE DRUG, as a retail chemist, trades in quite a different range of goods, but as a multiple is not unlike Marks and Spencer. It also devotes much attention to layout and appearance; it is a big manufacturer of its own wares. Its growth prospects have proved attractive to investors. This year they have no cause for complaint. Profits in the year to March 31st advanced, before tax, from £4,553,998 to £5,178,510 and, after tax, from £1,990,828 to £2,095,176. The ordinary dividend is raised from 16 to 18 per cent. That increase had already been discounted and in proposing (subject to CIC consent) a one for four scrip issue the directors say the issue "carries no implications as regards future dividends." On the new dividend the 5s. ordinary shares at 21s. 4½d. yield only 4.2 per cent, for—again like Marks and Spencer—a big discount has been put on future growth.

ROLLS-ROYCE

THROGMORTON STREET seemed pleased with the 1957 results of Rolls-Royce, for the £1 ordinary stock units were marked up by 9d. to 89s. 6d. As was forecast when the two for seven rights issue of ordinary stock was made, the dividend is left unchanged at 20 per cent on the increased capital. Investors cannot have expected anything better, but the dividend yield of £4 9s. per cent implies that they do expect an expanding return from the group's massive capital programme—and expect it soon.

At the moment the emphasis is still on capital development. Last year gross revenue from sales, royalties and investment income rose from £80.6 million to £91.8 million. But costs of all kinds also rose—from £72.3 million to £82.1 million (within which depreciation went up from £1,869,051 to £2,217,677). In addition, research and development expenditure increased from £3,005,663 to £4,331,349 with the result that gross profits merely crept upwards from £5,330,543 to £5,370,334 and net profits from £2,130,543 to £2,320,334. From the net profit, £1,194,089 (against £1,267,109) was retained in the business. Indeed, to buttress capital development and research, the group held back in all about £7.7 million (against £6.1 million) in addition to the £10 million proceeds of the rights issue. The capital programme is the base for increasing turnover and Rolls-Royce remains the strongest of all the companies connected with the aircraft industry. But if bigger sales are not eventually reflected in bigger dividends, investors will grow restive.

VICKERS

"FOR the first time . . . since 1912 no new aircraft was under development for military service." That sentence in Vickers' report epitomises the changing pattern of the group's activities. It was prepared for the change and before the cut in military aircraft and other defence orders came, the directors had been concentrating on commercial orders—in particular for civil aircraft but also for the group's shipyards, engineering factories and steel works. Their foresight has paid well: last year, despite the running down of defence orders, the group's sales expanded from £163,379,000 to £202,841,000 and trading profits from £12,665,000 to £14,263,000.

In becoming less dependent upon the Government contracts, Vickers has had also to become financially more self-reliant. For a time it had to rely on bank overdrafts (on which last year it paid over £1 million in interest) but in October it launched its unhappily timed twin issue of ordinary stock and debenture stock. The calls have now been made and through these issues and through profit retentions (which included last year a provision of over £3 million, against £2 million, for development expenditure) Vickers has solved its immediate capital problem.

Compared with some other aircraft companies, Vickers is happily placed: it made the transition from defence to civil orders in good time and it has got its appeal to the capital market behind it. But it has emerged in a new form in a world, as the directors recognise, where "highly competitive conditions are likely to persist and, perhaps, be intensified in the period immediately ahead." And there has been some slowing down in the flow of new orders—for ships as well as for Viscounts. Vickers can now show orders on hand worth nearly £400 million, but it is the future trend of orders for Vanguards and VC 10s that investors will watch. On the assumption of a full year's dividend of 10 per cent on the increased ordinary capital the £1 units (now standing at 30s. 6d., compared with the rights issue price of 38s.) yield £6 11s. per cent. That is a wait-and-see yield.

BRISTOL AEROPLANE

IT may not be relevant to compare the much smaller company, Bristol Aeroplane, with Vickers. But it is a comparison that investors will make; indeed, the yield of 10.4 per cent offered by the 10s. ordinary units of Bristol, standing at 9s. 7½d.xd., on the maintained dividend of 10 per cent, suggests that they have already made it. Bristol Aeroplane has not found the transition from military orders and development aid from the Government to dependence on a highly competitive market for civil aircraft comfortable: the chairman, Sir Reginald Verdon Smith, says that orders for Britannias are "shorter than we would wish" and the company has had to meet "exceptional" expenditure in curing the icing troubles of the aircraft and in paying compensation to BOAC for delays in delivery.

Bristol Aeroplane has seen its financial problem grow during the year. At the end of 1956 the group had a bank overdraft of about £8 million. Early in the year the company made arrangements to issue £6 million of 6 per cent debenture stock "but events combined to make such a public issue inappropriate." This stock was deposited with the company's bankers as collateral security for the overdraft. By the end of last year the overdraft had grown to nearly £13.4 million and the group paid over £900,000—nearly as much as Vickers—in interest to its bankers. Sir Reginald says that the group's future operations will require permanent capital and the "first opportunity will be taken to increase the capital in a suitable manner." The outcome of this formidable task is of more moment to investors now than that the fact that deliveries rose last year from £51 million to £56 million and that orders on hand amounted to £125 million (including £61 million for Britannias).

DUNLOP RUBBER

BY declaring a final of 11 per cent, compared with 7½ per cent in 1956, the directors of Dunlop Rubber have restored the ordinary dividend to 14 per cent—the level from what it was cut to 10 per cent in 1956. After the announcement the 10s. stock units rose 1s. 7½d., to stand at 17s. 7½d.xd. and to yield £7 19s. per cent. Anything short of 14 per cent could not have been justified in the face of the 1957 trading results. Last year's trading profit of £19,859,864 compares with £15,094,662 in 1956 and with the more normal figure of £17,508,519 earned in 1955. The group's net income after tax has risen sharply from £2,734,547 to £4,144,606 and the net dividend absorbs only £1,558,557 of it.

Moreover the gathering strength of the recovery in the motor industry, Dunlop's biggest customer, is reflected in the trend of half yearly trading profits which over the last two calendar years has run as follows: £5,730,000; £9,360,000; £9,420,000; and £10,440,000. This should breed short-term confidence. For the long-term much depends on Dunlop's capital investment and research programme and in particular on its participation in the synthetic rubber factory at Fawley.

BURMAH OIL

INVESTORS regard the £1 ordinary shares of Burmah Oil as an indirect route into British Petroleum and "Shell" Transport, in both of which Burmah is a big shareholder. The income from its investments of £8,517,208 in 1957 (against £8,018,336) is higher than the company's trading profit of £6,241,411 (against £7,584,750). The quoted investments have a market value of £140¾ million (against £212¾ million at the end of 1956). The figure does not include the company's new Shell shares, though it exercised its rights. It passed its rights in the British Petroleum convertible debenture issue to its own shareholders.

In its trading business in India, Pakistan and Burma the company's affairs present a mixed picture. Last year its sales in these areas increased—as did the sale of natural gas by Sui Gas Transmission in which Burmah Oil has an interest—but, because of the Suez crisis, the cost of obtaining crude oil and petroleum products rose even though most of the company's supplies come from East of Suez. Profits therefore fell.

The company and the Government of India have reached agreement on the development of the Nahorkatiya, Hugrijan and Moran areas in Assam. A rupee company, Oil India Private, has been formed, with Burmah Oil owning two thirds and the Indian Government one third of the equity. The refineries will be government sponsored and arrangements have been made to link the first of them (expected to come on stream in 1961) with the oil fields by a 280 mile pipeline. The pipeline will be financed by a loan and Burmah Oil will provide up to £10 million towards the sterling element of its cost.

On the dividend, at 2s. 7d. tax free, the ordinary stock at 69s. 4½d. yields just under 6½ per cent.

SEARS HOLDINGS

THE yield on the "A" ordinary shares of Sears Holdings—9.4 per cent at 12s. on the maintained dividend of 22½ per cent—suggests that investors are not expecting Mr Charles Clore to provide them with big growth this year. At some point he had to pause in the building of his industrial empire and take stock. The uncertain economic outlook seems to have prompted him to do so now. Thus, even though the Sears empire holds £5,350,000 in cash, Mr Clore speaks of the need to conserve resources, to wait for "a more favourable opportunity" for expanding the group either here or in North America, and to hold down the dividend so as to retain adequate resources for "the future maintenance and development" of the businesses already controlled by Sears Holdings.

Mr Clore can consolidate his empire on a firm base, as the latest comparison in gross profits shows:

	1956	1957
	£	£
British Shoe	2,809,000	3,078,000
Bentley Group	1,643,000	2,062,000
Other interests	1,498,000	1,526,000
Total	6,150,000	6,666,000

The group's boot and shoe interests continued to do well but now it seems that the shops are earning smaller margins of profits at a lower level of trade. Furness Shipbuilding's results were better and Mr Clore notes with satisfaction the company's big order books. Alexander Findlay, makers of structural steels, earned bigger profits last year and it has a good order book, though it may be affected ultimately by the downturn in constructional activity. But the earnings of Parmeko, makers of electrical transformers, have fallen. So too did the profits of SMT Sales and of Shaw and Kilburn, who received "an inadequate supply of vehicles from Vauxhall Motors" last year. An encouraging sign is that the Bentley Group, manufacturing knitting machines, continues to hold a full order book.

Mr Clore believes that shareholders will "have no cause for complaint" in this year's outturn. But shareholders should also note that the more ambitious development plans for Furness Shipbuilding have been shelved and that Mr Clore has begun to question the advantages of having the motor distributing interests tied so closely to a single supplier.

RICHARD COSTAIN

OVER the past quarter of a century, Sir Richard Costain has made the business that bears his name one of the most powerful contracting companies in the world. At home Richard Costain owns Dolphin Square, where as a good landlord it is offering sitting tenants new seven-year leases at the now moderate price of 2.3 times the gross rateable value. The backlog of repairs will absorb all the increased rent income this year. But about 60 per cent of the business is overseas, and includes the European township for the Kariba project (finished ahead of time), an £18 million oil terminal at Kargh Island in the Persian gulf, a harbour for £4 million at Barbados, the extension to the Ijora "B" power station in Nigeria, the hospital at Ibadan, which is the largest in Africa, and the hospital at Kitwe, the second largest. Against the background of an order book which rose last year to £28 million the consolidated balance sheet total of £10.3 million was small beer. As a matter of policy the company finances a fair part on borrowed money of which it was using on December 31st £3.5 million, including £1.9 million of bank loans.

Recently the business seemed to be attracting the eye of take-over bidders. The £1 ordinary shares, 45s. last year, recently rose to 80s. But there are reasons in the small central team personally attached to Sir Richard and in the enormous value of business at any moment under negotiation that might make any bidder think twice about violent changes. If those who bought the shares a few months ago now hold them as an investment they need not feel disappointed. The gross profit is up from £425,509 to £526,851, its dividend from 10 per cent to 17½ per cent, and a one for one scrip issue has been announced. The shares now at 76s. xd. yield 4.6 per cent. Does the future justify that yield? Or has the fear of the bidders provoked the dividend increase? Though Sir Richard reports "very competitive prices" in civil engineering and declines to make estimates for the future, the conservative policies of the past amply justify some loosening of the purse strings.

UNITED DRAPERY STORES

THIS multiple group secured a further increase in turnover in the year to February 1st. It was a genuine increase based on bigger sales by established shops as well as the automatic increase arising from the opening of new shops and branches. The increase was more than sufficient to offset the rise in costs, so that trading profits rose from £6,294,939 to £7,131,877 enabling the directors to leave the ordinary dividend unchanged at 32½ per cent on the capital as increased by a 10 per cent scrip issue. These bigger sales seem to have been achieved more through the use of short term credits and other forms of instalment buying in which business has increased than through hire purchase business (which the chairman, Sir Brian Mountain, says was "maintained" over the year); the group's debtors have risen from £6,081,089 to £6,795,769.

Further growth in turnover may be harder to achieve now that the reconstruction programme is nearing completion—with less than 70 shops remaining to be converted. So far this year sales have been maintained, the fall in the sales of fashion goods being more than offset by "increases in other businesses." Sir Brian knows that the multiples "would be affected by any growth in unemployment and consequential reduction of spending power," but the proposal to create £5 million of an unsecured loan stock, bears witness to his willingness to bag more business when he judges the time right. At 24s. the 5s. ordinary stock yields 6.8 per cent.

London Stock Exchange

FIRST DEALINGS: April 30 May 14 June 2
LAST DEALINGS: May 13 June 3 June 17
ACCOUNT DAY: May 20 June 10 June 24

SLIGHTLY firmer conditions prevailed in the market as the railway negotiations progressed; small gains were made and held despite the political troubles overseas, but oil stocks suffered a sharp reverse that more than wiped out earlier gains. Government securities recovered ground lost last Thursday, but the rally was not based firmly enough to make much impression on the heavy losses suffered in the previous week. Short-dated stocks slipped back under the influence of the rise in the Treasury bill rate.

The preliminary statement from Dunlop helped a small advance in industrial stocks on Monday, but the rally failed to go farther, *The Economist* indicator improving 1.1 to 182.4. Breweries attracted support, Threlfall's advancing 3s. 9d. to 50s. 6d. xd on the increase in dividend, but Flowers eased to 11s. 10½d. on the resignation of the chairman. Eastwoods lost 1s. 10½d. on the cut in dividend, but John Mowlem jumped to 63s. 9d. xd on the satisfactory results. Motor shares weakened on the strike at the Pressed Steel Works, but showed little net change over the week. ACV declined to 33s. 1½d. on the dividend reduction, and Raleigh lost 1s. 6d. to 26s. 10½d. xd on consideration of the trading outlook. Aircraft shares eased on the Minister's statement on the future of the industry. Among textiles, Crosses and Heatons fell 1s. 7½d. to 10s. xd on the dividend cut, but tobacco shares were consistently better, Gallaher improving 1s. to 26s. 7½d., while the new loan stock established a premium of ½.

British Petroleum fell 6s. 3d. on Tuesday and Wednesday, but was only 1s. 10½d. lower on balance. Shell fell 6s. 10½d. to 138s. 9d. and Royal Dutch 1 3/16 to 16 1/8. Kaffirs returned to favour and made persistent gains throughout the week until Thursday, but platinum shares eased on the price cut.

[1] Electricity production in New Zealand represents deliveries only and in Canada, prior to 1957, excludes industrial generation for own use. [2] Copper and tin refer to metal production. [3] General trade (including re-exports) except for Canada, which is special trade only. Imports are cif except for Australia, Canada and S. Africa which are fob; exports are fob. Trade for India includes that going by land; annual figures for India are for 12 months beginning April 1st of year stated and for Australia 12 months ended June 30th. [4] Gold and foreign exchange holdings are those of the government and central bank; only figures for Australia include holdings of commercial banks. Cost of living for S. Africa and S. Rhodesia relates to Europeans only and for S. Africa includes direct taxes. [5] Including foreign investments. [6] Including semi-processed gold. Beginning January, 1955, including South-West Africa. [7] In July, 1948, part of holdings was transferred to the State Bank of Pakistan. [8] April, 1948—March, 1949. [9] Including some long-term securities. [10] Prior to 1957, excluding industrial generation for own use. [11] Average for fourth quarter.

Financial Statistics

EXCHEQUER RETURNS

For the week ended May 10, 1958, there was an "above-line" surplus (after allowing for Sinking Funds) of £53,725,000 compared with a surplus of £20,332,000 in the previous week and a surplus of £18,835,000 in the corresponding period of last year. There was a net expenditure "below-line" of £15,667,000, leaving a total deficit of £36,511,000 compared with £5,801,000 in 1957–58.

THE MONEY MARKET

THE discount houses made a dramatic reversal in their tactics at the Treasury bill tender on Friday of last week. They reduced their bid price by a full 1s. to £98 13s. 9d. per cent, marking an increase in the discount rate of 4s. per cent. No corresponding adjustment was made by outside applicants. Total applications rose further, by £15 million to £448 million, but this was more than offset by the rise of £30 million, to £250 million, in the allotment. Yet the allotted portion of bids at the market's common bid fell from 40 to 20 per cent; and the average rate of discount on the whole allotment rose by 2s. 8.9d. (just over ⅛) per cent, to £5 3s. 10.81d. per cent.

As credit conditions in Lombard Street have become more stringent in the past week, the adjustment in the market's dealing rates has been a little larger than the change in the average bill allotment rate—though still much smaller than the rise in the market's own (common tender) rate. Dealings in July and August maturities have generally been at 5⅛ per cent, though the market conceded 5 3/32 per cent on Monday, when one or two houses were "in" the Bank for a trifling amount despite moderate special help; while on Wednesday, when credit was plentiful and the market experienced an unaccustomed surplus of funds, some banks bid down to 5 3/32 per cent. Previously, credit had been consistently short, the authorities giving special relief.

MR N. R. CRUMP ON COMPANY'S WORLD-WIDE REPUTATION

The Annual General Meeting of the Canadian Pacific Railway Company was held on May 7th in Montreal, Mr W. A. Mather, the chairman, presiding.

The President, Mr N. R. Crump, addressing the meeting, said:

This Seventy-seventh Annual General Meeting takes place in a much less favourable economic climate than has been experienced for some time. As your Directors pointed out in their Report for 1957, the results of all phases of operations were affected by a lessening in the forces of expansion which had been so strongly at work in the economy during the previous two years. While there are as yet no indications of a return to the 1956 level of business activity, neither are there grounds for believing that present conditions reflect any thing but a pause in the long-range process of bringing more and more of Canada's tremendous resources into production.

The effects of the change which we are experiencing in the tempo of business have been more serious for some industries and some areas than for others. Your railway transports the materials and products of industry and agriculture, and its freight traffic is sensitive to fluctuations in their purchases and sales. The full significance of the current decline in traffic does not stand out in the comparison of revenues of the first quarter of 1958 with those of the same period last year, since first quarter revenues in 1957 were abnormally low owing to the nine-day strike in January of that year. Compared with the first quarter of 1957 there has been an increase of $4.6 million in railway revenue, but compared with the first quarter of 1956 there was a decline of $2.4 million, in spite of the higher level of freight rates. Carloadings have recently been running about 8 per cent below 1957. While it is hoped that the decline will lessen in future months, the present trend indicates a level of traffic for 1958 approximating that of 1954. The comparison of net earnings in the first quarter of the year is also affected by the 1957 strike. Because of it, the net in January this year showed an increase of $4 million. In February and March, however, there was very little change from last year, and provided we are not burdened with still higher wages and prices, this may well be the pattern of results for the balance of the year.

DEVELOPMENTS IN RATE AND LABOUR MATTERS

On April 29th the Governor in Council, in a decision on an appeal by certain Provinces, rescinded the increase of 3.6 per cent in freight rates authorised by the Board of Transport Commissioners in a judgment issued in December last. At the same time the Cabinet decided to direct the Board in future to disregard provisions for tax equalisation reserve as charges to expenses in determining rates. This directive will nullify for your Company benefits of the provisions of the Income Tax Law which industry generally is free to enjoy.

The demands for increased wages and additional fringe benefits of the non-operating employees are still before a Board of Conciliation appointed by the Minister of Labour. The Board's report will likely be made in June. These unrealistic demands have formed a pattern for similar demands from Unions representing operating employees. Your Company has taken the position that in view of the existing economic conditions, present contracts should be extended unchanged for a period of one year.

The collective agreement with the firemen's Union provided for its amendment by re-negotiation in the light of and immediately following the issue of the Kellock Royal Commission Report. The firemen's Union took the position that nothing in the report was acceptable to them and accordingly no agreement could be concluded. Under the authority of Federal Labour Law, your Company, on March 31st, gave formal notice changing the terms and conditions of employment of firemen so that as and from that date firemen were subject to the terms of the notice and not to the collective agreement in regard to manning of diesel locomotives, payment of arbitraries and mountain differential. The notice established that the terms and conditions of employment of firemen should, from May 11th, be in accordance with the findings of the Kellock Report.

On May 1st the negotiating Committee of the firemen's Union issued notice of a strike on May 11th, and on behalf of your Company an offer was made to resume talks within the principles and framework of the Royal Commission Report. This offer was refused. The purpose of the Royal Commission was to bring the diesel dispute on Canadian Pacific to finality. The adamant and irresponsible attitude of officials of the firemen's Union has been difficult to understand. Your Company does not intend to allow the firemen's Union again by strike action to prevent its employees from working. Shippers, the travelling public and all employees have been informed that railway operations will be continued. The diesel dispute has now become an issue between the Canadian people and the firemen's Union.

FINANCIAL COMPARISONS 1957 AND 1928

The Annual Report which you received early last month contains a comprehensive review of the activities and the results of the year 1957, and in many instances provides comparisons with 1956 and other recent years. However, for a better perspective of our progress—and our problems—one needs to look back over a longer period. I think it might be useful, for example, to compare the present position of your Company with what it was thirty years ago.

The first striking change that has taken place is in railway revenue, which is more than double that of 1928. Railway expenses, however, have gone up at an even faster rate, and are two and one-half times as great as they were in 1928. As a result of this disproportionate change, net earnings in 1957 were less than three-fourths of the 1928 figure, and the ratio of net earnings to revenue was less than half of what it was three decades ago.

In contrast to the change in railway net earnings, other income over the same period has about doubled. Hence the proportion of total income provided by your railway enterprise dropped from 80 per cent in 1928 to around 60 per cent in 1957. Fixed charges have remained virtually unchanged, and net income after fixed charges, despite the substantial monetary inflation and increase in investment that has taken place over the period, remains today at about the same level as thirty years ago.

The lower level of income derived from the railway enterprise occurred in the face of a substantial increase both in the investment in railway plant and in railway service performed. Net railway property investment has increased some 40 per cent over 1928, and freight ton miles have gone up 50 per cent—from 18 billion in 1928 to last year's total of 27 billion. This 50 per cent increase in freight traffic was carried with 10,000 fewer freight cars and 500 fewer locomotives than were required in 1928. This was achieved through an increase of some 5 tons in the average car-load, an increase of 13 miles in the average daily mileage of freight cars and an increase of 300 tons, or 50 per cent, in the content loading of the average train.

Behind this record of operating progress is the story of large expenditures on more efficient equipment, tools and facilities. Since the last war, $150 million has been spent on 800 diesel locomotives, $300 million on some 40,000 modern freight cars and $100 million on 650 units of new passenger equipment. Another $250 million has been spent on such things as the installation of heavier rail and other track material, and on treated ties, on modern signalling systems and yard layouts. A recent study has established that these expenditures, totalling $800 million, resulted in maintaining in 1957 a level of operating expenses which was about $75 million below what it would otherwise have been. Without the benefit of these savings your Company would today be in a most perilous position.

THE CHANGED PATTERN OF TRANSPORTATION

Obviously some radical changes have been taking place during the last thirty years in the economic environment in which the railways operate. Virtually the whole field of transportation has altered. The change has been so fundamental that there can be no possibility of a return to the former situation—yet our national thinking about transportation problems is not free of concepts that belong to that dead past.

In 1928 most of the Country's transportation was handled by rail and water carriers. There were few paved highways, automobile ownership was limited, and motor trucks played a small and unimportant role. Commercial airlines were of no significance and there were no pipelines.

Compare that with the situation today. There are now more than 200,000 miles of surfaced highways, three million passenger cars and just under one million trucks, as well as 1,800 commercial aircraft, some 6,000 miles of petroleum pipelines and a similar mileage of gas pipelines. As a result of this transformation, the railways now carry only some 57 per cent of the total intercity traffic measured in revenue freight ton miles, as compared with 84 per cent in 1928.

Private and common highway carriers, on the other hand, have increased their share of traffic to 12 per cent, from the one-tenth of one per cent they handled 30 years ago, and pipelines now account for about 12 per cent. Railways are thus very far from operating under monopoly conditions and are now only one among a number of agencies in active competition for the traffic of shippers and travellers.

This could be a very healthy and desirable situation, since competition can be expected to lead to improvements in services, to an increase in the range of services available, and to lower costs through utilisation of the most efficient forms of transportation. Unfortunately, however, the attitudes of many sections of the public towards railways, and a great deal of the regulatory legislation on the books, are products of the era before competition had developed. The effect of failure to recognise and accept changed conditions is that the railways continue to be hobbled by restrictions and limitations of a seemingly infinite variety, and are hampered thereby in competing effectively. Let the average businessman, harassed by the problems which he considers normal for his business, imagine what it would be like in addition, to have his range of action and adaptability narrowed by procedures and formalities conceived prior to the turn of the century. Let him imagine how his difficulties would mount, and his effectiveness decrease, if his flexibility in coping with market and competitive conditions were curbed by an array of time-consuming requirements in connection with nearly every basic decision relating to the conduct of his affairs; if he were required to spend long months justifying his need to increase prices and then have the award of the regulatory authority suspended and later rescinded; if he were at the same time required to justify his course of action in lowering some of his prices to meet competition; and if all the while his competitors were free—as he was not—to pick and choose their customers as well as to adjust prices.

A study of transportation in Canada prepared for the Royal Commission on Canada's economic prospects refers at some length to these artificial handicaps from which railways suffer in the competitive struggle, and notes specifically—and this applies not only to rates but to many other aspects of operation as well—that "regulation is more restrictive for railways than for other carriers and, more important, is becoming more onerous with the growth of competition."

Now it would be quite unrealistic for me to suggest that our national transportation problems would all be solved if only we enjoyed the greater freedom of action and the more sympathetic attitude to necessary changes which are so highly desirable. But it would also be unrealistic to deny that improvements in these respects are an essential condition for progressing toward a rational and healthy transportation system. Since a system of this kind must be maintained in the interests of all groups in the community, whether producers or consumers, it is to be hoped that increasing evidence of understanding and support will be forthcoming in our efforts to achieve it.

TECHNIQUES FOR TOMORROW

For its part, your Company continues to plan for a future in which full use is made of whatever new techniques and advances in technology will improve services or restrain costs. With regard to technological developments, however, there are many which hold great promise but require vast outlays of capital. Such outlays can only be undertaken if the climate is a favourable one for the new investment required.

In a number of important ways the nature of the requirements of our customers has been changing over the years. Regularity of service is now a more important consideration than ever before and speed, frequency and flexibility have taken on new values. In the light of these new demands, new combinations of the elements making up transportation service have had to be devised, and still further shifts will have to be made if we are to do an efficient job.

Track and yard layouts which were formerly satisfactory will no longer do. In their place we must plan for yards in which cars can be classified by fully automatic operation and where switch engine movements can be expedited by use of radio communication. Terminal facilities which are located in the heart of large urban centres are proving to be uneconomic and our research into the whole problem of terminal operations has already yielded important operating savings and is expected to produce additional economies as the various recommendations can be implemented. Methods of loading and unloading require careful investigation to uncover possibilities for improvement. The probable value of special purpose freight equipment has to be assessed. Consideration is also being given to variations on the idea of the demountable freight container—of which trailers-on-flat-cars are one special type.

RAIL-HIGHWAY SERVICES EXPANDED

The setting up of a separate "piggyback" department of your railway last year gave official recognition to the importance of this recent development in transport technique. The railway industry on this Continent has found it convenient to classify its piggyback activities broadly into the following two generally accepted categories:

Plan 1.—All-rail piggyback service—under which the railway carries its own trailers which contain its own rail-billed traffic.

Plan 2.—Highway motor truck "for hire" carrier piggyback service—under which the railway carries the trailers of licenced "for hire" truck operators.

Canadian Pacific first entered the piggyback field in December 1952, with the establishment between Montreal and Toronto of an all-rail piggyback service. This service was subsequently extended to Hamilton and London. In October, 1957, your Company inaugurated a highway motor truck "for hire" carrier service between Montreal and Toronto. In February of this year Saint John, NB, was added and more recently Ottawa, Fort William, Dryden and Winnipeg.

Your Company is engaged in still another type which we can refer to as Plan 3—under which the trailers of your wholly-owned trucking subsidiary, Canadian Pacific Transport Company, Limited, containing truck-billed traffic, are moved in piggyback service. As you will see, our Plan 3 is really a wholly-owned Plan 2. Your Company inaugurated this type of service between Winnipeg and Regina in July, 1954. The following year it was extended by the addition of seven terminals in Western Canada and in 1956 two more were added. Today the trailers of your subsidiary, Canadian Pacific Transport, are moved in piggyback service between Winnipeg and Vancouver and nine other important cities in Western Canada.

The growth of your highway operations is typical of the way in which your transportation system is being adapted to modern conditions. Canadian Pacific Transport Company Limited, which was incorporated in 1925, was expanded, beginning in 1947, to provide shippers with the benefits of a co-ordinated rail and highway service. Today your road transport services in Western Canada use a fleet of 500 trucks and trailers in covering some 3,000 highway miles.

In order to round out its highway freight facilities, your Company recently acquired a controlling interest in Smithsons Holdings Limited, which Company owns Smith Transport Limited, the largest trucking Company in Canada, whose operations together with a number of affiliated companies in the highway transport business in Eastern Canada extend from Nova Scotia to Manitoba.

FIFTEEN YEARS OF CANADIAN PACIFIC AIR LINES

Still another phase of the advantages inherent in new forms of transportation is in the development of air services under the Canadian Pacific banner.

As early as 1919 an interest in the possibilities of aviation led your Company to seek a Charter from Parliament giving it the right to own and operate aircraft within and outside Canada. In 1930, in order to assist in Canadian air development, your Company joined in putting up capital for Canadian Airway; and beginning in 1939, following a survey of private lines operating generally in a North-South direction, a policy was followed of integrating those lines into a co-ordinated system. This resulted in the organisation in 1942 of the present Canadian Pacific Air Lines.

Initially the major emphasis had to be placed on services into Canada's Far North, and the record of your Air Lines in pushing back the new Northern frontier, parallels in many ways that of your railway in pushing Westward three-quarters of the century before. The intrepid "Bush-Pilots" who first visualised the significance of the airplane for Northern development have given us another of those great national legends certain to grow with the full recounting of their exploits, and it is a source of pride to your Company that many of these pioneers continue to service Canadian aviation in a variety of capacities under the CPA flag.

More recently your Air Lines entered the field of international air service, and here, once again, the pioneer aspect was present, for the routes available were principally those in which no other Canadian air carrier was interested. Today Canadian Pacific Air Lines has the world's seventh largest route pattern, flying over 44,000 route miles and serving a dozen countries in five continents.

With the entry into service of its six Bristol "Britannias" your Air Lines expects to score another first in serving all its international routes with these 400 mph long-range turboprop airliners.

As a natural outgrowth of success in providing international air service, and in view of the rapid growth of demand for air travel, it was thought timely last Autumn to seek the right to provide some of the additional services which are required within Canada. The willingness of the Government to permit the Air Transport Board to decide on this application on the merits is a welcome recognition of the coming of age of Canadian aviation.

Your Air Lines has sought authority for five East-West mainline routes, each with daily service, and is prepared to assign a fleet of 15 Super DC-6B Empress Airliners to them. These aircraft, which combine first-class and tourist accommodation, carry up to 72 passengers and cruise at 300 miles per hour.

The route pattern was planned so that there would be a minimum of duplication of then existing trans-continental services. Direct non-stop services were proposed for the first time on several of the routes, and among these would be the first service to link Ottawa, Saskatoon and Vancouver via Calgary, and Edmonton-Regina to Toronto.

STEAMSHIPS AND THE SEAWAY

Originally the linking of Europe and the Orient with Canada was undertaken by your steamships when flying was still only a dream. Your Company entered the ocean steamship field shortly after its trans-continental rail line was opened, in order to develop traffic for the struggling railway enterprise. Ever since, the Canadian Pacific House Flag has flown over cargo and passenger ships that provided on the High Seas those standards of service which were first set for your railway.

Today a fleet of three "Empresses" and seven "Beavers" operates on the Atlantic carrying passengers and freight on scheduled sailings which average better than two per week between Europe and Canada. Cruise Services to the West Indies and South America are operated during the winter season. Two of the "Empresses" are new ships which have won for themselves an enviable reputation among travellers. A third new ship, to be the largest and finest of the "Empresses" and specially designed for both North Atlantic and Cruise operations is now on order for delivery in 1961.

The freight traffic potentialities of the St. Lawrence Seaway are being carefully studied. Two chartered ships were operated by your Company last season between the United Kingdom and Great Lakes ports and two additional ships will operate on a similar basis this season. As this situation develops, a decision will be made as to what should be the role of Canadian Pacific Steamships on this new inland waterway.

AN INTEGRATED TRANSPORTATION COMPANY

Even this brief review of the activities of your Company in the various spheres of transport should serve to point out that the search for greater efficiency and for the best means of meeting the transportation needs of the Country goes on continuously.

Surely it is the worst kind of anomaly that success in this search should have yielded nothing in the way of an increase in over-all financial returns. Indeed, in the past few years it has required our utmost effort to hold railway earnings to their present level—which, as you all know, is shockingly low.

The reasons for this have been clearly stated in successive Annual Reports and in remarks at Annual Meetings. The fact is that the financial necessities of your railway have only been met by the substantial diversion of income from non-rail sources, to the detriment of the over-all corporate position.

Your railway is not alone, of course, in suffering from the ill effects of outdated public policies and extreme labour demands. While there are important differences between the railways in the United States and our own, I should like to point out that the present financial condition of US railways is considered to be so serious that a Senate Committee has been conducting hearings on what is described as "The deteriorating railroad situation," and has received recommendations from the Administration for assistance in solving the problems of the railroads.

It is our hope that while there is yet time, labour, the Government, and the public at large will give us the co-operation necessary to prevent the railway situation in this Country from deteriorating to any such serious extent. There is encouragement in the fact that the recent Report of the Royal Commission on Canada's economic prospects contains recommendations on transportation which are directed to improving the condition of Canadian railways.

The fine reputation established by your Company as a carrier by sea and by air, as well as by land, is world-wide and has been, I think, well earned. What has been accomplished so far is the foundation on which we expect to build further. As in the past, imagination and ingenuity will be required in discovering and in putting to use the best technology and techniques in every type of transport.

No development of any kind so far leads us to think that the railway will be supplanted as the basic medium of mass transportation. It is of interest to note, moreover, that of all forms of transportation the railroad train, being already guided by the rails, appears to lend itself most readily to automation.

It is hazardous, of course, to forecast the shape of things to come. I can only voice my confidence that whatever great and revolutionary advances may lie ahead in the field of transportation, your Company will keep fully abreast of them.

In carrying out its functions as an integrated transportation Company Canadian Pacific will continue to use to best advantage the low-cost, high-volume features of the railroad and of ships, the flexibility of the motor vehicle, the speed of the airplane. For all these media the goal will be to handle traffic even more economically, more safely and comfortably with greater dispatch and fewer interruptions than is possible today.

In reaching this goal we will need unstinted support born of a genuine understanding of our problems. Such support on the part of the public and co-operation from shippers have been abundantly evident on some recent crucial issues. We gratefully acknowledge this and are led to hope that it signifies a new awareness which is indispensable to our future progress.

The report and accounts were adopted.

TAYLOR WOODROW LIMITED

PROGRESS MAINTAINED

The twenty-third Annual General Meeting of the Company will be held on June 5th in London.

The following is an extract from the circulated review of the Chairman, Mr Francis Taylor: The accounts for the year show a considerable improvement in that our profit before taxation for 1957 were £1,284,673 compared with £840,651 for 1956, an increase of 53 per cent. The profits have again been affected by the favourable settlement of certain major contracts.

In view of these results, the Directors are recommending an increase in the Dividend and therefore, it is proposed that the Final Dividend shall be 7½d. per share, making a total of 1s. per share on the Issued Share Capital as against 6d. per share for the previous year paid on half the present Ordinary Capital.

The turnover of the Group in 1957 was £22½ million, an increase of almost 10 per cent, compared with the 1956 total of £20 million. These totals include the turnover of Subsidiary Companies but not of Associated Companies, which, I am pleased to say, also show progress.

AT HOME

Building and Civil Engineering: Last year I referred to our collaboration with The English Electric Company Limited and Babcock and Wilcox Limited in the design and construction of nuclear power stations of the gas cooled graphite moderated type. Our *Group in association with the Central Electricity Generating Board* has designed the world's largest nuclear power station, Hinkley Point, and it was a welcome reward for much hard work when last September this design was approved and our joint tender for the construction of the station accepted.

Work on this project is now well in hand and there is no doubt that the excellent start on construction was facilitated by the speed *execution of our contract* with the Somerset County Council for the six mile access road to the Hinkley Point site.

Our other major power station works at Castle Donington, High Marnham and Northfleet are all progressing well and are in advance of schedule.

Arcon Export and Home: 1957 brought *further advance in the volume* and value of Arcon Structures sold overseas. At present enquiries and prospective orders in the Home and Export markets continue at a reasonable level.

The research and development undertaken in our laboratories at Southall, coupled with the studies which we are continually making both at home and abroad of new techniques materials and equipment are helping to secure our future.

One of the assets of any business organisation is a loyal and efficient team, particularly is this the case where there is a *reservoir* of young and ambitious men and women. We *are most fortunate in having an encouraging* proportion of loyal and keen young people. Much time and thought is given to their technical education and training.

The statement concluded with a review of *overseas activities.*

THE NORTHERN ASSURANCE COMPANY LIMITED

CHAIRMAN ANNOUNCES CONTINUED GROWTH

RECORD "LIFE" BUSINESS

The one hundred and twenty-second Annual General Meeting of The Northern Assurance Company Limited will be held on June 6th in Aberdeen.

The following is an extract from the Statement by the Chairman, The Right Honourable Lord Glenconner, which has been circulated with the Report and Accounts:

Including the proceeds of the issue made in March, 1957, the total resources of the Northern Group increased during the past year by over £11.5 million, to a figure of £86.9 million, while only three years ago they stood at £62.5 million.

PROGRESS IN REORGANISATION

During 1957 considerable progress was made in the reorganisation of the Group, together with mechanisation of the accounts, to facilitate the handling of this increasing business and to improve efficiency. In particular, five more group branches were opened during the year, at Belfast, Birmingham, Croydon, Edinburgh and Leeds. We have also taken a lease of a new block of offices at 29, Gresham Street, near to the London Head Office at No. 1 Moorgate. We have christened this new office Northern House and it provides accommodation for the head offices of the London and Scottish and White Cross Companies, as well as for a number of Northern staff. As a result we have now also been able to merge the London and Scottish motor department with the joint motor department already serving the Northern and the White Cross, so that we now have a single department underwriting motor business for the Group as a whole.

Good progress has also been made on buildings in a number of other main provincial centres, including Liverpool, Newcastle, Nottingham and Bristol.

ACTIVITIES OVERSEAS

This year we celebrate the centenary of our activities in Australia, and it is a happy coincidence that our new building in Sydney is to be opened this year, where it will provide a suitable headquarters for our business in New South Wales. This new building will also be the head office of a new life assurance company to be known as the Northern Life Assurance Company of Australia that we are now *setting up. In South* Africa, too, we can look back on a century of work, for the Northern issued its first power of attorney to a South African representative in 1858, the year in which Livingstone set out on his great second journey of exploration. From small beginnings our organisation in the Union has grown to a countrywide network of branch offices and agencies, which forms an important part of the Northern Group's business throughout the world.

A NEW RECORD IN LIFE ASSURANCE

For many years now our life assurance department has beaten the previous year's record, and in 1957 new sums assured reached £31,984,424, compared with £28,952,893 in 1956. Substantial contributions towards this new record were made by the group branches at Birmingham, Glasgow and Leeds, and by the Northern West End branch, each of which secured more than £1 million of new business. Our staffs at head offices and branches in this country and overseas deserve congratulation on their success in obtaining and handling this *increasing volume of life business.*

"SELF-EMPLOYED" PENSIONS

There was much interest last year in the retirement or deferred annuities for the self-employed and for persons in non-pensionable employment, to whom the Finance Act of 1956 affords relief from income tax and surtax on the premiums they pay. Last year the Northern secured £632,771 of annual *premiums on this new class* of business and if these premiums are maintained until the latest date for retirement they will give rise to annuity payments of more than £2 million a year.

Some people eligible for "*self-employed*" pensions, however, may hesitate to take advantage of the 1956 concessions because they prefer to accumulate their savings in ordinary shares. The Northern Management has given most careful thought to this problem and has devised a new form of policy under which the premiums are almost entirely invested in ordinary shares and the benefits, when ultimately paid out, are related directly to the market value of the fund at that time. This is our Variable Annuity Plan. It is based on principles entirely new in this country (though more familiar in North America), and we have pioneered it not as a substitute for familiar and established methods of providing for pensions, but as an additional service, to cater for the specialised requirements of the man who believes in the long-term merits of a fund invested in equities. Our Variable Annuity Plan was *introduced only a few weeks ago* and we hope that in time it will make its special mark in our business.

OVERSEAS LIFE BUSINESS

Our life business is also prospering overseas. New sums assured in South Africa last year exceeded £3.5 million for the first time. In Central Africa, where life business is rapidly increasing in importance, over £1.5 million of new business was arranged. Two years ago we appointed an actuary to advise our chief offices in Johannesburg and Salisbury, and these figures provide real justification for this appointment.

FIRE AND ACCIDENT ACCOUNTS

Fire and accident premiums for the Group last year amounted to £10,935,665 and £13,372,380 respectively. The combined total of £24,308,045 shows an increase of 7.4 per cent over the 1956 figure. This is not unsatisfactory and there was an improvement in the results of our motor account both at home and overseas, resulting from concerted measures among insurers in some territories and from more selective underwriting on our own part. Underwriting results as a whole, however, were dominated by the severe losses incurred in the United States and Canada, which offset the favourable underwriting in other parts of the world. In this we have not suffered alone and we are taking every measure open to us to deal with the situation. For 1957, however, the accident account comes out with an underwriting loss of £170,660, against a loss of £278,967 in 1956. The fire account shows a loss of £175,195 compared with a profit in 1956 of £63,726.

MARINE INSURANCE

Marine insurance continued to be difficult last year and competition between the world marine insurance markets showed no signs of abating. It is too early to forecast the effect on the marine insurance market of the recent recession in the shipping industry. The marine fund shows a further increase from £8,444,608 to £8,924,563, after transferring to the Profit and Loss Account £163,278, against £299,722 in 1956.

The total outcome of our underwriting last year is, therefore, to leave a loss of £181,977 to be charged to Profit and Loss Account, compared with the modest profit of £84,481 transferred in the previous year. Gross income from *investments held in the share*holders' non-life funds, however, has made further strides, from £1,297,990 to £1,532,030, partly through the investment at satisfactory rates of the new money raised last year, and partly through the growth of our funds due to the expansion of our business.

On the other hand, the 1957 accounts have had to bear an exceptionally heavy loss on exchange of £274,486, due to the devaluation of the French franc, and the group's gross profit comes to £1,121,101, against £1,437,737 for the previous year. British and overseas taxation is lower at £855,041, against £900,578, but it absorbs no less than 76 per cent of the group's profit compared with 63 per cent in 1956 and 57 per cent in 1955. This situation is considerably influenced by the fact that much of the overseas taxation is based on premium income and other factors which take little account of what may be the rate of profit for the year. Net profit is £266,060, against £537,159, and of this it is proposed to put £85,000 to contingency reserve.

CAPITAL REORGANISATION

Following the reorganisation of the capital into £1 ordinary shares, an interim dividend of 5 per cent was paid in November last year. The final dividend proposed is 9 per cent making 14 per cent for the year. The total dividend will cost £495,204, after deducting income tax, compared with the net cost of £375,345 for dividends on the old Preference and Ordinary capital in 1956, the increase being largely in respect of the new shares issued for cash a year ago.

During 1957 there was a particularly marked increase in the total book value of our stocks and shares from £52,554,498 to £60,093,856, more or less evenly divided between growth of the various funds and the new money raised a year ago. For the second year running there was a fall in market values, according to the Actuaries Investment Index, of nearly 10 per cent in gilt-edged securities and debentures, with a smaller but still significant decline in industrial equities. The valuation of our Stock Exchange securities as at December 31st last reflected these market conditions, but our investment reserves more than cover the difference between market value and the book values of our portfolio.

THE BURMAH OIL COMPANY LIMITED

FORMATION OF NEW COMPANY IN INDIA

INCREASED DEMAND FOR PETROLEUM PRODUCTS

MR W. E. EADIE'S STATEMENT

The fifty-sixth Annual General Meeting of The Burmah Oil Company Limited, will be held on Friday, June 6, 1958, in the Merchants' Hall, 30 George Square, Glasgow.

The following statement by the chairman, Mr W. E. Eadie, has been circulated with the directors' report and accounts for the year ended December 31, 1957:

DIRECTORS

Since our meeting last year there has been a number of changes in the membership of your Board.

Sir Kenneth Harper, your Chairman since 1948, made known some time ago his feeling that the time was approaching for handing over his responsibilities, and on November 1st last he conveyed to the Board his desire to retire. I need not say how regretfully Sir Kenneth's decision was accepted by the Board. His retirement means a loss of wise and experienced guidance for which he was so well fitted by over 44 years' service, 20 of which were on the Board. These last 20 years covered not only the period of the Second World War, with its own special difficulties, but also the strenuous years of rehabilitation with the readjustment of policies consequent upon the political and economic changes in the East. Sir Kenneth's leadership over these difficult years has been greatly valued by us all. We wish him many years of good health and happiness in retirement.

I have been honoured by your Board by my appointment to take Sir Kenneth's place as Chairman.

It is with much regret that I have to report the retirement in August of last year, and subsequent death, of Colonel Hugh B. Spens who had been a member of your Board since June, 1937. His wise counsel was always greatly valued by his colleagues. We have been fortunate in the acceptance by Mr James Alexander Lumsden of the Board's invitation to fill this vacancy. Mr Lumsden is well known in Scottish business circles, and I am confident that his sound judgment will add to the strength of your Board.

For some time it has been felt that the executive of your Board required strengthening and accordingly Mr John Ferguson Strain, who was Chief Accountant, and Mr David Cuthbert Robertson, who was the most senior member of the Group's Eastern Management, were invited to join the Board on November 1st last. Both Mr Strain and Mr Robertson, by long experience in their respective spheres of responsibility, are well equipped for these appointments and I have complete confidence in recommending them for election by stockholders.

Mr R. P. Smith, Assistant Managing Director, has been appointed an additional Managing Director.

ACCOUNTS

Although the Group's main supply sources lie East of Suez, the cost of obtaining crude and petroleum products and especially the cost of transporting them to the countries in which we operate increased materially as a result of the Suez crisis. We were unable fully to recover these increased costs from the market and for this reason Group Profit on Trading in 1957, which is after charging the cost of the extensive programme of prospecting during the year, amounted to £6,241,411 compared with £7,534,750 in 1956, a reduction of £1,343,339.

There is an increase in the amount charged for depreciation in 1957, compared with 1956, resulting from the additional assets employed and, in particular, from the new refinery at Syriam erected by The Burma Oil Company (1954) Limited and brought into commission in February, 1957.

As a partial offset to the lower Profit on Trading, Dividends from Trade Investments in 1957 show an increase mainly because of the dividend received on our holding in Burmah-Shell Refineries Limited. The amount of the dividends received during 1957 from our other Trade Investments was little different from that for 1956.

The amount of Other Dividends and Interest increased because of the larger dividends received on our holding in The "Shell" Transport and Trading Company Limited following the free issue of one share for four in 1956 and for the reason that the "Shell" interim dividend for 1957 was paid earlier with the result that three dividends instead of the usual two were received in 1957.

You were informed last year that we pay relatively little UK taxation on the profits of our overseas trading Subsidiaries by reason of double tax relief and that it was unlikely that any material benefit would accrue to us from the 1957 budget proposals regarding Overseas Trade Corporations. We have, however, submitted claims to treat our wholly owned overseas trading Subsidiary Companies as Overseas Trade Corporations so as to obtain such benefits as are available, but, pending agreement by the Inland Revenue authorities to these claims, provision has been made in the normal way for UK and overseas taxation based on the profits for the year.

After charging taxation, the net profit for the year is £7,056,055 compared with £7,123,896 in 1956, a decrease of £67,840. Including the balance brought forward from 1956, there is available for appropriation £7,666,454 from which has to be deducted the Preference Stock dividends for the year and the Ordinary Stock interim dividend of 1s. per £1 unit of Ordinary Stock free of income tax which was paid on December 20, 1957. Out of £5,433,477 remaining for disposal your Board have appropriated £1,500,000 to General Reserve and recommend that an Ordinary Stock final dividend of 1s. 7d. free of income tax should be paid on June 27, 1958. This, if approved, will absorb £3,262,422 and leave a balance of unappropriated profit of £671,055 to be carried forward to 1958.

The lower Group Profit on Trading is reflected in the reduction in Accrued Dividends from Subsidiary Companies appearing in the Parent Company's Balance Sheet which also shows that net Advances to Subsidiary Companies have increased by some £3 million. Part of these advances has been used to finance the cost, which has again been carried forward, of prospecting in and developing the areas in Assam outside the Digboi Field and the Nahorkatiya Mining Lease. I refer later to the formation of a new Rupee Company in India which will take over this expenditure and need only mention here, in the context of the Accounts, that the further expenditure under this head in 1957 is the reason for most of the increase in Fixed Assets appearing in the Consolidated Balance Sheet. The other items in that Balance Sheet calling for comment are Debtors and Creditors, the increases in which result from the continuing expansion of the Group's trade.

Our share of capital expenditure for 1958 of our Subsidiary Companies and the Burmah-Shell refining and distributing companies in India and Pakistan is estimated to amount to £2,100,000.

OIL INDIA PRIVATE LIMITED

I am glad to be able to report that the discussions with the Government of India regarding the formation of a Rupee Company were successfully completed in December, 1957, and an Agreement was signed on January 14, 1958, to provide for the incorporation of the new company to be named Oil India Private Limited. Your company will hold two-thirds and the Government of India one-third of the equity capital. This new company's task will be to develop the Nahorkatiya, Hugrijan and Moran areas and to arrange for the transport of crude oil to the refineries where it will be processed. These refineries will be Government sponsored. Arrangements are being made for the construction of a pipeline to carry the crude oil to the first of these refineries, which is to be erected near Gauhati in Assam, a distance of some 280 miles. The cost of the crude oil pipeline from the oilfields to this Government refinery will be financed on loan terms and we have undertaken to arrange to provide up to £10 million against the sterling exchange element of this cost. The Government of India anticipate that this refinery will come on stream early in 1961.

BRITISH PETROLEUM AND "SHELL" ISSUES

Your Board were able to arrange that the rights which accrued to the Company under the terms of the issue of Convertible Debentures by The British Petroleum Company Limited were passed on to stockholders. It was decided, however, in the case of the rights issue of "Shell" Ordinary Shares in January, 1958, that these should be taken up and our allotment of 303,600 shares has been duly received.

TRADING

The year 1957, like its recent predecessors, was one of import controls with attendant difficulties in maintaining stocks.

The trade in Burma increased by 10 per cent. Since the Syriam Refinery came on stream in February, 1957, the major part of Burma's trade is now in indigenous oil.

Sales in Pakistan, through our Subsidiary and Associated Companies, increased in 1957 by 7 per cent over 1956, despite a shortage of transport facilities in the eastern wing of the country and an inadequate supply of tinplate due to the limited foreign exchange made available for imports. The new seaboard installation at Chittagong was officially opened by the Chief Minister in March, 1957.

In India, the volume of trade in petroleum products continued to expand, the increase in the Group's sales, in comparison with the previous year, being 8 per cent.

While sales of aviation gasolines still continue to expand, there is an increasing demand for aviation turbine fuel by civil aircraft. The national airlines of both India and Burma already have Viscount aircraft in operation and as more turbo-engined aircraft come into service over the next few years there will be some material change-over in offtake.

Although in all areas together there was a small increase in the demand for motor spirit over that in 1956, the trade in this product in India was below the level of the previous year due to increasing use of diesel vehicles. There is a similar trend towards the increased use of diesel road vehicles in Pakistan, but in Burma these have not as yet been introduced in any large number.

Sales of gas by Sui Gas Transmission Company Limited through the Sui-Karachi pipeline continued to improve throughout 1957. At the end of the year offtake was averaging 32 million cubic feet per day compared with 23 million cubic feet at the end of 1956. The saving of foreign exchange to Pakistan in terms of coal or fuel oil which otherwise would have had to be imported, was of the order of £1.7 million in 1957. The gas retailing companies have now got into their stride and there is every reason to expect a continuing steady increase in sales.

A feature common to the economy of the three countries where we operate and trade is a shortage of availability of oversea exchange. In India this stems from the application of foreign exchange control in the interests of the large capital requirements of the second Five Year Plan. Pakistan and Burma also have programmes for industrial development. The economy of these two countries, which is primarily agricultural in character, suffered from low rainfall resulting, in the case of Pakistan, in the need to import large quantities of food and, in the case of Burma, in a poor rice harvest which will seriously curtail the quantity of rice available for export.

These economic stresses have repercussions on the rate of trade expansion, but once they have been overcome we should be able to look forward to a steady increase in demand for petroleum products. It is of interest to note in this context that the per capita sales of these products per annum in India, Pakistan and Burma, with a total population of some 500 million, is less than 5 gallons, whereas the corresponding figure for the United Kingdom is around 120 gallons and for the USA 600 gallons.

OILFIELDS OPERATIONS

Burma.—The Oil Companies and their Government Partner in The Burma Oil Company (1954) Limited work together in a spirit of co-operation and an atmosphere of goodwill.

Drilling and production at Chauk and Lanywa fields proceeded normally throughout the year and the production from these fields was processed at the Chauk and Syriam (Rangoon) refineries which supply the whole of Burma's increasing requirements of the principal petroleum products.

Pakistan.—The small volume of production, of which the Balkassar field of Pakistan Petroleum Limited is capable, remained steady and the volume of gas produced from the Sui Field increased from 7,422 million cubic feet in 1956 to 10,874 million cubic feet in 1957.

Arrangements have been made for the drilling jointly by Pakistan Petroleum Limited and Pakistan Oilfields Limited, a Subsidiary of the Attock Oil Company Limited, of adjoining concessions at Kareal in Western Punjab.

India.—The known resources of the Digboi field are declining and further drilling has been undertaken in that area in the hope of finding fresh reserves. The field is structurally complicated, however, and the result of this further drilling is awaited with much interest.

In the Nahorkatiya, Hugrijan and Moran areas, 13 wells were drilled in the year of which eight were oil producers, two gas producers and three dry holes. A re-assessment of the reserves continues to indicate a production potential of 2½ million tons per annum.

Progress in improving drilling speeds continued and some wells have been drilled and completed to 10,000 feet in approximately 30 days.

PROSPECTING

Burma.—During the year the Government of Burma granted to The Burma Oil Company (1954) Limited an exploring licence covering 11,360 square miles in the alluvial belt of the Irrawaddy Delta. The first phase of the seismic survey was completed during the year and a deep test well has been located.

A test well was started at Ondwe, 30 miles south of the old Yenangyaung field, and this was drilling at the end of the year.

The discussions with the Government of Burma, referred to last year, regarding the taxation treatment of prospecting expenditure were concluded satisfactorily.

Pakistan.—Encouraged by the taxation incentives provided by the agreement with the Pakistan Government which was reported to you last year, Pakistan Petroleum Limited has continued its vigorous exploration programme in East and West Pakistan. In this it has several new competitors and there are now eight oil companies actively interested in the search for oil. Approximately one-third of the exploratory drilling by all companies during the year was done by Pakistan Petroleum Limited. In addition, a considerable programme of geophysical work was carried out. To date, the only success achieved outside the proved oil belt in the Punjab has been the gas discovered at Sui and Sylhet by Pakistan Petroleum Limited.

Meanwhile the deep test well at Lalmai in East Pakistan, to which reference was made last year, made good progress in difficult conditions up to the end of the year. Pakistan Petroleum Limited had three test wells drilling at the end of the year in areas separated by as much as 1,500 miles. This gives some idea of the scope and range of the effort involved.

India.—Apart from the seismic work and drilling at Nahorkatiya, Hugrijan and Moran, the Assam Oil Company has undertaken no further prospecting.

REFINERIES

Burma.—A significant development of the oil industry in Burma was accomplished when the new Syriam refinery of The Burma Oil Company (1954) Limited came on stream in February, 1957. All plant was brought into commission with no more than usual teething troubles. The Deputy Prime Minister performed the official opening ceremony in March, 1957.

The same company's refinery at Chauk operated trouble free throughout the year and with some expansion in capacity.

India.—For the second year in succession the rail communications between Assam and the rest of India were free from major interruptions with the result that Digboi refinery operated at a new record of 423,000 tons.

At Bombay, the Burmah-Shell refinery processed 2,297,000 tons, making a valuable contribution to India's economy.

PERSONNEL AND TRAINING

When operating and trading in overseas territories we employ nationals where possible in place of expatriate personnel, and we have been at great pains to see this policy developed while maintaining the efficiency of our organisations.

To carry out this policy we have set up training establishments locally and also brought to this country trainees and employees who we consider would benefit by attending one or other of the training schemes we have inaugurated or have assisted in inaugurating here.

A school for training apprentices and artisans which was established at Chauk, in Burma, during 1955 has now been raised to the status of an Institute of Technology and is recognised by the City and Guilds of London Institute, which allows the Guild's examinations to be held at Chauk. In India and Pakistan we make contributions to educational and training schemes conducted under the auspices of the respective Governments who select the candidates.

LABOUR

In the year 1957 we were free from any major labour trouble. This is not to say that we were free from the customary series of demands for higher pay and changes in conditions of service, but I am glad to say that, on the whole, a spirit of negotiation prevailed. In the last resort, strikes are generally averted owing to the system of compulsory adjudication by a Government-appointed Tribunal when the normal course of negotiation fails to arrive at a settlement.

TANKERS

Our small fleet continued to operate satisfactorily and without incident throughout the year.

We endeavour to keep our vessels equipped with the most modern amenities for the comfort of the ships' companies. We took the opportunity, therefore, during the first Special Surveys in the United Kingdom last year of mv *Burmah Star* and mv *Burmah Sapphire* to instal plant for air conditioning. When our other vessels next visit the United Kingdom they also will be fitted with similar equipment.

At the end of 1957 it was decided that ss *Badarpur*, after 35 years of steady and profitable service, had reached the end of a useful career and she was sold for scrap early in 1958.

STAFF

It is with great regret I have to report the loss of two members of our staff, Mr R. M. Johnson and Mr A. J. Brent, in an air accident last July in East Pakistan. Both were men of much promise and were held in high esteem by their colleagues.

Our operations in three separate countries continue to bring a great number of new problems and last year was no exception. The manner in which our staff at home, overseas and afloat have tackled and surmounted these problems is a matter of sincere appreciation by us all.

MR CHARLES CLORE REVIEWS TRADING RESULTS

The Annual General Meeting of Sears Holdings Limited will be held on June 5th at the Dorchester Hotel, London, W.1.

The following is an abridged version of the statement by the Chairman, Mr Charles Clore, circulated with the report and accounts for the year ended December 31, 1957:

During the twelve months since it was last my privilege to present to you the annual accounts of your Company, the economic situation and prospects throughout the world have greatly changed. A year ago conditions of inflation persisted in Britain, whereas now, in the early part of 1958, we appear to have entered a period of mild deflation. The confidence of early 1957 has been replaced by an atmosphere of uncertainty and increased restriction on policies of expansion.

Against this background it is understandable that your Board has not added any substantial businesses to the Sears Group during the past year. We shall, however, still seek to expand our interests when suitable opportunities are offered either here or in North America.

TRADING RESULTS FOR 1957

In view of the more recent general trend of profits in the United Kingdom, I believe you will regard the results for 1957 as most satisfactory. A summarised analysis of the trading profits for 1957 (with corresponding figures for the three preceding years and other statistics which show the progress of the group) is appended.

In total our trading profits in 1957 show an increase of over £500,000. Of this increase the British Shoe Corporation Group contributed some £270,000 (an increase of nearly 10 per cent) and the Bentley Group added nearly £240,000 (an increase of over 13 per cent). Other Interests contributed £28,000, the improved results of the Furness Shipbuilding Group and of Alexander Findlay being offset by a decline in the profits of Parmeko and, to a lesser extent, of the motor distribution business.

Taxation absorbs the enormous sum of £3,825,000. I am glad to learn of the proposal for revising the basis of assessing profits tax; had the new rate been applied for 1957 there would have been a saving of about £200,000.

Disappointment may be felt by some of you that, despite the satisfactory results of the past year, your Directors have not felt it advisable to recommend an increase in the dividend. We feel that the overriding factor to be taken into account in formulating our dividend policy is the vital need to ensure that adequate resources are retained in the business for the future maintenance and development of the Sears Group. In almost every branch of our large family, plans exist for developments and expansions of various kinds and sizes. I believe that over the longer term shareholders will benefit more from this present restraint than if, under existing conditions, we were to have recommended some increase in the dividend.

THE BRITISH SHOE CORPORATION

This Group comprises the multiple retail footwear businesses of Freeman, Hardy and Willis, True-Form, Dolcis, Manfield, Phillips Brothers, Character Shoes and Curtess Shoes. It embraces six major factories and nearly 1,500 retail shops. Despite the large production of our own factories, the greater part of the pairage sold in our shops is bought from independent manufacturers. This enables us to maintain our own factories with the output most suited to them and also to take full advantage of new developments and designs which may originate from outside sources.

Each member of the British Shoe Corporation achieved a record turnover in 1957. This is reflected in the increased profits of the Freeman, Hardy and Willis Group (which includes True-Form) and of Manfield, but a considerable part of these increases arose from economies in operation.

During 1957 we opened over thirty new shops. We shall continue to open new shops when they can be secured on reasonable terms, but under present conditions we cannot afford to pay excessive rents and I anticipate that landlords will find that lower rents are essential if they are not to have empty shops on their hands.

In certain sections of the retail trade a feature has been made recently of quite widespread price reductions. We have always kept our profit margins down to levels which cannot bear further reduction and we are confident that the value obtainable in our shops cannot be surpassed in the retail footwear trade.

So far in 1958 the combination of the late arrival of spring weather and an early Easter has affected our trade, but it is too early to prophesy the outcome of the year's trading.

THE BENTLEY ENGINEERING GROUP

Once again the Group sales of hosiery knitting machines have surpassed all previous records and we ended 1957 with a considerably larger order book than we had at the beginning of that year.

A very large and increasing proportion of our production has been sold to overseas markets. This has involved granting long-term credits to our customers which have absorbed, during the past year or so, an additional £1 million of the Group's working capital and this amount is still increasing.

The smaller members of the Bentley Group have each had a prosperous year in their various spheres. Particularly does this apply to Pegson Limited, whose sales and profits exceeded all previous records.

I am glad to say that the Bentley Group has now reached the stage when the benefits from the mergers of the past few years are becoming more and more apparent. Our large order book has been maintained and the Group should have another satisfactory year in 1958.

OTHER INTERESTS

This Group comprises a number of Companies engaged in various businesses, including motor vehicle sales and service, structural steel, shipbuilding, ferrous and non-ferrous pipes and the manufacture of electrical and electronic components. In terms of profits, shipbuilding represents rather more than one third of the total of this Group and the remainder is well divided between the other businesses, from the nature of which you will appreciate the extent of the diversification of our interests.

THE FURNESS GROUP

During 1957 Furness Shipbuilding Company Limited launched six vessels and a floating dock, the combined gross tonnage being 86,000. This compares with the previous year's launchings of five vessels aggregating 87,000 tons.

There has been a satisfactory improvement in the year's trading results, despite losses arising from an industry strike lasting almost three weeks early in 1957, and orders on hand are still sufficient to keep the yard fully occupied for some time ahead.

Last year I explained that plans were being studied for an extension to the shipyard. Due to the depressed state of the tanker freight market, the urgency to settle our plans is not immediate and we are taking advantage of this by examining all reasonable alternatives before coming to a decision. Additional berthing facilities have, however, become necessary to accommodate the larger vessels on order and a new 700-foot quay has just been completed.

Shaw & McInnes Limited, who operate a pipe foundry in Glasgow, have shown improved results in 1957. Anticipating some reduction in orders from the shipbuilding trade they have successfully obtained an increased share of orders from other sources.

During 1957 the share capital of Peter Johnston and Company (South Shields) Limited was acquired. The Company is well known for its work as fabricators and fitters of iron, steel and non-ferrous pipe work. In addition to its work with the shipbuilding trade it has extensive connections with other industries. We welcome Peter Johnston as a new, though as yet quite small, member of the Sears Group.

So long as we are spared from labour troubles, Furness Shipbuilding Company, helped by some improvement in the steel supply position, should enjoy another satisfactory year in 1958. The outcome of the year's operations for its Subsidiary Companies is dependent on the maintenance of a satisfactory level of profitable orders; so far this condition has been fulfilled.

PARMEKO

Trading conditions have again been difficult for Parmeko. Competition has become more intense and the Company has had to work on more slender profit margins. The increased competition at home has, however, caused us to increase our efforts in the export markets with considerable success. Nevertheless, Parmeko's profit for 1957 was somewhat less than the nine months' profit brought into the Group accounts for 1956.

Research and development work have continued on an increasing scale and we are now able to offer a range of magnetic amplifiers which, backed by the Parmeko reputation for workmanship, reliability and design, is meeting an increasing demand.

Our new factory extensions were completed during the year and are now fully in use. They render us less dependent on subcontractors and enable production to be undertaken on the most efficient and economic basis. This and the technical superiority of the Parmeko organisation enable us to look forward with confidence.

SCOTTISH MOTOR TRACTION

A year ago both of our two principal subsidiaries engaged in the motor distribution and servicing trades were emerging from the stagnation brought about by the Suez crisis and petrol rationing. They were, however, also suffering from an inadequate supply of vehicles from Vauxhall Motors Limited, whose products form the mainstay of their businesses. It was not until the autumn that "Victor" cars were delivered to us in any quantity and deliveries of the new "Cresta" and "Velox" cars only reached us early in 1958.

Our relations with Vauxhall Motors Limited have always been cordial and we are anxious that S.M.T. and Shaw and Kilburn should remain loyal distributors of their products. However, very large sums indeed are invested in our depots, showrooms and service departments and this investment can only be adequately remunerated if we are able to handle a sufficient number of units to retain and satisfy our customers. Our future policy in the trade must, therefore, be governed with these considerations in mind.

In the events of 1957 The S.M.T. Sales and Service Company Limited did well to maintain an average rate of profit nearly equivalent to that of the previous fifteen months, but owing to its more complete dependence on Vauxhall and Bedford vehicles, Shaw and Kilburn Limited had a disappointing year.

During 1957 we acquired new depots at Elgin, Falkirk, Carlisle and Glasgow and we shall continue to expand as suitable opportunities occur.

The Companies should do better this year than in 1957, provided we do not encounter declining industrial activity and retrenchment by our commercial and private customers.

ALEXANDER FINDLAY

Alexander Findlay, whilst able to tackle almost all kinds of structural steelwork, specialise in work for power stations and large industrial buildings. Helped by some easing of the steel supply position, a high tonnage was achieved by the works in 1957 and profits have been satisfactory. Competition for new work is, however, becoming more severe but our good order book will see us through for some time and we are satisfied that our skill and efficiency will keep us well ahead of most of our competitors.

Our confidence in the future is demonstrated by the fact that work has commenced on important extensions to our works and offices.

CONCLUSION AND GENERAL PROSPECTS

You will see that we have no immediate anxieties; in fact, if the remainder of 1958 proves as satisfactory as the months which have already passed, I believe you will have no cause for complaint.

I appreciate that, in present times, our economy may, on occasion, get out of gear and unwelcome controls may be necessary for a time. Nevertheless, my earnest appeal to those responsible for the government of this country is that they should recognise the dangers inherent in applying controls and deflationary measures as correctives for an ill which can be permanently cured only by giving industrialists the greatest freedom and encouragement to expand their activities and so increase efficiency and achieve lowest cost production.

STAFF

At the present time the number of our employees is over 20,000 and I am glad to say that relations between labour and management are excellent. It is at least as much on behalf of our employees as our shareholders that I express an earnest hope that, by this time next year, the clouds which can be seen on the economic horizon in all parts of the world will have cleared away.

Your Directors fully appreciate the vital part played by our employees in achieving the successes of 1957. We are glad of this opportunity to record our thanks to them for their hard work, loyalty and enthusiasm.

THE PYRENE COMPANY

RECORD TURNOVER

The forty-fourth annual general meeting of The Pyrene Company, Limited, will be held on June 3rd at Winchester House, Old Broad Street, London, E.C.2.

The following are extracts from the circulated Statement by the Chairman and Managing Director, Mr Francis A. J. Harrisen, FSMA, FIIA, for the year 1957:

The Group's trading profit at £638,031 shows a small increase over the previous year. Group sales were 4.1 per cent above those of 1956. By maintaining the total Ordinary dividends for the year at 25 per cent on the Ordinary Capital as increased by the rights issue of £125,000, your Directors have justified their belief regarding Ordinary dividend expressed in the Company's letter to Shareholders dated November 30, 1956.

Remembering the National and International difficulties affecting trade during the early months of the year, the Company did remarkably well to finish up with sales in terms of billings slightly ahead of 1956. The turnover achieved was the "highest ever."

Sales of the Fire Division were 8 per cent up, the chief increase being in the Foam and Crash tender Department. The production of crash tenders, particularly in respect of the Home and Canadian Government contracts, reached the peak by the end of the year.

The Bumper Division recovered from the reduced demand during the earlier months of the year and finished at a record rate of output. In fact the value of motor-car bumpers delivered during the second half of the year was 24 per cent higher than in the first six months.

INCREASED EXPORTS

The Company's direct and indirect exports combined represented 49 per cent of total sales and in value showed an increase of 18 per cent over the previous year. The increase in direct export turnover was considerably higher than this, being 47 per cent above 1956. These direct exports were mainly for Fire Division products and they were shipped to 97 overseas territories. This is a highly satisfactory export contribution, particularly as much of the increase was to hard currency areas.

The Parent Company has made an excellent start in the new financial year. Sales for the first quarter established an all time record. In fact billings for each of the first three months of 1958 exceeded those of any month up to and including December, 1957.

The outstanding order book was 12.6 per cent higher at January, 1958, than at the beginning of 1957.

Bumper production is at the highest ever and should continue at a high level as long as the British Motor Car Manufacturers are able to maintain their splendid sales achievement. The Metal Finishing Division's shipments over the first three months of 1958 are above last year's monthly average, and should continue to be so, as their "Parkerizing," "Bonderizing" and other anti-corrosive processes are used extensively not only by the Motor Industry, but by many makers of household durable goods. The United Kingdom sales of Minimax Limited to the end of March have been more than maintained.

The breadth of your Company's business has been so considerably expanded over the past several years that it is now more broadly based than ever.

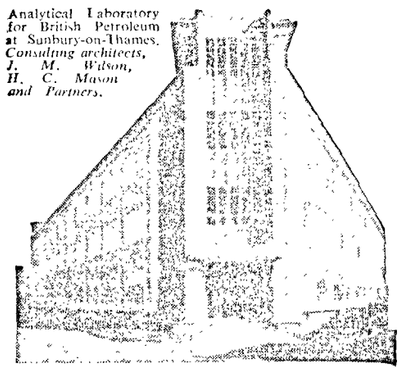
COSTAIN'S

ACHIEVEMENTS IN WORLD MARKETS

PROPORTION OF OVERSEAS WORK NOW 60%
SUCCESSFUL OUTCOME OF LONG-TERM PLANNING AT HOME AND ABROAD

The annual general meeting of Richard Costain Limited will be held on June 5th in London.

In the course of his circulated statement reviewing the year 1957, Sir Richard Costain, CBE (Chairman and Joint Managing Director) detailed the financial results and said that the consolidated profits of the Group for 1957 showed a satisfactory increase at £526,851, compared with £425,509 earned in 1956. That increase of approximately £100,000 was fairly evenly spread over the various activities of the Group both at home and overseas.



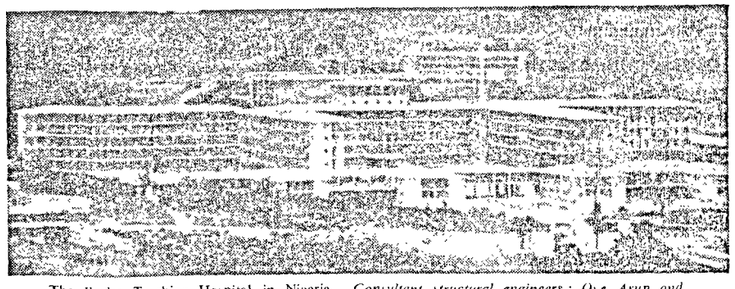
Reviewing the Group's activities, the statement continued:

CONTRACTING Our order book at the end of 1957 was higher than at the end of 1956 and amounted to £28 million. Since the end of the year we have formed a group with five other companies to build the £18 million oil terminal for the Iranian Oil Consortium at Kharg Island on the Persian Gulf.

Last year, I said that 50 per cent of the Group's turnover arose from work overseas. That proportion has now increased to 60 per cent, which I believe is possibly the highest percentage of work carried out overseas by any contractor in this country. In times like the present, where there are pockets of local trade depression, our wide spread of work territorially has enabled us to maintain our order book.

£3½ million township contract in fifteen months, nine months ahead of schedule, enabling work on the dam to start in good time. Owing to the decline in copper prices, we must inevitably find a recession in our business in Rhodesia.

AT HOME: The Building Division completed the new BEA Town Terminal at Cromwell Road in 104 days, 3½ weeks ahead of an already very tight schedule. Another building completed in much less than the usual time was the Analytical Laboratory for British Petroleum at Sunbury-on-Thames, one of the largest laboratories of its kind and completed in seventeen months, five months ahead of schedule. Another of the Division's successes



Analytical Laboratory for British Petroleum at Sunbury-on-Thames. *Consulting architects, J. M. Wilson, H. C. Mason and Partners.*

customers in the three years since private building restarted.

PROPERTY It has always been the policy of your Company to have a limited amount of its resources invested in property. We have, during the last twelve months, built and let Hercules House, a London Office block on the South Bank, and during 1957 have taken steps to develop property interests in Canada. At Dolphin Square we have offered seven-year leases which the great majority of tenants have accepted at rents which are on average only 45 per cent. in excess of the restricted rents based on pre-war values. The increased rents will enable maintenance work to be carried out which has had to be deferred, and as a result it is not expected that the net revenue will increase in 1958. It is hoped that by 1959 these arrears of maintenance will have been overhauled and that the Group will receive a reasonable return from its investment. Due to the operation of the Rent Restriction Acts and the steep increase in costs since the war, such a return has not been earned in the last few years.

FUTURE PROSPECTS The trading results for 1957 were the best in the Company's history I think I can say this success is the result of long-term planning, and the Board has constantly in mind the importance of adjusting the executive structure of the Group to meet present-day conditions. In spite of very competitive prices, we have been successful to date in securing our share of the available business in this country and I hope this will continue, but we cannot, of course, escape the consequences of any serious decline in building activity. With this in mind and in view of the limited opportunities for large-scale civil engineering work in this country, your Board has built up a very strong civil engineering business overseas, principally within the Commonwealth, and over 60 per cent of our Group business is now carried on abroad. Apart from spreading the risk so far as the Group is concerned, this policy has a material bearing on the National interest, since the export of civil engineering services represents an important item in our balance of payments. I can say with confidence that we have won for ourselves a position in the overseas contracting industry which is a matter for justifiable pride to our shareholders and employees, as it is to the Board. We cannot, however, ignore the possibility of a general world trade recession, which would obviously affect our overseas business.

CONCLUSION In existing economic conditions it is impossible to make any reliable estimates for the future. We can create a balanced organisation with interests abroad as well as at home, and with investments in property as well as in our principal businesses of civil engineering and building construction. We have been fortunate in obtaining the utmost support from our bankers in providing the very considerable sums necessary for the development of the Group business, but without the retention of profits within the business we could not have achieved the position in which we stand today.

The Ibadan Teaching Hospital in Nigeria. *Consultant structural engineers: Ove Arup and Partners. Architects for the main hospital buildings are W. H. Watkins, Gray and Partners, FF.R.I.B.A., of London, and, for the ancillary buildings, Architect's Department of the Federal Public Works Department.*

ABROAD: The £4 million harbour in Barbados which the Civil Engineering Division were awarded last summer is now well under way. In Nigeria, the Division have been awarded the extension to the Ijora "B" Power Station in Lagos and Costain (West Africa) Limited are carrying out an increasing amount of work on new roads which are necessary to open up that great country, but we are faced continuously with increased competition not only from British contractors, but contractors from other countries. We were honoured by the visit of HRH The Princess Royal at the opening of University College Teaching Hospital, Ibadan. This is the largest hospital on the African continent and one of the finest and most modern in the world. It so happens that our Rhodesian Company are building the second largest hospital in Africa at Kitwe in Northern Rhodesia. At Kariba on the Zambesi, the Rhodesian Company completed the in this type of work was the transistor factory for the Plessey Company at Swindon which was no more than an idea in July, 1957 yet was handed over to the client in January, 1958. In all these cases we were called in at an early stage, thus effecting considerable savings in time and cost.

The Civil Engineering Division has recently been awarded the contract for the £1.4 million Maidstone By-pass and its home order book is higher than it has been for some time.

After referring to the Specialist Services, particularly in regard to soil mechanics, and to Costain Concrete Company Limited, the statement continued:

HOUSING AND DEVELOPMENT Despite the credit squeeze and high interest rates, sales of houses on our estates in this country have been satisfactory and your Company has built up its reputation with building societies and

GALLAHER LIMITED

(Incorporated in Northern Ireland)

RECORD GROUP TURNOVER

INTENSE COMPETITION AND RISING COSTS

SIR EDWARD DE STEIN ON LEAF SUPPLIES

The sixty-second annual ordinary general meeting of Gallaher Limited was held on May 14th at Winchester House, Old Broad Street, London, EC, Sir Edward de Stein, chairman of the company, presiding.

The secretary (Mr George Iliff, ACA) read the notice convening the meeting and the auditors' report.

The following is the chairman's statement circulated with the report and accounts for the year ended December 31, 1957:

The year 1957 has been a year of intense competition and of rising costs. I am pleased to be able to say, however, that these adverse factors have been more than offset by the continued expansion of our turnover.

TRADING RESULTS

The profit of the Group, before tax, in 1957 is higher than in 1956 by £1,501,901 at £6,562,896. After provision has been made for Income Tax and Profits Tax the net profit for the year shows an increase of £743,685 to £2,887,179.

We are recommending to Stockholders a final dividend of 15 per cent on the Ordinary Stock—making with the interim distribution already paid of 5 per cent—a total of 20 per cent for the year, against 17½ per cent in 1956.

In recent years we have made only modest additions to the Group's General Reserve: having regard to the considerable growth of the Group's business we have decided to appropriate £1,824,064 to the credit of the General Reserve in the Parent Company's Accounts. We have also transferred £1,500,000 from Contingencies Reserve, to General Reserve, leaving a balance of £802,182 in the Contingencies Reserve, which, so far as we can see, should be adequate. The effect of these two additions to the General Reserve is to bring the Reserve in the Consolidated Balance Sheet to a round figure of £5 million. As a result of these proposals the Group's Profit and Loss Account Carry Forward will be reduced by £388,359 but will remain at the satisfactory level of £2,424,853. The amount retained out of the year's earnings is £1,435,705—slightly more than the total net cost of the Ordinary Dividend for the year.

CURRENT ASSETS

In the Consolidated Balance Sheet at December 31, 1957, the Group's Current Assets show an increase on the 1956 figure of £10,067,392. The major part of this increase arises in stocks of leaf tobacco where both the quantity carried and the average cost are higher than last year. So far as duty paid stocks are concerned—that is work in progress and finished goods—the value in 1957 is lower than in the previous year despite the increase in the Group's sales in 1957. This is mainly the result of a policy decision to accelerate our distribution; consequently we are turning over our finished goods more quickly now than previously.

Debtors are also up by a considerable amount—£2,746,010, at £21,018,700. This higher level of Debtors is mainly due to higher sales in November and December, 1957.

FINANCE

The growth of the Group's business has naturally called for additional finance, the full effect of which is not reflected in the Accounts as our peak requirements arise a few months before the end of the financial year: to meet the situation we are proposing to fund some of our short-term borrowings by an issue of Loan Stock in the near future, the terms of which are now under consideration.

Owing to the steady expansion of the volume of the Group's tobacco and cigarette sales the annual money turnover has increased in the period 1953 to 1957 as under:

	Annual Turnover £
1953	63,000,000
1954	91,000,000
1955	126,000,000
1956	160,000,000
1957	204,000,000

We have to finance tobacco duty for approximately seven weeks between the date of removing tobacco from bond and payment by our customers for manufactured goods. This has involved us in a daily lock-up represented by duty only of the following amounts during the last five years.

	Daily Duty Lock-up £
1953	10,500,000
1954	13,700,000
1955	18,200,000
1956	22,600,000
1957	26,600,000

The very large amounts locked up in tobacco duty will readily explain why our borrowing has been steadily mounting. In addition large sums have to be locked up in carrying our stocks of leaf tobacco—which at the end of the year amounted to £28,500,000.

PROFIT MARGINS

The tobacco industry always works on small margins of profit on its turnover: it was only the steady increase in costs prior to September, 1957 which forced us to make a slight increase in prices in that month. The great aim of our business is to give the highest quality and value for money to the smoking public. The main factor which contributed to the improved results this year is the considerable increase in our turnover by £44 million to £204 million—an increase of 27½ per cent—which I am bound to admit exceeded our expectations.

ENGINEERING SUBSIDIARY

Once again I am pleased to be able to report to you that our engineering subsidiary has had a successful year. You will recall that last year I informed you that it had purchased all of the issued capital of Larmuth and Bulmer Limited. This has turned out to be a satisfactory acquisition. A full year's profits of our new subsidiary are included in the Group figure for 1957 as compared with three months' profits in 1956.

The Board wish to record their appreciation of the good results achieved by the management, staff and workers.

GENERAL MATTERS

So far as general matters are concerned the principal events have been (1) the development of our Lisnafillan site in Northern Ireland together with additional leaf storage facilities and (2) the building-up of production at our new factory in the Manchester area. I referred to each of these matters in my Statement last year.

The first stage of the development at Lisnafillan was completed in January 1958 and the factory is now producing cigarettes, but not yet on a large scale. This factory is expected to be in full production about the end of September 1958. The remaining stages of the Lisnafillan development will reach completion towards the end of the year.

Our factories are still working under pressure. They will not really feel the effect of the additional production capacity for some time. The new manufacturing units which have so far become available have just about been able to meet the demands our expanding sales have made on them.

The new factory in the Manchester area is now in full production and I think we may justly feel that it is one of the most modern in the country.

SALES

The record turnover of the Group to which I have already referred is by no means attributable to a single brand; all our main brands have made a contribution—outstandingly "Senior Service" and "Park Drive" cigarettes and "Old Holborn" tobacco. Our new Benson & Hedges cigarette brand "Olivier" tipped, introduced in 1956, has established a significant sale in the price category 3s. 4d. for 20 which generally is proving popular with smokers today.

In February, 1958, we added a new brand to our range, "Park Drive Tipped" retailing at 2s. 6d. for 20. This brand has had a successful introduction.

LEAF SUPPLIES

The price of leaf tobacco in most markets advanced in 1957 to new high levels. With exceptions in the case of a few types of tobacco we were able to buy the quantities we required to replace our usage, but as our sales increased more than we anticipated we will require to increase our purchases again this year in order to build up our stocks.

The higher purchases we have required to make in America have thrown a heavy burden on our buying staff in the United States and we are very grateful to them for the excellent service they have given us.

Owing to the increase in the quantities of Rhodesian tobacco which we now need to purchase we have during the past year strengthened the organisation of our Salis-

bury branch and enlarged its handling and packing capacity.

We wish our staff in the United States, Rhodesia and Nyasaland a successful season in 1958.

With the exception of India, where we anticipate a satisfactory purchase, it is too early to attempt to forecast anything about the 1958 crops, but we have been sorry to learn that the heavy rains experienced in Central Africa are likely to affect both the quantity and the quality of what promised to be a record crop.

OUTLOOK

Owing to the various factors to which I have referred above you will readily understand that it is difficult to give an accurate prophecy of the results for the current year, but in the first quarter our sales have continued to expand and unless something unforeseen occurs it will be reasonable to expect another satisfactory year in 1958.

EMPLOYEES

The continued progress which the Company has made during the last few years in conditions of intense competition would not have been possible without the loyal and enthusiastic support of all employed in the business—in the purchase of our leaf tobacco and other materials, the high standard of maintenance of our production machinery and premises, the care taken in the manufacture of our brands under conditions of intense pressure, and the efficient selling and advertising of the Group's products. But all these factors are dependent on wise technical and commercial policy. I should like to pay a special tribute this year to the magnificent guidance and control in this respect which we have received from the Managing Director and his executive colleagues.

We thank our employees for their service in the Company's interests throughout the year and compliment them on their achievements, in recognition of which we have again this year paid them a bonus equal to six weeks' salary or wages.

The report and accounts were unanimously adopted; the proposed dividend was approved; the retiring directors, Mr E. J. Foord, Mr J. N. Hogg and Mr M. R. Norman, OBE, were re-elected and the auditors, Messrs Hill, Vellacott and Bailey, were reappointed.

FIAT S.p.A.

TURIN, ITALY

(Motorcars, Aircraft, etc.)

SHAREHOLDERS' MEETING

The annual Meeting of Fiat Shareholders, held in Turin on April 30th, under the chairmanship of Professor Dr Vittorio Valletta, Chairman of the Board and Managing director, unanimously adopted the report and balance Sheet for 1957. The net profit for the year was 13,899 million lire. Dividend 80 lire per share.

Professor Valletta's statement, touching on the international situation, noted that Russia's artificial satellite and the Paris meeting of the Nato council awakened the year 1957 from the sluggishness in which it began, mainly owing to the tightness of the international money market; and stated the institution of the European Common Market has helped to strengthen and effectuate the determination toward Western co-operation as well as to increase business and employment opportunities.

Also in 1957, in spite of difficulties, Fiat has succeeded in still further increasing its business. Thanks to the full efficiency of its very modern equipment and to the spirit of co-operation of its workers. Here are the main data of the increase:

— sales 350 milliards of lire (10 more than in 1956);
— 306,120 motor vehicles produced (285,656 cars and 20,464 commercial vehicles), an increase of 14,377 units over 1956, and 18,647 tractors;
— iron and steel production for a total of 73 milliards;
— total Fiat exports 95 milliards of lire (18 more than in 1956) of which 65 for automotive products, 13 for tractors, 17 for other products;
— Fiat employees now number over 80,000; on December 31st the situation was 80,423, of which 62,218 factory workers and 18,205 office personnel (including the OM Works).

Fiat's automobile production is on a high European level; an average of 1,300 a day, which will be increased. Constant customer confidence in Italy and abroad in Fiat models: the small 500 and 600 cars, and the 1100, 1200 full-light, 1400 and 1900 models. Among the successes of new Fiat products that of the "Fiat G.91" jet plane for the Nato is of international prestige. Fiat is also developing a Nuclear Section.

Fiat's welfare work for its people and their families is continually expanding. The Company's Mutual provides free medical care to about 200,000 persons, including personnel and their families. The Fiat Housing Plan consists of 2,709 apartments, for factory workers and office personnel.

Turin, April 30, 1958.

VINE PRODUCTS

INCREASE IN PROFITS

The thirty-second annual general meeting of Vine Products Limited, was held on May 8th at Surbiton.

The Viscount Marchwood, MBE, chairman and managing director, in the course of his speech, said:

The accounts show a very satisfactory increase in the trading profits of the Group, being an improvement even on the 1955 figures, which at that time were the best in the company's history. It must, however, be borne in mind that, for the reasons stated in the directors' report, this improvement cannot be attributed solely to increased sales.

As you well know, one of our main problems is the purchasing of the raw materials essential for our business and these, once again, have been subject to violent fluctuations during the year under review, and continue to be so during the current year.

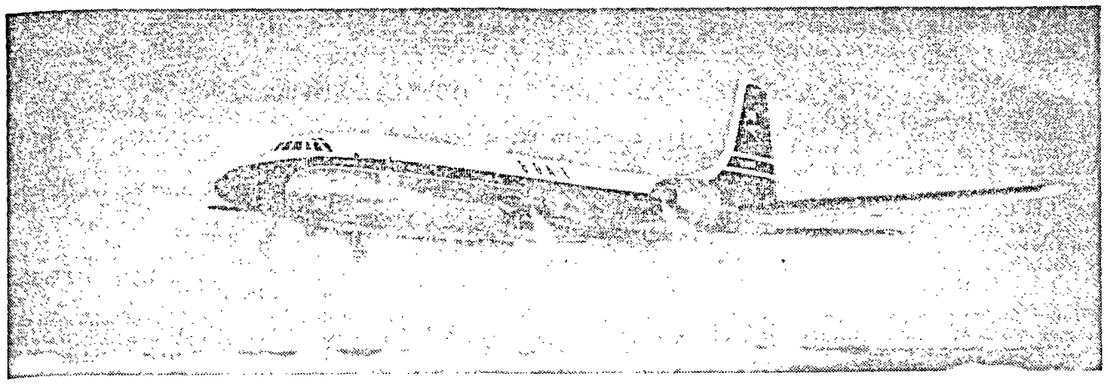
Nevertheless, last autumn, in response to many requests from the trade, we introduced a superior Cream Sherry, produced from the juice of selected Spanish grapes, in an attractive pack under the name "RSVP," selling at 7s. 6d. a bottle. The "RSVP" introduction met with such an instantaneous response that we had hardly sufficient supplies to meet the demand. As a result of this success we have now decided to market an "RSVP" Old Ruby, also made from Spanish grape juice which will be available in July and which will, we hope, prove equally acceptable.

Sales of BritviC Fruit Juices continued to expand and in 1957 they reached a record figure, exceeding the previous 1955 record by a reasonable margin.

You will have read in the Press of BritviC's new venture in the canned fruit trade. It is too early yet to do more than say I am confident that, by offering fruit of the finest quality, in keeping with the company's reputation for excellence, the name of BritviC will be brought before an even wider public.

INTENSIFIED COMPETITION

Last year I referred to the competition which British wines were facing from the lower-strength blended Commonwealth wines. This competition was intensified during 1957. However, as a result of the recent Budget the advantage in duty on a blended wine previously enjoyed by the Commonwealth producer has now been reduced though not eliminated.



Moreover, we now contemplate the marketing of a range of Commonwealth wines under the VP label and through the VP organisation which will, I feel sure, compete satisfactorily in this sphere.

One adverse feature of the Budget has been an inevitable and fairly substantial loss on those wines on which duty had already been paid.

The consolidated profit and loss account shows an increase in profit before taxation of £70,636 although the profit after taxation shows an increase of only £11,779.

I am always hesitant of forecasting future prospects, but, despite the fact that trading in the first three months of this year has been rather slow, I feel we may reasonably expect another successful year in 1958.

The report and accounts were unanimously adopted and the proposed dividend of 25 per cent, less tax, on the Ordinary stock was approved.

One of the long-range Britannias of BOAC. The Britannia is the largest, fastest and smoothest airliner in world-wide service.

"A CHALLENGING AND FASCINATING FUTURE, BUT..."

Chairman of the Bristol Aeroplane Group reviews progress

The following are extracts from the Chairman's Statement to Stockholders, issued with the Directors' Report and Accounts for the year ended December 31, 1957.

Measured in terms of technical possibility, the future for this industry remains as challenging and fascinating as at any time in its history. But whether its commercial prospects will be equally attractive depends upon issues of public policy; for ourselves, we believe we can satisfy any demands upon our ability.

Orders due for completion over the next two-three years are at a high level; thereafter the prospect is by no means so clear. We face reduced Service requirements, intense competition in selling to airlines and big cuts in Government sponsored research and development. But there is no evidence that air defence has become less important, and the British industry therefore remains vital to this country and the Western world. It is no evasion of responsibility to say that longer term prospects depend on Government policy.

Bristol Aero-Engines Limited

The Olympus turbojet is established in RAF service, and the Orpheus lightweight turbojet is maintaining its early promise. Bristol ramjets will shortly become the first ramjets to enter RAF service. The Proteus turboprop has displayed in the Britannia the excellent reliability predicted. Other turbine projects are being vigorously pursued, as is a small but growing research programme for the UK Atomic Energy Authority.

It has been arranged that Bristol Aero-Engines Limited and Armstrong Siddeley Motors Limited will pursue joint research and development and pool resources in relation to new engine projects initiated by the Ministry of Supply. A joint company has been formed, which we hope will lead to close identity of purpose.

Bristol Aircraft Limited

During the year the Britannia occupied a dominating place in the Company's affairs; we can fairly claim it is the finest airliner in use today. The order book is shorter than we would wish: special attention is being given to the freight market and to the international passenger fare structure, which seems at present to penalise aircraft with low operating costs.

The design team devoted much attention to a medium range turbojet airliner, and exploration of possible overseas demands continues. The Weston Division is busy with helicopter production and with rocket motors; at Cardiff, manufacture of the Bloodhound guided missile is well advanced. There are significant future possibilities for the Bloodhound.

Bristol Cars Limited

Sales have been maintained, and orders for a new model and for Bristol engines for AC cars have been encouraging.

Associated and Overseas Companies

Rotol Limited and British Messier Limited have fulfilled last year's promise of an increase in turnover. Defence programme fluctuations prevented Short Brothers and Harland Limited achieving the turnover expected, but recent progress has given better promise for the future. In general, the overseas companies have made steady progress.

Finance

In a difficult year, in which changes of official policy have coincided with problems encountered with new products entering service—it is evidence of the underlying strength of the Group that profits before charging interest have been maintained and that the proposed dividend should be at the same rate as for previous years.

THE BRISTOL AEROPLANE COMPANY LIMITED · FILTON · ENGLAND

OTTOMAN BANK

SATISFACTORY LIQUID POSITION

LORD LATYMER'S REVIEW OF WIDESPREAD INTERESTS

The ninety-first Annual General Meeting of the Ottoman Bank was held on May 14th in Winchester House, Old Broad Street, London, E.C.

The Right Honourable Lord Latymer, the chairman, presided and, in the course of his speech, said:

TURKEY

1957 saw further progress in the equipment and economic development of the country. Signs of this expansion are visible on all sides.

The Budget voted at the beginning of this year for the period March 1, 1958, to February 28, 1959, totals Ltq. 4,475,500,000 of which Ltq. 2,980 million for general expenses and Ltq. 1,495,500,000 for public works. For the previous year the figures were Ltq.2,733,400,000 and Ltq.1,273,300,000 respectively.

As regards foreign trade, the adverse trade balance was reduced from Ltq. 286,600,000 in 1956 to Ltq. 145,300,000 in 1957 following stringent import-restriction measures, especially of consumer and luxury goods. The import total fell from Ltq. 1,140,600,000 to Ltq. 1,112 million. In exports there is an increase from Ltq. 854 million in 1956 to Ltq. 966,700,000 in 1957: tobacco, fruit, cotton and minerals were the principal exports.

As regards your Bank, you will be interested to hear that in 1957 we opened new offices at Besiktas and Laleli in Istanbul and at Karsiyaka in Izmir. At the beginning of this year we also opened the Bakirkoy branch in Istanbul, and the Alsancak office in Izmir.

SUDAN

In January, 1957, the Sudan celebrated the first anniversary of its independence and in September became a full member of the International Monetary Fund and of the International Bank for Reconstruction and Development. During the year a mission from the said Bank and from the USA International Co-operation Administration visited the country with a view to providing advice and practical assistance in the many development schemes under consideration.

The trade figures for the year were: Exports £S.48,100,000 and Imports £S.63 million against £S.66,700,000 and £S.45,200,000 for the previous year: it will be noticed that the balance of trade has declined from a surplus of some £S.21,500,000 to a deficit of some £S.14,900,000.

It was a busy year for our branches, not without its anxieties, especially in the early part of the year. In April a new sub-branch (Khartoum North) was opened on the bank of the Blue Nile opposite Khartoum: the new sub-branch quickly established itself and fulfilled our expectations.

JORDAN

Jordan was of course affected economically, as well as politically, by the period of tension which followed the General Election of October, 1956, and led, in March, 1957, to the abrogation of the Anglo-Jordan Treaty, the evacuation of British Forces and the termination of the annual British Grant-in-Aid. The same period saw the signing of the Arab Solidarity Agreement which Jordan concluded with Egypt, Syria and Saudi Arabia.

There was a slight increase in the trade figures for the year which amounted to JD. 31,500,000 for imports and JD. 5,600,000 for exports and re-exports.

It is satisfactory to note that currency in circulation—which had risen to well over JD. 17 million at the beginning of the year owing to political uncertainties, had fallen in December to JD. 15,600,000.

IRAQ

For Iraq, 1957 was a year of steady, if unspectacular, progress. The trade totals for the year were: Exports (excluding Oil) ID. 18,400,000 and Imports ID. 152,200,000.

In the early part of the year the export of oil was still handicapped: the Syrian Pipeline had been cut in 1956 and was out of action. Pumping through Syria, however, was resumed in March. However, as might be expected, oil royalties for the year showed a decline to some £49 million from the £69 million total for the previous year. Production itself fell from 29 million to 20 million tons. Full production, however, is in course of resumption and should, it is hoped achieve an output of 36 million tons by next year.

Your Bank opened in 1957 three new sub-branches and a cash office in the City. A cash office has also been opened at Zubair, near Basrah. As this expansion suggests, it was a very busy year for your Bank.

CYPRUS

Behind the conflict and controversy in Cyprus, the development of the Island and of its natural resources continues.

In Cyprus we are bankers to the Government and to the Armed Services. This, as you can understand entails a very large volume of work, and has led to the opening of a number of sub-branches. Our offices in Cyprus now *number twenty.*

I know you will wish to have news of our affiliated institution, the Agricultural Bank of Cyprus Limited which, with its particular policy of long-term loans for the improvement of holdings and for purchase of tractors, pumps, and other modern machinery, continues to encourage and support Cyprus farmers. It is most satisfactory to note that nearly 99 per cent of all repayment liabilities under these loans, both in principal and interest, has been punctually met at due date.

PERSIAN GULF (QATAR)

Last year I mentioned the entry of your Bank into this new territory. I am pleased to add that our first full year's working in Qatar has been encouraging. There was some general recession in the early part of the year, a not unexpected reaction to the Suez Canal crisis of 1956. Since then, however, oil production has made steady progress, and is now running at the rate of some 8 million tons a year. Prospecting for further fields continues.

Possibilities in industries other than oil are being studied. Of these projects, the production of good quality cement appears to head the list.

MOROCCO

Morocco's foreign trade figures for 1957 were as follows: imports FF. 144,820 million against FF. 155,000 million in 1956; exports FF.117,729 million against FF. 118,000 million in 1956. The adverse balance was thus reduced from FF. 37,000 million in 1956, to FF. 27,091 million in 1957.

In spite of difficult conditions, our Casablanca Branch had a busy year with encouraging results.

LEBANON

The 1957 economic situation in the Lebanon remained satisfactory. Foreign trade showed a slight advance on the previous year; imports increased from £Leb. 561,200,000 in 1956 to £Leb. 627 million in 1957 and exports from £Leb. 145,800,000 to £Leb. 152,200,000.

SYRIA

1957 showed a substantial increase in exports which from £Syr. 516 million in 1956 reached £Syr. 548 million in 1957 and a fall in imports from £Syr. 690 million in 1956 to £Syr. 616 million in 1957. The trade balance of the country, therefore, does show improved stability.

The results, both in the Lebanon and in Syria, of the Banque de Syrie et du Liban, are on the whole satisfactory.

BANQUE FRANCO-SERBE

The General Meeting of the Shareholders of the Banque Franco-Serbe held on March 28, 1958, approved the accounts for the year 1957 and the payment of a dividend of 10 per cent, the same as for the previous year.

LONDON AND PARIS, ETC.

For the Paris and London Offices and for our Branch at Marseilles it was a busy but rewarding year.

BALANCE SHEET ITEMS

Turning to the Balance Sheet, it will be seen that the totals are up by nearly £4 million, this being primarily due to an increase in the "Current, Deposit and Other Accounts."

Cash, Money at Call and Bills Receivable again total more than 50 per cent of the Deposits, evidence of a satisfactory liquid position. There is little change in the proportions of Investments and Advances to Deposits, which work out at 14½ per cent and 40 per cent respectively.

The total amount of profit available, including the balance of £22,863 brought forward, is £382,321, compared with £422,86 last year.

£150,000 has been appropriated to "Reserve for Contingencies" (against £200,000 last year), leaving a balance of £232,321; and the Committee proposes that the dividend be maintained at eight shillings per share. This will absorb £200,000 and leave £32,321 to be carried forward in 195

The report was adopted.

ALUMINIUM-INDUSTRIE-AKTIEN GESELLSCHAFT CHIPPIS (SCHWEIZ)

ZURICH, SWITZERLAND

INCREASE IN OUTPUT

FOREIGN SUBSIDIARIES MAKE FURTHER PROGRESS

NEW INTERESTS IN AFRICA

The sixty-ninth Annual General Meeting of Aluminium-Industrie-Aktien-Gesellschaft Chippis was held in Zurich on April 25th, when the Board of Directors presented the following report:

REVIEW

The change in trends in the aluminium business in the United States, which had already been referred to in the last report, continued during the year under review. Overproduction made itself felt, particularly in the United States and Canada, and led to severe cuts in the expansion plans of the leading companies. In Europe, reaction to these developments varied from country to country. In Germany, Italy and Britain, in contrast with conditions in France and Switzerland, a business recession made itself felt during the last few months of the year.

World output of virgin aluminium for 1957 has been estimated at 3,360,000 tons and thus exceeds the previous year's figure by some 30,000 tons. In this connection, it is interesting to note that for the first time for a long period, output in the United States showed a decrease compared with the previous year. A regional breakdown shows the following figures:

United States	1,496,000 tons
Canada	505,000 tons
Europe	650,000 tons
Eastern Block	600,000 tons
Japan	68,000 tons
Miscellaneous	40,000 tons

The price of the virgin metal was further increased in the United States in August, 1957, and for their American deliveries Canadian producers followed suit, whilst reducing their export price to other countries from 25 cents/lb cif European port to 24.63 cents free European plant, in November. In Europe, French prices were increased on two occasions.

In spite of unfavourable water conditions, production in the Company's four plants increased once again during the year, although only to a small extent. Market conditions in Switzerland remained satisfactory until the end of the year, so that practically the whole of the Company's Swiss output of virgin aluminium could be sold in Switzerland itself. Metal from foreign subsidiaries, on the other hand, was used for the export of semis. Sales of Raffinal—refined aluminium—developed encouragingly, whereas sales of S. A. P.—metal made of sintered aluminium powder—and of gallium, were still relatively small.

SWISS PARTICIPATIONS

The Mörel and Ernen turbines of Rhonewerke AG, generated a total of 395 kWh—that is, some 9 million less than the previous year.

Ilsee-Turtmann AG. showed a decrease of 7 million kWh compared with the previous year, and its production reached 106 million kWh only.

Rheinkraftwerk Neuhausen AG. registered normal output with a figure of 40.5 million kWh.

Elektrizitatswerk Rheinau AG, in which the Company holds a 41.8 per cent interest, concluded its first year on September 30, 1957. Output reached 200 million kWh and the dividend distributed amounted to 4 per cent.

The *Kraftwerke Gougra AG.* dam reached its planned height during the year under review, and it has since been decided to raise it by a further 3 metres (10 feet). Power output during the winter 1957/58 was still small, but is expected to assume considerable proportions in the course of next winter. The company's share capital of Sfrs. 50 million has been fully paid up since the end of January, 1958.

Robert Victor Neher AG, Kreuzlingen, an aluminium foil plant, continued to function satisfactorily, and *Allega AG,* a Zurich company selling aluminium semis from stock, registered a considerable turnover.

FOREIGN ACTIVITIES

SA des Bauxites de France reached its normal output last year, but the level of selling prices fixed by the State continued to prevent a profit being made. In Italy exploitation of the Apulia deposits continued, and work was intensified on the deposits in the Abruzzi acquired a few years ago.

The difficult Greek bauxite has only been processed at Bergheim-Cologne up to now, but arrangements are now being made to provide the necessary installations at Porto Marghera as well.

The Company's plants for the production of aluminium oxide—Martinswerk GmbH, Bergheim-Cologne, Società Alluminio Veneto pA, Porto Marghera, and Société Française pour l'Industrie de l'Aluminium, Marseilles—worked to the limit of their capacity. At Bergheim-Cologne progress was made on the new power plant, and Porto Marghera for the first time produced more than 100,000 tons of alumina.

In French Guinea work began on the construction of an alumina factory, FRIA, in which the Company holds a 10 per cent interest. The plant is expected to be completed in 1960. French Guinea has very considerable bauxite deposits.

1957 was again an unfavourable year for the production of electric power and output had accordingly to be cut during the winter. Building activity at Mosjöen (Norway) continued vigorously, and the smelter was commissioned in the spring of 1958 as planned. The Adige Plant at Zevio in Italy made considerable progress during the year and is expected to be taken into service towards the end of 1959.

As in the previous year, processing plants worked satisfactorily. The new plant put into service with Aluminium-Walzwerke Singen GmbH during the last few years is working well. In Italy Lavorazione Leghe Leggere at Porto Marghera experienced a fall in orders, whereas Laminal Rusconi Fraschini at Nembro increased in output.

In Britain the Star Aluminium Company Limited, with factories at Wolverhampton and Bridgnorth, works satisfactorily, and in Belgium Aluminium Belge SA at Liège has begun to modernise its machinery. Aluminium Foils Inc. of Jackson/Tennessee now also produces Raffinal, and sales of foils were raised last year in the face of severe competition.

PROFITS

Operations in 1957 produced a net profit of Sfrs.14,191,009.22 which, together with the balance of Sfrs.1,806,644.27 brought forward from the previous year, made a total of Sfrs.15,997,653.49 available for distribution. It is proposed to allocate this sum as follows:

To distribute a gross dividend of Sfrs.100 per share of Sfrs.1,000;

To transfer Sfrs.1.5 million to the Special Reserve Fund;

To transfer Sfrs.2 million to Depreciation Reserves;

To allocate Sfrs. 1 million to the Provident Fund;

To carry forward the resulting balance of Sfrs.1,916,193.49.

The report, the accounts, and the proposals put forward by the Board were adopted.

BOARD OF DIRECTORS

(Verwaltungsrat)

Dr. Ernst Wetter, Zurich, Chairman; Robert Naville, Cham. Vice Chairman; Dr.h c. Carl J. Abegg, Zurich; Arnold Bloch, Heuhausen am Rheinfall; Dr. Robert Bühler, Winterthur; Heinrich Hürlimann, Zurich; Frédéric Maurice, Geneva; Cyrille Pitteloud, Sitten; Dr. Rudolf Speich, Basle.

HALL ENGINEERING INDUSTRIES LIMITED

ANOTHER SUCCESSFUL YEAR

WIDE DIVERSITY OF PRODUCTS

MR E. N. HALL ON MEETING CHANGING CONDITIONS

The Third Annual General Meeting of Hall Engineering Industries Limited was held on May 14th in London, Mr E. N. Hall, the Chairman, presiding.

The following is his circulated statement: The Group Accounts show the completion of another successful year. Turnover was up from £10,180,000 to £10,860,000 but, as forecast in the last Report, there was a reduction in profits, due mostly to increased labour costs and keener competition.

The problems of financing a business today are not made easier by the very heavy burden of present-day taxation and restricted credit facilities. Until some reform of the Taxation Code takes place or some substantial reduction of Taxation is made, the Government will continue to be in the position of a major partner, taking the whole of its share of the profits each year out of the business in cash.

A good deal has already been said on the folly of Steel Nationalisation, but a country or its industries cannot advance or plan ahead if succeeding Governments introduce diametrically opposed legislation.

The shortage of skilled labour in the engineering field is still a problem, although perhaps less acute than twelve months ago, but we are beginning to see the benefits of our apprenticeship schemes which have now been in operation for some years, and many of the young men who are passing out of this category will be a valuable addition to our highly skilled personnel in our various Companies.

For the benefit of shareholders it is worth while reiterating the wide range of the Group. This includes the manufacture of high speed and alloy tool steels, stainless steels and wires, tungsten carbide cutting tools, mining tools, engineers' small tools, electrical resistance alloys, the stock holding of mild steel and free cutting steels, the manufacture of welded steel fabric for concrete reinforcement of roads and buildings, steel mesh for many applications, the design of reinforced concrete structures, bankers' engineering and security equipment, steel office furniture, aircraft wind tunnels, atomic work, metal tags, reflecting and non-reflecting road and advertising signs, auto body dies. This wide diversity of products should stand us in good stead.

FINANCE

The Trading Profit of the Group amounts to £759,375, from which has to be deducted the charge for United Kingdom and Overseas taxes of £462,427, resulting in a net profit of £296,948 compared with £362,559 in 1956. The Board recommend the payment of a final dividend of 6 per cent less tax, which, with the Interim Dividend makes a total of 10 per cent, less tax, for the year. Profits of £162,733 are added to the Revenue Reserves of the Group which now total £433,118.

Approximately £500,000 has been spent during the year on Developments at home and overseas, on plant replacement and reorganisation programmes.

SUBSIDIARY COMPANIES

Hall and Pickles Limited.—The turnover shows an increase over last year and all departments have been fully occupied. The end of the year has seen a considerable easing of raw material supplies.

As far as our Overseas Subsidiaries are concerned, the recent recession in Canada has added to our existing difficulties in this market. Your Board is fully alive to the changing conditions and is taking all possible steps to deal with this problem. Our South African Company continues to make very satisfactory progress.

The British Reinforced Concrete Engineering Company Limited.—The Company has had a good year and is continuing with the development of machinery and methods for producing meshes for purposes other than the reinforcement of concrete, some of which have already been successful and have opened up new markets with prospects of considerable expansion.

The drawing of wire at the factory in Stafford, jointly with The Lancashire Steel Corporation Limited, is proceeding satisfactorily.

Overseas, the Johannesburg and Bulawayo works are operating on a profit making basis. The Vancouver Works is in production, but because of present conditions in Canada it is not yet working to full capacity.

Chatwood-Milner Limited.—The order book for the Shrewsbury factory is substantial. The reorganisation and capital expenditure on new plant over the last two years has widened the range of activities and strengthened the Company's position so far as scope and variety of work are concerned.

Further contracts for plant in connection with Atomic Power Stations have been received.

Reorganisation at the Speke factory is now practically completed and the effect of this should be shown during the current year.

The Company's turnover for Bankers' Engineering Security Work and Office Equipment shows steady improvement.

Towards the end of the year we came to an arrangement with Chubb and Sons, Lock and Safe Company (Pty.) Limited whereby they acquired the Share capital of our South African Chatwood-Milner Subsidiary.

Improved Metal Label Company Limited.—This Company has had a good year and is introducing new lines. The overseas projects continue to develop and further equipment has been installed in South Africa.

Auto Body Dies Limited (formerly Composite Forgings Limited).—Recently the name of the Company has been changed and its title is now more descriptive of the main product. Within the last few months the necessary machine tools for the production of motor body dies have been installed and the Company is very busy.

Webslight Limited (formerly Harry Heath (General Advertisers) Limited).—The last twelve months has seen a steady increase in the order book, and this has so far been maintained in the current period. Production increased during 1957 and additional equipment is being installed.

PROSPECTS

There is no doubt that in 1958 it will be more difficult to maintain profit margins, but the attention we are paying to research, improved design, quality control and cost, as well as the regular introduction of new plant, should equip the Group to meet changing conditions.

Finally I should like to thank our Executive Directors, Staff and Workpeople for their co-operation and efforts during the past year.

The report and accounts were adopted.

NEWTON, CHAMBERS & COMPANY LIMITED

RECORD TRADING RESULTS

The seventy-sixth annual general meeting of Newton, Chambers & Company Limited, was held on May 8th at Thorncliffe, near Sheffield, Sir Peter Roberts, Bart, MA, MP (the Chairman), presiding.

The following is an extract from his circulated statement: In view of the more competitive trading conditions which developed in 1957 it is very satisfactory to report that the profit increased by £88,551 to £805,855, the highest figure yet achieved.

For the first time in the Company's history the gross profit before charging depreciation or replacement of fixed assets has exceeded £1 million. This increase in profit justifies the heavy capital expenditure of over £1 million which your Company has undertaken in the past two years, and which has been made possible by continuing the policy of retaining substantial profits in the business.

After providing £469,000 for taxation, there is a net profit available for distribution of £336,855, compared with £296,338 a year ago.

Your Directors have felt it only right that the shareholders should benefit from the successful year's trading, and they propose to increase the final dividend to 10 per cent, making 16 per cent for the year compared with the 15 per cent which has been paid for the past three years.

If your Company is to continue to expand, it is necessary to retain a considerable proportion of the profits in the business, and it has therefore been felt desirable to transfer a further £100,000 to the General Reserve, which now stands at £1,200,000.

As you are no doubt aware, we have acquired virtually the whole of the issued share capital of Ransomes & Rapier Limited, the well-known firm of Engineers and Iron-founders at Ipswich. This involved increasing our authorised share capital by the creation of 133,000 5 per cent Cumulative Preference Shares of £1 and 603,000 Ordinary Shares of £1, which will be issued to the shareholders of Ransomes & Rapier as consideration for the business.

The capital expenditure and replacement programme, to which I have referred in recent annual statements, gathered momentum last year, and an expenditure of £553,000 was incurred, bringing the total for the past three years to nearly £1,300,000.

Although much has been accomplished we cannot yet afford to slow down the process of extending and re-equipping the Works, and you will note that at December 31st we were committed to further capital expenditure of £326,000. In addition other schemes are under consideration and it is expected that a further £200,000 will be required this year.

The report and accounts were adopted.

HAMBROS BANK LIMITED

A SUCCESSFUL AND PROSPEROUS YEAR

MR R. OLAF HAMBRO'S STATEMENT

The Forty-Sixth Annual General Meeting of Hambros Bank Limited will be held on Thursday, June 5, 1958, at the offices of the Bank, 41 Bishopsgate, London, E.C.2.

The following is the Statement of the Chairman, Mr R. Olaf Hambro, circulated with the Report and Accounts for the year to March 31, 1958:

Before turning to this year's activities of the Bank I would like to refer, with regret, to the death of our colleague Sir Ernest Oppenheimer. Although as a result of the many important positions which he held in South Africa, he was not often able to attend our Meetings his advice on a great many subjects was very valuable to us and we shall miss him sadly. We are, however, assured of friendship and close contact with those who follow him in his business.

During the year, owing to his age, Mr G. L. d'Abo has ceased to be a Managing Director, but we retain, I am glad to say, his advice and great experience in international banking by his continued presence on the Board.

On his retirement as Manager of our Norwegian Department we have elected Mr Anton Martens to the Board. From his future residence in Norway he will keep us in touch with our Norwegian clients.

CONTINUED GOVERNMENT PRESSURE

In presenting this Statement with the Accounts I have referred in the last two years to the difficulties and exceptional experiences through which the Bank has passed. As is well known this year has been no exception with its violent fluctuations in discount rates and continued pressure from the Government to restrict normal Banking relations with our customers.

We have tried to fall in with these restrictions as far as possible without disturbing the good relations between us and our customers, especially those of long standing. Any other course, in our view, could lead to ruining old friendships valuable to us and to this country. In turning to the Accounts it will, therefore, be seen that the Acceptances at £19,884,928 compare with £19,523,266 last year, the Loans and Advances are £15,329,920 against £14,839,811, and on the other side of the Balance Sheet the Deposits stand at £56,526,493 against £49,230,211 last year.

LIQUIDITY AGAIN STRONG

Our liquidity is again very strong. Cash, Bills of Exchange and dated Government Stock amounting to over 75 per cent of the Deposits.

We have decided this year to value our Gilt-edged holdings at market value. The same argument remains that these are all medium and short dated and that, therefore, it is unnecessary to take market valuation. Nevertheless, in view of the wide fluctuations resulting from changes in Bank Rate, we have decided to resume our previous practice of taking them at market value.

The paid up capital of the Bank was increased during the year by the issue at £2 per share of 500,000 £1 shares which resulted in the raising of the capital by £500,000 and the reserve from £3 million to £3½ million.

PROFIT AND DIVIDEND

In the Profit and Loss Account the profit for the year is £488,182 against £430,704 last year. It is proposed to transfer £175,000 to Contingency Account and, after recommending dividends at the same rate as last year, to carry forward £124,350.

Our associated company in New York, previously known as Hambro Trading Company of America Inc., now designated Hambro Automotive Corporation, has had a very active and successful year in importing the products of The British Motor Corporation Limited into the United States. The total number of cars shipped during this financial year reached the figure of 33,513.

HONEST VALUE FOR STERLING

A review of the past year and a forecast of the year ahead is, in these times, full of difficulty. In my opinion the steps that have been taken by the Government to procure an honest value for the Pound Sterling must be welcomed by all, irrespective of their political inclinations and, as London Bankers, we look forward with confidence to the day when the Pound is freely convertible into all currencies, for then, and then only, can London again resume her place as the banking centre of the world to which she has every right by experience and integrity.

The Accounts to which I am attaching this Statement show that the Bank has had a successful and prosperous year and continues to hold its own in international merchant banking in which it started and means to continue. I am very conscious that this is only possible by the devoted loyalty of the staff and the good understanding and friendship which the Bank enjoys from its friends throughout the world.

HAMBROS BANK LIMITED

Head Office: 41 Bishopsgate, E.C.2.

STATEMENT OF ACCOUNTS AT 31st MARCH, 1958

LIABILITIES	£
Current, Deposit and other accounts	57,209,053
Acceptances	19,884,928
Paid up Capital	3,500,000
Reserve	3,500,000
ASSETS	
Cash in Hand, at Bankers and at Call	27,080,816
Bills of Exchange	12,491,695
British Government Securities	5,428,591
Loans, Advances and other Accounts	15,357,951
Investments in Subsidiaries	3,256,000
Liabilities of Customers for Acceptances	19,884,928

MAPLE & COMPANY LIMITED

REPUTATION FOR HIGH QUALITY AND SERVICE

The sixty-eighth annual general meeting of Maple & Company Limited was held on May 8th in London. Mr H. Stanley Wharton, President of the Company, presided.

The following is an extract from his circulated statement:

At our last Annual General Meeting I spoke of our projected expansion in Newcastle-upon-Tyne and Leicester. The purchase of Robson & Sons Limited of Newcastle-upon-Tyne was completed last April. Your Board consider this business to be exactly of the right type for development by your Company.

As regards Leicester, our new premises under construction are progressing well and we hope to have this fine new shop open before the end of 1958. The trading experience of our present Leicester Branch has been consistent since it was opened and again a successful year has been concluded. I am confident our new venture will prove of value in this important Midland centre.

Re-building: Steady progress in our War Damage re-building programme has been made and of the two blocks to which I referred last year one is now open and in operation, and the other will be ready early in May.

Your Board is continuing to give close attention to the Company's real estate asset. As and when sales are effected it is the intention to employ the proceeds still further to extend the general trading scope of the business. At the same time, and in the light of prevailing circumstances, your Board will carefully weigh the possibility of making some proportion of any realised surpluses available for capital distribution, as has indeed been done this year.

Tottenham Court Road: The year under review has not been an easy one and there has been a slight falling-off in the sale of our less expensive furniture. It has only been by jealously guarding our reputation for fine quality goods and showing these to advantage that we have been able to maintain our turnover.

I would stress that your Board are very conscious of the high quality and service for which the name of MAPLE stands, not only in this country but throughout the world, and everything possible is being, and will continue to be done, to conserve this precious heritage.

The statement then reviewed the activities of the Subsidiary Companies at home and overseas, and continued: Our Branches have produced for the Group an excellent return, and your Board's policy in extending the activities of Maples to the Provinces has again proved of considerable benefit to your Company.

Contracts: Apart from Shipping work, further progress has been made in this important section.

EXPORTS

Whilst total exports show a slight reduction, we have none the less sent our merchandise to seventy-six different countries, but what is perhaps more satisfactory is that our Export Order Book is larger now than for many years past. Every effort will continue to be made to expand this department still further.

The report was adopted and the final dividend of 10 per cent, making a total of 12½ per cent for the year, was approved.

G. & J. WEIR LIMITED

HIGH LEVEL OF ORDERS AND OUTPUT

THE HONOURABLE J. KENNETH WEIR'S REVIEW

The sixty-fourth annual general meeting of G. & J. Weir Limited will be held on June 4th at the registered office, Cathcart, Glasgow.

The following are extracts from the statement by the chairman, the Honourable J. Kenneth Weir, CBE, circulated with the report and accounts for the year ended December 31, 1957:

In this Statement I have to refer to results somewhat less favourable than in recent years, a change in our corporate structure, an addition to our Group, and another busy year reflecting a continued high level of orders and output.

THE ACCOUNTS

The Consolidated Profit and Loss Account shows a trading balance for the year of £2,850,816, this being a reduction of £487,936 compared with the previous year. The results this year include those of two new Subsidiary Companies which operated profitably.

The reduction in earnings was spread over the Group as a whole, and, while it is not possible to give here a detailed explanation of the reduced earnings, the following points may be noted:

1. The continued rise of wage levels, and keener competition both at home and abroad reacted on our earning capacity through increased costs and lower selling prices.
2. A change in the composition of the output had an adverse effect as it carried a higher proportion of less remunerative contracts.
3. The incidence of the Strike in the Engineering Industry affected that division of the Group as also did some minor but nevertheless costly labour disputes.
4. Group output did not come up to the expected level.
5. There was a reduced demand for Public Authority housing in Scotland.

Each of these factors played a part in contributing to the drop in the trading margin, but it is probable that the most important factor was the increase in costs, this not being offset by a sufficient increase in output.

FORMATION OF A HOLDING COMPANY

Hitherto the Parent Company has functioned in a dual capacity, as it has been both a trading and a holding concern. Your Board believes that it would be better to separate these two functions, which would enable the Board of the Holding Company to concentrate exclusively on policy matters affecting the Group and leave the purely trading functions at Cathcart in the hands of the local Board.

PEACOCK BROTHERS LTD.

This firm has acted as Sales Representative in Canada for the Parent Company and Drysdale & Company *Limited* for over fifty years. During the year an opportunity arose for our acquiring a further and controlling interest in this Company as from January 1, 1957, and your Board felt it would be in the interest of your Group to take advantage of this offer.

We believe that this acquisition has materially strengthened our ability to sell in Canada, as well as achieving an interest in the expanding economy of that great country.

SURVEY OF PERFORMANCE

G. & J. Weir, Limited.—The output during the year of new work and repairs exceeded the record level established in 1955. Nevertheless we failed to attain the target which we had planned to reach, this being largely the result of an indifferent start and the effect of the Strike in March and April.

A prominent feature of the year's output was the delivery of the first four plants against our large contract for evaporating and distilling plants for the island of Aruba, these deliveries being made exactly in accordance with the original programme. Delivery of the last plant has now been made, and during the course of the year the plants will progressively come into commission.

On the input side, we had another good year and your Company's products were in considerable demand, resulting in a record flow of orders for new work.

Drysdale & Co., Ltd.—During the past year the output at Yoker showed a substantial increase over the previous year. Although, equally with Cathcart, Yoker experienced some dullness in orders towards the end of the year, the year finished with an order book higher than 1956.

Argus Foundry Limited.—This Company had to face a difficult year. We have taken positive action to improve and augment our selling effort, and if this results, as we hope, in a better order book for all three foundries, it will not be long before this Company once more shows a return satisfactory for a foundry business of this type.

Zwicky Limited.—This Company has always been markedly dependent on Defence requirements, particularly in aircraft refuelling equipment. The dangers of dependence on a restricted market have been apparent to your Board for some time, and over the past few years steps have been taken to diversify the range of the Company's products.

Weir Housing Corporation Limited.—1957 was not a good year for the building trade in Scotland, but nevertheless our Coatbridge Factory still maintained a high level of output and almost 3,000 houses were built during the year.

The civil engineering side of our organisation continued its modest expansion and is gaining experience in a variety of small but useful contracts.

Weir Valves Limited.—This Company also had a difficult year, basically due to lack of sufficient orders but accentuated by labour troubles which also delayed new developments. However, an increase in the number of designs of the standard range of valves has been effected and types suitable for the oil industry are now in production.

Wm. Simons & Company Limited.—During the year the yards and workshops have been well employed. We have not been without our share of the labour troubles affecting the shipbuilding industry, but it is hoped that more settled times are ahead.

At our Annual General Meeting I shall have the opportunity of making some observations on your Company's affairs and progress in the light of the later information then available.

BROWN BAYLEY LIMITED

NEW HOLDING COMPANY'S FIRST ACCOUNTS

MR J. W. GARTON ON SUCCESS OF CAPITAL REORGANISATION SCHEME

The second annual general meeting of Brown Bayley Limited, was held on May 8th at Attercliffe, Sheffield, Mr J. W. Garton, JP (the chairman), presiding.

The following is the statement by the Chairman which had been circulated with the report and accounts:

The Accounts now presented are for the period of five months ended December 31, 1957, and are the first Accounts prepared for the new Holding Company since the Capital Reorganisation Scheme outlined in my Circulars to you of July 5 and September 2, 1957.

The year ends of the Subsidiaries have been brought into line with that of the Holding Company. The Accounts of The Hoffmann Manufacturing Company, Limited, are not affected by this, but the Accounts of Brown Bayley Steels, Limited, are for a fifteen months' period.

Although the Accounts are in respect of a period of only five months, it should be particularly noted that they include dividends paid or recommended in the case of Brown Bayley Steels, Limited, in respect of profits earned over fifteen months and, in the case of The Hoffmann Manufacturing Company, Limited, twelve months. Future Accounts will, of course, include dividends paid by those Companies in respect of profits earned in each case over periods of twelve months only. Therefore, it should not be inferred that the amounts which may be distributed by way of dividends in respect of this current financial year will necessarily be any greater.

The reorganisation referred to above has met the three points outlined in my Statement of November, 1956, in that it has reduced the top heavy quotation of the shares, brought the capital of the Company more into line with its asset position and made the dividends expressed as a percentage of the issued share capital more realistic.

ACCOUNTS

There are no comparative figures shown this year as it is the first published Account of the new Holding Company. The Profit and Loss Account, after tax, shows a balance of £151,842.

The Interim Dividends already paid by the two Subsidiaries and the Final Dividends which have been recommended by them are taken into this Account, and it is on the basis of these dividends that your Directors have pleasure in recommending a Final Dividend of 7½ per cent, less tax. This, together with the Interim Dividend of 2½ per cent, less tax, already paid, makes the total for the period 10 per cent, less tax.

The Balance Sheet reflects the results of the recent Capital Reorganisation Scheme, the altered share capital and the revaluation of the shares in the two Subsidiary Companies.

SUBSIDIARY COMPANIES

The Hoffmann Manufacturing Company, Limited.—This Company has had a successful year, its turnover reaching a record level. The Accounts of this Company for the year ended December 31, 1957, are published as part of the Directors' Report and show a net profit, after tax and depreciation, of £647,026 which compares with £548,277 in 1956. The amount distributed by way of Ordinary Dividends is £175,000 compared with £125,000 in 1956.

Brown Bayley Steels, Limited.—The Accounts for the fifteen months' period ended December 31, 1957, are also published as part of the Directors' Report. The Accounts show a net profit, after charging depreciation and tax, of £458,975, and the amount distributed by way of dividends is £94,875, compared with £62,100 for the year 1956. The rate of dividend paid for the fifteen months' period is 13¾ per cent, less tax, and on the basis of this rate the effective rate for a full year would be 11 per cent, less tax, which compares with the 9 per cent, less tax, in respect of the twelve months ended September 30, 1956.

The Farnley Housing Association, Limited.—The Association have again reduced the interest free loan by £200, and the balance now outstanding on this loan to them is £4,600. As in the past year no dividends were received.

The report and accounts were adopted.

PETROFINA

SOCIÉTÉ ANONYME

BRUSSELS, BELGIUM

The Annual General Meeting of Petrofina S.A. was held in Brussels on May 9th, and the following are extracts from the Board of Directors' report:

GENERAL SURVEY

The year 1957 began at the height of the Suez crisis, and in its last months was marked by the upsetting of the balance between supply and demand. This was due to the after effects of the closure of the Suez Canal and to the slowing down of the economic activity of most countries during the second half of the year.

The oil companies' results have suffered in consequence. For the majority of them profits for the second half of the year fell off considerably. Petrofina's own experience has been different and the Group's increased sales made up for the lower margins of profit in the last few months of the year.

There is one important point to be stressed, for it shows that the oil industry is less susceptible than are other industries to the effects of economic crises. It is that the gradual deterioration of the economic situation has not stopped the increase in the consumption of oil. It has only slowed it down.

Long-term forecasts encourage expectations of a considerable increase in the consumption of petroleum products and it is believed that the present situation is a not unfavourable one for the Group, which has the advantage of a rate of expansion sufficient to justify its optimism.

FINANCE

It should be stressed once more how serious a problem is the financing of the capital investment which is essential to the oil industry.

The funds available in the money markets of the world can satisfy only a small part of its requirements, and this brings out more clearly than anything could do the particular importance of having profit margins sufficient to allow of a reasonable return on the capital invested in it, and at the same time sufficient to cope with the continually increasing need for fresh capital investment.

Despite the unfavourable conditions prevailing in the financial markets, it was thought to be in the Group's interest to make a debenture issue. It was for 25 million dollars, and it was made in Belgium, Germany, Canada, Holland and Switzerland, arousing lively interest in the international money markets and proving a pronounced success.

PRODUCTION

The companies of the Petrofina Group have not reduced their activities in the search for, and the production of, crude oil and their output in Canada, the United States and Egypt in 1957 was some 1,600,000 tons. Commercial production in Angola is expected to begin in 1958.

REFINING

The Group's refining capacity now exceeds 7¼ million tons a year.

TRANSPORT

The year 1957 witnessed a complete reversal of the situation in the tanker freight market, and freight rates for single voyages fell during the year by 90 per cent. It must be remembered, however, that single voyages represent less than 10 per cent of all tanker charterings, and have only a comparatively small effect on the average rates which serve as the basis for our operations. It appears improbable that there will be any substantial rise in the near future, having regard to the number of new ships being completed and the volume of the tonnage laid up.

The Group's fleet at the end of 1957, including ships on order and on long-term charter, amounted to 1,215,000 tons. This tonnage meets its minimum requirements.

DISTRIBUTION

Efforts have continued to strengthen the distribution network controlled by the Group, which at the moment covers seventeen countries.

The Group's products are sold on the Continent of Europe and in Africa under the brand name "Purfina," and in Great Britain (by Petrofina (Gt. Britain) Ltd.), the United States and Canada under the brand "Fina."

The Group's sales were 6,900,000 tons, an increase of 15 per cent.

PROFITS

The year showed a profit of 755,289,209 Belgian francs (approx. £5,395,000), including the balance of 74,367,627 Belgian francs (approx. £531,000) brought forward from the previous year.

(This compares with a profit of 656,120,315 Belgian francs (approximately £4,686,000) in 1956.)

It is proposed that this should be appropriated as follows:

	B. Francs	Approx.
Carried forward ...	80,769,854	(£577,000)
Reserves	100,000,000	(£714,000)
Directors' and auditors' remuneration	40,216,355	(£287,000)
Dividend of 110 B. francs (15s. 8d.) per share on 4,857,300 shares...	534,303,000	(£3,816,000)

The report, the accounts and the proposals put forward by the Board were adopted.

EAGLE STAR INSURANCE

The Annual General Meeting will be held in London on June 5, 1958. The following is a summary of the Directors' Report for 1957 circulated to shareholders, by Sir Brian Mountain, Bart, the Chairman.

Life Department premiums increased to £14 million and Funds now exceed £100 million. New Business amounted to £62 million. The Triennial Valuation at December 31, 1957 required provision to cover Stock Exchange values but since 98 per cent of British Government Securities held are redeemable, this depreciation will be more than made good. Liabilities were valued on a strong interest basis.

Reversionary bonus rates are higher than those declared in 1954.

General premium income expanded to over £16¼ million and the resultant profit was £424,052.

Fire premiums continue to expand at Home and Overseas, with satisfactory Home results. Home Motor Account yields a satisfactory profit partly due to petrol rationing, but the outlook is uncertain. Accident business increased and results were on the whole good. Marine and Aviation Account showed an increase in premiums and the profit has been retained in the Fund.

Overseas operations continued to expand profitably, particularly within the Commonwealth, although in North America the loss experience in the Fire and Automobile Department was still heavy.

The Ordinary Dividend for 1957 is 3s. 3d. per share (compared with 3s. for 1956) and balance carried forward in the Profit and Loss Account is £1,661,866.

STANHOPE STEAMSHIP COMPANY

The sixth annual general meeting of the Stanhope Steamship Company Limited will be held on June 5th in London.

The following is an extract from the statement by the Chairman, Mr J. A. Billmeir, CBE, FICS, which has been circulated with the report and accounts:

The Company, which now has only two of its twelve ships on forward contract, is feeling the full brunt of the present depression, with eight ships laid up, several since last August. Furthermore, the Company entered into a time charter contract last year, for a modern tanker, which is at present trading at a serious loss, and is causing the Board considerable concern.

World demand for shipping remains at a very low ebb and in many trades is almost non-existent. With the present needs of shippers being fully met by liners and time chartered ships, coupled with the considerable amount of new tonnage coming into service, the outlook is most serious and depressing.

These very changed trading conditions, and existing monetary stringencies, have caused a revision of the Company's building policy, and the order for a new cargo ship for delivery 1960, which was placed some time ago, has been cancelled. In addition, the new tanker mv *Stanvale* has been sold. Delivery of the tanker ordered by the Subsidiary Company is expected in November of this year.

There is no doubt the next twelve months will be a testing time for the independent British shipowner.

The Directors recommend the payment of a modest dividend of 5 per cent (less Income Tax).

RAND MINES, LIMITED

DE BEERS CONSOLIDATED MINES LIMITED

(Incorporated in the Union of South Africa)

GEM SALES SATISFACTORY IN VIEW OF U.S. RECESSION

GROUP'S ASSETS OUTSIDE DIAMOND INDUSTRY NOW £88 MILLION

The following are extracts from the statement by the Chairman, Mr H. F. Oppenheimer, which has been circulated with the annual report and accounts:

It has fallen to me to succeed my father as chairman of De Beers Consolidated Mines Limited and its subsidiary and associated companies. I am very grateful to my colleagues for the confidence they have shown in me and at the same time am deeply conscious of the great responsibility which is involved.

An essential factor for the stability of the diamond trade is the close co-operation that has long existed between the producers of our group and the important producers in the Belgian Congo, Angola, West Africa and Tanganyika whose production has for many years been marketed with our own. I would like to express my appreciation of the friendly spirit in which these producers have recently reaffirmed their confidence in our organisation.

To our great regret, early this year Dr J. T. Williamson, the discoverer of the diamond mine at Mwadui in Tanganyika territory, died. He was at once a figure of romance and a practical benefactor to Tanganyika. One could not fail to be impressed by his kindliness and his devotion to the interest of all who worked with him. Our sympathy goes out to his family and associates.

GEM SALES ENCOURAGING

Gem sales for the year 1957 at £52,818,096 constituted a record for the third successive year. Towards the end of the year, however, there was a marked falling off in demand. In view of the current economic recession in the United States it was to be expected that the gem trade would weaken, and the central selling organisation, in accordance with its established policy in such circumstances, reduced the quantity of diamonds offered to the market. I am glad to report, however, that the results for the first quarter of 1958 are more encouraging. Sales of gem diamonds for these three months amounted to £10,513,699 as compared with £10,972,484 for the same period of last year, which, in the circumstances, must be regarded as very satisfactory.

Industrial sales for 1957 reached a satisfactory total of £23,954,016 but here again a serious falling-off in demand made itself felt towards the end of the year and this side of the business is still very weak. This is attributable not only to the business recession in the United States, but also to a considerable extent to the cessation of stockpiling purchases, with the exception of purchases of crushing boart, by the United States Government.

In his statement last year, my father remarked that it was too early to predict where the remarkable achievement of the General Electric Company in producing synthetic industrial diamonds would lead. These synthetic diamonds consist of abrasi material which competes with the so-call crushing boart produced principally by t Société Miniere du Beceka at Bakwanga the Belgian Congo. There is, so far as I a aware, no question of the synthetic prod tion of the larger sizes and better qualit of industrials, and the production of synthe gem stones is apparently regarded as entir impracticable.

Extensive tests are now being undertak by our diamond research laboratory in Joha nesburg to determine the properties of new material and its advantages and dis vantages as compared with natural diamo for various uses and under varying conditio The Société Miniere du Beceka has recen substantially increased its productive capaci and I would be very surprised indeed if t synthetics could be produced as cheaply the natural stones. However, in the past chief limitation on the use of diamonds abrasive purposes has been the shortage supply, and there may well prove to be ro in the market both for the natural and synthetic product.

STRONG FINANCIAL POSITION

The financial position of the group been strengthened still further during past year. Large financial reserves essential for the stability of the trade, under my father's chairmanship the finan strength of the company was carefully b up. At the end of the year the group's cash assets totalled £26,959,607 in addi to which we held £9,496,532 in gilt-edg securities. When, in addition, the resour of the gem and industrial marketing co panies, amounting to nearly £15 million taken into account, it will be clear that

group has ample financial resources for the protection of the trade.

As you are aware, our company has, in recent years, through its subsidiary De Beers Investment Trust Limited, invested substantial sums in the Union of South Africa and the Federation of Rhodesia and Nyasaland outside the diamond industry. This policy was continued during the year, and at the end of the year the value of the group's investment outside diamonds amounted to £52,345,826 in addition to the cash assets to which I have already referred.

We may look forward with confidence to increasing revenue from these outside investments, and in making them we have broadened the base of the company's activities and added to its stability.

NORTH BRITISH AND MERCANTILE INSURANCE COMPANY LIMITED

MR CYRIL H. KLEINWORT ON NEED FOR REALISTIC RATES IN USA

The 148th Annual General Meeting of the North British and Mercantile Insurance Company Limited was held on May 8, 1958 at the Registered Office of the Company, *64 Princes* Street, Edinburgh.

Mr Cyril H. Kleinwort (Chairman of the General Court of Directors) presided.

The Chairman said:

In the first place, I would like to pay tribute to your late Chairman, Lord Brand. He joined the General Court in 1916, became Deputy Chairman in 1936 and Chairman in 1941. Lord Brand is one of the outstanding economists of this country and I need not elaborate the value to your Company of his guidance and advice over this period. Suffice it to say that we miss him greatly.

THE GENERAL SITUATION

With regard to the general situation as it affects your Company, the last year has seen resolute, painful and successful action by the Government to check inflation. Insurance has become the great medium of personal saving and, since stable monetary values are essential to the principles of insurance, it is satisfactory that a greater understanding of this problem has become apparent in some quarters. The theory that creeping inflation is a small price to pay to secure capacity production and full employment, is a dangerous fallacy. As a policy it treats the small saver with a cynicism which cannot be justified on moral or practical grounds and, by gradually destroying confidence in fixed interest securities, it strikes at the basis of industrial and government finance. The cycle of increased costs of production, falling exports, currency crisis, unemployment and devaluation, invariably follows inflation—creeping or otherwise.

CONTINUING UNSATISFACTORY CONDITIONS IN USA

You will perhaps wish me to say something about the continuing unsatisfactory conditions in the Fire and Casualty business in the United States of America where your Company is so largely involved. I and other members of your Board, also officers of the Company, were in the United States last year and I propose to cross the Atlantic again next week. I am satisfied that, within the limits of our size, our organisation in the USA is highly competitive and in no sense can the deplorable underwriting results before you be said to be due to lack of efficiency on the part of our management and staff in the USA. It is always difficult in the highly competitive business of insurance to raise rates sufficiently rapidly to match increases in losses but, in the United States, this problem is aggravated by the fact that premium increases require official sanction. The temptation to leave decisions until after elections is a serious factor in the delay which the industry is experiencing in the achievement of more realistic rates. The old story of too little and too late can only be countered by publicity and a greater degree of co-operation between the interested parties than at present exists. Fortunately, there are signs that a sense of urgency is at last prevailing.

I sincerely hope that next year I shall be able to speak of improving conditions but this year has not started well and it would be unwise to expect too much.

On the motion of The Chairman, seconded by the Honourable Arthur O. Crichton, the Report and Accounts were approved and adopted.

Following the re-election of the Directors, Extraordinary and Ordinary, and the adoption of the Resolution regarding the fees and expenses of the Auditors, Messrs Lindsay, Jamieson and Haldane, CA, which was proposed by Mr Alan F. Stark, WS, and seconded by Mr Thomas A. Aitchison, CA, the proceedings terminated with a cordial vote of thanks to the Chairman and Directors, proposed by Mr Charles R. Munro, CA.

CROSSE & BLACKWELL (HOLDINGS) LIMITED

RECORD SALES OF "TEN O'CLOCK TESTED" FOODS

The annual general meeting was held on May 14th in London, Mr H. L. Roy Matthews, CBE, the Chairman, presiding.

The following is an extract from his circulated statement:

The aggregate Sales figures of the Combine are again in advance of those of the previous year's trading and thus once more constitute a record. The advance applies both to home and export trade.

At home, competition is intensifying and the fact that a further advance can be noted in the face of this competition is gratifying. It is the Board's intention to take all possible steps to improve and expand the Export side of the undertaking.

The trading profit has increased to £1,268,300 and the net profit comes out at £527,617.

After reviewing the Group's world-wide activities, the Chairman said: In the main one can justifiably feel that our object to keep prices stable has been achieved in that, whilst comparatively small increases in certain prices have been unavoidable, the prices of some other products have been decreased. This matter of stable prices is of great importance.

On the general question of the Group's advertising, the Chairman said: There is no doubt that the "Ten o'clock *Tested*" *theme*, which is applied to all Crosse & Blackwell products has created something of real value to the Group, and the same theme is now being successfully adopted by our Subsidiary Companies overseas.

The report and accounts were adopted and a total dividend of 12½ per cent for the year was approved.

THE MANGANESE BRONZE AND BRASS COMPANY

EXTENSION OF PRODUCTION FACILITIES

MR J. C. COLQUHOUN'S REVIEW

The fifty-ninth ordinary annual general meeting of the Manganese Bronze and Brass Company Limited was held on May 12th in London, Mr J. C. Colquhoun, MBE (the Chairman), presiding.

The following is an extract from his circulated statement:

Before dealing with the accounts for the year I would like to refer to a change in the management structure of your company. Mr E. Robson succeeded me as Managing Director as from January 1, 1958. Mr Robson has served your company since 1921 and has played a prominent part in the development of your business as General Manager of your Ipswich factories and latterly as Deputy Managing Director of the company.

The Group accounts for the year ended December 31, 1957, show a profit before tax of £615,347 after £92,158 depreciation against £536,426 after £83,630 depreciation for the previous year but the latter figures are not comparable in the sense that they include only a portion of the year's earnings of subsidiaries acquired late in 1956.

Provision for taxation requires £348,713 (against £289,570). After making this provision there remains available for distribution and surplus £266,634 (£246,856).

Your directors recommend that a final dividend for the year of 6d. per share plus a bonus of 1½d. per share be paid on the 4,433,072 Ordinary shares as increased last autumn by a one-for-one scrip issue, making a total equivalent to 9¾d. per share on the enlarged capital for 1957. If this is approved, the surplus remaining out of the year's profit after payment of all dividends will amount to £160,897 against £161,362 retained out of the previous year's profits.

Turning to the Balance Sheet, you will notice that Net Fixed Assets of the Group at £1,916,456 show the substantial increase of £410,322. This results partly from the revaluation of assets of subsidiaries—partly from the continued re-equipment and extention of production facilities—and partly from the acquisition by Lightalloys Limited last December of the business of the *Caplin Engineering* Company and Capco Sales Limited. This acquisition is considered to fit in well with the business of Lightalloys Limited and to strengthen their position.

THE YEAR'S TRADING

Your marine propeller business had its best year yet in weight of output with 41 per cent for export and 74 per cent to our own SCIMITAR design. Extensions have now been completed into a portion of an additional 10 acres of land at your Birkenhead Works mainly to provide production facilities for the increasing number of very large propellers now required. This production is now supplemented for the smaller and medium sizes of propellers by your recently acquired subsidiary on the Clyde, Steven and Struthers Limited who, for many years, have also been manufacturing tail shaft liners, valves and whistles, but it is too early as yet to say to what extent these products may be developed.

In regard to extrusion, rolling, forging,

etc., your Handford Works at Ipswich found a slowing down in industry throughout the year with customers inclined to reduce stocks and limit purchases to day-to-day requirements influenced possibly by the falling metal prices. None-the-less they had a satisfactory year with results exceeding expectations. The field of Nuclear Energy calls for many special alloys, which has been well investigated by our technical staff, and where we can meet the demand new materials and processes are being developed for the purpose.

Since we started making "Oilite" self-lubricating bearings from metal powders in 1932 there have been very few years where sales, which now include many other parts made from metal powders, and profit were not up on the previous year. As 1956 was one of those years I am glad to say that 1957 again resumed the upward trend with a substantially higher level of sales. Undoubtedly we have reaped considerable benefit from widening the field in which such components can be used, and the Works are continuing the task of extending the application throughout industry in the firm belief that there is still room for further expansion.

The main items of interest to Lightalloys Limited during the year are that British Railways have standardised on our type of cast aluminium doors and that we have received a fair share of the contract. Main line express Diesel locomotives have gone into service with our cast aluminium cabends and various other fittings. In conjunction with Imperial Chemical Industries Limited we have developed a new method of fabricating doors and partitions for which we think there will be a ready market. We have also successfully made a deep tank hatch cover which we believe to be the biggest aluminium casting ever made, employing the large casting facilities of your Birkenhead Works.

In regard to the outlook, although our order book, as a Group, is better than a year ago, trading conditions generally throughout the world have contracted during the past few months and British industry has not entirely escaped this international movement. How this will develop is difficult to foresee but looking further ahead, in anticipation of the European Free Trade Area, we will continue with our endeavours and the necessary capital expenditure to ensure that plant is maintained at maximum efficiency.

The report and accounts were adopted.

REICHHOLD CHEMICALS

ANOTHER SATISFACTORY RESULT

EXPANDED SALES

MR WALTER H. BREUER'S STATEMENT

The sixth annual general meeting of Reichhold Chemicals Limited will be held on June 10th at Winchester House, Old Broad Street, London, E.C.2.

The following is the statement by the chairman and joint managing director, Mr Walter H. Breuer, circulated with the report and accounts:

The Annual Accounts are presented in established form and reflect the year's operations of our Group of Companies and their position at the close of the year.

A DIFFICULT YEAR

The Operating Companies have experienced a very difficult year owing to the effect of the Suez Crisis in the early months and the continued Credit Squeeze, followed by increasing competition, coupled with a substantial increase in Wages and Establishment Charges generally, but I am happy to record that in spite of these difficulties the expanded sales have enabled your Directors to again present a satisfactory result.

Accordingly they recommend the payment to the Holders of Ordinary Shares a Final Dividend of 10 per cent, and a Cash Bonus of 2½ per cent. With the Interim Dividend of 7½ per cent, already paid, this makes a total Dividend of 17½ per cent and a total distribution of 20 per cent, the same as last year.

In order to maintain the prudent policy of an adequate "plough-back" it is proposed to place a further £75,000 to General Reserve.

PHTHALIC ANHYDRIDE PLANT

The Phthalic Anhydride Plant has been in full operation since July last year, but as must be expected with new Chemical Plant, certain teething troubles arose, but I am happy to state that with the able technical co-operation of our American, French and German Associates these have been overcome so that we should derive a satisfactory profit from this new activity from January, 1958, onwards.

Apart from the arrangements concluded with our American Associates, Reichhold Chemicals Inc., mentioned in my report last year, we have a similar arrangement with our South African and Australian Associates which will result in increased revenue from these sources.

Once again, I must emphasise the effect of the intolerable burden of taxation confronting industrial enterprises today, and it is hoped that the necessary legislation to alleviate the position will soon be forthcoming.

VINYL AND VINATEX COMPANIES

The Vinyl and Vinatex Companies are rapidly expanding and have now 13 Licensees manufacturing their products overseas which are providing an increasing source of revenue. The Beck Koller Company is increasing its plant capacity to meet an increasing demand for its products. Sales of Polyester Resins in the reinforced Plastics Field are increasing satisfactorily and it is expected that further improvements and development of new types will reflect an accelerated expansion.

It is interesting to note that due to our "plough-back" policy in addition to the provision of maximum depreciation the substantial Capital Expenditure involved can be adequately taken care of having regard to the financial facilities available to the Group.

Once again you will doubtless wish to associate yourselves with the tribute I am happy to pay on behalf of the Board of Directors, to all our Factory Employees, Technical and Administrative Staffs and Directors of Operating Companies, for their continued enthusiasm and happy support.

BUSINESS AND PERSONAL

BAHAMAS, WEST INDIES

Director of distributing company proceeding Caribbean early July would consider representing UK Publishers; will carry out commissions, research, or furnish special reports. Complete coverage all islands assured.—Box 929.

APPOINTMENTS

MSL have been retained to advise on the appointment of a

GENERAL MANAGER

for a company in South West England whose products are used extensively throughout many industries. He will be responsible for the profitable operation of the company, including sales, production and certain aspects of research and development. Starting salary not less than £3,000.

Candidates should be graduates or qualified accountants and be holding executive responsibilities involving general management skills in manufacturing industry. Some experience of selling to the engineering industry would be an advantage. Age limits 35 to 45.

No information will be disclosed to our clients until candidates know their identity and have given permission after personal discussion. Please send brief details in confidence, quoting reference S 964, to R. A. Denerley.

MANAGEMENT SELECTION LIMITED
17, Stratton Street, London, W.1.

EXPORT MARKET DEVELOPMENT

A vacancy exists for an Assistant to Executive in charge of Export Market Development Unit of large manufacturing group in the Midlands. Age 25/35. At least 5 years' commercial experience, preferably on the sales side, with knowledge of market and sales development. The successful candidate will have a good educational background, will be adaptable, must possess drive and be prepared to tackle a variety of problems and have the wish to make a career in this field.—Applications should be addressed to Box 934.

THE GUEST KEEN AND NETTLEFOLDS GROUP OF COMPANIES

wish to make the following

Important Appointments in one of their

Constituent Companies.

(i) A fully experienced SALES MANAGER is required by a precision engineering company in the Midlands. Applicants must have had sound experience of selling at all levels, preferably in the Engineering industry, and should be able to organise internal and external sales forces and undertake market research for new projects. The ability to recommend new products and introduce additional precision and engineering business would be an advantage.

The appointment is of outstanding importance and offers exceptional prospects to a man of the right experience and personal qualities. The salary offered and associated benefits will be commensurate with this top-level appointment.

(ii) The same precision engineering company require a SALES REPRESENTATIVE who will be based on their London Office and be responsible for their Southern Area from a line south of Bristol to the Wash. Applicants, who should preferably have an engineering background, must have had sound selling experience at all levels. The appointment calls for a man of initiative and high personal qualities, who will be able to act independently and assume full responsibility for the sales activities of the Area.

Appropriately qualified men who consider that they have had relevant experience are invited to write, stating full details of age, qualifications, career to date, etc., to the Group Personnel Officer, Guest Keen and Nettlefolds, Ltd., Shell-Mex House, Strand, W.C.2.

THE ROYAL COLLEGE OF SCIENCE AND TECHNOLOGY GLASGOW

DEPARTMENT OF INDUSTRIAL ADMINISTRATION

Applications are invited for a Lecturership in the Department of Industrial Administration. Candidates must hold a professional qualification suitable for teaching budgetary control and standard costing. Experience in industry is essential. The salary will be on a scale £900 x £50—£1,350, with the possibility of extension £375—£1,650. The starting point will depend on qualifications and experience. Superannuation is under the F.S.S.U., and there is a system of Family Allowances. Members of the teaching staff are allowed to undertake a limited amount of consulting work.

Forms of application may be obtained from the Secretary-Treasurer, Royal College of Science and Technology, Glasgow, C.1.

NORTH WESTERN GAS BOARD

HEAD OFFICE, MANCHESTER

Assistant Statistician

Applications are invited for the above pensionable appointment at a commencing salary within Grade A.P.T.7 (£705/£785 p.a.).

Candidates must hold a graduate or equivalent qualification in mathematical statistics, preferably combined with economics, or be in their final year of study leading to such qualification.

The successful candidate will be engaged under the direction of the Board's Statistician in specialised investigations in the field of market survey, quality control, sales forecasting, etc., which call for the use of the techniques of mathematical statistics. The work is interesting, offering scope for imagination and initiative in the use of these techniques, and there are good prospects for advancement.

Detailed applications, giving the names of two referees, should reach the Secretary of the Board, Bridgewater House, 60, Whitworth Street, Manchester, 1, within 14 days of the appearance of this advertisement.

IMPERIAL CHEMICAL INDUSTRIES LIMITED

BILLINGHAM DIVISION

HEAVY ORGANIC CHEMICALS DIVISION

QUALIFIED ACCOUNTANTS

Chartered or Incorporated Accountants with industrial experience will find increasing scope with these two Divisions operating on Tees-Side.

To expand our Accountancy Departments, we need men up to 35 years of age who can master complex work and take over responsibility quickly.

Our salary scheme is designed to reward special experience and ability, and other conditions of employment are excellent. All employees join our Pension Fund and the Profit Sharing Scheme, while for married men there are schemes for assisted house purchase, payment of removal expenses and, where applicable, lodging allowances.

Those interested should write to the Staff Manager, Imperial Chemical Industries, Limited, Billingham Division, Billingham, Co. Durham, quoting Ref. B/W/9.

ST. ANNE'S COLLEGE, OXFORD

Applications are invited for the post of Tutor or Lecturer in Mathematics, to take office in October, 1958, or later.

The Tutor or Lecturer will be responsible for directing undergraduate work, and will be expected to teach for Honour Moderations and for the Final School of Mathematics. Applicants should have obtained an Honours degree in Mathematics.

Application should be made before June 10th to the Principal, from whom further particulars can be obtained.

KUWAIT OIL COMPANY LTD.

require a

SUPERINTENDENT

to take charge of their

HOLLERITH INSTALLATION

in

KUWAIT

Applicants should be qualified Accountants and in the age range 35-40. They should have not less than 5 years' experience of planning and organising work in a large punched card installation, and in control and administration of the staff. The selected candidate will be required to take charge of the Machine Accounting Division.

Local Salary will be according to qualifications and experience, and will be in the region of £3,000 p.a. Pension Scheme. Kit allowance. Write for application form, giving brief details and quoting K.2422, to Box Z/34, c/o 191, Gresham House, E.C.2.

MERCHANT Bankers require Investment Statistician. Knowledge of American securities an advantage.—Write, stating age, experience, qualifications and salary required, to Box MY/37, c/o 95, Bishopsgate, E.C.2.

THE UNIVERSITY OF LEEDS

DEPARTMENT OF HISTORY

Applications are invited, preferably from those with special interests or qualifications in modern European history, particularly the history of Europe before 1789 and/or English history of the 16th and 17th centuries, for appointment as Assistant Lecturer at a salary within the range £700-£850 a year, according to age, qualifications and experience.—Applications (three copies) stating date of birth, qualifications and experience, together with the names of three referees, should reach the Registrar, The University, Leeds, 2 (from whom further particulars may be obtained) not later than June 9, 1958.

THE REPUBLIC OF THE SUDAN

The Department of Statistics, Ministry of Social Affairs, has the following vacancy:

ASSISTANT DIRECTOR (Technical).—Candidates must hold an Honours Degree in Economics and Statistics, should have a sound knowledge of sampling theory and fully capable of planning and undertaking social surveys. A knowledge of national income statistics is required. Candidates must be fully literate in Arabic or English. Age 35-45. Appointment will be on contract for a period of 3 years. Salary range from £S 2,180 to £S 2,360. Starting point will be fixed according to age, qualifications and experience.

A cost of living allowance, which is reviewed every two months, is payable, and an initial outfit grant of £S 50 on appointment. Annual leave accrues at the rate of 7 days per month. Free air passage on appointment and leave.

Applications by letter in the first instance, giving particulars of qualification, age and experience, with copies of recent testimonials, to be submitted to Sudan Embassy, Personnel Section, Cleveland Row, London, S.W.1, quoting reference 4/914.

STATISTICIAN

PFIZER LIMITED

Invite applications from Statisticians for a new appointment at their Sandwich, Kent, Laboratories. The successful applicant will be required to design and analyse comparisons and surveys connected with medical, pharmacological, analytical control, microbiological and market investigation departments of a rapidly expanding pharmaceutical Manufacturing Company.

A graduate in statistics or mathematics, with post-graduate experience as a statistician, is needed to join in work which will be stimulating and require originality rather than a routine approach.

The commencing salary will depend largely upon age, qualifications and experience. The Company operates a non-contributory Pension and Life Assurance Scheme. Removal expenses are paid.

Applications should be made, in writing, to:

Personnel Officer,
PFIZER, LTD.,
137/139, Sandgate Road, Folkestone,
giving full details and quoting reference E 6673.

IMPERIAL CHEMICAL INDUSTRIES, LIMITED, Plastics Division, is setting up a team for work on ELECTRONIC COMPUTER applications.

Enquiries are invited from men in the age range 20/25, National Service completed or exempt, for work as PROGRAMMERS initially of commercial procedures. The desirable qualifications are:

(i) Some mathematical ability, e.g., G.C.E. "A" Level Mathematics or equivalent.

(ii) General experience of the commercial field.

(iii) Experience of punched card operating or of computer processing.

Training in programming the computer will be provided.

Apply briefly to the Staff Manager, Imperial Chemical Industries, Limited, Plastics Division, Black Fan Road, Welwyn Garden City, Hertfordshire.

APPOINTMENTS REQUIRED

LARGE numbers of men and women with wide experience of administration, government finance, mechanical and civil engineering, law, marine work, architecture, surveying, teaching and several branches of the railway services are becoming available from Malaya.

Employers are invited to apply to

The Malayan Services Re-employment Bureau,
Sanctuary Buildings,
Great Smith Street,
London, S.W.1.

Well pressed

or depressed

in your office?

No matter how sharp the crease in your trousers, if you work in a shabby old office, it will let them down—or rather, let you down. Threadbare carpet, dingy walls, clumsy old desk—these will blunt that good impression you want to give your important visitors. Now a *new* office . . . you could really get things done in a good new office. And Catesbys Contracts could give you a very good new office, quickly and reasonably. Ring Museum 7777, or if you're abroad, send them a letter. Then, *in no time at all, everything will be hard working, like you—a brilliant desk (nothing out of reach), a new carpet (softly proclaiming who's who). It will be an office planned, built, decorated and furnished to make your work more . . . worthwhile.*

AN EXPORT OPPORTUNITY

SOUTH AFRICA

National Income Up 130% in Ten Years

Between 1945/55, the Union's national income increased by 130%. A further increase is expected between 1955/65, from about £1,500 million to about £2,400 million.

South Africa produces most of the world's gold and diamonds, as much uranium as the U.S.S.R. and her satellites put together, more platinum than any other country. She may soon become the world's second largest producer of wool.

Already about a third of South Africa's imports are from the U.K. As the market expands, our export opportunities expand with it.

Reaching the Consumers

The Reader's Digest helps you to reach the consumers in this rapidly growing market. Its Southern African edition (also covering Rhodesia) has the second largest readership in the Union. *And 30% of that readership is Afrikaans-speaking, although the Southern African edition of the Digest is in English.* Among those magazines with top circulation in South Africa, The Reader's Digest is the only one in the English language.

These readers are *those who buy.* Over half have incomes of at least £100 a month. Over a quarter have managerial occupations. (ten are independent farmer half own their own homes. quarters own a car, and a run two or three cars.

Such people not only bu sumer and industrial goods influence others to buy. Y reach them through the ma they trust, the Reader's Di

Record Growth cuts Investment Costs...

The record growth of Kellogg in London is an indication of their success in cutting investment costs of petroleum and petrochemical units through better engineering. Starting in the early thirties as a small organisation with the purpose of making American chemical and petroleum engineering techniques readily available to British and European Companies, Kellogg International Corporation has passed through several stages of growth. To-day it is a complete engineering design and construction organisation operating throughout the world.

Outgrowing their City offices in 1952, Kellogg moved to offices nearly three times as large at Kellogg House in the West End. In 1956, four years later, the size of Kellogg House was doubled to accommodate the expanding staff of petroleum, chemical, civil and mechanical engineers, designers and other specialists.

Only a year later the requirements of the petroleum and petrochemical industries necessitated expansion beyond the confines of Kellogg House. An entire floor of one of London's newest office buildings was occupied. This continuous growth at Kellogg will assist companies in making optimum investments in new petrochemical and petroleum refining plants throughout the world. Enquiries are always welcome.

How a holiday can make your business trip to America a success

"In going to the New World one must for the time being utterly forget and push out of sight the Old one and bring none of its customs or observances into the comparison."
So Charles Dickens wrote in 1841. It is still true today.

Americans and Canadians are more "different" than the British often expect. Realizing this too late can be a big disadvantage.

The easiest and happiest way to overcome this is to travel American—in United States Lines ships, the "United States" and the "America." In the holiday atmosphere on board you will be amongst Americans and their ideas and opinions for several very pleasant days.

What's more, these fine ships are two of the world's best hotels. You—and your wife—can relax and enjoy the best English, Continental, or American food, and magnificent wines. There is a beautifully equipped swimming pool and a gymnasium. There is a pleasant social life, with cinemas, dances, deck games. You can take your ease in the library or in your own splendidly furnished stateroom or suite; or simply enjoy the fresh air.

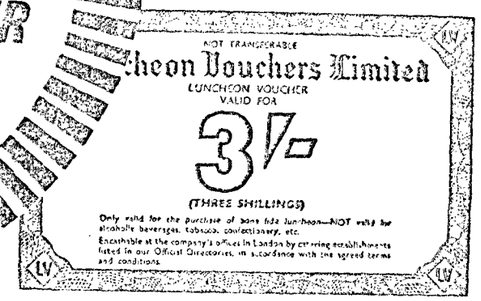
You'll be feeling really fit when you arrive, and in exactly the right mood to face any problems that lie ahead.

And, if you're lucky, you may well meet someone on board who knows the business and the men you are going to be dealing with—or perhaps someone who can influence a final decision in your favour.

NINE POINTERS TO LUXURY TRAVEL

- Superbly furnished staterooms and suites
- Internationally-inspired food and wine
- *Famous dance orchestras*
- CinemaScope theatres
- Full "keep-fit" facilities
- Dictaphone and typewriting services
- Ship-to-shore telephones
- 25 cubic feet or 275 lb. FREE *luggage allowance*
- Gay, informal CABIN and TOURIST CLASS—to beat that budget problem

On-board expenses and fares to destination in Canada or U.S.A. payable in sterling for you and your family single or return.



THRIFT-SEASON FARES
1st class, from £107.0.0; Cabin, from £73.0.0; Tourist, from £60.10.0.

Here's a man with a new factory on his mind.

Problems dance before his eyes.

How best to achieve that Class I rating for spread of flame?

How to ensure really good thermal insulation?

What about cost?

Then he hears about Stramit Class I Slabs.

Yes, his troubles are over. When he uses Stramit Class I slabs for the roof-decking in his new factory, he automatically achieves a Class I rating for spread of flame and superb thermal insulation values (U=0.23) *at no extra cost.* And bearing in mind that Stramit slabs when used as roof-decking are part of the factory's structure, their cost is amazingly low. As little as 1/3d. per square foot, in fact.

Stramit Class I slabs, made from scientifically-compressed straw and covered with a special asbestos facing, are immensely strong and durable. *Stramit is also available in many other grades and facings for use as wall-linings, ceilings, partitions and non-load-bearing thermal insulation.* Perhaps it can solve one of your problems, too.

For structural thermal insulation

Chemicals basic to industry . . .

DOW

makes possible new uses for plastics with eleven formulations of

STYRON

From toys to containers to refrigerator parts—the numerous forms of Styron* (Dow polystyrene) find application in many industries. Available in eleven formulations and a wide range of colors, Styron offers almost any property you desire. It has excellent surface finish, high impact strength, good flexural strength, shatter and crack resistance, heat distortion to 200°F. In making plastic parts or products, Styron satisfies your exact need . . . for vacuum forming, extrusion, calendering, or injection molding. Your local Dow representative can give you all the details about Styron, or contact the Dow branch office in your area.

YOU CAN DEPEND ON DOW

CITROËN...SUPERLATIVE...

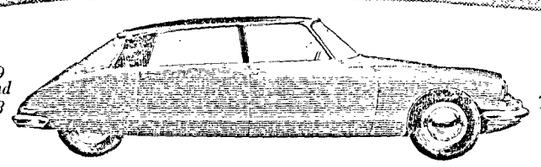
...but how can mere words describe heaven on the road?

MAKE a pepper-pot of the dictionary: shake out the comparatives, the superlatives, the adjectives, the adverbs. At the end, you'll have to admit defeat. You'll have to let a sigh of satisfaction, a possessive glance, a fondling touch, tell of your delight when you see, you drive, you *own* this sleek, wonderful machine that for want of a better, prouder title has to be called a car. A car! No, not a car, a realized dream of the motor transport of the future. In 1968, perhaps, there will be others like it. But *now* . . . only one. Yet you won't be able to brag about it. Words, mere words, will dry on your lips. You'll have to be satisfied with the envy you see in those who must remain content with a 1958 model . . . ten years behind your own, your unique, CITROËN D.S.19.

D.S.19 performance is *proved*—not only by first-time success in the Monte Carlo Rally but by thousands of owners all over the world. Get one of the 100 Citroën dealers in this country to give you a demonstration. For name of nearest agent and full details of the D.S.19 and other Citroën models write to the address below.

ONLY A CITROËN D.S.19 HAS ALL THESE FEATURES
no other car has more than two of them!

- **Hydro-pneumatic suspension on all wheels keeps car at same height and on even keel, whatever the load or camber . . . smooth riding over roughest surfaces.** *Exclusive to Citroën.*
- **Power-operated front-wheel disc brakes (standard brakes for rear wheels) with twin pedals — hydraulic & mechanical — for instant halting.** *Exclusive to Citroën.*
- **Hydraulically-assisted rack and pinion steering gives feather-touch, finger-tip control.** *Exclusive to Citroën.*
- **Hydraulically-operated gearbox. Clutch automatically disengages below minimum r.p.m. — *no stalling.***
- **Single spoke steering wheel and new-angle steering column minimize danger to wrists and chest — make Citroën safest to drive.** *Exclusive to Citroën.*
- **Front wheel drive plus low centre of gravity give maximum road-holding . . . high-speed cornering.**



PLUS (AMONGST OTHER THINGS)

- Seats six adults—in comfort. Oversize boot—17 cu. ft.
- Best all-round visibility of any production saloon.
- Genuine top-speed of 87-90 m.p.h., 28-30 m.p.g. at 45 m.p.h.

Price—£1,150 plus £576.7.0 p.t.

Don't just keep up— *get ten years ahead with a*

CITROËN

Also available: the I.D.19 £998 plus £500.7.0 p.t. and the versatile 2.C.V. – £398 plus £200.7.0 p.t.

France's Crisis

FRANCE'S friends must know by now on which side they must stand in the conflict that has broken out over the Republic. When M. Pflimlin compliments the soldiers in Algiers as guardians of public order, and when he confers on them in due form the arbitrary power which they are wielding already, he clearly has his tactical reasons; but no pretence can conceal the realities. The purpose of the Algiers coup of May 13th was to keep his government out of office. Initially, this purpose was defeated by a show of firmness in the National Assembly and by a turn of speed on the part of the new government itself. It has not yet been abandoned; if they cannot achieve it, the authors of the coup may have to be content, for the moment, with a second best—the imposition of an extreme Algerian policy on M. Pflimlin's government as the price of a domestic truce. To satisfy them, such a truce would have to keep open the possibility of a second coup.

Moves and counter-moves are still following each other, and it is too soon to say what the outcome will be. To men as sorely beset as the present French government, such a compromise as the present pretence may well appeal, for the moment again, as a means of preserving the Republic. But it is wise to reflect what "preservation" means. Is the Republic to be healed as a living organism, or is it to be preserved as a corpse? Two, perhaps three, schools of doctors, or undertakers carrying stethoscopes, are contending over the Republic's sick-bed. Some would embalm it; some would pursue its restoration to health; some want only a partial recovery, not too long-lived.

France is too close to the heart of the western world for it not to be clear that the death of the French Republic would fundamentally affect the political character and cohesion of the western world as a whole, however respectful the obsequies and whatever methods of embalming were applied. France's western allies can want no other solution than that Paris, the only seat of popular and responsible authority, should win the present conflict and in winning it should get the control of French policy in North Africa back in its own hands. The spectacle of French governments weaving their way, irresolute yet wilful, to the edge of the precipice must at times have made them, the allies and some of the French people as well, long for some stable, monolithic alternative. Sometimes it has been tempting to specify the alternative by the name of de Gaulle.

But it has always turned out so far that the de Gaulle label was not a specification at all, still less a specific, but an opaque wrapping for a mystery package. Even now, while putting in his bid in the auction of power, the general has contrived to give less indication of what he would do and how he would do it than, perhaps, any aspiring saviour has ever given to a baffled country. The role he sees for himself is that of an "arbiter"—between the contending groups and classes within France; and between metropolitan France and the peoples of North Africa—an arbiter whose decisions must not be made known in advance.

This idea of de Gaulle as "arbiter" has been heard simultaneously in Paris and in Algiers.

But the arbiter is at this stage himself a candidate for power; and if he cannot be judged by his programme, then he has to be judged by his friends. Even while remaining aloof and non-committal on matters of policy, General de Gaulle has deliberately attacked the parliamentary parties of the Republic and, no less deliberately, declared his "understanding" for the generals. Since it is they who cry *Vive de Gaulle* in refusing their obedience to the Republican government, he can only be regarded, in this crisis, as their man. Thus, while a de Gaulle solution might—who knows?—have been worth calling on at some time in the past, and while it may yet, just conceivably, be worth calling on in the future if all else fails, to entrust the Republic to the General now would be to give power to the wrong men in the wrong mood. If there had been any doubt about this, M. Soustelle, who also cries *Vive de Gaulle*, would have removed it with his discovery that the blend of synthetic mass emotion and brute force now sweeping the Algerian towns, disguised as a popular renaissance, represents "true democracy."

There has not been any serious doubt about this threat, from the moment when the committee in Algiers tore down the flag of patriotism and ran up the Jolly Roger of nationalism in its place. France's source of political vitality, and authority, must be in France; it cannot be in Africa, any more than Britain can seek its political inspiration in Belfast or Nairobi. A regime imposed upon Paris by Algiers cannot be right for France. From the nature of political life this would still be so even if, in the conflict of wills that has been evident between Paris and Algiers these ten years past, Algiers had not been all the time on the wrong side—the side that rejects the world as it is and seeks to make the river run uphill. France has done itself enough harm already by years of softness and turning the blind eye in its relations with the French settlers in Africa—whose futures does, indeed, present a sore dilemma. Its desperate struggle with the Arab nationalists, who represent the other and larger horn of the dilemma, made it imperative—as it seemed to a succession of weak and muddled governments—to evade or conceal the conflict of wills with the French men in Algiers. Yet, even so, not all the shifts an all the surrenders have been able to stop the conflic coming to a head, because Paris and Algiers have bee living in different worlds.

Vehemently refusing to admit that the world change Algiers has brought itself to the point at which, i order to assert its French-ness, it has cut the line t France. In refusing their obedience to Paris, th settlers and soldiers in Algeria counted, and still coun on the natural reluctance of France to proceed agains its own army and its own overseas communities. Bu do the bonds of affinity work only one way? It mus be obvious that a regime imposed upon Paris by thi kind of pressure, from this kind of men, would b sterile and anachronistic, a new Franco state twenty years later, with or without General de Gaulle as it figurehead. It would also be fearfully dangerous. Th whole Mediterranean basin would be more explosive than ever. Inside France, the Republican Left would be flung together with the Communists in a revolutionary alliance. The Algiers insurrection (not resurrection, as General de Gaulle calls it) runs athwart all the West's hopes for the future and all its present interests

THERE is still far more popular support in France for the Fourth Republic than for any new political experiment. The Republic can probably reassert itself if its leaders act resolutely enough. But, even then the problems and the conflicts which have brought thi crisis in France will still not have begun to be resolved —any more than they would be resolved simply by putting a strong man, real or imaginary, in power France's own dilemma lies in the fact that the majority which supports the Republic is still too deeply divided in itself to work together except negatively—and thi at a time when the change in France's external standing demands large positive decisions (just as the break-up of the Empire has required large political decisions from Britain). Of those missing decisions, the biggest the most difficult and the most painful is undoubtedly in Algeria. Whoever emerges on top from the present struggle, the Algerian problem will still remain to be solved. All that can be said with any confidence is that, if it is Algiers that comes out on top, a political solution will be ruled out; the only ways open will be military, and they will lead nowhere.

It remains the task of the politicians to provide the government of France. No doubt they will continue to make an indecisive job of it until some group or party contrives to gather the support and the authority to enable it to do better. That may take a long time and time is short. But none of the off-the-peg alternatives to this humdrum prospect holds out any better hope. Calls to national unity are easily uttered, but if the politicians did drop their opinions and rally without a programme round the flag, what would that achieve? France needs to escape from immobility, not to make immobility a national doctrine.

PARIS AND ALGIERS

In addition to this leading article, the greater part of the World Overseas section this week is given over to the events in France and Algiers:—

	Page
Parisian Panorama	704
View from Tunisia	707
Anxious Moments in Morocco ...	708
A French Journey—VI ...	709-710

Notes of the Week on page 683 discuss the position of the Arab rebel movement (FLN) and some economic aspects of the crisis.

Little else but promises of tight-lipped immobility has emerged from any of the pronouncements on the Algerian question itself that the present struggle has produced. Yet the choice between repression and negotiation in Algeria will still have to be faced, by Frenchmen and by Arabs, when the French domestic struggle for power is over.

One day it will have to be answered, in Paris, in favour of negotiation; until it is answered it will dominate everything else, both inside France and in the relations between France and the outside world. It is this, and little else, that has made France in the last three years a liability to the western world, where it should, and could, have been an asset. The struggle set off by M. Pflimlin's investiture is not about a trifle.

Towards a Hotter Air

Television will be the most important medium of communication at the next election. The two big parties must not be allowed to block suggestions for using it as an instrument to make democracy more informed

AN important controversy is going on behind the scenes about television and broadcasting arrangements for the next general election. The outcome will almost certainly be a compromise between two extreme views. What might be called the "extremely dead" view was the one that prevailed at the time of the election of 1955. The BBC, then without a competitor in independent television, not unnaturally did just what the two big parties asked it to do. The party organisations asked that all political broadcasting except their own should suffer a complete shutdown. The Conservatives, Labour and the Liberals were therefore given a careful ration of "party political broadcasts" to produce themselves; apart from these, controversy on sound and television was stilled. At a time when the political interest of the public was presumably at its height, programmes like "Any Questions" were taken off the air, and replaced by half hours of gramophone records. News bulletins concentrated on events in foreign countries as much as possible, and the most important political arguments developing on Britain's own hustings were studiously ignored. As television is now the main medium of communication with the public, this was an odd way of trying to make democracy tick.

Neither the BBC nor independent television is willing to return to that system again. The question is how far in the other direction the authorities will now dare to go. The diametrically opposite and "extremely live" system—which present legislation forbids (although ordinary people should constantly ask why)—would be for broadcasting to be as free as the press: for the various broadcasting and television organisations, the one that gets its money from licence fees as well as the ones that get theirs from advertisements, to be allowed to decide individually to support one or other party if they wished to, and to remain neutral only if they so preferred. To introduce such a system now, as a matter of fact, would not react greatly against the interests of any one party. The BBC would obviously opt for an *Observer*-like position of neutrality; one of the independent companies would be Labour-inclined in its views but would allow other parties to have the freedom of its air; most of the other independent companies would be Conservative or Liberal-inclined, but would certainly invite Labour spokesmen to state their case also. In an industry which has become very usefully competitive, nobody would want to offend the partisan viewer by appearing to be grossly "unfair."

Unfortunately, however, there is no prospect of a free system of this sort being permitted before the next election. For reasons that lie deep in the traditional British mistrust of all new gadgets, most professional politicians on both sides still regard any such idea as ridiculous. (If the printing press had recently been invented, instead of the cathode ray tube, they would no doubt hold the same view about free newspapers.) So the task for those who see television, not as a menace, but as an instrument which could make democracy more informed, is to make suggestions that can be fitted into a system that will become at best only half-free.

AS a first suggestion, then, it would be of advantage to everybody—including the established parties—if the party political broadcast were now to decline in importance. Perhaps these broadcasts, which are produced by the parties themselves, should be discontinued altogether; if they are not, then each individual broadcast should probably be put out on only one channel. It should no longer be regarded as essential that when a party telecast goes out on one television service, the other services should make room for it at the same time, and that sound versions should later obligatorily be repeated on the Home and the Light. The importance that became attached to party broadcasts last time—in the parties' own minds, and as a result of these portentous arrangements—made everybody concerned rather neurotic. If Mr Macmillan overran his time by twenty seconds, then Mr Gaitskell had to be allowed to overrun by twenty seconds, too, as if that would swing a single additional vote. (It is like saying that this

article will be more convincing to sceptics if it runs for 2,050 words instead of 2,000 which it won't.) One politician who had the bad luck to squeak with rather inelegant (and presumably vote-losing) excitement in one of these party programmes in 1955 was hated by her colleagues for weeks afterwards.

Then, when listener research figures came out after the election, it was discovered that the biggest audience was captured by the last five minutes of one Labour telecast which came just before a popular play serial: and there was a great to-do about the "unfairness" of letting the programme get next to the then popular Groves family. It will always be impossible to iron out all these "unfairnesses." The obvious thing to do is to blanket the importance of any one programme by making it only a small part of the election-affecting material the listener or viewer hears.

THE blankets concerned should be programmes like "Any Questions," under the BBC's or independent television's own control. Last time, these programmes were discontinued in the period between nomination day and election day. Next time, they should be not discontinued but increased. Perhaps the time allotted to them should not be increased too much, because then the electorate might become bored. But the subject matter of these programmes should be tied very specifically to the election battle. One can think of several ways in which this could be done.

For example, a fortnight before the poll, the BBC's television programme "Press Conference" might take the form of Mr Gaitskell answering questions put by three Conservative backbenchers; and then Mr Macmillan could answer three Labour backbenchers the next week. It might be rather fun if independent television's "Under Fire" programme took the form of a small Labour team being thrown at the mercy of questions by a studio-full of fanatical Conservative election workers and vice versa. The "Panorama" and "This Week" programmes could make extensive tours of the constituencies. Independent television's "Out of Step" programme could interview the candidates of decidedly minority opinion, such as the Welsh and Scottish Nationalists, the Sinn Feiners (in Belfast Gaol?), and the gentleman who stands at Penrith and the Border on the platform that cock-fighting should be made legal; these sort of people, though newsworthy and interesting, were all frozen off the air last time. If broadcasting had been invented fifty years ago, the infant Labour party would have been frozen off the air in the same way. Above all, the news bulletins should actively try to pick up the main political issues that emerge in the day-to-day campaign: with Tory ministers being asked by reporter-interviewers to comment on Labour allegations that the public does not want Tory fingers on the H-bomb trigger, and Mr Gaitskell being asked what he thinks about Tory allegations that a return to price control would inevitably mean a return to the ration book.

Another important point is that the television and broadcasting services should aim to present the political argument at different levels of intellectual appeal. The Swedes apparently have a system whereby formal nationwide debates on a number of the main election issues are broadcast just before a general election, with the Speaker presiding and rationing time among the MPs of different parties. Heaven protect us from anything quite so ponderous on the airwaves here. But some debates of this sort on very specific subjects—what each party thinks ought to be done about rents, agriculture, trade union law, colonial issues such as Cyprus and so on—might be useful pre-election material on the Third (or, perhaps if they are made snappy on a few selected issues, on the Home) programme. And some thought ought to be paid to what would be differently appropriate pre-election material for the Light programme, for Woman's Hour, the regional programmes and Network Three.

TWO further disconnected points. First, the question of how many of these arrangements should be put into effect at by-elections—as distinct from at general elections—should be left for settlement entirely by the broadcasting authorities themselves, whose responsibility this really is. They are the only people who can decide whether a particular by-election is newsworthy; it would be avoidable cruelty to viewers if, because a by-election like Torrington was exciting, some doctrine of "fair shares" should therefore be applied to the dull contest that will presently increase the overwhelming Labour majority at Wigan. Secondly, the one restriction on political broadcasting which might be wise would be for the airwaves to be shut down politically twenty-four hours before a general or by-election. With perhaps half the adult population liable to be looking in at their screens, there is a danger of last minute stunts and the propagation of arguments based on entirely false figures. There is a case for having twenty-four hours' breathing space in which any blatant untruths could be corrected—in very bad cases, of obvious errors of fact, by the broadcasting authorities themselves.

Many of these arguments, especially those designed rightly and salutarily, to give the broadcasting authorities more power, would be resisted by the big party organisations. At bottom, most party managers feel uncomfortable about this monster of television which is now poking its snout into their trade. They feel that they must be given power to control it, that the weapon must not be allowed to get out of their hands. But the question should be insistently asked: by virtue of what principle do the party managers claim this presumptive right of controlling the airwaves? Political at election time are not primarily a matter for the professional vote-seekers; they are primarily a matter for the voters themselves.

The party organisers' job is to put forward their particular case, and to let it be subjected to the fiercest and most awkward questioning that outsiders can devise. It is not for them to say how much awkward questioning should be allowed, or how many minority views should not be heard. Relatively recent developments within the party system have surely made recognition of this principle more important than ever. The party managers already control too much of the politics in our Parliament. They should not, they must not—can public opinion not now resolve that they shall not?—also control the politics on our hearth.

Between the Desk and the Dais

Our correspondent has been visiting one of the teachers' training colleges on which so much money has been spent since the war. He asks whether the proposed lengthening of the course from two to three years will really be rewarding

THREE crumbling gothic arches, made safe by the Ministry of Works, are all that remains of the thirteenth century convent on whose corpse the local squirearchial family built the country house which, after exactly four hundred years' occupation, it thankfully sold to the county council in 1947 for conversion into a teachers' training college. Through these arches can be seen a great aircraft factory three miles down the valley. The principal, an energetic spinster of perhaps 50 who was formerly the high mistress of a well-known girls' public school, likes to enlarge on the symbolism of this to visitors:

> Those arches are just about as much of the cloister as there is in *this* training college [she says]. Everyone knows what's wrong with the state-qualified teacher. Straight from a girls' school to a women's training college, and straight from college to a girls' school: a narrow, spinsterish and schoolbound life. Yes it *was* like that before the war, and there are still colleges that treat them like schoolgirls and send them out as schoolmarms. You will find it all in the recent report on training college conditions by the London University education students. But not here. There's no nonsense about getting back by ten, or not having men up to rooms . . . within reason; we are all ladies here. So boy friends are always coming over from that factory or from the agricultural research station over there or from London . . . we're no nunnery. Perhaps it isn't quite a university college—though it's nearly as expensive as one—but it is out of the classroom, away from home, in the real world. The college does give the girls a chance to think for themselves, even in the two years they're here—of course, thank goodness, in 1960 it will be three. . . .

With such a principal, this particular college, in five architectural styles from Tudor to prefabricated Ministry of Education craftsroom, cannot be typical of the 130 general training colleges that produce the 12,000 "qualified teachers" who enter the state schools yearly. But it is far from unique. It takes 170 girls aged 18 to 20, and provides them each with a pleasant study bedroom either in the hall or in annexes in the park, which is still lovely. Its library *is* a library with "an. dom. 1639" carved on the panelling; its Hall is a real hall; it has a country house air, not an institutional one; and this makes up for the lack of a few amenities which would not be tolerated by the London County Council in its big modern teacher-factories.

ITS students are not, the principal admits, girls of university standard. These have been creamed off at the schools. A small minority, the principal thinks, would get an honours degree, and occasionally a girl chooses this college in preference to Redbrick University; but over half of them come from the B and C streams of the grammar schools, and have done no better than to get GCE at ordinary level. But that does not mean that they are stupid, and it does mean that they are ambitious. They come from the new sub-technological, artisan white collar class; they are the daughters of policemen, municipal clerks, draughtsmen; here and there they come from a farm, a corner-shop, even a vicarage. (This is a non-denominational college with only a "quiet room," no chapel.) Few of their parents are paying the full difference between the tuition and boarding fees (of £250 a year) and the minimum grants; but many are paying £80 to £120 a year. The girls from the poorest homes often have most pin-money.

For the most part they are training for teaching in primary schools (i.e. children up to 11), some for nursery schools (i.e. children under 5). The grammar schools take almost all their staff from the universities, and teaching in the secondary modern schools has until recently not been popular with these girls. Under urgent appeal from Whitehall, however, the college is now producing some teachers for at least the lower forms of these schools. There are two lures: special grants, and the prospect that a girl can have a third year at this college if she agrees to go to a secondary modern school.

The girls for the primary schools have to pack a good deal into two years' training, the principal thinks, and quotes the McNair Committee's aphorism that "under present conditions students do not mature by living; they survive by hurrying." In two years they

have to strengthen their own general education and mug up the standard curriculum of state instruction; theoretically, they are expected to reach pass degree standard in a "main" subject of their own choice—though they must be equipped to teach all subjects. Then they are taught educational theory and educational practice—with eight weeks as student-teachers in nearby schools. They are given a general understanding of the physical and mental clockwork of the human (and sub-human) child.

This is also one of the colleges that pile on top of that curriculum a "contemporary studies course"; this means going out with questionnaires and notebooks to the surrounding countryside and finding out how it ticks. It involves visits to county hall, the local newspaper, the aircraft factory (where the welcome is spontaneous and hearty) and the hospital. It also means trips to London and the House of Commons, with evening lectures in college on social and economic subjects from visiting dons, on politics from visiting MPs, and on international affairs from retired ambassadors and colonial governors. Books are read, statistics compiled, "reports" written; above all, non-teachers are met.

They are charming girls, self-possessed, serious, questioning, anxious to teach. Do they really need another year, though? "Ask them what *they* think about that," said the principal; and your correspondent did so. Their reply was unanimous and affirmative: they just had not enough time for all they had to do. They wanted more teaching practice for one thing; and they wanted more time to read. "You just start getting into a new subject, like psychology, and then you have to stop," said one. "You're just getting interested in things, and then it's all over," said the senior girl sadly.

This is an important pupil-reaction, because, although the Ministry is now committed to lengthening the training course by a year in 1960 (and thus reducing teacher output by a third), not everyone is convinced that it is desirable. Indeed some people regard it simply as the manifestation of the non-graduate teachers' chip-on-the-shoulder itch for "parity of esteem" with graduates. Your correspondent therefore sought out some students at colleges run rather more like those of which the London University students so bitterly complain.*

THERE is no need to describe the surroundings at these worse colleges; often the surroundings and certainly the amenities are as attractive as at the good ones. But it is the difference in atmosphere and teaching standards that counts. "Another year?" came the disgusted exclamation from a pupil at one of these teacher-factories, "Why the course is far too long already. Half of us are bored to deadly death with being made to learn things that will be no earthly use when we get into a school—we know that, because the teachers tell us so. I absolutely could not stand another year of this beastly place, where you crawl through the work at the pace of the dimmest dimwit and have to be in by ten! If I'm not to be trusted with myself, how can I be trusted with other people's kids? Three whole years of educational theory to teach kids of seven to ten, which is what I want to do?" Her parting shot was reminiscent of Eliza Doolittle's.

This is, perhaps, a casual way of throwing light on a subject which has been thrashed out at length by experts (and notably by the Advisory Council on the Training and Supply of Teachers in several reports, the sixth of which appeared last June). Yet do not these girls' attitudes suggest that official policy is too rigid? Two points might be pondered before the foolishly sweeping decision to add the third compulsory year to teacher training is put into effect in 1960. The first is that a number of the training colleges are simply not good enough to imprison a girl for a third year. In two years (or less) they have given her all they can; and thereafter she is better on her dais and "learning by doing" among her children. Furthermore, the expansion of training colleges to meet the demand for more teachers is likely to make many of them even less capable of adding a worthwhile year.

SECONDLY, the colleges where a third year will be of great benefit to their students are the ones that impress because they give a measure of real further education to young women who are going to teach, rather than because they teach them to be teachers. This, in fact, should be a question of improving higher education in general, not of glorifying vocational training. On vocational grounds alone, the case for another year all round is poor—and it was, in fact, a purely political decision. It is still true to say that nobody can teach a man or woman to be a good teacher, but only to save him or her from being a very bad one.

Obviously, the best solution to the problem of improving teachers' training lies in the expansion of the universities: in putting all teachers through a university—with teacher training, as for most graduate teachers now, a one year post-graduate course. But the tremendous demand for teachers, in the light of population trends and the demand for educational reform, makes this a solution for the further future. The general, compulsory three-year training course in 1960 is likely to worsen the supply of teachers without doing much to improve quality. It would be better to be selective; to encourage the best students to take, and only the best colleges to give, an extra year. It might be possible even to give some training colleges, and their courses, a higher status. But whether the politicians can reverse, in the name of commonsense, a decision they have already announced as a concession to special interests is very much a question. Perhaps the worsening supply of teachers will force the *volte face* upon them.

Russia's New Men

Russia's new leaders are not young. Mr Khrushchev is now at the head of a team of experienced party organisers. He needs success to keep it together.

ON a crowded stage well-known performers catch the eye and newcomers tend to remain unnoticed for a time. This has been happening with the Soviet leadership. Mr Khrushchev's preeminence has obscured the fact that many new actors are now playing leading parts. Last month, when Marshal Bulganin made his exit, and the young Mr Kozlov was appointed one of the two first deputy prime ministers (on a par with Mr Mikoyan), attention was drawn to the Soviet change of guard. Yet this was merely a late, and relatively minor, episode in a big transformation that has been going on ever since 1953, when Stalin died. The seat of Soviet power has always been in the party, not in the government, and it is there that the drama of politics is played out. To see the extent to which old leaders have been falling by the wayside and new ones taking their place, it is enough to notice that eleven of the fifteen full members of the current party presidium (the highest executive body) did not belong to it as it was reconstituted immediately after Stalin's death.

Mr Khrushchev owes his present position to his possession since 1953 of the post of first secretary of the Communist party. The secretariat controls the "elections" to all the important provincial party jobs, which almost automatically carry with them a seat on the all-Union central committee. Mr Khrushchev's reshuffle must have been very far-reaching, since in the new central committee, selected in 1956 at the twentieth party congress, out of the 133 full members, 43 are entirely new and ten are candidates promoted to full membership. These changes prepared the ground for the victory of the party boss last June. When it came to a showdown between Mr Khrushchev and his various opponents in the party presidium, he avoided defeat by "democratically" asking for the verdict of this committee packed with his supporters. Victorious, he eliminated his rivals: Malenkov and Saburov, Molotov and Kaganovitch were extruded. Mr Pervukhin was reduced to the rank of candidate, from which the youthful Shepilov was removed.

After such a mass expulsion few men of the old guard were left in the Soviet leadership headed by Mr Khrushchev. The aged Voroshilov, Stalin's companion in the Civil War, is a figurehead president. Mr Shvernik, now head of the party control commission, was the head of the trade union system in its most Stalinist period: popularity is not for him. Marshal Bulganin is in disgrace. Anastas Mikoyan is the only survivor with any real political importance. He attained prominence much earlier than Mr Khrushchev, though he is the younger by a year. As first deputy prime minister he is probably the overlord of the foreign departments. Mr Mikoyan may well be the most intelligent and adroit man in the present leadership, but he is an Armenian from Tiflis and as such, after the long rule of Stalin the Georgian, he cannot very well be a contender for supreme power.

With so few old-timers left, there was plenty of room at the top. Indeed, the number of vacancies was actually larger than the number of expulsions. Mr Khrushchev increased the size of the presidium to fifteen members and eight candidates. To fill the empty seats he brought in his colleagues from the secretariat and, as long as he keeps the allegiance of the nine other secretaries, their block vote can settle every issue.

NEW men are not necessarily young men. Some of the new men in the presidium are veterans. Mr Kuusinen, a Finnish revolutionary who was on the executive committee of the Komintern as far back as 1921, is 77. Mr Kalnberzin is a veteran of the Latvian communist party. Mr Korotchenko was born in the same year (1894) as Mr Khrushchev, with whom he has worked closely both in the Ukraine and in Moscow. A second group includes people in their mid-fifties who were fairly prominent in Stalin's last years, were downgraded after his death and are being brought back by Mr Khrushchev. Leonid Brezhnev, who had worked under him in the Ukraine, and Nikolai Ignatov belong to that group. Mikhail Suslov, though of the same age group, stands somewhat apart. He was on the fringe of the top leadership even in Stalin's time and his voice seems to carry weight in the Kremlin. In all his posts he has been the watchdog of the party line, the purger of deviationists. Now he is probably the inspirer of attacks against "revisionism" at home and abroad, the restraining influence in Mr Khrushchev's moment of "liberal" zeal.

The younger leaders—fifty and less—are only a handful. Aleksiei Kirichenko owes his rise to Mr Khrushchev; he sat under him on the Ukrainian party secretariat and served with him during the war. The new principle of wider national representation has provided some younger men with an opportunity. Kiril Mazurov has been included to represent Byelorussia; Uzbekistan is represented by Nuritdin Mukhitdinov. At 40, this former political adviser in the army, prime minister, later party boss of Uzbekistan, has a double distinction: he is the Benjamin of the presidium and the first Central Asian to sit on that body. And Ekaterina Furtseva is the first woman to sit there.

But Frol Kozlov (a student at the Communist University in Moscow before Stalin shut it down) is

possibly the most prominent of the younger generation, though he did not attract outside attention until November, 1953, when he replaced Mr Andrianov, a follower of Mr Malenkov, as party secretary for the Leningrad region. Last year he advanced rapidly, becoming first a candidate, then a full member of the party presidium and prime minister of the Russian Republic. Last March he was appointed first deputy prime minister; probably he looks after home affairs, while Mr Mikoyan supervises the foreign front.

RUSSIA has been turned into a stratified society; the ascent to the top is slow. For a period before and after Stalin's death, it seemed that industrial managers might prove the quickest climbers. The rise of Mr Pervukhin, the engineer, and Mr Saburov, the planner, reinforced this theory. But Mr Pervukhin is now out of the way as ambassador to Berlin and Mr Saburov is out of the presidium. Among the new members only Averkhi Aristov and Aleksiei Kosygin—the specialist in light industry—can be described as having devoted most of their time to production. Admittedly, there are many more with technical education. Mr Kozlov was once a practising engineer; Mrs. Furtseva took a degree in chemical technology; Mr Brezhnev is a trained metallurgist. Yet their path to the presidium has led through a succession of steps in the party hierarchy.

To call them party men is not to say that they are intellectuals. Mr Suslov and Pyotr Pospelov—former head of the Marx-Engels Institute—are the only ones who can be suspected of such leanings. Most of the leaders, though not very young, did not come to maturity until Stalin was in power, when a quotation was an effective substitute for an argument. On the other hand, they had the advantage that, as they grew up, an industrial society grew up with them. They had to deal with economic problems, though as party overseers, not as production managers. Theirs is not the rule of the managers which Mr Pervukhin seemed to foreshadow; this is the age of the party organiser.

These practical men—energetic and flexible, yet obedient—are to Mr Khrushchev's image and liking. They know enough about production to run the economy, but they are not so intimately linked with management as to stand in his way when wants to reorganise. Most of them have been brought on by Mr Khrushchev at some stage in their careers. The presidium has been shaped in a coherent pattern. The ten secretaries headed by Mr Khrushchev are running the country through the party machine; some have local responsibilities; any of them can be sent to the spot in case of emergency or bottleneck. With his two ministerial overlords, Mr Khrushchev now runs the government as well. These are the ruling twelve.

Nikita Khrushchev now heads an apparently efficient and reliable team. But events change men. Did not he himself recite panegyrics to Stalin in 1952? Did not he rely on Mr Shepilov, who deserted him in last year's struggle? If the country should start to grumble, the party boss could discover that his own men were finding voices of their own and taking his lip-service to party democracy literally. Mr Khrushchev does not dispose of Stalin's weapons of intimidation. He needs success and popularity.

NOTES OF THE WEEK

THE ECONOMY

Reduction—On a Slide?

THIS has not been a good week for the fight against inflation, and it may therefore seem to have been an odd one in which to put Bank rate down. The most disturbing feature of the week has not been that half per cent reduction itself, which is discussed in Business Notes. Nor has it been the intimation from the latest trade returns that the period of unprecedented strength in Britain's balance of payments may be over—although that fact in itself could carry some warning for the awkward autumn ahead. Nor has it been the news of last month's increase from 108.4 to 109.6 in the cost of living index, mainly due to a rise in food prices—although that rise, coupled with the news of the surrender to New Zealand butter producers, emphasises again that a policy of shunning cheap food but trying to achieve cheap living really do not marry. By far the most disturbing feature of the whole week has been the further slide from the Government's former "firm line" on wages. This has been insufficiently frankly documented in the national press.

Last week, when the Cabinet worked so hard to achieve a railway settlement, it was confidently assuming that there would not be a consequent and similar retreat before inflation right along the wages front. Least of all did it assume that its action could lead to further concessions to the London busmen on their surprisingly minor nuisance of a strike; indeed the Cabinet thought that it had isolated Mr Cousins rather neatly. But it had underestimated, just as Mr Cousins may all along have rightly confided in, the impulses in this country towards peace-making once any retreat has been sounded. It may also have underestimated the peace loving leanings of the London Transport Executive. As soon as the rail settlement was announced, the usual white flags for parley on the bus strike began to flutter out from all the familiar places. Suggestions began to appear—from where?—that the rail settlement was "morally bound" to lead to an increase for some London Transport employees, and that this might "in fairness" have to be given to all such employees. The familiar phrases reared up in the reports of the industrial correspondents: witness *The Observer's* approving statement last Sunday that the London Transport Executive was making "no secret of the fact that it wants to end the strike as soon as possible and that to try to break the strike would be mis-guided." At about the same time, suggestions for various "compromise" settlements on the buses—all of them in effect ditching the arbitration award—began to be mooted in the newspapers. On Tuesday, London Transport withdrew its previous refusal of a wage increase to the underground railway staffs, and awarded them a 3 per cent rise—in return for some hastily advertised economies which look even less likely to cover the cost of the award than do those on the ordinary railways.

Mr Macleod's reaction to the white flags thus set flying should have been the same as Nelson's reaction to the flags Sir Hyde Parker flew at Copenhagen. Unfortunately, he did precisely the opposite. On Wednesday, Sir Wilfred Neden, his chief conciliator, called in the unions and London Transport for discussions. Once there, Mr Cousins seems (not unpredictably) to have stiffened his terms at the scent of possible victory rather than to have toned them down under the shadow of probable defeat; it was precisely because London Transport had been so amenable in discussions earlier this year that he had launched this bus strike, not at the strongest point of the union's bargaining power but at what seemed to him to be the most pliable of the nationalised employers' defences. London Transport may be not unnaturally piqued at being treated this way again, and it is now making stronger noises against surrender. But there must now be a greater danger than there was last week that this drearily familiar serial story may be weakly concluded in our next.

What Economies on the Buses?

THE pattern that is dangerously likely to emerge for British industry this year is a slightly postponed 3 per cent increase for practically every union member, and with only lip service about economies that will pay for them. If London Transport is going to be next in line to make settlements of this sort, it will be important to see that its economies are real ones and that they are made in the right places. Two of the economies so far suggested on the underground railways are that the earliest trains each day might have to start half an hour later and that the whole system might have to close down at midnight instead of at about half past midnight. Not many people will regard these economies as the sort for the acceptance of which the unions should be paid more money; cuts in services of this kind are not the same thing as increases in productivity. Moreover, as the demand for very late trains, although scant, is probably inelastic, it might be better to impose a big surcharge for after-midnight travelling rather than to stop it altogether.

But it is on the buses that the question of economies is most important. To put this in a possibly over-simplified form. London Transport thinks that its great disadvantage is that it needs the full carrying capacity of its 7,000-odd buses at the morning and evening rush hours. It then feels obliged to carry the costs of crews' wages and the cost of maintenance of these 7,000 buses all through the day. But are not these precisely the points on which an agreement with the unions ought to be able to reap economies. To obviate the problem of the surplus crews that are not needed in the slack periods, is it really impossible to have an extension of the split shift system: to get more crews to do their main work most days over the morning and evening rush hours—with time off in the middle of the day? About 20 per cent of crews do in fact do their main work at these times now, but on what looks like a union-rigged pay system which in effect means that they are paid for much of the time when they are not wanted. To meet the problem of carrying capacity, could not London Transport gradually introduce buses that are designed to carry many more passengers at the rush hour than they do at midday—that is, buses with extensive room for standing passengers? Indeed, would it be inconceivable even to have some buses from which some of the seats could be deliberately removed at 4.30 p.m., in order to pack more standers in? London Transport's newest buses are designed to carry more seated passengers, but the same number of standing ones. This surely must be the wrong way round, if it wants to be able to continue to carry its peak rush hour load and yet have fewer buses in total to maintain.

There is thus no reason to believe that London Transport is doing much new thinking along any of these lines. There might be objections on grounds of engineering or safety to some of the more extreme proposals. But the union's objections would probably be much greater. That suggests the grounds—one of the few economic grounds—for a *quid pro quo*. If all busmen are given a flat rate pay increase "in return" for economies less realistic than these, a settlement on the buses is likely to be a mere euphemism for surrender.

LEBANON

Time for Compromise

ANARCHY is a state ordinarily supposed and enjoyed by a large percentage of the Lebanese people. It is not likely that many of them enjoy it however, now that it has been raging through the country in an uncontrolled and un-Lebanese fashion for a fortnight. President Chamoun, ignoring the internal dissatisfaction with his regime, blames the United Arab Republic for all the trouble; but this is not a complete answer. The United States, rightly, supports the lawful Lebanese government. The United Arab Republic playing the game by a different set of rules, claims to be supporting public opinion there. The best hope for peace, however, lies not in the attitudes of outsiders but in the ability of the practical-minded business community to force the contending parties to restore the easy-going anarchy on which the country normally thrives. The spiteful utterances and violent actions of the past fortnight do not make compromise easy.

Perhaps the one six-year term which the constitution allows a president of the republic is an unhappy choice. Two four-year terms might better suit the national temperament. President Chamoun maintained his popularity for four years, and two years ago he could have been re-elected without all this trouble. The volatile Lebanese public is apt to grow tired of one man in office for six years, and opposition politicians fret when they see the spoils going in one direction for too long.

If Lebanon's western friends have misled the government about the amount and kind of support they were able

or willing to offer the regime, then they have done it a disservice. If the government has misled its western friends then it, too, has erred. Lebanon is the kind of place where foreign diplomats can easily be misled. They move, because of the nature of their jobs, among Lebanese whose first language is probably French or English and for whom Arabic is a language spoken only to servants. What the French newspapers there describe as *tout Beirut en smoking* is a glossy, cosmopolitan society. For dignity, deportment and distinguished appearance President Chamoun and his wife have no peers anywhere in the world. But it has been too easy to forget that Lebanon is in the Middle East, and too hard to remember that the polyglot Lebanese must be Arabs if they are to be anything at all.

IRAQ AND JORDAN

Federation's First Step

THE constitution of the Hashemite federation of Iraq and Jordan came into force in Baghdad on Monday. The federation has the advantage of beginning life formally at a time when Egypt's attention is diverted by events in Lebanon. As expected, Nuri es-Said is the federal prime minister. Jordan's Ibrahim Hashim is deputy prime minister instead of Samir al-Rifai, who presumably prefers to remain in the Jordanian government. A lack of eligible and able politicians may become one of the chief problems of the federation unless it can provide the advantages and prestige that will make the federal cabinet a home for elder statesmen. This arrangement might be useful to both countries if it made room nearer the top for ambitious younger men, whose talents can only be tested by their being given responsibility. The federal cabinet is a small one, comprising only three specific portfolios—foreign affairs, finance, and defence. Each country has contributed a minister of state.

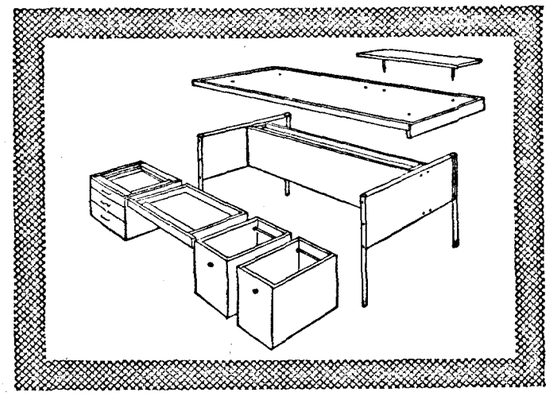
Launched with a minimum of popular approval—at birth it seemed no more than a tactical riposte to President Nasser's United Arab Republic—the federation has much to gain by putting on a show of energy, for it can offer many things which President Nasser can only promise. With Lebanon, for the moment, playing the role of weak sister among the Arab countries, Jordan's stature is slightly increased; but it cannot remain so without financial help from outside and determination from within. Whether that help comes from its Iraqi partner across the desert, or from its American friends across the seas, remains to be seen.

BUTTER IMPORT RESTRICTIONS

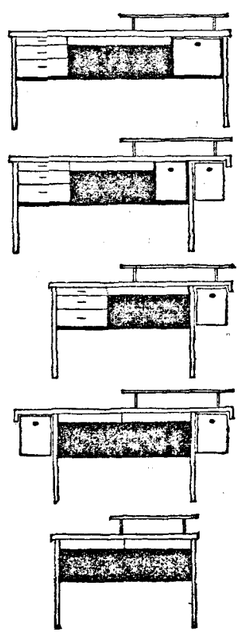
Not So Much the Butter

THE Government's decision to stop some foreign countries from selling butter cheaply to Britain is another sign of the past fortnight's retreat from ruthlessness in disinflationary policy. The cabinet's instinctive policy now seems to be to fight to keep down the cost of living only if this does not too greatly embarrass its personal relations with some trade union leader or distinguished dominion statesman who is champing in the ante-room. The New Zealand case in this dispute—that it was unfair on New Zealand producers that the British housewife should continue to accept the subsidies that some foreign taxpayers and consumers were so kindly presenting to her—has been widely advertised. But it is worth looking coolly at what were the interests of Britain—which, after all, now has a slightly lower general standard of living than New Zealand has.

The only circumstance in which the new restrictions would have been strictly and economically worth Britain's while would have been if it had felt that the cheap supplies from Europe were likely to be very temporary, and that the nibbling away at New Zealand's dairy herds caused by this competition would lead to a scarcity level of butter supplies next year. It is difficult to believe that the decision to restrict imports was taken on these hard commercial grounds; a more cynically self-interested view would have been that some cheap and subsidised foreign butter will be available until the cows come home from every marginal smallholding in every marginal political constituency in the advanced world, and this would mean for a long time yet. One can sympathise with the Conservative doctrine that British policy should safeguard the interests of Commonwealth producers just as much as it safeguards those of United Kingdom producers, but that does not mean that it should always sacrifice British consumers to either of them.



In any event, it is not a sensible way of safeguarding agricultural producers to say that all of them should remain in their present employments for ever, however much cheaper are the alternative supplies appearing from elsewhere; to the complaint that subsidised supplies are not really cheaper supplies, the proper retort may be that the almost universal existence of political subsidies for agriculture had now better be recognised as a fact of economic life—and, in any event, what happens if the higher price of butter in the shops now sends the housewife back to margarine? The argument that Britain's action will protect employment in its own export industries is nonsense; it is not good balance of payments economics to say that one should pay for one's imports above the market price, in the hope that some of the money thus spent will come back. The partial revocation of open general licences is not a good precedent for a trading nation such as Britain to have set at a time of possibly incipient trade recession; if Sweden, Finland and the Irish do not respond to Sir David Eccles's gentlemanly appeal, then we may have to face a row in Gatt. Mr Skinner has gone back to New Zealand feeling that Britain has not ceded enough to him. With the best will in the world towards a fellow Commonwealth country, New Zealand should know that this will not be the universal sentiment here. These restrictions have been an instance of weak if amiable government on the United Kingdom side.

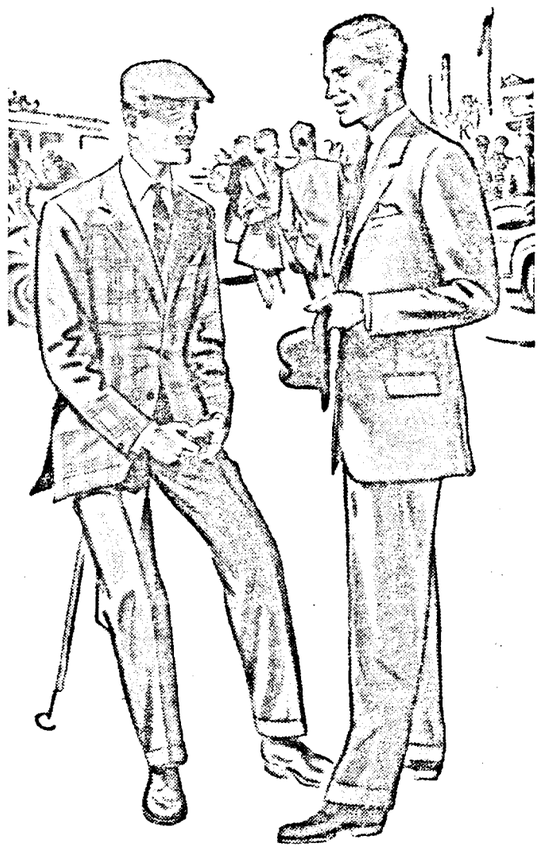


ISLINGTON BY-ELECTION

The Majors Retreat

THE Government has blown the retreat over the battle with the trade unions, and the abstaining majors have retreated into apathy again. For those who agree with the analysis of the local elections in *The Economist* last week (see page 574), that seems to be the lesson of the North Islington by-election, which took place the day after the Government's retreat over the railway wage dispute was announced. There was a complete collapse of the nascent revival of Conservative enthusiasm which the previous week's borough elections had appeared to show. The Conservative share of the poll—29.3 per cent—was exactly the same as at the London County Council election in North Islington in mid-April; Labour got 67.8 per cent and the

Variations on a desk



Concentrate for a moment, if you will, on the accompaniment to the Executive Suite—particularly the wood section, because we have introduced some interesting variations on a desk. Designed by Henry Long, M.S.I.A., this desk is built in three lengths. We've also built a number of drawer units etc. which can be fitted in a variety of ways to each of the three basic sizes, giving you many different arrangements to suit everyone's needs.

The conception of a desk such as this enables you to provide your individually graded executives with individually graded desks, yet retain the similarity in design which is essential to any office furnishing scheme.

HEAL'S CONTRACTS LTD.

196, TOTTENHAM COURT ROAD, LONDON W.1
TELEPHONE: MUSEUM 1666

Heal's Contracts Ltd. have carried out work for many well-known organizations, including:
THE BOWATER PAPER CORPORATION LTD · IMPERIAL CHEMICAL INDUSTRIES LTD · TRADES UNION CONGRESS · JOHN LAING AND SON LTD · BARCLAYS BANK LTD · IND COOPE AND ALLSOPP LTD · WIGGINS TEAPE GROUP · BRITISH TRANSPORT COMMISSION · KRAFT FOODS LTD · LONDON AIRPORT · TATE & LYLE LTD

Clothes for casual occasions

We have a wide choice of comfortable clothes for those pleasant occasions of relaxation. Quality is excellent and prices most reasonable.

MOSS BROS & CO LTD
OF COVENT GARDEN W.C.2
THE COMPLETE MAN'S STORE

Between the three of us,

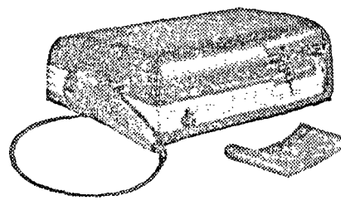
THIS OFFICE WORKS PERFECTLY

Until we got our Time-Master, I never realised just how inefficient we must have been.

Take dictation, for example. We were always being interrupted by the phone, or visitors, or urgent appointments. Wonder it didn't drive poor Miss Rogers mad!

Time-Master changed all that. Now I dictate on to those wonderful little Dictabelts and she types them out at her own pace. I use Dictabelts for all my notes and memos too. I estimate Time-Master saves me an hour's routine work a day.

The words DICTAPHONE, TIME-MASTER, and DICTABELT are registered trade marks



THE DICTAPHONE TIME-MASTER the world's greatest dictating machine

- ★ Made to an unequalled standard of precision engineering.
- ★ Fingertip control.
- ★ Perfect recording, playback, and correction.
- ★ Fast, efficient service—everywhere.

DICTABELT—the world's most modern dictation record—exclusive to the Dictaphone Time-Master

- ★ Light, handy, but virtually indestructible.
- ★ A permanent, visible recording. Can be posted or filed.
- ★ Crystal-clear recording at extremely low cost.

You cannot know *all* the advantages of owning a Dictaphone Time-Master until you've lived with it for a week. Try it—free.

The Dictabelt record—main reason why Dictaphone Time-Master far outsells all other dictating machines

NOTHING CAN COMPARE WITH

DICTAPHONE

Dictaphone Co. Ltd., 17-19 Stratford Place, London W.1. Sales and Service in 68 Countries

DICTAPHONE ALSO MANUFACTURE TELECORD — WORLD'S FINEST NETWORK DICTATION SYSTEM

.P candidate 2.9 per cent. The total swing to the left, mpared with the general election of 1955, therefore ached the considerable total of 10.4 per cent.

The outstanding feature of the by-election, however, was iat only just over a third of the electorate bothered to rn out to vote—one of the lowest polls in recent political istory. Of course, the physical difficulty of getting to the olling stations during the bus strike had something to do ith this; of course, there must always be considerable iution in commenting on the results of either a single y-election or a single group of borough elections. But ere is some subsidiary evidence to suggest what has been appening. For one thing, the spurt of quite mad right-ing letters, talking about "civil war" with the unions, hich suddenly hit some newspapers the week before last, eems to have as suddenly died away. It does seem prob-ble that two weeks ago, as the "showdown" of a railway rike seemed to be approaching, a sizeable group of people ho do not belong to trade unions (and who, perhaps there-ore, do not like them) were marching out to the local polls, xcitedly scenting battle. Now, one suspects, they are itting at home again, sadly tasting crow.

UGOSLAVIA AND RUSSIA

Better Unsaid

CATS are cascading out of bags as the new quarrel con-tinues between Belgrade on the one hand, and Moscow, Peking and the satellite capitals on the other. Massive etaliation takes the shape of multi-stage polemical missiles, uelled with gaseous jargon and warheaded with quotations drawn from the great arsenals stockpiled by Marx and Lenin. The fall-out is widespread and revealing. News-paper men will be professionally interested in the Jugoslav revelation that the Moscow press

> has generally given very scanty news about Jugoslavia. This was always explained as being due to shortage of space. It now seems that *Pravda* is not short of space when attacks on Jugoslavia are to be published.

Nor is Belgrade's *Borba*, which on Saturday printed a 7,500 word retort, stingy with space when really roused. The Jugoslavs—in the shocked words of one satellite news-paper, Bulgaria's *Rabotnichesko Delo*—are "making monstrous charges that the Soviet Union seeks hegemony over and exploitation of other peoples." In *Borba's* own words—the question is directed to the editors of *Pravda*, for this is all presented as a wrangle between leader-writers: "Was Soviet co-operation with Jugoslavia insincere, begun with ulterior motives, meant to make Jugoslavia abandon its position?"

Borba dwells with gusto on the allegations, put forward in pleasingly naïve juxtaposition by the Soviet and satellite press, that "the imperialists are now opening the doors of their banks" to reward the treacherous Jugoslavs, but that the country has been plunged into ruinous debt by this "so-called selfless aid of the American imperialists." Jugo-slav readers will be interested to learn, from their party organ, that US aid has been providing no less than four per cent of their country's whole national income, and that this aid "in no way prevented us from supporting all Soviet initiatives that corresponded to our attitudes." Other un-committed countries will also note with interest *Pravda's* denunciation of the Jugoslavs for seeking understanding and agreement with non-communist nations, and *Borba's* unanswerable retort:

> Is this not also the aim of current Soviet policy? Is this not the purpose of the effort to hold a summit conference?

ALGERIA

Less than Brotherhood

FRATERNITY between Moslem and Christian has been an insistent theme in the speeches of the present leaders in Algiers. General Salan and M. Soustelle have boasted that Algeria is from now on a country of ten million "Frenchmen," and numbers of enthusiastic Moslems have been seen at their meetings. M. Pflimlin, too, has seized on this as evidence that "French Algeria" commands sup-port outside the ranks of the Europeans. But out of a Moslem population of more than eight million it is not hard to get together a crowd; what is hard is to know why they are there, or whether they would be equally ready to attend the meetings of the other side.

The original Algerian rebels (the FLN) are biding their time. Their first reaction, uttered through Cairo radio, was to call a plague on both French houses and to reaffirm their resolve to go fighting for independence and nothing less. They have poured scorn on General Salan's surrender offer. But they have also refrained from giving any indication of what they will do. The new situation appears to favour them, at least by giving the army new preoccupations; at best, a serious breach between Paris and Algiers might cut off General Salan's supplies.

A logical step would be the formation now of the Algerian rebel government foreshadowed at the North African party conference at Tangiers last month. Before the Algerian coup, there were reports that the FLN would be ready to form its government by the middle of June: the date may now be advanced. But to begin with it would have to be a government in exile, and the other Maghreb governments, who might be its hosts, are sure to be urging delay. Both Tunisia and Morocco still have as their guests French troops whose loyalties in the present crisis are unknown; the Tunisians are finding it hard to avoid local conflicts. The Libyan capital is an alternative site. But the rulers of all three North African states are aware of the risk entailed in giving hospitality to an Algerian government at a time when the French temper is unpredictable.

THE FRENCH ECONOMY

Worth a Potato?

AT moments in the past fortnight it has seemed that Parisian phlegm was less likely to be shaken by the threats of soldiers, settlers, or communists than by a shortage of spuds. In face of the grim events which have so moved the journalists of Britain and their readers, the French people have kept their nerve and maintained their traditional calm. There are, however, not enough potatoes in the capital. Paris may not feel able to cut the supply lines of its boisterous army; but there is no telling whether they can expect any potatoes from Algeria. Parisians may have to choose between the republican integrity of their city and *pommes frites*.

Outside this vital field, however, the economic effects of the crisis have been remarkably small. Housewives have

been hoarding; the price of the gold napoléon has slipped upward; stocks have slid down. But as yet there has been no catastrophic flight from the franc.

In the long run, indeed, the present crisis could, in the economic sense, prove something of a catalyst, forcing France to face economic facts. Its remarkable prosperity—the continuing boom, with industry chalking up output figures 7 or 9 per cent greater than the year before—has of course only been bought at the price of a rip-roaring expenditure of exchange reserves which has consumed a fat chunk of the money raised abroad earlier this year. The bad trade figures for April and the even more depressing

The Strike at Pressed Steel

Our special correspondent who visited Swindon this week writes:

BY the middle of this week, the strike which started on April 28th at the Swindon works of Pressed Steel had so dislocated supplies of car bodies to the motor industry that 7,000 workers there had been dismissed and another 20,000 put on short time. Production at the British Motor Corporation, Rootes and Jaguar has been particularly badly hit, at a time when all three firms had been exporting cars in record numbers. Thus this stoppage, which was called by shop stewards without agreement from most of the union officials—and only a day after a meeting of the whole works had decided by a substantial majority not to strike—is rapidly becoming something of a national disaster.

The history of the strike goes back to last November, when workers at the Oxford branch of Pressed Steel were given a wage increase of between 2d. and 4d. an hour. There had always been a difference between rates paid at Oxford (covered by the London and District Employers' Association) and at Swindon (which is in the West of England Association); but the November increase raised this differential to 8d. an hour for skilled men and 4d. an hour for unskilled. The Swindon workers felt, reasonably enough, that this difference was too great; they said that their earnings, which are mostly between £12 and £16 a week compared with an average of over £16 for the motor firms as a whole, were the lowest in the industry, and they demanded that the differential between Oxford and Swindon be removed. The employers rejected this demand, pointing out, also truly enough, that they paid some of the highest wages in the town; certainly the 10,000 men in the railway workshops, who set the local wage pattern, can rarely earn more than £13 in a week. No ground was given by either side; arbitration at York produced no result; and at a meeting of the men on April 21st (called against the advice of some union officials), it was decided by 900 votes to 14 that if the management did not settle the claim within a week, there would be a strike.

So far, things had been conducted in due and proper order. The shop stewards seemed to have the men behind them; and when no offer was made during the week, they called another meeting to confirm the strike decision. But to their surprise anti-strikers had been busy during the week; and after a rowdy meeting at the Moonrakers pub, the 1,170 men there decided by a substantial majority to reverse the strike decision and instead to present the management with a new and more moderate claim. The source of the stewards' great influence up till then—which was that many of the workers, coming from far afield (indeed quite a lot of them from abroad, and with little or no union background), were easily swayed by a persuasive talker on the factory floor—had been turned against them. They were left, in the words of the strike leader, Mr Glendenning, "holding the baby."

★

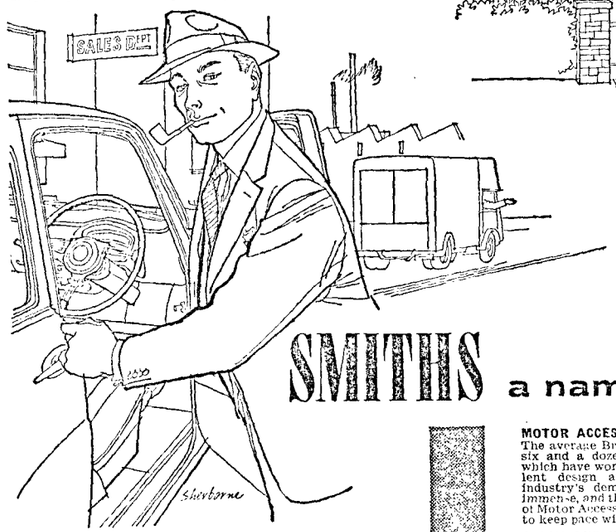
Meeting privately afterwards, however, a limited number of militants, principally in the Electrical Trades Union, decided that they would not accept the men's decision and would go it alone. At lunchtime next day, 60 key men walked out; and although Transport and General Workers' Union officials persuaded the night shift to stay in, the strike spread rapidly and by Wednesday all work had stopped. Many of the men did not want to strike. "I was taking home £15" said one unskilled worker, "and now I'm getting £2 strike pay and £3 from the national assistance. But if I didn't join the strike, I would lose my job afterwards, so there is no choice." A few Poles who speak no English have still not discovered what the strike is about. And while Mr Glendenning—an unusual sort of strike leader, who wears a crested blazer—may talk airily about massive support from the rest of the motor industry (which proves to be a few pounds and congratulations from some other shop stewards), the men themselves stand in groups talking about how to draw their benefit.

Since the strike started, feelings among the ten unions involved have been under greater strain than those between the union official and the management, which have remained surprisingly cordial. At the beginning of this year, the Amalgamated Engineering Union had the largest membership at the works, a position originally held by the TGWU, but lost by it after trouble with their chief works organiser over collecting dues. But recently the TGWU has been making a comeback and during the last three weeks, when the AEU members have not been receiving strike pay as promptly as they expected, it has done especially well. Charges of poaching members are heard. Another source of friction has been the fear that since it was the ETU who walked out, communists might have been behind the stoppage. But despite the fact that one of the local officials of the AEU is a communist, and that one allegedly sinister imported agitator has been found in the works, your correspondent did not feel convinced by some arguments that this strike is all a communist plot.

But the management too has its problems. The Pressed Steel factory has been open only two years, and three new bays were added only this week; it is thus badly placed for standing up to a long stoppage. Moreover, although Sir William Grant, chairman of the local employers association (whose forthright disapproval of Government intervention in wage disputes became something of a national issue last year) and Mr Edwards, managing director of the company, refused to give any ground at a six hour meeting last week, two factors may weaken their stand. The first is the serious effect the strike is having on other motor firms; the second is that the size of the differential between Oxford and Swindon has become unrealistic. Unemployment at Swindon, at 0.9 per cent, is well below the national average of 2 per cent; many firms are expanding and opening branches there and are having to pay higher wages than before to attract labour from as far away as London. In these conditions, a closing of the differential, even though this would spread to other firms in the area, might well be natural; the tragedy is that troublemakers at Pressed Steel may, by taking the law into their own hands, have delayed rather then advanced the day when this can be done.

The meaning of SMITHS

In the world at large, there are probably more than two million people bearing the English name Smith; but in the world covered by our own business activities we are the only SMITHS. Applied to any product within our special world, the name SMITHS means, 'A product of S. Smith & Sons (England) Limited'—and of nobody else.
In administrative terms, SMITHS means the great engineering organization set out below. In terms of bricks and mortar it means 20 superbly equipped factories; and in human terms, 18,000 carefully trained people, including some of Britain's most talented engineers. In terms of products, SMITHS means the clocks and watches, and the dashboard instruments and other motor accessories, that everybody knows, but it also means an immense range of other products—from Automatic Pilots for aircraft to electronic control systems for industrial processes—which enrich your own life in ways you can hardly have imagined. SMITHS is, indeed, a name with a world of meaning.



WHAT SMITHS MEANS TO CAPTAIN PARKHOUSE

For the aeroplanes that Captain Parkhouse flies, SMITHS Aviation Division make instruments and control mechanisms including the SMITHS Autopilot, which will fly an aircraft for 3,000 hours between overhauls—that's a million miles, at the moderate speed of 333 miles per hour. To Captain Parkhouse, SMITHS means easier, safer flying, and prompt arrivals at airports anywhere in the world.

WHAT SMITHS MEANS TO MRS. JONES

SMITHS Clock & Watch Division make the alarm clock that wakes Mrs. Jones, and the clock that tells her husband's employers whether she got him to his work in good time. They make the kitchen timer, too, that tells her when to take things off the stove, or out of the oven. To Mrs. Jones, SMITHS means the timing of her domestic routines and, though she probably doesn't know it, better motoring in the Jones family car. A later advertisement will explain how SMITHS also keep her fishmonger's prices down.

WHAT SMITHS MEANS TO JOHN BLAKE

To salesman John Blake, who practically lives in his car, SMITHS naturally means accessories for better motoring. SMITHS instruments help him to drive and maintain his car more efficiently. SMITHS K.L.G. sparking plugs, he knows from long experience, are the very best he can buy. A SMITHS heater comforts him in cold weather, and its de-misters keep his windscreen clear of dangerous mist and frost. Bluecol anti-freeze protects his car's cooling system against both frost and corrosion. SMITHS thermostats provide quick warming up for his engine and so save petrol and engine wear. In many ways like these, SMITHS means better motoring, not only to salesman Blake, but to the overwhelming majority of British motorists.

SMITHS a name with a world of meaning

MOTOR ACCESSORY DIVISION
The average British car probably uses between six and a dozen different SMITHS accessories, which have won their place in it by their excellent design and workmanship. The motor industry's demand for SMITHS accessories is immense, and the immense production resources of Motor Accessory Division work at full stretch to keep pace with it.

CLOCK AND WATCH DIVISION
Clock and Watch Division is, without any doubt whatever, the most completely equipped organization in this country for the development, design, and manufacture of clocks and watches of every kind. In all important respects it is the most completely equipped organization of this kind in the world, and its supremacy is demonstrated by the supremacy of its products in every price range.

INDUSTRIAL INSTRUMENT DIVISION
Industry already has a great need of instruments, to indicate or record such matters as speed, time, distance, quantity, pressure, or temperature; and the need grows at an increasing rate as industry becomes more automatic. A notable proportion of Britain's industrial instruments are made by SMITHS Industrial Instruments Division.

AVIATION DIVISION
Aircraft Division employs some of Britain's finest engineering and scientific talent, and most potent research facilities, in the development and commercial production of aircraft instruments of the utmost accuracy and reliability, and autopilots and complete flight systems which provide the safest possible navigation for nineteen airlines, including some of the biggest in the world.

KELVIN HUGHES
Though the name 'Kelvin' has been famous for over 50 years in the scientific-instrument field, and the name 'Hughes' in the nautical-instrument field for over 200 years, the two came together as recently as 1947 in the Kelvin Hughes organization, which joined the SMITHS group very soon afterwards. In their own fields, which have now widened considerably, Kelvin Hughes products are second to none.

S. SMITH & SONS (ENGLAND) LIMITED

concession to Africans, may settle the future not only of Southern Rhodesia, but of the whole Federation which will go to the polls later in the year.

LAOS

Red Votes and Red Faces

LAST November the royal government of Laos averted the threat of civil war and communist invasion and accepted that of internal subversion. Under an agreement with the communist-led Pathet Lao, two north-eastern provinces, then under communist rule, were brought under the government's authority; in return, the Pathet Lao troops and officials were to be "integrated" into the nation. The first test of the agreement must make the non-communist members of the government wonder whether the bargain they struck was as good as it looked. In supplementary elections to provide 21 extra seats for an enlarged electorate, the Pathet Lao's party—the Patriotic Front—won nine seats. With four more won by electoral allies, the communist-line newcomers got about two-thirds of the new seats.

The Patriotic Front's success is the more remarkable for two facts: it contested only 13 of the seats and, with its allies, polled only a third of the total vote. In Phong Saly, one of the two north-eastern provinces occupied by the Vietnamese communists during the Indo-China war and left in Pathet Lao hands, the Patriotic Front polled 20,000 votes; the remaining 26,000 went to non-communist candidates—who lost because they were fighting each other as well as the Pathet Lao.

It is small wonder that red faces are reported to have been seen in recent days in Vientiane, the sprawling village capital of a kingdom where life—but for the communist challenge—retains the idyllic flavour that charmed the French occupiers of the 'eighties. With sympathisers already in the old Assembly, the communists and their allies will control about 21 seats in the enlarged Assembly of 59. The electoral blow which the "red Prince" Souphanouvong, leader of the Patriotic Front, has dealt to his half-brother, Souvanna Phouma, the Prime Minister, is therefore not mortal. But the non-communist groups will need to concert their activities in the future.

EURATOM

Belated Gesture

THE Government's decision to accredit a representative whose task it will be to develop British co-operation with Euratom might well have been taken earlier. In Washington the representatives of the new six-nation community have been warmly welcomed, and finishing touches are being put to their agreement with the United States on a joint programme of reactor development in Europe, financed on a fifty-fifty basis. Euratom will get the benefit of American know-how, America a testing ground for its reactors and the *entrée* to the European market. Britain, by contrast, has hitherto ignored the new community.

The new ambassador's appointment is the first friendly gesture. He will have plenty to do, for in the few months since Euratom was born Britain has irritated it a good deal. There is a suspicion at its Brussels headquarters that Britain has been seeking to delay the new agreement with America, and there is even more resentment against British attempts to conclude bilateral deals with member countries behind the community's back. The Euratom treaty requires members to pool their knowledge about peaceful applications of nuclear energy; it sets up an agency through which all fuel is to be imported, and thus provides a sanction to back up the wide powers of inspection which the community enjoys; and the community alone is empowered to make agreements with third countries on these vital matters. Four days before the treaty came into force, however, Britain concluded a bilateral agreement with Italy which covered precisely this ground; more recently, within the framework of that agreement, a British and an Italian company have arranged to collaborate on the joint construction of power stations in Italy; and negotiations for similar arrangements have been started with the Germans and the Dutch. Admittedly, in these cases the impetus has come as much from the other parties concerned as from Britain. Men like Herr Balke, the able chemist in charge of Germany's power programme, and Signor Mattei, now extending his domain from oil and gas to nuclear power, are in a hurry to get their reactors up. But to the Euratom executive it inevitably looks as though *perfide Albion* is up to its old tricks. It has challenged all three bilateral arrangements as being contrary to the treaty.

This muddle should never have been allowed to obscure the great interests Britain and Euratom share. The leaders of the new community know as well as Signor Mattei that

The Economist

LOADS, QUARTERS, BUSHELS AND BARRELS

The important object of uniformity of weights and measure has not made much progress by the discussion upon Mr Lock's Bill, introduced with a view to that end, and rejected upon the second reading. It is not creditable to the legislative wisdom of the House of Commons that an object with regard to the necessity and convenience of which all are so well agreed, should offer difficulties in its accomplishment apparently insurmountable. Committee after Committee has considered the subject;—attempts one after another have been made to reduce the general wish into legislative form;—and now in the year 1858, we are just where we were, so far as uniformity is concerned, when the first Committee was appointed nearly twenty-five years ago. . . . What is the evil we have to remedy? It is plain and simple, and one that is really of practical inconvenience to a large number of persons:—landowners, farmers, corn-dealers, merchants, and all that class of politicians who watch the progress of the great material interests of the country. . . . Well, we have been able to make railways, to construct canals, to build and establish steamboats:—all these means of communication are, and have long been, at our command, while as yet we have not discovered the means of reducing to one common term or denomination the weights and measures in which the price of commodities is expressed, and which is essential to the public at large being able to appreciate the real comparison of prices in different places. This is not creditable:—it savours much more of the inveterate character of habit than of earnest love of practical improvement:—and we will venture to say that if the change had, from its nature, been one within the compass of the exertions of private merchants or engineers, in place of being only possible by an effort of legislation, the difficulty would have been solved long ago.

THE ROYAL AIR FORCE
orders the GNAT TRAINER

Advanced Training
at low cost

The Gnat Trainer shares the remarkable performance and ease of handling and maintenance of the Folland Gnat Light Jet Fighter.
Both pilots have a full range of instruments and controls; increased wing area and powerful split flaps give excellent low-speed handling.
The Gnat Trainer provides the most suitable introduction to supersonic swept-wing aircraft—and at moderate cost.
It has a considerable military potential in its own right.
ENDURANCE: 2¼ hours. **MAXIMUM LEVEL SPEED:** M.97

DEVELOPED FROM
THE FOLLAND
GNAT
LIGHT JET FIGHTER

FOLLAND AIRCRAFT LIMITED · HAMBLE · SOUTHAMPTON · ENGLAND

British-type reactors must form the basis of west Europe's power programmes in the next few years. The promised link with Euratom should be used at once to work out a general agreement with this country which satisfies both the community and its members. Under this umbrella, commercial agreements with individual countries can be properly reached. Then, with all urgency, the political potentialities of close association with Euratom, whose members are on the brink of taking up nuclear arms as well as nuclear power, must be developed to the full.

PORTUGAL

Object Lesson in a Mirror

In an eerie way, Portugal this week has looked rather like a mirror image of France, with the writing all the other way round. A strong man, sincerely convinced that he is indispensable, and enjoying the support not only of army officers but also of a large and variegated cross-section of opinion, dominates the Portuguese political scene too. Strong police action has been taken against demonstrators in Lisbon as in Paris; there, too, there is a sense of change, of the breaking up of established patterns, in the air. But Portugal's saviour figure, Professor Salazar, has held power for thirty years; the swing of opinion is towards getting him out, and the police activity is directed towards keeping him in.

A jittery clumsiness has marked the Salazar regime's latest actions. It has clearly been badly shaken by the sight of an opposition candidate for the presidency of the republic emerging from its own ranks in the person of General Delgado, the director-general of civil aviation. The general has many well placed friends, some of whom may have been deliberately frustrating the government's efforts to silence him. Some reports even suggest that the outgoing head of state, President Craveiro Lopes, is sympathetic to the challenger. His name is noticeably lacking from the list of official personalities cited as having rallied to the support of the defence minister, Colonel dos Santos Costa, whom the general had rightly criticised for attempting to tell the armed services how to vote.

Demonstrations in favour of the general were sternly checked last week in both Oporto and Lisbon. On the Rossio, the square in the heart of Lisbon, police and soldiers used their arms, including automatic weapons, and tanks were marshalled on the Terreiro do Paço, the great forum on the Tagus waterfront familiarly known to British visitors as "Black Horse Square." Outwardly Portugal remains quiet; but its cautious inhabitants have been stirred to unfamiliar emotions by the news of these events, and by the outspoken speeches of General Delgado—which, it may be noted, have been duly reported in the normally tight-reined press. Nobody is forecasting a victory for the general in the elections on June 8th. But even the theoretical possibility that if he did win the presidency, he might carry out his declared intention of appointing another prime minister in place of Dr Salazar, is enough to set every coffee-shop in a low buzz of guarded speculation.

MOTOR BUSINESS

The March issue of this quarterly research bulletin for the motor and allied industries is now available. It includes:

THE SWEDISH MOTOR INDUSTRY

THE UNITED KINGDOM HEAVY COMMERCIAL VEHICLE INDUSTRY

THE NEW ZEALAND MARKET FOR MOTOR VEHICLES AND TRACTORS

The Bulletin is fully illustrated by charts, amongst which are:

PRICE INDICES OF USED CARS AND VANS

WORLD EXPORTS OF VEHICLES

WORLD TRADE IN PASSENGER CARS

For full particulars of this Bulletin apply to:

FILM CENSORSHIP

Censors' Stag Party?

With an old-world delicacy which offers a piquant contrast to recent local history, the town councillors of Brighton have decided that the activities of their Watch Committee are unsuitable for the participation of women members. Among the duties of watch committees, it is explained, *is that of seeing, and adjudicating on, films that* possibly ought to be banned; and the embarrassment of watching and subsequently discussing these in mixed company has, it appears, proved too much for Brighton's committee men. It is not on record that the ladies—*in this connection, ladies is surely the word*—shared this embarrassment; while one of them has apparently raised no objection to being excluded, the other is sturdily protesting.

This is the sort of decision that almost defies serious comment. Given that cinema audiences consist of people, notably young people, of both sexes, it ought to go almost without saying that both masculine and feminine judgments should be brought to bear on a film's possible tendency to corrupt or to arouse manly passions. It also seems fairly self-evident that the sort of committee man who finds it unbearably embarrassing to discuss a borderline film with a woman colleague should be regarded as psychologically disqualified from judging such tendencies at all. Less seriously, the episode prompts some fascinating speculation as to just what film it was, and what passage in that film, which brought the Brighton Watch Committee to breaking point and prompted the councillors' action. Did some male member, betrayed into a revealing guffaw or shocked into inarticulate horror, find himself forced to explain to the mystified distaff side just what it was that had so affected him? Or worse still—far worse—were the explanations by any chance the other way round? "What," one imagines one uncomfortably innocent character asking of another, as the film-show sequence of "The Bachelor Party" unrolls itself, "*what* are they supposed to be looking at?"

The possibilities widen out deliciously as one thinks of them; indeed, the situation is tailor-made for a revue sketch. But it does not particularly redound to the dignity of the watch committee. Its surviving members should not be surprised if lewd fellows of the baser sort conclude—with whatever outrageous injustice—that underlying their complaints of embarrassment is the aim of reconstituting a right little, tight little stag party.

LETTERS

Tories in the Boroughs

Sir—Your comments about the municipal elections draw rather sweeping conclusions from rather scanty evidence. Labour did less well in May in the boroughs than in April in the counties; it does not necessarily follow that there has been "a large swing back to the Conservatives." You indeed concede that the "abstaining majors marching home" need not have been reinforced by a single floating voter.

Perhaps the abstaining majors ride no buses. Even so, if as you suggest it was resentment against the unions that brought out the backwoodsmen, they should surely have flocked to the polls most enthusiastically in Greater London, where the strike was four days old on municipal polling day. Yet this was the region where Labour did best—the only one where the party held its peak (1952) borough strength.

It seems more likely that Labour has a bigger faithful nucleus of fair-or-foul voters than the Conservatives, and that this bulks larger the smaller the total poll. Certainly Labour has done better in the boroughs in the last three years of low turnout than in the previous three when it was higher. Since county council elections arouse less interest, and attract a lower poll than any other, Labour might normally be expected to do better in them than in the boroughs—even though no voter changed his mind or was even moved by greater party fervour.—Yours faithfully,

PHILIP WILLIAMS

Jesus College, Oxford

★

Sir—You claim a swing to the Conservatives, because the Labour gains in the counties last month were greater than those recorded in the towns this month. This is not a comparison of like with like. It is recognised that apathy is always most marked in the county elections, and that apathy normally tells most against the party forming the government. Furthermore, Labour representation was (and is) weakest in the counties, so allowing greater scope for advance there than in the towns, where Labour was already the strongest party.

You assert that these local elections were a nasty shock for the Labour party, because it did not advance beyond its 1952 peak. In 1952 the Labour party was making its first substantial inroads into many councils then regarded as solidly right wing. In every year since then (except 1955) these beach-heads have been extended, in towns such as Oxford, Wallasey and Maidstone. Thus a large number of former Tory strongholds were this year faced with the prospect of Labour control for the first time. In many areas this stimulated a good desperation vote.

Surely it must be recognised that, beyond a certain point (1952?) the rate of Labour progress is bound to slow down considerably? Labour already controls the great majority of medium-sized and large towns of average or below average rateable value per head. Obviously, in areas of well above average rateable value, progress is bound to be very slow. In Britain's two hundred large towns (over 50,000 population, boroughs and urban districts) 130 have a majority of Labour councillors, 65 (mainly the smaller) have Tory or Independent majorities, and the Liberals dominate in 5. Of the 65 right-wing towns only four have an annual rateable value per head less than the national average of £12—West Hartlepool, Brierley Hill (Staffs), Bury and Huyton (Lancs). Five have average values—Burton-on-Trent, Tynemouth, Sale (Cheshire), Gosport and Fareham (Hants). Of the remainder, no fewer than 36 have rateable values at least 50 per cent above average, including such towns as Beckenham, Torquay, Cheltenham, Bournemouth, Sutton Coldfield, Twickenham, Eastbourne, Wimbledon, Southport, Finchley and Scarborough. Is it really necessary for Labour to capture Hove or Epsom before its postwar local government victory is conceded?—Yours faithfully, A. DONALD

Swindon

South African Elections

Sir—I would like to make three comments of a statistical nature on the results of the South African general election, described in your issue of April 26th.

1. The swing in favour of the Nationalists was about 5 per cent, but assuming that the Coloured voters voted Nationalist in the same ratio as they did in the 1958 elections of Coloured representatives, the swing in the vote works out at about 3 per cent. The swing was more pronounced in the Transvaal than elsewhere, but was nationwide. New registrations where the Nationalists enjoy a substantial majority as a result of the higher birth rate amongst Afrikaners could only have accounted for a swing of at the most 1½ per cent. Where the additional support came from is impossible to say. The result in the constituency of Port Beaufort, where the Nationalists polled 55 per cent of the votes, although only 51 per cent of the voters on the roll had their addresses and occupations in Afrikaans, seems to suggest some English-speaking support. With one or two unimportant exceptions, everybody that publicly announced a change of political views was, however, Afrikaans speaking. I am therefore inclined to think that the swing was mainly due to a further consolidation of the Afrikaners in the Nationalist party. Professor Keppel-Jones is probably not far from the mark when he states that they now enjoy the support of 85 per cent of the Afrikaners. This should be compared with an estimated 75 per cent in 1948.

2. The Nationalists polled some 140,000 more votes than the United party, but the United party had 24 unopposed returns. Both parties have therefore claimed to enjoy the support of the majority of the white voters and have published exhaustive analyses in support of their view. My own calculations give it to the United party by about 7,000 votes, but the margin of error in a hypothetical poll of 1,400,000 is bound to be larger and I feel that the only conclusion that can be drawn is that the white population is now about equally divided between the Nationalist and United parties with regard to their political views. This represents a substantial swing to the Nationalist party since 1948 when their support was estimated at just over 40 per cent of the electorate, which did, however, include the coloured voters. The swing in respect of the white voters only must have been at least 5 per cent since 1948.

3. The United party appears to have no prospect whatsoever of winning the next election. To gain a majority with the help of the coloured and native members of parliament, the swing against the Nationalists would have to be about 9½ per cent. To gain a working majority on their own, a swing of about 12 per cent is needed. Such a swing of opinion is quite unknown in South Africa. The swing to Dr Malan that put him into power in 1948 was only 7½ per cent. The United party's prospects seem now to depend entirely on the possibility of a rift in the Nationalist party.

Yours faithfully,

Cape Town H. DE G. LAURIE

BOOKS

"Bernie"

Mr Baruch: *The man, the myth, the eighty years*
By Margaret L. Coit.
Collance. 784 pages. 42s.

A MYSTERY surrounds this book. The dustjacket tells us that Mr Baruch threw open his great files of papers for it, but insisted that it be its author's book in every sense of the word. Its author, however—but not until page 699—tells us that Mr Baruch closed his papers to her and withheld permission to cite his unpublished writings after she had worked on a preliminary draft for five years. No explanation is given us. One is certainly needed, for the author is, at least for one reader, over-adulatory of her subject. She permits herself to him that Baruch's success in life might have been greater had he risked failure more: and therefore that he may have recoiled at the thought that a book about him might fail. Mr Baruch clearly loved himself enough not to court failure. He did not run for office. He never took a really big and important job, after his successful captaincy of the War Industries Board under Wilson in the first world war. He refused the secretaryship of the Treasury and regretted it the rest of his life. He would not even become chairman of the Democrats' National Committee when his party sorely needed him.

Baruch seems to have believed that he could have been President had he not been a Jew. That did not stop other Jews from believing that they could. His Roman Catholicism did not make Al Smith think he would fail, and it may not make young Mr Kennedy think so now. Again, Baruch was not a politician; but heaps of them failed to get that plum, whether they were Jews, Irish Catholics, atheists, adulterers, fathers of bastards, and so on, while many others got the plum who were no better. Was Mr Baruch over-ambitious, over-fond of success, and therefore over-frustrated by being Jewish? The offers and opportunities he did get were manifold, and much greater than most of the American goyim in politics ever enjoyed. This may explain what seems undue emphasis on American brands of social anti-Semitism. A Gentile father objected to Baruch's marriage to his daughter on account of the differences not of race but of religion; but most orthodox Jewish fathers (and mothers) object to it, too; and for "closeness" of family and society Jewish life takes much beating. It is almost certain that the silly, snooty set of the "400" snubbed Baruch and his wife. But Gentiles were snubbed too; and Gentiles up to Mr Baruch's grade of intelligence and taste would not willingly have spent an evening in the society of the "400" for a thousand dollars. Why, then, did Mr Baruch rate them so high? Miss Coit, an intelligent, trained, able biographer, does not tell us.

Her book gives illuminating accounts of Baruch's operations on Wall Street (he was a very thorough investigator before he invested in a company), political life in Washington, party conventions, the Peace Conference after 1918, the dumbfounding effect in London of Roosevelt's death, and so on. Baruch was obviously a shrewd planner, a thinker-ahead: witness his prophecy in the last war that there would be no unemployment problem thereafter; witness, too, his "Baruch plan" for international atomic control. He was courageous enough to clash with President Truman, in spite of their previous close collaboration. He is indubitably generous. Herbert Hoover said that "Bernie" gave a million dollars to the Red Cross without making it public, and General Johnson called him "the most faithful, kindly and considerate man" he had known. Yet one of his friends, asked to sum up the Baruch career in a word, chose for it "frustration." Miss Coit says no one would deny that more than her subject, who shies off violently from probing his own motives and from anyone who tries to search his "deeply forested interior."

All this being so Miss Coit's book seems unduly long: too much about Elsinore, too little about Hamlet. It is full of interesting information, much of it elsewhere available; it is interesting, if somewhat flowerily written. One's sympathies are, for once, with an author, not with her subject. Hers must have been a tough assignment. Like those who took the Golden Road to Samarkand, she must have been impelled by love of knowing what (to Mr Baruch) "should not be known." Was that why the guillotine fell after five years' work? Maybe; but the work up to that point has not really made *the* book on the subject. And maybe, like the small boy's apple, "there ain't gonna be no core!"

The Private Belloc

Letters from Hilaire Belloc

Edited by Robert Speaight.
Hollis and Carter. 313 pages. 30s.

IT is not surprising that Mr Speaight, confronted with such excellent stuff as the correspondence on which he drew for his biography of Hilaire Belloc, should have wished to use more of it than that biography could reproduce. The resulting volume is, as he explains, in no sense a "Collected Letters." It excludes much that has been already published and does not print in full many of the letters which it does include; it is, in fact, a limited anthology, the more tantalising since the reader cannot follow up his aroused curiosity by turning to a more comprehensive volume.

Within these limitations, however, "Letters from Hilaire Belloc" is a delight. Belloc had the first and greatest of the letter-writer's gifts; that of focusing all his consciousness and powers, thought, emotion and wit, on the person to whom he was writing. It is the quality that makes a man a good conversationalist as distinct from a mere good talker, a quality rather human than literary, and it appears unfailingly in these letters, whether Belloc is drawing on all the strength of the faith that is in him to comfort a friend who has lost her child, or entertaining Maurice Baring with limericks, or discoursing on current politics, or narrating one of his innumerable journeys. He had, of course, the appropriate literary gifts as well; vividness and a knack for the thumbnail sketch, a fine capacity for extravagance, a spontaneous wit, a fund of allusion. ("The position is ridiculous and the expense is damnable"—thus, in deadpan quotation, he sums up his reasons for not seeking re-election to Parliament.)

Speaking thus for himself and in private, he is a far more sympathetic character than the Belloc of the books and the public prints. There is nothing in the letters of that faint distasteful hint of attitudinising which pervades his published work. Not that they indicate, by contrast, anything in the public Belloc that could properly be called insincerity; on the contrary. Cleansed of self-righteous bluster, his convictions, opinions, likings and antipathies remain recognisably the same and transparently genuine. His friends were fortunate.

East End Families

Widows and Their Families

By Peter Marris. 172 pages. 18s.

The Family Life of Old People

By Peter Townsend. 284 pages. 30s.
Routledge and Kegan Paul.

THESE two essays in social research maintain the high standard set by the recently established Institute of Community Studies in its first survey, "Family and Kinship in East London." They form a trilogy of studies, with unity of locale and common doctrine, that cast new light on the family as a living organism.

There is something here for everyone, for social surveys are a meeting ground for laymen and specialists of varying disciplines, each with his own tests and standards. The survey methodologist should find much to praise; sampling methods are strict; sample sizes, though small, are unlikely to disturb even the fanatical purist; interviewing techniques—the fieldwork was largely carried out by the authors themselves—permitted intensive and wide-ranging discussions, thus avoiding the somewhat cramping effects of the more rigid formal questionnaire. The lay reader will find both books very readable and stylistically superior to most social research: the material is treated with lively sympathy, and individual cases come to life. Nevertheless, the authors have not neglected to provide valuable material for experts in the sociological, psychological and anthropological fields, and for the administrator, there are the many implications for policy.

Although many findings of social surveys may appear commonplace, one striking *Leitmotif* emerges from both works: Bethnal Green, possibly modern society as a whole, is one vast matriarchy. The family pivots round the mother or grandmother, above all round the proverbial maternal mother-in-law; the "old man," especially when he has retired, is very much the outsider in daily family life, while the newly married man tends to forsake his own family.

Each work has its special interest. The most notable contribution of Mr Marris's study of widowhood is a warm and sensitive treatment of grief and a powerful plea, in the light of current anomalies, for a major review of social insurance provision for widows. Mr Townsend focuses attention on two major problems of old age: the catastrophic fall in income that accompanies retirement; and the vastly differing plights, vis-à-vis the welfare services, of old people who form part of an extended family and those who do not. For the old, even when they live alone, are truly isolated only where there is no family.

Granted the limited financial resources of much social research, comment on the scope of these studies may seem churlish. How far the experience of Bethnal Green may be typical of Britain as a whole is an issue of which the authors are properly aware. One is driven to ask how far these findings would be paralleled not only in middle-class families, but also in the growing strata of suburbia and dormitory-land, which straddle the working and middle classes. How far do their conditions differ, or how far can social patterns and human experience transcend material differences? Further research could give added value to these studies.

The Turn of the Tide

The Englishman's Food

By J. C. Drummond and Anne Wilbraham. Revised by D. F. Hollingsworth.
Cape. 482 pages. 36s.

AFTER Sir Jack Drummond's death, Miss Hollingsworth, who had worked with him during the war in the Ministry of Food, undertook the revision of this book, the first edition of which appeared in 1939. Some of the earlier chapters have been curtailed to make room for new material and the book now provides a fascinating account of eating habits over five centuries.

In Tudor times, we are told, "the Englishman of every class fed better than his counterpart on the Continent." Needless to say, this did not mean fair shares for all. The Venetian Ambassador at the beginning of the sixteenth century comments: "The English, being great epicures and very avaricious by nature, indulge in the most delicate fare themselves and give their households the coarsest bread and beer and cold meat baked on Sunday for the week, which, however, they allow them in great abundance." There was a surprising variety of foods available in the fifteenth and sixteenth centuries; records refer to foods as varied as beef, bacon, garlic, lettuce, salted greens, olive oil, raisins, herrings, pepper and marmalade.

Sir Jack was a biochemist and his book gives an expert's view of the deficiencies in diet at different periods and the diseases that resulted. There are revealing accounts of meals in workhouses, hospitals, schools and prisons. Although the foundations of the science of nutrition were laid in the nineteenth century, it was only with the turn of the century that public concern was aroused. Of the general health of the English in the aftermath of the industrial revolution, Sir Jack wrote: "It is no exaggeration to say that the opening of the twentieth century saw malnutrition more rife in England than it had been since the great dearths of medieval and Tudor times." It is a depressing thought that it required two world wars to accelerate the study of nutritional science. In a new and final chapter to this book, unfortunately telescoped through lack of space, Miss Hollingsworth discusses the changes in food supply and policy since 1914.

Primus in Indis

The First Punjabis

By Mohammed Ibrahim Qureshi.
Gale and Polden. 484 pages. 30s.

REGIMENTAL histories are designed for Captain Gunn. He turns hurriedly to the index and, finding his name mentioned, sighs with relief; for if his name does appear, the reference to his achievements will be laudatory—or, at the worst, non-committal. Discretion of this kind has its merits, for the book is written to keep alive that intangible, so dear to most armies, the regimental tradition. To the outsider the long, detailed regimental history serves another purpose: it reminds him that war is not just a matter of neat oblongs of colour or broad sweeping arrows on a map; it reminds him that war has a price.

Why, then, single out for mention "The First Punjabis," which in form differs not a jot from all the other histories? First because it is a worthy representative of the whole, presenting through the story of one regiment the history of military India. Secondly, because it has unique qualities. It deals with the oldest regiment, first raised in Madras in 1759—the year of Plassey—of the old Indian army; it remains alive as a unit in the Pakistani army, its traditions undimmed, having fought from Wandiwash to Meiktila and having done its duty in the Punjab at the time of partition. It is written, moreover, by a serving Pakistani officer, who belongs to a regiment in which the present Chief of the General Staff of the Pakistani army as well as Field Marshal Sir Claude Auchinleck have served. This book deserves to carry the motto won at Plassey by the old 39th Foot: *Primus in Indis.*

Economists in Congress

Stability and Progress in the World Economy

Edited by D. C. Hague.
Macmillan. 267 pages. 25s.

IN 1956 the International Economic Association celebrated the third triennial meeting of its council with a general congress, open to any member of the various affiliated national associations of economists, on the theme of "Stability and Progress in the World Economy." Project and theme were both ambitious; the theme, perhaps, too much so—although here it is only fair to distinguish between its suitability for debate and the suitability of that debate for compression into book form.

As usual, the work of the conference was organised around a series of main papers each followed by an open discussion. The first two papers were on the general problem of stability and progress as it confronts the richer countries of the world (Sir Dennis Robertson) and the poorer countries (Professor Jacob Viner). Professor François Perroux and Professor Gottfried Haberler dealt respectively with the real and the monetary factors in the quest for stability; and Professor Erik Lundberg spoke on international stability and the national economy. As might be expected, the standard is high; M. Perroux's paper in particular, concerned with the general stabilising or destabilising effects of particular changes in demand, techniques or localisation, contains a treatise's worth of original and important thinking. But while the participants in the congress must have taken away with them, for the most part, an eminently worthwhile sense of mutual illumination, the study of their proceedings yields very little in the way of authoritative agreement or even, in general, of clearly confronted and documented dissent. To choose at random a few questions from among those arising in debate. Is inflation, whether deliberate or accepted as a necessary by-product, a suitable means for financing national development? Are differing rates of growth between different countries an inevitable, or a serious cause of instability? Is full employment compatible with a steady, or even a tolerably slowly-rising, level of prices? Are floating exchange rates preferable to conformity with the requirements of a fixed parity? On none of these familiar conundrums is it any more possible, after reading "Stability and Progress," to give a consensus of scientific opinion. No doubt the inevitably ruthless summaris-

ing of discussion conceals, in one instance or another, certain shifts in the balance of convictions, the germinating of certain salutary doubts, certain hardenings of attitude; and the reader can sometimes glimpse not only the primary impact of agreement or disagreement but something of the process by which disagreement becomes specific and ultimately capable of resolution—the process of coming to terms or to grips. Over so wide a field, swarming with so many newly-started hares, it is however impossible for the most gifted of *rapporteurs* to convey the extent, or the deficiencies, of this process. It is better, in fact, to read "Stability and Progress" as a collection of related essays and loosely related comments than to court disappointment by looking in it for a report on the state of world economic opinion.

The Epic Spirit

The Epic Strain in the English Novel

By E. M. W. Tillyard.
Chatto and Windus. 208 pages. 21s.

LITERARY kinds, Dr Tillyard believes, exist and are distinguishable; each answers to certain clear habits and motions of the human mind. The epic is such a kind, and it is constituted by its communal or choric quality. "The epic writer must express the feelings of a large group of people living in or near his own time." Tragedy, although it cannot lack some imprint of its age, is in its essence timeless. But the epic in a sense subsumes the tragic. "It is when the tragic intensity is included in the group-consciousness of an age, when the narrowly timeless is combined with the variegatedly temporal, that the epic attains its full growth." Moreover, the epic requires faith in the system of beliefs or way of life it bears witness to. "Only when people have faith in their own age can they include the maximum of life in their vision."

These principles have already been given exemplification in Dr Tillyard's earlier work, "The English Epic and Its Background." He now applies them in the field of the novel—a vague entity that can answer to most of the habits of mind from which the literary kinds proper derive. In "Robinson Crusoe," in "Waverley," "Rob Roy" and "The Heart of Midlothian," in "Nostromo" and in "The Old Wives' Tale" the epic spirit is, he argues, unchallengeably pre-eminent; these have the sustained intensity lacking in "Tom Jones," and they have the choric appeal that "Ulysses," epic in its intentions, loses amid such negative feelings as the sense of exile and of being odd man out. "Middlemarch," in which Dr Tillyard formerly felt George Eliot to have got nearer to the epic than any other of the great Victorian novelists, he now decides must be turned down. It deals not with a group but with individuals; it is a novel of personal relations, with a morality turning upon problems of individual choice. So in its place we have Arnold Bennett's masterpiece—accompanied by a pleasing expression of surprise on Dr Tillyard's part that it "insisted after all in getting an honourable place in this volume."

But the volume is not in the least a barren affair of affixing or removing labels. What its author is talking about is really there—and moreover the reader will be equally delighted and instructed when the author is talking about something else. On Conrad nothing better has been written. Sulaco is shown as one of the supremely realised places and societies in all literature; a miraculous power of keeping everything and all people present simultaneously is revealed in the book's sheer wealth of unexpected small touches. "It is the same power that Homer commands in the *Iliad* when he suddenly mentions the insignificant military class of storekeepers or tells us that Patroclus's captive maidservants, when they lamented his death, were in reality lamenting their own unhappy lot." Admirers of "Nostromo" will admire this essay. They will also be delighted with the unassuming sketch-map of Costaguana which Dr Tillyard reproduces on his last page.

Philosophy Among the Tribes

Function, Purpose, and Powers

By Dorothy Emmet.
Macmillan. 300 pages. 28s.

"BLESSINGS and curses," writes Professor Emmet, "are probably among the most ancient and universal forms of religious act." They also spring readily to the lips of anyone who reads her latest book, which presents "some concepts in the study of individuals and societies." For while it is a welcome change for concepts like "function" and "purpose" to be presented at work in the probings of social anthropologists instead of merely in the paradigm cases of everyday speech, it is also infuriating to be led through such a jungle of erudite exposition that one can only curse the anthropologists who luxuriate in Professor Emmet's philosophical path.

The book is proclaimed as a new approach to certain questions in political philosophy and the philosophy of religion. It may well be; but it is never altogether clear what the philosophical problems are that are being approached by this somewhat devious and tribe-infested route. Professor Emmet is in little danger of committing the philosophical sin of ignoring important conceptual distinctions; for she surveys a vast field of literature to introduce the concepts of "function," "purpose," "powers," and "vocation." But it is also a philosophical sin to make (or quote) distinctions that do little work in an argument. And the reader is never quite clear what thesis is being argued. "Interesting" he constantly reflects, "but so what?"

With the massive erudition displayed in so small a compass Professor Emmet could have written at least three books. She might have concentrated on the vexed problem of explanation in the social sciences. She has most illuminating things to say about the illegitimate transfer of functional explanations, which make good sense in physics and physiology, to the social field. But she breaks off when she is, as it were, poised to take a decisive step in clarifying the conceptual issues involved. Or she might have used her distinctions to clarify problems about the justification of authority, which have been traditionally associated with questions about the purpose of the state. Or she might have elaborated a fascinating thesis in sociology about the importance of people with a vocation in shaping social change. As it is she flirts with all these problems—and with many more; but she never gets beyond the stage of setting the scene for an engagement that never materialises.

Professor Emmet once seemed to have, to use her own word, a "vocation" for metaphysics. She did her training with an admirable book on "The Nature of Metaphysical Thinking." But somehow she faltered when confronted with the task of doing metaphysics herself, and to slump back into the accepted view that philosophy is merely conceptual analysis. The result is that when she does conceptual analysis it seems somewhat mechanical—as if her heart is not in the job. Indeed one feels that her heart is now really with the tribes and that the excitement which was once aroused by the prospect of a new categorical scheme has flowed into the contemplation of the fascinating lives of the Nuer, the Nuber, and the Navaho. And these, as a matter of fact, give rise to few philosophical problems.

OTHER BOOKS

BIBLIOGRAPHY ON INCOME AND WEALTH. Volume VI—1953-54. Edited by Phyllis Deane. Published for the International Association for Research in Income and Wealth by *Bowes and Bowes.* 139 pages. 37s. 6d.

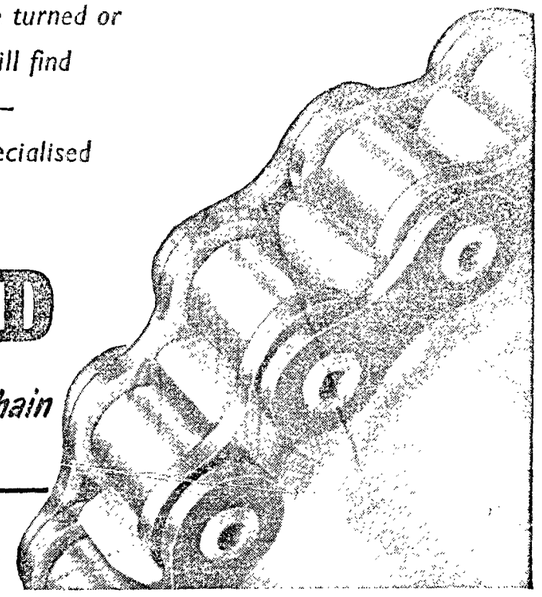
This volume, the sixth in a well-arranged, well-indexed bibliographical series, gives annotated references to material published on income and wealth and related subjects in more than fifty countries during 1953 and 1954.

THE MIDDLE EAST 1958: A Survey and Directory of the Countries of the Middle East. *Europa Publications.* 477 pages. £3 10s.

A useful reference book on a rapidly changing part of the world. The background information on the individual countries is straightforward and covers a wealth of history in remarkably few words.

SOCIAL SECURITY: A Workers' Education Manual. *International Labour Organisation.* 132 pages. 4s. 6d.

COMMONWEALTH UNIVERSITIES YEARBOOK 1958. Edited by J. F. Foster. Printed by *R. and R. Clark* for the Association of Universities of the British Commonwealth. 1,337 pages. £4 4s.



STATISTICAL SUMMARY OF THE MINERAL INDUSTRY: Production, Exports and Imports 1951-56. *HM Stationery Office.* 371 pages. £1 7s. 6d.

AMERICAN SURVEY

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

The Unloved Ones

WASHINGTON, DC

MOST of the parties involved in the Latin American riots are likely to gain from the occasion. Mr Nixon has a better chance of becoming President of the United States, the Latins will probably have more attention paid to their economic predicament, and the Communists have of course reaped a propaganda harvest. It is being said privately that the Latins have left no stone unturned in advancing Mr Nixon's career. His exemplary conduct under fire, followed by his triumphant reception in Washington, has for the first time made criticism of him seem to be in almost as poor taste as criticism of President Eisenhower was considered to be throughout his first term of office. On the other hand, beneath the florid expressions of Latin regret, there lurks in the South American mind a certain satisfaction that the United States has recognised a Communist menace in its own hemisphere. For many years the Latins, raising their hands dutifully on the American side at the United Nations, have been bitterly measuring their own slices of economic aid against the much larger helpings going to more dubious friends. This has prompted the well-worn sarcasm that the Republics should import a few Communists in order to make sure of their share.

While what happened to the Vice President has caused some officials to insist that the United States ought not to reward insults and should remain austerely aloof from governments that cannot or will not control their own mobs, this does not appear to be the predominant reaction. On the contrary, the lesson is being drawn in many quarters that the despatch of a one-man debating team to foreign universities, however gallant the challenge to the students to come out and argue, is no substitute for a policy. Unkind critics of Mr Dulles have dug up one of the first speeches he made on taking office at the beginning of 1953. In it he attacked his predecessors for becoming "so preoccupied with some of these problems in Europe and Asia" that they had taken South America too much for granted. In fact by taking on himself almost the sole responsibility for making policy Mr Dulles, in spite of his extraordinary memory and capacity for hard work, has committed the United States to an even more extreme preoccupation with the main battle fronts of the cold war. Although the question of what to do about the excess supplies of Chilean copper, Colombian coffee and Peruvian lead is a tough one and the question of whether to give democratic governments softer conditions in qualifying for aid than are given to dictatorships is almost as baffling, they are not of that intractable order which requires Russian co-operation. As Mr James Reston wrote in the *New York Times* last Sunday:

> The truth is that the Administration has for long been diverted from serious allied problems it could have done something about into an overwhelming concentration on Soviet problems it can do very little about.

When challenged at the National Press Club on Wednesday as to whether his debating with radical students at Latin American universities was compatible with the dignity of his office, Mr Nixon vigorously defended his methods of diplomacy. He contended that in under-developed countries it was no use dealing only with the ruling *élite* at cocktail party level, since this left a free field to Communist influences on the forces of the future in labour movements and universities. In his opinion, American spokesmen should take firm positions on such central issues as preferring democracies to dictatorships. Only the day before, Mr Dulles had expounded the orthodox diplomatic view that one could not do business according to such distinctions, since it would soon involve all kinds of arbitrary judgments about the exact shade of internal regimes in other countries. The contrast reflected the different backgrounds of the two men —Mr Dulles comes from the cosmopolitan atmosphere of pre-first world war diplomacy, while Mr Nixon is a true child of the age of propaganda. But the Vice President has been making a serious effort to come to grips, however crudely, with a problem that must often have baffled his older colleague—how to avoid identifying America with archaic governments that are inevitably strengthened for the short run by the receipt of American aid.

THE first impact of the riots on Congress, coming as they did just when mobs were burning American libraries elsewhere around the world, was to put some life into the flat debate on this year's legislation on foreign aid. As might have been expected, both sides derived support for their viewpoints. Opponents of foreign aid have for many years rested on the *cliché* that "you cannot buy friends" and every instance of anti-Americanism is taken as a confirmation of the futility of passing out dollars around the world. Representative Colmer of Mississippi declared flatly that:

> Today American prestige, after expenditure of over $100 billion in trying to buy friendship abroad, is possibly at its lowest ebb since the Spanish-American war.

However, his attempt to cut off all economic aid was easily defeated and the determination that the Communists must not be allowed to deflect American purposes by working up a few mobs seems to have carried more weight than the argument that Americans, being unappreciated, should sulk in their own tent. But although Washington's reaction, by and large, has been phlegmatic, there is evidence of a more impatient mood building up across the country and the anti-American incidents may have a delayed action effect even though they seem to have arrived too late to prejudice the aid programme this year. Meanwhile the sterner test will

probably come over foreign trade. The Administration may have been sleeping at the switch in its handling of relations with its "good neighbours" but the immediate grievances that caused most of the trouble arose from the fact that it is Congress that controls important segments of American policy. Quotas to cut down the market in the United States for the oil and metals on which many of the Latin economies depend, and which are of great concern to Canada as well, are the price being demanded by many key Senators and Congressmen for extension of the President's authority to make concessions on tariffs.

Despite some initial murmuring to the contrary, the State Department is now cleaving to the obviously sensible line that, although Communist agents are ever alert to seize what advantages offer themselves, there is no evidence to support the idea that the simultaneous outbursts of anti-American violence in different parts of the world were part of a co-ordinated plan. Mr Robert Murphy, the Deputy Under Secretary of State, told the Foreign Relations Committee, which is holding an investigation behind closed doors, that it would be wise to concentrate on the very varied, and indeed often quite contradictory, local causes of dissatisfaction with the United States. Some of the professional diplomats are hoping that those politicians who are mainly interested in striking attitudes will learn something about the nature of diplomacy from recent experiences.

Events in France have, in the opinion of these professionals, demonstrated why the United States could not have followed a more flamboyantly anti-colonial line in North Africa. Every responsible official from the President downwards has been taking quite exceptional steps to prevent any quotable American comment on France emerging from Washington. But in the Defence Department quiet studies are going ahead on alternative plans for the North Atlantic Treaty Organisation in case France ceases altogether to be a reliable ally. From now on the existing preference for West Germany will inevitably be more marked, as will the opposition to any idea of disengaging Nato forces from Germany and basing them instead to the west of the Rhine.

Crusade That Failed

THE only beneficiaries of the failure of Mr Harold Stassen's latest, and probably last, attempt to free the Republican party from its bondage to unimaginative conservatism will be the Democrats. For whatever his opponents may say, Mr Stassen's chances of winning the Governorship of Pennsylvania would have been brighter than are those of Mr McGonigle, the choice of the party machine who is also the choice of the state's Republican voters for their candidate in next November's contest. Since only party members could vote in last Tuesday's primary election, Mr Stassen's heavy defeat was evidence only of his inability to arouse the enthusiasm of registered Republicans and the small turnout does not suggest that they found much inspiration in Mr McGonigle, an experienced pretzel manufacturer but an inexperienced political campaigner. Mr Stassen would have had the advantage of being a dynamic personality, with a long fighting record, well known to the independent voters who will decide the result of the November election; to them his reputation as a crusader for disarmament and against the Republican regulars would have had more appeal than it did for the party faithful.

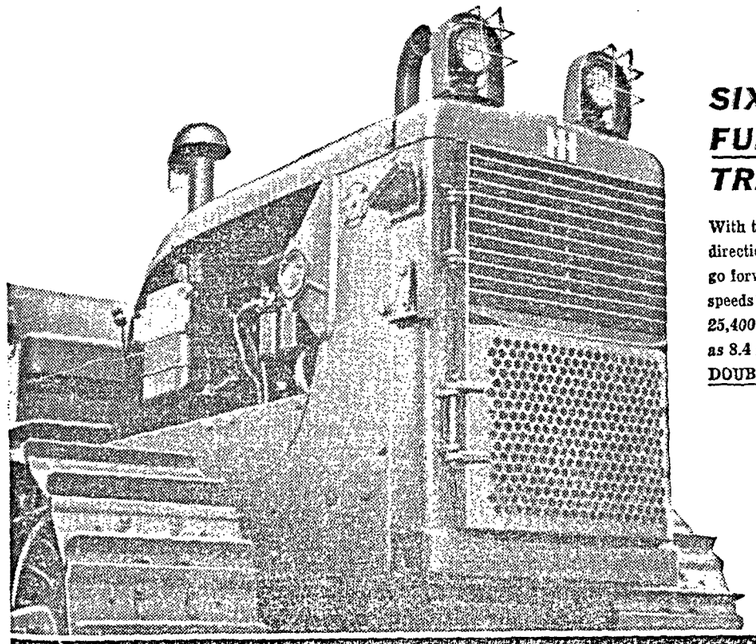
Some such appeal is essential if the series of Democratic victories in Pennsylvania is to be checked this year, for they are based as much on disgust with the hide-bound, self-centred and disrupted Republican machine in the state as they are upon real faith in Democratic principles. In any case the Republicans needed the best candidate they could get to beat the Democrat, Mr David Lawrence, one of his party's established national figures; his record as Mayor of the steel city of Pittsburgh should be specially useful in an election in which the main issue seems sure to be the economic difficulties of the state. At this point it is being generally assumed, perhaps prematurely, that Mr Lawrence will win. Of greater interest and national importance are his chances of carrying with him the retiring Democratic Governor, Mr Leader, a more controversial and less influential man, who is running for the Senate seat left vacant by a Republican, Mr Edward Martin. Representative Hugh Scott, a staunch supporter of President Eisenhower and a strong candidate, is attempting to hold this seat for his party; it is one which the Democrats need if their hopes of increasing their narrow majority in the Senate are to be fulfilled.

Victories in Committee

WHERE foreign aid, foreign trade and defence reorganisation are concerned, the President has nailed his colours to the mast and the preliminary battles in committee show that his new determination not to surrender has served surprisingly well. The Senate Foreign Relations Committee is now at work restoring part of the modest cut in funds voted by the House when it passed this year's authorisation for foreign aid. On modernising the defence establishment, Mr Vinson, the chairman of the House Armed Forces Committee and formerly the Navy's congressional sheet anchor, has capitulated on a broad front to the impressive array of informed witnesses who stressed the need for streamlining the chain of command and giving the Secretary of Defence clear and unchallengeable authority over the individual services.

Mr Eisenhower, while tactfully applauding the committee for "dealing positively" with all the major points he had raised, is pressing his advantage; he has given notice that he is not satisfied with the way the committee has watered down on two vital issues the authority he wanted to give to the Secretary of Defence. Its Bill provides that if any member of the Joint Chiefs of Staff objects to a decision of the Secretary to merge, reassign or abolish any important combatant function of the services, Congress must have sixty days in which to over-rule him; it could do this by passing a concurrent resolution, which requires only a majority vote. The President's plan would, in effect, have required a two-thirds vote and thus made it harder for Congress to thwart the Secretary and less attractive for the services to pull political strings. Mr Eisenhower also wished to eliminate the present requirement that the services must be "separately administered" and he objects to the language which the committee substituted in order to safeguard the existence of each service. In other respects, while the word-

Bigger News!



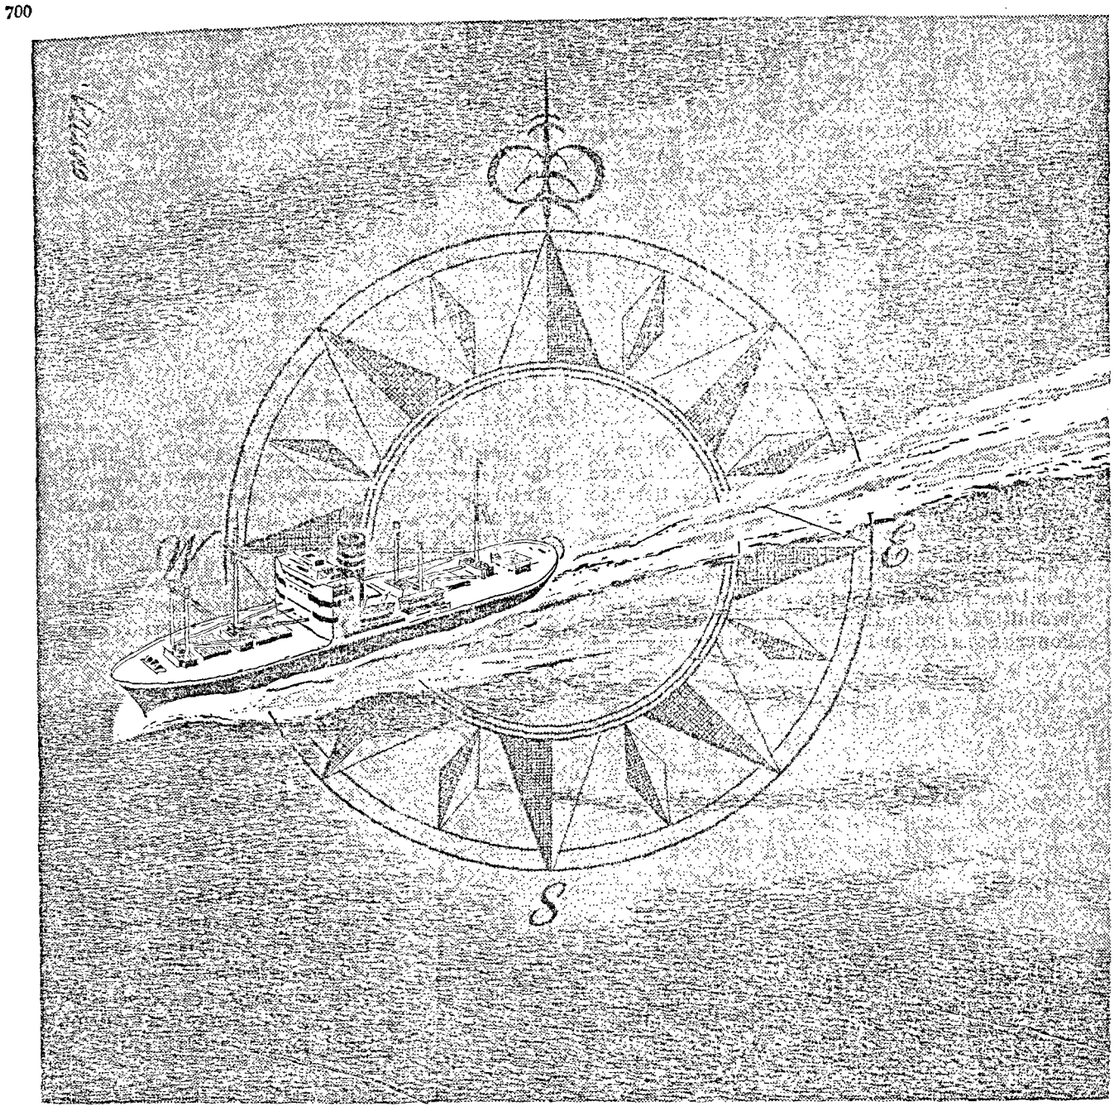
It's the BTD-20

by International

Announcements about the production in Britain of a 124 horsepower International crawler tractor have set construction equipment users talking. Now the news is even more exciting. The new tractor is the BTD-20! This is an entirely new model—an even greater performer than the famous TD-18!

The BTD-20, powered by a Rolls-Royce 6-cylinder diesel engine, is designed to set new standards in flexibility and productive capacity. Besides Hydraulic Power Steering and countless other advanced features, it has new *Full Reverse Transmission*, giving the advantage of instant selection from a range of six forward speeds *and* six reverse! The BTD-20 is the only crawler tractor of its size with *this feature. You'll work faster*—move hundreds more yards daily.

This sensational new International tractor will be available this summer! Contact us *now* for the name and address of the International Construction Equipment Dealer for your area, who will gladly keep you posted with the latest news.



SIX-SPEED, FULL REVERSE TRANSMISSION!

With the BTD-20 you can change gear and direction with a single sweep of your arm—go forwards or backwards in any one of six speeds! You can 'doze at 1.5 m.p.h. with 25,400 pounds of push, then back out as fast as 8.4 m.p.h. THE BTD-20 CAN GIVE YOU DOUBLE DOZING-CYCLE SPEED!

ing of the committee's Bill is far less sweeping than that proposed by the White House, the President's chief requests have all been granted and the unanimity of the committee is a good omen for a safe journey through Congress.

The same cannot be said for the Bill extending the trade agreements programme, although the Administration by a judicious mixture of firmness, small compromises, and political wire-pulling of the kind which the President usually scorns, has persuaded the fearful House Ways and Means Committee to approve—by 18 votes to 7—a Bill which gives the President the five-year extension and almost all the tariff-cutting power he sought. The protectionists, irritated rather than placated by concessions which they regard as meaningless, are lying in wait for the Bill on the floor. But at least the President's firmness has given the House a clear-cut choice.

Per Ardua ad Lunam

IN the past week the Russians have launched a 2,900 lb satellite and the Americans have launched a 19-man space agency charged with catching up with it. The easy nonchalance with which Russia has put into the sky a piece of equipment a hundred times bigger than anything the Americans themselves have got aloft (and the curl of *Pravda's* lip in making the comparison) have confirmed fears that the Russians are a very long way ahead, probably two years or more, in the race for space. The President's proposal for a National Aeronautics and Space Agency to help close the gap has moved swiftly through the first stages of its congressional journey. A Bill to create the agency, which will co-ordinate all the non-military aspects of research into space, and all but a few of whose members will be civilians, was passed unanimously on Monday by the committee dealing with it in the House of Representatives. It may encounter opposition in the Senate, many of whose members want to strengthen the services' role. To meet these demands, the President has already amended his original proposal to make it clear that all military problems remain the responsibility of the Department of Defence; any jurisdictional disputes between the two bodies that cannot be settled by a special liaison committee will go to him for a decision. The civilian agency will be entitled to employ a much larger staff of senior scientists than the Defence Department, and it may even build and operate its own satellites.

Just how big a task the agency faces can be seen from the estimate that the Russians used a rocket with a thrust of 500,000 pounds to propel the latest sputnik. The American *Jupiter-C* rockets which sent the two Explorers into orbit were mere pipsqueak 83,000-pounders, and the "lunar probe" rockets planned by the services will have a thrust of less than a third of the demonstrated Russian model. Dr Herbert York, the chief scientist of the Defence Department's advanced research agency, estimates that next year the Americans will be able to put satellites of rather less than one-tenth of Sputnik III's size into relatively "easy" orbits (that is, those running close to the equator); and the Titans and Atlases for a really big jump forward are unlikely to be available before the early nineteen-sixties. And, above all these worries, glows the moon. General Medaris, the military head of the Army's space research section, thinks that the Russians could already get a 600-lb satellite into its vicinity. The one cheerful piece of ne[ws] was the successful recovery of the nose co[ne] rocket from the Atlantic on Sunday. If the U[S] has really solved the re-entry problem, at least for mediate-range missiles, the new agency will receive a thrust on its journey after the sputnik.

Patent Reforms Pending

FROM A CORRESPONDENT IN NEW YORK

SENATOR O'Mahoney's efforts to improve the federal laws governing patents, which started three years ago with a blast, are now reduced to a series of plaintive bleats. The preliminary report of the Senate Sub-Committee on Patents, Trademarks and Copyrights, of which he is chairman, pointed out that the patent system should be adjusted to modern conditions, that the Patent Office and the courts are in conflict as to what is and what is not patentable, and that the Patent Office needs a larger staff and better salaries. The fourth recommendation called for a new court of patent appeals. The latest report of the subcommittee lists most of these aims, but they are subordinated to the international aspects of the patent system, which the post-sputnik defence programme has made important. The need for interchange of scientific information between the United States and other free nations, the desirability of translating and disseminating scientific data, the wisdom of studying foreign patent systems—these are the subjects now claiming first place.

This change of focus is in part a symptom of the Senate's susceptibility to public opinion. It may also reflect the fact that the subcommittee's funds are running out; of the $80,000 appropriated for its work in 1955, only $6,000 is left. Its chief legal counsel has resigned to go into private practice; its assistant counsel is teaching law in Wisconsin. If more funds are to be secured, so that new investigations can be undertaken, these must be given an up-to-date look.

The subcommittee has published eight studies of various aspects of the patent system and many more are on the way. Useful as they may be as additions to the literature for patents, none of these studies has yet produced the clear evidence of an abuse crying for correction, or the brilliant solution of a puzzling problem, from which crusades spring. The mild Bills sponsored by the subcommittee failed to come to a vote in 1957, and may well suffer the same fate in 1958. Yet whether or not they become law, these Bills are significant in both temper and direction. All of them are designed to uphold the patent system rather than to destroy it, and to improve the functioning of the Patent Office. All are straws in a breeze which, though still capricious, has recently been blowing with increased strength in favour of improving and strengthening the operation of the laws through which the government rewards invention.

How great a change this means can only be understood by recalling the bitter hostility toward the patent laws which has prevailed for more than a decade. Senator O'Mahoney, who now speaks so fair, made his original reputation during the hearings of the Temporary National Economic Committee in 1939 to 1941, which exposed monopolistic abuses of the patent laws so flagrant that the system itself, cornerstone of industrial progress though it is, fell into public disrepute and for a time seemed threatened with destruction. The country, appalled at the practices revealed in the Hart-

ford Empire case, began to distrust both patents and patentees. The conviction that patents were being issued too freely and were rendering unholy aid to monopoly reached as far as the Supreme Court. Industries which were completely dependent on the validity of their patents faced a period in which the tendency of the courts was to declare invalid any patent brought before them.

Meanwhile the Patent Office, operating under this cloud of disesteem, was pinched for funds by one censorious Congress after another, until its staff began to wither away, and its primary work of examining and passing on applications for patents fell as much as two years behind schedule. Increasingly timorous Patent Commissions responded by shaving their budgets and reducing their forces still further. So deadly was the combination of judicial disapproval and administrative confusion that the situation began to attract the attention of disreputable financiers, who found it profitable to launch an attack on the patents that sustained a manufacturer's business, and then to buy up the business cheap. Patent raiding began to be an increasingly frequent hazard.

It has taken twenty years to repair the damage that was done and to restore a more judicial view of the patent system. During that interval specific reforms have been advocated to lessen the possibility of abuse, but these made little progress and the public hostility to patents persisted. The first sign that it was fading came in 1952, when Congress, yielding to the alarm of industry, passed a long-needed codification of the patent laws, which also contained a number of technical changes designed to strengthen patent rights. That was followed by a quiet campaign organised by interested lawyers to strengthen the Patent Office and improve its administration. They persuaded Congress to give the Patent Office more funds than it had courage to ask for itself, and then recruited for it a new pool of examiners by going straight to the colleges and persuading graduates that here was a career worth entering. This has made it possible to break up a paralysing log-jam of applications for patents.

Finally, there came a hint that the courts might be reconsidering their destructive attitudes towards patents. Most of them were slow to respond to the changing climate of opinion. But one of the more perceptive judges, Mr Learned Hand, then of the United States Court of Appeals in New York, gave an opinion in a patent suit involving the optical firm of Bausch & Lomb. In effect, it said that he had previously been led by the example of the Supreme Court, with its "unexpressed and unacknowledged misgiving about the increased facility with which patents are being granted," to throw out one patent after another. But he now saw evidence in the Patent Act of 1952 that Congress, far from wishing the patent system to be destroyed, wanted it to be upheld and strengthened. He held that the patent in question was valid.

This opinion has created wide interest among lawyers. Attempts were made to take the Bausch & Lomb case to the Supreme Court, and there was hope—which so far has been unfulfilled—that Judge Hand's comment might lead the nine Justices to clarify their position. Until they do, Congress and the courts will continue to be at loggerheads and the standards required for a valid patent will remain uncertain. It is that uncertainty which Senator O'Mahoney is trying to dispel.

Reluctant Emancipator

By 1963, the hundredth anniversary of the Emancipation Proclamation, Negroes hope to achieve full legal equality. It is not surprising, therefore, that they felt some impatience last week when President Eisenhower counselled patience and forbearance, particularly as he was speaking to a Negro audience for the first time since 1954, and at a moment when the South, fighting to keep Negro children out of its white schools, seems to have exhausted the possibilities of legal delay. Seven southern states still refuse to allow any Negro children in their tax-supported schools; next September Virginia, the ringleader, will probably see the first clash between the federal courts and the determination of the state to shut its schools rather than permit them to admit Negroes. A federal judge has now named the beginning of the autumn term as the date when schools in Charlottesville must comply; the same deadline is about to be set for Norfolk and Newport News, and Arlington, in the shadow of the capital, has just had its appeal to the Supreme Court rejected.

At his press conference last week Mr Eisenhower was asked whether any steps were being taken to prevent the pattern established in Little Rock (where federal troops had to be sent to enforce a court order) from being repeated in Virginia. Mr Eisenhower replied by disclaiming any intention of authorising a Gestapo—an admirable but surely irrelevant sentiment—but reaffirmed his intention of upholding the law as interpreted by the Supreme Court. In Little Rock itself this course has not, so far, scored any notable, or lasting, success. The President's order withdrawing the state troops from the Central High School at the end of the school year and releasing them from federal service clearly implied that they would return if the community itself could not see that the court order to admit Negro children was honoured. But it will not be easy to order the troops back in cold blood if Arkansas remains obdurate.

It may well be an even more complicated matter to uphold the orders of federal courts in Virginia, with its battery of anti-integration laws. There may not be any mob violence, actual or fabricated, to justify the dispatch of federal troops—although the climate of opinion in the southern states has encouraged fanatics to put bombs in a number of Negro and Jewish institutions. One small encouragement is the confirmation, over almost unanimous southern opposition and after months of delay, of Mr Gordon Tiffany to be staff director of the new Civil Rights Commission; but it is not concerned with the schools.

Leaks and a Drought

"Leaks" come in a steady drizzle in Washington, which has long had the reputation of being a capital where civil servants and generals talk with unusual readiness to friendly journalists and Congressmen. Last week it became known that the State Department, which like other government agencies is reported to be anxious to control this unofficial trickle of information, has been doing some internal caulking. An old rule has been revived by which members of the department who give interviews to journalists are required to draw up memoranda on what they said, and officials in the intelligence and research section (who deal in information that sets reportorial noses twitching) will have their contacts with newspapermen limited.

The rule about memoranda, at any rate, seems to be a reasonable enough measure if it is used simply to ensure that conversations are reported accurately; but the press, ever vigilant against secretiveness in government, sees the whole operation as another restriction on the public's right to know what is going on inside the Administration. The Department of Defence, where inter-service rivalries have encouraged volubility among competing generals and admirals, is trying to restore discipline by centralising the information departments of the various services. The *New York Times* reported earlier this year that some reporters, particularly those covering the Defence Department, suspect that they are being "shadowed." The Federal Bureau of Investigation disclaims any knowledge of this, but it is not clear that the intelligence agencies are equally innocent.

In any case, many members of Congress and of the press are anxious to establish not merely the right but also the duty of officials to reveal what is going on inside their departments except where official secrets are concerned. A Bill was passed by the House of Representatives last month, and is now working its way through the Senate, to amend an ancient Act of 1789 which allows departments to prescribe regulations for the "custody, use and preservation" of their records. The authors of the new Bill want to make sure that this relic of Congress's first year cannot be used to justify the withholding of information from the public. But, even if the Bill is passed, it is doubtful whether it will achieve its sponsors' aim of opening up the government's files to investigators thirsty for the truth. Even if the departments cannot invoke the 1789 statute, they can invoke the equally time-honoured "executive privilege" by which, under the doctrine of the separation of powers, the Administration holds itself entitled to keep its knowledge to itself when it judges that the public interest requires it. The proposed Bill may remove one excuse for silence, but unless the "executive privilege" can be challenged in the courts it will be difficult to make unwilling men talk.

Red Ink on Labour's Books

The pinch of the recession is now being felt on both sides of the bargaining table. It is not known how deep a dent 1958 is going to make in the income of the trade unions, which last year reached about $620 million, but the big industry-wide groups, such as the automobile workers, which in the past have set the pace for the rest of the labour movement, are hard hit. Some 400,000 members of the United Automobile Workers are out of work and hence excused from payment of dues, at a monthly cost to the union of about $450,000. The steel workers, with 250,000 out of work, are losing even more. Although both trade unions are wealthy—the steel workers have total assets of $23 million and the automobile workers of $35 million—most of their reserves are locked up in special funds, such as the automobile workers $24 million strike fund; for day-to-day operations they may be as short as the smaller unions which are in real trouble. Craft unions of skilled workers have escaped lightly, because members must keep up their payments to qualify for insurance and death benefits. What must be most exasperating to the virtuous industrial unions, however, is the flourishing state of the teamsters, who were expelled last year for bad behaviour from the American Federation of Labour and Congress of Industrial Organisations.

The federation itself is having to retrench, partly because the income it derives from a 5 cent a month tax on the members of its affiliated trade unions has fallen, but more because the expulsion of the teamsters and several small tainted unions has cost it about $1 million a year. This is one reason advanced for the retiring, firing, and reassignment last January of nearly half of the federation's own organisers—which has led to the embarrassing spectacle of the temple of labour in Washington being picketed as "anti-union." According to the organisers themselves, who early in 1957 formed a small union of their own, the truth is that the federation as an employer is as little adverse to union-smashing as private enterprise. If the federation is so badly off, they ask, why cannot its officers accept a temporary reduction in salary, as the officers of the automobile workers have done?

The National Labour Relations Board has now unanimously over-ruled the federation's contention that organisers are "management representatives" and, if an election shows that a majority of the organisers still employed favour a union, the AFL-CIO will have to bargain with it, as it does with other groups of its employees. No doubt the federation is over-staffed, since it inherited the employees of both the merged organisations. But if, as it says, it is going to abandon its own organisational efforts, which have been ineffective, and concentrate on better public relations, it has made a poor start.

Indoor Haymaking

American farmers no longer need to wait for the sun to shine to make hay—nor do they even need fields. A new "grass incubator," using the hydroponic system, enables fresh grass to be grown indoors all the year round by means of artificial sunlight and air-conditioning. Prices of the incubators vary from $2,880 to $5,580 and the cost of growing grass from $10 to $14 a ton, depending on the local price of seed, labour and, above all, electricity for the sun lamps, which never go out, and for the air pumps. This is cheaper than dry fodder in states such as Colorado, New York and Wisconsin, which have severe snowbound winters during which dairy cows cannot graze out of doors; moreover, the vitamins in the fresh grass make it a more valuable food.

Pre-germinated seeds of any cereal are put in stainless steel trays in culture tanks, piled one above the other, and a chemical solution, containing all the vital fertilisers—nitrogen, phosphorus, potassium, etc.—drips through. In less than a week each tray will produce 30 to 35 lb of grass, six inches high, from five lb of seeds. This can be pulled off and fed to cattle, roots and all, since no soil is attached. The labour involved in the whole process averages only about an hour a day. It is claimed for the incubator that it could make dairy farming profitable in parts of the country where extra pasture land is unobtainable or climatic conditions unfavourable.

THE WORLD OVERSEAS

Parisian Panorama

FROM OUR PARIS CORRESPONDENT

WHAT might have been the end proved to be only the beginning. General de Gaulle's statement on May 15th transformed a trial of strength between Paris and Algiers—which was turning to Paris's advantage—into a struggle for the life of the Fourth Republic ; and the outcome is still uncertain. The Algerian settlers, who on May 13th had stormed the offices of the Government-General, put the paratrooper General Massu at the head of their Committee of Public Safety and dictated terms to Paris, were still in angry mood, but the generals themselves were having second thoughts. Paris had not given in. M. Pflimlin was invested as prime minister with a big majority. Generals, like everyone else, have to consider their careers, and they were beginning to think in terms of a compromise.

Then came the rumour that General de Gaulle would speak. This was a godsend for the generals. Now they could look for Gaullist honours instead of Republican sanctions. On the Thursday morning (May 15th) the Algiers crowd, gathered in the Forum, responded enthusiastically to General Salan's cry: "Long live de Gaulle." The general did not disappoint their hopes. At 5 p.m. in Paris journalists crowded into the quiet Rue Solferino, outside the Gaullist headquarters. They pushed inside and emerged with a simple sheet of paper which was nevertheless a political bomb. In his laconic statement the general had no word of reproof for Algiers in revolt. He repeated his usual charges against the degradation of the state and ended with a challenge: "I am ready to assume the powers of the Republic."

History, it has been said, repeats itself, first as a drama, then as a farce. General de Gaulle drew an analogy with his stand in 1940, but was his new message perhaps only a parody of its predecessor ? In 1940, with his country trampled underfoot by the Nazis, he replied from London that France would regain its freedom. Now his voice came as an echo to the cries of Algerian settlers and their military accomplices who were defying the French Republic. "Powers of the Republic": this plural did not pass unnoticed in Montesquieu's country ; it could cover legislative as well as executive powers, and to many it smacked (though the general, pointing to his past record, has disclaimed it) of dictatorship. What worried people even more was the sponsorship under which he was essaying to make his political comeback. He had been out of political life for six years ; he had kept silent for three. Now he broke this silence—to lend support to the settlers and soldiers defying the government ; and he worded his first statement not to give offence to the ultras.

It was difficult to maintain the pretence that all this was a misunderstanding. The general had restored the flagging confidence of the insubordinate soldiers and settlers in revolt. He now had only to wait until the government proved unable to cope with the situation and called him to take over. Algiers had no doubt about his message ; it put out flags. The generals, their confidence revived, assumed power throughout Algeria and challenged the President of the Republic to form a government headed by de Gaulle. Algiers was once again dictating terms to Paris.

On this side of the Mediterranean the threat first produced reactions likely to lead to a Popular Front. That night, in the lobbies of the Palais Bourbon, the sight of M. Duclos in friendly conversation with Radical deputies revived memories of the nineteen-thirties. From the country, too, came first reports of Committees of Republican Defence being formed, including both communists and non-communists. The government decided at once to stop this trend—intelligibly ; some argued that an appeal to the people would result in a communist victory ; others, that co-operation of any sort with the Communists would act on the army, and others, as a red flag to a bull. In any case, for very many members of the government majority, anything was preferable to communist embraces ; no amount of caution, no reassurances from M. Duclos that the Communists were only interested in defensive action, could alter their minds.

Gunfire at Windmills

A democratic government faced with rebellious settlers and insubordinate generals derives its strength not only from its legal authority but also from its popular support. This government, however, had to debar itself from bringing popular support to bear in its deadly struggle. Parliament had to fight with its left hand tied behind its back, and was thus compelled to perform some strange shadow boxing. It had to bring the generals to heel by pretending that they were its most obedient servants. It had to face General de Gaulle's challenge while imploring his help. The government was refusing to be forced to choose between Gaullism and some sort of Popular Front. The question was whether it could avoid the choice.

On the Friday (May 16th) the dilemma of the government and its resulting contradictions were shown in the debate on the introduction of a state of emergency. Emergency laws provide the government with immense powers of arrest, deportation, censorship and other controls. Yet in asking for them M. Pflimlin could not frankly describe the situation in all its gravity. He admitted that General Salan had replaced some officials in Algiers without prior consultation with Paris and that this raised the issue of the part played by the army in the state. That was as far as he would go in indicting the army. Simultaneously, he admitted that M. Gaillard, as acting prime minister, had transferred all

military and civilian powers in Algeria to General Salan and that the present government had endorsed this act. If the army was in control and had the government's confidence, why all the fuss ? It was true that, in France, right-wing extremist leagues had been disbanded and more than a hundred people, both civilians and officers, had been arrested ; and there was every indication that the Algerian rising had been staged to coincide with troubles in metropolitan France. The admission of such threats, however, did not justify the measures proposed. In its desire not to cut its contacts with the army, the government of the Republic, in real danger, had to present its defence preparations as big guns directed at windmills.

Another contradiction sprang from the nature of M. Pflimlin's majority. In theory, only the poujadists and the handful of gaullists were against the government. The independents had four ministers in the cabinet, but most of their group was now going to vote against the emergency powers, while M. Mollet, the socialist, had accepted a vice-premier's post. The independent leader, M. Pinay, refused a similar post when M. Pflimlin turned down his conditions, which included sending the discredited M. Lacoste back to Algeria. Since then, many independents have not missed the opportunity to tell M. Pflimlin that he should give way to a government of national union. M. Pflimlin received the solid backing of his fellow Christian Democrats and of the Radicals and Socialists. The biggest block of votes in his favour, however, he could not claim. He announced that he would not count the votes of the Communists, and added that the emergency powers would not be used only in one political direction.

But more than this was needed to discourage M. Duclos. Although the Communists had an awkward feeling that these powers might be turned against them, they still voted in favour. Their strategy is to work on parallel lines with the Socialists and Radicals and the non-communist unions which still refuse formal unity of action. In a moment of real danger they expect that the parallel lines will be forced together, and that the leaders will have to accept common action under pressure from below. This rejection of a dangerous ally has compelled the government to be courteous to its open opponent. Instead of attacking General de Gaulle, M. Mollet, in the Assembly, and M. Pflimlin, in the Upper House, requested him to go on to explain what he meant.

Questions to de Gaulle

Their questions can be summarised as follows: Does General de Gaulle recognise the government as the legitimate one ? Does he disavow the Committee of Public Safety in Algiers ? Would he feel responsible to the National Assembly if invested ? And would he retire if he failed to get the investiture ?

In the meantime, the parliamentary machinery, for once, worked smoothly and swiftly. The state of emergency was accepted in the Assembly by 462 votes to 112 and was passed by a large majority in the Council of the Republic that night. The government received its wide powers ; in judging its strength, however, one should not be too impressed by parliamentary arithmetic.

While Paris was waiting for its answers, the "town meeting" of Algiers was once again summoned to the Forum. The novelty was that a third of the crowd now consisted, on the face of it, of Moslems proclaiming their allegiance to France. The total numbers gathered were originally estimated at 20,000, then 45,000, and later put even higher. Strict censorship in Algiers and the arrest of independent journalists there make it hard to check the reports. (The FLN has claimed that the Moslem participants were brought to the Forum under threat.) Experts in Paris explain that for months French authorities unable to protect friendly Moslems in the countryside had been moving them to the towns, and these may now have come out for the parade. The settlers go on to proclaim that Frenchmen and Arabs are equal, and that Algeria is an integral part of France. Does this mean that they are now willing to accept more than 100 Algerian deputies in the Palais Bourbon ? All this is uncertain and out of focus.

Tense Weekend

Paris had a weekend of spring. The crowds in the street were bigger than usual, but their mood was inscrutable ; all demonstrations had been forbidden. Only hooting lorries carrying crack policemen from all over France were a sign of the times and a reminder that M. Jules Moch, the new Minister of the Interior, meant business. M. Pflimlin broadened his cabinet by admitting three new Socialist ministers. M. Moch is the best known of them outside France, his name being associated with international negotiations on disarmament. In France he has a reputation for toughness which he gained dealing with the strikes of 1947. The other reputedly strong man is M. de Chevigné, Minister of Defence. It was his actions that resulted in the final resignation on Saturday of General Ely, the Chief of Staff, who wanted to protest in this way against the removal of two close collaborators. The putting of two generals under house arrest indicates what are believed to be the ramifications of the plot in the armed forces.

In some cases the security services were not as vigilant. M. Soustelle, the former chief of de Gaulle's secret service and M. Lacoste's predecessor as resident minister in Algiers, was known as one of the colonialist leaders in the Assembly and as such was suspected to have close connections with the Algerian putsch. He was therefore placed under police protection under the pretext of FLN threats, but on the night of Friday to Saturday (May 16th-17th) he managed to slip from his house concealed in a friend's car and, via Geneva, flew to Algiers. There he was received with acclamation by the crowds ; they felt that at last they had a politician of distinction with them. Nevertheless he did not take over the leadership of the Committee of Public Safety. The probable explanation is that General de Gaulle could scarcely pose as arbiter between France and Algeria if one of the protagonists in the dispute were his former faithful assistant. Algiers, too, was waiting for the general's press conference.

Just after lunch on Monday (May 19th) a few hundred journalists and guests of honour fought their way through the Hotel Palais d'Orsay to an old-fashioned hall with crystal chandeliers—a very Third Republican background. From behind the photographers' flashes emerged the aloof, grey-clad figure of the general. He spoke distinctly, in well-constructed sentences, with a touch of disdain. This air of haughtiness (evidence, some said, of his Joan of Arc complex) was strengthened by his occasional references to "de Gaulle" in the third person. There was little in what he said to console admirers from the Left. All the scorn was poured on the incapacity of the party system to solve the

great problems facing France and the Algerian question in particular. Those who had in fact dictated that policy for years went unscathed. The rising in Algiers, the general thought, was natural; the army had done a good job. He had a word about "my friend" M. Lacoste, and a patronising passage about M. Mollet. His one proffered guarantee for the future was to ask: "Does anyone believe that at 67 I shall embark on the career of a dictator?" "Pétain was older," a journalist murmured. There was also a crucial passage:

> If exceptional powers were to be delegated to de Gaulle for an exceptional task at an exceptional moment one would have to adopt an exceptional procedure for the investiture by the National Assembly. In case of need I shall make it known to whoever is legally entitled which procedure would, in my opinion, be the best.

And so it was over. "I will go back to my village and remain there at the disposal of the country."

It was an adroit performance. Perhaps the only mistake was to make his blessing for Algiers too obvious. He did not demand power at once. This could have precipitated a general strike and civil war. But, by encouraging the generals in Algiers to resist the government, he could expect that parliament, finding itself at a loss, would soon call him to the rescue. In General de Gaulle's opinion Marianne need not be raped; conquest will come of its own accord to Colombey. M. Pinay has gone there already (May 22nd).

When the general began to speak the Métro stopped; so did most of the Paris buses. Elsewhere, the strike call by the communist-led CGT was not so successful. M. Duclos subsequently proclaimed that this was only the first warning. Could the CGT precipitate a general strike? Probably not, in isolation. On Monday evening the Socialist and Radical parties, as well as the non-communist unions, condemned the general; but they merely told their followers to remain vigilant.

Mendesian Logic

An outsider coming back to the Assembly on Tuesday (May 20th) after a week's interval, for the debate on the extension of the special powers in Algeria to the new government, might well have thought that he had lost his senses. A week before, Algiers had rioted and a general had taken the lead in a committee of public safety just because M. Pflimlin was suspected of liberal views on Algerian policy. Now the government and its conservative critics were outbidding one another in protestations of faith in the army. To make confusion worse confused, at the end of the debate the Communists, who openly disagree with the Algerian policy now foreshadowed, decided to vote for M. Pflimlin in order to defend the republic.

In between, M. Mendès-France delivered probably the most moving and honest speech of the entire crisis. He first tackled General de Gaulle, whose companion and minister he had been; he has also been one of those who had faith in the general's ability to solve France's African problems. Hence, he confessed, his terrible disappointment that General de Gaulle had kept quiet for so long, yet was so quick to fall in with rebellion. The general was lending his name to a cause that could lead to civil war. Coming from an avowed admirer, the condemnation was bitter. M. Mendès-France then turned to M. Pflimlin; he offered his support in order to defend democratic freedom. But he warned M. Pflimlin against ambiguities in his policy which the country could not be expected to understand, and urged him to act with greater resolution. Earlier republican leaders, he recalled, when faced with insubordination by generals, had known how to overcome it with the help of the people.

The government's dilemma stands out in sharp relief. To force the generals to obey, the government would need the active support of the population. But it does not appear to be willing to run the risk involved. So, to prevent a breach with Algeria and to outlast and outwit General de Gaulle it must try to come to terms with the very generals in Algiers who demand its abdication. M. Pflimlin pushed through the transfer of the special powers in Algiers to General Salan himself. His hope must be that once the emergency is over, and the gaullist danger has subsided, he will come into his own. The flaw in the calculation is that to placate the generals the government must swallow the Algerian policy dictated by the ultras. And even if the perpetuation of the war reduced Paris to a province of Algeria and made the government the prisoner of the generals, there would still be no guarantee against the return of General de Gaulle.

The Shadow Lengthens

Indeed, the shadow of de Gaulle is lengthening. He has the support of the colonialist lobby—illustrated by M. Bidault's open letter—and the sympathy of some Conservatives such as M. Pinay. Against them, as long as a parliamentary crisis may result in a call to de Gaulle, the Communists are determined to go on voting for the government. M. Pflimlin wants to use his outwardly massive majority to carry out constitutional reforms strengthening the prerogatives of government.

Power, however, is not acquired on paper. Its substance is progressively shifting to Algiers. The government clings desperately to General Salan; but it is the insurgents who are making the pace. On Wednesday (May 21st) General Salan replied to the Paris Assembly's message of confidence by telling the crowd: "We shall walk together up the Champs Elysées."

Paris is packed with policemen. Scaffolding outside the Palais Bourbon is evidence of the intention to redecorate the building in which the National Assembly sits. M. Pflimlin's government will have to reassert its authority in Algeria rapidly if this seat of the sovereign Republic is to remain something more than a relic for tourists.

View from Tunisia

FROM A CORRESPONDENT IN TUNIS

In Tunisia the Algerian crisis has caused neither tension nor excitement; it has not even aroused great interest. There have been so many incidents between Tunis, Algiers and Paris in the last two years that Tunisian reactions to crisis are blunted. There has been no rush to buy newspapers or to hoard food as there has been in France; nor has there been any flight of capital. Still, the men at the top do believe that the French may commit some act of folly against Tunisia; and they are taking the best precautions they can, in concert with the Algerian rebels (FLN).

The Tunisian interpretation of the Algerian coup is that it was a long-prepared plot that, perhaps, came to a head prematurely. The fact that General de Gaulle on May 15th broke a three-year silence by declaring that he was "ready to take over power" only a few hours after General Salan had cried "Vive de Gaulle" is taken as proof that the general is at the head of the movement. This belief was reinforced by the general's declaration at his press conference on Monday that "*l'armée a bien fait.*"

The Tunisians have put a lot of faith in General de Gaulle. A year ago, M. Bourguiba in an interview with *L'Express* was unmistakably appealing to him. And immediately after the bombing of Sakiet, the Tunisian ambassador in Paris, M. Masmoudi, demonstratively paid the general a visit before being withdrawn to Tunis.

They do not think of General de Gaulle either as a liberal or as a revolutionary. They merely know that he was not in favour of "French Algeria" and that his coming to power would transform the balance of political forces in France. This might open a way of escape from the present deadlock and make a step forward possible. On the other hand, they know that he is deeply imbued with ideas of French greatness and domination, and that his proposals for any kind of "French association" are unlikely to be less anachronistic than, say, the British Commonwealth would have been if it had remained unchanged since 1930.

The Tunisians are now expecting the general to come to power in the next few weeks. But they also believe that he has spoilt his entrance; his alliance with the extreme right wing has aroused the suspicions of the Left and disappointed all those who looked to him as the champion of France's unity and rebirth. They believe that even if he succeeds in rallying some of the left-wing parties to his side, which they think he was trying to do at his press conference, he could do no more than produce a new version of the movement he formed in 1948. This movement, the Rally of the French People, originally included left-wing members such as André Malraux; but it subsequently slipped away to the Right and eventually disintegrated.

On the other hand, there are Tunisians who believe that General de Gaulle might in the next few days come to terms with the party leaders and make up some kind of coalition government—including not only MM. Mollet, Pflimlin and Pinay but also M. Mendès-France. A compromise along these lines is regarded as probably the lesser evil.

It is thought that if the general takes charge there will be changes that might result in a step towards solving the Algerian problem—but it would not be a step that could lead the way to closer association between France and Tunisia. He is in danger of becoming the prisoner of men who have chosen him more than he has chosen them.

The Algerian rebels are also divided between "gaullists" and "anti-gaullists." There is a rumour in Paris that they might come to terms with General Massu with some plan for partitioning Algeria into two zones. But in fact there is absolutely no basis for a *modus vivendi* or even for negotiation between the FLN and the present leaders in Algiers.

Anxious Moments in Morocco

FROM A CORRESPONDENT IN RABAT

"This is the beginning of the end of the war in Algeria," was the comment of Allal al Fassi, the Istiqlal leader, when the first news of the happenings in Algiers on May 13th reached Morocco. It was made when the demonstrations merely seemed something which might stimulate Paris to take a firmer line with the European Algerians. As the extent of the dissidence became known, however, the reaction in Rabat was one of almost unrelieved anxiety. Any insignificant incident, it was felt, might lead to catastrophe. Strict security measures were applied, and communications with Algeria suspended; this greatly reassured the French authorities who, for their part, had confined their troops to barracks. Within 48 hours, it was felt that tension could again be lowered by restoring their normal freedom of movement.

While this was going on, the prime minister conveyed to the British and American ambassadors the anxiety of the Rabat government lest all North Africa should be involved in the upheaval. The French ambassador was reminded that the Moroccan government had requested the total withdrawal of the French forces from Morocco some time ago. The possible reactions of the remaining French troops, many of whom are stationed near the Algerian border, were a major preoccupation of the Moroccan government. They might, it was felt, set off incidents by demonstrating their sympathy for their comrades across the border; or appeals from those comrades might provoke reactions among them.

To most foreigners these fears seemed exaggerated, though not unfounded. The French commander, General Agostini, had had long experience of the country and believed that he had his men well under control; and they were not suffering like their comrades in Algeria from the stresses of a long campaign. Their natural sympathy with the forces in Algeria was no more likely to be demonstrated ostentatiously than was that of their 225,000 civilian compatriots who had just settled down again after the period of transition to independence. Common sense would discourage rash action.

In fact, on May 16th an influential deputation of French residents visited the Moroccan prime minister to express their disapproval of the events in Algeria. The gesture was answered by an official communiqué urging them to maintain their calm and assuring them that the government was taking all possible steps to preserve the existing spirit of co-operation.

Both French and Moroccans, however, had reason to fear the chain reactions which might result from events outside Morocco. It was not thought that there would be an attack on the frontier, though a large part of the army was moved there. On the other hand, in the event of punitive raids on Tunisia, or a full-scale invasion of that country, the popular reaction in Morocco might prove uncontrollable. Anxiety waxed and waned according to the latest news from Paris. M. Pflimlin seemed to be acting with vigour; so far, so good. His refusal to yield to the demand for the immediate return of M. Lacoste to Algeria strengthened this impression. So did the critical reaction in France to General de Gaulle's first statement, and particularly the large parliamentary majority in the government's favour. But then the resignation of General Ely and the arrival of M. Soustelle in Algeria revived pessimism.

Moroccan policy could do nothing but wait on events, except for taking security measures and appointing an interministerial committee to watch developments. There was anxious speculation on the causes of the Algiers movement and on its possible repercussions. There was general agreement that the dissidence had been brewing for months; no doubt the execution by the FLN of the three French soldiers as a reprisal was an aggravating factor. But it was agreed that basically the movement was simply a glorified repetition of the events of February 6, 1956, when the policy of sending General Catroux to Algeria, with a liberal

brief, was reversed as the result of the hostile demonstration which greeted M. Mollet.

The one practical deduction universally drawn in Rabat was that a determined effort must be made to get the French troops out of Morocco as soon as possible. The country had just completed two years of independence and had come through them with considerable credit. A newly-formed government was about to start a constitutional development that might well cause strains. This programme must not be at the mercy of incidents arising from the presence of foreign troops.

Whether the events in Algeria could be made to yield political advantage remained to be seen. A Pflimlin government with a leftist flavour might adopt a policy attractive to the Maghreb. General de Gaulle, if he came to power, might impose a solution which no other Frenchman could; but the indications of the first few days suggested that he was still thinking in terms of his postwar Brazzaville statement, long since outdated in Moroccan eyes. All that was certain was that many difficult problems had become more acute; in particular, if the Moslem Algerians chose this moment to proclaim a government, how could Morocco fail to recognise it?

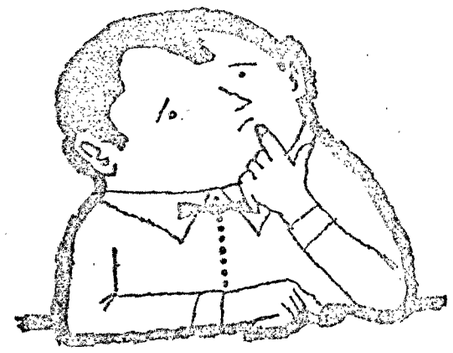
A FRENCH JOURNEY—VI

The Lowering Paradox

FROM OUR SPECIAL CORRESPONDENT

THE dramatic events of the last week have shown the extraordinary negative strength of the Republic: incapable of acting in almost any field, it still remains the choice of most Frenchmen who, even in this crisis, hesitate to trust another regime. This may seem quite traditional: Frenchmen are reputed to love liberty, to the point of anarchy and gross civic selfishness. But when one reflects on the intensity of nationalist propaganda in recent years and the recurrent failures of the regime, underlined by the regular, half-yearly change of government, this loyalty or, rather, this profound desire for law and order, expressed again and again in the past week, strikes one as little short of miraculous.

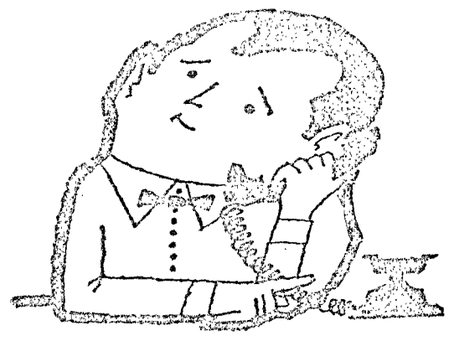
Is it not then amazing that a people with, apparently, such a distrust of facile solutions should for a decade have acted and reacted in its affairs, especially colonial affairs, so foolishly—and inconsequently? For, despite the Right, the dominant French traditions are anticolonialist and one meets extremely few citizens who really believe in the country's prospects of empire. Further, it is not men of the Right, but of the Left, officially anticolonialist socialists like Marius Moutet over Indo-China in 1947 and MM. Mollet and Lacoste in Algeria in 1956, who have stamped their seal on France's colonial follies. These paradoxes need explaining if one is to understand the present tragic situation.



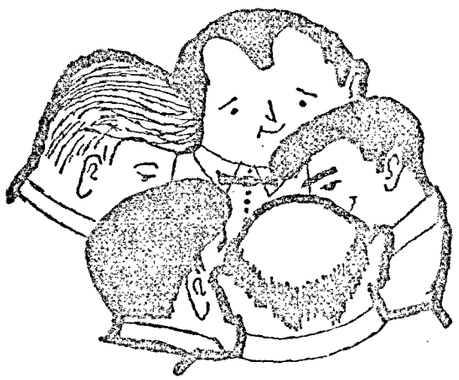
An undermined sense of security in an increasingly unfriendly world accounts for much of the Frenchman's significantly defensive and defiant nationalism. The fanatical divorce of proletarian communists and petty bourgeois socialists also largely explains the failure of the natural impresarios of reform to help the French face new realities. But behind these important factors, the clue to France's untraditional behaviour in these postwar years, both in sickness and in health, must be sought in the contrast between muscle-bound politics and rapidly changing material structures. The great contrast in contemporary France is in the adaptability of the individual Frenchman when changing his daily behaviour in a rapidly industrialising, progressing economy, set beside his static, *ci-devant*, privileged attitude to world politics, a view of the world which is being strained to breaking point without yet giving birth to a new mentality. By a similar contrast the French have tended to look for salvation, very traditionally, to political upheavals, either through the communists, or de Gaulle or Mendès-France; yet in fact they have progressed only organically, when renovating the economy, or indirectly in moving towards the acceptance of European unity. To cap the paradox, when the opportunity of the Gaullist revolution dawned last week, they registered a nearly unanimous No, unless the general came legally as the elect of the Republic.

The trouble is that the tremendously powerful shaping force of French culture and traditions has aged and hardened into a compulsive mould. A famous scientist recently gave as one reason for French weakness in physics the fact that it is an international science. "They have been slow to recognise that anything happens outside Paris." In exactly the same parochial spirit, the parties harp on past issues and ideologies and the doctrines which are relics of them. If the catholic M. Pflimlin has only become premier in the Republic's hour of desperation, the clerical question is responsible. The counterpart of this conservatism can be seen in any visit to the headquarters of a French party in poverty-stricken seedy premises, with understaffed research teams and a blowsy nineteenth-century air. The result of this inadaptability is that all the "republican" parties are associated with their collective practical failures: too few houses and too many governments, inflation and colonial blindness, lack of leadership in a frivolous Assembly. At the same time their opponents are in little better shape: neither the Gaullists who disintegrated on contact with Parliament; nor the communists, caught out in sterile opposition, in political strikes and support for Russian repression in Hungary; nor even, in another field, the trade unions divided into communists, catholics and socialists, opponents and supporters of the regime. The citizen has turned away from every organised group. The strongest party, the communists, probably has barely 200,000 members, compared with 800,000 in 1948; and only one-fifth of France's workers are paid-up members of a trade union.

Yet there has been progress, tremendous progress, since the war. It has come not from the supposed political repositories of change and reform, but from management in all its forms—technocrats in government, teeming in the wake of the Monnet investment plan and the nationalised industries, big business, and all the individuals in trade unionism, agriculture and elsewhere who have been busy adopting new techniques. The most rejuvenated sector of French society today is probably big business, driven into new directions, first by fear of the communists, then by heavy postwar investment in the basic industries and, finally, by the recent consumer boom. Today the business executives are essentially expansionist in outlook, concerned with output, not like their fathers with dividends or tax evasion. The result of such advances, of which the ordinary citizen is perfectly aware, is that the public believes in progress the way the technicians make it, but in no doctrine, party or political utopia. "The main rival of the CGT (the communist-led union) is not the other unions, but television," I was told with pardonable exaggeration in the mining area of the Nord. Even the young are markedly utilitarian in their

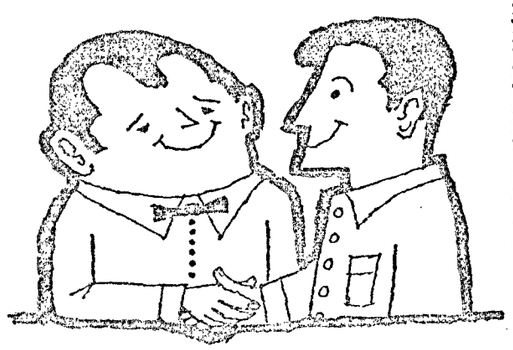


CONSIDERATION



"Intricate product. Needs precision manufacture. Needs a good colour finish. Needs a highly resistant material. Needs . . . *PLASTICS, of course!*"

COMMUNICATION



"It's just the job for the 'Lively Lads at Lorival'. They know plastics like no-one else. Get their advice right away."

CO-OPERATION

"First-class service. Bright ideas. Up-to-the-minute knowledge. Friendly, understanding people, too. Always co-operative."

CONGRATULATIONS

"Never thought plastics could be so helpful. For long-running, mass-production plastic mouldings in *any* material—it certainly pays to 'leave it to Lorival'."

approach, far from the enthusiasts of the latin student tradition.

All this perfectly explains the attitude the ordinary Frenchman has taken so far in the present crisis: his indifference and apathy while the politicians complicated the Algerian problem till it became inextricable, but also, with the memory of Vichy, his lack of sympathy for right-wing hotheads and his reluctance to think that "strong men" are all that is needed to solve complex problems. True, republican leaders like Mollet, aware that they were probably incapable of solving the Algerian tragedy, have seemed to want to leave the door open for a contract between the parties and de Gaulle. This is dangerous, but it is not the spirit of Bonapartism—or of Gaullism for that matter. What Mollet's hints have appeared to show is that this crisis is, even in the minds of its leaders, the last chance of the regime to reform the state, and that they are none too confident of their chances of success.

Every previous attempt at constitutional reform has failed. The electorate, for all its distrust of the parties, is too stable—and the party machines have been too hidebound—to undertake it. Ever since Mendès-France failed to reform the regime from within, the minority of Frenchmen who did not retire to cultivate their garden have looked for change in one of two directions outside the regime. The reformists, including many party leaders, have put their hopes in a gradual sublimation of French politics in stabler European institutions dominated by the big European parties. The radicals have hoped for the kind of cataclysm now working itself out, and principally in de Gaulle.

Now that disaster is here, de Gaulle, who waited on it, feels his hour has come. Certainly, if he takes power legally he may even avert a Popular Front, anyway at first. People hanker for some kind of reform of the state, and hope he at least could solve the Algerian puzzle. But it is still highly doubtful if even he can win the war against embattled rebels or sign the peace against insurgent settlers. As things have gone so far, he may well be as powerless as the rank-and-file politicians to break the seemingly eternal triangle of Paris, settlers and rebels. And there are many Frenchmen who also look ahead and wonder what de Gaulle, with his anachronistic preoccupations, means by "independence" in this twentieth century: nothing better than upsetting Anglo-American nerves by Russian handshakes and overturning the applecart of European integration?

M. Mendès-France used to claim: "We are in 1788." Other pundits take one back less far—to Franco. But the comparison is probably more with the misguided attempts at reform, themselves twisted by outdated ambitions, which litter the decay of many a once-great power. There is an awful inevitability about decline. The chances of escape, especially in this age of social observation and technical growth, are numberless: in a sense, the world expansion which has created many of France's troubles is also her lifeline to salvation. But again and again the opportunities are missed because "the acceptance of necessity" is lacking. Today France, behind the political scene, is more vital demographically, economically and even, despite appearances, in her thinking citizens' dawning awareness of international realities, than ever the Third Republic was. But clinging neurotically to pride or prejudice, the relics of a great or a parochial past, leaders of opposite persuasions seem in league to lead her down the marsh-road.

Today, the raw materials of revival exist in France—and since for many decades they were lacking, their tremendous importance cannot be underrated. But this crisis may prevent their ever being forged into a new essence. The next weeks and months may well settle the issue for France and the West.

(*Concluded. The previous articles appeared on April 5th, 12th and 19th, and on May 10th and 17th.*)

Lebanon Awaits a Decision

FROM OUR MIDDLE EAST CORRESPONDENT

Beirut, Wednesday

THE fighting in Tripoli has subsided and a clash of serious proportions between the army and the opposition has been averted. Earlier reports of savage fighting followed by mass surrenders were greatly exaggerated. It is now clear that the army was in no sense committed in a determined attempt to clear strongholds of the opposition. General Chehab, the Lebanese commander-in-chief, has again stated that he has no desire to use the army "against this group or that group." The role of the troops has been rather to hold the ring and to ensure peace while the politicians work out a solution. It was a shrewd observer indeed who said that the army has emerged in the course of the present struggle as the true "third force" in Lebanon, keeping a balance between the extremists of either side.

So far there has been no direct contact between the government and the opposition. Neither side has budged from its position. The government, and particularly President Chamoun, is still reported as being adamant in its demand that normality should be restored before political negotiations begin. The opposition insists that the president should resign as the first condition of a settlement. They hold him personally responsible for the recent bloodshed and express their opinion of him in violent terms. Yet it is difficult to see an end to the struggle without both sides backing down from these extreme positions—unless the army is prepared to intervene in force on one side or the other. Any such decision would inflict wounds which the republic could scarcely survive. One certain result would be the development of a powerful secessionist movement in the north in favour of the United Arab Republic (UAR). Indeed, the country would be split in more than one sense into two roughly equal halves.

Throughout the struggle the government has remained strangely quiescent. On May 13th, Dr Charles Malik, the foreign minister, made his charge of large-scale intervention in Lebanese affairs from the UAR and threatened to take the complaint to the United Nations. The charge was repeated by the prime minister on May 16th. Otherwise the government has done little to force the issue. No complaint has been made to the United Nations yet. The president's first statement, on May 21st, only repeated earlier charges of UAR intervention. Meanwhile, members of the opposition and would-be mediators are stating their cases freely and having them reported at length in the censored press of Beirut. Warrants that were reported to be out for the arrest of the principal opposition leaders have not been executed. Indeed, little has been heard from these leaders for the past week.

One positive action that has been taken is the rounding up of a large number of Syrians and Palestinians who appeared to have inadequate reasons for their presence in the country. It seems likely that more Syrians have been expelled from Lebanon in the last ten days than ever infiltrated across the border to join the fight.

The fear of foreign intervention is receding. For some

days there have been no new reports of infiltration from Syria and western authorities in Beirut appear to be taking a calmer view than they did a week ago. It is unfortunate that the United States government should publicise its delivery of arms to the Lebanese government since the action gives further ammunition to Cairo and Damascus radios without materially strengthening the president. It is, of course, arguable that as the arms are destined for the army, which is holding the ring, American action falls short of taking sides.

Such is the situation in which the mediators are now busy. Almost all of the compromise schemes put forward have two common proposals: that the president should declare his withdrawal from the presidential contest; and that the opposition, in turn, should drop its demand for his resignation before the expiration of his term next September. If an agreement could be reached on that basis—it is not yet in sight—a number of interim possibilities would open up. One of these might be a caretaker government, composed of equal numbers of the supporters and opponents of the president under a neutral prime minister, to ensure peace now and the orderly election of a president in September.

Strife on the Italian Left

FROM OUR SPECIAL CORRESPONDENT

Rome, Wednesday

ITALIANS have been deprived of their accustomed fun in the battle of election posters. The specially erected official hoardings to which posters have now been restricted have a tatty and neglected air. They either spoil the view for tourists or are themselves largely obscured by parked cars. They have become a Roman joke. The politicians have stumped the country indefatigably and a record number of election meetings have been held. But public interest is said, rightly or wrongly, not to be high.

For the past ten days the French crisis has monopolised the front pages of all the newspapers. At any other time it would, no doubt, simply have provided the Italians with an agreeable demonstration of their own comparative stability. But, coming now, it has given the politicians an entirely new theme. Each finds in France's troubles grist for his mill. Signor Fanfani, the Christian Democrat party secretary, has reached almost apocalyptic heights in comparing the situation with that of 1948 after the Czech communists took over in Prague, and in calling on the voters to produce "a new Eighteenth April"—the date of the 1948 elections in which the Christian Democrats were returned with an absolute majority. The Communists claim that the French crisis shows the importance of voting for the one party that has always uncompromisingly opposed the Right—and of not weakening the Communists by voting for the Nenni Socialists.

This strife on the Left is something new in postwar Italian elections. Signor Nenni's refusal to join forces with Signor Togliatti for the election campaign brought a flood of Communist recriminations down upon his head. *Avanti*, in return, has given as good as it got; some leading Nenni Socialists, indeed, are said to be worried by their party newspaper's line. The polemic, revolving largely round a somewhat mystical conception of the unity of the working class, has been on a rather esoteric level. More practically, the Communists, burdened by a leader in delicate health, a divided succession, falling membership and the stigma of Soviet intervention in Hungary, are afraid of losing votes to the Socialists and for this reason attack them as enemies of working-class unity. Signor Nenni, for his part, remains a model of urbane and ambiguous discretion about his future intentions. In spite of the asperities of the election campaign, he does not, apparently, intend to break completely with the Communists.

Another unusual feature of this election is the prominence of the clerical issue. A widespread feeling that the church is exerting itself to increase its power and influence has given a new bite and edge to anti-clerical polemics. (The front page of the current number of a radical weekly is largely taken up with a map of Italy on to which numbers of cardinals' hats are floating down, as it were, out of the sky.) In addition, two *causes célèbres* have sharpened anti-clerical feeling—the case of the Bishop of Prato and the affair of the Popes' nephews. (The latter arose out of a discovery that Signor Andreotti, the Christian Democrat finance minister, has granted tax exemptions to three Italians holding obscure diplomatic posts at the Vatican; one of them is a nephew of the present Pope and another is a great-nephew of a previous Pope.)

The church, apparently, has done nothing to mollify its opponents. On the contrary, it has come down into the political arena much more than before. It is not just a matter of individual priests exhorting their flock from the pulpit to vote Christian Democrat. The exhortations this time have come from the highest quarters, quite openly. In particular, earlier this month a "conference" of bishops issued a solemn injunction to the faithful to vote, in effect, for Christian Democrats and only for Christian Democrats. This injunction is now pinned on all church doors. The Republicans have protested officially to the prime minister about this clerical interference; they also allege that there never was a bishops' conference but that the episcopal injunction was in fact drawn up within the Vatican itself.

It is a moot point whether the Christian Democrats stand to gain or lose from the church's efforts on their behalf. They are certainly not approaching polling day with any over-confidence. As with all parties that have been long in power, their achievements tend to be forgotten and their sins remembered. They have been strongly attacked by their former allies, not only for subservience to the Vatican, but also (by the Liberals) for the growing intrusion of the state in the country's economic life—a phenomenon personified by Signor Mattei. Like the Communists, the Christian Democrats are at a disadvantage under an electoral law designed to strengthen the representation of the smaller parties. Above all, without any outstanding and popular leader to step into de Gasperi's shoes, the party is more than ever a house divided against itself—and everyone knows it. It was thought at one time that Signor Fanfani would get enough of his men on to the Christian Democrat lists to win control of the party. But the church and the Italian Federation of Industry took fright at his supposed leftward leanings and insisted on more conservative candidates.

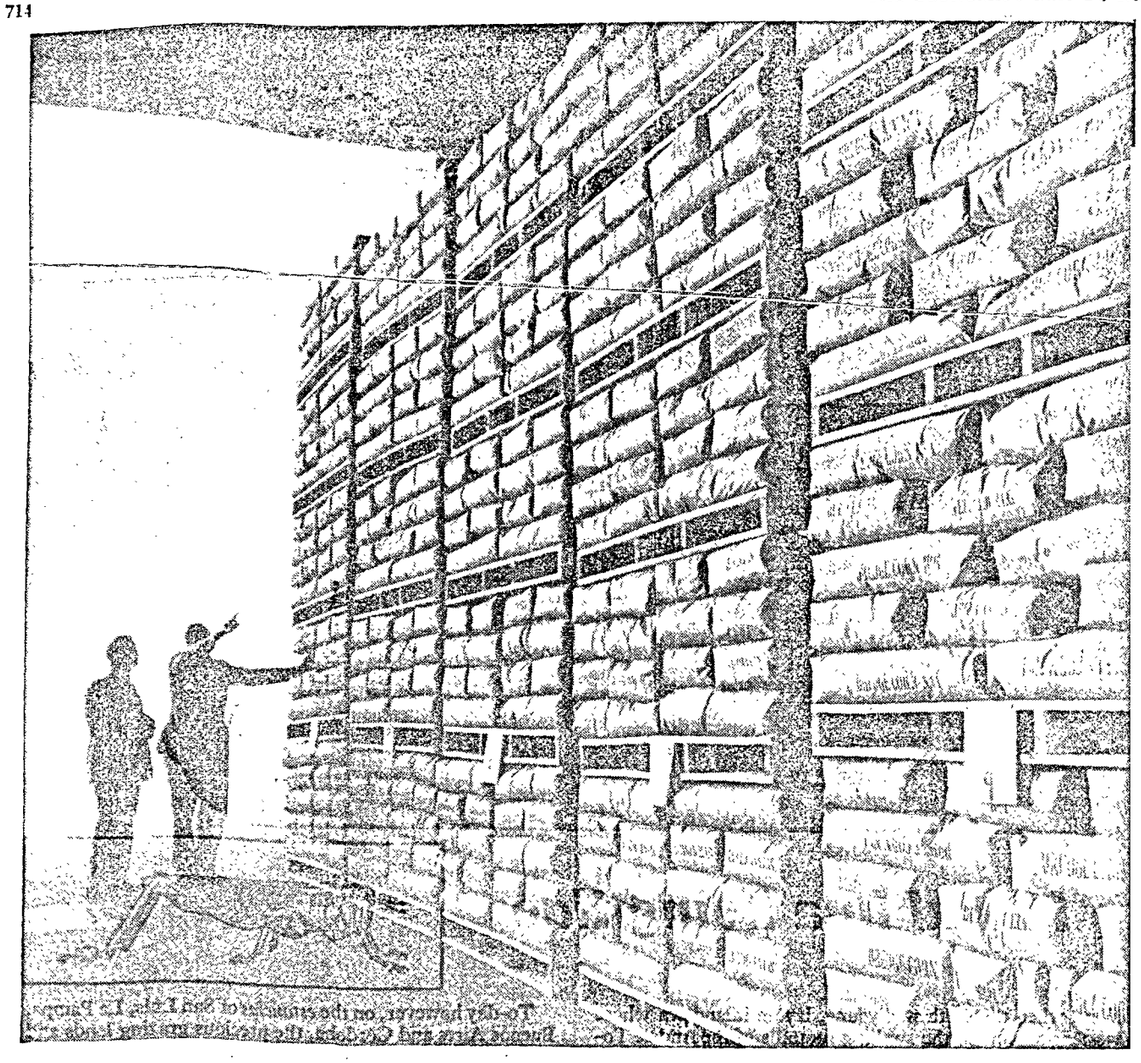
Few doubt that the Christian Democrats must form the major ingredient in the next government—unless the party's warring elements can no longer hold together. The question is whether it will turn to the Left (perhaps as far as the Nenni Socialists) or to the Right (perhaps as far as the Monarchists) for the necessary support. The answer will largely depend on which elements gain the upper hand within the Christian Democrat party.

Island in a living tide

Here, when the earth was young, lay an inland sea whose western shore was the swelling foothills of the Andes. To-day, where vast herds of cattle graze and the hot, dust-soft wind whispers endlessly in the ears of the grass, a world of water once moved—and smoothed the earth to an unimaginable flatness. Stoneless, soft, immensely fertile, the Argentine *pampa* stretches sea-flat to the horizon. A sea without water, yet which knows a dangerous and deadly tide.

For the advance of the pampa grasshoppers is tide-like in its relentlessness. *Tucura*, the *criollos* call them, 'locust-like' in their seething numbers and clustering rapacity. Nothing green or growing is immune to their feeding. Only the leaves of the lonely, indestructible Ombú tree, generally spurned by all insects, sometimes survive. When the fierce tide has passed, the Ombú, traditional refuge of the pampas, is often alone and forlorn in a waste of destruction.

To-day however, on the *estancias* of San Luis, La Pampa, Buenos Aires and Córdoba, the precious grazing lands and forage crops of alfalfa are at last being protected—by dieldrin, developed by Shell. Of all the insecticides tried, none has proved more effective or more persistent. Applied from the air as a spray (150gms. of dieldrin to 6 litres of diesel or gas oil per hectare—or 50 gms. to 2 litres, using the strip method) dieldrin not only controls *tucura*, but controls it *for at least 25 days after application.*



When it is borne in mind that infestation can spread over 10 million hectares annually, involving losses—in reduced meat production, devastation of pastures and diminished yields of alfalfa seed—approaching 60 million U.S. dollars, the value of dieldrin to the *estancieros* is clear. Whereas the Ombú is an island in the living tide of *tucura*, dieldrin is the wall which halts its flow.

dieldrin

DIELDRIN, ENDRIN, ALDRIN, D-D AND NEMAGON ARE SHELL PESTICIDES FOR WORLD-WIDE USE

For further information apply to your Shell Company.

Issued by The Shell Petroleum Company Limited, London, E.C.3, England

How a 19-company team puts paper to work for you

Nowadays multiwall paper sacks are used for countless commodities – from cement to foodstuffs, rose trees to scientific instruments, chemicals to hats! And little wonder – they are strong, hygienic, weatherproof, easy to fill, seal and stack. One of their new highly successful uses (illustrated here) is for the bulk packaging of seed grain.

Paper sacks by the million are but one example of the vast range of paper and paperboard products for packaging, printing and building which are made by the Reed Paper Group – the 'go ahead' team of 19 major companies which is concerned with every aspect of paper making and converting.

By making full use of the Group's collective experience and resources, Reed team-work ensures that all these products are best and right for the job. By encouraging the *individuality* of each Reed company, the Group is able to offer better, more personal, on-the-spot service. Each Reed company takes the initiative in thinking and acting for itself *and for its customers.*

"YOU profit from the initiative of each Company backed by the resources of the Group"

THE BUSINESS WORLD

What Future for EPU?

SUBMERGED below the constitutional crisis in Paris is the future of the European Payments Union. In formal fact, the union expires on June 30th. In practical fact, it must be renewed, but the term and the terms of its renewal, which were already uncertain enough a fortnight ago, must be doubly uncertain now, simply because France's future contribution towards European economic co-operation has been thrown so violently in doubt. EPU has been the outstanding achievement in economic co-operation in Western Europe since the war. It is paradoxical that it should now be threatened by apprehensions of the direct consequences of the closer economic integration to which six of its members have committed themselves in the European Common Market.*

These apprehensions are most keenly felt by the Swiss and the Scandinavians. They are outside the common market, but they, like Britain, have been expecting to widen its liberalising impact by reaching agreement on a Free Trade Area. These negotiations have run into great difficulties, with particular opposition from France, and it is quite possible that the project for a free trade area may founder. So these members of EPU outside the common market fear that in the course of time they may be discriminated against in matters of tariff policy by other members of EPU which are inside the common market. They have been quick to point out that they buy more from the six common market countries than they sell to them; therefore, they say, they provide the common market as a whole with currencies which its members can spend freely elsewhere. They are not keen on supporting a system of multilateral payments through EPU which would be conspicuously to the advantage of the common market countries, and even less keen on the tariff discrimination that the common market, they fear, will exert against them.

It is for this reason that the Swiss recently proposed that EPU should be renewed for only six months. The common market six are committed to make the first instalment of tariff reductions among themselves by January 1st next year. If, then, the free trade area project were to founder, the future of EPU would automatically come up for reconsideration at a timely moment. There is a big propaganda element (to use no stronger words) in the Swiss stand. It is galling that the French should have launched their counter attack on the free trade area in terms so hostile to its whole conception; and the support they received from other common market countries provides some justification for the misgivings of the rest that discrimination and retaliation within Western Europe could easily wreck much of the constructive achievement of economic unity in Europe. But British misgivings stop well short of suggesting that the preservation of EPU could be traded against agreement on the free trade area.

INDEED, the threat to end EPU should never have been used in this sense. So far as Britain is concerned, it does not even furnish a convincing debating point. The plain fact is that Britain could not withdraw from EPU without gravely damaging the system of multilateral payments on which British trade and that of the whole sterling Commonwealth is intimately dependent. European trade after the war was released from the shackles of bilateral barter through the creation of EPU in 1950. It provided for settlement in a common currency unit and thus encouraged multilateral payments; it provided a banking system with an economical use of reserves. But what began as an intra-European arrangement took on a world-wide importance through the settlement of transactions in transferable sterling which now bring within the technical mechanism of EPU an ever-widening circle

*The Six are Belgium, France, Holland, Italy, Luxemburg and Germany. The EPU includes these countries, together with Austria, Denmark, Greece, Iceland, Norway, Portugal, Sweden, Switzerland, Turkey and the United Kingdom. The proposed Free Trade Area would include the sixteen members of EPU together with Eire.

of trade conducted in sterling across five continents. EPU in fact now clears the trade accounts of most of the non-dollar world, whether in sterling, francs or marks. To dismantle it would not mean merely a return to the jungle of bilateralism in Europe ; it would in fact involve the dismantling of the whole transferable account system. It would damage many countries in Europe, but it would inflict grievous harm on British and Commonwealth trade. For Britain to hint that it might withdraw from EPU would not carry much conviction. Whether or not a free trade area comes about, Britain would still be better off with EPU than without it.

THERE is, however, another point in the Swiss argument which touches directly on an important matter of principle. This concerns the automatic credit (or overdraft) facilities which are afforded to member countries whose clearing accounts are in the red at the end of the month. Part only of such deficits has to be settled in gold or dollars ; the rest is covered by an extension of credit from EPU. These mutual credit arrangements have undoubtedly contributed much to the liberation and expansion of trade among European countries and their associated territories. But it is possible to distinguish between these credit granting and receiving functions and the clearing mechanism by which a multitude of transactions are rendered down into net sums payable and due among the members. As EPU has developed, it would not be an easy matter to divest it of the automatic credit facilities without making a serious impact on the clearing mechanism through which the members' surpluses and deficits are compensated. Yet the distinction exists, and it is certainly very much in the minds of the Swiss. They see no reason why, say, France should be in the doubly advantageous position of being able, as a member of the six, to discriminate against the other members of EPU and at the same time look to them for easy credit to finance France's deficits in the union. It is an issue that goes wider than the argument about the free trade area ; there is perennial debate at each renewal of EPU whether the union, as trade banker for Europe, should go on lending so easily or whether its terms for advancing credit should have more bite.

It is true, indeed, that they have been hardened. Three-quarters of any deficit now has to be met in gold. But 25 per cent credit is still worth having for a country that cannot or will not put its trade and monetary affairs in order, and even the sting of an absolute limit on overdraft facilities has been drawn on occasions when some countries in persistent deficit have approached it. The demand for further toughening, therefore, has a persistent logic, apart altogether from side arguments about the effect of the common market on EPU. If the EPU rules were hardened to the point of making the end-month settlements payable wholly in gold or dollars, however, the time would have arrived to wind it up and establish in substitution for it the European Monetary Agreement that was drawn up in 1955. That agreement was negotiated in the expectation that the major European currencies might soon be advancing towards convertibility, but it attracted support on the sensible ground that even in a world of convertible currencies a system of regional settlements in Europe would have a positive value as well as being a continued demonstration of economic collaboration in Europe.

In such a system, as now, the central banks of the member countries would be intervening to preserve an orderly system of exchange rates within fixed margins, and would in the ordinary course hold each other's currencies, pending the monthly settlement. That is only one aspect of the wider part that EPU has come to play in the world's, as well as Europe's, currency arrangements. A European Monetary Agreement which retained the clearing mechanism but abandoned the automatic arrangements for credit between the members would need a strong central fund and a firm board of disciplinarians to administer it to those countries that demonstrably needed help that they could not provide for themselves. And so the future of EPU can be wisely decided only in apposition to the widest questions of international liquidity that the two Treasury knights are at this moment exploring in Washington.

Yet the fears of failure for the free trade area are also a threat to EPU's future. Although the six may write off the present views of Switzerland and Sweden as mere retaliatory bluffs, they might also note—and take rather more seriously—the British initiative to strengthen sterling by new banking arrangements within the Commonwealth. It would be tragic if the counterpart to this initiative were to be a weakening of the complicated ties between sterling and the intra-European payments system. These ties have converted EPU from an intra-European into an extra-European monetary system which no longer needs such anachronisms as members' quotas ; once settlements are made between the members in 100 per cent convertible money, what remains of the distinction between the various types of sterling currently earned and held by countries outside the sterling area would disappear. EPU would get a new measure of discipline and sterling a new measure of purification.

EPU, it is said, has had its day. It has, indeed, outlived its present form, but its work must be extended. In the last year or two, this has been done with a "break clause" to allow for it to be merged into the European Monetary Agreement, if and when that is put into effect. If it is prolonged, as it should be, for the now customary period of twelve months, there will be time to see whether the common market is really going ahead and whether a free trade area can be associated with it. And a wider view of its destiny must link it with the efforts that have now to be made to expand the effective monetary reserves of the free trading world and to edge it nearer to the general convertibility of currencies.

Expenses and Benefits

If the holder of an office or employment of profit is necessarily obliged to incur and defray out of the emoluments thereof the expenses of travelling in the performance of the duties of the office or employment, or of keeping and maintaining a horse to enable him to perform the same, or otherwise to expend money wholly, exclusively and necessarily in the performance of the said duties, there may be deducted from the emoluments to be assessed the expenses so necessarily incurred and defrayed.
(Rule 7 applicable to Schedule E.)

IT has been said that the different treatment of expenses under Schedule D (mainly profits) and Schedule E (mainly wages and salaries) of the Income Tax has changed them from two different Schedules into two different taxes. After the House of Commons reassembles it will have to consider in committee the only concession that the Chancellor of the Exchequer was able to introduce in the Finance Bill to mitigate the notorious narrowness of the rule that defines the expenses which may be deducted in assessing incomes to tax under Schedule E. It is a mouse of a concession—although it takes two pages of the Bill and a schedule—and if this is the Chancellor's last word, as well as his first, it will be a big disappointment. The section starts by listing seven statutory fees (such, for example, as the annual fee payable by a registered patent agent) which employed persons may deduct from their earnings provided that the payment of the fees is a condition of the performance of the duties of their employment. It is odd, to put it no higher, that such fees should not be allowed already under Rule 7. Could there be a sharper illustration of its limitations ?

The listing of specific items in this way is no guarantee that it will prove to be comprehensive. Apart from such fees, the employed taxpayer will be able to deduct, subject to a number of tests, "any annual subscription paid to a body of persons approved for the purposes of this section by the Commissioners of Inland Revenue." The organisation will have to satisfy the Revenue that one or more of its main objects is the spreading of knowledge, or the maintenance of professional standards of conduct, or the protection of its professional members. Organisations of a mainly local character do not qualify, which suggests that subscription to local branches of national professional organisations will not obtain relief. If these first hurdles are overcome, approval is not mandatory, although there is a right of appeal. No provision is made for a subscription paid to a body which would qualify but does not take steps to do so ; an overseas professional institute might be such a case in point. Since it is an employee who is concerned to get relief in his own case, the opportunity might have been left to him to justify his claim.

Assuming that the "professional body" or "learned society" (to use the words of the side note in the Bill) has obtained the approval of the Inland Revenue, the next step is to ascertain whether any part of the subscription should be disallowed because the other objects are to a significant extent directed to purposes other than those which justify relief. Then the taxpayer must show that the subscription is relevant to his employment—in short, that the performance of his duties is directly affected by the knowledge concerned or involves the exercise of the particular profession. The section opens up the prospect of long negotiation and even of litigation. Is the Institute of Directors a professional body, or a learned society, or does it come within the "etcetera" in the side note ? The work of trade unions certainly includes some element of the advancement and spreading of knowledge ; so does that of many trade associations. How will they stand ?

The most discouraging aspect of all this is that it represents the end-product of a long period of criticism, recommendation and study. Judges have shown often enough how their hands are tied by the words "wholly, exclusively and necessarily in the performance of the duties." Their comments have had a critical slant: "jealously restricted" ; "strictly limited" ; "notoriously rigid, narrow, and restricted in their operation." The Royal Commission fully appreciated the Revenue's apprehensions about any general relaxation of Rule 7, but they were quite clear that it should in some way be eased. They disliked "necessarily," on the reasonable ground that there are many employments of which the true obligations cannot be precisely defined and written into a service contract. Their recommendation was that the law should be altered to allow the deduction of "all expenses reasonably incurred for the appropriate performance of the duties of the office or employment."

An amendment of these lines was pressed on the government during the committee stage of the finance bill of last year. It was withdrawn after Mr Thorneycroft stated that, while he thought the Royal Commission had "correctly pin-pointed the area of difficulty," he did not think they had formulated a solution. He then promised to have further discussions with interested bodies, which have since taken place. Many suggestions have been explored. The chartered accountants, for example, supported the Royal Commission's formula ; but they suggested as an alternative, in the hope that agreement might be reached, the words "all expenses incurred wholly and exclusively for the proper performance of the duties."

But this has not been found acceptable. The House of Commons will surely have to consider whether justice is being done. Are the different standards for

Schedule D and Schedule E justified? Is there not, as the Royal Commission thought, an undue concentration on the test whether the employee would have actually breached the terms of his employment if he had not incurred the expense? Cannot an employee incur an admissible expense himself—on the purchase of technical books and magazines, attendance at refresher courses, travel for research, or the purchase of instruments? Is it unreasonable that the removal expenses that he incurs when he takes up a new job should be allowed? The cost of travel between multiple employments is certainly not incurred out of personal choice. If, therefore, Mr Amory is still unable to agree to a general redefinition of the Schedule E rule, he ought at least to consider whether there are not other expenses apart from professional subscriptions which ought to be specifically admitted. But the rule itself is archaic, and not only in its reference to the "maintaining of a horse." How many Schedule E horses are there?

BEHIND the new clause can be seen the hand of the Revenue. They have been adamant in their objections to any broadening of the Schedule E expenses rule and if they can limit the concession to the allowance of certain professional subscriptions they will have scored a significant victory. They deserve a good deal of sympathy in their desire to keep a tight grip on Schedule E, for they have good reason to be conscious of the consequences of relaxation in other directions. First and foremost of these are the benefits in kind provided for employees who earn less (benefits included) than £2,000 a year. Following a long chain of case law starting, reasonably enough, with the bank manager who was required to live on the bank premises, it is well established that an inconvertible benefit is not regarded as taxable income and therefore escapes assessment. This follows from the principle that benefits in kind are not to be regarded as equivalent to money's worth. This general principle was counteracted in 1947 by legislation aimed specifically at those earning more than £2,000. But it is insidiously spreading and acquiring an alarming importance in the determination and taxation of incomes below £2,000. It is not universally applicable—for instance, it does not cover the discharge of obligations which are the liabilities of the employee, such as a direct payment of rent by the employer to his employee's landlord. The benefit of such a payment would not be tax-exempt because the contract is between the landlord and the employee. But, this class of transaction apart, the field is wide open. Free luncheon vouchers have become a classic example. So has miners' free coal (extended with the Revenue's acceptance to cash payments made in lieu of free coal). There seems to be no reason why an employer should not send weekly parcels of groceries to his staff, or have them clothed, or send their children to private schools (provided the school will contract with the employer rather than with the parent) or provide them with a car, holidays or a wide variety of welfare facilities. As matters now stand, such benefits could not be taxable in the hands of an employee earning less than £2,000.

Already the money wage is losing its importance through tax avoiding arrangements which substitute benefits in kind for money wages for the under £2,000 a year man. The possibilities of full exploitation of these arrangements have as yet hardly been appreciated. But many conscientious employers already feel they are fighting a losing battle. It is very much easier for the Revenue to take a stern moral line about expenses, which have to be claimed by the taxpayer, than about benefits in kind, where the onus would more often lie on the Revenue to initiate the attack. The law is hardly fair to the taxpayer in the first case, or to the Revenue in the second.

BUSINESS NOTES

BANK RATE

5½ *Per Cent*

BANK rate was reduced by ½ per cent on Thursday, to 5½ per cent, just two months after the reduction from the crisis rate of 7 per cent at which it had stood since last September. Once again, the Bank achieved an element of surprise in its timing. Many people had felt that a further reduction would not be made while the wages issue was still in its decisive crunch; and the political upheavals in France and the Middle East might have added another argument for delay. The Bank evidently felt that these considerations were not sufficient to override the general arguments in favour of a further reduction which technical considerations had supported for some time past. Its cautious move—a cut of 1 per cent would have been a different matter—expresses continuing satisfaction with sterling's progress, which the Governor voiced in a speech earlier in the week. Certainly, it is encouraging that, after a momentary weakening early this month, sterling has stood up so well to the labour troubles, and that it has remained unaffected by the international uncertainties. The new Bank rate is still a high one, and in the present world pattern still offers a large margin over other leading centres. The Federal Reserve rate is 1½ per cent and the German rate 3½ per cent.

As was to be expected, the Bank rate reduction was followed by equivalent reductions in fixed rates in the money market and in rates on bank advances. Thus deposit rate at the clearing banks is now 3½ per cent; the banks' minimum rate on call loans to the discount market is 3¾ per cent; and the spread of rates on overdrafts is from 6 per cent for "blue chip" companies to 7 per cent for some personal borrowers.

Not Fully Discounted?

ONLY the timing of the Bank rate reduction really took the stock market by surprise—and even then not all investors were caught off balance, as the improvement in short-dated gilt-edged early on Thursday morning shows. A reduction had been discounted for some weeks past and it was assumed that, with the conversion operation safely and successfully carried through, only the course of the wages disputes stood in the way of some reduction.

In the industrial market, the cut in Bank rate did little more than to reinforce the tendency of prices to move slowly and cautiously upwards. Bank rate at 5½ per cent does not fundamentally change the condition of the industrial market; prices will still turn on the course of recession in the United States and of wages and production at home. It may be noted that gold shares, referred to in a later note, continued to improve on Thursday afternoon.

The reduction gave gilt-edged prices a fillip. The longer dated stocks had been moving up but after the Bank rate announcement they gained as much as ¼ or ½ of a point. The biggest gains were made in the shorts, where the 4½ per cent Conversion stock, 1962, gained ¾ to 99½, but that improvement had begun before the announcement was made. One half of one per cent now, and what in the future? Thoughts are already veering that way and that may be sufficient to re-awaken the semi-speculative interest in short-dated stocks. Yet the objectives for the gilt-edged market as a whole have not changed: the aim of the Government is still to fund. The reduction, coming after heavy buying by the banks and the institutions, is presumably intended in part to keep investors on the feed. But that will not produce a breakaway in prices. The queue of local authority borrowers is as long as ever and though with the AEI issue coming shortly there is no immediate prospect of a local authority issue the easing of Bank rate may help to bring the queue shuffling forward. That should reduce the pressure on the mortgage market, where in anticipation of a Bank rate reduction local authorities have been big borrowers of temporary and short-term money.

Sterling Near the Roof

STERLING showed a slight weakening on the reduction in Bank rate, from $2.81¾, its effective ceiling, to $2.81½. But earlier in the week the pound had been helped by the actual or prospective settlement of various wage disputes, which induced foreign firms to cover commitments previously being left open. The demand was varied in character, mostly commercial, but some of it, linked to further interest arbitrage, in view of the further fall in the New York bill rate. This week's Treasury bill tender, and the prospective movement in the forward dollar exchange rate, will decide whether a modest margin of profitability in interest arbitrage will continue. London bill rates, at least, seem headed for a fall.

A particularly large turnover has taken place in transferable sterling, the rate for which this week has strengthened to $2.7960. There has been keen demand from Russia and the Scandinavian countries, while a fair amount of the selling appears to have come from Amsterdam. The Exchange Equalisation Account has been fairly persistent in its intervention in the official market as a seller of sterling this week, and must have gained both dollars and EPU currencies, making good the losses that were sustained earlier this month when fears of serious labour troubles had led to considerable market selling of sterling.

Activity in the market for French francs has hardly reflected the significance and importance of political developments in France. The spot rate has been steady at Frs. 1,180¼ against sterling, and though it may have been propped up by modest French official support, it has in fact had to resist very little selling. This is because very few firms outside France have any francs that can be withdrawn, while French nationals are finding the exchange control tightening against them—witness this week's withdrawal of tourist allowances. Speculative activity against the franc is of minor proportions as the discount on the forward rate, which early in the week was equivalent to nearly 14 per cent per annum, is virtually prohibitive.

TELEPHONES

Cheaper Service?

THE more mechanised that any service becomes, the more its suppliers can logically shift the balance of their tariff towards higher standing charges and lower prices per unit. In recent years, the Post Office has steadily been doing the first half of this: it has increased the rental it charges subscribers for access to the telephone system at all, and has reduced the allowance of free calls one used to get with the instrument down to nil. Until now, however, inflation has been putting up its running charges, too, faster than mechanisation has been able to reduce them: so these have gone up, too. This week, for the first time, the Post Office has been able to offer the second half of the bargain: it has extended the period for cheap rate trunk calls to cover the whole of each evening plus Sunday afternoons, and—for the present in the Bristol area only—it is offering subscribers calls timed in twopenny units, both local and trunk, so that the laconic will be able to telephone more cheaply. But it should be noted that locally only the laconic will benefit: the verbose (which may well comprise the better half of us) will probably have larger telephone bills to pay.

How much call one will get for one's twopence will depend on distance and time: locally it will buy three minutes' connection, over 125 miles only 12 seconds (which will still reduce the cost of most three-minute trunk calls substantially). Beginning with Bristol's 18,000 subscribers on December 1st, this service will be extended throughout the country as areas are fitted with "subscriber trunk dialling," which will enable each subscriber to make his trunk calls himself through automatic exchanges. No start is being made in London until 1961, as STD in so large a city requires rather more complex equipment. By 1970, it is hoped, about three-quarters of all trunk calls will be dialled by subscribers.

Larger Bills?

THE Post Office says it costs £110 to install a private telephone—£9 for the telephone itself (not much less than a portable radio), £16 for the exchange connection, and no less than £85 for the cable to the exchange—and about £250 to put in a public kiosk (in remote villages the cost has on accasion touched £1,000). Each private telephone in this country is used, on average, for only two calls a day: yet demand for new telephones since the war has always exceeded the resources that the Post Office has been able to devote to supplying instruments and exchange positions and to connecting them. This is not the ordinary "peak load" problem of public utilities: this vast mass of under-used capital equipment, worth some £1,200 million at current prices, is maintained in being to provide for a potential, not an actual demand. It is natural that the Post Office should be doing its best to encourage fuller utilisation of the telephone system: and also, by timing local calls, to make more money out of the local calls that last longer than three minutes.

Local calls are not timed today: nobody knows what proportion of them are discursive. For many private subscribers the extent to which these cost more may outweigh the saving of a penny for each short local call and more than that on the few trunk calls one makes, but business telephone bills should be reduced by the change. The change, on the face of it, may certainly tend to bring the pattern of charges more in line with that of costs. The resulting bills, which may be larger or smaller according to our telephone habits (the STD timing system will render them impossible to check unless one hires a special meter, and perhaps ominously the Post Office proposes to render its accounts quarterly on this system, not half-yearly) may induce the subscriber to behave more like economic man (or economic woman) with a telephone—or do without one.

KAFFIR BUYING

Gold Rash

THE best than can be said about the prospects for gold is that pipe dreams and rumours about an increase in its dollar price are a little less improbable than they were. That has not stopped the Kaffir market from reaching a higher level of activity than it has known for over three years and prices are now up to the levels they touched last August when sterling was under severe pressure. Only a few days ago, markings in gold shares were not much above 200; on Tuesday 823 bargains were marked, and on Wednesday 1,273. The *Financial Times* gold share index has jumped this week from 74.2 to 77.6. Some buying has come from the United States, and reports that a banking group there is setting up a fund to deal in gold and gold shares has provided an optimistic background for the market. Zurich has been buying too, though not necessarily on domestic account, and Paris, which always turns to gold in a political crisis, has come in as well. But it is buying in London, which the Cape has been content to follow, that has sent up the temperature.

Much of the buying can only be classed as speculative. The investment merits of tangible yields and earnings of the new producers in the Orange Free State cannot be denied and over the last six months some trusts have been buying quietly and selectively. They are firm holders and many of the new mines have already enjoyed a good rise. But recent buying has spread beyond the OFS to the old low grade mines which would benefit most from an increase in the gold price. That may not be a reckless hope, but it is undoubtedly a speculative one. And there is plenty of stock for sale by the shops and by private holders who bought higher up.

MOTORS

Output Before the Strike

THE steady, upward surge of motor production was interrupted slightly last month by the two-day Easter holiday but not at all by the strike of 1,500 Pressed Steel workers at Swindon, which did not break out until the closing days. So, although the tally of new vehicles for the month was below that of March, the daily rate of output rose still further, sailing past the 5,800 units a day mark. Car production exceeded 4,500 a day for the first time, against 4,370 a day in March and 3,375 just one year ago. At this rate, the industry could turn out more than 1,100,000 cars in a working year. The other side of the industry, the manufacture of commercial and public service vehicles, fared less well. Production declined for the second month running, to 1,291 vehicles a day, from 1,315 in March and 1,374 in February. The home market for lorries and vans is still affected by the general industrial recession in this country. Exports of vehicles also fell off in April, more so than could be accounted for by the Easter shut-down; again, more heavily in commercial vehicles than in cars. For this the New Zealand import cuts and fewer sales in one or two Continental markets appear to be mainly responsible.

But if these April performances are reasonably satisfying, the figures for the present month certainly cannot be. The Pressed Steel strike has by now cut deep into car production. This company provides the industry with about 40 per cent of its car bodies. The four-week stoppage at its new Swindon plant, which produces bodies for Austin Healey, Wolseley, Riley and Hillman cars, has now put about 30,000 other vehicle workers out of production or on to short time. These are mainly in the BMC factories, the Rootes group and certain other suppliers of parts and accessories whose delivery schedules have had to be slowed down. Since the present talks between the seven unions involved and the company's management have produced no quick settlement, Standard, which gets its Vanguard and Ensign bodies from Pressed Steel, may also have to cut production after Whitsun. The loss of car output must now be running well into hundreds each day. At this time of the year such forfeited sales are unlikely to be made good: prospects in overseas markets outside the United States are not improving, and the industry is not so sure how home sales will behave once this summer is over.

Sprite on the Ground Floor

UNTIL this week, the cheapest sports car offered by any of the major car manufacturers in Britain was the MGA for £996, including purchase tax: one could buy a two-seater Morgan for about £250 less than that, or baby cars that are sportive in mien if hardly in performance, such as the elegant little Berkeley, for about half the price. The British Motor Corporation has now slipped a lively little new car with a top speed of better than 80 mph, which to many people could fairly rank as a sports car, into the price range at £679, which is not very far above the Anglia-Prefect, Morris Minor or Standard Eight level. The Austin-Healey Sprite indeed uses the 948 cc engine that goes into the A.35 and the Morris Minor, modified to give 43 bhp against the Minor's 37, inside an "envelope" two-seater body shell designed by Donald Healey as a scaled-down version of his established "100-six." Its maximum speed is about ten miles an hour more than the Morris Minor: the fuel consumption of the Sprite, at comparable speeds, seems to be of

SPORTS CARS BELOW £1,500

	Price (incl. PT) £	Cubic capacity c.c.	BHP	Max. speed mph	Overall length ft	Kerb weight cwt
Austin-Healey 100-six ...	1,227	2,639	102	(112)	13½	22
Triumph TR3	1,050	1,991	100	(109)	12½	19
Sunbeam Rapier	1,044	1,390	67	87·5	13½	20¾
MGA 2-seater	996	1,489	72	(101)	13	16¾
Simca Montlhéry	939	1,290	48	82·1	13½	18½
Turner 2-seater	864	948	40	...	11½	11½
Dellow Mk. VI	863	1,172	36	(81)	11½	11½
Metropolitan hard-top ..	749	1,489	47	75·0	12½	16½
Morgan 4/4 2-seater	748	1,172	36	75·3	12	13
Fairthorpe Electron Minor	720	948	38	...	10	8½
Austin-Healey Sprite	679	948	43	82·9	11½	12¾
Berkeley Standard 2-str.	500	328	18	62·1	10½	6½

Maximum speeds in brackets are the manufacturers' figures; the rest are reproduced with acknowledgments to *The Motor* road tests.

the same order; its acceleration, 0-50 mph through the gears in 13.7 seconds, is markedly brisker. The little car—it is about as long as the A.35—holds the road well, and has rack and pinion steering. It is not quite a car for the enthusiast as defined in Britain, but it should give young people an exciting run for the kind of money that a growing number of them are becoming able to afford. In the United States, it should have the *chic* of an imported sports car at pin money prices: a figure of about $1,250 has been mentioned.

ICI

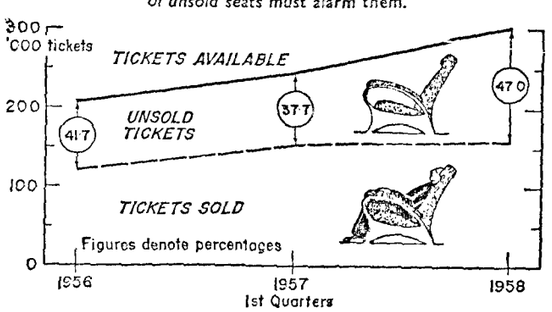
Some Domestic Issues

"THAT there is a serious recession in the United States," declared Sir Alexander Fleck at the Imperial Chemical Industries meeting a week ago, "cannot be doubted." But his statement was less exercised by the consequences of recession for ICI; though he noted some signs of weakening demand in overseas markets and in some sections of the home market, Sir Alexander affirmed that ICI would not be deterred from its long-term policy of expansion and that investment in new plants and extensions would continue as a mark of faith in the long-term trend of demand for ICI's products.

This apart, the chairman's speech concentrated on two domestic issues of particular interest. First, ICI has made a second revaluation of the net written down value of its plants. The first was made in 1950 and the second is justified by the considerable further inflation that has since occurred. The result is that the net book value of fixed assets at January 1st goes up from £326 million to £396 million. But the additional depreciation to be provided in this year's accounts will be no more than £2 million because the plants themselves are now attributed with a longer working life than was originally supposed.

Secondly, a considerable change in the employees' profit sharing bonus is being made. The past rule was that employees' remuneration was increased by the percentage by which the rate of ordinary dividend exceeded 5 per cent—7 per cent last year on a 12 per cent dividend. That arrangement would have had to be changed this year because of the one for two scrip issue that has now been approved. The directors have changed the bonus so that it will in future be 22 per cent of the total remuneration, before tax, of all forms of capital. That will give roughly the same bonus as in 1957 (if the results of the year are the same) and it undoubtedly provides a better basis, both for employees and stockholders, than the old system. Over two-thirds of the ICI shares allotted as employees' bonus have been retained, and the proportion sold appears to be declining.

THE OIL MARKET



Shell Remains Optimistic

HISTORICALLY, said Lord Godber at the "Shell" Transport meeting this week, recessions have not had as much general impact upon consumption of petroleum products as upon demand for other commodities: and the current slackening of growth in the oil industry appeared to him as no more than "a pause in the upward trend of expansion." The curtailment of crude oil production in Texas (now down to 8 days' operations a month), and reductions in refinery runs, have eased the burden of product stocks in the United States. Elsewhere, as a whole, consumption is being maintained, "without the full impetus to expansion which previous years' experience have led us to suggest."

Current earnings for the Shell group, he added, could not be expected to compare with those of early 1957 (when Shell's stronghold in the Western Hemisphere was enabling it to benefit from the tribulations of other companies with a much greater proportion of their crude production in the Middle East). But "viewed in the light of the position two years ago, they seem reasonably satisfactory." In Amsterdam, Mr J. H. Loudun, president of Royal Dutch, was asked about the group's tanker building programmes. He said that these would continue: no cancellation of orders for ships due to be delivered up to 1961 was envisaged.

POOR FLYING CONDITIONS

Air traffic on the North Atlantic increased by a mere 4 per cent in the first quarter. All airlines had planned for a big increase in passengers and the high proportion of unsold seats must alarm them.

STOCK EXCHANGE

Should Brokers Advertise?

"The Stock Exchange must offer direct benefits or, at least, direct services, and in order to do this must advertise directly."

"Some private investors believe that brokers are now only really interested in obtaining institutional custom."

THESE quotations from two articles in the latest issue of the *Stock Exchange Journal* (issued under the auspices, but not necessarily representing the views, of the Stock Exchange Council) are a welcome intrusion of controversy in a journal that might be tempted to confine itself to innocuous generalities. Evidently the Governor of the Bank of England is not alone in his anxiety to dispel the fog of mystery that hides the City from the public and frightens people from using its services.

The writers of the two articles, however, light two different flares. Mr Donald Cobbett suggests that brokers should advertise directly for custom. The other, anonymous contributor argues that the links between a broker and his clients are fragile and that many investors instead of looking to their broker for advice turn to the financial press or their bank managers; the suggested answer is that a broker should charge a separate fee for advice, coupled with a lower commission on actual dealings.

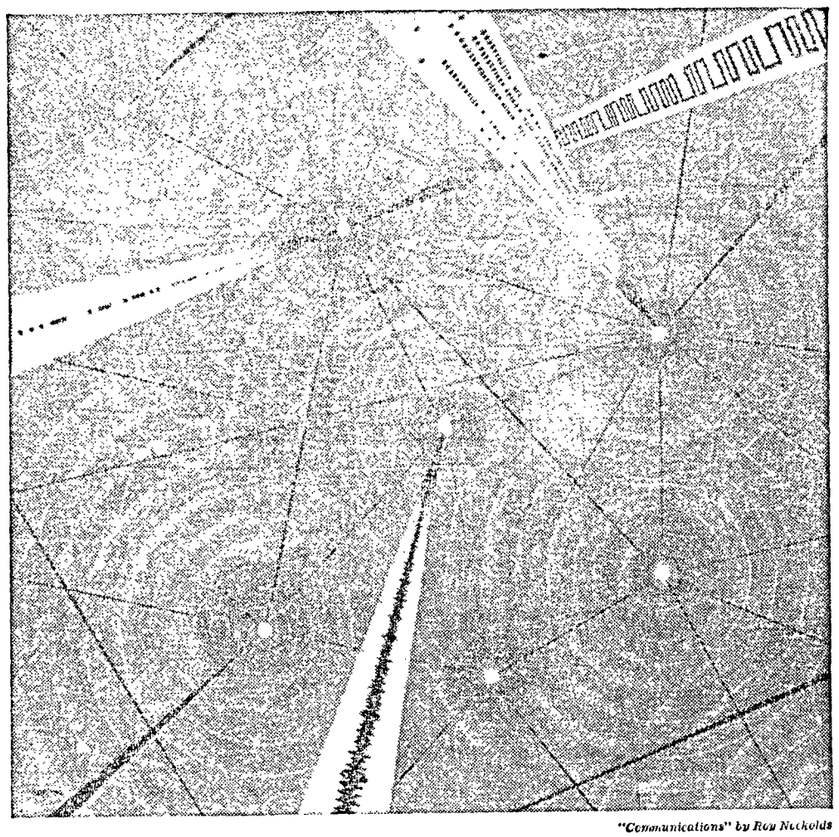
To meet its overheads the big broking firm has to look more and more to institutional investment for a regular income. But the case for attracting small savings into stock exchange investment rests on wider grounds than any desire to preserve the number of stockbrokers or to protect their incomes. If brokers want to encourage the small investor, charging a fee for advice is not likely to attract his custom. He will expect advice as part of the broker's service.

A broker's ability is tested by the soundness and responsibility of that advice as well as by the sureness with which an order is executed. His best advertisement is his own ability. Whether direct advertising which, Mr Cobbett suggests, should include some guidance on the principles of sound investment, would widen the field of custom is not proved. Public attitudes towards private capital are so different in the United States that it would be wrong for a British broker to draw any firm conclusions from, say, the experience of the "thundering herd," Merrill Lynch. But other British financial institutions have advertised their services with sobriety and restraint. Are the objections to broker advertising for custom in these days of universal publicity so obviously overwhelming as they were?

Should They Deal in Options?

ANOTHER result of a low volume of turnover in the market has been a demand that option dealings should be revived. In the past the Stock Exchange Council has given a very definite "No" to such requests, but this week it had to face an extraordinary general meeting, requisitioned by fifty members, to discuss and to vote on a revival of the prewar practice. It was very well attended—one third of the members turned up—and only one voice was raised against. On a show of hands the vote was overwhelmingly in favour of beginning option dealings again. A poll was then demanded, the results of which were being announced after this issue had been published. It is known that a number of unmarked proxies had been lodged with the chairman, Sir John Braithwaite. If the poll is against the proposal to restore options, the Stock Exchange has probably heard the last of it. But if it is in favour, pressure to resume option dealings will be difficult to resist, even though the Council is not bound either by the vote at the meeting or by the poll to any specific course of action.

ATOMIC ENERGY



Zeta Plays Tricks

BEFORE recent experiments on Harwell's Zeta are hailed as a great technical achievement, it is as well to remember that their outcome also represents a considerable disappointment. The experiments have proved conclusively that Zeta is a long way yet from controlled thermonuclear fusion, and that the popular belief, encouraged by expert claims, that the first step had been mastered, was totally wrong.

Fusion of atomic nuclei has indeed been taking place inside Zeta, but it turns out to have been a different kind of fusion. It was fusion caused artificially by some outside agency that is not wholly understood as yet; the kind that Harwell has been looking for, thermonuclear fusion, occurs spontaneously because the nuclei are so agitated by heat that they are bound to collide and fuse. Outward evidence of both types of fusion is the same—the presence in large numbers of minute particles thrown off by the atoms at the moment of fusion. A surprisingly large number of these particles were recorded in Zeta every time the gas temperature inside the apparatus touched 5 million degrees Centigrade—more, in fact, than the actual temperature seemed to warrant. The question that has hung over Zeta since last autumn is whether these neutrons were thermonuclear in origin: it was certainly difficult to think of any other means that could have caused them. It was easy to slip from this lack of explanation into the comfortable assumption that in spite of the discrepancy in the figures, controlled thermonuclear fusion was taking place inside Zeta.

It was not. What was happening was that some atoms were reaching tremendous speeds, probably as a result of the immensely powerful electric field applied to Zeta at the beginning of each pulse to heat up its gas. When these ultra-fast atomic nuclei collide with slow or stationary atoms in the gas, fusion takes place. But the form of fusion caused by this outside agency is not the true thermonuclear fusion that gives the sun its heat; it takes more energy than it gives back. About 95 per cent of the particles measured in Zeta arise from this sterile process; the balance of 5 per cent may indeed be of spontaneous thermonuclear origin but the proportion is so small that it cannot be proved.

Zeta temperatures will have to be doubled to 10 million degrees Centigrade, it is now expected, before thermonuclear fusion genuinely takes place in such volume that it can be measured and thus established with complete certainty. This is expected to be done before the year is out. The power input of Zeta is being increased five-fold (not doubled as was planned at the end of January) to 1 million amperes and it is hoped that the interval during which it will be possible to hold 10 million degrees can be raised from three thousandths of a second to a tenth of a second—Zeta's biggest contribution yet towards controlled fusion. Conditions should then be right for controlled thermonuclear

"Communications" by Ron Nickolds

Taxi! Taxi!

The newer applications of electronics in industry, medicine and commerce have tended to overshadow the tremendous advances made in radio communications. Yet in half-a-century, age-old barriers of time and distance have been eliminated, and men can, if they wish, communicate instantly with each other by word or picture over vast distances, and sometimes in circumstances which challenge the imagination.

But it is in the daily scene that one can best recognise the contribution of radio communications to our welfare and safety—the radio-equipped taxi, the walkie-talkies of the fire brigade and railway marshalling yard, the air traffic control system, the ship-to-shore telephone, the newspaper photograph radio'd from New York.

Mullard's part in the development of radio communications can be judged by the number of manufacturers who consistently use Mullard valves, tubes, transistors and magnetic components. Here, then, is yet another example of how Mullard experience and know-how, on which you too may draw, is serving Britain's designers of electronic equipment.

Mullard

the things they say!

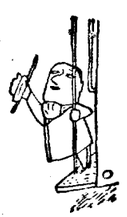
He says that British industry can't be efficient today because investors can't put up sufficient capital for it.

Maybe, but somebody ought to tell him about I.C.I.'s last issue of loan stock.

How did it go?

Well, I.C.I. asked its stockholders and employees for £40 million—a sizeable sum, you'll agree—and was offered *nearly six times* as much.

That doesn't sound as though people were unable to lend money to one *company, anyway.*



No—and the same sort of thing has happened every time I.C.I. has asked the public for capital. Investors, big and small, know a sound proposition when they see it.

But why did I.C.I. need all that money?

Because the company is always planning and building new plants to make new products that other industries and the public are going to need in the future. And they're always modernising or replacing plants to make established products more efficiently. Why, altogether since 1945 they've spent over £300 million on new factories and equipment here in Britain.

All right, I see where the money goes. But how do we know they are efficient enough to compete with foreigners? And if they are, what are their chances of staying efficient in the future?

Take a look at the figures again. In 1957 I.C.I. exported a record total of over £76 million of products in the face of ever fiercer foreign competition. And they're pressing on with a Research and Development programme that costs about £13 million a year.

Does that look like a lack of enterprise, or initiative?

No, it sounds as if they know where they're going.

Yes, and lots of ordinary folk, who've saved a bit, have sufficient faith to back them.

ICI

fusion. Whether it will in fact take place must depend on questions that no scientist at this stage can answer. Zeta is very much an empirical experiment, one of several possible methods of achieving controlled thermonuclear fusion. When scientists say they do not know quite why Zeta works as it does, it might be as well in future to take them at their word.

HOTELS

69 Feet Too Tall?

On the same day that the Minister of Housing gave planning permission to a proposal to erect a 305-ft hotel on a site in Bayswater on the north side of Hyde Park, in London, he turned down another project for a 374-ft hotel on a site in Park Lane, on the east side of the Park—on the grounds that it would be too high. This frigid attitude of public planners towards high buildings in the centre of cities is in real danger of becoming not merely a cause for national blushes but, more regrettably, a crippling restriction on future development. At the public inquiries into these two applications last November, the London County Council, which was the principal objector to both projects, stated that it did not object to high buildings as such but . . . managed nevertheless to produce a long list of reasons why permission should be refused in these particular cases. Both sites were in an area for which the London Development Plan (which has been implemented so far more by negation of this kind than by positive action) prescribed a 2:1 plot ratio—the ratio of floor area to site area. The Bayswater scheme envisaged a plot ratio of 3.7:1 and the Park Lane hotel would have one as high as 8:1, which would mean, so it was argued, serious traffic congestion in the neighbourhood and a disruptive effect on the pattern of existing local development.

These arguments, which appear to have swayed the Minister in his consideration of the Park Lane proposal, need to be looked at carefully. The traffic problem from hotel users, who unlike office workers do not normally help to swell the twice-daily surge of peak-hour movement, is not an enormous one. As for the desire for orderly upward development in these central areas, the standard of reference ought not to be the height and style of the existing neighbouring buildings but what the surrounding architecture will be or should be like in a couple of decades' time, when other nearby sites will also have been re-developed. The Minister's decision on the Bayswater scheme actually makes a reference to a case for "preserving the symmetry of the Victorian composition of Lancaster Gate. . . ."

This carping, backward-looking approach, instead of a ready acceptance of new development, has led the Minister to suggest to Mr Charles Clore and the Hilton Hotels group, who submitted the Park Lane project, that another design be prepared for a building not quite as high and presenting "a less massive appearance viewed from the Park." As they claim to have spent £750,000 already on the scheme, which would ultimately have cost £3½ million, they have replied they will try. But there appears to be some doubt whether a smaller building of the same standard of accommodation—a bathroom and dressing room to each of the 700 bedrooms—will pay its way. The developers had based their calculations on an average daily charge of six guineas a room and an average "occupancy" of 80 per cent, which other hoteliers at the inquiry thought rather optimistic. The Bayswater hotel is not in such an "ultra-luxury" class, envisaging room charges of 50s. to 60s. single and 90s. to 110s. double. Though the shortage of hotel accommodation in central London should enable new building to be worth while, a somewhat less luxurious standard might fare better in the off-season.

BOAC

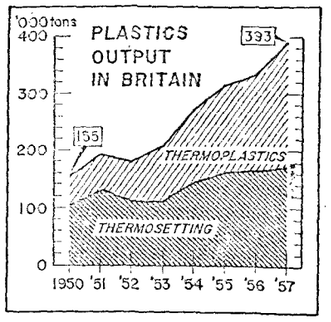
How to Run an Airline

Rationalisation to secure economies is much in fashion among nationalised industries: the local engineering unions at London Airport, in a pamphlet published during the week-end on how to run the British Overseas Airways Corporation, seem to have in mind rationalisation to avoid economy. The policy there set out might be roughly summarised as:

(1) sack the chairman,
(2) but no one else,
(3) and suppress all outside competition.

The call has gone out for Sir Gerard d'Erlanger's head since BOAC began reorganising its engineering divisions, which involves roughly halving the staff and sacking 3,000 men in two years. The union reckons that this will cut wages by about £3 million, sufficient to cover the corporation's current deficit of £2.75 million: "we rightly expect different treatment from a nationalised industry." In fact, the total saving on all counts will probably be nearer £5 million.

The idea that the chairman should be sacked before and not after other members of the staff is a novel one: it had undeniable attractions, for example, when one of the nationalised industries was reorganised a few years ago in exactly the opposite way. But it is not necessarily the best way to run an airline. The unions must feel, however, that the current dispute has been a one-sided affair up till now. They introduced an overtime ban in the engineering divisions as soon as they were given details of the reorganisation scheme; they have now had to withdraw this ban without so much as a whiff of a concession from the management. The management has, indeed, gone to considerable pains to avoid any gesture that might be interpreted as departure from the original—admittedly stringent plan. And on the heels of the union's pamphlet came an open letter to the staff from the managing director pointing out once again that BOAC's engineering division was twice as big as that needed by Pan-American, KLM, or United Air Lines to do the same work.



Mr Smallpeice has taken some of the wind out of the union's sails by himself putting the blame squarely on the corporation's management, which rejected evidence as far back as 1953 showing that by comparison with SAS, Air France, or KLM, "an unsatisfactory position" was developing in BOAC's engineering department. There has, indeed, been quite a sharp struggle inside the corporation to get the new scheme accepted.

PLASTICS

Polythene's Progress

In the quite detailed statistics that it publishes once a year about plastic materials, showing sales in Britain and exports, the Board of Trade distinguishes nine main "families" of plastics, sub-divided between the types of

product made from each. But for the last four years the largest tonnage in any single group has come under one of its residual, miscellaneous headings, "Other thermoplastic materials." In 1957, for which the figures have just been published, this category accounted for more than a quarter of total output by weight: 113,400 tons out of 393,100 tons of plastics of all kinds. In principle, the mushroom growth under this miscellaneous heading—where the figures have doubled since 1954—emphasises that in this rapidly growing industry new materials and new markets can be developed a good deal faster than statistics can be altered to portray them properly. In practice, it means that output of polythene is growing to the point where it cannot much longer be masked inside any grab-bag category. Imperial Chemical Industries is still the only significant producer, but it must be turning out 50,000 tons of polythene a year, and other units, using new processes, should soon be in production. As they do, and if demand continues to grow at its recent rate, it cannot be long before output of polythene reaches the highest tonnage for any plastic material.

This comparatively new plastic (discovered by Imperial Chemical Industries in 1933; first production unit operating by 1939; much postwar development both in processes and in the product) has been a commercial success in an extremely broad range of applications. Its outstanding electrical properties give it a widespread use in radio-frequency cable insulation: most of its kitchenware applications have eventually built up a steady sale: and its packaging applications, in "squeeze" bottles, other containers, and as transparent film, have grown steadily over recent years. This is probably the most rapidly expanding of all plastic materials, but the vinyl plastics and polystyrene are growing very rapidly too. In contrast to these thermoplastic materials (the term means that a material can repeatedly be heated and softened without changing its properties), the use of thermosetting materials (which cannot), which developed earlier, is now growing at a slower rate: output of phenolic and cresylic resins (the kind used, for example, in an ordinary telephone receiver) is indeed lower than it was in 1955. Total tonnage for the plastics industry now exceeds British consumption of all non-ferrous metals except copper: and when one takes account of density, the volume of plastic materials used is close on five times that of copper.

BUILDING SOCIETIES

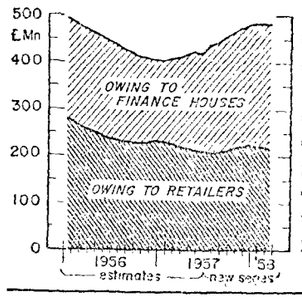
An Eye on Liquidity

LAST week the Halifax Building Society reported a more than seasonal volume of withdrawals. Figures now published by the Building Societies Association, which exclude the Halifax and the Provincial and represent about 73 per cent of the total assets of the movement, show that this experience was shared by other societies in the first months of the year. For most of the quarter, Bank rate was still at 7 per cent, but the reason for heavy withdrawals is not simply the competing attractions of other savings media. Shareholders and depositors in the building societies are beginning to feel the pressure of the deflationary squeeze. In the North, where a building society is used very much as a savings bank, pay packets are smaller and savings are being dipped into. House purchasers throughout the country are putting down cash payments out of

	Qtr. I, 1957	Qtr. IV, 1957	Qtr. I, 1958
	£'000's	£'000's	£'000's
Receipts	72,275	67,721	83,143
Withdrawals	52,035	56,035	64,147
Advances	57,332	65,335	56,105
Repayments	57,330	67,739	59,365
Cash and securities	248,819	258,444	247,849
Total assets	1,695,752	1,705,017	1,310,365

Figures cover 203 societies and represent about 73 per cent of the total assets of the building society movement.

savings that often enough are deposited with building societies. And there must be some investors who have drawn on their balances with building societies to meet calls on stock exchange new issues.

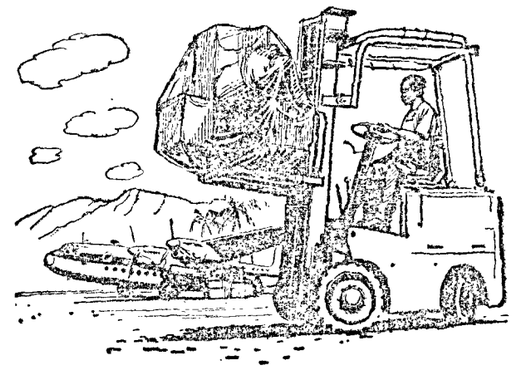


Confronted by this flow of withdrawals, the societies have had to go slow on mortgage advances. They sense a disinflationary atmosphere and they are mindful of the sad lesson so recently taught by the Scottish Amicable Building Society. Their present concern is not merely to preserve but positively to reinforce their liquidity ratios; even so, the Building Societies Association's figures suggest that the average ratio of cash and securities to total assets fell from 14.4 per cent at the end of December to 13.7 per cent at the end of March. The reduction in Bank rate does not fundamentally change this situation.

NEW ERA BANKING

The Old Lady Nags

PROGRESS in the banking world, which often appears slow from the outside, has contrived to pass two landmarks in a single week—one at the Bank of England and the other at a leading clearing bank. The Bank of England is still far from being the most talkative of central banks; but Mr Cameron Cobbold's policy, defined last February in his own words, of making "more public speeches than I did in my earlier years or, I think, than my predecessors did"—an interestingly tactful understatement—has transformed the old tradition. And last week he actually admitted television cameras into the Bank parlours,



HIRE PURCHASE DEBT

Hire purchase and other instalment debt owed to household goods shops seasonally declined by £6 million between February and March. But the debt to the finance houses, particularly for motor vehicles, continued to rise and was about £30 million more than a year ago.

Get it there faster—
and the
market's *yours* . . .

AFRICARGO *pays off*

Just think what rapid, reliable delivery means to customers in the fast-expanding Africa market. They don't need to tie up capital in stock, they save on storage and insurance, don't risk stocks becoming out-of-date—and can give their clients much more efficient service.
So, naturally, they prefer to order from firms who ship by air—by Africargo for preference. For Africargo is the only all-cargo air service to Africa—so we can guarantee absolutely firm bookings, expert advice on cheap, effective packaging, *specialist handling* for your cargo. And our aircraft can carry cargoes whose bulk or tonnage would otherwise make air transport impracticable.
Expensive? Not at all. Packaging is usually much cheaper than with sea transport—often a dust-cover alone is quite enough. Insurance, too, is cheaper—because there's much less risk of damage or pilfering. So *total* air freighting costs compare very favourably with those of sea shipment.

appearing himself for an interview in the ITN feature "Tell the People."

The interview was confined to the work and functions of the Bank, as distinct from high policy, and covered much of the ground made familiar by the Parker Tribunal. Was the Bank's relationship to the Government that of a wife who has promised to obey, but who manages to get her own way? The Governor was appropriately shocked; the Old Lady, he affirmed, was "a very dutiful wife." "We offer our advice freely, as a good wife should"; but, "on occasion we've been known to nag if our advice has not been accepted."

A new theme in the Governor's drive in public relations is that there is nothing mysterious about high finance and central banking—they merely appear so because the sums involved are large. On the day following his ITV appearance, this idea figured in the Governor's speech to the Manchester Chamber of Commerce, in which he appealed for aid in dispelling public illusions about the "mystery" of the City. On the future of sterling he sounded an optimistic note: recent experience had suggested that there is "a real foundation of progress towards stable prices and a stable exchange situation."

Young Ladies Can Manage

THE other landmark has been passed by Barclays Bank, which has the distinction of being the first clearing bank to appoint a woman as manager of one of its branches. The new office to be opened in Hanover Square, London, towards the end of this year will be under the management of Miss H. M. Harding, who entered the bank in 1934 as a shorthand typist at a branch. Seven years later she became secretary to the local directors at Reading and for the past ten years has been secretary to successive general managers.

This, clearly, is an unusual progression, and likewise an unusual route towards branch management. Barclays' experiment will be watched with interest; but there are no signs that the example will be quickly followed, important though the role of women now is in all the banks. Their range of responsibility steadily extends—but the pace is governed by the sad fact that many bank customers are even more conservative than bank managements.

COFFEE

African Futures for London

AFTER a lapse of thirty years London is again to have a coffee futures market. The original market, opened in 1888, closed down in 1928. The new market will be under the management of the London Produce Clearing House and will be housed in the Commodity Exchange. The final announcement calling for applications for membership among coffee traders is going out this weekend and it is hoped that trading may begin early in July. The market will be based on the African Robusta contract. Dealers have not had any real facilities to hedge against price fluctuations in Robusta, which is taking an increasing share of the world coffee market. The New York futures contracts are based on Brazilian and Colombian coffees, and though the Le Havre terminal market does deal in Robusta, currency restrictions and an inconvenient location make the market of little significance. The London market should be able to attract a good deal of American business as more and more Robusta is being consumed in the United States, where it has proved suitable for the manufacture of instant soluble coffee powder.

WOOL

Steady After Shaky Start

AFTER a fall on the opening day of the May series of London wool sales last week, prices held up well at the lower level under a steady demand from the home trade and the Continent. Altogether, some 50,000 bales were on offer, about 38,000 bales coming from New Zealand and 9,000 bales from Australia. Quality was the governing factor in prices. Long Australian greasy merinos were barely 5 per cent cheaper than at the last London sales at the end of March. Average lengths were, however, up to 7½ per cent lower and shorts at least 10 per cent below previous levels. Of the New Zealand selection, good qualities from Dunedin and Invercargill were only around 5 per cent down, while those from Auckland and Wellington were about 5 to 10 per cent lower. The New Zealand Wool Commission stepped in to support this section on the opening day and gave further support to greasy and scoured crossbreds later in the sale.

The initial decline in London reflects the fall in prices in the primary markets since the end of March. But Australian and other overseas markets have become steadier in the last three weeks, and though Bradford and other consuming centres have remained quiet, this has been sufficient to prevent prices slipping back still more. But stocks of wool and tops are still rather more plentiful than a year ago and quiet conditions have ruled both in the wholesale and the retail business since the middle of February. Some traders now expect increased business if the improved tone of the raw wool market is maintained. Prices rose by about 2½ per cent at the Auckland sales this week and South African values have also improved.

MATCHES

Competition for a Light

EVER since 1954, when following criticism by the Monopolies Commission the British Match Corporation abandoned agreements about sharing the British market for matches with the Swedish Match Company (which owns 35 per cent of its equity capital) growing imports of matches have been eating into its sales: but last year there were signs that it was holding its own rather better. Total sales of matches in Britain are completely steady, at about 17½ million "Customs units," which means about one box per week per head of the adult population. From 1953 to 1956, the British share of these sales dropped from about 73 per cent of the whole to about 65 per cent: last year British Match, the sole producer (the only other makers having gone out of business in the last five years), held its share of a fractionally smaller total market.

Imports from Swedish Match have increased since the two companies abandoned their working arrangement: but the biggest increase over the four years from 1953 to 1956 was in imports of matches from behind the Iron Curtain. The Board of Trade made an arrangement with Russia by which matches came here and textiles went there: large quantities have also come in from Czechoslovakia, Poland, and some countries in Western Europe. All these are cheaper matches. Though British Match is spending some £1,500,000 on making its six remaining factories "the best-equipped in the world," it is hampered by the fact that its competitors can get the right wood much cheaper than it can itself. Its wholesale price for a gross of boxes today is 19s. 7d.: the most expensive foreign match, from Norway, is offered at 19s. 4d. per gross boxes, while the Dutch offer them at 17s. 2d., the Russians at 16s. 6d., and the Yugoslavs at 15s. 9d. per gross boxes. British Match has been experimenting for years with growing suitable timber here and is trying to interest landowners in the poplar it needs: but planting trees is a very long-term investment.

THE MARKET FOR MATCHES
(million "Customs units"*)

	1953	1954	1955	1956	1957
British	12·8	12·0	11·7	11·4	11·3
Imported	4·7	5·5	5·8	6·2	6·1
Total	17·5	17·5	17·5	17·6	17·4

* Equalling 7,200 matches each.

SHORTER NOTES

Provisional figures from the Ministry of Works for the first quarter of 1958 indicate that the amount of new construction in Britain was about two per cent lower in value than in the first three months of 1957 and slightly more if account is taken of the fractional rise in building costs over the twelve months, while expenditure on maintenance and repairs was roughly the same. These figures may rather under-estimate the rate of decline since the opening months of 1957 provided unusually good weather for building operations. Altogether in this first quarter building and civil engineering contractors did about £330 million worth of new work, against £337 million a year ago.

The Board of Inland Revenue has issued explanatory notes on the taxation arrangements that apply to overseas trading corporations. Copies are obtainable free from Inspectors of Taxes.

COMPANY AFFAIRS

ALBERT E. REED

AT the end of last October the interim ordinary dividend of Albert E. Reed, whose production is weighted much more towards kraft and similar papers than to newsprint, was cut from 6 to 5 per cent and the directors predicted a cut in the final payment as well. With productive capacity, including new equipment installed at a heavy capital cost, outrunning the demand for paper, investors feared the worst and thought in terms of 12½ per cent for the year to March 31, 1958, as compared with 16 per cent in 1956-57. They were too pessimistic; the final dividend is cut by only 1 per cent to 9 per cent, making the year's total 14 per cent. The price of the £1 "A" ordinary shares immediately rebounded from 30s. 6d. to 33s. 6d., to yield £8 7s. per cent.

Though profits are well down over the year—before tax they fell from £5,691,434 to £4,500,956 and after tax from £2,979,545 to £2,335,883—the key point of the preliminary statement is that trading results did not go from bad to worse in the second half of the financial year. The decline in profits in the second half of the year was held at 20 per cent, the same rate that had been recorded in the first half of the year. The table illustrates this result:

	Six months ended			
	Sept., 30, 1956	Mar., 31, 1957	Sept., 30, 1957	Mar., 31, 1958
	£'000s	£'000s	£'000s	£'000s
Turnover	26,400	32,100	29,700	32,000
Gross profit	2,714	2,977	2,170	2,331
Gross profit/turnover	10·3%	9·3%	7·3%	7·2%

The slight fall in profit margins in the second half of the year seems to be due to start-up expenses of new machines in the company's mills which came into production shortly before the end of the financial year but which made "no material contribution" to the year's income. Investors are not wrong in finding some comfort in these results. But there is still a surplus of paper-making capacity and there is no reason as yet to change the view on paper shares that is so clearly reflected in their high current yields.

UNITED MOLASSES

THROGMORTON STREET greeted the news of a maintained tax free dividend of 1s. 5d., from trading coupled with a special tax free distribution of 4½d. from capital reserve by marking up United Molasses 10s. ordinary shares. The reaction to Mr G. W. Scott's later statement was to mark them down by 2s. 3d. to 27s. xd. Mr Scott was indeed far from encouraging; profits would show a "considerable fall' this year and "may not in themselves cover the payment of dividends at the same rate as for the current year." The market seemed to overlook the chairman's rider that the directors have "every intention" of maintaining the trading dividend even though it may entail "drawing on the substantial carry forward on profit and loss account." If the depression in shipping is short lived United Molasses, holding about £15 million in liquid form out of a balance sheet total of £35 million, has the resources to pay a dividend uncovered by current earnings. But if the depression were prolonged the company, which still has new tankers and bulk cargo vessels on order, would have to think again.

Profits began to slide last year, though the fall in the trading surplus from £7,101,533 to £6,573,322 cannot be attributed so much to shipping as to the need to write £604,500 off stocks of molasses and to provide a further £126,000 against molasses contracted for at high prices that remained undelivered at the end of last year. Sales of molasses have picked up a little but at lower prices and smaller margins. Shipping is the group's mainstay, and though time charters continue to afford United Molasses some protection against the fall in spot freights, earnings from tanker and cargo voyages already show a "very considerable drop."

If the trading outlook is bleak, what are the chances of another capital distribution? Last year's capital payment was made possible by the sale of investments and of two old tankers and the consequent reinforcement of the capital reserve. United Molasses is currently negotiating the sale of its majority holding in the American concern, Olympic Portland Cement; if this goes through it should result in "an extremely substantial profit" for United Molasses. Another capital distribution is clearly not ruled out. But on the basis of the projected trading dividend alone, the 10s. units at 27s. xd. yield 9½ per cent.

FRANCE FENWICK

TIME charters also afford this shipping company some protection and, having last year earned a profit of £1,162,648 (against £1,148,070), the directors were able to maintain the ordinary dividend at 15 per cent and the tax-free capital distribution at 3 per cent. On a 15 per cent trading dividend the £1 ordinary units at 31s. 6d. xd. yield 9½ per cent. But nowadays, as the chairman, Mr Kenneth Pelly says, in fixing a tramp voyage at current rates "it is a question of working out whether the loss involved will exceed the cost of laying up, there being little likelihood of making a profit." Against that background, the directors of France Fenwick have decided to cancel three out of four reservations in the shipbuilding yards. The reasons for this decision are set out by Mr Pelly:

1. It is prudent to conserve our resources in these times rather than to continue to build at the top of the market and borrow money at high rates of interest.

2. If present conditions are to continue, I consider there will be few or possibly no orders placed at prices and conditions demanded and, in fact, there may be many cancellations of orders, resulting in a major change in the shipbuilding industry.

3. I consider that British shipbuilders are no longer competitive with foreign shipbuilders in their price or conditions . . . we must be free to place orders in the most advantageous quarters.

BEECHAM GROUP

AS promised at the time of the 10[illegible] cent scrip issue, the final ordi[illegible] dividend of the Beecham Group for [illegible] year to March 31st is set at 9 per c[illegible] making 20 per cent (against the equ[illegible] lent of 16⅔ per cent) on the new cap[illegible] The 5s. units, which have been favoured by investors over the last [illegible] or so, stand at 17s. 3d. xc. to yield [illegible] per cent. The principal investm[illegible] interest in the preliminary statemen[illegible] on the trend shown by the half ye[illegible] results rather than the full year's figu[illegible] The latter include a growth in sales fr[illegible] £28,974,000 to £34,153,000, in trad[illegible] profits from £4,516,000 to £6,093,[illegible] and in net profits from £1,867,000 to £2,516,000. The net ordinary dividend absorbs £1,174,000. From recent six monthly periods the following trends emerge:—

	Six months ended			
	Sept., 1956	Mar., 1957	Sept., 1957	Mar., 1958
	£'000s	£'000s	£'000s	£'000s
Sales	13,497	15,477	16,102	18,051
Trading profit	1,879	2,637	3,195	2,898
Net profit	722	1,145	1,396	1,120
Trading profit/sales	13·9%	17·0%	19·9%	16·1%

Thus it appears that recently the Beecham Group has achieved another big increase in sales, but at some expense to its profit margins; that could reflect heavier expenditure on advertising its proprietary drugs and foods as well as increases in prime costs.

J. & P. COATS

THE dividend policy of J. & P. Coats has been conservative to the point at which shareholders have written to Mr Robert Laidlaw, the chairman, asking why the payment has not been increased. Conservatism of this kind imposes a duty on the directors that when profits fall, as they did last year, they should maintain the payment. That they have done, leaving the rate unchanged at 8¾ per cent. But the consolidated gross profit fell steeply last year from £12,238,591 to £8,692,309, largely because of the writing off in 1957 of £1,250,000 from stocks (which required nothing in 1956) and the provision of £568,000 for exchange losses (in 1956 there were gains on exchange of £125,000).

If these items are excluded from the reckoning, the group's profits from trading appear to have come down from £12.1 million to £10.4 million. The decline in earnings seems to have occurred in overseas markets as well as at home. Declining profits from the group's overseas factories are suggested by the fall in foreign tax from £3.7 million to £2.8 million; a decline in profits earned in this country or from direct exports is suggested by the fall in British tax from £2.3 million to £1.9 million and by the drop in the parent company's gross profit from £5.6 million to £4.9 million. From the consolidated profit of £3,958,863, against £6,225,807, the repeated ordinary dividend absorbs just under £1.5 million net. The fall in the earnings cover brought the price of the £1 ordinary stock down from 21s. 1½d. to 20s. 7½d.; the yield is just under 8½ per cent.

F. PERKINS

LAST year the turnover of F. Perkins, the diesel manufacturers, fell by a third; a profit of £768,934 was replaced by a loss of £327,478; and the ordinary dividend was passed. This sudden about-turn in the company's fortunes was discussed in these columns on May 10th. In the full accounts, the chairman, Mr Frank Perkins, now says that "for 1958 there should be at least a reasonable turnover and a profit thereon." But the company has a financial as well as a trading problem. Last year, despite a reduction in stocks from £3,414,152 to £3,031,180 and in debtors from £2,597,029 to £2,088,556, the bank overdraft increased from £486,663 to £1,283,245. The company, Mr Perkins says, is in need of "additional permanent finance." To raise new money when the ordinary shares at 10s. 1½d. stand only 1½d. above par cannot be an easy task.

COPPER DIVIDENDS

THE writing on the wall, spelt out of the steep fall in the price of copper, the cut-back in Rhodesian production and heavy falls in profits, had long been evident to investors in copper shares and further reductions in copper dividends had been discounted. Even so, the sharpness of cuts in the interim dividends of the Rhodesian Selection Trust group of companies came as something of a surprise. The interim dividend of Roan Antelope is cut from 6d. to 1d. per 5s. unit, of Mufulira from 3s. 3d. to 8d. per £1 share, and of the parent, Rhodesian Selection Trust, from 8d. to 1d. per 5s. unit. Clearly there will be big cuts in the final payments as well; RST have eased from 15s. 9d. to 15s. 3d. and Roan from 7s. 10½d. to 7s. 9d.

Dunlop Rubber

FOR such an established giant as Dunlop Rubber the yield of 8½ per cent on the 10s. ordinary units at 21s. 3d. xd. looks high—higher, for instance, than the yields on many motor and component shares. Yet Dunlop's dominant role and wide international spread cannot be disputed. It ranks fifth, after the four big American companies, among the world's tyre manufacturers; it accounts for over half of the sales of tyres in this country and is especially strong as a supplier of original equipment to the motor industry; and in many overseas markets outside the United States it is a powerful producer and seller. Roughly two-thirds of its profits come from direct exports and overseas production (including its own rubber plantations).

Most of its earnings—of the order of two-thirds to three quarters—come from the sale of tyres. With its business in other motor components the company's fortunes are tied to the car industry and especially in its British business. Dunlop's profits over the last three years swung in time with the changing pattern of motor production in this country. Here is one reason for a high yield. Another is that the company's principal raw material, natural rubber, is volatile in price: in 1956 big stock losses as well as the cut-back in motor production contributed to the fall in profits, whereas the comparative stability of rubber prices smoothed the company's path last year. So much so, indeed, that while the volume of sales rose by about 4 per cent, the value of sales rose rather less, by 3.1 per cent, from £224 million to £231 million. Late in 1956 the prices of tyres in the British replacement market were raised (and only recently have been reduced). These figures of volume and value suggest that for some of its other manufactures and, perhaps, in some of its other markets Dunlop was reducing prices: the export business and the overseas trading activities of the group in 1957 "earned only slightly increased profits on a turnover approximately 1 per cent higher" as compared with an increase of 8 per cent in turnover in Britain.

Another less specific but none the less real reason for the high yield in the investor's mind is the air of caution and conservatism that the Dunlop group has sometimes worn. When profits went down in 1956, the ordinary dividend was cut from 14 to 10 per cent. The dividend is now back to 14 per cent and investors must ask themselves where Dunlop Rubber will go from here. It would be too much to say that the group has a new look, but tangible evidence that it is looking forward to the prospect of growth cannot be denied. Last year the group spent £9.1 million on capital, of which £5.6 million was spent by overseas companies; and on December 31st its capital commitments amounted to £5.4 million, the greater part of it earmarked for new factories in Rhodesia, India and France. Dunlop Rubber seems to be thinking in terms of modernisation at home and definite expansion abroad. Last year, too, the group spent over £2 million on research and development: a good deal of it must have gone into long-term research on synthetic rubber, including the experimental pilot plant at Fort Dunlop capable of an output of 1,500 tons a year. But research on textiles and the development of pneumatic suspension and of disc brakes show that the group's effort extends beyond its basic raw material.

Yet in a sense the real test of the future and of Dunlop's role rests on rubber. The British rubber industry has been slow to go into synthetic rubber—perhaps unavoidably so, given the pace of development of petroleum chemicals. But after long delay it moved; the synthetic rubber plant at Fawley, set up at a capital cost of £3 million by a syndicate of tyre manufacturers, should come on stream in the next few months. The plant will produce a GRS type of rubber but under a modified formula involving small royalty payments to American producers. Its nominal rated capacity was designed at 50,000 tons a year but—and this is a measure of the inherent difficulty of designing chemical plant to a given capacity in the present state of the art—it is likely to be able to produce about 70,000 tons a year. If so, the British industry's dependence on North American for synthetic will be reduced to a minimal quantity. Dunlop owns about 45 per cent of the equity of the Fawley plant and it has interests in similar plants in Germany and France. If costs at Fawley compare favourably with American GRS, then the British rubber industry and Dunlop will have taken a clear step forward.

London Stock Exchange

FIRST DEALINGS:	May 14	June 4	June 18
LAST DEALINGS:	June 3	June 17	July 1
ACCOUNT DAY:	June 10	June 24	July 8

THE reduction in Bank rate caused a sharp revival in short-dated stocks which had eased at first under the influence of the slight rise in the Treasury bill rate at last week's tender. But the short-dated issues had begun to move up before the Bank rate announcement. On Thursday, 4½ per cent Conversion, 1962, rose ¼ to 99½ and 5½ per cent Exchequer, 1966, rose ⅝ to 101¼. Gains were extended in long-dated Government issues, among which 5½ per cent Funding 1982-84 and 3 per cent Gas 1990-95 rose ⅞ and ⅝ respectively over the week. Among the irredeemables, 4 per cent Consols gained ½ on balance to 74¼, but Old Consols only improved ⅛ to 50⅛.

There was a cautious improvement in industrial shares during the week which carried *The Economist* indicator up 2.0 to 184.4. But gains made after the Bank rate decision were small. Bank stocks, however, responded briskly, Barclays rising 1s. 1½d. to 42s. 7½d. and Lloyds a similar amount to 44s. 7½d. Prudential "A" improved by 2¼ over the week. Brewery and paper shares were firm, and further rises occurred in tobacco stocks; BAT gaining 6d. to 45s. 6d. Bowmaker improved 9d. to 23s. 4½d., and other finance houses made small gains.

The advance in Kaffirs broadened; prices advanced throughout the week supported by steadily increasing business. After hesitating on Thursday, prices resumed their advance. Among the Central Rand mines, City Deep rose 1s. 10½d. to 17s. 7½d., Durban Deep 4s. to 32s. and Crown Mines 3s. 1½d. to 29s. Venterspost gained 2s. 4½d. to 15s. 10½d., and President Brand 4s. to 52s. 3d. Of the finance houses General Mining put on 4s. 4½d. to 91s. 3d., Anglo-American Corporation 8s. 9d. to 135s. The movement extended to West African and Australian mines. Copper mines were easier following the latest dividend reductions.

(1) Employment figures relate to June of each year; other figures are monthly averages. (2) Engineering, shipbuilding, electrical goods, vehicles, metal goods, precision instruments and jewellery. (3) Textiles, leather goods, clothing, food, drink and tobacco, manufactures of wood and cork, paper and printing. (4) Number registered as unemployed expressed as a percentage of the estimated number of employees. (5) From June, 1956, onwards, comparison with earlier figures is affected by the revocation of the Notification of Vacancies Order, 1952. (6) United Kingdom. (7) Figures have been revised back to July, 1956, on the basis of mid-1957 count of National Insurance Cards.

(1) Relates to wholesale prices in Athens and Piraeus only for Greece. Figures for Ireland from 1955 onwards are for home-produced goods only. Figures for Germany, F.R. are producers' prices of industrial products. (2) July-December. (3) Relates to prices in capital cities only for Austria, France, Greece and Turkey. Austria and Belgium exclude rent. Denmark includes direct taxes. Figures for Ireland are based on August, 1953=100. (4) Including direct taxes. (5) Including trade with Faroe Islands. (6) Index numbers of unit value which compare the current average value of trade with its value in 1953; they are influenced by changes in the composition of trade as well as price movements. Export prices in Ireland are adjusted for seasonal variations. (7) Deposit money and notes and coins held by business, individuals and foreigners. Except for Greece, holdings of the issuing authority and other banks are excluded. (8) Holdings of the government and central bank at end of period. Foreign exchange figures for Norway exclude government holdings; Netherlands, Norway and Sweden include foreign investments. Ireland includes some long-term securities. (9) Beginning May, 1954, a new drachma equal to 1,000 old drachmas was introduced.

Financial Statistics

EXCHEQUER RETURNS

For the week ended May 17, 1958, there was an "above-line" deficit (after allowing for Sinking Funds) of £15,522,000 compared with a surplus of £3,725,000 in the previous week and a deficit of £21,650,000 in the corresponding period of last year. There was a net expenditure "below-line" of £22,042,000, leaving a total deficit of £74,075,000 compared with £39,432,000 in 1957–58.

THE MONEY MARKET

THURSDAY'S cut of ½ per cent in Bank rate was followed by a corresponding cut in the fixed rates in the money market, bringing deposit rates at clearing banks and discount houses down to 3½ per cent, and the clearing banks' minimum rate on call loans to 3¾ per cent. The timing of the Bank's move came as a minor surprise to the market, though not to the extent that the upturn in the Treasury bill rate at the two preceding tenders would suggest. The *volte face* made by the discount market in reducing its bid by 1s. per cent (marking a rise in the rate of 4s. per cent) at the tender on May 9th was essentially a tactical move against the "outside" tenderers.

At last Friday's tender, the fall in the market's rate was resumed, the common bid being raised by 3d. to £98 14s. per cent; but the outsiders were moving in the opposite direction, to bring themselves into line with the cut in the market's bid the week before. Hence their share of the bills fell—allotments at the market's common bid rose from 20 to 44 per cent—and the average rate of discount on the whole allotment again rose, to over 5⅛ per cent, more than ⅛ per cent above the rate a fortnight before.

On the three days preceding the Bank rate reduction, the discount market was consistently "in" the Bank; but on each day the amount borrowed at the penal rate was small, and taken after the Bank had given special help through purchases of bills.

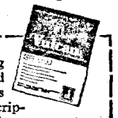
And the difference?

Maybe £5,000



How?
He spotted a fault in the safe load indicator and an accident has been prevented.

Who?
The Vulcan Engineer-Surveyor during his regular inspection of the crane. His experience gives him almost second sight into accidents that are waiting to happen.

Are his services expensive?
Not at all. Your broker will tell you that, though the Vulcan man is a specialist, his services cost no more than insurance and inspection by general practitioners.

What Vulcan insures, Vulcan inspects—thoroughly and regularly. As a result our clients have made us one of the largest engineering insurance companies in Europe.

Pension & Life Assurance Scheme

The Board of Associated Engineering Ltd. are pleased to announce that they are installing, as from 1st July 1958, a Pension & Life Assurance Scheme to cover all employees of the Subsidiary Companies for whom no provision is at present being made. The Scheme will cover approximately a further 6,000 people and the Company will be paying a substantial part of the cost.

The Scheme has been arranged in conjunction with their Pension Advisers, Hobbs Savill & Bradford (Pensions) Ltd. of 29/30 St. James's Street, London, S.W.1 and will be assured with The Friends' Provident & Century Life Office.

Engineers' Guild

A very comprehensive Pension Scheme was recently installed for Professional Engineers by Hobbs Savill & Bradford (Pensions) Ltd. and the Friends' Provident & Century Life Office.

looking ahead to CANADA - 1980

- **Labour Force to Grow 80%**
- **Natural Income to Triple**
- **Per Capita Income May Double**

We all know just how rapidly Canada is growing, but the Gordon Royal Commission was the first to make any studied forecasts of that development. The growth predicted by 1980 will mean constant changes in Canada's economy. Through our more than 480 branches of the Toronto-Dominion and by our close participation in that economy, we're right at the centre of all Canadian business activity...able to assist any manufacturer planning market expansion in prosperous Canada by supplying such information as:

• market statistics • corporation procedure • information on plant sites
• advice on customs problems • data on market distribution • incorporation procedure

COMPANY MEETINGS

LOW & BONAR LIMITED

A SATISFACTORY YEAR'S OPERATIONS

SOMBRE BACKGROUND IN TEXTILE INTERESTS

IMPORTANCE OF OVERSEAS UNDERTAKINGS

MR H. V. BONAR ON CURRENT PROSPECTS

The forty-sixth annual general meeting of Low & Bonar Limited, will be held on June 11th at Dundee.

The following is the Statement by the Chairman, Mr H. V. Bonar, circulated with the report and accounts:

Before proceeding with my general remarks I have to refer with deep regret to the resignation from the Board owing to ill health, on 30th November last, of Mr Thomas H. McLaren. Mr McLaren, who was also Managing Director of your flax spinning and weaving subsidiary, Baxter Brothers & Co. Ltd., will be much missed by his colleagues both in the Flax Trade and on the Parent Company's Board. I should like to take this opportunity of expressing thanks to him for the many years of sterling service which he has given, and the unbounded enthusiasm which he put into that service.

The Directors' Report and Accounts for the year to November 30, 1957, which now come into your hands give the picture of what has again been on the whole a satisfactory year's operations. Looked at in the bread, some decline in returns from textiles in the United Kingdom has been offset by an excellent year in our Canadian operations and some increase from the Engineering Division, though the prudence of taking extra depreciation on Fixed Assets in Transparent Packaging and certain of the Group's textile sectors has resulted in the Nett Consolidated Profit being somewhat down on last year.

OUTLOOK FOR CURRENT YEAR

Your Directors, however, have thought it necessary both in their Preliminary Announcement and in the compilation of their Report to you, to draw some distinction between past results and current prospects, and to warn you of the likelihood of an appreciable drop in earnings in the current year. While at the moment we expect satisfactory contributions from Canada and from Southern Africa, it seems idle to expect a repetition of last year's excellent figures from the first area in view of the North American recession, or a maintenance of as good figures as last year's from the second area in view of the all-over slowing down of world trade and the low prices of commodities. In the UK itself we may, I think, fairly look for some increase in earnings from our Engineering Division. The tremendous drop in copper prices over the last two financial years—and such a fall cannot be fully hedged—has meant lower earnings from this source than were truly representative of the forward strides which have been made both in volume of overturn and diversity of product. It is true that copper has fallen somewhat further since 30th November last, but a provision has been set up in the Accounts to take care of this, and in any event that fall, or indeed any further falls, can only be of a minor nature compared to the falls of the preceding 24 months. The expected increase, however, from our *Engineering* Division is likely to be more than offset by a deterioration in the Group's UK textile operations, whether manufacturing or merchanting, and whether jute or flax. There can unfortunately be little doubt of this trend, nor of the fact that in the textile field we are in a period of real difficulty.

As far as flax is concerned, the lack of demand arising from Government economies, reduced Defence buying, etc., which I referred to last year, has now been intensified by the recession in the shipping industry. The shipping industry has long been one of the main and most regular consumers of heavy flax canvases. Nor does there appear any early prospect of a revival. This has inevitably meant some reduction in activity and employment of labour in the past few months, with the concomitant increase in the overhead burden on the balance of production. Every effort is, of course, being made to find economies to offset this increase and to explore the possibility of new markets.

THE GOVERNMENT AND THE JUTE INDUSTRY

The United Kingdom Jute Industry has been much in the public eye, at least in Scotland, over the last few weeks and months, partly in its own right, and partly because of the weight which it exercises on the employment situation in Dundee and district. I made reference last year to an impending statement by the President of the Board of Trade regarding action "to restore to some degree the competitive position of sacks made from imported jute cloth vis-a-vis substitute materials." That action came shortly after our last Annual General Meeting and took the form of a reduction of 10 per cent in the mark-up applied by the Jute Control to those widths and weights of certain lines of imported cloths which form in fact the great bulk of the standard sack usage in this country. At the same time he tied the future price level within the United Kingdom of these particular goods to the price movements of the Indian goods market instead of to the price movements of the Pakistan raw jute market, which had been the main controlling factor, and which remains the main controlling factor, on all other internal United Kingdom jute yarn or cloth prices. By this action, which can only be considerid as in some degree a breach of the many past undertakings given to the Industry regarding protection (on the basis of these undertakings millions of pounds have been spent on re-equipment by the Industry within the past few years) the Board of Trade immediately made it uneconomic for the Dundee and District Industry to produce these particular cloths. For many years past the Industry has produced a sufficient tonnage of these goods to balance out and reduce the overhead upon all their other more specialised productions. Moreover, inasmuch as the price of Indian manufactured goods is somewhat lower than that ruling in the early days of August last year while the price of Pakistan jute is relatively unchanged, the gap between the sales price in the United Kingdom of these standard widths and weights and that of the rest of Dundee and District's productions has widened. This has had two further unfortunate results. Firstly, it has tended to tempt certain marginal consumers off Dundee and district specialities, where these were of a nature somewhat similar to standard imported goods, and secondly, in order to minimise the effect of this first point, it has forced manufacturers to absorb rising labour and raw material costs to a degree which is becoming dangerous to the long-term interests of the Industry. The result of this Government action is already clearly to be seen in a falling off in activity and profitability, perhaps more particularly on the weaving side of the Industry.

EMPLOYMENT IN DUNDEE

This falling off in activity and profitability is serious enough but from many points of view the consequent decline of employment in Dundee and District is much more serious still, particularly coming as it has done at a time when the recession in North America—to which the Jute Industry sends a considerable volume of exports—is already having a sharp effect on local employment. The employment position in Dundee is even now a black spot in Scotland, where the all-over unemployment figure was well above the average for the country as a whole. Moreover, the Government has refused, at any rate up to this date, to give any categoric assurance that further steps along the lines taken in July last may not from time to time be taken. With this background I wish most heartily to endorse the resolution of the Scottish Council (Development and Industry) which was passed to the Secretary of State for Scotland at the beginning of April. This resolution presses strongly that, altogether apart from considerations of how far the Government was committed by past pledges, and from any considerations of policy regarding the long-term future of the Industry, any further exposure of the Angus Jute Industry to competition from India should not be allowed to occur any faster than the build up of alternative sources of local employment, and that moreover the Government should make an official announcement to this effect with the least possible delay.

Your Group's jute spinning and weaving activities inevitably must suffer with the rest

of the Trade in these difficulties. I am able to say, however, that while our weaving establishment is clearly suffering sharply from them, we have in spinning, thanks to concentrating to a greater degree on specialities, a reasonably good order-book.

Our recent jute goods merchanting figures show some decline as compared with the same period of last year, a decline which would appear, as far as the Home Trade is concerned, to suggest that the Board of Trade action in July, which has had such serious implications for the spinning and weaving industry, has at the same time failed in its ostensible purpose of making jute bags of standard types more competitive with substitute materials.

HIGH PRICE OF RAW JUTE

Before concluding my remarks upon jute, I should like for the third year in succession to draw the Pakistan Government's attention to the fact that it is its policy of crop restriction, high prices and export duties which constitutes quite a major part of our difficulties, and not only of our difficulties but those also of all the long-established European jute industries, and this despite the fact that we and they are amongst Pakistan's best customers. This point was clearly made to Pakistan at a World Jute Conference held in East Pakistan towards the end of last year, but from actions and trends since that Conference it would appear that the representations then made have fallen upon deaf ears.

DIVERSIFICATION

With this somewhat sombre background in our UK textile interests added emphasis must necessarily be given to the Group's long-term policy of diversification. This is now not only important in the Group's own interests but also in the interests of employment in Dundee. With this in mind the Board have recently authorised, and work has started upon, a further major extension to the Group's engineering subsidiary, Bonar, Long and Company Limited. This extension will involve capital outlays, when completed, of between £175,000 and £200,000 and will put Bonar, Long in a position to manufacture the very large sizes of transformers at present outwith their range of manufacture. I am glad also to be able to report that Bonar Long's Switchgear Department has built up its overturn most satisfactorily, and is now making a healthy contribution to earnings.

Our modest electrical contracting venture through Sturrock Power Installations, Limited, made a small profit in the year to [illegible] and it should continue to grow slowly in stature, subject, of course, to the temporary effects of any recession in the general economy, and building in particular.

With this growing need for diversity I am sorry to have to report that the Group's modest venture in the Transparent Packaging field has so far proved a sharp disappointment. This business has proved far more difficult to bring on to a satisfactory basis than we had earlier anticipated. One problem after another has arisen, culminating in some recession in demand. Losses, which while small in the perspective of the whole scope of the Group's activities are nonetheless heavy in this particular Division, are still being recorded. This is a matter which is seriously engaging your Board's attention.

OVERSEAS

This review would not be complete without some further reference to the Group's overseas undertakings, which as you know form today such an important part of the organisation as a whole.

In Canada the year that has passed was a good one—indeed, in Eastern Canada an excellent one. In Eastern Canada we got the full advantage during the year of our previous capital outlays in the paper bag field, and this considerably more than offset any decline in textiles. Our Canadian Management are due hearty congratulations upon their achievements. While the chill wind of recession blows now in Canada, and while our operations are bound to be affected by it, if the general economy there deteriorates no further the current year should still be a satisfactory one.

In Southern Africa our local Board was again able to produce figures which although down on the previous year were nonetheless a first-class achievement in the highly competitive climate in which they were operating. Despite some fall of turnover in the early months of this year as compared with the same period last year, and despite the fact that there was certainly no easing in the tempo of competition, they are not unduly pessimistic regarding the future. Clearly a drop in earnings must be expected, but unless things take a turn for the worse they see no reason at the moment why they should not produce a reasonable contribution in the current year to the Group's figures.

Once again, before closing this review, I would like to express my gratitude and appreciation to all my colleagues, at all levels throughout the Group. They put in an excellent year's work, and struggled loyally and unremittingly to further your interests.

VIGZOL OIL COMPANY LIMITED

MR PERCY BILTON'S STATEMENT

The twenty-ninth annual general meeting of the Vigzol Oil Company Limited, was held on May 19th, Mr Percy Bilton, FInstPet, MISAE (chairman and managing director), presiding.

The following is the chairman's circulated statement for the year ended December 31, 1957:

I think the results of your Company's activities during 1957, as shown in the attached accounts, will be received with general satisfaction by all shareholders. This achievement is all the more gratifying when one considers the heavy buying of lubricating oils by consumers during the Suez crisis of late 1956 and the first few months of 1957. In the latter part of 1957 the nation-wide demand for lubricating oil declined substantially from its normal level. Your company weathered this set-back very convincingly.

PROGRESS OF AGRICULTURAL CHEMICAL DIVISION

Our Agricultural Chemical Division continues to make substantial progress. Towards the end of the year under review, a foliar nutrient in a new formulation—NATURFEED—was developed by your company and is being introduced to the farming community this year, 1958, with very satisfactory results up to date. This chemical solution takes advantage of the discovery that agricultural crops can be fed by applying liquid fertiliser direct to the foliage in the form of a fine spray. Apart from the benefits which this new system confers under difficult growing conditions, it also provides an additional use for your company's Spraying Machines. Two more models of our Spraying machines were introduced at the Smithfield Show in December, 1957. Sales have so far been very satisfactory.

Your subsidiary company in Dublin again had a good year. Your South African Company, formed last year, is gradually making progress. Exports continue to be very satisfactory.

A RECENT ACQUISITION

Your company has recently acquired the share capital of a small oil company, viz. The Record Oil and Grease Company, Limited, of Manchester, who have been established in the industrial oil business over eighty years. Your Board are confident that, with the savings that can be effected, this further subsidiary will make a fair contribution to our future profits. This acquisition follows your Board's policy of broadening the basis of your company's business.

It is expected that my statement should refer to present trading and the future prospects of your company. At the moment sales of all products are reasonably close to the comparable 1957 figures and the final outcome must bear some relationship to the general levels of farming and industrial activity of the remaining period of the year. We have an excellent range of products, a nation-wide coverage with well-trained, enthusiastic salesmen, and a large body of distributors and customers. Finally I would like to thank, on behalf of the Board and the shareholders, all our staff, both in the field, in the office and works, for their co-operation, loyal and conscientious work, which has resulted in maintaining our profits during a difficult time.

The report and accounts were adopted and a final dividend of 20 per cent actual (less tax) was approved.

IMPERIAL CHEMICAL INDUSTRIES

STEADY CHANGE IN PATTERN OF OPERATIONS

SIR ALEXANDER FLECK ON LONG-TERM POLICY OF EXPANSION

The thirty-first annual general meeting of Imperial Chemical Industries Limited was held on May 15th in London.

Sir Alexander Fleck, KBE, DSc, LLD, FRS (the Chairman), presided and, in the course of his speech, said:

Group sales to external customers have risen from £435 million in 1956 to £463 million in 1957. There is a steady change in the pattern of our operations, and a larger proportion of our turnover and profit comes from new products. Products which were not manufactured before the war accounted for a quarter of our home sales and a third of our export sales. We have reason to hope that this trend of increasing turnover and increasing profit from new products will continue. At the same time much expenditure has been incurred in extending, modernising and improving the plants which manufacture our more traditional products, and the drive for improved efficiency goes on all the time.

With sums set aside out of profit and with the premiums on the issue of Ordinary shares and other capital items, the Company's reserves at £171 million now exceed the Issued Ordinary Capital of £144 million. Rates of dividend declared on Ordinary Capital may, in these circumstances, appear to be an adequate or even excessive return when in fact they are not. It is for reasons of this kind that your Directors decided to issue one new Ordinary Share of £1 each for every £2 of Ordinary Stock held. This action has been approved by the Extraordinary General Meeting of Stockholders which was held immediately prior to this Annual General Meeting, and which sanctioned the necessary increase in the Company's share capital.

EMPLOYEES' PROFIT-SHARING SCHEME

You will remember that when the Employees' Profit-Sharing Scheme was introduced, the Board regarded it as a great industrial experiment aimed at several objectives. Although it is still early days, we are pleased with the results that have been so far achieved. This scheme is, of course, affected by the Scrip Issue. Under the Scheme, all eligible employees receive a bonus, which is expressed as that percentage of their total emoluments by which the Ordinary dividend for the year exceeds 5 per cent. The bonus is given in Ordinary Stock of the Company.

Sir Alexander then reviewed at length the altered basis of the Scheme necessitated by the alteration of the Company's capital structure, and said: I think you will agree that the new arrangement represents a better basis both from the stockholders' and from the employees' points of view.

REVALUATION OF ASSETS

The table in the Annual Report shows that the gross Ordinary dividend expressed as a percentage of the total funds belonging to Ordinary Stockholders has varied in the last ten years from 3.4 per cent to 5.8 per cent, and in my opinion this percentage is, if anything, too low. To some extent this percentage actually overstates the return to the Ordinary Stockholders on the total of their funds in the Company, and this is due to the simple fact that much of the capital was put in when the pound was worth more than it is today. In an effort to correct the position, our manufacturing assets in this country were revalued in 1950, and this is one of the reasons why the return as shown in the records fell from 5.8 per cent in 1949 to 3.4 per cent in 1950. We have come to the conclusion that the time has arrived for a fresh revaluation of our manufacturing assets, because there has been considerable further inflation since 1950. This revaluation has now been made as at January 1, 1958, and will be incorporated in the Accounts for 1958.

The net book value at January 1, 1958, goes up from £326 million to £396 million, and the total depreciation on these assets in 1958 will rise by about £2 million. There will, of course, be added the depreciation on new assets brought into use during 1958. The principles of revaluation are the same as those employed in 1950.

FUTURE PROSPECTS AND PLANS

For the first few months of this year we have had to face, in the home market, the results of the high Bank Rate and the credit squeeze. Our sales to some industries have been reduced as a result of the difficulties they have been facing, but in other cases demand has held up well, and for the first few months of 1958 home sales turnover has not been unsatisfactory.

So far as exports are concerned, conditions in the same period have become considerably more difficult, partly as the result of the tightening of import restrictions, but despite this, sales are running reasonably close to last year's.

It is more than usually difficult for me to give an indication of how the current year as a whole will turn out. A major uncertainty lies in the forecast of American conditions, which affect both our export and, to some extent, our home trade. That there is a serious recession in the United States cannot be doubted. Average unemployment in Britain is at present only 2 per cent, whereas it is as much as 7 per cent in the United States. We are experiencing signs of weakening demand in some of our overseas markets and also in some sections of our home market.

Your Directors remain confident in the long-term future of the business. If the demand for some of our products appears to weaken or fails to rise in accordance with our expectations, we shall not be deterred from carrying out our long-term policy of expansion. We shall continue to spend capital on the erection of new plants, or on the extension of existing plants, not with an eye on the demand in the next few months but rather with a faith in the long-term trend of demand for our products. In this way, we believe that we shall serve not only the interests of our customers, our stockholders and our employees, but also the interests of the country as a whole, as our capital expenditure will make a modest, but significant, contribution to the stability of demand for the products of other British industries.

The report was adopted.

This announcement is neither an offer to sell nor a solicitation of an offer to buy these securities. The offer is made only by the Prospectus.

ROLE OF THE POPULAR PRESS

Mr. Cecil H. King on its aims and influence

DAILY MIRROR INCREASED PROFITS—SALES MAINTAINED

The thirty-eighth Annual General Meeting of the DAILY MIRROR NEWSPAPERS LIMITED was held on the 21st May, 1958 at Brettenham House, Lancaster Place, London, W.C.2.

Mr. Cecil H. King, Chairman and Managing Director, said:

GENERAL REVIEW AND PROSPECTS

The result for the year discloses a trading profit, after all charges except taxation, of £1,438,005, an increase on the previous year of £777,030. The revision in the selling price of the *Daily Mirror* last October contributed materially to the increase. The sale of the paper was not seriously affected by the price rise.

Demand for advertisement space justified our producing larger sized papers throughout the year, thus giving the public better value for money.

Production costs were affected by a higher price for newsprint, a rise in railway freight rates in August last, and a revision in salaries and wages from 1st December, 1957.

Associated TeleVision Limited and The Herald and Weekly Times Limited contributed for the first time to our investment income and, with a non-recurring payment from the company that supplies us with printing ink, the total income from Trade Investments was over £50,000 more than for the year 1957.

The Balance Sheet shows that we expended a further £951,930 on the new building and machinery for it at Holborn Circus. You will appreciate that it is essential for the cash resources of the Company to be conserved to finance the capital commitments attaching to the new building. For this reason, we recommend only a moderate increase in the dividend on the Ordinary and 'A' Ordinary capital. Barring unforeseen developments, the results for the present year should be satisfactory.

The profits of Anglo-Canadian Pulp and Paper Mills Limited were adversely affected by the premium on the Canadian dollar. The present situation of overproduction in the pulp and paper industry does not affect our confidence in the future of that company, and of Albert E. Reed and Company Limited.

Despite a further decline in sales, *Reveille* continues to make a profit, although a smaller one than in previous years.

The trading results of the Scottish Daily Record and Sunday Mail Limited have been satisfactory since the increase in selling prices. In the foreseeable future that company should be making a regular contribution to group income.

The profit made by the West African group of companies again increased. Higher revenue was, however, largely absorbed by additional costs, particularly wages and salaries.

The profits of the radio interests in Australia have increased. The Sydney television station, in which we have a small interest, is showing improved results.

FUNCTION OF THE POPULAR PRESS IN MODERN SOCIETY

The popular press, of which the *Daily Mirror* is the most successful example, often comes under fire from critics whose violence is matched only by their ignorance. Their spectacular denunciations must puzzle the many millions who look to the more sprightly papers for guidance in national and international affairs, as well as for entertainment.

One of the astonishing aspects of these attacks is the variety of invective which flows from the pens of an equally varied collection of commentators. We ourselves, for instance, have at times been accused of being 'an explosive purgative' and 'a daily narcotic'—strangely varied descriptions.

There is so much confused criticism of the *Daily Mirror*, and of other popular papers, that one cannot escape the conclusion that many people totally misunderstand our function. While fear of the press is one motive for some of the more abusive attacks, in other cases calumny cascades on us for less honourable reasons; among them, political bigotry, social snobbery, and, on occasions, sheer envy.

It is sometimes suggested that a large sale is a sign of moral turpitude; a small sale, of virtue. This is nonsense. There are responsible, reliable and authoritative newspapers with large sales as well as irresponsible and unreliable newspapers with small sales. In no other industry is it considered immoral to design the produc one is selling to suit the market at which it is aimed.

PRICKING THE BUBBLE OF BUREAUCRATIC POMPOSITY

Let me efface once and for all the sneer, fostered by self-styled intellectuals, that the people who buy popula newspapers neither read nor think. In my opinion they think very clearly and decisively, but with their feet firmly on the ground. They do not bury their heads in the sand, like the mental ostriches who swear by the fuddy-duddy press; nor do they carry them in the clouds. The men and women and teenagers who buy the *Daily Mirror* have character and courage and good common sense; their fight is our fight, and they welcome the weapons we wield effectively to prick the bubble of bureaucratic pomposity, to safeguard the liberty of the individual, and to alert the mass of the people to the perils facing them. Our critics would be delighted if we would cease our vigilance and let the rust of disuse and neglect blunt these weapons. We shall continue. I assure you, to give our readers the news, and our views, in good plain language.

One of our most important duties in this past year has been to inform the public of the unparalleled achievements in the world of science. The Space Age is with us; and the popular press, more than any other medium, has gone to immense pains to explain the significance of Russian and American satellites circling the globe, and to describe the considerable British achievements with Zeta and other aspects of nuclear power. The *Daily Mirror* led the field with a series of Space Mirrors, which dealt with these complex matters in a way everyone could understand. No part of the earth was too distant for The Man from the Mirror to be there when major scientific history was being made. We sent a man half way round the world to report the British H-bomb explosion at Christmas Island; our reporters joined the American scientists in the Nevada desert when new atomic devices were being tested, and in Florida when the first United States satellite went up.

ALL NATIONAL NEWSPAPERS PART ENTERTAINMENT

Papers for the millions tend to use larger type and pictures, and their contents have more emotional overtones than the more staid, inhibited journals. Some groups in our community like their newspapers to stir them emotionally—to be sensational newspapers, in fact. Other groups prefer a more intellectual approach. There is nothing moral or immoral about either of these preferences. All the national newspapers are part information and part entertainment. In the popular field the element of entertainment is larger, but that arises from the appetite of the reader, not from any lack of virtue on the part of the proprietor. There are those who think that success in popular newspapers is assured by flamboyant headlines and by front-paging feminine pulchritude, but that success in pompous journals is more difficult to achieve. This is not true.

We at the Mirror give more thought to the contents of our paper than is the case elsewhere in Fleet Street. Success for us involves the closest contact with our readers and a sensitivity to atmosphere as it changes. Next year's paper should be different from this year's, but how? And how much? The bond of warm affection between the *Daily Mirror* and its readers must be strengthened. Respect for our independence, integrity and forthrightness must be increased.

What effect will television have on newspapers? We can see some effects, but only some. Commercial television has made an immense impact on the British family and home. The BBC, with its self-importance and snobbery, was for many years so far out of touch with popular thought that it made no public impact at all. Competition has enlivened it, and now that we have the new medium in enterprising hands there is no knowing what effect it will have on life in England, on advertising, and on newspapers.

PRE-EMINENCE OF THE PRINTED WORD

A critic recently claimed that if popular newspapers are damaged by commercial television, they have only themselves to blame, because they have encouraged readers to demand entertainment. Television can entertain, he added, more effectively than newspapers, therefore the pre-eminence of the printed word is in jeopardy. We are left to infer that if the *Daily Mirror* and other popular papers, filled their pages with high-brow articles designed to transform the entire population into 'intellectuals' the world would be a better place. I do not agree.

The popular press has recently faced a barrage of ill-tempered and ill-founded charges reflecting on our attitude in matters of private grief. The word 'intrusion' has been bandied about by mischief-makers who would be better employed in setting their own house in order, and has been falsely applied to responsible reporters and photographers who have been honestly going about their job of recording the events of the day.

I take this opportunity of rebutting these charges. Our own staff must have initiative and determination in face of the formidable difficulties which they frequently meet in the course of their news-gathering, but they are expected at all times to show courtesy and consideration. I am satisfied, from personal investigation, that they do so.

One test of a newspaper's strength is the loyalty of its readers in times of adversity. The Mirror's family of fourteen million readers is a happy one and the largest in the world. When prudent housekeeping led us, with the rest of the popular press, to increase our price to 2½d. last year, we retained greater goodwill and suffered a lower percentage loss than any of our competitors among the popular papers. Our Scottish paper, the *Daily Record*, enjoyed a similar constancy. One reason for such loyalty is that every page of every issue can be read, understood, and absorbed by every reader.

FRIEND, TUTOR, COUNSELLOR, ENTERTAINER

What of the future? I make this prophecy. When the history of the twentieth century is written, its chroniclers will need to devote a special chapter to the growth and influence of popular newspapers. I believe their judgment will be that the *Daily Mirror* has filled with honour and a high sense of duty the part of friend, tutor, counsellor and entertainer, to the many millions who form its daily readership.

LONDON AND MANCHESTER ASSURANCE COMPANY LIMITED

ASSETS EXCEED £60 MILLION

RECORD TOTAL INCOME

LORD GRANTCHESTER ON STATE PENSIONS

The Eighty-ninth Annual General Meeting of London and Manchester Assurance Company Limited was held on May 14th at the chief office, Finsbury Square, London, E.C.

The Right Honourable Lord Grantchester, OBE, chairman of the company, who presided, said:

Our report and the accounts for the year ended December 31st last have been in your hands for some weeks. I hope the new form in which the accounts are presented commends itself to you for clarity and that you found the report of your directors comprehensive. My remarks today will be more in the nature of comment than explanation. You will note some milestones passed. For the first time the total assets exceed £60 million. For the first time the total income exceeds £10 million.

No change has been made by the actuary in the basis adopted for the valuation of the company's liabilities in respect of its assurance contracts. For the new classes of business a basis appropriate to the particular circumstances has been used.

INDUSTRIAL BRANCH

I will refer first to the industrial branch which was the original business of the company and is still the largest account in premium income. It is important to note that with a premium income under £4 million you are asked to approve accounts which provide for bonuses to policy holders costing this year nearly £600,000. This is outside and in addition to our contractual liability and represents progressive improvement of the contract of insurance which has come to be expected from competitive private enterprise. I do not believe such a practice would be followed if the business were taken over by the State.

More and more closely as the years pass does the industrial branch conform to the pattern of the ordinary branch so that the only real distinguishing feature of this branch is the convenience of the service provided through weekly collections at the home of the policyholder. I am sure that in many other instances the public would welcome the saving of their time and energy which a weekly service in the home provides. Inevitably such a service must add to the cost of the business, but how costly is the loss of time, for instance, in going to the post office and often waiting in a queue or in compiling PAYE returns, items which are entirely ignored in computing the cost of Government controlled administration. To keep the cost of this home service to a minimum is one of the primary concerns of your board.

ORDINARY BRANCH

Turning to the ordinary branch, I think you will agree that the progress of this branch has not been unsatisfactory. Owing probably to the general reluctance to look far ahead, policyholders are still tending to ask for policies maturing within a comparatively short period thus minimising the value of the life insurance element which it is our primary object to provide. You will observe the very heavy maturities shown in the accounts. It is gratifying that so many policies run their full course thus enabling policyholders to enjoy the full benefit of their thrift.

FIRE AND GENERAL DEPARTMENT

The fire and general department has again contributed to the comprehensiveness of the company's service.

Our thanks are due to the directors, management and staff of the County Fire Office for their continued assistance in this branch. I am pleased to say that the relations existing at every level between the staff of the London and Manchester and the staff of the County Fire Office are of the happiest character.

INVESTMENT TRUST RETIREMENT ANNUITIES

I referred last year to our retirement annuity policy which we had introduced to meet the demand for a policy under which each premium and annuity payment is linked with equity values at their dates of payment. This year you see the figures for the first year's business. I am sure you will agree a premium income of over £¼ million in the first year shows that the initiative we took in this field was well justified.

It is of interest that the Institute of Chartered Accountants has incorporated our policy as one part of its own retirement scheme for its members.

In our opinion the real foundation for such a policy is the belief in a growing and expanding economy. The future prosperity of this country depends upon the brains of our people, the flexibility of our economic structure and the maintenance of a sound currency.

CHEAPER INSURANCE THROUGH REDUCED RATES AND INCREASED BONUSES

If further inflation can be avoided we may reasonably expect and press for reductions in the prices of manufactured products. There has already been a considerable fall in the cost of basic commodities and a heavy fall in shipping freight rates. Adjustments in passing on these reductions seem overdue. In this matter of reducing prices I can claim we have made our contribution. Our policyholders have benefited from the higher rate of interest earned on the funds which this year was £5 15s. 2d. per cent. Bonuses have again been increased. We have also been able to quote very favourable terms for immediate annuities and have received nearly £¼ million during the year for the purchase of such annuities.

STERLING SINGLE PREMIUM RETIREMENT ANNUITIES

Our Investment Trust Retirement Annuity is drawn in the form of a succession of single premiums and thus the annuitant is able, within certain specified limits, to decide each year how much premium he will pay. As this facility is much appreciated by an annuitant whose income fluctuates, a few weeks ago we launched a sterling retirement annuity at very competitive rates which incorporates this feature, and I am pleased to tell you that already the response has been most gratifying.

INVESTMENTS

From an investment point of view I can only describe this year as a particularly boisterous one. We hope there will not be a recurrence of the rough period since midsummer during which the prices of securities have been so variable on account of financial considerations rather than because of a falling off in production. In spite of this, I am pleased to be able to say that at December 31st last the market value of our assets exceeded by a reasonably comfortable margin balance-sheet values less the investments reserve fund.

It will interest you to know that all our investments in Government, municipal, and public board stocks and over 90 per cent of our debenture stocks are in securities which are definitely redeemable. The market value at the end of the year of these redeemable securities was less than their ultimate redemption values by no less than £7 million.

PENSIONS

As the subject of pensions has been much in the news of late I should say that we do not consider compulsory contributions, however they are levied, the right way to provide a universal pension in excess of a minimum flat rate in line with other State regulated benefits.

We consider that any State pension scheme should be limited to provision against basic needs. In the endeavour to build a responsible society it is essential that the independence of the individual and the necessity for personal thrift should not be undermined. This has always been fundamental to our British way of thinking and to depart further from this principle would be to court disaster in a progressive and highly competitive world. Nothing could be more harmful to the character than to create the impression that it was no longer necessary for the individual to think about his future or to make provision for his future. This is not solely a matter of destroying initiative. To provide for pensions by a State scheme above basic needs would add greatly to the obligations of the citizen to the State. The sum of such obligations for State benefits in infancy, in childhood, in education, and in the health and other welfare services is already substantial and will increase steeply as more of the elderly in our ageing population claim old-age pensions at even the present level.

Nor would we approve of any State scheme providing more than basic needs even if there were provision for opting out which is probably not feasible anyway.

We cannot agree that citizens elect a Government to compete with them in their businesses. Rather is it a duty of Government to protect its citizens in the carrying on of their legitimate business, to hold the balance fairly between competing citizens and to provide a sound currency and stable conditions in which they can prosper.

Of recent years more and more progressive employers have been directing their efforts toward the provision of pension schemes for their employees. In a comparatively short period more than a third of the employed population of both sexes have been provided for under such schemes. This proportion could I think be materially increased if the Government would simplify the conditions and perhaps extend the scope for getting approval under the appropriate legislation. If current schemes do not conform in all details to present Government thinking on the subject it will be no difficult matter to secure by legislation or through administrative practice any modifications desired by the Government as for instance to provide for transferability of pension rights if this is thought to be a desirable condition of service in a particular industry.

I would suggest that the most suitable type of policy for those who are not covered by a pension scheme, such as the employees of small firms and workers who frequently change their employer, is an individual policy, individually owned, providing for an annuity at a given age to which the employer can contribute. I should have thought that automatic approval could be given by the revenue authorities for the issue of suitable policies.

TAXATION AND SAVINGS

We welcome the action taken by the Chancellor of the Exchequer in his Budget in respect of profits tax as a move towards greater flexibility in investment. It is important that there should be the largest possible reservoir of money available for investment in the hands of the widest number of thrifty people. To obtain this there must not be discrimination against profits distributed.

The savings out of income of the thrifty help to raise further the level of this reservoir. I think it important to stress that taxation is not just an instrument for restricting purchasing power. Taxation is an imposition which has to be justified by necessity. It is one of the most important factors in the depletion of private savings. This country is still the most heavily taxed in the world. Who would have anticipated that 12 years after the successful termination of the war, there would be still a rate of tax exceeding 50 per cent levied on the profits of industry, and taxation rising steeply to much more than half the earnings of the most responsible men in industry and administration?

It is no wonder that the demand for investment which can only come out of savings exceeds the supply. If we are to have a growing and expanding economy, the supply of savings must be increased, and an essential condition is the reduction of taxation.

I would add another necessary condition: a sense of security for the investor who has stinted himself to save. The investor can judge or make some attempt to appraise the ordinary hazards of commerce, but he cannot be expected to view with equanimity the vagaries of unpredictable intervention, expropriation or other confiscatory acts of Governments, or even the threats of such action. In such an atmosphere savings will vanish.

Without sincere co-operation between all concerned there will not be a flow of savings to the less developed areas of the world and an improvement in the standards of living of millions of people.

No business plays a more important role than the insurance companies in mobilising savings for investment. Every member engaged in the service of the company should be proud that this company is playing its part in this great service, and I am sure every shareholder present will join us in this sentiment.

STAFF RELATIONS

Staff relations are an intangible matter. The board have made great efforts to establish happy and more personal relations with the staff. I believe that this has been appreciated by members of the staff individually and the unions who speak for them. Our thanks and yours are due to all the staff for the good work they have put in to make possible the results before you.

The report and accounts were adopted.

McINTYRE & SONS

(Constructional Engineers)

NET PROFIT MAINTAINED

THE YEAR'S REVIEW BY LIEUTENANT COLONEL W. D. GIBBS

The fifth annual general meeting of McIntyre & Sons Limited was held on May 22nd at The Waldorf Hotel, Aldwych, London, W.C., Lieutenant Colonel W. D. Gibbs (chairman of the company) presiding.

The following is the chairman's statement circulated with the report and accounts for the year ended December 31, 1957:

I am pleased to report that the increased Net Profit of your Company last year (£38,360) has been maintained and is shown at £40,543 for the year under review. Taxation absorbs the sum of £21,172 so that the Net Profit after taxation is £19,371.

As already announced, it is proposed to recommend the payment of a dividend of 15 per cent (same), less tax.

PURCHASE OF SUITABLE STOCKYARD SITE

Last year I referred to further capital expenditure being incurred on additional plant and to the fact that resources had to be conserved with a view to the purchase of a suitable stockyard to replace the one which your Company had rented for over 20 years. Your Company has been successful in securing a convenient and suitable site for a stockyard and has installed a 5-ton electric travelling crane and at the same time your Company is now provided with much-needed additional space. The major portion of the cost has already been met and is reflected in the Accounts which also refer to the sum of £3,000 capital commitments necessary to complete the project.

Your Company was again fully engaged during the year under review and undertook many profitable contracts.

The present year has started favourably in spite of the credit squeeze although much of the work has been secured in face of keen competition.

In conclusion, I wish to thank my colleagues on the Board and also the staff and employees of the Company for their continued co-operation and support.

The report and accounts were adopted.

POWER SECURITIES CORPORATION LIMITED

LARGER PROFIT

The thirty-fifth annual general meeting of this company will be held on June 11th in London.

The following are extracts from the circulated statement by Sir Andrew M. MacTaggart, chairman and managing director, for the year 1957:

The results for the year can, I think, be regarded as satisfactory. The gross profit at £1,330,700 was higher than that of the previous year by some £38,000. On the other side of the account depreciation is approximately £124,000 higher at £485,692, but this increase has been offset by the decrease in United Kingdom taxation, which is some £130,000 less. Part of such deduction is the estimated relief resulting from the transfer of part of our activities to a new subsidiary company which is expected to qualify as an Overseas Trade Corporation.

The consolidated net profit at £373,948 compares with the previous year's figure of £222,680, but in that year £100,000 was provided for Contract Contingencies. Taking this into account, the 1957 net profit shows an increase of some £51,000. Carrying down the consolidated net profit and adding taxation over-provided and the balance brought forward from the previous year, there is a total of £756,722. The sum of £135,000 has been transferred to General Reserve and the directors recommend a dividend on the Ordinary shares of 11 per cent for the year.

Balfour, Beatty and Company, Limited, our principal engineering and construction company, have been fully occupied during the past year, both in the United Kingdom and overseas.

GREAT POSSIBILITIES

In view of the increasing international competition for contracts overseas the provisions of the 1957 Finance Act regarding Overseas Trade Corporations were generally welcomed by United Kingdom companies operating abroad. In order to take advantage of the benefits available under the Act we formed a new company named Balfour Beatty (Overseas), Limited. As from January 1, 1958, this company has been operating in Iraq, East Africa and Malaya, and its operations will be extended to other overseas territories as circumstances permit.

It is now over twelve years since the last world war terminated, at least officially, and what has been done by the so-called victors to adjust themselves to peace conditions? In some countries vested interests have undoubtedly played a large part, and it is easy for the political side to be influenced by such interests when it means full employment. Surely, however, the adjusting period has been somewhat over-stressed, and there must be a more profitable way of using worldly wealth in the shape of raw materials than using it for the manufacture of so-called defence weapons.

The Commonwealth nations hold out great possibilities to this country for the future, and Canada's new Prime Minister has already indicated in no uncertain terms how Canada would welcome a great expansion of trade with this country. Do not let us miss this wonderful opportunity. So far as this corporation is concerned, it is our intention to continue to develop and expand the work which we started when we opened an office in Toronto four years ago, and we look forward to a closer collaboration with our kinsmen in that great Commonwealth country.

SUNDAY PICTORIAL NEWSPAPERS (1920) LIMITED

IMPROVED TRADING RESULTS AND INVESTMENT INCOME

The thirty-eighth Annual General Meeting of
SUNDAY PICTORIAL NEWSPAPERS (1920) LIMITED
was held on the 21st May, 1958, at Brettenham House, Lancaster Place, London, W.C.2.
Mr. Cecil H. King, Chairman and Managing Director, said :

As you will have seen from the accounts circulated to you, Profit Before Taxation at £1,230,346 was £362,113 up on last year. While there was a useful addition to our dividend income, the greater part of the improvement in our profit stemmed from trading, which for the last five months of the year benefited from an increase in the selling price of the *Sunday Pictorial*.

In order to conserve liquid resources, your Directors have considered it prudent to recommend only a moderate increase in the dividend on the Ordinary Capital.

The combined sale of all Sunday papers decreased by approximately five per cent in the weeks immediately following the price rise—a much larger decrease than occurred after the previous rise in 1955. The *Sunday Pictorial* decrease was in line with the average, but it is not proving easy to regain the losses.

The forecasts I have been making for some years, that newspaper sales generally would fall with the return of larger-sized issues, have certainly been justified by events. The three price increases since 1950, as well as the phenomenal spread of television viewing as a family pastime, are other factors which have made their impact on the sales of daily and evening, as well as Sunday papers.

Wage rates in the industry rose again—this time by five per cent—from December 1, 1957. The time has come when the less prosperous newspapers *cannot* further increase wages without some relaxation of the restrictive practices imposed by some of the trade unions.

Other costs have been held steady: the small reduction, recently announced, in the price of newsprint will mean a saving of about £20,000 in the current year, if consumption remains at the present level.

Increased investment income

As you will have seen from the accounts, investment income increased last year by £86,532 to £551,055. I will now deal briefly with the fortunes of the important companies in which you hold a substantial number of shares.

The Daily Mirror Newspapers Limited, in which you have a major holding, has had another good year. Profit on Trading increased by three-quarters of a million pounds to £1,675,624 (before depreciation and payments to directors). Investment income also increased to £882,515.

The *Daily Mirror* sale fell less than its competitors in the popular newspaper field when the price was increased to 2½d. last October. The sale of 4,657,873 for the six months ending December 31, 1957, was, in fact, less than two per cent down on the previous year.

The sale of *Woman's Sunday Mirror*, a publication which, as you know, is jointly controlled by the Daily Mirror and Sunday Pictorial, decreased slightly at the time all other Sunday papers increased in price. At 1,149,717 for the second half of 1957, it remains well above the *Sunday Graphic*, its nearest competitor.

Despite a further decline in sales, *Reveille* continues to make a profit, though a smaller one than in previous years. Competition in the periodical field has been intensified, and reached fever pitch with the launching of two new women's weeklies earlier this year. The enormous sum of money spent on advertising the new publications and others, well-established, has undoubtedly affected the sales of *Reveille*. During the year we experimented with *Mid-Week Reveille*, turning it into a periodical purely for young people. When it became clear that the market for such a publication was not large enough to ensure its commercial success, we closed it down, and concentrated our efforts on improving the week-end edition. Now renamed *Reveille*, our weekly still has a sales lead of some half million over its nearest competitor. Profits of the Reveille Company, in which you hold a half interest with the Daily Mirror Newspapers Limited, were again retained within the business.

Sale of Scottish Daily Record continues to climb

In Scotland the *Daily Record* continues to do well. The sale reached 414,600 for the second half of 1957, and since then has further risen to well over 420,000. This brings the increase since January, 1956, to 90,000, despite two price rises.

The *Sunday Mail*, which suffered a small decrease in sale after the price rise last October, continues to make a profit. The trading results of the Scottish Daily Record and Sunday Mail Limited have been satisfactory since the increase in selling prices. In the foreseeable future this company will be making a regular contribution to group income.

History made in West Africa

The development of your interests in the three territories of West Africa continued last year, but increased revenue from sales and advertisements was largely absorbed by increased costs, particularly wages and salaries. However, there was a small increase in the group's profit, despite these higher outgoings.

West African newspaper history was created last September, when for the first time the sale of the Sunday newspaper operated by the Nigerian subsidiary exceeded 100,000. Sales of the other papers are buoyant, although the rate of increase is naturally slowing down.

In March, 1957, Ghana attained self-government as an independent state within the Commonwealth. We continue to enjoy friendly relations with the Government, as we hope to do with the Government of Nigeria, when the Federation becomes fully independent in 1960.

There remains some political risk in the operation of these companies, but commercially the future is assured.

Pulp and paper—world production outstrips consumption, profits lower

For the first time since the war a world situation of over-production has arisen in the paper-producing countries. This is because the recent considerable increase in productive capacity has outstripped consumption.

This situation of over-production is likely to continue for two or three years, when it is anticipated that increases in consumption throughout the world may again match capacity.

The profit of Anglo-Canadian Pulp and Paper Mills Limited has declined substantially. The income of the company was seriously affected by the premium on the Canadian dollar, but the rate has recently become more favourable to the Canadian company. The profits of Albert E. Reed and Company Limited have also declined, but not to such a marked extent, thanks to the diversity of their business.

Our confidence in the future of these two great enterprises is undiminished, but we must be prepared for temporary setbacks from time to time in the world demand for the products they manufacture.

First dividends from Associated TeleVision and Melbourne Herald

Your joint investment, with the Daily Mirror Newspapers Limited, in commercial television is exceeding all expectations. The consensus of opinion among viewers and advertisers, is that Associated TeleVision Limited is the leading programme contractor, and the hopes I expressed last year concerning the prospects of this company, have been fully realised.

The success of commercial television has now been established and Associated TeleVision has been increasingly profitable during its current financial year. You will be pleased to learn that we have now received a dividend in respect of the period from the date of your Company's investment to April 30, 1957. More recently, an interim dividend at the rate of 10 per cent per annum for the year ending April 30, 1958, has been declared, and we expect a final dividend in due course.

In Australia the value of your shareholding in the Melbourne Herald and Weekly Times Limited has increased considerably during the year. The dividend declared for the year ending September 30, 1957, was the same as last year, and the first payment from this source has been included in the accounts before you.

The profits of the radio interests in Sydney and elsewhere have increased, and the television station in which we have a small interest, is showing improved results.

Once again I should like to pay tribute to all personnel at home and overseas for the part they have played in the improved result before you.

THE LITTLEWOODS ORGANISATION

MR JOHN MOORES ON A RECORD YEAR

TURNOVER UP 10 PER CENT

I am glad to say that the benefits I anticipated would result from the reorganisations we carried out in 1956 were fully realised in the past year, and the whole Littlewoods Organisation had a very successful year indeed. Once again our gross turnover irrespective of Pools increased, reaching a record total of £53 million, an increase of £5 million or rather more than 10 per cent.

This advance was not due to any sudden capture or development of new markets, but through streamlining our business and paying particulous attention to the needs of our customers. By offering higher quality merchandise at more attractive prices than ever before, we were able to make a host of new friends.

Ultimately, the Littlewoods Organisation is just as dependent as any other Company on the prosperity of the people it serves, but I believe that we are a good deal less sensitive to the type of slight recession that the country is now experiencing than those stores marketing similar but higher priced merchandise. In these times the public economises, either by refusing to buy or by making their purchases at lower prices at places where they can be sure of getting the best possible value for money. We now have repeated evidence that we have established in the minds of the public our ability to provide high quality merchandise at very attractive prices indeed. I think the result of this is that we are holding all our old customers, and at the same time attracting new customers who used to buy in a higher-priced bracket. These people come to us with complete confidence, and it is our concern to see that their confidence is amply justified.

LITTLEWOODS POOLS LIMITED

The past year has been a very exciting one for all concerned with Littlewoods Pools because, in September, 1957, we made a very important decision to remove the limit of £75,000 as the top dividend on the Treble Chance Pool. As a result of this decision, there have been three wins of over £200,000 —in November last Mrs Nellie McGrail, a young widow with two small children, of Stockport, received £205,235 ; in February, 1958, Mr John Brockwell, a foreman cellarman of Epsom, Surrey, together with his wife won the sum of £206,028 ; and then, on March 29th, Mrs Elizabeth Riley, with her husband, Mr Thomas Riley, of Horden, Co. Durham, won £209,079.

I have always considered it part of our duty to the investors in Littlewoods Pools to offer them every possible service to assist them when they come into the possession of sudden wealth, and here I can record a very inspired example of Banker/Customer relations when my Executives, together with those of Martins Bank—our Bankers—have founded Advisory Committees to take over the financial worries from Mrs McGrail, Mr and Mrs Brockwell and Mr and Mrs Riley. The membership of these Committees comprises a Senior Bank Executive, the head of the Bank's Trustee Department, a leading Stockbroker, a Lawyer and an Income Tax Consultant, with my brother—Mr Cecil Moores, who is the Managing Director of the Pools operation of our Organisation—available for consultation. To date, the Chairmen of these Committees report complete success with their charges. In each case, large settlements have been made on the children, gifts made to various relatives, friends and charities, advice given and taken on suitable shares in which to invest, wills made out, insurance policies taken out, house purchases arranged. In fact, wise counsel has been given on every subject and has proved of great assistance to these winners.

I intend to continue with the study of other possible ways in which we can help or advise the investors in Littlewoods—the world's largest football pool.

LITTLEWOODS MAIL ORDER STORES

1957 has been a fine year for Mail Order. Never before have we had so many active Organisers on our lists as we have today. We also note another significant fact—more middle-class folk are becoming Club members, and the day seems to be passing when instalment buying through Clubs was popular mainly among those with only restricted means. It really looks as though a much wider public is now aware of the benefits and convenience of home-shopping through our attractive reliable catalogues.

These changes have in my opinion been stimulated by us in two important ways.

First we have improved the merchandise we are offering by taking more care than ever before to find out what exactly customers buying through a catalogue want. Having found this out we have improved the all-round quality of our buying staff which I regard as the most important group of people in the whole Organisation. A first-rate buying team is the best guarantee of success in a business like ours, and I would like to thank all our Buyers for what they have done and for what I know they will do in the future.

Secondly, as you will remember, last year I told you about the financial scheme we had evolved to help Club Organisers to serve the needs of their members more quickly, and I am pleased to report that this scheme has continued to be an unqualified success. It has materially increased our turnover and has made the pastime of being a Littlewoods Club Organiser much more interesting and remunerative. I have the utmost confidence in the Club Organisers—those enthusiastic people who collect orders and cash and forward them to us. After all, we have been in business together for a long time. I thank them for all they have done, and look forward to many more years of mutually profitable co-operation.

So far as the future of Mail Order is concerned, I feel very confident that unless the present economic position deteriorates considerably—which I do not expect—our future will be very bright. However, I am conscious that we shall never reach a stage where we have done enough to improve our goods and services, to the point where we can become complacent.

DESIGN

Our latest drive and one in which I am taking a personal interest is to establish better standards of design in all our categories of merchandise. I do not believe that inexpensive articles need to be poorly designed, still less do I believe that the public do not care what the things they buy look like, so long as they serve their purposes. I have encouraged my Buyers to seek the help of the Council of Industrial Design so that eventually we can eliminate any merchandise which does not reach the standard of good design. As a result, many of the items in our forthcoming Catalogues will be marked as having the approval and recommendation of the Council of Industrial Design. We are grateful to the Council for the help they have given us, and we believe that our customers will appreciate these improvements as time goes on.

I owe a debt of thanks, too, to our manufacturers who have loyally supported us during the past year. It is a great satisfaction to me to feel that I can rely on them at all times.

CHAIN STORES

Once again, I am happy to report that 1957 was an excellent year's trading—our best yet. Much of what I have said about improvements in buying has been reflected in our Chain Store merchandise and this has stimulated sales to a very satisfactory degree. I welcome the Chancellor of the Exchequer's revision of purchase tax on certain items, and at a considerable cost to ourselves we immediately passed these benefits on to the public. But I look forward to the day when purchase tax is abolished or brought to an absolute minimum, because it is not right that retailers, who have to pay the tax on goods when they put them into stock, should always be at risk when there is a change in the rate of purchase tax. For the plain fact is that under our present system reduction of purchase tax may mean serious losses to the trader. Quite apart from passing on reductions in purchase tax, our entire policy is devoted towards cutting the cost of living. All of the economies that have been effected through the measures I have referred to earlier in this report have been utilised to bring prices down. We have recently made extensive cuts in the prices of a wide range of women's and children's wear.

In addition, we are endeavouring at all times to allow the shopping public to enjoy the benefits of reductions in prices of raw materials.

And our "Satisfaction or Money Back" Guarantee is evidence in itself that our price reductions are not made at the expense of quality.

In my last report I had rather a dismal tale to tell of Chain Store development, so hampered by the credit squeeze. Well, things are not much better now, but in one respect we have been able to take an important step forward which removes a nagging worry and a sense of, almost, frustration.

Last year I spoke of our valuable site in Glasgow as being "just a hole in the ground." At that time it looked like remaining so. Today I am able to tell you that we have found the money from our own resources to push ahead with a Store worthy of the great city we strive to serve. The new Littlewoods Store is even now under construction. It will not be the near-skyscraper we had originally planned, but it will be a three-storeyed building, and a handsome

addition to Glasgow as well as offering a valuable service to its citizens.

STAFF

Finally, I must pay my tribute to the 20,000 or more men and women who have helped to make the Littlewoods Organisation what it is. It is in many ways stimulating to be involved in a concern which is so constantly expanding. It can also be rather unsettling. The organisation has to make plans and take decisions, almost overnight. Traditional policies are swept away and new and better ones take their place. Functions have to be re-allocated, and all the time there is a ferment of discussion, replanning and thinking out the next move. It's tough work for all of us sometimes. I thank everyone for bearing his or her part so enthusiastically and, if I may say so, so successfully.

DARWINS LIMITED

TURNOVER APPROACHING £6 MILLION

The twenty-ninth annual meeting of Darwins Limited was held on May 22nd in Sheffield. The following is an extract from the circulated review by the Chairman, Mr F. Thompson-Schwab:

The trading results for 1957 show a satisfactory improvement over 1956. The demand for the products of the Group was such that a high rate of output was achieved. The reputation of the Group's products is increasing steadily. We have spent large sums in improving quality. This, combined with a vigorous sales policy, has had a gratifying influence on the maintenance of a high turnover.

The turnover of the Group in 1957 was almost £6 million. This compares with £3,652,000 in 1954 (which was the first year Sheffield Forge and Rolling Mills Company Limited appeared in our accounts), £4,662,000 in 1955 and £5,135,000 in 1956.

The Darwins Group of Companies, with one exception, did not come within the scope of the previous Nationalisation Act, and while it is not possible to forecast with any degree of certainty, owing to the vagueness of the present proposals, it is not anticipated that the Special steels and Engineering business of the Group would be affected by the threatened re-nationalisation of the Iron and Steel Industry.

The exception referred to is The Sheffield Forge and Rolling Mills Company Limited, which we purchased from the Iron and Steel Holding and Realisation Agency in 1953. During the four years we have owned this Company a great deal of re-organisation, modernisation and development has been accomplished with the consequence that the present state of the Company bears little relation to that at the time of acquisition.

The prospects for the current year are more difficult to forecast than for several years. As a result of expansion in recent years, our business is now on a wider basis with many more customers than we had in the past that I am confident that the effect of any setback in trade would be less than would have been the case previously.

The report and accounts were adopted and at a subsequent Extraordinary General Meeting a resolution changing the name of the Company to DARWINS GROUP LIMITED was approved.

THE CAPE ASBESTOS COMPANY LIMITED

YEAR OF GRATIFYING PROGRESS

MR GILES NEWTON ON HEALTHY INCREASE IN GROUP TURNOVER

The 65th annual general meeting of The Cape Asbestos Company Limited will be held on June 12th in London.

The following is an extract from the statement by the Chairman, Mr Giles Newton, MBE, which has been circulated with the report and accounts for the year ended December 31, 1957:

I should like to pay a tribute to Mr Robert Walker, who retired from the Chairmanship in September last. Mr Walker had been Chairman since 1934 and during that time he saw the Company rise from modest dimensions to its present stature.

The results for the year under review disclose a satisfactory advance on those of the previous year; progress which is particularly gratifying in a period when many industries—not excluding that in which we are engaged—have experienced augmented costs and declining margins of profit.

The net profit of the Group, after all charges except taxation, amounted to £1,421,021 against £1,154,595 last year, and enables your Board to recommend a total distribution of 17½ per cent as compared with 15 per cent in the previous year.

The substantial increase in profit stems in no small measure from the vigorous prosecution of our policy of expansion and re-equipment of the Mines in South Africa. The Parent Company in the United Kingdom, and our subsidiaries both at home and abroad, have also produced improved results. Before arriving at the figure of net profit for the Group, the very substantial sum of £598,552 has been set aside for depreciation as against £552,945 in 1956. Taxation exacts a heavy toll in the sum of £704,449. Since the end of 1954, when you subscribed £1,564,000 of new capital towards our efforts to expand the Company's business, it is worthy of mention that no less than £2,875,000 has been invested in capital additions of which some £1,251,000 was invested in the twelve months now under review.

The Group's cash resources have been relatively well maintained at £983,532 compared with £1,323,739 at the end of the previous year.

The Net Profit of the Parent Company this year amounted to £801,774, which, after having provided £352,894 for taxation, leaves £448,880 for appropriation.

In his statement in 1957, Mr Walker gave warning of the heavy calls for capital expenditure and said that it was hoped that they could be met from internal resources. This was achieved during 1957, but it has since proved necessary to obtain overdraft facilities in South Africa for the continued capital commitments in that country, though there are very substantial working balances elsewhere in the Group. While I believe that the peak of the present phase of capital development in South Africa is now well behind us, I am very conscious of the necessity for maintaining a strong liquid position.

SALES

The Group turnover during the year yielded a very healthy increase over 1956. While the volume of export of manufactured goods remained at about the same level as in 1956, exports of crude asbestos from South Africa to the United States of America and Canada increased appreciably.

Of the particular application of the Company's products, I should like to make reference to the Power Station programme, where our CAPOSITE high temperature insulation has found extensive application in both nuclear and traditional stations.

It has been a year of full production at the factories.

SUBSIDIARIES

Once more I have to report a year of great labour in the face of difficulties in South Africa which has happily shown a distinct improvement in earnings. The developed ore reserves at all the main centres have been substantially increased.

The demand for Amosite fibre continues strong and I feel confident that 1958 will bring further improvement to the mining situation.

On the Blue fields, it has been another successful year. Ore reserves have been substantially increased during the year and exploration of possible new deposits is being actively pursued.

Cape Asbestos Insulations (Pty) Limited at Benoni had a higher turnover than in the previous year, but margins were reduced.

In the United States, the North American Asbestos Corporation increased its level of business and maintained a satisfactory profit margin.

Cape Asbestos (Canada) Limited was less successful, due to the trade setback and severe competition in Canada. Our manufacturing offshoot, owned jointly with Holmes Foundry Limited, had a profitable year.

At home, Cape Building Products Limited has done well with its range of flint bricks, ASBESTOLUX, ROCKSIL and other products, and has increased both its volume of business and profit. Marinite Limited's incombustible ship's board had another sucessful year, and there is a substantial order book to carry into 1958. Andersons Insulation Company Limited carrying on its insulation contracting business in the face of stiff competition, has again produced a satisfactory result.

The Weaver Manufacturing & Engineering Company Limited maintained its turnover, but margins fell. Much development work has been done and there are interesting possibilities for the future.

OUTLOOK

The Company with its subsidiaries covers an extremely extensive market, and though in some directions there is the probability that both volume and margins will decrease in 1958, our factories have substantial contracts in hand and the output of the mines is still in heavy demand. While results for the first three months of the year approximate to those of the corresponding period in 1957, much will depend on general trade conditions so far as the remainder of this year is concerned.

THE ANGLO-PORTUGUESE TELEPHONE COMPANY

FURTHER YEAR OF SUCCESSFUL PROGRESS AND SATISFACTORY RESULTS

SIR ALEXANDER ROGER ON COMPLETION OF 4-YEAR EXPANSION PLAN

The seventy-first annual general meeting of The Anglo-Portuguese Telephone Company Limited, will be held on June 10th at Strowger House, 8 Arundel Street, London, WC2.

The following is an extract from the statement by the Chairman and Managing Director, Sir Alexander Roger, KCIE, which has been circulated with the Report and Accounts:

ACCOUNTS

I am glad to report the completion of a further year of successful progress and satisfactory results.

The Accounts for the year to December 31, 1957, show total Revenue to be £2,833,522. This is £268,693 higher than the corresponding figure for 1956.

After providing for Royalties to the Portuguese Government, Renewals, Depreciation, Taxation, Capital Issue Expenses, Debenture and Loan Interest and Sinking Fund Instalments, the total expenses amount to £2,280,690, an increase of £94,864.

Net Revenue at £552,832 is £173,829 higher than in 1956 and it is proposed to pay a final dividend of 6 per cent on the £4,810,000 issued Ordinary Stock which, together with the Interim Dividend of 3 per cent paid in November last, makes 9 per cent for the year, an increase of 1 per cent. It is also proposed to pay a dividend of 9 per cent on the "A" Ordinary Stock.

The above dividends, together with the dividend on the 6 per cent Preference Stock, require £288,593, and after transferring £250,000 to General Reserve the Carry Forward is increased by £14,239 to £249,312.

The Company qualified as an Overseas Trade Corporation with effect from April 6, 1957, and, in accordance with the provisions of the Finance Act, 1957, is subject to tax on a different basis from that which applied before.

The legislation is lengthy and complicated but the principal effects on the Company are that its operating income is exempted from Profits Tax entirely and from Income Tax except to the extent to which it is distributed to Stockholders.

The taxation provision for 1957 takes into account the fact that the Company has been an Overseas Trade Corporation for approximately nine months of the year.

For many years the Company's liability to tax has been limited by reason of the Capital Allowances deriving from the large scale expansion programmes which have been undertaken. This has the effect of reducing the relative benefits of qualification as an Overseas Trade Corporation. Nevertheless, given normal conditions we can expect our taxation liabilities to be less than they would have been on the former basis of computation.

Over the years a provision has been made, where necessary, to cover the deferred liability resulting from Capital Allowances. As an Overseas Trade Corporation we no longer require this provision and a sum of £720,000 has been transferred, for the time being, from the Provision for Taxation to Contingency Reserve.

GENERAL PROGRESS OF THE COMPANY

The year 1957 saw the successful completion of your Company's four year Expansion Plan which was entered upon in 1954. The programme envisaged the addition of 69,000 stations to our systems in Lisbon and Oporto but the ever growing demand for service made it necessary to increase this to 75,000 stations in order to reduce the waiting list effectively. I think I should add that a prospering telephone company is never without a waiting list.

19,778 stations were added during the year but, in spite of this, the waiting list at the end of 1957 stood at 6,608.

The total number of stations at December 31st last was 209,493.

There are no signs of decline in the rate at which we are being called upon to provide service. For some years we had been receiving an average of 1,500 applications each month and over the past year applications have been coming in at the rate of 1,750 per month.

FINANCE

As is well known, progress in the telephone operating business is largely dependent upon the amount of new capital that can be put into it and this is as essential in Portgual as in other countries.

The manner and form in which our capital requirements can be met must depend upon market conditions and other economic factors ruling from time to time.

In June 1957 a "rights" issue of 824,500 Ordinary Shares of £1 each was successfully made, applications for Excess Shares having to be substantially scaled down.

On April 15, 1958, arrangements were made with a consortium of Banks in Portugal to offer to the public in two parts, in April and October, a second series of Esc 80 million 5 per cent Obligations at par. This issue is identical in its terms with the one made in October, 1956, and will produce almost £1 million of new money to provide further telephone plant and equipment.

In the periods between capital issues we are supported by day to day loans from our associated Company, Telephone and General Trust Limited. By this means it is possible to meet the costs of steady development without having to carry for long periods large sums of unremunerative capital. This policy has worked satisfactorily and economically for over thirty years and has greatly facilitated our financial arrangements throughout that long period.

G. D. PETERS & CO.

FURTHER PROGRESS

The forty-ninth annual general meeting of G. D. Peters & Company Limited was held on May 19th in London, Mr Alexander Dowie, MBE (the chairman), presiding.

The following is an extract from his circulated statement:

The accounts show a net profit, after charging all expenses but before taxation, of £252,988, compared with £164,891 for the previous year. Income Tax and Profits Tax require £128,000. Your Directors recommend a Final Dividend of 7½ per cent, which will bring the total distribution for the year to 10 per cent, as compared with 7½ per cent for the last year.

Your Company has made further progress and once again there has been a substantial increase in turnover against last year's trading. The flow of incoming orders has also increased and today stands higher than ever before in the Company's history.

The British Railways Modernisation Programme of continuous braking has taken up most of the expanded capacity of your Subsidiary, The Consolidated Brake and Engineering Company Limited, but we have also assiduously pursued overseas inquiries, and substantial orders from South Africa, South America, Pakistan, etc., will keep us very busy for some time to come.

To bring the capital more into line with that employed in the Company's activities the consent of the Capital Issues Committee has been sought to increase the capital of the Company to £1 million and to the issuing of a one for three scrip bonus. On this application being granted it must be clearly understood that the dividend rate will not necessarily be maintained at the present rate on the larger share capital.

There has been an improvement in the intake of skilled labour over the last few months, enabling product development to be accelerated, and this augurs well for the future of your Company. The report was adopted.

FREDERICK LAWRENCE LIMITED

SUBSTANTIALLY INCREASED SALES

The thirtieth ordinary annual general meeting of Frederick Lawrence, Limited, was held on May 21st in London, Mr Frederick Lawrence, OBE, JP, LCC (Chairman and Managing Director), presided and, in the course of his speech, said:

The Profit on Trading amounted to £127,413, to which must be added Investment Income and Transfer Fees of £2,367, giving a total of £129,780, as against £11,886 last year. Provision for Income Tax and Profits Tax amounts to £49,846. The Board recommend a Final Dividend of 15 per cent on the Ordinary Shares, making 25 per cent (less Tax) for the year.

Trading activities fluctuated during the year, and were certainly a good deal more difficult in the second half. Overhead charges have further increased, and reductions in the rate of Purchase Tax have from time to time resulted in substantial losses being suffered on stocks on hand. This was the case last year, when the rate of Tax on Carpets was reduced from 30 per cent to 15 per cent and again in the current year, when the rate on domestic appliances and apparatus was reduced from 60 per cent to 30 per cent.

The subsidiary Company, Maggs Furniture Industries, enjoyed a satisfactory year.

The Company's aim continues to be the maintenance of trading standards, combined with value for cash. There has been a continuous demand from those who prefer Hire Purchase facilities, for whom the Company's terms are the cash price, clearly marked on the price ticket, plus a small service charge.

Sales have substantially increased in all sections of the Company's business, and I am confident that the excellent value and originality of our productions will assure the continuance of this progress.

The report was adopted.

ALLIANCE ASSURANCE COMPANY, LIMITED

Extract from the Review of the Report and Accounts for the year 1957 by the Chairman, Mr T. D. Barclay

The net profit for the Group shows only a small recovery from that for the previous year at £1,284,944 as against £1,224,201. Nevertheless, it is satisfactory to be able to report that the total premium income in the Fire, Accident and Marine Departments rose from £16,963,793 to £18,669,583.

LIFE DEPARTMENT

The net new sums assured completed during the year amounted to £12,189,750 compared with £11,273,090 in the previous year.

The purchase money for immediate annuities was £98,785 as compared with £59,030 and deferred annuities were issued for £417,468 as compared with £337,152.

FIRE DEPARTMENT

In this Department the net premiums rose from £7,293,974 to £7,655,804 and the claims, I am glad to say, fell from £3,348,179 to £3,155,571, the result of the year being a surplus of £606,456, as opposed to £314,984 for 1956.

The loss ratio at 41.16 per cent is less than that for the previous year. The weight of the losses came from overseas, particularly from Canada, where a substantial deficit was incurred, largely owing to the uneconomic levels to which competition has reduced premium rates, which has coincided with an unusually heavy incidence of claims.

MARINE DEPARTMENT

The net premium income rose from £2,137,712 to £2,439,774, showing an increase of £302,062.

The Underwriting Account for 1955 has now been closed with a balance of £237,290. Unfortunately, however, £190,329 of this amount was required to settle claims arising from previous years' accounts, leaving only £46,961 available for transfer to the Profit and Loss Account.

Since 1955 the number of major casualties has been the worst recorded in peacetime. As one would expect, these casualties have fallen heavily on older vessels, but there have been serious losses in first-class modern tonnage, including passenger liner tonnage. The effect of this experience on the market will doubtless lead to increased rates, but in any case it must be some time before their impact is felt and the position is to some extent relieved.

ACCIDENT DEPARTMENT

The net premiums in the Accident Department amounted to £8,564,005 as compared with £7,532,107 in 1956. The claims rose from £3,632,142 to £4,151,186, and the surplus, after providing for unexpired risks, rose from £561,785 to £646,048.

The Motor Account, I am glad to say, showed a considerable improvement for the first time for several years, although there was still a small deficit. Substantially increased rates both at home and abroad, combined with stringent underwriting, and the fortuitous incidence of petrol rationing during the early part of the year, have contributed to the better result, but I am afraid it would be unwise to assume that this improvement will be maintained.

The other sections of the business, including in particular the Public Liability Account, provided increased and profitable business.

TRUSTEE DEPARTMENT

The total fees received during 1957 amounted to £30,020, showing an increase of £1,905 over the previous year.

INVESTMENT DEPARTMENT

It is perhaps not unsatisfactory that the Stock Exchange Investment portfolio of the Alliance Life and Annuity Funds experienced during the year an over-all depreciation in market value of no more than above 5½ per cent. The gross income yield on the whole Fund rose further to £5 5s. 10d. per cent.

In the case of the Shareholders' Funds, there was a favourable though reduced margin between book and market values, though it will be noted that the sum of £96,552 was utilised to write down the book values of Securities held by certain of the Associated Offices.

The gross investment income rose further by some £40,000 to £1,162,917.

PROFIT AND LOSS ACCOUNT

The profit of the Group, after making provision for taxation and other outgoings, amounted to £1,284,944 as compared with £1,224,201 in 1956.

In all the circumstances it was decided to maintain the dividend at the rate of 3s. 9d. per Share.

F. PERKINS LIMITED

(Manufacturers of High Quality Diesel Engines)

SETBACK TO PROGRESSIVE GROWTH ENVISAGED AS TEMPORARY

The twenty-sixth Annual General Meeting of F. Perkins Limited will be held on June 9th at Peterborough.

The following is an extract from the Statement by the Chairman, Mr F. A. Perkins, which has been circulated with the Report and Accounts:

I have with regret to report that the trading result in 1957 was not satisfactory in that for the first time in over twenty years a loss has been incurred. This was mainly due to the turnover of the Company having fallen by £7 million to approximately £14 million.

The reasons for the loss, having been foreshadowed in my additional remarks at our last Annual General Meeting, were given in my letter to you of November 30th last, when it was thought right and proper to acquaint shareholders of the position then. Briefly these were a combination of the following: that the Company's pioneering of diesel engines had been so successful that large vehicle manufacturers had commenced to produce their own engines; that the Suez crisis had substantially reduced a major portion of our overseas and United Kingdom markets, and that the Company's most important Eastern market had been closed because of internal financial restrictions. The second two circumstances were impossible to forecast, though happily the effects of Suez are now fading and our trading is better in the Eastern market.

With regard to the production by vehicle manufacturers of their own engines, this was a factor which your Board has had in mind for some time.

So far as the year under report is concerned, it was forecast that the programme for other manufacturers, which was referred to in my Statement to you at the last Annual General Meeting, would offset the loss of vehicle engine orders. Unfortunately deliveries under these contracts were not called for as soon as was anticipated, which adversely affected your Company's plant utilisation.

The combination of these circumstances seriously affected the year's turnover.

You will be pleased to know that the two contracts for tractor engine manufacture, previously referred to, are now proceeding well.

The Management of the Company achieved a substantial reduction in overheads but it was not possible to bring these down in line with the fall in turnover because of the new design development programme and production increase forecast for 1958.

For the future—your Board considers that though your Company should diversify its products there is still much good trading to be had by your Company in the diesel engine field, in which we have built up a first-class reputation throughout the world.

You will, no doubt, have been glad to read of the launching of one of our new engines, the 1½ litre Four 99. The agricultural version of this engine was first exhibited at the Smithfield Show in December last, and we have recently launched the vehicle version, which I am glad to record has created an excellent first reaction in the trade. Your Company has reason to hope for some good results from the trading in this engine in the future years.

Your Company is continuing to devote time and money in improving our present product and also developing new types of diesel engines which will be in advance of anything else currently produced.

Diesel engine manufacture will be the Company's mainstay, and I hope to have illustrated to you our ability to achieve this. Nevertheless your Board considers that in the prevailing conditions of today in the diesel engine field, it would be wise to manufacture other products, non-competitive with our present customers. Your Company has a first-class organisation and although it would be premature to disclose the investigations which are being actively pursued and discussions which are being carried on with other bodies, both national and international, I can assure you that this matter is one of priority to your Board.

As I have stated before, your Company has need of additional permanent finance, and you will observe that in spite of reduction in stock and debtors it has been found necessary to increase our borrowing from our Bankers. You may be assured that your Board is giving this matter of additional finance constant attention.

Although your Company has had a setback in an excellent record of growth over the last twenty years, I consider that this is only temporary and that for 1958 there should be, and I say this advisedly, at least a reasonable turnover and a profit thereon. Your Board and Management of your Company have devoted, and will continue to devote, all its skill to restore the continued growth of this Company.

BANK OF WEST AFRICA

SATISFACTORY GROWTH OF BUSINESS

The 64th annual general meeting of the Bank of West Africa, Limited, will be held on June 12th in London.

The following are extracts from the circulated statement of the Chairman, The Right Honourable Lord Harlech, KG, GCMG:

The Balance Sheet shows a satisfactory growth in our business and in spite of a somewhat difficult year successful results have been achieved with the profit virtually unchanged compared with a year ago. Shareholders will observe that an allocation of £200,000 has been made from the profits of the past year to Reserve Fund. Your Directors feel it is desirable, in view of the spread of the Bank's activities, to increase this Fund further by way of a transfer of £300,000 from Contingencies Account which will now bring the Reserve Fund to a total of £2½ million equal to the Paid Up Capital of the Bank.

Current, Deposit and other Accounts are some £5,615,000 higher at £67,473,918 which is in some measure a result of the campaign we have pursued recently to promote the banking habit in the territories in which we are primarily engaged.

Liabilities on Acceptances, Confirmed Credits and other engagements on behalf of customers at £7,541,927 show a reduction of approximately £4,120,000.

On the opposite side of the Balance Sheet our cash is slightly higher at £7,358,194; money at call and at short notice together with Bills at £23,204,550 are practically unchanged by comparison with a year ago.

As to our profits the improvement secured during the past year or two has been maintained in spite of rising expenses. Your Directors therefore recommend a final dividend of 7 per cent which makes a total of 12 per cent for the year. This is the same rate as for the year ended in March, 1957, when the total distribution was increased by 2 per cent.

POLITICAL DEVELOPMENT

Political development continues at a fast pace in the West African territories. Ghana, placed under her full Dominion Constitution in March, 1957, encountered political difficulties which at one stage disturbed her internal trade, but the situation has now settled down. In the case of Nigeria, a Constitutional Conference was held in London in June, 1957, as a result of which the Eastern and Western Regions have become internally self-governing within the structure of the Nigerian Federation. Since the Conference various matters have been under examination in preparation for the granting of a Constitution making the Federation a self-governing territory within the Commonwealth.

A delegation from Sierra Leone has visited London and it is believed that good progress has been made in the further constitutional advancement of that territory.

The demand for capital becomes even more pressing. Many desirable schemes are in abeyance for want of funds but experience shows that manpower in all degrees of skill is yet more urgently needed. Local capital in so far as it exists, tends to move into the acquisition of land and buildings rather than into industrial undertakings or commercial ventures. Overseas investors would be more readily attracted were they able to see indigenous private capitalists participating in new constructive enterprises.

LUNUVA (CEYLON) TEA & RUBBER

The annual general meeting of The Lunuva (Ceylon) Tea & Rubber Estates, Limited, will be held on June 12th in London. The following are extracts from the circulated address of the Chairman, Mr H. W. Horner:

It will have been realised that the company's profits for 1957 would be below those for some years past. The restrained optimistic view which was current in the early months of last year has not materialised. Instead, there followed a period of fluctuations in the world market for tea, particularly for tea of medium growth, which resulted in lower prices. By the end of September some improvement had occurred. The total tea crop harvested exceeded that of 1956 by nearly a million pounds, constituting a record for the company and a valuable set-off to the effect of rising costs.

The rubber crop was slightly lower than that of 1956 owing to the replanting programme. Rubber will continue to be a secondary product for this company, but it is hoped that, as the replanted and higher yielding areas come into bearing, rubber will make a substantial contribution to the total profits of the company.

The price realised for the tea crop averaged 32.54d. net (1956, 40.82d.) and for the rubber crop sold locally 17.51d. (1956, 21.97d.). The year's profits before taxation is £164,269, and the Board recommend a final dividend of 10 per cent, making 15 per cent for the year.

The estimated crops for 1958 are just over 9½ million pounds of tea and just under 1½ million pounds of rubber.

CRUSADER INSURANCE COMPANY LIMITED

ANOTHER YEAR OF PROGRESS

In his annual statement the Chairman, Mr Harvey Bowring, after commenting that the year 1957 was one of considerable development for the Company, drew attention to the importance of the new City Office (where the administration of all Group business had been brought under one control) and branch offices in future plans for improved service. Referring to the Head Office at Reigate he said that it was just twenty years since the decision to move out of London was made and there can be no question but that our country Head Office in its congenial surroundings has proved an unqualified success.

He stated that in 1957 *New Life Sums Assured* including Group, reached a record £7,067,394, the Life Premium income exceeding the "million" mark for the first time at £1,073,257. Substantial reductions had been made in the rates of premium applicable to certain "Without Profits" Life Assurance Policies on January 1, 1958. *Fire* premium income had increased to £176,187, while that for *Sickness and Accident* and *Miscellaneous* business was £55,874 greater at £688,585. There were now over 760 *Group Staff Welfare Plans* in operation. Overseas development, especially in Africa, was proceeding satisfactorily. The overall interest on investments had risen by 5s. per cent to £5 3s. 8d. per cent. A major part in the Company's progress, the Chairman said, had been played by the staff, mentioning particularly those 77 who had served for 25 years or more, while the Company was also indebted to the Insurance Brokers and other friends whose support and service were highly valued.

SPICERS LIMITED

(Paper Makers, Paper Merchants and Manufacturing Stationers)

ENCOURAGING INCREASE IN TURNOVER

The 70th annual general meeting of Spicers Limited will be held on June 18th in London.

The following is an extract from the statement by the chairman, Mr Lancelot Spicer, DSO, MC, which has been circulated with the Report and Accounts:

The drop in profit from £751,414 to £672,968 should not be entirely unexpected, for in my statement last year I said that trade conditions were not easy and that whilst I was not pessimistic about the long-term future of the Paper Trade, none the less we were entering a period when production was likely to exceed consumption, a situation which makes business highly competitive.

Your Directors are not complacent about this situation. It is our responsibility to do all we can to increase demand for our products and to get the largest share possible of all business that is being placed, and we continually strive to do so. New outlets for paper are frequently under examination with a view to increasing the range of products which we market. Two years ago we decided on a national advertising campaign, the object of which was to bring home to the public at all levels the important part played by your Company in the country-wide distribution of paper products. We are also constantly taking steps to increase our own efficiency and reduce costs, but all the time we find that expenses largely outside our control continue to rise and thus reduce the net profit.

UNDERLYING HEALTHY POSITION

In the difficult conditions of 1957 it is, therefore encouraging that we were able to achieve an increase in our turnover which rose from £21,960,000 to £22,820,000. This increase in business was spread evenly over most of the various sections and subsidiaries of the Organisation; in fact in only three units was there a diminution in turnover and in each of these the diminution was not more than marginal. This reflects an underlying healthy position and has enabled us to meet to some extent the increased cost of maintaining our Organisation at a proper standard of efficiency in the face of continued inflationary pressure.

None the less, we cannot escape from the fact that wherever one goes in the world today it is noticeable that there is a surplus of pulp and paper.

Commenting on his world tour in the late autumn, Mr Spicer said that in all the markets he visited it was clear that there was no shortage of paper; indeed orders were eagerly canvassed, but at the same time he did not find any feeling of undue alarm. He added: Generally speaking, it was felt that within two or perhaps three years the situation would be improved and demand for paper, which throughout the world always goes on steadily increasing, would have begun again to equal production and that by that time production would temporarily be stabilised and would not be increasing at the phenomenal rate of expansion of the past few years.

The statement concluded: We shall always make it our business to support in every way possible the British Paper Industry in which so much British capital has been invested in the last 25 years.

SHELL TRINIDAD LIMITED

INCREASED EARNINGS

The 45th annual general meeting of Shell Trinidad Limited was held on May 20th at Point Fortin, Trinidad, Mr G. L. Reid (chairman and managing director) presiding.

The following is an extract from the report of the directors:

The Net Earnings for the year ended December 31, 1957, £2,984,742 (BWI $14,326,762) show an appreciable increase over those earned in 1956 (£2,426,449 BWI $11,646,955). The primary reason for this is that once again, crude production from the Company's properties has shown a marked increase, namely some 25 per cent, over the previous year. Moreover, product prices were at a higher level in 1957 than the averages for 1956. For these reasons, combined with increased refinery throughput, the Company's earnings have improved by £558,293 or 23 per cent.

The Company's financial position continues to be satisfactory, a high proportion of our assets being in liquid form and thus available for future development as and when required.

An interim dividend of 2s. 6d. per unit of Ordinary Stock, amounting to £337,500 and a dividend of 8 per cent, amounting to £28,000 on the Preference Stock have already been paid in respect of the year 1957. Having regard to the trading results of 1957 and to the general financial position the Directors recommend a final dividend of 3s. 4d. per unit of Ordinary Stock, representing £450,000 after deducting Trinidad Income Tax at 1s. 4d. per unit.

Since the latter part of 1957 a general condition of surplus production in relation to consumption has developed throughout the world oil industry and this has had a weakening effect on prices. For this and other reasons, including increasing material costs and higher salary/wages levels, it is not to be expected that the record earnings achieved by the Company in 1957 will be reached in the current year.

RECORD PRODUCTION

Total crude oil production in 1957 averaged 24,900 barrels daily, representing an increase of approximately 25 per cent over the previous year's figure and being a further record in the Company's history. This increase was largely due to Catshill, where the output rose to a peak of over 9,000 barrels daily in April, and partly to Inniss which was producing approximately 2,000 barrels daily by the end of the year. Total production for the first three months of 1958 has been at the average rate of 24,700 barrels daily.

The average refinery throughput during 1957 was 38,500 barrels daily, representing an increase of approximately 14 per cent over the 1956 average. This increase resulted from technical improvements carried out on the processing units and higher crude supplies.

During 1957 bitumen sales totalled 77,901 tons, a reduction of 17 per cent compared with 1956. Sales of bitumen to areas outside the Eastern Caribbean continue to decline due to increasing competition from new refineries more favourably located in respect to consumer markets.

The report and accounts were adopted.

BARTON & SONS

The ordinary general meeting of Barton & Sons Limited was held on May 21st in London, Mr H. Prichards (Chairman and Managing Director) presiding.

The following is an extract from his circulated statement: The group trading for the year 1957 resulted in a record profit before taxation of £787,597 and this was achieved in a year in which trading conditions gradually became more competitive.

We reported last year that our largest investment was in the production of steel tubes and fittings. Our output of these products in 1957, both at home and overseas, constituted a record. Our next largest section, structural steelwork, had a very successful year although there was keen competition for the jobs available.

You will be asked to approve a capitalisation of reserves and a bonus distribution of one new share for each ordinary stock unit held. This will absorb £889,583 of our reserves but will still leave us with Revenue Reserves in the parent Company of £538,722 and Capital and Revenue Reserves in the group of £933,956.

It will not necessarily follow that there will be any increase in the amount of dividend paid but the opportunity might be taken to narrow the gap between the amount of the interim and final dividends.

It is probable that business will become even more competitive, but if the volume is maintained at present levels I see no reason why the 1958 results should not continue to be satisfactory.

The report was adopted and the capitalisation and scrip issue proposals approved.

E. POLLARD & CO.

The forty-sixth Annual General Meeting of E. Pollard & Company Limited was held on May 20th in London.

Mr H. Edward Pollard (Chairman and Managing Director) presided, and in the course of his speech said: As a result of a further substantial increase in Turnover the Group Profits total £441,183, which is £51,000 more than last year.

Our sales in the Shopfitting and Shop Display sections constitute a large portion of our turnover, and the strong demand experienced during the past year was an important factor in the final results. Orders were above the average for most of the year. The factories were fully occupied and production was at a high level and the labour shortage not so acute as in the past.

In the Drapery Display market we negotiated the sole selling rights of Continental display figures of exceptional quality that were enthusiastically received by the trade and with the highly specialised products of the Jewellery section accounted for a record year's orders.

Our Engineering division also had a most satisfactory year's trading and the Lift section under the Hammond and Champness subsidiary company were responsible for installations of their high-speed automatically controlled electric lifts in many of the new buildings in the City of London rebuilding scheme.

As regards the future, we have started 1958 with a full order book, and the first few months have been encouraging. Providing there is no deterioration of trading circumstances the prospects are attractive.

The report was adopted and the Ordinary dividend distribution of 17½ per cent approved.

"SHELL" TRANSPORT & TRADING

FURTHER EXPANSION EXPECTED

The annual general meeting of the "Shell" Transport and Trading Company Limited was held on May 20th in London.

The Right Honourable Lord Godber, chairman, in the course of his speech, said:

In the Annual Report I gave a brief description of conditions in the oil industry today. In the short time which has elapsed since the preparation of my Statement there is little which could have occurred to bring about any fundamental change of outlook. The key factor in the situation is the recession in the United States. It has already gone slightly deeper than either the two previous ones through which the United States has passed since the war and this fact itself, together with other portents, may possibly encourage the view that we may soon see a modest recovery.

So far as our industry is concerned, the stock position in the USA is better, owing to much reduced refinery runs and to severe curtailment of production of crude oil, which in the Texas fields has been reduced to 8 days a month—the lowest ever recorded. In the world outside the United States, records of the year so far available suggest that as a whole consumption is being maintained, but without the full impetus to expansion which previous years' experience had led us to expect. Within the whole field, of course, some parts of the business have slackened and others have improved.

PAUSE IN UPWARD TREND

Historically, recessions have not had the same impact, except in certain limited fields, on the levels of oil consumption as they have had on the demand for other commodities in general. So far as we are concerned, as I have already mentioned in my Statement, on this occasion I see no reason to expect more than a pause in the upward trend of expansion.

The new funds recently raised by the two parent companies of the Group, although small in relation to its capital expenditure requirements, will also assist us to face the future with confidence. The strong financial position which the Group now has means that it can steadily pursue its long-term plans for the development of its facilities. When the upward trend of consumption is resumed and the current surpluses of supply and of manufacturing and transportation capacity are absorbed, we will then be in a position with such facilities to take full advantage of all opportunities for expansion which arise.

It is still a little too soon to say what the financial picture for the first quarter will be, since this meeting is now taking place some 10 days earlier than last year, and consequently the Royal Dutch/Shell Group's first quarter's results are not yet quite ready. They will be published on the 29th of this month. They cannot be expected to match our exceptionally good earnings of the same period last year, when you will remember that, largely owing to a material increase in our companies' production of crude oil in the Western Hemisphere, the Group's results were very good indeed. Viewed in the light of the position two years ago, however, and in relation to existing economic conditions, I believe that the picture will prove to be reasonably satisfactory.

The report was adopted.

UNITED PREMIER OIL AND CAKE COMPANY

PERIOD OF INTENSE COMPETITION

The thirty-ninth annual general meeting of United Premier Oil and Cake Company Limited was held on May 21st in London, Sir Eric Miéville, GCIE, KVCO, CSI, CMG (the chairman), presiding.

The following is an extract from his circulated statement:

The year 1957 has been a difficult one for your Company in many respects and, in particular, it has seen a steady and almost continuous fall in most commodity prices. The extent of this fall in the prices of many of the raw materials which we process has, in some cases, been very substantial.

It is against this background that the results of our seed-crushing activities must be judged and it is gratifying to note that these were actually more profitable in 1957 than in the previous year. Our subsidiary company connected with oleines and stearines, however, met severe competition and a slackening of demand, which resulted in much lower profits from that section of our activities.

The gross trading profits of the group amounted to £365,241, a decrease of £76,438 compared with the previous year. After all charges, including interest on Debenture stock, taxation, and the dividend on the 7 per cent Preference stock, the balance of the year's profits available for the Ordinary dividend is £74,676.

We have already paid an interim dividend of 3d. per Ordinary stock unit and now recommend a final payment of 9d. making a total of 1s. per unit, less tax. This is at the same rate as for the previous year and absorbs £46,000, leaving £28,676 to be retained in the business.

Our net current asset position which was fortified by the issue of £500,000 Debenture Stock in 1956 has improved since December 31, 1957, as lower raw materials prices are reflected in the value of stocks on hand and we anticipate some further improvement in this respect.

DEVELOPMENT

Last year I emphasised that we had virtually completed our programme of modernisation of the Isis Mill, but that in the manufacture of technical oils, new methods were constantly being developed. During 1957 a new hydrogenation plant has been installed at Universal for the hardening of fatty acids. Hydrogenation in the oil and fat industry is a process by which free hydrogen gas is chemically combined with oil, resulting in a rise in the melting point of the oil or fat. By this means an oil can be converted into a fat, hence the term "hardening process" often used instead of "hydrogenation process." This new plant started operating in February, 1958, and we anticipate that it will increase our profitability during the current year.

We are passing through an anxious period and at this early stage it is not possible to foresee what the rest of the year may bring. It is, however, certain, that the long period of scarcity and sellers' market is now over and that we are in a period of intense competition. In such circumstances we can take heart in the fact that we have a very modern plant and that in our Managing Director, Mr W. E. Waterhouse, and his colleagues, we have the benefit of a great fund of energy, wisdom and experience.

The report was adopted.

THE UNITED MOLASSES COMPANY

MR G. W. SCOTT'S STATEMENT

The thirty-second annual general meeting of The United Molasses Company Limited will be held on June 10th in London.

The following is an extract from the circulated statement by the Chairman and Managing Director, Mr G. W. Scott, CBE:

The gross profits of the Group for 1957 at £6,573,322 have been arrived at after writing down the value of molasses stocks at December 31, 1957, by £604,500 and providing a further sum of £126,000 against high price molasses supply contracts remaining undelivered at December 31, 1957. Your directors have no hesitation in recommending the continuance of the Ordinary dividend at the same rate as for 1956 and also the Special Cash Distribution of 4½d. per unit.

There has been a considerable improvement in the volume of molasses deliveries during the first four months of the current year compared with the previous year, but margins have been somewhat smaller. Prospects for shipping are depressing and there is no evidence of any likelihood of an early material improvement in either dry cargo or tanker freights.

Whilst it is difficult and dangerous to attempt to prophesy the future, the present indications are that the earnings of the Group for 1958 will show a considerable fall over those for the previous year. Nevertheless, your directors have every intention, unless some unforeseen event occurs, to continue dividends out of Revenue Profits for 1958 at the same rate as 1957.

BRITISH ROPES LIMITED

SALES MAINTAINED

The thirty-sixth annual general meeting of British Ropes Limited, was held on May 21st in London.

Mr Herbert Smith (Chairman) in the course of his speech, said: I would refer first to the very satisfactory result of the year's trading, and the strong position disclosed by the balance sheet. The group trading profit before taxation amounts to £2,566,000 compared with £2,369,000 for the previous year, an increase of £197,000. Taxation again absorbs more than half of the profit. Your directors recommend a final dividend of 13 per cent, the same rate as last year, on the ordinary stock, making a total of 17 per cent for the year.

Trading conditions have tended to be rather more difficult than in recent years, but the three main sections of the company—Wire, Wire Rope and Hard Fibre—have attained a sales level in both tonnage and value which is very similar to the previous year. More than 20 per cent of our production in the United Kingdom was exported; this represents an important part of our business. Intense competition has been met in many of these markets, but in spite of this we have increased our overseas trade.

During the last few months of 1957 the demand for wire rope and fibre rope for the Shipping industry fell below the normal level. Otherwise during the year the demand by the various users has reached the expected level. The future, however, is not so certain, and in 1958 we may not attain the profits shown for 1957. In addition, other industries in this country and overseas have suffered a decline in activity.

The report and accounts were adopted.

THE LONDON ASSURANCE

DIFFICULT CONDITIONS IN NORTH AMERICA

The Annual General Court of The London Assurance will be held on June 11th in London.

The following is an extract from the circulated statement of the Governor, Mr R. Olaf Hambro:

In my review addressed to the shareholders a year ago, I said that "Over all, the year has been a bad one." I am sorry to say that, taken as a whole, the figures for 1957 represent no improvement on those for 1956. Once more we have achieved an excellent profit in the Marine Department and the Life Department has maintained its admirable record, but the disastrous experience in North America in the Fire and Accident Departments has resulted in underwriting losses which have exceeded the profits achieved in other territories and in other Departments.

I cannot promise an immediate change for the better, but I can say with confidence that the "London" group is better placed now to meet further difficulties or to take advantage of any improvement in general conditions.

Life Account.—In the Life Department 1957 has been another year of steady and satisfactory progress. Although the total amount of new business showed a slight reduction when compared with the previous year, the total measured in sums assured was in excess of £10 million, and we are very well satisfied with the figures.

Premium income in the Life Assurance Account increased by nearly £90,000 to £2,532,704. The gross rate of interest earned on the fund increased by 3s. 6d. per cent to £5 9s. 11d. and the net yield to £4 4s. 4d.

Fire Account.—The fire premium income for the year amounted to £8,238,716, a decrease of nearly £700,000. The claims cost at £4,661,452 represented 56.6 per cent of the premiums, and an underwriting loss of £249,101 or 3 per cent of the premium income, has had to be met by a transfer from Profit and Loss Account.

Accident Account.—Premium income in the Accident Department shows a further substantial increase of over £1,700,000 to £12,248,809, the increase being spread over almost all the territories in which we operate. After setting aside the increased provision for unexpired risks and meeting claims, which absorbed 67.4 per cent of the premium income, as compared with 65.4 per cent, a transfer from Profit and Loss Account of £1,394,834 has been necessary to balance the Account.

Marine Account.—The total premiums amounted to £3,627,607, an increase of nearly £380,000 when compared with the previous year. The ratio of claims to premiums remained almost exactly the same as in 1956 at 73.9 per cent. The transfer to Profit and Loss Account is again £550,000.

Profit and Loss Account.—The gross income from interest, dividends and rents shows an increase from £1,261,140 in 1956 to £1,285,670 in 1957, but there is a loss of £333,509 on the operations of the year. The Court of Directors recommend a total distribution for the year of 2s. 3d. per share, the same as last year.

Balance Sheet.—The combined assets of the Group, including the Life Department, amounted on December 31, 1957, to £64,741,000, an increase of over £2,300,000 on the year.

FINANCIAL NOTICE

ROYAL DUTCH PETROLEUM COMPANY

N. M. Rothschild & Sons ANNOUNCE that the General Meeting of Shareholders of the Royal Dutch Petroleum Company on May 20, 1958, has decided to declare a total dividend in cash of fls. 5.— per share in respect of the financial year 1957 to be paid on each of the 60,818,280 ordinary shares outstanding at December, 31, 1957, and of fls. 3.50 on each of the 7,602,285 new shares issued since then. The amount of fls. 5.— includes an interim dividend of fls. 1.50, which was made payable in November, 1957, on each of the 60,818,280 ordinary shares then outstanding.

The dividend amounts to fls. 175.— per bearer certificate for 50 shares, fls. 17.50 per bearer certificate for five shares and fls. 3.50 per registered share respectively.

A. *On the bearer shares:*

This dividend will be paid on and after May 23, 1958, at the office of N. M. Rothschild & Sons on business days, Saturdays excepted, between the hours of 11 a.m. and 2 p.m. against surrender of Coupon No. 115, Coupons must be accompanied by a declaration in triplicate signed by an Authorised Depositary reading:

"We declare submitted to us that the securities evidence has been deposited enumerated below have been from which the coupons detached are provided with red export certificates detached are provided with red export certificates issued by De Nederlandsche Bank."

Coupons will be paid in sterling at the buying rate of exchange on Amsterdam current at 2 p.m. on May 21, 1958, or on the day of presentation in the case of later date. In view of the fact that guilder funds are being provided by the Company for payment of this dividend the usual foreign exchange commission will be deducted from the sterling proceeds.

From the gross dividend to be deducted (i.e. there will be paid of 15 per cent is to be deducted (i.e. there will be paid on Coupon No. 115 a net amount of fls. 148.75 per certificate for 50 shares and fls. 14.875 per certificate for five shares), except in the case of Coupons presented on behalf of (i) residents in the United Kingdom, provided they lodge a Netherlands declaration "Inkomstenbelasting No. 92 V.K." in duplicate; (ii) residents in the U.S.A. provided they lodge a Netherlands declaration "Inkomstenbelasting No. 92 V.S." in duplicate; (iii) residents in Sweden, provided they lodge a Netherlands declaration "Inkomstenbelasting No. 92 ZWE" duly completed by the Swedish tax authorities; (iv) residents in Finland, provided they lodge a Netherlands declaration "Inkomstenbelasting No. 92 FIN" duly completed by the Finnish tax authorities; and (v) residents in France, in which case either a French declaration model B signed by the shareholder with the certificate on the back duly completed by the appropriate French Inspector of Taxes or a French declaration model B in duplicate duly completed and signed by an authorised French bank must be provided.

As regards holders resident in France, attention is drawn to the fact that the regulations giving effect to the Franco-Netherlands Tax Convention provide that unless the model A or model B declaration referred to above is lodged when dividends are collected on and after September 1, 1954, dividend tax will be deducted and there will be no possibility whatever of reclaiming this tax.

In cases (ii), (iii), (iv) and (v) above the usual affidavit certifying non-residence in the United Kingdom will also be required if payment is to be made without deduction of United Kingdom income tax.

Coupons must be left for an appropriate period for examination and must be handed in personally. Coupons cannot be paid through the post.

Coupons must be listed *in triplicate* on special forms embodying the declaration referred to above, which can be obtained on application.

B. *On the registered shares:*

As to the shares registered in the United Kingdom section of the Netherlands register, N. M. Rothschild & Sons are authorised to announce that the following arrangements have been made for the payment of the dividend amounting to fls. 3.50 per registered share (nominal value fls. 20):

On May 21, 1958, the Sterling amount of the dividend will be fixed on the basis of the Sterling/Guilder rate of exchange current in Amsterdam on that date.

May 28, 1958, will be the record date. Shareholders registered at the close of business on that date will be entitled to receive the dividend.

On or before June 20, 1958, dividend warrants will be posted by the transfer agent, Nederlandsche Handel-Maatschappij, to shareholders registered in their books on the record date.

As soon as possible after May 21, 1958, a further announcement will be made giving the rate of exchange, the amount of the dividend in Sterling per share and the amount of the 15 per cent Netherlands dividend tax in Sterling per share.

New Court, St. Swithin's Lane, London, E.C.4.
May 21, 1958.

APPOINTMENTS

ECONOMISTS/STATISTICIANS

TREASURY, KENYA

Candidates, who must be under 45, should possess an Honours Degree or equivalent in Economics or Economics and Statistics. Experience desirable of economic research or economic administration and previous service in a government organisation an advantage. Some knowledge of handling statistical data and experience in its collection and interpretation is essential. For one vacancy, a knowledge of agricultural economics and experience in an advisory capacity in the field of agricultural research would be of value. Duties will include collecting economic and statistical information from various organisations, analysing this information and preparing reports and precis for submission to the Economist to the Treasury.

Appointment will be on probation for the permanent and pensionable establishment, inclusive salary scale £939 to £1,863, point of entry determined by experience. Government quarters, if available, at moderate rental. Free passages for officer, wife and family. Income tax at local rates. Generous home leave.

Application forms and further particulars from Director of Recruitment, Colonial Office, Sanctuary Buildings, Great Smith Street, London, S.W.1. (Reference BCD 161/7/01.)

PEP requires staff for study of European Common Market and Free Trade Area. Project, on a grant from Ford Foundation, covers trade and tariffs, economic and social policy, industry, agriculture, institutions. Salaries according to responsibility involved and experience. Posts of special responsibility £1,500 to £2,500; seniors £1,000 to £1,400; research assistants £600 to £1,000.—Write, giving full particulars to Richard Bailey, Director, Political and Economic Planning, 16 Queen Anne's Gate, London, S.W.1.

ADMIRALTY require two Temporary Assistant Statisticians for service in London. Applicants must normally be British subjects and possess either 1st or 2nd Class Hons. Degree in Mathematics or Economics with Statistics as a special subject. London salary within scale £535-£1,110 (men) and £535-£1,050 (women). Annual leave 3 weeks 3 days, plus public holidays. Write, giving details age, education and experience, to The Manager, Ministry of Labour and National Service, Professional and Executive Register, Atlantic House, Farringdon Street, London, E.C.4, quoting Ref. No. P.E.9844. Only candidates selected for interview will be advised.

NORTHUMBERLAND COUNTY EDUCATION COMMITTEE

ASHINGTON COUNTY TECHNICAL COLLEGE

Applications are invited for the following posts:—Training and/or experience in technical education will be an advantage.

COMMERCE DEPARTMENT

(1) ASSISTANT (GRADE A) COMMERCIAL SUBJECTS—For work in full-time and part-time courses with a special interest in either Secretarial or accountancy subjects.

(2) ASSISTANT (GRADE A) SHORTHAND AND TYPING (MAN OR WOMAN)—Ability to assist with Office Practice or other general commercial subjects will be an advantage.

Forms of application and further particulars may be obtained by forwarding a stamped addressed foolscap envelope to The Director of Education, County Hall, Newcastle upon Tyne, 1, to whom completed forms should be returned as soon as possible.

UNIVERSITY OF BIRMINGHAM

FACULTY OF COMMERCE AND SOCIAL SCIENCE

Applications are invited, from social scientists who have specialised in Statistics or from mathematicians who have worked in social or economic statistics, for a temporary LECTURESHIP or ASSISTANT LECTURESHIP IN STATISTICS.

Applications, which should contain the names of two referees, should be sent by June 16, 1958, to the Registrar, The University, Birmingham, 15, from whom further particulars can be obtained.

OXFORD UNIVERSITY

INSTITUTE OF STATISTICS

Applications are invited for research posts in applied economics. Candidates should have a good degree in economics or statistics and for one of the posts research experience. The salary will be according to age and qualifications in the range £700-£1,750 per annum. Posts are superannuable and an allowance of £50 per child is paid. Application forms may be obtained from the Secretary of the Institute, St. Cross Road, Oxford. Closing date June 21st.

APPOINTMENTS

THE GUEST KEEN AND NETTLEFOLDS GROUP OF COMPANIES

INSURANCES. An appointment is to be made at the Head Office of the Group in Birmingham of an appropriately qualified man to deal with the centralised work connected with the Insurances of the Group. Candidates in the 28-38 age bracket must have sound knowledge and experience of all classes of Industrial Insurance.

The appointment is pensionable and the initial salary will depend upon experience and qualifications.

Applications are invited from appropriately qualified men who consider that they have the relevant experience. They should write, stating full details of age, qualifications, career to date, etc., to the Group Personnel Officer, Guest Keen & Nettlefolds Ltd., Shell-Mex House, Strand, W.C.2.

A COST ACCOUNTANT

is required by

KUWAIT OIL COMPANY LTD.

for service in

KUWAIT

Applications are invited from Associates of the Institute of Cost and Works Accountants who should be in the age range 25-28 and have 2-4 years' experience in industry since qualifying. A degree in economics or commerce would be an advantage.

Local salary according to qualifications and experience, but not less than £2,100 p.a. Pension scheme. Kit allowance.—Write for application form, sending brief details and quoting K.2469, to Box Z/81, c/o 191 Gresham House, E.C.2.

ELECTRONIC COMPUTER PROGRAMMERS.—Littlewoods Mail Stores Ltd. have recently installed an Elliott 405 data processing system in their Head Office at Liverpool, and have vacancies for two experienced Programmers.

The successful applicants (age not over 35) will be competent to work as members of a team responsible for the investigation and programming of large scale commercial problems.

These are senior appointments within the Head Office, offering excellent progress in a rapidly expanding organisation, and candidates must be prepared to live in the Liverpool area.

Very attractive commencing salary based on experience and qualifications, with life assurance and pension facilities. Five-day week.

Letters of application, stating age and full particulars of education and experience, to the Employment Manager (E.C./5), Littlewoods Mail Order Stores Ltd., Kershaw Avenue, Endbutt Lane, Crosby, Liverpool X.

THE INSTITUTE OF RACE RELATIONS

The vacancy exists for a Deputy Director on a salary of £1,200 to £1,500 according to age and experience. Should be graduate in history, psychology or social sciences. References with application.—Further particulars from the Institute, 6 Duke of York Street, London, S.W.1. (TRAfalgar 4161.)

RECKITT & COLMAN HOLDINGS LTD. wishes to appoint a Chartered Accountant (under 30) at its Head Office for interesting and responsible work in connection with its considerable overseas business. Ability and character are more important than experience.—Details, including age, education and present salary, to Personnel Adviser, Danvers Lane, Hull.

PETROLEUM ECONOMICS LTD. invites applications from graduates under 35. Duties will consist initially of selection, analysis and preparation of data and statistics or studies and reports. Prefsons oil industry experience desirable but not essential. A knowledge of languages esirable. Salary according to age and experience. Write box 935.

UNIVERSITY OF EXETER

Applications are invited for the post of Lecturer in Economic and Social Statistics.

Salary scale £900-£1,650 (with efficiency bar at £1,300).

Further particulars may be obtained from the Secretary of the University.

Closing date for applications June 7, 1958.

CANTERBURY AGRICULTURAL COLLEGE

(UNIVERSITY OF NEW ZEALAND)

Applications are invited for appointment to the position of PROFESSOR OF AGRICULTURAL ECONOMICS. Applicants should hold academic qualifications in Arts, Commerce or Agriculture with special qualifications and experience in teaching or research in Agricultural Economics, or in any branch of economics as applied to agriculture.

Salary £2,190 per annum.

Conditions of appointment obtainable from the Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1.

Applications close in New Zealand and London, on July 31, 1958.

UNIVERSITY OF BIRMINGHAM

FACULTY OF COMMERCE AND SOCIAL SCIENCE

EDWARD WILSHAW POSTGRADUATE EXHIBITION

The Exhibition, of the order of £200, but the amount to be determined in each case by the applicant's merits and circumstances, will be offered each year from a fund founded by Sir Edward Wilshaw, K.C.M.G., D.L., LL.D., M.I.Mech.E., J.P. The Exhibition is open to graduates of this and other Universities who wish to prepare themselves for careers in business administration and management and who propose to read for the Graduate's Commerce Diploma in business administration.—Applications (6 copies), including the names of two referees, should be sent by June 14, 1958, to the Registrar, The University, Birmingham, 15.

KUMASI MUNICIPAL COUNCIL, GHANA

APPOINTMENT OF MUNICIPAL TREASURER

Applications for the above post are invited from candidates under 60 and preferably over 40, years of age, possessing the final certificate of the Institute of Municipal Treasurers and Accountants or an equivalent qualification provided the candidates or an equivalent experience of local authority finance. The post is on contract for three tours, each of 15 months' duration at a salary of £2,500 a year with gratuity at the rate of £12 10s. for each completed month of residential service payable on completion of contract. First-class passages for officer, wife and up to three children under 18 years, and in addition an education allowance for children when not resident in Ghana, of £100 a child up to three children under 18 years. Generous home leave on full pay. House provided, with basic furniture, at a reasonable rental. Car allowance will be provided, and facilities for the purchase of a car on an interest-free loan from the Council, free medical attention.

Applications, stating age, qualifications and experience, together with the names of three referees, should be sent, not later than June 23, 1958, to The Director of Recruitment, Ghana High Commissioner's Office, 13 Belgrave Square, London, S.W.1.

ACTUARIAL OPPORTUNITIES IN U.S.A.

The Equitable Life Assurance Society of the United States has several openings at its Home Office in New York for men interested in an actuarial career in the United States. Candidates should be up to about age 30 and have passed some or all of the examinations of the Institute of Actuaries, or of the Faculty of Actuaries.

Those interested should write to Mr. Harry Walker, Second Vice-President and Associate Actuary the Equitable, at 393 Seventh Avenue, New York, 1, New York, U.S.A., stating their qualifications, including age, education and experience. Interviews with Equitable representatives will be arranged in Edinburgh on July 21st and in London on July 22nd and 23rd.

A CAREER IN MARKET RESEARCH

A progressive career is open to young men between the ages of 21 and 27 in the Market Research Department of a nationally known Company manufacturing consumer goods.

Candidates should be graduates with an inclination to apply research to business problems.

A thorough training is offered in all branches of Market Research, leading to a rewarding career with early and increasing responsibility for guidance on important decisions on marketing and product development.

Letters of application should contain full details of background, age, education and career to date, and be sent to Box 937.

MARS LIMITED, confectionery manufacturers, invite applications for the post of Market Research Manager. The successful candidate will be responsible for the detailed planning of all research concerned with the distribution and sales of Company products and services. He will also be required to liaise with the Statistical Department on the preparation of reports on distributive research.

Candidates should be between 25 and 35 years of age, be graduates in economics (preferably with statistics as a subsidiary subject) and be able to undertake some travel within U.K. Previous experience in a Market Research or Economics/Forecasting Department and an interest in helping to produce and interpret statistics are also desirable.

The post carries an initial salary of at least £1,000 p.a. plus a generous non-contributory pension, life assurance and sickness scheme.

Applications, stating age, education and experience, should be addressed to the Personnel Officer, Mars Limited, Dundee Road, Slough, Bucks.

WORKS MANAGER required by well-established and progressive Company manufacturing office, works and specialised sheet metal equipment. Applicants, age 38-45, qualified engineers possessing knowledge up-to-date methods, time study, work minutes, budgetary control, development, etc., should write, giving full details of career to date. Permanent pensionable post.—Box 936.

UNIVERSITY COLLEGE OF NORTH STAFFORDSHIRE

Applications are invited for the post of Lecturer or Assistant Lecturer in Mathematical Economics, the appointment to be taken up on October 1, 1958. Salary in scale £900 x £50 to £1,350 x £75 to £1,650 p.a. (according to £700 x £50 to £850 p.a. (Assistant Lecturer).

Applications should reach the Registrar, The College, Keele, Staffs, from whom application forms may be obtained, not later than June 7, 1958.

UNIVERSITY COLLEGE OF SOUTH WALES AND MONMOUTHSHIRE

Applications are invited for the post of RESEARCH ASSISTANT in the Department of Economics, for one year from October 1, 1958, with a possibility of a renewal for a further one or two years, to take part in a research project on long cycles and economic growth. Salary £675 per annum.

Six copies of applications, together with the names of three referees, should be sent to the undersigned not later than June 10, 1958. Further particulars can be obtained by applying to the Registrar.

Cathays Park,
CARDIFF. E. R. EVANS,
Registrar.

FEDERATION OF BRITISH RUBBER AND ALLIED MANUFACTURERS

EXPORT DEPARTMENT

Applications are invited for an appointment in charge of the above Department. Candidates should hold an Honours Degree in Economics, and some experience in export business would be an advantage. Salary would be settled according to age and experience.—Detailed applications, giving the names of two referees, should be addressed to the Secretary, Federation of British Rubber and Allied Manufacturers, 43 Bedford Square, London, W.C.1, from whom further particulars of this post can be obtained.

THE AUSTRALIAN NATIONAL UNIVERSITY

CANBERRA

Research Scholarships

Applications are invited from postgraduate students with capacity for research for scholarships in Anthropology and Sociology including Oceanic Linguistics, Demography, Economics including Economic History and Economic History, Geography, Australian History, Far Eastern Relations, Law, Political Science, Pacific History, International Administration, Philosophy, Political and Social Philosophy and Statistics including Mathematical Statistics.

The scholarships are tenable for an initial period of two years and may be extended for a third year. Scholars are expected to enrol for a Ph.D. degree.

The present value of a scholarship is £A822 per annum. Married scholars with dependent children may be granted an additional allowance of £A225 per annum in respect of the first child and a further £A75 per annum for each other child.

A grant will be made towards a scholar's fares to and from Canberra at the commencement and expiration of his scholarship.

Application forms and further information may be obtained from the undersigned†, to whom applications should be submitted, or from the Secretary, the Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1. The University regularly considers applications in June and November but special consideration may be given to applications at other times. Scholarships may be taken up at any time after award including vacation periods.

*A substantial knowledge *of the relevant language* is a pre-requisite.

† R. A. Hunnen, Registrar, Box 4, G.P.O., Canberra, A.C.T., Australia.

THE POLYTECHNIC

309 REGENT STREET, W.1

DEPARTMENT OF MANAGEMENT STUDIES

Applications are invited for the posts of SENIOR LECTURER and LECTURER to the EXECUTIVE PROGRAMME, jointly conducted by the British Institute of Management and the Polytechnic.

The Senior Lecturer will be assistant director of the course and will, in addition to his teaching duties, take a large share in the administration of the course. Both he and the Lecturer will be expected to undertake research and some consulting work may also be undertaken.

Candidates should be graduates with an inclination to apply research to business problems.

A thorough training is offered in all branches of Market Research, leading to a rewarding career with early and increasing responsibility for guidance on important decisions on marketing and product development.

Letters of application should contain full details of background, age, education and career to date, and be sent to Box 937.

The salary scale for Senior Lecturers commences at £1,350 p.a., rising by annual increments of £50 to £1,550. The scale for Lecturers commences at £1,200 p.a., rising by annual increments of £50 to £1,350 p.a. In addition, a London allowance of £36 or £48 is payable in both cases.

A form of application, which should be returned within 14 days of the appearance of this advertisement, may be obtained by sending a stamped addressed foolscap envelope to the undersigned.

J. E. RICHARDSON,
Director of Education.

ACTUARY, National Mutual of Australasia seeks Resident Actuary for one of its largest Branches (New South Wales)—New Sums Assured £A14 million per annum and rising) after one year's experience at its Head Office in Melbourne. Generous salary according to age and experience with excellent prospects. Association will pay transfer costs to Australia. Applicants should either be Fellows or Senior Students who have completed three-quarters of examinations.—Apply to Manager for United Kingdom, 5 Chesapside, London, E.C.2.

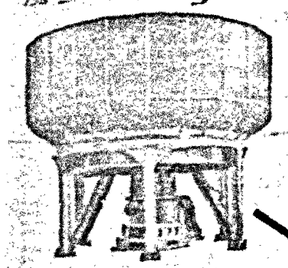
COMPUTER PROGRAMMERS.—N.A.T.O. is installing an electronic computer in Germany at the end of this year to deal initially with distribution and control of stocks. Programmers are required to join the team which is developing and will operate the system. Vacancies exist for both senior and assistant appointments. For the senior post a degree in mathematics or science is indicated but a near equivalent may be acceptable; additionally some commercial experience is desirable. Experience in programming is an advantage, but training will be given. Knowledge of German not essential.—Write, in confidence, giving full details of experience and qualifications, to R. T. Eddison, Esq., Manager, Plans and Methods Department, NAAFI, London, S.E.11.

UNIVERSITY OF BIRMINGHAM

The University will offer a number of Scholarships, value £245 to £310, to graduates and to those expected to graduate this summer who wish to read for higher degrees in the Faculty of Commerce and Social Science. There will be opportunities for advanced study and training in research in all the main departments of the Faculty and in subjects common to more than one department.

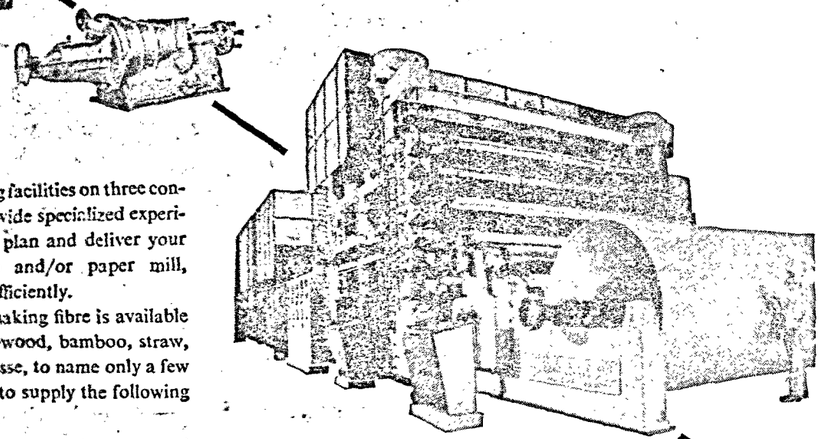
Further particulars may be obtained from the Registrar, The University, Birmingham, 15, to whom applications should be sent before June 14, 1958.

UNIVERSITY COLLEGE OF ARTS AND SCIENCES



Baghdad, Iraq

A Lecturer in Economic History is required, to commence duties in October, and to teach courses in the economic history of England and France, 1700-1870, and in the economic history of Western Europe and North America, 1870-1939, to students in the second and third years respectively. It will be an advantage if, in emergencies, the Lecturer could also give an elementary course in Principles of Economics. Candidates should possess a good honours degree in economics and economic history. Starting salary: 1,800 dinars p. a. (1 dinar = £1 stg.), with cost of living allowance 144 dinars for single, 192 dinars for married Lecturer. Provident fund. Income tax approx. 6%. Free/low fares for Lecturer and wife and up to two children under 13 at beginning and end of contract. Travel allowance on leave, 60 dinars married, 40 dinars single. Annual home leave from mid June to late September. Up to 50% of salary may be remitted to U.K. Contract, one year or three years, with first year probation on both sides. Candidates with particularly good qualifications should write to the Dean without delay.



Applications should be addressed to the Cultural Attaché, Iraqi Embassy, 22, Queen's Gate, London, S.W.7, before May 30.

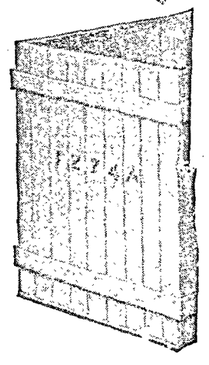
If your country must
PRODUCE more
PULP AND PAPER—

Our manufacturing facilities on three continents and world-wide specialized experience enable us to plan and deliver your "packaged" pulp and/or paper mill, ready to operate efficiently.
Whatever paper-making fibre is available in your country—wood, bamboo, straw, or sugarcane bagasse, to name only a few—we stand ready to supply the following services:

1 *Conduct a thorough technical and economic field survey and prepare a report suitable for submission to financial institutions.*



2 *Assist the local group in financing the project.*

3 *Design the complete project in co-operation with the world's leading consulting engineers.*

4 *Produce and deliver all pulp and paper-making machinery and other equipment which is not locally available.*

5 *Supply skilled personnel to ensure efficient operation until local staff has been trained.*

6 *Assist in the procurement of foreign raw materials and in the sale of the mill's output on world markets through our own branches.*

thermal insulation: act wisely

Nine questions before the Board—THE CHOICE OF THERMAL INSULATION

1 How much will it cost?
2 How much will it save?
3 How long will it take to amortize?
4 How long will it last?
5 Can you install it and forget it?
6 Will it increase or reduce FIRE RISK?
7 Can you change your *production* processes below it?
8 Will it be harmed by steam, condensation or a corrosive atmosphere?
9 Will it comply with every possible regulation of the Act—FOR EVER?

If you would like nine straight answers to the above questions write to the Sales Director, Cape Building Products Limited. In the meantime, you may like to note that an Asbestolux Thermal Insulation lining specification cannot be improved upon so far as Thermal Insulation, Fire Protection and durability are concerned—whatever the conditions may be.

FIRE will not hurt it **TIME** will not harm it **WATER** will not damage it **VERMIN** will not touch it

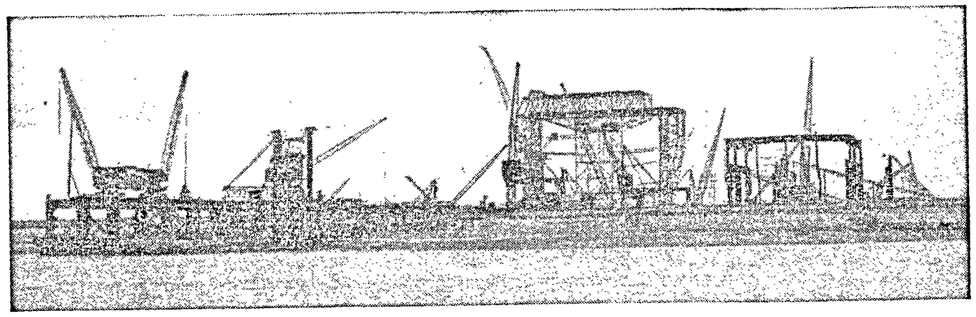
When Geigy was founded . . . .

Rococo was in fashion. Madame Pompadour was the ruling favourite at Versailles. Haydn was composing music, Voltaire and Rousseau were writing, Goethe and Mozart were still in their childhood. A few years earlier, Benjamin Franklin had invented the lightning conductor; a few years later James Watt built the first steam engine. In France, Diderot and d'Alembert were working on their Encyclopaedia; the University of San Felipe in Santiago de Chile was two years old, the Vienna and Edinburgh Stock Exchanges five. Adam Smith was writing the Wealth of Nations. Britain and France were fighting for possession of overseas territories, and war was also in progress between Frederick the Great and Maria Theresa, Empress of Austria. Porcelain factories were being founded, cement had just been discovered, and the cabinet maker Chippendale had created a new style of furniture.

1758



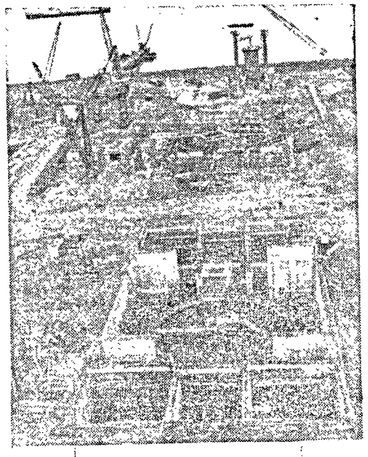
In 1758 one of the oldest chemical firms in the world was founded in Basle, Switzerland. It was a shop where dyes, drugs and Chemicals were sold, and the founder's name was Johann Rudolf Geigy.

The firm has carried that name ever since. This year J. R. Geigy S. A. of Basle joins its associates throughout the world to celebrate the 200th year of its foundation. In two centuries the one-man business has grown into an international concern whose products – like the DDT insecticides and the Mitin mothproofing process – are famous everywhere.

The Geigy Group of Companies today make and sell dyestuffs and tanning materials, industrial chemicals, plasticisers, pesticides and pharmaceuticals. In the field of organic chemicals the name of Geigy is a mark of quality.

200 years Geigy

Progress report on BRADWELL



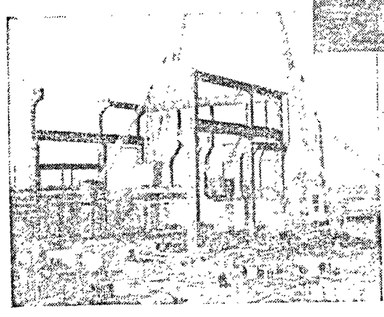
1 THE FIRST YEAR . . .

January 18th, 1958, was the first anniversary of the start of construction of Bradwell nuclear power station in Essex, England.

The station was designed, and is being built, by the Nuclear Power Plant Company Limited for the Central Electricity Generating Board. Employing two gas-cooled, graphite-moderated reactors, the station will have a guaranteed net electrical output of 300 megawatts.

TURBINE HALL

The reinforced concrete foundation blocks for the main and auxiliary turbo-alternators have been completed and the outer retaining walls are above ground level from an excavation depth of approximately 24 ft. Structural steelwork, carried on mass concrete foundations, is now being erected. The dimensions of the turbine house excavations are 550 ft. x 200 ft.



REACTOR PROGRESS

Both reactor buildings are now above ground level from an excavated depth of 40 ft. The support plinths for the pressure vessels have been cast, and work has started on the fabrication of the vessels.

GOLIATH CRANE

This 200-ton crane to be used primarily for the fabrication of the reactor pressure vessels and the hoisting of complete boiler shells has been completed. Running on tracks on each side of the reactor buildings the bridge structure will clear the buildings at any time. The track of approximately 1,200 ft. length is also nearing completion.

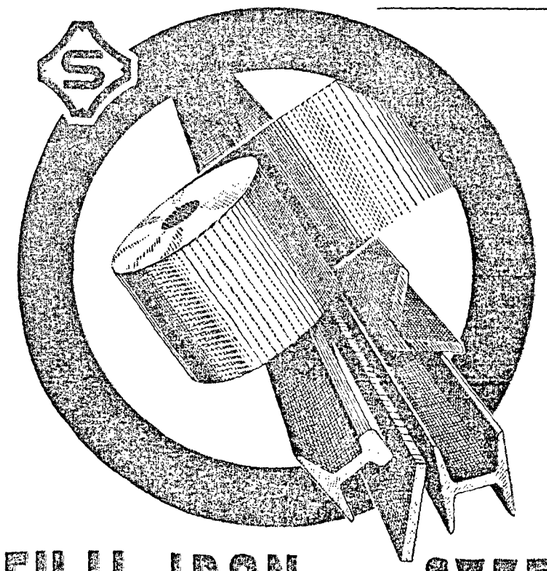
"Talking of Sound Barriers...."



"The Works Doctor came to see me the other day and put forward a strong case for some form of insulation to protect employees from excessive noise. Apparently most of the absenteeism and nervous illness in the place is due to sound irritation, although I believe he had another word for it. I must admit our re-equipment scheme has increased the noise level considerably—and absenteeism has increased likewise. Anyway I'm recommending to the Board that we call in Newalls to see what can be done about it. It will be a worthwhile investment to get back to something like peak efficiency."*

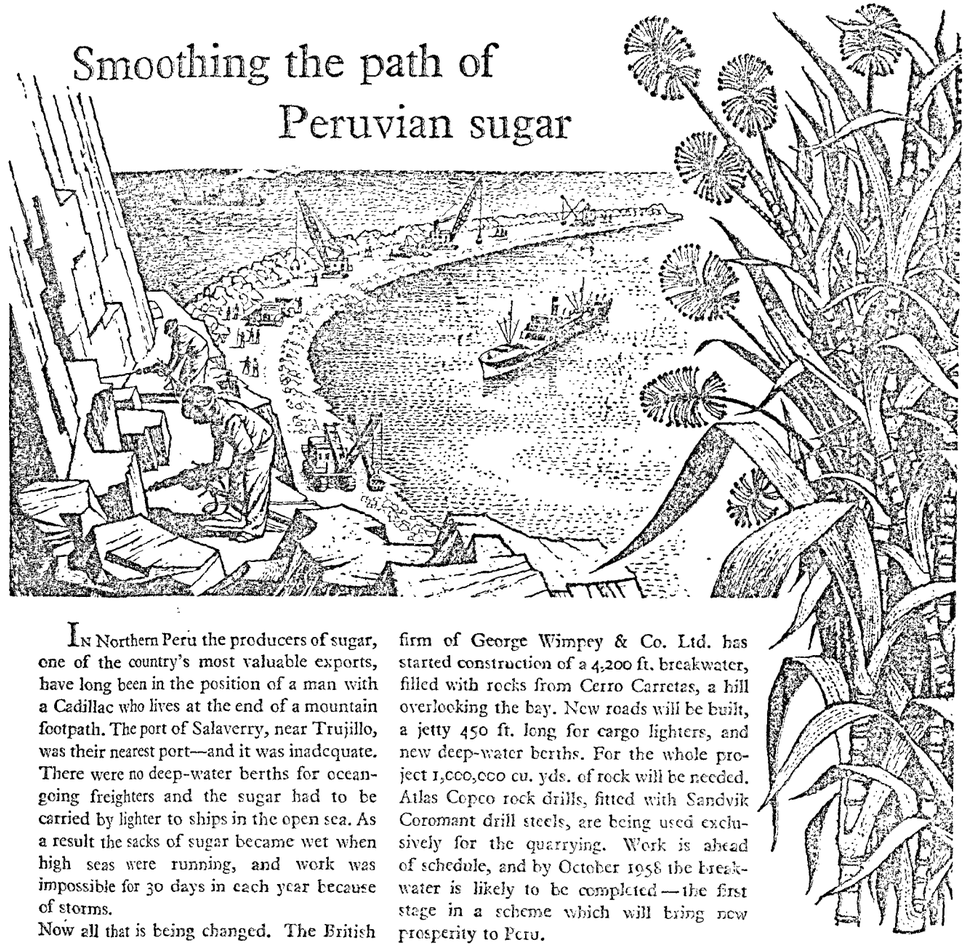
If fresh water is one of your problems you can, if sea water is available, readily arrange ample supplies — clear fresh and pure — for drinking, boiler feeding, etc. by the installation of Weir sea-water evaporating and distilling plant.

Weir plant is at this moment producing millions of gallons of fresh water daily from sea water at Aruba, Aden, Curacao, Lobitos, Kuwait, etc., while plant is under construction for the Bahamas and similar areas where the natural fresh water supply is restricted.



There is no firm with greater experience of the subject than Weirs (who were the pioneers of ship's evaporators) nor with more advanced ideas on efficient and economical operation.

Smoothing the path of Peruvian sugar

In Northern Peru the producers of sugar, one of the country's most valuable exports, have long been in the position of a man with a Cadillac who lives at the end of a mountain footpath. The port of Salaverry, near Trujillo, was their nearest port—and it was inadequate. There were no deep-water berths for ocean-going freighters and the sugar had to be carried by lighter to ships in the open sea. As a result the sacks of sugar became wet when high seas were running, and work was impossible for 30 days in each year because of storms.

Now all that is being changed. The British firm of George Wimpey & Co. Ltd. has started construction of a 4,200 ft. breakwater, filled with rocks from Cerro Carretas, a hill overlooking the bay. New roads will be built, a jetty 450 ft. long for cargo lighters, and new deep-water berths. For the whole project 1,000,000 cu. yds. of rock will be needed. Atlas Copco rock drills, fitted with Sandvik Coromant drill steels, are being used exclusively for the quarrying. Work is ahead of schedule, and by October 1958 the breakwater is likely to be completed—the first stage in a scheme which will bring new prosperity to Peru.

All the fun of the fair

Compressed air is versatile. Atlas Copco provides the means for all its many applications. One Atlas Copco portable compressor supplies all the power necessary to operate the flying boats at the Luna-Park Fairground in Rotterdam.

The Atlas Copco Group of Companies is responsible for the manufacture of compressed air equipment and its distribution and servicing in 90 countries throughout the world. Group Headquarters: Atlas Copco AB, Stockholm 1, Sweden.

Cincinnatus from the Marne

FRANCE'S three capitals—Paris, Algiers and Colombey-les-deux-Eglises in the Haute Marne—have none of them the whole answer to the continuing crisis of a great country. President Coty's message to Parliament on Thursday brought all three to the point of decision. The risk of a trial of strength remains. The frailty of republican institutions in Paris, demonstrated so often in the past, needed no further confirmation from the events of the past three weeks. Even so, the frailty of some republican hearts in the immediate crisis still produced an unpleasant shock, only belatedly offset by the mass march through the streets of Paris on Wednesday evening and the last ditch resistance of the rank-and-file of the Socialist party in the face of almost irresistible pressure. From the men of Algiers neither France nor the western world, although both may understand the human springs of their insurrection, can expect much of promise or of comfort. But from General de Gaulle France itself once received its salvation. Before the Algiers coup his reputation remained all but intact; it has been the most ominous development of the crisis that the means whereby he has sought to come to power have seemed to belie a great past. If the general does, at last, rule again in Paris he will undoubtedly stand higher than his camp-followers in the world's esteem. His backers have already thrust the saviour image upon the country. He, himself, no doubt, believes it.

But before the general is hailed as Cincinnatus summoned from Colombey to save the republic from chaos, the record of his struggle back to power should be seen for what it is. There must be no new Gaullist myth. The general has told M. Vincent Auriol that, although the Algiers military coup of May 13th was done in his name, it was done without his knowledge. But the fact remains that he bestrides France today because he deliberately exploited the coup by preventing the Republican government from restoring its authority against the insurrection. He did not disclaim the coup when he broke his silence on May 15th; and before he spoke up even General Massu was climbing down. M. Pflimlin's overnight investiture by the assembly had thrown Algiers into disarray. General Salan, the reliable weathercock of the crisis, had once more turned towards Paris for his orders. But General de Gaulle's statement openly encouraged the Algiers leaders to look to his return to office as the easier alternative to working out their troubles with M. Pflimlin. His press conference on May 19th then widened the breach between Algiers and Paris by implying that the generals' revolt was, in fact, respectable. No casuistry can call this intervention disinterested.

General de Gaulle has been carried onward by the paratroopers, settlers, and right-wing militants who bellowed for him in the streets of Algiers and whose armed seizure of Corsica he pointedly failed to denounce. If he sees himself now as the liberator of 1944 returning once more, the faces of this entourage should disconcert him. The original purpose of the Algiers conspirators was not, in fact, to summon him to

power; they would have preferred a Bidault-Morice-Soustelle coalition in the assembly. They intended to stop the formation of any government in Paris not explicitly dedicated to the pretence of French Algeria. Only when this failed did their shouts for de Gaulle become distinct. M. Soustelle, although prudently refusing the aid of ex-poujadist thugs who bustled expectantly to Algiers, is surrounded by men of dubious political instinct like MM. Dronne and Delbecque, and the Corsican plotter M. Arrighi. Inside the Committee of Public Safety sit former Petainists like M. de Sérigny, of the *Echo d'Alger*. This is no band of Gaullist brothers. It is true that the army, principally General Massu, seems to have persuaded the settlers to accept a formula of racial integration which might (if it had been tried before the last quarter-of-an-hour had struck) even have spiked the guns of the rebel FLN. But it remains very doubtful whether integration will, in practice, be pressed beyond the settlers' own desires.

The Corsican coup a week ago spoke unmistakably of the strong-arm tactics favoured in Algiers—so strongly indeed that, when the threat of its repetition anywhere on the French mainland south of the Loire was understood by the wilting M. Pflimlin, he drove himself to voice a last protest. General Salan, who had surrendered to revolutionary euphoria and by this stage envisaged a victorious march up the Champs Elysées, was not deterred from appointing his own governor for the island. This open insubordination might have proved fatal to any officer class less aware of the weaknesses and divisions of its political masters. As it was, the seizure of Corsica was a decisive blow to M. Pflimlin's crumbling prestige; as such, it gave M. Soustelle, the Gaullist brain in Algiers, a further claim on General de Gaulle's gratitude, and on the general's ear once in office. There can be no glossing over by whom the Gaullist progress was planned and set in motion.

The centre parties in the assembly, although their leaders seemed willing instruments in their own destruction, soon made plain their reluctance to co-operate in fulfilling the minimum of republican legality under which the general wished to come to power. The general's announcement, after the nocturnal encounter with M. Pflimlin, that he was already forming a new government before the old one decently fell might have been due to a misunderstanding, to fears of a paratroop coup in Paris itself, or to a natural anxiety to force the pace. The immediate response of the Socialists and the MRP was to refuse M. Pflimlin all but the flimsiest excuse for yielding. When the Prime Minister did go to M. Coty it was with the ludicrous explanation that the resignation of three right-wing ministers (whose parties had deserted the republic some time since) made it impossible for him to continue, even with the possession of 408 votes in the assembly. That there were 150 Communist votes in M. Pflimlin's majority should not have filled him, or anyone else, with nameless fears. The recreation of the popular front of the nineteen-thirties, with its international overtones, was probably a fantasy even to M. Duclos. What should have counted with a resolute cabinet was that these votes were available to help them to save republican institutions—and to call the army's bluff.

So the republic entered the last ditch. It found itself there through the accumulation of its sins of omission since the liberation, and an accumulation of popular disrespect since, indeed, the beginnings of the Third Republic in 1871. To history it may even seem remarkable that it survived so long. It was threatened because it failed to provide an efficient political system in keeping with a modern, technologically advanced, state. It was threatened because the assembly failed to reform itself, except for the last, despairing and slightly absurd attempt this week when it was already in extremis. It was threatened because all its shifting majorities were against something, but not for anything. It was threatened because it refused to come to terms with itself on how to deal with its communist minority. The republican parties did not succeed in reducing communist strength in the country, but they could not bring themselves to accept communist support to push through reforms to strengthen the republic or, in the last ditch, to save the republic from dissolution. By conducting their political combinations for a decade as though the communists did not exist they merely disfranchised a quarter of the population. And now the republic was close to extinction because it failed, almost throughout its existence, to adopt a colonial policy fitted to the times, to France's own interests, and to the influence and cohesion of the western alliance. Madagascar, Indo-China, Tunisia, Morocco and now Algeria: it is a sorry procession of political ineptitude, civil brutality, military humiliation, and ministerial surrender. The bravery and devotion of many thousands of Frenchmen deserved a better cause, and a better fate.

These follies and these weaknesses of the French state touched their nadir with the Algiers coup. The customary interregnum in Paris encouraged the plotters to act on May 13th. The governing parties' past refusals to make up their minds about Algeria left them in no order to take a strong line toward the settlers after the riots. (M. Pflimlin's investiture speech, in fact, discounted a liberal solution.) When the generals defied Paris the government turned the other cheek through fear of de Gaulle. When the generals appealed to de Gaulle the government, fearing association with the Communists, did not dare to call for popular support. And when de Gaulle moved openly the government invited the assembly to defeat it. Even that, through the final stand of the Socialist rank-and-file, was bungled. When M. Pflimlin turned himself out it seemed almost too late to do anything—to save the republic, to make terms with de Gaulle, even to ensure against a general strike and the barricades.

There is no point in mincing words. General de Gaulle has manœuvred for power in the wrong way to be immediately acceptable as a true arbiter between Algiers and Paris, as the negotiator of a durable (that is, a political) solution in Algeria, or as the national leader who will heal his country's divisions. It may indeed be that—if he comes to rule—his own character and high patriotic sense will serve him now as they did in 1940. Before the coup, what is known of his present opinions and what is remembered of his postwar policy had suggested to many of his countrymen, M. Mendès-France among them, that a recourse to the general might well be the one way to solve the Algerian problem. These estimates have been damaged by his performance in the past fortnight, but they must not be written off now. Yet, even if the general were to act as the noblest Roman of them all, he would still have to take into account the demands of his motley backers: the embattled settlers, the army colonels who want to reconquer Tunisia and Morocco, and the right-wing camp followers who claim political and administrative spoils in France itself. More than the most arresting myth will be needed to bring them to heel.

It is too soon to guess what General de Gaulle's advent might mean to Nato and the west. France's friends would look as anxiously for signs of liberalism within France as for signs that the general is not still committed abroad to the *politique de grandeur* that once sent him to interview a mystified Stalin (Mr Khrushchev would be more accommodating) and sent the French army into what became the Indo-Chinese war. But the Gaullist shadow invites one broad question which the West, or at least its politically advanced member countries, have not previously had to face. How can a democracy on a narrow base, forced to be vigilant against a communist fifth column directed from Moscow, sustain itself in face of a challenge from a belligerent and dissatisfied Right? There are other Nato countries which have reason, whatever their present stability, to fear that France's toils might one day bind them. Would they, like M. Pflimlin, prefer political death to the risk of contamination? The pathology of the Fourth Republic concerns us all.

Back from Sandys?

Doubts about the emphasis of Mr Sandys's defence doctrine grow. Conventional arms are not obsolete but vital.

Mr Sandys is fighting two wars in Whitehall: one that is righteous, and one that looks less and less righteous as the months pass. Like other wars started independently they are tending to merge, which muddles the rights and wrongs of each. The righteous war is the one fought to develop the supremacy of the Ministry of Defence over the service ministries, to prune vested interests at chiefs of staff level, and to keep the way open for service amalgamations if technical change makes this logical. Far less certainly righteous is Mr Sandys's ideological war to force British defence organisation entirely into the mould set by his two defence white papers.

The essential doctrine of those two papers was that Britain must have the nuclear deterrent. A growing number of people believe that the first principle of British defence policy should instead be that Britain must have conventional weapons. If Britain can afford it—and if there is any reason to suppose that it is collectively required—then let Britain keep on developing the deterrent also, in order to supplement American nuclear power. But a sufficiency of conventional arms is needed first.

This is not a purely British debate. It also crackles behind closed doors in the Pentagon, where note is being taken of Russia's persistence in developing its

MAY 29, 1858

GOVERNMENT BY THE SWORD

"An army, which is not distinctly the servant of the State, must be its master. . . . Society in France is beginning to find all the practical consequences of having the soldiery for its master brought home to its business and bosoms. The impression seems to be general . . . that in the time of Louis Philippe, the army was comparatively unimportant as being in no way the foundation or main support of the existing Government, and therefore was neither arrogant nor presuming. . . . But of late, its temper and its *personnel* have greatly changed as well as its position. It feels its own omnipotence, and is resolved to make this felt by the community. And, being to a great extent officered by men whose habits and *manners* are formed not in society but in garrison and in camp, it chooses the most offensive methods of imposing its sway and asserting its superiority. . . . We give the above statements with some degree of diffidence, though in truth we entertain only a very slight misgiving as to their accuracy. Granting them to be true, what a fearful picture do they display!—a great, powerful, highly civilised country, our nearest neighbour and our closest ally, at the mercy and under the heel of an enormous armed force, master at once of the Government, by which it is feared and needed, and of the people, by whom it is loathed, dreaded and despised.

own conventional forces, even though its bid to draw level with the west in nuclear arms is nearing success. This is causing much American heart-searching about the wisdom of "going nuclear" in everything. To do so could introduce a fatal measure of inflexibility into western defence and foreign policy.

For some years the West was able to argue that its monopoly of nuclear weapons made up for its weakness in divisions. Now the Russians, too, have the bomb—and, more recently, have approached equality in the tactical means of delivering it (witness their advances in rocketry and the size of their tactical air force). This leaves the disparity in conventional arms unredressed. Indeed it has become worse if the Russians have brought their forces up to date, while the west has, in the search for economies, reduced its capacity to retaliate except by nuclear means. This puts a string of advanced western positions from Quemoy to Berlin under the threat "we take, and if you go one higher, so do we." The danger is that in all clashes that are less than nuclear the West is now likely to be beaten; and that if it raises any struggle even to the lowest level of tactical nuclear war, it will incur such political odium, and arouse so many fears that it is about to launch the holocaust, that defence of that particular outpost may not seem worthwhile. The tendency then may be to let the Russians have it.

MILITARY thinkers often find it hard to see the importance of the attacking pawn, when they have the position covered by castle and queen. One atomic weapons-system begets another as fast as it goes into operational service (or before). To intercept the fast atomic bomber, the complex atomic anti-aircraft missile is devised, and in turn makes possible further adaptations of weapons to nuclear explosives all down the line. All the "hardware" becomes more complex and expensive, and less adaptable to conventional uses. Thus, to take an example, the American tactical air force is now not designed to support ground forces fighting an old fashioned (Korea type) campaign, but only to drop atomic bombs on those "tactical" targets which the Strategic Air Force would not cover in some unthinkable all-out war. Because all this is so expensive, the idea of also providing "obsolete" types of planes or other weapons is rejected; increasingly the only war thought about, or trained for, is some sort of atomic war.

These problems are as relevant to American defence doctrine as to British. But Britain has a particular obligation to weigh them carefully. Obviously it is America's role to maintain, and largely to supply, the West's nuclear deterrent, which is indispensable. But this is not Britain's primary role; nor can it be right for Britain to render its forces incapable of anything except nuclear warfare. Britain's first responsibilities are to provide deterrence at the other end of the spectrum, particularly in view of the wide range of British commitments throughout the world. This is the true, and most practicable, form of interdependence. Yet, in deference to the need to economise in order to build up its own nuclear deterrent, this country has weakened its capacity to ward off colonial incidents; and in Europe Britain's withdrawal of some troops from the continent has forced General Norstad, in turn, to rely more on his nuclear arms to meet any scale of attack.

This is not to suggest that the West can regain bargaining strength by trying to match Russia's conventional forces man for man (although, in strict terms of manpower and resources, it could in fact do so) Mr Sandys has calculated that to do so would cost Britain alone another £1,000 million on the defence budget (as well as national service indefinitely), which is a measure of the abstinence that the free peoples will not accept. What is urgently needed (and this applies to Nato and American forces, as well as to British) is to raise the scale of the limited threat that could be contained without recourse to atomic weapons—and not, as now, progressively to reduce it.

The fact is that there is still a real distinction in use between atomic and conventional arms, and that this should be preserved as an act of deliberate political choice. In an atomic age, when the atomic bomb is itself a key piece in the war of minds and wills, conventional forces are no less necessary as an instrument of policy than is the maintenance of an adequate atomic deterrent. It is a matter of choice which countries in the western alliance should maintain that deterrent, in its several forms, and which should concentrate more upon the range (which is wide) of non-nuclear roles. This is far from agreeing with the neo-pacifists who wish Britain unilaterally to dismantle its—and the Americans'—nuclear deterrent now mounted in Britain. Nor it is to suggest that America, because it must be the main provider of the deterrent, should have no non-nuclear capability. There are now 5½ American divisions in Europe; who can doubt that these American forces, the core of Nato's shield, would have to rely less on their corporals and matadors if they were backed by 20—or, better, 30—allied divisions instead of the bare ten?

Mr Sandys may be tempted to say that the question-mark thrown over Nato's future by events in France fully justify his emphasis on the British nuclear deterrent. He should hesitate. Nato's future might now be far more secure if the emphasis had been placed the other way round, and more British divisions now stood on the Rhine. More may yet have to stand there, and more be found to back British commitments under other treaties. Mr Sandys has been courageous in overhauling a defence organisation which had not moved with the times. He should now have the courage to look again at a defence doctrine already eroded by rapid political and technical developments; and, having reassessed it, he should pass the results to the nation—if necessary with the bill for continuing conscription after 1961. He need not fear the charge of inconsistency—only the charge of not keeping up with the pace of change.

A Finland in Asia?

If Korea is ever to be reunited, it may have to model itself on another small country on the other side of the communist land mass

TIME heals many wounds, but it has not healed the incision that cuts Korea in half. The general election held in the southern half of the country early in May was the third—two for parliaments, one for the presidency—since the fighting ended nearly five years ago. The South Koreans can congratulate themselves on having developed something more like what veteran democrats would recognise as a free poll and a workable two-party system. But nothing has been achieved in these three elections and five years that promises to alter the basic Korean paradox. The two halves of the country are as apt for fitting together as a plug and a socket; yet they remain unconnected, and each drains strength from the great power that supports it. The onward roll of time has produced neither of the consequences that the free world might once have hoped for: neither the disintegration of the communist regime in the north nor the blossoming in the south of a society so free and prosperous as to entrance other Asian eyes. It becomes increasingly clear that, if the problem is ever to be solved, both sides will have to change their mental image of the future of Korea.

There have been two developments in the past year which are likely to make the present compromise even more unsatisfactory, not less, than it is now. On the whole, this month's elections went well. There was some intimidation in the country villages where the foreign correspondents and United Nations observers did not penetrate; apparently President Rhee's police kept their usual avuncular eye on his interests, and the supervision of polling stations was not always up to democratic standards. But the Koreans behaved better than the Filipinos did in their election last year, and the possible alternative ills—a huge rigged majority for Dr Rhee's Liberal party, or the chaos and possible army *coup* that might have followed a Democratic victory—were both avoided.

Nevertheless, the election produced two parties which, though rivals at the polls, cling cosily together on a narrowly conservative policy. The left-wing Progressives, the one party which formerly had something fresh to say about the problem of the north, have now been banned. It is true that during the campaign the Democrats suddenly declared that they would be willing to allow all-Korean elections under UN supervision, whereas the government insists that it will tolerate nothing more than a kind of mass by-election in the north to fill the "vacant seats" in the legislature in Seoul. But it is hard to know how long even this degree of divergence will last. Lately there has even been talk of a merger from members of both parties, including Dr Rhee's heir apparent, Mr Lee Ki-poong. Even if the South Koreans are developing a two-party system, it is not one that offers a genuine alternative government.

The second development is a new danger to the South Korean economy. It keeps its nose barely above water by virtue of American aid, which in the past two American fiscal years has been running at more than $300 million a year. In the present year, however, ending next month, the total is substantially lower, and Koreans expect to get little more than $200 million next year. If it were possible to eliminate the very high proportion of losses caused by graft and the simple disappearance of goods within Korea, two aid dollars might go nearly as far as three used to. But, if not, the South Koreans will be forced to pare down some of their more ambitious plans. A heavy industry, centred on aid-financed iron and steel works, would recede into the dreams of the future. And if South Korea's economy never gets beyond the stage of light industries and consumer goods, its chances of emerging one day into prosperous self-sufficiency are dim. The many thousands of angry (because unemployed) young men are likely to grow angrier still if they suspect they are being educated merely to be turned out on the streets.

THIS is the context for the recent exchange of Notes between the Chinese government and the sixteen nations that fought in Korea. In February, the Chinese announced that they were evacuating their troops and made a vague suggestion that, if the allies did likewise, all-Korean elections might be held under neutral supervision. The allies countered by asking for more details about the kind of elections the communists had in mind; and this month the Chinese avoided the question by repeating their call for an American withdrawal and saying that the elections could be talked about afterwards. At this point the observer begins to fear that the discussion is about to be impaled on the familiar barbed-wire semantics of "neutral" and "supervision," and that the Chinese are simply interested in getting the last couple of American divisions off Korean soil—though one might suppose that this prospect, in view of President Rhee's musings about what he would like to do if he had a free hand, might alarm China as much as the rest of the world.

And yet the situation is not yet so obviously hopeless that there is no point in going on with the discussion. It is essential that the Chinese should see the folly of demanding a total evacuation of foreign troops before a real political settlement is reached: leave the two Korean governments by themselves, and they would simply leap at each other's throats. But if the Chinese could be made to realise this, they have already agreed,

at least in principle, to the other main requirement: a supervised election for the whole of Korea. The importance of this should not be underestimated. If the Chinese were to stand by what they have said, they would have reconciled themselves to the prospect of an election in which their chances of winning would be virtually nil. The population of the north is a mere fraction of that of the south ; and there is no reason to think either that the northerners are unanimously communist or that the southerners have forgotten 1950. As a simple matter of arithmetic, the allies could afford to be a little more generous in their definition of "neutral supervision" than they could consider being if the communists were within jumping distance of a majority.

This is a surprising risk for the Chinese communists to consider, but there is no mystery about their motives. In order to keep the shadow of American nuclear weapons away from their Manchurian doorstep, they may be willing to relax their control over North Korea—hoping that in the long run the whole country will either turn communist or, failing that, simply be a harmless small neighbour. Of course they will try to get rid of the Americans without submitting to elections in return ; but it is the allies' business to make them pay the price. China's foreign policy may not always be as rawly immature as it was a few years ago. Peking may be willing to tolerate the existence of an independent but neutral Korea on its flank much as Russia tolerates the existence of Finland, that other tiny appendix to the communist continent.

Is this concept unacceptable to the West ? The comparison with Finland is a close one. Finland, like Korea, has no reason to love its big neighbour. Its independence is tolerated because it presents no threat to the Russians and because they know that subduing it would be an awkward, risky and possibly bloody business. A reunited Korea, with the benefit of a good deal less foreign aid than the two halves now get, could become a tolerably prosperous country by Asian standards. Its parliament might well, like Finland's, include an obstinate minority of communists, but so long as the country was well run they would not necessarily be a dangerous minority.

Of course, such a Korea would always be "at China's mercy" in precisely the same way as Finland depends on Russia's tolerance. One can even foresee it developing the same kind of special trade links with the communist block as Finland has (and, with luck, being tossed the same little privileges that Mr Khrushchev is now offering President Kekkonen) and it would have to be equally careful how it voted in the United Nations. But the point is that Finland stayed genuinely free. The Russians have tacitly admitted that the military and diplomatic disadvantages of changing its status by force outweigh any advantages they might gain. Might it not be worth while to try to win a similar status for Korea ?

NOTES OF THE WEEK

BUS STRIKE

Mr Cousins Over the Capital

There is now a nasty prospect that Londoners may be about to be stricken hip and thigh by Mr Cousins, and it will be well to be clear about how the threats of new strikes have come about. It is now confirmed that, shortly after the railway settlement, London Transport offered to bring forward from the autumn to the summer its review of the wages of those London busmen who had been refused an increase ; as it is summer now, and as "review" is a euphemism for a rise, this meant that Mr Cousins had won a large part of his case. Most of his fellow trade unionists must have expected him to call off the bus strike on these terms. But it is a favourite personal tactic of Mr Cousins's that, when a settlement is in sight, he suddenly asks for a little bit more than anybody had expected ; he has found that, at this penultimate stage, when everybody is usually sick to death of argument, that little bit more is often given. This past week's performance was not an isolated example of this personal tactic ; students of Mr Cousins's career say that they can trace similar instances right back to his earliest industrial days, when he worked in a small transport undertaking on the employers' side.

The little bit more for which Mr Cousins is now demonstrating is apparently that the review of the wages of country bus crews and garagemen, which will mean a rise for them, should be *called* a rise, and announced as such with a minimum figure declared in advance. It is probably precisely because this seems to him such a relatively small point of substance that he feels that he can get it ; and it is because he thinks that he can get it that he decided this week to be very terrible in both threat and visage. Contrary to some people's assumption that he is merely acting in an angry temper, it is in the calculating nature of this normally shrewd tactician to seek the maximum advertisement of his probable victories, not to strike out in desperation at moments of probable defeat. It is when his opponents are insufficiently defending themselves that he becomes dangerous, not when he himself is being attacked (London Transport has misunderstood this point all along). Mr Cousins's idea seems to be to huff and puff now that he thinks that London Transport has pulled much of its house down, so that everybody will eventually say that all the concessions given (those that have already been promised, as well as those that he hopes are to come were the results of that huffing and puffing. This tactic can be very clever ; but the question mark that hangs over his performance this week is whether it may not sometimes be too clever by half.

More than He Can Chew?

All Mr Cousins's actions since the peace feelers were made have fitted into this tactical pattern. His show of anger at being rung up by Sir John Elliot's secretary, instead of by Sir John himself, was patently the action of a man manœuvring for the advantage of seeming to be offended. (It was not, as the innocent might have assumed, that of a touchy snob.) His next ploy, over the weekend, was to ask the railway unions to tighten restrictive practices on the London Underground, so that fewer people who would normally be bus passengers should be carried on the Tube. This may have been his first mistake, because the railwaymen's leaders, who must be getting a bit tired of Mr Cousins's "more militant than thou" attitude by now, have politely refused. But Mr Cousins has followed up by threatening to try to close the underground system next week, by calling out his union members at the electrical power stations which provide the trains with current (even although, under the Electricity Supply Act of 1919, the legality of such a strike is open to question). Finally, he has threatened that petrol distribution workers in one of his satellite unions will strike in south-east England next week, so that private cars and coaches in Greater London may be brought to a standstill. He then suggested to the Minister of Labour that, in order to retreat before these threats, the Government had better call himself and his officers into consultations at once.

Mr Macleod very rightly and promptly refused. The extent of the new threats to London should not be underestimated. If the strike of petrol distribution workers comes off, the Government should certainly send in soldiers or volunteer non-unionists to drive the petrol tankers ; this will be called blacklegging, but never mind. It is not yet clear whether the stoppages at the generating stations would be designed to stop all electrical current or only that on the Underground ; in either event, the stoppage of any current will be complete only if members of the Electrical Trades Union come out as well. Mr Cousins would then find himself being carried along by a communist union's helping hand, an embrace which he would surely view with distaste. And there is another political factor which ought to cause him to pause.

Perhaps the most interesting development this week has been that many newspapers, which have hitherto been more sympathetic to the busmen's claim than the claim itself deserves, have reacted to these latest threats very sharply indeed ; accusations of "arrogance" and "bullying the country" have been thrown at Mr Cousins from the most surprising places. As he thinks that the appearance of victory will eventually be his, Mr Cousins may not be as worried about this as he would have been three weeks ago. But some of his friends in the wider Labour movement are distinctly concerned. They know that there is a point in trade union battle and bluster beyond which the shrewd tactician is always unwise to go ; it is the point at which he may arouse bitter resistance from the public, because they think that he is starting to portray himself, not as a defender of his members' interests, but as a would-be terror of the earth.

SOVIET BLOCK

Summit for One

Prospects will be poor for inquiring newspaper men if future "summit" talks follow the pattern set by Saturday's brief meeting in Moscow of the Warsaw Pact powers' heads of government. The meeting was announced only four days beforehand, and nothing more transpired until selected documents were published on Tuesday. Mr Khrushchev's notion of the degree of privacy that heads of government should enjoy when in conference is evidently even firmer than Sir Winston Churchill's.

The seven satellite governments now announce that they mean to cut their armed forces by a total of 119,000 men. The Russian army is to withdraw from Rumania altogether, and to reduce its garrisons in Hungary by one division. These announcements fit in aptly with the Warsaw powers' renewed promises of peaceful intent, and their offer of a non-aggression pact to Nato. But, although there is no sure way of checking the genuineness of the reductions, they need not be dismissed as mere propaganda. Arms need less men as the technical race proceeds, while civil economies need more. (A new United Nations study shows that some of the large numbers of unemployed in the Balkan communist states have already been transferred to work in Russia and Czechoslovakia, where labour shortages have become chronic.)

Mr Khrushchev's speech at last Saturday's meeting scarcely bore out recent deductions that he had lost interest in the true "summit." He spelled out in detail the already familiar warning that, if missile bases were set up in western Germany, they would be set up in eastern Germany, Czechoslovakia and Poland too ; and he repeated the denial that such bases had already been set up. He recurred to the idea of three or four heads of government from "each side" taking part in summit talks. No reference was made to the participation of any "neutrals." This omission may reflect Russia's present displeasure with the Jugoslavs. Of the eight premiers assembled in Moscow, only Mr Mehmet Shehu of Albania made any public mention of the Jugoslavs. It was not complimentary ; but it was mild in comparison with the deluge of abuse that continues to rain on them from the fraternal socialist countries which are now accusing them of "glorifying bourgeois dictatorship and the imperialist camp," and even—most shocking of all—of "a concentrated expression of neo-Bernsteinism."

JUGOSLAVIA

Plucking Invisible Strings

With the Chinese banging on the Kremlin's back door and stepping up their demands for economic aid, it probably suits Mr Khrushchev to have found a pretext at this moment for ditching the Jugoslavs. On Tuesday he followed up his cordial birthday greetings to President Tito by scrapping the £100 million worth of Soviet credits offered to Jugoslavia since 1956. The Jugoslavs were not exactly surprised. They had seen this blow coming ever since Moscow began its new campaign against them ; they also had a lively recollection of the way the Russian credit accepted in 1956 had been frozen only a few months later

after their deviation from the Moscow line over Hungary, and revived only last July, when Mr Khrushchev was satisfied that he had got them back in step.

Yet the Russians seem to be acting foolishly. Where now are their claims about Soviet aid being disinterested and offered "without strings"? A resounding twang like this may lead even the most naïve "uncommitted" nation to look again at the apparently stringless aid it has been offered, or accorded, by Russia. And Mr Khrushchev ought to know by now that twisting the Jugoslavs' arms is apt to make them all the more stubborn in defence of their independence. Only the Chinese stand to gain from the affair; and they have been reviling the Jugoslavs more bitterly than any other communist country save one—Albania.

RUSSIA AND FRANCE

Duclos for Democracy

NOTHING that has happened so far either in Paris or in Moscow lends any support to the idea that Russia might have told the French communists not to prevent General de Gaulle's coming to power. Those who have sometimes mooted this theory have argued that, as was shown in the days of the Nazi-Soviet pact, the interests of communist parties in various countries are subordinated to the higher aims of Soviet foreign policy; and that Moscow might well prefer a Gaullist government in Paris to a democratic one, counting on the general to weaken the Atlantic alliance—and because his regime, if it foundered, would then be succeeded by a "popular front." But no such strategy has become apparent. If the French communists have hitherto shown little fighting temper, the explanation seems to lie, not in deliberate restraint, but in the general passivity of their following.

Russia, for its part, had an opportunity to state its views on Algeria just after the putsch of May 13th. President Nasser was then about to leave Moscow, and he and Mr Khrushchev, in their joint declaration, condemned "the barbarian war waged by France" and supported Algerian independence. Similar sentiments were expressed in this week's joint statement by the Soviet and satellite governments; and Mr Khrushchev, when he addressed their assemblage in Moscow, urged France to end its "war against Algeria" —though his reference to a peaceful settlement "taking account of the historical links between France and Algeria" caught some attention in Paris. Meanwhile, Soviet commentators supported M. Duclos in maintaining the need to defend the Fourth Republic despite its sins, and branding General de Gaulle as the leader of the Algiers putsch. The Soviet rulers may well be nervous both about the possibility of civil war in France and about the threat to one of the two big communist positions in western Europe. But no doubt they will do their best to exploit the situation, if a Gaullist regime comes to power, to disrupt the Atlantic alliance.

TUNISIA

No Time to Wait

THE Security Council will have no appetite for the complaint that the Tunisian government has put on its plate this week. President Bourguiba's grievance against France covers not only the latest incidents at the French bases at Remada and Gafsa, in southern Tunisia, but also the bombing three months ago of Sakiet, the Tunisian village on the eastern frontier of Algeria. The Security Council heard officially about Sakiet immediately after the bombing but never had to do anything about it; instead, it gratefully accepted Mr Hammarskjöld's proposal to pass an embarrassing buck to the Anglo-American "good offices" mission. The mission's formula for a settlement between France and Tunisia (accepted in Tunis but a knock-out blow to M. Gaillard's government) is now buried under the history of the last three weeks. The complaint has come back to the Security Council with urgent additions.

Whatever the Tunisians expect of General de Gaulle, their overwhelming concern at the moment is to get the French troops out of their country. Tunisian jumpiness at being host and warder to some 20,000 French troops, whose temper after being kept in their bases for three months is unpredictable, prevents them from playing a discreet waiting game. In present circumstances, M. Pflimlin's offer to start withdrawing troops in two months struck them as both inadequate and unrealistic. The Tunisian weekly *L'Action* has just warned its readers that the constant menace of French troops has become psychologically unbearable.

CO-OPERATIVES

A Kind Word to Scarborough

AS Co-operative Congresses go, this week's meeting at Scarborough has been a quietly constructive one. In political affairs, it has been revealed that the negotiations with the rest of the Labour movement about Co-operative MPs are moving slowly, if somewhat too secretly, towards a solution. The formula is apparently to be that the Co-operatives can nominate as many candidates as they like to constituency Labour parties, but that they cannot dangle the bait of sponsoring candidates and paying their full expenses in an unlimited number of cases. As some offence to democracy was being caused by the number of Labour candidates whom the Co-operatives were sponsoring and paying for—in a way that no commercial organisation would ever dare to pay for the expenses of a single Conservative MP—this would be the right change to make. In economic affairs, the Co-operatives have thanked Mr Gaitskell and his expert committee for the independent report which [illegible] and have unanimously agreed to consider it. In a speech to the congress Mr Gaitskell urged the Co-operatives to carry through the reforms which his committee suggested, and not to "defer and defer and defer."

On the occasion of this Scarborough congress, it is right that one kind word should be said for a movement which has perhaps had more than its fair share of brickbats thrown at it recently; it is a point of which its main opponents in the recent intra-Labour party row about candidates should take note. Whatever criticisms can be levelled against the Co-operatives, it is to their considerable credit that they have commissioned—and agreed to have published—a report upon their failings of structure and management, compiled by economic experts who are sympathetic to their general ideals. What a very much better country Britain would be if that other great component of the Labour movement—the trade unions—would only do the same.

LOCAL AUTHORITY BILLS

New Powers without Scrutiny?

JUST before Whitsun the House of Lords turned some intriguing light into one of Parliament's darkest corners —the machinery for dealing with the massive private bills, some of them running to over 500 clauses, which are brought forward by local authorities and which are often passed by Parliament with disturbingly little scrutiny. It is over one such bill, promoted by the Kent County Council, that a minor revolt has at last broken out in the Lords. This bill of 440 clauses not only takes fresh powers for the council itself, but also seeks sixteen new powers for the 250 odd parish councils in the county. It was this second aspect of the bill that attracted the attention of the chairman of committees in the Lords. Although county councils have for many years been claiming powers for their lesser authorities, the chairman (Lord Merthyr) felt that to claim so many additional powers for the parish councils in one bill was going too far; and he proposed that, as a matter of general principle, the practice should be stopped, at least until there had been further inquiry. There was quite an angry debate on his motion; the Government supported him, the Labour peers opposed him, so naturally the motion was passed, but coupled with an offer of an inquiry into the whole problem.

As often happens in political life, the precise issue is debatable; there seems no reason in principle why in fact county councils should not take powers for their subsidiary authorities. The real question that needs to be considered is whether local authorities *at all levels* are not asking for and getting too many powers, which they were never meant to have under the British constitution. As the introduction of a private bill is expensive, any local authority that is bringing one forward tends to put in any powers that anybody at County Hall thinks might conceivably be useful some time during the next five or ten years; quite often, new local criminal offences are created, so that the traveller's liability to prosecution changes as he crosses county boundaries marked by some not very distinctive milepost on the road. When a local authority bill is opposed—by having a petition laid against it—Parliament will usually give it some sort of double check; often interested MPs force a second reading debate on the floor of the Commons, and the bills have to be considered by committees—of four MPs in the Commons, or of five peers in the Lords—and the rules commanding the attendance of the committee members are unusually strict in both Houses.

Inevitably, however, very many local authority bills are technically unopposed—not least because prospective opponents often do not even know of the bill's existence. These unopposed bills get much more summary treatment. In the Commons they are handled by a committee of five, with three members forming a quorum; while in the Lords the so-called "Unopposed Committee" in fact comprises the chairman of committees, acting alone, with the assistance of his counsel. No one doubts the chairman's sense of responsibility, but scrutinising a mass of legislation is a job for more than one man. The proposed inquiry into procedure for local authority bills should be pressed forward quickly, and made wide-ranging.

ARDWICK CEMETERY

Decent Burial?

THE dangers of leaving private bill procedure in its present unsatisfactory state have, as it happens, recently been well illustrated by a clause in one such bill which did not get away from the watchdog. A House of Commons committee has censured Manchester Corporation for the way in which the corporation sought to acquire Ardwick Cemetery. The facts appear to be these. The corporation included, as one clause in its private bill, pro-

Italy's Uncertain Swing

Our special correspondent cables from Rome:

THE unusual calm that reigned over the Italian election campaign reigned also over the elections themselves. A drive across Italy last Sunday and Monday revealed nothing more unusual than a ban on the sale of alcohol, the postponement of a famous village *festa* and the sight, just before the poll was due to close, of an incredibly doddery old man being helped painfully into a polling station from a communist-labelled car.

The results perhaps justify the apathy of the Italian voters, for they have produced no cure for the growing instability of Italian governments. The Christian Democrats have admittedly increased their percentage of votes by 2.2 per cent and their seats in the Chamber by ten—as well as gaining an absolute majority in the Senate. Much of this success, which was as much of a surprise to them as to everyone else, was undoubtedly due to the French crisis; much, too, to the unwearying and unprecedented pressure by the Church. On the extreme right, the two monarchist parties and to a lesser extent the neo-fascists have lost a good deal of ground; Signor Lauro's gaudy bubble has been pricked. On the extreme left the Communists—who were also probably helped, in a different way, by France's troubles—have fully maintained their hold on the voters, although they lost three seats. Signor Nenni has done better; apparently unharmed by extremely bitter Communist attacks, and helped perhaps by his own equivocations, his Socialist party won 1.5 per cent more votes and nine more seats. Finally, the small centre parties, including the Social Democrats, have made little or no progress; in particular, the Liberals, who got two more seats, have not done as well as their energetic campaign against state enterprise had led many to expect.

It is a result that has allowed all three of the big parties, the Christian Democrats, the Communists and the Nenni Socialists, to claim a victory; but it adds up to the mixture as before. With 273 seats, the Christian Democrats still lack an absolute majority; and having fought the campaign without allies, they are bound to find the search for a coalition even trickier. Their tactics will largely depend on the new balance between the factions within the party; this will be clearer when the complex business of filling the last few seats in the Chamber by distributing the preference votes is completed. Signor Nenni, too, will have to assess the relative influence, within his newly strengthened ranks, of the "autonomists"—some of whom may now again incline towards an accommodation with the Social Democrats—and the outright pro-communists.

visions to vest the Ardwick Cemetery Ltd in the corporation, which was to take over the company's assets in consideration of a payment of twenty shillings for each nominal share of £1 ; and, in advance of the passing of the bill, the corporation made a take-over bid to the shareholders of that amount. As the company had recently been paying a dividend of only 2½ per cent—not from the cemetery, which was wholly unremunerative, but from some of its land on which commercial property was built—the owners of all but 75 of the shares jumped to accept this bid. But when the bill came before the select committee the corporation was still not fully the owner of the company's share capital ; and the Board of Trade declared that the company could not be vested in the way prescribed in the bill. On the contrary, the company ought to be wound up in accordance with the Companies Act and the provisions in its own memorandum of association. The Board of Trade also stated that, under that procedure, the break-up value of the company's assets would probably be in excess of £1 a share ; and the committee, accepting the Board's viewpoint, has reported that " the corporation obtained the shares by presenting a one-sided view which failed to disclose the true position of the company on a break-up."

These are hard words. Members of Manchester's Labour-controlled council complain bitterly that they would not have been applied to an operation by a private take-over bidder, who usually makes an offer for shares well above their market price and leaves things at that. But the point is that the corporation did not confine itself to a simple offer. It sought to justify its offer. It put forward some, but not all, the facts ; and, before the committee, its clerk brought in irrelevant arguments about the cost of putting the cemetery into decent condition. It jumped the gun on the bill, and it clearly hoped to evade the normal winding-up procedure. It has only itself to blame for the result—which is more likely to be opprobrium than loss. Public authorities need to be very careful about obeying all the rules of open dealing—especially as they are already suspect for a propensity to acquire property below its market value. The Commons committee did well to make a fuss about this skeleton in a cupboard. But in the obscure mass of local authority bills there must be many other skeletons which the Commons at present miss.

LEBANON

Nobody Can Win

THE United Nations Security Council on Tuesday tossed the Lebanon's charge of "massive intervention" against Egypt and Syria into the lap of the almost defunct Arab League. This Saturday the Arab League Council is meeting in a neutral Arab capital (Tripoli, Libya) in hopes of settling the quarrel in an Arab way, between Arabs.

The western friends of Lebanon should welcome the change in plan. In a UN debate they would be compelled to ruffle Arab tempers which they have recently been trying to soothe. They have become too closely identified with President Chamoun, though they are said to have seen several months ago that his position was weakening ; he did not recognise it until this week. The disastrous stubbornness of the past weeks has prevented the gentlemanly kind of compromise, with prizes for everybody, which formerly kept the peace among Lebanon's warring factions and confessions.

To blame the regime for Lebanon's present extremity is not to excuse the excesses committed in the name of the opposition. The responsibility must be shared between the two contending parties—the regime for failing to recognise the strength of its opponents, and the opposition for carrying out the deeds of destruction. President Nasser shares some of the responsibility, not so much because of "massive intervention," but because his propaganda machine has been wooing the Lebanese people away from the policy of the Chamoun government since it failed to support him ardently at the time of Suez. It must be remembered, however, that if the Lebanese had been satisfied with Mr Chamoun's policy themselves, then all the efforts of Cairo Radio would have been in vain.

This season's sowing of hate will be harvested for years to come in the mountains and valleys where, in some years, feuds and hashish are the sole crop. It is a penalty which both sides will continue to pay long after the present cause of Lebanon's sorrow has been forgotten.

ARAB REPUBLIC

Neutrality under Pressure

FRESH from Russian hospitality, President Nasser has taken pains to exhibit Egypt's untarnished neutrality. When he arrived in Cairo two weeks ago he stressed that the policy of non-alignment was now acceptable to the United States as well as to the Soviet Union, and Dr Kaissuny, his minister of economics, has emphasised the United Arab Republic's willingness to trade with the West as well as with the East. Even under pressure from events in Lebanon, Cairo has seemed reluctant to indulge in the anti-Americanism that might have been expected. The radio, loudly protesting that the UAR is a spectator, not an agent, in the Lebanese revolt, has directed the burden of its attack against the Lebanese government. President Chamoun is stigmatised as the agent of imperialism, but American involvement, except for some side-swipes at Mr Dulles, is usually left to be understood.

Calmly considered, there are many arguments why President Nasser should not want to add Lebanon to his other commitments. But logic could give way to instinct and to impulse if the opportunity seemed golden. The Lebanese government's identification with western interests has, in Cairo's own words, made the UAR seem a " symbol of Arab liberation and Arab dignity." Western intervention could, foreseeably, tempt Nasser to animate the symbol.

SAUDI ARABIA

An Arab Awakening

THE royal decree of May 12th setting up a cabinet system gives hope that the Saudi regime recognises the dire necessity for doing something to strengthen its internal position. While various provisions of the decree—requiring ministers to be Saudi nationals (the king can make anyone a Saudi national by a stroke of the pen) and forbidding ministers to engage in private business (sons and brothers can take care of such affairs)—are part of the window dressing, the decree does mark the first occasion on which the ruler has accepted any limitation on his absolute power. It remains to be seen whether the process is allowed to develop further or if the regime of princes and princelings

Safety Crossing

The wise man who has a banking account always uses crossed cheques, knowing that he will gain some protection if a cheque that he has issued falls into the wrong hands. For it is a rule of the banking system that a crossed cheque may not be exchanged for cash at the bank on which it is drawn, but must be paid into a banking account.

For advice on every aspect of banking, and for the up-to-date information you need, apply to any branch of

will continue to soak up most of the country's annual oil revenue of £100 million.

A sign that the government may have regained its self-confidence lies in the fact that the carefully censored Saudi press is being allowed to express itself in a remarkably bold fashion. Not only are harmless demands for the cleaning of streets in Mecca tolerated, but leading articles have been allowed to appear under daring and unusual titles: a recent one was "Beware the Consciousness of the Masses."

As always, money for current expenses is the government's chief worry. The oil revenues are composed of ordinary royalties and income tax payments. There has been no borrowing on royalties, though the "current earned taxes" which are due for payment early next year have already been spent. Not many countries can see their way out of debt by next spring, and it is not likely that Saudi Arabia will accomplish this feat; but the financial affairs of the country are in better condition than is usually believed.

If, in time, Amir Faisal is able to offer the Saudi people a responsible government and benefits from the national income he will not then need to fear internal and external pressures. The question is whether he will be allowed enough time.

MALTA

Mr Mintoff in Eclipse

It is more than a month since Mr Mintoff, after delaying the threatened resignation of his cabinet for a few days in the belief that Britain would back down at the last minute, left Malta without a government. Since Dr Borg Olivier would not—and still will not—form a caretaker minority government, the governor rules the island under reserve powers; and as the Maltese parliament has already had its statutorily minimum meeting for the year, he can continue to rule without this parliament until next March.

Evidently he hopes to move faster than this, but his recent attempt to have a further talk with Mr Mintoff was snubbed by the ex-prime minister. Although a remarkable quiet now reigns in the island, Mr Mintoff clearly still hopes to rouse the people to a more active sense of its wrongs—if necessary, apparently, by buying time on Italian television, which can be received in Malta. He is furious that the governor has refused to let him air his views on the island's own radio rediffusion system—just as he, when he was Prime Minister, refused to allow the governor or anybody else to air theirs. As a reprisal for this Mr Mintoff has returned his own radio set and has asked his supporters to do the same, but only a few hundred have obeyed. There is, therefore, an excellent chance to tell the people what Britain's offers to Mr Mintoff have been over the past year or more—which Mr Mintoff certainly has not. The reluctance of the ordinary Maltese to turn out to large anti-colonialist rallies is significant. The police, though its officers were in some cases appointees of Mr Mintoff, have impartially maintained law and order; and only a handful of insurgent patriots languish in gaol on short sentences for disturbing the peace.

But the problem remains. The British parliamentary climate has turned chilly to integration, on whatever terms. It is likely that Mr Lennox Boyd is now turning towards consideration of a simpler and colonial constitution, perhaps somewhat on the lines of Jamaica's—plus limited subsidies; if and when Mr Mintoff returns to power he may find his choice lies between accepting that, or taking independence with little more than a parting gift and a cheery "good luck to you" from Britain. This is what the Maltese need to be told their prime minister has done to their once excellent prospects of "special area" status and cosseting.

TREATMENT OF OFFENDERS

Sentencing in the Dark

Last November, at the annual meeting of the Howard League for Penal Reform, Mr Butler emphasised the importance of providing a court with all the information it needs about an offender before he is sentenced. Parliament, he said, had made plain its intention that the courts should have at their disposal "a wide range of medical, psychological and social information about offenders"; the problem was how and when it should reach them. When a person awaiting trial is remanded on bail rather than in custody—and in the case of a young offender it is particularly desirable that he should be—the prison authorities have no means of deciding whether he is suitable for, say, borstal training. Further, when it is thought that the accused will plead not guilty, a probation officer usually refrains from making inquiries about his circumstances and home surroundings before his trial takes place. Thus, a full probation officer's report, which is almost always available to a juvenile court before it disposes of a juvenile offender, cannot be readily provided to a court that has to dispose of older offenders.

It is to see if there is a way round these difficulties that the Government has set up an inter-departmental committee, under the chairmanship of Mr Justice Streatfeild, whose terms of reference were announced by Mr Butler in the House of Commons last week. Where assizes or quarter sessions sit for short periods and at long intervals, it is, as Mr Butler pointed out to the Howard League, impracticable to remand an offender for inquiries to be made between conviction and sentence; and the committee will presumably consider whether more Crown courts should be set up, like those recently established at Manchester and Liverpool, which, like the Old Bailey, are in permanent session. The committee's findings may also give an impetus to the setting up of the long-delayed remand centres envisaged in the Criminal Justice Act of 1948. It will certainly find it difficult to reconcile all of these four principles: first, that a person should not be treated as an offender until he is proved one; second, that he should, wherever possible, not be remanded in prison before trial; third, that after conviction he should know his fate as soon as possible; but fourth, that his sentence should not be a hit-and-miss affair but related as much to the nature of the offender as to the nature of his offence.

CEYLON

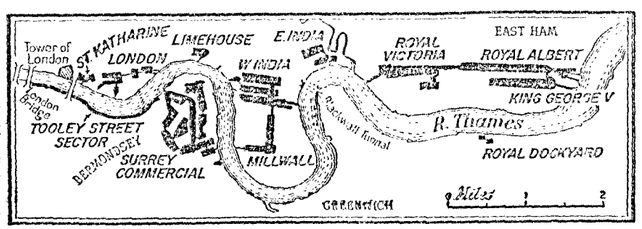
Violent Language

On Monday the new wave of communal violence in Ceylon spread to the capital, Colombo, and on Tuesday a state of emergency was proclaimed all over the country. Press censorship and an all-night curfew have been imposed, and two political parties banned—the Federal party, which represents a large part of the Tamil minority, and an extremist Sinhalese party which had come into being primarily to fight the language issue. Ceylon's modest armed forces, whom the Governor-General and Mr Bandaranaike have called out to maintain order, must now face the task of re-establishing it, particularly in the northern and eastern areas, where the government seemed

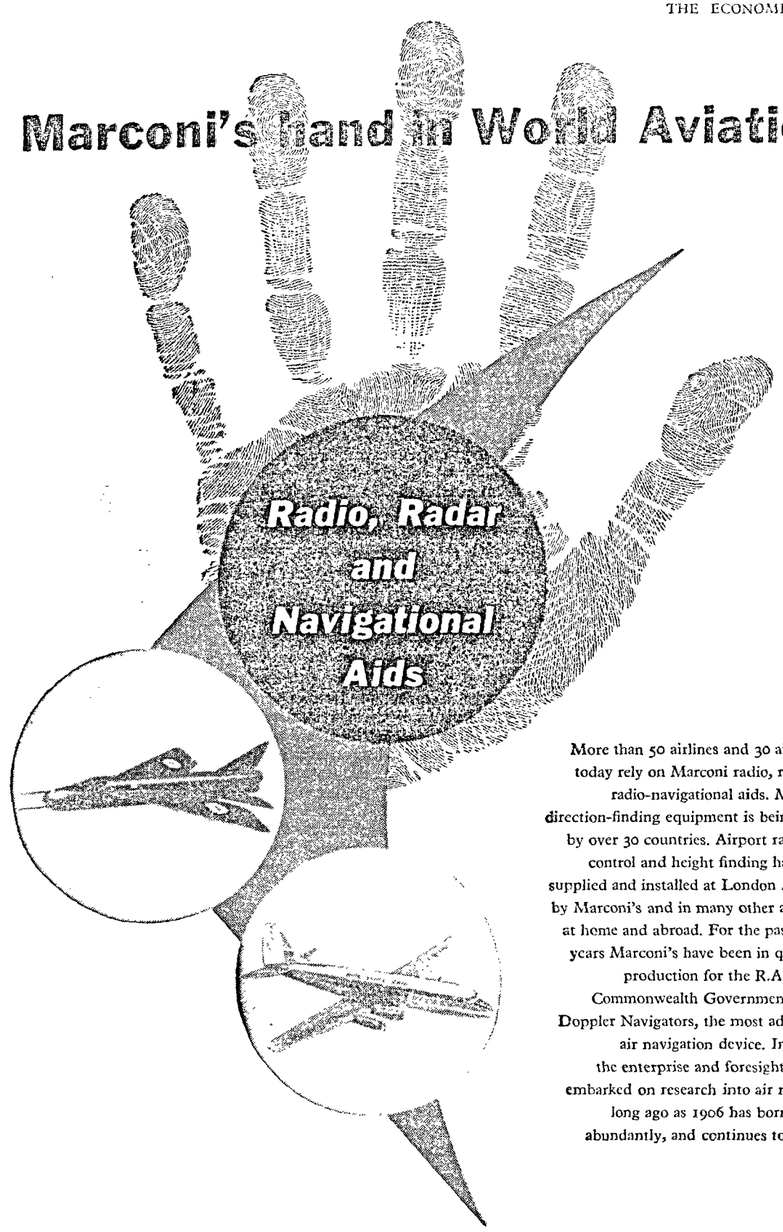
Trouble at the Docks

Our special correspondent reports:

The strike at the London docks, which at its peak last Friday involved 10,000 of the 28,000 workers in the port and delayed the unloading of 63 ships, bounced down and then up again this week. At Thursday midday some 8,200 men were out. Already more than 45,000 man days have been lost in the dispute, compared with 94,000 at all ports for the whole of last year; and the chances are that the stoppage will increase again next week.



The labour position at the docks is a complex one—indeed, in certain respects, unparalleled. National wage bargaining is done, as elsewhere, through the National Joint Council for the industry, on which sit the National Association of Port Employers and four of the dockers' unions (the Transport and General Workers, the Scottish TGW, the General and Municipal Workers, and the Lightermen's Union). About 90 per cent of dockers belong to these unions; the rest belong largely to the Stevedores' (whose drive for membership in northern ports led to a series of strikes during 1954 and 1955 and to all sorts of trouble with the TGWU and, through it, the TUC). But, in the docks, the make-up and distribution of the labour force (as opposed to wages and conditions) are not in the employers' hands. Control here is vested in the National Dock Labour Board, which came into being in June, 1947, as Mr Ernest Bevin's answer to the problem of casual labour in the docks.



The National Board, which delegates authority to local boards in every port, has eight members: four of them are employers and four trade unionists. It decides on the number of men on the dockers' registers; it allocates work to men not attached to a particular employer after the morning and afternoon "calls"; it distributes wages, attendance money and the £6 15s. fall back allowed to men under 65 who get no work. Some employers contend that the board harms labour relations in the docks in two main ways: first by removing the loyalty that the men should feel to their real employers; and secondly, because the presence of unionists on the management side weakens the respect of the men for their union leaders—and thus leads to a rash of unofficial strikes. Their case receives powerful support from figures of dock disputes since the war; between 1948 and 1955, days lost per thousand workers there were nearly nine times greater than between 1939 and 1938, and over four times greater than in the mines (which, with the shipbuilders, are the next peak strike industry). However, both the Leggett report in 1951 and the Devlin report in 1956 rejected the employers' argument; they held instead that the major sources of industrial unrest had been the willingness of dockers to take sympathetic action to help other strikers (as, recently, at the British Motor Corporation, Covent Garden and now Smithfield), and the presence in the ports of unofficial groups dedicated to causing trouble.

The activities of these troublemakers, whose names are familiar to everybody at the docks, wax and wane like the moon. In the last two months, they have been definitely waxing, possibly under somebody's instruction. Under the name of the Portworkers' Liaison Committee, they organised the ineffective eight week ban on overtime in March and April at the Royal and West India docks, demanding at the same time that the fall back be increased to £8 4s. and that the number of work calls a day be reduced from two to one. This month they have been more successful in organising support for the striking lorry drivers at Smithfield; 3,500 dockers and cold storage men in the Tooley Street sector have been out for the past fortnight in sympathy with the Smithfield men. But in spite of the efforts of one of the most renowned trouble makers—a man who was expelled from the TGWU after alleged communist activities in 1949—sympathetic action did not immediately spread to the Royal and West India docks, both centres of unrest. It was not until word got around that Tooley Street employers had used "blick" labour to move cargoes into cold storage that another 7,300 men in the Royal, India, Millwall, London and St Katharine docks stopped work.

Last Friday, however, at a meeting attended by 1,800 men at Canning Town, the dockers decided to return to work (and in doing so, to collect 23s. 6d. for the Whitsun holiday) so long as the employers withdrew "blick" labour; and this the public wharfingers—the employers whose men are on strike but who, since wages are not yet in dispute, are technically not involved in the stoppage—agreed to do. The Tooley Street men did not return since the stoppage at Smithfield still shows no sign of ending; and on Thursday, the unofficial strike started to spread once again. But even more trouble looms ahead. The "substantial" wage claim for the country's 100,000 dockers was rejected by the employers on May 8th—and again, summarily, last week. The unions are meeting next Monday to decide on their next step; but the restiveness of the men, together with the pressure from militants that the dockers support the busmen—and, possibly by then, the oil truckers—will leave them little scope for manoeuvre.

On the other hand, employment in the docks is increasing with the seasonal expiration of the ore and timber trades and is now—after quite a painful recession—about the same as at this time last year. Perhaps a compromise on wages could be found by reopening negotiations for a dockers' pension scheme. This is favoured by the National Board and the unions, and it has never really been rejected by the employers. The initial cost would be high; but against that could be set the £74,000 paid last year to some of the 5,400 dockers over 65, many of whom should certainly have retired long ago, but who turn up daily—not primarily to do any work, but to draw wages by signing on at the morning and afternoon calls.

More than 50 airlines and 30 airforces today rely on Marconi radio, radar or radio-navigational aids. Marconi direction-finding equipment is being used by over 30 countries. Airport radar for control and height finding has been supplied and installed at London Airport by Marconi's and in many other airports at home and abroad. For the past three years Marconi's have been in quantity production for the R.A.F. and Commonwealth Governments with Doppler Navigators, the most advanced air navigation device. In short, the enterprise and foresight which embarked on research into air radio as long ago as 1906 has borne fruit abundantly, and continues to do so.

to have virtually lost control at the beginning of the week.

It is equally clear that the Tamil leaders have also lost control of their followers in the north and east. When they announced, some weeks ago, that they meant to launch a full-scale campaign of protest against the government on the linguistic issue, the leaders were at pains to emphasise that it would be a campaign on non-violent Gandhian lines. From the very beginning, doubts were expressed about their ability to restrain the more hot-headed partisans of the Tamil cause ; and now those doubts have been sadly justified. In Ceylon as in other countries, political leaders who once allow extremists to push them from behind are all too liable to end up as their prisoners.

Some consolation may be drawn, in certain quarters, from the fact that the government's emergency actions have led to the abandoning of the series of industrial strikes called by communist-run trade unions. Against this, however, must be set the fact that the wave of communal bloodshed and disorder has come at a particularly untimely moment for a government which was straining to reassure foreign investors about Ceylon's future, and to put up a respectable case for financial support in Washington. The same potential investors who might have been pleased by Mr Bandaranaike's self-denying ordinances about nationalisation will now probably look askance at an island which seems threatened by another long period of communal tension.

SPAIN AND FREE TRADE

Emerging from Quarantine

SPAIN'S emergence from international quarantine has been a long, slow process. It has been admitted to the United Nations, and it is the trusted ally of the United States, but it has not seemed wise to exacerbate feelings or compromise the West by admitting it to the North Atlantic Treaty Organisation. Of late the Spanish government has been feeling its way into international economic organisations. In March it became an associate member of the Organisation for European Economic Co-operation—on the same basis as America and Canada ; now it has joined the International Monetary Fund and the World Bank.

These moves reflect an encouraging new awareness in Madrid that Spain's economic problems cannot be solved in autarkic isolation. If membership of the Fund is to be any use to Spain, it will imply a certain willingness to discipline financial policies in accordance with international advice. And the move towards OEEC has even greater significance.

Like Britain, Spain cannot afford to be left right out of the European schemes. Its orange and wine producers see plainly that the six-power treaty of Rome will give their Italian competitors an advantage in the German market. Important Spanish agricultural and exporting interests, like their Danish counterparts, would therefore like to join the common market too. And their view is shared by some industrialists who, despite fears of competition, are impressed by the possibilities of close collaboration with the Germans and French. Politically, Herr von Brentano's visit to Madrid in April strengthened the Spaniard's wish not to be separated from their friends to the north.

On the whole, however, looser arrangements on the lines of the free trade area have more appeal to Spain than the common market. There may be an element of cant in the Spanish claim to stand as arbiter between Europe and the Arab world. Yet its Mediterranean situation and the nature of its regime suggest for Spain, today at any rate, loose association with the rest of Europe rather than intimate ties. The new link with OEEC, while it does not commit Spain to the free trade area, gives it a close-up view of the progress of the talks. Once they seem near success, Spain may well be tempted to join. Its closed economy, like that of Portugal and the other so-called "peripheral" countries, will not be able to face the rigours of full-scale membership at once. But even a qualified membership would expose Spain not only to a new breath of competition from outside but to political influences which could have far-reaching effects.

OFFICE WORKERS

Why Typists Leave

A SURVEY by the Industrial Welfare Society, designed to find out why London employers find it so hard to get and keep office staff, has turned up some obvious reasons—and others less obvious. The obvious reasons can be discerned, without need of a special survey, by anyone familiar with the London rush hour or the slumminess of many City offices. Of the others, most can be summed up under one head: bad management. Office workers did not complain either of inadequate pay or of over-heavy work—the two traditional grouses of other employees. Instead, they complained of not having enough to do ; of not knowing how they stood in the boss's opinion ; of the lack, or elusive vagueness, of promotion prospects ; of misleading interviews ; of the absence of training opportunities. They also—while disliking out-of-date equipment—saw in increasing mechanisation the threat of increasing boredom.

Apart from the last item, none of these discontents is presumably new. What is new is that they should effectively produce a shortage of office workers. In part, of course, this shortage (not confined to London) merely reflects a shortage of young workers in general. The average age of the clerical working force has always been lower than that of the working population at large, and the low birth rates of twenty or so years ago have accordingly had a disproportionate effect. This factor will right itself soon ; indeed, at the most junior levels it is righting itself already. But other factors which have altered the relative attractiveness of office and other work are not automatically reversible. The comparative security, the pension rights, better sick pay arrangements, longer holidays, and "fringe benefits" in general, which used to be the office worker's privilege, are now much more generally available outside the white-collar range. The social prestige of the white collar, while still persisting, has dwindled. At the same time, better educational facilities

allow the more gifted potential recruits to fly at something higher than clerking. Increasingly, office work must attract and hold the new entry on its merits—and not on the demerits or inaccessibility, of other occupations. This new situation calls for deliberate and methodical training, for a visible promotion ladder, for constant alertness against waste and misuse of ability; but most office employers who have an unduly large turnover of staff simply have not begun to think of the problem in this light.

COMMONWEALTH AND EUROPE

Legs for a Tripod

It will not be easy for the economic experts now assembling in London to write a brief for the Commonwealth economic conference at Montreal in September. The Montreal conference is likely to be mainly concerned with the problem of international "liquidity"; with the strengthening of the sterling area and its reserves; with the related need to promote investment in the poorer countries by the richer ones; and with the problems raised by the European common market and free trade area plans. Uncertainties abound. France's crisis jeopardises the European schemes; and the solution of the liquidity problem must largely wait on the attitude of the United States.

Yet these uncertainties need not rule out all constructive thought. Members of the sterling area have to find ways to live within their means, whether or not America decides to help the exchange reserves of the non-dollar world. No new formal arrangements to discipline members' spending of gold and dollars seem likely, but collective development efforts like those under the Colombo Plan might be extended, and an investment bank might be set up under joint auspices. As to trade with Europe, the French crisis will not necessarily involve a fundamental change in British policy. The crisis has provided some fresh ammunition for those who oppose any kind of British political commitment in Europe. But the essential arguments remain valid, both for Franco-German rapprochement within a continental economic and political community and for the British project of a broader free trade area encircling that community.

A NEW SERVICE
OF ECONOMIC AND MARKETING RESEARCH

DURABLE CONSUMER GOODS

A series of continuous comprehensive surveys are now being prepared to assist manufacturers and others to estimate the future market for the following goods: Electric washing machines; Tyres; Refrigerators; Car heaters; Vacuum Cleaners; Cycles; Electric fires and convector heaters; Gas and electric cookers; Car radios; Radios and radiograms; Record players and Gramophones; Sewing machines; Television sets; and Passenger cars.

These surveys are being prepared jointly by
THE ECONOMIST INTELLIGENCE UNIT LIMITED
and
THE BRITISH MARKET RESEARCH BUREAU LIMITED
Further information from:
THE ECONOMIST INTELLIGENCE UNIT LTD.,
22 Ryder Street, London, S.W.1. Whitehall 1511, ext. 13

All three sides of the triangular relationship between Britain, the Commonwealth and continental Europe in fact need to be strengthened. The way to develop British trade with the Commonwealth is not by trying to resurrect preferential schemes in which the Commonwealth has scant interest, but by commonsense approaches like those that are being adopted in trade with Canada. Commonwealth backing has to be sought for freer trade between Britain and Europe. And Britain should encourage the development of a closer relationship between the Commonwealth and Europe, if necessary by the eventual extension of preferential arrangements to European countries. Now that the position of France is so much in doubt, both at home and abroad, a greater responsibility than ever falls on Britain in all these matters.

SINGAPORE

Taking no Chances

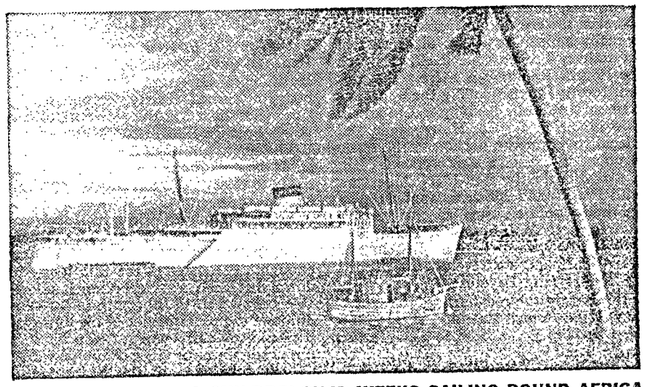
The same all-party delegation from Singapore that negotiated the new constitution with Mr Lennox-Boyd in April, 1957, has now negotiated with the Colonial Office the finishing touches to the arrangements to make Singapore an autonomous city-state within the Commonwealth, within which Britain will retain its naval and military base. The State of Singapore Bill will be introduced with two months or so to clear the decks for elections under the new constitution, which must take place at latest by March next year; it has, in fact, been assumed that the elections will, if possible, be held in the autumn.

It was foreseen a year ago that these elections would be critical. Although under the new constitution the security of the base has been safeguarded by the device of a public security committee on which there will be equal numbers of British and Singapore representatives under a Malayan chairman, it would clearly be difficult to operate the base peaceably if Singapore had a communist-guided government. Mr Lennox-Boyd has insisted on retaining the provision in the agreement, which he introduced last year at the last minute, that at the first general elections under the new constitution no candidate connected with "subversive activities" should be allowed to stand. This, the Colonial Office thinks, while not ensuring the survival of Mr Lim Yew-hock's moderate Labour government, will at least keep out a left wing party under extremist control; it should confine, for example, the membership of the parliamentary People's Action Party to relatively moderate left-wingers like its leader, Mr Lee Kuan-yew. Events in the last year, including the capture of the municipal council by a very left-wing anti-colonialist group of politicians, have confirmed the view of the Colonial Office that its foresight has been amply justified.

But neither Mr Lim Yew-hock nor the other party leaders like the restrictive covenant on the first general election which, they think, will present a big handle to extremist propaganda and give democracy an unnecessarily poor chance of survival. They point out that as candidates have to be Singapore citizens, most of the troublemakers, who come from the mainland Federation (or from China) are automatically excluded anyway. They would prefer to manage things in their own way. But the Colonial Office, believing that Britain and Singapore need a breathing space in which to develop the new relationship, is taking no chances.

His doctor told Sir Timothy he had got to rest . . .

in the sun, if possible

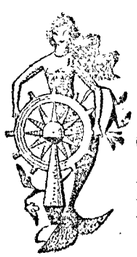


So SIR TIMOTHY did it in style, and went round Africa with his feet up, by Union-Castle. He took his unmarried daughter as companion and secretary (precious little secretarying she did!).

They left London on a thoroughly bleak afternoon in April with a bitter East wind in the River. The Warwick Castle was in sunshine by lunch time on the second day and, by the third, Sir Timothy was leaving his coat and tie in his cabin.

Into the Mediterranean . . . Gibraltar, Genoa, Port Said, Aden, Mombasa, Zanzibar, Dar-es-Salaam, Lourenço Marques, Durban, Cape Town.

They had bought their tickets to go right round Africa in the Warwick Castle, but a young South African business man on board persuaded Sir Timothy's daughter to bring her father, and meet his family at their house by the sea at Hermanus. Sir Timothy was also determined to see Kruger Park at its best and with all the big game there. All the arrangements were made for them, and they broke their trip for four weeks 'shore leave,' and took the Kenya Castle home.



9 SUN-DRENCHED WEEKS SAILING ROUND AFRICA

Fewer ports of call this time, but just as romantic: St. Helena, The Canaries and . . . home.

They had travelled 15,000 miles by sea. Sir Timothy had cooked in the sun for 60 out of 65 days. But he had also done quite a lot of work, keeping in touch with his office in London by wireless, and by letter from ports of call. He had also put on some weight (Union-Castle food is a constant temptation). He had collected a walnut sun-tan from the top of his bald head to practically his toes. He had missed the worst English spring on record, and he got back just when his roses and herbaceous borders were at their summer best.

And when his daughter goes to live in South Africa (yes, she is going to marry that young man) Sir Timothy proposes to visit them as often as he can get his doctor to tell him he needs a rest in the sun.

THE GOING'S GOOD BY

UNION-CASTLE

About twice a month a Union-Castle liner goes out from England to do the Round Africa voyage. May we send you our 'Colourful Africa' booklet? It gives you some idea.

CHIEF PASSENGER OFFICE: 19-21 OLD BOND STREET, LONDON, W.1. TEL: HYDE PARK 8300

LETTERS

Algeria

SIR,—Your remarkable correspondence on the French crisis and also your leading article overlook one possible meaning of the events in Algeria. Ostensibly the generals are trying to renovate France, claiming that the politicians in Paris have ruined her. The *colons* for their part are afraid of the Moslem tribal wave and invoke General de Gaulle as *deus ex machina* and saviour. Many Moslems are equally oppressed by the FLN and by the military occupation. In General Massu they see, or think they see, a new hope for Franco-Moslem co-existence in Algeria.

All this, however, is on the surface, however sincere the protagonists. What is really happening is the disruption of the unitary French state itself, of which the Fourth Republic is merely the present form. Fundamentally the appeal to General de Gaulle is an appeal to a man who in the past successfully challenged a legal government; not to someone who is going to create a new version of it. Unconsciously the non-FLN Algerians, both French and Moslem, want a separate body politic: just as the revolutionary *juntas* of South America rose against the Spanish state in the name of King Ferdinand the Seventh, imprisoned by Bonaparte at Bayonne.

If we drop the red herring of renovation of the French state and stick to the Algerian Tea Party, how does the future shape itself? First, the FLN is on the defensive. Some kind of Franco-Moslem fusion is now on the cards since Massu is publicly committed to it. Morocco and Tunisia, although nervous, may well prefer a Franco-Moslem Algeria to an eventual FLN regime which would be far more radical and expansionist in the name of Maghreb brotherhood. With Paris out of the picture, a North African Confederation in which local French interests, including those in the Sahara, have a voice, ceases to be impossible.

Your leader states that the Nato interest requires a restoration of Parisian authority in Algeria. But is this so? No amount of "renovation" in Paris, whether by General de Gaulle or "the parties," could restore a contented Algeria under the old unitary system. This crisis is as much philosophical as political. The curse of the French Union since 1946 has been in its inherited dogma of the indivisibility of the French body politic and in the myth of assimilation. The question now is whether new concepts of the association of peoples will supersede them. As things are, negotiation with and conquest of the FLN are equally impossible. The only chance for North Africa lies in a regional new deal.

The real catastrophe for Nato, and indeed metropolitan France, would be the extinction of Tunisia and Morocco at the hands of the FLN. This could easily come about if Paris were able to continue the war under the bankrupt policy of maintaining Franco-Algerian union in its present legal form. If, however, the generals can be encouraged to implement their *pronunciamento* by proceeding to a genuine integration of French and Moslems on the spot, all will be for the best. Moreover General de Gaulle would have done better to join them there instead of adding his own brand of nationalist metaphysic to the general confusion.—Yours faithfully,

CZESLAW JESMAN
CHARLES JANSON

Expenses

SIR—You ask in your article last week, Expenses and Benefits, whether the Institute of Directors is a professional body, a learned society, or one of the "etcetera" listed in the side note to this year's Finance Bill.

The answer is that the Institute certainly satisfies the three objects of bodies likely to receive the Revenue's approval; i.e. advancement of knowledge, maintenance of standards of conduct, and protection of members. In the Chancellor's view, however, this does not go far enough. For, later in the Bill, it is laid down that such a subscription is allowable only when membership is "a condition of the performance of the duties of the office or employment." So far it is not necessary to produce a "union card" to gain admission to the boardroom—and, however much we might welcome such a condition from the point of view of increasing the Institute's membership, we hope that this day will never dawn.—Yours faithfully,

RICHARD POWELL
Director-General, Institute of Directors

Political Broadcasts

SIR—There is a likely consequence of your proposals which you do not appear to have considered. Already the party political broadcasts have decreased attendances at general election meetings in the individual constituencies. Poor things as they were, they nevertheless had an air of authority few candidates could hope to match. If to authority there is to be added entertainment in the shape of the quiz or inter-party ding-dong, even thinner attendances are a foregone conclusion. With political programmes erupting at different hours on different channels the poor candidate could come to be regarded as an annoying interruption even on the doorsteps of his own constituency (he already has to avoid the peak viewing hours).

You castigate the party machines in your conclusion, but the election over, might not the lowered status of private members strengthen the power of the machines still further? (You will find others to question the propriety of elevating to temporary omniscience BBC or ITV "personalities" with no responsibility except to their own future television careers.)

I do not suggest our present pattern is right. But changes should be in the direction of persuading voters to look at the man as well as the machine. (Curiously, in years of party political broadcasts I cannot recall one of these top people recommending listeners to go along to their local meetings.) A few well-designed programmes to show the attractions of a lively constituency meeting might stimulate interest. A legal obligation for candidates to share a platform, say three times during the election campaign, would help to maintain it. A legal obligation for local newspapers to give equal publicity to dates, times and locations of meetings would reinforce party publicity. But broadcasts by either the top people or of the entertainment character you visualise should in my view be strictly limited to viewing and listening hours outside normal meeting times.

Here there is no analogy between a broadcast and a newspaper. The latter does not (even *The Economist*) tie you to your chair of an evening.—Yours faithfully,

Leeds S. E. GRAHAM

Tanganyika

SIR—We are puzzled about the sources of information upon which your special correspondent based some of his economic statements in his two articles, on April 5th and 12th, about Tanganyika.

Tanganyika's economy is said to have made "great advances" in the last eight years. We have recently compiled a series of national income figures, published in *The National Income of Tanganyika, 1952-54*, which hardly bear out such a view. Gross domestic product per head at £16-17 increased only slightly over the period 1952-54, and this was to some (unknown) extent merely a price movement. There seems to be no evidence of any great advancement since that period.

A misleading picture of the economy can easily be given by your correspondent's concentration on export crops. In fact, the three great export crops of Tanganyika, coffee, sisal, and cotton, accounted for only 13 per cent of gross domestic product in 1954, whilst other agricultural and pastoral production accounted for 42 per cent. Further, Tanganyika being a relatively small seller, the three export crops are the plaything of world markets, and the expansion of one year can readily be eliminated in the next.

Whilst not forgetting the interdependence of export and other sectors, it appears to us that a more flexible approach to economic advancement might well come through the re-organisation and the substitution of production for cash in the large, non-export, agricultural, pastoral, and forestry sectors. This calls for the encouragement in all sectors of African and Asian enterprise along the lines suggested by the Royal Commission on East Africa.—Yours faithfully,

ALAN T. PEACOCK
D. G. M. DOSSER
University of Edinburgh

[Our special correspondent writes: The figures quoted by Professor Peacock and Mr Dosser relate to the years 1952-1954. I was writing of the period 1949-1957; the total revenue in 1957 was more than twice that in 1949.]

Gaining on the Roundabouts

SIR—As a fairground fan I was most interested in the article in your issue of May 10th.

There is one correction. You talked about switchbacks. There are only two switchbacks left in the whole country. A switchback is a machine with a spinning top frame; this frame pulls round gondola cars on an undulating track and is a slow sedate ride.

These were succeeded by the scenic railways where the gondola cars were powered by individual electric motors, the centre of the ride being occupied by a massive organ. I think you must have had in mind the "Waltzer," which is third most numerous, the "Dodgems" and "Ark Speedways" being in the first two places.

It is a matter for regret that the old organs and traction engines are now defunct.—Yours faithfully,

WILLIAM G. R. WEEKS
University of Durham

BOOKS

Mr Acheson's Revenge

Power and Diplomacy
By Dean Acheson.
Harvard University Press. London: *Oxford University Press.* 149 pages. 17s. 6d.

No one can grudge Mr Acheson the pleasure, if it is a pleasure, of pointing out the errors and follies into which dogmatism, ignorance and the horror of being thought unorthodox have led the directors of American foreign policy under the Republican administration. Perhaps the simultaneous outbreaks of anti-American folly in the last few weeks, in apparently unrelated sets of circumstances, among people of completely different outlook and temperament in widely separated parts of the world—Lebanon, Algiers, Indonesia, Uruguay, Venezuela—will assure him of a more attentive hearing than he would normally have got. His political opponents, who used to attack him as a fool and a traitor when he was Secretary of State, have been learning for themselves.

Mr Acheson offers them much good sense, but what he offers them is limited. He is a penetrating critic of the fashionable military ideas; about foreign policy, to the extent that it is more than a subordinate arm of defence policy, he is acute in matters of detail—sometimes very important detail—but to the oversimplified picture of the world that is still at the bottom of so many American mistakes, he has not much depth to add.

One difficulty may be that diplomacy has in fact become not much more than a branch of defence. If a man like Mr Kennan seeks to lift it out of that position, by directing attention away from the military problems towards the political problems of international life, his attitude is thought to be shocking. Certainly it shocked Mr Acheson, even though he himself is fully prepared, indeed delighted, to contest the assumptions of current military policy. With force and insight he argues that the obsession with the nuclear arm is tending to reduce the western armies to immobility and the western governments to impotence. By following a one-sided trend in military thinking they are tending, he points out, to debar themselves from any defensive action short of total war; thus they leave an enjoyable and ever-broadening field of manœuvre open for the free use of the other side. And when the western military planners turn for relief to theories of limited nuclear war, Mr Acheson can show without difficulty that they are turning to an illusion. True, the nuclear weapons grow ever more various in size and kind. But where is the theatre in which a limited nuclear war—that is, a war in which the major opponents blow up each other's armies on a battlefield chosen by mutual assent, while leaving the American and Russian homelands intact—can be fought?

So far, so good. But Mr Acheson is not prepared to contest the political assumptions underlying the conventionally accepted American view of world affairs. One looks in vain for any awareness of the Soviet Union, or, indeed, any part of the communist world, as a country with a political life in which political forces grow, wane, and contend. Here is a world in which Russia is a constant, a monolith, at best an enigma. If they accept it (as, for most purposes, they do), the political leaders of the West when they decide their courses of action are not likely to give much thought to the possibility that Russia itself has choices to make; that there is a domestic balance that tips the scale when those choices are made; and that it can be influenced by what the West decides to do.

★

Against a prefabricated view of the Soviet Union Mr Acheson sets a prefabricated view of an America enjoying "the good fortune to be spared the desire for expansion abroad," but faced with the simple choice whether, how and to what purpose to deploy its strength in the world. He would have America deploy its strength to organise the non-communist world as an impassable barrier to communist penetration. This has a lot to be said for it; but only Americans or Europeans (and not all Europeans) will see at a glance that it has nothing to do with any desire to dominate others; and when American policy runs into trouble, this is most often the reason. Many distant peoples do not wish to be organised into a block, whether the opponent against which the organisation is aimed is communism (as Mr Acheson believes) or simply Russian power (as it tends in reality to be). The view of Russian policy as inflexible, unvarying in its resolution, and fundamentally warlike—the universal enemy against which the world must be organised in permanence—is simply not saleable to many of the countries whose participation in the projected "world system" is required; and to most of the questions that crop up in practice it offers no guide. Even when the simplifier is as acute and thoughtful a man as Mr Acheson, foreign policy will insist on being more complex than he would allow.

The Tail that Wagged the Lion

The Boer War

By Edgar Holt.
Putnam. 317 pages. 25s.

IT took the settlers a good many years to drag an unwilling mother country into a full-scale war, but they managed it in the end. They were helped by the narrow-minded obstinacy of those on whom they wanted war to be made, but this alone was not enough. The settlers were not in the slightest danger (indeed, they were doing very nicely) until they themselves, by keeping up a clamour and at times staging an armed provocation, eventually roused their intended victims into ill-judged and violent action. To whip up a vaguely jingo mood in the home country was not difficult. There were smarting memories of earlier defeats to be wiped out. There were "women and children of our race" who could be represented as in dire peril. There was a major foreign power that had openly backed the other side. There was a vast, empty and beckoning horizon to point to—and it was already well known what tremendous mineral wealth lay beneath those arid expanses. There was money in plenty, money already amassed in those African territories, a fantastic amount of it concentrated in the hands of a small number of ambitious men skilled in intrigue and inured to rough methods. In Africa, the voices that counselled moderation were shouted down, and some who came out from the home country sceptical or cautious were won over to the malcontents' side as tension mounted. At home, hesitant politicians looked weak and pallid alongside the sun-tanned heroes who periodically blew in from the south with tales of derring-do and dividends to whet the public appetite.

So war came—and came to stay for several years. The mother country was grossly ill-prepared, and at first very half-hearted about the conflict provoked by the actions of its sons overseas. Things went very badly, and there were many hunts for scapegoats. But as the black news continued day after day, and the casualty lists mounted, so patriotic fervour mounted too. What matter if this campaign was losing the country many of its friends abroad? Doubt and criticism were branded as near-treason. When the tide at last seemed to be turning, the rejoicings took hysterical form. The successful generals were almost deified; the unfortunate leaders of a divided political opposition were increasingly at odds among themselves. When ugly stories began to reach the public at home, stories of indiscriminate burning of homes and crops, of "enemy" children dying like flies in the fetid camps where they had been given what passed for a refuge and where, according to the commander-in-chief, they were "far better looked after in every way than they are in their own homes"), many people refused to listen; others unable to deny the damning evidence, still thought that such revelations were untimely. Meanwhile small bands of ill-equipped guerillas continued to defy a now huge army, and final victory seemed an unconscionable time coming.

South Africa is not North Africa, any more than Boers are Moors or the 1890s comparable with the 1950s. Yet there is a curious aptness about the publication at this moment of this new account of the origins and course of the South African war. Mr Holt handles his subject with a dispassionate frankness that will scarcely satisfy readers who have been reared on either of the conflicting myths about that war. Yet he shows that it is possible to be fair without being dry; his lively style, and admirably digested store of anecdote, make this a most readable book, even in those sections that are merely chronicles of countless minor engagements. It can be warmly recommended even to those who are not interested in learning how a small colonial community can, like a tail wagging a dog, force its homeland into a sad and sorry conflict—and in so doing inflict grievous damage on the homeland's national mentality and international repute.

Man with an Obsession

The Mist Procession: *The Autobiography of Lord Vansittart*

Hutchinson. 568 pages. 35s.

WOE betide those who settle down with this book to a steady read through 550 pages from beginning to end. Unless they are over forty they will get lost, so few are the dates and the milestones of historical sequence. If they are over forty they may be confused by the mass of detail: what sound like diary jottings interspersed with brilliant worked-up sketches of people and situations. So far as there is a thread to cling to, it is like a mournful and sinister theme by Richard Strauss: Britain declining, its leader failing, its people faltering.

The author, like so many of his generation, was obsessed with Edwardianism, its real opulence and unreal self-confidence. Like so many today, who should know better, he was also obsessed with an inaccurate picture of Britain's record in the nineteenth century and apparently ignorant of the knife's-edge path its people trod during the previous three centuries—a serious failing in a private secretary to successive Prime Ministers, who finished as head of the Foreign Office. It was the historical bias that made him such a doughty critic of demagogy, wishful thinking in foreign affairs, and the cowardice of politicians with five-year leases of power.

Scattered about this book lie the seeds of a reassessment of appeasement and of Chamberlain. Firmly planted in the later chapters—the book ends in 1936—are unforgettable clumps of Baldwiniana. He defends the ministers of the thirties on everything except their record in Europe. He is scathing—and to this reviewer convincing—about the throwing overboard of Hoare's plan for Abyssinia, partly caused by one of the most sensational headlines ever written: "A Corridor for Camels." "The later effort to depict our rulers as Guilty Men," Lord Vansittart writes, "was made by employees of guiltier Beaverbrook and men of the Left with tracks to cover and footprints to obscure." The real culprit all through was public opinion, which would never accept the clear-cut choice between war and compromise, clinging to the non-existent third course of collective security.

It is a great pity that Lord Vansittart did not have time to divide his book into three parts: portraits of people, which he is best at; analysis of key events on which he is an important witness; reflections on life and the passing of time, which have more charm than originality. Then we could enjoy more easily such things as these.

On Eden:

> He learnt early and instinctively all the things that please in Britain, and these things were right but not real, unsuiting him at this juncture as mediator with the wrong-minded.

On Ciano:

> He was having too good a time to want trouble; and a *jouisseur*'s repugnance to war is more reliable than a pacifist's because it is more practical.

On Mussolini:

> Bold, stumpy, stagey, skilled in the management of his voice and eyes. . . . With a better figure he would have reminded me of a boxer in a dressing gown shaking hands with himself.

And his epitaph on Baldwin, so relevant to the debates and discontents of today:

> He had to contend with a time of recoil so powerful that simple men like Dick Shepherd could be canonized for helping to endanger lives by the million.

Charity pervades the book, pity for the weakness of men wrestling with contempt for the foolishness of masses. It was written "to show how happy one can be even when things go cock-eyed."

Footnotes to History

Some Memories

By Lord Percy of Newcastle.
Eyre and Spottiswoode. 223 pages. 21s.

LORD EUSTACE PERCY (to give the author his earlier and better known title) died on April 3rd, 1958, at the age of seventy-one, a month before the publication of this book of "footnotes to History". Too fragmentary for an autobiography, it contains discursive elements from two other books that he might have written had his health allowed: the one a political history of Britain from the end of the Boer War to the seizure of the Suez Canal; the other a survey of British educational policy in the twentieth century.

His testimony as to the motives and the capacity of Hoover, Lloyd George, Baldwin, Austen and Neville Chamberlain adds what he modestly calls "a newish point of view", which we read with delight today, and which will be of enduring value to future historians of these years of change. The following extract (not with interest in a month when £3,500,000 is requested for a new Churchill College at Cambridge) gives the flavour of his language:

> To tell the truth, Churchill's feelings about education have often reminded me, then and since, of Person's famous comment on Gibbon's attitude to Christianity; he seemed to "hate it so cordially that he might seem to revenge some personal injury". . . . His imagination would have been caught by the use of taxpayers' money to build and staff some great or national institution; but he could see no political or national advantage in the making of grants in aid of municipal institutions, from which the municipalities would reap most of the credit—whether it were the extension of the great Manchester College of Technology or the improvement of what he once described to me, in one of his baroque moments, as "village schools with a few half-naked children rolling in the dust."

The book shows that, while a young politician, Eustace Percy saw that Britain's future well-being would depend upon the character and sufficiency of its education, and that in his later years as a vice-chancellor he remained fascinated by politics and dedicated to the promotion of understanding between Britain and the United States. If he was a comparative failure in politics, it was because his attitude was that of the intellectual historian trained as a civil servant. But he was able to achieve profound changes in the British educational system and methods because he had a philosophy on which to base policy and a capacity to administer.

His principal contribution was that he was the first President of the Board of Education who really grasped the full implications of technical education. He worked to create two educational ladders: "one leading through the Secondary Schools to the University, the other through the Senior and Technical Schools to the College of Technology, with ample facilities for changing from one to the other at almost any rung". This was the doctrine of the Percy Report on Higher Technological Education, on which tardy action has recently been taken.

Eustace Percy says that his best work was done after his return to his "wildly beautiful Northumberland" during the fifteen years that he was Rector of King's College, Newcastle upon Tyne (and, for alternating periods of two years, Vice-Chancellor of the University of Durham). His aim was to make Newcastle the pattern of a modern Redbrick university, with an expanded production of humane scientists and technologists. He succeeded in taking the first steps towards the creation of both the physical university and the university community, but was held back (as he had been as President of the Board of Education in 1924-29) by the reluctance of Chancellors of the Exchequer to spend money on education. "It is indeed odd that statesmen never learn from the past, and what they learn most slowly seems to be arithmetic." There is a sombre note throughout all these memories—the warning that the British people continually adhere to outmoded habits of thought and so to policies that prove unsuited to the world of today. This book shows that Eustace Percy (though he would never have claimed it) possessed that priceless gift of "real farsightedness—that telescopic vision that is the rarest of political virtues."

More Essential Economics

Lecture on Economic Principles, Vol. II

By Dennis Robertson. *Staples.* 162 pages. 16s.

IT is unlikely that anyone will tackle this second volume of Sir Dennis Robertson's Cambridge lectures without previous acquaintance with Volume I; and anyone who has read Volume I will hardly need reminding either of its limitations or of its qualities. Volume II shares these. Building on the theory of value already discussed, it deals with the theory of distribution, leaving money and the theory of fluctuations for a third and final volume. Like its predecessors, it reproduces with a minimum of revision a lecture course whose undergraduate audience—concurrently following other courses, and pursuing other reading programmes—were able, as the detached reader is not, to supplement and fill out the intellectual menu provided. Like its predecessor, it is a *tour de force*, combining an extreme economy of exposition with all the familiar grace, wit and unshakable common sense.

It is very possible that certain students, after following Sir Dennis as he pirouettes across successive *pontes asinorum*, may find themselves in the plight of the man to whom the Secret of the Universe was revealed in a dream and who, waking and falling on his knees to thank his Maker, found on rising to his feet that he had entirely forgotten the revelation. But unlike this unfortunate they can always re-read, if need be with a wet towel round their heads, the passages in question; literary gifts, with Sir Dennis, are never devices for masking ambiguity or confusion of thought.

Five stars, in the manner of Baedeker or Miss Stella Gibbons, should properly mark the passages on the supply of savings (pages 84-85), of business enterprise (page 103), and on possible eugenic standards (page 143).

Advertising's New Technique

Motivation Research

By Harry Henry.
Crosby Lockwood. 240 pages. 30s.

THAT advertising should seek the aid of the psychologist is hardly surprising since its basic function is to influence people's minds. This was seen quite clearly thirty years ago, but neither psychology nor advertising appears to have been ready for each other. All that resulted was the inclusion in advertising examinations of papers on a rather vague social psychology. Meanwhile the advertising business turned increasingly to the study of human behaviour and developed the now almost universally accepted techniques of market research in order to do so.

By means of market research, advertising developed from a hit or miss activity based on "hunch" to a closely reasoned operation based on an ever-growing mass of statistical evidence. One effect of this was, however, to reveal that it was not always enough to know what people did; it was often even more important to know why they did not. Attempts to solve these questions by simple question and answer techniques were seldom satisfactory. More often than not people explained their behaviour, their likes and dislikes in terms of clichés which all too often obscured their real reasons, either because they wished to hide these reasons or often because they did not know them.

Out of this need grew "motivation research"—a technical development which, for some people, has acquired an emotional content that it is hard to understand. There is at times a tendency to associate it with subliminal advertising as part of a conspiracy by large advertisers to hypnotise the consumer. In fact there is little evidence that subliminal advertising is a practical proposition, and certainly the only thing it shares with motivation research is the attention of the psychologist.

Mr Henry's book is the first important full-scale study on this subject produced in this country. Previous contributions have come mainly from the United States and have all too frequently appeared to be the view of the professional psychologist, looking at advertising and marketing as yet another series of problems in applied psychology. Mr Henry, having started as a market research worker some twenty years ago, has had plenty of opportunity to discover how far purely statistical research can take him and where he has to look outside to techniques of motivational research to get past the limitations of straight behaviourist market research.

As with most techniques that are developing from one application to the next, there is an area of disagreement among practitioners of motivation research, particularly on how to bring together the tendency of the psychologist to be personality centred and the needs of the marketing man, which are usually product centred. Mr Henry's book does much to orient the new techniques towards the product and its market; this should at least diminish suspicion of motivation research and make it more readily acceptable among the older and more tried techniques of market research.

Aquinas and the State

Principality and Polity

By Thomas Gilby.
Longmans. 357 pages. 30s.

IN the spirit of the thirteenth century there were two contrasting, yet related impulses: an impulse toward exact division and minute discrimination and a striving for unity and the encompassing design. Out of the proliferation of meaningful detail and the constant division of space, the high Gothic rises to its total, all-embracing effect. It was an age in which various orders of metaphysical, scientific and rhetorical cogni-

tion were severely defined. In the proportions of some of the great cathedrals, however, the geometry of golden sections is intimately related to the divisions of the musical scale and, ultimately, to neo-Platonic doctrines of light. It is because of this sense of variety aspiring to final order that many historians have seen in the thirteenth century one of the specific glories of the western tradition.

From this glory Aquinas and the Aquinian mode of understanding are obviously inseparable. Aquinas was at once a master of classification, a precise divider of the rapidly expanding provinces of learning, and an architect on the grand scale. In this useful and crowded book, Father Gilby has sought to isolate from among Aquinas's numerous writings those elements directly concerned with the theory of the state and the nature of the body politic. Though Aquinas wrote no political treatise in the formal sense, he was heir to that Augustinian tradition which viewed the problem of the state as essential to an understanding of divine justice and of man's place in the chain of being. To this tradition, Aquinas contributed his Aristotelianism. What Father Gilby discerns in his thought is a "combination of the social teleology of Aristotle with the stylized order of the Roman Law."

From the point of view of the history of state theory, Aquinas stood at a point of transition "between the old and the new in the movement which was marked in civil government by the substitution of official edict for folk-custom, and in ecclesiastical government by the substitution of the elective chapter for the acclaim of clergy and people." Without ever questioning the universal primacy of the Pope, Aquinas was nevertheless prepared to see in common law, in the affirmation of the ethos of a community, an original and legitimate source of political power. Father Gilby speaks of him as a "liberal constitutionalist." He emphasises the rational, even pragmatic quality of Aquinian politics and contrasts the latter with the chiliastic speculations of the Spirituals. Nothing in this work is more valuable than his account of the complex legal and theological background against which St. Thomas attempted to evolve a comprehensive definition of law.

One feels that one must speak of an endeavour rather than a fulfilment. All of Father Gilby's exhaustive scholarship does not conceal the fact that Aquinas's political ideas were fragmentary and that many of them must be deduced from scattered pronouncements. Often, Aristotelian texts are made to speak on behalf of Aquinas himself. In seeking to illustrate Aquinian politics, Father Gilby ranges widely and brilliantly: we are carried from Jung to C. S. Forester, from A. J. P. Taylor to Rebecca West. But again, this underscores the essentially fragmented nature of the theme. It is one thing to exemplify a medieval concept in terms of Bismarck; it is another to give a footnote reference to the "Politics" for a statement about the "reign of law" under the Nazis. Indeed, it is not always easy to make out what kind of reader Father Gilby has in mind. "Principality and Polity" is too difficult for the layman; its spare style carries a heavy load of erudition and exegesis. On the other hand, the medievalist will find in the work an exposition of accessible texts rather than a new interpretation. Professional historians, moreover, will find omissions.

These are, however, minor queries. The advanced student of medieval thought will find in Father Gilby's work an invaluable guide. Few expositors are more familiar with Aquinian doctrine and its temporal background. None has covered the same ground so thoroughly.

The Soviet System

Russian Political Institutions

By Derek J. R. Scott.
Allen and Unwin. 265 pages. 21s.

THE argument that Soviet political institutions cannot effectively be taught to non-specialists should receive serious damage from this thoughtful and thorough textbook, which patiently, and without importing irrelevant criteria, sets out what can be known about the Soviet governmental system, and describes exactly what gaps in our knowledge are the inevitable product of the limitations of the sources. Based as the work is upon a course of lectures regularly given in the University of Manchester, it has the additional merit of being the first English (as opposed to American) textbook of the kind, and is thus easier to handle for the British student. It has certain weaknesses. The author has crammed too much detail into the available space, and since the formal pattern, though not the spirit of Soviet institutions, continually alters, some of this detail is certain to be out of date very rapidly. And it may be that the changes going on at the moment are not confined to points of detail: the changed relationship between machine-tractor stations and the collective farms, recently announced, is a case in point. This detail also tends to overload the text and to make it very hard going, particularly since Mr Scott, besides having the inescapable problem of finding approximate equivalents for Russian words and phrases, is not gifted with a very pleasing prose style.

A more dangerous weakness is revealed in the title: Mr Scott is dealing with the Soviet method of conducting political affairs, not anything specifically Russian; and though no doubt a good deal of the system is explicable in terms of the particular Russian inheritance of the Bolshevik leaders, the basic pattern has been so widely adopted in, or imposed upon, countries with a very different set of physical, social and intellectual conditions that to emphasise the Russian side is perhaps less helpful than Mr Scott believes. This is not only a question of theory; for it makes him give only perfunctory attention to the fact that, among other things, the Soviet political system is still a system of combat against external enemies. He says that it is "unlikely that any very great weight is given in the minds of the Soviet leaders" to the international significance of the role of the Russian Communist Party. How does he arrive at this conclusion? Has it anything to do with his odd view that the "mutual resentment" between the Soviet and non-Soviet worlds arose "from the timing of the revolution in the middle of a world war . . . intensified by the decision almost inevitable for a revolutionary government to disown Russia's immense foreign debt"? What of Lenin and Leninism?

Nevertheless, this criticism is outweighed by the immense service that Mr Scott renders in perceiving both how the formal institutions of state and party can be described, and how the final decision-making process escapes them both: "the real constitution is obviously unwritten and consists in understandings as between persons." A brave remark—and one that will sweep much rubbish out of the door.

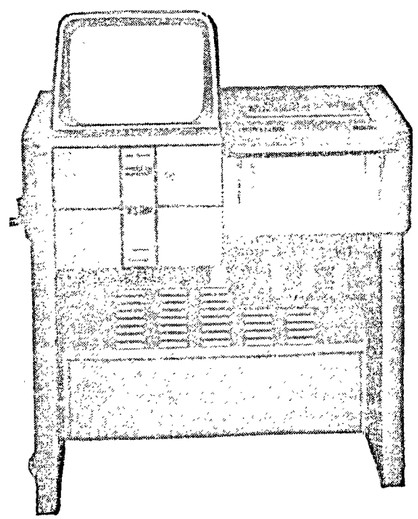
OTHER BOOKS

SELECTED PAPERS ON ECONOMIC THEORY. By Knut Wicksell. *Allen and Unwin.* 287 papers. 30s.

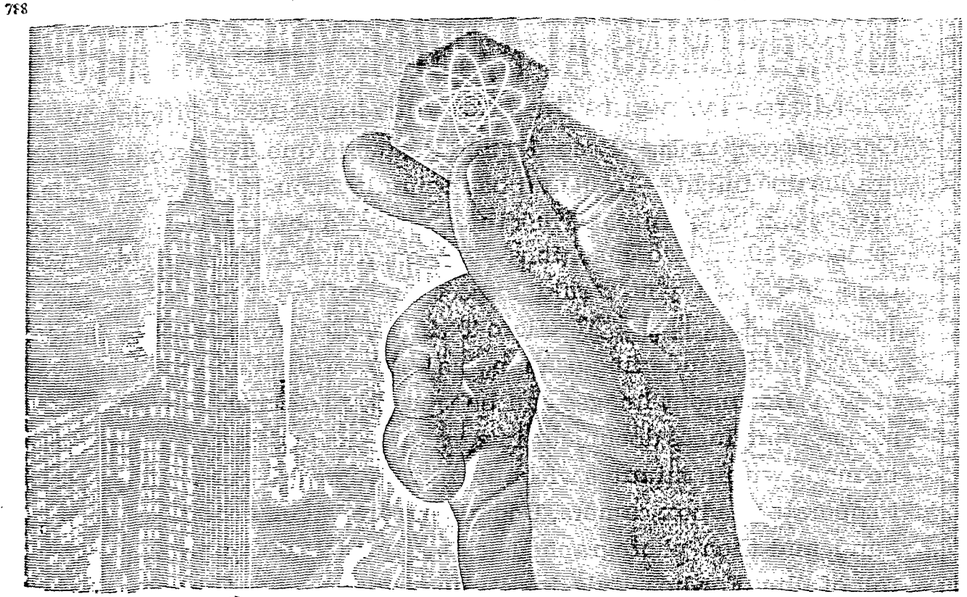
As a profound and path-breaking economic thinker, as a fertile teacher, and as a persuasive radical propagandist, Knut Wicksell stands out, in Professor Erik Lindahl's biographical Introduction to this volume, as one of the moulders of modern Sweden. For an English parallel one would have to imagine a composite of Alfred Marshall and both the Webbs; a decidedly intimidating thought. Among the papers here collected and made available in English for the first time is Wicksell's first, concise and comparatively untechnical statement of his theory of the relation between interest rates and the price level—a theory on which a generation later Keynes was to build, though eventually rejecting it, and of which, however amended and refined, the last has probably not been heard. There are two essays on marginal productivity theory; review articles on Pareto, on Böhm-Bawerk (whose "Theory of Capital" Wicksell hails as "an exceptionally great scientific step forward"), on Menger, and on Bowley, who gives him occasion to make a luminous assessment of the value of mathematics to the economist; and three papers on foreign exchange questions. The interest of the collection is obvious to anyone concerned with the past development of economic theory: but it is more than merely historical, for the ideas, methods, and attitudes here expressed remain seminal and active in Swedish economic thought and policy today.

CAREERS ENCYCLOPEDIA. Second edition. Edited by G. H. Chaffe and P. J. Edmonds. *Cleaver-Hume.* 672 pages. 15s.

This second edition gives facts about some 200 careers in callings as far removed as horse-riding and the lighthouse service. For those who refuse to be satisfied, there is also a section on emigration. The information given is concise and clear, and—rare these days—the price of this second edition is little more than half that of the first.



THE CONTROL OF INFLATION: An Inaugural Lecture. By J. E. Meade. *Cambridge University Press.* 52 pages. 5s.



This lecture was discussed in a Note of the Week in our issue of March 8, 1958.

MICROFILMING AT A PRICE YOU CAN AFFORD

Micro-Twin cuts the cost with increased efficiency

One single compact unit—Recorder and Reader in one. The recorder photographs documents—front and back simultaneously if desired—as fast as they can be fed into it. Flick the switch and the unit becomes a wide-screen reader. Two machines—two operations; yet the Micro-Twin costs less than you would expect to pay for the recorder alone. **TRACES DOCUMENTS IN SECONDS** Micro-Twin reading unit features the exclusive meter, indexing as many as 999 locations on each 100 ft. roll of film. Document images can be traced in seconds. The wide-vision screen reproduces document images full-size and facsimile prints can be made within minutes without a dark room. The recorder is as easy to operate as a box-camera. Documents are fed in, automatically or by hand, and then photographed—as many as 21,000 on a single 100 ft. roll of film. For hospitals, institutions or any office that needs a first-class record-keeping system, Micro-Twin saves time, money, labour and office space. Visit your nearest Burroughs office for a demonstration or write to Burroughs Adding Machine Ltd., 356-366 Oxford St., London, W.1. **BURROUGHS MICRO-TWIN** British-made for Burroughs by Rank Precision Industries (B.A.F.) Ltd., to Bell & Howell design

A pound of fuel to light a city

THAT'S ALL THE URANIUM needed to produce atomic power equal to the energy in 3 million pounds of coal. It could light the city of Chicago in the United States for a full day!

ATOMIC RESEARCH is focused on developing an economical way to produce electricity from atomic energy. Scientists at Oak Ridge National Laboratory in the United States, which Union Carbide operates for the United States Atomic Energy Commission, have already built experimental power producing reactors that are serving as a guide to commercial atom power plants.

PEACEFUL USES for the atom have also been found in the diagnosis and treatment of disease. Radioactivity is uncovering important facts about plant and animal growth. Industry uses the atom's radiation to control production processes, to test product quality, and for research

THE CHALLENGING FIELD of atomic energy is not new to the people of Union Carbide. They have been pioneering in every phase of this exciting business—from the mining of uranium ore to harnessing the atom for our future comfort and well-being.

FREE: *To learn more about the atom and the tremendous strides made in the peaceful applications of atomic energy, write for the illustrated booklet "The Atom In Our Hands." Please ask for booklet H-5.*

UNION CARBIDE INTERNATIONAL COMPANY

Division of Union Carbide Corporation

30 East 42nd Street UCC **New York 17, N. Y., U.S.A.**

Cable Address: UNICARBIDE, New York

AFFILIATED COMPANIES:

ARGENTINA: Eveready S. A. Industrial y Comercial
AUSTRALIA: Union Carbide Australia Limited
BRAZIL: S. A. White Martins
Union Carbide do Brasil, S. A.
National Carbon do Brasil, S. A.
